It is difficult to predict what will be the final outcome of the admittedly unsatisfactory state of affairs prevailing in plate glass insurance, with rates low, commissions excessively high (sometimes as much as 50 per cent), and the cost of replacements increasing, unless the companies form a national compact and place the business upon a logical underwriting basis. One company heretofore writing plate glass insurance alone, decided early in the year 1904 to add a personal accident department, and it is probably only a question of time when every company engaged in this one line of business will be forced either to add other lines of insurance, or to consolidate with other companies engaged in the same business.

Sprinkler Leakage Insurance.—While not constituting one of the main divisions of casualty insurance, this form of policy is written to a limited extent by two of the casualty companies, as well as by some fire insurance companies. The contract covers loss or damage to the building and contents caused by the accidental discharge or leakage (except from fire) of the sprinkler equipment erected in or on the premises. The premium, based at a varying rate, depending on the class of merchandise covered, is predicated upon a certain percentage, usually 10 per cent, of the cash value of the building, stock, and machinery. Sprinkler leakage insurance has been in vogue only nine years in America, during which period the total premiums have not amounted to any considerable sum. There is, however, a slow, steady growth of the business, due to the wider use of sprinklers in mercantile and manufacturing plants, principally in the Eastern and Middle States.

Fly-wheel Insurance.—This is one of the less important branches of casualty insurance and is of recent origin in this country. One company alone is engaged in the business at this time, and hence the statistics are limited. The contract covers loss caused by the explosion, bursting, or disruption, during rotation of the fly-wheels or any of them, first for loss upon the fly-wheel or fly-wheels and upon other property

of the assured; second, for loss from liability of the assured for loss upon property of any other person or persons; third, for loss from liability of the assured for bodily injuries or death sustained by any person or persons. Flywheel insurance is more or less allied to boiler insurance, and the limits of the company's liability in case of loss, as well as the rates of premium and the methods of handling the business, are very much the same as in boiler insurance. The insurance against breakage of machinery in general is being introduced to some extent in one or two European countries, but has not yet been attempted in America. There appears to be a field for such a policy, and doubtless the indemnity will be offered by some American company before very long. In fact, at the present time, a few corporations are engaged in the business of insuring the maintenance of electric machinery and of making the repairs found necessary from a periodical inspection of the premises or plants.

Physicians' Liability Insurance.—This is another of the modern schemes in casualty insurance, and provides indemnity against loss from common law or statutory liability for damages on account of bodily injuries fatal or non-fatal suffered by any person or persons in consequence of any alleged error, mistake, or malpractice by the assured in the practice of his profession. The limits of the company's liability are uniformly $5,000 for one person injured or killed, and $10,000 for any number of persons injured or killed during the term of the policy. Naturally, the moral hazard is the main consideration in a contract of this nature, and, while a fixed premium is charged, a careful selection is made by the conservative companies of the risks offered.

Taken all in all, the field for casualty insurance is an ever widening one, and the vast interests involved have given to this branch of indemnity a place in the front rank of insurance schemes. The magnitude of the business, the great scope of the contracts, the elaborate and comprehensive machinery required to properly conduct the affairs of these great corporations, can best be understood and appreciated when it is known that during the period in which the various lines of casualty insurance heretofore enumerated have been written by the total premiums have exceeded $221,000,000, the total losses have been more than $88,000,000, and the total amount of insurance in force on 1 Jan. 1904 was estimated at the bewildering sum of over $5,000,000,000.

EDWIN W. DE LEON,
Vice-President Casualty Company of America, New York.

Insurance, Credit, is a business proposition which offers to the seller of merchandise on credit protection against excessive losses as the result of bad debts. When loss occurs a certain percentage is to be borne by the party insured, and the balance of the loss is made good by the company issuing the policy of indemnity. To illustrate: Application is made for an insurance bond on sales amounting to $400,000 a year, and a bond is written on a basis of one half of 1 per cent loss; this one half of 1 per cent on sales, or $2,000, would represent the insured's own risk in bad debts, and if he lost no more than that amount he would receive nothing from his insurance. But should his losses be $5,000 in bad debts, his own loss would still be only $2,000, and the excess, or $3,000, would be paid him by the insurer, provided the losses had come within the terms and conditions of the bond. Credit insurance is a natural product of the present age. The first important systematic aid to the credit system was the establishment of the commercial agency, which is now recognized as indispensable to an intelligent transaction of credit business. But this first aid was not complete within itself, and a supplementary system was needed to still further minimize the risk of excessive losses through insolvency of debtors, which want is supplied by credit insurance.

The annual losses in the United States by the insolvency of debtors exceed by about 50 per cent the losses by fire. It has long been the general custom to pay insurance companies to carry the risk of loss by fire, but until comparatively recent years each merchant had to carry his own risk of loss through insolvency of debtors. Credit insurance is based on the sound economic principle which recognizes the province of the specialist. Both fire and life insurance offer protection superior to that which can be obtained through any other medium, because the principle of the law of average cannot be efficiently employed except by the specialist. Protection is against the possibility of abnormal loss no less with fire than with credit insurance. Credit insurance from the standpoint of the insurer proceeds on the principle of average which promises a profitable return on the sale of protection. The cost of protection is assessed on the basis of normal losses accruing in any given business for a period of years. Such loss may be termed the normal loss. Normal loss is that inevitable impairment of resource which can be borne by a business and yet admit of a satisfactory dividend on capital invested Abnormal loss is loss in excess of that which permits satisfactory dividend on capital investment, and it is against such loss that credit insurance offers protection. From the standpoint of the insured, credit protection cannot be considered a profit-earning investment. It is simply and solely protection against excessive loss by bad debts. A crop failure; an epidemic of disease, or a widespread or protracted industrial labor strike, are possibilities of danger which no man can provide against, as respects commercial credits, except through the medium of insurance protection. Experience may qualify a credit man to guard against bad debts through the rascality or impaired credit condition of those seeking credit, but no amount of experience or capacity can of themselves render it possible to provide against contingencies growing out of such cases as above mentioned.

Great care should be exercised by the insured in taking out a policy of credit indemnity. The peculiar need of his business should be intelligently considered. Precedent cannot be safely followed, for the character of every man's business is in more or less degree individual. Unless an intelligent application of the principle of credit insurance is made to each individual case, the greatest amount of protection cannot be realized. The principle of credit insurance being economically sound, it follows that if the insured in any given case does not realize the protection contemplated, it is because the conditions of the

indemnity are not adjusted to the needs of the business. No amount of indemnity can be considered a profit maker of itself; its true sphere is that of a profit saver. In explanation of the proposition that an insured is always a loser, when his losses make demand on the indemnity company, it is conceivable that excess losses should so dovetail with the conditions of the policy as to reimburse the insured for every dollar of excess loss, but such instances would be rare indeed.

It would be practically impossible to limit precisely the line of credit on every individual case to the exact ratio of protection. Such a conservative policy would by no means realize the best results of credit protection, and, if strictly adhered to, would restrict rather than expand business. Protection can be made to operate injuriously in both directions, and it would be as false policy to limit business to the letter of protection as it would be to expand it beyond the limits of the spirit of indemnity. A credit should not be extended merely by reason of the collateral security furnished by credit-indemnity, but such security should be used to justify a risk which would not otherwise be undertaken, and to increase a line of credit beyond its natural unsecured limit. A bank will not lend on collateral alone. The personnel of an individual borrower is an equation which can not be eliminated, whether the loan be in money by a bank or in merchandise by a merchant. Collateral security in the case of a bank operates to reduce the interest rate, and the difference between the rate which would be demanded without collateral and the rate with collateral, measures the premium paid by the bank for the protection. In the case of a merchant, the rate paid for protection is the cost of carrying the security as represented by the premium on the policy of indemnity. The banker, therefore, pays a higher rate for collateral protection than the merchant.

The essential features of the contract between the insured and the insurer are: (1) The insured to bear a normal loss of an agreed percentage of his annual sales. The said ratio of own loss to be determined by facts established by the record of the business for a series of years. (2) Insurance to apply to both rated and unrated accounts at an agreed ratio, as the circumstances of the business in question may require and justify. (3) Liberal insolvency conditions, in which technical distinctions are eliminated, and the actual and virtual facts equitably arrived at. (4) Prompt payment of losses at the period of settlement.

J. A. Taylor,
Prest. Wilmington, N. C., Board of Trade.

Insurance Engineering, a science or method of procedure for the better application of principles and rules in the business of insuring property against fire. The decision of the trustees of the Massachusetts Institute of Technology to establish a course in what for want of a better name has been designated insurance engineering, is commendable and should meet with hearty encouragement from the fire underwriters. Its object will be to instruct those who take the course in the selection and constructive use of materials with a view to minimize the risk of destruction by fire. Naturally, this will for the present relate more directly to mill and factory property than to dwellings, but the influence of such a school should soon be felt in every department of architecture, especially if out of its work shall grow a determination on the part of the fire underwriters to make such discrimination against buildings in which they are expected to take all the risks as will make it to the advantage of those who build or buy houses of any kind to do what is possible to share this risk by guarding against fire within practicable limits of slow-burning construction.

The latest official calculations — those of Insurance Commissioner Dearth of Minnesota — lead to the conclusion that 75 per cent of the enormous annual loss from fires in this country results from fires which are preventable. The policy of the insurance companies has lent itself to the encouragement of indifference on the part of owners of insured property to everything except the rate of premium. Commissioner Dearth's further conclusions are:

> It is not to the large number of promiscuous fires that heavy losses to property are attributable, but more to the larger select risks occuring in heavy commercial circles where great values are involved. One of the greatest evils in fire underwriting is in the matter of over-insurance, which places a premium upon criminal carelessness on the part of the assured, if not absolute incendiarism. For this evil the companies themselves alone are, of course, to blame, and consequently have it entirely within their power to eliminate. There is very little question that the companies are at the present time exercising a far greater degree of precaution in this direction than heretofore; in short, cancelations, reducing the liability of the companies on all the more hazardous classes of risks, are causing not only the local agents, but the assured, no end of trouble, and much greater care is, beyond question, being exercised in the line of inspections, especially looking to the matter of values as compared with the amount of insurance covering on the property. These are all matters that are being strenuously considered by the underwriters throughout the country, and beyond question must result in a material decrease in the fire waste.

The erection of insurance engineering into a profession will enable the insurance companies gradually to reorganize their business on safer lines, and in so doing discourage the practices which have grown up through the co-operation of owners and agents to saddle them with larger responsibilities than any scale of practicable premiums would warrant. The number of men qualified to practise as insurance engineers has never been great enough to meet the requirements of the companies. The new school should have an immediate and important practical relation to the public welfare in the safeguarding of life and property and the raising of the standards of construction in buildings admitting of classification as insurable risks.

The undertaking has the enthusiastic support and co-operation of Edward Atkinson of Boston, whose efforts in recent years have materially changed the methods of mill construction and the theories of industrial insurance; and it has appealed so strongly to mill owners, builders, manufacturers, and other investors to whom fire is a constant menace that, at Mr. Atkinson's instance, a fund sufficient to place it at once on a substantial money basis with liberal allowance for the heavy initial expense has been raised

Insurance, Fraternal. The principles which govern the system of fraternal insurance can be gleaned only from the decisions of the courts of law, the dictum of the insurance departments of the different States, the files of the leading fraternal journals, and the official reports issued by the National Fraternal Congress, the associated fraternities of America and the fraternal societies themselves.

Fraternal Insurance, as popularly understood at the present time, is "The obligation of a fraternal beneficiary association to pay the benefits prescribed in its constitution and laws when all requirements by or on behalf of the members are fulfilled." In the early days of fraternalism in America the term "protection" was universally used in describing the benefits furnished by the different beneficiary societies. See FRATERNAL BENEFICIARY SOCIETIES IN AMERICA.

The term fraternal insurance, although originally a misnomer, and clearly inapplicable in any true conception of the real aims and objects of a fraternal beneficiary association, has, however, come into general use of late years as being synonymous with the words fraternal protection and fraternal benefits, whenever reference is made to the money benefits paid by a fraternal beneficiary society. This change has come about so gradually that it is difficult to trace its origin or fully measure its effects. The primary cause of this mingling of insurance terms with fraternal names has undoubtedly been the failure of the officials of the different societies to constantly keep in mind the distinction between the insurance contract supplied by an insurance company and the fraternal protection furnished by a fraternal society, while a secondary cause has been the efforts of the insurance commissioners of the different States to compel all fraternal beneficiary associations to comply with the regulations in force as to insurance companies.

In order, therefore, to fully understand the scope and meaning of the term fraternal insurance, as now understood, it is first necessary to ascertain the meaning of the word insurance. Webster defines it as "a contract whereby for a stipulated consideration called premium one party undertakes to indemnify or guarantee another against loss by certain specified risks." The supreme court of Pennsylvania (1890), in the case of the Commonwealth *v.* the Equitable Beneficial Association (137 Pa. St. 412) (18 Atl. 1,112), thus points out the distinction between regular life insurance and fraternal protection, as then understood.

"The general object or purpose of an insurance company is to afford indemnity or security against loss. Its engagement is not founded in any philanthropic, benevolent, or charitable principle; it is a purely business venture, in which one, for a stipulated consideration or premium per cent engages to make up, wholly or in part, or in a certain agreed amount, any specific loss which another may sustain, and it may apply to loss of property, to personal injury, or to loss of life. To grant indemnity or security against loss, for a consideration, is not only the design and purpose of an insurance company, but is also the dominant and characteristic feature of the contract of insurance.

"What is known as a beneficial association, however, has a wholly different object and purpose in view. The great underlying purpose of the association is not to indemnify or secure against loss; its design is to accumulate a fund from the contributions of members for beneficial or protective purposes, to be used in their own aid or relief in the misfortunes of sickness, injury or death. The benefits, although secured by contract, and for that reason, to a limited extent, assimilated to the proceeds of insurance, are not so considered. Such societies are rather of the philanthropic or benevolent character. Their beneficial features may be of a narrow or restrictive character; the motives of the members may be to some extent selfish, but the principle upon which they rest is founded in the considerations mentioned. These benefits, by the rules of the organization, are payable to their own unfortunate out of funds which the members themselves have contributed for the purpose, not as an indemnity or security against loss, but as a protective relief in cases of sickness or injury, or to provide the means of a decent burial in the event of death. Such societies have no capital stock; they yield no profit, and their contracts, although beneficial and protective, altogether exclude the idea of insurance, or of indemnity, or of security against loss."

We may therefore assume that insurance is a contract between an insurance company on the one hand and the insured on the other, and provides for the payment of a specific indemnity by the company in consideration of certain stipulated premium payments by or on behalf of the insured. It has been held that a verbal contract of insurance is valid, but by universal practice the contract is made in writing, and is called a policy. The policy, therefore, expresses the terms of the contract, and governs the right of the parties.

Fraternal insurance, on the other hand, is the very antithesis of insurance as above understood. A fraternal society does not, and under the laws of the different States has no power to, make an insurance contract. It does not, and cannot, issue a policy. It does not promise indemnity against loss, and is not limited to any stipulated premium payments. Its contract is not between the society on the one hand and the members on the other, but between the members of the society, each with the others, and this contract is not expressed in the certificate of membership issued by the society. This certificate which it issues is not a policy. If it were, the society would immediately cease to be a fraternal society, and be not only classed by the insurance departments of the different States as an insurance company, but required to report and pay taxes as such. The usual form of certificate in use certifies that the holder has been duly and regularly accepted and admitted to membership in the organization, and entitled to all the rights and privileges accruing under the specified benefit, as prescribed in its constitution and laws as then existing or subsequently altered or amended by the duly constituted supreme body of the association. The certificate, therefore, is merely evidence of membership, and certifies that the holder is entitled to the rights and privileges flowing therefrom. It is in no sense a policy, and has never been so construed by any court of last resort.

Of late years there has been some conflict in the decisions of the courts as to the legal effect of some peculiar certificates of membership that have been issued by fraternal associations, but in the leading cases the courts have uniformly adhered to the rule that the certificate is merely evidence of membership, and that the rights of the parties, or, in other words, the contract for fraternal protection, is governed by the constitution and laws of the organization as they exist at the time the right to the benefit accrued, although in some cases the society has been held

to have waived certain provisions in its constitution and laws because of peculiar features in its certificate, and in other cases, certain practices or customs that, in the judgment of the court, tended to mislead the members, as to the proper construction or binding effect of some clauses in the constitution, have been held to be a waiver on those provisions.

The laws of the different States require every fraternal beneficiary association to have a representative form of government and to be organized and carried on for the sole benefit of its members and their beneficiaries. Each member, therefore, has a voice in the management, and has no right to complain of any lawful changes, alterations or amendments to the constitution and laws made during his membership, because they have been made by him or in his behalf, and for the general good of the entire membership.

As the organization is purely mutual, every member who is to share in the benefits ought in equity to bear his fair share of the cost, and it follows, therefore, that he is also bound by any changes that may be made in his rate of dues or assessments by the constituted authorities of the organization.

To sum up in a word, "insurance" is a contract, while fraternal protection is the result of a contract; the one makes a definite promise of a certain indemnity in consideration of certain stipulated premium payments, while the other is the obligation of a fraternal association to pay the benefits prescribed in its constitution and laws when all requirements by or on behalf of a member have been fulfilled. Many, of course, prefer to rely on the business promise of the insurance company to pay the prescribed indemnity, but the millions of members in the fraternal societies of America prefer their fraternal protection, not only because it is cheaper, but because it is better and surer. Every member of every fraternal association fully realizes that any tampering with good faith in dealing with any single member would be fatal to the organization, and ultimately injure the entire membership. In the judgment of all true fraternalists, the mutual interests of the members, therefore, constitute a safeguard that is far more reliable, and certainly more durable, than the mere promise of any purely business company. The membership of the various fraternal beneficiary associations in America that report to the insurance departments of the different States is over 4,500,000, and the amount of protection carried is in excess of $6,450,000,000. Up to the end of 1902, the various societies have distributed over $800,000,000 among the beneficiaries of deceased members. Last year their total payments for death losses were over $73,000,000. These figures do not include the vast number of small societies scattered through the various States which do not report to the insurance departments. For further information consult: The Annual Reports of the Insurance Departments of the different States, and the Official Reports of the Fraternal Beneficiary Societies.

FREDERICK GASTON,
President The Grand Fraternity.

Insurance, Industrial. *Definition.*—Industrial insurance may be defined as family insurance at retail. While in scientific principles it does not differ at all from ordinary life insurance as described by Mr. Nichols, in practice its distinctive features are: (1) that instead of having its policies written for $1,000 and multiples thereof at varying premiums according to mortality tables, its policies call for premiums of 5 cents and multiples thereof, the amounts of insurance varying according to age; (2) the premiums instead of being payable annually, or semi-annually, or quarterly, are payable weekly; (3) these premiums are called for weekly by collectors instead of being remitted by mail; (4) the amounts of insurance payable are based upon mortality tables drawn from experience in industrial insurance, and these tables differ very widely at all ages from the tables used by the ordinary companies; (5) the insurance is taken upon lives between ages 1 and 70, without distinction of sex as to premium, and, in the largest company, without distinction as to color. Industrial insurance is so called because it is the insurance of the working classes. For this reason it has grown very rapidly, and no doubt in time will exceed in amount the annual premium insurance.

History.—For its origin industrial insurance must point to the guilds of the Middle Ages, whose place was taken in England after the Reformation by burial societies or clubs. These were voluntary associations, meeting periodically and collecting dues and undertaking to bury members out of the funds so paid in. The dues were the same for all ages and the management so bad that up to 1867 14,000 of the clubs out of 38,000 had collapsed and a large majority of the existing remainder were insolvent. In 1849 the first industrial life insurance company was founded in England, called the Industrial and General; three years later an offshoot called the British Industry Life Insurance Company was formed; two years after this — in 1854 — the Prudential Assurance Company, which had been in existence six years as an ordinary company, took up the industrial business and soon absorbed the British Industry. At the outset the business was experimental, as actuaries had insufficient data upon which to base calculations; and several tables of benefits for the weekly premium of a penny succeeded each other, widely differing in amount. The first table ran from ages 10 to 50; age 10 was found too high for practical working and the table was run down to age 7; then a demand arose from the people for insurance at younger ages which was first met privately by an agent of the Prudential on his own account. His fine business record attracted the attention of the officers, who found it arose from his practice of himself insuring the younger members of the family. This discovery led to the company's making its system a real family insurance. It was not successful until all ages were accepted. Thereafter the business grew rapidly, so that at the end of 1904 the Prudential had 15,577,161 industrial policies in force secured by £24,973,082 of assets credited to the Industrial Department, besides £30,386,422 assets credited to the Ordinary Department. The Board of Trade exhibit of regular industrial insurance (that is, excluding friendly societies) in Great Britain shows the steady and rapid growth of the business as will be seen from the following table:

INDUSTRIAL INSURANCE IN GREAT BRITAIN.

Year	No. of Companies	No. of Policies	Insurance	* Death Claims Paid	Assets
1890	8	9,432,778	£86,203,873	£1,928,406	£8,737,936
1895	7	14,990,581	144,142,569	2,418,754	13,803,227
1900	14	18,653,846	181,135,538	3,410,642	21,512,384
1904	21	23,810,937	234,217,606	3,944,927	32,412,434

The number of policies in force in the industrial companies of Great Britain equals about one half of the population of the country.

In America the first weekly premium experiment of importance was the connection of the Hildise Bund, a German society which received premiums weekly and used them to pay to the Metropolitan Life Insurance Company to be credited upon quarterly premiums on policies issued by the Company on the lives of the members of the Bund. A large business was done on this plan for several years after 1860, amounting at one time to $7,500 per week. There were other similar societies in name, but they seem not to have done much business. The English experiment had attracted a good deal of attention in America, and various industrial insurance companies were formed which, however, never got to the point of issuing policies. There was a good deal of literary discussion which culminated in a State report in 1874 by Commissioner Clarke of the Massachusetts Insurance Department, describing the work of the English Prudential Company and setting forth the principles of industrial insurance. In 1875 the Prudential Insurance Company of America, then a small corporation in Newark, New Jersey, known as the Widows' and Orphans' Friendly Society, changed its name to the Prudential Friendly Society and in November began the industrial business on the lines of the London company after which it was named. Before it attained much growth the John Hancock Mutual Life Insurance Company, of Boston, the Germania Life Insurance Company, of New York (which, however, soon ceased writing industrial insurance), and the Metropolitan Life Insurance Company of New York, old line companies of experience, began the industrial business. The progress of this system of insurance in the United States has been wonderful. Its first policy was issued in America only 30 years ago; at the end of 1904 there were in force in the United States and Canada over fifteen and a half millions of industrial policies against less than five millions of annual premium policies — the amount insured thereby being respectively: $2,134,458,411 industrial insurance and $9,360,278,728 annual premium insurance.

The following table shows the rapid growth of the business:

INDUSTRIAL INSURANCE IN THE UNITED STATES AND CANADA.

Year	No. of Companies	No. of Policies in Force	* Death Claims Paid	Insurance in Force	* Assets
1880	3	228,357	$ 430,631	$ 19,579,780	$ 4,687,071
1885	3	1,360,375	1,919,533	140,101,632	6,573,267
1890	9	3,875,102	6,438,334	427,882,964	21,229,162
1895	12	6,947,223	12,551,865	820,062,966	54,306,416
1900	17	11,115,968	20,301,793	1,450,324,885	122,943,845
1904	11	15,599,449	31,436,785	2,134,458,411	255,255,034

The following table shows how extensively the working classes take out this insurance, by a comparison of the population of five large cities with the number of industrial policies in force in three companies (other companies are doing business in most of these cities):

City	Population in 1900	Number of Industrial Policies in Three Companies in Force Dec. 31, 1904
New York	3,437,202	2,191,818
Philadelphia	1,293,697	1,145,172
St. Louis	575,238	427,403
Baltimore	508,957	424,135
Cincinnati	325,902	294,540
	6,142,996	4,483,068

There are in the United States about 30,000 agents writing industrial insurance and the head office clerical force numbers about 5,000.

Industrial insurance was introduced in Australia in 1884, but was not vigorously prosecuted until 1887. By the end of 1902 there were six companies, with 291,198 policies in force, assuring £6,216,589. In New Zealand the Government started the business of Industrial insurance in 1875, but quickly discontinued it. In 1881 the Government revived the work of the insurance branch of its Insurance Department, but finally abandoned it in 1887.

* The figures in the columns of payments and assets include the annual premium business of the companies. As to these items, the reports do not separate the weekly premium business from the annual premium business. But so very large a proportion of the business of the companies is industrial that these figures are not at all misleading.

The business flourishes best in Anglo-Saxon countries. It is scarcely known anywhere else except in Germany, where in 1900 there were 34 companies, having two and a half millions of policies in force for $115,000,000. In Austria, Holland, Denmark, Sweden, Switzerland, Hungary, and Belgium the business is transacted on a very small scale.

Policy Contracts.—We have said that the unit in industrial insurance is the five cent premium; the amounts of insurance vary with the age of the insured and the duration of the policy. The curve in the mortality table descends from birth to age 12 and then ascends, and the companies for the same premium increase the amount of insurance with each age up to age 10. The amount of insurance thereafter does not decrease through life; for the policies are, like the annual premium policies, constructed with a level premium carrying a reserve from age 10 on whole life and on endowments at all ages. Insurance at younger ages is term insurance. Different kinds of policies are issued. The Prudential and John Hancock companies' policies are nearly all whole life; the Metropolitan policies issued for the last ten years have been practically all endowments; together these three companies have in force and issue yearly about 95 per cent of the American business. This table of the largest of the companies shows the benefits payable on children for a 10 cent premium with the period of endowment:

PREMIUM OF 10 CENTS, IN USE BY THE COMPANY WHICH HAS IN FORCE ABOUT ONE HALF OF THE AMERICAN BUSINESS.

Amount payable provided death occur after the policy has been in force for the following periods:

Age next Birthday	Under 3 months	Under 6 months	Under 9 months	Under 1 year	1 year	2 years	3 years	4 years	5 years	6 years	7 years	8 years
2	16	20	24	30	34	40	48	58	110	160	200	240
3	18	22	28	34	40	48	58	102	150	200	240	
4	20	26	32	40	48	58	94	140	200	240		
5	22	28	36	48	58	80	130	190	240			
6	24	32	44	58	78	120	180	240				
7	28	38	52	70	110	170	240					
8	32	44	70	100	160	240						
9	40	56	100	150	240							

On each anniversary of the policy, after the insured reaches twelve years of age, there will be added to the maximum amount named in the above table, ONE DOLLAR.

The endowment periods and the amounts payable at the end of such periods are as follows:

Policies issued at	age	2	mature in	47	years for	$276.00
"	"	"	3	"	48	"	278.00
"	"	"	4	"	49	"	280.00
"	"	"	5	"	51	"	283.00
"	"	"	6	"	53	"	286.00
"	"	"	7	"	56	"	290.00
"	"	"	8	"	62	"	297.00
"	"	"	9	"	68	"	304.00

For five cents per week the benefits are one half those named above.

No higher premium than 10 cents will be taken.

It will be noticed that the amount payable increases materially after the policy has been in force for several years. The reason is that in the early years insurance is not needed in so large amounts and the unearned part of the premium charged is used to increase the amount of insurance in the later years as well as to shorten the endowment period. Technically in industrial insurance adult insurance begins at age ten because the old actuarial tables were not carried below that age. Above that age at each advancing year at entry the amount of insurance for the same premium decreases. Thus, entering at age 10 the amount of insurance is $230 for 10 cents; entering at age 20 $154; entering at age 30 $120—and so on. These amounts are payable (with certain dividend additions) at age 80 or prior death. There are other tables, whole life tables, where the insurance at certain ages for the first few years of insurance is slightly higher for the same premiums; and there are also 20-year endowment tables, where obviously the death benefit for the same premium is less.

The provisions of the policies in industrial insurance do not differ in principle from the annual premium policies. Because of the small premium payable weekly the policies are only in partial benefit during the first year of insurance, that is, one quarter is paid if death occurs within six months, and one-half if death occurs after six months and within a year. The insurance is payable immediately upon receipt of proofs of death; and these proofs are prepared by the companies' agents without charge. The intention of the insurance being mainly to provide for expenses of sickness and death, everything is done to facilitate the payment of the premiums of the company and of the claims to the insured. Collectors call weekly for the premiums; the companies have local offices convenient to the policy holders and from there death claims are attended to and paid either without reference to the home office or on telegraphic instructions therefrom. Four weeks' grace are allowed in the payment of premiums which in practice is usually extended to five weeks, within which time claims are paid even if premiums have not been. Paid up policies are issued after two, three, or five years in different companies. The Massachusetts law provides for two years; the New Jersey law for three years; the New York law does not compel paid-up insurance—but the company grants it nevertheless. Revivals are freely granted in cases of lapsed policies, and where policies have been long lapsed, so that payment of arrears is difficult, the companies loan the amount of arrears on the security of the policies. Special allowances are made in cases of long strikes and lockouts, death claims usually being paid even if policies are lapsed.

Dividends.—Policies of industrial insurance have in form been mostly non-participating; but of late years three American companies have begun to pay dividends and have voluntarily disbursed to industrial policy holders over nine and a half millions of dollars—averaging over a million of dollars annually in cash dividends for the last eight years. The profits come from a very small margin upon an enormous amount of business. It has been estimated that the reduction of premium one cent a week on each policy would bankrupt the largest of the companies in five years. The only feasible way of reducing the cost to the holder is therefore the return of surplus by dividends. Two of the companies

once in five years return to the holders of life policies a cash dividend equal to ten weeks' premium — or about 20 per cent of the premiums for a year. One of these companies, which in 1896 practically withdrew the whole life form and has since issued endowments, substituted as to this form of contract a reversionary dividend guaranteed in the policy; that is, after the third year a sum is annually added to the face of the policy equal to the sum of ten weeks' premiums. Thus a policy which is for $230 after the first year (premium 10 cents, age 10 years) eventually is for $297 payable as an endowment at age 80. One advantage of this long endowment is that the amount of paid up policy is readily calculated by the insured — being for such a proportion of the amount of the policy as the number of years paid bears to the endowment period. The other of the large American companies provides in the policies for reversionary dividends to be paid when death occurs after 5 years; for cash dividends after 15 years and quinquennially thereafter; and for cash surrender values after 20 years.

Mortality.—When the cost of industrial insurance is considered, the first thing to be noted is the increased mortality among the industrial classes. Let us compare the number per thousand dying at each of several specified ages according to (*a*) Farr's English life table of the general population in Great Britain, compiled from two censuses (we have no such table in America); (*b*) Actuaries' table, (that is, a table of insured lives formulated from the combined experience of 17 companies, compiled by English actuaries, which is made the statutory basis in many of the United States for the computation of insurance liability); and (*c*) the Metropolitan Life Insurance Company's industrial table (based on observation of twelve millions of insured lives):

DEATHS PER 1,000.

Age Next Birthday	Farr	Actuaries	Metropolitan
20	7.74	7.29	10.52
21	8.46	7.38	11.56
25	9.24	7.77	14.14
35	11.24	9.29	17.15
45	14.50	12.21	22.56
55	21.75	21.66	35.22
65	41.20	44.08	64.51
70	60.80	64.93	90.99

A glance at these tables shows the net cost of industrial insurance of adults to range from 140 to nearly 200 per cent of the Actuaries' table. As the experience of the American companies shows an actual mortality of only about 80 per cent of the Actuaries' table, it follows that the industrial mortality is from 170 to 230 per cent of annual premium insurances. At age 35, generally taken as an average age, the percentage is 230. A comparison of industrial mortality with general mortality shows a less, but still large, percentage of difference. It is reasonable that it should be so, because, in the first place, industrial insurance in this country has not yet reached, in proportionate amounts, the agricultural and rural population, which is so large a percentage of the whole population. In the second place, the mortality of the working people in cities is large, because of the exposure, the mode of life, the hard toil and confinement, the carelessness of self which the observation of everybody must have noted among working men and women. To some extent there is also a selection against industrial companies, often unconscious, which is the correlative of the unconscious selection against tontine and endowment policies in annual premium companies. A man vaguely conscious of low vitality will insure himself more readily than his opposite, just as one vaguely conscious of superior virility will prefer tontine to whole life insurance.

Insurance of Children.— The insurance of children has been the subject of much discussion in England and Ameriea, and legislation against it has been proposed; but no law of prohibition has been passed in any State where the business has been well established. In England the law has remained for many years permitting the insurance of children within the limits previously adopted and maintained by the companies; and this after repeated Parliamentary investigations. In America, New York State in 1892 adopted as part of the insurance code a provision authorizing the insurance of minors according to the table of benefits in use by the companies. The Province of Ontario, Canada, followed a few years after with a similar table. In the States of Massachusetts, New York, Pennsylvania, Ohio, Connecticut, New Hampshire, Tennessee, Missouri, Wisconsin, Michigan, Georgia, Virginia, North Carolina and California proposed legislation forbidding the insurance of children has been defeated, in many of them repeatedly. In Massachusetts in 1895 the joint legislative committee took six weeks to investigate the subject, examining hundreds of witnesses, resulting in a vote of 143 to 29 against the prohibitive bill. Colorado is the only State which forbids the business and the law was passed there without a hearing of the company which had only recently begun business in the State — in other words, in anticipation of, not after experience of, evils. So France, which is without experience of industrial insurance, recently passed a prohibitive act; while in Australasia, where such insurance has been written for years, New Zealand has passed a law on the lines of the English permissive act. The tables above printed show the American limit on child insurance by the practice of the companies. It is apparent therefrom that at the earlier ages the insurance is simply burial insurance, while at the older ages it amounts to a very respectable endowment insurance. No case of child murder or abuse for insurance has ever been shown in the United States. In England the matter is thus summed up by Doctor Jones of the Royal Southern Hospital in Liverpool (where child insurance is most common and has been for many years) in a book 'On the Perils and Protection of Infant Life': "The incentive to child neglect and child murder is *not* the prospective receipt of insurance money." Statistics in both England and America show that the mortality of insured children is less than the general child mortality. The following table compares the mortality of the company which has in force one half of all the industrial policies in the United States and Canada, with that shown by Farr's English life table of the general population of

Great Britain and by the United States census of 1880:

DEATHS PER 1,000 AMONG CHILDREN.

Age Next Birthday	Farr's Table	United States Census		Co.'s Experience 1904
		General Population 1900	31 Cities 1880	
2	65.59	46.6	87.4	32.7
3	36.13	20.5	36.7	22.
4	24.59	13.2	24.7	12.8
5	17.92	9.4	17.9	8.8
6	13.53			
7	10.75			
8	9.18	5.2	8.9	5.1
9	7.69			
10	6.56			

*The census tables of 1880 were the last to give mortality percentages for the group of 31 cities. Improvement in the mortality of the general population and of the company's experience is shown in the adjoining columns. The company's business is, however, done almost entirely in cities, and a very large proportion is in the 31 cities referred to in the census of 1880.

The companies limit the amount of child insurance to the amounts fixed by the New York statute, which are practically those shown by the Infantile Endowment tables printed above; and the rule in case of over-insurance is either for all companies to cut down the payments proportionately or for the companies issuing the latest policies to return the premiums. No specialty of child insurance is made. Industrial insurance is, as we have said, family insurance. This is strikingly shown by comparing the percentage of population at various groups of the ages with the percentage of policies in force at the same ages in the largest industrial company:

Ages	Percentage of Population Census, 1900	Percentage of Policies in Force, 1904
1 to 4 inclusive	9.57	9.57
1 to 9 inclusive	21.28	22.47
1 to 14 inclusive	31.94	34.66
1 to 19 inclusive	41.91	45.35
5 to 17 inclusive	28.42	31.65
20 to 29 inclusive	18.29	17.68
30 to 39 inclusive	13.88	12.83
40 to 49 inclusive	10.16	9.96
50 to 59 inclusive	6.80	8.06
60 to 69 inclusive	4.08	4.86
1 to 69 inclusive	95.12	98.74

Expense.—Like everything else sold at retail the cost of industrial insurance is high. Its cost, however, is scientifically adjusted. The loading on the net premium is necessarily about double that used in annual premium companies; and, as we have seen that the mortality is also double at some ages, the cost of industrial insurance is necessarily great compared with annual premium insurance. The expense ratio is high because of the system of weekly collection of premiums, because of the large number of policies for small amounts which have to be recorded and cared for at the head offices, because of the relatively high cost of medical examination (two of the large companies medically examine every applicant, adult and infantile, on every application, however small, and the third examines in cases of policies over $300), and because of the heavy lapse rate. One company paid $550,000 in the year 1904 for medical examinations of applicants for industrial insurance. As the premiums are payable weekly there are 52 opportunities each year for lapsing, as against 1 to 4 in annual premium companies; and in the first year of insurance the lapse ratio is very high. All of these lapses are a pecuniary loss to the companies; and this largely accounts for the high expense ratio. In fact it takes nearly and in some cases more than the fund accumulated from premiums for five years to cover the reserve. Of the business lapsed within the first three years, more than half goes off within the first three months, and six sevenths during the first year of the life of the policy. The lapses in industrial insurance, while they cause a heavy loss to the companies, do not usually represent any serious loss to the insured. The premiums are weekly and the policies are carried on grace for four weeks after lapse; and they are reissued upon payment of a single week's premium; the loss is therefore not like that of those who pay annually. On the infantile table the policy, if reissued, is for the same amount as the policy lapsed would have called for at the age of reissue, because up to age 10 the amount of death benefit increases each year; so that the only loss is from the partial benefit rule for the initial year. On the adult table a policy lapsing during the first year in force can be revived at any time without any loss to the insured; after a policy has been in force a year it may be revived within a year after lapse at the original amount in full benefit. Here also is no loss. If the policy has been in force two years and lapses, the premiums will within two years thereafter be loaned by the company if the applicant wishes to revive and is unable to pay the arrears. Here therefore there is no loss. If not revived and new insurance is taken, the amount of insurance at each advancing year is very little less than the preceding year. If the policy is kept in force until it is entitled to be surrendered for paid-up insurance, the holder may have paid-up insurance; or he has the alternative privilege of extended insurance, by which the full reserve is applied to the payment of premiums upon a new policy issued at the attained age. If he elects to take the extended insurance he can begin paying again when the period of extension has elapsed and thereby lose nothing by his original lapse except the reduction in the amount of the policy by his increased age at the date of the new policy. It goes without saying that in all these cases lapses are no great source of loss to the insured. There can be no doubt that the lapses in industrial policies are very largely by those who subsequently take new insurance, suffering no loss at all in case of revival, and otherwise suffering only the small loss arising from partial benefits during the first year and the small decrease of benefits by reason of advanced age. The fact is there are many who insure and lapse and reinsure, according to their disposition of mind and their resources, with small loss to the holders but large loss to the company, which is put to the expense of commissions for placing the business and the large expense of caring for it. After

three years the business is very persistent; so that the average persistence of industrial business as a whole compares very favorably with annual premium business. The average duration of the policies in force in the largest English company is 10¾ years, and that of the policies of the largest American company (which has been in business only about half as many years) over 6½ years. In Australia, in 1902, the average duration of the policies in the company which had two thirds of all the industrial insurance in force was about 6 years. The expense of insurance to the industrial classes has been greatly reduced by the introduction of what is known as intermediate policies. These are policies which in 1896 the two largest industrial companies designed and issued for the working classes. They are policies for an even amount of $500 each, premiums payable yearly or in half or quarter years. The premiums of the largest company are based on the industrial table of mortality and the loading is similar to that used in annual premium policies. The result is a moderate priced ordinary policy contract issued on all the usual forms — whole life, limited payment and endowment — and placed in a separate class for dividends. A working man who has got beyond the necessity of making small weekly payments and can afford to pay dollars annually where he has been paying cents weekly, finds in these policies insurance approximately as cheap as his rich neighbor buys. There were at the end of 1904, 308,796 of these policies in force in the United States and Canada, insuring $152,710,657. The English Prudential had at the same date 742,147 ordinary policies in force, of which a very large proportion is endowment, averaging less than £100 each, the premium averaging about £5. The English Prudential policies are participating, the dividends being applied to increasing the amount of insurance. In America the "Intermediate" policies are also participating, kept in a separate class; the dividends have been large, derived principally from saving in mortality and gains in interest; they are payable in cash reduction of the premium or in reversionary additions. The industrial companies on both sides of the water claim that by the issue of this class of policies they have perfected the system of industrial insurance and have performed their full duty to the wage-earners by furnishing insurance adapted to the condition, means, habits of life, and requirements of all: weekly premiums for those who can afford no better, and for those of an age unsuitable for large insurances; annual premiums for small policies with dividends as earned, bringing the cost down to nearly the cost of what is known as ordinary insurance.

HALEY FISKE,
Vice-President of the Metropolitan Life Insurance Company.

Insurance, Life. Life insurance is the application of insurance to loss or injury caused by death. It may be defined as a contract under which one party called the insurer, in consideration of certain stipulated payments, termed premiums, agrees to pay to another a moneyed benefit upon the happening of a contingency dependent on the duration of a human life. The person whose life is the subject of the contingency is termed the insured, and the party receiving the benefit the beneficiary, while the benefit itself is called the insurance money. The contract when in writing is known as a policy. In practice the contingency involved is either the death or the continued survival of the insured. If the benefit is to be paid upon the death of the insured, it is known as a strictly life insurance contract, if upon his survival to a given age, it is called an endowment. The issue of such contracts is confined to companies incorporated for the purpose and to benevolent and fraternal associations. The fundamental object of life insurance is the protection of families and dependents, or of business interests from the pecuniary loss which is liable to result from the death of the party insured. It furnishes a method of at once providing a fund which shall be available in case of such misfortune, by means of a series of limited payments made during the continued life of the insured. The latter is able for a small consideration to secure the benefit of an immediate investment payable upon the expiration of the contract, instead of awaiting the slow and uncertain process of accumulating a capital which may be defeated by his untimely decease. The business man is thus enabled also to protect his creditors or his business as well as those dependent on him. In case of the endowment the policyholder is able to unite such protection with a fund available for his own use should he survive during a stipulated period. In short, life insurance may be regarded as a method of purchasing immunity against moneyed misfortunes liable to result from death, and appeals with special force to those whose chief dependence is on their daily or yearly earnings. It offers peculiar advantages, too, because it can be placed beyond the reach of creditors and need not be involved in business misfortunes, while the policies themselves can be hypothecated or sold like ordinary commercial securities.

The policies are issued by the companies upon written applications from the purchasers, in which detailed statements are required regarding the health, habits, and family history of the applicant, accompanied by the certificate of a physician based on a careful examination. The policy stipulates as to the amount and character of the benefit to be paid, the party to whom it is payable, and the premium payments to be received, together with such other provisions as may be needed to express the complete contract with the applicant. The premiums are usually payable annually or at shorter intervals in advance.

History.—Life insurance in its more modern form was practically unknown until it was introduced into England by the establishment of the Amicable Society in 1696. Other companies were gradually started there. But for many years afterward it was prohibited on the continent of Europe as immoral. Modifications of the system, however, known as annuities and tontines had long been familiar, and the former had been employed as a basis for national loans. It was not until the 17th century that sufficiently reliable observations on human life were compiled to furnish a satisfactory foundation for the business, and that the commercial elements of society attained an importance sufficient to give it the needed support. Companies thereafter multiplied in Great Britain and the business gradually extended to the continent of Europe.

Life insurance was introduced from Great Britain to America, and the first society was organized in Philadelphia in 1759 for the relief of Presbyterian ministers and their widows and children, followed 10 years later by a similar corporation for the benefit of Episcopal clergymen and their widows. Their operations, however, were confined to the classes named. The first company to attempt a general business was the Insurance Company of North America, organized in the same city in 1796. A number of other companies gradually followed in that and other important cities during the earlier part of the 19th century. All these earlier offices, however, combined fire or marine insurance, or banking and trust business, as well as annuities with life insurance, and gradually abandoned the latter. Popular prejudice proved to be too strong, and the economic condition of the country to be too little developed to make its prosecution successful. The real beginning of modern life insurance in the United States dates from the organization of the Mutual Life Insurance Company in New York in 1843, which was quickly followed by that of others, both there and elsewhere, some of which had already secured charters for the purpose. The business of these new companies was confined to life insurance, and their success led to the gradual multiplication of such companies until within 20 years it had attained proportions which made these corporations among the most important financial institutions of the land. The business has since continued to expand until the enormous sums now invested in life insurance in America far exceed those in any other country. Its leading institutions are unrivaled in their size elsewhere, and several are transacting business in every quarter of the globe.

Insurable Interest.—Every form of insurance presupposes some pecuniary interest in the subject insured, without which it would be a mere speculation or gamble and a temptation to crime which public policy does not permit. Where the insurance is on property, such interest on the part of the insured must usually be commensurate with the amount of the insurance. The insured is restricted in his recovery on the policy to a sum which will indemnify him for his loss. This doctrine, however, is relaxed in case of life insurance, since no strictly moneyed value can well be placed on a human life. The principle of indemnity goes no farther here than a requirement that the party procuring the insurance shall have such an interest in the life insured as shall prevent the contract from being a mere gamble on its survival. Any reasonable expectation of pecuniary advantage from the continuance of the life is deemed sufficient, such as dependence or the payment of a debt. Every person, too, is assumed to have an interest in his own life, which he may insure to any amount, and may make the policy payable to any beneficiary whom he may elect so long as the scheme is not a mere cover for gambling.

Classes of Companies.—Life insurance is carried on by two distinct classes of institutions. One consists of those which treat it as an ordinary commercial or financial business, the other, of those which deal with it as a form of benevolence or fraternal aid. The former may be again divided into those in which the premiums are definite in their amount and time of payment, and those which depend on assessments from their policyholders to pay claims as they become due. Life insurance as a business, however, is chiefly carried on by the first mentioned, which are known as old line or legal reserve companies. It has been found the only business method which has successfully stood the test of experience. Two systems have been adopted in this class of companies. One is the mutual, in which the policyholders are regarded as the owners of the corporation, and all profits or surplus arising from the business are distributed among them. Such surplus performs the functions of an ordinary capital. The choice of directors or trustees and consequent management of the company is usually placed in the hands of the members. The majority of companies in the United States are conducted on this system. The other is the stock plan, in which the company is owned and controlled by stockholders, who deal with the policyholders simply as customers and divide the profits of the business among themselves. Higher premiums are charged for mutual policies for the purpose of creating a surplus, which may be eventually returned in dividends to the policyholders. In the stock policy, on the contrary, the holder sacrifices the right to dividends in exchange for a lower premium rate. Many of the companies combine both features, mutual offices issuing also stock policies, known as non-participating, at lower rates of premium. Often, too, a stock capital is added to a mutual company which is restricted by the charter to the amount of dividends which it can receive. When the stock is allowed to share in the profits in excess of its legitimate earnings as an investment, the system is known as the mixed plan. Sometimes, too, the election of directors is apportioned between the stock and policyholders, or, in a company otherwise mutual, may be restricted to the former. In some of the States a capital stock is required by law in the organization of a mutual company until it can be replaced by surplus belonging to the policyholders. The distinctive feature of the legal reserve company, apart from its fixed premiums, is that it must at all times maintain a reserve fund adequate to the payment of its future obligations, less the future premiums which it will receive; in other words, it must in a commercial sense be financially solvent. It is also known as an old line company because conducted on the principles which have always characterized life insurance as a business until the introduction of the assessment plan.

Assessment companies were started in the United States over 30 years ago for the purpose of furnishing life insurance at lower rates than those charged by the regular old line companies. Instead of a fixed premium, assessments were levied on the policyholders to pay the losses as they occurred. Various methods were adopted for levying such assessments, and, as the policyholders were in theory liable for whatever assessments were needed, they only became insolvent when unable to meet their claims. The plan was an adaptation of methods employed by fraternal orders, and for a while was exceedingly popular among those seeking a cheap form of insurance, since the actual cost of insurance being low in the early years, the assessments were correspondingly light. But the increased

cost as time went on ultimately so increased the assessments that it was found impossible to enforce them, and most of the companies were compelled to retire or change their methods. Comparatively few now remain, and the system itself has been condemned by some of the State authorities. Many of the companies were accustomed to assume the character of benevolent organizations in their operations.

Stipulated premium insurance is a combination of the assessment and legal reserve systems with a view to correct the defects of the former. The premiums, as in the old line company, are definite payments, supplemented, if needed, by assessments, and a moderate reserve is carried to reduce or render such assessments unnecessary. It has been employed by some of the assessment companies as a method of establishing their business on a firmer foundation. But life insurance as a business in the United States, as well as in other countries, is chiefly done by old line legal reserve companies, whose definite contracts, financial strength, and scientific business methods give to such contracts a commercial standing unattained under any other system.

Industrial insurance is a branch of the legal reserve system designed to furnish burial funds for the poorer classes, and especially children. Its principles do not differ from those of ordinary insurance, but its methods are essentially different in many respects owing to the small size of the policies and the character of the applicants. The premiums are payable weekly or at short intervals, and are collected by agents through house-to-house visitations. It was introduced into the United States from Great Britain about 30 years ago, having been an outgrowth of the burial clubs and friendly society system of that country, and has attained enormous proportions in America, as well as Great Britain. See INSURANCE, INDUSTRIAL.

Fraternal and benevolent societies have been popularly associated with assessment companies owing to the similarity of their methods. But they are a distinct class, having the character of social clubs solely for fraternal or benevolent purposes, with a form of insurance as merely one, though it may be their most important, feature. They are strictly mutual in their character. Their general type of organization is that of the ordinary society or club known as a lodge, whose members meet for social or fraternal purposes. The society is formed of a combination of such lodges, through chosen representatives, into a single grand lodge, by which the insurance is carried on, the subordinate lodges acting the part of agents in securing members and collecting the payments. The insurance itself is simply a death benefit allowed to the members under provisions in the constitution, and not a business contract secured by the purchase of a policy. The premiums are paid in the form of dues and assessments, much after the manner of assessment companies, the dues being used for expenses and other incidental features. Efforts are being made to scientifically adjust the payments and benefits of these societies according to the cost of insuring the various members, as is done in the legal reserve companies. The insurance which they furnish is regarded as a species of fraternal aid to the members and their dependents, and their operations are not subject to the same legal control as those of business corporations. See INSURANCE, FRATERNAL.

Mortality Tables.—The life or mortality table, from which the premiums must be determined, is at the foundation of the business. The tables mostly employed are constructed from the experience of the companies themselves with insured lives which have been found to have a mortality distinct from that of the population at large. Such a table in its simplest form consists of a statement of the number surviving at the beginning of each succeeding year out of a given number living at any age, from which the number of deaths and percentage of mortality at each age are readily determined. The latter is the important function employed in life insurance. In America the two tables which are chiefly used, and which have been recognized by the various States as standards for determining the liabilities of the companies, are the Actuaries or Combined Experience and the American Table. The former was constructed from the experience of 17 prominent English offices, and was published in 1843. Its general accuracy has since been confirmed by later observations. The American Table was constructed from the experience of the Mutual Life Insurance Company of New York, and came prominently into use about 1868. It was found to represent the actual experience of American companies better than foreign tables which had been employed. Many other mortality tables have been constructed which have attained a recognized standing. Prominent among them were the Northampton and later the Carlisle Table, both of which were framed from mortality returns of English towns, and were successively used both in England and America, until replaced by the Actuaries' Table. Farr's Tables, constructed from the census returns in Great Britain and published in 1864, have been much used for certain purposes. Various tables, too, have been constructed from observations in other European countries and employed there as standards. The three requisites of such tables for insurance purposes are that they should be safe, should be properly graduated, and should fairly represent the mortality to be expected.

Premiums.—The premiums, which must equal the cost of insurance, are computed from the risk of death, as shown by the mortality table; and since the former are usually fixed sums, while the risk increases with age, it is necessary to charge more than the actual cost in the early years in order to offset the deficiency later on. This excess above the cost is accumulated at compound interest by the company, and constitutes its reserve fund. The rate of interest assumed in the calculation is such as the company is justified in expecting will prevail during the continuance of the contracts. In the United States 4 per cent was formerly considered a safe rate, but the continued fall in interest has led to a general substitution of 3 or 3½ per cent for newer contracts. The payments, which, when thus accumulated will be sufficient on the average to meet the claims on the policies as they fall due, are known as the net premiums, to which additional sums are added for expenses and other contingencies. When thus loaded they are known as gross or office premiums, and are the real amounts charged by the company.

These loadings may vary from a trivial addition to 40 per cent or more of the net premium, according to the character of the contract. Premiums in ordinary insurance are usually payable annually in advance, and are then known as annual premiums. Frequently the payments are restricted to a certain number or term of years. These are known as limited payments. Sometimes the entire payment is made at the start. This is known as a single premium payment. The annual premiums, too, are sometimes payable in instalments at shorter intervals to suit the convenience of the policyholder.

Expenses.—The expenses of a life company are chiefly made up of two classes, the cost of securing the business, and the office expenses incident to its care. The principal element in the former is the commission or other compensation paid to the agents, which also varies with the character of the contract. It is usually a large percentage of the first premium paid, and a very moderate percentage, in the nature of a collection fee, for those succeeding. The office expenses aside from the salaries of the officers and employees include taxes, fees, rents, and those numerous items involved in the care and investment of funds, and the conduct of the business.

Legal Reserve.—The legal reserve is the measure of an ordinary life company's liability on account of its insurance contracts to which, in addition to any other liabilities, its funds must be equal in order that it may be legally solvent. The process of estimating this reserve is known as valuing the policies. Two methods of valuation are used, known as net and gross, dealing respectively with the net and gross premiums charged. The former is generally employed in the United States, and is the one usually adopted by the State authorities. It consists in determining what fund the company must have in its possession in addition to the future net premiums which it expects to receive in order to meet future claims on its policies. This fund is the net or legal reserve. It assumes that all other expenditures are cared for by the premium loadings. The gross valuation, on the contrary, deals with the gross or office premiums, and a certain deduction is made from the resulting fund for assumed future expenses. The latter method is regarded as furnishing the surest test of a company's actual condition, and is sometimes employed when the question of legal solvency is in doubt. The former has the advantage of compelling the use of the premiums for the purposes assumed by the company in their computation.

As in the case of the premiums, the computation of this reserve depends on the future rate of interest which is assumed. In most of the States 4 per cent, as in the case of premiums, was formerly regarded as a safe rate, and even 4½ per cent was at one time allowed, but during recent years 3 or 3½ per cent have been insisted on in the case of new contracts by some of the States.

The mortality on which the sufficiency of the premium depends is lighter in the case of insured lives, owing to their careful selection, than among the general population or that called for by the mortality table for a number of years after the policy has been issued. The cost of insurance in mutual companies is reduced to the policyholders by this lighter mortality. In American companies the mortality among lives that have not been newly selected remains nearly stationary after age 20, or increases but slightly until age 40 is reached, when it is not far from 1 in 100, increasing more rapidly with each age thereafter until it is about 2 per cent at age 50 years and 4 per cent 10 years later.

Form of Contract.—As before remarked, policies may be either participating or non-participating, the chief difference being that smaller premiums are charged in the last and no provisions are included for sharing the profits. Policies for short terms are more frequently made non-participating. The classes of policies most in use are three in number, whole life, term, and endowment. In the first the insurance is simply against death and covers the whole term of life, while in the second it runs only for a certain term of years. The pure endowment is an insurance payable at the end of a certain term of years only in case the insured is alive, and is the reverse of a term policy. The ordinary endowment which is almost exclusively used, however, and which has of recent years largely supplanted the whole-life policy, is a combination of the pure endowment and the term policy. The insurance money is payable to the insured if alive at the end of the endowment period, or to some beneficiary in case of his previous death. Such endowments are usually issued for periods of from 10 to 30 years.

The annuity is a contract frequently combined with life insurance in which the life insurance principle is reversed. The purchaser buys outright a contract under which he is to receive an annual payment during life. Annuities have been familiar since an early period, and before life insurance became understood was the principal form of contracts dealt in by this class of companies. It secures a fixed income during life to those who may wish to surrender their capital for that purpose.

Still another form of contract is the tontine, in which the funds of a body of subscribers are pooled and the accumulations are divided among the survivors after a certain time. Societies of this kind were formerly common in Europe and were occasionally found in the United States, though few, if any, remain.

All these different contract forms are now frequently combined in various ways in the ordinary life policy, in order to increase its attractiveness or to better meet the requirements of policyholders. Various methods of premium payments and of paying dividends are also combined for the same purpose. Great ingenuity has been displayed by the companies in making these combinations, and an almost innumerable variety of contracts have resulted. Among those more familiar in the United States are the tontine or deferred dividend policies, in which dividends are accumulated and divided among the surviving policyholders after a certain period; limited payment policies, in which the premiums are limited in number; instalment policies, in which the insurance money, instead of being payable in a single sum, is converted into a series of annual payments as an annuity; and debenture bonds, which are similar to instalment policies, except that the insurance money is represented by a bond bearing an annual inter-

est and payable at the end of a certain time. Besides, there are policies insuring the life of more than one party. When they are payable upon the death of either of the parties insured, they are known as joint life insurances; when payable only on the death of all they are survivorship insurances. The greater part of the business in the United States is written either in the form of continued payment life, 20-payment life, or 20-year endowment insurance. Renewable term insurance is another plan for reducing the cost of insurance during the early years and avoiding the accumulation of a reserve. The premium is only sufficient to pay for the temporary cost of insuring and increases with age. The policies are written for a single year or term of years, with the right to renewal at the increased premium. The subsequent increase of cost, however, has been found a serious obstacle to the plan. Preliminary term insurance is also insurance for a single year, but with a right of renewal for the entire period at the same rate of premium. The object of such policies is to enable the company to use the fund which, under the law, must otherwise be added to the reserve during the first year of insurance to meet the cost of securing the business, and is a favorite method with young companies having a limited surplus.

Dividends.—Dividends are apportioned from the accumulated surplus according to the equitable share of each policy. Many different methods of determining this share have been devised. That chiefly employed in the United States is what is known as the Contribution Plan. The surplus is treated as made up of gains from a lower mortality and expense and a larger interest earning than those assumed in computing the premiums, and the contribution of each policy to the fund is estimated. Dividends are applied according to the provisions in the policy in various ways. They may be used as single premiums to increase the amount of insurance, which is called a bonus addition, or to shorten the term of the insurance, or to the payment of the premium, or may be received in cash. When, as in tontine dividends, they are to be apportioned among a special class, the share of surplus belonging to that class is separately dealt with. Sometimes a minimum future surplus earning, which can be relied on, is made the basis for guaranteeing the payment of a certain dividend in the policy. But as such earnings are uncertain, the usual estimates of these amounts, as given by the companies, are simply expectations and not obligatory as promises. The fall of interest rates has tended to reduce dividends during recent years. At an earlier stage of life insurance, dividends were payable at intervals of five years or more. Afterward, as the business became better understood, the practice of declaring annual dividends in the United States became universal. Of late, however, the introduction of deferred dividend policies has again lengthened the distribution periods among these special classes. Notes were at one time received by many of the companies in part payment of premiums, but the practice has been for the most part abandoned.

Policy Loans.—Practically all forms of life insurance in which a level premium is paid involve an investment or savings bank element, which is represented by the reserve and is now treated by the law and the contract as belonging, in a sense, to the policyholders. This is the basis of the policy loans which are so generally granted. The portion of the reserve fund belonging to the individual policy, or a portion of it, may be borrowed by the policyholder as a loan bearing interest, on his own note with the policy as a collateral, and is deducted from the insurance money when the policy becomes payable.

Termination of the Contract.—The life insurance contract is terminated either by becoming a claim, which is usually payable at once after satisfactory proofs have been furnished, or by previous lapse or forfeiture through a violation of its conditions, especially non-payment of the premium, or through a voluntary surrender. Policies usually provide for their surrender and allow the insured to receive back a large part of the reserve held against them, called the surrender value, either in the form of paid-up insurance for such an amount as this value will purchase, or insurance of the original amount for such a term as it would pay for, called extended insurance, or else in the form of cash. Statutes in many of the States require similar returns in case of lapse for non-payment of premium, and such provisions are also usually incorporated in the policies. Non-forfeiture laws, as these statutes are called, are designed to prevent the assumed hardship or injustice entailed on the insured through the forfeiture of the money standing to his credit in the reserve fund. This money is regarded as a saving bank accumulation for his future benefit, which is in a sense his property and which should be restored after reserving a surrender charge to compensate the company for his loss. Since healthy lives are most likely to lapse and the cost of insurance to be made greater for those who remain, the selection against the company, as it is termed, is an important element in determining the surrender charge.

Insurance for the Benefit of Wife and Children.—The fundamental object of life insurance as a family protection is liable to be defeated if the policies can be attached for debt. Therefore, statutes have been enacted in many of the States exempting from the claims of creditors policies up to a certain amount made payable to wives and children. The interests of such parties, too, have been held unassignable, at least without their consent. The life insurance contract, except in the case of benevolent societies, is held to be the property of the party who is the beneficiary, when not otherwise stipulated, and not of the party who may pay the premiums, and can usually be assigned as collateral or sold outright by the owner. Policies not protected by statutes, as above, may, like other personal property, be attached for debt to the extent of their surrender value; and where, as in endowments, two interests are sometimes involved, the interests may be severed.

Medical Examinations.—Medical examinations of applicants for insurance are essential to prevent an inroad of unsound lives that would wreck the company, whose mortality rates are based on the acceptance only of healthy lives. For this purpose medical examiners are employed, who report the health, physical condition, and habits of the applicant and the life history of his near relatives. These reports

are passed upon by the medical directors of the companies to determine whether the life is up to the normal standard fixed by the company, otherwise the application is rejected.

Sub-Standard Insurance.— Parties who may not be seriously diseased and yet who are not insurable as healthy lives, on account of constitutional weakness or predisposition, are known as sub-standard or under average lives and are insured by some companies as a separate class under special rates of premium, or under special policy conditions, according to the defects of each applicant.

Limitation of the Risk.— Formerly many restrictions were imposed in the policy as to the residence, travel, and personal habits of the insured, and military employment and suicide were debarred. These have been gradually modified or removed, until it has become customary with some companies to issue so-called indisputable policies, which in the absence of fraud, can only be forfeited by failure to pay the premiums.

Moral Hazard.— The moral hazard in the business arises from deceptive representations as to health, the temptation to insure as a mere speculation lives in which no insurable interest exists, in the expectation of an early death, and the temptation to destroy life through suicide or murder in order to secure the insurance money. The ability of an average applicant to judge of his future health is shown in the higher death rates among those classes of policies where an early death would profit the applicant and is an element of the moral hazard.

Legislation and Supervision.—Until about 1860 little or no supervision was attempted over life insurance by the various States. Legislation concerning it was chiefly confined to taxation of the companies or restrictions on their operations. The multiplication of irresponsible corporations, the growing magnitude of the business, and the recognition of the dangers involved in its mismanagement, led to the creation of special departments for its supervision, and the enactment of laws for its conduct by the States of Massachusetts and New York. Their example has been followed by most of the other States. The fundamental aim of these laws is to compel the companies to so utilize and apply the moneys which they receive as to properly carry out the contracts with their policyholders. This is accomplished by requiring the funds in the company's hands to be at all times sufficient, together with its future accumulations and the future premiums, and their accumulations receivable from its policyholders, to meet its future claims as they arise. Since the proper investment of these funds is also essential, this becomes an important part of the investigation, as well as the general manner in which the business has been conducted. Annual statements are required from the companies, embodying the facts essential to such an inquiry, and may be supplemented, if necessary, by a personal examination of the company on the part of the State official. Failure to meet the required test may be followed by a prohibition against additional business until the defect is remedied, or, if actual future insolvency is threatened, by proceedings to close the company.

Theary of Life Insurance.— The fundamental problem in life insurance is to find the average premium at each age, which, with its accumulations, will be just sufficient to meet the promised future payment. This is done by first finding the present value of that future payment, or the sum which, invested immediately at compound interest, will, on the average, with its accumulations, meet this payment when due. The probability of death occurring, and consequently the payment becoming due, during any subsequent year is determined from the mortality table. This probability, multiplied by the sum which accumulated to the end of that year would equal the required payment, is the present value of the payment if made that year. The aggregate of such values computed for each successive year of life, is the entire present value of the future payment to which the present value of the premiums to be charged must be equal. These premiums are in effect so many annuities receivable by the company, and their present value is the amount which, at once invested at compound interest, would reproduce them. The problem, therefore, now becomes the determination of the present value of an annuity at any given age. The process is analogous to that already described. The value sought is the aggregate of the amounts which, at compound interest, would provide the annuity at the beginning of each year, multiplied by the probability of the insured being then alive to pay it. Having determined the present value of any given annuity it is easy to find the annuity which has the value required. This annuity is the net premium.

Life Insurance a Science.—This brief explanation will serve to illustrate the general character of the problems involved in the theory of life insurance, many of which are exceedingly complicated and require a knowledge of the theory of compound interest and of the calculus of probabilities, which, when combined, form the mathematical basis of life insurance. The calculus of finite differences has also an important place, and even the infinitesimal calculus has been utilized to advantage, especially in preparing mortality tables. This whole subject has been developed into a special branch of mathematics termed actuarial science, which has become a recognized profession, whose members, known as actuaries, direct the mathematical computations required for the business. A special class of symbols has been devised in connection with this science, by which the processes involved in its various calculations are readily expressed in the shape of ordinary algebraic formulas. Life insurance computations have been greatly facilitated by an ingenious device known as commutation columns, through the use of which the calculations are much simplified. Published tables of premium and annuity rates and policy values, in connection with the more important benefits, too, relieve much of the office work.

WALTER S. NICHOLS, A.M.,
Lecturer on Insurance at Yale University, and Editor of the 'Insurance Law Journal' and 'Insurance Monitor.'

Insurance, Life, Assessment. The plan of meeting the cost of life insurance through assessments was first used in the United States

about 1807 by local bodies, making no pretense to business standing or management. Their plan followed in a crude way that of the levy societies and friendly societies of Great Britain, but without the variety of benefit which these give. As a rule, they confined themselves to funeral or death benefits, with, occasionally, weekly payments in case of sickness.

The disasters which, in the early seventies, overtook companies operating on the basis of fixed premiums and an accumulated reserve, turned popular attention strongly toward a system which claimed to give corresponding benefits without the accumulation of large funds, and which confined its demands for payments to its actual needs in meeting benefits. As a result there grew up organizations operating through local councils or lodges, having a general governing body, representative in character, at least nominally. These grew, in time, into the great fraternal or beneficial orders, with hundreds of thousands of members, obligated to pay hundreds of millions of benefit, the integrity of the obligation dependent upon the ability for perpetual renewal of membership, with perpetual willingness to respond to assessments.

The marked success of these organizations in securing large memberships and temporarily meeting claims at low cost attracted the attention of men intent upon conducting life insurance as a business. There were organized a great number of business, or open, companies, which dispensed with the lodge machinery and placed the business upon a commercial footing. In organizing these, advantage was taken of the charitable and club statutes of different States. Not until 1883 was there a special law regulating this business in New York. The law in Massachusetts was enacted in 1885.

There was no attempt at scientific method, and, indeed, the claim of the earlier projectors of these companies was that, for the practical business of life insurance, a mortality table is useless. It was constantly set forth that, since contracts remain in force but a comparatively few years, a table based upon the theory that every man will ultimately die and become a claim on the funds, is essentially a falsehood.

At first, the simple plan was to collect from every member, on the death of another, $1, with generally 10 cents for expenses, and to pay to the beneficiaries of the deceased the fund formed from the dollar payments. The benefit was, therefore, indeterminate in amount, as was also the cost. An early modification of this scheme was to divide the members into classes of 1,000 or 2,000, which classes were theoretically to be kept full by the infusion of new blood, which, it was claimed, would, by keeping a level average age, result in a level cost. This theory ignored the fact that death rate depends upon actual, and not average, age.

When the plan of uniform payments began to break, through its practical discrimination in favor of older lives and heavier risks, the plan of graded assessments fixed by the age of admission was adopted. This simply modified the degree of error, by substituting for the assumption that all risks were equal, the equally inconsistent assumption that, after the admission of a member to a society, the risk of death ceased to increase. The scheme thus resolved itself into an attempt to meet the cost of insurance, which increases with increasing age, by a level premium, but without the accumulation of a reserve for the diminution of the risk. The fallacy of this was repeatedly urged by those who understood the scientific principles of life insurance, but obtained little or no effective hearing. Strenuous opposition was developed to the accumulation of a reserve, and a great parade was made of "the reserve in the pocket," ready to the call of the company when needed.

The irregular periods for calling assessments gradually merged into periodical assessments at fixed dates, varying in amount with the number of claims which had accrued since the last preceding call. Then came a tendency to call for an assessment in advance, to provide for death claims to occur, the fund thus accumulated being generally named an "emergency fund."

In the meantime, statutes regulative of the business were passed in many States, but in none was any particular regard paid to the demands of a permanent business. In fact, these statutes were in very many instances addressed to securing the advantage of a claim of State supervision, without the imposition of the requirements necessary to permanence. In 1885, however, Massachusetts provided by law that the amount of the benefit must be fixed in the contract, and this provision was finally adopted by New York in 1892.

Finally, as the proportion of older members became heavy, with rapid increase in the cost of the benefits afforded, there came rapid diminution of membership, especially among the younger, and this, in turn, had a tendency to increase the death cost by depleting the character of the risks. The transfer of memberships from one association to another followed in many instances. There was no possibility in such transfers of protecting accumulated liabilities, the result being that claimants under death claims which had accrued received but a small percentage of their face. Later, many of the larger and better managed business organizations passed under the laws regulative of fixed premium insurance with accumulated reserve, and the plant which they had established thus became foundation for new legal reserve companies. In 1899, the State of Massachusetts repealed the law permitting assessment life companies to do business therein, and provided a means by which those then authorized to do business on the assessment plan could obtain licenses under the legal reserve law.

There was an important organization of the business assessment companies, known as The National Convention of Mutual Life Underwriters, which held its first meeting in Elmira, in June 1876. Reports of the fourth meeting, in 1879, show 136 companies, with a membership of 253,000. This convention held its last session, at Mackinaw, in 1898. The report made at the session in 1897 showed 650 companies, with a total membership of 4,039,000, and insurance in force to the amount of $7,800,000. The payments to beneficiaries for the year 1896 were given at $73,000,000, and the total payments to beneficiaries, so far as records existed, since the organization of the business, amounted to $711,700,000. These statistics, to a large extent, covered the fraternal, as well as the business, organizations. The reports of the 23 sessions of this

convention afford an amount of historical matter connected with the movement of great importance.

The fraternal organizations established, in 1886, the National Fraternal Congress, which still holds annual sessions and has compiled and is compiling exceedingly valuable statistics. It formulated the National Fraternal Congress Mortality Table, which has been adopted as the official standard in several of the statutes since enacted, and which is coming quite generally to be recognized as a standard table in connection with fraternal insurance. Their latest compilations show a membership of four and one half millions, with benefit obligations amounting to nearly seven billions of insurance.

There is also an organization of younger fraternal orders, known as the Associated Fraternities of America, the first meeting of which was held in 1901. The published records of both of these associations afford a vast amount of useful material to anyone who would study the history of the fraternal insurance movement of this country. GEORGE DYRE ELDRIDGE,
Vice-President Mutual Reserve Life Insurance Company.

Insurance, Life, Statistics. The business of life insurance is of comparatively modern growth in this country, the oldest company transacting it being but little over 60 years of age. It was practised in Europe, however, many years before, but its development there was slow. There was much prejudice against it at first in this country, and instead of being regarded as a most beneficent method whereby the widows and orphans and other dependents upon the head of a family could be provided for in the event of his death, it was denounced as a gambling scheme, a wager against death, and some clergymen went so far as to condemn it from their pulpits as opposed to biblical laws. But the pioneer companies pushed the business with vigor, at the same time carrying on an educational campaign, until the public have come to recognize the value and importance of life insurance, valuable alike to the rich and the poor. To the poor, and to those of moderate means, it is held to be an imperative duty for every man whose life is insurable to insure for as liberal a sum as he can afford, in order that, in the event of his death, those dependent upon him may not become objects of charity or be thrown upon relatives for their support. The rich man finds in life insurance a relief from possible financial entanglements that might otherwise, upon his death, wreck his estate. Men whose wealth would seem to relieve them of all financial anxiety carry insurance upon their lives in sums ranging from $50,000 to $2,000,000. Their reasons for so doing are that they have investments that may prove troublesome for their executors to close up, necessitating sacrifices that would prove costly. The insurance upon their lives is payable immediately upon their death, and the funds thus made available at once will prevent the sacrifice of any portion of their estate to meet the claims of clamorous creditors.

Primarily life insurance is designed for the especial protection of families deprived by death of their head, the breadwinner, upon whose efforts they are dependent for subsistence. By the payment of a small sum annually a policy of insurance can be obtained whereby the company contracts to pay to the heirs of the insured a specified sum in the event of his death. For instance, a person 30 years of age can obtain a policy of insurance upon his life for $1,000 upon the payment of an annual premium of $24.18, and this rate does not increase during the life of the policy — hence the term "level premium." Should he die at any time after receiving the policy the company will pay the amount to his designated beneficiary immediately upon the receipt of proofs of his death. Insurance for a larger sum is obtainable by the payment of the same rate per $1,000 of insurance. The rates increase according to the age of the applicant, for the death rate increases with age, and the added liability must be provided for correspondingly. While at age 30 the premium for $1,000 of insurance is $24.18, at age 40 it is $32.76, and goes higher as age increases. The rates for life insurance are based upon scientific deductions. Carefully prepared mortality tables show how many persons out of a given number of a certain age will die each year, and while it cannot be told of an individual when he will die, it can be estimated with certainty how many persons in his class will die each year. Life insurance is a business of averages, and the cost of insuring 1,000 or 2,000 or 10,000 persons at a particular age is mathematically determined. The rates charged by all companies are substantially identical, and a person desiring insurance, if in good health, can obtain any amount he is able to pay for from $500 to $2,000,000 — this being the largest amount carried by one man.

As stated, the early days of life insurance in this country were days of trial and tribulation to the organizers of the pioneer companies, but the characteristic energy which is found in all great enterprises has carried the American life insurance companies far in advance of any others. A few statistics, given in concise form, will serve to show the magnificent proportions to which the business has attained in this country. At the beginning of 1905 there were 93 "old line," or "level premium" companies, doing business in the United States, a few confining their operations to a particular section, but the majority of them seeking business in all the States. Of this number 84 had 3,269,089 whole life policies outstanding, insuring the lives of their owners in an aggregate amounting to $6,767,197,991, while the total insurance in force (including endowments and other forms of policies) amounted to $10,412,078,338. The 93 companies were organized at different times and several of them have not been in business long enough at this writing to have made a record. The total premium receipts of 79 of the companies since their organization amounts to $5,214,441,446; they have paid to policyholders $3,276,051,697; their present assets held for the protection of policyholders are $2,261,851,182. As these companies operate on the mutual plan, all the assets belong to the policyholders; if the assets on hand be added to the amount paid to policyholders it gives an aggregate of $5,537,902,879, exceeding the amount paid in premiums by $323,461,433. In other words, the companies have paid to policyholders or now hold for their protection $106.20 for every $100 they have received in premiums.

In 1904 the total premium income of 79 companies was $378,118,121, most of this being in cash for new policies issued and for renewals on old policies. The investment of these vast sums pouring in to the several companies requires the highest order of financial talent in order that a profit to the companies shall be secured and no bad investments made. That these funds have been carefully and judiciously handled is shown by the fact that the companies hold or have paid out in benefits $106.20 for every $100 they have received in premiums.

The vast sums received annually by the life insurance companies for investment places them in the front rank of the great financial institutions of the country. Their finance committees are constantly on the lookout for safe and profitable investments, and their detailed annual reports to the various State insurance departments show that they are large holders of National, State, city, railroad, and other bonds, paying good rates of interest. Other classes of securities that are known to be safe are purchased at times, but their soundness must be absolutely guaranteed.

Other forms of policies than those referred to as "whole life" are issued by the companies, but the fundamental object of life insurance is the protection of families when the breadwinner is removed by death. Endowment policies provide for the payment of a stipulated sum at a specified period, 10, 15, or 20 years from the issuance of the policy. The gives the insured himself the use of funds in his mature years, the proceeds of his savings in his younger years, when his earning capacity was at its best. This form of insurance is popular with young men, who can afford to pay the extra cost of such policies. The companies also sell annuities, contracting for a specific sum paid in advance, to pay to the assured a certain sum annually during his lifetime. How much can be paid annually for the advance premium paid is computed by the actuaries of the companies, according to mathematical formulas scientifically evolved. It has been the aim of the life insurance companies, in their educational campaigns, to liberalize the conditions of their insurance contracts as far as safety will permit, and to popularize them by issuing policies to suit the requirements of all classes of persons, hence there are an almost endless variety of contracts grafted upon the original "whole life" or "ordinary life" form, as the basic contract is designated. But for whatever change of form there may be, whatever of special conditions may be exacted, there must be a corresponding increase in the premium paid.

Four of the American companies are doing business in foreign countries and have been wonderfully successful. Their active and aggressive methods have enabled them to meet in competition the native companies, and generally to excel them in the volume of business written year by year. This has led to restrictive legislation in some countries calculated to restrain the activities of the American companies, but they have been found equal to the emergencies and have generally conformed to all lawful requirements.

In some States the law requires that a life insurance company, before beginning business shall have a certain amount of capital paid up, for the protection of its policyholders, but before the enactment of such law, some companies were organized on the purely mutual plan, without capital. Of the 102 existing companies, including the latest additions to the number, 38 are mutual, while the others possess capital varying from $25,000 to $2,000,000. Dividends to stockholders are generally limited to 7 per cent, all profits in excess being apportioned among the policyholders. In 1904 the capital stock of all the stock companies amounted to $16,919,930; the dividends paid to capital were $916,824, while dividends to policyholders were $33,579,020. Policyholders thus participate in the profits of the companies, whether stock or mutual, according to the varying terms of their contracts. Dividends to policyholders are computed on the anniversaries of the dates of the policies and passed to their credit, to be applied to the payment of future premiums, to increasing the amount of insurance, or in some other way inuring to the benefit of the insured, as he may direct. The insured not only provides insurance upon his life for the benefit of his dependents, but he becomes a member of a dividend-paying corporation, with an interest in all its assets. No better testimony in favor of life insurance can be adduced than is to be found in the figures above quoted, showing the millions upon millions of dollars distributed among the beneficiaries of persons insured. The funds so distributed usually reach the beneficiaries in the hour of their direst need, when death has visited the home and removed the prop that supported it.

CLIFFORD THOMSON,
Editor 'The Spectator,' New York.

Insurance, Marine. American marine insurance business had its birth at about the close of the 18th century, but suffered heavily when the American flag began to disappear from the high seas. For the past quarter of a century it has had a hard struggle to keep itself anywhere near the old standard of prosperity. To do this it has had to draw for the greater part of its returns upon foreign commerce, and been forced to compete with English companies.

New York's marine-insurance history is that of all the other seaboard States, for in nearly all marine insurance once flourished, but has now succumbed to English competition. The golden period of American marine insurance was between the years 1840 and 1860, when the clipper sailing ship was developed and perfected. In those times the leading merchants owned their own ships, and frequently a member of the firm would go to China or the East Indies to supervise the proper distribution of the cargo, and to secure a remunerative one for the return. The ship and cargo were insured with an American company, and as it might be as long as nine months before the vessel was heard from, the risk was considerable and rates were high. As much as five or six per cent was charged for insurance in those times. The rate on dry goods from Liverpool to New York in the old packet sailing ships was placed at two per cent. This trade was carried in American ships, and the insurance, both on the vessel and on the cargo, was naturally placed in American companies.

But the rates of insurance have changed with the transformation of the ocean-carrying service. The East India goods are now shipped across the Pacific to San Francisco, and thence east via rail. The cost of insurance on these is now

only three quarters of one per cent. Rates on the Atlantic have likewise declined. Insurance on dry-goods and like merchandise carried in the modern "liners" is placed at two tenths of one per cent. In other classes of goods depreciation in rates is in like proportion.

Marine underwriters do not ascribe the decline in American marine insurance to any trouble from unwise laws or legislative interference, but to the changed business conditions and to English competition. The bulk of the carrying trade of the world has passed into British hands, and a British merchant and ship owner insures in a British company. The English marine companies have, as well, invaded American soil, and have secured a large portion of the American business. When the English companies first established themselves in America, along in the early seventies, they began cutting rates. The American companies did not effect any combination to prevent this, but followed their example. The American companies were also placed somewhat at a disadvantage by the laws governing the admission of foreign marine-insurance corporations. The foreign companies are required to make a deposit before they can write American business; but in New York State, which has stringent insurance laws, the amount is fixed at the minimum capitalization allowed a home company, namely, $200,000. So much of the carrying trade of the world is done under the British flag and with the aid of British credit, and with countries under British control, that the American underwriter, working against all these disadvantages, is seriously handicapped. Therefore, there being no national or local tariff associations among marine underwriters, the American companies are worsted in this rate war. There are now not enough of them to form any sort of an association which would wield much power.

Despite the work of the American companies to hold their own, through loss of prestige on the ocean and active rivalry on land, there are a number of stock and mutual American marine-insurance companies which continue to do a flourishing business. The largest and one of the oldest is the Atlantic Mutual of New York, which has over $12,000,000 of assets, and has been most carefully managed throughout its career. It was formed in 1842, at the time when many stock companies were turned into mutual companies, and by which change the profits accrue to the policy-holders instead of the stockholders. The company is noted for retaining its faithful and tried officers until their death. The late John P. Jones was connected with the company for 50 years, and was its president for 40. In his life-work of building up the company he was ably assisted by Vice-presidents W. H. H. Moore and A. A. Raven, who have been with the company 30 and 40 years respectively. Among the other large companies which still do a thriving business are the two Boston corporations, the China Mutual and the Boston Marine.

There have never been many marine Lloyds in the United States, though this form of marine insurance has been most in vogue in marine underwriting in Great Britain. The origin of the term is both interesting and peculiar. The name of Lloyd originated in old Lloyd's Tavern, in Tower Street, London, far back in the days of Queen Anne. It was the practice of many shipowners and traders to drop in at the tavern and talk over their prospective profits; and gradually a custom developed of inscribing their names on a blackboard, certifying that the men signing would be jointly liable for the loss of a vessel during a certain voyage. From this crude beginning have grown the world-famous associations in the British Isles. In the United States there are a few Lloyds, two of the principal ones being located in New York — the United States Lloyds and the New York Marine Underwriters.

The scope and definition of a marine policy is, of course, entirely different from a land fire policy. The risks insured against are many, and may be summarized as including all perils of the sea. There are two classes — a voyage and a time policy; the former is generally used in insuring vessels, and the latter for cargoes. There are naturally many clauses governing marine-insurance policies, such as capture, seizure, war, and so on. The life of the insurance on a ship begins at the port from which it is insured until moored for 24 hours at the port to which it is insured. When an insurance is made on freight to be carried under a charter, the policy attaches as soon as the vessel sails, although she may be destined to a distant port for her cargo.

Though single losses to marine underwriters have been small, compared with some of those of fire underwriters, there have been shipwrecks that have lived in marine insurance men's memories. One of the greatest losses to American marine insurance was that of the American steamer Central America, which foundered off the Cuban coast in September 1857. The Central America was bound from Aspinwall, now Colon, to New York, and was loaded principally with treasure from the California gold-mines. She carried insurance amounting to between $700,000 and $800,000, all of which had to be paid by American underwriters. Another notable loss was that of the steamer Erie, which sailed from Pernambuco, Brazil, loaded with coffee, on 1 Jan. 1893, and was burned at sea. Coffee prices were high in those days, and the Erie went down with $500,000 insurance.

Two losses which not only made inroads on the American marine companies, but which also seriously crippled the growth of American steam transatlantic service, were the sinking of the steamer Arctic, off Newfoundland, in 1854, by collision, and the disappearance of the steamship Pacific, which sailed from Liverpool for New York in January 1856, and was never heard from. Both steamships belonged to the Collins Line, which was the first one to put on steam-vessels for the Atlantic trade. These early losses were particularly detrimental to American marine insurance, because the companies carried extremely heavy lines in those days. Among the recent heavy losses was that of the steamer Oregon, which was run into and sunk off the Long Island coast in 1886. American marine underwriters had between $700,000 and $800,000 on the Oregon's cargo. The loss of the Oregon also showed underwriters how quickly even a properly constructed iron ship sinks. The introduction of iron in place of wood for building vessels has not made any material difference in the rates of insurance, for iron has hazards which wood has not, and *vice versa*.

As to the future of American marine underwriting, it is difficult to prophesy. As trade follows the flag, so marine insurance flourishes in the country with a prosperous merchant marine. The United States is again forging to the front as a great ship-building nation, and this gives American marine underwriters hope that American marine insurance may follow in the wake of the growth of American ship-building.

Insurance Patrol, an organization peculiar to New York and other large cities, which cooperates with the fire department, but is controlled by the combined insurance companies, who support it through the board of fire underwriters. The New York corps was organized in 1835, when there was an epidemic of incendiary fires. The patrol is provided with wagons and an equipment designed for its special work. Its most important service is in saving goods, which it does by removing them from burning buildings, or by covering them with rubber or oiled sheets, as a protection from water, dirt, or cinders. In some cities it is known as salvage corps, or protective association.

Insurance, Science and Economics of. Insurance, to-day, forms an integral element of our social and commercial life. From crude beginnings, the principle of providing, by the contributions of the many to a common fund against the financial consequences of individual losses due to the inherent uncertainties in human affairs, has been perfected until the modern practice of insurance includes all the more important contingencies affecting human welfare. In both science and economics insurance holds a most important position, which becomes more readily apparent as the practice and results of the business are inquired into and considered in their relation to individual and national well being. As a business insurance holds rank as one of the foremost enterprises of the age, equal in importance to banking and transportation. It would, without exaggerating, be as difficult to think of commerce without insurance as of transportation without railroads or the transmission of intelligence without the telegraph. Modern life has become so completely interwoven with the idea of insurance that there are few contingencies affecting life and property to which the principle of insurance has not been more or less successfully applied.

The scientific basis of insurance is the same in all its branches, that is, the laws of chance and probability. In considering any future event we are confronted by the uncertainty whether such an event will or will not happen, but from the facts of experience upon a large scale it is now possible to calculate with sufficient accuracy the monetary equivalent required to meet the risk assumed by an insurance company. The recognition of insurance as a science dates from 1747, when Corbyn Morris published his classical 'Essay Toward Illustrating the Science of Insurance,' wherein he attempted to "fix by precise calculations several important maxims upon this subject." Accuracy and precision is the essence of all scientific method which in its practical application to insurance does not differ in any important essential from the method which underlies all other scientific processes. The larger the mass of facts considered, the more definite must be the resulting conclusions, which for practical purposes are the equivalent of natural laws and confirmed by subsequent experience verifying the truth of the theory assumed.

Insurance science has thus far found its chief development in the department of life contingencies, due, no doubt, to the fact that the average duration of human life and its pecuniary value require to be determined with the greatest possible accuracy, since the contracts made dependent thereon extend, as a rule, over many years. In other forms of insurance, such as fire, marine, and accident, the contracts are generally for short periods, seldom of longer duration than a single year. Hence most of the scientific discussions and the numerous dissertations upon the subject relate chiefly to life contingencies, but there has been a decided improvement in this direction during recent years. The deliberations of associations of actuaries and insurance managers extending over many years, in particular the Institute of Actuaries of Great Britain, are fully entitled to rank, in thoroughness of research and grasp of fundamental principles, with the deliberations of other scientific bodies. It is, no doubt, due to this fact that insurance was included in the most recent classification of the sciences as represented at the International Congress of Arts and Science at Saint Louis, held in connection with the exposition of 1904.

Insurance as a science is a branch of economics, although only a few of the more recent writers on the subject have given careful attention to the theory of risk and insurance in its relation to public welfare. A fairly complete explanation of the economic theory of insurance is to be found in an essay by Allan H. Willett, published by Columbia University in 1901. He holds, and very properly so, that "as a general rule uncertainty exercises a repellent influence in human life, and the existence of risk in an approximate static state causes an economic loss, while (on the other hand) the assumption of risk is a source of gain to society." From this point of view the business of insurance does not differ essentially from general commercial enterprises. Risk is assumed in mining and agriculture in much the same manner as risk is assumed in the business of insurance, but in life insurance, for illustration, the assumption of a risk and the equivalent premium payments required are determined by the theory of probability and the established laws of human mortality and observed experience. In general commercial enterprise the risk assumed is, as a rule, created, while in insurance the risk is pre-existing. This marks the broad division between gambling and insurance. Insurance is not "in the nature of a bet," for in insurance an effort is made to eliminate an existing individual risk by its assumption on the part of the many, while in gambling a non-existing risk is created with resulting uncertainty and needless loss to society.

Insurance companies are chartered institutions with their powers of existence and rights of transacting business derived from the State. They are subject to supervision by special departments in charge of commissioners or superintendents of insurance, who have ample power to inquire into every important detail of office administration. At first the burdens of State supervision were light, since the companies transacted but little business outside of their home

State, but within the last generation the business operations of most of the companies have of necessity been extended to other States and territories. There has, as a result, been developed a vast system of over-supervision, accompanied by an immense amount of over-legislation, much of which is inimical to the highest and broadest development of the business. The position of the commissioner is, as a rule, a political one, subject to the changing fortunes of the parties, and new men have frequently come forward with radical ideas, which, if carried to the extreme, would have resulted disastrously to the companies and their policy-holders. It has been very ably pointed out by Senator John F. Dryden, in an address on 'The Regulation of Insurance by Congress,' that "Insurance is to-day a universal institution reaching all classes and affecting more or less all commercial interests. It is an essential element of human progress and a method and means for the uplifting of the masses to a higher level of economic security. It has become national in character, and few companies confine their operations to a single State; in fact, if operations were so limited they might prove disastrous and make the conduct of the business impossible."

The taxation of insurance is a difficult problem and a matter of serious concern to the companies. In its final analysis the incidence of insurance taxation falls upon the policy-holders and the cost of insurance is correspondingly increased. The fact is overlooked that insurance itself is in the nature of a tax and that additional tax burdens are a needless hindrance to the largest development of the business. In life insurance alone the annual amount paid in taxes, fees, etc., is not far from $10,000,000 and the proportion of taxes to income is constantly increasing, due to additional burdens placed upon the companies as a convenient source of public revenue. A tax upon premiums is an unjust burden upon the business, and is both inexcusable and unscientific. This tax falls alike upon new premiums for risks just incurred and upon renewal premiums upon risks assumed years ago. Since risks assumed years ago were calculated to produce a certain result on the assumption of a known mortality and 4 per cent interest, taxes upon premium payments must necessarily and considerably decrease the returns to participating policy-holders, and increase, in consequence, the cost of insurance. If carried to the extreme, especially in the case of companies which issue only non-participating policies, it is possible that the companies may ultimately be unable to meet their obligations in consequence of a policy on the part of the State which is as unwise as it is unnecessary.

Insurance by government is not a new proposition, but it is only during the last half century that there has been an effective effort to establish an insurance department by government in active competition with private companies. In life insurance the experiments of England and New Zealand are the most valuable because the results are, on the whole, fairly comparable with those of non-governmental institutions. Post-office life insurance in England was established in 1864, and the life insurance department of New Zealand in 1869. The former employs no agents or solicitors, while the latter, in all essentials conforms to the methods and usages of private companies. The premium rates and the results to policy-holders have been about the same, averaging fairly with those of regular companies of good standing. The business results in England have been insignificant, while in New Zealand a fair measure of success has been achieved. In New Zealand at best and at most, the results have not been better, the cost has not been lower, and the security has not been superior to that offered by private institutions, which have increased their business in force at the rate of 51 per cent during the past nine years, against an increase of 16 per cent for the government department. The private companies are gradually gaining on the government, and while in 1894, 49 per cent of the total policies in force were with the government, in 1902 the proportion was only 42 per cent. To those who believe that the government which governs best is the government which governs least, and that the limit of State duties is unduly enlarged by State trading in such directions as these, the New Zealand experiment is conclusive evidence that State effort in the field of life insurance is not likely to produce results superior to those which have made commercial life insurance the most successful business of the age.

As distinct from voluntary insurance by government or private companies, the so-called system of compulsory insurance for workmen holds a unique and important place in the social economy of certain European nations, particularly Germany. The term compulsory insurance is seriously misleading, for as a matter of fact, the system is not insurance at all, but a state provision for workmen against the financial consequences of accidents, sickness, invalidity, and old age. In its inception the German system of government insurance was a measure designed to counteract the socialistic tendency in opposition to the monarchy. In its development it has been made to include nearly the entire body of workmen and as a theory of government and social reform it has unusual attractions. Critically examined, the system is little else than poor relief under another name, and inadequate in many respects as all methods of compulsory thrift must necessarily be. It is insurance in name, but not in fact, for it is not by the sole contributions of the beneficiaries that the required funds are provided, but by the joint and compulsory payments of employer and employee, plus a state subsidy or grant from the general revenue raised by taxation. The evidence as to the economic and social results of this system is so involved and conflicting and subject to such different interpretations, that no final conclusion for or against the system can be advanced at the present time. This much, however, it is safe to say, that the anticipated benefits have not materialized, and the socialistic agitation, although much modified and of a somewhat different character, is to-day more pronounced in Germany than ever before. Nor has compulsory insurance solved the labor problem and brought about a substantial improvement in the relation of capital and labor. The most serious economic aspect is the burden of the system upon German industry and the resulting handicap upon competition in international trade. This explains the anxiety of the German government to induce other nations to follow its example and by means of exhibits,

illustrations, and literature advance the cause of government insurance abroad. Even at the present time the system is but in its initial stage, and time alone can prove whether it will ultimately result to the advantage of the German people or otherwise. In the opinion of Prof. Farnam of Yale, an impartial student of the subject, "the supporters of the German system are claiming for it more than the facts of the case as they now stand warrant," and that "The German experience with this kind of insurance seems to show that, while it is possible with a highly trained intelligent administration to carry through a scheme which will compel provision against various contingencies, it has thus far been impossible to create the instinct of forethought and care which is implied where insurance is voluntary. There are many facts which go to create a strong presumption that the result of this governmental care is actually to make people less careful of the future, and less judicious in their expenditure."

Insurance had its origin in private enterprise and it has attained its commanding position as a world force for the betterment of the social condition of mankind through the initiative, ability, and courage of a group of men as much deserving of immortal fame and glory as any other class of benefactors of the human race. State trading in the field of insurance has never advanced the cause by a single important innovation or by a new theory or a material improvement in practice. The necessary reforms and changes as dictated by experience have been brought about by the companies and it is due to these and these alone that the insurance business has become one of colossal magnitude and world-wide extent. The amount of insurance of all kinds in force in the United States has been estimated by the Committee on Insurance Law of the American Bar Association to approximate $50,000,000,000. The aggregate assets of the companies approximate $3,000,000,000, and the American people pay annually for insurance of all kinds approximately $1,000,000,000, while they received from the companies during the year ended 31 Dec. 1904, approximately $800,000,000. These figures are exclusive of the business of many fraternal associations and local mutual fire insurance companies, of which there is no trustworthy or complete record.

No other business so completely enjoys public confidence and has so successfully stood the test of long experience. As the scientific principles of insurance are examined and the highly specialized administration of the companies is considered and the results are measured by a fair standard of benefits in proportion to cost, the verdict of science and economics will agree with that of the mass of mankind, that our social and commercial progress would have been impossible without insurance. Resting upon this broad foundation of human experience and public confidence, the colossal business of modern insurance challenges the admiration of the world.

Bibliography.— Insurance has a literature of its own and a most interesting history extending over more than four centuries, with suggestions of at least a conception of the insurance idea among the most ancient people of whom there is a recorded history. The limitations of this article preclude more than a brief reference to the more recently published works, among which, however, I may mention Willett, 'Economic Theory of Risk and Insurance' (Columbia University Press, New York 1901); the Yale Insurance Lectures 2 vols., C. C. Hine Company, New York 1904); Alexander, 'The Life Insurance Company' (Appleton & Co., New York 1905); Young, 'Insurance' (Isaac Pitman & Sons, London); Dean, 'Fire Rating as a Science' (J. M. Murphy, Chicago 1901); Phelps, 'History of American Insurance During the Last Decade' (American Underwriter, New York 1904); Vance, 'Handbook of the Law of Insurance' (West Pub. Co., St. Paul, Minn., 1904); Wolfe, 'Investments of Insurance Companies' (The Insurance Press, New York 1905). These are but a few of the many books on insurance which have been published during recent years. In addition there are the Insurance Year Books on life, fire, and miscellaneous insurance, published by The Spectator Company, New York, the annual reports of insurance commissioners, some of which contain critical observations on insurance problems of the day, the annual proceedings of underwriters' associations, and the national conventions of insurance commissioners, the special publications of insurance companies, their histories, etc., the discussions on State supervision and Federal regulation of insurance, of which the two more important are an address by John F. Dryden, president of the Prudential Insurance Company of America (1904), and a report of the Committee of the American Bar Association on Insurance, by Ralph W. Breckenridge, chairman, Omaha, Neb. (1905). But the chief source of information regarding insurance practice, the progress of the business, the organization of companies, etc., is to be found in the technical and general insurance periodicals, the 'Insurance Monitor,' 'The Spectator,' the 'Weekly Underwriter,' and the 'Insurance Press,' of New York, the 'Baltimore Underwriter,' of Baltimore, the 'Standard,' of Boston, and many others. The principal publishers of works on insurance are The Spectator Company, New York, and C. and E. Layton, London.

FREDERICK L. HOFFMAN,
Statistician of the Prudential Insurance Company of America.

Insurrec'tion, the act of rising against governmental authority, active opposition to the power of the state. In the United States, power to suppress insurrections by employing the militia is given to Congress by the Constitution, Art. I., Sec. 8, Clause 15. In 1792 and 1807 acts were passed giving the President power to call forth the militia when notified by an associate justice of the Supreme Court or a district judge that the execution of the laws is obstructed, and on application of a legislature or a governor, when the legislature could not be convened, and to employ also the land and naval forces of the United States. The Whiskey Insurrection (q.v.) was directed against the Federal authority and the President employed force to suppress it on notification by the Federal judge. During the Buckshot War (q.v.), in 1838, between the Whigs and Democrats in Pennsylvania, the governor of that State asked for assistance, but it was refused. The governor of Rhode Island made a similar application during the Dorr Rebellion (q.v.) and the regulars were held ready for action, but their aid proved unnecessary. These last two cases came under Art. IV., Sec. 4,

of the Federal Constitution, which provides "that the United States shall protect" each State on application of the legislature, or of the executive, against domestic violence.

When the Civil War began the President was obliged to take prompt steps in calling out the militia, though no application had been made to him as required by the acts of 1792 and 1795. His action was justified by Art. II., Sec. 3, of the Constitution, providing that "he shall take care that the laws be faithfully executed," but Congress on 6 Aug. 1861 formally validated and made legal all of President Lincoln's previous acts, proclamations, and orders. The Force Bill (q.v.) of 20 April 1871 gave the President special power to use military force in certain contingencies. In the South during the reconstruction period, and in the North, during strike riots, Federal troops have been used.

Integral Calculus. See CALCULUS, INFINITESIMAL.

In'tellect. See MIND; PSYCHOLOGY.

Intent, a legal term signifying the end or object which a person had in the performance of an act, the making of an engagement, or the drawing up of a will. Generally the legal consequences of an act are considered quite independently of the intention of motive of such an act. A wrong done to the person or property of another is punishable at law without consideration of the intentions of the person committing the violence or trespass. But when an engagement has been made by person, or a written disposition of property executed, the intention of the person making the engagement or signing the deed is fair matter for legal inquiry. In this connection a subsequent stipulation by word of mouth is not competent to nullify or modify the terms of a written engagement. Intent also forms an important part in suits for defamation, fraud and negligence. Negligence must have intent to make it criminal, so must defamation and fraud and malicious mischief. Consult Thayer, 'Preliminary Treatise on Evidence' (1898); Black, 'Construction and Interpretation of Laws' (1896); Hardcastle, 'Rules which govern the Construction and Effect of Statutory Law' (1900).

Intent, in psychology, according to James, is that which intelligent consciousness "means or intends"; the intent is a feeling in consciousness which is usually identified or practically identical with the object of consciousness at a particular time. By others, however, the word intent is meant to apply to a certain point of view from which an object may be regarded. Thus when our conscious processes have a unity of interest, there is, as a rule, a certain amount of unity of object. If the interest is divided, more particularly to the attainment of a definite or a vivid knowledge, the object as it becomes more perfectly known is identical with the object as previously less perfectly known; and as one's conscious thought is directed constantly toward the object, it receives, little by little, further and further definite specification, the detail being more or less in the background; yet the detail is all the time in consciousness, as it were inevitably associated with the object itself. The detailed object, considered by Baldwin as the goal of conscious endeavor, may be called the intent of consciousness. The end pursued becomes defined in the pursuit of it, and so far as it is yet indefinite, and therefore only partially developed in consciousness, it is an intent. Consult Baldwin, 'Dictionary of Philosophy and Psychology,' Vol. I.

Intercollegiate Athletics. See EDUCATIONAL ATHLETICS.

In"tercolumnia'tion, in Greek architecture, the space between two columns. This space is measured in diameters of the foot of the column. Vitruvius mentions five varieties of intercolumniation. These are the *pycnostyle* (that is, with columns thickly ranged) of one diameter and a half, which are least frequently found; the *systyle* (that is, with columns harmoniously ranged) of two diameters, the *diastyle* (that is, with columns far apart) of three diameters, the *areostyle* (that is, with columns sparsely ranged) of four diameters; and the *eustyle* (that is, with columns a due distance apart) of two and a quarter diameters.

Intercontinen'tal Railway, or Pan-American Railway, a proposed line of standard gauge, to connect the railway systems of the United States and Mexico with those of the Argentine Republic, utilizing as far as practicable existing systems in Central and South America. At the first International Conference of American States, held in Washington (1889–90) the committee on railway communications said in their report, "That a railroad connecting all or a majority of the nations represented in this conference will contribute greatly to the development of cordial relations between said nations and the growth of their material interests." President Harrison on 19 May 1890 recommended that Congress should make an appropriation for the share of the United States in the expenses of a preliminary survey. Congress complied, and the Intercontinental Railway Commission began its work with A. J. Cassat as chairman and H. G. Davis at the head of the finance committee. The commission spent about $360,000 for surveys, maps, etc., three corps of engineers making experimental surveys between the north of Guatemala and Argentina in 1892, 1893, and 1894. It was found that the approximate length of the line to connect the southeastern boundary of Mexico with Buenos Ayres would be: in Guatemala, 230 miles; Salvador, 220; Honduras, 70; Nicaragua, 224; Costa Rica, 363; Colombia, 1,372; Ecuador, 635; Peru, 1,671; Bolivia, 774, and Argentina, 1,143; total, 6,702. The distance from New York to the Guatemalan frontier is 3,769 miles, and thus the total from New York to Buenos Ayres is 10,471 miles. Links between the termini of the Argentine and Mexican systems: In Bolivia, 192 miles; in Peru, 151 miles; in Nicaragua, 31 miles; in Salvador, 20 miles; in Guatemala, 30 miles. This statement shows that about half of the distance between New York and Buenos Ayres was covered by railways then existing. On 27 Nov. 1901 the Pan-American Railway committee of the Second International Conference held in Mexico City stated that "some additional railroad has been built that could be utilized as a part of a continental system"; that not more than 5,000 miles of road would have to be constructed to establish railway communication between the systems of North and South Amer-

ica; that $200,000,000 would be ample for this work; and that the surveys made by the engineers of the commission demonstrated the practicability of constructing all of the missing links. The concluding assertion, however, should be received with caution. In Central America the proposed line runs along the volcanic coast; on entering South America it is continued among the enormous volcanic Andes, still paralleling the Pacific shore, but further inland. Recommendations made by the committee on 27 Nov. 1901 were that a permanent committee on Pan-American Railway should be appointed "to further the project after the adjournment of the conference"; also that the United States should take the lead in sending "competent and reliable persons whose duty it shall be to determine accurately the resources of the different countries and the condition of railway lines in operation . . . and the prospects for business for an intercontinental line . . . and also to ascertain what concessions or assistance each of the respective governments is willing to grant to the enterprise." The permanent committee appointed by the president of the conference comprised Ex-Senator Henry G. Davis and four others. A special commissioner was sent to the Latin-American republics, as suggested.

In'terdict, an ecclesiastical decree which forbids the performance of certain acts of public worship. When an interdict was laid upon a town, district, or country, all the churches were closed, the bells were silent, the sacraments, except infant baptism and extreme unction (and sometimes even these), were withheld, the rites of burial were not performed, and all the public ceremonies of religion were suspended. Interdicts may be general, as applied to a country or city; particular, as applied to a parish or diocese; personal, as applied to a person, or some class of persons. The bishops seem to have anciently exercised the right of publishing interdicts; for in 870 Hincmar, bishop of Laon in France, issued one against a parish in his diocese. One of the earliest censures of this sort on record was imposed upon the city of Rouen in the 6th century on account of the murder of the Archbishop Pretextatus by order of Queen Fredegonda. In 997 Gregory V. laid the kingdom of France under an interdict because King Robert had married his cousin, and the king was abandoned by most of his court. The same penalty was inflicted upon the kingdom of England under Stephen (1147) by Eugenius III., under John (1207) by Innocent III., under Henry VIII. (1535) with little effect by Paul III., and under Elizabeth (1587) by Sixtus V. Adrian IV. laid Rome under an interdict for the purpose of compelling the Romans to drive out Arnold of Brescia. Gregory IX. made use of the same instrument of compulsion in his quarrel with the emperor Frederic II. During the middle ages the interdict was a powerful engine of attack for the popes in their contests with sovereigns, as the popular dread of its effects was so great that kings were often forced by rebellions to submit to almost any conditions in order that it might be taken off. From the time of the reformation general and local interdicts have become rare. When Paul V. laid Venice under an interdict in 1606, the churches were not closed, and only a minority of the bishops submitted to it.

Interest ("it concerns"— the party in issue — originally an award of damages, later used to evade the anti-interest laws), a charge for the use of money, by custom computed annually, on a basis of so many out of each 100 units loaned; but without diminishing the capital. It is possible to pay interest without loss, because, under conditions now general, the borrowed money can be employed in productive industry, from which a return equal to or greater than the interest can be obtained; or because comfort, prestige, or moral advantages of many kinds are derivable, justifying the expenditure when enough is left. Such borrowing is now useful on the whole, because civilization has ingrained a self-restraint in the masses which makes them in most cases manage money soberly and prudently. But in the early ages this was not so, except in a few developed commercial cities: Babylon carried on business by interest loans, and even bottomry bonds on shipping. Tyre probably did so, the great Athenian commerce was built up entirely by it, as Demosthenes explicitly says, but the mass of people were not fit to have the use of money, had no remunerative employment for it, and borrowed it only to use in self-indulgence, or in desperation because any rate was a choice of evils. There was little property to pledge, and the security was mostly the debtor's person; foreclosure meant selling him for a slave, and the grievance which called for Solon's legislation was the debt-slavery of a large section of the citizens. Hence arose a violent prejudice against the system altogether, as immoral in itself; the law of Moses prohibited it between Jew and Jew; Aristotle says it is essentially immoral, because money cannot breed money (this in the age of Athenian commerce), and never was meant for any such use; the Christian Church inherited the reprobation from the Jewish, and for many centuries forbade its members to take "usury" (money for the use of money, that is, interest at any percentage), and the secular laws were correspondent. In England interest did not become legal till the time of Henry VIII., but had been actually practised for many generations, by legal fictions of partnership or breach of contract, etc.; previously it was in the hands of the Jews — who were so indispensable as financial agents that a Jew who was converted to Christianity had all his property confiscated — and later of the Lombards. The first English permissive statutes fixed 10 per cent as the legal limit that might be charged; early in the 17th century it was set at 5. No serious doubt of the power of governments to regulate the current rate of interest obtainable was entertained till Bentham wrote his 'Defence of Usury' in 1786, proving that the laws could not possibly have any effect; because if the legal rate fixed was equal to or greater than the current rate it could not work any change in it; and if less, holders of money would not lend without obtaining their price plus an insurance for the risk of legal punishment. The doctrine was violently disliked, and has not even yet overcome the determination of the mass to show their dislike of usury by statute, or their belief that they can affect rates; but in a few American States of late years the anti-usury laws have been abol-

ished. Of course a legal rate is always provided in default of contract.

Interest is not a natural right, but a matter of law or contract. The holder of a note payable without stipulation of interest cannot claim any until the note has become due and remains unpaid; thenceforward it draws money at the legal rate. The United States pays no interest on its debts, except where bonds are issued specifying it.

Of the separate States and Territories there is no legal restriction on the rate allowable by contract in Arizona, California, Colorado, Connecticut, Maine, Massachusetts, Montana, Nevada, Rhode Island, Tennessee, Utah or Washington; the legal rate in each is 6 per cent except with Colorado (8), Montana (8), Nevada (7), Utah and Washington (8). The others have rates as follows, the legal rate coming first, then the contract rate permitted: Alabama, 8, 8; Arkansas, 6, 10; Delaware, 6, 6; Florida, 8, 10; Georgia, 7, 8; Idaho; 7, 12; Illinois, 5, 7; Indiana, 6, 8; Iowa, 6, 8, Kansas, 6, 10; Kentucky, 6, 6; Louisiana, 5, 8; Maryland, 6, 6; Michigan, 5, 7; Minnesota, 6, 10; Mississippi, 6, 10; Missouri, 6, 8; Nebraska, 8, 8; New Hampshire, 6, 6; New Jersey, 6, 8; New Mexico, 6, 12; New York, 6, 6; North Carolina, 6, 6; North Dakota, 6, 12; Ohio, 6, 8; Oklahoma, 7, 12; Oregon, 8, 10; Pennsylvania, 6, 6; South Carolina, 7, 8; South Dakota, 7, 12; Texas, 8, 10; Vermont, 6, 6; Virginia, 6, 6; West Virginia, 6, 6; Wisconsin, 7, 10; Wyoming, 8, 12. The rates in the District of Columbia are 6, 10.

That these provisions are more the result of tenacious tradition than of any very exact reasoning is shown by their terms. Only in three States — Illinois, Louisiana, and Michigan — has there been any recent attempt to keep down by law the rate of contractual interest to the rate actually current in the community; in the others, unspecified debts bear 6 to 8 per cent interest while the current rate is 5. As to the contract interest, 11 States stick to the attempt to forbid anything beyond the legal rate; but that assumed interest being above current rates, some leeway is left. One of these, moreover — New York — favors its peculiar interest by allowing any contract rate on "call loans" over $5,000. Sixteen make the rate so high — from 10 to 12 per cent — that any one with the least pretense of credit or security can contract freely; above that, we have to deal with pawnbrokers and "fences," the former protected by tacit allowance, the latter amenable only to criminal legislation.

The theories of interest, like most economic principles, are much disputed by economists. The chief theories are those of "abstinence," holding interest to be a reward of abstinence from using up the capital in enjoyment (a variant of this regards it as a result of the general appreciation of the present above the future); of "productivity," holding it to be the return for production by capital in the same way that wages are a return for production by labor; the combination of the two, regarding the return as fixed by supply and demand, the latter depending on productivity and the former on abstinence; and the "monopoly" theory, which considers it a toll levied on the product of labor by the capitalists who control the means of production.

Interest, in psychology, is a term by which at least two or three different things may be meant. On the one hand interest may be defined as the consciousness which accompanies mental tendencies of any sort so far as they are concentrated on mental objects. It is manifested by a certain amount of voluntary attention to which it may be considered a stimulus. The exploiting habit, curiosity, the desire to know, may be defined as primary forms of interest, as distinguished from custom and habit and one's way of regarding things, the former being regarded by Baldwin in the nature of a stimulus to the intellectual function, the latter as frequent performance of a process.

The word also, in the vulgar sense, applies loosely to what is meant by personal advantage; as, for instance, it is "to a man's interest" to obtain such and such.

In pedagogics interest is often looked upon as a form of amusement, a stimulus through the play-instinct to induce intellectual effort. In the science of teaching, the ideal is to awaken an interest in the ends for which pupils study, and that a permanent interest in the ends should be fostered through the means. Baldwin well says that when interest attaches to the end, but not to the means of reaching it, we have drudgery, as in the case of workmen who think only of the dollar, taking no interest in the labor that wins it; on the other hand, when there is interest in the means, but not in the end, we have play, we do not work. When, however, there is interest in the end to be obtained, and also in the means for reaching the end, the ideal of work desirable in education is reached. See Herbart, 'Science of Education'; 'Doctrines of Interest'; Baldwin, 'Story of the Mind'; 'Educational Review,' Vol. X.; Baldwin, 'Dictionary of Philosophy and Psychology,' Vol. I.

Interfer'ence, in physics, is a phenomenon exhibited by wave motion of all kinds, and consists in the coming together of waves having different phases, in such a way that the effects of the waves are either increased or diminished. Interference may be observed when two different trains of waves come together upon the surface of water or any other liquid. Where the crest of a wave belonging to one system coincides with the crest of a wave of the other system, the elevation of the water surface is sensibly equal to the sum of the heights that the separate waves would have if each existed in the same place alone. When a crest of one of the waves coincides with the trough of another, the disturbance of the water surface is reduced, and the elevation (or depression) which results is equal to the difference between the elevation of one of the component waves and the depression of the other one.

The kinds of interference that are of the greatest practical importance in physics are those which occur among sound waves, or among waves of light. The phenomena in these cases are ultimately of the same general sort as those observed upon the surface of water. In the case of sound, interference may even produce entire silence in certain regions, when two trains of sound waves, of equal intensity, are brought together in a suitable manner. A more familiar result of the interference of sound waves, however, is the production of "beats," when two or

more trains of waves, having but slightly different wave-length, come together while the two are moving in nearly the same direction. This phenomenon is exhaustively treated in Helmholtz's 'Sensations of Tone,' and it also receives a more or less adequate treatment in all of the better works on physics.

The more familiar of the interference phenomena that are afforded by light are those which are observed in connection with soap bubbles and with very thin plates of transparent solids. Light, upon striking the soap bubble or the thin plate, is reflected toward the eye from both surfaces, and the trains of light waves that reach the eye from these two sources, since they have a slight difference of phase (which varies, moreover, from point to point of the bubble or the plate), interfere with one another so as to produce effects that are often very beautiful and striking. A soap bubble, when viewed by monochromatic light, often appears to be covered with dark striæ; the dark lines being due to the fact that at the points that appear dark the two trains of light-waves, coming respectively from the inner and outer surfaces of the soap bubble, nearly or completely neutralize each other. When the bubble is viewed by white light, we do not commonly see the dark striæ, their places being taken by bands of color. This is because the different colors that compose white light have different wave-lengths, so that at any given point in the bubble only a portion of the colors are destroyed by interference, leaving the remaining constituents of the white light to produce their full chromatic effect upon the eye. See LIGHT; SOUND; PHYSICAL CRYSTALLOGRAPHY.

Inte'rior, Department of the, one of the executive departments of the United States government whose heads are cabinet secretaries. The "home department," long existent in all European governments, was only constituted in this country by act of 3 March 1849. Its functions had previously been exercised by bureaus or officials of nearly all the other departments: patents, copyrights, public documents, and the census belonged to the State Department; public lands, mines, and judicial accounts, to the Treasury; Indian affairs, to the War Department; and pensions to the War and Navy, each for its own pensioners. By later laws the Interior was given charge of education, public surveys (including the geological survey; but the coast and geodetic survey belongs to the Treasury), subsidized railroads, Territories, national parks and reservations, returns of public contracts made by several other departments, some charitable institutions in the District of Columbia, and a number of other matters. The secretary makes an annual report of the number of public documents received and distributed. He has a salary of $10,000, and two assistant secretaries. His office has seven divisions: appointments, disbursements, lands and railroads, Indian affairs, pensions and miscellaneous, public documents, and stationery and printing. Although most of these are managed by commissions appointed by the President, their work is under the secretary's direction, and their reports are made through him. Most of the clerks and subordinate officers in the bureaus are appointed by him. All patents issued by the United States must be signed by him. The first secretary was Thomas Ewing of Ohio.

Interlaken, ĭn'tĕr'läĸ ĕn ("between the lakes"), Switzerland, village in the canton, and 26 miles southeast of the town of Berne, one mile southeast of Unterseen, beautifully situated near the left bank of the Aar, in the valley of Boedeli, between the lakes of Thun and Brienz. It contains a beautiful old castle and numerous hotels. It is visited annually by 80,000 to 100,000 tourists. Pop. about 2,500.

Internal Improvements, the construction and reparation of roads, bridges, canals, harbors, lighthouses, etc., at the expense of the United States government. The Constitution not having made any provision for such improvements, the execution of public works of this character became subject to the vicissitudes of party politics. Yet since 1789 funds have been perpetually appropriated by Congress for the carrying on of improvements throughout the country, so long as these lay strictly within Federal jurisdiction. Such would include lighthouses, buoys, beacons and public piers, rivers and harbors. The Federalist party, and after it the Democratic party, opposed all improvements on rivers and roads, the benefit of which passes to the several States. Yet in 1806 an appropriation was made for the construction of the Cumberland Road, which should penetrate the Western States and facilitate the mail service, as well as open up unsettled territory to the increasing tide of immigration, and serve for the transportation of troops and army supplies. The Federal Government, about the same time, undertook the construction of a road through Georgia toward New Orleans. In 1898 Congress passed a resolution in which it claimed the power to make appropriations for such internal improvements as the construction of roads and canals, and the maintenance and direction of water courses. Such roads and canals as the President should consider of Federal importance were ordered by Congress to be surveyed, and $300,000 was subscribed to stock of the Chesapeake and Delaware Canal. But there was a wide difference of opinion with regard to the constitutionality of such legislative action, and in May 1822, President Monroe vetoed the Cumberland Road bill. He supported this procedure by the declaration that Congress had acted *ultra vires*. That body, he maintained, had no right under the Constitution to carry out such internal improvements at Federal expense. President Jackson in 1830 followed Monroe's example and vetoed the Maysville Turnpike Road bill. Henceforth, the matter of such internal improvements was left to the legislation of the various States. Jackson had somewhat mitigated the force of his veto by advocating the distribution of the Treasury surplus among the various States, but when the Whigs tried to put this into execution in 1841, President Tyler by his veto put a stop to any such attempts, and they have never since been repeated. The introduction of railroads under the management of private corporations did away with the call for road appropriations, although something like a bonus was given to the projectors of new lines by the vast grants of lands which were made to them. Tracts of 40,000,000 and 50,000,000 acres were thus transferred to railroad companies. At

present both the great political parties are inclined to reclaim so much of the public lands thus granted, as has not been earned by a strict fulfilment of the conditions on which the grant was made. The appropriations for internal improvements under the head Rivers and Harbors for the year 1903 was $32,540,199.50 as against $7,046,623.00 in 1902.

Internal Revenue System, of the United States, properly all taxation except that of foreign goods at customs offices; but in use restricted to what were formerly termed excises (q.v.), on internal trade and manufactures, through a bureau of the Treasury Department, organized 1862. Before that time, though excises had been imposed, they were unpopular and brief. An intense dislike to them had been inherited from England, where they traditionally connoted an independent revenue for the sovereigns to free them from popular control, and arbitrary interference with private business and persons by irresponsible officials, the raw state of trade and manufacture in this country made a general excise system very injurious; and the customs dues amply provided for the expenses.

The first occasion when they were resorted to was just after the adoption of the Constitution. The assumption of the State debts, and other expenses of the new government, compelled Hamilton to recommend an excise, though in the 'Federalist' and elsewhere he had strongly urged its impolicy; he was also anxious to test the power of the government to enforce taxation, which the Articles of Confederation could not. On 3 March 1791 a bill was passed taxing distilled spirits of domestic manufacture. In the then West (western Pennsylvania) the still was like the New England cider mill, but much more important, because the long distances and bad roads made corn unprofitable unless condensed into whiskey, hence there was open revolt, which had to be put down by national troops (1794). Direct resistance ceased, but the tax was largely evaded, and it was two years before it was extended to Kentucky and Tennessee, while the collections in North Carolina were poor. In 1794 the system was extended in fear of a war with England, but owing to unskilful choice of articles or provisions in detail, the only one which produced much was that on sugar, from the high import duty, which gave the home market to the domestic manufacturers, so that what went into excise came off customs. Stamp taxes were laid in 1797, but were of odious associations. With the election of Jefferson as President the whole system came under ban, the Democrats having always opposed it, and on 6 April 1802 the entire internal taxes were repealed, with nearly $700,000 outstanding and uncollected, and which remained so. The dislike was not to the taxes as such, but to the inquisitorial methods of collection involved; and this persisted. But the War of 1812 compelled a renewal of them: unfortunately they were laid so late that the war was over before they began to produce much. They were needed to pay off the war debts, however, and were retained till 23 Dec. 1817. Thence till the Civil War no internal tax of any kind was levied in the United States.

The first real "system" — for the others included but few articles — and which has become a standing part of our system of taxation, was inaugurated 1 July 1862, others followed, placing an enormous and very ill-distributed burden on the people, which they bore uncomplainingly for the end in view. It is almost too complimentary to call it a system, as it was an indiscriminate heaping of taxes upon every stage of every article, on labor and tools, raw materials and finished products, processes and professions. Articles paid sometimes a dozen taxes on the various stages, and another on the final one, before reaching even the wholesaler to begin a round of middemen's profits. "The only principle recognized," says David A. Wells, "if it can be called a principle, was akin to that at Donnybrook Fair, "Wherever you see a head hit it." "Wherever you find an article, a product, a trade, a profession, or a source of income, tax it!" Within the period 1861–7 no less than 25 revenue bills were passed by Congress. The incessant endeavor was to find new objects of taxation. The industrial effects of the sudden huge unequal burdens, and the political effects of the enormous revenue to spend at discretion, cannot be discussed here. The taxes did not begin to produce largely at once; in 1863 the receipts were $37,640,787.95; in 1864, $109,741,136.10; in 1865, $209,464,215.25; in 1866, the summit, $309,226,813.42. Then the items began to be stricken off, the total sinking by 1873 to $113,729,314.14: able business men have attributed part of the inflation, and consequent panic, to the sudden removal of burdens to which business had adjusted itself. The next year it touched bottom, $102,409,784.90. The taxes by this time had been reduced to about the present status, and tended to increase with the growth of the country, even rising somewhat through the bad years 1875–9. The income tax, though fairly productive — the height being $37,775,873 in 1870 — was dropped in 1872; no other tax was ever so unpopular, from its prying into private secrets, and its working through informers. It is also the one which bears hardest on the most heavily burdened class of the community, the moderately salaried men in various callings. Protection leaders have repeatedly urged or hinted at repeal of all internal taxes, to prevent any reduction of customs duties; but the moral feeling reinforces the economic sense of the people in insisting on liquors and tobacco being taxed. Attempts have been made to increase the revenue from liquors by raising the tax; but the result is the reverse, the premium on fraud being too great. In 1894 the income tax was re-established, but the Supreme Court decided it unconstitutional under its particular terms. On 1 July 1898, to provide for the expenses of the Spanish War, fresh internal taxes were laid; of which the most fertile were stamps on all mercantile papers, telegrams, etc., and on patent medicines, and wines, which yielded in the ensuing fiscal year $43,837,816.66. Special taxes on bankers and amusements, and some other things, yielded several millions. The total receipts in 1899 were $273,484,571.44. In 1901 and 1902 the new taxes were all abolished.

International Brotherhood of Maintenance-of-Way Employees, an American labor union, having a department of fraternal insurance. It was founded at Demopolis, Ala.,

in 1887, and had a membership in 1903 of 40,000. Since its organization the society has disbursed $500,000 in death and disability benefits. It has secured increased wages for maintenance-of-way employees to the amount of $6,000,000 annually. It was actively engaged in the great strike on the Canadian Pacific Railway in 1901. The strike was settled after a struggle lasting 11 weeks, with the understanding that all members of the brotherhood would be reinstated in their former positions within two weeks; the question of wages to be left to arbitration. Sir John A. Boyd, Chief Justice of Ontario, was chosen chairman of the Board of Arbitration and awarded the employees an increase of 20 per cent over previous wages. The brotherhood holds a charter of affiliation with the American Federation of Labor, and publishes the 'Advance Advocate,' a magazine devoted to the interests of maintenance-of-way employees. See RAILWAY LABOR ORGANIZATIONS.

International Councils of Women. See NATIONAL AND INTERNATIONAL COUNCILS OF WOMEN.

International Date Line, an imaginary line

Map of the world, showing the International date line.

drawn through the Pacific Ocean somewhat irregularly, but tending in a general northerly and southerly direction, and separating the islands of the Pacific Ocean in such a way that all those which lie to the east of it carry the same date as the United States, while all those on the west of it carry the same date as Japan and Australia. The nature of this line may be made clear by the following illustration: A traveler leaves New York city at noon on Sunday, and proceeds westward just as fast as the earth turns on its axis, so that he follows the sun in its apparent westward progress with such precision that he keeps it always directly south of him. It will be noon, therefore, at every place he passes. If, however, he asks the day of the week at every point of his journey, he will be told that it is Sunday at all points in the United States, and even as far west as Hawaii. This can not hold true indefinitely, however, because when he has gone entirely around the world, and has returned to New York, he will have been gone 24 hours, and will therefore be told that it is Monday noon. Everywhere in Europe, too, he would have been told that it is Monday noon.

Yet it has always been the same day to him, and there must have been some place on the journey where he was told, for the first time, that the day was Monday instead of Sunday. At this place, if he wishes to be in accord with the people that he meets, he must arbitrarily change the name of his day from Sunday to Monday. Mariners are in the habit of making the change upon crossing the 180th meridian from Greenwich, England; but this fact is of no service to us if we wish to compare the date carried on one of the Pacific Islands with the corresponding date (say) at New York, because the mariners pay no attention to the local dates on the islands that they pass. The ideal way to find out where the date actually does change would be to canvass the entire Pacific Ocean, so as to find out what date is actually in use on every one of its islands at some given instant. A line drawn from pole to pole in such a manner as to keep all islands bearing one date on one side and all islands bearing the other date on the other side, would afford a perfectly definite basis for the comparison of dates, and would be the true "International Date Line."

No such canvass has yet been made. As a general rule, it may be said that the date now in use upon most of the different islands or groups, is the date which results from the one carried there by the first European or American colonists; and this date will presumably be different according as the colonists came from the east or the west. This is not true universally, however, because arbitrary changes in the date are known to have been made in a number of cases. For example, Alaska was first colonized by the Russians, who brought with them the Russian date. When the American settlers moved there, they carried with them the date of the United States, and this led to some considerable confusion, the Sunday of the Americans being the Monday of the Russians, in spite of the fact that the Russians still use the Julian calendar. In 1867, when Alaska was purchased from Russia, the date in use there was made to conform to that used in the United States. Again, the Philippines were discovered by Magellan, in 1521, and Manila was founded by Lagaspi in 1571. Magellan brought his date from the east, and after the islands were colonized they kept the same date as the Spanish possessions on the opposite side of the Pacific; and they therefore carried a different date from that prevailing on the neighboring Asiatic coast. This was changed in 1844, by the omission of the 31st day of December in that year from the Philippine calendar; this change bringing the date in use in the Philippines into harmony with that prevailing at Hong Kong and other Asiatic ports. The best data at present available indicates that the date line follows substantially the course shown upon the accompanying map.

which is prepared from data furnished by the United States Naval Observatory. This date line is subject to modification, as our knowledge of the dates carried on the various Pacific Islands increases.

International Law. International law as embodied in the practice of states begins with the Peace of Westphalia (1648), which gave rise to modern international society. International law as a branch of jurisprudence begins with the publication in 1625 of the epoch-making treatise of Hugo Grotius entitled 'The Laws of War and Peace' (*De Jure Belli ac Pacis*), although the earlier works of Albericus Gentilis entitled 'De Legationibus' (1585) and 'De Jure Belli' (1588–9, enlarged ed. 1598) were important contributions to the subject, and furnished Grotius with the pattern for a portion of his great book. After the Peace of Westphalia the teachings of Grotius made rapid conquest, and in 1661 the first chair of the law of nations was founded at Heidelberg, with Samuel Pufendorf as the first incumbent. He afterward became professor of jurisprudence at Lund, in Sweden, and while there published his work entitled 'De Jure Naturæ et Gentium' (1672). During the 18th century the publications of Bynkershoek, Wolff, Vattel, Moser, and de Martens contributed to advance and popularize the subject in the schools and among statesmen and military leaders. The work of Vattel in particular became deservedly popular for its practical value as embodying the law of nations as it then was (1758); it has been translated into most of the languages of Europe, and is still frequently referred to and cited. The first half of the 19th century made numerous additions to the list of authoritative writers, among whom may be especially named Henry Wheaton in the United States and Robert Phillimore in England. Of more recent writers the works of Bluntschli, Heffter, Calvo, Pradier-Fodèrè, Hall, Lawrence, and Taylor are especially worthy of mention. David Dudley Field drafted an 'Outline of an International Code,' which is interesting as an attempt to codify the whole field of international law.

The term "Law of Nations" was formerly used to denote the body of doctrines governing the relations of independent states or sovereignties. The modern term "International Law" was first coined by Jeremy Bentham, in 1780, and is now everywhere adopted; it has been extended to include both public international law and private international law, but is here employed only in the first and more accurate sense. The phrase "conflict of laws" is better adapted than "private international law" to describe the doubt that may arise in a local court as to whether, in a case involving private rights, the local, territorial law should govern or a foreign, exterritorial law should be applied.

International law consists of that body of rules by which states are habitually controlled in their relations with one another, and by which arbitrators are controlled when authorized to determine international disputes. While it has not all the sanction of municipal law, it is, as one writer has well said, binding on states in their international relations with a force comparable in nature and degree to that binding the conscientious person to obey the laws of his country, and it is also enforceable by appropriate means in case of infringement. These means are diplomatic negotiations, arbitration, withdrawal of diplomatic relations, so-called pacific blockade, seizure of property, and actual war. In addition, some parts of international law are enforced in the courts. The Supreme Court of the United States has recently said: "International law is a part of our law, and must be administered by the courts of justice of appropriate jurisdictions, as often as questions of right depending upon it are duly presented for their determination. For this purpose, where there is no treaty, and no controlling executive or legislative act or judicial decision, resort must be had to the customs and usages of civilized nations; and, as evidence of these, to the works of jurists and commentators, who, by years of labor, research, and experience, have made themselves peculiarly well acquainted with the subjects of which they treat. Such works are resorted to by judicial tribunals, not for the speculations of their authors concerning what the law ought to be, but for trustworthy evidence of what the law really is." (Paquete Habana v. United States, 175 U. S., 677.)

Owing to the absence of a common superior or sovereign to declare or to enforce the rules of international law, a school of jurists, led by John Austin, and known as the analytical school, has denied that it is law at all and has relegated the system to the domain of international morality. The historical school of jurists, of whom Savigny and Sir Henry Maine are brilliant exponents, has combated this view and has made clear that there have been and still are systems of municipal law in which it cannot be said that there is either a sovereign or a sanction, and that international law corresponds to all systems of law at some stage of their development and to certain archaic survivals still to be observed among primitive peoples. English legal thought has been profoundly influenced by the Austinian conception of law, but on the Continent, and even among English and American jurists of to-day, the historical conception is generally accepted. With the assertion of the primacy of certain great powers and with the establishment of an international tribunal, international law is tending toward an analogue of the common superior and the definite sanctions that now characterize municipal law in the more highly civilized states. There are those who now dream of an authoritative international legislative body, compulsory arbitration, and the enforcement of arbital decrees; but it is doubtful whether these indicia of municipal law are adapted to the peculiar conditions of international relations. It is probable that the same ends will be worked out by international conferences and conventions, and by voluntary arbitration compelled and enforced by enlightened public opinion.

The early publicists sought the basis of international law in the so-called "law of nature," or those principles of justice in which the speculative philosopher affects to see an abstract body of doctrine written in the very nature of man and of society. But the law of nature of the international jurist rested upon a firmer basis than the concepts of speculative philosophy. The 'Jus Gentium' (Law of the Peoples) of the Roman jurists was "the sum of the common ingredients of the customs of the old Italian

tribes." It was upon this storehouse of determined and common customs that Grotius and his successors drew for the definite and practical rules of international law, and added them to such customs of modern states as were generally accepted and acted upon in international affairs. Thus arose the law of nations which, under the influence of the revival of Greek thought and speculation, was philosophized into the law of nature. Modern international law has escaped from the domination of speculative philosophy and now speaks in the language of the practical jurist; it is regarded as a branch of jurisprudence and the business of lawyers rather than a branch of philosophy and the concern of schoolmen.

International law rests, then, upon custom, and in this respect differs not at all from municipal law. In the last analysis the practices of states is the authoritative test. As evidence of such practices resort is had to the decisions of courts upon points that may be brought before them for determination, to the decisions of international tribunes to which questions have been referred for arbitration, to treaties and conventions of general application, to the writings of jurists, and to the arguments of statesmen in diplomatic correspondence and state papers. In comparatively recent times there have been negotiated numerous international conventions which correspond to legislative acts and put into definite form the rules to be observed. These sometimes codify the customary law, sometimes change it, and sometimes add to it. Among such great international documents may be named the Declaration of Paris (1856), the Geneva Red Cross Convention (1864), the Declaration of St. Petersburg (1868), the Convention for the Protection of Industrial Property (1883), the Convention for the Protection of Submarine Cables (1884), the Convention for the Repression of the Slave Trade (1890), the Universal Postal Convention (1891), The Hague Convention for the Pacific Settlement of International Disputes (1899), The Hague Convention with respect to the Laws and Customs of War (1899), The Hague Convention to extend to Maritime Warfare the provisions of the Geneva Red Cross Convention (1899). This growing body of international conventions indicates the method by which, in the future, international law may be expected to progress. The common law of international law is not likely to expand beyond its present content; it has either been settled by concurrent custom or its disputed problems have given rise to conflicting schools. It remains for states by international agreement to codify, to reconcile, and to extend the doctrines of the customary law.

Independent, sovereign states are the parties to international law. States whose external sovereignty has been wholly yielded up, as is often the case with members of a confederation or union, cease to have any independent international status. States whose external sovereignty has been limited, but not wholly extinguished, have an international status subject to the limitation imposed, as for example Bulgaria or Cuba. Certain states, like Belgium and Switzerland, have been neutralized, and while still parties to international law are forbidden to engage in offensive warfare. Any limitation upon freedom of international action tends to reduce the state so restricted below the normal status of the parties to international law.

Of the independent, sovereign states only those whose municipal law is essentially similar to that originating in Europe can be said to enjoy to the fullest extent the rights and privileges of international law. With states whose law is of non-European origin, the European and American states have insisted upon treaties under which they exercise through their consular courts an exterritorial jurisdiction inconsistent with the full international equality of such states. Outside of Europe and America only Japan can be said to enjoy full international equality. In Europe the position of Turkey is anomalous. While admitted by the Treaty of Paris (1856) to participate in the advantages of the public law and system of Europe, the powers still maintain there consular courts with exterritorial jurisdiction, as they do in most Asiatic and African states. On the other hand, such exterritorial jurisdiction has been abandoned in Japan, whose municipal law is now modeled upon that of Europe. While other states like China and the Asiatic and African Moslem states, are dealt with in general upon the principles of international law, and are expected to observe the obligations imposed by it and are entitled to its privileges, there is a specific reservation as to some parts of the system, and an underlying, though often unrecognized, difference in the whole spirit of their international relations.

Theoretically the principles of international law rest upon the postulates of the independence and the equality of the states that are parties to it. Practically six states in Europe, one in America, and one in Asia are dominant, and can, and often do, impress their will upon the other states within the sphere of their influence. Great Britain, Germany, France, Russia, Austria-Hungary, and Italy constitute the concert of Europe and settle or leave unsettled questions of European law and politics. The United States occupies the same dominant position in America and has the final voice in the settlement of American questions. Japan has very recently assumed the same dominant position in Asiatic affairs, but it is yet too early to predict how potent or lasting her influence will be in that quarter. While international law may be said to have well defined principles throughout the greater part of its field of action, the play and counterplay of international politics, as practiced by these eight powers, must continue profoundly to influence its application in specific cases of general importance and to determine its progress through international conferences and conventions.

The normal relation of states is that which exists when they are at peace with one another. An abnormal relation is created when two or more of them engage in war, so far at least as their relation to each other and to the neutral states is concerned. If we assume a war to be going on between State A and State B, the normal relation continues among all other states, but the relation of State A to State B is governed by the laws of war, while the relation of each to all other states is affected by the laws of belligerency and of neutrality. There are, then, three situations: the relation of peaceful states to each other; the relation of enemy states to

each other; and the relation of belligerent states to peaceful states. Each has its own special code of laws.

Peaceful Relations.—States in times of peace sustain toward each other a relation similar to that of well-disposed citizens in civilized societies. Each possesses and enjoys its own rights with a due regard to the corresponding rights of others. These rights if infringed call for appropriate remedies, the gravest of which is that of self-help or self-defense. Modern states tend more and more to the avoidance of this ultimate form of redress, and the past century, and particularly the past quarter-century, has shown an increasing resort to peaceful arbitration when diplomatic negotiations have proved ineffective. The establishment in 1899 of a permanent arbitration tribunal at The Hague marks a decisive victory for the principle of arbitration. See HAGUE CONFERENCE.

A state may be said to possess these fundamental rights; to preserve its independence and integrity; to determine its own form of government; to acquire and dispose of territory; to protect itself and its citizens or subjects from unjust aggression; to exercise jurisdiction over persons and property within its territory, unless they be exempted by law or by treaty; to exercise jurisdiction over its public and private vessels on the high seas; to exercise jurisdiction over its public vessels, over its legations, and over persons connected with its public vessels and legations, even within the territory of another state. A visiting sovereign or head of a state is also exempt from local jurisdiction.

Some of these rights may be limited by treaty, as in the case of the consular jurisdiction exercised in Oriental states, or by the doctrines of intervention as illustrated by the action of the concert of Europe in numerous cases involving the balance of power or of the United States in cases involving the Monroe Doctrine (q.v.). Especially has the right to acquire or dispose of territory been limited by considerations of international politics.

Intervention is a doctrine of vague limits. Although usually based upon the asserted right of self-preservation, it has been justified upon the grounds of humanity, as in the case of the intervention of the powers in behalf of Greece in 1827 and of the United States in behalf of Cuba in 1898. In such instances it is a moral rather than a legal right, and has been aptly described as "a high act of policy above and beyond the domain of law." The Monroe Doctrine has as one of its purposes the prevention of European intervention in the affairs of the independent American states. On the other hand, the United States has as a fundamental maxim of its diplomacy that of non-intervention in the political affairs of Europe.

The territorial jurisdiction of a state extends to three miles of open sea adjoining its coast. This limit was fixed when that was approximately the distance that could be defended from the shore. With the increase in the range of guns, a proposition to extend the limit to six miles, or even more, has been advanced, but has not been acted upon. Such a change in the law could now be made only by a general international agreement. Bays and gulfs not more than six miles wide from headland to headland are within the jurisdiction of the state owning the shores, and some whose mouths are wider than this are conceded to be within the jurisdiction of the local state, especially where the indentation is deep, as in the case of Chesapeake and Delaware bays. Straits not more than six miles wide are within the jurisdiction of the state or states owning the shores; but if they connect waters open to free navigation other states are entitled to navigate them subject to reasonable regulations. The three-mile territorial waters are also free for the innocent navigation of other states, but not for fishing or for naval warfare. Interoceanic canals are regulated by treaty. The Suez Canal is regulated by the treaty of 1888, signed by the six great powers and by the local power, Turkey; the Panama or other possible isthmian canal is regulated by the Hay-Pauncefote treaty of 1901; both are by treaty to be open in time of war or peace to every vessel, public or private, without distinction of flag. River navigation is now, as to all the great rivers flowing through two or more states, also regulated by treaty; prior to such treaties many disputes arose as to the right of an upper riverian state to navigate through the territory of the lower owner to the sea.

Exterritoriality is the name applied to the exercise by one state of jurisdiction within the limits of another state. It extends to visiting sovereigns, diplomatic agents and their families and suites, and visiting public vessels. It is also by The Hague Convention extended to the judges of an arbitration tribunal organized under that convention. Consuls do not enjoy the privilege unless by treaty. In Oriental countries the citizens and subjects of European and American states are by treaty generally subject to the jurisdiction of their own consular courts. In all the above cases the persons concerned are exempt from all local judisriction both civil and criminal. Moreover, local process will not run upon the deck of a visiting public vessel nor within the gates of an embassy or legation. This gives rise to the right of asylum by which political offenders often escape, especially in South American and Oriental countries, by taking refuge in a legation or on board a public vessel. This is a right which is guardedly exercised and is, or should be, never extended to ordinary criminals.

Extradition is the delivery up by one country of criminals who flee to its territory from another. It is regulated by treaty; no state is bound, except under treaty stipulations, to deliver up criminal refugees, and it is doubted whether any constitutional power is lodged anywhere in the United States to do so except under a duly ratified treaty. Political offenders are not subject to extradition.

A state has jurisdiction over aliens within its borders, except those representing another state. It may exclude aliens, and if it admits them it may fix the conditions of such admission. When admitted they are subject to the local laws, except, perhaps, that they cannot be compelled to render military service. But if a state deals unjustly with an alien, or fails to use due diligence to protect him, the state to which he owes allegiance may seek or compel redress.

If a subject of one state is naturalized in another state, a question of double allegiance may be raised. Formerly European states asserted

the doctrine of indelible allegiance and did not recognize that a subject could expatriate himself without the consent of the parent state. This seems to have been the common law and is so announced by American writers and judges. But Congress, in 1868, passed an act declaring expatriation to be a natural and inherent right and that any order or decision to the contrary by any officer is inconsistent with the fundamental principles of government. Great Britain in 1870 enacted that any subject who becomes naturalized in a foreign state shall be deemed to have ceased to be a British subject. The United States has treaties with some governments fixing the status of its naturalized citizens. Where there are no such treaties the matter often becomes a delicate and difficult one in case the naturalized citizen returns to his parent state and military service, or some other obligation of citizenship, is there demanded of him.

The high seas are free to all and no state can claim any exclusive jurisdiction in them. The struggle for the establishment of this principle has been a long and difficult one, but with the Bering Sea arbitration of 1893 it may be said to have ended, when the claim of the United States to a property right in fur seal beyond the three-mile limit was decisively rejected. Vessels on the high seas are free from interference in time of peace unless suspected of piracy or slave-trading. Piracy is justiciable everywhere. Slave-trading is not piracy and vessels engaged in it cannot lawfully be visited, searched, or seized by vessels of other nations unless such right be given by treaty. The international convention for the repression of the slave-trade gives such a right within a specified zone adjacent to the coasts of Africa. All neutral merchant vessels are liable to visit and search in time of war by a public vessel of either belligerent. If carrying contraband of war or intending to run a blockade, a neutral merchantman is liable to seizure and detention until a prize court has determined the validity of the capture and whether the vessel or any part of its cargo is subject to condemnation as prize of war.

Relation of Belligerents to Each Other.— War suspends all civil intercourse between states. Formerly the subjects of enemy states were regarded as enemies, but this doctrine is now confined to rendering illegal all contracts and commerce requiring any communication across the lines of hostilities. But a subject of one belligerent residing in the territory of the other is permitted to remain and to carry on business there so long as this does not embarrass the state of his domicile with reference to his protection or the conduct of hostilities. If required to depart or if desirous of doing so, the alien enemy is given a reasonable time in which to withdraw himself and his family and property. The last instance of the forcible detention of alien enemies who were non-combatants was the exercise of this now obsolete right by Napoleon against resident subjects of Great Britain in 1803.

War suspends all executory treaties between the belligerents except those negotiated with a view to hostilities. At the close of the war executed treaties or those of a permanent nature remain undisturbed, but those of a transient nature and subject to change or extinction do not revive unless by express stipulation.

The laws governing armed hostilities on land have been the subject of much codification. The first was that of Professor Lieber, prepared for the American Civil War and adopted in 1863 for the government of the armies of the United States. In 1874 an international European conference at Brussels framed and recommended a code for general adoption, but its work was not ratified. In 1880 the Institute of International Law recommended one prepared by M. Moynièr. In 1899 The Hague Conference adopted and recommended one based largely on the Brussels code, and this has been ratified by the United States and many other powers. The United States in 1900 promulgated a Naval War Code for the guidance of its naval officers and forces. No international naval code has yet been framed.

Modern warfare seeks to distinguish between combatants and non-combatants, and to give every possible immunity to the latter, while providing for the humane treatment of the former. To this end the laws of war define combatants, provide against unnecessarily cruel weapons or missiles, against the refusal of quarter, and for the proper care of prisoners and of the sick and wounded. The Geneva Red Cross Convention neutralizes hospitals, surgeons, and nurses in land warfare, and The Hague Convention extends the principle to naval hospital ships and their attendants. Non-combatants who refrain from all participation in the war are free from molestation, although when a territory is occupied by the enemy they are required to give a temporary war-allegiance to the conqueror. Non-combatants engaging in hostilities are liable to punishment.

Save in the case of a levy *en masse* to resist invasion, persons in order to be regarded as combatants and entitled to privileges as such, must be commanded by a responsible officer, wear a fixed distinctive emblem recognizable at a distance, carry arms openly, and conduct their operations in accordance with the laws and customs of war.

All weapons are forbidden which cause needless suffering. By the Declaration of Saint Petersburg (1868) no projectile of less weight than 400 grams that is explosive or is charged with fulminating or inflammable substances may be used. By a declaration of The Hague Conference (1899) the launching of projectiles or explosives from balloons was forbidden for five years, but this has now expired by time limitation. The Hague Conference also declared against projectiles the object of which is the diffusion of asphyxiating gases and against bullets which expand or flatten easily in the human body, but the United States delegates did not assent to these propositions.

It is forbidden to use poison, to kill treacherously, to refuse quarter, to make improper use of a flag of truce or a Red Cross badge or ensign, to bombard undefended towns, or to pillage a captured place. The United States Naval Code forbids the use of false colors, though such a deceit has been deemed to be allowable under the older practices.

Private property on the land is now regarded as exempt from capture except in case of military necessity. Pillaging and freebooting are

strictly prohibited. Requisitions may be levied for the support of an invading army with a due regard to the resources of the country. It has been found difficult to reconcile the doctrine of the inviolability of private property with the right to levy contributions, and no satisfactory rules have yet been framed to limit the exercise of this right.

Naval warfare has partaken more of the character of freebooting than modern land warfare. Private property is liable to capture. Privateering was long permitted, and is now theoretically admissible unless the belligerents have by treaty agreed to forego it. The Declaration of Paris (1856), assented to by most civilized nations, forbids it. The United States is not a party to this, but in two wars in which it has been engaged since the declaration was issued, it has observed it. Mr. Marcy, secretary of state, offered to assent to it provided the declaration was amended to read, "Privateering is and remains abolished, and the private property of the subjects or citizens of a belligerent on the high seas shall be exempt from seizure by public armed vessels of the other belligerent, except it be contraband." This was not assented to by the other powers. Since that time the United States has frequently sought to secure such an exemption of private property from capture, but as yet without success. All private and public vessels and property of the enemy are liable to capture except hospital ships, coast fishing craft, vessels on voyages of science or discovery, and property devoted to science, education, religion, and art. It is usual to exempt also vessels on voyage to or from a port of the captor at the outbreak of the war and to permit those in its ports a reasonable time to depart. All enemy merchandise in an enemy vessel is liable to capture, but the Declaration of Paris exempts enemy goods in a neutral vessel and neutral goods in an enemy vessel except contraband of war.

Vessels and cargoes captured during the war are taken into a prize court for adjudication. But if the captor cannot spare a prize crew, or there is danger of recapture, they may be sold or destroyed if clearly enemy property, and the papers and other testimony sent to the prize court in order that a judicial decree may be entered. Title to captured property changes only by decree of a competent court. The personnel of a captured merchant vessel of the enemy may be detained as prisoners of war, or as witnesses, or they may be released. Passengers are released at the first convenient port.

Relation of Belligerents and Neutrals.— The doctrines of neutrality have received their chief application since the foundation of the American Republic, and foreign writers give to the early statesmen of that Republic the credit of having done most to ascertain and establish the sound principles upon which neutrals should act toward belligerents. Jefferson summed up the whole matter in one of his felicitous phrases: "It is the right of every nation to prohibit acts of sovereignty from being exercised by any other within its limits. It is the duty of a neutral nation to prohibit such as would injure one of the warring powers." The conduct of M. Genet, the French minister, in using our ports as a base of naval operations in 1793 and in setting up prize courts in them, called for the rigorous application of the doctrines of neutrality, and led to that attitude on the part of our government which has elicited the admiration of all publicists. In 1794 Congress passed an act forbidding American citizens to enlist in the service of a foreign state at war with another state with which the United States is at peace and prohibiting the fitting out of ships of war or armed expeditions within the territory of the United States. This and its amendments were consolidated into the Foreign Enlistment Act of 1818, and the latter has served as a model for similar legislation by other states.

On the one hand each belligerent must observe the inviolability of neutral territory and territorial waters, and on the other the neutral must observe a strict neutrality and impartiality in its attitude toward both belligerents. It may admit their war vessels to its ports, but must so regulate the length of the visit and the amount and nature of supplies as to preserve its neutral duties. The usual rule is a visit of 24 hours, or, if a vessel of the other belligerent is in the same port, 24 hours after the latter has departed. The supplies furnished must be only sufficient to take the vessel to the nearest home port and are not to be again furnished within three months. It cannot be said that the letter of these rules is universally accepted, but the principle involved in them is admitted. An international agreement may be necessary to define them with precision.

To permit a ship of war to be built and equipped by one belligerent in a neutral port is a breach of neutrality. This was so adjudged by the Geneva Arbitration Tribunal in the case of the Alabama, Florida, and Shenandoah, which were built or adapted in England by order of the Confederate government during the American Civil War, and their equipment sent out from England in transports. It has been contended that a ship of war is a legitimate article of commerce, as much so as guns, ammunition, and the like, and that it is merely contraband of war; but the distinctions are marked enough to lead to the rule that neutral states must use due diligence to prevent the fitting out, arming or equipping of such vessels within its jurisdiction.

A neutral state is not bound to prevent its citizens from engaging in contraband commerce with the belligerents; but they do so at the risk that the contraband articles may be captured and condemned. Non-contraband commerce between a neutral state and a belligerent state cannot be interfered with, except by the establishment of an effective blockade.

The right of a belligerent to cut submarine cables has been much discussed of late. Those between belligerent points may be cut anywhere, but it is contended that those between a belligerent and a neutral point can be cut only in belligerent territory, and that those between neutral points cannot be cut at all. This is the provision of the United States Naval Code, but it is likely that an international agreement may be necessary to secure uniformity of action.

Relation of Neutral Individuals to the Belligerents.— Citizens of a neutral state may engage in commerce with either belligerent, subject to the right of the other belligerent to capture neutral vessels carrying contraband of war or intending to run a blockade. But neutral citi-

zens who render belligerent or unneutral service, such as carrying military dispatches, military officers or forces, transmitting signals, and the like, may be treated as quasi-belligerents and their vessels and property may be confiscated. When Messrs. Mason and Slidell, agents of the Confederate government, were taken from the British steamer Trent on a voyage between Havana and England, the British government contended that the act was unwarranted. The United States government, while contending that the agents might lawfully be captured, admitted that in case of capture the vessel must be taken to a prize court and the legality of the capture judicially determined, and as this was not done, released the captives. The penalty for unneutral service is the confiscation of the vessel engaged in it. It is usually stated that neutral mail vessels may be searched for belligerent dispatches, but this right is very cautiously exercised.

Contraband of war consists of goods having a belligerent destination and purpose. It is impossible to fix a definite list or a specific classification of articles deemed contraband. Some are clearly so because their sole purpose is for military operations. Some are clearly not so because their use is exclusively peaceful. Between these lie many important articles which may be used for military or for peaceful purposes, and these are classed as conditionally contrahand. The United States Naval Code declares the following to be conditionally contraband: "Coal, when destined for a naval station, or a ship or ships of the enemy; materials for the construction of railways or telegraphs; and money, when such materials or money are destined for the enemy's forces; provisions, when actually destined for the enemy's military or naval forces." Such a list might be extended by including clothing, balloons, bicycles, barbed wire, or any other articles used in warfare and destined for a belligerent. A neutral vessel carrying contraband is liable to capture. If the vessel belongs to the owner of the contraband it also is condemned, but otherwise it is released and the contraband condemned.

The United States Supreme Court decided during the Civil War that contraband goods shipped from England to Nassau, W. I., but with the intent to tranship them there and send them into a Southern port were liable to capture. This is known as the doctrine of "continuous voyage," and has been condemned by some publicists who argue that the destination of the ship should be conclusive as to the destination of the goods. Great Britain seems to have acted upon the same principle, however, in the case of goods shipped to Delagoa Bay during the Boer War in South Africa.

Neutral vessels destined for a blockaded port are liable to capture. Blockades in order to be binding must be effective, that is, they must be maintained by a force sufficient to render hazardous the ingress to or egress from a port. A neutral vessel must have notice of the blockade before being liable to capture. This may be given by a general notification to the government of the neutral; but if the vessel sailed before such general notification it is entitled to a special notification which is entered upon its ship papers. Neutral vessels in a port when it is blockaded are allowed a reasonable time to load and depart. The penalty for an attempt to run a blockade is confiscation of vessel and cargo. The officers and crew are not to be deemed prisoners of war but may be detained as witnesses for the hearing of the prize court.

When a vessel is captured it is the duty of the captor to take it into a convenient home port and deliver it into the custody of a prize court. In the United States the district courts are vested with admiralty jurisdiction. Any claimant may appear and contest the legality of the capture. If the vessel or cargo is condemned it is sold and the proceeds paid into the public treasury. Formerly the captors were by law entitled to a portion of the prize money, but by an act passed in 1899 Congress repealed this provision.

The right to capture contraband and to capture vessels bound for a blockaded port carries with it the right to visit and search neutral vessels. A neutral claim has been pressed in recent times to the effect that private merchant vessels under convoy of a public vessel of the same nationality are not subject to visit and search in case the commander of the public vessel certifies that the merchantmen have on board no contraband articles. While this is in some dispute, the United States Naval Code directs naval officers to accept such certificate. A neutral vessel is bound to submit to visit and search unless under convoy, and any attempt to escape or resist, or to destroy her papers or present fraudulent ones, renders her liable to capture. Dean of the Cornell University College of Law.

International Peace Conference. See Hague Conference.

International Workingmen's Association, an organization of the workingmen of all countries for the advancement of the interests of labor and the emancipation of the working classes. It grew out of a visit of French workingmen to the World's Exposition at London in 1862. In 1864 an organization was formed in London, and an 'Address and Provisional Rules' published; the rules provided for a general congress to be held annually and a central council appointed by that congress to sit in London; workingmen's societies were to join the International in their corporate capacity. The principles and policy were not then definitely announced; the first congress held at Geneva in 1866 passed resolutions favoring the limitation of the working day and the abolishing of child labor; at the next congress at Lausanne (1867) socialistic principles were first definitely announced; from this time the influence of Marx and his followers grew in the organization. In 1868 at the Brussels congress the International announced its opposition to war, and favored the general strike; at the Basel congress in 1869 Bakunin and the anarchists were admitted; but they were expelled from the association in 1872 at the congress at The Hague; this same congress transferred the seat of the General Council to New York. The anarchists held a separate congress at Ge-

neva in 1873. In 1867 the International rendered substantial aid to the strike of the bronze workers in Paris, and the next year to the strike of the Geneva builders; it assisted the English workmen by preventing the importation of underpaid laborers from the Continent in time of strikes. The International was accused of complicity in the Paris Commune, and while the two had no official connection many of the leaders of the Commune were Internationalists, and its principles and aims were defended by the International. In the United States the Social Party, a socialist political organization, was affiliated with the International in 1868, and later some individual trades-unions were also affiliated; finally the North American Federation of the International was formed and held its first national congress in 1872; its organization was in local sections of at least ten members, with a Federal Council of nine elected by the annual congress. Shortly after the transfer of the General Council to New York the Internationalists took a prominent part in the eight-hour day demonstration in New York. The formal organization of the International was dissolved in 1875; in Europe the Social Democratic parties of the different countries grew out of it, and in the United States the Socialist-Labor party. The anarchist faction in the United States split into two organizations, the International Workingmen's Association and the International Working People's Association. The International was important in the history of the labor movement as being the first expression of the recognition of the common interests of labor in all countries, and as being the means of spreading widely the knowledge of the principles of the Marxian socialism. Consult: Ely, 'French and German Socialism,' and 'The Labor Movement in America'; Villetard, 'History of the International'; Zacher, 'The Red International.'

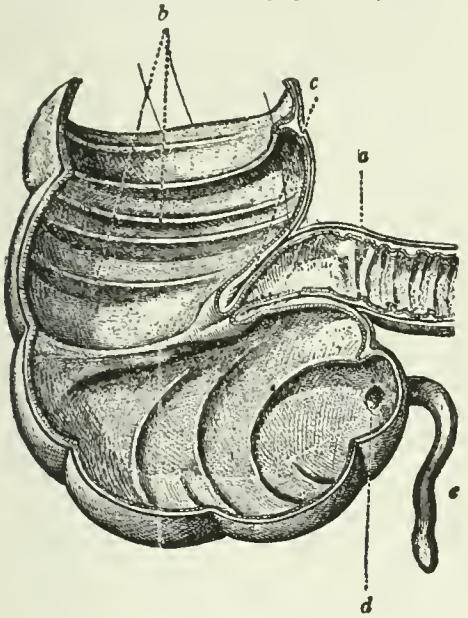
In'terval, in music, is the distance or difference of pitch, arithmetically expressed, between any two tones of a given scale. Occidental nations, including America, employ the diatonic scale (see SCALE), an octave comprising five tones and seven semitones, named after the first seven letters of the alphabet. The affix of a flat or sharp before a note denotes its quality but does not affect its name, and the eighth note being in unison commences a new octave. Taking the scale in the key of C major, the various intervals are: minor second = E–F or B–C; grave major second = C–D, F–G, A–B; grave minor third = D–F; minor third = E–G, A–C, B–D; major third = C–E, F–A, or G–B; perfect fourth = C–F, D–G, E–A, G–C′, or B–E′; acute fourth = A–D′; acute augmented fourth = B–F; grave diminished fifth = B–F′; grave fifth = D–A; perfect fifth = C–G, E–B, F–C′, G–D′, A–E; minor sixth = E–C′, A–F′ B–G′; major sixth = C–A, D–B, G–E′; acute major sixth = F–D′; grave minor seventh = D–C′, G–F′, B–A′; minor seventh = E–D′, A–G; seventh = C–B, F–E′; octave = C–C′, D–D′, etc. By taking various notes of the diatonic scale as starting points, and measuring known intervals from these, we arrive at intermediate notes of the scale, of which the following are examples: C♯ minor third below E; D♯ minor second below E; E♭ minor third above C; A♭ minor sixth above C; B♭ minor seventh above C; B♯ 3 major third above C. The difference of pitch between C and C♯ or between D and D♭ is called a semitone, and an interval increased or diminished by a semitone is said to be augmented or diminished. This applies especially to the interval of a fourth or a fifth, which with the octave are said to be perfect, because any augmentation or diminution mars their consonance. The major sixth or third may, however, be diminished to a "minor" sixth or third without destroying the consonance; and the term "minor" is also applied to the diminished second or seventh. Intervals confined within the octave are simple, when they exceed it compound; the octave beginning a new series, the ninth is the octave of the second, and so forth.

Intes'tacy, the legal state of a person dying without having disposed of his property by last will and testament. In Great Britain intestacy does not affect real estate, which is disposed of in accordance with the rule of descent. The effect of intestacy in Great Britain is merely that no directions have been left for the distribution of personal property. The effect of intestacy in the United States varies in accordance with the laws of inheritance fixed by each of them. Intestacy may be complete, as when a valid will is not left by the dead proprietor; or partial, when the extant will only provides for the distribution of part of the property. In these cases the property passes to the heirs or next of kin of the decedent in accordance with the laws of the place where the property is. See DESCENT; HEIR; INHERITANCE.

Intestine, Bowel, or Gut, the alimentary tube, in the higher animals limited to that portion between the stomach and the outlet at the anus. The human intestine is divided into the small and large intestine, the two parts varying in structure, movement, and function. The small intestine starts at the pylorus of the stomach, as the duodenum, and the first eight or ten inches are so distinguished. This portion is the widest and most deeply placed of the parts of the small intestine. About three or four inches below the pylorus the ducts of the gall-bladder and pancreas open conjointly into the bowel. The duodenum emerges from the cover of the peritoneum and becomes the jejunum. The remainder of the small intestine constitutes the jejunum (about two fifths) and the ileum. Between these divisions there is little difference, except that the jejunum is more freely movable, occupies the upper left portion of the abdomen more than the lower and right, and has thicker walls. The lumen of the small intestine gradually grows less from the duodenum, where it is two inches and a half in diameter, to little more than an inch where the ileum empties into the large intestine. The ileum is inserted several inches above the actual beginning of the large intestine, so that a blind pouch is formed below the point of juncture; this pouch, called the cæcum, gives off the appendix vermiformis (see APPENDICITIS) from its lower and back part. From the cæcum the large bowel passes up to the under surface of the liver as the ascending colon (see COLON), thence across the abdomen

below the lower border of the stomach as the transverse colon, turns down to the iliac fossa as the descending colon, forms a peculiar S-shaped curve, the sigmoid flexure, which passes over the brim of the pelvis, where it is called the rectum (q.v.). The large bowel is about six feet in length. Both bowels have four coats, the mucous coat, the submucous, the muscular, and over most of the bowel an investment of peritoneum forming the serous coat. In the small intestine the mucous membrane is thrown up into permanent folds, each extending over half-way around the inside of the bowel. In this way a large surface is exposed for the absorption of food. Furthermore, the inner surface is covered with finger-like projections called villi, each having a large absorbing vessel in its centre. At the bases of the villi are tubular (of Lieberkuhn) and branching glands (of Brunner) that dip down into the mucous membrane. Scattered over the surface there are tiny collections of lymphoid tissue, called solitary follicles, and here and there collections of these follicles into groups one to three inches long, called Peyer's patches. It is these spots that are attacked and ulcerated in typhoid fever. The muscular coat consists in an inner layer running around the bowel and an outer longitudinal coat. The large bowel differs from the small in the absence of the folds and villi, and is but slightly movable within the abdomen, being bound down to the abdominal wall posteriorly by the peritoneum. (See PHYSIOLOGY.)



Section of the Ileum and Cæcum: *a*, ileum; *b*, cæcum; *c*, ileocæcal valve; *d*, opening of the appendix; *e*, appendix.

Diseases of the Intestine.— These may be disturbances of the function of the bowels without actual inflammation, or they may be inflammations in different parts and of different kinds; but with inflammations there is necessarily a disturbance of the various functions, and differentiation frequently becomes a matter of difficulty. Diarrhœa and constipation (qq.v.) are symptoms of many different conditions, as are also deficiencies of secretion and absorption. The nervous mechanism of the bowels may be changed, giving rise to abnormal sensations and disturbance of all the functions. True inflammation of the intestines is the most common cause of abnormal action, and therefore is described in detail.

Acute Intestinal Catarrh is an inflammation of the mucous membrane that varies much in its symptomatology with the part of the bowel affected and the causative agent. Among the causes may be mentioned the eating of tainted fruits and other foods; the overeating of any food; overdrinking, particularly of very cold liquids; the injestion of chemical or mechanical irritants; "catching cold"; and the poisons of the infectious diseases. The bowel is inhabited by numerous forms of micro-organisms, many of which are entirely harmless; but when any of the various agencies mentioned above affect the mucous membrane, the micro-organisms are able to attack the damaged surface. Many forms of bacteria produce particular types of disease when they find such lodgment, because they invade the system with their peculiar products. (See CHOLERA INFANTUM; CHOLERA; DYSENTERY.) But to the growth of bacteria must always be ascribed some of the symptoms in any intestinal catarrh. The attack usually starts in acutely with fever, general bodily discomfort, and abdominal pain. If the inflammation be confined to the upper part of the small intestine there may be constipation; but this is uncommon, and diarrhœa is the rule. Inflammation of the small intestine is spoken of as enteritis, but this is usually associated with more or less inflammation of the large bowel, called colitis (q.v.), although it may occur alone even in its last portion, the rectum. The pain in colitis is apt to be confined to the sides of the abdomen, and when the inflammation is low down there is constant desire to defecate, pain accompanying the act. Passage of mucus alone also indicates an inflammation low down in the rectum. The stools in acute intestinal catarrh vary much with the cause of the trouble; in some observed cases of dysentery the discharges are like rice-water. Treatment of these conditions depends upon the severity and location of the inflammation. The mild cases, with ordinary loose movements, recover without medication with abstinence from food for 24 hours. Castor-oil or small doses of calomel will cleanse the intestine of irritating substances. The more severe cases are kept in bed and allowed small amounts of milk after the first day, and are given small doses of castor-oil or mixtures of bismuth, opium, and other sedative drugs. If the large intestine is found to be involved, irrigation with common salt in water (teaspoonful to the quart) is valuable. Great care must be used in the selection of diet for some time.

Duodenitis occurs associated with acute gastritis (q.v.), and has the same symptoms, except for the presence of jaundice due to the closure of the bile-ducts. The disease runs its course ordinarily in a few weeks without any treatment except rest in bed for a few days, simple diet, and mild cathartics to relieve the constipation. *Chronic intestinal catarrh* results from a severe attack of acute inflammation in which the mucous membrane is left with permanent changes, or from repeated attacks of inflammation. Cases

of chronic inflammation may occur without previous evidence of acute attacks. The symptoms vary much in kind and intensity, but pain, flatulence, and disturbance of the bowels are usually complained of. There may be pronounced constipation, alternating constipation and diarrhœa, daily unformed movements not distinctly diarrhœal, or, what is most common, a constant diarrhœa. More or less admixture of mucus in the stools is usually observed. Sooner or later there is apt to be a loss of flesh and strength. When the large bowel is much involved in such a process there is usually a coating of the stools with mucus, or the passage of clear mucus.

In the treatment it is best to rely mainly on carefully regulated life — exercise, baths, fresh air, sufficient rest, avoidance of exposure, and properly selected diet. In diet the objects sought are the regulation of the bowels and the avoidance of irritation. When there is diarrhœa it is wise to avoid fruits, salads, cabbage, coarse-fibred breads, sugars, honey, pastry, sour and sweet wines, and carbonic beverages. In cases attended with constipation most of these may be allowed, but sausages, rich dressings, cucumbers, cabbage, and very coarse-fibred breads should be forbidden. Mineral waters are frequently used with success, such springs as Carlsbad and Vichy for the diarrhœal cases, and such as Marienbad, Hathorn, and Congress for those attended with constipation. Chronic catarrh of the large bowel is treated with small doses of castor-oil and irrigations of the bowel with water, to which may be added antiseptics or astringents.

Intestinal Hemorrhage, or blood passed from the bowel, may be due to piles, tumors, dysentery, colitis, typhoid fever, tuberculosis of the intestinal tract, ulcers of the duodenum, portal obstruction as in cirrhosis of the liver, hæmophilia, purpura, and the hemorrhagic forms of the infectious diseases. When blood coming from the stomach or high up in the small intestine is passed by rectum it is changed to a tarry appearance. This is due to the action of the digestive juices and bacteria. The farther down the intestine the blood starts, the brighter red is it found when passed.

Intestinal Obstruction.— This is a term that includes a great variety of conditions in the abdomen having the common feature of obstruction to the passage of the contents along the bowel; and in addition there is in the acute condition some injury to the bowel resulting in special symptoms. Two varieties are differentiated, the acute and the chronic. Acute intestinal obstructions are caused by foreign bodies, gall-stones, and hardened or large collections of fæces in the canal; by contracting scars, or tumors of the wall, twists of the gut (volvulus), intussusceptions (invagination of a portion above into the part below); by adhesions of the peritoneum, causing constricting bands; and by strangulations of portions of the bowel contained in hernia. Besides these causes, from local or general peritonitis there is apt to be a condition of paralysis of a portion of the bowel, giving rise to the same state. The symptoms vary considerably with the cause of the obstruction and the part of the bowel affected, but in general the symptoms are pain — frequently of a colicky sort — constipation, inability to pass gas — with resulting tympanites — vomiting, first from the shock, and later from reversed peristalsis, until at length the vomitus is bilious and finally even fæcal. Because of these symptoms and the injury to the nerves of the intestine resulting in "shock," there is a gradually increasing prostration. Certain features indicating that the obstruction is in the small intestine are early vomiting, the passage of fæces from the lower bowel, and the greater swelling of the centre of the abdomen. Absolute constipation from the first is apt to mean an obstruction low down in the large bowel. The cause of the obstruction may be indicated by the presence of a tumor, or by something in the previous history. Intussusception is the most common cause of the obstruction in children; a tumor may be felt on the outside, or the bowel may be felt in the rectum. Fæcal impaction is indicated by a long history of constipation, and rectal examination shows the hardened masses. If intestinal obstruction be not relieved, the patient may die of shock, with gradual exhaustion, from gangrene of the bowel — the blood-supply being usually shut off — and sometimes from peritonitis.

Medical measures for the relief of most forms of the malady are not successful, and temporizing is attended with danger; but rest of the body as a whole, and especially of the intestinal tract, must be absolute. Some authorities advise the use of opium for further quieting the intestine when the diagnosis is certain. Lavage of the stomach is of great value, and large enemata may be curative when the cause of the trouble is intussusception, foreign body, or hardened fæces. Most forms of obstruction require the opening of the abdomen, search for the cause of the obstruction, and attempts at removal. Results depend on the quickness with which operation is undertaken; death may ensue, in spite of the removal of the obstruction, if interference be too long postponed. Chronic intestinal obstruction is caused by about the same conditions as the acute variety. The symptoms include various digestive disturbances, flatulency, constipation, and, when due to malignant growths, the general loss of flesh and strength.

Intestinal Parasites.— Three principal forms of these affect man — tapeworms, roundworms, and pinworms (qq.v.) The list of symptoms attributed to the presence of tapeworms in the human intestine is long and varied, but even loss of nutrition from such a parasite's presence is usually slight. Finding the worms or their eggs in the stools is the only convincing symptom. Treatment of this condition consists first in the preparation of the intestine by light diet for 24 hours before the tænifuge is given and six or eight hours before, allowing a liberal diet of onions, salty herring, and garlic; this rather loosens the worm's hold. Mild purgatives may also be given at this time. Early on the following morning the selected drug is taken, and this may be either male-fern, pomegranate, pumpkin-seed, kousso, or kamala. After about 12 hours a brisk cathartic is taken and the worm is passed. Careful search must be made for the head, for unless it is passed treatment must be started again while the worm is yet weak. Santonin and purgatives effect expulsion of roundworms. In the treatment of pinworms it is customary to take advantage of the fact that the females deposit their eggs in the large intestine and rectum. Santonin

and cathartics aid in gathering the worms where they may be killed by injections of benzine (20 drops to the pint of water), or by solutions of quinine, though further catharsis may be necessary.

DUDLEY D. ROBERTS, M.D.,
Brooklyn, N. Y.

Inton'ing, the practice of delivering prayers in the recitative form. Intoning differs little from chanting: in the latter case the cadence is more developed, the divisions more rhythmical, and the music in continuous harmony. In intoning the greater part of the prayer is recited on one note, and then sung by several voices in unison, the closing words of the sentence being sung to the proximate notes of the scale and in harmony. The practice of intoning prevails in the Greek, Roman, Anglican, and Lutheran Churches.

Intoxica'tion (literally poisoning, commonly restricted to poisoning by means of alcohol, for a discussion of which latter see ALCOHOLISM). Intoxication in the sense of poisoning may result from poisons having their origin outside of the human body (exogenous poisoning), or from poisons which may be developed within the body itself (endogenous poisoning, or autointoxication). Some of the most important problems connected with the infectious diseases concern themselves with the study of the intoxications that result from the formation of toxins by specific bacteria distributed throughout the human body during the course of a disease. From the same point of view many of the most complicated intoxications result from variations in the normal metabolism of the body. Thus in diabetes mellitus (q.v.) there is developed an acid intoxication (diabetic coma), which is due to the inability of the body properly to neutralize by its alkaline salts the excessive amounts of acid produced as a result of the perverted metabolism of this disease. Similarly in Bright's disease a type of intoxication (uræmic poisoning) results from failure of the kidneys to eliminate poisonous products from the human body. It seems not unlikely that a number of diseases such as migraine (sick headache), some forms of epileptic convulsions, different types of skin-eruptions, and some of the mild insanities result from autointoxication (q.v.). See TOXICOLOGY.

Introduced Species. A long catalogue might be made of species of animals and plants which have been transferred by accident or design from their native country or locality to other regions. Sometimes, as in the case of salmon in New Zealand, rabbits in Australia, the European house-sparrow in America and elsewhere, or western fishes in eastern waters, this is done by design; but in the great majority of cases the introduction is accidental and unwelcome, as in the case of the hundred and more species of injurious insects brought into the United States from foreign lands (or the fewer sent abroad from here), and the very many species of «weeds» naturalized on our and other shores. Such introductions are in the main accidental, the eggs or seeds or grown individuals passing from one region to another in ships or railway trains, or cargoes or discharged ballast; so many plants have been introduced by the latter means that botanists class the group of alien weeds as «ballast plants.» See ACCLIMATIZATION; ZOOGEOGRAPHY.

Intuba'tion, the introduction of a tube into an orifice or an organ, as the larynx, to keep it open. Specially designed tubes for such a purpose are sometimes used in cases of croup, diphtheritic obstruction, etc., as a substitute for tracheotomy.

In'ulin, a substance resembling starch, but intermediate in nature between that body and the gums. It occurs in the roots of elecampane, dandelion, and certain other plants, and also in the Jerusalem artichoke and the common potato. When pure it is a tasteless white powder consisting of spherical particles. Its chemical formula is probably a multiple of $C_6H_{10}O_5$, though $C_{72}H_{124}O_{62}$ has been suggested. It is insoluble in alcohol, and but slightly soluble in cold water, although it is very hygroscopic. It dissolves freely in hot water. It melts at 320° F., becoming thereby converted into a different substance known as «pyro-inulin.» It is not fermentable, and does not reduce Fehling's solution. Iodine renders it brown or yellow.

Invariants and Covariants. 1. These terms were introduced, and are still ordinarily employed, in connection with a special mathematical theory, namely, the theory of the linear transformation of algebraic forms developed by Cayley and Sylvester during the middle third of the nineteenth century. The central idea, however, is a very general one, which has been applied in recent years to almost all branches of mathematics. It deserves, in fact, to be ranked with such fundamental concepts as function and group. We therefore divide our sketch into three parts as follows: (1) The general concept of invariant; (2) The theory of algebraic forms, or invariants in the narrow sense; (3) Other invariant theories.

THE GENERAL CONCEPT.

2. The suggestion for the formation of the concept comes from the familiar observation, at the bottom of all science and philosophy, that, while the world about us is in a continual state of change, there are yet certain aspects or properties which are unaltered. To find the permanent in the changing is the most general statement of the problem of invariants. Abstractly, the idea may be explained more definitely as follows: Consider a set of objects or elements O of any conceivable kind, finite or infinite in number; and a set of operations or transformations T, each of which interchanges the objects in a definite manner. Then a property of an object O is said to be *invariant*, provided it holds for all the objects obtained from the given O by the transformations T. Similarly, any relation between a number of O's which holds for the transformed O's is said to be an invariant relation, that is, an invariant relation of the given objects with respect to the given transformations.

The idea of *covariant* involves nothing essentially new. An object $\overline{O}$ is said to be a covariant of a given number of objects O_1, O_2, etc., provided $\overline{O}$ is invariantly related to O_1, O_2, ... In this case, if any one of the transformations T converts $\overline{O}$ into $\overline{O}'$, O_1 into O_1', O_2 into O_2', etc., then the relations connecting $\overline{O}'$ with O_1', O_2', etc., are the same as those connecting $\overline{O}$ with O_1, O_2, etc.

3. The idea is best illustrated by examples from geometry. Consider a number of points P_1, P_2, . . . , connected with a solid body. When the body is displaced, its points take new positions, P_1', P_2', ... Many such positions are possible, since the displacement may be made in an endless number of ways. But in every case, of course, the distance between P_1' and P_2' is the same as that between P_1 and P_2. That is, distances between points are invariant with respect to rigid displacement.

Suppose next that the solid carrying the points is not only displaced but is magnified (or diminished) according to any scale. (We may, for example, picture such a change as produced by subjecting the homogeneous solid to a higher or lower temperature.) The solid is then converted into one of different size but of the same shape, that is, a similar solid. Distances are changed in the same ratio. Hence $P_1'P_2'/P_2'P_3' = P_1P_2/P_2P_3$. That is, the ratio of any two distances is invariant with respect to similitude transformations.

4. In both examples, points on a straight line are converted into points on a straight line. Collinearity is then a relation which is invariant with respect to displacements and similitude transformations. A more general type of transformation for which this is true is the homographic or projective transformation. We consider, for simplicity, only the case of figures drawn in a plane M. From a fixed point (termed the center of projection) outside of M draw lines to the various points of M until they intersect a second plane M'. Thus, every point P in M is associated with a definite point P' in M'. The operation of passing from a figure in M to the corresponding figure in M' is termed projection. Concretely, we may think of the center of projection as a source of light and the figure in M' as the shadow of that in M.*

If we consider three points P_1, P_2, P_3 on a straight line in M, they are converted, by projection, into points P_1', P_2', P_3' on a straight line in M'. But in general the distances and also the ratios of distances will differ. In fact, three points have no invariant, since they may be converted into three points at arbitrarily assigned distances by a suitable projection. If, however, we take four points (on a straight line) it may be shown that, for any projection,

$$\frac{P_1P_3}{P_3P_2} : \frac{P_1P_4}{P_4P_2} = \frac{P_1'P_3'}{P_3'P_2'} : \frac{P_1'P_4'}{P_4'P_2'}.$$

In each member of this equation we have a combination of the distances between four points which is termed their cross ratio (anharmonic ratio). Hence the cross ratio of four collinear points is invariant with respect to projective transformation.

5. Let the figures considered be all the ellipses of a plane. With respect to displacement an ellipse has two invariants, the major and the minor axis. With respect to similitude transformation, there is one invariant, the ratio of the axes, or what is essentially the same, the eccentricity. Finally, in the projective theory there are no invariants, since one ellipse may be converted into any other (and even into any proper conic).

* It is however necessary to include the ideal shadow formed by producing the rays away from M.

In this connection we may illustrate the notion of a covariant. The center of an ellipse is a covariant with respect to displacement and magnification, but not with respect to projection. For if the plane containing an ellipse E and its center C is displaced or magnified, so that ellipse E is converted into another ellipse E' and the point C is converted into a point C', then C' is necessarily the center of E'; while under projection this is not the case. A similar result holds for the center of gravity of any figure, plane or solid.

6. Another well-known type of transformation is that known as inversion. Take a fixed circle F with center C and radius r, and suppose that any point P of the plane is converted into the point P' situated on the line CP, so that $CP \cdot CP' = r^2$. The points P, P' are then said to be inverse with respect to the circle F. By the inverse of a curve is meant the locus of the points inverse to the points of the curve. The collinear relation of points is no longer invariant, for a straight line (not passing through C) is converted into a circle. An arbitrary circle is converted into a circle, but the center of the circle is not a covariant point. The most important property of the transformation is this: the angle at which any two curves intersect is equal to the angle at which the inverse curves intersect. Angles are invariant with respect to geometric inversion.

7. We pass now to a few simple examples of the general definition in No. 2, in which the objects and transformations are analytic instead of geometric.

Let the objects O be functions of any number of variables, and let the operations T performed on these functions be the permutation of the variables involved. A function written down at random, for example x^2+2yz, changes its form when say x and y are interchanged. There are exceptional functions, like $x^2+y^2+z^2$ and $xy+yz+xz$, which are not altered by interchanging the variables in any way, and are termed symmetric. The symmetric functions are invariant with respect to permutation of the variables.

In the differential calculus it is shown that the exponential function e^x has the property of being its own derivative. The only functions which are invariant with respect to the process of differentiation are in fact those of the form ae^x, where a is a constant. It is obvious that if the first derivative is equal to the original function, all the higher derivatives will also be equal to the function.

The trigonometric functions have a period of 2π or 360°. Such a function $f(x)$ is unaltered in value when x is replaced by $x+2\pi$. It is obvious that the double application of the operation, that is, the replacing of x by $x+4\pi$, will also leave $f(x)$ invariant. The periodic character thus involves the invariance of the function with respect to all the operations $(x,\ x+2k\pi)$ (this denotes the replacing of x by $x+2k\pi$), where k is any integer. We note here that if one of these operations, say that of adding $2k'\pi$ to the angle, is followed by another, say that of adding $2k''\pi$, the result is the same as the single operation of adding $2(k'+k'')\pi$, which is a member of the set. The set of operations thus possesses the essential property of a GROUP.

8. In general, if an invariant is found with respect to certain operations, T_1, T_2, . . . , the

invariance also holds for all combinations of these operations. Adding these combinations to the original operations, a set is finally obtained with the group property; this is then termed the group generated by the given operations.

Thus, in connection with No. 6, since angles are unaltered by inversion with respect to any circle, it follows that they are unaltered by successive inversion with respect to a number of circles. The inversions themselves do not constitute a group; but the totality of combinations is the important group of circular transformations which are expressed analytically by the linear transformations of a complex variable and of its conjugate.

9. The general problem of the mathematical theory of invariants may now be restated as follows: Given any group of transformations, and any set of configurations (mathematical objects) which are converted into one another by these transformations, to find the properties of the configurations which remain unaltered. There are thus as many types of invariant theories as there are types of groups and types of configurations. The distinction according to groups is the more fundamental.

10. The relation between the concepts invariant and group is thus very intimate. Suppose that instead of assigning transformations and seeking invariants, the question is inverted: Given a property or a function, find the transformations which leave it invariant.

Thus, if space is to be deformed so as to leave the distance between every pair of points unaltered, the deformation must be simply a displacement. The totality of displacements forms a group; for if one displacement is followed by a second, the effect is the same as that due to a single displacement. In general the totality of transformations defined by one or more invariants is a group. Many groups are defined in this way.

11. In connection with any group this question may be asked: Given two configurations, is it possible to convert the one into the other by a transformation belonging to the assigned group? If this is the case, the configurations are said to be *equivalent* with respect to the group.

Thus, two figures are equivalent with respect to the displacement group when they are congruent; they are equivalent with respect to the similitude group when they are similar. The study of equivalence with respect to the projective group is the main object of projective geometry; its systematic analytic treatment depends upon the theory of algebraic forms considered below.

The importance of the notion of equivalence depends upon the fact that equivalent configurations necessarily have the same invariant functions and properties. Thus in studying the projective properties of (proper) conics, it is sufficient to consider the case of a circle. The circle may thus be taken as the *type* or *canonical form* of the class of conics.

The Theory of Algebraic Forms.

12. This part of modern algebra deals with the invariants of algebraic forms with respect to the group of linear transformations. It has been variously termed the theory of forms, the algebra of quantics, the algebra of linear transformations, the linear or projective invariant theory. Traces of the idea may be found in papers by Lagrange, Gauss, and Cauchy; and simple results on quadric forms were given by G. Boole (1841); but the construction of the systematic theory begins with the memoirs of A. Cayley (1845–) and J. J. Sylvester * (1851–). The recent developments are due mainly to German and Italian mathematicians.

13. The objects considered are algebraic forms. A *form* or *quantic* is a rational integral homogeneous function of any number of variables. Forms are classified according to the number of variables and the degree in which they are involved. A *binary* form involves two variables; a *ternary*, three; a *quaternary*, four; in the general case of p variables the adjective p-ary is employed. The degree in which the variables enter is termed the *order* of the form; we denote it in general by n. If n is one, the form is linear; if two, quadric (or quadratic); if three, cubic; if four, quartic (biquadratic); etc.

Thus the binary cubic form is

$$ax^3+bx^2y+cxy^2+dy^3,$$

where x, y are the variables and a, b, c, d the coefficients. It is usual, however, to distinguish the variables and the coefficients by subscripts, a notation which has the advantage of generality and symmetry; also binomial coefficients are introduced. Thus the above form is written

$$a_0x_1^3+3a_1x_1^2x_2+3a_2x_1x_2^2+a_3x_2^3.$$

The ternary quadric is

$$a_{11}x_1^2+a_{22}x_2^2+a_{33}x_3^2+2a_{23}x_2x_3+2a_{13}x_1x_3+2a_{12}x_1x_2.$$

The general binary form is

$$(1)\quad a_0x_1^n+\frac{n}{1}x_1^{n-1}x_2+\frac{n(n-1)}{1\cdot 2}x_1^{n-2}x_2^2+\ldots+a_nx_2^n.$$

14. The group employed consists of the totality of linear transformations of the variables. A linear transformation from the original variables $x_1, x_2, \ldots x_p$ to the new variables $X_1, X_2, \ldots X_p$ is defined by p equations of the first degree, as follows:

$$\begin{aligned} x_1&=l_{11}X_1+l_{12}X_2+\ldots+l_{1p}X_p,\\ x_2&=l_{21}X_1+l_{22}X_2+\ldots+l_{2p}X_p,\\ &\ldots\ldots\ldots\ldots\\ x_p&=l_{p1}X_1+l_{p2}X_2+\ldots+l_{pp}X_p. \end{aligned}$$

The determinant

$$\Delta=|l_{ij}|,$$

whose elements are the p^2 coefficients in these equations, is termed the *modulus* of the transformation. It is assumed that Δ does not vanish; for in the latter case the X's cannot be expressed in terms of the x's, that is, the transformation is not reversible.

We shall deal mainly with binary variables and then employ the simpler notation

$$(2)\quad x_1=l_1X_1+m_1X_2,\quad x_2=l_2X_1+m_2x_2.$$

The modulus is $\Delta=l_1m_2-l_2m_1$.

* Most of the technical terms employed (including invariant, covariant, form) are due to Sylvester, who gloried in the title of "The Mathematical Adam."

15. When a linear transformation is carried out on a form, the latter is converted into a form of the same order containing the new variables. The coefficients of this transformed quantic depend of course upon the transformation employed. Thus if in the quadric

$$f \equiv a_0 x_1^2 + 2a_1 x_1 x_2 + a_2 x_2^2$$

we make the substitution (2), the result is a new quadric,

$$F \equiv A_0 X_1^2 + 2A_1 X_1 X_2 + A_2 X_2^2,$$

where

$$A_0 = l_1^2 a_0 + 2l_1 l_2 a_1 + l_2^2 a_2,$$
$$A_1 = l_1 m_1 a_0 + (l_1 m_2 + l_2 m_1) a_1 + l_2 m_2 a_2,$$
$$A_2 = m_1^2 a_0 + 2m_1 m_2 a_1 + m_2^2 a_2.$$

It is easy to verify that

$$A_0 A_2 - A_1^2 = (l_1 m_2 - l_2 m_1)^2 (a_0 a_2 - a_1^2).$$

According to the general definition in No. 2, the function $a_0 a_2 - a_1^2$ is not an invariant function, since it is not equal to $A_0 A_2 - A_1^2$; but the relation $a_0 a_2 - a_1^2 = 0$ is invariant, since its fulfillment necessitates $A_0 A_2 - A_1^2 = 0$. This is sometimes expressed by saying that the function is a *relative* invariant.

It is usual, however, to modify somewhat the general definition as follows: A function of the coefficients of a quantic is said to have the invariant property when it is equal to the same function of the coefficients of the transformed quantic, except for a factor depending only upon the coefficients of the linear transformation. Thus if $\phi(a)$ is such a function, where a denotes the coefficients collectively, and if A denotes the coefficients in the new form, then

$$\phi(A) = M\phi(a), \tag{3}$$

where M depends only on the transformation coefficients.

All such functions can be expressed in terms of rational integral functions with the same property. These are termed simply invariants. Thus an *invariant* is a rational integral function of the coefficients with the property expressed by (3).

16. A *covariant* of a quantic differs from an invariant only in that it involves both the coefficients and the variables. Its defining property is expressed by

$$\phi(A, X) = M\phi(a, x). \tag{3'}$$

Thus the binary cubic

$$a_0 x_1^3 + 3a_1 x_1^2 x_2 + 3a_2 x_1 x_2^2 + a_3 x_2^3$$

has the covariant

$$(a_0 a_2 - a_1^2) x_1^2 + (a_0 a_3 - a_1 a_2) x_1 x_2 + (a_1 a_3 - a_2^2) x_2^2;$$

for when the cubic is linearly transformed, it is found that the corresponding expression

$$(A_0 A_2 - A_1^2) X_1^2 + (A_0 A_3 - A_1 A_2) X_1 X_2 + (A_1 A_3 - A_2^2) X_2^2,$$

built from the new coefficients and variables, reduces to the original expression multiplied by $(l_1 m_2 - l_2 m_1)^2$.

17. Invariants and covariants are collectively termed concomitants or, more simply, *comitants*. We give now a few of their important general properties.

A comitant is homogeneous in the coefficients (a) and in the variables (x). Its dimension in the former is termed its degree (d); its dimension in the latter, its order (m). For an invariant, of course, $m = 0$.

The factor M produced by the linear transformation is for every comitant an entire power of the modulus Δ. Hence

$$\phi(A, X) = \Delta^w \phi(a, x). \tag{4}$$

The exponent w is termed the *weight* of the comitant.

The proof of the first theorem depends on the use of linear transformations of the special type $x_1 = \rho X_1$, $x_2 = \rho X_2$; that of the second theorem depends on the group property of linear transformations and the fact that Δ is not factorable.

18. The weight w, order m, and degree d of any comitant of a binary n-ic are connected by the relation

$$2w = nd - m.$$

This holds in the example given in No. 16, where $n = 3$, $m = 2$, $d = 2$, $w = 2$.

Taking $m = 0$ and n odd, we have the corollary: A binary form of odd order cannot have an invariant of odd degree.

When n is even, so is m. Hence a binary form of even order cannot have a covariant of odd order.

19. The preceding definitions and theorems may readily be extended to *simultaneous* comitants, that is, invariants and covariants of two or more forms.

20. An important process for the formation of simultaneous comitants depends on this principle: If in an invariant $\phi(a_0, a_1, \ldots a_n)$ of a single form f, we substitute $a_0 + \kappa b_0$ for a_0, $a_1 + \kappa b_1$ for a_1, etc., and expand the result according to powers of κ, the first term is the original invariant $\phi(a)$, the coefficient of κ^d is the corresponding invariant $\phi(b)$ of a form g with coefficients $b_0, b_1, \ldots b_n$, and the remaining coefficients are simultaneous invaraints of f and g.

For example, when this principle is applied to the invariant $a_0 a_2 - a_1^2$ of a quadric $f = a_0 x_1^2 + 2a_1 x_1 x_2 + a_2 x_2^2$, we have

$$(a_0 + \kappa b_0)(a_2 + \kappa b_2) - (a_1 + \kappa b_1)^2$$
$$= a_0 a_2 - a_1^2 + \kappa(a_0 b_2 - 2a_1 b_1 + a_2 b_0) + \kappa^2 (b_0 b_2 - b_1^2).$$

It follows that $a_0 b_2 - 2a_1 b_1 + a_2 b_0$ is a simultaneous invariant of f and $g = b_0 x_1^2 + 2b_1 x_1 x_2 + b_2 x_2^2$.

The coefficient of the first power of κ, by Taylor's theorem, is

$$b_0 \frac{\partial \phi}{\partial a_0} + b_1 \frac{\partial \phi}{\partial a_1} + \ldots + b_n \frac{\partial \phi}{\partial a_n}.$$

Hence if the operation $b_0 \dfrac{\partial}{\partial a_0} + b_1 \dfrac{\partial}{\partial a_1} + \ldots + b_n \dfrac{\partial}{\partial a_n}$

is applied to an invariant of a single form, the result is an invariant of two forms. The operation is known as the *Aronhold process*.

21. In the domain of simultaneous comitants the distinction between invariants and covariants may be said to disappear. All the covariants of a form f may be obtained from the simultaneous invariants of f and a linear

form $u_1x_1 + u_2x_2$ by the substitution of x_2 for u_1 and $-x_1$ for u_2.

22. *Geometric Interpretation.*—If a binary form f of nth order is equated to zero, the resulting equation, by the fundamental theorem of algebra, determines n values of the ratio $x_1 : x_2$. Taking $x_1 : x_2$ as homogeneous coordinates of a point on a straight line, we thus obtain a definite set of n points corresponding to the form f. Conversely, if a set of n points is given, the form f is determined (except for a numerical factor).

Linear transformation of x_1, x_2 has the same effect upon the points of the line as the projection of the given line upon a second followed by the displacement of the second line upon the first. Hence an invariant of f equated to zero represents a projective relation between the corresponding n points, that is, a relation not altered by the process of projection. Similarly, a covariant of order m represents a set of m points projectively related to points defined by f.

Thus, the vanishing of the invariant $a_0a_2 - a_1^2$ of a quadric form means that the two root points coincide. Again, the vanishing of $a_0b_2 - 2a_1b_1 + a_2b_0$, derived in No. 21, means that the pairs of points represented by the two quadrics are situated harmonically.

The interpretation often suggests the invariant character of complicated algebraic functions. For example, the *resultant* of two equations, $f=0$, $g=0$ (that is, the expression which vanishes when and only when the equations have a common root), is a simultaneous invariant of f and g. The condition that the equation $f=0$ shall have equal roots leads to an invariant termed the *discriminant* of f.

23. *Absolute Invariants.*—By considering fractional instead of integral functions of the coefficients, it is possible to obtain *absolute invariants*, that is, functions which are unaltered by linear transformation. The factor M in (3) is then unity. An absolute invariant is necessarily the ratio of two (relative) invariants having the same weight. We give an example in connection with the form of fourth order. Here there are two invariants I and J with weights 3 and 2 respectively. Linear transformation affects them as follows: $I' = M^3I$, $J' = M^2J$. Hence $I'^3/J'^2 = I^3/J^2$. That is, I^3/J^2 is an absolute invariant.

Geometrically, every absolute invariant of any number of forms is expressible in terms of cross ratios of the corresponding points.

24. *The Symbolic Notation.*—The most powerful method for attacking the general problem of our subject, the determination of all the comitants of any number of forms and their interrelations, is the so-called *symbolic* method. The origin of the method is to be found in Cayley's hyperdeterminants (1845), but the symbolic notation itself is due to Aronhold (1859). The general theory was developed by Clebsch and Gordan (1870–).

A binary form of nth order is represented by the nth power of a linear form,

$$f = (a_1x_1 + a_2x_2)^n.$$

Here the a's are merely symbols which have a real meaning only in the combinations

$$a_1^n = a_0,\ a_1^{n-1}a_2 = a_1,\ a_1^{n-2}a_2^2 = a_2,\ \ldots,\ a_2^n = a_n.$$

The Roman letters denote real coefficients and the Greek letters symbolic coefficients. The latter were termed *umbrae* (shadows of quantities) by Sylvester.

A combination of a's of dimension $<n$ has no real meaning. On the other hand, if the dimension is a multiple of n, there are several corresponding real quantities. Thus $a_1^{2n-2}a_2^2$ represents both a_0a_2 and a_1^2. This ambiguity is removed by introducing several equivalent sets of umbral quantities, each entering in precisely the nth dimension. We abbreviate by writing $\alpha_1x_1 + \alpha_2x_2 = \alpha_x$, $\beta_1x_1 + \beta_2x_2 = \beta_x$, etc. The given form is then

$$f = \alpha_x^n = \beta_x^n = \gamma_x^n, \text{ etc.}$$

The fundamental theorem is as follows: Every comitant of binary forms f is expressible symbolically as a combination of determinants of the type $(\alpha\beta) = \alpha_1\beta_2 - \alpha_2\beta_1$ and linear factors of the type $\alpha_x = \alpha_1x_1 + \alpha_2x_2$. In the case of invariants, only the determinants are involved. Conversely, all combinations of these two types (in which each set of symbols is involved in the proper dimension) represent comitants.*

Thus the quadric $f = \alpha_x^2 = \beta_x^2$ has the invariant $(\alpha\beta)^2$. Expanding, we have

$$(\alpha_1\beta_2 - \alpha_2\beta_1)^2 = \alpha_1^2\beta_2^2 - 2\alpha_1\alpha_2\beta_1\beta_2 + \alpha_2^2\beta_1^2 = a_0a_2 - 2a_1a_1 + a_2a_0,$$

which is simply twice the discriminant $a_0a_2 - a_1^2$.

25. *Transvectants.*—Among the comitants of two forms, $f = \alpha_x^n$, $g = \beta_x^m$ (here α and β are non-equivalent symbols), those represented by $(\alpha\beta)^\kappa\alpha_x^{n-\kappa}\beta_x^{m-\kappa}$ are of special importance, since they are of the first degree in each set of coefficients. They are termed the *transvectants* of f and g and are denoted by $(f, g)_\kappa$. Gordan has shown that all comitants may be derived by the repeated application of the process of transvection.

The first transvectant of two forms is termed their *Jacobian;* its non-symbolic value is $\frac{\partial f}{\partial x_1}\frac{\partial g}{\partial x_2} - \frac{\partial f}{\partial x_2}\frac{\partial g}{\partial x_1}$. The transvectant $(f, f)_2$ is termed the *Hessian* of f; its non-symbolic value is $\frac{\partial^2 f}{\partial x_1^2}\frac{\partial^2 f}{\partial x_2^2} - \left(\frac{\partial^2 f}{\partial x_1 \partial x_2}\right)^2$.

26. *Complete Systems.*—In general, a set of forms has an infinite number of comitants. Thus any entire power of a comitant, or a product of powers of two comitants, is also a comitant. It is evident, however, that there cannot exist an infinite number of algebraically independent comitants, since all are functions of a finite number of coefficients and variables. The following result is fundamental in the systematic theory: For a given set of forms there exist a finite number of comitants such that every comitant of the forms is a rational integral function of the selected comitants. The latter constitute the *complete system* of the given forms.

The proof was first given by Gordan (1870) by means of the symbolic method. It has since been simplified and generalized by numerous investigators—in particular, Hilbert.

27. We now give the complete systems for the forms of order 1, 2, 3, 4:

* Sylvester observed certain formal analogies between this symbolism and that employed in chemistry, and developed a so-called chemico-algebraic theory. See Grace and Young, (Algebra of Invariants,) Cambridge, 1903, p. 366.

Linear form. No invariant; the only covariant is the given form $f=\alpha_x$.

Quadric form. One invariant (the discriminant) $D=(\alpha\beta)^2$; one covariant $f=\alpha_x^2$.

Cubic form. The only invariant is the discriminant $R=(\alpha\beta)^2(\alpha\gamma)(\beta\delta)(\gamma\delta)^2$; in addition to $f=\alpha_x^3$, there are two covariants, $H=(\alpha\beta)^2\alpha_x\beta_x$ (the Hessian of f) and $Q=(\alpha\beta)^2(\alpha\gamma)\beta_x\gamma_x^2$ (the Jacobian of f and H).

Quartic form. Two invariants, $I=(\alpha\beta)^4$, $J=(\alpha\beta)^2(\beta\gamma)^2(\gamma\alpha)^2$; three covariants, the given form $f=\alpha_x^4$, its Hessian $H=(\alpha\beta)^2\alpha_x^2\beta_x^2$, and the Jacobian of f and H, namley, $T=(\alpha\beta)^2(\alpha\gamma)\alpha_x\beta_x^2\gamma_x^3$.

Every invariant of the quartic form is thus a rational integral function of I and J; every comitant is a rational integral function of I, J, f, H, T.

28. The systems given are *irreducible;* that is, no member of a system can be expressed as a rational integral function of the other members of the system.

Complete irreducible systems have been calculated for single forms up to the order 10, and for pairs of forms up to the order 4. The system of the quintic contains twenty-three members.

While the finiteness of the system is assured, no general formula for the exact number of irreducible comitants is known.

29. *Ternary Forms.*—Many of the results stated for the binary case apply with little change to ultrabinary forms. There are, however, certain aspects of the general theory which are disguised when only the binary case is studied.

Consider a ternary form $f(x_1, x_2, x_3)$ of nth order. (The symbolic representation is α_x^n, where $\alpha_x=\alpha_1x_1+\alpha_2x_2+\alpha_3x_3$.) If x_1, x_2, x_3 are taken as the homogeneous coördinates of a point in a plane, the equation $f=0$ defines a curve of nth order. The vanishing of an invariant denotes a projective property of the curve. A covariant defines a curve which is projectively related to the original curve.

The principle of duality suggests the introduction of line coördinates u_1, u_2, u_3. When the x's undergo a linear transformation, the u's undergo another linear transformation which is said to be *contragredient* to the first. A function involving the u's and having the invariant property is termed a *contravariant* of f. Geometrically it represents a curve considered as the envelope of its tangent lines. A *mixed* comitant is one involving both point coördinates and line coördinates; geometrically it defines a so-called *connex*.

The complete system of the ternary quadric $f=\alpha_x^2$ consists of the covariant f, the invariant $D=(\alpha\beta\gamma)^2$, the contravariant $F=(\alpha\beta u)^2$, and the so-called identical form u_x. (Here $(\alpha\beta\gamma)$ represents a determinant of third order $|\alpha_1\beta_2\gamma_3|$.) Geometrically, $f=0$ represents a conic considered as a point locus, $F=0$ represents the same conic regarded as line envelope, and $D=0$ denotes that the conic degenerates to a pair of straight lines.

30. *Quaternary Forms.*—Here the essentially new feature is that in addition to point coördinates (x_1, x_2, x_3, x_4) and the dual plane coördinates (u_1, u_2, u_3, u_4), it is necessary to consider line coördinates $(p_{12}, p_{13}, p_{14}, p_{34}, p_{42}, p_{23})$. Comitants may contain, besides the coefficients of the given form, any combination of these types of variables. Little advance has yet been made in the complete treatment of even the simpler cases.

31. Gordan's method for proving the existence of a complete system applies only to binary forms. The proof for forms of any kind (including multiple forms containing two or more sets of variables) was first given by Hilbert (1890). The basis of his method is the following theorem, which has many important applications:

In any assemblage containing an infinite number of forms it is possible to select a finite number of members $F_1, F_2, \ldots, F_r$, so that every member can be written $F=P_1F_1+P_2F_2+\ldots+P_rF_r$, where the P's are forms not belonging necessarily to the given assemblage.

Other Invariant Theories.

32. *Special Linear Transformations.*—Forms have been treated with respect to linear transformations of special type. Thus the transformations $x_1=\alpha X_1+\beta$, $y_1=\alpha Y_1$ lead to the so-called *seminvariants* of binary forms.

Again, the formulas for passing from one system of rectangular coördinates to another,

$$(5)\qquad \begin{aligned} x&=X\cos\theta-Y\sin\theta+h,\\ y&=X\sin\theta+Y\cos\theta+k,\end{aligned}$$

constitute a special linear group. Invariants with respect to this group are termed Cartesian or metric or orthogonal. In the case of the conic $ax^2+bxy+cy^2+dx+ey+f=0$, there are three such invariants, $a+c$, b^2-4ac, and the discriminant. The latter is the only one which is invariant in the projective theory. If $a+c=0$, the conic is a rectangular hyperbola; if $b^2-4ac=0$, it is a parabola.

For any number of variables the linear transformations which leave a given quadric form unchanged constitute a type of group which arises in many applications (line and circle geometries, geometry on a quadric surface, etc.).

33. The general method of finding the invariants of any continuous group involving a finite number of parameters is due to Sophus Lie. An r parameter group is generated by r independent infinitesimal transformations; these determine a set of r partial differential equations whose solutions are the invariant functions.

34. A *differential invariant* is one that contains the derivatives of the variables. Thus for the group (5) the expression $\frac{y''}{(1+y')^{\frac{3}{2}}}$ is a differential invariant. It represents in fact the curvature of an arbitrary curve at a point; this is obviously independent of the system of axes to which the curve is referred.

35. Special theories of invariants have been constructed in connection with *differential equations.* Thus an ordinary linear equation,

$$\frac{d^ny}{dx^n}+p_1(x)\frac{d^{n-1}y}{dx^{n-1}}+\ldots+p_n(x)=0,$$

is converted into an equation of the same kind by the substitution $x=\phi(X)$, $y=Y\psi(X)$. The totality of substitutions here forms an infinite continuous group, since ϕ and ψ are arbitrary functions. By an invariant of the equation is meant a function of the coefficients p_1, $p_2\ldots$ and their derivatives, which retains its value (except perhaps for a factor depending on the transformation) when formed from the coefficients of the new equation.

36. *Differential Forms.*—In the theory of surfaces the distance between two consecutive points of the surface is given by the formula

$$ds^2 = E(u, v)du^2 + 2F(u, v)du\,dv + G(u, v)dv^2.$$

The second member is a binary quadratic differential form. Such forms possess a theory of invariants with respect to arbitrary change of variables. Any change is expressed by $u = \phi(U, V)$, $v = \psi(U, V)$, where ϕ, ψ are arbitrary functions. The simplest example of an invariant is the expression, depending on E, F, G and their partial derivatives, which represents the Gaussian curvature.

37. *Arithmetical Theory of Forms.*—In this theory, inaugurated by Gauss, the coefficients and variables involved are supposed to be whole numbers. Attention has been confined mainly to the binary quadratic $ax^2 + 2bxy + cy^2$. The transformations are defined by $x = \alpha X + \beta Y$, $y = \gamma X + \delta Y$, where the coefficients α, β, γ, δ are integers such that $\alpha\delta - \beta\gamma \neq 0$. In this case, then, the group is discontinuous.

38. *Automorphic Functions.*—Such discontinuous groups arise also in the theory of functions. Thus in No. 7 it was seen that the trigonometric functions are unaltered by the substitutions $x = X + 2k\pi$. Similarly, a doubly periodic function (of a complex variable) is invariant with respect to $z = Z + k_1w_1 + k_2w_2$, where w_1, w_2 are the given periods and k_1, k_2 are arbitrary integers. The modular function is invariant with respect to the linear group $z = (\alpha Z + \beta)/(\gamma Z + \delta)$, where α, β, γ, δ are integers such that $\alpha\delta - \beta\gamma = 1$. The problem of finding all functions which admit an infinite discontinuous group of linear transformations is one of the most important in recent investigation. Such functions are termed *automorphic*. They have been classified by Poincaré into Fuchsian and Kleinian according as the defining group involves real or complex coefficients.

EDWARD KASNER,
Instructor in Mathematics, Columbia University.

Invasion, the entry into a country by a public enemy. As early as 1795 Congress provided by law for protection against the invasion of the United States by any foreign nation or Indian tribe. The act made it lawful whenever there should be an invasion, or imminent danger of one, for the President to call out such number of the militia of the State or States convenient to the place of invasion as he might think necessary to repel it. This, strengthened in some respects by amendments, has been in force ever since. An invasion has usually all the elements of war, and the invaders may be dealt with as persons at war with the country invaded, in accordance with usages of warfare without the declaration of war by Congress. The Supreme Court of the United States has decided that a State is invaded when there is a domestic rebellion within its territory, and that the same rules of law may be enforced as in the case of an invasion by external foes. This decision practically abolishes all distinction between invasion and insurrection, and the same rules which furnish a remedy for invasion can be applied in the suppression of an insurrection or local rebellion. In case the State militia is not sufficiently strong, or not easily available, the standing troops of the United States may be ordered out by the President, if indeed it be necessary to call upon the State troops before resorting to the regular troops of the United States. It is not necessary that actual armed violence shall be resorted to in order to constitute insurrection. Any combination of persons too powerful to be suppressed by the ordinary course of judicial proceedings is tantamount to insurrection, and warrants the use of the effective measures provided for by law for its suppression.

As regards the rights of the invader many rules have been laid down, carefully distinguishing between invasion and conquest, especially with respect to private and public property. It is now held that public money, military stores, and public buildings with their contents are lawful sources of plunder, and telegraph and railway property may be used as needs require. The unwarranted burning of the capitol and other public buildings in Washington by the British in 1814; the removal of the Palatine libraries during the Thirty Years' War; the confiscation of the astronomical instruments in the Observatory of Peking by the Germans during the operations of the Allies against the Chinese capital—all these were in direct violation of the accepted rules of invasion. The levying of supplies, labor, forage, transportation facilities, etc., upon the native people is strictly within the lawful confines of invasion; for example, during the wars of Frederick the Great, both the Austrians and the Prussians were mainly supported by these enforced contributions of supplies. Napoleon was probably the greatest exponent of the belief that a war should support itself, either during the conflict, or by imposing a large indemnity, or both; hence we see that he exacted of Prussia, after the battle of Jena, more than a hundred million francs, and Spain was also forced during the Peninsular War to pay a similar amount. The pillage of private property is strictly prohibited, but should the owners give aid to their country, the property may be sold at the discretion of the invading general.

Inventions. The progress of the world in its numerous vast industries and arts has been founded, to a very large extent, upon inventions and discoveries and their subsequent development. Under the American patent law and system, inventors all over the world are stimulated to make public their inventions by reason of receiving in exchange a monopoly in the form of a patent on the invention for a

period of 17 years. The remarkable increase in the number of protected inventions is shown by the records of the United States Patent Office, as follows: At the end of the first year (1790) 3 patents were issued. In the year ending 1902, 27,136 patents were granted. The total number of patents issued from April 1790 to November 1903 was 752,774.

An invention is recognized to be any new or useful mechanical contrivance or article, method, discovery, composition of matter, or system not previously known or used, or any improvement on any known machine, art, method, or system. Below is given in chronological order a list of important inventions beginning with the 16th century, with the title of the invention, the year it was made, the name of the inventor and his nativity:

Inventions	Date	Inventor	Nativity
Discoveries of Electrical Phenomena.. Won the title of "founder of the science of electricity."	1560 to 1603	William Gilbert	England
Screw printing-press.	1620	Blaew	Germany
Spirally grooved rifle barrel	1620	Koster	England
Iron furnaces	1621	Lord Dudley	England
The use of steam.... The first authentic reference in English literature to the use of steam in the arts.	1630	David Ramseye	England
Bay Psalm Book, first book published in the Colonies....	1640		Mass.
Barometer	1643	Torricelli	Italy
Steam engine, atmospheric pressure ...	1663	Thomas Newcomen	England
Machine for generating electricity.....	1681-6	Otto von Guericke	Germany
First paper mill in America	1690	William Rittenhouse	Penna.
First steam engine with a piston.....	1690	Denys Papin	France
The manufacture of plate glass established	1695		France
First to discover difference between electric conductors and insulators.....	1696 to 1736	Stephen Gray	England
The first practical application of the steam engine.....	1702	Thomas Savery	England
First newspaper in America "Boston News Letter".....	1704	John Campbell	Mass.
First to produce electric spark.....	1708 to 1716	Dr. J. Wall	England
Thermometer	1709	Fahrenheit	Danzig
Electrometer, the well known pith ball...	1718 to 1772	John Cantor	England
The "Franklin" printing-press	1725	Benjamin Franklin	Utd. States
Electrical glass plate machine	1727 to 1772	Martin de Planta	France
Stereotyping	1731	William Ged	Scotland
First to discover that electricity is of two kinds	1733-9	Cisternay du Fay	France
Flying shuttle in weaving	1733	John Kay	England
Rotary 3-color printing-press (Multi-Color)	1743	Platt & Keen	England
Electric or Leyden Jar	1745	Kleist	Germany
Substitution of coke for coal in melting iron	1750	Abraham Darby	England
Lightning conductor.	1752	Benjamin Franklin	Utd. States
Spinning jenny	1763	James Hargreaves	England
Piano forte, played in public in England in	1767		England
Drawing rolls in a spinning machine..	1769	Richard Arkwright	England
The introduction of the "Hollander" or beating engine for pulping rags in the manufacture of paper	1773		
The mule spinner...	1774	Samuel Crampton	England
Cut nails.....	1775	Jeremiah Wilkinson	Utd. States
Circular wood saw...	1777	Miller	England
Embryo bicycle.....	1779	Branchard & Magurier	France
Steam engine, the basis of the modern engine	1782	James Watt	Scotland
Gas balloon	1783	J. E. & J. M. Montgolfier	France
Puddling iron	1783-4	Henry Cort	England
Plow, with cast iron mold board, and wrought and cast iron sbares.....	1784	James Small	Scotland
Power loom.....	1785	James Cartwright	England
First steam-boat in the United States..	1786	John Fitch	Utd. States
Steam road wagon... (First automobile).	1787	Oliver Evans	Utd. States
Grain thrashing machine	1788	Andrew Meikle	England
Uranium discovered..	1789	Klaproth	Germany
Hobby-horse, forerunner of bicycle.....	1790		England
Rotary steam power printing-press, the first idea of.....	1790	Wm. Nicholson.	England
Wood planing machine	1791	Samuel Bentham	England
Gas first used as an illuminant	1792	Wm. Murdoch	England
Cotton gin.....	1794	Eli Whitney	Utd. States
Art of Lithography..	1796	Alois Senefelder	Germany
Machine for making continuous webs of paper.....	1800	Louis Robert	France
Steam coach	1801	Richard Trevithick	England
Wood Mortising Machine	1801	M. J. Brunel	England
Pattern loom	1801	M. J. Jacquard	France
First fire proof safe..	1801	Richard Scott	England
Steamboat on the Clyde, "Charlotte Dundas"	1802	William Symington	England
First photographic experiments	1802	Wedgewood & Davy	England
Planing machine.....	1802	J. Branch	England
The application of steam to the loom..	1803	William Horrocks	England
Steel pen.....	1803	Wise	England
Steam Locomotive on rails	1804	Richard Trevithick	England
Application of twin screw propellers in steam navigation..	1804	John Stevens	Utd. States
Process of making malleable iron castings	1804	Lucas	England
First life preserver..	1805	John Edwards	England
Electro-plating	1805	Luigi Brugnatelli	Italy
Knitting machine, the latch needle in the	1806	Jeandean	France
Steamboat navigation on the Hudson River	1807	Robert Fulton	Utd. States
Percussion or detonating compound..	1807	A. J. Forsyth	Scotland
First street gas lighting in England....	1807	F. A. Winsor	England
Band wood saw	1808	Newberry	England
Barium, strontium and calcium	1808	Sir Humphry Davy	England
Polarization of light from reflection....	1808	E. L. Malus	France

Inventions	Date	Inventor	Nativity
Voltaic arc	1808	Sir Humphry Davy	England
First steamboat to make a trip to sea, the "Phœnix"	1808	John Stevens	Utd. States
Homeopathy introduced	1810	S. C. F. Hahnemann	Germany
Revolving cylinder printing-press	1810	Frederick Koenig	Germany
Breech-loading shotgun	1811	Thornton & Hall	Utd. States
Storage battery	1812	J. B. Ritter	Germany
Dry Pile (prototype of dry battery)	1812	Zamboni	
First practical steam rotary printing press, paper printed on both sides	1814	Frederick Koenig	Germany
First locomotive in Scotland	1814	George Stephenson	England
First circular wood saw made in this country	1814	Benjamin Cummings	Utd. States
Heliography	1814	Jos. N. Niepce	France
Discovery of Cyanogen	1814	Gay Lussac	France
Kaleidoscope	1814	Sir David Brewster	England
Miner's safety lamp	1815	Sir Humphry Davy	England
Seidlitz powder	1815		
Dry gas meter	1815	S. Clegg	England
Morphine, first organic alkaloid known	1816	Sertürner	Germany
Knitting machine	1816	Brunel	England
"Draisine" bicycle	1816	Baron von Drais	Germany
"Columbian" press, elbowed pulling bar, number of impressions per hour, 50	1817	George Clymer	Utd. States
Stethoscope	1819	Laënnec	France
Electro-magnetism discovered	1819	H. C. Oersted	Germany
Lathe for turning irregular wood forms	1819	Thomas Blanchard	Utd. States
The theory of electro-dynamics first propounded	1820	Andre Ampère	France
Quinine	1820	Pelletier & Caventon	France
Electroscope	1820	Bohenberg	Germany
The conversion of the electric current into mechanical motion	1821	Michael Faraday	England
Galvanometer	1822	Schweigger	Germany
Multi-color printing	1822	P. Force	Utd. States
Calculating machine	1822	Charles Babbage	England
Silicon	1823	James Berzelius	Switzerl'd
Discovery of thermo-electricity	1823	Prof. Seebeck	England
Liquefaction and solidification of gas	1823	Michael Faraday	England
Water gas, production of	1823	Ibbetson	England
Portland cement	1825	Joseph Aspdin	England
First passenger railway, opened between Stockton and Darlington, England	1825		
Electrical spur wheel	1826	Barlow	England
Bromine	1826	M. Balard	France
First railroad in United States, near Quincy, Mass.	1826		
The law of galvanic circuits formulated	1827	George S. Ohm	Germany
Friction matches	1827	John Walker	Utd. States
The reduction of aluminium	1827	Friedrich Wohler	Germany
Law of electrical resistance	1827	George S. Ohm	Germany
Improved rotary printing-press London Times, 5,000 impressions per hour	1827	Cowper & Applegarth	England
Hot air blast for iron furnaces	1828	J. B. Neilson	Scotland
Wood planing machine	1828	William Woodworth	Utd. States
Tubular locomotive boiler	1828	Séquin	France
Prism for polarized light	1828	Nicol	England
Spinning ring frame	1828	John Thorp	England
The "Washington" printing press, lever motion and knuckle joint for a screw, number of impressions per hour, 200	1829	Samuel Rust	Utd. States
First steam locomotive in United States, "Stourbridge Lion"	1829		
Double fluid galvanic battery	1829	A. C. Becquerel	France
Magnesium	1829	Adam Bussey	France
First portable steam fire engine	1830	Brathwaite & Ericsson	England
Magneto-electric induction	1831	Michael Faraday	England
Chloroform	1831	G. J. Guthrie	Scotland
First conception of electric telegraph	1832	Prof. S. F. B. Morse	Utd. States
First Magneto-electric machines	1832	Saxton	Utd. States
Rotary electric motor	1832	Wm. Sturgeon	England
Chloral-hydrate	1832	Justus von Liebig	Germany
Locomotive, "Old Ironsides" built	1832	M. W. Baldwin	Utd. States
Link-motion for locomotives	1832	Sir Henry James	England
Adoption of steam whistle for locomotives	1833	George Stephenson	England
Reciprocating saw-tooth cutter within double guard fingers for reapers	1833	Obed Hussey	Utd. States
"McCormick" reaper	1834	Cyrus H. McCormick	Utd. States
Rotary electric motor	1834	M. H. Jacobi	Russia
Carbolic acid discovered	1834	Runge	Germany
Horse shoe machine	1835	H. Burden	Utd. States
Constant electric battery	1836	J. P. Daniell	England
Acetylene gas discovered	1836	Edmund Davy	England
The revolver; a device "for combining a number of long barrels so as to rotate upon a spindle by the act of cocking the hammer."	1836	Samuel Colt	Utd. States
The screw applied to steam navigation	1836 / 1841	John Ericsson	Utd. States
The galvanizing of iron	1837	Henry Cranfurd	England
Indicator-telegraph	1837	Cooke & Wheatstone	England
Photographic carbon printing	1838	Mungo Ponton	France
Babbitt metal	1839	Isaac Babbit	Utd. States
Vulcanization of rubber	1839	Charles Goodyear	Utd. States
The first boat electrically propelled	1839	Jacobi	Germany
Daguerreotype	1839	Louis Daguerre	France
First to produce a direct photographic positive in the camera by means of highly polished silver surfaced plate exposed to the vapors of iodine and subsequent development with mercury vapor.			
Making photo-prints from paper negatives (First production of positive proofs from negatives).	1839	Fox Talbot	England

INVENTIONS

Inventions	Date	Inventor	Nativity
Photographic portraits. (Daguerreotype Process)	1839	Profs. Draper & Morse	Utd. States
Pneumatic Caissons	1841	M. Triger	France
Pianoforte automatically played	1842	M. Seytre	France
Steam hammer	1842	James Nasmyth	Scotland
Typewriting machine	1843	Charles Thurher	Utd. States
First telegram sent	1844	Prof. S. F. B. Morse	Utd. States
The use of nitrous oxide gas as an anæsthetic	1844	Dr. Horace Wells	Utd. States
The electric arc light (gas retort carbon in a vacuum)	1844	Léon Foucault	France
Automatic adjustment of electric arc light carbons	1845	Thomas Wright	England
Double cylinder printing-press	1845	R. Hoe & Co.	Utd. States
Pneumatic tire	1845	R. W. Thompson	England
Sewing machine	1846	Elias Howe	Utd. States
Suez canal started	1846	De Lesseps	France
Ether as an anæsthetic	1846	Dr. Morton	Utd. States
Artificial limbs	1846		
Gun cotton	1846	Schönbein	Germany
First pianoforte key board player	1846	Debain	France
Chloroform in surgery	1847	Dr. Simpson	Scotland
Nitro-glycerine	1847	Sobrero	
Time-lock	1847	Savage	Utd. States
Hoe's lightning press capable of printing 20,000 impressions per hour	1847	Richard M. Hoe	Utd. States
Match-making machinery	1848	A. L. Dennison	Utd. States
Breech gun-lock, interrupted thread	1849	Chambers	Utd. States
Magazine gun	1849	Walter Hunt	Utd. States
Steam pressure gauge	1849	Bourdon	France
Lenticular stereoscope	1849	Sir David Brewster	England
Latch needle for knitting machine	1849	J. T. Hibbert	Utd. States
"Corliss" Engine	1849	G. H. Corliss	Utd. States
Printing-press, curved plates secured to a rotating cylinder	1849	Jacob Worms	France
Mercerized cotton	1850	John Mercer	England
Collodion process in photography	1850	Scott Archer	England
American machine-made watches	1850		Utd. States
Electric locomotive	1851	Dr. Page	Utd. States
Self-raker for harvesters	1851	W. H. Seymour	Utd. States
Breech loading rifle	1851	Maynard	Utd. States
Icemaking machine	1851	J. Gorrie	Utd. States
The Rhumkorff coil	1851	Rhumkorff	Germany
Fire-alarm telegraph	1852	Channing & Farmer	Utd. States
Reticulated screen for half-tone photographic printing	1852	Fox Talbot	England
Soda process of making pulp from wood	1853	Watt & Burgess	Utd. States
Laws of magneto-electric induction	1853	Michael Faraday	England
Laws of electrostatics	1853	Michael Faraday	England
Electrolysis	1853	Michael Faraday	England
Duplex telegraph	1853	Gintl	Austria
Photographic roll films	1854	Melhuish	England
Diamond rock drill	1854	Herman	Utd. States
Four motion feed for sewing machines	1854	A. B. Wilson	Utd. States
Magazine firearm	1854	Smith & Wesson	Utd. States
Fat decomposed by water or steam at high temperature, since largely used in soap making	1854	R. A. Tilghman	Utd. States
Safety matches	1855	Lundstrom	Sweden
Iron-clad floating batteries first used in Crimean war	1855		
Cocaine	1855	Gaedeke	Germany
Process of making steel, blowing air through molten pig-iron	1855	Sir Henry Bessemer	England
Dryplate photography	1855	Dr. J. M. Taupenot	
Bicycle	1855	Ernst Michaux	France
Sleeping car	1856	Woodruff	Utd. States
Aniline dyes	1856	Perkins	England
Printing machine for the Blind (contains elements of the present typewriting machine	1856	Alfred E. Beach	Utd. States
Regenerative furnace	1856	Wm. Siemens	England
Refining engine in paper pulp making	1856	T. Kingsland	Utd. States
Coal-oil first sold in the United States	1857	Messrs. Stout & Hand	Utd. States
First sea going iron-clad war vessel, the "Gloire"	1857		France
Ground wood pulp	1858	Henry Voelter	Germany
Inclined elevator and platform in the reaper	1858	J. S. Marsh	Utd. States
Cable car	1858	E. A. Gardner	Utd. States
Breech loading ordnance	1858	Wright & Gould	Utd. States
Feed injector for Boilers	1858	Giffard	France
Storage or secondary battery	1860	Gaston Planté	France
Singing telephone	1860	Philip Reis	Germany
Ammonia absorption ice machine	1860	F. P. E. Carré	France
Improved stereotyping process	1861	Charles Craske	Utd. States
Shoe sewing machine	1861	George McKay	Utd. States
Driven well, a tube with a pointed perforated end driven into the ground	1861	Col. N. W. Green	Utd. States
Passenger elevator	1861	E. G. Otis	Utd. States
Barbed wire fence introduced	1861		Utd. States
Calcium carbide produced	1862	Frederich Woehler	Germany
Revolving turret for floating battery	1862	Theodore Timby	Utd. States
First iron-clad steam battery, "Monitor"	1862	John Ericsson	Utd. States
Gatling gun	1862	Dr. R. J. Gatling	Utd. States
Smokeless gunpowder	1862	J. F. E. Schultze	Prussia
Pneumatic pianoforte player (regarded as first to strike keys by pneumatic pockets)	1863	M. Fourneaux	France
Explosive gelatine	1864	A. Nobel	France
Rubber dental plate	1864	J. A. Cummings	Utd. States
Automatic grain binding device	1864	Jacob Behel	Utd. States
Process of making fine steel	1865	Martin	Utd. States
Antiseptic surgery	1865	Sir Joseph Lister	England
Web-feeding printing press	1865	William Bullock	Utd. States
Automatic shell ejector for revolver	1865	W. C. Dodge	Utd. States
The Atlantic cable laid	1866	Cyrus W. Field	Utd. States
Open-hearth steel process	1866	Siemens-Martin	England
Compressed air rock drill	1866	C. Burleigh	Utd. States
Torpedo	1866	Whitehead	Utd. States
Dynamo electric machine	1866	Wilde	England
Sulphite process for making paper pulp from wood	1867	Tilghman	Utd. States
Disappearing gun carriage	1868	Moncrief	England
First practical typewriting machine	1868	C. L. Sboles	Utd. States
Dynamite	1868	A. Nobel	France
Oleomargarine	1868	H. Mege	France

INVENTIONS

Inventions	Date	Inventor	Nativity
Water heater for steam fire engine..	1868	W. A. Brickell	Utd. States
Sulky plow.....	1868	B. Slusser	Utd. States
Railway air brake....	1869	George Westinghouse	Utd. States
Tunnel shield (operated by hydraulic power)	1869	Alfred E. Beach	Utd. States
A curved spring tooth harrow	1869	David L. Garver	Utd. States
Dynamo-electric machine	1870	Gramme	France
Celluloid	1870	J. W. & Isaac Hyatt	Utd. States
Rebounding gun-lock	1870	L. Hailer	Utd. States
The Goodyear welt shoe-sewing machine	1871	Goodyear	Utd. States
Photographic gelatino bromide emulsion (Basis of present rapid photography).	1871	R. L. Maddox	England
Continuous Web printing-press	1871	Hoe & Tucker	Utd. States
Grain binder	1871	S. D. Locke	Utd. States
Compressed air rock drill	1871	S. Ingersoll	Utd. States
Positive motion weaving loom	1872	J. Lyall	Utd. States
Theory that light is an electric phenomenon	1872	Clerk Maxwell	England
Automatic air brake	1872	George Westinghouse	Utd. States
Automatic car coupler	1873	E. H. Janney	Utd. States
The photographic platinotype process Prints by this process are permanent.	1873	Willis	England
Quadruplex telegraph	1873	T. A. Edison	Utd. States
Twine binder for harvesters	1873	M. L. Gorham	Utd. States
Gelatino bromide photographic emulsion (Sensitiveness to light greatly increased by the application of heat)..	1873	Charles Bennett	England
Self-binding reaper..	1873	Locke & Wood	Utd. States
Barbed wire machine	1874	Glidden & Vaughan	Utd. States
Siphon recorder for submarine telegraphs	1874	Sir William Thompson	England
Store cash carrier...	1875	D. Brown	Utd. States
Illuminating water gas	1875	T. S. C. Lowe	Utd. States
Roller flour mills....	1875	F. Wegmann	Utd. States
Middlings purifier for flour	1875	Geo. T. Smith	Utd. States
Ice making machine	1875	R. P. Pictet	Switzerl'd
Speaking telephone..	1876	Graham Bell	Utd. States
Electric candle ..... (The first step towards the division of the electric current for lighting.)	1876	Paul Jablochkoff	Russia
Continuous machine for making tobacco cigarettes	1876	Russell	Utd. States
Steam feed saw mills	1876	D. C. Prescott	Utd. States
The first Portland cement plant in U. S.....	1876		Coplay, Pa.
Phonograph	1877	T. A. Edison	Utd. States
Gas engine.....	1877	N. A. Otto	Utd. States
Carbon microphone..	1877	T. A. Edison	Utd. States
Telephone transmitter of variable resistance	1877	Emil Berliner	Utd. States
Carbon filament for Electric lamp..... (Beginning of the incandescent vacuum electric light.)	1878	T. A. Edison	Utd. States
Rotary disk cultivator	1878	Mallon	Utd. States
Decided advance in the "Expression" of self-playing pianofortes.....	1878	Gally	Utd. States
Automatic grain binder	1879	J. F. Appleby	Utd. States
Kathode rays discovered	1879	Sir Wm. Crookes	England
Steam plow.....	1879	W. Foy	Utd. States
Magazine rifle	1879	Lee	Utd. States
"Blake" telephone transmitter	1880	Blake	Utd. States
Hammerless gun.....	1880	Greener	Utd. States
Storage battery or accumulator	1880	Camille A. Faure	France
Typhoid bacillus isolated	1880	Eberth & Koch	Germany
Pneumonia bacillus isolated	1880	Sternberg	Utd. States
Button hole machine	1881	Reece	Utd. States
Improvement in "Expression" of self-playing pianofortes	1882	Schmaele	Utd. States
Hand photographic camera for plates..	1881	Wm. Schmid	Utd. States
Tuberculosis bacillus isolated	1882	Robert Koch	Germany
Hydrophobia bacillus isolated	1882	Louis Pasteur	France
Cholera bacillus isolated	1884	Robert Koch	Germany
Diphtheria bacillus isolated	1884	Loeffler	Germany
Lockjaw bacillus isolated	1884	Nicolaier	France
Antipyrene	1884	Kuno	Utd. States
Linotype machine ...	1884	Othmar Mergenthaler	Utd. States
The rear-driven chain safety bicycle.....	1884	George W. Marble	Utd. States
Chrome tanning of leather	1884	Schultz	Utd. States
Process of reducing aluminium	1885	Cowles	England
Gas burner	1885	Carl Welsbach	Germany
Hydraulic dredge ...	1885	Bowers	Utd. States
First electric railway in United States, Hampden and Baltimore, Md.....	1885		
Contact device for overhead electric trolley	1885	C. J. Van Depoele	Utd. States
Graphophone	1886	Bell & Tainter	Utd. States
Electric welding	1886	Elihu Thompson	Utd. States
Combined harvester and thresher	1886	Matteson	Utd. States
Band wood saw.....	1887	D. C. Prescott	Utd. States
Cyanide process of obtaining gold and silver	1887	McArthur & Forrest	Utd. States
System of polyphase electric currents ..	1887	Nicola Tesla	Utd. States
Incandescent gas light ..... The formation of a cone-shaped interwoven mantle of thread coated with a refractory rare earth and rendering the same incandescent by the heat rays of a Bunsen gas burner regardless of how the gas is produced	1887	Carl A. Von Welsbach	Austria
Process of annealing armor plate	1888	Harvey	Utd. States
"Kodak" snap-shot camera ..... Constructed to use a continuous sensitized ribbon film.	1888	Eastman & Walker	Utd. States
Process of making artificial silk	1888	H. DeChardonnet	France
Hertzian waves or electric wave radiation	1888	Heinrich Hertz	Germany

Inventions	Date	Inventor	Nativity
First rotary cement kilns in U. S.	1889		Coplay, Pa
Nickel steel	1889	Schneider	Utd. States
Process of making aluminium	1889	Chas. M. Hall	Utd. States
Electric plow	1890	W. Stephens	Utd. States
Improved linotype machine	1890	Othmar Mergenthaler	Utd. States
Bicycles equipped with pneumatic tires	1890		
Krag-Jorgensen magazine rifle	1890	Krag-Jorgensen	Utd. States
"Coherer" for receiving electric waves	1891	Edouard Branly	England
Rotary steam turbine	1891	C. A. Parsons	England
Cement lined paper pulp digester	1891	G. F. Russell	Utd. States
Round bale cotton press	1891	Brown	Utd. States
Microphone	1891	Emile Berliner	Utd. States
Power loom	1891	Northrup	Utd. States
Commercial application of Formic-aldehyde	1892	J. J. A. Trillat	France
Shoe-last lathe, for different lengths	1893	Kimball	Utd. States
Kinetoscope	1893	T. A. Edison	Utd. States
Process for making carborundum	1893	E. G. Acheson	Utd. States
Calcium carbide produced in electric furnace	1893	Thos. L. Willson	Utd. States
Argon, a chemical element	1894	Lord Rayleigh & Sir Wm. Ramsay	England
Process for liquefying air	1895	Carl Linde	Germany
Electric locomotive, B. & O. Belt Tunnel	1895		Utd. States
X-Rays	1895	Prof. W. C. Roentgen	Germany
Acetylene gas from calcium carbide	1895	Thomas L. Willson	Utd. States
System of wireless telegraphy	1896	G. Marconi	Italy
Foundation laid of science of radio-activity, i. e., emanation of penetrating rays from luminescent bodies	1896	Henri Becquerel	France
Use of ultra-violet rays in treating diseases	1896	Niels R. Finsen	Denmark
Nernst electric light	1897	Walter Nernst	Germany
Method of rendering a clay compound capable of conducting electricity and thence becoming brilliantly incandescent without a vacuum.			
Radium discovered	1898	Madame S. Curie	France
Mercury vapor electric light	1900	Peter Cooper Hewitt	Utd. States
An artificial light composed strictly of the ultra blue violet rays of the spectrum obtained by passing an electric current through a partial vacuum tube filled with mercury vapor, the latter acting as a conductor. Possesses remarkable actinic power for photographic purposes.			
Air-ship	1901	M. Santos-Dumont	France
Automobile mower	1901	Deering Harvester Co.	Utd. States
The first passenger steam turbine ship, "Edward VII."	1901	Denny & Brothers	England
The first oil burning steamship built in the United States, "Nevada"	1902		
English Pacific cable, Canada-Australia	1902		
American Pacific cable	1903		Utd. States

It is interesting to note that between the years 1872 and 1900 there were on what may be termed the honor roll of inventors 39 inventors each of whom had received over 100 patents. A few of the most important were:

Thomas A. Edison	742
Francis H. Richards	619
Elihu Thompson	444
Charles E. Scribner	374
Luther C. Crowell	293
Edward Weston	280
Rudolph M. Hunter	276
Charles J. Van Depoele (deceased)	245
George Westinghouse	239
Rudolph Eickemeyer (deceased)	171
Hiram S. Maxim	146
Philip Diehl	137
Hosea W. Libbey	127
Louis K. Johnson	114
Talbot C. Dexter	109
James H. Northrup	102

In the preparation of the foregoing statistics, credit is given to L. H. Campbell, of the United States Patent Office, for valuable assistance.

Frederick C. Beach, Ph.B.
Editor 'The Scientific American.'

In'ventory, a written list or schedule of goods, chattels and other personal property of an individual or estate, whether for use in legal proceedings, or for commercial purposes. The term is also employed to designate lists of assets prepared in cases of insolvency and bankruptcy, and lists of property made out by guardians of estates or infants. These inventory lists are usually filed with the court for public examination. After an administrator or other officer of the court files his inventory he becomes personally accountable for the property or goods so listed. See also Executor.

Inver'sion, a change of order whereby the first becomes last and the last first. (1) In rhetoric, a reversal of the natural order of words for the sake of euphony, emphasis, or the like; also the turning of one's own argument against him by an opponent in discussion. (2) In chemistry, a change in molecular structure which is usually induced by fermentation or by heating with a dilute acid, as in the case of starch, sugar, etc. Thus starch and dextrine are changed into glucose, cane-sugar into invert sugar, and maltose into glucose. (3) In geology, the overturning or folding over of strata by igneous agency, so that the order of their succession seems reversed. (4) In mathmatics, the operation of changing the order of the terms, so that the antecedent shall take the place of the consequent and the reverse, in both couplets. Thus, from the proportion $a : b :: c : d$, we have, by inversion, $b : a :: d : c$. (5) In music, the transposition of certain phrases having a common root. (*a*) The change of a chord by making one of the inner note act as a bass note, by which means as many inversions can be made as there are actual notes in the chord, not counting the root, the

harmony in such inversions remaining the same, though the order of component parts is changed; (*b*) alteration of intervals by making that which was the upper note the lower, and the reverse, the inversion of an interval within the octave being readily found in the difference between the figure 9 and the interval known; (*c*) the alteration of a subject produced by inverting the intervals of which it consists.

In'vertase, or **In'vertin,** an enzyme occurring in many fungi, notably in certain yeasts (for example, the saccharomyces), and also in the seed-plants. It transforms cane-sugar into a mixture of dextrose and levulose; this mixture being called "invert-sugar" because it turns the plane of polarized light to the left, while the cane-sugar from which it is obtained turns it to the right. According to some writers, a yeast cannot invert cane-sugar except by secreting invertase; but *Monilia candida* effects the inversion, and yet produces no invertase. In this case the action is probably due to some other enzyme, hitherto unidentified. Invertase probably plays a very important part in vegetable chemistry. Like other enzymes, it can apparently perform an unlimited amount of chemical work, without sensible diminution of its own substance. (See FERMENTATION.) Invertase is most active at a temperature of from 120° to 140° F., and in a slightly acid medium. It has been isolated in the form of a powder.

Inver'tebrates, a collective term for the lower divisions or phyla of the animal series, which agree in not having a vertebral column or back-bone, used in contradistinction to the highest group of the animal kingdom, to which the name *Vertebrata* or vertebrate animals is given. In the system of Cuvier the *Invertebrata* were divided into the *Radiata, Articulata,* and *Mollusca.* Further study revealed that these names did not distinguish natural groups; and the term *Invertebrata* has no longer any definite significance in classification (q.v.).

Inves'titure, in the feudal law, was the open delivery of a feud by a lord to his vassal, thus, by external proof, affording evidence of property. To use the words of Blackstone, "Investitures, in their original rise, were probably intended to demonstrate, in conquered countries, the actual possession of the lord, and that he did not grant a bare litigious right, but a peaceable and firm possession. At a time when writing was seldom practised, a mere oral gift, at a distance from the spot that was given, was not likely to be long or accurately retained in the memory of by-standers, who were very little interested in the grant." For this reason investiture was performed by the presentation of some symbol to the person invested, as a branch of a tree, etc. In the primitive church, after the election of a bishop, and his consecration, the early Christian emperors claimed a right of confirmation. Charlemagne is said to have introduced this practice, and to have invested the newly consecrated bishop by placing a ring and crozier in his hands. Gratian, indeed (Distinct. 63, cap. Adrianus), directly affirms that Pope Adrian positively conceded to the emperor the power of electing, even to the papacy, in 774; but neither Eginhard nor any other contemporary writer mentions this fact.

The custom, however, existed, nor does it appear to have been objected to or opposed during the lapse of two centuries from his reign. The disorderly state of Italy, which succeeded the death of Charlemagne, frequently interrupted the exercise of this right by the Carlovingians; but even so late as 1047, when the empire had passed to another line, Henry III. received an explicit admission of his prerogative, and repeatedly used it. The investiture in the lesser sees followed as a matter of course. Alexander II. issued a decree against lay investiture in general, which was revived by Gregory VII. (Hildebrand), who, having succeeded in annulling the prerogative of the emperors to nominate or confirm popes, sought to disjoin entirely the ecclesiastical from the civil rule. It was not, however, until the papacy of Calixtus II., in 1122, that the question was terminated, as it appears, materially to the advantage of the holy see. In France, even under the papacy of Hildebrand, the right of investiture does not appear to have been made a subject of open quarrel. In spite of the protests of the holy see, the kings exercised the power, but at length relinquished the presentation of the ring and crozier, and contented themselves with conferring investiture by a written instrument, or orally, upon which they were left in peaceable possession of the power. But in England Paschal II. was engaged in a contest little less fierce than that which he maintained with the emperor. Anselm, the primate, refused to do homage to Henry I. for his see. The king seems to have asserted an unqualified right of vestiture, which the pope, who was appealed to, as unqualifiedly denied. After a protracted struggle, and continued threats of excommunication, the controversy ended in England, as it did afterward in Germany, by compromise. Paschal offered to concede the objections against homage provided Henry would forego the ceremony of investiture. To this he agreed (1107).

Invin'cibles, an Irish secret society of 1882, an off-shoot of the Fenians. One of the objects of the Invincibles was to "remove" or assassinate government officers or others who might incur the displeasures of the association or its leaders. On 6 May 1882 the society succeeded in "removing" Lord Frederick Cavendish, who had just arrived from England as secretary for Ireland, and Thomas A. Burke, the under-secretary, in the Phœnix Park at Dublin. The plot was directed against the latter gentleman, and the former, interfering to protect his friend, shared his fate. On 20 Feb. 1883 20 persons charged with complicity in the Phœnix Park murders were put on trial; on 14 July, Joseph Brady, who had been convicted of actual perpetration of the murder of Mr. Burke, was executed, as were others subsequently. The leading witness, who revealed all the secrets of his fellow conspirators, was James Carey of Dublin. He was shot dead near Natal, on 29 July, by an Irishman, O'Donnell, who was subsequently tried, and executed for his crime.

Invocation of Saints. See SAINTS.

In'voice, a list or bill of goods; a detailed statement of merchandise in stock, or to be shipped. Very frequently an invoice accompanies a shipment of goods along with the bill of lading from the consignor to the consignee,

An invoice is a memorandum and is not a document of title nor a contract of sale, and has no value in law other than memoranda.

Io, ī'ō, in Greek mythology, a daughter of Inachus; according to others of Iasus or Peiren. Zeus (Jupiter) fell in love with her. Hera (Juno) perceived the infidelity of her husband, and resolved to be revenged on both. Zeus, to protect Io from the jealousy of Hera, changed her into a beautiful white heifer. Hera was not deceived, and set a gad-fly to torment her, and persecuted her without a moment's rest through the world. The wanderings of Io in this condition were a favorite subject with the poets of ancient Greece. Also, in astronomy (1) the first satellite of Jupiter, discovered by Galileo in 1610. (2) The name of the 85th asteroid, discovered by Peters at Clinton, N. Y., 19 Sept. 1865.

Iodine, ī'ō-dīn or -dīn, a non-metallic element, analogous in its general properties to chlorine and bromine. It was discovered by Courtois in 1811, in the mother-liquor of kelp that had been used for the production of sodium carbonate; occurring there in combination with sodium and magnesium. It is still obtained from the ashes of certain seaweeds, but the principal supply is now obtained from "caliche," a crude nitrate of sodium that occurs in immense quantities in northern Chile. In the preparation of the commercially pure nitrate of soda from caliche, the mother liquors, after the removal of the nitrate by crystallization, are found to contain large quantities of iodine, chiefly in the form of iodate of sodium, $NaIO_3$; and it is from this substance that the iodine of commerce is now chiefly prepared. The richest caliche contains about 3.5 pounds of iodine per ton.

In its ordinary form, iodine is a solid substance, melting at 237° F., and boiling at about 380° F. In a vacuum, iodine sublimes without melting. Solid iodine is soft, and dark gray in color, with a metallic lustre. The vapor is violet in color, from which circumstance the element takes its name (Greek, "like a violet"). Chemically, iodine has the symbol I, and an atomic weight of 126.85 for O = 16, or 125.9 for H = 1. Solid iodine has a specific gravity of about 4.95 at ordinary temperatures, and a specific heat of about 0.05412. Its volume increases, on account of thermal expansion, by about 0.00013 of its own value for a rise of temperature of 1° F. At temperatures not far above its boiling point, the vapor of iodine has a specific heat (at constant pressure) of 0.03369; and in this same region of temperature the ratio of its specific heat at constant pressure to the specific heat at constant volume is about 1.294. Iodine shows an important change in its vapor density at high temperatures. Thus, below about 1,200° F. the vapor has a density about 126 times as great as that of hydrogen under the same conditions of temperature and pressure; but as the temperature rises the density of the vapor, relatively to hydrogen, falls off, until it is only about 68 at 2,700° F. It is believed that this change in density indicates that the molecules of iodine vapor split in two as the temperature rises; a molecule, just above the boiling point, containing two atoms, while at the higher temperature the molecules are monatomic. Iodine is freely soluble in alcohol, ether, carbon disulphid, chloroform, and glycerin. It is only slightly soluble in pure water, but dissolves readily in aqueous solutions of the iodides. It is also soluble in benzine, acetic acid, and numerous other organic fluids. Iodine is a non-conductor of electricity.

With hydrogen, iodine forms the important compound HI, known as hydriodic acid. (See Hydriodic Acid.) With the metals it forms binary compounds called "iodides," which may also be regarded as salts of hydriodic acid. Of these the most important is potassium iodide, KI, which is largely used in medicine. It is prepared by dissolving iodine in a solution of caustic potash, evaporating to dryness, and igniting. This salt is very soluble, and crystallizes in cubes. The iodides of ammonium, sodium, strontium, and zinc are also used to a more limited extent. Iodoform, a yellow crystalline powder with a peculiar characteristic odor when warmed, is also much used as a dressing in surgery. It has the formula CHI_3, and is analogous in its chemical structure and deportment to chloroform. Iodoform may be prepared by dissolving iodine in an alcoholic solution of caustic potash, the iodoform that is produced separating out as a precipitate. It is also prepared in Germany, to a certain extent, by the electrolysis of a similar solution. (See Löb, 'Electrolysis and Electrosynthesis of Organic Compounds.') Iodine and its compounds are used to some extent in photography, and to a larger extent in synthetic chemistry, for the preparation of the coal-tar colors (q.v.), and other organic substances.

Iodine forms two important oxy-acids, known respectively as iodic acid, HIO_3, and periodic acid, $HIO_4 + 2H_2O$. These are analogous, in their chemical deportment, to chloric and perchloric acids.

Free iodine combines with starch to form a remarkable deep blue compound, whose production is a well-known test for the presence, in a given substance, of either starch or free iodine. To detect the presence of iodine in a solution, a few drops of thin, clear starch paste are added to the solution to be tested (which should be cold), and hydrochloric acid is added until the reaction is acid. A couple of drops of a concentrated solution of potassium nitrite are then added, when the dark blue color of iodide of starch will instantly be produced, if iodine is present. This test may readily be modified so as to serve for the detection of starch. The reaction is not given by dextrin, nor by other isomers of starch.

Iodine and Iodides in Medicine. Iodine and the iodides have been used in medicine since the Chinese are supposed to have introduced them, 2000 B.C. or earlier. The exact method of action of the iodides is not clear, but it would seem that iodine, being a normal constituent of the human body, is a very essential element in normal metabolism. It is found in comparatively large quantities in the thyroid gland, which is known to exercise a very important action in the general body-metabolism, and it is probably by means of the stimulation of the general metabolism of the body that the iodides manifest their beneficial action. The iodides are freely absorbed from watery solutions by mucous membranes throughout the body, particularly in the stomach and intes-

tine. They are taken up into the blood, pass through the tissues, stimulating the lymph-flow, and are excreted in the urine in the form of salts. Iodine itself possesses a local irritant action. It is soon converted into the iodides when taken internally, and causes similar internal changes.

When the iodides are taken in large doses, or even in small doses for a long time, a form of chronic poisoning known as iodism results. In this the chief symptoms, found in the air-passages, consist of a catarrh, especially of the nose, with profuse watery secretion, sneezing, and sometimes bronchitis. There is usually swelling and irritation of the throat and tonsils, and salivation. Nausea and gastric discomforts are common, and skin-eruptions are frequent. There is usually loss of weight, and if the iodide has been taken for a very long period a condition of cachexia, characterized by a great loss of flesh, weakness, depression, and restlessness, may result. The chief use of the iodides in medicine is in the treatment of syphilis, on which it has a specific effect. It is also very useful in the various joint-pains of a chronic character, usually known as chronic rheumatism. Iodine is valuable in the treatment of those diseases known to result from thyroid insufficiency, notably in myxœdema (q.v.), and in cretinism, its allied form in children. For stimulation of the respiratory and nasal passages, as in chronic bronchitis, asthma, and dry nasal catarrh, the iodides are of great value.

Io'la, ī-ō'la, Kan.— The city of Iola, Allen County, Kan., is located on the left bank of the Neosho River, about 40 miles west of the Missouri line, and about 100 miles south of Kansas City. The town is reached by the Atchison, Topeka & Santa Fé, the Missouri, Kansas & Texas, and the Missouri Pacific railroads.

History.— It was laid out by the Iola Town Company in 1859. A post-office was located there the same year and a small village soon grew up. During the war the town made but little progress. In 1865 it became the county-seat of the county, and grew steadily, although very slowly until 1895, when its population was 1,565. In 1896 natural gas was discovered on the town site, and as soon as it was shown that a large gas field existed in and near the town it began to grow rapidly, the population in 1904 exceeding 11,000. This rapid growth followed the location in and near Iola of nine large zinc smelters, a number of brick factories, two Portland cement plants and other manufacturing enterprises attracted to the place by the cheap fuel which the large field of natural gas supplied.

Churches, etc.— The leading church denominations are the Presbyterian, Methodist Episcopal, Christian, Baptist, Episcopal, Reformed, and Catholic. The city is well supplied with schools, its high school being one of the best in the State. There are two daily papers, the 'Record' and the 'Register.'

Business, Population, etc.— The city is surrounded by a well-settled and prosperous agricultural community, but its chief business is derived from the manufacturing industries already named. The population is almost wholly American, the exceptions being a few Poles and Swedes employed in the manufacturing plants. An electric road connects Iola with a number of suburban towns, aggregating a population of about (1904) 5,000

CHARLES F. SCOTT.

Io'na, or **Icolmkill**, an island on the west coast of Scotland, one of the Inner Hebrides, in the county of Argyle. Iona is about 3 miles long by 1½ miles broad; area, 2,000 acres, of which 600 acres are under cultivation, the remainder being hill pasture, morass, and rock. The island derives its interest and celebrity wholly from its history and its ancient ruins, and especially from its connection with Saint Columba, who took up his residence here after the middle of the 6th century (565). The existing ruins are all, however, of a much more recent date. Forty-eight kings of Scotland, four kings of Ireland and eight kings of Norway are said to have been buried on Iona Island, among them being King Duncan, made famous by Shakespeare. About 1900 the Duke of Argyle conveyed the entire island to the Church of Scotland under certain conditions of preservation and restoration.

Ionia, ī-ō'nĭ-a, that part of the seaboard of Asia Minor which was inhabited by Ionian Greeks, a beautiful and fertile country opposite the islands of Samos and Chios, which also belonged to it. According to tradition, the Greek colonists came over from Attica about 1050 B.C., and founded 12 towns, which, though mutually independent, formed a confederacy for common purposes. These included Phocæa, Ephesus, Miletus, etc., and latterly Smyrna. Commerce, navigation, and agriculture early rendered them wealthy and flourishing, but the country was made tributary by Crœsus, king of Lydia, and later by Cyrus, king of Persia (557 B.C.). With an interval of independence they remained under Persia until this empire was overthrown by Alexander the Great, 334–1 B.C., when they became a part of the Macedonian empire. Ionia, at a later period, became part of the Roman province of Asia. It was afterward totally devastated by the Saracens, so that few vestiges of its ancient civilization remain.

Ionia, Mich., city and county-seat of Ionia County; on the Grand River, and the Detroit, G. H. & M., the Pere M., and the Grand T. R.R.'s; 34 miles east of Grand Rapids. It contains the State house of corection, the State asylum for the dangerous and criminal insane, large railroad repair shops, and manufactories of pottery, furniture, machinery, edged tools, and clothing. The industrial interests are greatly promoted by excellent power furnished by the river. The city has a public high school, library, several daily and weekly periodicals, and an assessed property valuation of about $2,500,000. Under the revised charter of 1897, the government is administered by a mayor and city council elected annually. Ionia was settled in 1833 and incorporated in 1873. Pop. (1890) 4,482; (1900) 5,209.

Io'nian Islands, a number of islands belonging to the kingdom of Greece, in the Ionian Sea, off the coast of Albania and the western and southern shores of Greece, the most southern, Cerigo, and its dependent islets being off the southeastern extremity of the Morea. The principal islands, seven in number, are, reckoning from north to south, Kerkyra (Corfu), Paxos, Levkas (Santa Maura), Ithaki (Ithaca), Kephallenia (Cephalonia), Zakynthos (Zante), and Kythira (Cerigo). To each of these larger islands a number of smaller, scattered along their respective coasts, are attached, and in-

cluded in their several local jurisdictions. Area of the whole, 1,097 square miles. Pop. about 300,000. All these islands belong to the great calcareous formation of Greece. They are extremely mountainous, and do not contain enough arable land to produce the corn required by the population; and were it not for the vine, olive, and currant, all of which they produce, they could support but a small number of inhabitants. The climate is even more temperate than that of the neighboring mainland. Snow often falls in the winter, and lies on the mountains, but rarely on the plains. The staple exports are oil, currants, valonia, wine, soap, and salt. The few manufactures are chiefly textile and ornamental. The religion is that of the Eastern Greek Church, to which four fifths of the population belong. Each island has its own bishop, and at the head of the whole is an exarch or primate. The Ionian Islands, so called from lying in that part of the Mediterranean anciently known as the Mare Ionicum or Ionian Sea, often figure in the ancient history of Greece, but only singly, not collectively. In 1809–10 all the islands were overrun by the British troops except Corfu, which did not come into the hands of the British till it was assigned to them by the Peace of Paris in 1814, and the possession of the British was finally fixed and regulated by another treaty concluded at Paris in 1815. The seven islands were then formed into a republic, under the protectorate of Great Britain. In 1857 a wish was expressed by their representatives for reunion with Greece, and the islands, with the consent of the other European powers, were transferred to the kingdom of Greece in 1864.

Ionian Philosophy, the earliest school of Greek philosphy, a school which attempted to explain the phenomena of nature from the forces and attributes of matter itself. In order to do this the philosophers of this school followed two courses, some assuming a single original substance as the ground of all things, and explaining the development and formation of the phenomenal world by a process of condensation and rarefaction which they conceived as affecting the mode of existence of that substance; while others considered all things as formed by separation and combination out of a permanent and unalterable primitive form of matter. According to the view of the first class of Ionian philosophers, therefore, the original material principle was conceived as itself liable to change, and the changes which take place in it were held to give rise to the forms by which the world is known to us; while according to the view of the second class of Ionian philosophers the original material principle was looked upon as in its own nature and qualities unchangeable, and everything was explained by a change of external relations in space.

Ionian School, the school of philosophy which started from the Ionian city of Miletus. The leader of the school was Thales, who started from a disbelief in the current mythological fables of his day. Thales was born about 636 B.C. He was a man of political activity as well as of deep meditative habits. He was proficient in mathematical knowledge and founded the Ionian school which was principally concerned in an inquiry as to the constitution of the universe. He propounded the axiom that the basis of all phenomena was water, and perhaps he was just as near the truth as Huxley when he declared that everything came out of what he called, by a question-begging term, protoplasm. The next philosopher of the Ionian school was Anaximenes 529 B.C. He also was a materialistic philosopher and like Liebig believed that the origin and substance of everything was air. Diogenes of Apollonia went farther than his predecessor and taught that the basis of phenomena was mind. The Ionian school found its highest development in Anaximander of Miletus 610 B.C., who taught what has been the profoundest discovery of all philosophy ancient or modern that the basis of being was τὸ ἄπειρον, the Infinite.

Ionian Sea, that part of the Mediterranean communicating with the Gulf of Venice by the Strait of Otranto, and having Greece and part of European Turkey on the east; Sicily and the most southern part of Italy on the west. Its greatest breadth is between Cape Matapan in the Morea, and Cape Passaro in Sicily, which is about 400 miles.

Ion'ic Order. See ARCHITECTURE (*Greece*).

Ioniza'tion. See ELECTROLYSIS; ELECTRON; SOLUTION.

Ios, ī'ŏs, an island in the Ægean Sea, said to have been the birth-place of Homer. According to the ancients his mother was born here, and the poet's grave was likewise located here.

I O U, a written acknowledgment of debt, usually made in this form:—"To A. B. I O U Ten Dollars.—C. D. May 12, 1891." In Great Britain when the name of the creditor is stated such a document is evidence of a debt of the amount stated due to him by the person whose signature it bears. In the absence of the name of the creditor the document is *prima facie* evidence of such a debt being due to the holder of the document. It is not negotiable. The letters I O U are of course used instead of the words "I owe you," on account of the similarity of sound. The I O U is seldom used in the United States.

Iowa, ī'o-a ("the Hawkeye State"), a north-central State extending from the Mississippi River to the Missouri River, and occupying three and one sixth degrees of latitude. It is bounded on the north by Minnesota, on the east by Wisconsin and Illinois, on the south by Missouri, and on the west by Nebraska and South Dakota. Area, 56,025 square miles; 550 water; it is 310 miles east and west, and 210 north and south. Capital, Des Moines. Pop. (1900) 2,231,853. It is the sixteenth State in order of admission to the Union.

Topography.— Iowa is a part of the great central plain, and is chiefly undulating prairie, rising in gentle swells from the Mississippi River to a divide running diagonally, from a height of 1,694 feet in the northwest to a slight elevation in the southeast, with a parallel subdivide in the southwest. There are now no swamps and few natural forests. The only rough spots are the sharp bluffs where the rivers have cut their paths through the glacial drift; the only woods, those along the streams,— altogether about 7,000 square miles of woodland, with oak, elm, hickory, black walnut, maple, cottonwood, linden, ash, box-elder, pine,

cedar, etc. The eastern watershed, two thirds of the whole State, is drained to the Mississippi by a series of streams, nearly all of which are parallel and have a southeastward course. The western part is drained to the Missouri by shorter and swifter rivers, flowing first southwest and then south as the Missouri turns eastward. The chief Mississippi affluents are the Upper Iowa, the Turkey, the Maquoketa, the Wapsipinicon, the Iowa, and the Cedar (the "main" stream, the Iowa,—375 miles, its "tributary," the Cedar, 400 miles, the two forming the second largest interior system of the State and joining not far from the mouth of the Iowa), the Skunk, and lastly the Des Moines with its numerous affluents, far the greatest and commercially the most important as well as the finest scenically, rising in Minnesota and running diagonally across the entire State in a course of 550 miles, with a basin of 14,500 square miles. The State is prolonged by a southeastern corner to include the entire channel of the Des Moines. The northern part of the State has a continuation of the many small, clear, pebbly lakes of Minnesota in glacier-scored pits; some of them—the Walled Lakes—surrounded each by a natural wall of loose stones. The largest are Spirit Lake and the two Okoboji lakes in Dickinson County, and Clear Lake in Cerro Gordo County, all popular summer resorts. West Okoboji, of great depth, lies between wooded hills, and is indented by several picturesque "points" or promontories.

Climate.—The winter climate is somewhat severe, owing to the influence of the great uninterrupted plains to the northwest; but like all this region, the severity is tempered by freedom from excessive moisture. The State is one of the healthiest in the Union, several of the streams in the northeast having rocky channels, and none having the miasmatic bottom-lands found farther south. The dry, pure air of its rolling prairies affords a valued sanatorium for consumptives. The extreme temperatures range from 110° above to 40° below zero; but the average range is from 95° above to 20° below. The average rainfall during the years from 1890 to 1903 inclusive was 31.4 inches—two thirds of it between April-October, and more than half during the critical crop months, May, June, July, and August.

Geology.—No less than five separate sheets of drift cover the State, giving a remarkable variety of productive soil, as well as many different clays for industrial purposes. The watershed shows the inclination to the underlying palæozoic rocks, in lines from northwest to southeast. The oldest formation is Sioux quartzite in the northwestern corner. Cretaceous deposits overlie the older formations through the northwest part generally; along the eastern side from north and south are Cambrian, Silurian, Devonian, and Carboniferous in succession. The most valuable mineral beds are the vast fields of bituminous coal, covering more than one third of the entire area of the State, and turning out in the year ending 30 June 1903, 6,185,734 tons, valued at $8,016,274; employing 13,192 persons, of whom 9,169 were miners. It is the leading coal State west of the Mississippi except Colorado, and a great factor in all the northwestern industries. Its limestone, the finest grade of building stone, near Marshalltown, Anamosa and other points, is quarried to the extent of about $800,000 a year. Its gypsum from the rocky hills in the vicinity of Fort Dodge is the basis of a fast increasing manufacture of stucco, hard-wall plaster, and paint, also clays for pottery, fire and building brick, tile, and terra-cotta. Iowa ranks eighth in the value of its clay products. Considerable mineral water is also exported, that from the Colfax springs being in the lead.

Agriculture.—Iowa is unsurpassed in the quality and extent of cultivated land. It presents mainly a friable black loam on the top, from one to five feet deep; is easily worked, is in the main free from stumps and stones, and requires little or no commercial fertilizers. It has three main varieties, the principal being the alluvial mud of the river bottoms, the glacial drift of the prairies, covering most of the State, a sand and clay loam, and the loess, a rich yellow deposit containing much carbonate of lime, found at great depth on the Missouri slope and along the streams in the central and eastern portions. There is now almost no waste land in the State. In 1900 it presented the unparalleled record of 86.5 per cent improved farm land. A large part of the remaining 13.5 per cent yields income as timber and pasture land. With this fertility and a steady and sufficient rainfall, the State has for many years been first in the Union in value of products derived exclusively from the soil. The total value of its farm products in 1900 was $365,411,528, of which over a hundred million was fed to its own live stock. Its great crop is corn; it varies, in bushels, from 129,104,930 in 1894 to 383,453,190 in 1900, with an average value of $100,000,000 to $150,000,000. A fourth of its surface is covered with cornfields. Its second crop is oats (of which it was second in the United States), with a total in 1900 of 168,364,170 bushels; third, barley, 18,059,060; wheat, 22,769,440; rye, 1,170,970; and buckwheat, 151,120. Its cereals altogether occupy nearly half of its area. It also raises considerable flaxseed. Its hay product is surpassed only by New York; in 1902 it was 5,211,232 tons, most of it used for feeding its own stock. The vegetable crops are also of great importance; in potatoes it was second in 1900, producing 2,662,660 bushels, also 224,622 bushels sweet potatoes, altogether realizing $3,870,746; other vegetables, $3,332,039. It has a considerable fruit crop, especially of apples; in 1900 the value of orchard products was $1,849,767, besides $878,446 of small fruits and berries. The average of Iowa's chief products during the 13 years, 1890–1902, in bushels, is: Corn, 261,200,756; wheat, 16,130,339; oats, 117,118,483; rye, 1,907,482; barley, 12,503,051; flax, 2,182,950; potatoes, 12,198,347; hay, tons, 5,517,884. Iowa leads all the other States in the value of the implements on its farms, namely, $57,960,660.

Stock-Raising.—Iowa stands near the top in the value of live stock, $278,830,096 in 1900; and it is significant that while one State, Texas, surpassed it in number of neat cattle,—9,428,196 to 5,367,630—the difference in values was only as $163,228,904 to $142,518,902; the average Iowa animal being worth $26.55 against the Texan's $17.31. In dairy cows New York alone takes precedence, and the value of dairy products in 1900 was $18,819,000. That of poultry and eggs was $19,508,000. Great care is taken to have the best breeds of stock, and

this alone accounts for the difference in value of the Iowa and the Texas cattle. The richness of the milk is due largely to the breed. In the number of horses (1,268,016) and swine (9,723,791) Iowa led all the other States in 1900; and from 1850 to the last census there has been a steady increase in the number of swine, cattle, and horses.

Manufactures.— The State's fast-growing population and prosperity and its abundant and almost inexhaustible supply of bituminous coal have, together, within the last decade given a rapid impetus to manufacturing. Small factories have enlarged and many new factories have sprung up. Not a few of these are assuming large proportions. In 1900 Iowa manufactured 7,800 cultivators, 5,000 equalizers, 7,560 harrows, 34,560 hoes, 13,638 plows, 2,021 seeders, 100 drills, 3,720 harvesters, 3,775 hay-carriers, 10,980 dozen hay-forks, 5,809 horse hay-rakes, 79,296 scythes, 58,003 separators, etc., representing a total value of $1,343,455 — a gain of over $400,000 in a single year. In the same year Iowa's product of metal-working machines was valued at $273,501. There is but one manufactory of typewriters in Iowa (Des Moines), but it is fast becoming one of the foremost in the country, exporting largely to Great Britain, France, and the colonies. The output of carriages and wagons in 1900 was $4,087,400; product of paints was $336,867; chemical industries paid $70,022 in wages. A curious industry has sprung up in and about Muscatine — the manufacture of pearl buttons from mussel shells found in the beds of streams. Almost unknown, it has grown to huge proportions, and now that the manufacturers have united in the protection of the sources of supply, the future of this industry is assured. The value of its products in 1900 was $866,538, more than one fourth of which went for wages. The industry is now chiefly confined to the cutting of blanks for the eastern market. Iowa has 702 flouring and grist mills, two with a capacity of 100,000 barrels annually. The output of its mills in bushels is: wheat, 12,521,953; corn, 6,352,045; rye, 458,763; buckwheat, 277,593; barley, 538,740; other grain, 5,859,842. Cedar Rapids, Fort Dodge, and Muscatine have extensive oatmeal mills; the one at Cedar Rapids is said to be the largest in the world. The grand total of food products in 1900 was $142,000,000. The slaughtering and meat-packing industry represented in 1900 a total product amounting to $25,695,044. Cheese, butter and condensed-milk factory product in 1900 was $15,846,077 — an increase of nearly 50 per cent in 10 years. The fruit and vegetable canning product in 1900 was $1,359,958 — a gain of over $800,000 in 10 years. Iowa ranks third in the canning of corn. The starch product in 1900 was $896,831 — a gain of over $500,000 in 10 years; product of boots and shoes in 1900 was $786,141, a gain of over $200,000 in 10 years; product of gloves and mittens in 1900 was $142,600; product of planing mills in 1900 was $8,684,566. A fact not generally understood is that there is more timber in Iowa to-day than at any other time in its history. The clay products, which were $175,165 in 1890, had increased in 10 years to $2,224,920; to this should be added brick and tile products, which in 1900 aggregated $1,979,322; also pottery, terra-cotta and fire-clay products, $192,702. The paper product in 1900 was $243,776. Dubuque has the only ship-building plant in the interior. Among the larger cities Des Moines leads in brick-making (over 25,000,000 annually), proprietary medicines, book and job printing and binding, typewriters and hosiery; Sioux City, Ottumwa, Cedar Rapids, and Des Moines in meat-packing; Davenport, Dubuque, Burlington, Des Moines, and Ottumwa in foundries and machine works; Dubuque, Council Bluffs, and Grinnell in carriages; Burlington, Davenport, Des Moines, Dubuque, Ottumwa, Keokuk, and Oskaloosa in cigars; Sioux City, Des Moines, Cedar Rapids, Fort Dodge, Mason City, in flour and other food products; Des Moines, Ottumwa, Grinnell, Newton and Fort Madison in farm and other machinery; the principal river cities in malt products. The total value of manufactured products in 1900 was $164,617,877 — an increase of over 31 per cent in 10 years; the capital represented in 14,819 factories was $102,733,103 — an increase of over 32 per cent; the wages paid the 58,553 employes was $23,931,680 — an increase of over 17 per cent. These figures, showing enormous growth in the last decade, are a surprise to those who regard Iowa as distinctively an agricultural State.

Transportation and Commerce.— Several of the interior rivers are navigable for small boats, the Des Moines for 100 miles, the Missouri for fair-sized steamers its whole length, and the Mississippi for large ones. But the first named are not used to any extent; they have been superseded by railroads; the shifting channel, sandbars and snags of the Missouri make its navigation dangerous and slow. Only the Mississippi remains in practical use. The State, lying in the main path of transcontinental commerce, and originating much well-distributed local traffic, is a vast network of railroads, seven of the great trunk lines crossing it. Every one of the 99 counties has at least one railroad. The farthest distance between railroads at any point in the State is 13.79 miles. In 1903 it had 9,855 miles of road, exclusive of electric lines.

Banking and Insurance.— Iowa has the greatest number of banking institutions of any State in the United States. In August 1903, it had 1,482, divided into 258 national banks, 245 State banks, 350 savings banks, and 561 private banks. The State banks had capital of $10,445,800; deposits, $45,268,974.73; surplus, $1,718,832.41. The savings banks had capital $11,565,500; deposits, $87,620,377.34; surplus, $2,173,462.88. Total capital of all banks in the State, $53,435,020; total deposits, $264,803,000. Iowa is rapidly gaining prominence in the insurance world. In life insurance it promises soon to become a formidable competitor with the Eastern States. In 1902 there were 42 life insurance companies having headquarters in the State, and of this number 24 were located in Des Moines, "the Hartford of the West." Of the 42, 10 were "old line" life companies, carrying insurance to the amount of $36,972,257; 8 were assessment companies, carrying $209,955,500; 16 were fraternal benefit associations, carrying $168,418,000. Total of insurance carried by Iowa companies, $415,345,757.

Education.— Iowa stands second in the literacy of its population; 99.63 per cent of those from 10 to 14 years were, in 1900, able to read and write, although there was no compulsory attendance law prior to 1902. In 1902 it ex-

STATE CAPITOL AT DES MOINES.

pended $9,556,890 on its schools, there being 18,513 schoolrooms with 22,708 teachers holding certificates. The enrollment of children in the public schools in that year reached 560,173. There has been a liberal increase in the wages of teachers during the school year of 1902 and 1903. About one third of the schools are located in towns and cities and two thirds in the country. Relatively few of the teachers have had normal training. One State normal school and several private normal schools were in operation in 1900. In 1902 the State normal school had 28 professors and 28 other teachers, with 2,065 students. Under a law passed in 1902, 16 private schools have become accredited for the training of teachers under State supervision. For higher education there are about 200 public high schools and a number of private academies. The courses of study pursued are of high standard and generally uniform. The State University, the head of the public school system, is at Iowa City, the former capital, with law, medical, dental, and other colleges, which in 1902 had 48 professors, 111 other teachers, and 1,512 students. There is also a State College of Agriculture and the Mechanic Arts, located at Ames, which in 1902 had 32 professors, 43 other teachers, and 1,480 students. In 1902 a "Memorial University," at present a military academy, was opened at Mason City by the national order of the Sons of Veterans. Connected with certain of the public secondary schools there are 20 training classes for teachers. Among the private schools of the State there are 16 business colleges and 26 academies. Under the auspices of the Roman Catholic Church there are in the State 25 schools for higher education (academies and colleges), with an attendance of 4,040 pupils, 3 normal schools, 167 parish schools, with an attendance of 22,529 pupils. Iowa was one of the first States to pass a township school law. This law has enabled a number of towns to better their school facilities. In 1895 Buffalo Centre township, for example, was organized into a school township, and within four years all the district schools except two were closed and the pupils were transported to a central graded school. The law makes provision for the transportation, at public expense, of children living remote from the central school. The State report for 1901 shows that consolidation has been tried in 28 counties, transportation in 35, and both in 19. Good results were reported in 27 counties, doubtful in 5 counties. Bad roads are the chief obstacle in the doubtful counties, but a vigorous "Good Roads" movement is minimizing this obstacle. Ninety-five per cent of the county superintendents for 1901 favored the plan.

Libraries.— In 1893 there were 83 public libraries in Iowa, as follows: Supported by the State, 12 (volumes, 118,974); college and academic, 24 (volumes, 95,114); association and subscription, 16 (volumes, 81,234); free public, 15 (volumes, 68,809); miscellaneous, 7 (volumes, 46,176); public school, 5 (volumes, 7,850); total, 418,157 volumes. In 1903 the number of libraries had increased to 248, as follows: Supported by State, 22 (volumes, 236,953); college and academic, 36 (volumes, 179,261); association and subscription, 32 (volumes, 52,080); free public, 70 (volumes, 336,305); miscellaneous, 11 (volumes, 89,159); public school, 77 (volumes, 75,982); total, 969,740 volumes.

Churches.— In the number of church societies in the State the denominations rank as follows: Methodist, Lutheran (three branches), Roman Catholic, Baptist, Christian (Disciples), Presbyterian, Congregationalist, United Brethren, Evangelical Association, Protestant Episcopal, Friends, Reformed, Adventist. There is one Roman Catholic archdiocese, with two dioceses. The non-polygamous Mormons or "Latter-day Saints," and the Amana Colony community of Christian Socialists, have a large and prosperous membership.

Charities and Penal Institutions.— The State charitable institutions are managed by a board of control appointed by the governor with the consent of the senate. There are four insane retreats: at Clarinda, Mt. Pleasant, Independence, and Cherokee; besides four private asylums; a school for the deaf at Council Bluffs; a school for the blind at Vinton; an institution for feeble-minded children at Glenwood; a soldiers' home at Marshalltown; and a home for soldiers' orphans at Davenport. There are State penitentiaries at Anamosa and Fort Madison, both have adopted the graded system; an industrial school for boys at Eldora, and one for girls at Mitchellville. L. S. Coffin has established a home for ex-convicts on his farm near Fort Dodge.

State Government.— The constitution was adopted in 1857. By law, the electors must vote once in 10 years on calling a convention to revise the constitution, which convention the legislature must call if so voted. All amendments must receive a majority vote of both houses at two successive legislatures, and then be passed by popular vote. The Senate has 50 four-year members, the House 100 two-year; legislative sessions are biennial. Bills must have a majority of all members elected to both houses — not merely present. A two-thirds vote overcomes the governor's veto. Executive officials are elected for two years — half in one year and half in the alternates, with the exception of the railway commissioners, who are elected for three; the railroad commission has power to regulate rates, etc. The judiciary consists of a supreme court, with a chief justice who is such by reason of priority of election, and five associate judges, one chosen every year; also 53 district judges in 20 districts, each serving four years. Women may vote only on school questions involving the expenditure of money. All incorporated towns of 2,000 people and over are ranked as cities; all platted but unincorporated towns are villages. In 1902 there was a militia of 2,474 officers and enlisted men. The number of representatives to Congress is 11. In politics the State has been Republican since the organization of the party, except in the years 1890–4, when the advocacy of prohibition drove it into retirement. The prohibitory amendment adopted in 1882 was pronounced unconstitutional by the supreme court of the State, and was succeeded by prohibitory laws which after several years' trial were in turn succeeded by a local option law, under which 54 of the 99 counties were reported in 1903 as wholly free from saloons.

Finances.— The State has no debt except one of $10,936 to its own school fund, which debt by provision of the constitution is a permanent

one. It had a balance in the treasury 1 Jan. 1903, of $926,916.65. Local taxation is limited to 1 per cent of valuation for current expenses, but this may be exceeded for waterworks, sewers, schools, etc. The State as a whole cannot incur a debt greater than $250,000 except for war purposes, and cannot loan its credit to any person or association; counties and towns cannot run in debt to over 5 per cent of their actual valuation. The average income is about $3,000,000 a year.

Population and Divisions.— Iowa ranks tenth among the States in population. The population was 43,112 in 1840; (1850), 192,214; (1860), 674,913; (1870), 1,194,020; (1880), 1,624,615; (1890), 1,911,896; (1900), 2,231,853. The original population was part of the great Free-State movement which peopled the central States except Indiana. Of the entire population (1900), 305,920 were foreign-born. Of these 123,162 were from Germany; 72,611 from Scandinavia, or nearly two thirds from the Teutonic nations; besides several thousands from German Austria and Switzerland. From England and English Canada were 35,195, French Canadians 14,168, Ireland 28,321, Holland 9,388. Colored, 12,693. There were 81,845 more males than females. There are no great centres of population. The capital, Des Moines, on the river of the name, is the largest, with 62,139. On the same river to the north is Fort Dodge, an old frontier fort and settlement (12,162), and below it Ottumwa (18,197) and Keokuk (14,641). The Mississippi River business is chiefly represented, from north to south, by Dubuque (36,297 — the first settled site in the State), Clinton (22,698), Davenport (35,254), Muscatine (14,073), Burlington (23,201), Fort Madison (9,278), and Keokuk, the "Gate City," at the mouth of the Des Moines. Sioux City (33,111), in the extreme west near the mouth of the Big Sioux, and Council Bluffs (25,802), opposite Omaha, the old terminus of the Union Pacific, represent the Missouri River; Cedar Rapids (25,656) and Waterloo (12,580), the valley of the Cedar River; and Marshalltown (11,544), the valley of the Iowa River.

History.— The territory now included in Iowa was originally inhabited by the Ioway and Illinois tribes of Indians, which were driven out by the Sacs and Foxes. In 1761 the "Ioway" or Iowa tribes were on the east side of the Missouri River and near the headwaters of the Des Moines; but in 1805 they were occupying land on the south side of the Des Moines River. Later they left the vicinity of the Des Moines, some going to the reservation of the Foxes and Sacs (now Oklahoma), others to a reservation in Kansas. The missionary, Father Marquette, and Joliet, the fur trader, were the first white men known to have traveled in this section. In 1673 they visited the tribes of Indians along the Mississippi River, and first landed on Iowa soil near the mouth of the river now known by the name Iowa. In 1788 a party of 10 white men under Julien Dubuque established the first white settlement at the place now occupied by the city of Dubuque. They were attracted to this locality because of the lead deposits in the vicinity. They opened mines, but how successful they were may be conjectured from the fact that after the death of Dubuque, in 1810, his associates abandoned the settlement. All that portion of country drained by the Mississippi was claimed by France because of the explorations made by Marquette and some of his companions, and because of settlements made by other Frenchmen. France's claim to this territory was ceded by treaty to Spain in 1763, but the country was returned to France in 1800-1. In 1803 all the territory now known as the "Louisiana Purchase" (q.v.) was bought of France by the United States government. The territory now the State of Iowa was part of the Territories of Louisiana in 1805; of Missouri in 1812; of Michigan in 1834; of Wisconsin in 1836. Iowa became an independent territory in 1838, and was admitted as a State in 1846. The Indian claims to lands within the boundaries of the State were purchased by the United States government before its admission as a State. The last purchase was made in 1843. Remnants of the Sacs and Foxes occupy a reservation, 419 acres, in Tama County, and still receive annuities from the government. In 1832 a settlement was made at Fort Madison, an abandoned government post, and soon after Burlington was founded, and in 1830 a settlement was again made at Dubuque. In 1857 the Indians attacked the settlers living near the Okoboji lakes and Spirit lake, in Dickinson County, and about 30 whites were killed and nearly all the houses burned. This action on the part of the Indians retarded for some years the growth of that section of the State. Iowa City was first selected for the Territorial capital (it became the State capital in 1846), but in 1857 the capital was changed to Des Moines. Iowa had in the Federal army during the Civil War 75,839 men, which was about one tenth of her population. Some of this number were in regiments belonging to other States. Consult: Aldrich, 'Annals of Iowa'; State Historical Society publications; Shambaugh, 'Documentary Material Relating to the History of Iowa'; Monette, 'History and Discovery of the Mississippi Valley'; Iowa Geological Survey publications; Shambaugh, 'History of the Constitutions of Iowa' and 'Messages and Proclamations of the Governors of Iowa'; Gue, 'History of Iowa.'

JOHNSON BRIGHAM,
Librarian, Iowa State Library.

Iowa Central Railway Company.— *History.* — The Eldora Railroad and Coal Company was organized in 1866 to build a railroad from Eldora northward to a junction with the Dubuque and Sioux City Railroad at Ackley, Iowa, a distance of about 17 miles, and to engage in the business of mining and selling coal. The company received about 1,200 acres of coal lands (about 600 acres thereof in fee simple and the rest by ground lease) as a consideration for completing the work within a specified time. The road was opened in July, 1868. It was then decided to extend the line 28 miles southward to a junction with the Chicago and Northwestern Railway at Marshalltown, Iowa. This necessitated a reorganization of the company, which was effected in August, 1868. In the reorganization, the coal interests were turned over to the Eldora Coal Mining Company and the railroad property to the Iowa River Railway Company. The capital stock of the latter was limited to $30,000 per mile and the first mortgage bonds were issued at the rate of $16,000 per mile, about $400,000 of them being

used to retire an issue of bonds of the Eldora Railroad and Coal Company. The extension to Marshalltown was completed in December, 1869, the line being formally opened from Ackley to Marshalltown on 7 Jan. 1870. At about the same time the Saint Louis and Saint Paul Railway Company was organized under the auspices of the Iowa River Railway Company, to build a railroad from Ackley to the Minnesota State Line, and an independent corporation, the Iowa Central Railroad Company, was organized to build a north and south line, starting from the Missouri State Line at a point near the boundary of Appanoosa and Davis Counties and running northerly and northeasterly through Albia, Eddyville, Oskaloosa, Grinnell, Toledo and Cedar Falls to the Minnesota State Line. In 1870, the Iowa River Railway Company, the Saint Louis and Saint Paul Railway Company and the Iowa Central Railroad Company were consolidated under the name of Central Railroad Company of Iowa. The Iowa River Railway Company had in operation at the time 45.92 miles of railroad which was turned over to the consolidated company under an even exchange of $30,000 in stock and $15,000 in first mortgage bonds per mile. The entire issue of bonds of the Iowa River Railway Company was retired and the mortgage cancelled. A contract was made with the Iowa Valley Construction Company to complete and equip the road from Marshalltown to the Missouri State Line and from Ackley to the Minnesota State Line in consideration of receiving $30,000 per mile in stock and $16,000 per mile in first mortgage bonds, together with local aid guaranteed at $2,500 per mile. The entire line from Albia to Mason City, Iowa, a length of 178.72 miles, was completed and opened for traffic on 7 Feb. 1871. On 15 June 1871, the company made final settlement with the construction company for the 132.8 miles of new road, and was released from any obligation to build the rest of the projected line. The extension from Mason City to Northwood, 20.73 miles, was commenced on 1 Aug. 1871, and completed on 10 Oct. 1871. The total length of line in operation on 1 Jan. 1872, was 202.11 miles, the cost of the road being represented by $4,644,630 of capital stock, $3,700,000 of the first mortgage bonds and $609,000 of second mortgage bonds. Default having been made in payment of second mortgage interest due 15 April 1873, and of first mortgage interest due 15 July 1873, the property was placed in the hands of a receiver. The company was reorganized on 4 June 1879, under the Central Iowa Railway Company and took over the property after foreclosure sale on 18 June 1879.

In 1880–1882 the company constructed the following lines: Montezuma branch, 13.61 miles; State Centre branch, 25.64 miles; Story branch, 34.5 miles; Belmond branch, 22.20 miles; Keithsburg branch (Oskaloosa to west bank of Mississippi River), 97.16 miles, and Newton branch, 27.75 miles. The Peoria and Farmington Railroad, extending from Iowa Junction, Ill., to the east bank of the Mississippi River, a distance of 88.65 miles, was purchased in May, 1883, the company at the same time securing the right to run its trains into Peoria, Ill., over the tracks of the Peoria and Pekin Union Railway. First mortgage bonds to the amount of $1,531,000 were issued on the Keithsburg and Newton branches, and to the amount of $1,200,000 on the Montezuma, State Centre, Story and Belmond branches, both issues being dated 1 April 1882, and payable 30 years thereafter, with interest at the rate of 7 per cent. per annum, payable semi-annually. Also, $1,517,000 6 per cent. 45-year bonds dated 1 June 1879, secured by first mortgage on the Illinois division, were assumed from the Peoria and Farmington Railroad Company. Default was made in payment of interest due 1 Oct. 1884, and was followed by defaults under the main line and Illinois mortgages. A receiver was appointed 1 Dec. 1886. In pursuance of a plan of reorganization the road was sold under foreclosure of the several divisional mortgages, the sales taking place in September and November, 1887, and in March, 1888. The present company was organized by the purchasers taking over the property on 15 May 1889.

Lease of Iowa Central and Western Railway.— The company leases for 50 years from 1 July 1901, with rights of purchase at any time during the continuance of the lease, the Iowa Central and Western Railway, from Belmond to Algona, Ia., a distance of 37 miles, upon condition that it shall maintain the property, paying, in addition to all taxes lawfully assessed, 20 per cent. of all gross earnings accruing from the operation of the property. The earnings are to be applied to the payment of interest and principal upon the bonds of the Iowa Central and Western Railway Company as the same may become due and payable, and the Iowa Central Railway Company guarantees to make good any deficiency that may arise.

Traffic Agreement with Chicago, Burlington and Quincy Railroad Company.— Under an agreement effective 16 Jan. 1905, this company's freight business between Oskaloosa and Des Moines, Ia., is handled by the Chicago, Burlington and Quincy Railroad Company at an agreed rate per loaded car.

F. H. Davis,
Vice-President.

Iowa City, Iowa, city and county-seat of Johnson County, on the Iowa River, and the Burlington, C. R. & N., and the Chicago, R. I. & P. R.R.'s; 54 miles west of Davenport. The city is pleasantly built on a succession of plateaus, rising one above another from the river banks, which are here high. The first plateau is laid out as a public promenade, and the third, which is about 30 feet higher than the first, is crowned by a handsome Doric edifice 120 feet long and 60 feet wide, of a beautifully marked stone quarried in the vicinity called "bird's-eye marble." This building was originally intended for the State capitol, but, on the removal of the seat of government to Des Moines, was appropriated to the State University. From 1839 to 1854, this was the seat of the Territorial and State governments. It is the seat of the State University of Iowa, the Iowa State Academy, the State Historical Society and Library, the Homœopathic, Allopathic, and Mercy hospitals. It is the farming trade centre for Johnson, Cedar, and Iowa counties, with an annual trade exceeding $1,000,000; has excellent power provided by the Iowa River; and has

manufactories of flour, iron, woolen goods, perfumery, gloves, jewelry, fencing, and linseed oil. The city has electric light and street railroad plants, waterworks on the Holly system, numerous churches, and an assessed property valuation of about $6,500,000. Besides its manufacturing interests the city has an extensive stock-raising and meat-packing industry. Pop. (1890) 7,016; (1900) 7,987.

Iowa College, a coeducational institution founded in 1847 at Grinnell, Ia.; under the auspices of the Congregational Church. In 1901 it had 33 professors and instructors, 411 students, 27,000 volumes in the library; productive funds, $470,000; grounds and buildings valued at $150,000; and an income of $49,000.

Iowa River, a considerable stream in the State of Iowa rising in Hancock County, near the Minnesota State line and flowing southeast into the Mississippi River, north of Burlington. It is 300 miles in length, and is navigable to Iowa City, 80 miles from its mouth.

Iowa State College of Agriculture and Mechanic Arts, a coeducational institution for technical education at Ames, Iowa. It received a grant of land from Congress under the law of 1862, and was first opened in 1868. Regular courses are offered in agriculture, mechanical engineering, civil engineering, electrical engineering, mining engineering, technology, science as related to industry, and general and domestic science; special shorter courses are given in the fall and winter in dairying, agriculture and mechanics, horticulture and mechanics, and domestic science. The State Agricultural Experiment Station is also allied with the college. The annual income in 1902, including the Federal appropriation, was $120,000; there were 1,220 students in attendance, and 84 professors and instructors.

Iowa, State University of, an educational institution forming an integral part of the public school system of the State, situated at Iowa City. It was first opened in 1847, receiving control of lands given by the Federal government. (See COLLEGES, LAND GRANT.) The university is controlled by a board of regents of 2 *ex-officio* members and 11 elective members. Its work is organized in the following departments: the college of liberal arts (including the summer session), which offers courses leading to the degrees of A.B., B.S., and Ph.B.; the graduate college; the Iowa school of political and social science, with both undergraduate and graduate courses; the college of law; the college of medicine; the college of homœopathic medicine; and the college of dentistry. The library, which lost 25,000 volumes by fire in 1897, now contains nearly 65,000 volumes; the university issues the following publications: 'Natural History Bulletin'; 'The Transit,' an engineering journal; 'The Law Bulletin'; 'The Bulletin of the Homœopathic Medical College'; 'The University of Iowa Studies in Psychology'; 'The State University of Iowa Studies in Sociology, Economics, Politics and History.' The State appropriates over $125,000 annually to the university, and the total income amounts to over $300,000 annually. In 1902 the number of students was 1,512; the number of professors and instructors, 160.

Iowa Wesleyan University, a coeducational institution founded in 1844, at Mount Pleasant, Iowa; under the auspices of the Methodist Episcopal Church. In 1901 it had 20 professors and instructors, and 380 students. There are 5,000 volumes in the library. It has productive funds, $75,000; grounds and buildings valued at $150,000; benefactions, $32,000; and an income of $14,000.

I'owas, a tribe of American Indians of the Algonquin family. In 1800 the Iowas lived in Minnesota and soon after moved southward. They were called Palinchas, or "Dusty Noses," in their own tongue. Lewis and Clark, the explorers, designate them as the Ayanways, and the early French traders called them the Ajowes. In 1836 they moved to the Wolf River region west of the Mississippi, and in 1861 ceded 16,000 acres of land to the United States. The remnants of the tribe, some 1,000 in number, at present live on reservations in Oklahoma and Kansas. See also INDIANS, AMERICAN; IOWA.

Ip'ecac, or **Ipecacuanha,** a South American plant of the order *Rubiaceæ* variously called by botanists *Cephælis ipecacuanha* and *Psychotria ipecacuanha.* The plant, which is found mainly in moist shady forests in Brazil, is a creeping herb or sub-shrub with mostly bare stems, only the extremities producing leaves. The small white blossoms, which are borne in heads with long stalks, are followed by dark purple berries. The rather fleshy more or less divided roots were in medicinal repute among the South American Indians, and gradually found their way into European medicine under the name "ipecacuanha." They have been considered emetic, nauseant, diaphoretic and expectorant, and in large doses are reputed poisonous. They appear in commerce in various grades (gray, brown and red), which are dependent mainly upon the season at which they are gathered, the way they are dried, the age of the plants, etc. The chief supplies are collected during January, February and March by the Indians. Owing to the slow growth of the plant and the low price the roots command, ipecac is not cultivated commercially; it has, however, been successfully grown in various parts of the world. The roots of several other plants are substituted for those of true ipecac, among the best known being those of *Tylophora asthmatica* and *Sarcostemma glaucum* (Venezuelan ipecac), both of the natural order *Asclepiadaceæ.* Other species of *Psychotria* and certain species of *Richardsonia* are similarly but unofficially employed.

Wild or American ipecac (*Gillenia stipulacca*) of the rose family, is a common plant in the southeastern United States and as far north as western New York. It is a perennial herb about three feet tall, bearing paniculate corymbs of white or pale rose colored flowers. It is hardy, of simplest culture and being graceful is frequently planted for ornament in flower borders where the soil is of good quality.

Iphicrates, ī-fik'ra-tēz, Athenian commander: b. and d. in the 4th century B.C. Of humble origin, he raised himself to eminence by his courage and talents. In the war of Corinth (393–2 B.C.) he opposed with success Agesilaus, the warlike king of Sparta. He was sent to the Hellespont to act against Anaxibius, but in spite of his victory was unable to prevent the

conclusion of the shameful Peace of Antalcidas (387 B.C.). In 360 B.C. he was appointed to the command of the troops sent by the Athenians to the assistance of Sparta, on the invasion of Epaminondas, but allowed the Theban general to retreat from the Peloponnesus. In the Social War (357–5) he was one of the commanders of the fleet fitted out by the Athenians for the recovery of Byzantium. Being accused of treachery and neglect of duty in the battle at the Hellespont, by one of his colleagues, Chares, and put on trial, he was acquitted, while his colleague Timotheus was fined 100 talents; but though he lived to a great age, did not again engage in active service. Iphicrates was the author of some improvements in Greek arms and accoutrements. He was accustomed always to fortify his camp in the field even in a friendly country; "Because," he said, "if, contrary to probability, I should be attacked, I may not be obliged to make the disgraceful excuse that I did not expect it."

Iphigenia, ĭf-ĭ-jē-nī′ạ, in Greek legend, a daughter of Agamemnon and Clytemnestra (according to some an illegitimate daughter of Theseus and Helen), who was to have been sacrificed to Artemis (Diana) at the advice of the prophet Calchas, when the goddess, enraged with Agamemnon, detained the Greek fleet in Aulis by a calm. Under pretense that she was to be married to Achilles, Iphigenia was led to the altar. But in the moment when the priest was about to give the death-blow Iphigenia disappeared, and in her stead a beautiful hind was substituted, whose blood gushed out on the altar. Artemis had relented, and conveyed her in a cloud to Tauris, where she became the priestess of the goddess. Conformably with the law of the country, she was obliged to sacrifice every Greek that landed there. While serving as priestess her brother Orestes came to take away the image of Artemis, as he had been advised by an oracle to do, that he might get rid of the madness to which he had been subject since the murder of his mother. Iphigenia having recognized him as her brother, the two contrived a means of escape, and carried off with them the image. The story of Iphigenia was dramatized by Euripides (who composed two plays upon the subject — 'Iphigenia in Aulis' and 'Iphigenia in Tauris'), and Goethe, and it is also the subject of two operas by Gluck, 'Iphigenie en Aulide' (1774); and 'Iphigénie en Tauride' (1779).

Ipomæa, ĭp-ō-mē′ạ, a genus of plants, including several hundred species, of the order *Convolvulaceæ,* consisting mostly of twining prostrate herbs, widely distributed in warm regions. The species of most importance is *I. Purga,* which yields the jalap of commerce. Some are cultivated for the beauty of their flowers, and are known to gardeners as convolvuli. *I. purpurea* is the best known garden species. See JALAP.

Ips′wich, Mass., town in Essex County, on the Ipswich River near its mouth, and on the Boston & Maine railroad, 27 miles northeast of Boston, and 9 miles south of Newburyport. As Agawam, it was settled in 1633 by John Winthrop and 12 others. The name was changed to Ipswich (after Ipswich, England), in the following year, by resolution of the Massachusetts General Court. As early as 1634 it had a meeting-house, while in 1642 the first free school in the town was established. Ipswich was among the foremost towns of Massachusetts in resisting the arbitrary taxation introduced under Gov. Andros in 1687, and a number of its citizens suffered punishment in consequence of this action, which foreshadowed the stand to be taken later, by this town and the colonies generally, against similar policies on the part of the British government. Among the distinguished persons who at some time lived at Ipswich were Anne Bradstreet, Nicholas Easton, William Hubbard, John Norton, and others. The town has various industries, among the articles manufactured being grist-mill products, hosiery and underwear, bricks, lumber and boxes, carriages, cabinet-work, soap, isinglass, heels, etc. The Manning High school, the Ipswich Historical Society, and the excellent public library give the town rank and influence in educational and literary affairs. Pop. (1900) 4,658.

Iquique, ē-kē′kā, Chile, a seaport in the province of Tarapacá, till quite recently merely a small fishing village, but now a town of about 34,000 inhabitants. It owes its prosperity to the export of nitrate of soda and borax, the former of which especially is found in great quantities in the pampa of Tamarugal. The annual export of nitrate amounts to about 350,000 tons, and that of borax to about 1,500 tons. Iodine is also exported. The pampa of Tamarugal still contains, it is estimated, about 60,000,000 tons of soda niter. In 1868, and again in 1877, the town was almost entirely destroyed by an earthquake. In 1879 it was bombarded and captured by Chile from Peru; and in 1891 it was much damaged by insurgents.

Iquitos, ē-kē′tōs, a native tribe in Peru, residing at Loreto, on the left bank of the Marañon, about 75 miles above the mouth of the Rio Napo. The settlement has an active trade, valued at $2,000,000 annually; the imports are exchanged mostly for india rubber. In 1900 they numbered about 12,000.

Irade, ĭ-rä′dĕ, a Turkish decree or command of the Sultan, directed to his grand vizier, whose duty it is to announce it to the public.

Iran, ē-rän′, the name given by the ancient Persians to their native land, in opposition to Aniran (that is, Not Iran), the land of the barbarians, by which term were meant principally the Turco-Tartaric tribes bordering on the north. The Persian rulers of the dynasty of the Sassanidæ call themselves, in inscriptions on monuments and elsewhere, kings of Iran and Aniran. At the present day the name is used in contradistinction to Turan, the name applied to the more depressed regions of Asia inhabited by the Turco-Tartaric tribes, to designate the great table-land of Asia, which has a mean elevation of from 3,500 to 4,000 feet. The central portion of this table-land consists of an extensive salt-desert.

Iranian (ī-rā′nĭ-ạn) **Languages,** a family of the Indo-European languages, closely allied to the Indian group, and called by some philologists Persian, from the best known member of the family. The two oldest known Iranian languages are the Old Persian and Zend. The former — that of the cuneiform inscriptions of the Achæmenian dynasty, and the language of the Persians proper — has only become known

in its chief traits at a comparatively recent date through the deciphering of those inscriptions. The Zend is the language in which the Zend-avesta, the sacred writings of the Parsees, are composed. By the term Middle Iranian languages the Huzvaresh or Pehlevi and the Parsi principally are understood, which are preserved in the commentaries to the Zend-avesta. The latter approaches to the modern Persian. The dialect of the Pehlevi coins, as well as the inscriptions of the time of the Sassanian dynasty, also belong to this section. The most important of the New Iranian languages is the Persian. The Afghan, or Pashtu, and the dialects of the Kurds, form separate branches of the Iranian family. The isolated Ossetes of the Caucasus also speak an Iranian language. The Armenian is a branch of the same stock, and contains many peculiar elements.

Irawadi, ĭr-a-wŏd'ĭ, or **Irrawady,** one of the great rivers of Southern Asia, traversing Burma in a southerly course. One branch of it rises near the eastern extremity of Assam, another branch rises in East Tibet, the two branches uniting about lat. 26°. It has generally a south course, being deflected west, and its total length has been estimated at 1,200 miles. There are three rocky defiles in which its channel is suddenly contracted, the lowest near Mandalay; but from that point downward to its delta it has generally a breadth of from 1 to 4 miles. About 140 miles from the Indian Ocean, which it enters by numerous mouths, the delta commences. The current of the Irawadi is commonly gentle — even in its upper part being no more than at the rate of two miles an hour: except during the inundations, when it flows so rapidly that no sailing vessels could navigate it but for the assistance of the southwest monsoon. It is navigable from the sea upward for steamers of five feet draft to the Chinese frontier, 900 miles from the sea.

Iredell, ĭr'dĕl, **James,** American jurist: b. Lewes, Sussex, England, 5 Oct. 1751; d. Edenton, N. C., 20 Oct. 1799. He was appointed comptroller of customs at Port Roanoke, now Edenton, where he arrived in 1768, retained this office several years, and meanwhile studied law. He was appointed by the attorney-general his deputy in 1774, and in 1777 was placed by the legislature on the bench of the supreme court, then just organized under the State constitution. In 1787 he was designated by the general assembly sole commissioner to collect and revise the acts of previous assemblies, which were to be considered in force in North Carolina. This collection of the laws, now referred to as "Iredell's Revisal," was published in 1791. In February 1790 he became one of the justices of the Supreme Court of the United States, and held that office till his death. The 'Life and Correspondence' of Iredell was published in 1857.

Iredell, James, American lawyer, son of the preceding: b. Edenton, N. C., 2 Nov. 1788; d. Raleigh, N. C., 13 April 1853. He was graduated at Princeton in 1806, and was bred to the bar. He served for 10 years in the house of commons of his native State, and twice as speaker in a house of which the majority were politically opposed to him. In 1827 he was governor of North Carolina, and from 1828 to 1831 a member of the Senate of the United States. He afterward resumed the practice of his profession at Raleigh, where he was also for many years reporter of the decisions of the supreme court of North Carolina. In 1833 he was appointed by Gov. Swain one of three commissioners to collect and revise all the statutes in force in North Carolina. The result was the work known as the 'Revised Statutes.' He afterward published a 'Treatise on the Law of Executors and Administrators.'

Ireland, īr'land, **Alleyne,** American author and lecturer: b. Manchester, England, 19 Jan. 1871. He was educated at the University of Berlin, traveled widely, lectured on tropical colonization at Cornell University in 1899, and in 1900 was appointed lecturer in politics at the University of Chicago, where his subjects were tropical colonization and Chinese foreign relations. Besides contributions to periodicals, he has written: 'Georgetown, Demerara' (1897); 'Tropical Colonization' (1899); 'The Anglo-Boer Conflict' (1900); 'China and the Powers' (1901).

Ireland, John, American Roman Catholic prelate: b. Burnchurch, County Kilkenny, Ireland, 11 Sept. 1838. He came to America in 1849 and attended the Cathedral school at Saint Paul, Minn., and in 1853 went to France and studied theology in the seminary of Meximieux and subsequently in that of Hyeres, remaining there till 1861, when he returned to Saint Paul and was ordained priest on the 21st of December. During the early part of the Civil War Father Ireland tendered his services as chaplain of the 5th Minnesota regiment and later became rector of the cathedral, Saint Paul. An ardent advocate of temperance, he devoted much time and energy to promoting the cause, organized temperance societies and traveled about the country lecturing on the subject. For a time he was secretary to Bishop Grace of Saint Paul, whom he represented at the Vatican Council, Rome, 1870–71, and later became his coadjutor, being consecrated Titular Bishop of Maronea, 21 Dec. 1875. He was likewise very diligent in advancing Roman Catholic colonization in the northwest and not only founded colonies but became a director in the National Colonization Association. Later, in 1887, Bishop Ireland accompanied Bishop Keane to Rome to consult with Pope Leo XIII. upon the necessity of erecting a Catholic university in Washington, D. C., and on returning from Europe in 1888, he was made first archbishop of Saint Paul. He is a distinguished lecturer and pulpit orator, a contributor to the leading magazines, and a member of the American Federation of Labor. At present (1905) his diocese includes about 230,000 Catholics; 258 priests; 252 churches; 1 theological seminary; 90 parochial schools; 3 orphanages; 3 hospitals, and various other religious and educational institutions.

Ireland, Mary E. Haines, American translator and author: b. Calvert, Cecil County, Md., 9 Jan. 1834. In addition to serials and numerous other contributions to the periodical press, she wrote 'What I Told Dorcas' (1895), and 'Grandma Elliot's Farmhouse' (1900).

Ireland, William Henry, English literary forger: b. probably London 1777; d. there 17 April 1835. He imposed spurious Shakespearian

MSS. upon his father, Samuel Ireland, a bookseller and engineer, who was a Shakespeare enthusiast, and also upon other men of letters, and produced two "Shaksperian" plays, 'Vortigern' and 'Henry II.,' the former of which was purchased by Sheridan and acted at Drury Lane, but was a complete failure. The criticisms of Malone led to the exposure of the fraud, which was acknowledged by Ireland in 1796. He wrote various novels, poems, etc., besides his 'Confessions' (1805), containing an account of his forgeries.

Ireland, the most westerly and smaller of the two principal islands of which the United Kingdom of Great Britain and Ireland is composed, extends from lat. 51° 26′ to 55° 21′ N.; its average width is about one fourth its length; area, 32,583 square miles. It is separated from England by Saint George's Channel and the Irish Sea, and from Scotland by a narrow passage, the North Channel. Ireland is on the continental shelf, or sub-marine plain, which borders the continental land mass of Europe, hence it is physically a part of Europe.

Topography.— The coast line is irregular; from Dundalk Bay to Wexford Harbor on the east there are less indentations than on any other part of the coast; Dublin Bay, an arm of the Irish Sea, is the only indentation of any size on this part of the island. Galway, Sligo and Donegal Bays are the largest on the western coast. The Atlantic currents, which beat against the western coast, have worn away the land in many places, thus causing fiords such as exist on the coasts of other countries subject to similar wave-action. Some of the many islands which fringe the coast have been formed by the washing away or the submergence of the land. The capes, promontories, and peninsulas have been formed largely by submergence. Some of the islands, all small, are Aran, Achill, Clare, and Rathlin. The chief ports are Cork, Dublin, Belfast, Waterford, and Londonderry. There are 14 harbors which will accommodate the largest ocean steamers.

The highlands are chiefly along the coast; the greater part of the interior is a plain. The mountains, more rounded hills than mountains, are short ranges with little or no connection except the several ranges in the southwest. Some of the mountains are Mourne, in County Down, the Wicklow Mountains, Knockmealdown and Galty in the south; Caha, Stack and other ranges in Kerry; Slieve Boughta in Galway, a number of short ranges in the counties of Mayo, Leitrim, Donegal, and Londonderry, and the Slieve Bloom between Queens and Kings counties. The majority of the peaks are less than 3,000 feet in height; Carrantuohill (Carrantual), in Kerry, near the Lakes of Killarney, is 3,404 feet, and Galty Mountains, in Limerick, are 3,015 feet. The plain in the interior is about 500 feet above sea-level.

Hydrography.— The rivers of Ireland, like those of England and Scotland, are small streams. The Shannon, the largest river in the British Isles, has its rise in the northeastern part of the province of Connaught, flows east, south, and west, forming quite a curve before entering the Atlantic Ocean, between the counties of Kerry and Clare. It passes through several lakes, the largest of which are Ree, Allen, and Derg. The estuary at the mouth is about 70 miles long; the whole length of the river is about 250 miles, 130 of which are navigable for large steamers. Its importance for transportation has been increased by the canals Royal and Grand, which connect it with Dublin. In the southwest, in County Kerry, is a short mountain stream called Roughly River, with a long, broad estuary called Kenmare River. The Liffey, which flows into the Irish Sea at Dublin, the Lee which flows into Cork Harbor, the Boyne with its tributary, the Blackwater, are all short streams which have been made famous in history and literature. The Foyle, Erne, Lagan, Moy, Slaney, and others reach the ocean through broad estuaries or bays. Lough Neagh in the northwest is the largest lake of the British Isles. A number of the lakes of Ireland occur along the river courses, but are really basins, and not merely expansions of the rivers. Lakes Corrib, Conn, Foyle, Belfast, Strangford, Carlingford, and others on the coast are estuaries or fiords, but the land-locked mouths entitle them to be called lakes, like Maracaibo in South America. The famous Lakes of Killarney are in County Kerry, in the southwestern part of the island. There is scarcely a place in Ireland that is more than 25 miles distance from water communication with the ocean.

Geology.— A limestone stratum belonging to the basal portion of the Carboniferous system underlies a large part of the interior plain. The upper Carboniferous rock has been destroyed by erosion except in a few places. Silurian rock underlies nearly all of the northern part, but the Cretaceous, Triassic, and Permian formations exist and appear at the surface in several places. Some of the cliffs of the north are of basaltic formation. The Giant's Causeway (q.v.) on the north coast of Antrim is basaltic. Its 40,000 or more, perfectly formed polygonal columns constitute remarkable specimens of this formation. Crystalline rocks form the axis of the mountains of the province of Connaught, and the highlands of Leinster. Old red sandstone and carboniferous limestone are found in the southwestern counties. Marble exists in large quantities in the county of Kilkenny and in parts of the adjacent counties coal of an anthracite variety is found, but not in large quantities; iron-ore exists in nearly every county. Copper of an excellent quality is in the western mountains, also gold and silver in small quantities.

Soil.— The erosion of the limestone rock which has been going on for ages has contributed largely to the fertility of the soil of Ireland. The igneous rocks, the red marls, and other mineral formations, have added to the richness of the soil, and all has been distributed, by the gradual removal of the ice-covering, over a large area of the plain. After deducting the area, about one fifth of the whole, which is covered by bog, mountain, and moorland, there is left a vast extent of arable surface covered with a deep friable loam of remarkable richness. In addition to the decomposed trap and the calcareous matter derived from the limestone, there is a large amount of vegetable mold which forms one of the most important ingredients of the soil. The bogs, useless for tillage, furnish peat for fuel. The Bog of Allen is the largest one in Ireland.

Climate.— The warm moist winds from the Atlantic blowing over Ireland affect its climate more than any other cause except its latitude.

The mean temperature is from 20° to 30° F. higher than other places in the same latitude on the eastern coast of America or the interior of Europe, and a few degrees higher than places in the same latitude on the west coast of America. The summer temperature is modified by the surrounding waters, being lower by a few degrees than inland places of the same latitude. The moisture brought by the winds from the ocean causes a heavy annual rainfall, and much fog, mist, and general dampness. The low mountains serve to some extent as condensing agents, so that the greatest rainfall is near the coast. The average rainfall on the west and south coasts was, in 1879, 43.56 inches; in 1896, 36.36. The averages for the interior were in 1879, 34.39 inches; in 1896, 34.07 inches.

Vegetation.—The climate and soil are very favorable for vegetation. Its mild temperature and humid atmosphere enable several delicate plants, which usually in the same latitude can be cultivated only in sheltered gardens, to flourish here with vigor in the open air; and frequently forest trees continue to retain their foliage after similar trees have lost their leaves in the warmest parts of England. The conditions would naturally indicate forests, and it seems that in early times, large tracts of magnificent timber were spread over its surface; but the grossest waste and mismanagement have prevailed, trees have almost disappeared except from the parks of the wealthy land-owners, or the "gentry"; and what ought to be among the best is about the worst wooded country in the middle latitudes of Europe. More attention is now being given to the subject of forestry; in 1901 there were 309,741 acres in Ireland under forest, a portion of which was a new growth. During the year, 1,740 acres were planted with trees, mostly fir, spruce, and larch. Grass grows luxuriantly in nearly all parts of the island.

Animals.—The fauna of Ireland consists now of birds and small rodents. Animals once found here and mentioned in the ancient literature, as the deer, bear, wildcat, wolf, beaver, cattle peculiar to the island, and certain birds (including the garefowl), have all disappeared. There are no snakes nor toads in Ireland. Fish are plentiful in the streams and on the coasts.

Fisheries.—The salmon fisheries are very valuable, and are increasing in value every year. With an increased supply of fish, high prices are maintained owing to the improved means of communication from remote districts with the best markets. In spite of this, however, these fisheries are not cultivated to anything like so high a degree as they might be. Still, the number of men engaged in the salmon fisheries in Ireland is over 13,000, the estimated value of the salmon exported being from $700,000 to $950,000 annually. The principal sea fisheries of Ireland are those of herring and mackerel. The herring fisheries in the Irish waters are prosecuted chiefly on the east coast by Irish boats from Howth, Arklow, and other places on the Irish coast, and by a fleet of vessels from Cornwall, Scotland, and the Isle of Man. The number of boats engaged in this branch of the sea fishery is much smaller than in Scotland, from which considerable quantities of cured herrings are imported. The total number of vessels engaged in the sea fisheries is now about 6,525, the number of men and boys employed being about 26,200. The native fishermen, it is said, are now successfully competing with their rivals, yet the sea fisheries of Ireland on the whole have much declined, as shown by the decrease from 55,630 hands and 13,483 boats employed in 1860, to the figures just given.

Agriculture and Stock-raising.—The chief occupation is agriculture. The richness of the soil, its lightness that makes tillage easy, the large percentage of arable land, the amount of rainfall, the mildness of the climate, all combine to make Ireland an agricultural country. Despite the great extent of moorland-wastes and the large amount of bog-land, few countries raise, in proportion to the area, such a large amount of food products year after year. But with natural advantages above the average, agriculture as a system has not progressed as in many other countries. The wholesale confiscation of estates by the English gave the absentee landlord a large portion of the farm land of Ireland. The new owner usually cared only for his rent and gave little heed to improving the land, and showed no regard for the welfare of the man who tilled the soil. The holders and laborers received no encouragement to improve methods or make progress; on the contrary, they were handicapped in many ways, especially in the 18th century, when the English markets were closed to their products, and Ireland was excluded in a large measure from the commercial advantages given to the British possessions in other parts of the world. The holdings, or farms, originally too small to be occupied by farmers of capital and enterprise, were in many cases subdivided until they were reduced to the smallest patches, on the produce of which a family could barely subsist. One result of this poor policy was that the holders were obliged to raise as much as possible each year, for immediate use, without regard to the ultimate effect of this mode of farming upon the land. Competent authorities say that this over-cropping has had a most deleterious effect upon the land. Yet the soil must have been restored to some extent, by rotation of crops or by the use of fertilizers, for the average produce of the soil per acre, in 1902, was found to have increased over the years 1850 and 1860. In some cases the holdings were enlarged during the last years of the 19th century. Statistics show that a change in the kind of crops has been gradually taking place; a decrease in the acreage under cereals and green crops and an increase in the area under meadow and clover. The following table shows the distribution of the cultivated area, given in acres, the first years of the present century:

Year	Cereals	Green crops	Flax	Clover and hay	Pasture
1900	1,347,189	1,098,377	47,451	1,218,717	11,510,370
1901	1,317,574	1,079,443	55,442	1,233,770	11,522,060
1902	1,306,398	1,070,449	49,746	1,228,498	11,575,592

The number of acres of farm land not under crops, but "resting," was, in 1900, 12,589; in 1901, 10,886; and in 1902, 9,558.

Between 1851 and 1881 the farms of 1 to 15 acres decreased in number by 66,363. The total number of holdings in 1891 was 486,865, or 12,244 less than in 1881. Of these 18,243 (1,364 more than in 1881) did not exceed 1 acre, 55,584 (decrease of 6,197) were from 1 to 5 acres, 139,195 (8,628 decrease) from 5 to 15 acres, 120,472 (2,045 decrease) from 15 to 30 acres, and 139,401 (3,262 increase) above 30 acres. Each province

JOHN IRELAND.

ARCHBISHOP OF ST. PAUL.

shows a decrease in the total number of holdings, but in Munster the number is very small. Between 1841 and 1899 there was a total decrease in holdings "above 1 acre" of 25 per cent.

The Land Act of 1870 greatly improved the conditions of tenure in Ireland. The chief aims of the act were to provide compensation to tenants for arbitrary eviction, and especially for improvements effected by them on their holdings in case of their being disturbed in their possession by the landlords, and to afford facilities to tenants for the purchase of their holdings. The act legalized what is called the Ulster tenant-right custom in all the districts in which it prevailed, and decreed the amount of compensation to be awarded in absence of such custom. In 1881 it was supplemented by a more thorough and comprehensive measure. The benefits conferred on Irish tenants by this act were briefly summarized under the terms "fair rent," "fixity of tenure," and "free sale." By the first of these every tenant who objected to his rent, or the rent the landlord wished to exact, was entitled to have a "fair rent" fixed for him by a court. The rent was to remain unaltered for 15 years, at the end of which period it might be readjusted, and raised or lowered. By the principle of "fixity of tenure" the law recognized that the tenant had a certain right in his holding in virtue of which he was not to be arbitrarily removed from it without compensation, and which enabled him on leaving his farm to obtain the best price he could for yielding up his possession. The "free sale" of this right of tenancy was restricted only in so far as that it must be to one person only (except under agreement with the landlord) that the landlord might object on sufficient grounds to the person purchasing, and that he also had the right of pre-emption. At the expiration of the 15 years the landlord might resume possession of the holding on paying the tenant compensation for improvements effected by him, and also paying him the value of his tenant-right, both being determined by the court should the parties be unable to agree. A tenant who sold his tenant-right on quitting his holding was not to be entitled to compensation for disturbance, or if he had received compensation he was not entitled at that time to sell his tenancy. A tenant holding under the Ulster tenant-right might sell under that or under this system, but not partly under one and partly under the other. The scale of compensation for disturbance of tenancy was fixed as follows: Where the rent was $146.70 or under, a sum not exceeding 7 years' rent; rent from $146.70 to $244.50, not exceeding 5 years' rent; from $244.50 to $489, not exceeding 4 years' rent; from $485 to $1,467, not exceeding 3 years' rent; from $1,467 to $2,445, not exceeding 2 years' rent; above $2,445, not exceeding 1 year's rent. The act also empowered the land commission to advance loans to tenants not exceeding three fourths of the value of their holdings, to enable them to become proprietors, and such loans were repayable by an annual payment of 5 per cent for 35 years. Provision was also made for assisting emigration. A tenant whose holding, or the aggregate of whose holdings, were valued at not less than $733.50, was entitled by writing to contract himself out of any of the provisions of this act, or of the act of 1870. Another act passed in 1887 extended the privileges conferred by the act of 1881, and a third act passed in 1896 went farther in the same direction. The Purchase of Land (Ireland) Act of 1891 supplied the Land Commission with further funds for advances to tenants to enable them to purchase their holdings. But the Land Purchase Act of 14 Aug. 1903, whereby the tenants may buy the farms and become independent of the landlords, is a great beginning toward a readjustment of agricultural conditions. The new law provides that the actual tenants or persons, or persons who have been tenants within 25 years, may purchase all the land they occupy or desire at prices varying according to the condition of the property, to be paid for upon the installment plan, the seller accepting a mortgage for a term of years, the government guaranteeing the payment at the ruling rate of interest. The law is not compulsory; landlord and tenant may arrange matters.

Stock-raising has increased in importance during late years. Statistics show that there are now in Ireland more cattle, in proportion to area, than in any other country of Europe. The following table will show the changes which have taken place since 1900:

Year	Horses	Cattle	Sheep	Pigs
1900.....	491,156	4,608,550	4,386,876	1,268,521
1901.....	491,430	4,673,323	4,378,750	1,219,135
1902.....	509,284	4,785,204	4,215,740	1,372,592

England is the principal market for the cattle raised in Ireland. The breeds of horses vary with the locality; ponies are numerous in Connaught; hunters in the north of Leinster; and draft horses in nearly all the counties on the eastern coast. Much good has been effected by co-operative societies. The number of co-operative organizations in 1901 were as follows: 106 agricultural societies, 187 dairy and agricultural societies with 81 auxiliaries, 29 poultry societies, 103 co-operative banks, 46 miscellaneous societies, and 2 federations. The membership of the whole was 51,000.

Manufactures and Trade.— The linen manufacture early took root in Ireland, and still continues to be its most important staple; and in every article, except lace and cambric, competes successfully with all other countries. It has increased in a remarkable manner within the last 40 or 50 years, and Belfast, its centre, has now become the first city of Ireland in population as well as in manufacturing industry. The linen manufacture, indeed, is of importance; a large number of the factories are in Ulster. The cotton manufacture has had a very different history, the number employed in this industry having declined from 4,000 in 1868 to 800. The woolen manufacture appears at the outset to have outstripped that of linen. It had at least made such progress as to alarm the woolen manufacturers of England, who, in a spirit of petty jealousy, petitioned the English parliament for its discouragement, and succeeded. The Irish were prohibited from sending their woolens abroad, and could not even send them into England without paying an oppressive duty. Had the manufacture been suited to the country it might have surmounted all this absurdity and injustice; and, at all events, when these ceased to operate, would have revived. But the woolens of Ireland continue to be of very secondary importance, and indeed the manufacture seems to have much decreased in recent years. The tweed has retained its popularity. The manufacture of Irish poplins (of woolen and silk, or woolen and flax

or cotton) is very flourishing. The number of textile factories in 1890 was 263, which employed 71,788 persons. There are about 20 mills engaged in paper-making. The brewing of porter and distillation of whiskey form important items in the national production. The making of shirts and other clothing for men is becoming prominent. Ship-building was begun several years ago, and during the last of the 19th century it became quite prominent. The largest ship-building yards are in Belfast, where about 10,000 men and boys are employed. The ships of the White Star line are all built in Belfast. Ship-building is carried on to some extent at Dublin, Londonderry, and Haulbowline. Home work still flourishes; and the Irish hand-made laces and embroideries are still popular.

Commerce.— That of Ireland is not at all proportioned to her natural capabilities, and to the admirable facilities afforded by the excellent harbors situated on her coasts. The laws made by the British government to destroy the commerce of Ireland account in a large measure for the present condition of trade. The most important articles of export find a market in Great Britain. They consist chiefly of grain and flour, live stock, salt and fresh meat, eggs and butter. Manufactured articles, particularly linen, rank next in importance; but as the bulk of such articles is very small in comparison with their value, the trade, or at least the shipping connected with them, holds only a secondary place. The trade with foreign countries is also inconsiderable. The principal imports are colonial produce, woolen and cotton goods, wheat, wool, coal, and salt. Of the shipping employed in this trade only a mere fraction is Irish. Belfast and Dublin are the chief shipping ports. The value of the exports direct from Ireland to foreign ports was about $4,533,090 in 1883, of imports from foreign parts $53,166,620; in 1900 they were $6,560,240 and $50,072,985, respectively. In 1900 the number of vessels entered from the colonies and foreign parts was 1,048 (1,032,109 tons); and cleared 448 (473,758 tons); entered coastwise 31,069 (6,401,172 tons); cleared 31,026 (6,746,328 tons).

Transportation.— The rivers of Ireland form excellent navigable channels. In several of them, however, when the water was low, the navigation became seriously impeded by rocky shoals. In removing these, or in making artificial cuts for the purpose of avoiding them, vast sums have been expended. Improvements of equal importance have been made by the construction of canals; but since the introduction of railroads, canals have in Ireland, as elsewhere, sunk to a position of secondary importance. The principal canals are the Grand Canal, 165¾ miles in length; the Royal Canal, 96¼ miles; the Barrow Navigation, 42¼ miles; the Newry Navigation, 35 miles; the Lagan Navigation, 26¼ miles. With the exception of the Barrow Navigation, the Grand Canal, and the Lagan Navigation, the dividends paid by the Irish canals in the possession of public companies are almost nominal. The Royal Canal yields a profitable return, but it is merged in the Midland Great Western Railway. The Grand and Royal canals connect the important systems of the Shannon Navigation, in all 158 miles in length, with Dublin. The railroad system of Ireland has attained a considerable development. The roads are all constructed on a gauge of 5 feet 3 inches, which is compulsory. The average cost of construction, including carrying stock, is about $80,000 per mile. The principal railroads are the Belfast and Northern Counties Railway, with a total length of 180 miles; the Dublin, Wicklow, and Wexford Railway, 135 miles in length; the Great Southern and Western, 478 miles; the Midland Great Western Railway, 425 miles (including the Dublin and Meath, Great Northern and Western, etc.); the Great Northern of Ireland, 503 miles (including the Dublin and Belfast Junction, 63 miles, and the Ulster Railway, 140 miles); and the Waterford and Limerick Railway, 141¼ miles, or including the lines of other companies worked by it, 269 miles in length. Few of the Irish railroads pay any dividend at all; but those that do pay represent a large proportion of the capital invested in railroads in Ireland, and some of them are very remunerative concerns. The most profitable of them are a short one connecting Dublin with Kingstown, the Belfast and Northern Counties, and the Ulster Railway. The total length of railroads completed and open for traffic 1 Jan. 1902 was 3,208 miles. The total number of passengers for that year was about 28,000,000, the total amount of minerals and general merchandise carried, about 5,300,000 tons; the total receipts from the carriage of passengers and goods amounted to nearly $20,000,000.

Public Works.— Large sums have been advanced in loan by the sanction of the imperial parliament under various acts for public works and improvements in Ireland. The Irish board of public works has charge of such grants and their expenditure; the objects to which they are applied include landed improvements and drainage, fishery piers and harbors, roads, bridges, and public buildings, tramways, light railways, and certain lines of inland navigation, and the preservation of ancient monuments. The commissioners have authority to lend for the purpose of any work for which county or borough councils are authorized to borrow. Of $121,141,190 of loans advanced for purposes that have not yet been fully carried out ("current services"), $67,655,395 have been repaid, besides interest amounting to $35,707,115, while the sum of $7,985,250 has been remitted. The largest item of this expenditure, namely, $26,196,100, has been spent on the improvement of lands; river drainage and navigation have absorbed some $14,837,500, while on lunatic asylum buildings there has been spent $13,101,925; in schemes for the improvement of public health, $13,451,390; under the Laborers' Acts, $9,150,940 (to provide employment, etc.); on railways, $6,000,635; in advances to occupants for improvement of holdings, $5,355,530; roads and bridges, $5,041,220. Other sums have been spent on harbors and docks, reclamation of lands, dwellings for the poorer classes, teachers' residences, dispensaries, and in advance to tenants for the purchase of their farms. The recent Land Purchase Bill has made available a large sum of money to be used in aiding tenants in purchase of holdings (1903).

Money, Weights, Measures.— The standard of value is gold. Silver is legal tender up to 40 shillings; bronze up to 12 pence; and farthings only to 6 pence. Bank of England notes are legal tender. The names of the coins used are sovereign, half-sovereign, crown, half-crown, florin, shilling, sixpence, threepence, penny, half-

penny, and farthing. The standard units are: of weight, the pound, 7,000 grains; of length, the yard; of capacity, the gallon, containing 10 pounds avoirdupois of distilled water at 62° F., the barometer at 30 inches. On these units all other legal weights and measures are based.

The sovereign weighs 123.274 grains, and contains 113.001 grains of fine gold. The shilling weighs 87.27 grains, and contains 80.727 grains of fine silver. Bronze coins consist of a mixture of copper, tin, and zinc. The penny weighs 145.83 grains.

Banks.— The institution known as the Bank of Ireland has a royal charter and unconditional liability. This bank manages, free of charge, all the public debt of Ireland, and, like the Bank of Scotland, it loans money to the British government, for which, since 1865, 3 per cent is paid. In 1902 there were in Ireland nine joint-stock banks with 625 branches, all of which had adopted limited liability. Six of the nine banks were note-issuing.

There are two kinds of savings banks in Ireland: one the trustee savings bank, which has been in existence since the first years of the 19th century; the other, the postal savings bank, which was begun in 1861. The annual amounts which may be deposited by each person are regulated by the Savings Bank Act. According to the act for 1893 the amount which may be deposited in one year by one person is £50, or $244.50, and not £30, or $146.70, as was the law under a former act. The amount of stock which may be purchased was raised from £100, or $489, to £200, or $978, and the increase in the stock-holding limit was changed from £300, or $1,467, to £500, or $2,445. The post-office savings banks are considered more secure than the trustee savings banks, and the deposits in the former are some larger than in the trustee savings banks. The trustee savings banks received in 1897 about $23,044,180, and in 1902 about $23,547,910. The postal savings banks received in 1897 about $10,869,735, and in 1901 about $12,298,705.

Charities.— The Poor Law, which regulates the system of public charities, is about the same for Ireland as for England and Scotland. It provides for relieving the needy in their own homes or for placing them in charitable institutions. The law is administered by the local government board through boards of guardians elected for the purpose. The number of indoor poor who received assistance for the year 1902 was 43,531; the number of outdoor poor for the same year was 57,813; and those in asylums, 1,427. A large amount of aid is dispersed through private means; but a strong effort is being made to remove the causes, which are about the same in all countries, and which usually result in poverty. Efforts have been made to improve the methods of work, and to foster habits of economy.

Government.— Ireland, by the Act of Union, became an integral part of the United Kingdom, and shares in its legislation by means of 28 representative peers in the House of Lords, and 103 representatives in the House of Commons. The representative peers are elected for life by the whole body of Irish peers. The Lord-Lieutenant, who represents the sovereign, holds his court in the castle of Dublin. Since 1898 great changes have been made in the manner of administering the local government. Previous to that date the chief authority in the county was the grand jury, and all local affairs pertaining to the government and local laws were attended to by the grand juries and presentment sessions. The act of 1898 provides for a council, elected by the people, for a term of three years. The government of the boroughs, rural and urban districts, is also vested in an elective council. The unincorporated boroughs are governed by commissioners.

The government of the incorporated boroughs is vested in a mayor, aldermen, and council. The large cities are now county boroughs. The chief secretary, the under-secretary, and four commissioners, who are appointed by the Lord-Lieutenant, constitute the local government board, which has supervisory authority over the local council. This board approves or rejects nominations made by the local authority, decides upon salaries, and has the whole local government in charge to a certain extent.

The judiciary of Ireland is similar in many respects to that of England. The highest tribunal is the Supreme Court of Judicature, composed of the High Court of Justice and the Court of Appeal. Other courts are the Court of Bankruptcy, the Land Commissioner's Court, and the High Court of Admiralty. The English municipal law is administered by the courts of Ireland.

Finances.— In addition to local indebtedness Ireland assists in the liquidation of the national debt of the kingdom. The amount which has been apportioned to Ireland, it is claimed, is larger, in proportion to the wealth of the island, than the amount apportioned to England and Wales. The imperial revenue collected in Ireland for the fiscal year ending 31 March 1902 was about as follows: Customs, $15,500,000; excise, $15,850,000; estate and duties, $317,300; stamps, $15,740,000; income tax, $5,822,000; post-office, $3,697,000; telegraphs, $876,200; crown lands, $163,400; miscellaneous, $574,200; making a total, together with the non-tax revenue, of $46,792,000. The local taxation revenue for the same year was about as follows: Customs, $74,850; excise, $635,000; estate and duties, $995,000. The expenditures for the same year were about as follows: Against exchequer, for the civil government, $22,200,000; for collection of taxes, $1,215,000; post-office, $5,435,000. For local taxation accounts paid the same year, $5,275,000. The whole makes a grand total of about, for imperial revenue, $284,125,000; for local revenue, $1,945,000. The total amount raised for local expenditure was distributed about as follows: For water, gas, electric lights, $12,270,820; tolls, dues, $1,913,560; rents, interest $1,229,225; government contributions, $7,810,780; loans, $2,365,800; miscellaneous, $2,103,685. The chief local expenditures were about as follows: Town and municipal authorities (police, sanitary works, etc.), $8,025,450; unions, poor relief, $5,592,420; county, rural sanitary, and road authorities, $9,591,165; harbor authorities, $2,422,620.

Population.— Since the census of 1841, when the inhabitants of Ireland numbered fully 8,000,000, the population has almost steadily decreased. In 1846–7 a frightful famine, occasioned by the potato disease, broke out, and was followed by a visitation of fever and cholera. The population was in consequence greatly reduced, and since then emigration has taken the place of

famine and disease in reducing it further. The extent of this emigration will be gathered from the following statement of the numbers that left the country between 1851 and 1899:

Provinces	Number of Emigrants between May 1, 1851, and Dec. 31, 1898.		
	Males	Females	Total
Leinster	355,104	320,706	675,810
Munster	673,106	640,092	1,313,198
Ulster	590,314	475,761	1,066,075
Connaught	282,532	306,616	589,148
Not specified	61,766	48,902	110,668
Total	1,962,822	1,792,077	3,754,899

From the causes just referred to the total population of Ireland, which might by natural increase have amounted to at least 10,000,000, had dwindled away to 4,425,597 in 1902.

The population by provinces in 1901 was as follows: Leinster, 1,152,829 (150.1 per square mile); Munster, 1,076,188 (112.3 per square mile); Ulster, 1,582,826 (183.8 per square mile); Connaught, 646,932 (94.5 per square mile). In that year the average population per square mile for Ireland was 136.7. In 1901 there were six county boroughs with populations as follows: Dublin, 290,638; Belfast, 349,180; Cork, 76,122; Limerick, 38,151; Londonderry, 39,892; Waterford, 26,769.

Education.— The present difficulties in establishing a public system of education in Ireland had their origin in the times following the efforts to make the people abandon the Roman Catholic Church. As a consequence, the parents refused to patronize the government schools. The laws of the time of William III. and Queen Anne made it a crime for Catholics to teach or to have their children taught by Catholics, or to send them abroad where they would be educated in Catholic schools. The rigid enforcement of these laws resulted in a large proportion of illiteracy among the Roman Catholics, although they had established schools abroad which were attended by those with wealth sufficient to live in a foreign country. (Consult, 'History of Irish Schools and Scholars of the Middle Ages.') The principal educational institutions in Ireland are Dublin University and the three Queen's Colleges. The Queen's Colleges were formerly connected with an examining and degree-conferring body, Queen's University, for which the Royal University of Ireland was substituted in 1882, in pursuance of the University Education (Ireland) Act, 1879; $100,000 being yearly granted from the surplus funds of the Irish Church (q.v.). The Queen's Colleges, however, are not directly affected by this act. The Royal College of Science for Ireland was established under the authority of the Science and Art Department, London, in August 1867. Its object is to supply a complete course of instruction in science applicable to the industrial arts, and to aid in the instruction of teachers for the local schools of science. There are professors of physics, chemistry, botany, zoology, agriculture, mining, geology, applied mathematics, etc. The course of instruction extends over three years. There are also the General Assembly's Theological College, Belfast; the Magee College, Londonderry, a Presbyterian college opened in 1865, and embracing in its curriculum literature, science, and theology; the College of St. Columba, near Dublin, founded for the purpose of establishing a system of instruction preparatory to the university.

The Catholic University of Ireland, established in 1854, grants degrees in theology and philosophy, and since 1882 sends its students to the Royal University for examinations for degrees in arts, medicine, law, and engineering. Affiliated with the Catholic University, and now a part of it, are the following colleges: St. Patrick's, Maynooth; University College, Dublin; University College, Blackrock; St. Patrick's, Carlow; Holy Cross, Clonliffe; and School of Medicine, Dublin. There are additional, in different cities and towns, about 40 Roman Catholic colleges and seminaries for men, and a large number of academies or secondary schools for women. There are numerous non-sectarian schools, some of them of royal and private foundation and endowed, but the most prominent are those established since 1831 under the superintendence of the commissioners of national education. These schools are open to the children of parents of all denominations. The pupils are not required to attend any religious exercises or religious instruction of which their parents or guardians disapprove, and opportunity is given to pupils of each religious persuasion to receive separately at appointed times such religious instruction as their parents or guardians may approve of. Of these schools there were 8,670 in operation in 1899, with 785,139 pupils on the rolls. The average daily attendance was small, being only 513,852. In 1892 an act was passed by which a beginning was made of free education, and a modified system of compulsion. In 1878 an act was passed for the promotion of the intermediate secular education of boys and girls in Ireland. By this act about $5,000,000 from the Irish Church surplus fund was set apart, being invested in commissioners who are to apply the revenue arising from it to the purposes of the act, these being (1) the carrying on of a system of public examinations; (2) the awarding of exhibitions, prizes, and certificates to students; and (3) the payment of results fees to the managers of schools fulfilling certain prescribed conditions. The schools referred to in the act are of a grade superior to the national schools. The subjects of examination are Latin and Greek, modern languages, Celtic, natural science, mathematics, etc. The system of apportion according to results is no longer in use; instead the amounts awarded are based on average attendance.

Considerable attention is given to technical instruction. In all the convent schools the young girls have regular courses in domestic science, and in several trades are taught. The Department of Agriculture and Technical Instruction has an advisory board of technical instruction. In 1901–2 the course of experimental science had been adopted in 152 schools with 6,412 science pupils. The central institutions belonging to this department are the Royal College of Science, Dublin, and the Metropolitan School of Art. Throughout the provinces the work is being organized by the councils of county boroughs, urban districts, and counties. The annual grant for the technical instruction is $25,895,000. Provisions are made for the

1. Albert Memorial, Belfast.

2. St. Stephen's Green Park, Dublin.

special training of teachers for the different departments of work.

Language and Literature.— The predominant in the Irish literature is the heroic, pathetic, love of nature, romance, virtue, and through all runs the traditional. Although the Ogham, a system of writing, was introduced into Ireland about 13 centuries before Christ, yet the literary productions were transmitted orally. Hyde says, "The love of literature of a traditional type, in song, in poem, in saga, was more nearly universal in Ireland than in any other country of western Europe."

The modern literature of Ireland, or the literature produced by Irish writers of the last centuries, has been included under English literature because the language used is English. See CELTIC LANGUAGES.

Music.— See IRISH MUSIC.

Art and Architecture.— Many of the ancient types of architecture extinct in other lands may still be found in Ireland. Their buildings and home life remained practically undisturbed for centuries; no ancient Roman architecture is found on the island. When Christianity was introduced, the change in form of the Druid temple was for several centuries in accordance with the natural development of the people, except the addition of the small cross, the windows facing the east, and the altar. When the building became too small a new one was erected beside it. Some of the existing ancient specimens are a group of stone buildings on Skellig Michael, a rock rising precipitously out of the sea to the height of 700 feet, and about eight miles due west of the nearest headland in the County Kerry. The approach is by a flight of stone steps. Dry rubble masonry forms the walls, and in this group, as in others, the absence of the arch shows its ancient origin. It is oval outside, bee-hive in form, but rectangular within. The door has a horizontal lintel, above which is a small cross worked into the stone wall. The six cells in the interior, the common room for prayer (choir), the chapel, all show it was occupied by monks. The doors, with inclined jambs and horizontal lintels, antedate the arch. A wider lintel above, or the double lintel, indicates progression in architecture, a method of relieving the pressure of the roofs. The roofs of the ancient buildings were of stone. There are many of these ancient ruins, some in a good state of preservation. Off the coast of Sligo, at Inishmurray, on the Isles of Aran, on islands off the coast of Kerry, and in many places are found buildings of dry rubble masonry. The change shows itself when cement is used and the walls become perpendicular, as at Gallarus, in Kerry, and a further advance is shown in St. Declan's oratory in Ardmore, with square perpendicular towers, or, more properly, supports at the corners. Some of these were erected in the 6th, 7th, and 8th centuries. St. Colum-Cille's monastery at Kells was built about 807 A.D. In the 'Annals of the Four Masters' mention is made of the church St. Kevin founded in about 1108, and which is still in existence, at Glendalough. The Romanesque style makes its appearance in the 11th century; the earliest example is in St. Flannan's, at Killaloe. Brian Boroimhe is said to have built churches at Killaloe, in County Clare. A church built about this time, at Freshford, the ancient Achadh-ur, eight miles northwest of Kilkenny, is still in use. At Clonfert Cathedral, in County Galway, there is a fine example of an Irish Romanesque doorway. This church is said to have been founded by St. Brendan, "the navigator." The interlaced patterns on the piers, the ornamented column, are all most beautiful. "There is not," says Mr. Brash, "a square inch of any portion of this beautiful doorway without the mark of the sculptor's tool, every bit of the work being finished with the greatest accuracy." The Cathedral at Ardmore, County Waterford, shows another advance in its decoration; here may be seen The Judgment of Solomon, Adam and Eve, The Magi bringing their gifts, the stable indicated by a cow, etc. Many of the modern cathedrals are most beautiful.

The "Round Towers" of Ireland have been for years subjects of study and discussion. There exist in Ireland in whole or part about 100 of those towers; 18 are in a perfect condition. Many claim that the Round Towers are of pre-Christian origin, and cite the similar towers, two in Scotland, seven on islands off the coast, one on the Isle of Man, and a few on the Continent, as examples of pagan architecture. Their average size is 100 feet in height, circumference at base, 50 feet, walls at door lintel, 3½ feet. The interior is divided into from four to eight stories. Petrie, who has studied the subject with care, claims that the towers are of Christian origin and were used both as bell towers and as safes or places in which to deposit the Church treasures. The Irish name for the towers, *Cloigtheach*, which means "house of a bell," supports the theory of Petrie and others. Petrie advances other and strong arguments in support of his theory. The 'Annals of the Four Masters' mentions the bells in some of the towers. One of the finest examples of a Romanesque doorway in a Round Tower is at Kildare. Some of the ancient pottery shows skill and artistic merit. In designing and coloring the ornamentation of the old Celtic manuscripts show great artistic power. The initial letters are most beautiful, especially in the 'Book of Kells,' a copy of the four Gospels in Latin, and in 'Annals of the Four Masters.' The symbolism used by other early nations is not found in the works of the ancient Irish. The designs are geometrical patterns, interlaced ribbon work, diagonal and spiral lines, strange animals, peculiar birds, and the key pattern. The ancient metal work shows unique and beautiful designs; the bell shrines, the brooch of Tara, and many pieces of old metal work may be seen in museums. The laces of Ireland, revived the last of the 19th century, show most intricate and charming patterns. Sculpture and oil painting are modern arts in Ireland, and in both many of Irish birth have excelled.

Religion.— The first authentic account of the introduction of Christianity into Ireland was in the 5th century, when Pope Celestine sent Germanus, bishop of Auxerre, and later, in 431, Palladius as bishop. Both Germanus and Palladius found on the island believers in Christianity, but no organized body of Christians. However, the chief work of conversion and organization was accomplished by St. Patrick, who, good authorities state, was sent to Ireland by the same pope. Killpatrick, a town of Scotland, is said to have been Patrick's birthplace, but some authorities claim that he was a native of France. He had been consecrated bishop

before coming to Ireland as a missionary, and he selected Armagh as his see. A large number of converts were made, so many that even before Patrick died he had other bishops and a number of priests to assist him. The Roman Catholic Church in Ireland has four archdioceses and 25 dioceses. The archdioceses are Armagh, Dublin, Cashel, and Tuam. The Roman Catholic clergy and churches are all supported by voluntary contributions. The college at Maynooth, for the education of those studying to become priests, was founded in 1795. There are several other Roman Catholic ecclesiastical seminaries and colleges.

The Reformation never made much progress in Ireland, and though a Protestant Episcopal church was established by law, it was only the church of a small minority. In 1869 it was disestablished. Previous to this time the clergy were supported by a tithe rent-charge, the proceeds of the Church lands, etc., the total annual income of the Church, including the value of houses and lands in occupation, being about $3,068,920. By the above act, taking effect from 1 Jan. 1871, the position of the Church and clergy was entirely changed, though those holding benefices at the time of its passing have not suffered loss. The property and tithes formerly belonging to the Church are now vested in commissioners, who pay to all deprived of income by the act, so long as they continue to discharge the duties of their offices, such an annual sum of money as they would otherwise have received, deduction being made of curates' salaries, and other outgoings to which the parties would have been liable, and regard being paid to the prospective increase of incomes by the falling in or cessation of such charges; or instead of an annual sum, an equivalent single payment has been paid to such as have commuted their claims in that manner. The Irish Church accordingly is no longer a state Church, and none of its bishops have now a seat in Parliament. It is still a vigorous and flourishing institution, however, and possesses funds amounting to over $40,640,000. Of this, upward of $20,000,000 have been voluntarily contributed by friends of the Church since it was disestablished. While disestablishing the Irish Church, the act at the same time declared the cessation of the Maynooth grant and the *Regium Donum.* The affairs of the Irish Church are now managed by the diocesan synods and by the general synod in conjunction with the representative body. The supreme legislative powers reside in the general synod, which meets in Dublin, and is composed of the archbishops of Armagh and Dublin and the 11 bishops, and of lay and clerical representatives from the different dioceses; the lay representatives being more than twice as numerous as the clerical. The representative body incorporated in 1870 consists of the archbishops and bishops *ex officio,* 39 lay and clerical elected members (three for each diocese), and 13 co-opted members elected by the other two classes conjointly. This body is empowered by its charter to hold Church property, subject to the regulations of the general synod. The Church uses the Book of Common Prayer, as revised in accordance with statutes passed by the general synod, and furnished with a preface containing an exposition of its formularies in the sense in which they are understood by the Church.

The Presbyterian Church of Ireland is chiefly confined to the province of Ulster, where it may be said, more especially in the counties of Down and Antrim, to be the leading religious denomination. Its ministers are supported by voluntary contributions, seat-rents, and church funds. They were formerly aided by an annual grant from government, called the *Regium Donum,* the amount of which, paid in 1869, was $202,735. This annual grant, however, was abolished, as already mentioned, by the Irish Church Act of 1869, and was commuted to a single sum of $3,506,860 paid to the Church. According to the census of 1901 there were in Ireland 3,310,028 Roman Catholics, 579,385 Protestant Episcopalians, 443,494 Presbyterians, 61,255 Methodists, and 56,703 members of other persuasions, besides 3,769 Jews.

History.—The beginning of the history of Ireland is, like that of all European nations, enveloped in fable. Among the ancients it was known at least as early as the time of Aristotle, who calls it *Ierne.* In Diodorus Siculus it is called *Iris;* in Strabo, *Ierne;* in Pomponius Mela, *Iverna;* in Pliny, *Hybernia.* Plutarch calls the island *Ogygian,* meaning very ancient, and says: "They drew their history from remote antiquity, so that of other nations is new compared with them." Yet the information to be found about Ireland in the works of the ancient geographers and historians is altogether very scanty. The bardic historians of the country speak of Greek and Phœnician colonies, and lists of kings, for which there is no authentic, but some probable, foundation. The vernacular language of the Irish proves that they are a part of the great Celtic race which was once spread all over Western Europe. The first probable records of the Irish people show that for the times they were advanced in civilization. The ancient bards were called *Fileas* or *Feardanos,* which means philosophers. Cæsar mentions in his 'Gallic Wars' their advancement. Pliny, Cæsar, and other authors say that the Druids who inhabited Ireland were learned; they knew philosophy and the sciences. In the Irish chronicles we find that in the reign of Eochy the First, more than a thousand years before the birth of Christ, "society was classified into seven grades, each marked by the number of colors in its dress, and that in this classification men of learning, that is, eminent scholars, were by law ranked next to royalty." Another proof of the existence of an ancient civilization, marvelous for its time, was the institution of Feis Tara or the Triennial Parliament of Tara. The monarch, Ollav Feola, who reigned as Ard-Ri, or monarch, of Erinn, about 1,000 years before Christ, established this parliament. The subordinate royal princes or chieftains, constituted one branch; the Ollavs or law-givers, and bards, judges, scholars, and historians, another branch; and the third consisted of the military commanders. Under the Ard-Ri, or monarch, were the kings of the provinces, and under each king were the clans who were governed locally by a chief, each clan selecting its own. Wars were frequent, as fighting and bloodshed were common pastimes throughout the then known world. The battle was the final court of appeal, and in most instances the first court of trial. A cause of dissension in Ireland, as in Great Britain and other countries, was the antagonism

1. Blarney Castle.

2. Innisfallen, Lake Killarney.

existing among people of different races. The Milesians, the Tuatha de Danaans, and the Firbolgs (q.v.) were distinct races centuries after the Milesians landed in Ireland. The differences among themselves seem not to have seriously affected their union when attacked by a common foe; as at the birth of Christ, when Rome was mistress of nearly all of Europe, she had never gained possession of Ireland. The introduction of Christianity into Ireland was not attended with bloodshed as in many other countries; indeed, afterward the nation seems to have enjoyed a season of repose from strife, although southern Europe was being overrun with the Germanic hordes. This repose favored the growth and expansion of Christianity and the progress of learning. The schools and monasteries founded by Saint Patrick and his bishops in the 5th century became the centres from which went forth many scholars; and even as early as the 6th century, Ireland became the seat of western learning; and its monasteries were the schools from whence missionaries who disseminated the Christian faith throughout continental Europe proceeded. In the 8th and 9th centuries the scholars of Ireland were among the most distinguished at the courts of the kings, especially at that of Charlemagne, but when the Northmen commenced their descents some of the schools were destroyed and the monks dispersed. The ravages of the Danes at this period had results different from the attacks of the Romans. The continued attacks for nearly two centuries fostered internal dissensions, when in the beginning of the 11th century Brian Boroimhe (Brian of the Tribute) united the greater part of the island under his sceptre, restored public tranquillity, and subdued the northern invaders. After a contest of about 20 years he conquered Malachy, the brave warrior who "wore the collar of gold" won from the Danish invader, and became Ard-Ri of all Erinn. After the death of Brian, the island became a place of dissension; frequent wars rendered them weak against a foreign foe. This condition was largely the result of the divisions, made by Brian, of the island among his three sons. At this time Henry II. of England, professing love for Ireland and a great desire to restore peace, sought to gain possession of the island. This was the beginning of the Anglo-Norman invasion of Ireland. Henry II. claimed to have received from Pope Adrian IV. a bull authorizing him to take possession of Ireland. (The authenticity of this bull is very doubtful.) After some delays occasioned by internal troubles in England, Henry attempted to gain possession of Ireland. For many years after, the history of Ireland was a record of persecution, confiscation of lands, and attempts to wrest from the people inalienable and hereditary rights. So great was the resistance that in the 14th century, at the time of Richard II., the authority of England extended practically over only a small portion of country on the eastern coast, called "The Pale" (q.v.). This was governed by various nobles subject to a viceroy. The subjection was, however, sometimes little more than nominal. The nobles quarreled among themselves, and were very often at open feud. The beginning of the reign of Edward III. (1327) was marked in Ireland by the outbreak of civil strife in every part of the English "Pale," advantage of which was taken by the Irish for a general rising, which threatened the safety of the English colonists, and which the government found itself unable to subdue, until it yielded to the demands of the barons in Ireland, by granting them complete civil and military jurisdiction in their own districts. During the wars with France some Irish troops served in the English armies, and the common sympathies induced by that circumstance seemed likely to promote a better state of feeling between the two races, when the breach was made wider than ever by the celebrated statute of Kilkenny (1367), framed under the viceroyalty of Lionel, duke of Clarence, son of Edward III., forbidding, under severe penalties, intermarriages between English and Irish, the assumption of Irish names by persons of English blood, the use of the Irish language, the native (Brehon) law, etc. In consequence of this the disturbances between the Irish and English inhabitants of Ireland increased so greatly that the English viceroy found it necessary to protect The Pale by payments of money to the Irish chiefs, and this state of matters continued during the reigns of Richard II., Henry IV., and Henry V., until, in that of Henry VI., when Richard, duke of York, was appointed governor of the island, who succeeded by his politic measures in restoring peace. In the reign of Henry VII. (1495) was passed Poyning's Act (so called from Sir Edward Poyning, lord-deputy of Ireland), which provided that all former laws passed in England should be in force in Ireland, and that no Irish Parliament should be held without previously stating the reasons on account of which it was to be summoned, and the laws which it was intended to enact. The power of the English government in Ireland was thus strengthened, but nothing was done to improve the condition of the Irish, whom the oppressive severity of the English yoke embittered without subduing. At the beginning of the 16th century the greater part of the island still remained unconquered by the English. The Irish still lived according to their old constitution under their own chiefs. In 1541 Henry VIII. received from the Irish Parliament the title of King of Ireland; but he did nothing to extend the English sway, or to improve the social circumstances of the people. The Reformation which took place in England during this reign took but a slight hold upon Ireland even in the English districts; but the monasteries were suppressed, and the tribute to the Papal see abolished. Elizabeth's reign was marked by a series of risings, which finally terminated in a general war against England, usually called the Rebellion. Hugh O'Neil, who had been raised by the queen to the dignity of Earl of Tyrone, was the leader in this war, which, though successfully begun, ended with the complete defeat of the insurgents, and the reduction of the whole island by the English (1603). More than 600,000 acres of land were taken from the Irish chiefs, and for the most part distributed among English colonists. The reign of James (1603–25) was somewhat favorable to Ireland; the arbitrary power of some of the chieftains was restrained, and the administration of justice improved, etc.; but the means which he took to effect some of these improvements were tyrannical. He demanded from every Irish chief the document upon which he rested his claim to his property, and if it were

not to be found, or contained even any formal error, his lands were forfeited to the crown. Of 800,000 acres of land which in this way came into the hands of the king in the north of the island, a large share was entirely withdrawn from the Irish, and divided among Scotch or English settlers. In addition to this, the Catholics, on account of the oath of supremacy by which all public officers were required to acknowledge the king as head of the church, remained excluded from all official appointments. The Roman Catholic hierarchy established in the 5th century was still in existence. Various circumstances, led, in 1641, to an attempt to shake off the English yoke. Dr. Lingard says of this insurrection that it has been usual, for writers to paint the atrocities of the natives, and to omit those of their opponents, but that revolting barbarities are still recorded of both, and that if among the one there were monsters who thirsted for blood, there were among the other those who had long been accustomed to deem the life of a mere Irishman beneath their notice. After the death of Charles I., Cromwell was appointed (15 Aug. 1649) lieutenant of Ireland. With great cruelty, he reduced the whole country within nine months. All the possessions of the Catholics were confiscated, about 20,000 Irish were sold as slaves in America, and 40,000 entered into foreign service, to escape the severity of the conqueror. (See Drogheda.) Charles II. restored a portion of the lands, but fully two-thirds remained in possession of the English or of Irish who had become Protestants. Under James II. some changes were made; under his viceroy, Earl of Tyrconnell, Catholics were given a fair representation in Parliament. In the English Revolution of 1688, the Catholics of Ireland sided with James, and the Protestants with William III. For a time the army favoring James were fairly successful; but the landing of William in Ireland changed matters. The battle, 1 July 1690, at Boyne, won by William, proved a turning point, as it encouraged the English and in a great measure discouraged the Irish. Sarsfield's gallant defense of Limerick, the last place in Ireland that held out for James, saved that city from capture by William's troops; but on 3 Oct. 1690, the city capitulated, a treaty being concluded with Gen. Ginkell on behalf of the English, according to which the Irish were to be allowed the free exercise of their religion, as had been granted by Charles II. More than 12,000 Irish that had fought on the side of James went into voluntary exile. The Treaty of Limerick was not kept by the English, a fact which is commemorated by the name which the Irish still give to the place at which it was concluded, "The City of the Violated Treaty." By a decree of the English Parliament upward of 1,000,000 acres of land were now confiscated and divided among Protestants. In order to keep down every movement of the Catholic population, cruel penal laws were passed against those who adhered to that form of religion. By these laws the higher Roman Catholic ecclesiastical dignitaries were banished from the island; the priests were not allowed to leave their counties; no Roman Catholic could hold a public office, acquire landed property, enter into a marriage with a Protestant, etc. Such suppression and persecution naturally led to the formation of secret organizations whose object would be an overthrow of those in power, in order to secure freedom and justice. "Whiteboys," "Levellers," and a number of kindred organizations were formed, whose methods were not always fair; but who were brought into existence by force of circumstances. All this, however, did not ameliorate the general condition of the country, and it was not till the American War of Independence taught the English government the folly of attempting to govern a people by coercion, that the severity of the laws relating to Ireland was mitigated. In 1778 the penal laws against the Catholics, although not repealed, were made much more lenient. Catholics were henceforth permitted to acquire landed property, to erect schools, and to observe their own religion under fewer restrictions. In 1783, Poyning's Act was repealed.

The outbreak of the French Revolution had naturally a great effect on the minds of the Irish people. Out of a corps of volunteers which had been formed in 1779, but which had been dissolved a few years later, a society was formed calling itself the Society of United Irishmen, which included in it many Protestants, and which sought to make Ireland an independent nation. The Catholics at the same time took advantage of the embarrassment of the British government to demand equal rights with the Protestants, and the government gave in to this demand so far as to remove the hindrances which had been placed by the law in the way of Irish trade and industry, and to repeal nearly all that remained of the penal laws against the Catholics, who now received the right of acting as counsel before the court, and of entering into marriages with Protestants. When further demands were refused, the Society of United Irishmen allowed its revolutionary aims to become more apparent, and the government then determined to quell the movement by force. The Habeas Corpus Act, which had been introduced into the country in 1782, was repealed; the towns were strongly garrisoned, and the society dissolved and disarmed. But the conspirators, trusting to expected aid from France, were not discouraged. At the close of 1796 a considerable French fleet did actually appear off the Irish coast bearing 25,000 land troops, under the command of Gen. Hoche; but owing to adverse winds, and the incompetence of the commanders, it was obliged to return without having accomplished anything. The only effect of this expedition was to induce the government to take still stronger measures in Ireland, the whole of which was placed under military law. The United Irishmen were thus prevented from taking any open steps for renewing the society, but they continued to pursue their ends in secret, and devised for themselves a very skilful military organization. At its head was a directory of five men, whose names were known only to those at the head of the provincial committees. In January 1798 the society already numbered more than 500,000 members, when a treacherous member gave information regarding the society to the government, and several of the leaders were seized. In consequence of this the conspirators, not knowing the extent of the revelations that had been made, resolved to anticipate any further preventive measures on the part of the government, and rushed into premature action. In May 1798, simultaneous

risings took place at different parts of the island; but the government was fully prepared, and the main body of the insurgents, who made a brave fight, suffered a decisive defeat at Vinegar Hill on 21 June. Flying columns traversed the island, and checked by the most violent measures any further outbreaks. In August a French squadron appeared in Killala Bay with 1,500 men on board, under Gen. Humbert; but the British troops prevented a junction with the insurgents, so that they were soon compelled to surrender. Another French expedition which approached the Irish coast in September was overtaken and attacked by Admiral Warren, and nearly all the ships composing it were captured. Several subsequent attempts of the French were similarly frustrated.

The events of this insurrection brought the British government to form the resolution of uniting the Irish and English Parliaments, since in the state of feeling which that movement too plainly manifested as prevailing among the people, it was seen that the independence of legislation enjoyed by the country fostered the desire of political independence, and it was feared that new revolutionary efforts might thence derive a legal sanction. The first proposal to this effect which was made in the Irish Parliament was rejected with indignation. The government then resorted to bribery to secure its purpose, and $8,000,000 was spent in buying up the rotten boroughs which had the majority of seats in the Irish House of Commons. The Irish landlords were from the first favorable to the project. By these means an act providing for the legislative union of the two countries passed the Irish Parliament on 26 May 1800, and the British Parliament on 2 July in the same year, in virtue of which the union was effected on 1 Jan. 1801. But although this measure bound the destinies of Ireland still more closely to those of England, yet it was far from putting an end to the religious and political troubles which had so long divided the two countries. In order to gain the masses the enlightened Pitt had promised a complete political emancipation of the Catholics; but the bigoted George III. could not be induced to make this concession. Enraged at this great breach of faith the Catholics in 1802 formed a Catholic Association, having for its object the accomplishment of this end; but it was not till the period of O'Connell's agitation, favored by a change of public opinion in England, that the government was induced to bring in an Emancipation Bill, which after passing both houses of Parliament, received the assent of George IV. on 13 April 1829. A new oath, which could be taken by Catholics as well as Protestants, was substituted for the one previously required from members of Parliament, and the Catholics were thus enabled to take a seat in the house. They were also allowed to fill all public offices except that of lord-chancellor.

This victory was greeted by the Irish Catholics with great joy; but they wanted more than emancipation which meant permission to hold certain offices, they wanted independence. The efforts of the national party were now directed to the repeal of the Union, for which purpose O'Connell founded the Repeal Association, which caused the Grey ministry in 1833 to bring before Parliament the Irish Coercion Bill (q.v.). When this bill became law the Lord-Lieutenant of Ireland was empowered to forbid all assemblies of the people, and to proclaim military law throughout the island; and in order to give force to the act an army of 36,000 men, besides 6,000 armed police, was sent over. The Coercion Act was indeed soon repealed, and from 1835, under the viceroyalty of Lord Mulgrave, a better feeling seemed to be growing up between the people and the government. But when the Tories came again into power in August 1841, O'Connell began anew the repeal agitation, and with such boldness that in 1843 the authorities caused him to be apprehended on a charge of conspiracy and sedition, on which he was convicted and condemned to pay a fine and suffer imprisonment for a year. These proceedings were, however, declared illegal by the House of Lords, and O'Connell was released. Soon after the terrible famine which visited Ireland in the autumn of 1845, and still more severely in the summer of 1846, cast all other interests into the background. The spirit of the people seemed broken, and many of them sadly left their native land and by hundreds of thousands emigrated to America. In the midst of this crisis O'Connell died, and the place of the party which he led was taken by one still more advanced, which received the name of Young Ireland. In these circumstances of political excitement the French revolution, which took place in February 1848, had a great effect upon Ireland. The leaders of the Young Ireland party, Smith O'Brien, Mitchel, Duffy, Meagher, and others, entered into relations with the provisional government at Paris, and the people generally began openly to provide themselves with arms, and to exercise themselves in the use of them. But the measures of the government fustrated the designs of the conspirators. The Habeas Corpus Act was suspended, the insurrectionary newspapers suppressed, and Smith O'Brien, who had been hailed by the people as King of Munster, and a number of his associates were arrested and condemned to death. This punishment was afterward commuted to transportation. In a short time peace was restored; but the material distress remained undiminished. Famine and disease decimated the population. The agricultural holdings were deserted, whole districts remained uncultivated, and a constant and overflowing stream of emigration directed itself toward the United States.

After a time agriculture revived, and the manufacturing industries of the island began to compete with those of England. In 1849 were chartered the Queen's Colleges, offering the same advantages to Catholics as to Protestants; but these institutions have been taken comparatively little advantage of by the former. The history of those institutions made the Catholics fear they were meant as a menace to their faith. In 1852 telegraphic communication was opened with Great Britain. In 1853 an industrial exhibition was held at Dublin, resembling that held two years before in London; another exhibition was held in 1865. The latter year witnessed the discovery of a new conspiracy designed to effect a separation between England and Ireland. This had its origin in America at the time of the Civil War in the United States, when the numerous Irish in that country saw an opportunity in England's attitude toward the seceding States. This conspiracy, originating among the

members of a secret society calling themselves Fenians (see FENIANS), soon spread to Ireland; but before the Fenians could take any overt action in that island their design was stifled by the proceedings of the British government (1865–6). The attention of English statesmen was now strongly drawn to the necessity of doing all that could be done to render the Irish people loyal and contented; and with this view an act to disestablish the Irish Protestant Episcopal Church was passed in 1869, and another to improve the tenure of land, in 1870. Since 1871 an agitation for what is called Home Rule has made itself prominent. In 1880 Ireland became the scene of an agitation carried on mainly by a body calling themselves the Land League. Various severe laws were passed to "coerce," but further concessions were made, and to redress Irish grievances a land act was also passed in August 1881. Under this act substantial reductions on rents were made. The Land League was suppressed, but a new body called the National League was soon organized in its place. Another act for the relief of tenants in arrear with their rents was passed, 1885. In 1885, 86 Nationalist members, headed by C. S. Parnell, were returned to Parliament, and their pressure on the government led to the production of a scheme by Mr. Gladstone, in 1886, by which Ireland was to receive a parliament of her own and the Irish members to be withdrawn from the Imperial Parliament. This scheme and the accompanying land purchase scheme were rejected by Parliament and the constituencies; and a fresh act against crime in Ireland was passed in 1887, although statistics showed the island was in a most peaceable condition, and no remarkable acts of lawlessness were being committed. In 1898 a very important Local Government (Ireland) Act was passed. It established county councils, urban district councils, rural district councils, and boards of guardians in Ireland, and transferred to them the administrative functions formerly discharged by the grand juries and presentment sessions. The first elections under the act took place early in 1899. The results showed that the voters of Ireland realized they were gaining ground. They never lost an opportunity to proclaim their discontent with the existing land laws, and their desire for "Home Rule." The Irish members of the British Parliament kept the cause of Ireland before the people; and in 1903 a further concession was gained. On 1 Nov. 1903 a new "Land Act" went into effect whereby the tenants, sub-tenants, or the people, may purchase the land and hold it as their own. Arrangements were made to assist the tenant in making the purchase.

Ireland, Church of. See IRELAND.

Ireland, Language of. See CELTIC LANGUAGE.

Irenæus, ī-rē-nē'ŭs, **Saint,** one of the Greek Church Fathers: b. Asia Minor: d. Lyons, France, about 202. He was a learned and zealous man, a pupil of Polycarp and Papias. He actively opposed the Gnostics, and especially the Valentinians. His works are lost, except his 'Libri V. adversus Hæreses,' of which there are fragments in the original Greek, and a Latin version, made, it is supposed, toward the end of the 4th century. He suffered martyrdom at Lyons, of which he was bishop, in the persecution under Septimius Severus.

Irene, ī-rē'nē, empress of Constantinople: b. Athens about 752 A.D.; d. Lesbos 15 Aug. 803. In 769 she married Leo IV., after whose death, caused, as is generally believed, by poison administered by her, she raised herself (780) and her son Constantine VI., then but nine years old, to the imperial throne. When Constantine came of age he refused to permit her to participate in the government, and seven years later was arrested at the order of his mother, blinded and at last murdered. Irene was the first woman who reigned over the Eastern Empire. Her triumphal entrance into Constantinople, her liberality, the freedom bestowed on all prisoners, and other artifices employed by her, were not sufficient to secure her from the consequences of her criminal accession. She had ordered many nobles into banishment, when Nicephorus, her treasurer, who had secretly been made emperor, exiled her in 802 to the Isle of Lesbos. Her zeal for image-worship has caused her to be regarded as a saint by the Greek Church.

Ireton, īr'tŏn, **Henry,** English general and statesman: b. Attenton, Nottinghamshire, 1611; d. Limerick, Ireland, 26 Nov. 1651. He was graduated at Trinity College, Oxford, and brought up to the law: but when the civil contests commenced joined the parliamentary arm-

and by the interest of Cromwell, whose daughter Bridget he married in 1646, became commissary-general. At the battle of Naseby he commanded the left wing, which was defeated by the furious onset of Prince Rupert, and was himself wounded and made prisoner. He soon recovered his liberty, and took a prominent part in all the transactions which threw the Parliament into the power of the army. He had also a principal hand in framing the ordinance for the king's trial, and was one of the judges. Ireton accompanied Cromwell to Ireland in 1649, and was left by him in that island as lord-deputy. He reduced the natives to obedience with great vigor, but not without cruelty. He was buried in Westminster Abbey, and after the Restoration his body was taken up, suspended from the gallows with that of Cromwell, and buried in the same pit.

Irid'ium, a metallic element resembling platinum in its general properties, and occurring in nature in the metallic form, alloyed, usually, with platinum and osmium. The commercial supply comes chiefly from the Ural district, from Brazil, and from Borneo. Small amounts have also been obtained from California. The existence of iridium was first recognized, in 1802, by Tennant, who observed that an insoluble residue remained behind after dissolving platinum ore in aqua regia. In 1804 he showed that this residue contains two new metals, to which he gave the respective names "iridium" and "osmium." The separation of iridium from the other metals of the platinum group is a matter of some difficulty; and for details of the processes employed the more extended treatises on metallurgy and the chemistry of the metals must be consulted. Iridium is frequently obtained in the form of a spongy gray mass, or a gray powder; but by heating either of these to whiteness, and subjecting them to compression, the metal may be brought into the form of a compact, lustrous mass resembling steel. In this form it is harder than iron, and somewhat malleable when hot, though brittle when cold. At ordinary temperatures it has a specific gravity of about 22.4, being, with the exception of osmium, the heaviest substance known. Its specific heat is about 0.0323 at ordinary temperatures, and its coefficient of linear expansion (Fahrenheit) is about 0.0000039. Its melting point is very high, the estimates given by various authorities ranging from 3,600° F. to 4,500° F. Compact iridium, after being strongly heated, is insoluble in all acids, and is not affected by air or moisture. The metal has the symbol Ir, and an atomic weight of 193 if O = 16, or 191.5 if H = 1. It forms numerous salts, but these are of no practical importance. The name "iridium" (from Greek, "rainbow,") refers to the varied colors exhibited by the salts of this element, as they pass from one state of oxidation to another. Metallic iridium, either alone or alloyed with other metals of the platinum group, is used in the arts to a limited extent, where a hard, noncorrosible metal is needed. In particular, it is used for the tips of gold and stylographic pens, for the construction of standards of length, and for standard electrical resistance coils.

Iridosmine, ĭr-ĭ-dŏs'mĭn, or **Osmiridium,** a natural alloy of iridium and osmium in varying proportions, is a hard slightly malleable mineral, crystallizing in hexagonal prisms. It occurs as irregularly flattened grains, and contains some platinum, rhodium and other metals of the platinum group. It is found associated with platinum in the Ural Mountains, in South America, and elsewhere. It is also found in the black sands on the ocean beaches of northern California, and a small amount is recovered yearly by placer miners in the Sierra Nevada. Iridosmine is used to a small extent for pointing gold pens.

Iriga, ē-rē'gä, Philippines, pueblo of the province of Ambos Camarines (Sur), Luzón, on the Buhi River, 23 miles southeast of Nueva Cáceres. It is on the main road, is a military and telegraph station, and one of the most important towns in the province. Pop. 17,100.

Iris, ī'rĭs, in Greek mythology, daughter of Thaumas and Electra, sister of the Harpies, the fleet golden-winged messenger and servant of the Olympian gods, especially of Zeus and Hera. Iris was originally the personification of the rainbow, though she does not appear in the Homeric poems as the goddess of the rainbow. She is sometimes represented as a beautiful virgin with wings and a variegated dress, with a rainbow above her, or a cloud on her head exhibiting all the colors of the rainbow.

Iris Family, a natural order of monocotyledonous herbs, mostly perennials with tubers, corms or rhizomes, and usually with an acrid flavor. About 800 species belonging to more than 50 genera have been described from temperate and tropical climates, mostly from South Africa and tropical America. They are characterized by two rows of leaves, the outer of which fit over and protect the inner (equitant); regular or irregular perfect flowers which are frequently handsome; perianth six parted, the other floral organs in threes; and many-seeded, three-celled fruits (capsules). Some species have been used as food in countries where they are native; others furnish rootstocks which are used for making perfumes, especially orris; some few have been employed to a limited extent in medicine; but the species most widely popular are cultivated for ornamental purposes. Of these last the most important genera are *Iris* (fleurs-de-lis), *Gladiolus, Freesia, Crocus, Tigridia, Tritonia, Sisyrinchium, Ixia* and *Belemcando,* elsewhere described.

The plants of the genus *Iris* constitute one of the chief ornaments of the northern regions of the globe, and usually grow in wet places, bearing flowers of various colors, but the prevailing tint is blue. The common wild iris or flag (*I. pseudacorus*), common in Europe and also found in the eastern United States, has yellow flowers of large size and long sword-like leaves. The gladdon or stinking iris (*I. fœtidissima*) is a British species, with bluish flowers. Among favorite garden species are the English iris (*I. xiphioides*), the Persian iris (*I. persica*), the common iris (*I. germanica*), the snake's-head iris (*I. tuberosa*), and the Chalcedonian iris (*I. susiana*). Orris root consists of the rootstocks of the white-flowered *I. florentina* and some other species. Among other species found in the United States are the larger blue flag (*I. versi-color*), common from the Atlantic coast to the Mississippi, the slender blue flag (*I. virginica*), and several dwarf species.

Irish Academy, Royal, a literary and archæological association founded in Dublin, Ire-

land, in 1786. Its object is to promote the study of literature, antiquities, and science. The library founded and owned by the association contains a large number of Irish manuscripts and documents of public interest. It has a fine collection of antiquities which have been loaned to the National Museum, Dublin. The association is governed by a council consisting of 21 members. This council meets regularly several times a year. The work is divided among the members, who are subdivided into committees. The committees are three in number; committee of literature, committee of science, committee of antiquities. Students making historical research in Ireland have found this association of great assistance.

Irish Catholic Benevolent Union, a fraternal organization founded in the United States in 1869. It has 149 subordinate societies and 14,000 members. The benefits disbursed since organization have amounted to over $2,500,000, and during the year 1902 amounted to $45,371. The membership in the union is confined to persons of Irish extraction who are communicants in the Roman Catholic Church.

Irish Deer, or Elk. See ELK.

Irish Language, Society for the Preservation of, an organization established in 1873, in Boston, Mass. The object is to foster the study of the Gaelic language so that it may again be one of the spoken languages of the Irish people. At first the society was called the Philo-Celtic Society. The headquarters are now in Dublin, where the organization was established in 1877. It has a number of branches in different parts of the United States.

Irish Land Laws. Under the Brehon laws, when the people of Ireland were divided into tribes, the land was usually the property of one of the four or five tribes which were the strongest in Erin. A large portion was given to the king or chief of the tribe, then divided among the clans that made up the tribe. Here again a large portion was given to the chief of the clan and then divided among the septs. The chief of the septs received the largest portion of the amount set apart for the sept. The free tribesmen, after the chief, received the greater part of the sept lands.

Some of the tribesmen, the Ceil, owned cattle, some, the Daer and Saer, were loaned cattle by the chief. The Fuidhir were the tenants who performed the manual labor.

When a chief died, the tribesmen distributed his land among his descendants, and when a tribesman died, the chief distributed his property. After England took possession of Ireland, the land tenure in a large part of the island continued to be administered under the Brehon laws; but within "The Pale" the English feudal system prevailed; there the king alone owned the land and the tenants derived ownership from him. Gradually England forced her land laws upon Ireland. This was done by driving the "rebellious Irish" out of certain counties. Kings and Queens, then all Ulster, when the Ulster plantation was established, in 1607. Other confiscations and dispossessions took place until all Ireland came under the English law. Cromwell took forcibly the best lands of Munster and Leinster and a large part of Ulster, and divided the whole among his soldiers. Although some of the lands were restored later, it was retaken, by act of Parliamen, under William III. Naturally the chiefs and leaders among the people of Ireland were deprived of their lands and the friends of the king of England or the English government, were given Irish possessions as a reward. The penal laws later made it a crime for a Catholic to acquire or hold land. Thus the Irish land question virtually began with the entrance of Henry II. into Ireland. With the Irish owners deprived of their lands there was instituted the system of "landlordism" which has been a hindrance to Ireland's progress. The majority of those who owned the land did not live upon it, and usually the money received for rent was spent in a foreign country. The landlord owned only the land, the houses had to be built and all improvements had to be made by the tenant and at his own expense. The more a holding was improved, the more rent was demanded. The "middle men" who held lands under the owner, and sublet to tenants were the means of increasing the burdens of the peasantry. The commission under Lord Devon, in 1843, to investigate conditions in Ireland, revealed an alarming state of affairs and the famine of 1846–8 brought the Irish Land question to the notice of the whole civilized world, even many of the English statesmen who had censured Irish shiftlessness were astonished when they learned the nature of the land laws which gave power of eviction without any remuneration for improvements; and the wonder was that so much thrift and industry existed. In 1847 Lord Russel endeavored to have Parliament pass an act to protect the tenant against loss by eviction. This measure failed, and others accepted by Parliament later proved ineffectual. Two years after the terrible devastation by famine, the Tenant Right League was organized in Dublin, and its members began a systematic campaign to elect to Parliament members pledged to support measures for the relief of the tenants. The Land Acts of 1860, under the Palmerston ministry, may be said to have resulted from the agitation kept up by the Tenant Right League. Various other organizations for the betterment of the people of Ireland were established, and among them were "physical force" societies. In 1870, under the Gladstone ministry, three new laws were enacted; that a tenant could not be evicted if his rent were paid; that this non-payment must be for at least three years; and that if the tenant choose, he might sell his improvements. This purchase of improvement clause was a great advance in favor of tenants' rights. The Land League in various parts of the world, especially the United States, continued the agitation and brought the question of the wrongs of the Irish tenants before the whole world. The Ashbourne Act of 1885 provided for the purchase of the lands by the tenants and nearly $25,000,000 was set aside for that purpose. Later a like amount was added. In 1891 the Balfour Law Purchase bill was passed and nearly $150,000,000 was provided for its enactment. In 1896 this law was improved; but for various reasons all the laws enacted by Parliament proved ineffective only in so far as the bringing of the matter to the notice of fair-minded statesmen. (See LAND LEAGUE.) The most radical and satisfactory "Land Purchase Bill" was enacted 14 Aug. 1903, whereby the tenant

may purchase and own land and the government will, under certain and fair conditions, be responsible for the payment. To George Wyndham, who as chief secretary for Ireland, prepared the bill, the credit is largely due for the passage of the act. (See WYNDHAM, GEORGE.) Consult: Reports on the "Land Purchase" acts for relief of Ireland; Hansard's 'Parliamentary Debates'; Guinell, 'The Brehon Laws'; Maine, 'Lectures on the Early History of Institutions'; Fisher, 'History of Landholding in Ireland'; Richey, 'The Irish Land Law'; Godkin, 'The Land War in Ireland'; Richey, 'The Irish Landlord.'

Irish Literary Society, an organization established in 1892, in London. Its object is to promote the study of Irish literature, music, art, and history. Some of the leading Irish literary men and women of England and Ireland are active or honorary members, and strive in many ways to promote the work of the society. The society provides lecture courses on topics pertaining to literary Ireland, and it has a large library which may be used by any of its members. Some of the members are Justin McCarthy, W. B. Yeats, Rev. Stopford Brooke, Barry O'Brien, and several of the well known writers among the Irish women. There were (in 1903) about 625 members.

Irish (Gaelic) Literature. See CELTIC LITERATURE.

Irish Moss, an edible dulse or seaweed. See CARRAGEEN.

Irish Music has been celebrated from almost prehistoric times, Irish teachers of the art as early as the 7th century holding high rank as specialists in the faculties of continental and English colleges. While the bagpipe was the popular instrument of the common people, the harp was in great favor among the noble and educated classes, and their professional harpists were noted for their skill. The Irish scale originally consisting of five notes, gradually developed with the addition of a sixth and a seventh, until the Irish harp had a finely graduated scale of tones and semitones either in the key of C or G, extending through a compass of four octaves. A harp in the museum of Trinity College, Dublin, said to be that of Brian Boru, has 30 strings, and the Dallway harp, made in 1621, has 52 strings. The national temperament was so musically imbued that there were special songs and airs for different crafts and for almost every conceivable occasion. War marches were played by the pipers at the head of the clansmen marching to battle; spinning, weaving, smithy, plowing, boating, and sporting songs were in daily use, and there were even milking songs, slow and plaintive airs which had the effect of soothing the cows and induced them to submit gently to the milking operation. In Irish literature, native music is frequently classed under three different styles, known as mirth, sorrow, and sleep music, comprising (1) lively, spirited pieces, as jigs, reels, hornpipes and other dance music; (2) solemn and slow pieces, as laments or dirges, commonly called *caiones* or *keens*, and sung on the occasion of a death; (3) plaintive and soothing airs, such as nurse tunes, cradle songs, lullabies, etc. In the numerous collections of these airs, about 2,000 different melodies are preserved, some of the most popular being 'Savourneen Dheelish,' 'Eileen Aroon' (popularly known by the Scotch appropriation 'Robin Adair'), 'The Coolin,' 'Garryowen,' 'Langolee,' 'Molly Asthore' and 'Patrick's Day.' With the universal spread of music after the 17th century, Irish music as a national feature became merged in the general history of the art. Turlogh Carolan, Carroll O'Daly, Reilly and the Conallons were among the chief of Ireland's ancient harpists and musicians. In modern times Ireland's musical productivity is represented by Michael William Balfe, William Vincent Wallace, Sir Charles Villiers Stanford, and others. Consult: Graves and Stanford, 'Songs of Old Ireland and Irish Songs and Ballads' (1882–92); id., 'Songs of Erin'; Graves and Wood, 'Irish Folk Song'; Graves, 'Songs of Irish Wit and Humor'; and collections of Bunting, Joyce, Moore and Petrie.

Irish Presbyterian Church, formerly called the Synod of Ulster. Its members are mostly descended from the Scotch Presbyterians, who migrated to Ireland by invitation of James I., between 1609 and 1612, to colonize Ulster.

Irish Sea, the body of water between England and Ireland. It is connected with the Atlantic Ocean on the north by the North Channel, and on the south by Saint George's Channel. The north shore of Wales and the southwest shore of Scotland are washed by this sea. It is almost circular in form, about 140 miles north and south, and the same east and west. The largest arms of the sea are on the west shore. The Morecambe Bay on the coast of England, and several large fiords. Dublin and Dundalk bays are the most important on the west coast. The only large islands are the Isle of Man in the north, about midway between England and Ireland, and Anglesey off the northwest coast and a part of Wales.

Irish Terrier, a rough-coated, strongly built terrier, resembling the Welsh and Scotch terriers. See DOG.

Irish Texts Society, an organization established in London. Its object is to promote the study of Irish literature,—that is, of literature in the Irish text. They foster societies and issue publications to aid the work. In 1900 they published their third volume, which contained the poems of Egan O'Rahilly. In 1901 their annual volume contained Keating's 'History of Ireland,' edited by David Comyn. The volume of 1903 contains an 'Irish-English Dictionary.'

Iritis, ī-rī'tĭs, inflammation of the iris, the colored curtain that shows the pupil in its centre. This disease follows several types, depending on the kind and virulence of the causative agent. In the serous form there is an exudation of blood-serum into the space in front of the iris, and more or less fibrinous matter that tends to glue the parts together. Pain shoots through the whole eyeball, and vision is dimmed by the turbid fluid. Persistent adhesions to the lens are formed, causing a permanent distortion of the shape of the pupil. Another form is the plastic, in which the pupil is actually occluded by the fibrinous deposits. Rheumatism and syphilis are the two most frequent causes of the malady, but many constitutional diseases —as gout, diabetes, anæmias, and menstrual disorders—may be factors in causing the disturbance, and it may also be secondary to diseases

in other parts of the eye, or even in the other eye, as in sympathetic ophthalmia. The treatment consists of dilating the pupil by dropping solutions of some drug, as atropine, into the conjunctival sac, treating the constitutional disease at the seat of the malady, and in relieving the pain by hot fomentations, blood letting, and the administration of drugs that are sedative. Syphilitic iritis is a lesion of the third stage of syphilis (q.v.), where tiny spots called gummata grow in the substance of the iris.

Irkutsk, ĭr'kootsk, a provincial government of Russia, in eastern Siberia, separated from China by the Sayan Mountains. It has an area of 287,061 square miles. The country is generally mountainous, but produces rye, barley, oats and vegetables. The most important rivers are the Angara, Lena and its tributary the Vitim. Gold, iron, and salt figure foremost among the mineral products. Agriculture, cattle-breeding, and the transport of goods to and from China are the chief occupations of the people. Pop. 501,237 (one third exiles and forced colonists). The capital city, Irkutsk, on the Angara, is the residence of the governor-general of eastern Siberia and the seat of a bishop.

Iron, a common and exceedingly useful metallic element, which has been known and used in the arts for many centuries. It occurs in nature in the metallic form, both in meteorites and in certain lavas and volcanic rocks; but the commercial supply is obtained by the reduction of the oxids (or other ores) of the metal, by strongly heating them in a blast furnace with carbon. Iron is grayish in color, with a marked lustre. It crystallizes in the isometric system, usually in the form of cubes or octahedra. The melting point of iron varies to a considerable extent, according to the impurities with which the metal is associated, and also, apparently, according to the physical condition of the iron itself. Pictet gives it as about 2900° F. for iron that is sensibly pure. The specific gravity of the metal also varies to a considerable extent, the determinations ranging from 6.95 to 8.2. The specific gravity of pure iron, at 60° F., may be taken to be 7.85. The specific heat of the metal is about 0.112 at ordinary temperatures, and its coefficient of expansion (on the Fahrenheit scale) is about 0.0000068. Taking the electrical conductivity of mercury (at 32° F.) as unity, the conductivity of iron is about 9.68 at 32° F., and 6.19 at 212° F. Iron is the most magnetic substance known. Soft, pure iron is capable of being magnetized very highly when surrounded by a solenoid of wire that is conveying an electrical current; but its magnetization persists only while the electric current is flowing, falling off, upon the cessation of the current, to a value that is practically negligeable. It is upon this property of temporary magnetization that the action of the telephone, the telegraph, and many other useful electrical inventions depends. (See MAGNETISM; and for a full discussion of the phenomena of magnetization, consult Ewing, 'Magnetic Induction in Iron and Other Metals.') Hardened steel, when magnetized by the action of the electric current (or otherwise), retains a large proportion of its magnetism permanently. Iron becomes non-magnetic at a red heat, but regains its magnetic properties upon cooling again. Wrought iron, when pure, is malleable to a certain extent at all temperatures; but it yields to the hammer with special readiness when heated to whiteness, and it may then be forged and welded without difficulty. The presence of any considerable proportion of sulphur or phosphorus makes the metal "short," or brittle. When phosphorus is present in too great a proportion, the iron is brittle in the cold (that is, "cold-short"); while if sulphur is present in excess it is brittle when hot (that is, it is "hot-short").

Chemically, iron is a dyad. It has the symbol Fe (from "ferrum," the Latin name for the metal), and an atomic weight of 56 if O = 16, or 55.6 if H = 1. It forms two basic oxids, (1) ferrous oxid, FeO, which gives rise to a series of salts known as "ferrous" salts, and (2) ferric oxid (or ferric sesquioxid), Fe_2O_3, which gives rise to a corresponding series of "ferric" salts. A third oxid, having the formula Fe_3O_4, is also known, which is magnetic, and occurs in nature, either amorphous or crystallized in octahedra, as the mineral "lodestone." This oxid is black in color, and is known as the black oxid, magnetic oxid, or ferroso-ferric oxid. It may be prepared, artificially, by oxidizing iron at a high temperature, either in air or in steam, or by heating carbonate of iron to 650° F., in a current of carbon dioxid. It is not readily attacked by acids or other chemical agents, and for this reason a coating of it is often formed on articles of iron to protect them from further oxidation. The Russian iron that is used for stove-pipes is coated in this way, by a secret process. When in mass, iron does not readily decompose water at ordinary temperatures, though it does so at high temperatures. Finely divided iron decomposes water at 212° F., and at lower temperatures according to some authorities. When in a sufficiently fine state of subdivision, iron will burn in the air or in oxygen, with the formation of a mixture of Fe_2O_3 and Fe_3O_4. Iron forms alloys with many metals, and combines directly with chlorine, bromine, iodine, fluorine, sulphur, carbon, boron, silicon, phosphorus, and arsenic. Melted iron dissolves carbon to some extent, and when the molten mass is cooled the carbon is largely deposited in the graphitic form, although a part of it remains in the iron, combined with it in the form of a carbide; and it is believed that the presence of varying quantities of such carbides has much to do with the physical qualities of iron and steel. When melted iron that is saturated with carbon is allowed to cool under great pressure, the carbon is partly deposited in the form of minute crystals of diamond (q.v.); but the manufacture of the diamond by this method has not yet been made commercially practicable.

Ferrous Compounds.— Ferrous oxid, FeO, has not yet been prepared in a state of absolute purity, but it may be obtained approximately pure by reducing ferric oxid, Fe_2O_3, by heating it to 600° F. in a stream of pure hydrogen. It is black in color, and absorbs oxygen with great readiness, passing into the higher oxids. Ferrous sulphate, otherwise known as protosulphate of iron, green vitriol, or copperas, is prepared by dissolving metallic iron in sulphuric acid, and crystallizing by evaporation. It has the formula $FeSO_4 + 7H_2O$, and is greenish in color. It is soluble in water, but the solution oxidizes readily, the salt becoming converted into ferric sulphate, $Fe_2(SO_4)_3$. Ferrous sulphate is largely used in the manufacture of certain black dyes,

in the preparation of writing ink, and, to a certain extent, in photography. The ferrous oxalate developer, made by mixing a solution of ferrous sulphate with one of oxalate of potassium, was formerly in great favor, but has now fallen into comparative disuse, owing to the discovery of other developers that are more active and more convenient to handle. Ferrous chloride, $FeCl_2$, may be prepared by heating excess of iron wire or iron filings in chlorine, or by passing dry hydrochloric acid gas over hot metallic iron. It crystallizes in white, lustrous, six-sided forms, and is volatile at a yellow heat. In air it oxidizes readily to a mixture of ferric oxide and ferric chloride. Ferrous carbonate, $FeCO_3$, is an insoluble compound, occurring in nature as "spathose iron ore," and constituting a valuable ore of iron. Ferrous sulphide, FeS, is a black or grayish-black body, which may be prepared by melting sulphur and iron together in the proportion of 56 parts (by weight) of iron to 32 of sulphur. It is insoluble in water, but dissolves readily in dilute acids, with copious liberation of sulphuretted hydrogen gas. It is therefore greatly used in chemical laboratories, where this gas is extensively used for the separation of the metals. See CHEMICAL ANALYSIS.

Ferric Compounds.— Ferric oxid, Fe_2O_3, occurs native as hematite (q.v.), and it may be prepared artificially by heating ferrous sulphate to redness. Ferric hydrate, $Fe(OH)_3$ is precipitated as a brownish-red powder when ammonia or caustic potash is added to the solution of a ferric salt. Ferric sulphate and ferric chloride are prepared by dissolving this hydrate in sulphuric and hydrochloric acids, respectively. In general, a ferrous salt, when in solution, is converted into the corresponding ferric salt by the action of oxidizing agents; and the ferric salts, conversely, are reduced to ferrous salts by the action of certain reducing agents. Ferrous salts give a white precipitate with caustic alkalies, and, with potassium ferrocyanide, a light-blue precipitate which quickly turns black. Ferric salts give a reddish-brown precipitate with caustic alkalies, and a deep blue precipitate with potassium ferrocyanide. Iron is sometimes called "ferrosum" when it is present in a ferrous salt, and "ferricum" when present in a ferric salt. See IRON AND STEEL INDUSTRY IN AMERICA.

Iron Age, (1) in mythology, the last of the four great ages of the world, supposed to be characterized by abounding oppression, vice, and misery. (2) In archæology, an age, the third in succession, in which weapons and many other implements began to be made of iron, stone having been used for these purposes in the first, and bronze in the second.

Iron, Manufacture of. The metallic products extracted from iron ores for use in the arts are generally divided into three classes: (1) pig or cast iron, (2) wrought iron, and (3) steel. For a description of the distinctions between these products and for their properties, see IRON AND STEEL INDUSTRY; STEEL INDUSTRY; STEEL; STEEL, HEAT TREATMENT OF.

In the present article the methods employed for the manufacture of cast iron and of wrought iron will be shortly outlined. For the methods used in the production of steel, see STEEL, MANUFACTURE OF.

Although the minerals in which iron occurs are very numerous, the only ones from which the metal can be extracted under economical conditions — that is, the only ores of iron — are those in which the iron is present as an oxide, as in magnetites, hematites, and limonites, or as a carbonate, as in siderites. (See IRON ORES.) When carbonate of iron, moreover, is heated to a sufficiently high temperature either at an early stage of the process of manufacture or in a preliminary operation (the calcining of the ore), the carbonic acid which it contains is expelled as a gas and the iron is reduced to the condition of an oxide, hence the operation of extracting metallic iron from its ores always consists in the deoxidation or reduction of iron oxide.

In order to reduce oxide of iron two conditions are essential: (1) contact with a reducing or deoxidizing substance, and (2) a high temperature. By heating iron oxide in contact with some carbonaceous fuel these two necessary conditions are realized, the carbon acting both as the needed fuel and as the needed reducing body, for at a sufficiently high temperature it has a stronger affinity for oxygen than iron and therefore deprives the latter of that element.

Iron ore, however, never consists of pure oxide of iron: in the richest varieties the iron oxide is associated with at least a small amount of other minerals, generally of an earthy character, such as quartz, clay, or limestone, and which are called the *gangue* or *vein stuff*. In the majority of cases the gangue is silicious, that is, made up chiefly of silica or quartz. Silica is *per se* a very infusible compound, but when brought in contact with iron oxide at a high temperature it combines readily with it to form a silicate of iron, a readily fusible substance or slag.

Besides the earthy matters which constitute the gangue, iron ores generally contain other minerals in which are present such elements as phosphorus, sulphur, manganese, etc., and under the strongly reducing conditions prevailing during the operation some of these elements, as well as some of the silica of the gangue, are partially reduced to the metallic state, in which condition they combine with the reduced iron. The influence of these impurities upon the quality of the iron is generally harmful, especially so in the case of phosphorus and sulphur, and their elimination constitutes one of the most delicate problems of the iron metallurgist. Metallurgical fuels also generally contain such impurities as sulphur and phosphorus, and if the fuels be used in contact with the reduced iron, these elements will in part be absorbed by the metal.

Finally, if metallic iron be kept in contact with incandescent carbon for a sufficient length of time, a considerable amount of that element will be absorbed by the metal. The conditions are then said to be carburizing. This affinity of iron for carbon plays a most important part in its metallurgy, chiefly because of the marked influence of carbon upon the melting point of the metal. Pure or rather carbonless iron requires a very high temperature to be melted (about 2,900° F.), necessitating the use of special furnaces and implements capable of producing intense heat. By the introduction of some carbon in the iron, however, its melting point is greatly lowered, from which the im-

portant conclusion is to be drawn that if the metallic product of the metallurgical operation be highly carburized it will be produced and maintained in a liquid state much more readily than if it were freer from carbon. If the iron contains but a small amount of carbon and if we lack the means of producing an intense heat, the product of the operation will be pasty and not molten.

The Primitive or Direct Methods.— The simple operation outlined in the preceding paragraphs which consists in heating iron ore in contact with carbonaceous fuel, was the one conducted in the direct or primitive methods which for ages were the only ones used for the production of iron and steel. Charcoal was the fuel employed and the simple furnace required, called a forge or bloomery, resembled a smith's forge.

So simple is the operation required for extracting a small mass of malleable iron from some rich ore that it seems highly probable that man became acquainted with the use of iron at a very early period of his existence. A fire accidentally lighted by a primeval man upon the ground where iron ore occurred near the surface would have resulted, under suitable conditions, in the production of some metallic iron. Indeed, the first iron furnaces of which we have any record consisted in a single excavation dug preferably on the side of a hill, facing the prevailing wind, and with suitable openings at the bottom for the necessary draft. Artificial blast was later introduced and the construction of the furnace improved. It will suffice to mention here two representative types of this class of furnaces: (1) the old catalan furnace or forge, and (2) the American bloomery, a modern adaptation of this primitive forge.

The catalan forge takes its name from the province of Catalonia, in Spain, where at one time it supplied a large proportion of the world's production of iron, and where, indeed, it is still in operation, as well as in other localities adjacent to the Pyrenees. In its more modern form it consists of a shallow hearth made up of thick iron plates, with the exception of the back, which generally consists of masonry lined with fire clay, while the bottom is frequently made of a movable block of granite. The blast was undoubtedly at first supplied by crude bellows, but was later produced by a water blower or "trompe." The furnace is kept filled with charcoal and small lumps of rich iron ore until a pasty mass of metallic iron is obtained weighing some 350 pounds, called a "bloom," and which contains much slag. It is then removed from the furnace and much of the slag expelled by hammering or squeezing.

For many years a direct process known as the American bloomery process was extensively used in those localities of the United States where suitable ore and an abundant supply of charcoal were available. This process does not differ in any essential feature from the catalan method, which has just been described, but in details of furnace construction and in manipulations there are many points of difference between the two methods.

The hearth of the bloomery is kept full with burning charcoal and coarsely pulverized ores until a bloom of iron weighing some 300 or 400 pounds has been produced and which generally requires three hours. The loss of iron in the operation is said to be about 20 per cent and the fuel consumption some 2½ tons of charcoal per ton of iron produced.

These methods are called direct because they yield iron by the direct treatment of the ore in a single operation, in contradistinction to the modern methods in which at least two distinct treatments are required for the production of iron and steel, the first operation yielding, as will be seen presently, an impure product called cast iron, which must be refined or purified in order to convert it into iron or steel.

While these methods are now obsolete, having been replaced by the more modern indirect processes, they are still in use in some countries, although only to a very limited extent.

According to James M. Swank, in 1902 and 1903 there were no forges in operation in the United States for the manufacture of blooms and billets from the ore. In 1901 the blooms and billets so made amounted to 2,310 gross tons, against 4,292 tons in 1900, 3,142 tons in 1899, 1,767 tons in 1898, 1,455 tons in 1897, 1,346 tons in 1896, 40 tons in 1895, 40 tons in 1894, 864 tons in 1893, and 2,182 tons in 1892. All the ore blooms produced since 1897 were made by the Chateaugay Ore and Iron Company, of Plattsburgh, N. Y., at its Standish Works, which, however, have been idle since 1892.

The Blast Furnace.— In order to prevent the great waste of iron previously alluded to and resulting from the combination of the gangue of the ore with some of the metallic iron, it is necessary to provide a substance with which the silica of the gangue will readily unite, forming with it a fusible slag, and as silica is an acid it is necessary to provide a base to that effect.

Limestone (a carbonate of lime) is the most readily obtainable and cheapest substance for such purpose. It is either burned or calcined in a preliminary operation by which it is converted into lime, the carbonic acid escaping as a gas, or if used raw, it is likewise changed to lime at an early stage of the metallurgical operation by the heat to which it is exposed.

The substances which are thus added for the purpose of forming a fusible compound with the gangue of the ore or with other impurities are called fluxes.

The use of fluxes constitutes one of the most important improvements ever introduced in the manufacture of iron, for it made it possible to extract the metal, under economical conditions, from the enormous amount of relatively lean ores which occur in nature, and to do so at a relatively very low cost. Previously to the use of fluxes it was unprofitable to treat ore containing less than some 60 or 70 per cent of metallic iron, while with their assistance iron ores with as little as some 25 per cent of iron may be profitably smelted.

With the addition of lime, however, it is no longer possible to carry on the operation in the very simple furnace or forge previously used, because the resulting slag or silicate of lime is a much more infusible substance than the silicate of iron produced without the addition of lime and a sufficiently high temperature to fuse this lime slag could not be produced in the forge furnace.

The very high temperature required to fuse the lime slag necessitates the use of a very different type of apparatus (a high, chimney-like

furnace), together with the necessary appliances for the production of the needed heat; in other words, the reduction of the ore must be carried on in the modern blast furnace. The blast furnace was gradually evolved from the primitive forge or bloomery by a mere increase in height, such furnaces as the "Osmund," the "Stückofen," and the "Blauofen" forming as many steps in this evolution. The exact date of the origin of the blast furnace, that is, of an apparatus in which cast iron alone could be produced — and it might be added with addition of flux — is not positively known but it is generally believed that it originated in the Rhine provinces about the beginning of the 14th century.

The operation conducted in early blast furnaces consisted chiefly in smelting iron ore with the necessary amount of charcoal for fuel and of limestone to flux the gangue of the ore. The waste gases which contained a large amount of carbon monoxide were allowed to escape and to burn freely at the top of the furnace. The molten cast iron was allowed to collect at the bottom of the furnace until a sufficient quantity had accumulated, when it was withdrawn by opening a tap hole at the bottom and in the front part of the furnace. The slag was permitted to escape as soon as formed by flowing through an opening and over a stone on one side of the furnace known as the dam-stone. The blast was at first created by rude bellows, later by blowing cylinders, and finally by steam-blowing engines, while no attempt was made at preheating it.

The following improvements introduced in blast furnace practice, outside of mere improvements in construction, marked the most important steps which have led to the modern blast furnace operations. They are mentioned in a chronological order: (1) Use of coke instead of charcoal introduced by Abraham Darby in 1735; (2) the heating of the blast first proposed by James Beaumont Neilson in 1828; (3) the closing of the top of the furnace and utilization of the waste gases by P. Taylor in 1840; (4) the heating of the hot blast stoves by the waste gases of the furnace successfully accomplished between 1833 and 1845 by Faber du Faur and James Palmer Budd; (5) the cup and cone arrangement for closing the top of the furnace invented by G. Parry in 1850; (6) the waste gases used for generating steam by James Palmer Budd in about 1855; (7) regenerative stoves for heating the blast introduced by E. H. Cowper in 1860.

The important and numerous improvements in construction cover every part of the furnace as well as every appliance connected with iron making. To attempt even to mention them would occupy an amount of space which is not here available.

Modern American blast furnaces generally measure from 90 to 100 feet in height and from 20 to 30 feet in diameter at the widest part, while the hearth diameter frequently measures 13 or 14 feet, giving a capacity of from 20,000 to 30,000 cubic feet. The bosh walls which extend from the hearth to the widest part of the furnace are cooled by hollow rings of cast iron or bronze built in sections and inserted into the brick work, and through which water is constantly flowing. The water required for cooling purposes often exceeds 3,000,000 United States gallons in 24 hours. Two down-comers conduct the blast from the top of the furnace to the dust-catchers, from which it is led to the stoves and the boilers by means of a gas main. Another main leads the blast from the stoves to the furnace. Before connecting with the bustle pipe surrounding the furnace the hot blast main frequently divides in order to better equalize the pressure around the complete circle. Explosion doors are provided at the furnace top, and whenever possible in all pipes and chambers carrying gas.

Blast at the rate of 40,000 to 60,000 cubic feet per minute is forced into the furnace through pipes or "tuyeres," varying between 12 and 20 in number, under a pressure of 10 to 15 pounds per square inch and preheated by its passage through the stoves to a temperature of 1,000 to 1,500° F. The output of these furnaces frequently averages 600 tons of pig iron in 24 hours and is occasionally considerably greater, the furnace being tapped six times a day and some 100 tons of iron being obtained at each cast. The tapping hole is frequently opened by means of compressed air drills and closed by means of a tapping hole gun which forces clay into the hole. The fuel consumption varies between 1,500 and 2,000 pounds of coke per ton of pig iron, according to conditions.

The raw materials are conveyed to the top of the furnace by an inclined plane and skip cars, which discharge the raw materials automatically into a receiving hopper provided with a bell and placed over the main hopper. The use of an upper bell acting as a seal while the material is introduced into the furnace, prevents the escape and waste of the gases during this operation, resulting in further economy.

Modern blowing engines supplying the blast to the furnace are constructed both horizontal and vertical and are generally compound and condensing. They frequently have a capacity of some 30,000 cubic feet of air per minute which they can deliver under a pressure of 25 pounds or more per square inch if needed. Two such engines are generally employed for each furnace. A recent improvement in blowing engine construction consists in the use of gas or internal combustion engines for creating the blast. The first successful engine of this type was built at the Cockerill Steel Works at Seraing in Belgium and the results were so encouraging that many other similar engines have since been constructed, especially in Germany, Belgium, and France. It has been found by careful tests that gas blowing engines consume only from one sixth to one fourth of the gas which would be required to raise the steam for use in an ordinary engine of the same capacity. In spite of its evident superiority over steam engines, however, its introduction into American plants is proceeding very slowly.

The modern stoves employed for heating the blast before it enters the blast furnace consist, roughly stated, in high cylindrical chambers filled with bricks placed some distance apart. The waste gases from the furnace are admitted at one end of these chambers together with sufficient air to burn them, and the hot products of the combustion on their way to the chimney heat the brick work to a very high temperature. After the stove has thus been properly heated, the supply of gas and air is shut off and the cold blast from the engine is admitted. The heat

which has been stored up in the brick work is now imparted to the blast, which in this way is highly preheated. After the stove has cooled down to a certain temperature the blast is shut off and the stove is again heated by the waste gases. Modern furnaces are generally provided with four of these stoves, the blast passing in succession through each stove for one hour, while the three others are being heated. With such regenerative system of heating the temperature can readily be maintained at 1,450° F., which results in a considerable economy of fuel in the furnace.

Until quite recently it was the universal practice, after opening the tap hole, to allow the iron to run into sand molds, prepared for that purpose on the floor in front of the furnace, and this method is still widely used. The metallic mass filling each mold is called a pig, while the metal filling the channels connecting a number of molds is called a sow. The pigs are, of course, fastened to the sow, and, after solidification, must be broken loose, generally with sledge-hammers. When the cast iron is to be used for conversion into steel by the Bessemer process the metal as it flows from the furnace is frequently received in large tanks or "ladles" mounted on wheels, which are afterward taken to the steel mill, where the metal is converted into steel without being allowed to solidify, thus saving the cost of remelting the pig iron. In later years casting machines have been introduced to save the heavy labor connected with the handling of the pigs, and to otherwise expedite the casting operation. Nearly all these devices consist in an endless chain, the links of which are made of small iron molds, which are filled in succession by passing under the stream of molten metal. The chain then carries the partially solidified pigs or "chills" under water to promote their cooling and discharge them automatically on cars, the empty molds returning to the ladle again to be filled, and so on.

In the modern furnace the slag tap hole or "cinder notch" is kept closed as well as the iron tap hole, being opened only at stated intervals, generally a short time before the casting of the iron. In the latest American practice the slag is generally received in ladles which carry it away to the dumping place, or it is handled by means of a device known as "slag conveyor," and which is not unlike the casting machines just described, consisting in an endless chain of shallow pans which are successively filled as they pass under the stream of molten slag. After being immersed under water the pans are automatically emptied on cars.

The Products of the Blast Furnace.—Owing to the extremely high temperature at which the operation must be conducted and to prolonged contact between the reduced iron and the incandescent carbonaceous fuel, the conditions in a blast furnace are strongly carburizing, the metal absorbing a large amount of carbon, (generally between 3 and 4 per cent). Moreover, owing to the fact that highly carburized iron is much more fusible (melting generally between 2,100° and 2,400° F.) than iron containing little carbon, and to the intense heat of the furnace, the extracted metal, instead of being obtained in a semi-fused, pasty condition, will be perfectly liquid, and on account of its high specific gravity will settle at the bottom of the furnace. The slag also will be melted, and being lighter than the iron, will float as a separate layer above the metallic bath. The molten slag and the molten iron are withdrawn separately from the furnace, thus effecting their complete separation.

This highly carburized iron produced in the blast furnace is called pig iron, or cast iron. Owing principally to the large amount of carbon which it contains, the properties of cast iron are very different from those of wrought iron and steel.

Owing to the intensely reducing conditions prevailing in a blast furnace, to the high temperature and to the presence of metallic iron, many impurities, such as phosphorus, sulphur, manganese, and silicon, which are always present in greater or less amount in the ore, flux, and fuel, are partially or wholly reduced to the metallic state, and in this condition are retained, in part at least, by the molten cast iron. Cast iron, therefore, is not simply an association of iron and carbon, but contains also varying amounts of the impurities just mentioned.

The following table illustrates the rapid increase in the world's production of cast iron since the beginning of the last century.

YEARS	Production tons.	YEARS	Production tons.
1800	825,000	1880	17,950,000
1830	1,825,000	1890	27,157,000
1850	4,750,000	1900	40,400,000
1870	11,900,000	1903	46,420,000

The following table shows the wonderful growth of the manufacture of cast iron in the United States:

YEARS	Production tons.	YEARS	Production tons.
1810	53,908	1901	15,878,354
1850	563,755	1902	17,821,307
1875	2,023,733	1903	18,009,252
1900	13,789,242	1904	16,497,033

The Refining of Cast Iron or the Indirect Methods for the Production of Wrought Iron and Steel.— Cast iron is not malleable — it cannot be forged; that is, it cannot be shaped into finished implements by mechanical pressure such as that exerted by hammering, rolling, etc. Cast iron, therefore, can only be used as such for casting purposes, which means that cast iron implements can only be obtained by pouring the molten metal into molds having exactly or very nearly the external shape of the objects we desire to manufacture. Cast iron, moreover, is brittle and lacks both strength and toughness, which further greatly limits its useful application. To produce a metal which is forgeable, which possesses more strength and toughness and other valuable properties absent in cast iron, and, therefore, a much more useful metal, it is necessary to subject cast iron to a refining operation by which it is converted either into steel or into wrought iron.

This indirect method of producing iron and steel is the prevailing modern method, for, in spite of strenuous efforts made to improve the older or direct method, it remains by far the cheaper of the two.

The refining of cast iron or its conversion into wrought iron or steel consists essentially in eliminating a large proportion of the impurities which it contains, especially carbon and silicon. In order to expel these impurities

we must bring the cast iron in contact with a substance, either solid or gaseous, possessing more affinity for them than the iron itself, and here again heat is required for such reaction to take place. Oxygen has a very great affinity both for carbon and silicon, and in general for the other impurities present in cast iron, and it is upon this element that we shall depend for the elimination of the impurities. We may for that purpose use either atmospheric oxygen or the oxygen of some oxidizing substances. The oxidizing agents generally used besides atmospheric oxygen are rich iron ore or rich slag from some previous operation, or the slag produced in the refining operation itself. These substances are composed essentially of oxide of iron, which is an oxidizing compound, for it readily parts with some of its oxygen which is taken up by the carbon of the cast iron.

When cast iron in order to be purified is exposed at a sufficiently high temperature to the action of atmospheric oxygen or of some other oxidizing substance, the silicon which it contains combines with some oxygen, being converted to silica. Some of the iron itself will be oxidized and the resulting oxide of iron will in turn enter into combination with the silica to form a fusible silicate of iron or slag.

The carbon present in the cast iron also combines with some atmospheric oxygen, or more frequently with some of the oxygen held by the slag or by some iron ore purposely added, and is converted into carbonic oxide or carbonic acid gas, in which condition it escapes from the furnace. By being deprived of its oxygen the iron ore added in some of these refining operations is reduced to the metallic state and incorporated into the refined metal.

The Products of the Refining of Cast Iron.— As was the case in the treatment of the ore, the nature of the metal resulting from the refining of cast iron will likewise greatly depend upon the temperature at which the operation is conducted. If the temperature be low the refined metal will be obtained in a semi-fused or pasty condition, and will on that account include a relatively large amount of slag, while it will generally be quite free from carbon. In other words, the product of the refining operation conducted under these conditions will be wrought iron, or, if the conditions be made slightly more carburizing, steely iron. These are the conditions prevailing in the old forge refining of cast iron or "finery method," as well as in the more modern puddling process for the manufacture of wrought iron, which methods will be outlined briefly.

The Finery Methods for the Production of Wrought Iron.— When the ironmaster of the 13th or 14th century, through the gradual development in height of its catalan or other forge so increased the carburizing conditions that he finally obtained a small amount of molten cast iron, he was confronted with the necessity of refining this brittle, unforgeable metal in order to convert it into malleable iron, and he quite naturally endeavored to conduct this refining operation in furnaces similar to the low hearths or forges which for so many centuries had been the only apparatus used for the direct extraction of iron from its ores. In these forges, known as "fineries," the pig iron was melted in contact with charcoal and under the oxidizing influence of a blast issuing from a single tuyere. While the details of the finery operation and of the furnace differed much in various countries, and even in different sections of the same country, their essential features were identical. Four of these processes attained especial prominence and have not been entirely driven out of existence by the puddling process nor later by the Bessemer process; they are the Walloon process as still conducted in Sweden, the Franche Comté process, the Lancashire process still used in England, the United States, and some other countries, and the South Wales process which was for many years extensively used in South Wales for the production of iron plates for tinning. In recent years, however, soft Bessemer and open hearth steel have taken the place of wrought iron for such purpose and this once flourishing industry is now quite, if not altogether, extinct.

These charcoal hearths or fineries are frequently used for the remelting of iron and steel scrap resulting in the production of wrought iron of high quality. The operation consists in filling the hearth with charcoal, upon which the scrap is placed and covered with additional charcoal and the charge melted. The slag produced in this operation is very basic and therefore promotes the removal of the phosphorus and sulphur which are eliminated to a notable extent.

The iron manufactured or remelted in these hearths is mainly used for the manufacture of plates, sheets, skelp rods, etc., which are used in the manufacture of boiler tubes, boilers, screws, rivets, wire, etc.

According to J. M. Swank, the iron blooms produced in forges from pig iron and scrap in 1903, in the United States, and which were for sale and not for the consumption of the makers, amounted to 9,940 tons, against 12,002 tons in 1902, 8,237 tons in 1901, 8,655 tons in 1900, 9,932 tons in 1899, 6,345 tons in 1898, 7,159 tons in 1897, and 6,494 tons in 1896. All the pig and scrap blooms made in forges from 1895 to 1903, and for sale, were made in New York, Pennsylvania, and Maryland.

The Puddling Process.— The finery methods described in the preceding paragraphs were the only ones available for the conversion of cast iron into wrought iron until an Englishman by the name of Henry Cort invented the puddling process in the year 1784, a date which marks a very important epoch in the metallurgy of iron. It has been seen that in the finery processes the pig iron is heated in contact with solid fuel, and this necessitates the use of charcoal, because this fuel alone is sufficiently pure to yield wrought iron of good quality. If the attempt were made to use inferior fuels, such as coal or coke, it would be found that the iron absorbed so much impurity from the coal, notably sulphur, as to be of inferior quality. The necessity of using such an expensive fuel as charcoal, and a large amount of it, is a serious limitation of the finery processes, greatly increasing the price of the iron. To make the use of more impure but cheaper fuel possible, Cort proposed to conduct the refining of the pig iron in the hearth of a reverberatory furnace, that is, out of contact with the fuel itself, thereby preventing the contamination of the iron by the impurities of the fuel. In a reverberatory furnace the fuel is burnt in a separate fireplace, the substance to be treated coming in

contact only with the flames and gases resulting from the combustion of the fuel. In the puddling furnace, moreover, the labor required per ton of iron was greatly reduced and it was possible to treat in one operation a considerably greater amount of pig iron.

The puddling operation as originally conducted by Cort and others is now known as the "dry puddling process," while the more modern method of conducting the operation which involves some important alteration of the original method, is known as the "wet" or "pig boiling" puddling process. Only the latter will here be described.

The Wet or Pig Boiling Puddling Process.— In the original or dry puddling process, while the oxidation of the carbon, silicon, and other impurities was brought about to a certain extent by the oxide of iron formed during the operation, we depended mostly for their elimination upon the oxygen of the air, and this necessitates for reasons which cannot here be explained the use of white or refined pig iron. The modification about to be described was introduced into the puddling process for the purpose of making it possible to treat grey cast iron at once in the reverberatory furnace doing away with the preliminary refining operation and otherwise hastening the process. It is said to have been first used by Joseph Hall, of the firm of Barrows and Hall, of Tipton, England, about the year 1830.

The modern puddling furnace employed for the conduct of the pig boiling process resembles in its general lines the earlier puddling furnaces, the essential difference being in the nature of the lining of the hearth. The bottom of the hearth and the sides are made of iron plates which are protected by a thick layer of oxide of iron, called the "fettling" of the furnace. The substances used for fettling purposes consist of pure hematites (ferric oxide) crushed or ground to the desired size and of slags or scales obtained in the production or working of iron, and which are very rich in oxide of iron, such as roasted tap cinder or "bull-dog." This oxide lining, as previously stated, plays an important part in the operation by giving up a part of its oxygen to the carbon and other impurities present in the pig iron, thus greatly hastening their removal. From 300 to 500 pounds of grey pig iron are generally treated in these furnaces, frequently with the addition of some hammer scale, which consists of magnetic oxide of iron and which therefore help in oxidizing the impurities. The pig iron is now melted and becomes liquid without assuming the pasty condition characteristic of white pig iron. During the melting down period a large proportion of the silicon is oxidized and some of the carbon chiefly by the oxygen of the air. Some iron also is oxidized and slag formed, while owing to the removal of silicon the remaining carbon passes to the combined condition.

The bath is constantly stirred or "rabbled" so as to promote contact of all portions with the oxidizing lining and with the iron oxide of the slag, thus hastening the oxidation of the silicon and carbon. As the carbon is expelled the mass becomes pasty, the metal having now "come to nature." The spongy mass of wrought iron is then divided into balls weighing some 60 pounds, which are withdrawn from the furnace and worked in the usual way.

The whole operation lasts usually about 1½ hour, but may be longer or shorter, according to the purity of the metal treated. The loss varies from 7 to 20 per cent, being chiefly dependent upon the amount of impurity in the pig iron. According to Turner, the consumption of coal in the puddling furnace per ton of puddled bars amounts generally to about 2,600 pounds. The following interesting comments are from Prof. H. M. Howe:

"While the yearly production of wrought iron in the United States more than doubled between 1870 and 1890, yet since the latter year it has shrunk very much, probably nearly to that of 1870; and between 1870 and 1900 the proportion which the production of wrought iron bears to that of steel diminished very greatly. Of the combined annual production of wrought iron and steel in the United States that of wrought iron formed 95 per cent in 1870, 63 per cent in 1880, 37 per cent in 1890, and probably not far from 15 per cent in 1899. The corresponding numbers for Great Britain are 34 per cent for 1890 and 19 per cent for 1899, and 16 per cent for 1901. In the year 1899 the average number of British puddling furnaces in operation is reported as 1,149 out of a total of 1,320 in existence. Thus in 19 years the position of wrought iron changed from that of the chief product to one of secondary importance."

ALBERT SAUVEUR,
Assistant Professor of Metallurgy, Harvard University, and Editor of 'The Iron and Steel Magazine.'

Iron and Steel Industry in America. The iron of commerce is classified under three groups. These are "wrought iron," "steel," and "cast" or "pig iron."

In the colonial period the British government systematically discouraged all efforts of the colonists to produce iron, in order to avoid competition with home industries. There were forges or bloomeries in nearly all the colonies from the times of earliest settlement, and as unlimited supplies of fuel were always at hand in the vast forests it was only necessary to find ore and obtain persons who could construct forges. The iron required for structural purposes, such as bars, straps, nails, sheets, etc., was obtained in the early days either by hammering the bloom from the forge or by shaping with rolls propelled by water-power. In fact, before the invention of the puddling process in England by Cort, in 1784, a large proportion of all forms of wrought iron were derived in this manner. The old so-called "Walloon" process of refining pig iron into the malleable or wrought form or into a crude mild steel was introduced into the colonies at an early date in their history. By the puddling process malleable iron is not directly produced from the ore, as in the older methods of manufacture, but indirectly from pig iron. The introduction of the puddling process was second in importance to no other invention in the history of the iron industry of this country.

After the Revolution the iron industry developed steadily but slowly, probably owing to the fact that, as in colonial days, much, if not most, of the iron used along the seaboard was imported. No statistics of the production of iron were collected before the year 1810. The produc-

tion of pig and cast iron in that year was 53,908 tons; wrought and malleable iron of all kinds, 27,105 tons; having a total value of $6,081,374, of which amount Pennsylvania produced $2,473,748. The product of the steel furnaces of Massachusetts, Rhode Island, New Jersey, Pennsylvania, Virginia and South Carolina in 1810 was 917 tons, valued at $144,736; of the whole number of steel furnaces Pennsylvania contained five, producing 531 tons, valued at $81,147. An analysis of these figures gives us some idea of the state of the industry at the beginning of the century. The product of the blast-furnaces — pig, or, as it was at that time termed, cast iron — was run directly into small castings then in demand for commercial purposes; the malleable iron was probably all derived directly from the ore in forges or bloomeries, whence it was taken to the rolling or slitting mills to be made into rods, bars, plates, nails, etc. The steel made at this period in the United States was probably all produced by the cementation or blister process, and was all of the grade now known as high-carbon or tool steel. Although Huntsman's improvement of this process, by which the steel bars thus made were fused in crucibles and subsequently cast into ingots, had been in operation in Sheffield, England, a number of years prior to 1810, it is doubtful if his invention had been adopted in the United States at this early date. In the census of 1820 the quantities of iron made are not given; their value, however, is stated as follows: Pig or cast iron, $2,230,275; wrought iron, $4,640,669; total, $6,870,944. The 1830 census gave: Pig iron and castings, $4,757,403; wrought iron, $16,737,251; total, $21,494,654. The production of iron steadily increased upon much the same lines as before and in 1840, 804 blast-furnaces produced only 286,903 tons of iron, and 795 bloomeries, forges, and rolling-mills only 197,233 tons of malleable or bar iron. For the first time in the history of the industry the production of cast or pig iron exceeded that from the bloomeries and forges. No figures are published for the value of the product in 1840, but if we assume the ton of pig iron to have cost $30, and the ton of hammered bar iron $90, we obtain $8,607,090, or nearly double the value of pig and cast iron produced in 1830. The total value of the bar iron at this estimate would be $17,750,970.

The high cost of manufacturing charcoal, and its enormous consumption in the furnace per ton of iron produced, were serious obstacles to the growth of the industry, even where a good supply of ore was well assured. As early as 1835 the adaptation of anthracite to the manufacture of iron began to attract attention, and Franklin Institute offered a gold medal "to the person who shall manufacture in the United States the greatest quantity of iron from ore during the year, using no other fuel than anthracite coal, the quantity to be not less than 20 tons." The medal was never awarded, but there is abundant evidence that from 1830 to 1840 a number of attempts to use mineral fuel in smelting iron ores were made. The first practically successful attempt to produce pig iron by the use of anthracite was made by David Thomas at Catasauqua, Pa. The furnace which he erected there for this purpose was blown in on 3 July 1840. It was equipped with a "hot blast" operated by water-power, and thus inaugurated in the United States, two of the greatest innovations in blast-furnace practice. This furnace, producing from the start 50 tons of iron per week, continued in profitable operation until the year 1879, when it was dismantled. The early forms of hot-blast apparatus consisted of nests of iron pipes heated externally by separate fires, the object being to pass the air from the blowing- or blast-engine through these pipes, thereby greatly augmenting its temperature, and to decrease the consumption of fuel per ton of ore smelted. The hot blast was patented in 1828 by James B. Neilson of Glasgow, and its use is perhaps the most important improvement ever made in blast-furnace practice, for without it the present large and cheap production of pig-iron would have been impossible. Notwithstanding that the success in smelting iron in blast-furnaces with anthracite had been practically demonstrated in 1840, the general use of this fuel appears to have grown slowly; it was 10 or more years before the use of coal (either anthracite, coke, or a mixture of the two) became general. In 1846 the first furnace constructed with the intention of using raw bituminous coal as fuel was successfully placed in operation at Lowell, Mahoning County, Ohio. Although coke had been in general use in England for a number of years, it was not until 1837 that it was successfully used in the United States in the blast-furnace at Lonaconing, Alleghany County, Md. The manufacture of Connellsville coke was commenced in 1841, but, according to Weeks, it was not until a number of years later, when railroad transportation had become more fully developed, that its value as a furnace fuel became thoroughly demonstrated. The period between the years 1840 and 1850 was a most eventful one in the history of the American iron industry. The introduction of the improvements in smelting already indicated, together with the use of steam-power for propelling the blast and in performing other varieties of work about the furnaces, its replacement of water-power in operating rolling-mills and hammers, in mining coal and ore, and the rapid growth of the railroads, produced a stimulating effect probably never before experienced in a similar degree by any American industry. The railroads contributed largely to the development of the iron industry in two ways: directly, by rendering transportation comparatively cheap, thereby enlarging the iron market and increasing the demand; and indirectly, by creating in their construction a new and unprecedentedly large consumption of iron. As the production of iron increased in later years, the older iron-ore deposits became exhausted, or were proved inferior to the newly discovered ore-beds of the Lake Superior region. The problem of suitably locating a modern blast-furnace producing from 9,000 to 10,000 tons of pig iron per month became a serious one, and its solution has had the effect of moving the geographical centre of the iron industry west of the Alleghany Mountains, nearer a new and larger ore supply, yet handy to the coke of Connellsville. In 1850 there were produced in the United States 563,755 tons of pig iron by 377 establishments, and wrought iron to the value of $22,629,271 in 552 establishments.

The evolution of iron and steel plate making, particularly boiler-plates, forms an interesting chapter in the growth of our great industry.

About 1815, when steam began to be used, Dr. Charles Lukens remodeled his mill to produce thicker plate. The bloom was reheated at the forge and hammered thin, usually about one and a half inches. It then went to the rolling-mill, where it was laid on a bed of coal in what was called a grate-furnace. After heating, it was rolled into plates one quarter and three sixteenths of an inch thick and sent to the boiler maker. But soon the mill began shearing into regular commercial sizes: 48 and 49 by 26 by one quarter or three sixteenths; or, if large enough, it was sheared into plates 68 and 69 by 26, and the scrap was cut into nails. But when the reverberatory furnace was introduced, the scrap was arranged into piles of such size as was necessary to produce the required plate, heated to a welding heat, and rolled in the mill. This state of things continued until the introduction of the puddling furnace. The most important advances made in the years between 1850 and 1860 were the invention of the "three-high" roll-train; the introduction of mills for rolling beams, by Cooper & Hewitt, at Trenton, N. J.; and the invention in 1848 of the "universal mill," by Daelin, a German engineer, which found its way to America 12 years later. In the manufacture of the finer qualities of steel, no progress was made up to 1860. According to the census of 1860, 97 establishments in the United States produced 51,290 tons of blooms, valued at $2,623,178; 286 establishments produced 987,559 tons of pig iron, worth $20,870,120; 256 establishments produced 513,213 tons of rolled iron, worth $31,888,705; 13 establishments produced 11,838 tons of steel (probably of cheap grades), worth $1,778,240.

During the Civil War the resources of the iron industry in the Northern States were taxed to their utmost. The industry in the South, strained at an early day beyond its feeble capacity, soon broke down, and most of the requirements of the Confederate armies were supplied from abroad. In the train of dire disaster wrought by the Civil War some good to the iron industry may be found; for not only did iron ships make their appearance in the navy, but the use of iron plates had its inception. As early as 1859 the French had built the frigate Gloire, armored with iron plates five inches in thickness, and in 1861 the British constructed the frigate Warrior, which was protected by solid iron plates four and a half inches thick. As regards armor, either of these vessels was much better protected than any of our monitors constructed during the Civil War, for the first monitor was protected by six to eight thicknesses of one-inch iron plates bolted one on the other with overlapping joints, and later vessels were probably protected in much the same way by armor made up of a greater number of similar one-inch plates.

In 1855 and 1856, Henry Bessemer, of London, had obtained patents for a process of converting molten pig iron into steel by forcing small jets of cold air through the molten iron; but his invention was not successful until modified by Robert F. Mushet, who added to the molten steel, after the blast had been stopped, a sufficient quantity of spiegeleisen (an alloy of iron and manganese) to neutralize the oxide of iron caused by blowing and to give the steel the proper degree of hardness and fluidity. Neither Bessemer nor his American rival, William Kelly, of Pittsburg, who secured a patent but did not utilize it, accomplished anything in America until 1866, when their interests were combined with Mushet's and the first plant to produce the steel as a commercial article was put in successful operation by the Pennsylvania Steel Company at Steelton, near Harrisburg, Pa., June 1867. The first steel rails rolled in the United States in the way of regular business were rolled by the Cambria Iron Company, Johnstown, Pa., August 1867, from ingots made by the Pennsylvania Steel Company. The production of Bessemer steel in the year 1867 was 3,000 tons, the industry continuing to grow with rapid strides. In 1890, 4,131,535 tons were produced, in 1900 7,532,028 tons, and in 1902 9,138,363 tons. Of these amounts 2,550 tons were made into rails in 1867, 1,853,862 in 1890, 2,250,457 in 1900, and 2,935,392 tons in 1902. The importance of the invention of the Bessemer process to the world in general and the United States in particular cannot be overestimated, since it has reached a development with us greater than in any other country in the world. In 1901 the total amount of all varieties of steel made in the United States was 44 per cent of the entire world's product. The rapid and enormous development of the Bessemer-steel industry in the United States is attributable chiefly to the great extension of our railroads. Bessemer steel is also used for steel bars, merchant steel and for tin plates. The basic Bessemer or Thomas process though used in Germany to produce 4,888,054 tons in 1902, has not gained a foothold in this country.

The open-hearth steel process was first used in 1856, when the Siemens Brothers of London perfected what is now generally known as the Siemens regenerative gas-furace, without which no open-hearth steel can be made. In 1864, Messrs. Emile and Pierre Martin, of the Sireuil works in France, erected, with the assistance of Dr. Siemens, one of the regenerative gas-furnaces to convert steel in an open-hearth or reverberatory furnace of their own construction. This scheme was a success from the start, and by a subsequent consolidation of the Siemens and Martin inventions a steel-making apparatus was devised, known as the Siemens-Martin or open-hearth process. This process was introduced into America in 1868 by F. J. Slade for Cooper, Hewitt & Company, at the works of the New Jersey Steel and Iron Company, at Trenton, N. J. In 1870 the production of open-hearth steel in the United States was 1,500 tons, and in 1890 574,820 tons, the industry showing a rapid development during the intervening 20 years. Great Britain was long the largest producer of open-hearth steel in the world, and in this branch of the iron industry the United States was somewhat behind its great rival, until 1900. In 1890 Great Britain produced 1,564,200 tons, as against 574,820 tons in the United States; in 1899 Great Britain produced 3,030,251 tons and the United States a little more than 2,900,000 tons; but in 1900 the figures are 3,398,135 tons for the United States (following James M. Swank, 'Iron and Steel at the Close of the 19th Century,' 1901; the census figures, always incomplete, are 3,044,356) and 3,156,050 for Great Britain. This growth is all the more striking when it is known that in 1895 the writer of this article hopefully

prophesied that the production might reach in that year 1,000,000 tons. Five years later it had passed the 3,000,000-ton mark. The so-called "basic" open-hearth process, although in successful operation in Europe for a number of years, was not introduced into the United States until 1888, when a number of such furnaces were constructed at the works of Carnegie, Phipps & Company, at Homestead, near Pittsburg, Pa. Without going into technicalities, the basic open-hearth process may be briefly defined as an ordinary open-hearth plant whose furnace lining is made of a basic material, such as dolomitic limestone or the mineral magnesite. When pig iron containing a sufficiently great quantity of phosphorus to render it unfit for conversion into steel by any other method is melted in such a furnace, the basic lining, together with a basic flux which is added, removes the objectionable phosphorus and renders (other conditions being normal), the resulting steel equal to that prepared in the open-hearth furnace in the old and usual manner. The purposes for which open-hearth steel is ordinarily adapted are quite different from those for which the Bessemer steel is most suitable; but the converse of this fact, however, is not true, since open-hearth steel may be and frequently is used to an equal, if not greater, advantage wherever Bessemer steel is employed. In this country, at least, all high-grade structural material, such as boiler and ship plate, bridge and building members, high-grade castings, etc., is almost invariably of open-hearth steel, which is generally considered, and doubtless is, more uniform in quality than soft steel made by the Bessemer method.

One of the most curious phases in the history of the American iron industry is the fact that although the United States at one time consumed nearly 60 per cent of the world's entire production of tinned plates, with the exception of a few sporadic attempts in 1873 and 1875, no tin or terne plates were made in the United States until 1891. Great Britain furnished virtually all the tin-plate used in the United States during the 20 years ending 1890. No better evidence of the success of our domestic tin-plate industry could be afforded than the fact that our imports have steadily decreased since 1889, those for 1890 being 29,435 tons, for 1894 215,068 tons, and for 1900 only 60,386 tons. The American production amounted to 999 tons in six months of 1891; to 6,092 tons in 1892; 44,563 tons in 1893; over 100,000 tons in 1895, and in 1900 to 302,665 tons. The census of 1900 reports 57 establishments manufacturing tin and terneplate; gives their capital as $6,650,047, its wage-earners as averaging 3,671, and their wages as $1,889,917; and estimates the cost of materials at $26,728,150, and the value of the product as $31,892,011. In 1890 the industry was practically non-existent and was not reported in the census of that year.

If the history of the development of the American blast-furnace practice were written it would form a large book of itself. In 1870 most of the blast-furnaces in operation were still very primitive, and although no statistics for that year are given, it is probable that the best of them did not produce as an average over 50 tons of pig iron per day, whereas in 1902 the production of 300 tons per day was a common occurrence, and some furnaces regularly produced over 500 tons daily. The table at the bottom of the page taken from the United States census reports, exhibits the production of pig iron from 1870 to 1900.

These figures show the rapid fall in the number of establishments, resulting from the movement of concentration nowhere so strikingly shown as in the steel and iron industry. The capital invested has increased 150 per cent approximately in 30 years, the production nearly 700 per cent and the value of the product almost 200 per cent. During the 20 years between 1870 and 1890 production in the Middle States had nearly quadrupled, in the Western States increased nearly 5 times, and in the Southern States nearly 10 times. In 1890 the American product passed the record figures of the British furnaces, made in 1882. Between 1890 and 1895 the American trade suffered considerably and fell below the British in its total product; then it again advanced and is now 100 per cent greater than that of Great Britain.

The wonderful growth of the world's iron industry within 50 years is shown by the following tables, in metric tons (2,204 pounds).

Country	1854	Per cent	1902	Per cent
United States	750,000	12.5	18,003,448	40.7
Great Britain	3,000,000	50.0	8,653,976	19.5
Germany	400,000	6.6	8,402,660	19.0
France	750,000	12.5	2,427,427	5.5
Russia	200,000	3.3	2,566,000	5.8
Austria-Hungary ..	250,000	4.3	1,335,000	3.0
Other countries ..	650,000	10.8	2,869,480	6.5
Totals.....	6,000,000	100.0	44,257,991	100.0

Even more striking is the increase in steel output in the last 35 years, as shown below:

Country	1867	Per cent	1902	Per cent
United States	19,963	4.1	15,186,406	44.0
Great Britain	235,000	47.8	5,102,420	14.8
Germany	122,591	26.0	7,780,682	22.5
France	47,597	9.7	1,635,300	4.8
Russia	6,271	1.3	1,730,250	5.0
Austria-Hungary...	15,000	3.1	1,143,900	3.3
Other countries ...	35,000	7.1	1,900,825	5.6
Totals.....	491,422	100.0	34,479,783	100.0

PRODUCTION OF PIG IRON.

	1870	1880	1890	1900
Number of establishments.....	386	341	304	224
Capital	$56,145,326	$89,531,362	$134,608,543	$148,226,113
Wage earners.....	27,554	41,695	33,415	39,358
Total wages.....	$12,475,250	$12,665,428	$14,614,458	$18,500,462
Tons produced.....	1,832,876	3,375,912	8,845,185	14,452,234
Cost of materials.....	$45,498,017	$58,619,742	$110,098,615	$131,536,424
Value of product.....	$69,640,498	$89,315,569	$145,643,153	$206,823,202

The total iron and steel exports and imports of the United States for the years 1890, 1900, and 1902 are shown below, the totals being long tons (2240 pounds).

Year	Exports	Imports	Excess
1890.....	45,687	603,749	Imp. 558,062
1900.....	1,154,284	209,955	Exp. 944,329
1902.....	370,805	1,212,839	Imp. 842,034

A sketch of the American iron industry would be incomplete without some reference to the introduction of the manufacture of armor-plate into the United States. This class of material not only has a peculiar and limited demand, but its manufacture requires the highest degree of metallurgical and mechanical skill, together with an exceptionally expensive plant. When the reconstruction of the United States navy was begun, some 20 years ago, we had absolutely no facilities for making the simplest kind of armor-plate, although we had some of the largest steel-works in the world. One of the first of the new armored vessels completed (the monitor Miantonomoh) was protected by "compound" plates imported from England. All the large forgings for the guns and shafts of the earlier ships were likewise imported. Owing to the policy of Congress, the Bethlehem Iron Company, and Carnegie, Phipps & Company, of Pittsburg, were induced to erect expensive plants necessary for making not only the heavy gun-forgings required, but also for all the different grades and thicknesses of armor-plate. In 1891 these firms began to supply armor for the ships in course of construction, although at first their output of finished armor was extremely slow. The delays have now been slowly overcome, and at the present time there is little doubt that these great steel-works will be able to supply the armor as fast as new ships are constructed. How successful these works have been in furnishing our government with the best grades of armor-plate could have no better illustration than the fact that the Bethlehem Iron Company soon began supplying foreign governments with armor for their ships. The only two important iron and steel commodities which the iron industry of the United States did not supply in 1890 (tin-plate and armor-plate) are at present being made in large quantities, and the census for 1900 reports during the year 1900 15,302 tons of armor plate all produced in Pennsylvania, and valued at $7,526,479. Vast improvement has been made in the machinery necessary to manipulate iron and steel. The Bethlehem Iron Company has a hammer of 125 tons' capacity, built by John Fritz and put into successful operation in 1891. But armor-plate is no longer rolled nor forged by hammers, but manufactured with huge hydraulic presses, some with an energy of 15,000 tons. George Fritz is the inventor of what is known as the "automatic tables," which with John Fritz's roll train enables the manufacturer to successfully handle almost any weight of ingot. I well remember when a 500-pound mass of iron was thought to be so heavy that the whole neighborhood gathered in to see it rolled. The necessity of handling such very heavy weights as could be made from ingots cast in large masses brought into play the invention of hydraulic machinery, so that we now have pumps to produce any required pressure in a series of pipes which deliver the water to the hydraulic engines in any part of the works. By simply turning a valve now a boy will pick up a heavy ingot (say of 10,000-pound weight) with his hydraulic crane and deliver it anywhere within reach of the crane. If on a car, it may then be taken by a small locomotive to the rolling-mill, where another crane picks it up and puts it into the furnace, and, after heating to the required degree, takes it out and delivers it to the machinery at the rolls; then the automatic tables push it back and forth through the rolls until it is reduced to the required dimensions. The same tables now take it to the shears, which are also operated by hydraulic power, and the plate, sometimes two inches thick, is sheared ready for shipment. All this is done with more ease than was possible a few years ago. Within the last few years electricity has been brought into play to do some of the heavy work.

Revised by S. Sanford,
'Engineering and Mining Journal,' New York.

Iron City, a name given to Pittsburg, Pa., owing to its extensive iron industries. "Smoky City" is another name frequently applied to Pittsburg because of the large number of rolling-mills, furnaces, and foundries in which bituminous coal is used.

Iron Cross, a Prussian order, instituted by Frederick William III. in 1813, and conferred for distinguished services in war. The decoration consists of a Maltese cross of iron, edged with silver. The order was revived by William I. in 1870, on the eve of the great war with France. The grand cross, of double size, is presented exclusively for the gaining of a decisive battle.

Iron in Medicine. Iron was in use in medicine by the Chinese as early as 2700 B.C., and was employed in the treatment of anæmia much as it is administered to-day. In its native form, as iron, it is devoid of action, but when reduced to a salt, or oxide, capable of dissociation, it becomes active. Iron differs from many of the other heavy metals in that it is an active ingredient of the tissues, and is probably essential to the life of many if not all forms of living things. In the human blood it is an absolutely essential constituent, and its importance is great for all of the tissues of the body. In a number of the animals that lack red blood-corpuscles iron is not found abundantly in the blood, but is nevertheless present in large amounts in all parts of the body, and is perhaps just as essential for the chemical processes of nutrition as in higher vertebrates. It is well known that the presence of iron is necessary for the active processes of photosynthesis in plants, and that in its absence the higher plants are unable to develop chlorophyll, although chlorophyll itself does not contain iron in the form of hæmoglobin. It is of interest, however, to note that Nencki, a Russian biologist, has shown that reduction compounds of hæmoglobin and of chlorophyll are very closely allied, and he propounds the interesting speculation that probably the same iron compound was present in the living matter before a differentiation of animal and plant was made, and that as plants and animals developed along divergent lines of struc-

ture the iron compounds became somewhat separated in their chemical character.

Iron combinations in medicine are usually divided into two classes, inorganic and organic. In the former the iron is dissociated in solution, and is usually acted upon by the hydrochloric acid of the gastric juice and converted into soluble chlorides, in which form it probably enters into the tissues. In the organic iron it is probable that the same conversion takes place, although there is much controversy regarding the method of its absorption; but this is true of all iron. The iron is usually taken up in the stomach and intestines, the larger part of it being rejected, and it enters into the blood in the form of an albuminate which passes into the duodenum, some being absorbed by the epithelium, and more or less of it carried directly to the spleen and probably to the liver. In the spleen it seems to undergo some changes, and is taken up by the blood and thereafter deposited more particularly in the liver and in the bone-marrow. When there is deficiency of iron in the blood or other organs, the liver gives up its store and it is absorbed by the tissue that is most in need of it. While in the blood, iron is the great organ of oxidation. By means of the hæmoglobin the oxygen of the air is taken up and distributed to the different parts of the body. This permits of the active chemical oxidative changes that take place throughout the entire body, which changes are of such vital importance in general metabolism, and without which the body suffers, degenerates and dies.

Iron is used particularly for diseases in which the blood is poor in that metal. This is particularly the case in anæmias of primary and secondary character. In primary anæmia or chlorosis (q.v.), iron is a distinct help, often curing the condition. In primary pernicious anæmia, which is a grave blood-disease, it is of secondary value. In all of the secondary anæmias, those that follow hemorrhage, the acute infectious diseases, such as scarlet fever, malaria, whooping-cough, measles, typhoid, pneumonia, etc., iron is of great service. It is particularly valuable following childbirth or any condition in which there has been a great loss of blood. It is also useful in conditions of scanty menstruation, in tuberculosis, and is one of the best general tonics in the realm of medicine. The effects of inorganic and iron solutions on the teeth should be borne in mind, although they are much exaggerated. Iron is apt to cause a certain amount of constipation, but this, by proper laxatives regularly taken, should be overcome.

Iron Mask, The Man with the, a famous personage who was kept a prisoner in two or three French prisons in the time of Louis XIV., and who excited a curiosity corresponding to the care with which his identity was concealed. His first prison was the castle of Pignerol, of which Saint-Mars was governor. In 1686 he was carried by Saint-Mars to the isles of St. Marguerite; and the same precautions were observed as upon his first journey. Saint-Mars having been appointed governor of the Bastile in 1698, carried the prisoner with him there, but still masked. An apartment had been prepared for him more convenient, and furnished with more care than those of the other unfortunate beings who inhabited this sad abode. He was not permitted to take off his mask even before his physician. In other respects the greatest attention was shown him, and nothing which he requested was refused him. His education appeared to have been carefully attended to; and he amused his leisure by reading, and playing upon the guitar. This unknown person died 19 Nov. 1703, at 10 o'clock in the evening, without having undergone any severe sickness. He was buried the next day in the afternoon in the cemetery of the church of St. Paul. He was, it was said, about 60 years of age, although the register of burials for the church of St. Paul, in which he is mentioned under the name of Marchiali, makes him only about 45. It is said that orders were given to burn everything which had been employed in his service; that the walls of the chamber which he had occupied were rubbed down and whitewashed; and that the precautions were carried so far, that the tiles of his room were removed, in the fear that he might have displaced some of them to conceal a letter behind them. Conjecture exhausted itself to discover who this mysterious personage might be.

At the time of the destruction of the Bastile, in July 1789, there were not wanting curious persons, who sought, in the archives of this fortress, to discover some notices which might throw light upon this historical problem. But to no purpose. A widely-accepted conjecture was first thrown out in a letter written in 1770 by Baron D'Heiss to the 'Journal Encyclopédique.' According to this view the Man with the Iron Mask was Count Girolamo Magni, or Mattioli, first minister of the Duke of Mantua, who had betrayed the interests of Louis XIV. by failing to secure for him, as he had pledged himself to do, in consideration of a large bribe, possession from his master of the fortress of Casale. For this offense he was lured to the French frontier, secretly arrested, and imprisoned in the fortress of Pignerol in 1679. The secret was preserved so carefully, on the supposition that Mattioli was the prisoner, because his seizure and detention were flagrant violations of international law. In a more recent investigation by M. Jung, 'La Vérité sur le Masque de Fer' (1873), an attempt is made to identify the Mask with a gentleman of Lorraine, who was connected with an association for the assassination of Louis. Funck-Brentano in 1894 revived the view that Mattioli was the mysterious prisoner, and many now consider the controversy settled and this view established. Consult: Hopkins, 'The Man in the Iron Mask.'

Iron Mountain, Mich., city, county-seat of Dickinson County; on the Chicago, M. & St. P. and the Chicago N. W. R.R.'s; about 47 miles southwest of Marquette and 57 miles west by north of Escanaba. It was settled in 1879 and chartered in 1888. It is the commercial centre for a large mining section in Michigan and for a farming section in Wisconsin. The city government consists of a mayor and council, elected annually. Its trade is principally in iron-ore and farm products. Pop. (1900) 9,242.

Iron Mountain, the southern spur of the St. Francois Mountains, a low range in the eastern part of Missouri. This mountain, which is really a hill or knob, is in St. Francois County, about 60 miles southwest from St. Genevieve, the nearest point on the Mississippi River. It is about 300 feet above the surrounding land and

about 2,000 feet above the sea. It covers an area of 500 acres. It is famous for its remarkable mineral deposits, specular or hematite iron-ore, the purest iron ore in the United States. The average elevation above the land around is 550 feet, and the area it covers is about 500 acres. Large oak trees flourish on its slope, their roots embedded in soil composed largely of fragments of peroxide of iron. Excavations were begun in 1845. An artesian well has been sunk to the depth of 152 feet, with the result that the beds passed through from the surface were as follows: Iron ore mixed with clay, 16 feet; sandstone, 34 feet; magnesian limestone, 7½ inches; gray sandstone, 7½ inches; hard blue rock, 37 feet; pure iron ore 5 feet; porphyritic rock, 7 feet; iron ore 50 feet to the bottom. It would seem that nearly the whole mountain was a mass of magnetic iron ore. The adjacent valleys are underlaid with magnesian limestone in horizontal strata. Pilot Knob (q.v.), about six miles south of Iron Mountain, also contains an extensive deposit of iron ore; Shepherd Mountain, a short distance southwest of Pilot Knob, is the largest of the iron mountains in that immediate vicinity.

Iron Ores. Although iron is the most abundant of the useful metals, forming 5 per cent of the earth's crust, it is rarely found native — one famous native occurrence of it, however, being at Ovifak on the west coast of Greenland. The iron ores of chief commercial importance are hematite, magnetite, limonite, siderite and pyrite. Pure hematite contains 70 per cent iron; magnetite 72.4 per cent; limonite 59.89 per cent; siderite 48.27 per cent; pyrite 46.6 per cent. Iron ores, however, are practically never mined pure, but are mined in quantity averaging 10 per cent and over less iron than above stated, the principal impurities being silica, alumina, and lime.

Hematite, ferric oxide (Fe_2O_3), by far the most important iron ore, varies greatly in physical characteristics. Specular hematite is black, with a brilliant metallic lustre. Martite is a variety of hematite. Magnetite, a ferro-ferric oxide ($FeO.Fe_2O_3$), is black magnetic, and crystallizes in octahedra, but as mined it is usually massive or granular. Ilmenite, an oxide of iron and titanium, is not yet an ore of commercial importance. Franklinite, an oxide of iron, manganese, and zinc, found at Franklin, N. J., is used in making spiegeleisen, an alloy of iron and manganese after the zinc has been removed by roasting. Limonite or brown hematite, hydrated ferric oxide ($2Fe_2O_3.3H_2O$), is brown or yellow in color and occurs in massive, earthy, or in botryoidal forms. Bog-ore is a variety of limonite. Goethite, differing from limonite in crystalline form and containing less water, is found in large quantities in Minnesota. Siderite, or spathic iron, ferrous carbonate ($FeCO_3$), is white to gray when pure, and crystallizes in rhombohedra. As mined, it varies much in appearance, owing to oxidation. Clay iron stone is siderite mingled with clay. Blackband ore is siderite mixed with more or less bituminous matter. Pyrites, ferric disulphide (FeS_2), often called "fool's gold," is used in great quantities to make sulphuric acid. The residue, known as "blue-billy," or pyrites clinker, is in some countries smelted in the blast-furnace as an iron ore.

In smelting an ore the silica, lime, and alumina are removed as slag. Ores high in silica require more limestone in the furnace-charge for fluxing, that is, for combining with the silica. Some ores contain silica and lime in such proportions as to be self-fluxing. The higher the iron content of an ore, generally speaking, the greater the yield per ton of material put through the furnace, and the lower the cost per ton of the iron made.

A very hard ore must be broken into small lumps to give best results in the furnace. Hematites often smelt easier than magnetites. A fine granular ore makes trouble in smelting, and a certain proportion may be lost as dust, which clogs furnace-flues. The really injurious impurities most often found in iron ores are sulphur, phosphorus, and titanium. Sulphur can be largely removed by roasting the ore before smelting; phosphorus cannot, and all the phosphorus in the ore goes into the iron. For making steel by the Bessemer process an ore should contain less than 1–1,000 of its amount of iron; thus, to be classified as Bessemer, an ore containing 61 per cent iron should contain less than .061 per cent phosphorus. For making steel by the basic process, high phosphorus ores are used.

The present development of the world's iron mines is the outcome of many factors. Generally speaking, it is cheaper to bring the ore to the fuel than the fuel to the ore, hence, countries or districts that have great supplies of iron ore may be insignificant producers of pig-iron. Low-priced fuel has been the chief factor in determining the location of iron and steel industries, while the chief factors in the development of iron mines are the quality of the ore and the cost at which it can be put down at the furnace.

Iron-Ore Supplies of the World.— The iron industry in Asia is several thousand years old, but the annual output of iron ore is small. China has vast but little-developed deposits of limonite and hematite. Japan is very poor in iron ores. The iron industry of Australia is not of importance. The only ores exported from Africa are mined in Algeria, where the annual production has fallen to about 150,000 tons. Europe has famous ore fields. The ores of Elba and those of Styria were worked by the Romans. Certain Swedish mines have been worked almost continuously since 1300. The German output now comes chiefly from so-called minette beds of Lorraine and Luxemburg. The ore, a low-grade limonite high in phosphorus, is used in making steel by the basic process, and the present annual output is over 7,000,000 tons annually. The total ore supply left in the field is estimated at nearly 2,000,000,000 tons. The iron fields of Great Britain have passed their greatest productiveness. The principal districts are Cleveland in North Yorkshire, yielding clay ironstone containing about 30 per cent iron; Cumberland and Lancashire, yielding red hematite containing 50 to 60 per cent iron; and Lincolnshire, Leicestershire, and Northampton, yielding cheaply-mined low-grade hematite. The blackband ores of Scotland are of much less importance than formerly. The principal Spanish mines are in the Bilbao district in the province of Biscay, the productive field being 15 miles long and 2½ wide. The ores are red and purple hematite, limonite, and carbonate, the iron content in the crude ores running from 45 to 56 per cent. The district has produced to date about 95,000,000 tons. The greater part of the

Russian ore supply comes from the Ural Mountains, the ores on the east side of the range being magnetite, and on the west side limonite and carbonate. Near Krivoi Rog, in the Caucasus, are mines of hematite and magnetite. Fully 80 per cent of the iron ore of France is obtained from the minette beds of the Moselle that extend into Lorraine and Luxemburg. Most of the French ores are limonites. The principal Austrian iron mines are in Styria, the Styrian Erzberg having one of the largest deposits of siderite in Europe, yielding yearly about 1,000,000 tons of carbonate ore, containing 40 per cent of iron. In Bohemia are mines of magnetite, limonite, and siderite. Sweden has immense deposits of iron ore, chiefly magnetite with some specular hematite. The most important deposits are at Grangsberg in Central Sweden, where are specular hematite and magnetite ores containing 62 to 64 per cent iron and 0.9 to 1.5 per cent phosphorus, and at Gellivare, 100 miles from the Gulf of Bothnia, where are huge bodies of magnetite that run from 68.69 iron and 0.05 phosphorus to 60 per cent iron and 1.5 per cent phosphorus. The ores from this field and the neighboring districts of Kurunavara and Luossavara will be of great importance to British iron-masters, and shipments to the Atlantic seaboard of the United States are quite possible.

WORLD'S PRODUCTION OF IRON ORE — METRIC TONS.

United States	29,350,325	37.7
Germany	16,570,182	21.4
Great Britain	12,475,700	16.1
Russia	6,700,000	8.6
France	4,260,747	5.5
Austria-Hungary	3,623,115	4.7
Sweden	2,793,566	3.6
Other countries	1,800,000	2.4
Total	77,573,635	100.0

The total production was undoubtedly larger, since among the "other countries" are those that collect no returns of mineral output. The figures are for 1901 or 1902.

The iron ore supplies of South America have been little developed, and those of Mexico are just coming into prominence. In the province of Santiago, Cuba, are deposits of high-grade hematite. From there over 690,000 tons were exported to the United States in 1902. At Belle Isle, N. F., beds of hematite are now worked on a large scale. In Ontario, Quebec, and British Columbia are deposits of good hematite and magnetite, and the Dominion will soon be a large producer. There is a possibility of iron ores being mined in Labrador.

The United States leads the world in the production of iron ore. The ores mined range from low grade limonite to the highest grade hematites and magnetites. The purest ore ever mined in the United States in quantity was probably the magnetite from the Lovers Pit at Mineville, N. Y., which ran 72 per cent iron in carload lots, though the Lake Angeline mine at Ishpeming, Mich., has shipped hard hematite running 68 per cent iron and 0.008 phosphorus in thousand-ton lots. Minnesota now leads the States in production, with Michigan second, Alabama third, and Pennsylvania fourth. The chief centre of iron-ore production is about Lake Superior, where the ores occur along five mineral belts or "ranges," in Pre-Cambrian rocks. The Marquette range, in Michigan, was opened in 1856; the Menominee, mostly in Michigan, but partly in Wisconsin, in 1887; the Gogebic, in Michigan and Wisconsin, in 1884; the Vermilion, in Minnesota, in 1884; and the Mesabi, in Minnesota, in 1892. The ores shipped are nearly all red hematite. The Marquette produces some magnetite. As much of the ore is hauled long distances to a furnace, 60 per cent iron was once about as low grade ore as could be shipped profitably, but now some mines ship Bessemer ores containing but 45 per cent iron. The ore-bodies are sometimes of great size. The Chapin mine, on the Menominee range, is working lenses 100 feet wide and 600 feet thick in the middle, and 2,500 feet long. The Fayal mine, on the Mesabi range, in 1902 shipped 1,681,000 tons, and the Chapin in the same year 927,747 tons. The Mesabi deposits are flat-lying, covered by a varying depth of clay, sand, and boulders. By stripping off the surface and working the granular ore with steam-shovels, an enormous output is possible. The output of the various ranges in 1902 was: Mesabi, 13,342,840 long tons; Menominee, 4,627,524; Marquette, 3,853,010; Gogebic, 3,663,484; Vermilion, 2,084,263; making a total of 27,571,121 long tons.

In the South there are three important iron-mining centres — one near Birmingham, Ala., another in southeastern Tennessee, and the third in southwestern Virginia. The ores are red hematites and low-grade limonites. The growth of the Alabama industry is due to cheap ore, limestone and coking-coal being found in close proximity. Pennsylvania leads the Union in the production of magnetite, chiefly from the great ore-body at Cornwall, and also produces much limonite. New York and New Jersey also produce magnetite, and the former State some red hematite. Carbonate ores now come chiefly from Ohio. Of the western States, Colorado produces limonite, and in Utah and Wyoming are great deposits of magnetite and hematite, destined to be of importance in the near future. The famous specular hematite mines at Pilot Knob and Iron Mountain, Mo., are exhausted. Texas has large deposits of ore, and several other States are or will be important producers.

Mining and Handling Iron Ores.— Some extraordinary records of cheap mining and transportation have been made in the Lake Superior iron-ore trade. Large ore-bodies, effi-

UNITED STATES IRON ORE PRODUCTION — IN LONG TONS.

	1880	1890	1900	1902
Lake Superior	1,985,334	7,558,076	19,095,393	27,571,121
Southern States	627,517	2,904,322	5,100,000	4,850,000
Other States	4,884,658	4,056,469	1,758,000	2,215,000
Total	7,497,509	14,518,867	25,953,393	34,636,121

cient labor, and excellent management have been the factors in reducing mining costs, while the long lake-water haul, nearly 900 miles, in specially designed vessels, has made it possible to put down Lake Superior ores at Pittsburg, over 1,100 miles from the mine, at a total transportation cost of under $2 per ton. On the Mesabi range, in some large mines steam-shovels load the ore directly upon the cars, one shovel having loaded 170,000 tons in 26 days, or at the rate of over 6,500 tons per day. The shovels are each operated by five men, and the labor cost for mining and loading averages but about 16c per ton, and at one mine which dug and loaded 293,651 tons in 174 days, the labor cost was only 4c per ton. The loaded ore-trains go 50 to 115 miles to a shipping port. There they are run on to long, high docks having large pockets or bins into which the ore runs through openings in the bottoms of the cars. From these pockets the ore passes by gravity down along chutes into the hold of the vessel, so that no hand-labor is required. The ore-pockets hold about 160 tons each, and number from 90 to 384, according to the length of the dock.

In unloading the ore from the vessels, the use of labor-saving machinery is even more notable. A series of steel bridges, easily moved along the docks, is supplied with hinged arms which can be lowered into the hatch of the vessel. Along each arm and across the bridge runs a trolley-train to which are attached automatic grabs similar to a double scoop. The grab or scoop holds about five tons of ore, and when it begins to draw together it digs into the ore. The grabs can remove over half of the cargo without any assistance, and the remaining half is brought directly under the hatch by use of a scraper, operated by similar machinery. The grabs are so controlled by the engineer that he can drop them at any point over the hold he may wish, and after a grab seizes its load of ore it is raised at full speed, carried rapidly along the trolley to any given point, and dumped into railroad cars or on stock piles. This 5-ton grab has a hoisting speed of 100 ft. a minute, and can run along the bridge at the rate of 1,000 ft. a minute. The bridges to which the arms with their grabs are attached are worked by electricity. By such a device 26 men can do the work of 300 under the old system. Another unloading device, the Hulett unloader, requires even fewer men, and takes out a larger proportion of the cargo without aid.

Bibliography.— Owing to the enormous growth of the iron industry, there is no recent single work covering the production and use of iron ores. Statistics of production can be found in 'The Mineral Industry,' the 'Mineral Resources of the United States,' and the 'Engineering and Mining Journal.' Descriptions of geological occurrence and mining methods can be found in the monographs and bulletins of the United States Geological Survey; and the 'Transactions' of the American Institute of Mining Engineers. See GOETHITE; HEMATITE; ILMENITE; LIMONITE; MAGNETITE; MINING; ORE DEPOSITS.

SAMUEL SANFORD,
Assoc. Editor 'Engineering and Mining Journal.'

Iron Skeleton Construction, a modern system of constructing high buildings, by which architects and builders are enabled to plan and erect buildings as high as 15 or 20 stories on plots of ground 20 to 30 feet wide. By the use of this system the thickness of walls is considerably reduced, thus giving a larger floor space, a very desirable consideration, especially in office buildings. Iron and steel columns are carried up from foundation to roof, and then covered in with bricks or stone. Thus a carrying capacity equal to that of walls of much greater thickness is produced. A 12-story building in New York city thus constructed upon a lot 25 by 100 feet means a saving in floor space of thousands of feet.

Ironclad. See ARMOR-PLATE.

Ironclad Oath, The, an act passed by the United States Congress in 1866, excluding voters, in the States lately in rebellion, from the franchise. The act practically disfranchised all Southerners over 25 years of age. It was repealed shortly after its passage.

Irondale, ī'ėrn-dāl, Wash., a place in the northeastern part of Jefferson County, a few miles south of Port Townsend. The first blast-furnace on the Pacific coast was erected at this place in about 1880. The furnace was in operation about 12 years, and was then abandoned because of the great expenses incurred in production. The ore was obtained from Texada, an island belonging to British Columbia, and 130 miles distant. The last of the 19th century the Pacific Steel Company, a corporation in which practical iron-makers of Pennsylvania are the chief owners, began investigations as to the nature of the ore, and the possibility with improved machinery, to manufacture iron at Irondale or vicinity at paying rates. As a result the Pacific Steel Company have taken up the work abandoned by the Puget Sound Iron Company. The works have been so improved as to be practically new, and 20 brick charcoal kilns have been erected for the use of the company. Coke is obtained in Washington.

Ironton, ī'ėrn-tŏn, Ohio, city, county-seat of Lawrence County; on the Ohio River, and on the Detroit S., the Norfolk & W., and the Cincinnati, H. & D. R.R.'s; about 100 miles directly southeast of Columbus. The Chesapeake & Ohio railroad, in Kentucky, has here a ferry for passengers and freight, which practically gives the city the benefit of four important railroads. Ironton was settled in 1832, and for some years was known as a river-trading town. It was incorporated in 1849. It is situated in a section of country noted for its clay (suitable for pottery), iron ore, and bituminous coal. Its chief industrial establishments are foundries, rolling-mills, blast-furnaces, machine-shops, nail-works, furniture factories, and planing-mills. It has also among its manufactures doors and mantels, stoves, boilers, cement, and fire-bricks. The clay in the vicinity is much used for pottery. The parks, River View, Lincoln, and Beechwood, are attractive. Some of the principal buildings are the Briggs Public Library, the Kingsbury school, Odd Fellows' Hall, Masonic Temple, City hospital, and several churches. Ironton was the home for some time of the artist Sarah Cotter-King. Pop. (1900) 11,868.

Ironweed, a tall, coarse, composite plant of the genus *Vernonia,* three species of which

grow abundantly in woods and along roadsides throughout the southern half of the Union, bearing heads of magenta-colored flowers somewhat like miniature thistles. The most conspicuous species (*V. gigantea*) is often 10 feet high, and blooms in August and September. A similar species (*V. noveboracensis*) grows in low grounds throughout the Northern States.

Ironwood, Mich., city in Gogebic County, on the Wisconsin C. and the Chicago & N. W. R.R.'s; about 12 miles south of Lake Superior and 33 miles southeast of Ashland. It was settled in 1884 and incorporated in 1887. It is situated in a region rich in iron ore and timber; the section is known as the "Gogebic iron region." The famous Norrie mine is in this vicinity. Ironwood is the trade centre for the greater part of the mining and lumbering business of the county. Some of the principal buildings are the Carnegie library, the city-hall, the high school, and several churches. Trolley lines connect the city with Gile and Hurley, Wis. The government is vested in a mayor, who is elected annually, and a council. The mayor appoints, subject to the approval of the council, all the subordinate officials except the members of the board of education. Pop. (1900) 9,705.

Ironwood, a popular name for many trees whose timber is very hard and heavy. Probably the best known species in America is also known as leverwood, *Ostrya Virginica,* of the natural order *Cupuliferæ,* indigenous from Nova Scotia to Florida and westward to Minnesota and Texas. It is a medium sized tree with furrowed bark, birch-like foliage, pistillate flowers in catkins resembling the female flowers of hop, hence its popular name hop-hornbeam. The name ironwood is also sometimes applied to *Carpinus Americana* or *Caroliniana,* of the same natural order. (See HORNBEAM.) Among foreign "ironwoods," perhaps the most widely known is *Mesus ferea,* an East Indian tree planted around Buddhist temples for its fragrant flowers, which are used to decorate the images of Buddha. Another Asiatic species is *Metrosideros vera,* from which the Chinese and Japanese make rubbers. In Australia and South Africa various species of *Olea, Melaleuca, Sideroxylon, Notelaca,* and *Myrtus* are valued for their timber, locally called ironwood, employed where great toughness is desirable and weight no obstacle.

Iroquoian Stock, a linguistic stock of North American Indians deriving their name from the form Iroquois (q.v.), the name given to the "Five Nations." The Saint Lawrence River was probably their first habitat, and from there they gradually spread to the Great Lakes, primarily because of the hostility of the Algonquins. Cartier found, in 1535, a people living between Montreal and Quebec whose language showed them to be Wyandots, but 100 years later these had entirely disappeared and the Algonquins occupied their territory. The Iroquoian stock is divided into four groups: the northern — Wyandot, Tionontati, Wenrorono, Tohotænrat, Neuter, Hochelaga; the central — Mohawk, Oneida, Cayuga, Onondaga, Erie, Conestoga, Seneca; the southern — Tuscarora, Meherrin, Nottaway, Chowanoc, Coree; the Cherokee — Elati or Lower Cherokee, Middle Cherokee, and Atali or Upper Cherokee. The tribes of the Iroquoian stock were all agricultural, and were noted for their houses and fortifications. They have also made considerable advance in education. The whole population is about 43,000, of whom 10,000 are in Canada. The major portion of the population are Cherokee. See IROQUOIS.

Iroquois, ĭr-ō-kwoi', the name given by the French to the confederacy of North American Indians, called by the English the "Five," and afterward the "Six Nations." The Mohawks, Oneidas, Onondagas, Cayugas, Senecas, and Tuscaroras, after they were driven from their hunting-grounds in North Carolina in 1712, were the members of this confederacy. They formerly resided on the Mohawk River in New York State and on the lakes which still bear their names, and extended their conquests to the Mississippi and beyond the St. Lawrence. Their valor and successes had procured them the name of the Romans of America. Their territory abounded with lakes well stored with fish; their forests were filled with game, and they had the advantage of a fertile soil. The sachems owed their authority to public opinion; the general affairs of the confederacy were managed by a great council, composed of the chiefs, which assembled annually at Onondaga. The history of the Iroquois probably dates back to 1535, when Cartier found the peoples who had settled along the shores of the Saint Lawrence River, from Quebec to Montreal, and who, judging from the similarity in languages were undoubtedly the ancestors of the later Iroquois. The Algonquins, who at this time were more powerful, drove those people from their habitations and scattered them throughout the country, some, like the Hurons, traveling west, and the majority, among whom were the Iroquois, going south, settling mainly in North Carolina. Hiawatha, their leader, then persuaded them to form a league or confederacy for their own protection, and the league thus formed became known as the "Five Nations," and was based upon such sound and well-ordered plans that it is in existence at the present time. In 1712 they were driven from their territory in North Carolina and coming north again settled in Central and Western New York. Here they gathered other tribes and merged them into the confederacy; and in 1715 took in the Tuscaroras, after which the league was known as the "Six Nations"; they bought firearms and supplies from the Dutch and gradually strengthened themselves so that in 1630, they took the offensive in a long and bloody war against the Algonquins, first attacking the French missions among the Hurons in Canada and either slaying, capturing, or sending into exile all this tribe; they then rapidly subdued the Neutral Nation, the Erie, the Ottawa, and all the remaining tribes of the Algonquin race; and conquered in quick succession the Conestogas in the south, those east of the Hudson, among whom were the Mohicans, and the Miami and Illinois tribes of the Middle West, the only tribes who successfully opposed them being the Ojibwas of the Northwest and the Cherokees of the South. In the long wars between the British and the French, which continued with some interruption for nearly a century, until 1763, they were with a few exceptions in the British interest. These exceptions were notably the

Cayugas and the Mohawks, over whom the French Jesuit missionaries exercised a great influence, and who later withdrew from the league and settled in the villages of Caughnawaga and Saint Regis. In the Revolution the Iroquois as a league were neutral, but the separate tribes took up the warfare generally in favor of the British, the Oneidas and some of the Tuscaroras being the only ones who sided with the Americans. Brant led the Mohawks and Cayugas into Canada, where, at the end of the war, the Canadian government gave them several reservations, and where a majority of them are at the present time. The reservations for the Iroquois in the United States are mostly in New York, where all now live except the Oneidas, who in 1820 migrated to Wisconsin, and a small band of Senecas, who have a small reservation in the Indian Territory. According to the United States census, and a Canadian report, the total number of the Iroquois in 1902 was about 17,000, of whom about 8,000 were in the United States. See SIX NATIONS, THE.

Irradiation, an apparent enlargement of a bright body when seen against a background darker than itself. A simple method of observing this phenomenon is to view a bright sky through the spaces between a grating. If the breadth of the opening can be made equal to the breadth of the bars of the grating it will be seen that, when viewed from a little distance the bars look narrower than the spaces between them. This is obviously owing to the encroachment of the light upon the dark spaces around it. The first question to arise and one which was long discussed was whether the encroachment was due to an excitation of the nerves of the retina outside the limits on which the light fell upon the nerves, or whether it was necessary that the light should actually fall outside of its geometrical limits. The latter view is found to be the correct one, unless in cases of extreme brilliancy of the light. Irradiation is almost entirely in the nature of an optical defect or aberration of light. It begins with the atmosphere, which, when light passes through long stretches of it, slightly deflects the rays, so that a point is no longer seen as such, but as a small ill-defined waving surface. No lens ever brings the rays from a point to exactly the same focus. The lenses of the eye itself have defects which everyone who consults an oculist is acquainted with. The result of all these imperfections is to produce the enlargement we have described.

Irradiation is a notable subject in the history of astronomical observations. It was necessarily larger with the imperfect telescopes of former times than with the improved ones of our own period. Total eclipses of the sun, the transits of Venus and Mercury were especially productive of the phenomenon. The enlargement of the moon resulted in a star appearing as if within the bright disc of the moon when its light was really only grazing the surface. The sharp points or horns of light formed by the limb of the sun during the transits of Venus and Mercury were rounded off, so as to present quite an illusory view of their form. Just at the beginning and end of total eclipses of the sun the phenomenon known as Bailey's beads, really enlargements of the last points of light from the sun's limb, which could be seen before the sun was quite covered, looked like a string of beads. Many learned memoirs have been written on the subject, but the consensus of opinion to-day is toward the very simple and comprehensive theory above mentioned.

Irrawad'dy. See IRAWADI.

Irredentists, an Italian political party formed in 1878, having for its object the redemption and incorporation into the kingdom of Italy of all those regions near Italy having an Italian-speaking population and which they called "*Italia Irredenta*" (unredeemed Italy). This immense territory included some of the lands now belonging to France, Austria, Switzerland, and England. The immensity of the undertaking was probably the cause of the downfall of the movement, though the formation of the Triple Alliance also gave it a setback, as Austria was the enemy against whom the main efforts of the party were directed.

Irrigation, the watering of land by artificial means to make it productive. Historically, irrigation seems coeval with the earliest attempts to construct complicated machinery, and the systems of irrigation used in the earliest times in the Far East, in Babylonia, and in Egypt, dating in the last-named country 20 centuries before Christ, furnish as important a chapter in the history of invention as in the story of agricultural development. In our times the systems of India (q.v.) and Egypt (see ASSOUAN; NILE) are probably the best organized, being largely under governmental control. In Europe, irrigation is widely used in northern Italy, southern France, and throughout Spain. The British colonial possessions of the southern hemisphere, notably Australia and South Africa, benefit more and more by artificial water-supply.

Early Irrigation in America.— Irrigation was practised in prehistoric times by the town-building Pueblo Indian tribes inhabiting portions of New Mexico and Arizona. The descendants of these Indians still utilize some of the lands which were tilled by irrigation at the time when the Spaniards first came from the south, and practise many of the primitive customs of their ancestors. The Mexicans of mixed Spanish and Indian origin, gradually extending their settlements from the south, through necessity practised irrigation. The early missions of the Pacific coast also used it, and in southern California particularly are to be found the ruins of substantial dams and headworks built of masonry and constructed by Indian labor. But the first systematic application of irrigation in the arid West by English-speaking people was made by the Mormons on the shores of the Great Salt Lake. The soil was so barren that crops could not be raised by ordinary means, and they turned the waters of the little cañon streams upon the ground where Salt Lake City now stands. After many years they succeeded in mastering the art of irrigation, and under the wise rules of Brigham Young, limiting the size of irrigated farms, the Mormons have become a prosperous people. At about the time the Mormons were settling Utah, the gold-miners in California were building ditches for placer-washing, and were using water from these ditches for irrigation. The results obtained attracted public attention, and irrigation slowly

1. Scene in Southern California, showing the furrow method of irrigation.
2. Desert land reclaimed by irrigation, showing recently planted orchards.

developed as an adjunct to mining. With the stoppage of hydraulic mining, the ditches built for mining were either abandoned or used exclusively for irrigation. Many of them have been enlarged, and have now even greater value than in the old days of mining excitement.

Development in the United States.—The successful irrigation attained by the Greeley colony in Colorado, and the wonderful results shown by the Mormon communities in Utah, Idaho, and Arizona greatly stimulated the colony idea; many organizations brought people in large bodies from the Eastern States, and even from Europe, and placed them on small farms located near each other and supplied with water from a common ditch. Individual settlers also sought opportunities for bringing land under cultivation by artificial watering; and thus, at many widely scattered points, irrigation has been introduced. There are no statistics concerning the area irrigated in 1870, but it is probable that in that year there were not over 20,000 acres under irrigation in the whole United States; but 1870–80 saw a rapid development of small ditches, constructed by individuals and associations of farmers. At the end of that period there were probably 1,000,000 acres under irrigation. In the decade 1880–90 occurred the "boom" of speculative enterprise in irrigation canals. Large sums of money were obtained for irrigation works, but nearly all of these failed, and although they aided in the extension of irrigation, they did not enrich the investors. The 11th census showed that in 1889 there were 3,631,381 acres irrigated on 54,136 farms, with an average irrigation area of 67 acres. During the following decade the irrigated acreage doubled in extent. This was due to the extension and enlargement of the many canals existing in 1889, and to the more complete practice of irrigation on the lands under ditch.

In addition to the statistics obtained at the Eleventh (1889), and Twelfth (1899) Censuses, a special investigation was ordered in 1902 of irrigated farms and extent of irrigation in acres in the principal arid States, and also the total in the semiarid States, namely, North and South Dakota, Nebraska, Kansas, Oklahoma, and Texas. These lie east of the truly arid region but extend in parts into regions of deficient rainfall.

National Irrigation Act.—The latest and most important step in American irrigation is marked by the National Irrigation Act, which was passed by Congress in 1902, and received the countenance of President Roosevelt. The act provides for the construction of irrigating works under the control of the secretary of the interior, the funds being derived from the disposal of public lands in the 13 States and 3 Territories. The public land is withdrawn from entry excepting under the Homestead Act. The holdings when reclaimed are to be restricted to between 40 and 160 acres, the area being limited to the acreage which in the opinion of the Secretary may be reasonably required for the support of a family. The cost of the reclamation works is to be apportioned to the reclaimed lands and is to be refunded in not exceeding 10 annual installments, the charges being determined with a view of returning to the Reclamation Fund the estimated cost of construction. For land in private ownership no right to the use of water shall be sold for tract exceeding 160 acres to any one landowner, and he must be an actual resident on or near the land. The result of the law is to give free land under the terms of the Homestead Law and supply water at cost from permanent systems without charging profit or interest to the settler. The management and operation of the irrigation works will ultimately pass to the owners of the lands to be maintained under such rules as may be acceptable to the Secretary, the title and operation of the reservoirs and similar works remaining in the government. It is believed that during each 10 years for the next third of a century an acreage equal to the total now under irrigation in all the West may be added to the agricultural area of the 16 States and Territories affected; thus rapidly multiplying production, furnishing new homes for millions, and providing the food products needed for shipment from the Pacific coast for use in the lands across the Pacific where new markets are now being opened for the surplus products of this country.

Upon the passage of the Reclamation Law in 1902, examinations and surveys were begun in the arid States and construction started in Arizona and Nevada. In Arizona flood water is to be stored on Salt River by a dam below the mouth of Tonto Creek, furnishing a supply for arid lands in the vicinity of Phœnix. In Nevada the flood water of Truckee River is to be diverted by a canal under construction taking it to Carson River, storage being there provided for the excess water of both streams. This will be used upon the desert area in the vicinity of Carson Lake. Other principal projects favorably reported upon are Colorado River in Arizona and California; Gunnison River in Colorado; Snake River in Idaho; Milk River in Montana; North Platte River in Nebraska; Rio Grande and Pecos rivers in New Mexico; Yellowstone River in North Dakota; Umatilla River in Oregon; Belle Fourche in South Dakota; Bear Lake in Utah; Palouse River in Washington, and Shoshone River in Wyoming.

Surface streams supply over 90 per cent of the irrigated land of the United States. Streams within the arid region of the United States rise high, and at one point or another flow for a time through upper valleys or parks. But after passing through rocky defiles to a fertile lower valley, the typical stream of the arid West loses itself in a shallow sandy channel.

Water-Supply and Regulation.— The water used in irrigation is for the most part taken from the river or creek by natural flow or gravity. The cost of lifting or pumping water is usually too great in proportion to the value of crops raised to permit the general use of pumps. Water will flow rapidly in a ditch having a fall of two feet per mile, and the stream supplying the ditch may be falling at a rate of 12 feet per mile. At the end of the first mile the water in the ditch will be 10 feet above that in the river, and at the end of the tenth mile will be 100 feet higher, and will thus cover land which is less than 100 feet in altitude above the stream at this locality. It is usual to construct some device at the upper end of each ditch or canal by which the amount of water entering from the river can be regulated. Without this, flood-waters would fill the ditch beyond its capacity, and would overflow and wash away the banks. In times of low water, also, the stream may fall to such an extent that it must be raised somewhat and forced into the ditch, and at all times it may be necessary to regulate the flow in order to apportion the water fairly to all concerned. In the case of the simplest ditch, a small dam of brush and stone is built diagonally or into or across the stream-bed as the water becomes low in summer, and this is made tight by means of sod and earth. More permanent dams are sometimes built of timber, or masonry. The head-gate or regulator of the canal placed at the end of the dam consists of a stout framework firmly bedded in the earth or rock with one or more openings, each of which can be closed by a gate sliding vertically. The water enters under the gates, the quantity being controlled by raising or lowering them.

A considerable slope can be used for small ditches, since the volume of water is not sufficiently great to move the large particles of sand and gravel. As a general rule, conduits of this character built in common earth should be so proportioned as to have an average velocity of a little less than three feet per second, or two miles per hour, when carrying their full capacity. It is necessary, therefore, to take into consideration the amount of water to be carried and from this deduce the size and shape of the cross-section of the canal or ditch in order to obtain the desired velocity. If the grade be excessive the seepage or loss of water becomes large. The shape of the cross-section of a canal depends largely upon the character of the surface soil. In light or sandy soil, where the earth is easily eroded, very gentle side slopes are given, while in harder materials the side slopes can be steeper. When the fall of the canal is so great that it is impracticable to allow the water to flow freely down the slope, devices known as drops are introduced. These consist of an arrangement whereby the water can drop to a lower level without injury to the canal. Drops are usually built of planks with a sharp overfall edge, and a low dam or obstruction below the fall in order to maintain the pool. Occasionally they are made in the form of an incline, with a pocket at the bottom to break the force of the falling water. They are expensive to build, and difficult to maintain, because of the rapidity with which the timbers decay and the wearing action of the water, which constantly tends to cut exposed portions.

It is necessary in the construction of nearly every ditch or canal to take water across a depression at some point in its course. This is usually done by means of a flume or long box, usually rectangular and supported above the ground by a frame or trestle of timber or iron. Such flumes are often used across rocky ground where it is impracticable to dig a ditch. This is particularly the case near the head, where the water, after being taken from the river, is often carried through a narrow, steep-walled cañon. Here the foundation for a flume is prepared along the rocky cliffs, supports being devised to suit the inequalities of the ground. A better, though more expensive, type of flume is that having a semicircular section, and built of narrow planks or staves laid side by side and held in place by iron bands run around the flume, joined by nuts and threads by which the bands can be drawn up and the staves brought together. In crossing very deep depressions it is necessary to have a correspondingly high trestle in order to carry the flume across on grade. Such high trestles are expensive and liable to destruction from storms. In their place there have been built inverted siphons, wooden stave-pipe, or aqueducts of other form. The stave-pipes are similar in construction to the semicircular frame of narrow plank, carefully planned to a given dimension, and held in place by circular iron bands or hoops.

Application of Water.— The methods of irrigation practised in various parts of the United States differ with the climatic conditions and soil, and especially with the early habits of training of the irrigators. The methods of conserving and applying water have been improved under the stimulus of modern invention, although there has been little if any scientific or well-considered information available. Water is applied to the irrigated field in three ways — by flooding, by furrows, and by sub-irrigation.

Flooding.— This is done by the check system and by wild flooding. By the latter process the irrigator turns the water from a ditch over a level field and completely submerges it. Perfectly level fields are, however, camparatively rare, and the first step in primitive agriculture by irrigation has been to build a low ridge around two or three sides of a slightly sloping field, so that the water is held in ponds. These low banks are commonly known as levees or checks. In construction they are frequently laid out at right angles, dividing the land into a number of compartments. Water is turned from a ditch into the highest of these compartments, and when the ground is flooded the bank of the lower side is cut or a small sluice-way opened, and the water passes into the next field, and so on until each in turn is watered.

Furrows.— Irrigation in checks has gradually been given up, owing to the expense of leveling and leveeing the ground. With experience the irrigator has become able to apply water to crops which are cultivated in furrows, without resorting to such expensive means. The furrows are plowed in such a direction that the water

when turned into them from the lateral ditches will flow freely down them without washing away the soil. When the water has completely filled the furrows, and has reached the lowest points, the little streams are cut off and turned into another set of furrows. The methods of doing this differ. Sometimes the irrigator simply cuts the bank of the distributing ditch with a shovel and then closes the opening after sufficient water has escaped. A more systematic method is commonly employed in California. Water is carried to the furrows in a small box-flume with openings in the side. These openings are closed by little shutters and a number can be opened at once, permitting a certain quantity of water to escape into each furrow. The slope given the furrows determines to a certain extent the amount of water received by the soil. If the fall is very gentle, the water moves slowly and a large portion is absorbed while the furrow is being filled. If steep, the water quickly passes to a lower end and the ground does not absorb so much. When the entire field has been watered the furrows are usually plowed out and a thin layer of the top soil stirred to make an open, porous covering or mulch, preventing excessive evaporation and allowing the air to enter the ground. Without such cultivation a hard crust may be formed. The loosening of this crust breaks the capillary connection with the moisture beneath and thus lessens the loss of water. For irrigating small grain, such as wheat, the ordinary plow furrows are not used. The fields, brought to a uniform surface, are thoroughly cultivated, and after the grain has been sown, small parallel lines are made similar to furrows, but smaller and nearer together. These tiny channels are made either by a peculiar drag or by a roller upon which are projections so arranged as to make small grooves in the soil. These are made in the direction of the desired slope, so that the water can flow down the marks through the grain as it would in furrows through a cornfield. The rapidly growing grain shades the surface and prevents the formation of crust, rendering subsequent cultivation unnecessary. In order to cause the water to spread from the lateral ditches into the furrows through the ground, use is made of the tappoon — a small sheet of metal of such shape as to fit across the ditch. This can be forced into the soft earth, making a small dam and causing the water to back up and overflow the field of grain. Sometimes a canvas dam is used.

Furrow-irrigation is usually employed in watering trees and vines. In some localities, however, basin or pool irrigation is practised. The supply is conducted often in cement-lined ditches and by wooden flumes as near as possible to the trees and vines, and is then turned out into the furrows plowed around or near the trees. The water issuing from small apertures in the side of the wooden box falls into the furrows and is immediately conducted to the vicinity of the trees. Care is usually taken that the water shall not actually touch the tree-trunks, and it is extended far enough about the extremities of the roots to encourage these to spread outward. After the water has traversed the furrows to the lower end of the orchard, the supply is cut off, and the ground is tilled as soon as the surface dries sufficiently.

Sub-Irrigation.— Attempts have been made to conduct the water beneath the surface immediately to the roots of the trees, thus preventing waste by evaporation from the surface of the ground. Few devices have been successful, owing to the fact that the roots of the trees rapidly seek and enter the openings from which the water issues, or, surrounding the pipe by a dense network, cut off the supply. Porous clay tiling has been laid through orchards, and also iron pipes perforated so as to furnish a supply of water along their length. A machine has been invented and successfully used for making cement-pipe in place. Small trenches are dug through the orchard between the trees and the pipe-making machine deposits the material in the trenches, which are filled with earth as soon as the cement is set. Water is thus distributed underground where needed. In orchards where sub-surface irrigation has been unsuccessful because of roots stopping up minute openings beneath the surface, the system has been reconstructed and water has been brought to the surface at or near each tree by means of small hydrants. Vertical pipes are placed at short intervals leading to the level of the ground, and in these are small iron gates or shutters so arranged that the flow can be cut off in the buried pipe. For annual or root crops sub-irrigation has been successfully practised by the use of small iron pipes partly open at the bottom, allowing a small amount of water to escape. These pipes are laid 12 inches or more beneath the surface, and are connected with lines of tile or clay pipes leading from the reservoir or source of supply. As the crops are removed each year, and the ground cultivated, the roots have no opportunity to stop up the pipes. The term sub-irrigation is occasionally applied to conditions occurring in nature where water percolates freely beneath the ground for a considerable distance sufficiently near the surface to supply the need of crops. Where the subsoil transmits water freely, irrigation ditches may sub-irrigate large tracts of country without rendering them marshy. Thus farms may obtain an ample supply of water from ditches half a mile or more away without the necessity of distributing small streams over the surface. In the San Joaquin Valley, California, vineyards in certain localities are thus maintained in good condition, although water has not been visibly applied for many years.

Quantity of Water.— The amount of water required for raising crops varies according to the character of the soil. The plants themselves need a certain minimum supply, but a far larger quantity is required to saturate the surrounding soil to such a degree that the vitalizing processes can continue. Prof. F. H. King of Madison, Wis., has found by direct measurements that from 300 to 500 pounds of water are required for each pound of dry matter produced. When the ground is first irrigated an enormous quantity of water is sometimes required to saturate the subsoil. The quantity of water turned upon the surface during the first year or two has frequently been sufficient to cover the ground to a depth of 10 to 20 feet, and in some cases an amount equal to a depth of 5 feet or more per annum has been thus employed for several years. Gradually, however, the dry soil is filled. The pioneers of irrigation frequently use too much water, often to their disadvantage.

The quantity of water used in irrigation is usually stated in one of two ways: (1) In

terms of depth of water on the surface; (2) in quantities of flowing water through the irrigating season. In the humid regions the rainfall is usually from three to four inches per month during the crop season. In the arid region, where the sunlight is more continuous, and the evaporation greater, there should be for the ordinary crops at least enough water during the growing season to cover the ground from four to six inches in depth each month. The second method of stating the quantities necessary for irrigation is of convenience when considering a stream upon which there is no storage. It is estimated that one cubic foot per second, flowing through an irrigating season of 90 days, will irrigate 100 acres. One second-foot will cover an acre nearly two feet deep during 24 hours, and in 90 days it will cover 180 acres one foot deep, or 100 acres to a depth of 1.8 feet, or 21.6 inches. This is equivalent to a depth of water of a little over seven inches per month during the season of 90 days. Successive years of deficient rainfall in southern California from 1897 to 1900 served to prove that, with careful cultivation, crops, orchards, and vineyards can be maintained by using very small quantities of water. In some cases an amount not exceeding six inches in depth was applied during the year, this being conducted directly to the plants, and the ground kept carefully tilled and free from weeds. As estimated by various water companies in southern California, one miner's inch of water will irrigate from five to ten acres, the miner's inch equaling 12.960 gallons in 24 hours, or almost exactly 0.02 second-foot, this being the amount delivered under a 4-inch head, measured from the centre of the opening. Under this assumption one second-foot should irrigate from 250 to 500 acres. If it be assumed that one miner's inch is allowed for ten acres, or one second-foot for 500 acres, this quantity of water flowing from May to October, inclusive, will cover the ground to a depth of a little over seven tenths of a foot. The method of applying water largely governs the amount used. With alfalfa flooding is practised; with small grains the water is run in furrows; while with orchards the water is sometimes applied directly to each tree, or is run in furrows, four or five in each case between two rows of trees.

The annual charges for water by the acre in southern California, where this economy of water is practised, have been as low as $3, and from this rising to $15 or more per acre. For good farming in parts of the arid region outside of southern California, a depth of from 24 to 30 inches of water during the crop season should be sufficient. The usual charge for this quantity is from $1.00 to $2.00 per acre irrigated per annum. The temperature and the wind-movement introduce so many conditions that broad statements of this kind are merely suggestive, and not to be followed as rules.

Where an excessive amount of water is put upon irrigated land, as high as 70 per cent has been known to pass by seepage to the lower grounds. Growing plants evaporate in many cases 300 times their own weight of water each year. If a crop be carelessly cultivated and weeds allowed to grow with plants, the worthless plants waste as much water as is used by those that are valuable. But with careful cultivation the evaporation is lessened and the waste of water is prevented. Thus the quantity of water required is only one half or one third of the amount needed where the farming is carelessly done.

Users' Rights.— The first settlers frequently laid claim to the whole flow of the stream. Soon after the first ditch was built others were constructed a few miles above or below. As long as the stream is of sufficient volume to fill each of the ditches, no difficulties from this arise; but sooner or later the increasing size and number of ditches and canals result in diminishing the flow in the river to such an extent that it becomes low, and water does not reach the ditches farthest downstream.

The result has been that in many parts of the arid region, owing to scarcity of water, lawlessness has prevailed, and every man has endeavored to obtain for his own crops as much as possible of the scanty supply. Usually the irrigators elected a water-master to apportion to each claimant a certain amount of water, or assign certain days or hours upon which water can be used. Often the quantity of the water has been settled only after vexatious lawsuits or neighborhood quarrels. In some parts of the arid region, notably in Wyoming and Colorado and Idaho, the States have undertaken the regulation of disputes, and have created special boards or tribunals to consider the matter and apportion water.

Methods of Obtaining Water.— In the arid region water can be obtained frequently by digging or boring wells at points near stream-channels or along the foot-hills. Out on the broad valleys it may be necessary to go to a depth of from 100 to 300 feet or more before reaching moisture. Where the supply of water from wells is ample, various devices have been employed, such as windmills and gasoline engines, for bringing it to the surface. It is very important to continue the borings through the water-bearing sands or gravel, so as to take advantage of the full thickness of the pervious deposits. Perforated pipe is often driven into the layers of coarse gravel, and adds greatly to the capacity of the well. Artesian or flowing wells may be sunk wherever water held under pressure in pervious material is overlaid by clay. In a well dug through the impervious layer into the gravel the water will rise to a height equal to the line of saturation of the gravel stratum in the surrounding country. Artesian conditions occur in nearly every State, but they do not extend over any considerable portion of the country, excepting on the Great Plains and in California. Wherever they occur the water has especial value on account of the convenience incident to its rising above the surface. In some places, as the James River Valley of South Dakota, the pressure is 100 pounds or more to the square inch, throwing the water to a considerable height and enabling the wells to be used as sources of power. The quantity of water to be had from deep wells is governed by the diameter of the well, the structure and thickness of the water-bearing rocks, and the pressure sustained by the water. With relatively dense rocks a slight head of water will throw only a feeble stream, but from thick layers of open gravel or sand rock large volumes are delivered. It frequently occurs that a 4-

rises. Selby has shown it to be a consequence of the principles of thermodynamics that the amount by which the surface tension changes should be proportional to the change in the absolute temperature. Most of the older measurements of the temperature coefficients do not confirm this conclusion, but the recent observations of Knipp on water, and of Feustel on various organic liquids are in agreement with it.

The magnitudes of the constants of capillarity manifestly depend on the magnitudes of the forces between molecules and on the range of molecular action. The theory of van der Waals leads to an estimate of the molecular pressure within a liquid, the values obtained for it ranging from 1,430 atmospheres in the case of ether to 10,700 atmospheres in the case of water. The same theory indicates that the range of molecular action is proportional to the linear dimensions of the molecule, and is of about the same magnitude as the radius of the molecule. By the help of a modified form of this theory, Eötvös came to the conclusion that the rate of variation with the temperature of the product of the surface tension and the two-thirds power of the molecular volume should be constant, and the same for all liquids, within a certain temperature range, if their molecules are single, and not double or compound. Observation shows that this law holds true for many liquids, and in cases in which it fails, there are often other reasons to support the conclusion that the molecules of the liquid are compound.

Before closing, we may consider a few examples of the effects produced by surface tension.

When waves are set up on the surface of water, they are transmitted across the surface at a rate which depends on the hydrostatic pressure and on the surface tension. The surface tension is practically the only agent in transmitting the waves when they are very short. Such waves may be set up by the use of a vibrating tuning fork, and the measurement of their lengths furnishes a means for the determination of the value of the surface tension. The ripples set up on the smooth surface of a pond by a breath of air, or which proceed in front of a slowly moving boat, are largely due to surface tension.

When a glass tumbler is partly filled with water, the surface tension draws the water up the sides. As more water is carefully poured in, the line of contact rises until it reaches the edge of the glass. It often happens that the line of contact is checked at the edge, so that the water does not run out over the top of the glass. In this case the glass can be filled above the level of its edge, and the water will stand in it under a surface that is convex upward, the surface tension in which keeps the water from running out.

The surface tension in the convex surface of the mercury in the tube of a barometer produces a pressure downward, which has to be estimated and allowed for when accurate observations are to be made.

A fine needle that has been slightly oiled or greased, if laid gently down on the surface of water, will float there. It lies in a concave trough formed in the water surface. The water cannot wet the needle, because of its coating of oil, and so the needle is supported by the uplift due to the surface tension acting in the concave surface in which the needle rests. In a way generally similar, the insects which run over the surface of water are supported in little hollows in the water surface. Their feet are not wetted by the water.

When two light bodies, floating on the surface of a liquid, are moved toward each other until the curved parts of the liquid surface near them intersect, they seem to exert forces on each other. If they are both wetted by the liquid, or are both not wetted by it, they move together and adhere to each other. If one of them is wetted by the liquid and the other not, they move apart. If water is run in between two parallel sheets of plate glass, they are drawn closely together and adhere very strongly to each other. These actions are ascribed to differences in the pressures on opposite sides of the bodies. In case the bodies are wetted by the liquid, the pressure in the region between them, in the elevated portion of the liquid under its concave surface, is less than the pressure on their outer sides, and they are pushed together. This action takes place even in a vacuum, in which case the pressure under the concave surface is a negative pressure or tension. In case the bodies are not wetted by the liquid, the liquid is depressed between them, and the pressure inward on their outer sides is greater than that acting outward, and they are pushed together. A curious effect, predicted by Laplace from the theory of capillarity, and verified by experiment, is exhibited by two bodies, one of which is wetted by the liquid and the other not. These bodies, as the distance between them is diminished, at first appear to repel each other, but as the distance is reduced the repulsion changes to an attraction and the bodies come together.

If a small lump of camphor is dropped on clean water, it begins to move about over the surface in an irregular way, and continues to do so, generally, for some time. These motions are explained by noticing that one part of the lump of camphor dissolves more freely than the rest, and so, near it, the surface tension of the water surface is lowered below that near the other parts of the lump. The camphor is accordingly drawn toward that part of the surface in which the tension is greatest.

If a thread of water is at rest in a horizontal capillary tube, and one of its two end surfaces is touched by a wire that has been dipped in turpentine or benzine, the tension at that end will be diminished, and the greater tension of the other end will draw the water along the tube. This effect is taken advantage of in cleaning off grease spots from cloth. The surface tension of benzine is very low, and when benzine is applied in a gradually narrowing ring around the spot of grease, the grease is drawn in toward the centre of the ring, and if the cloth is laid on a piece of blotting paper, the grease will be taken up by it. This action is promoted if a hot iron is applied to the other side of the cloth, for the heat lessens the tension in the ends of the pores nearest the iron, and the greater tension at the other ends draws the grease into the blotting paper.

William Francis Magie,
Professor of Physics, Princeton University.

Capilupi, Camillo, Italian poet: b. Mantau in the early part of the 16th century. He was the author of a work issued in 1572 entitled 'The Stratagem of Charles IX. against the Huguenots,' in which the Massacre of St. Bartholomew was justified, and made it appear that the action was premeditated. Cardinal Lorraine, who at the time was attending the Pope in Rome, endeavored to suppress the book from motives of policy.

Capistrano, Giovanni di, jō-vän'nē dē kä-pē-strä'nō, or **Capistranus, Johannes, Saint,** Italian monk: b. Capistrano, a small Neapolitan town of the Abruzzi, 24 June 1386; d. Illock, Slavonia, 23 Oct. 1456. He at first studied law, but in his 30th year, impelled by a vision, entered the Franciscan order, and was soon distinguished by the austerity of his manners, and a great zeal against the numerous heretical sects in Italy. The Popes Martin V., Eugene IV., and Felix V., often employed him as legate and inquisitor in suppressing the sect of the Fraticelli, which had spread widely over Naples and the Papal States. In 1444 he became vicar-general of the strict order of Franciscans called Observants, and in 1450 proceeded as legate to Germany with a view to suppress the Hussites, and rouse the Germans to a crusade against the Turks. Although he was successful in his opposition to the Hussites in Moravia, he was expelled from Bohemia by George Podiebrad. His fanaticism often led him into many acts of cruelty, one of the worst being the racking and burning of 40 Jews in Breslau, on the charge of profaning the Host. His harangues in favor of a crusade against the Turks failing to make much impression on the German princes he resolved to try their effect on the populace, and easily persuaded great numbers to join him in marching against the Turks, who were advancing under Mohammed II., and had closely invested Belgrade, the key of Hungary, with an army of 150,000 men. At the instigation of Capistranus, John Corvinus Hunnyades furnished a force of 60,000, destroyed the Turkish fleet on the Danube, and threw into Belgrade succors both of men and provisions. On this expedition Capistranus in person commanded the left wing of the party, forced his way into Belgrade, repulsed a general assault by the Turks, and on 6 Aug. 1456, in conjunction with Hunnyades, signally defeated the whole Turkish host. His exertions, and the pestilential atmosphere caused by the dead bodies lying unburied around Belgrade, laid him on a sick-bed, and he died in the same year in the Franciscan monastery at Illock. He was canonized in 1690. He was the author of 'Speculum Conscientiæ.'

Capisucchi, kā-pe-sook'kē, or **Capizucca, Biago,** or **Biasio,** Marquis of Monterio, Italian general: b. Rome about the middle of the 16th century; d. 1613. He was in the service of Spain in the Low Countries, under the Duke of Parma, in 1584, afterward becoming lieutenant-general and commander of the army of Ferdinand I. de Medici, duke of Tuscany.

Capisucchi, Paolo, Italian ecclesiastic: b. Rome 1479; d. there 1539. Having become bishop of Neocastro he was summoned to Rome by Clement VII., who referred to him the question of a divorce between Henry VIII. of England and Queen Catherine. In this matter Capisucchi made a report against Henry.

Capital, in architecture the uppermost member of a column, that is to say, a separate piece of stone set upon the shaft and supporting an epistyle or the abutment of an arch — in short the mass of the building which is imposed upon the column.

A column must always have a shaft and a capital; without these features it would be a post, perhaps a pillar or a pier, but would have no architectural character. The capital, moreover, has generally received the most elaborate decorative treatment of the whole composition. Thus in Egypt, while the shaft might be cylindrical or conical, the capital would spread out immediately in curves either concave or convex, and would be carved and painted. It is even practicable to divide Egyptian columns into four orders by their capitals, which spread in different ways, and are ornamented by different sculpture, more or less imitative of nature. The idea of the spread given to the capital is, of course, that in this way the superstructure is taken more easily, as it is always and of necessity much larger horizontally than the column itself.

The stone uprights left in rock-cut temples in India and called ordinarily pillars, because of their varied forms — octagonal, square, and the like — are still divided into shaft and capital, though the forms of these are entirely remote from Egyptian or later European examples. Thus, some capitals consist of a mere enrichment of the uppermost band of the shaft and a superincumbent block very elaborately carved. In some cases this upper block gives off corbels and consoles which help to carry the roof by their greater spread.

The capitals which have excited the most interest among European students of art are those of the three Greek orders and of the five Renaissance orders which were deduced from the first three. The capital of the Grecian Doric is a reversed cone rounded off at top and carrying a square plinth or die; this plain *echinus* was richly painted in bright colors. The capital of the Ionic order is a curious device consisting of scrolls or volutes, two on each of the two opposite sides, so that this capital, almost alone, has not the same appearance from every point of view. The capital of the Corinthian order is a circular bell, surrounded by acanthus leaves and having at each corner a couple of projecting scrolls not unlike those of the Ionic order but small. This Corinthian order received many modifications in ancient Roman practice, and one of these was erected by the Renaissance men into a separate order, the so called Composite. From the Grecian Doric the Roman Doric took shape, and this was used by the Renaissance men, while a still simpler order was made from it and called the Tuscan. The capitals of these two orders are very thin and low in vertical measurement, and consist of moldings running round the continuation of the shaft, and either plain or slightly carved into the simplest of the egg and dart moldings or the like.

In mediæval architecture, both Romanesque and Gothic, the capitals are almost infinitely varied. The strong tendency of the time toward elaborate carving made this block of stone, from 5 to 20 feet above the aisles and in a prominent place, a most tempting vehicle for sculpture, and

the abandonment of the classical orders left every artist free to design his own system of leafage, animal forms and the like. In this way mediæval capitals are often of extraordinary beauty; but no attempt has been made to classify them except as they form part of a style. See COLUMN.

RUSSELL STURGIS.

Capital, in political economy, the accumulated wealth, in possession of individuals or of a community, which is available for use in further production. In estimating the capital of any individual we necessarily take into consideration the debts due to and from him; and many men of large capital are only possessed of claims upon others; their whole stock is in the hands of others at interest; and they have only promises for a certain amount of money, and actually possess neither lands nor goods to any considerable value; while others possess large quantities of both, and yet have little or no capital, since they owe in money the value of the greater part or the whole of their possessions. Now it is plain that no individual can undertake production, to any large extent, without an extensive stock. He must have land to cultivate, or materials to work up, and implements to work with. Even a savage must have a capital, such as his hut, clothes, cooking utensils, food enough to support him until he can obtain a new supply, and implements, such as a hatchet, gun, canoe, fishing gear, to procure this supply. The first effort of industry is to supply the implements, apparatus, and machinery for his own employment; and as society and the arts advance, and the operations of industry are extended, the implements, apparatus, machinery, and materials requisite in conducting the processes of production must be proportionally accumulated; and these will constitute a part of the capital of a community, and also of an individual, which is essential to success in productive processes. And these can be commanded by any one in proportion to the extent of his individual capital; or, if he have credit, then his resources for production will depend upon the capital of others — in other words, that of the community to which he belongs.

In considering the aggregate capital of a community we may put out of the question all the debts due from any of the members to others; for, whether these be great or small — and they will vary according as the practice of giving credit is more or less in use — still the capital of the community will consist in its lands, buildings, ships, machinery, materials on hand, implements; in short, in all those things which bear a value in the market. Provided the community owes no debt abroad, these will constitute its aggregate capital; and, if its members are indebted abroad, we find its actual net capital, as in the case of an individual, by deducting the amount of its debts from the value of its possessions, without regarding the debts due from some of its members to others.

Capital has long been recognized as necessary as an auxiliary to labor, despite the fact that in more recent times it has been urged by unscholarly writers and by demagogues that capital is really the tyrant of labor and that the latter could readily dispense with it. The cultivator of the soil demands a spade or a plow, the blacksmith an anvil, hammer, and bellows, etc. All trades and industries demand certain instruments,— tools, raw material, every kind of supplies, and all these are capital. This, being true on a more primitive basis, is proportionately truer in a civilized state, where labor is complicated and returns are not immediate. "In that rude state of society," says Adam Smith, "in which there is no division of labor, in which exchanges are seldom made, and in which every man provides everything for himself, it is not necessary that any stock should be stored up in order to carry on the business of the society. . . . But when the division of labor has once been thoroughly introduced, the produce of a man's own labor can supply but a very small part of his occasional wants. The far greater part of them are supplied with the produce of other men's labor, which he purchases with the produce, or, what is the same thing, with the price of the produce of his own. But this purchase cannot be made till such time as the produce of his own labor has not only been completed but sold. A stock of goods of different kinds, therefore, must be stored up somewhere sufficient to maintain him and to supply him with the materials and tools of his work." At any given time, capital may be arranged under the three heads above indicated — subsistence, tools, and materials.

An owner of capital, possessing an amount larger than he is capable of using in his own work, obtains the labor of others. He either attempts an industry with the assistance of workmen to whom he pays a remuneration agreed upon, or diverts a portion of his capital as a loan, or as stock, or in some other way, such capital being made effective by others. On the contrary one not possessing capital adequate to the useful employment of his activities, undertakes the combination of his labor with the capital of another. This combination may vary according to circumstances, and may of course be at times unfavorable to labor.

Capital is distinguished into floating or movable, and fixed; the former consisting of things that may be transferred by delivery of any kind from place to place, the latter of land, houses, and other property which must be taken delivery of in the place where they stand. Another use of the distinction is made to represent the difference between the permanent plant of a business and the current capital necessary to carry it on. Capital may thus be said to be fixed either when it is physically incapable of being moved, or when it is rendered immovable by the permanent arrangement of its owner. Thus one carrying on a flour-mill wants a floating or disposable capital, over and above the cost of his works, to be invested in wheat to be floured, and flour not yet disposed of. This instance illustrates what is meant by the floating or disposable capital of a whole community, being that movable exchangeable stock of things on hand, over and above the fixtures and apparatus of production, including lands, buildings, ships, working animals, all the implements of the arts, with necessary food, clothing, and a stock of seed sufficient for the time requisite for reproduction. What remains over these is the disposable capital, and, in a flourishing community, the disposable floating capital is constantly invested in new fixed capital, implements and apparatus of production. A declining community, on the contrary, consumes a part of its implements and apparatus of in-

dustry; or what is in effect the same thing, it does not repair and replace the damage of use and decay. The idea is held out in many economical treatises that a community cannot have a surplus capital; that is, it cannot have more capital than it can make use of in its consumption and reproduction. As no grounds whatever are given for this doctrine, it seems to be hardly entitled to a consideration; for the position is certainly, at the first view, very improbable, since we know very well that men may accumulate; and why they may not, in any possible case, accumulate a surplus, does not appear by any plausible reason, and whether such surplus accumulation may be useful or not will depend entirely upon the kind of articles of which such accumulation consists. If it consist in articles the value of which depends on the prices in foreign markets the excess may be of no value at all; for it may so depress the foreign prices as to countervail all the direct advantage arising from the cheaper supply, for a time, of the domestic demand.

Fictitious capital generally means nothing more nor less than excessive credits, which throw the management and disposition of a great deal of property into the hands of persons who are not able to answer for the risks of loss from its bad management, or other causes. A whole community, in the aggregate, can have fictitious capital only in case of its members having an excessive credit in a foreign country. But the members may, among themselves, have a fictitious capital by too great credits in their dealings with each other, and the fiction, in this case, is in their false promises of payment. See Political Economy; Trusts; Wages.

Capital (*Das Kapital*), a noted work by Karl Marx, published in 1867. English translation edited by Fred Engels, 1887. A book of the first importance, by the founder of international socialism. The conservative aspect of Marx's teaching is in the fact that he honestly seeks to understand what, apart from any man's opinion or theory, the historical development actually is; and that he does not think out and urge his own ideal programme of social reform, but strives to understand and to make understood what must inevitably take place.

Capital Punishment (Latin, *caput*, "the head"; hence *capitalis*, "pertaining to or affecting the head"; hence "affecting the life"), the punishment of death. The questions most commonly discussed by philosophers and jurists under this head are: (1) as to the right of governments to inflict the punishment of death; (2) as to the expediency of such punishment; (3) as to the crimes to which, if any, it may be most properly confined and limited; (4) as to the manner in which it should be inflicted.

1. As to the right of inflicting the punishment of death. This has been doubted by some distinguished persons; and the doubt is often the accompaniment of a highly cultivated mind, inclined to the indulgence of a romantic sensibility, and believing in human perfectibility. The right of society to punish offenses against its safety and good order will scarcely be doubted by any considerate person. In a state of nature individuals have a right to guard themselves from injury, and to repel all aggressions by a force or precaution adequate to the object. This results from the right of self-preservation. If a person attempts to take away my life, I have, doubtless, a right to protect myself against the attempt by all reasonable means. If I cannot secure myself but by taking the life of the assailant, I have a right to take it. It would otherwise follow that I must submit to a wrong, and lose my life rather than preserve it by the means adequate to maintain it. It cannot, then, be denied, that in a state of nature men may repel force by force, and may even justly take away life, if necessary, to preserve their own. When men enter society, the right to protect themselves from injury and to redress wrongs is transferred generally from the individuals to the community. We say that it is generally so, because it must be obvious that in many cases the natural right of self-defense must remain. If a robber attacks one on the highway, or attempts to murder him, it is clear that he has a right to repel the assault, and to take the life of the assailant if necessary for his safety; since society in such a case could not afford him any adequate and prompt redress. The necessity of instant relief, and of instant application of force, justifies the act, and is recognized in all civilized communities. When the right of society is once admitted to punish for offenses, it seems difficult to assign any limits to the exercise of that right, short of what the exigencies of society require. If a state have a right to protect itself and its citizens in the enjoyment of its privileges and its peace, it must have a right to apply means adequate to this object. The object of human punishments is, or may be, threefold: (1) to reform the offender; (2) to deter others from offending; and (3) to secure the safety of the community, by depriving the offender of the power of doing mischief. The first consideration rarely enters into human legislation, because of the inadequacy of our means to produce great moral results by the infliction of punishment. The two latter considerations enter largely into the theory and practice of legislation. Who is to be the judge in such cases? what is the adequate punishment for any offense? Certainly punishments ought not to be inflicted which are utterly disproportionate to the offense, and beyond the exigencies of society. No government has a right to punish cruelly and wantonly and from mere revenge; but still, the discretion must be vested somewhere, to say what shall be the degree of punishment to be assigned to a particular offense. That discretion must be, from its nature, justly a part of the legislative power, and to be exercised according to the actual state of society. It may,— nay, it must,— be differently exercised in different ages and in different countries; for the same punishment which in one age or country may be sufficient to suppress an offense, or render it comparatively harmless, may, in another age or country, wholly fail of the effect. If mild punishments fail of effect, more severe ones must be resorted to if the offense be of a nature which affects society in its vital principles, or safety, or interests. The very frequency of a crime must often furnish a very strong ground for severe punishment, not only as it furnishes proof that the present punishment is insufficient to deter men from committing it, but from the increased necessity of protecting society against dangerous crimes. But it is often said that life is the gift of God,

and therefore it cannot justly be taken away, either by the party himself or another. If he cannot take it away, he cannot confer that power on others. But the fallacy of this argument is obvious. Life is no more the gift of God than other personal endowments or rights. A man has, by the gift of God, a right to personal liberty and locomotion, as well as to life; to eat and drink and breathe at large, as well as to exist, yet no one doubts that, by way of punishment, he may be confined in a solitary cell; that he may be perpetually imprisoned or deprived of free air, or compelled to live on bread and water. In short, no one doubts that he may be restrained in the exercise of any privileges or natural rights short of taking his life. Yet the reasoning, if worth anything, extends to all these cases in an equal degree. If, by his crimes, a man may justly forfeit his personal rights, why not his life? But we have seen that it is not true, even in a state of nature, that a man's life may not be taken away by another if the necessity of the case requires it. Why, then, may not society do the same if its own safety requires it? Is the safety of one person more important than the safety of the whole community? Then, again, as to a man's inability to confer on others a right which he does not himself possess. Suppose it is so; the consequence which is deduced from this does not, in fact, arise. Blackstone, indeed, seems to deduce the right of society to punish capital offenses in certain cases (that is, in cases of *mala prohibita* and not *mala in se*) from the consent of the offenders. The Marquis Beccaria, on the other hand, denies than any such consent can confer the right, and therefore objects to its existence. But the notion of consent is, in nearly all cases, a mere theory, having no foundation in fact. If a foreigner comes into a country and commits a crime at his first entrance, it is a very forced construction to say that he consents to be bound by its laws. If a pirate commits piracy, it is absurd to say that he consents to the right of all nations to punish him for it. The true and rational ground on which the right rests is not the consent of the offender, but the right of every society to protect its own peace, interests, property, and institutions, and the utter want of any right in other persons to disturb, or destroy, or subtract them. The right flows, not from consent, but from the legitimate institution of society. If men have a right to form a society for mutual benefit and security, they have a right to punish other persons who would overthrow it. There are many cases where a state authorizes life to be taken away, the lawfulness of which is not doubted. No reasonable man doubts the right of a nation, in a just war, especially of self-defense, to repel force by force and to take away the lives of its enemies. And the right is not confined to repelling present force, but it extends to precautionary measures which are necessary for the ultimate safety of the nation. In such a war a nation may justly insist upon the sacrifice of the lives of its own citizens, however innocent, for the purpose of ensuring its own safety. Accordingly we find that all nations enrol militia and employ troops for war, and require them to hazard their lives for the preservation of the state. In these cases life is freely sacrificed by the nation; and the laws enacted for such purposes are deemed just exercises of power. If so, why may not life be taken away by way of punishment if the safety of society requires it? If a nation may authorize, in war, the destruction of thousands, why may it not authorize the destruction of a single life, if self-preservation require it? The mistake, however, is in supposing that life cannot be taken away without the consent of the party. If the foregoing reasoning be correct, such consent is neither supposed nor necessary. In truth, the supposition of an original compact between all the persons who are subject to the regulations of a society, by their own free consent, as the necessary and proper basis on which all the rights of such society depend, is at best a gratuitous supposition, and it sometimes leads to very incorrect results. It may be added that the Scriptures most clearly recognize and justify the infliction of capital punishments in certain cases.

2. As to the expediency of capital punishment. This opens a wide field for discussion. Some able men who do not doubt the right do still deny the expediency of inflicting it. It may be admitted that a wise legislature ought to be slow in affixing such a punishment to any but very enormous and dangerous crimes. The frequency of a crime is not of itself a sufficient reason for resorting to such a punishment. It should be a crime of great atrocity and danger to society, and one which cannot otherwise be effectually guarded against. In affixing punishments to any offense, we should consider what are the objects and ends of punishment. It is clear that capital punishment can have no effect in reforming the offender himself. It may have, and ordinarily does have, the effect of deterring others from committing a like offense; but still, human experience shows that even this punishment, when inflicted for small offenses, which are easily perpetrated, and to which there is great temptation, does not always operate as an effectual terror. Men are sometimes hardened by the frequent spectacles of capital punishments and grow indifferent to them. Familiarity deprives them of their horror. The bloodiest codes are not those which have most effectually suppressed offenses. Besides, public opinion has great weight in producing the acquittal or condemnation of offenders. If a punishment be grossly disproportionate to the offense, if it shock human feelings, there arises, insensibly, a sympathy for the victim and a desire to screen him from punishment; so that, as far as certainty of punishment operates to deter from crimes, the object of the legislature is often thus defeated. It may be added that a reasonable doubt may fairly be entertained whether any society can lawfully exercise the power of punishing beyond what the just exigencies of that society require. On the other hand, a total abolition of capital punishments would, in some cases at least, expose society to the risk of deep and vital injuries. A man who has committed murder deliberately has proved himself unfit for society and regardless of all the duties which belong to it. The safety of society is most effectually guarded by cutting him off from the power of doing further mischief. If his life be not taken away, the only other means left are confinement for life or transportation and exile for life. Neither of these is a perfect security against the commission of other crimes, and may not always be

within the power of a nation without great inconvenience and great expense to itself. It is true that the latter punishments leave open the chance of reform to the offender, which is indeed but too often a mere delusion; but, on the other hand, they greatly diminish the influence of another salutary principle, the deterring of others from committing like crimes. It seems to us therefore that it is difficult to maintain the proposition that capital punishments are at all times and under all considerations inexpedient. It may rather be affirmed that in some cases they are absolutely indispensable to the safety and good order of society. Some states have, however, entirely abolished capital punishment, as is the case in Holland, Rumania, Portugal, a certain number of the Swiss cantons, and some States of the American Union. It was entirely abolished in Switzerland in 1874, but a few years after, owing to the increase of murders, it was again made permissible. It was also for a time done away with in Austria and in one or two of the States of this country.

3. As to the crimes to which capital punishments may most properly be limited. From what has been already said it is plain that this must depend upon the particular circumstances of every age and nation; and much must be left to the exercise of a sound discretion on the part of the legislature. As a general rule humanity forbids such punishments to be applied to any but crimes of very great enormity and danger to individuals or the state. If any crimes can be effectually suppressed by moderate means, these ought certainly to be first resorted to. The experience, however, of most nations, if we may judge from the nature and extent of their criminal legislation, seems to disprove the opinion so often indulged by philanthropists that capital punishments are wholly unnecessary. The codes of most civilized nations used to abound with capital punishments. That of Great Britain long continued to be very sanguinary. Blackstone, in his 'Commentaries,' admits that in his time not less than 160 crimes were by the English law punishable with death. Forgery was one of these up to the reign of William IV. The only crimes for which capital punishment may now be inflicted, according to the law of England, are high treason and murder. The law in Scotland is substantially the same, a sentence of capital punishment now being competent only in cases of treason, murder, and attempts to murder in certain cases. By United States statutes nine crimes are so punishable, including treason, murder, arson, rape, piracy, and robbery of the mail. In several States of the Union still fewer crimes are generally punishable with death. Beyond treason, murder, arson, piracy, highway robbery, burglary, rape, and some other offenses of great enormity and of a kindred character, it is extremely questionable whether there can be necessity or expediency in applying so great a severity. Beccaria, with his characteristic humanity and sagacity, has strongly urged that the certainty of punishment is more important to deter from crimes than the severity of it.

4. As to the manner of inflicting the punishment of death. This has been different in different countries, and in different stages of civilization in the same countries. Barbarous nations are generally inclined to severe and vindictive punishments; and, where they punish with death, to aggravate it by prolonging the sufferings of the victim with ingenious devices in cruelty. And even in civilized countries, in cases of a political nature or of very great atrocity, the punishment has been sometimes inflicted with many horrible accompaniments. Tearing the criminal to pieces, piercing his breast with a pointed pole; pinching to death with red-hot pincers; starving to death; breaking his limbs upon the wheel; pressing to death in a slow and lingering manner; burning at the stake; crucifixion; sawing to pieces; quartering alive; exposure to wild beasts; and other savage punishments, have been sometimes resorted to for the purposes of vengeance, public example, or public terror. Compared with these the infliction of death by drowning, strangling, poisoning, bleeding, beheading, shooting, or hanging is a moderate punishment. In modern times public opinion is strongly disposed to discountenance the punishment of death by any but simple means; and the infliction of torture is almost universally reprobated. Even in governments where it is still countenanced by the laws it is rarely resorted to; and the sentence is remitted, by the policy of the government, beyond the simple infliction of death. In Prussia, where atrocious criminals were required by the penal code to be broken upon the wheel, the king latterly used always to issue an order to the executioner to strangle the criminal (which was done by a small cord not easily seen) before his limbs were broken. So in the same country, where robbery attended with destruction of life was punished by burning alive, the fagots were so arranged as to form a kind of cell in which the criminal was suffocated by the fumes of sulphur, or other means, before the flame could reach him. Not only is torture now abolished by civilized nations, but even the infliction of capital punishment in public has been given up by most of them. In England, in high treason, the criminal is sentenced to be drawn to the gallows, to be hanged by the neck until he be dead, to have his head cut off, and his body divided into four parts, and these to be at the disposal of the Crown. But, generally, all the punishment is remitted by the Crown, except the hanging and beheading, and these too may be altogether remitted according to circumstances. In other cases the punishment is now simply by hanging, or, in the military and naval service, by shooting. In France formerly the punishment of death was often inflicted by breaking the criminal on the wheel. The usual punishment now is beheading by the guillotine. In 1853 a kind of guillotine (*Fallschwert*) was introduced into the kingdom of Saxony, and it has since been adopted as the means of execution in several other German states. In Austria the general mode of punishment is by hanging. In Prussia hanging is rarely inflicted; but the usual punishment is beheading with a heavy axe, the criminal's head being first tied to a block. In one or two German states execution by the sword still exists. It should be remarked, however, that in Germany hanging has always been deemed the most infamous sort of punishment; and the sentence has often been commuted for beheading by the sword as a milder or less dishonorable mode of punishment. In the United States of America hanging is the almost universal mode of capital punish-

ment, though electricity has recently been tried. The Constitution of the United States contains a provision against "cruel and unusual punishments." In China decapitation by the sword is the usual form: murderers are cut to pieces; robbers not. In Russia the punishment of death has been frequently inflicted by the knout. In Turkey strangling and sewing the criminal up in a bag, and throwing him into the sea, are common modes of punishment. In the Roman code many severe and cruel punishments were prescribed. During the favored times of the republic many of these were abolished or mitigated. But again, under the emperors, they were revived with full severity. In the ancient Grecian states the modes of punishment were also severe and often cruel. The ancient Greek mode of capital punishment by taking poison at such hour as the condemned party should choose, seems never to have been in use among any Christian people.

Whether execution ought to be public or private has been a question much discussed, and one upon which a great diversity of opinion exists among intelligent statesmen. On the one hand, it is said that public spectacles of this sort have a tendency to brutalize and harden the people, or to make them indifferent to the punishment; and the courage and firmness with which the criminal often meets death have a tendency to awaken feelings of sympathy, and even of admiration, and to take away much of the horror of the offense as well as of the punishment. On the other hand it is said that the great influence of punishment in deterring others from the like offense cannot be obtained in any other way. It is the only means to bring home to the mass of the people a salutary dread and warning; and it is a public admonition of the certainty of punishment following upon crime. It is also added that all punishments ought to be subjected to the public scrutiny, so that it may be known that all the law requires, and no more, has been done. Since 1868 the law of the United Kingdom has required all executions to take place privately within the prison walls, and this system seems to have given general satisfaction. The same method is also practised in various other countries. In 1870 a similar measure was proposed in the French Assembly, but the war prevented it being passed and it is not yet law.

In England, the court before which the trial is held declares the sentence and directs the execution of it. In the courts of the United States there is a like authority; but in the laws of many of the States there is a provision that the execution shall not take place except by a warrant from the governor, or other executive authority. In cases of murder and other atrocious crimes the punishment in England is usually inflicted at a very short interval after the sentence. In America there is usually allowed a very considerable interval, varying from one month to six months. In Great Britain there lies no appeal from the verdict of a jury and the sentence of a court, in capital cases, and the very fact that the verdict and sentence are final produces great caution and deliberation in the administration of criminal justice, and a strong leaning toward the prisoner on trial. In the United States there is considerable latitude of appeal. In France there may be a review of it in the court of cassation. In Germany there is, in criminal as in civil cases, a right of appeal; hence, in that country, few innocent persons have suffered capitally since the 16th century. Capital punishment cannot be inflicted, by the general humanity of the laws of modern nations, upon persons who are insane or who are pregnant, until the latter are delivered and the former become sane. It is said that Frederick the Great required all judgments of his courts condemning persons to death, to be written on blue paper; thus he was constantly reminded of them as they lay on his table among other papers, from which they were readily distinguished. He usually took a long time to consider such cases, and thus set an excellent example to sovereigns of their duty.

Capitals (*majuscula*), the large letters used in writing and printing, most commonly as the initial letters of certain words, or of all words in certain positions, and distinguished from the small letters (*minuscula*). As among the ancient Greeks and Romans, so also in the early part of the Middle Ages, all books were written without any distinction in the kind of letters used; but gradually the practice became common of beginning a book, subsequently, also, the chief divisions and sections of a book, with a large capital letter, usually illuminated and otherwise richly ornamented. In legal or state documents of the 13th century capital letters are found dispersed over the text as the initial letters of proper names, and of the names of the Deity, and in the next century the same usage was followed in ordinary manuscripts. The practice with regard to the use of capitals varies in different countries. Sentences and proper names begin almost universally with capitals, but there are several other cases in which the usage is not so general. In English there cannot be said to be any invariable rule regulating their use. The first personal pronoun is always written and printed with a capital letter, and it is common also to begin titles and the names of well-known public bodies, societies, institutions, etc., with capitals. Formerly, it was a frequent practice to begin all substantives in English with a capital, which is still the rule in German. The Germans also begin all titles and pronouns of address with capitals, but not the first personal pronoun. One point in which the English practice differs from that of Germany, France, Italy, and other continental countries, is in beginning adjectives derived from proper names, such as Spanish, Italian, etc., like proper names themselves, with capitals, such adjectives being printed in other countries entirely with small letters.

Capitanis, kăp-ĭ-tā′nēs. See ARMATOLES.

Capitation is applied to anything that concerns a number of persons individually. Thus a capitation-tax is a tax imposed upon all the members of a state, each of whom has to pay his share, and is distinguished from taxes upon merchandise, etc. A capitation-grant is a grant given to a number of persons, a certain amount being allowed for every individual among the number.

Capito, or Kopfel, Wolfgang Fabricius, vōlf′gäng fā-brēt′sē-oos cä′pē tō, or kėp′fĕl, Alsatian reformer: b. Haguenau, 1478; d. Strassburg, November 1541. Entering the Benedictine order, he became professor of theology at Basel, where he showed in his lectures

a tendency to shake off the trammels of the scholastic writers. He approved of Luther's action, but nevertheless in 1519 entered the service of Albert of Mainz; and it was not till some years later that he finally declared for the Reformation. He then entered zealously into its work, shared with Bucer the composition of the Confessio Tetrapolitana, and took part in the Synod of Bern in 1532.

Cap'itol, now *Campidoglio,* the citadel of ancient Rome, standing on the Capitoline Hill, the smallest of the seven hills of Rome, anciently called the Saturnine and the Tarpeian Rock. It was planned and said to have been begun by Tarquinius Priscus, but not completed till after the expulsion of the kings. At the time of the civil commotions under Sulla it was burned down, and rebult by the senate. It again suffered the same fate twice, and was restored by Vespasian and Domitian. The latter caused it to be built with great splendor, and instituted there the Capitoline games. Dionysius says the temple, with the exterior pillars, was 200 feet long and 185 broad. The whole building consisted of three temples, which were dedicated to Jupiter, Juno, and Minerva, and separated from one another by walls. In the wide portico triumphal banquets were given to the people. The statue of Jupiter, in the capitol, represented him sitting on a throne of ivory and gold, and consisted in the earliest times of clay painted red. Under Trajan, it was formed of gold. The roof of the temple was made of bronze; it was gilded by Quintus Catulus. The doors were of the same metal. Splendor and expense were lavished upon the whole edifice. On the pediment stood a chariot, drawn by four horses, at first of clay, and afterward of gilded brass. The temple itself contained an immense quantity of the most magnificent presents. The most important papers were preserved in it. The Capitoline Hill consists of three parts, namely, the northern summit, now occupied by the church of Santa Maria in Aracœli; the southern summit, crowned by the Palazzo Caffarelli, now occupied by the German ambassador; and the depression between these, in which is now the Piazza del Campidoglio. The above church, which is approached from the northwest by a lofty flight of steps, is of great antiquity. In 1888 the Franciscan monastery which was connected with it was replaced by a large monument of Victor Emmanuel II. The Piazza del Campidoglio was designed by Michael Angelo. In its centre is a fine equestrian bronze statue of Marcus Aurelius. On the southeast side there is the Palazzo del Senatore, with a fine flight of steps erected by Michael Angelo. The Palace of the Conservatori occupies the southwest side of the square, and contains valuable collections in art and antiquities. Directly opposite is the Capitoline Museum, founded by Innocent X. The southern summit of the hill is now called Monte Caprino, and on it, beside the Palazzo Caffarelli already mentioned, stands a hospital and a German archæological institute. (See Rome.) Besides the edifice in Washington where Congress assembles, some of the statehouses in States of the Union are officially called capitols.

Capitol at Washington, History of the. After the national capital had been located on the Potomac in 1789, Washington and Major P. C. L'Enfant selected sites for the public buildings. On the first map (1791), the "Congress House" is situated as now, on a low hill commanding the best view in Washington, with 12 broad streets radiating from it, so that it closes the vista of every main avenue. On the decision of a board of three commissioners, with Washington and Jefferson, the plans of the capitol and the President's house were given out in 1792 to public competition, for a prize of $500 or a medal of that value, at the winner's option. For the President's house James Hoban's plans were accepted at once, and he was made superintendent of its erection. For the capitol none were satisfactory, but the three foremost competitors were given another trial, and one, Stephen Hallet, a French artist living in Philadelphia, was employed at a salary and indemnity to revise his plans under the commissioners' criticism. But later in the year Dr. William Thornton (q.v.) of Tortola Island, W. I., submitted plans whose "grandeur, simplicity, beauty, and convenience" forced the committee to accept them. They were too grand for the commissioners' ideas of national needs or resources at the time, however, and specified too costly materials. Thornton wished marble and mahogany and the best of construction, and under a bitter assault from several of his rejected competitors, headed by Hallet, whom the commissioners had joined with Thornton in a revising board, he was forced to reduce its scale and material greatly. Their suggested modifications of his general plan were, however, disapproved. These plans were for what is now the central portion of the capitol.

Work was begun about 1 August. The corner-stone was laid 18 September in the southeast corner of the old north wing, now the supreme court section, with imposing ceremonies, Masonic rites and procession, and a barbecue. Hoban was made superintendent, and Hallet his assistant; but Hoban gave his whole time to the White House, as the President's house came to be called, and Hallet was the real manager. He proceeded to change Thornton's plans and specifications at will, was repeatedly censured for it, and at last ordered to stop it. He resigned, but refused to give up the drawings; the commissioners at last secured them and discharged him, 15 Nov. 1794. Thornton, now one of the commissioners of the District of Columbia, was asked by Washington to obliterate Hallet's changes as injurious, and did so. Hoban now acted as superintendent until George Hadfield, an English architect, was engaged to succeed Hallet, on Jonathan Trumbull's recommendation of him as a modest man and good artist. He outdid Hallet; spent his whole energy in fighting Thornton and Hoban (who always worked in harmony), and after repeated resignations and reconsiderations, was discharged for practical incompetence 10 May 1798. Hoban again took charge. On 17 Nov. 1800 the second session of the sixth Congress met in the north wing of the building. Much of this early construction was of wood or poor material. This was on account of haste, the local interests being very urgent for the coming of the government to that seat. A few years later more durable material was substituted. The commissionership was abolished May 1802, and Thornton and Hoban ceased direct superintendence, though often called in

consultation. At this time the north wing was complete, the foundation of the central rotunda and dome in place, and the basement story of the south wing partly done. These are still as Thornton planned them.

On 6 March 1803 Jefferson appointed Benjamin H. Latrobe (q.v.) "surveyor of public buildings." He at once began, like the others, to besiege the President with the bitterest assaults on Thornton's designs, and when the former declined to interfere, appealed to Congress. Thornton, however, now in charge of the patent office, though he defended himself with severity, made no further attempt to prevent the alteration of his plans; and Latrobe made many serious changes, some of them since judged harmful to beauty and utility. Thus, the Representatives' hall was changed from a graceful, ellipse to a square with semicircular ends; a bad echo gave trouble for many years, caused by the changes. The number and size of entrances to the rotunda were curtailed, the splendid open staircases, cut down and placed in obscurity, were difficult for strangers to find; and the grand semicircular western portico was abolished. The principal entrance was also changed from the west front, facing the White House, to the eastern side. Latrobe was constantly in hot water with both Jefferson and Congress, and published a pamphlet against them in 1806; but till 1811 had pretty much his own way. When the War of 1812 broke out, the capitol consisted of the north and south wings, connected by a corridor of rough boards over the central foundations. On 24 Aug. 1814 the British burnt it as far as possible, piling the furniture and platforms in the rooms with rocket stuff and igniting them; the interior was dreadfully damaged, but the outside walls remained, also the inside brickwork and some stone. A strong movement arose for removing the capital elsewhere; but the same considerations prevailed against it as later. In fear of such a result, however, the local interests formed the "Capitol Hotel Company," and erected a building for government occupancy till the repairs on the capitol were finished. It was occupied, 1815–19, and was afterward known as the "Old Capitol," and used in the Civil War as a military prison. In the reconstruction the House wing was entirely altered.

Near the end of 1817 Latrobe became embroiled with a new commissioner of the Federal building, Samuel Lane, and resigned. In his place was appointed Charles Bulfinch (q.v.), from 1 Jan. 1818; he remained supervising architect for the next decade. In the winter of 1819–20 Congress took its seat in the new hall. The centre was pushed forward to completion, and on 10 Dec. 1824, the entire interior was finished. In 1825 a public competition was held for the figures on the pediment of the eastern portico. From 1826 on Bulfinch was employed on special detail, and the landscape gardening and work on the grounds, which were of his designing. The capitol was set in a park of 22½ acres, encircled by an iron railing somewhat taller than a man, affixed in the sandstone coping of a low wall. There were four carriage and five pedestrian entrances. On 2 March 1828 the position of architect of the capitol was abolished; but Bulfinch remained in employment till the end of June 1829, when Jackson dismissed him. He designed and planned the modern form of the then west extremity of the building, the Senate galleries, and the terraces on the east; and made the dome higher than in Thornton's plan. Among others who should have great credit for the beauty of the capitol are Peter Lenox, clerk of works under Latrobe; George Blagden, superintendent of stonecutters; and Giovanni Andrei, an Italian, superintendent of carvers. That so beautiful and harmonious a structure should have emerged from the contentious of so many different minds is due partly to the really great ability of the three chief architects, Thornton, Latrobe, and Bulfinch, and partly to the determination of successive Presidents that the changes should harmonize with the original design. Latrobe's material external alterations of Thornton's plan have been mentioned; Bulfinch designed the western central portico as it now stands.

From 1829 to 1836 there was no architect of the capitol. On 6 June 1836, Jackson appointed as Federal architect Robert Mills (q.v.), who had studied under Latrobe; and he held the place till 1851. Thomas U. Walter (q.v.) then took the post, having drawn the plans for the two modern wings that extended the original capitol, which the government needs had outgrown, into the modern one. The corner-stone of the extension was laid by President Fillmore, 4 July 1851; the new Representatives' hall was occupied in 1857; the Senate hall in 1859. The great lengthening of the dimensions required a correspondent heightening of the dome; and Mr. Walter designed a new one, which was constructed during the Civil War, and completed at the close of 1863, the statue of Freedom being then lifted into place. Mr. Walter, however, had foreseen a future need of still further extension, and had drawn plans for it while the other work was going on. These have been awaiting their time since; and Congress in the spring of 1903 authorized their execution, at a probable expenditure of $2,500,000 and three years' time, under the supervision of the present Federal architect, Mr. Woods. This extension is to the eastward, and involves the removal of Latrobe's portico at the east front, but none of the old walls. The present front wall will become the rear wall of an open court, which is to light the west side of the addition. This will contain 66 new and handsome rooms, divided equally between the Senate and the House. (For a minute history of the capitol down to 1851, see Glenn Brown in the 'American Architect,' Vols. LXII.–LXV.).

Capitoline Games, games held in ancient Rome in celebration of the deliverance of the city from the Gauls, and in honor of Jupiter Capitolinus, to whom the Romans ascribe the salvation of the capitol in the hour of danger. They were instituted 387 B.C., after the departure of the Gauls.

Capitoli'nus, Julius, Roman historian, who lived toward the end of the 3d century, and wrote the lives of nine emperors. He is one of the writers of the 'Historia Augusta,' in the editions of which his works are to be found.

Capitulary, ka-pit'ū-la-ri (Lat. *capitula,* "chapters"), a writing divided into heads or chapters, especially a law or regal enactment so divided into heads. Laws known by this designation were promulgated by Childebert, Clothaire, Carloman, and Pepin, kings of France;

but no sovereign seems to have put forth so many of them as the Emperor Charlemagne, who appears to have wished to effect, in a certain degree, a uniformity of law throughout his extensive dominions. With this view it is supposed he added to the existing codes of feudal laws many other laws, divided or arranged under small chapters or heads, sometimes to explain, sometimes to amend, and sometimes to reconcile or remove the differences between them. These were generally promulgated in public assemblies composed of the sovereign and the chief men of the nation, both ecclesiastical and secular. They regulated equally the spiritual and temporal administration of the kingdom; and the execution of them was entrusted to the bishops, the courts, and the *missi regii*, officers so called because they were sent by the French kings of the first and second race to dispense law and justice in the provinces. Many copies of these capitularies were made, one of which was generally preserved in the royal archives. The authority of the capitularies was very extensive. It prevailed in every kingdom under the dominion of the Franks, and was submitted to in many parts of Italy and Germany. The earliest collection of the capitularies is that of Anségise, abbot of Fontenelles. It was adopted by Louis the Debonnaire and Charles the Bald, and was publicly approved of in many councils of France and Germany. But as Anségise had omitted many capitularies in his collection, Benedict, the Levite or deacon of the church of Mentz, added three books to them. Each of the collections was considered to be authentic, and of course was appealed to as law. Subsequent additions have been made to them. The best editions of them are those of Baluze (two volumes, Paris 1677), and of Pertz in the 'Monumenta Germaniæ Historica' (2d div. Vols. I. and II.; Hanover 1835–7). The capitularies remained in force in Italy longer than in Germany, and in France longer than in Italy. The incursions of the Normans, the intestine confusion and weakness of the government under the successors of Charlemagne, and above all the publication of the epitome of canon law termed the Decretum of Gratian, about the year 1150, which totally superseded them in all religious concerns, put an end to their authority in France.

Capitula'tion ("a writing drawn up in heads"), in military language, the act of surrendering to an enemy upon stipulated terms, in opposition to a surrender at discretion.

In the 15th century capitulations, as they were called, were presented by the ecclesiastical establishments in Germany to their newly chosen abbots and bishops, who were obliged to swear to observe them as laws and conditions for their future rule. The ecclesiastical Electors obtained, after the fall of the Hohenstaufen family, certain advantageous promises from the new emperors, which were called capitulations. When Charles V. was proposed as emperor, and it was apprehended, on account of his foreign education, that he would disregard the German constitution, he was obliged to make oath that he would not reside without the German empire, nor appoint foreigners to office in the empire, etc. This was called his "election capitulation." Such a *Wahlcapitulation* was afterward presented to every new emperor as a fundamental law of the empire. In this way the authority of the German emperors was constantly more and more diminished, so that at last it became merely nominal, since the electors, at the choice of every new emperor, made some new infringement on the imperial privileges. The *Wahlcapitulationen* were acknowledged bargains, certainly unique in history.

Capiz, kä pēth', Philippines, capital of the province of Capiz, situated in the northern part of the island of Panay, four miles from the mouth of the Panay or Capiz River. The river is navigable to the city, and there is also an excellent roadstead at its mouth. There is a large local trade, particularly in rice, and connection by steamer with Manila. Capiz is also a telegraph and military station. Pop. 13,676.

Cap'lin, or **Capelin**, a small savory smelt (*Mallotus villosus*), found in large numbers on the Arctic coast as far south as Cape Cod. The inhabitants of Newfoundland and Labrador catch it in large quantities at certain seasons, and many are dried and exported to Great Britain.

Capmany y Montpalau, Antonio de, än-tō'-nē-ō dā käp mä nē ē mōnt-pạ-läṅ', Spanish critic and historian; b. Barcelona, 24 Nov. 1742; d. Cadiz, 14 Nov. 1813. He served in the wars with Portugal in 1762, left the army in 1770, and joined Olavide in his scheme for colonizing and cultivating the Sierra Morena. This enterprise terminated disastrously, and Capmany removed to Madrid, where he was chosen secretary of the Royal Historical Academy of Spain in 1790, and filled several offices in the gift of the government. He traveled in Italy, Germany, France, and England. When the French entered Madrid in 1808, he fled to Seville, arriving there destitute and in rags. He was chosen a member of the Cortes of Cadiz, in which capacity he made himself conspicuous by his patriotism and active opposition to the new rulers. His works, which enjoy a high reputation in Spain, are numerous; among them are 'Memorias historicas sobre la Marina, Commercio y Artes de la antiqua Ciudad de Barcelona'; 'Questiones criticas sobre varios puntos de historia, economica, politica y militar'; 'Teatro historico-critico de la Elocuencia Española'; and 'Dictionario Frances-Español.'

Cap'nomancy, divination by smoke, one of the modes of divination resorted to by the ancients. They used to burn vervain or some other sacred plant, and observe the form and direction which the smoke took in escaping, and from these circumstances they drew their auguries. Sometimes the smoke of sacrifices was observed instead of that of vervain. When this smoke was thin and transparent, it was considered a good omen; if, on the contrary, it was thick and opaque, the omen was bad. Another method of acquiring a knowledge of the future by capnomancy was to throw the seeds of jasmine or poppy on burning coals, and to observe the smoke which rose from them.

Capo d'Istria, Austria (the ancient Ægida, later Justinopolis), a seaport on the Gulf of Trieste, nine miles south of Trieste. It is connected with the mainland by a causeway rather more than half a mile long. It is defended by an old fort now going to decay. It contains a cathedral, a lofty edifice, faced in the Venetian

style with marble, and containing some fine paintings, sculptures, and arabesques. It is the seat of a bishop, and has six monasteries and two nunneries, a gymnasium, several hospitals, and a penitentiary. There are manufactories of soap, candles, leather, and sea-salt; and there is also a considerable trade in wines, oil, and fish. After the 10th century Capo d'Istria belonged, alternately, to the Venetians and Genoese, till finally, in 1478, it succeeded in making itself independent of the latter with the aid of the former. Capo d'Istria now became the capital of Istria, and along with it came into the possession of Austria in 1815. Pop. (1903) about 12,000.

Capo d'Istrias, or **Capo d'Istria, Ioannes Antonios,** yō-än'nēs än-tō'nyōs kä-pō-dēs'-trē-as, COUNT, Greek statesman: b. Corfu, 11 Feb. 1776; d. Nauplia, 9 Oct. 1831. His family had been settled in Corfu since 1373, but originally came from the Illyrian town of Capo d'Istria. He devoted himself to political life, and in 1809, after holding a high place in the Ionian Islands, entered the diplomatic service of Russia. Here his policy tended to the separation of Greece from Turkey. In 1828 he entered on a seven years' presidency of Greece: but whether from his attachment to Russian interests, or from the jealousy and impatience of restraint of the chiefs, he speedily became extremely unpopular. Several of these unruly chiefs belonging to the islands and to the province of Maina at last, in the spring of 1831, rose in open rebellion against him, demanding a convocation of the national assembly, the establishment of the liberty of the press, and the release of certain state prisoners, especially of Petros Mauromichalis, one of their own number whom D'Istrias had arrested and imprisoned. The president obtained the aid of Russia, but before the insurrection could be quelled he was assassinated in a church at Nauplia, by Constantine and George Mauromichalis, the brother and nephew of Petros Mauromichalis.

Caponière, kä-pō-nyār, or **Caponnière,** in fortification, a place covered against the fire of the enemy on the sides, sometimes also above, and serving for the connection of two works or for maintaining an important point. In particular:

1. A passage secured by two parapets, in the form of glacis, which leads through the dry ditch from one work to another; for instance, from the chief wall to the ravelin. If danger is to be apprehended only from one side, and consequently only one parapet is made, it is called a demi-caponnière; if it is covered above with hurdles or with wood, it is called a coffer: but this word is often used indifferently for caponnière.

2. Small block-houses in the covered way, for its defense. Coehorn laid out similar but less useful works below the glacis, and Scharnhorst proposes them, under the name of field-caponnières, for the salient angles of field fortification.

Capote, Domingo Mendez, dō-mēng'gō mĕn-dāth' kä-pō'tā, Cuban statesman: b. Cardenas, 1863. He was graduated at the University of Havana, and became one of the best-known lawyers in Cuba. Susequently he was a professor in the University of Havana for many years. In December 1895 he joined the insurgents under Gen. Maximo Gomez; became a brigadier-general; and was appointed civil governor of Matanzas and of Las Villas. In November 1897 he was elected vice-president of the Cuban republic. When the Cuban Constitutional Convention appointed a commission of five members to confer with President McKinley and Secretary Root concerning the future relations of the United States and Cuba, he became its leader. The conference was held in Washington, D. C., in April 1901.

Capoul, Joseph Amédée Victor, zhō-zĕf a-mā-dā vēk-tōr kä-pool, French tenor singer: b. Toulouse, 27 Feb. 1839. He was educated at Paris; and sang there in the Opéra Comique, 1861–72, where he was very popular, especially in his role as Gaston de Meillagré in Auber's 'Premier Jour de Bonheur.' He has also sung in New York, London, Vienna, St. Petersburg, and other cities, being everywhere very successful.

Cappadocia, kăp-pä-dō'shĭ-a, in antiquity, one of the most important provinces in Asia, once a famous kingdom; in its widest extent bounded west by Lycaonia, south by Cilicia and Syria, east by Armenia, and north by the Pontus Euxinus. In the period of the Persian government Cappadocia comprehended all the country between the Halys and Euphrates. By the former river it was separated from Phrygia and Paphlagonia; by the latter, from Armenia: therefore the region afterward called Pontus was comprehended in this territory. The Persians divided it, according to Strabo, into two satrapies, which bore the name of Cappadocia Magna, afterward Cappadocia Proper; and Cappadocia Minor, afterward Pontus. This division, however, was not always strictly observed. The Persian satraps governed, at a later time, under the title of kings, and sometimes made themselves independent. At the time of the famous retreat of the 10,000 Greeks, both the Cappadocias seem to have been under the rule of Mithridates I., who had participated in the conspiracy of Cyrus the Younger, but retained his government and became, after the defeat of Cyrus, again dependent upon the kings of Persia. It became a Roman province in 17 A.D. Cappadocia Magna was a good grazing country, and also well adapted for the cultivation of grain, especially wheat; but wood was scarce. Mazaca, afterward Cæsareia, now Kaisariyeh, was the residence of the kings of Cappadocia. The name of Leukosyri (White Syrians) is said by Strabo to have been applied to the Cappadocians, as if to distinguish them from the dark Syrians who dwelt to the east of Mount Amanus.

Cappel, kä'pĕl, Switzerland, a village in the canton of Zürich, and 10 miles from the town of Zürich. It contains an old Cistercian convent, founded in 1185, and a simple monument erected in 1838 to the reformer Zwingle, who was killed 11 Oct. 1531.

Cap'pon, James, Canadian educator: b. Scotland, 8 March 1854. He was educated at Glasgow University, and since 1888 has been professor of English language and literature at Queen's University, Kingston, Ontario. He has published 'Victor Hugo: a Study and a Memoir'; 'Britain's Title in South Africa.'

Capponi, Gino, MARCHESE, gē'nō mär-kā'zĕ käp pō'nē, Italian scholar and historian: b. Florence, 14 Sept. 1792; d. there, 3 Feb. 1876. He traveled widely and devoted himself almost entirely to his studies in spite of the fact that he became blind early in life. For a short time in 1848 he was at the head of the Tuscan government; in 1859 he was a member of the Constitutional Convention of Tuscany; he was also made a senator of Italy; and in 1862 was at the head of the Historical Commission for Tuscany, Umbria, and the Marches. He wrote 'Storia della Repubblica di Firenze' (1875); and had a part in the preparation of a lexicon by the Accademia della Crusca, and in the editing of texts of Dante's 'Divine Comedy.'

Capps, Edward, American philologist: b. 21 Dec. 1866. He was graduated from Illinois College, 1887; took his doctor's degree at Yale, 1891; and was tutor in Latin at the latter place, 1890–2. Since then he has been successively associate professor and professor of Greek in the University of Chicago. Besides a number of philological papers, he has written 'From Homer to Theocritus' (1891).

Caprara, Giambattista, jäm-bät-tēs'tä käprä'rä, CARDINAL, Italian ecclesiastic: b. Bologna, Italy, 29 May 1733; d. Paris, 21 June 1810. He studied theology, became vice-legate of Ravenna in 1758 under Benedict XIV., and in 1785 was sent by Pius VI., as nuncio to Vienna, to remonstrate with the Emperor Joseph on his conduct in relation to Church matters. His remonstrance proved ineffectual, but in 1792 he was appointed a cardinal, shortly afterward a member of the state council, and in 1800 bishop of Jest. In 1801 he went to Paris as legate of Pius VII., and conducted the negotiations with the French republic with so much success that in 1802 the first concordate was concluded. Shortly after he was appointed archbishop of Milan, and in 1805 he crowned Napoleon king of Italy.

Caprera, kä-prā'ra, a small island in the northeast of Sardinia, and separated from it by a narrow strait. It is six miles long from north to south, and two miles broad. It is fertile, and produces both corn and good pasture. It is well known as the ordinary residence of Garibaldi, who since 1854 possessed a dwelling-house on the island, along with a piece of ground which he farmed until his death here in 1882.

Capri, kä'prē, an island in the beautiful Gulf of Naples, which contributes not a little to the charms of this favorite scene of nature. Capri, five miles long and two broad, lies at the entrance of the gulf, and consists of two mountains of limestone, remarkable for their picturesque shape, and a well-cultivated valley. The inhabitants, amounting to 4,600, are occupied in the production of oil and wine, in fishing, and in catching quails, which come in immense numbers from Africa to the shores of Italy. Every spot on the island which can be made productive is cultivated. In fact, agriculture all around Naples is in the highest state of perfection. The town of Capri is the seat of a bishop, to whom all the quails belong. A high rock separates Capri from the little town of Anacapri, which is reached by 522 steps cut in the rock. With the Romans Capri was called Capreæ. Augustus obtained it from the Neapolitans in exchange for Ischia, and made it a place of agreeable retreat, but never made use of it. Tiberius spent here the last seven years of his life in degrading voluptuousness and infamous cruelty. The ruins of his palaces are still extant, and other ruins are scattered over the island. The island of Capri is remarkable for several remarkable caverns or grottoes in its steep, rocky coast. By far the most remarkable of these is unquestionably the celebrated Grotta azzurra (Blue Grotto), which was discovered by a singular accident in the summer of 1832, an Englishman while bathing having observed the opening in the rocks which forms the entrance to the grotto, and swum into it. It gets its name from the fact that, while the sun is shining outside, all the objects within the cavern — rocks, water, and sand — are tinged with a beautiful blue color, very soft and agreeable to the eye. The cavern is elliptical in form, measuring about 1,200 or 1,300 feet in circumference; its height is considerable, and its roof and sides bristle with stalactites. The blue color within the grotto is supposed to be caused by the refraction of the rays of light in passing through the water before entering the cave. The blue rays, with those next to them, the violet and the indigo, being the most refrangible, are the only rays that are admitted, the others — red, orange, etc., being dispersed in the water. In another part of the coast there is another grotto which exhibits phenomena precisely similar, except that the objects in this one are clothed with a green instead of a blue color. It is hence called the Grotta verde (Green Grotto).

Cap'ric Acid. See DECOIC ACID.

Capriccio, kä-prē'chō (*Caprice*), is the name applied to a musical composition, in which the composer follows the bent of his humor. The *capriccio* may be used with propriety in pieces for exercise, in which the strangest and most difficult figures may be introduced, if they are not at variance with the nature of the instrument or of the voice.

Capricor'nus (Lat. *caper*, "a goat," and *cornu*, "a horn"), "the goat," one of the 12 signs of the Zodiac, between Sagittarius and Aquarius; also the corresponding zodiacal constellation, one of Ptolemy's original 48. One of its brightest stars, Alpha, is a wide double, easily separated by the naked eye by any one with good eyesight. Capricornus is surrounded by Aquila, Aquarius, Piscis Austrinus, Microscopium, and Sagittarius.

Caprification, käp-rĭ-fĭ-kā'shŏn, the fertilization of the flowers of the Smyrna fig with pollen derived from the wild fig, or caprifig. From time immemorial it has been the custom of Orientals to break off the fruits of the caprifig, bring them to the edible-fig trees, and tie them to the limbs. From the caprifigs thus brought in there issues a minute insect, which, covered with pollen, crawls into the flower receptacles of the edible fig, fertilizes them, and thus produces a crop of seeds and brings about the subsequent ripening of the fruit. It has been shown that the varieties of the wild fig or caprifig are the only ones which contain male organs, while the varieties of the Smyrna fig are exclusively female. In the caprifig there are said to exist in Mediterranean regions three crops of fruit,— the spring crop, a summer crop, and a

third, which remains upon the trees through the winter. The fig-insect (*Blastophaga grossorum*) over-winters in the third crop, oviposits in the spring crop, develops a generation within it, each individual living in the swelling of a gall-flower (a modified and infertile female flower), and, issuing from it covered with pollen, enters the young flower receptacles of the young Smyrna fig, which are at that time of the proper size, and makes an attempt to oviposit in the true female flowers, fertilizing them at the same time by means of the pollen adhering to their bodies. The life history of the insect from that time on is not well understood, but the *Blastophaga* has been known to occur again in the over-wintering crop of figs. The effect of caprification on the young Smyrna figs becomes readily visible within a few days; before the *Blastophaga* enters the fig the latter is transverse and strongly ribbed, while a few days after fertilization the fig swells up and becomes rounded and sleek. The male *Blastophaga* is always wingless. It has no ocelli, and its compound eyes are greatly reduced in size. The fact that the male rarely leaves the fig in which it has hatched might almost be inferred from these facts of winglessness and partial blindness. When this wingless male issues from the seed-like gall in which it is contained, it seeks a female gall in the interior of the same fig, gnaws a small hole through its cortex, inserts its extremely long, almost telescopic, abdominal extremity through the hole, and fertilizes the female. The female subsequently, with her powerful jaws, gnaws the top of the gall off and emerges, crawling around the interior of the fig, and eventually forcing her way through the ostiolum, almost immediately seeking for young figs, which she enters, and, should the fig entered prove to be a caprifig, lays her eggs at the base of as many flowers as she can find, and then dies. Should the fig entered, however, be a Smyrna fig, either through the fact of the caprifig from which she issued having been hung in the branches of a Smyrna-fig tree, or from the fact that she has flown to an adjoining Smyrna-fig tree, she walks around among the female flowers seeking for a proper place to oviposit. It is this futile, wandering search, when her body is covered with pollen from the caprifigs, that produces the extensive and almost perfect fertilization of the entire number of female flowers. The young larva is a delicate little maggot curved upon itself and showing no visible segmentation. In the full-grown larva the segments are more apparent, and with the growth of the larva the gall at the base of the male florets becomes hard, and greatly resembles a seed, turning light brown in color. The male and the female pupa each occupies a greater portion of the interior of the gall. Consult: 'The Fig' (United States Department of Agriculture, Washington 1901).

Although figs are raised in California and the southern States they have long been inferior to the Smyrna fig, the standard kind of commerce, which owes its peculiar flavor to the number of ripe seeds which it contains. These seeds are obtained only by the process described above, and the United States Department of Agriculture has recently devoted much attention to caprification, with a view to the development of the American fig industry.

Caprimulgidæ, kăp-rĭ-mŭl'jĭ-dē, the goat-suckers (so called from a superstition regarding their habits), a family of birds of puzzling affinities, but nearest to the swifts (*Cypselidæ*), with which, and the humming-birds, they are often considered to constitute an order, *Macrochires*. The family is characterized by a small bill, enormous gape fringed with elongated, stiff bristles, elongated tail of 10 soft rectrices, long pointed wings, very small feet with the middle claw pectinate, and very lax plumage. Two subfamilies, the *Caprimulginæ* or true goatsuckers, and the *Nyctibiinæ* of tropical America, are recognized, to which the oil-birds (*Steatornis*), and *Podargus* and its allies, are sometimes added as two more. The family is nearly cosmopolitan, and comprises 12 or 15 genera and perhaps 100 species, all birds of more or less crepuscular habits, which catch insects on the wing like swallows. The "night-hawk" and "whip-poor-will" are the common species of the eastern United States.

Caprivi, Georg Leo, gā ōrg lā ō kä-prē'vē, Graf von, sometimes called Caprivi de Caprara de Montecuculi, German soldier and statesman: b. Charlottenburg, 24 Feb. 1831; d. Skyren, 6 Feb. 1899. He entered the army in 1849; fought in the campaigns of 1864 and 1866; and in the Franco-German war of 1870 was chief of staff to the 10th Army Corps. In 1883–8 he was at the head of the Admiralty; in 1888 he became commander of his old army corps. Hence he was removed, on the fall of Bismarck, in 1890, to become imperial chancellor and Prussian prime minister. His principal measures were the army bills of 1892 and 1893, and the commercial treaty with Russia in 1894, in which year he retired.

Capro'ic Acid. See Hexoic Acid.

Capron, Allyn, American soldier: b. Tampa, Fla., 27 Aug. 1846; d. Fort Myer, Va., 18 Sept. 1898. He was graduated at West Point, 1867, and entered the 1st Artillery, receiving his captaincy 4 Dec. 1888. During the Sioux campaign of 1890 he made a brilliant record at the battles of Wounded Knee and Drexel Mission. During the war with Spain, 1898, he opened the fight at El Caney, Cuba, and shattered the first flagstaff in Santiago. During this campaign he was taken ill with typhoid fever, and succumbed to its attack. He was a fine mathematician, and a recognized authority on artillery and tactics. His father, Erastus Allyn Capron was killed at Churubusco, in the Mexican war, 20 Aug. 1847.

Ca'pron, Allen Kissam, American military officer (son of Allyn Capron, q.v.): b. Brooklyn, N. Y., 24 June 1871; d. Las Guasimas, Cuba, 24 June 1898. He enlisted as a private (1890), and rose to a second lieutenancy (1893), joining the "Rough Riders" on the outbreak of the war with Spain. He was made a captain for bravery, and was the first American army officer who fell in that war.

Capryl'ic Acid. See Octoic Acid.

Cap'sicin, kăp'sĭ-sĭn, a name given to two apparently different substances. One described by Braconnot, obtained from chilli pepper, is an acrid oil or oleoresin, of a reddish-brown color, the vapor of which excites sneezing and coughing. It is probably a mixture of different bodies. The other is a resinoid substance ob-

tained from cayenne pepper; it is brown with a golden tint, has the consistence of tar, an aromatic smell and pungent taste, and is used in America as a powerful stimulant in influenza, fever, indigestion, and other disorders, and externally as a rubefacient. Quite recently a volatile alkaloid has been obtained from chilli pepper, by first removing the acrid resin, then making the fluid alkaline, and extracting with petroleum spirit. On evaporating, a substance is produced with an odor like that of conia. It is distinguished from conia and nicotine by a variety of reactions.

Capsicum, a genus of plants of the order *Solanaceæ,* consisting of annual or biennial plants, bearing membranous pods containing several seeds, noted for their hot, pungent qualities. *C. annuum,* a native of South America, furnishes the fruits known as chillies. These, as well as the fruits of *C. frutescens* and other species, are used to form cayenne pepper. For this purpose the ripe fruits are dried in the sun or in an oven, and then ground to powder, which is mixed with a large quantity of wheat flour. The mixed powder is then turned into cakes with leaven; these are baked till they become as hard as biscuit, and are then ground and sifted. Cayenne pepper is largely adulterated with red lead and other substances. *C. fructus* is the dried ripe fruit of *C. fastigiatum,* imported from Zanzibar. It is a small, oblong, scarlet, membranous pod, divided internally into two or three cells containing numerous flat, white, reniform seeds. It has no odor; its taste is hot and acrid. Capsicum fruits are used medicinally, in powder or as a tincture, externally, or as a gargle in cases of malignant sore throat, and internally as a stimulant in cases of impaired digestion.

By reason of the resin-like body, capsicin, which is contained in the fruits of these plants, they possess very active irritant properties. The pure crystals of capsicin are extremely virulent, and readily cause severe poisoning; but the ground fruit is less active, and is of service in medicine, both for external and internal medication.

Externally, capsicum is used as an irritant to cause redness of the skin or to blister, thus affecting related visceral areas within the body. It is thus employed in bronchitis, in early stages of pneumonia, in pleurisies, and in joint and nerve affections. Internally, capsicum is used to stimulate the appetite and to increase the amounts of gastric and intestinal juices. It is particularly serviceable in the gastritis of alcoholism. All capsicum should be excluded from the diet of patients with disease of the kidneys or acute disease of the genito-urinary system.

Cap'stan (Fr. *cabestan,* probably from a derivative of Lat. *capistrum,* a halter, from *capere,* to hold), an apparatus constructed on the mechanical principle of the wheel and axle, used for moving heavy weights and by various methods for the application of power. Its axis, unlike that of the windlass, is vertical. The capstan may be operated either by steam-power or by means of a lever set in its socket and worked by horses or pushed by hand, the last method usually requiring several men. When used elsewhere than on shipboard, the capstan generally has some specific name. Thus, when employed for raising coal from pits it is commonly called a gin; if worked by horses, it is known as a whim-gin. Capstans were formerly made of wood, but are at present almost universally of iron. The upright barrel of a capstan is constructed around a spindle. The barrel is sometimes smooth, and sometimes for increase of friction has, running up and down its surface, ribs or ridges called whelps. In the capstan-head or drum-head, surmounting the barrel, are holes for the levers or capstan-bars used to revolve the barrel. Being smaller at its centre than at the top or bottom end, the barrel has a curve from above and below, whereby a rope wound by working the capstan slips toward the concave part so formed. By this device a length of rope may be compactly and securely wound and kept in place for repeated use. On the circumference of a pawl-head at the bottom of the barrel are pivoted pawls which catch a pawl-rim or ratchet-ring fastened to the platform or floor on which the capstan is fixed. There are various other devices for increasing friction, the prevention of slipping, and reverse operation of the mechanism.

Cap'sule, in botany, a dry fruit containing several seeds, sometimes a large number, and opening of itself by means of valves or pores when it comes to maturity. According as it contains one, two, three, or more cells, the capsule is called unilocular, bilocular, trilocular, etc., and when it has many cells it is called multilocular.

In anatomy a capsule is a mass of fibrous, connective tissue cells surrounding or supporting an organ, either as a bag, as is the case in the kidneys; or as a framework, as in the liver. The capsule is usually an integral portion of the structure of an organ.

In pharmacy gelatin capsules are widely used for purposes of rendering medicines tasteless.

Captain. This is one of those many words derived from the Latin of the Middle Ages, and now to be found in all the different idioms of Europe. Captain comes from the Latin *capitaneus,* from *caput,* head, and signified, first, a governor of a province, who in the first half of the Middle Ages was generally a military man. Thus the word captain soon came to be used chiefly to denote a high, or rather the highest military officer. Like many other words, however, this has in the course of time lost much of its dignity, and in military technology now signifies the commander of a small body, a company, and in maritime language the master of a vessel. In the navy it indicates a specific rank, the captain being distinctively the officer commanding a war-vessel. In the latter part of the Middle Ages, when armies were not yet so regularly divided and subdivided as at the present time, captains were the commanders of those small bodies of which the armies consisted. These were generally collected by their commander, who entered with his company into the service where most pay or most booty could be obtained. The practice of carrying war by troops collected in this manner prevailed to the greatest extent in Italy, where the continual quarrels of the numerous small states afforded ample employment to the unsettled and the dissolute. These companies play an important part in the history of the Middle Ages, particularly that of the two centuries preceding the Reformation, and had a very important influence on

the manners and morals of the south of Europe. They are further interesting to the student of history, because they are so unlike anything at present existing.

Captain, in modern armies, is the commander of a company of foot or a troop of horse. In the United States army he nominates the sergeants, corporals, and lance-corporals of his company, who are appointed by the commander of the regiment.

Captain, in the navy, an officer commanding a ship of war. The naval captain is next in rank above the commander, and in the United States ranks with a colonel in the army.

Captain-General, the commander-in-chief of an army or of all the military forces of a country. In France it was an ancient title which conferred an almost unlimited power on the person who possessed it in the district where he commanded. But it never corresponded to that of generalissimo except in the case of the Duke of Savoy, in 1635, in the time of Louis XIII. The title is not in use at present, nor would it agree with the existing organization of the administration. In Spain the rank of a captain-general corresponds with that of a marshal of France, the captain-general having command of an army or army-corps. The title was also given to the head of a province in the Spanish colonies in South America, which were divided into viceroyalties and captain-generalships (*capitanias-generales*); thus Chile used to be a captain-generalship. The captains-general were not placed under the viceroys, but accountable only to the king through the council of the Indies. The captain-general of Venezuela, for instance, had no connection with the viceroy of New Granada. They decided, in the last instance, on all legislative, judicial, and military affairs, and presided in the *real audiencia*. The time during which these governors remained in power was limited to a few years, probably in order to prevent them from becoming too powerful. The consequence was, that the colonies were oppressed the more to enrich the governors, for rich every one was when he left his office.

Captain of a merchant ship, he who has the direction of a ship, her crew, lading, etc. In small vessels he is more ordinarily called master, which indeed is the correct title.

Caption, in law, signifies that part of a legal instrument such as an indictment or commission, which states when, where, and by what authority it is executed. In Scotch law it signifies a warrant of imprisonment issued against a party to enforce an obligation, being now confined to a warrant served upon a party who has illegally retained papers in a lawsuit that had been borrowed by him, and intended to compel the return of the papers.

Capua, kä'pö-ä, Italy, a city in the province of Caserta, 18 miles north of Naples, on the Volturno, which is crossed by a handsome bridge. The district is very fertile, but somewhat unhealthy. It is the seat of an archbishopric, and is the principal fortress that covers the approach to Naples. It has two magnificent gates, three principal streets, two handsome squares, and three public fountains. The town is dirty and badly built. The principal public buildings are the cathedral, with a cupola supported by 18 columns, entirely modernized; the church of the Annunciation; the governor's palace, the town-hall, a museum with many ancient works of art, etc. The ancient city was situated two and a half miles southeast from the modern town, which was built from its ruins on the site of the ancient Casilinum by the Lombards in the 9th century. The site is now occupied by a considerable town, called Santa-Maria-di-Capoa-Vetere. The ancient Capua, one of the finest and most agreeable cities of Italy, was of such extent as to be compared to Rome and Carthage. Hannibal wintered at ancient Capua after the battle of Cannæ, and thus not only lost time, but also is commonly said to have rendered his army unfit to follow up the advantage he had gained. It was a favorite place of resort of the Romans, on account of its agreeable situation and its healthy climate; and many existing ruins attest its ancient splendor. In 456 A.D. it was devastated by the Vandals under Genseric, and in 840 the Saracens completely destroyed it. Pop. about 14,000.

Capuana, Luigi, loo-ē'jē kä-poo-ä'nä, Italian poet, novelist, and critic: b. Mineo, Sicily, 27 May 1839. Having devoted himself to journalism, he settled in Florence in 1864, where he wrote dramatic criticisms; from 1868 until 1877 he lived in his native town, then in Milan, again as a journalist. His best-known work is 'Giacinta' (1879), a naturalistic novel. Besides this he has published several volumes of short stories, among them: 'Profiles of Women' (1881); 'Homo' (1883); and two collections of charming fairy tales: 'Once upon a Time' (1882) and 'Fairy Land' (1883). A curious specimen of rhythmical prose is his 'Semi-Rhythms' (1888), in praise of worldly joy and beauty.

Capuchin, kăp ū shĕn or kap ū chĕn, the name of several animals in which the growth of the hair or feathers upon the head forms a sort of hood suggesting that of a Capuchin friar. Certain monkeys are so called, especially the South American sapajous (q.v.) and one or more of the macaques (q.v.). A breed of domestic pigeons is also so called.

Capuchins, an order of mendicant friars in the Roman Catholic Church founded in 1528 in virtue of a bull of Clement VII. Its founder, Matteo Barro, was a member of the rigorist section of the Observantine Franciscans, who sought to restore the rule of perfect poverty and humility, and to be of aid to parish priests in the cure of souls. The Capuchin friars obtained their name from the capuerce, cowl, or hood which they wore. They were vowed to live according to the rule of St. Francis in hermitages and to labor for the conversion of notorious sinners. Their churches were to be bare of ornament. Soon after their foundation they did heroic service in ministering to those stricken by the plague which at that time ravaged all Italy. The third vicar-general of the order, Bernardino Ochino (q.v.) brought the Capuchins into discredit by his notorious leanings toward protestantism, and the fraternity was interdicted from preaching by Paul III., and would have been suppressed had not Cardinal Sanseverino, archbishop of Naples, interceded for them. Paul also forbade them to establish any convents beyond the Alps, but his successor, Gregory XIII., revoked that decree. Again, Gregory XIV. in 1591 withdrew from them the fac-

ulty of ministering in the confessional; but it was restored to them 10 years later by Clement VIII. Finally, in 1619 the fraternity was restored to good standing, and was even erected into an order administratively independent of the general of the Franciscans, and their vicar-general assumed the style of minister-general. Ever since, the Capuchins have been recognized as eminently useful servants of the Church. The order conducts missions in all quarters of the globe, and has the reputation of being very successful in winning converts.

Cap'ulets and Mon'tagues, the English spelling of the names of the Cappelletti and Montecchi, two noble families of northern Italy, according to tradition of Verona, chiefly memorable from their connection with the legend on which Shakespeare has founded his tragedy of 'Romeo and Juliet.'

Ca'put Mor'tuum (Latin), literally, a dead head; a fanciful term much used by the old chemists to denote the residuum of chemicals when all their volatile matters had escaped; hence the word is figuratively used of anything from which all that rendered it valuable has been taken away.

Caputiati, kă-pū-shĭ-ā'tī, a Christian sect which arose in France in the 12th century. They wore on their heads a leaden image of the virgin Mary. They wished liberty, equality, and the abolition of all civil government. Hugo, bishop of Auxerre, suppressed them by military force.

Capybara, kă-pē-bä'ra, an aquatic rodent (*Hydrochoerus capyoora*), of the family *Caviidæ*, native to South America. It is the largest rodent known, being four feet long, and weighing nearly 100 pounds. It has a rough brown coat, a heavy flat head, small, pig-like eyes and ears, and a blunt muzzle. Its feet are supplied with hoof-like claws, and its tail, unlike that of most rodents, is very short. The animal is herbivorous, browsing on grass along river banks, and often creating havoc in sugar plantations. It is awkward on land, but swims and dives well, and can remain under water a long time. The flesh is edible, except that of very old males.

Carabao, kä-ra-bä'ō. See BUFFALO.

Car'abas, Marquis of, the exalted personage who figures in Perrault's story of 'La Chat Botté' ('Puss in Boots'). The name is often applied to an extremely conservative aristocrat. In Disraeli's 'Vivian Grey' the Marquis of Clanricarde is satirized as the Marquis of Carabas.

Carabidæ, the family of *Coleoptera*, comprising the ground-beetles. In form the species vary greatly; the antennæ are inserted behind the base of the mandibles under a frontal ridge; maxillæ with the outer lobe palpiform, usually biarticulate, while the inner lobe is usually curved, acute, and ciliate, with spines. The epimera and episterna of the prothorax are usually distinct; the three anterior segments of the abdomen, usually six, rarely seven or eight in number, are connate. The legs are slender, formed for running; anterior and middle coxæ globular, posterior ones dilated internally, and the tarsi are five-jointed. They are, with few exceptions, predaceous and carnivorous beetles; they are runners, and do not fly, the hind wings being often absent. Their colors are dull metallic or black. They run in grass, or lurk under stones or the bark of trees, whence they go out to hunt in the night-time. The larvæ are found in much the same situations as the adult beetles, and are generally oblong, broad, with the terminal ring around, with two horny hooks or longer filaments, and with a single false leg beneath. *Carabus serratus* and *Calosoma calidum* are common examples.

Car'abine, or **Carbine.** See RIFLE.

Carabobo, kä-ra-bō'bō, a state of Venezuela, bounded on the north by the Caribbean Sea; area, 2,984 square miles. The capital is Valencia, and the chief port Puerto Cabello. Coffee, cacao, and sugar are cultivated. The village of Carabobo, 20 miles southwest of Valencia, was the scene of the battle fought 24 June 1821, which was decisive of the independence of Colombia. Caracas, La Guayra, Carthagena, Cumana, and all that portion of Venezuela which is dependent upon them, were permanently secured to the patriots by this victory. Pop. (1900) 225,000.

Caracal, kăr'a kăl, a lynx-like wild cat of Africa and southern Asia, slender in form and usually red-brown in color. See LYNX.

Caracal'la, Roman emperor: b. Lyons, 188 A.D.; d. 217. His real name was MARCUS AURELIUS ANTONINUS BASSIANUS, and he was the eldest son of Septimius Severus. On the death of his father he succeeded to the throne with his brother, Antoninus Geta, whom he speedily murdered. To effect his own security upward of 20,000 other victims were butchered. He was himself assassinated by Macrinus, the pretorian prefect, near Edessa, in 217. Among the buildings of Caracalla in Rome, the baths — *Thermæ Caracallæ* — near Porta Capena, were most celebrated, and their ruins are still magnificent.

Caracara, kä-ra-kä'ra, a genus of large carrion-eating hawks of the tropical parts of America, with black and white plumage, the head somewhat crested, legs long and naked and the general aspect vulture-like. They have increased greatly with the spread of the cattle-raising industry in South America, and have proved of much service as scavengers about the ranches and villages. The species to which the name most strictly applies is *Polyborus cheriway*, which is found from Venezuela to Texas and southern California. Another prominent species is the carancho (*P. tharus*) numerous and well known all over Brazil and Argentina. Darwin gives interesting facts in regard to this and related vulture-hawks in his journal. Compare CHIMANGO.

Caracas, kä-rä'käs, city and capital of the United States of Venezuela, was founded in 1567 by Diego de Lozada, who called the city Santiago de Léon. But in popular usage a more distinctive name was adopted — that of the Caracas tribe of Indians, formerly inhabiting the valley in which the city is built. Its altitude being about 3,000 feet above sea-level, the climate is generally mild and agreeable, the temperature seldom rising above 82° F. (with 84.2 as a maximum), or falling below 65° F. (with a minimum of 48.2). Toward the end of December the temperature is lowest, and it is highest from June to September. Mean temperature, 66.2° F. Lat. 10° 32′ N., lon. 67° 4′ 45″ W.

separated by hand and each leaf scraped on both sides with a kind of dull edged knife, in order to release the fibre, which lies just under the epidermis. After drying, the fibre is sold at the haciendas, put up in bundles of about 75 pounds, and transported on the backs of pack animals to the neighboring towns, where it is sorted, baled, and sent by rail to the port of Tampico for shipment, hence the commercial name Tampico. For further information see article on Istle Fibre in Mexico, Scientific American Supplement, (1902). See CORDAGE: CORDAGE INDUSTRIES: FIBRE; MEXICO.

CHAS. RICHARDS DODGE.

Itacolumite, ĭ-ta-kōl'ŭ-mīt, also known as flexible sandstone, is a mineral curiosity. It is a light colored, laminated-granular quartzite containing besides quartz grains, mica, talc and chlorite. Usually thin bedded, pieces an inch thick or more have considerable flexibility. This property is attributed to the presence of thin laminæ of mica, talc, etc. and also to the shape of the sand grains which have interlocking angles, due to a secondary growth of the grains by deposition of silica. Itacolumite is found in Brazil, also at several localities in the southern Appalachians.

Itagaki, Taisuke, tī-soo'kā ē-tä-gā'kē, COUNT, Japanese statesman: b. Tosa province, island of Shikoku, 1838. He received a military education, and in the war of the Restoration (1868) was prominent in the imperial army. From 1871 until his resignation in 1873 he was a privy councillor to the emperor. He then became the centre of a movement for constitutional government which in 1877 addressed to the government a memorial asking for a representative assembly and broaching popular rights. Itagaki aimed at a system based on that of Great Britain or the United States, as opposed to the system based on that of Germany, drafted by the Marquis Ito and promulgated in 1890. But he would have been satisfied at first, it is said, with an assembly which quite excluded the popular element. He organized the *Jiyuto,* or Liberals, the first Japanese political party, which rapidly increased in numbers. In 1878 he became minister of public works, in 1880 minister of the interior, and in 1898 the Liberals united with the Progressists, led by Count Okuma, to form the so-called Constitutional party, which had a large majority in the lower house of Parliament. At the Mikado's request Itagaki and Okuma formed a cabinet, with Itagaki as minister of the interior. The cabinet resigned after six months, and the Constitutional party was separated into its original parts.

Italian Architecture. See ARCHITECTURE: ITALY.

Ital'ic Languages, the languages of ancient Italy, before it had become Latinized by the predominance of Rome. These are generally described as Umbrian, Oscan, Etruscan, and Latin. The three first only survive in some fragments and inscriptions. Thus the Eugubine Tables, seven tablets of brass discovered in 1444 near Eugubium, are engraved with a series of sacerdotal inscriptions in ancient Umbrian. Taken together they contain about 450 lines, reading from left to right, some in Roman, others in Etruscan letters. The most important fragment of the Oscan language is that inscribed on a bronze tablet discovered in 1793, and called the Bantine Table, from the neighboring city of Bantia. The Oscan Bantine inscription contains 36 lines, and is much more easy to interpret than the Eugubine Tables. The Oscan language was spoken in the south of Italy. Another important monument of Oscan is the Cippus Abellanus discovered in 1685. The bronze tablet of Agnone discovered in 1848 also contains an Oscan inscription. The Etruscan language is most difficult of all to interpret. The most important remains which are known were discovered in the neighborhood of Perugia in the year 1822. The inscription is engraved on two sides of a block of stone, and consists of forty-five lines. The learned are divided about its interpretation. The most copious and important of the legal fragments which exhibit the Latin language in its earliest form are the Twelve Tables (q.v.).

Italy, a kingdom in southern Europe, consisting in the main of a large peninsula stretching southwards between the Adriatic Sea and the western part of the Mediterranean, but also including a considerable portion of the mainland and some of the adjacent islands. It is bounded on the north by the Alps, which separate it from Austria and Switzerland, except at the district lying to the north of Lake Garda, where its frontier does not follow the line of the Alps; on the west by France, from which it is separated along the larger part of the frontier line by the Graian, Cottian, and part of the Maritime Alps, and by the Mediterranean; on the south by the Gulf of Taranto and the Mediterranean; and on the east by the Adriatic and a portion of the Austro-Hungarian Empire. It is comprised between lat. 36° 40′ and 46° 40′ N. and between lon. 6° 35′ and 18° 35′ E.

Political Divisions.— For administrative purposes Italy is divided into 69 provinces, which are grouped under 16 departments (*compartimenti territoriali*), some of which consist of only a single province. The provinces are subdivided into circles (in Venetia and the province of Mantua called districts). The following table furnishes a list of the provinces and departments, with the area of each, and the population as estimated 1 Feb. 1901:

PROVINCES AND DEPARTMENTS	Area in sq. m.		Pop. on Feb. 1, 1901	
Alessandria	1950		811,833	
Cuneo	2882		638,235	
Novara	2553		743,115	
Torino (Turin)	3955		1,124,218	
PIEMONTE (Piedmont)		11,340		3,317,401
Genova (Genoa)	1582		934,627	
Porto Maurizio	455		142,846	
LIGURIA		2,037		1,077,473
Cagliari	5204		483,548	
Sassari	4090		308,206	
SARDINIA (Island)		9,294		791,754
Bergamo	1098		459,594	
Brescia	1845		538,427	
Como	1091		580,214	
Cremona	695		327,838	
Mantova (Mantua)	912		311,942	
Milano (Milan)	1223		1,442,179	
Pavia	1290		496,969	
Sondrio	1232		125,565	
LOMBARDIA (L'bardy)		9,386		4,282,728
Belluno	1293		192,800	
Padova (Padua)	823		443,227	
Rovigo	685		221,904	
Treviso	960		412,267	

Provinces and Departments	Area in sq. m.		Pop. on Feb. 1, 1901	
Udine	2541		592,592	
Venezia (Venice)	934		401,241	
Verona	1188		422,437	
Vicenza	1052		447,999	
Venetia		9,476		3,134,467
Bologna	1448		527,367	
Ferrara	1012		271,776	
Forli	725		280,823	
Modena	987		315,804	
Parma	1250		294,159	
Piacenza	954		245,126	
Ravenna	715		235,485	
Reggio nell'Emilia	876		274,495	
Emilia		7,967		2,445,035
Ancona	762		302,172	
Ascoli Piceno	796		245,172	
Macerata	1087		259,429	
Pesaro e Urbino	1118		253,982	
Marca (The Marches)		3,763		1,060,755
Perugia	3748		667,210	
Umbria		3,748		667,210
Arezzo	1273		271,676	
Firenze (Florence)	2265		939,054	
Grosseto	1738		144,722	
Livorno (Leghorn)	133		123,877	
Lucca	558		319,523	
Massa e Carrara	687		195,631	
Pisa	1179		320,829	
Siena	1471		233,830	
Toscana (Tuscany)		9,304		2,549,142
Roma (Rome)	4663		1,196,909	
Latium		4,663		1,196,909
Chieti (Abruzzo Citeriore)	1138		370,907	
Teramo (Abruzzo Ulteriore I.)	1067		307,444	
Aquila (Abruzzo Ulteriore II.)	2484		396,629	
Campobasso (Molise)	1691		366,571	
Abruzzi e Molise		6,380		1,441,551
Benevento	818		256,504	
Napoli (Naples)	350		1,151,834	
Salerno (Principato Citeriore)	1916		564,328	
Avellino (Principato Ulteriore)	1172		402,425

The principal islands belonging to Italy are Sicily and Sardinia; the others include the Lipari Islands, Capri, Ischia, Giglio, Monte Cristo, Elba, etc. Rome is the capital.

Physical Features.— The length of the coast of the mainland of Italy has been estimated at about 1,450 miles, that of the islands of Sicily and Sardinia at about 850 miles; so that the whole coast-line, inclusive of the smaller islands, must amount to about 2,400 miles. It is not much broken. The whole shore of the Adriatic presents a comparatively smooth and continuous line, interrupted only by the spur of Gargano, which, by its south side, contributes to form the Gulf of Manfredonia. The largest gulf of all is that of Taranto, in the south. The west coast, though much more indented than the east, is more remarkable for the number, and occasionally for the beauty, of its bays, than for their magnitude. Commencing at the south extremity and proceeding north, the most important which present themselves, in succession, are those of St. Eufemia, Policastro, Salerno, Naples, Gaeta, and Genoa. The eastern shore is generally flat and uninteresting, presenting, particularly along its northern part, a long series of sandy islands and lagoons, which retard the progress of the rivers, dam up their mouths, and, depriving them of a proper outlet, occasion the formation of pestilential marshes. On the west coast the same thing is occasionally seen, but occurs on a large scale only in the Roman territory, where the Pontine Marshes, notwithstanding the proved practicability of draining them, are permitted to spread their poisonous malaria, and convert extensive tracts, of great natural fertility, into almost uninhabitable deserts. But with this very prominent exception, the west coast is considerably elevated, the ramifications of the mountains often stretching down and terminating in lofty cliffs, with a magnificent background of alpine heights. Few countries can boast of possessing scenery of this description equal to that which is exhibited by the Gulfs of Genoa and Naples.

The interior of Italy is finely diversified. The loftiest mountains of the Alps stand on its northern and northwestern frontiers, and shelter it from the rigors of the north, giving here a climate which is unrivaled for the general mildness of its temperature and the brightness of its sky. In immediate connection with the branch of the Alps called the Maritime Alps is the chain of the Apennines, which, first proceeding east till the Adriatic is approached, then turn south, and run down the middle of the peninsula through its whole length to the Straits of Messina; while numerous branches are thrown off laterally, and form an endless succession either of loftier hills clothed with forests, or gentler slopes covered with olives and vines. In the spaces between the mountains and hills lie valleys remarkable either for their wild romantic beauties or the fertility of their soil. In the north, enclosed between the ranges of the Alps and Apennines, is a plain of vast extent, stretching from the western frontiers of Piedmont, across Lombardy, to the shores of the Adriatic, and perhaps the most fertile in Europe, other plains, still more attractive by their beauty, occur in various parts of the Italian peninsula.

Hydrography.— The Po is the only river of magnitude. It has the advantage of pursuing its course between the Alps and the Apennines, and deriving its supplies from both of them, conveyed from the Alps by the Dora Riparia, Dora Baltea, Sesia, Ticino, Adda, Oglio, and other tributaries on the left bank of the river, and by the Stura on its right bank; and from the Apennines by the Trebbia, Secchia, Panaro, etc., all on its right bank. Another river of some importance, which has its mouth at no great distance from the former, and is partly fed in the same way, is the Adige (*Etsch* in Austria); and the Bacchiglione, Brenta, Piave,

Livenza, and Tagliamento, which are of much less importance, have their basins in Venetia or the northeastern part of Italy, and all fall, like the Po and the Adige, into the Gulf of Venice. In the southern part of Italy, the peninsula of which it consists is not only narrow in itself, but is divided by the central chain of the Apennines into two watersheds, each of which lies so near the shore as to leave no room for the formation of large rivers. If the streams descend directly from the mountains to the shore, their course is necessarily so short as to give the character of mere torrents, often rising suddenly in their beds, and again as suddenly retiring within them. It sometimes happens, however, that the mountains, in ramifying, form parallel ridges, and thus give rise to longitudinal valleys, by pursuing which the course of the rivers is greatly lengthened, and their volume of course augmented. In this way the Italian peninsula, notwithstanding its narrowness, has obtained the Arno, Tiber, Garigliano, and Volturno. Numerous lakes are scattered over the surface. Many of them, independent of their natural beauties, derive much adventitious interest from classical associations; the most important are Lakes Maggiore, Como, and Garda.

Geology and Soils.— The general fertility of Italy is intimately connected with its geological structure. Except in the ranges of the Alps in the north, and the terminating branches of the Apennines in the south, granite and the metamorphic strata, which generally form soils of little natural fertility, are not of frequent occurrence, and occupy a very limited extent of surface. On the other hand, volcanic rocks, as might be expected in a country whose volanic agency is still active, occupy considerable tracts, particularly on the west coasts of Naples and of the Roman territory, where, by their decomposing lavas, soils of almost exhaustless fertility have been formed. The sedimentary rocks of the Italian continent, with exception of the metamorphic strata already referred to, are comparatively recent. At the bottom of the series is the Jura limestone, which is largely developed in the Apennines. The main body of it, commencing on the eastern frontiers of Tuscany, is continued in a broad zone far south into the old kingdom of Naples, where, after a partial interruption, it reappears in the southwest, chiefly in the province of Salerno, and partly in that of Potenza, and in the southeast in the province of Bari. It also occupies a considerable space on the north side of the Gulf of Gaeta, and on the western slope of Mount Gargano. It is likewise the prevailing rock in the north of Lombardy, where it stretches east from the shore of Lake Maggiore to the Austrian province of Illyria. Above the Jurassic limestone, and occupying almost an equal extent of surface, is the chalk, with its accompanying rocks. The main body of it stretches east along the Gulf of Genoa, and north into Emilia, then turns southward through Tuscany, forms a long narrow belt along the eastern side of the main body of the Jurassic limestone, and, though partially interrupted, finally reaches the extremity of the peninsula, where, in Cape St. Maria di Leuca, its white cliffs form the eastern entrance of the Gulf of Taranto. In the north of Naples a large tract, of a somewhat oval form, lies completely enclosed by the Jura limestone. The next strata in the ascending series belong to the Tertiary period, and consist of sandstones, travertin, and marl. These rocks occupy a considerable portion of Tuscany, and of the central part of Piedmont between Turin and Alessandria, but receive their chief development on the east coast, where, without attaining much width, they stretch without interruption from the neighborhood of Rimini to the northwest extremity of the spur. Here the main body, spreading out, is continued south-southeast, and forms the greater part of the shore of the Gulf of Taranto. Another branch, still skirting the east coast, reaches its extremity in the Gulf of Taranto. Above all the ancient strata now mentioned are immense diluvial and alluvial deposits, still in course of gradual augmentation. Of these partial tracts are found both on the coast of Tuscany and the maritime provinces on the west near Rome, particularly the Pontine Marshes; but they are insignificant in comparison with the space which they occupy in the luxuriant plains of Lombardy, not only forming extensive flats along the northern shores of the Adriatic from the Gulf of Trieste to the Gulf of Venice, but filling the greater part of the basin of the Po.

Mineral Resources.— The chief minerals are sulphur, zinc, lead, copper, coal, iron, antimony, gold, mercury, manganese, silver, arsenic, salt, graphite, borax, petroleum and asphalt. The chief sulphur mines are in Sicily; Elba is noted for the quality of its iron ore, and Lombardy and Sardinia for their zinc ore. In 1901 there were over 1,100 productive mines of various minerals, employing 68,000 workers, with a total output valued at nearly $17,000,000.

Climate.— The peninsula in its southern part has the dry and burning climate of Africa, as well as the sirocco which blows on its coasts, and resembles the simoom of that continent. In the continental part of the country the neighborhood of the Alps, the abundance of watercourses, and the direction of the fine valley which opens on the Adriatic are all circumstances which serve to maintain a delightful temperature. Yet this region is at times extremely cold. The climate of Italy generally is salubrious, but there are numerous exceptions to this character. In the north the lagoons and the rice-plantations of the basin of the Po give rise to exhalations which engender fevers. In central Italy the Maremma of Tuscany, the Campagna of Rome, the Pontine Marshes, and the environs of Volturno, produce miasmata which infect the air especially during the night.

Forestry.— The sweet chestnut constitutes the larger part of the forests that cover the lower slopes of the Alps and the Apennines, while pine, fir, poplar, myrtle, and other evergreens, clothe the hills of a considerable portion of rest of the country. There is a governmental department of forestry directed by the ministry of agriculture, industry and commerce, through a forestry council. Exclusive of chestnut plantations, the forest area is over 10,000,000 acres producing lumber, firewood, charcoal, and secondary produce to the annual value of over $17,600,000.

Flora.— The natural productions of the soil of Italy are as various as its climate. In the Alpine regions all the plants belonging to cold climates flourish, while the southern regions possess a real tropical flora. The olive, mulberry, fig, orange, citron, pomegranate, pistachio, jujube, and date grow in the south and in suit-

able places in the north. In the extreme south the cotton-plant, sugarcane, Indian fig, agave, and other tropical plants are cultivated. Everywhere is seen the grapevine. The other vegetable products are common to Italy and the rest of Europe.

Fauna.— The fauna of Italy differs little from that of the other countries of Europe situated in the same latitude. Its mountains afford a retreat to the lynx, chamois, brown bear, and wolf, while among those of Sardinia is found the moufflon or wild sheep. The porcupine is very generally found in the Apennines. The pale-red fox (different from the common species) and the blind mole are also found. The birds, which are very numerous, comprise most of the species of Central Europe, a large number of those belonging to the eastern part of Europe, and some African birds, especially the Egyptian vulture. Among the reptiles are the common viper and the asp; other noxious creatures are the scorpion and the tarantula. The marine fauna of Italy is also very comprehensive, including all the varieties of fish which are found in the Mediterranean. The fisheries embrace anchovies, sardines, tunnies, sword-fish, etc. The coral polyp (among other species the madrepore) is also of economic importance, there being a large number of persons employed in the coral fishery.

Land Tenure.— There are three systems of land tenure; that of peasant proprietorship which exists throughout Italy, but chiefly in Piedmont and Liguria; the rent system common in Lombardy and Venetia; and the partnership system, general in Tuscany, the Marches and Umbria, slightly in Sardinia, Calabria, and Apulia, but abandoned in Barese and the province of Naples. The latter system consists in a form of partnership between the proprietor and the cultivator, profits and losses being equally divided, and the families of the partners subsisting in many cases entirely on the common produce of the cultivation.

Agriculture forms the chief support of the population, and the land is very productive in almost all parts of the kingdom, although it is not everywhere equally well cultivated. The best cultivation, aided by an excellent system of irrigation, is found in Lombardy, Venetia, Piedmont, Tuscany, and the parts of Emilia adjoining the Po. The most neglected parts of the country in point of cultivation are the islands of Sicily and Sardinia. About 85 per cent of the surface of Italy is productive, and 15 per cent unproductive. Of the productive land again about 41 per cent consists of arable land and vineyards, 21 per cent of meadows and pastures, 5 per cent of olive and chestnut plantations, and 18 per cent of forests. Italy may be divided into four agricultural zones or regions:—(1) the olive, orange, and citron region, embracing Sicily and Sardinia, the Neapolitan provinces except the Abruzzi, and the part of the coast of Liguria called Riviera di Ponente; (2) the region of olives and pines, embracing the Abruzzi, Umbria, Tuscany, and the part of the Ligurian coast called Riviera di Levante; (3) the vine and oak region, embracing Lombardy, Venetia except the province of Udine, the provinces of Parma, Piacenza, Modena, Novara, Alessandria, and Lomellina, now part of the province of Pavia; (4) the vine and chestnut region, comprising the two large Piedmontese provinces of Turin and Cuneo, and the province of Udine in Venetia. All kinds of cereals are cultivated. The wheat is of fine quality, and is chiefly used as a breadstuff by the wealthier classes, while maize and rye are principally used by the poor, who also consume great quantities of pulse and chestnuts. Among plants used in commerce and manufacture the following are grown: hemp and madder, which are articles of export, flax, tobacco, hops, and rape in small quantities, saffron, cotton (in the level districts of the province of Salerno, and of Calabria, Sicily, and Sardinia), and sugarcane in Sicily and Sardinia. The commoner kinds of fruit-trees are the objects of attention everywhere, and the cultivation of southern fruits is carried on particularly in the Neapolitan and Sicilian provinces, and in Sardinia, and furnishes large quantities for export. Chestnuts are frequently used as a substitute for bread. In the cultivation of the olive Italy surpasses all other European states; so that, although the home consumption of olive-oil is very large, there remains a considerable quantity for exportation. There is also a very large production of wine. The average annual production of some of the above-mentioned objects of cultivation may be estimated as follows:

Wheat	143,400,000	bushels.
Maize	85,600,000	"
Oats	19,360,000	"
Rye and barley	18,400,000	"
Rice	26,800,000	"
Other cereals	18,000,000	"
Total cereals	311,560,000	"
Potatoes	19,360,000	bushels.
Hemp	111,000,000	lbs.
Flax	30,000,000	"
Cotton	22,000,000	"
Tobacco	7,250,000	"
Olive-oil	74,500,000	gals.
Wine	666,000,000	"

Italy anciently was celebrated for its wines, the best of which were obtained from the vineyards on the two slopes of the Apennines. Among the most celebrated were those of Liguria, Albanum (now Albano), near Rome, which received the warmest praises from ancient writers; those of Nomentum (Mentana), about 15 miles to the east of Rome, which are compared by Strabo to the best wines of Greece; those of Setia (Sezze), about 35 miles to the southeast of Rome, which were much prized by Augustus and all the wealthy Romans of his age; the Cæcuban wine, which grew in Campania, the province to the south of Latium, and which from the earliest times held the first place among the wines of Italy, and was particularly esteemed for the exquisite delicacy of its flavor; the Falernian and Massic wines, which also grew in Campania, and likewise had a high reputation; and the Mamertine wine from the neighborhood of Messana in Sicily. The southwest of Sicily, which now produces excellent wines, is nowhere mentioned for its wine-growing qualities in the writings of the ancients. At the present day the wines of Italy are admittedly inferior to their ancient reputation. The vines yield many wines, among which the liqueur wines are distinguished for their good quality; but those which serve for daily use cannot enter into competition with those of France. The most of them are at once sweet and harsh, often coarse, and although they appear to combine much body and strength they do not easily bear transport, and deteriorate in little time, even

without being removed to a distance. Their bad quality proceeds not only from the want of care shown in the cultivation of the vines, but also from the bad processes employed in the manufacture. Among the liqueur wines which are so abundant in Italy may be mentioned the lacryma-Christi, nasco, giro, tinto, Malmsey, aleatico, and muscat. The most famous of the Italian red wines are those of Carmignano in Tuscany, and those of the Isle of Elba, Bari, and Ischia. The white wines of Marsala and Castel-Veterano are compared to Madeiras of the second class.

Stock-raising.— The rearing of live-stock is an important industry in Italy, which exports cattle, sheep, goats, and swine. Horses are imported, and also sheep's wool. The cultivation of green crops as food for cattle is scarcely known. During the summer the animals are led to the pastures, and in winter they are furnished with straw and a little hay in their stalls. The farmers do not give much attention to the improvement of their domestic animals, which have lost much of their original excellence. The cattle are estimated to number about 5,000,000 (including 15,000 buffaloes), many of them team oxen. Sheep number 6,900,000. Some camels are perfectly acclimated near Pisa in the low-lying tracts of San Rossore. The cheese of Italy is famous, especially the Parmesan.

Commerce.— The foreign trade of Italy is not large in proportion to the size and population of the country, and does not make much progress. In 1882, 1889 and 1900 the imports and exports reached the following figures:

	1882	1889	1900
Imports	$269,080,000	$277,230,000	$341,295,925
Exports	231,160,000	190,130,000	270,979,920

Among the chief imports are coal, grain, cotton, silk, wool, sugar, coffee; by far the largest export is silk, raw and thrown, others being wine, olive-oil, oranges and lemons, hemp and flax, sulphur. In 1901 the import of coal reached the value of $30,001,763; of raw cotton, $31,618,501; cotton goods, $1,918,296; of silk, raw, twisted, etc., $14,766,680; of machinery, $14,521,488. In the same year the exports of silk and silk goods were valued at $86,272,986 (as against $101,764,494 in 1899); of animals and animal products at $10,504,021; of wine in casks at $7,405,762; olive-oil, $9,136,994; fruit, $10,710,753. The trade of Italy is chiefly with France, the United Kingdom, the United States, Germany, Austria, Switzerland, and Russia, the United Kingdom sending in 21 per cent of the imports, and the United States being second with 13 per cent.

In the foreign trade of the United States, Italy occupies the eighth place in exports, and the tenth place in imports, the largest items of import being raw silk, sulphur, and lemons.

Manufactures.— Since the consolidation of the Italian kingdom the manufactures of the country have made considerable advances, especially in the department of Tuscany and the northern provinces. They now afford support to 13 per cent of the whole population. Machine-making, although not sufficing to meet the internal wants of the country, nevertheless employs many workmen, especially in Genoa and neighborhood, Turin, Milan, and Naples. Coach and carriage making is an important industry in Milan. Ship-building is largely carried on in Liguria. Musical instruments are made in all the capitals. Especially famous are the bow instruments of Cremona, and nowhere are violin strings made so well as in the Abruzzi. In the iron industry the department of Lombardy stands at the head; and in that department more particularly the provinces of Brescia, Como, and Milan. The town of Brescia is the chief seat of the cutlery manufactures. The manufacture of gold and silver wares is very flourishing in Rome, Milan, Naples, Genoa, Venice, and Catania, and like that of articles in bronze has long been an important branch of Italian manufacturing industry. Italy is very rich in marble of the most beautiful and various colors and markings. The department most celebrated in this respect is Tuscany, especially the province of Massa e Carrara, and the district of Serravezza in the province of Lucca. The district of Volterra in the province of Pisa is noted for its alabaster quarries and the making of articles in alabaster. The cities of Rome, Naples, and Florence enjoy a world-wide reputation for their cameos and mosaics, as also (along with Leghorn and Genoa) for articles of coral. Earthenware manufactures have long been carried on in Italy with the best success. The articles in terra-cotta especially are remarkable for the beauty of their forms. Venice and the neighboring island of Murano are celebrated for the manufacture of glass beads, but the other glass manufactures of Italy do not nearly suffice for the home consumption. In the department of chemical industries the production of boracic acid (obtained from the lagoons of Tuscany) and of tartaric and citric acids, the manufacture of soap (of great consequence in Venice), and the preparation of alizarine or madder-red at the mouth of the Sarno, may be particularly mentioned. Among articles used for meat or drink, pickled meat and sausages (which are exported to a considerable extent), and liqueurs and rosolios, are the most important which are made in Italy. The sugar industry holds a very subordinate place, as does also the brewing of beer. The manufacture of tobacco is a state monopoly, and employs about 15,000 hands. The spinning and weaving industries in Italy are in some branches very highly developed. The most important of these are the silk manufactures, which form one of the chief sources of the national wealth. With the exception of Abruzzi, Basilicata, and the island of Sardinia, all the provinces of the kingdom take part in the preparation of the raw silk which is used in the manufacture, but this is more especially the case in Lombardy, Piedmont, and Venetia. The rearing of silkworms is more largely carried on in Italy than in any other country in Europe. Over 2,000,000 spindles are employed in spinning the silk, and the weaving is a very extensive branch of manufacture in Como, Genoa, Caserta, Milan, Turin, Florence, and Naples. Silk industries employ over 170,000 hands. The cotton manufacture is, as a textile industry, next to that of silk, and has greatly increased in recent years, the factories being chiefly in Lombardy, Piedmont, Lucca, and the Genoese district. About 1,900,000 spindles are now employed, the number of hands being 80,000. Woolen manufactures are carried on chiefly in Upper Italy, in Piedmont and Venetia, in the provinces of Novara, Vicenza, and Turin. The number of spindles at work is about 345,000, the

looms about 9,000 (half being power-looms), the hands employed about 28,000. The import of woolen yarns, and still more so of woolen fabrics, is large. Flax, hemp, and jute support industries of some importance. Hand-spinning is general where the raw material is grown. Good fabrics are woven, although they are not able to compete with those made in England, France, Germany, and Austria. Hempen fabrics, which are chiefly produced in the provinces of Bologna and Ferrara, where rope-making also plays an important part, are articles of export. Tanning is carried on in almost every part of the peninsula. There are in several places, but chiefly Genoa and Naples, factories for the making of gloves, boots, and shoes, which are of excellent quality, and exported to various countries, and even to America. The paper manufacture is very flourishing, and great advances have been made in the processes employed. In the making of straw hats and other articles in plaited straw, Italy maintains the first place among the countries of Europe. The chief seat of this industry is in Tuscany (especially Florence and its environs), where it supports a great number of persons. The products of this manufacture are known all over the world. The making of furniture, and of articles of turnery, and articles used for personal adornment, as well as the manufacture of felt and silk hats, may be mentioned among the other manufacturing industries carried on in Italy.

Shipping and Navigation.— In 1901 the merchant marine of Italy consisted of 5,511 sailing and 446 steam vessels, of 945,008 tons burden, the steamers being of 376,844 tons burden, these figures including vessels engaged in the coasting trade and in fishing from 1 ton burden upward. The total tonnage entered at Italian ports in 1901 amounted to 31,362,192 tons; cleared, 31,317,937 tons. The principal ports are Genoa, Leghorn, Messina, Naples, Palermo, Venice, and Catania, Genoa standing first and Naples second.

Railways, Telegraphs, and Post-office.— The length of the railways in operation, including Sicily and Sardinia, is now about 10,000 miles, of which considerably more than half belong to the state. The first line of railway was opened in 1839, but the process of construction was for a long time slow. In recent years the state has engaged in constructing railways, and has also obtained possession of others by purchase, but all are now worked by private companies. It is expected that when all the lines undertaken by the government have been completed, the total cost of construction will have amounted to 5,000,000,000 lire, or $1,000,000,000. The expenditure in 1900 amounted to $47,903,278, and the receipts to $63,673,265, of which $24,698,193 were from 60,029,673 passengers.

The total length of the telegraph lines in operation in the kingdom in 1900 was 27,918 miles, most of which belong to the state. The total number of inland despatches amounts to between eight and nine millions annually. The post-office in the course of the year now transmits considerably more than 373,000,000 letters and post-cards. The number of post-offices in the kingdom, including collecting boxes, is stated to be over 8,000.

Money, Weights, and Measures.— The monetary system of Italy is based on the Decimal System, the lira, equivalent to the French franc, being divided into 100 centesimi. The lira is equal to about 20 cents. The weights and measures also, are those of the metric system, the French names having such modifications as are necessary to give them an Italian form. Thus the Italian gramma = the gramme, the chilogramma = the kilogramme, the litro = the litre, the ettolitro = the hectolitre, and so on; the metro = the mètre, the ettometro = the hectomètre, the chilometro = the kilomètre, etc.; the aro = the are, the ettaro = the hectare; and the stero = the stère, and the decastero = the decastère. The quintale metrico is the same as the quintal metrique, and the tonnelata the same as the tonneau metrique. See DECIMAL SYSTEM.

Banking.— There is no national bank in Italy and since 1893 only three banks of issue. The chief of these is the Bank of Italy, formed by the union of the National Bank of the Kingdom of Italy, founded in 1850, with a share capital of $40,000,000, and having its chief seats in Florence, Genoa, Milan, Naples, Palermo, Rome, Turin, and Venice; with the National Bank of Tuscany, founded in 1857, share capital $10,000,000; and the Tuscan Credit Bank, founded in 1860, share capital $12,000,000. The other two banks of issue are the Bank of Naples, founded in the 16th century; and the Bank of Sicily, founded in 1843; chief seats, Palermo and Messina.

Constitution and Government.— The constitution of the kingdom of Italy is a limited monarchy. It is based upon the fundamental statute of 4 March 1848, fixing that of the kingdom of Sardinia. The throne is hereditary in the male line of the royal house of Savoy. The king attains his majority on completing his 18th year. He exercises the power of legislation only in conjunction with a national parliament, consisting of two chambers. The first chamber is called the senate, and is composed of the princes of the blood, and an indefinite number of members appointed for life by the king. These last must be above 40 years of age, and must be distinguished either by holding or having held some high office either in church or state, or by eminent services in literature, science, art, or any other pursuit tending to the benefit of the nation, or they must have paid for at least three years a sum not less than 3,000 lire ($600) in direct taxes. In 1902 the senate numbered 356 members. The second chamber is called the chamber of deputies, and consists of 508 members, who are elected by a majority of all the citizens above 21 years of age who are in the enjoyment of civil and political rights, can read and write, and who pay direct taxes to the state or the provincial administration to the amount of 20 lire ($4) yearly. Certain persons enjoy the franchise independently of the taxation test, such as members of learned academies and of chambers of commerce, professors, state officials, members of knightly orders, doctors, advocates, etc. For the election of the members of the chamber of deputies the whole country is divided into electoral colleges or districts. Any one who has the right of voting and has completed his 30th year may be elected, unless he be a clergyman or an officer of state. Some officers of state, however, may be elected. The king calls the chambers together every year. The sittings are public. The president of the senate is appointed by the king, that of the chamber of deputies is elected by the chamber itself

The chamber of deputies has the right of impeaching ministers of the crown, in which case the senate is the court before which the impeachment is tried.

The executive power of the state is exercised by the king through responsible ministers forming a council of ministers. In addition to this there is a state council possessing consultative powers, and authorized to decide on questions of competence arising between the administrative departments and the law-courts, as well as in cases of dispute between the state and its creditors. There are 11 departments in the government: 1, the ministry of foreign affairs, to which is attached the diplomatic council; 2, the ministry of the interior, with the supreme sanitary council, and the command of the national guard; 3, the ministry of justice and ecclesiastical affairs; 4, the ministry of finance, with the permanent council of finance; 5, the ministry of the treasury; 6, the ministry of war; 7, the ministry of marine, with the supreme council for naval affairs; 8, the ministry of public instruction, with the supreme council of instruction; 9, the ministry of public works, with the supreme council for public works; 10, the ministry of agriculture, manufactures, and commerce, with the councils for trade and manufactures, agriculture, mines, and woods and forests; and 11, the ministry of posts and telegraphs.

Finances.— The finances of Italy are not in a satisfactory condition, this being due partly to the expensive wars which were necessary in order to establish and consolidate the unity of the kingdom, partly to the increase of the public debt in consequence of the successive annexations of different portions of the Italian territory, since the present kingdom of Italy has naturally inherited the debt of each of the separate states of which it was formed partly to the large sums expended on railways and on the army and navy. At the end of 1874 the nominal capital of the whole Italian debt was valued at a sum equal to $1,976,717,845. In 1901 the total debt was $2,528,698,992. The difficulty experienced by the government in raising money to meet all its obligations has impelled it to resort to means which are, in some cases, extremely oppressive and unpopular (such as the grist tax), and in other cases scarcely creditable (state lotteries). The Italian budget divides the revenue and expenditure into ordinary and extraordinary. According to the budget of 1902–3 the total revenue estimated for that year was $365,133,700, and the total expenditure $362,472,708. For a number of years following the establishment of the kingdom (1861) the expenditure generally exceeded the revenue, the deficit rising in one year (1866) to $123,400,000. From that date the deficit decreased steadily, and 1884–5 showed a surplus of $12,000,000. Such a surplus, however, is rare, that for 1899–1900 being $1,042,097. The progressive increase of the receipts to balance the expenditure is mainly due to two causes, the establishment of new taxes and the more careful collection of the old ones. Besides the general budget there is one for communes and another for provinces, both of which exhibit, if not an altogether satisfactory condition, at least an improving one.

Army and Navy.— By the law of 7 June 1875, supplemented by subsequent enactments, all men capable of bearing arms are under obligation of military service from the end of their 20th to the end of their 39th year. The forces are divided into three main branches: the standing army, the mobile militia, and the territorial militia. The regular time of service for the infantry is two or three years with the flag, six or five years in the reserve, three or four years in the mobile militia, and seven years in the territorial militia. The cavalry serve three years with the flag, six years in the reserve, and ten in the territorial militia. A certain number of the annual recruits (decided by the ballot) are only called on to serve under the flag from two to six months, which may be spread over several years. A third category have to engage in military exercises for only 30 days during the 19 years. The whole kingdom is formed into 12 military districts, each with an army corps. In 1901 the permanent standing army numbered in all 819,069, of whom 261,976 were actually serving with the flag. Of the latter 120,975 were infantry, 20,980 cavalry, and 32,563 artillery. The mobile militia numbered 320,170, the territorial militia 2,275,631. The total army strength was 3,356,920.

Great efforts have been made to strengthen the fleet in recent years, and it now possesses some powerful vessels. There are 14 battleships of the first class, two of which, the Duilio and Dandolo, have their citadel armor 22 inches in thickness. These are reputed to be among the most powerful war-ships yet constructed, each carrying four 100-ton Armstrong guns. Three others carry 105-ton guns. There are also 11 first-class cruisers, all decks protected. The total strength of the navy is 25,595 men, including 1,799 officers, of which the chief are one admiral, 21 vice- and rear-admirals and 203 captains.

Colonies.— Italy possesses the colony of Eritrea on the African shore of the Red Sea, and some territory in Somaliland. The total area of these possessions is about 188,000 square miles, with a population of about 850,000.

Ethnology.— The inhabitants of Italy are a mixture of many different races who have successively obtained the mastery of the country. Central Italy was the seat of several races which had partly been settled in the land from time immemorial, and were thence regarded as aborigines, and had partly immigrated from foreign countries. Among the former were the Sabellians, a powerful, warlike, freedom-loving people, subdivided into various tribes, the chief of whom were the Sabines, Samnites, and Æquians; the Umbrians, who dwelt to the north of the Sabellians, and are considered to be the most ancient of all the races inhabiting Italy; the Latin tribes, living to the west of the Samnites in the region called, from them, Latium; and the Oscans, Opicans, or Ausonians, living farther south than the Latins, being the earliest inhabitants of Campania. Among the latter races who came into Italy from foreign countries, the most remarkable were the Etruscans, who dwelt between the Gauls in the north, the Umbrians, the Latins, and the sea. The region on both sides of the Po (Padus) in Upper Italy was inhabited by a Gallic race, divided into numerous tribes and states possessing a number of towns on the coast as well as on the fruitful plain in the interior. Adjoining them on the northeast were the Venetians, and on the west coast the Ligurians. Lower Italy was occupied by Apulians in the southeast, supposed

to be a member of the Oscan race; and by Lucanians, a Sabellian tribe; and the Brutii in the southwest, the former occupying the district to the south of Campania and Samnium, and extending as far as the root of the small peninsula in the extreme southwest, which was the habitation of the latter. The coasts of lower Italy as far north as Latium were studded many hundred years before Christ with Greek colonies, from whom the neighboring tribes derived some of the elements of Greek culture and an acquaintance with Greek mythology. Evidence of this is found in the Latin legend to the effect that after the destruction of Troy the hero Æneas, with a number of Trojan followers, came to Italy and formed a settlement in Latium, where he married the daughter of the Latin king.

The Gallic (Celtic) and the Roman elements have in the course of time become the principal ingredients of Italian nationality, but few traces of the character of the aboriginal population being now discernible. In upper Italy the Germanic element has contributed its share toward the formation of Italian nationality. Even the name of Lombardy is derived from that of a German tribe. In southern Italy and Sicily the Arab element enters into the mixture of national characteristics. The Italian has generally a fine exterior. He is slim rather than stout, but strong and agile. A dark complexion, an expressive countenance, sparkling eyes, black hair, and a grave gait combine to render the physique of the Italian characteristic and prepossessing. A great proportion of the inhabitants retain many of the characteristics of the Roman conquerors of the world. The predominating system of agriculture, however (see *Land Tenure*), the peasants being obliged to pay one half of their gross income to the landlords, and the minute subdivision of the soil, exert a depressing effect upon the condition of the lower classes.

Population.— The total population of Italy as shown in the table under *Political Divisions* was 32,475,253, or 293 people per square mile, as compared with 28,459,628 in 1881, thus showing an increase of about 14 per cent in 20 years. The foreign population in 1901 consisted of 37,706 residents and 23,709 transients, the majority being Austrians, Swiss, Germans, English and French. The natives of foreign extraction comprise 90,000 Albanians in southern Italy, 80,200 French in northern Italy, 31,200 Greeks in Calabria, 30,000 Slavs and 11,400 Germans in the northeast, and 9,800 Spanish in Sardinia.

Religion.— According to the provisions of the fundamental statute the Roman Catholic is the state religion, but all other creeds are tolerated, and adherents of all religions have equal municipal and political rights. The spiritual head of the Roman Catholic Church, the Pope, has his seat at Rome. His prerogatives are regulated by the law of 13 May 1871, which also determines the relation between church and state. By this law the person of the Pope is pronounced sacred and inviolable. The Italian government pays sovereign honors to the Pope, and guarantees him a yearly dotation of 3,225,000 lire ($645,000). The Pope also enjoys the possession of the palaces of the Vatican and the Lateran, and the villa of Castel Gandolfo, without being subject to taxes on their account, and these places are not put under the jurisdiction of the state. Temporary residences of the Pope, as well as places where a conclave or a council is held, are protected by similar immunities. The Pope is perfectly free in the exercise of his spiritual functions; and free intercourse is also guaranteed between the head of the church and the episcopate, as well as the whole Catholic world. The ambassadors of the Pope, and those accredited to the Holy See by foreign powers, enjoy all the privileges granted to such functionaries by international usage. The Church has the entire right of nominating to all ecclesiastical offices and benefices. The royal exequatur and placet are abolished. This guaranty-law, as it is called, which really determines the relations between church and state, at the present day, has never been acknowledged by the Popes, who have hitherto declined to accept the dotation. In the kingdom of Italy there are 51 archbishoprics and 223 bishoprics, beside 6 cardinal-bishops with sees in Italy. The number of parish priests is about 76,500. The monasteries and convents have been abolished by a royal decree dated 7 July 1866, and extended to the former Papal States, and to Rome itself, by another decree dated 25 June 1873. Among the Waldenses, who follow the religious observances of the Reformed Church, the highest spiritual authority is confided to a synod.

Judiciary.—For the administration of the law there are, beside numerous courts of first instance, 161 civil tribunals and the tribunals of correction, 92 assize courts, 24 courts of appeal, and 4 courts of cassation (at Turin, Florence, Naples, and Rome). The court of accounts occupies an independent position.

Local Government.— The constitution of the provinces and communes is based upon the law of 20 March 1865. Each province has the right of independent administration, and the executive power is entrusted to a provincial council, the members of which are elected by the communal electors for five years, and to a provincial deputation or commission elected by the council from its own members, and managing the business of the province when the council is not sitting. The provincial councils elect their own presidents and other officials. In each commune there is a communal council elected like that of the provinces for five years, and a municipal giunta elected by the council. The head of the communal administration is the sindaco, who in all the chief communes is elected by the council from among its own members, and in other cases is nominated by the king from the members of the communal council.

Education.— Compulsory education is enforced by the law of 15 July 1877, for all children who have completed their sixth year, and do not receive adequate instruction either at their homes or in private schools. Attendance is obligatory at the rudimentary schools in the commune for such children up to their ninth year, and in case of failure to pass the requisite examination they may be detained a year longer. The elementary communal schools are entirely supported by the municipalities, which nominate and pay the teachers, and carry out the educational laws under the supervision of the state school-inspectors. The subjects of compulsory instruction are reading, writing, arithmetic, the metric system, the rudiments of Latin, and the first duties of a man and a citizen. Religious instruction is not obligatory. There are many schools supported by the Church, as well as

private schools, but all must adopt the government code, and are open to government inspection, while all teachers must hold the government certificate. The urgency of the need for all practicable measures being used to advance the cause of popular education in Italy may be gathered from a return issued by the Italian government in March 1870, which gives information regarding the amount of education received by the military conscripts born in 1847, and called up for active service in 1868, and shows that throughout the kingdom of Italy the average percentage, reckoned over the different provinces of the kingdom, of these conscripts who were totally unable to read or write was 64.27. In the province of Girgenti it was 85.82, and in the southern provinces generally it was above 80. The average percentage by 1897 had decreased to little more than 37. It is now comparatively rare to meet a boy or girl who cannot at least read. Education is practically free up to the university. Beside the regular day schools there are evening schools, in which elementary education may be carried further. The principal institutions for secondary education are the gymnasiums and lyceums, the former having a course of five years, the branches taught being Greek, Latin, Italian, history, geography, and arithmetic; the latter, having a course of three years, add to these subjects philosophy, mathematics, physics, chemistry, and natural history. No fees are charged either in gymnasium or lyceum. In addition to these there are a number of technical schools, in which fees are charged. There are also schools of agriculture, mining, commercial education, etc. For the higher education there are no less than 21 universities, many of them of ancient foundation, and at one time of considerable renown. The oldest are those of Bologna (founded in 1119), Padua (1222), Naples (1224), Rome (1244), Perugia (1320), Pisa (1329), Siena (1349), Pavia (1390), Turin (1412), and Parma (1422). The other universities are Cagliari, Camerino, Catania, Ferrara, Genoa, Macerata, Messina, Modena, Palermo, Sassari, and Urbino. The number of students at all the universities was returned in 1897–8 at 22,540, of whom Naples had 5,465, Turin 2,551, and Rome 2,300. In all universities the theological faculty has been abolished. Cooperating with these institutions for the education of the people there are about 150 training schools for teachers, with an attendance of about 18,000 students. There are government art schools at Bologna, Carrara, Florence, Lucca, Milan, Modena, Parma, Ravenna, Rome, Turin, Venice, etc., with a total of 3,300 pupils; and in addition the academies of Genoa, Bergamo, Verona, Siena, Pisa, and Perugia. Musical conservatories are supported by the government at Florence, Milan, Naples, Palermo, and Parma.

Emigration.— Military conscription, oppressive taxation, and the agricultural conditions already enumerated, are the causes of extensive emigration, the great bulk of which finds its way to the United States, Argentina, and Brazil, European nations adjacent to Italy also receiving their share. From 1870 to 1902 the total number of Italians who arrived in the United States amounted to 1,391,076. If to this is added the children born here, a total of 1,500,000 is reached. It is estimated that for 10 years Italian immigration will continue in the present proportion and then gradually decrease, so that in 1920 the Italian population of this country will probably number from four to five millions.

The Italian immigration has a peculiar character. Until 1890 the percentage of women was less than 15, but now it has increased to 39. This indicates that the immigration has a marked tendency to become permanent. Thirty per cent or more of Italian adults who had been in this country more than 10 years went back at least once to Italy, and 80 per cent of these came to this country again, bringing their families with them. During the time in which the family is not here the man sends money weekly to Italy. It is calculated that about $50,000,000 crosses the ocean every year in this way.

The Italian population in this country is changeable; roughly speaking, it is better the farther we go westward. New York has about 250,000 Italians, who are chiefly the worst kind of those coming to America. Philadelphia has about 80,000; Newark, N. J., 40,000; Boston, 25,000. In the New England States, where about 50 per cent of the entire population are foreigners, the Italian element is no more than 10 per cent, but is rapidly increasing. Cincinnati, Ohio, has only 5,000 Italians; Pittsburg, 12,000; Chicago, 15,000. California has about 60,000 Italians, of whom 25,000 are in San Francisco. The Italians in California are of the best kind, mostly Genoese, clean and intelligent.

Unfortunately many Italians coming from their farms abroad, who could be a valuable and strong agricultural element in this country, mass in the unclean and narrow quarters of the big cities. The only difficulty in directing them to the farming West, where they would be easily Americanized, is their ignorance of the state of things in this country and the lack of money to make the journey.

History.— Italia did not become the general name of this country until the age of Augustus. It was known to the Greeks under the name of Hesperia, and also, either in whole or in part, by those of Ausonia, Saturnia, and Œnotria. The name of Italia was at first merely a partial name for the southern extremity. From the earliest times Italy was inhabited by many tribes of different origin. See paragraph on *Ethnology*. At an early period Rome, the chief town of Latium (founded, according to the received date, 753 B.C.), became predominant among the cities and tribes of Central Italy, and it gradually extended its influence over the whole country until, by the end of the 3d century B.C., it had brought into allegiance or subjection all the tribes of Italy from north to south, including those of the islands of Sicily, Corsica, and Sardinia. The history of ancient Italy thus merges to a great extent in that of Rome, to which article, as well as those treating of the more important races of Italy, the reader is referred for further information concerning ancient Italy, while the subsequent history of Italy is resumed from the overthrow of the empire in the west, 476 A.D.

From 476 to 568 Italy was under the dominion of the Herulians and Rugians, and of the Ostrogoths. Odoacer, the leader of the Roman-Germanic troops, dethroned the Emperor Romulus Augustus, assuming the title of King of Italy, and after ruling 12 years was defeated by Theodoric, king of the Ostrogoths, who

ruled over Italy with Ravenna as his capital. Theodoric, who combined the vigor of the north with the cultivation of the south, is justly termed the Great, and, under the name of Dietrich of Bern (Verona), has become one of the principal heroes of old German story. About 568 the country was invaded by the Lombards (Langobardi, Longobardi), a German people which had emigrated from the Elbe to Pannonia. Under King Alboin they conquered the Po basin, which received from them the name of Lombardy. The kingdom of the Lombards included Upper Italy, Tuscany, and Umbria. Alboin also created the Duchy of Benevento, in Lower Italy, with which he invested Zotto. The popes, in their efforts to defend the freedom of Rome against the Lombards, had recourse to the Frankish kings. In consideration of the aid expected against King Astolphus, Pope Stephen III. (754) anointed Pepin, who, with the approbation of Pope Zacharias, had been made king of the Franks in 752, and with the assent of the municipality of Rome, appointed him patrician. In 756 Pepin presented the exarchate of Ravenna, with the five cities, to the Pope. At the invitation of Pope Hadrian I. Charlemagne made war upon Desiderius, the king of the Lombards, took him prisoner in his capital, Pavia, united his empire with the Frankish monarchy (774), and eventually gave Italy a king in his son Pepin. Charlemagne was unsuccessful in his attempts against the Duchy of Benevento, the independence of which was maintained by Duke Arichis, and against the republics in Lower Italy, where Naples, Amalfi, and Gaeta in particular, had become rich by navigation and commerce. Leo III. bestowed on the king of the Franks, on Christmas day, 800 A.D., the imperial crown of the West. But dislike to the Franks united the free cities, Rome excepted, more closely to the Eastern Empire. During the lifetime of Charlemagne Frankish Italy was given to his grandson Bernard (810), who having attempted to become independent of his uncle, Louis the Debonnaire, was deprived of the crown, and had his eyes torn out. Italy now remained a constituent part of the Frankish monarchy, till the partition of Verdun (843), when it was allotted, with the imperial dignity, and what was afterward called Lorraine, to Lothaire I., eldest son of Louis. Lothaire left the government (850) to his son Louis II., the most estimable of the Italian princes of the Carlovingian line. After his death (875) Charles the Bald of France first took possession of it, and after his death (877) Carloman, who was succeeded, in 884, by his brother Charles the Fat, who united the whole Frankish monarchy for the last time. His dethronement (887) was the epoch of anarchy and civil war in Italy. Berengarius, duke of Friuli, and Guido, duke of Spoleto, disputed the crown between them. Guido was crowned king and emperor, and after his death (894) his son Lambert, although Berengarius got himself crowned king in the same year. Arnulf, the Carlovingian king of the Germans, enforced his claims to the royal and imperial crown of Italy (896), but like most of his successors was able to maintain them only during his residence in the country. After the death of Lambert (898) and Arnulf (899) the struggle for supremacy in Italy continued, the competitors now being Berengarius, of Friuli, and Louis, king of Lower Burgundy (Arles), but at last the former succeeded in restoring quiet by driving out his rival. He reigned from 915 when he was crowned emperor till 924, when he was assassinated. Hugh of Provence, who succeeded, sought to strengthen the insecure throne of Italy by a bloody tyranny. His nephew, Berengarius, marquis of Ivrea, fled to Otho the Great of Germany, assembled an army of fugitives, returned, and overthrew Hugh (945), who was succeeded by his son Lothaire. Berengarius became his first counsellor, and after the death of Lothaire, in 950, poisoned, it was said, by Berengarius, wished to compel his widow — the beautiful Adelaide — to marry his son. Escaping from his cruelty she applied for aid to Otho I., king of Germany, who passed the Alps, conquered Pavia, became king of the Franks and Lombards (in 951), and married Adelaide. To the cession of Friuli, the key of Italy, which Otho gave to his brother Henry, Berengarius was indebted for permission to reign as the vassal of Otho. But 10 years after, on complaints, Otho returned (961), deposed him, and led him prisoner to Bamberg. Early in the following year (962) Otho was crowned emperor by Pope John XII., thus uniting Italy with Germany, and from this event dates the foundation of what is known in history as the Holy Roman Empire.

Otho granted to the Italian cities privileges that were the foundation of a free constitution. Owing to the corruption existing in the Papal Court he deposed John XII., who had crowned him emperor, and chose Leo VIII. in his stead; but the people, jealous of its right of election, chose Benedict V. From this time the popes instead of ruling the people of Rome, became dependent on them. In Lower Italy the Republics of Naples, Gaeta, and Amalfi defended their independence against the Lombard duchy of Benevento,. with the more ease in that they had a common enemy in the Saracens, who previously invited over from Sicily by both parties (about 830), as auxiliaries against each other, had settled and maintained themselves in Apulia. Forty years later the Greeks in Lower Italy, who had adhered to the Byzantine Empire, succeeded, with the aid of Louis II. of Germany, in recovering the territory that had been wrested from them by the Saracens, and out of the recovered region formed a separate province, called the Thema of Lombardy, which continued under their dominion upward of a hundred years, being governed by a capitan (governor-general) at Bari. Otho the Great did not succeed in driving them from Italy, and the marriage of his son, Otho II., with the Greek princess Theophania, put an end to his exertions for this purpose.

In opposition to the designs of the Count of Tusculum, who wished to supplant the absent emperor at Rome, a noble Roman, the consul Crescentius, attempted to govern Rome under the semblance of her ancient liberty (980). Otho II., king since 973, occupied with his projects of conquest in Lower Italy, did not interfere with this administration, which became formidable to the two popes Boniface VII. (anti-pope) and John XV. But when Otho III., who had reigned in Germany since 983, raised his kinsman Gregory V., to the popedom, Crescentius caused the latter to be expelled, and John XVI., a Greek, to be elected by the people. He also endeavored to place Rome again under the nominal supremacy of the Byzantine Em-

pire. Otho, however, reinstated Gregory, besieged Crescentius in the castle of San Angelo, took him prisoner, and caused him to be beheaded with 12 other noble Romans (998). But the Romans again threw off their allegiance to the emperor, and yielded only to force. On the death of Otho III. (1002) the Italians considered their connection with the German Empire as dissolved. Harduin, marquis of Ivrea, was elected king, and crowned at Pavia, whereupon Milan, the enemy of Pavia, declared for Henry II. (in Italy, I.) of Germany. A civil war ensued, in which every city, relying on its walls, took a greater or less part. Henry was chosen king of Italy by the nobles assembled in Pavia; but disturbances arose in which a part of the city was destroyed by fire (1004 A.D.). Not till after Harduin's death (1015) was Henry recognized as king by all Lombardy. He was succeeded by Conrad II. (in Italy, I.). When Henry III. (in Italy, II.), the son of Conrad, whom he succeeded in 1039, entered Italy (1046), he found three papal claimants in Rome, whom he deposed, appointing in their stead Clement II., and ever after filled the papal chair, by his own authority, with virtuous German ecclesiastics. Henry died in 1056. During the long minority of his son Henry IV. (in Italy, III.) the policy of the popes, directed by the monk Hildebrand (afterward Gregory VII.), succeeded in creating an opposition which soon became formidable to the secular power. (See POPES.) The Normans also contributed to this result. As early as 1016 warriors from Normandy had established themselves in Calabria and Apulia. Allies sometimes of the Lombards, sometimes of the republics, sometimes of the Greeks against each other and against the Saracens, they constantly became more powerful by petty wars. The great preparations of Leo IX. for their expulsion terminated in his defeat and capture (1053). Nicholas II. united with the Norman princes, and, in 1059, invested Robert Guiscard with all the territories conquered by him in Lower Italy. From that time the Pope, in his conflicts with the imperial power, relied on the support of his faithful vassal, the duke of Apulia and Calabria, to which Sicily was soon added. While the small states of the south were thus united into one large kingdom, that in the north was dissolving into smaller states. The Lombard cities were laying the foundation of their future importance. Venice, Genoa, and Pisa were already powerful. The Pisanese, who, in 980, had given to Otho II. efficient aid against the Greeks in Lower Italy, and in 1005 boldly attacked the Saracens there, ventured, in connection with the Genoese (no less warlike and skilled in navigation), to assail the infidels in their own territory, and twice conquered Sardinia (1017 and 1050), which they divided into several large fiefs, and distributed them among their principal citizens.

Gregory VII. humbled Henry VII. in 1077. Urban II. instigated the emperor's own sons against their father. Conrad, the eldest, was crowned king of Italy in 1093, after whose death (1101) Henry, the second son, succeeded in deposing his father from the imperial throne. Henry V., the creature of the Pope, soon became his opponent; but after a severe conflict concluded with Calixtus II. the concordat of Worms (1122). A main issue which remained unsettled gave rise to new difficulties in the 12th and 13th centuries — Matilda, countess of Tuscany, who died in 1115, by a will, the validity of which was disputed by the emperor, bequeathed all her property to the Papal See. Meanwhile, in the south, the Norman state, under Roger II., was formed into a kingdom, from the ruins of republican liberty and of the Greek and Lombard dominion (1130). In the small republics of the north of Italy the government was in most cases divided between the consuls, the lesser council (*credenza*), the great council, and the popular assembly (*parlamento*). Petty feuds developed their youthful energies. Such were those that terminated with the destruction of Lodi by Milan (1111), and the 10 years' siege of Como by the forces of the same city, allied with those of nearly all the Lombard cities (1118–27). The subjugation of this city rendered Milan the first power in Lombardy, and most of the neighboring cities maintained an alliance with her. Others formed a counter-alliance with her antagonist, Pavia. In Rome the love of liberty, restrained by Gregory VII., rose in proportion as his successors ruled with less energy. The schisms between Gelasius II. and the antipope Gregory VIII., Innocent II. and the antipope Anacletus II., renewed the hopes of the Romans. Arnold of Brescia (q.v.), formerly proscribed (1139) for his violent attacks against the luxury of the clergy in that country, was their leader (1146). After eight years Adrian IV. succeeded in effecting his execution. Frederick I. of Hohenstaufen (called Barbarossa) crossed the Alps six times, in order to defend his possessions in Italy against the republicanism of the Lombard cities. Embracing the cause of the Pavian union as the weaker, he devastated (1154) the territory of Milan, destroyed Tortona, and was crowned in Pavia and Rome. In 1158 he reduced Milan, demolished the fortifications of Piacenza, and in a diet at Roncaglia extended the imperial prerogatives conformably with the Justinian code, gave the cities chief magistrates (podestà), and proclaimed a general peace. His rigor having excited a new rebellion, he reduced Crema to ashes (1160), compelled Milan to submission, and demolished the fortifications (1162). Nothing, however, but the terror of his arms upheld his power. When the emperor entered Italy (1163) without an army, the cities concluded a union for maintaining their freedom, which in 1167 was converted into the Lombard Confederacy. In 1176 he suffered a severe defeat at Legnano, and was obliged to conclude a concordat with Alexander III., and a truce with the cities at Venice. Some years afterward a peace, which secured their independence, was signed at Constance (1183). The republics instead of strengthening their league into a permanent confederacy were soon split into new factions, most cities being internally divided into Guelfs and Ghibellines (q.v.). After Frederick II. returned from his crusade (1229), for undertaking which contrary to the will of the pope he was excommunicated, he waged war, with varying success, against the cities and against Gregory IX., heedless of the excommunication. The plan of Gregory IX. to depose Frederick, was followed by Innocent IV., in the Council of Lyons (1245), whither the Pope had fled to be out of the power of Frederick. This greatly weakened the Ghibelline party: the hitherto faithful Parma revolted; and the war between

Guelfs and Ghibellines raged with greater fury than ever. In 1250 Frederick died, and his sons Conrad IV. and Manfred, endeavored to maintain themselves in the possession of their hereditary dominions in Lower Italy; but Innocent IV., who now returned to Italy, excommunicated them, and his successor, Urban IV., offered the crown of Naples to Charles of Anjou, brother of Louis IX. of France, who accepted the offer and landed at the mouth of the Tiber in 1265.

With Charles I. of Anjou, king of Naples, senator of Rome, and Papal vicar in Tuscany, the names of Guelfs and Ghibellines acquired a new signification. The former denoted the friends, the latter the enemies, of the French. Although with the fall of Hohenstaufen the power of the German emperors in Italy was practically at an end for the time, yet in Lombardy, and to some extent also in Tuscany, their supremacy was still at least nominally recognized; many Ghibellines still looked forward to a restoration of the Holy Roman Empire in Italy as the only means of reestablishing order, and others wishing to gratify their own schemes of ambition, often sought to obtain a legal authority for their usurpations by purchasing from the empire the title of imperial vicars. In Sicily, by the so-called Sicilian Vespers (1282), the French were driven out, and the crown of the island was bestowed upon Peter of Aragon, the son-in-law of Manfred, with whose help the inhabitants successfully resisted all the attempts of Charles of Anjou to recover the island, which remained separate from Naples for nearly 150 years. Thus the house of Aragon came to be the natural allies of the Ghibellines, as the house of Anjou were the allies of the Guelfs. To the factions of Guelfs and Ghibellines were added in the republics the parties of the nobility and the people. Everywhere in Middle and Upper Italy there was anarchy and civil war. The noble exertions of Gregory X. (who died 1276) to establish peace were of no avail; those of Nicholas III. (1277–81), who feared the preponderance of Charles, were more efficacious; but Martin IV. (1281–5), servilely devoted to Charles, destroyed everything which had been effected, and persecuted the Ghibellines with new animosity. A different interest — that of trade and navigation — impelled the maritime republics to mutual wars. The Genoese assisted Michael Palæologus (1261) to recover Constantinople from the Venetians; at Meloria, they annihilated (1284) the navy of the Pisans, and completed their dominion of the sea by a victory over the Venetians at Curzola (1298). In Tuscany the party of the Guelfs formed themselves under the leadership of Florence and the influence of the Church into a league for the maintenance of national freedom against imperial power. Only Pisa and Arezzo remained attached to the Ghibelline cause. In Lombardy many towns, such as Novara, Lodi, Vercelli, Asti, Cremona, and above all Milan, formed themselves into a Guelf confederacy; but there was on the one hand an equally strong Ghibelline confederacy, consisting of the cities of Verona, Mantua, Treviso, Parma, Piacenza, Reggio, Modena, and Brescia. Freedom seemed to have expired, when the people, weary of the everlasting feuds of their tyrants, rose in most of the cities, and expelled them (1302–6), including the Visconti, who had supplanted the Della Torre (1277) in the government of Milan.

Henry VII., the first emperor who had appeared in Italy for 60 years (1310), restored the princes to their cities. Florence alone undertook the glorious part which she so nobly sustained for two centuries, as the guardian of Italian freedom, chose Robert of Naples, the enemy of Henry, her protector for five years (1313), and remained free while Italy swarmed with tyrants. Robert also held the dignity of Papal vicar in the States of the Church during the pontificates of John XXII. and Benedict XII., the popes then residing at Avignon under the influence of France in what is known as the second Babylonian captivity. In the other cities a rule of tyranny existed, frequently changing from family to family, and therefore more oppressive. These petty princes, especially Della Scala, Matteo Visconti, and Castruccio, were a counterpoise to the ambitious views of Robert of Naples, son of Charles II. of Naples.

About 1334 Martino della Scala, master of half Lombardy and of Lucca, began to menace the freedom of Lombardy. Florence led the opposition against him, and excited a war of the league, in which it gained nothing but the security of its liberty. After the baffled Martino had sold Lucca to the Florentines the Pisans arose and conquered it for themselves (1342). In Rome, still torn by the feuds of the nobles, Cola di Rienzi (1347) sought to restore order and tranquillity; he was appointed tribune of the people, but was forced, after seven months, to yield to the nobility.

In 1348 the emperor Charles IV. made an expedition into Italy from which may be dated the gradual extinction of the political parties of Guelfs and Ghibellines. Charles had himself crowned king of Lombardy at Milan, and emperor at Rome, but he saw that neither of the Italian parties really desired foreign domination, and that the Ghibellines merely gave the empire their support for their own party purposes, and he therefore did not seek to strengthen himself by attaching himself to either party, but was content to add to his resources for the government of the empire in Germany by selling to the towns and princes the imperial rights in Italy. In 1425 the Venetians in alliance with the Florentines conquered all the territory of northeastern Italy as far as the Adda, which they retained in the Peace of Ferrara in 1428. Milan, Venice (which possessed half of Lombardy), Florence (wisely managed by Lorenzo Medici), the States of the Church (for the most part restored to the Holy See), and Naples (which was incapable of employing its forces in direct attacks on other states), constituted, in the 15th century, the political balance of Italy, which, during the manifold feuds of these states, permitted no one to become dangerous to the independence of the rest, till 1494, when Charles VIII. of France entered Italy to conquer Naples as the inheritance of the house of Anjou. After an unresisted march through Italy Charles took possession of Naples; but a league was formed against him by the leading Italian states, who were joined by Ferdinand of Aragon, and he was compelled hastily to retreat, leaving only a small body of troops to protect his new conquest. In 1496 the whole of Naples was reconquered from the French and the Aragonese dynasty restored. Louis XII., the successor of

Charles VIII., resumed the plans of the latter, and with Ferdinand of Spain as ally, having conquered Naples, fell to disputing as to the division of their conquest. War was declared between them, the result of which was that Ferdinand managed to retain the whole conquest for himself, which was thus reunited to Sicily and Aragon (1501–4). Louis was more successful against Milan, which he subjected in 1500. The attempts of Cesare Borgia, the son of Pope Alexander VI., to acquire the sovereignty of Italy were frustrated by the death of his father (1503), when the war-like Pope Julius II. completed the subjugation of the States of the Church. He concluded with Maximilian I., Ferdinand the Catholic, and Louis XII. the league of Cambray (1508) against the ambitious policy of the Venetians, who artfully succeeded in dissolving the league, which threatened them with destruction. The Pope then formed the so-called Holy League with the Venetians themselves, Spain and the Swiss, for the purpose of driving the French from Italy. Maximilian Sforza, who had reacquired Milan (1512), relinquished it without reserve to Francis I. (1515) after the battle of Marignano, but the Emperor Charles V. assumed it as a reverted fief of the empire, and conferred it on Francesco Sforza, brother of Maximilian (1520). This was the cause of violent wars, in which the efforts of Francis were always unsuccessful. He was taken prisoner at Pavia (1525), and, with his other claims, was compelled to renounce those on Milan. In 1530 Florence, which through inner demoralization had lost its ancient love of freedom, was converted into a regular principality under Alessandro de' Medici, who was imposed on the Florentines by Charles V. Genoa, subject to the French since 1499, found a deliverer in Andrea Doria (1528). In 1553, beside Milan Charles V. conferred Naples on his son Philip II., and for a century and a half the Austro-Spanish influence was predominant in Italy. In the second half of the 16th century the prosperity of Italy was increased by a long peace, as much as the loss of its commerce allowed. Misfortunes in Germany compelled Ferdinand II. to confer both countries as a fief on Charles of Nevers, the *protégé* of France, whose family remained in possession till the war of the Spanish Succession. The peace of Italy was not interrupted during the second half of the 17th century, except by the attempts of Louis XIV. on Savoy and Piedmont, and appeared to be secured for a long time by the treaty of neutrality at Turin (1696), when the war of the Spanish Succession broke out. Austria conquered Milan, Mantua, and Montferrat (1706), retained the two first (Mantua was forfeited by the felony of the duke), and gave the last to Savoy. In the Peace of Rastatt (1714) Austria obtained, moreover, Sardinia and Naples; Savoy obtained Sicily, which it exchanged with Austria for Sardinia, from which it assumed the royal title. The house of Farnese becoming extinct in 1731, the Spanish Infant Charles, son of Elizabeth Farnese, daughter of the eldest brother of Antonio, the last duke of the Farnese family, obtained Parma and Piacenza. In the war for the Polish throne, of 1733, Charles Emmanuel of Savoy, in alliance with France and Spain, conquered the Milanese territory, and received therefrom, in the Peace of Vienna (1738), Novara and Tortona. Charles, infant of Spain, became king of the Two Sicilies, and ceded Parma and Piacenza to Austria. The Medici of Florence, entitled, since 1575, grand-dukes of Tuscany, became extinct in 1737; and Francis Stephan, duke of Lorraine, then received Tuscany by the preliminaries of Vienna, and, becoming emperor in 1745, made it the appanage of the younger line of the Austro-Lorraine house. In the war of the Austrian Succession the Spaniards conquered Milan (1745), but were expelled thence by Charles Emmanuel, to whom Maria Theresa ceded in reward some Milanese districts. Massa and Carrara fell to Modena in 1743 by right of inheritance. The Spanish Infant, Don Philip, conquered Parma and Piacenza in his own name, lost them, and obtained them again as a hereditary duchy by the Peace of Aix-la-Chapelle (1748). Thus in the 18th century the houses of Lorraine, Bourbon, and Savoy possessed all Italy with the exception of the ecclesiastical territories, Modena, and the republics, which beheld with apathy operations in which they had no share. A quiet of 40 years ushered in their downfall.

The French revolution had a great influence on the history of Italy. From 1792 to 1797 Italy was overrun by the victorious French troops under Bonaparte and in the latter year the Pope purchased peace by the cession of Bologna, Ferrara, and Romagna in Italy, and Avignon in France; the payment of a money indemnity, and the surrender of art treasures. Bonaparte then advanced into Austrian Germany, and a rising having taken place among the Venetians in his rear, he made this a pretext for overthrowing the Venetian state. In October 1797 the Peace of Campo Formio was concluded, by which the Cisalpine Republic (q.v.) was formed out of the Italian territories which had been surrendered by Austria and the Pope, together with some sections taken from other powers. Austria received in compensation Venetia and Dalmatia. A few days later Sardinia concluded a treaty of alliance with France. The French then advanced toward Rome, overthrew the ecclesiastical government, and erected a Roman republic (1798). In Genoa, in the same year, Bonaparte occasioned a revolution by which a democratic republic was formed after the model of the French, under the name of the Ligurian Republic; and Lucca also was obliged to accept a republican form of government. In 1798 the second coalition against France was formed, and the king of Naples, instigated by his wife, a daughter of Maria Theresa, sent a Neapolitan army to attack the French at Rome. The French were at first driven out, but soon returned, and repulsed the Neapolitan army, forcing it to retreat into its own territory, where they followed it, and having taken the capital after an obstinate resistance, erected Naples into the Parthenopean Republic. The French directory also compelled the king of Sardinia to surrender his territories on the continent, and Piedmont and Tuscany received a military administration. In consequence of the victories of the coalition, the French were again driven out of Rome, Naples, and the rest of Italy except Genoa, and the king of Sardinia and the Pope returned to their capitals; but in the brilliant campaign of 1800 Napoleon destroyed all the advantages gained by the allies in Upper Italy, the most of which he reconquered. By the Peace

of Lunéville the possession of Venice was confirmed to Austria. The Duke of Parma received Tuscany, and afterward from Bonaparte the title of King of Etruria. Parma was united with France. The Cisalpine and Ligurian Republics were guaranteed by Austria and France, and with the Ligurian territories were united the imperial fiefs included within their limits. The king of Naples, who had occupied the States of the Church, was obliged to conclude peace at Florence. By Russian mediation he escaped with the cession of Piombino, the Stato degli Presidj, and his half of the Island of Elba, together with the promise of closing his harbors against the British. The other half of Elba Tuscany had already relinquished to France; but the whole island was obstinately defended by the British and Corsicans, with the armed inhabitants, and not evacuated till autumn. In January 1802, the Cisalpine Republic was transformed into an Italian republic, formed on the model of the new French constitution, and Bonaparte became president. Genoa also received a new constitution, and Girolamo Durazzo for doge. Piedmont, however, was united with France. After Bonaparte had become emperor in 1804 he attached (17 March 1805) the royal crown of Italy to the new imperial crown; he promised, however, never to unite the new monarchy with France, and even to give it a king of its own. The new constitution was similar to that of the French Empire. Napoleon founded the order of the Iron Crown, and having placed the crown on his own head at Milan 26 May, appointed his stepson Eugène Beauharnais viceroy of Italy. No European power recognized expressly the Italian kingdom of Napoleon. The emperor continued to strengthen his power against the active enemies of the new order of things. He seized Dalmatia, and annexed it to the kingdom of Italy. Guastalla, the Ligurian Republic, Parma and Piacenza were made French provinces. The Pope was obliged to sanction the imperial coronation by his presence. Naples was occupied by the French, and Napoleon gave it as a kingdom to his brother Joseph; and afterwards, in 1808, when Joseph was nominated to the throne of Spain, to Joseph Murat, grand-duke of Berg; while the English secured the rightful king Ferdinand in the possession of Sicily. In 1808 Etruria was annexed to France, and in 1809 Tuscany was given to Napoleon's sister Elise as a grand-duchy. In the same year (1809) the States of the Church were entirely united to France. After the Peace of Venice, Istria and Dalmatia were separated from the kingdom of Italy, and incorporated with the newly-created kingdom of Illyria. Bavaria was obliged to cede to Italy the circle of the Etsch (Adige) in the Tyrol, a part of the circle of Eisack, and the district of Clausen.

The power of the French emperor was, to all appearance, as firmly established in Italy as in all Europe, but after the fatal retreat from Russia, Murat, whom Napoleon had personally offended, deserted the cause of France, and joined Austria, whose army penetrated into Italy under Bellegarde. After the truce of 21 April 1814, the French troops evacuated Italy, and most of the provinces were restored to their legitimate sovereigns. But before the Congress of Vienna had organized the political relations of Europe, Napoleon escaped from Elba and effected his return to France, 1 March 1815. At the same time Murat, king of Naples, abandoned his former ambiguous attitude, and took up arms, as he pretended, for the independence of Italy. But his appeal to the Italians was answered by a declaration of war by Austria. Driven from Bologna by the Austrian forces, and totally defeated by Bianchi at Tolentino, he lost the kingdom of Naples, seven weeks after the opening of the campaign. Ferdinand IV. returned from Palermo, and Murat's family found an asylum in Austria. Murat himself made a descent in Calabria from Corsica, in order to recover his lost kingdom, but was taken prisoner at Pizzo, brought before a court-martial, and shot 14 Oct. 1815.

Meanwhile the Congress of Vienna had arranged the affairs of Italy, so that Austrian predominance was again more firmly established than ever in Italy.

The result was to leave the country in the same divided condition and among the people. The spirit of Carbonarism (see CARBONARI), having for its object the union of Italy under one government, threatened to subvert the political institutions. In Naples and Sicily, in 1820 Ferdinand I. (IV.) was compelled to promise a constitution similar to that granted to Spain in 1812; and in Sardinia, Victor Emmanuel abdicated in 1821 in favor of his brother Charles Felix. But Austria, as the power most nearly concerned, undertook, with the approbation of the other powers assembled at the Congress of Laibach, to restore despotism in Naples and Sicily as well as in Sardinia. The system of repression was carried out with the utmost rigor, and great cruelties were practised in Naples and Sicily, even on those who were only the objects of political suspicion.

The arbitrary proscriptions and imprisonments aroused a deep hatred of the government, and when, in 1830, in consequence of the French revolution, a general spirit of revolt spread itself throughout Europe, the Italians considered the state of events a favorable conjuncture for striking a blow for national and political freedom. But the hopes of the patriots were soon quenched. The risings in Modena, Parma, and Bologna were suppressed by Austrian troops, and the reigning princes who had been driven out of the first two states returned to their dominions. In the States of the Church the papal troops, recruited from banditti and criminals, were employed to put down the uprisen provinces, and they behaved with so much violence that Austrian forces were necessary to defend the government and country from their own soldiers. In order not to allow all the power in Italy to fall into the hands of the Austrians the French suddenly occupied Ancona in February 1832, and retained it for several years. In 1834 an invasion of Savoy from Switzerland by a band of Italian and Polish exiles under the Genoese Ramorino, undertaken with the purpose of overthrowing the Sardinian throne, and then in conjunction with the Italian patriots, headed by Mazzini, who gave themselves the name of "Young Italy," bringing about a revolution throughout the whole country, ended in a miserable failure.

But the unwearied activity of the secret societies, more especially of Mazzini's "Young Italy," with its republican tendencies, diffused itself over a great part of the peninsula. In 1838 Ancona was evacuated by the French; and

at the same time the Austrian troops quitted the Papal States, while the amnesty, proclaimed a short time previously in Venice and Lombardy, appeared to produce a lasting conciliatory effect on the minds of the people. Pope Gregory XVI. died in June 1846, and the election of Cardinal Mastai Ferretti to the papacy under the name of Pius IX. seemed to mark an epoch in the history of Italy, for the spirit of reform which he introduced into the government of the Papal States soon spread to Tuscany and Sardinia. But Naples and Austria strongly opposed the new system of politics. Naples suppressed the violent attempts made in the summer of 1847, without putting a stop, however, to the increasing ferment. In Lombardy, Austria maintained the old system, and by the investment of Ferrara in August 1847 made an unmistakable declaration against the papal policy. Throughout the whole of Italy a hatred of the Austrian sway was systematically cherished, and to the whole movement a hostile direction was gradually given against Austria. In January 1848 the inhabitants of the island of Sicily were in rebellion, demanding a constitution and ultimately the complete severance of the island from the continental government.

At this juncture occurred the French Revolution of 1848, and the reserve which had hitherto prevailed in Upper Italy was thrown aside, and the overwhelming intelligence of the insurrection in Vienna soon completed the universal eruption. The insurrection at Milan, on 22 March, followed by similar commotions throughout almost the whole of north Italy, compelled the Austrian army, under Field-marshal Radetzky, to evacuate the capital and retreat to Verona; while, at the same time, Venice, by the hasty capitulation of the authorities, recovered its independence, and the reign of despotism came to an end in Parma and Modena. Charles Albert, king of Sardinia, with the hope of making himself master of the Lombardo-Venetian kingdom, and carrying out his idea of a national Italian confederacy, declared war with Austria, and, supported by numerous Italian free companies during the first period of enthusiasm and surprise, drove back the enemy's troops to the northern frontier of Italy. But on 6 May Radetzky (then in his 82d year) successfully withstood the attacks of the Italians at Santa Lucia, not far from Verona, and on 25 July gained at Custozza a second bloody victory, which resulted in the reconquest of Milan and the whole of Lombardy. The king of Sardinia made his escape by night into his own territories, and then concluded an armistice with the victors. Pushed on by the democrats, Charles Albert renewed his attempts in the following year (1849), but in a campaign of five days (20–24 March) the old field-marshal put a speedy termination to the enterprise, and frustrated the hopes of the Italian patriots. Charles Albert, despairing of his fortunes, abdicated in favor of his son, Victor Emmanuel, and fled from his dominions. The young king then concluded a disadvantageous peace with Austria. Venice, favored by its position, resisted for some months longer the besieging army of the Austrians, but was at last obliged to surrender (25 Aug. 1849). In other parts of Italy events had meanwhile taken a similar course. In Rome, where Pope Pius IX., alarmed at the sudden outburst of revolutionary projects, checked himself in his career of reform, the excitement grew to such a pitch that he lost all control of his subjects. In vain he promised a constitution and summoned an assembly of the states to the capital. His minister Rossi was assassinated in November 1848, whereupon the democrats took all the power into their own hands. The Pope fled in terror to Gaeta, leaving his capital in the hands of the populace and the insurgent volunteers, who proclaimed a Roman republic, and even laid hands on the Church property (February 1849). Mazzini, the active head of "Young Italy," and Garibaldi, the leader of the volunteers, ruled in Rome. The Pope appealed to the protecting states for help, and a French army under Gen. Oudinot marched up to the walls of Rome and demanded the restoration of the old order of things. When this was refused the French proceeded to lay siege to the city, but met with so determined an opposition that it was only after frequent bloody contests, extending over several weeks, that the city fell into their hands (July 1849). The republicans sought safety in flight, a French garrison was permanently posted in Rome, and under the protection of French bayonets the old condition of affairs was gradually restored. The insurgent Sicilians had no better success than the Lombards, Venetians, and Romans, being gradually subdued by the Neapolitan arms. In Tuscany, as in Rome, the democrats for a short period obtained the upper hand and compelled the grand-duke to flee, but the republican form of government lasted only a few weeks. Sardinia, therefore, remained the only state which preserved the constitutional benefits resulting from 1848, and strenuously withstood all requisitions to act otherwise. The Lombardo-Venetian kingdom entered the states of the Austrian union, whilst, notwithstanding some isolated conciliatory measures, such as the reestablishment of a free port at Venice, the system of military dictatorship was still maintained. In Rome, which the Pope again entered in April 1850, the new organization of the state restored the spiritual rule, with a silent abrogation of the constitution of 1848. In Naples the last miserable shadow of freedom was abolished, and against the originators and promoters of the insurrection of 1848 there was opened an array of legal proceedings, the tyrannies of which engaged deeply the attention of foreign countries. In Tuscany, which was occupied by Austrian troops and wholly bound to Austria by a military convention, despotism and priestly power returned in in all their force. In Modena and Parma the returned princes, relying on the protection of Austria, pursued a policy of revenge and repression against the adherents of a free political life. In such circumstances the condition of Italy, harassed and unsettled, presented a most melancholy picture; nor could some important non-political improvements, including the formation of railways, the accession to the Austrian postal union, and the freedom of the navigation of the Po, effect any satisfactory amelioration. In Naples the cruelties exercised on political prisoners led to a cessation of intercourse between that state and Great Britain, and Austrian oppression in Lombardo-Venetia, the misgovernment of the Papal States and of the duchies, abetted by Austria, led to the war of 1859, when France, siding with Sardinia, defeated the Austrians at Magenta (4 June) and Solferino (24 June), and drove them out of Lombardy,

after which Francis Joseph, emperor of Austria, in a personal interview with Napoleon III., emperor of the French, at Villafranca, agreed to the preliminaries of a peace, stipulating for the surrender of Lombardy, as far as the line of Peschiera and Mantua, by Austria to France, the formation of a confederacy of Italian states under the presidency of the Pope, and the return of the princes who had been expelled in the course of the war from their dominions by their subjects, provided that their return was not effected by foreign intervention, but only by the will of their subjects. Of these three preliminaries only the first was ultimately ratified by the Treaty of Zürich (10 Nov. 1859). Lombardy was ceded to France, who gave it up to the king of Sardinia, in return for which the latter ceded to France, some time later, Savoy, the ancestral domain of his family, and Nice. The other two stipulations of the preliminaries of Villafranca were not carried out. So far from inviting back their banished rulers, the inhabitants of the duchies hastened to summon assemblies to pronounce their deposition, and to annex themselves to Sardinia. Even Bologna withdrew from the papal rule, and put itself under the protection of Victor Emmanuel. In March 1860, popular votes were taken in Savoy, Nice, Tuscany, Parma, Modena, and the four northern papal legations constituting Romagna, in virtue of which the cession of the first two to France was carried into effect, and the remainder were incorporated in the kingdom of Sardinia. Neither the protests of Switzerland against the surrender of the districts on the south of the Lake of Geneva, nor the ban of excommunication pronounced by the Pope on the chief actors in these events, could prevent them from taking their course. Meanwhile the victorious career of Garibaldi in Sicily and lower Italy had led to the dethronement of the king of Naples, and the detachment of the provinces of Umbria, Urbino, and the Marshes, with Benevento and Pontecorvo, enclosed by the kingdom of Naples, from the states of the Church; and Sardinia intervening to complete the revolution, the whole of Italy and Sicily, except Rome and its vicinity and Venetia, was combined in a united realm, which, in 1861, was proclaimed as the kingdom of Italy, with Victor Emmanuel as its sovereign, the temporal power of the Pope being secured by French troops stationed in Rome. In the war which broke out in the spring of 1866 between Prussia and Italy combined on the one side, and Austria on the other, the Italian invasion of Venetia was repulsed in the battle of Custozza 24 June; but the Austrians, suffering heavy reverses from the Prussians, ceded Venetia to the emperor of France, by whom its destiny was put to the vote of its inhabitants. Their vote being in favor of union with Italy, the province was accordingly joined to it. There was still one part of the Italian territory not included in the kingdom of Italy, namely, the Papal States, where the Pope continued to maintain his temporal authority under the protection of French troops. According to a convention concluded between France and Italy, 15 Sept. 1864, these troops were to be withdrawn in the course of the year 1866. This was, indeed, actually done, but their place was taken by a corps levied in France and commanded by the French general Dumont, whom Napoleon sent in July 1867 for the purpose. The protestations of the Italian government were of no avail, but on the outbreak of the Franco-German war the French troops were withdrawn, and after the fall of the empire in consequence of the defeat at Sedan, the Italian government could no longer resist the demands of the press and of popular feeling, and occupied the Papal States (September 1870), soon after which they were annexed to the kingdom of Italy. While the Pope was deprived of his temporal dominions, his spiritual independence was guaranteed. In 1871 the seat of government was removed to Rome from Florence (having until 1865 been at Turin). In 1878 Victor Emmanuel, the first king of united Italy, died, and was succeeded by his son Humbert. The acquisition of territory in Africa was pursued with vigor from 1880 until 1896, when a conflict with Abyssinia and a severe defeat of the Italian troops at Adowa checked colonial enterprise. Humbert was assassinated in 1900 and was succeeded by his son Victor Emmanuel III. Italy, with Germany and Austria-Hungary, form the Triple Alliance, having in view the preservation of the peace of Europe.

Language.—Ancient Italy is supposed to have had a common language of many dialects. That which is common in all these dialects is the heirloom of the Indo-European stem; while that in which they differ either belongs to other stems of languages, or is of later irigin. Leonardo Bruni (15th century), Cardinal Bembo ('Prose, nelle quali si ragiona della volgar lingua,' Venice, 1525), Saverio Quadrio, etc., assert that it is as ancient as the Latin; that both were used in Rome, the Latin in public speeches, in legal documents, and by the learned, while the *Romana rustica* was spoken by the people and in private conversation. The Latin, having been Grecized, became, so to speak, stereotyped and sterile, and died away with the aristocracy; whereas the vulgar speech, carelessly spoken, and poor in grammatical forms, continued to live. Ciampi traces the use of the language to the 5th century. Gonzo (about 960) attests its use among the better educated portion of the inhabitants; and Wittekind mentions that the emperor Otho I. (936–73) spoke both the *lingua Romana* and the *lingua Slavonica*. Pope Gregory V. (996) instructed the people in the same. The opinion, therefore, that the Italian was formed as late as the 11th century, is groundless. In the 13th century the Italian improved rapidly in pliability, elegance, and soon also in regularity, so that in grammar and lexicology it approached in the 14th very much the form it has now. With the exception of the Icelandic, all other modern European languages were yet in their infancy. Dante did most of all toward developing and consolidating the native elements, in legitimizing the exotic accessions, and in polishing the whole language, which he calls *illustre*. Petrarch (died 1374) and Boccaccio (1375) rendered Dante's idiom more mellow and popular; the former by imparting to it the polished suppleness of the Provençal, the latter by emboldening it to express all shades of thought.

Little was done in promoting the language in the 15th century, but the 16th endowed it with choice terms of art, in consequence of antiquarian researches. Nicolo Macchiavelli (1469–1527) was

the father of Italian prose. Pietro Bembo (died 1547), Giovanni Rucellai (1526), Jacopo Sannazaro (1530), G. G. Trissino (1550), Ariosto, Tasso, Guarini, etc., raised it above all other European languages. Aug. Beolco di Ruzzante (Venice, 1505) wrote six comedies, in which each person speaks his native dialect; a method analogous to the use of Prakrit in Indian dramas. Benedetto Varchi ('L'Ercolano,' etc., Florence, 1570) reformed the orthography and established the grammar. Grazzini with Leonardo Salviati founded, in the *accademia della crusca* at Florence, a tribunal of the language (1582). The influence of French on European languages during the 17th century began to be exerted on the Italian, especially on its syntax. Algarotti was the chief fosterer of this influence. But Monti ('Correzioni al vocabolario della crusca,' and in other works) and Perticari strenuously and successfully resisted this denationalization, and restored to their cherished tongue the glorious direction imparted to it in the 14th century. The area of the Italian language comprehends the whole peninsula and the islands of Sicily, Sardinia, Corsica, etc.: the Swiss canton of Ticino, and parts of the Grisons and Valais; South Tyrol, some cities of Istria and of Dalmatia, and partly the Ionian islands. A rough idiom of Mediterranean navigators, and a jargon known as the *lingua franca*, are spoken in the Levant. Dante's *parlare illustre* (also *cardinale, aulico, cortigiano*) is common to all well educated Italians. Many of the dialects differ as much from it as it differs from Spanish, and some even more. This is owing to the ancient local varieties of the *Romana rustica* and of others, as well as to the tongues of foreign invaders. Dante ('De Vulgari Eloquio') speaks of 14 dialects, one class on the west, the other on the east of the Apennines. Those on the north approach the Provençal language.

Literature.— The Italian language molded into a peculiar shape, different from the Latin, and free from most of the rough and uncouth words and phrases which the invading hordes of northern barbarians had introduced into it, the Emperor Frederic II., who resided in Palermo till the commencement of his reign in 1212, made the language of his court. He gathered there many men who delighted in composing verses, and founded the university of Naples, and schools in Palermo and other Sicilian cities. More celebrated as a poet than either himself or his two sons, Enzio and Manfred, was his secretary Pietro delle Vigne, who was wont to go about singing his songs in the newly formed language, some of which have been preserved and are deserving of praise. From Sicily the taste for literature seems to have spread to other parts of Italy. Foremost among the succeeding authors were the Bolognese Guido Giuncelli (died in 1762), mentioned most honorably by Dante in many of his works, Guido Ghislieri, Fabricio, and Onesto. In Tuscany also appeared Guittone d'Arezzo (died in 1294), Bonagiunta da Lucca, Gallo Pisano, Mino Macato Sanese, Brunetto Fiorentino, and others. Several sonnets and songs of Fra Guittone are preserved, and also 40 letters to a friend, the oldest specimen of the epistolary style in Italian. Dante criticises his compositions as languid and unimpassioned. Brunetto Latini (about 1260) was the teacher of Dante and the author of 'Il Tesoro,' written first in French and afterward translated into Italian, in which he aimed to give a cyclopædic view of the state of knowledge at that time. He also wrote the 'Tesoretto,' consisting of moral sentences in seven-syllabled rhyming couplets. Guido Cavalcanti (died in 1300), one of the best friends of Dante, was styled by Benvenuto da Imola the second eye of Italian literature, of which Dante was the first. He was a philosophic poet, and his verses gave him a reputation for learning, and show that he had a deep knowledge of human heart and was accustomed to moral reflections. The first book in Italian prose was the 'Chronica' by Matteo Spinnelo, a Neapolitan, relating the history of events from 1247–68. The honor of writing history in a neat style belongs also to Ricordano Malespini, a Florentine, who died about 1281. The 'Agricoltura' and other scientific works of Pietro Crescenzi, a Bolognese, show in several respects a thorough knowledge; but in attempting to explain vegetation and other natural phenomena after the theories of Aristotle, he fell into the errors prevalent in his age. In the 13th century began the glorious literary era of Dante, Petrarch, and Boccaccio. Dante (1265–1321) rose like a sun, and shone on Italy with an unparalleled splendor, giving to that nation almost a new life. He raised the language from comparative rudeness to the highest refinement, conceived a poem which is admitted to be one of the sublimest creations of the human mind, and charmed a people yet groping in ignorance and barbarism by the sweetness, beauty, and grandeur of his delineations, compelled them to listen to the dictates of morality and Christianity, and proclaimed the principles from which alone they could hope for rest from the desolation of civil wars. Involved in the intestine discords between the Guelfs and Ghibellines and the parties *dei bianchi* and *dei neri*, his works bear the impress not only of the ideas but of the conflicts of his time. His masterpiece is the 'Divina Commedia,' incomparably the greatest of Italian epics. It was so called because he conceived that there were three kinds of style, the sublime, the middle or comic, and the lowest of all, which he called the elegiac, and he selected the second of these for his poem. Even in this finest product of his genius he supported the emperor and the Ghibelline party against their enemies the Guelfs. He depicted an inferno in which were placed those petty tyrants and chieftains who had filled Italy with the horrors of civil war. He described a purgatory in which those men were punished who with too little heroism and firmness had maintained the cause of justice and their country. He finally pictured a paradise in which those were rewarded who had devoted themselves only to virtue, and had labored for the commonwealth with strong hearts and magnanimous deeds. There he imagined a throne to be raised, and a crown upon it, as a reward for that Henry who, he hoped, would restore Italy to her ancient power and splendor. This political aim of the 'Divina Commedia' was only incidental to its moral and religious meanings. The work displays an immense amount of theological as well as philosophical and historical knowledge, and contains some ingenious scientific

views, which were fully developed and understood only after several centuries. It is for these that Redi, Magalotti, and other scientific writers quoted from him in preference to any other poet. The unfinished 'Convito' of Dante is called by Monti the first sound and sober prose writing that Italian literature can boast, and the first on moral philosophy. Dante abandoned the Latin language, in which he had begun to write, for the Italian, the perfection and embellishment of which he deemed would be of great advantage toward uniting Italy. In his Latin treatise 'De Vulgari Eloquio' he maintained that no one of the Italian dialects merited the name of the Italian language, which was rather the language spoken in all the cities, without belonging to any one in particular. Francesco Stabile, called also Cecco d'Ascoli (burned for heresy at Florence in 1327), wrote the 'Acerba,' a witty poem, directed against Dante and Guido Cavalcanti, and treating of natural and philosophical subjects with little wisdom or eloquence. It is in strophes of eight verses, the last two rhyming, and some have therefore ascribed to him the honor of inventing the *ottava rima*. More highly esteemed was Fazio Bonifazio degli Uberti (about 1367), who wrote in *terza rima* the long allegorical poem of 'Dittamondo' (*Dicta Mundi*). Cino da Pistoja (1270–1336) excelled both in jurisprudence and poetry. His songs were in praise of Selvaggia, a lady of whom he was enamored, but his legal work 'Il comento' is of greater importance, and displayed an erudition which gained him invitations to lecture in many universities. Dante commended him as an improver of the language, and Petrarch lamented his death in touching verses. Petrarch (1304–74) had seen Laura de Sade at Avignon, who was the inspiration of the charming verses to which he owes his immortality, and had produced his Latin poem of 'Africa,' on which by a strange misjudgment he chiefly prided himself, when in 1341 he received the laureate crown in Rome. The noble delicacy and tenderness of affection which make him so distinctively the poet of love were hardly his principal merits. All men who honor and cherish learning and patriotism, revere his name, who left as an heritage the precept and example of seeking to end the intestine discords of his country by elevating it to a worthier life. His principal philosophical treatises and poems, in Latin, demonstrate his erudition, justness of philosophical thought and sentiment, and exquisite skill in Latin composition. He has a greater celebrity as the father of Italian lyric poetry. In this department he surpassed all his predecessors, and has been equaled by none of his numerous successors and imitators. A less versatile author was Giovanni Boccaccio (1313–75), who abandoned successively commerce and law for literature, studied with ardor the 'Divina Commedia,' and cherished the friendship of Petrarch. He wrote several works in Latin, and made an expensive collection of Greek manuscripts, but is chiefly known as the author of the 'Decameron,' and thereby as the father of Italian prose. The 'Decamerone' (ten days) is so called because each of the 10 persons introduced into it, seven ladies and three young men, relates 10 stories per day, 100 stories being thus told in 10 days. The scene is a villa in the vicinity of Florence, whither they had fled from the plague (1348), and the description of that pestilence with which the work opens is admired as a masterpiece of eloquence. Its real object seems to have been to present a picture of the whole human family, and to encourage virtue by commendation and to correct vice by ridicule. Its beauty of composition is, however, sometimes expended on the most indelicate subjects. The 'Cento novelle antiche' are for the most part written from those of Boccaccio, but some are of earlier date. They relate short adventures in a graceful and simple style, free from indelicacy. Franco Sacchetti of Florence left 300 tales, of which 258 are preserved, written carelessly but with great purity. The 'Pecorone' of the Florentine Ser Giovanni, an imitation of the 'Decamerone,' contains about 50 tales. This was the age of chroniclers as well as novelists. Dino Compagni chronicled the history of Florence from 1270 to 1312 with truthfulness and elegance. More celebrated is the work of Giovanni Villani, containing the history of the city from its foundation till a few years before his own death by the plague in 1348. His work was continued with greater prolixity by his brother Matteo to 1363, when he also fell a victim to the plague; and to 1364 by Filippo the son of the latter, who also wrote a series of biographies of illustrious Florentines. The 'Specchio della vera penitenza' of Giacopo Passavanti (died in 1357) is the first example of an ascetic work in the vulgar tongue, and its style is comparable for excellence with that of Boccaccio. Various similar treatises were written by Domenico Cavalca of Pisa; the 'Ammaestramenti degli antichi,' by Bartolommeo da S. Concordio, merits particular praise; and the 'Trattato del governo della famiglia,' by Agnolo Pandolfini (1365–1446), is equally esteemed for its happy and useful choice of materials, and for its natural and graceful style, adorned with all the skill which the writers of his age may boast. Most of the men who flourished in the 14th and 15th centuries were not distinguished like Dante and Petrarch for creative genius, but delighted rather in reproducing and commenting on the authors of antiquity. The printing-press, invented in Germany, was most usefully employed in Venice, Bologna, and Rome, in multiplying copies of the ancient authors, corrected by learned scholars. To the passion for discovering and publishing new manuscripts was joined that of finding and interpreting ancient monuments, medals, inscriptions, and sculptures. Only the first steps toward a new civilization had been taken by Petrarch and Boccaccio. The introduction of the mariner's needle by Flavio Gioja had opened the ocean to the Europeans; the travels of Marco Polo had awakened that curiosity concerning the way to the East Indies which led Columbus to the discovery of the new world; the Arabic numerals had been substituted in Italy for the Roman; academies were established to nurture the love of letters, and courts became an asylum for the most distinguished men; and the popes in Rome, the Medici in Florence, the houses of the Visconti and the Sforzas in Milan, and of the Gonzagas and Estes in Mantua and Ferrara, became protectors of literature and the arts. Pope Nicholas V. is especially distinguished for the encouragement which he gave to every branch of learning, and for the generous sacrifices which he made in col-

lecting books. It was under his liberal protection that Francesco Filelfo translated the 'Iliad' and the 'Odyssey' into Latin verse. His example was followed by numerous courts in Italy. Lodovico invited to his court in Lombardy many learned men, painters, and architects, among whom were Leonardo da Vinci and Bramante, founded the university of Pavia, granting it many privileges, and opened schools in Milan, to which most renowned professors gave distinction. But the most illustrious of the patrons of letters was Cosmo de' Medici. He founded one library in Venice and three in Florence, and established the first academy for the study and promulgation of the Platonic philosophy. Pico della Mirandola and Cristoforo Landino exercised the happiest influence in advancing and creating a popular esteem for knowledge, and especially in exciting the Florentine youth to an enthusiasm for it. The former was almost unrivaled in erudition, and seemed to possess a miraculous memory, being profoundly and prematurely versed in numerous languages, in metaphysics, and in mathematics. Lorenzo de' Medici (died in 1498) greatly and variously increased the glory which his uncle had acquired in the culture of learning. But it is lamentable, after the three great masters of the Italian tongue which the preceding age had presented, that the taste of the learned returned to the Latin language. To such a degree was Italian neglected, that it was hardly used at all in writing; it was even disdained for legal documents, and its development was arrested by a boundless reverence for antiquity. But Lorenzo the Magnificent may be considered the reviver of Italian literature, and was even called its father. Most esteemed for his virtues and manners, he enriched libraries, reopened the university of Pisa, collected numerous remains of antiquity, promoted the study of the popular poetry, and wrote himself many admired pieces for the improvement of the public taste. His 'Nencia da Barberino' is the first example of Italian rustic poetry, and his 'Compagnia del Mantellaccio' seems to have given the first idea of Italian satire in *terza rima*. Under him Florence became a new Athens. Angelo Poliziano (1454–94) enjoyed the friendship of Lorenzo, attained to great erudition, and was an elegant writer both in Italian and Latin. His most celebrated works are the 'Stanze,' which were imitated even by Ariosto and Tasso, and the 'Orfeo,' the first regular and consistent Italian drama. Contemporary poets of less note were Burchiello, Girolamo Benivieni, and Giusto de' Conti. To the various kinds of composition which have thus far appeared must now be added some epics. Of the brothers Bernardo, Luca, and Luigi Pulci, only the last (1431–87) achieved lasting eminence in poetry. His 'Morgante Maggiore,' burlesque and fantastic, opens the brilliant Italian series of romantic poems of chivalry. It belongs to the circle of legends concerning Charlemagne and his paladins, but degrades the primitive simple faith in them by persiflage. The 'Mambriano' of Cieco da Ferrara deserves to be mentioned and compared with the 'Morgante.' The best of the romantic poems of the 15th century is the 'Orlando innamorato' of Boiardo, which introduced materials so beautiful and so vast as to induce Ariosto to follow in the same path. To sustain the marvels of his subject, he employed magicians and fairies in connection with the classic divinities, and beneath the veil of poetry he represented the most useful truths of philosophy. The 'Orlando innamorato' was left incomplete, and the original has become rare even in Italy, on account of its rude and antique diction. Its tone is much modified in the elegant elaboration of it by Berni, which has enjoyed the most general favor. The prose literature was enriched by the writings of two artists: Leon Battista Alberti, the author of a dialogue 'Della famiglia,' containing philosophical precepts for domestic life and the education of children, and of treatises on painting and architecture which gained him the name of the Italian Vitruvius; and the renowned Leonardo da Vinci (1452–1519), at once painter, sculptor, architect, mathematician, musician, the best extemporaneous poet of his time, and the author of a 'Trattato della pittura,' which reveals both his scientific and artistic knowledge, and is a classical authority on the use of terms pertaining to the arts and sciences. Numerous historians, also, belong to this age. Pandolfo Collenuccio was the first to write an esteemed history of the kingdom of Naples, revived and corrected the taste for comedy, founded the first museum of natural history in Europe, and wrote dialogues after the manner of Lucian, and the solemn poem of 'Inno alla morte.' Historians of travels were the Genoese Giorgio Interiano and the Venetian Cadamosto, who give the oldest narratives of the Portuguese discoveries, and the Florentine Amerigo Vespucci. Aldo Manuzio (Aldus Manutius) rendered signal services to letters, and gained a European repute by the care and taste with which he published the classics. The 16th century, in respect of Italian art and literature, is surpassed by none in modern history, and rivals the ages of Pericles and Augustus in antiquity. A family of great names occurs, each of which might form an epoch. Leo X. was the most illustrious of a series of papal patrons, bestowing liberal rewards not only on authors but on Raphael and Michelangelo. After the extinction of Florentine liberty, literature was again protected by various reigning families. Cosmo de' Medici commanded Varchi to write his history without any regard to persons, and we therefore owe to him a narrative of the crimes by which his own family attained the sovereignty. Under his son Francesco the learned institutions already in existence were advanced, and the academy *della crusca* was founded. The court of the Estes in Ferrara entertained Ariosto and Tasso; most of the other courts, great and small, as those of the Gonzagas in Mantua, of the dukes of Urbino, and of Manuel Philibert of Savoy, were hospitable to scholars and poets; and numerous literary academies with capricious names, as those *dei sonnacchiosi, degli storditi,* and *dei selvaggi,* were instituted. Pre-eminent among the poets of the age rose Ariosto (1474–1533), called the Ferrarese Homer, who aimed to celebrate in a great poem the origin of the house of Este. The loves and exploits of Bradamante and Ruggiero, imaginary ancestors of that house, form the basis of his romantic epic, the 'Orlando furioso,' the subject of which is the war of the Saracens against Charlemagne. The courtesies and hero-

isms of knights, the loves of ladies, and the madness of Orlando give occasion for most various and always natural pictures, all the passions being delineated in appropriate colors, so that Tasso affirmed the excellence of Ariosto not only in versatility of invention but in propriety of treatment. Many of his similes are unsurpassed in simplicity and grace. Beside his masterpiece, he wrote satires on the politics and the rulers of his time, and his 'Negromante' and 'Zanotti' almost entitle him to be called the father of Italian comedy. Bernardo Tasso, the father of Torquato, was the author of the 'Amadigi' and other esteemed poems. His more renowned son (1544–95) strictly followed Virgil and Homer in the form of his 'Gerusalemme liberata,' but its finest ornaments belong to the romantic spirit of his age. To the classical mythology it adds the marvels of enchantment and magic. The greater merits of the 'Gerusalemme' have caused his 'Rinaldo' and his pastoral drama of 'Aminta' to fall into undeserved neglect. Some of his sonnets also, and other minor pieces, possess a rare beauty; and his prose letters and moral dialogues are remarkable for their eloquence and philosophical tone. Inferior to the epics of these great masters are the 'Girone il cortese,' treating the legends of King Arthur, and the 'Avarchide,' describing the siege of Bourges, by Alamanni, who also wrote the 'Coltivazione,' a specimen of monotonous harmony. Rucellai is the author of a short and carefully finished didactic poem, entitled 'Le api.' Valvagone wrote in the 'Angeleide' a description of the battle between the good and rebel angels, from which Milton is supposed to have derived materials. The 'Italia liberata dei Goti,' by Trissino, is in every respect a wretched imitation of Homer; but his 'Sofonisba' is the first Italian tragedy of high merit. Leo X. himself witnessed the production of the 'Rosmunda' and the 'Oreste' of Rucellai. Better tragedies are the 'Tullia' of Martelli, the 'Canace' of Sperone Speroni, the 'Torrismondo' of Torquato Tasso, and the 'Epido' of Andrea dell' Anguillara, all of which display a too servile imitation of the Greek authors. The Latin comedy, meantime, was made too strictly the model of the Italian. The learned comedy (*commedia erudita*) was cultivated at almost the same time by Cardinal Bibbiena, Ariosto, and Macchiavelli. The best examples are the 'Cassaria' and 'Suppositi' of Ariosto, the 'Calandra' of Bibbiena, and the 'Madragola and 'Clizia' of Macchiavelli, the last especially remarkable for their knowledge of men. The 'Pastor fido' of Guarini deserves especial mention as one of the pastoral poems with which Italy abounded, inferior at furthest only to the 'Aminta' of Tasso. At this period a new and brilliant step was taken by the Italians in the dramatic art, by the union of music with poetry. The invention of the opera belongs to the Florentines, the first having been the 'Daphne,' the words of which were by Rinuccini and the music by Peri, and which was represented in 1597. Orazio Vecchio of Modena produced melodramas, which Muratori regards as the beginning of the modern opera. The attraction of this new style was so great that authors and musicians immediately devoted themselves to it in Italy, and it was soon introduced into Germany and France. Every variety of poetry seems to have been tried in this age with success. Berni was the head of a school of burlesque poetry, called from him the Bernesca rhyme. The best of his pieces, the 'Orlando innamorato,' possesses grace, elegance, and originality. One of his imitators was Agnolo Firenzuola, who is more esteemed for the amenity of his prose writings. To Ariosto belongs the first place among the satirical as well as romantic poets of his age. Scarcely comparable with him are the satirists Ercole Bentivoglio, Nelli, and Luigi Alamanni. Pietro Aretino (1492–1557), the most indelicate of Italian writers, evinced a versatile and brilliant genius in almost every style of composition. The monk Folengo (died in 1544), better known under the name of Merlino Coccajo, was either the inventor or one of the first and happiest improvers of macaronic poetry. Superior to a crowd of rhymers, imitators of the ancients or of Petrarch, was the sculptor Michelangelo, whose style was influenced by the study of Dante. Pietro Bembo (died in 1547) was the restorer of elegance and correctness to the native language, and revived its popularity among the learned. Francesco Maria Molza excelled in thoughtful and humorous poetry. The 'Galateo' and other writings in prose and verse of Giovanni dalla Casa are still esteemed for vigor of thought and beauty of expression. The translations of many of the classics into Italian by Annibale Caro (1507–66) are accounted by some critics superior in style even to the compositions of Petrarch. His versions have an air of originality, and it was said that Virgil would hesitate whether to give the palm to his own work or to that of his translator. His original writings obtained the highest praise for elegance. The sonnets of Angelo di Costanzo have been said to combine every merit of which the sonnet is capable. He wrote also a history of Naples. The most eminent poetess of this age was Vittoria Colonna, highly applauded by Ariosto. The 'Arcadia' of Sannazaro holds the first rank among the bucolics, written in alternate prose and verse in a vigorous, correct, but constrained style. The eclogues of Baldi are philosophical maxims versified. An important place in the literature is held by political writers, foremost among whom was Macchiavelli (1469–1527). A dramatist and historian of Florence, he is chiefly known as a profound and philosophical statesman by his discourses on Livy, his dialogues on the art of war, and especially by his 'Principe,' a manual of government, which was constantly in the hands of such sovereigns as Charles V. and Sixtus V., and the real intent and character of which has been long in dispute. His style is marked by simplicity, strength, thought, and a rare but felicitous use of ornament. Other political writings were the 'Ragione di stato' of Botero, and the 'Republica Fiorentina' of Giannotti. Nearer to Macchiavelli in merit was Paruta (1540–98), the author of 'Discorsi politici,' and of a treatise 'Della perfezione della vita civile.' The most renowned of Italian historians is Guicciardini (1482–1540), whose work embraces the period from 1494 to 1534. It is esteemed for impartiality and for its moral and political reflections, but is so diffuse and tedious that it is hard to read. Paolo Giovio wrote in Latin a partisan history of his own time. Historians of Florence were Nardi, Varchi, Nerli, Segni, Capponi, and Scip-

ione Ammirato; the 'Storie Fiorentine' of the last includes the events from the foundation of the city to 1574. Historians of Venice were Bembo, Paruta, and Contarini; of Genoa, Giustiniani, Bonfadio, and Foglietta; of Ferrara, Cinzio and Falletti; and of Naples, Costanzo, Porzio ('La congiuro dei baroni,' etc.), and Summonte. General histories were written by Giambullari and Adriani. Davanzati translated Tacitus to prove the conciseness and energy of the Italian language, and made his version shorter than the original. He also wrote a history of the reformation in England. The splendor of the fine arts in this century gave occasion for historians of art, the principal of whom was Vasari (1512–74), whose lives of the most excellent painters, sculptors, and architects of Italy are written with naturalness and grace, and contain interesting notices of prominent Italian works of art. The autobiography of the Florentine goldsmith Benvenuto Cellini, one of the liveliest books in the literature, not only recounts his own fortunes, but gives curious notices of the courts of Rome, Florence, and France. He wrote also valuable treatises on jewelry and sculpture. Works on painting were written by Bernardino Campi of Cremona, Lomazzi of Milan, and Armenino of Faenza. Vignola and Palladio gained distinction as writers on architecture, and Marchi by a treatise on military architecture. Philosophy now began to assume an independence of the scholastic and ecclesiastical systems, and Girolamo Cardan and Giordano Bruno ventured upon the boldest speculations. The mathematics were cultivated by Tartaglia, Cardan, and others. The 'Instituzione di tutta la vita dell' uomo' of Alessandro Piccolomini treats of education, marriage, the government of a family, and the chief end of man. The 'Cortigiano' of Castiglione has rare literary merits, making courtesy the theme of many learned and weighty reflections. Numerous novelists now flourished, among whom Bandello holds the first rank, his *novelle* being chiefly founded on real and common events. The novels of the monk Firenzuola and the 'Cene' of Lasca are both elegant and indelicate. Vettori and Salviati commented on the older poets, and the latter was engaged in compiling the 'Vocabolario della Crusca,' then the most important philological work in the language. All words not used by the great Forentine authors were excluded from it; even Tasso was not admitted as an authority. In the 17th century the natural sciences especially flourished. Under able patrons, the principal of whom was Duke Ferdinand of Tuscany, the Italian universities attained unprecedented celebrity. Scientific academies were founded in Rome, Florence, Bologna, and Naples; the Florentine *accademia del cimento* embraced the most illustrious savants of the time, and published important accounts of its researches. Preeminent among philosophers was Galileo (1564–1642), who was denounced as an innovator, and maintained the Copernican system only at his peril. His 'Dialoghi' and other works are written with elegance, his style and taste having been formed by reading Ariosto. His most noted pupils were Viviani, Torricelli, and Castelli, and contemporary physicists were Borelli, Malpighi, Bellini, and Francesco Redi. The learned and philosophical jurisconsult Vincenzo Gravina attracted scholars from all parts of Europe to his lectures in Rome on public law, contained in his 'L'origine de diritto civile,' and other publications. The greatest historians were Sarpi, Davila, Bentivoglio, and Pallavicini. Sarpi (died in 1623), the defender of the republic of Venice in its contest with the Holy See, wrote an anti-papal and spirited history of the Council of Trent, which was replied to by Pallavicini in a work on the same subject. Davila, after 16 years' residence in France, narrated the civil wars of that country in a work esteemed for its truthfulness, and in respect of style one of the best Italian histories. Bentivoglio, the papal nuncio in Flanders, wrote of the Flemish wars of his time, many of the heroes of which he knew personally. Baldinucci, Dati, and Scamozzi were historians of the fine arts, and Cinelli and Boccalini of literature, while Bianchi treated important historical problems as to migrations, colonies, voyages, and the origin of monarchies and republics. Montecucculi, the military antagonist of Turenne, acquired distinction as an author by his aphorisms on the art of war. The Jesuit Bartoli wrote the history of his Society, and the sermons of the Jesuit Segneri were unrivaled in eloquence. The first Italian literary journal, the 'Giornale de' letterati,' was established in Rome in 1668. A want of naturalness and truthfulness marked the poetry of the age. External delineations, trifling details, conceits, and plays upon words were the leading objects of the poets. At their head was Marini of Naples (died in 1625), who was admired not only in Italy but in France and Spain, and originated the poetical school of the Marinists, by which only his faults were imitated. Among his contemporaries and successors were Chiabrera, Guidi, Tassoni, and Marchetti. The foundation of the academy of Arcadians in Rome in 1690 by Crescimbeni and Gravina introduced an affectation of pastoral sentiments and habits in place of Marinism. Menzini, Zappi, Maggi, De Lemene, Salvator Rosa, and Bracciolini wrote satirical, erotic, and facetious verses. Throughout the 17th and 18th centuries the opera was the favorite Italian exhibition. It had long been produced with theatrical and musical splendor, when Zeni of Venice (died in 1750), and especially Metastasio (died in 1782), wrote operatic plays having remarkable poetical merits. When near the beginning of the 18th century the war of the Spanish Succession raged in Italy, and the kingdom of Naples fell beneath the sceptre of the infante Don Carlos, and afterward of Ferdinand III., literature and the sciences were cultivated with renewed vigor. Naples produced Giannone, distinguished in the department of history, Capasso in literature, Cirillo in medicine, Mazocchi in archæology, Genovesi in political economy, one Gagliani in architecture, and another in domestic economy and philology. Filangieri rivaled Montesquieu in the philosophy of legislation; Pagano wrote on the criminal law; Poli distinguished himself in the positive sciences; Maffei and Calsabigi devoted themselves to poetry. The university of Bologna was now in its splendor, its academy of sciences taking the name of "The Institute." Marsigli, Stratico, Cesarotti, Foscarini, the brothers Gozzi, Morelli, Maffei, Pompei, Lorenzi, Mazzuchelli, and Serassi made the city of Venice illustrious; but political jealousy prevented the culture of the

economical and legislative sciences there, which under Beccaria and others were making great progress in other parts of Italy. In Tuscany, the famous French Encyclopædia was republished. In the cities of Lombardy flourished Scopoli, Fontana, Frank, Tissot, Spallanzani, Bertola, Villa, Natali, Volta, Scarpa, Tamburini, Parini, Beccaria, Verri, Landriani, Agnesi, Carli, and others devoted to literature, art, science, and the development of political and ethical principles. Bodoni raised the art of typography to an admirable elegance. Prominent among the patrons of literature was Victor Amadeus II. of Savoy. The Italian drama had as yet attained to excellence only in the opera, and lacked superior tragedies and comedies. It received an impulse in the 17th century from the French theatre, Martelli of Bologna (died in 1727) being the first who attempted to naturalize not only the French tragedy but the Alexandrine verse. The 'Merope' of Maffei was the best tragedy produced in the early part of the century. A greater influence was exerted upon his age and upon literature by Alfieri (1749–1803), the head of an important school of tragedy. He was the poet of energetic action and profound thought and feeling, as Metastasio was of love. Abandoning the customs of the court of Louis XIV., he revived the simple sublimity of the Greek stage, which had been the object of his favorite studies, and which was removed alike from French effeminacy and Spanish extravagance. A reformation in the Italian comedy was meantime effected by Goldoni (1707–93), the only genuine comic poet that Italy can boast, who sought in imitation of Molière to substitute for the *commedia dell' orte* a natural comedy of manners. In his efforts to give to the stage a more human and real character by ridding it of the traditional masks of the harlequin, pantaloon, and other stock characters, he had to contend especially against Chiari and Carlo Gozzi. The example of Kotzebue and Iffland gave rise to a lachrymose school of dramatic composition, maintained by Avelloni, Gualzetti, Greppi, and especially by Federici. The most illustrious historians were Muratori (died in 1750), Maffei, Denina, Mazzucchelli, Tiraboschi, and Lanzi (died in 1810). The 'Annali d'Italia,' 'Verona illustrata,' 'Revoluzioni d'Italia,' 'Scrittori d'Italia,' 'Storia della letteratura d'Italia,' and the 'Storia pittorica d'Italia' were respectively their best works. The writings of Muratori and Tiraboschi still maintain their reputation both for erudition and criticism. In archæology, the names of Fabretti, Gori, Mazzocchi, Martorelli, Passeri, and Carli were distinguished. Campanella continued the philosophical movement of Bruno in opposition to scholasticism, and Vico (1670–1744) founded the new science of the philosophy of history. His 'Scienza nuova' is a view of general history, founded on the idea of Divine Providence and the essential elements of the common nature of man. Algarotti, Bettinelli, Buonafede, Vanetti, Tartarotti, and Alessandro Verri also added to the glory of the literature by abandoning the pedantic style that had been in vogue and introducing an acquaintance with foreign ideas and productions. Baretti contributed to the revival of good taste by ridiculing the Arcadians. Parini (1729-99) excelled in satirical poetry, his 'Giorno' being as remarkable for elegance as for severity upon the effeminate life of the wealthy Milanese nobles. Among the works of Cesarotti was a translation of Ossian, esteemed in many respects among the happiest productions in the language, and which Alfieri confessed had been of service to him in the composition of his tragedies. The political and military movements in Europe of the last decade of the 18th century occasioned a regeneration not only of the literature but of the national spirit of the Italians. The early part of the 19th century rivals the age of Leo X., presenting Canova, Longhi, Cicognara, Appiani, and Beltrami in the fine arts; Monti, Foscolo, Pindemonte (partially contemporary with whom was Alfieri) in literature; and Volta, Melchiore Gioja, Romagnosi, Scarpa, Spallanzani, and Oriani in the sciences. The author who doubtless exerted the greatest influence on the regeneration of poetry was Vincenzo Monti (1754–1828), who in the contest between the classic and the romantic tendencies favored the former, and in the contest between the Gallicists, or imitators of the French literature and idioms, and the Purists, who made Petrarch, Dante, and the other old Italian masters their models, sided with the latter. His poems, as 'Basvilliana' and 'Feroniade,' his tragedies, as 'Galeotto Manfredi,' his elegy 'Mascheroniana,' the 'Proposta,' in which he disputed the restrictions which the Della Cruscans had fastened upon the language, and his translation of the 'Iliad' alike display an admirable and nervous style. Pindemonte also made a light and graceful version of the 'Odyssey,' and in his original poems especially lamented the desolation of his country. Ugo Foscolo (1777–1827) belongs to the school of Alfieri. His 'Ultime lettere di Jacopo Ortis,' a political and passionate romance in imitation of Goethe's 'Werther,' is supposed to describe his own troubled life. He wrote the lyric 'I sepolcri,' and other works in prose and verse, remarkable both for power and beauty. Mezzanotte celebrated in verse the struggle of the modern Greeks for liberty, regarding it not only as a political but as a religious conflict between Christianity and Islamism. The lyrical poems of Leopardi are highly esteemed. Among the epic and didactic poets were Botta, Ricci, Bagnoli, Arici, Grossi, Sestini, Pananti, and Lorenzi. Antonio Cesari (died in 1828) was the chief of the Trecentists, a school which carried its love of the Italian authors of the 14th century to affectation. Stratico published a dictionary containing only the words used by the Marinist authors. Mameli had exhibited the greatest promise in his ode to Venice, before he fell in the conflict at Rome in 1848–9. Prati, Aleardi, and the versatile priest, dramatist and journalist, Dall' Ongaro, were among the best lyric poets of Italy of the last half-century, and among contemporary lyric poets are Graf and Ada Negri. For the revival of pure and unaffected writing Italy was much indebted to the example of Carlo Botta, called by his countrymen the modern Thucydides. He wrote histories of the war of American independence and of Italy during the last three centuries. Vacani was a historian of the Peninsular war. Pietro Colletta wrote the history of Naples from its conquest by Charles III. of Spain in 1734. Amari wrote the history of the Arabs in Sicily and of the Sicilian Vespers, illustrating obscure periods in an age of national

glory. Both were reflective or philosophical historians. Cesare Cantu wrote an immense universal history, a work of critical and artistic merit, which has been translated into several languages. He has also written novels, poems, critical essays, and other histories, one of the most important of which is 'La Storia di cento anni' (1851). Bianchi Giovini, a prominent and anti-Catholic journalist, wrote a history of the popes, a biography of Fra Paolo Sarpi, a history of the Hebrews, and a work on the supposititious Pope Joan. The political writings of Mazzini consist chiefly of articles in journals. Cesare Balbo wrote historical meditations, a life of Dante, and a summary of the history of Italy. Franscini wrote an accurate and authoritative statistical work on Switzerland (1847–51). La Farina is the author of a history of Italy from the most ancient to recent times; Federico Sclopis, of a history of Italian legislation (completed in 1857); Luigi Zeni, of an excellent compendium of Italian history; Romanin, of a learned history of Venice, written in opposition to that of Daru, and of a work on the Venetian inquisitors; Carlo Gemelli, of a history of the Belgian revolution of 1830; Giuseppe Rubini, of a history of Russia from 862 to 1725; Canette, of a history of Amadeus II. of Savoy; Canale, of a history of the Crimean war of 1854–5; Gallenga, of a history of Piedmont; Angelo Brofferio, of a history of Piedmont from 1814 to 1849, and of other works interesting from their patriotic spirit as well as literary merit; Anelli, of a history of Italy from 1814 to 1850; Carlo Catteneo, of a history of the insurrection at Milan in 1848 (he was a member of the committee that directed the operations against the Austrian militia, and a participant in the struggle); he also compiled the 'Archivio triennale,' an elaborate and most careful and valuable collection of authentic documents relative to the events that occurred in Italy from 1848 to 1850; Federico Torre, of a history of the French expedition to Rome in 1849; Ferrari, in a work on republican federation, treated the question under what form of government Italy ought to be reorganized; L. C. Farini wrote a history of the Papal States from 1814 to 1850; Gualterio, of the last Italian revolutions (1852); Vecchio, of the events in Italy in 1848–9; among more recent historians were Giudici (1812–72), Settembrini (1813–76), and De Sanctis (1818–83). A taste for illustrating the national antiquities also arose and Inghirami published 'Monumenti Etruschi,' Delfico his 'Origini Italiche,' Fanucci his 'Storia dei Veneziani,' 'Genovesi e Pisani,' Manno his 'Storia di Sardegna,' Bres 'Malta illustrata,' and Pompeo Litta his learned 'Famiglie celebri d'Italia,' containing interesting studies on every period of the national history. Visconti (1751–1818) was distinguished in classical archæology, and Sestini was unrivaled in numismatics, making medals illustrate geographical questions. The natural sciences were advanced by four illustrious savants, who were nearly contemporary, Volta, Galvani, Scarpa, and Spallanzani. The discussions of Galvani and Volta concerning their new discoveries in electricity divided the scientific men of Europe into two factions, and the poets followed their example. Scarpa, a learned disciple of Morgagni, reduced anatomy to a positive science. Spallanzani wrote on physics and physiology in a style worthy of one who declared philosophy itself imperfect unless its principles were elegantly expressed. Gioja and Romagnosi treated philosophical questions and the economical and political sciences, the 'Filosofia della statistica' being the principal work of the former, and the 'Genesi del diritto penale' of the latter. Manzoni produced new models of lyric verse, and examples of historical dramas and novels in his 'Adelchi,' 'Il conte di Carmagnola,' and 'I promessi sposi.' To the modified classical school of Monti belong the dramas of Silvio Pellico, chiefly known by his 'Francesco da Rimini' and 'Le mie prigioni,' and those of Nicolini, often founded on the history of his country, and strongly marked by patriotic feeling. The example of Sir Walter Scott in the production of historical romances had many followers in Italy. 'I promessi sposi' of Manzoni (1825) was succeeded by the 'Monaca di Monza,' 'Luisa Strozzi,' and 'Il conte Ugolino della Gerardesca' of Rosini; the 'Margherita Pusterla' of Cesare Cantu; the 'Marco Visconti' of Grossi; the 'Ettore Fieramosca' of Azeglio; and the 'Battaglia di Benevento,' 'Assedio di Firenze,' 'Isabella Orsini,' and 'Beatrice Cenci' of Guerrazzi. Italy received with enthusiasm these romantic delineations from her ancient history. The romance entitled 'Famiglia' (1850), by Bersezio, is one of the best late Italian novels. The 'Dr. Antonio' of Ruffini is esteemed for its pictures of Italian scenery. Accomplished women have taken a considerable part in recent Italian literature. The 'Morte di Adone' of Teresa Bandellini was followed by the learned philosophical and religious poems of Diodata Saluzzo, with which she intermingled slight lyrical pieces. Cecilia de Luna Folliero wrote on the education of girls and the moral influence of music. Giustina Rinier Michiel celebrated in song the festive days and commemorated events of Venice. Isabella Teotochi Albrizzi wrote a graceful and truthful biography of Canova. The work of the Signora Ferucci on the education of girls received the encomiums of Gioberti and other distinguished thinkers. Other female authors are Lucrezia Marinella, Sabina Rasori, Silvia Curtoni Verza, Costanza Moscheni, and Leonora Fonseca Pimentel. In philosophy, the names of Gioja and Romagnosi were succeeded by that of Pasquale Borelli (Lallebasche), the author of an introduction to philosophy, and of works on the nature and genesis of thought, in which he opposed the empiricism of Romagnosi. Pasquale Galuppi (1770–1846), in elaborate works, combated the philosophical tendencies of the 18th century by doctrines founded on the philosophy of the Fathers of the Church. He was a student of the German philosophers, and one of his most interesting works was on the changes of modern philosophy from Descartes to Kant. Mamiani (born in 1802) published his 'Rinnovamento dell' antica filosofia Italiana' with the design of restoring the philosophical method of the Church Fathers, which he regarded as the national philosophy of the Italians, and of reconciling the extreme conclusions of speculative philosophy with the dictates of common sense. Rosmini (1787–1855) and Gioberti (1801–52) developed ideal Catholic theories, and founded a school in which, according to Rosmini, the only necessary and innate idea is that of the possibility of being. Gioberti, a more brilliant and learned

author, denounced psychology, and made the formula *L'ente crea le esistenze* the ontological basis of philosophy. Among contemporary literary celebrities are Annunzio, poet, dramatist and novelist; Carducci and Rapisard, poets and critics; Cossa, Ferrari, Giacometti, Pulle ("Castelnuovo"), dramatists; De Amicis, Barrili, E. Castelnuovo, Farina, Matilde Seras, and Verga, novelists. Among modern scientific authors and critics are D'Ancona, Ascoli, Comparetti, De Gubernatis, Lombroso, Rajna, and Villari.

Art.—For *Italian Architecture* see ARCHITECTURE.

Painting and Engraving.—The 12th century is generally taken as the period of the beginning of the history of painting in Italy, but before that time it had been the scene of the labors of Greek and Byzantine artists. During the pontificate of Leo the Great (440–461) a large picture in mosaic was executed in the Basilica of St. Paul, on the road to Ostia, and the portraits of the first 42 bishops, which are seen in the same church, date their origin from the same time. Mosaic and encaustic painting was then the prevalent mode. Painting in distemper was afterward introduced. About the end of the 6th century there were many paintings which were not believed to be the work of mortal hands, but were attributed to angels or blessed spirits. To this class, called *Acheiropoieta* (not made with hands) belongs one of the most famous representations of the Savior, in wood, at Rome, of which a sight can be obtained only with difficulty, in the *sanctum sanctorum*. In the 8th century painting on glass, mosaic on a ground of gold, and painting in enamel, were zealously prosecuted in Italy. There were already many native artists. One of the oldest monuments of art is the celebrated Christ on the Cross, in the Trinity church at Florence, which existed there as early as 1003. About 1200 a Greek artist, Theophanes, founded a school of painting in Venice. The art was first pursued with zeal in Pisa. The only artist of eminence who preceded Cimabue, who was born at Florence in 1240, was Guido of Siena, whose most celebrated work is a madonna, executed in 1221 for the church of San Domenico in his native place, where it is still to be seen. Cimabue, who was regarded as a prodigy by his contemporaries, first introduced more correct proportions, and gave his figures more life and expression. His scholar Giotto (died 1336) excelled him even in these respects, and exhibited a grace hitherto unknown. He was the friend of Dante and Petrarch, and practised with equal success historical painting, mosaic, sculpture, architecture, and portrait and miniature painting. He first attempted foreshortening and a natural disposition of drapery, but his style nevertheless remained dry and stiff. Boniface VIII. invited him to Rome, where he painted the still celebrated Navicella. He was followed by Gaddi, Stefano, Maso, and Simone Martini (Memmi). But Masaccio (properly Tommaso Guidi, born 1402) first dispelled the darkness of the Middle Ages, and a brighter dawn illuminated the art. The Florentine Republic in the beginning of the 15th century had attained the summit of its splendor. Cosmo de' Medici patronized all the arts and sciences; Brunelleschi then built the dome of the cathedral; Lorenzo Ghiberti cast the famous doors of the baptistery in bronze; and Donatello was to statuary what Masaccio was to painting. Paolo Uccelli laid the foundation for the study of perspective. Luca Signorelli, who first studied anatomy, and Domenico Ghirlandaio, who combined noble forms and expression with a knowledge of perspective, and abolished the excessive use of gilding, were distinguished in their profession. Leonardo da Vinci (1452–1519), who was a master in all the arts and sciences, infused so much philosophy and feeling into the art that, by his instrumentality, it quickly reached maturity. From him the Florentine school acquired that grave, contemplative, and almost melancholy character to which it originally leaned, and which it afterward united with the boldness and gigantic energy of Michelangelo. The Roman school already enumerated among its founders the miniature painter Oderigi, who died in 1300. He embellished manuscripts with small figures. Guido Palmerucci, Pietro Cavallini, and Gentile da Fabriano were his most distinguished successors. Almost all the painters of this time were accustomed to annex inscriptions to their pictures: the annunciation to the Virgin Mary was their favorite subject. Perugia was the principal seat of the Roman school. As early as the 13th century there was a society of painters there. Pietro Vanucci, called "Perugino" (1446–1524), first introduced more grace and nobler forms into this school, whose character acquired from him something intellectual, noble, simply pious, and natural, which always remained peculiar to the Roman school. Perugino's great scholar Raphael soon surpassed all former masters, and banished their poverty, stiffness, and dryness of style. Taste came into Venice from the East. Andrea Murano and Vittore Carpaccio are among the earliest artists of that city. Giovanni and Gentile Bellino are the most distinguished painters of the earlier Venetian school. The latter labored some time in Constantinople under the reign of Mohammed II. They introduced the glowing colors of the East; their style was simple and pure, without rising to the ideal. Andrea Mantegna (died 1506) was the first to study the ancient models. Padua was the principal seat of the Venetian school. Mantegna afterward transferred it to Mantua, and his style formed the transition to the Lombard school. Schools of painting flourished in Verona, Bassano, and Brescia. Giovanni da Udine (who was so distinguished by his faithful imitation of nature in secondary things that he painted for Raphael the garlands around his pictures in the Fernesina), Pellegrino, and Pordenone were the most able predecessors of the two great masters of the Venetian school, Giorgione and Titian. No capital city served as the central point of the Lombard school. Bologna subsequently became the centre. Imola, Conto, Ferrara, Modena, Reggio, Parma, Mantua, and Milan were afterward considered the seats of this school. Galasio (who lived about 1220), Alighieri, Alghisi, Cosimo Tura, Ercole Grandi, and especially Dosso Dossi (died 1560), were the principal painters of Ferrara. The last, a friend of Ariosto, possesses a remarkable grandeur of style, united with a richness of coloring which may bear comparison with that of Titian. Bramante (died 1514), who was likewise a great architect; Lippo Dalmasi; and especially Francesco Raibolini (died 1517), called "Francesco Francia," were

highly distinguished among the Bolognese masters. Here also belongs the charming Innocenzo da Imola.

We now come to the greatest masters of any age, called "Cinquecentisti," from the century in which they flourished. After Leonardo da Vinci, in the Florentine school, had settled the proportions of figures, and the rules of perspective and of light and shade, and his scholars, Luini, Salaino, and Melzo, besides the admirable Baccio della Porta ("Fra Bartolommeo," d. 1517), Andrea del Sarto (d. 1530), the gifted Baldassare Peruzzi and the gay Razzi had made this school distinguished, there arose the most extraordinary of all masters, Michelangelo Buonarotti (1474–1564). His gigantic mind grasped, with equal power, statuary, architecture, and painting. His fire of composition, his knowledge of anatomy, the boldness of his attitudes and foreshortenings, leave him without a rival; but, as a model, he was detrimental to the art, because his imitators necessarily fell into exaggeration and contempt of a simple style. In grandeur his fresco painting, the 'Last Judgment,' in the Sistine chapel at Rome, is inimitable. Beauty was never so much his object as power and sublimity, especially since, in the former, he could never equal Raphael, but in the latter stood alone. Dante was his favorite poet. In his later years the erection of St. Peter's church almost entirely engrossed his thoughts. Rosso de' Rossi, Daniele da Volterra, Salviati, Angelo Bronzino, Alessandro Allori, and many others were his scholars and imitators. If we turn our attention to the Roman school we find at its head the first of artists, Raphael Sanzio da Urbino (1483–1520). His genius showed itself as elevated in his fresco paintings, in the *stanze* and *loggie* of the Vatican (the former of which contain the 'School of Athens,' the 'Parnassus,' and the 'Conflagration of the Borgo,' while the latter contain Scriptural scenes from the creation through the whole Old Testament), as it appears lovely, spiritual, and original in the frescoes of the Farnesina (representing the life of Psyche). No less superior are his oil paintings, of which we shall only mention his madonnas, celebrated throughout the world, especially the 'Madonna del Sisto' (in the Dresden gallery), the 'Madonna della Sedia' (in Florence), 'Madonna della Pesce' (in Madrid), 'Maria Giardiniera' (in Paris), 'Madonna di Foligno' (in Rome), his 'St. Cecilia' (in Bologna), and his last work, the 'Transfiguration of Christ.' His scholars and successors — the bold Giulio Romano (d. 1546), the more gloomy Gianfrancesco Penni, called "il Fattore" (d. 1528), the lofty Bartolommeo Ramenghi, surnamed "Bagnacavallo," Pierino del Vaga (properly Buonaccorsi), Polidoro da Caravaggio, Gemigniani, Benvenuto Tisio da Garofalo, and many others — were skilful masters; but they forsook the path of their great pattern, and degenerated into mannerism. Federico Baroccio (d. 1612) endeavored to counteract this tendency. In spirit he belonged to the Lombard school, as he aimed at, and in part attained, the grace of Correggio. With his scholars Francesco Vanni and the brothers Zucchero he infused a new life into the Roman school, though the latter produced pleasing rather than great works, and fell into mannerism. Muziano was distinguished in landscape-painting, and Nogari and Facchetti in portrait-painting. At the head of the Venetian school we find the two excellent colorists Giorgione Barbarelli di Castelfranco (d. 1511) and Tiziano Vecelli (d. 1576). The portraits of the former are celebrated for their warmth and truth. The latter was great in all the departments of art, inimitable in his carnation, or painting of flesh tints, excellent as an historical and portrait painter, and the first great landscape-painter. Even in extreme old age his powers were unimpaired. Ariosto and Aretino were friends of the gay, happy Titian. Some of his most famous works are the altar-piece of St. Pietro Martire, his pictures of 'Venus,' his 'Bacchanal,' and his 'Children Playing,' in Madrid, his 'Cristo della Moneta,' etc. He first understood the art of painting with transparent colors. In groups, he selected the form of a bunch of grapes for a model. His successors — Sebastiano del Piombo, Palma Vecchio, Lorenzo Lotto, Paris Bordone, Pordenone — are distinguished especially in coloring. Schiavone, whose *chiaroscuro* and richness of color are truly remarkable; Giacomo da Ponto, called "Bassano," who imitated reality, even in common things, to deception, and who was the head of a whole family of painters; the ardent, inspired Robusti, called "Il Tintoretto" (d. 1594), and the fantastic, splendid Paul Veronese, properly Paolo Cagliari (d. 1588), who painted boldly and brilliantly with a free pencil, but neglected all propriety of costume, and frequently mingled masks in historical paintings, were ornaments of the Venetian school. It likewise degenerated, and its mannerists were worse than those of the other schools, because they did not study the antiques and the ideal. At the head of the Lombard school we find the charming Antonio Allegri da Correggio (d. 1534), whose works are distinguished for harmony of colors as well as for expression and grace. His successors and scholars were Francesco Rondani, Gatti, Lelio Orsi, and especially Francesco Mazzola, called "Il Parmegianino" (d. 1540). This artist possessed much ease, fire, and a peculiar grace, which frequently borders on mannerism. Gaudenzio Ferrari and many others are the ornaments of the Milanese school. In Bologna we find Bagnacavallo (d. 1542), a distinguished artist of this period, whom we have already mentioned as one of Raphael's scholars. Francesco Primaticcio (d. 1570), Niccolò dell' Abbate, Pellegrino Tibaldi, Passarotti, and Fontana were also celebrated Bolognese artists.

They were followed by the three Carracci, who endeavored to restore a pure style, and, by the combined study of the ancient masters of nature and science, to give a new splendor to the degraded art. Their influence was powerful, and Italian art became divided between the followers of the Carracci, who were called eclectics, and the followers of Michelangelo da Caravaggio, called naturalists. Lodovico Carracci (1555–1619) was, according to some accounts, the uncle, according to others the cousin of the two brothers Agostino (1558–1601) and Annibale (1560–1609). In 1589 all three united in establishing at Bologna an academy for painting, which was called accademia degli incamminati, and soon became so famous that all other schools for painting in the city were closed from want of attendance. The scholars of the Carracci are numberless. The most famous endeavored to unite the grace of

Correggio with the grandeur of the Roman masters. Cesare Aretusi was distinguished for the most faithful copies of Correggio and Guido Reni (d. 1642), especially for the ideal beauty of his heads, the loveliness of his infant figures and the uncommon facility of his pencil. The Bolognese Francesco Albani (d. 1660) lived in constant rivalry with Guido. He produced many large church paintings, but was most celebrated for the indescribable charm with which he represented, on a smaller scale, lovely subjects from mythology, and especially groups of Cupids. His paintings in the Verospi gallery, and his 'Four Elements,' which he painted for the Borghese family, gained him universal reputation. The background of his landscapes is excellent. All his works breathe serenity, pleasure, and grace. The third great contemporary of those already mentioned, Domenico Zampieri, called "Domenichino" (d. 1641), was at first little esteemed by them, on account of his great modesty and timidity. Thrice were prizes awarded by Lodovico to drawings, the author of which no one could discover. At last Agostino made inquiries, and the young Domenichino timidly confessed that the drawings were his. His industry and perseverance rendered him the favorite of his master. His works evince the most thorough knowledge, and are rich in expression of character, in force, and truth. His 'Communion of St. Jerome,' his 'Martyrdom of St. Agnes,' and his fresco in the Grotta Ferrata, are immortal masterpieces. Giovanni Lanfranco (d. 1647) was especially distinguished for the effect of his light. Bartol. Schidone is one of the best colorists of this school. The Bibienas, the Molas, Al. Tierini, Pietro da Cortona, Ciro Ferri, also deserve mention. At the head of the naturalists, who, with a bold and often rash pencil, imitated nature, without selection, stands Michelangelo Merighi, or Amerighi da Caravaggio (d. 1609). The chief of those who in a later age took him as a model was Salvator Rosa (d. 1673), to whose name may be added those of Preti "il Calabrese" and Giuseppe Crespi, called "Spagnuolo." His chief opponent in Rome was D'Arpino, who stood at the head of the idealists, or rather of the mannerists. Caravaggio and his successors, Manfredi, Leonello Spada, Guercino da Cento, etc., often took common nature for a model, which they servilely imitated, thus profaning the genuine dignity of the art, though they cannot be denied strength and genius. About this time, the beginning of the 17th century, the *bambocciate* were introduced. (See LAAR, PETER.) Many artists, especially Michelangelo Crequozzi, surnamed "delle battaglie" and "delle bambocciate," followed this degenerate taste. Andrea Sacchi made great efforts to oppose him. His drawing was correct and grand; Raphael was his model.

Italian art, already in the 17th century very far sunk below the purity of style and the nobility of composition which distinguished it in the time of Raphael, during the 18th century fell into a complete decay. Three or four names of this epoch, those of the Neapolitan Solimena, the Venetians Tiepolo and Canaletto, and the Luccese Pompeo Battoni, alone deserve to be saved from oblivion. During the first half of the 19th century the artists of Italy still confined themselves to dull imitations of the ancient masters and to academical commonplaces. The Milanese Andrea Appiani is the only one that need be separately distinguished among the crowd. The other more tolerable painters of this period are Francesco Hayez, Vincenzo Camuccini, Pietro Benvenuti, and Giuseppe Bezzuoli. At the present day an improvement is discernible in the position of Italian art, and serious efforts are being made to rise above the standard of academic conventionality. Among the chief artists are Ussi of Florence, Andrea Gastaldi of Turin, Federigo Faruffini of Sesto, Domenico Morelli, Francesco Castiglione, Camillo Miola, and others belonging to Naples, Pompeo Molmenti of Venice, etc.

In the art of engraving the Italians acquired great eminence. Tommaso Finiguerra, who flourished 1460, was the first celebrated master of this art, which he taught to Baccio Bandini. They were succeeded by Mantegna; but Marco Antonio Raimondi, of Bologna, who lived in 1500, was the first to introduce greater freedom into his engravings. His copies of Raphael have always been highly valued, on account of their correctness. His manner was imitated by Bonasone, Marco da Ravenna, Ghisi, and others. Agostino Carracci, Parmegiano, Carlo Maratti, and Pietro Testa etched some excellent works. Stefano della Bella was distinguished for his small, spirited, and elegant pieces. Among the moderns, Bartolozzi deserves mention in stippled engraving. Cunego, Volpato, and Bettelini are also distinguished; but, above all, Giuseppe Longhi (d. 1831) and the Florentine Raphael Morghen (d. 1833), who carried the art of engraving to a degree of perfection never before anticipated. Among the most celebrated Italian engravers subsequent to these two are Faustino, Pietro Anderloni, Domenico Marchetti, L. Calamatta, Giuseppe Bianchi, Pietro Fontane, Cremonesi, Michele Bisi, Filippo Caporali, Locatelli, and Faruffini.

Sculpture.— Although Italy has possessed some eminent sculptors, this branch of art (apart from some great works of Michelangelo) never attained so high a position in that country as painting. Nothing need be said of the sculptures which decorate the monuments erected during the Romano-Byzantine period of Italian art. For the most part they merely reproduce conventional types, and they are uniformly very roughly executed. To Niccolò da Pisa in the 13th century belongs the honor of having first broken loose from the barbarous manner of the early carvers in stone, and to have taken as models the masterpieces of ancient art. His numerous works (among others the pulpit in the baptistery of Pisa and the tomb of Saint Dominic at Bologna) clearly reveal the new source of inspiration. Niccolò had a worthy successor in his son (according to other accounts brother), Giovanni da Pisa, who in his turn trained up a school of sculptors in the true principles of the art. The most famous of these are the brothers Agnolo and Agostino da Siena and Andrea da Pisa. The influence of Giovanni da Pisa may also be traced in the magnificent works of Masuccio, Pietro, Stefanoni, and others, all of whom were distinguished in architecture as well as in sculpture, for it must not be forgotten that at that time, and even as late as the 15th century, sculpture and even painting were rather regarded as handmaids of architecture, than as separate arts regulated by laws of their own. Hence it was necessary for the archi-

tect to possess a thorough knowledge of all the three arts, and thus we find that several masters, such as Giotto, Andrea, Orcagna, Leonardo da Vinci, Michelangelo, and Raphael were at once architects, painters, and sculptors, that others were architects and painters, and still more architects and sculptors. During the 15th century the sculptors of Florence, then the metropolis of the arts, excelled all their rivals, as much as her painters and architects did theirs. At their head stand Lorenzo Ghiberti (d. 1455), and Donatello (d. 1466), both of whom instead of contenting themselves with a mere imitation of the works of antiquity, only looked to them for lessons as to the manner in which nature was to be understood and interpreted, while in other respects they followed an independent path. Among the other great artists of the period were Filippo Brunelleschi, Giacomo della Quercia, and Niccolò d'Arezzo, all of whom besides Donatello were competitors with Ghiberti in the case of the famous bronze doors of the baptistery of the church of San Giovanni at Florence. (See GHIBERTI.) Giacomo della Quercia afterwards rendered himself celebrated by executing the central door of the cathedral of Bologna. Brunelleschi was so much devoted to architecture that he has left behind him but a small number of sculptures. Luca della Robbia was also eminent among the masters of that time, but his works are chiefly in enameled earthenware, the secret of making which he discovered. The best pupils of Donatello were Desiderio da Settignano (d. 1485), and Andrea Verrochio, a jeweler, sculptor, engraver, painter, and musician, celebrated as the sculptor of one of the most admirable equestrian statues in bronze anywhere to be seen, that of Colleone at Venice, and no less so as the teacher of Leonardo da Vinci and Michelangelo. The other chief sculptors of the 15th century are Matteo Civitali, Benedetto da Rovezzano, and Lorenzo di Pietro (called "Il Vecchietta"), the last also celebrated as a painter and an architect. In Michelangelo the Italian renaissance in statuary reached its highest point. That great artist gave to the human form a character of force and majesty, and in action a fulness and vehemence which he did not always keep within the limits of reality, but which constitute the sublime and truly original aspect of his works. His great misfortune was to be followed by a crowd of imitators, who exaggerated the majesty of his style to a ridiculous extreme. The two most illustrious of his pupils were Montorsoli and Baccio da Montelupo. Sansovino (d. 1570) was able to preserve himself from a servile imitation, and became the founder of a school at Venice, from which proceeded Cattaneo, Pietro da Salo, Jacopo Colonna, and others. Besides these the 16th century numbers among its celebrated masters of the chisel Benvenuto Cellini, more famous as a designer in metal than as a sculptor in marble, Tribolo, Vincenzio Danti, Giovanni Merliano da Nola, called the Michelangelo of Naples, etc. With Bernini in the 17th century statuary underwent a complete decline similar to that which befell the other arts as well as literature during the same period, from which condition it did not rise again till about the end of the 18th and the beginning of the 19th century, when a renewed lustre was shed on the Italian school of sculpture by Antonio Canova (d. 1822), who acquired an immense reputation, partly justified by the grace of his figures and the delicacy of the execution. After him Lorenzo Bartolini (d. 1850) acquired distinction by the excellence of his works. The chief defects of this artist and of the Italian sculptors of the present age generally is the want of originality of conception and breadth of execution.

Music.— In Italy the imperfect forms of ancient music were first lost in the modern. Here we first find the proper choral song, the foundation of modern church music, which was at first sung in unison, chiefly in melodies derived from the old Græco-Roman music, and adapted to Christian hymns and psalms. (See MUSIC.) It seems to have had its origin when Bishop Ambrosius, in the 4th century, introduced into the Western Church songs and hymns adapted to the four authentic modes of the Greeks, and appointed psalmists or precentors. Gregory the Great, in the 6th century, enlarged the choral song by the plagal modes. From this time singing-schools were multiplied, and much was written upon music. The most important inventions for the improvement of music generally we owe to the 11th century, and particularly to the Benedictine Guido of Arezzo, who, if he did not invent the mode of writing musical notes and the use of the clef, improved and developed them, determined the exact relations of the tones, named six of the tones of the scale, and divided the scale into hexachords. In the 13th century the invention of music in measure was spread in Italy, dependent upon which was that of counterpoint and figured music. Instruments were multiplied and improved in the 14th and 15th centuries. Many popes favored music, particularly vocal, and consecrated it by their briefs; yet the ecclesiastical ordinances restrained the independent development of music. Much instruction was given in singing in the 15th century, and not entirely by monks. Music acquired the rank of a science, and vocal music in counterpoint was developed. In the 16th century we discover distinguished composers and musicians — Palestrina (chapel-master to Pope Julius III.), whose works possess great dignity and scientific modulation; his successor, Felice Anerio; the celebrated contrapuntist and singer, Gregorio Allegri; and the writer upon harmony, Giuseppe Zarlino, chapel-master at Venice. Music was cultivated at Rome and Venice with the greatest zeal. Hence it spread to Naples and Genoa; and all Italy, Schubert says, was soon a loud-sounding concert-hall, to which all Europe resorted to hear genuine music, particularly beautiful singing. About the end of the 16th century we first meet with the opera. The first operatic composer was Jacopo Peri. The taste for this new kind of composition spread so quickly, that composers were soon unable to supply the demands of the people, and from 40 to 50 new operas appeared yearly in Italy. This caused great competition among the Italian musicians. Thus the peculiar character of the Italian music, not to be changed by foreign influence, was developed the more quickly, because this species was cultivated independently, and unrestrained by the church. Already, in the middle of the 17th century, when the music of the theatre was continually advancing, simplicity began to give place to pomp and luxuriance, and the church style to decline. Music (says Schubert) united the profane air of the drama with the fervor of the church style, and

this was the first cause of the decline of the latter. Let us now consider the principal periods of the former. Vocal music must have been first; it was regulated by the discovery and improvement of instruments; thence arose the simple, grand church music of the 15th and 16th centuries; with it various forms of national song were developed. On the stage the higher style of music flourished independently. Here the Italian, without much attention to the poetical part of the performance, which was, as a rule, only the hasty work of a moment, though an exception must be made in favor of the operatic texts of Metastasio, followed his inclination for melody and sweet sounds, which appears even in his language. All the southern nations show a great sensibility, and melody is to them as necessary as harmony to the inhabitants of the north; but to no nation so much as to the Italians, whose beautiful climate and happy organization for song (Italy produces the most beautiful alto and tenor voices — few bass) made melody their chief aim in their music. On the other hand, the simplicity of melody degenerated into effeminacy and luxuriance, from the time when vocal music developed itself independently, and the voice, but little supported by the instrumental music, began to be cultivated like an instrument; when, instead of poetical expression and truth, mere gratification of the ears, not deep emotion, but a momentary excitement, and a rapid change of tones, with the avoidance of all dissonance, were principally desired: when music began to predominate over poetry, which first took place on the stage and thus the musical part of the performance obstructed the improvement of the dramatic and poetic. This taste spread over other countries so much the more easily as Italian music had advanced by rapid strides far before that of the rest of Europe, as appears even from the predominance of Italian terms in the language of music. Among the best composers of the 17th century are Girolamo Frescobaldi, Francesco Foggia, Bapt. Lully, and the celebrated violinist and composer Arcangelo Corelii. To the singers, of whom the most were also composers, belong Antimo Liberati, Matteo Simonelli, both singers in the chapel of the Pope. In the beginning of the 18th century Ant. Caldara was distinguished. He increased the effect of the singing by the addition of instruments, but his style partook much of the theatrical. In the middle of this century Italian music, especially theatrical, flourished, particularly at Naples, Lisbon, and also in Berlin. This has been declared by some the most brilliant period of Italian music. There were some distinguished instrumentalists in Italy, as the organists Scarlatti and Martinelli, the violinist Tartini, Domenico Ferrari, Geminiani, Ant. Lolli, Nardini, and Clementi. Among the composers of the 18th century may be mentioned Traelta, who, through his refinements, injured the simplicity of composition; Galuppi, distinguished by simple and pleasing song, rich invention, and good harmony; Niccolo Jomelli, who gave greater importance to instrumental music; Nic. Porpora, distinguished for his *solfeggios* in church music; Pergolesi, whose music is always delightful from its simple beauty (for example, his Stabat Mater); Pater Martini, at Bologna; the sweet Piccini, rival of Gluck; the agreeable Sacchini Sarti. Of a later date are Paesiello, Cimarosa, the ornament of the *opera buffa*, and Zingarelli (Romeo and Juliet), Nasolini, Paganini, Niccolini, Cherubini, Rossini, Bellini, Donizetti, Verdi, Mascagni, and Perosi.

Italy, Free Church in, a reformed religious sect founded by Alessandro Gavazzi in 1870 (see GAVAZZI, ALESSANDRO). In 1874 a confession of faith was formulated, an ecclesiastical constitution framed under a General Assembly; and the title of "Free Church in Italy" assumed. The confession scarcely does more than echo those of the Protestant Churches, and the constitution is based on the government by elders, like that of the Presbyterians, though the several congregations are practically uncentralized, as with the Independents. In 1891 by royal decree, the title "Chiesa Evangelica Italiana" was given to this body. The English sympathizers of Gavazzi bought and presented to the Free Church in Italy the old Church of San Jacopo in Florence, which city is the headquarters of the sect, and the meeting place of the General Assembly, and the present seat of the theological seminary which was originally established at Rome (1875), but transferred in 1891. Gavazzi, a remarkably eloquent man, was appointed professor of dogmatics, apologetics and polemics, as well as of pulpit oratory, a position he held till his death. The schools of the church in Florence are partially supported by the state. According to statistics for 1901 the General Assembly legislates for 30 congregations represented in it, of which there are 14 ordained ministers and 1,831 communicants.

Itasca Lake, farthest source of the Mississippi, in northern Minnesota. (The name is declared by Rev. W. T. Boutwell, a companion of H. R. Schoolcraft in his exploration, to have been barbarously formed in his presence from syllables of Latin *veritas*, truth and *caput*, head, as the "true head" of the Mississippi; but on Schoolcraft's first map it appears as Itasco, a neighboring stream being named Itasca, and Schoolcraft was a college-bred man hardly capable of such a solecism.) An extremely irregular body of water occupying a glacier-made bowl-shaped depression, surrounded by heights covered with dense forests, interspersed on the slopes with streams, springs, and small lakes often with no apparent outlet. The ground has a substratum of sand and gravel, mingled with large boulders; the surface is spongy and swampy. This basin has been made a national

park of about 7 by 5 miles, containing 19,701.69 acres (30.78 square miles). In the centre, fed by sources so permanent and with a flood plain so small that it has actually risen in dry seasons (though it receded some feet during the 19th century), lies Itasca, a giant among the small ponds around it, but having an area of only 1,130 acres, or 1¾ square miles. It is composed of a centre running east and west about a mile, whence extend north and south an east and a west arm about 1½ miles long each, and another northward about a mile, the width varying from ⅛ to ¾ of a mile. It has a shore line of 23,000 yards (over 13 miles). Depth, 4 to 50 and 60 feet; average, 20 to 35. The Mississippi flows from its north arm; a strong brook called by Nicollet the "Infant Mississippi" flows into the west arm. See MISSISSIPPI RIVER.

Ita'ta Case, 1891, an important international imbroglio, resulting from the *coup d'état* of Balmaceda (q.v.) and the revolt of the constitutional party in Chile. The latter through an agent had bought a quantity of arms and ammunition in New York, which were shipped to San Francisco and then sent by a schooner to the southern coast, where it was met by the insurgents' vessel, the Itata, and the cargo transferred. The vessel had a few soldiers and a little artillery on board. The attorney-general issued a writ of detention on the ground that she was violating our neutrality laws; and this failing, our cruiser Charleston was sent in pursuit, overhauled and captured her, and placed her on trial before the United States district court at San Diego. The courts discharged her as not having been guilty of such violation. The real interest of the case was political. It was notorious that our government and many of its civil and naval representatives sympathized with Balmaceda against the insurgents, and it was charged with going out of its way in order to cripple the latter; while the other party were ready to make war on the Chilean constitutionalists for defying our authority.

Itch, a contagious disease of the skin (scabies) due to its invasion by the itch-mite (*Sarcoptes scabici*), now rather rare in civilization. Even the adult mite is so small as to be barely visible, the female being about one sixteenth of an inch long and not quite as wide, while the male is still smaller. It has eight legs, two on each side of the head, to which suckers are attached, and four behind. (See MITE.) The female burrows into the skin and deposits her eggs, about 50 in number, and dies after a period of six weeks. After the eggs hatch out, the young make their way to the surface, and the impregnated females again burrow into the skin, so keeping up the process. The most frequent sites selected by the bugs for their burrows are the web between the fingers, the front of the wrists, the umbilicus, the genitals in men, and the under side of the breasts in women. The first sign of the disease is itching, which forces the patient to scratch, particularly at night, as the warmth of the bed increases the itch. The skin soon becomes inflamed from scratching, and the discomfort is increased. Close examination may show the tiny burrow like a reddened pin-scratch about half an inch long. Many remedies are used with success, but sulphur in the form of an ointment is the most common. As the bugs cannot be killed while still in the skin, a good plan is to take a hot bath with brisk rubbing, apply the ointment night and morning for three days, continuing to wear the same clothing and sleep in the same bed-clothes; at the end of that time another bath is to be taken, all clothing and bed-clothes changed, and another series of rubbings started. This must be continued as long as fresh burrows are found. Great care must be taken in washing the clothing of an affected person, thorough boiling or baking being necessary to kill the mites. Transmission from one individual to another on close contact is readily effected.

Itch due to varieties of this mite affects all the domestic animals and some wild ones, as the lion, wolf, wombat, etc.; and in Europe, where it occurs more often than in America, epidemics of it sometimes run their course through the dogs, cats, horses, etc., of a town or district, often causing the death of the smaller animals. An application of sulphur ointment is recommended. The itch-mite of fowls is a different species.

Ith'aca, Mich., village and county-seat of Gratiot County, on the Ann Arbor railroad, 40 miles northeast of Lansing. It has a courthouse erected at a cost of $75,000, high school and other public buildings; and manufactures of flour, lumber, wind-mills and agricultural machinery, and several large potteries and iron works. It is the centre of an important agricultural district. Pop. (1890) 1,627; (1900) 2,020.

Ithaca, N. Y., city and county-seat of Tompkins County, on Cayuga Lake, and on the Lackawanna and the Lehigh Valley R.R.'s; 70 miles southeast of Rochester. It derives water power from Fall Creek and has manufactories of autophones, glass, typewriters, drop forgings, calendar clocks, firearms, salt, wall paper, agricultural implements, iron castings, machinery, etc. The city is best known as the seat of Cornell University (q.v.) and the Cascadilla Preparatory School; and also as a popular summer resort. There are two national banks, trolley connection with East Ithaca, large farming trade with Tompkins, Tioga, Cortland, and Seneca counties; and an assessed property valuation exceeding $7,000,000. In the immediate vicinity are numerous gorges and waterfalls, the most noted of the falls being Triphammer, Ithaca, Taughhannock, and Buttermilk. The Taughannock is 215 feet in height and is the highest waterfall east of the Rocky Mountains. There is here the Cornell Free Library containing 21,000 volumes, the Ithaca Conservatory of Music and Renwick Park. Under the charter of 1888, the government is vested in a mayor and city council elected every two years. Ithaca was first settled in 1787 and was called at different periods, "Sodom," "The Flats," and "the city," until 1806, when Simeon Dewitt gave it the name it bears. It was incorporated as a village in 1821. Pop. (1890) 11,097; (1900) 13,136.

Ito, Hirobumi, hē-rō-boo'mē ē'tō, **Marquis,** Japanese statesman: b. in Choshiu province, 1840. When the officer of the deck of the United States S. S. Mississippi, at midnight on 25 April 1854, heard the cry "American, Amer-

ican!" he found two Japanese gentlemen who had blistered their hands in rowing a fisherman's boat from the shore to get on board the American warship, hoping to be taken to America. Their clothing was stuffed full of writing paper and materials on which they expected to note down what they saw in foreign countries. One of these was Yoshida Shoin, who had long believed in breaking up the hermit policy of Japan and opening his country to human intercourse. Against his own sympathies, and despite their piteous appeal, Commodore Perry, keeping his word of honor, put the two men ashore. Seized as a prisoner, Yoshida was kept in domiciliary confinement in Choshui for five years, finally suffering decapitation and political martyrdom in Yedo, 31 Jan. 1859. He had for his pupils Ito Hirobumi and Inouye Kaoru. Thus early instructed, Ito determined to see the great world. Getting secretly on board a foreign ship, he reached Shanghai. While his other companions went to Europe by steamer, he and Inouye worked their way before the mast. In London he saw and learned much amid varied experiences, meanwhile making up his mind that Japan must change her entire civilization, cease being Oriental and become modern, or else go the way of India and the conquered Asiatic nations. Hearing that his feudal lord, having erected batteries commanding the straits of Shiminoséki, was about to defy the combined fleets of Great Britain, France, Holland, and the United States, he hastily left for Japan, but at home his efforts did not prevent that bombardment of 5 Sept. 1864 which so enlightened the eyes of the Choshui men, leading them to sink their clan feuds and join with Satsuma, Tosa, Echizen, and others for the restoration of the emperor's power and the unity of all Japan. Active as one of the younger men in the revolution of 1868, he saw the necessity of a uniform coinage. Visiting the United States, he studied American financial history, and on his return the decimal system of money and a mint at Osaka were established. He was one of the first to propose the abolition of feudalism, and in 1872–3 went round the world in the embassy to obtain from the Powers revision of the treaties. As minister of public works he established a college of engineering and secured the building of the railway from Yokohama to Tokyo. After serving as head of the Home Office he visited Europe in 1876 to study the constitutions of the various countries with the idea of forming a written constitution, in fulfilment of the emperor's oath of 1868 to create representative government. He became an intense admirer of the Bismarckian methods and system, and on his return inaugurated a radical plan for altering social customs. As minister president of state, he reconstructed the government, eliminating men of the older traditions and putting in men of modern training. He carried out drastic reforms in economy, besides reconstructing law and codes which, departing widely from those hitherto built on Chinese models, were made in harmony with the jurisprudence of Western countries. In 1888 there was a conservative reaction, and Ito retired to prepare, with three others, the constitution, which was finally promulgated 11 Feb. 1889. Though astonishingly liberal in matters of conscience and personal liberty, it follows the Prussian model in making the ministers responsible not to the Diet but to the emperor, against which provision the Liberals, eager to follow American and English precedents, have made unceasing protest. This struggle is the key to Japanese politics. Ito wrote a volume of commentaries on the constitution, translated into English by Ito Myoji. Again called to the premiership, he averted a political crisis at home and directed the diplomacy of the Chino-Japanese war of 1894–5. Resigning the premiership, he traveled in Europe, and on his return was again called by the emperor to form a government, and besides working for the Anglo-Japanese alliance, sent 21,000 fully equipped soldiers to join the allies and relieve the legations at Peking. In 1901, after the fall of his "coalition cabinet," he was succeeded by Katsura and went abroad for travel. In the United States for health, he received at Yale University the degree of LL.D. In 1904 he was the emperor's special envoy in Korea to consummate the alliance of the two countries. Enjoying the full confidence of his sovereign, he is, despite his opportunist proclivities, probably the best all-round statesman in Japan's modern history, incarnating, as he does, her past, present, and future.

WILLIAM ELLIOT GRIFFIS,
Author of 'The Mikado's Empire.'

Iturbide, ē-toor-bē'dā, **Augustin de**, emperor of Mexico: b. Valladolid de Michoacan (now Morelia), Mexico, 27 Sept. 1783; d. Padilla, State of Tamaulipas, 19 July 1824. In 1810 he was lieutenant in the provincial regiment of his native city, but on the breaking out of the troubles in Mexico joined the royalist party, and in this cause displayed such valor and ability that in 1816 he rose to the command of what was called the northern army, which occupied the provinces of Guanaxuato and Valladolid. In 1820 the imprudent acts of the Spanish cortes produced so much exasperation among the clergy and the partisans of absolutism in Mexico, that these persons united to effect the independence of their country, selecting Iturbide as their agent, and appointing him commander of the army in the south. He quickly bore down all opposition, and became so popular that he had himself proclaimed Emperor of Mexico, in July 1822, under the name of Augustin I. The Congress declared the throne hereditary in his family, and voted him a yearly allowance of $1,500,000. His troubled reign came to an end in less than a year, by his abdication in March 1823. Congress granted him on his abdication a yearly pension of $25,000 on condition of his leaving the country, making sufficient provision for his family in case of his death. He resided in Leghorn for about a year, when he was induced to make an attempt to recover his lost crown. He landed with but a single attendant at Soto la Marina, and was arrested and shot. His family settled in Philadelphia, where his widow died in 1861. Several of his sons subsequently held positions under the Mexican government, the eldest, Prince Angel, dying in the City of Mexico in 1872, the youngest, Prince Augustin, dying in Paris in 1873. Prince Angel's son, Augustin, b. 1864, was adopted by the Emperor Maximilian as his heir, Maximilian himself being childless. The collapse of the second empire, however, destroyed his chances of a throne.

MARQUIS HIROBUMI ITO,
Ex-Premier of Japan.

Iuka, Miss., a small village on the Memphis & Charleston railroad, in the northern part of the State, about 115 miles east of Memphis, was the scene of a severe engagement during the Civil War. Early in September, 1862, it was occupied by a small Union regiment as an outpost. On the morning of 13 September Gen. Sterling Price, moving north from Tupelo with a force of 14,000 men, to prevent Grant from sending reinforcements to Gen. Buell in Kentucky, drove the Union regiment from the village and occupied it, and on the 19th was about moving to Rienzi on the Mobile & Ohio Railroad to form a junction with Earl Van Dorn's army preparatory to an attack upon Corinth. Gen. Grant had been closely watching the movements of Price and Van Dorn, and when he heard that Price had occupied Iuka he determined to attack and cut him off before he could effect a junction with Van Dorn. Gen. Rosecrans, who was near Corinth with 9,000 men, was ordered to move south to Rienzi and Jacinto, then eastward, and, marching on the roads from Jacinto and Fulton, to attack Iuka from the south. Gen. Ord, with 6,500 men, was to move along the Memphis & Charleston Railroad to Burnsville, thence by roads north of the railroad, and to attack on the north and west of Iuka. Grant accompanied Ord, who reached Burnsville on the 18th, and encamped within six miles of Iuka, which he proposed to attack early in the morning; but Grant, hearing that Rosecrans had been delayed in his movements and would not probably be up in time to attack next day, instructed Ord not to move to the attack until the sound of Rosecrans' guns was heard south of Iuka. Rosecrans, with the two divisions of Hamilton and Stanley, moved from Jacinto at 5 o'clock in the morning of the 19th and, after a march of 18 miles, at 4 P.M. his advance division (Hamilton's), about two miles south of Iuka, encountered Little's division of Price's command, Maury's division remaining in the north of Iuka, to confront Ord. Little had about 4,000 men, with which he attacked Hamilton vigorously before the latter could complete his lines. After a very severe fight, Hamilton was driven back some 600 yards, abandoning nine guns; but, receiving three regiments of Stanley's division as a reinforcement, he rallied and regained part of his lost ground, when darkness ended the fighting. Gen. Price reports: "The fight began, and was waged with a severity I have never seen surpassed." Price prepared to renew the battle in the morning; but, convinced by his subordinates of the critical position he was in with Rosecrans in his front and Ord in rear, retreated southward by the Fulton road, which Rosecrans had failed to close as was intended. Ord did not hear the sounds of battle on the 19th, but, advancing on the morning of the 20th, found that Price had escaped. Price retreated southward and reached Baldwyn 23 September. Rosecrans and Ord returned to Corinth. Rosecrans reported a loss of 144 killed, 598 wounded, and 40 missing. Price reported a loss of 86 killed and 408 wounded; Union estimates placing it much higher. Consult: 'Official Records,' Vol. XVII.; Greene, 'The Mississippi'; the Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. Carman.

Ivan, ē-vän', the name of several rulers distinguished in Russian history. The most celebrated are the Grand Dukes Ivan III. and Ivan IV., who laid the foundations of the Russian Empire, the latter (b. 1529; d. 1584) being commonly known as Ivan the Terrible. (See Russia.) Ivan VI. was son of the Grand-princess Anna and of Antony Ulrich, duke of Brunswick-Wolfenbüttel. The Empress Anna, 1740, declared him her successor, and her favorite Biron was to be his guardian and regent. Biron caused the oath of allegiance to be taken to the prince, and when he was banished the parents of the child assumed the reins of government until the daughter of Peter I., Elizabeth, ascended the throne. The young Ivan was taken from his cradle by soldiers, and shared the fate of his banished and imprisoned parents.

I'vanhoe, the title of one of Sir Walter Scott's most famous novels, written and published in 1819. The manuscript is now at Abbotsford. Immediately after its appearance, 'Ivanhoe' became a favorite, and now ranks among the most brilliant and stirring of romantic tales. The scene of the tale is England in the reign of Richard I.

Ives, īvz, **Brayton**, American financier: b Farmington, Conn., 1840. He was graduated from Yale in 1861, served in the Union army in the Civil War, attaining the rank of colonel, 5th Connecticut infantry, and brevet brigadier-general, in 1867–89 was a broker of New York, and in 1878–9 president of the New York Stock Exchange. At one time president of the Northern Pacific railway, he later was chosen to the presidency of the Metropolitan Trust Company of New York.

Ives, Frederic Eugene, American inventor: b. Litchfield, Conn., 17 Feb. 1856. He received a public school education; was director of the photographic laboratory at Cornell University in 1874–8, and has lectured before scientific societies in this country and in England. Among his inventions are the process of half-tone photo-engraving (1878); and the three-color printing process in the typographic press. He has published: 'Isochromatic Photography with Chlorophyll' (1866); 'A New Principle in Heliochromy' (1889); etc.

I'vory, properly the substance of which the tusks of the elephant consist, though the similar substance constituting the tusks of the hippopotamus and the horn of the narwhal is also so called. There is also a wholly different substance known as vegetable ivory (q.v.). Ivory is prized for its beautiful color, the fineness of its grain, and the high polish it is capable of receiving. That of the African elephant is most esteemed by the manufacturer for its density and whiteness. It is used as a material for knife-handles, pianoforte keys, combs, the backs of brushes, billiard balls, chess-men, carved figures, and ornamental articles of various kinds. Thin plates of ivory are used as panels for miniature paintings, and etchings are sometimes executed on such plates. The ivory of the hippopotamus is preferred by the dentist. The shavings and sawdust of ivory, by burning in a crucible, are converted into a black powder, from which is prepared a pigment known as ivory black. Ivory may be stained or dyed. The use of ivory was well known in very early

ages. The ancients were acquainted with the art of sculpturing in ivory, of dyeing and inlaying it, and they often employed it in statuary. Some of the most famous Grecian statues were chryselephantine, that is, were overlaid with plates of gold and ivory in conjunction. To provide the world's supply of ivory it is estimated that 9,000 to 12,000 elephants are killed annually. The medium weight of a tusk is about 60 pounds, but some are found weighing as much as 170 pounds.

Ivory-bill, the great black-and-white, scarlet-crested woodpecker (*Campephilus principalis*), formerly numerous and greatly admired throughout the Southern States, but now surviving only in a few of the most secluded cypress swamps of the Gulf coast. Its extermination was begun by the Indians, who valued highly its splendid head-feathers as an ornament for warriors; and completed by sportsmen and plume-hunters. The books of Wilson, Audubon and early writers on American animals give many interesting facts as to its habits.

Ivory Palm, a South American palm-tree yielding corozo-nuts,—large white seeds called "vegetable ivory" (q.v.).

Ivory, Vegetable. See VEGETABLE IVORY.

Ivy, a popular name for various climbing, creeping, and drooping herbs and shrubs, the most widely known of which are the following: Common or English ivy (*Hedera helix*) is a tall climbing evergreen shrub of the order *Araliaceæ,* widely planted in Europe (where, as in Northern Africa and Eastern Asia, it is native), and in the warmer parts of the United States, its ornamental, abundant foliage being highly valued for covering walls, rocks, and trellises. Its small and inconspicuous greenish, perfect flowers appear late in the autumn and the small black fruits (three to five seeded berries) ripen the succeeding year. The fruits, which are devoured by birds, are bitter and pungent, and were formerly in medicinal repute, The gummy juice obtained from the stem, as also the fruit, contains the bitter principle hederin and the hederic acid characteristic of the plant. It has been used in making varnish. Contrary to popular opinion, ivy is not parasitic upon such trees as support it. It merely clings to them by its numerous hold-fast roots produced along the entire length of its stems. Such trees as it injures are killed by constriction. The other popular notion that it makes the walls and houses upon which it climbs damp and unhealthy is also erroneous; in reality it dries them, the roots abstracting such water as reaches the wall through the dense foliage; yet exceptional cases of damage occur. It has numerous horticultural varieties which differ mainly in the form, color and markings of the leaves. These succeed best in rather moist, rich soils and shady positions and are not usually found to be hardy much farther north than New York unless well protected from the winter sun, as upon the north side of buildings, etc. As a cool greenhouse and a house plant it is very popular. Ivy leaves and ivy berries were formerly administered for various medicinal purposes, but they have been long out of use. The leaf and habit of the common ivy are so characteristic that reference is often made to them in the specific names of other plants, "ivy-leaved" being common as a designation. The plant takes a prominent place in mythology and folk-lore.

Japanese or Boston ivy (*Ampelopsis tricuspidata*) and its near relative Virginia creeper (*A. quinquefolia*) of the order *Vitaceæ,* are probably the next best known species to which this name is applied. The former is the more graceful, and is gradually gaining in general favor over the latter, which demands more attention to keep it looking presentable. Both climb by means of tendrils, but the Boston ivy clings better to walls. It has three-lobed leaves; its rival, five-lobed. Both have brilliant autumnal colors in the north, where the Virginia creeper is the more hardy.

Among the herbaceous ivies Kenilworth ivy (*Linaria cymbalaria*), German ivy (*Senecio mikanoides*) and ground ivy (*Nepeta glechoma*) are best known in America. They are all popular greenhouse plants and are frequently planted in hanging-baskets because of their graceful habits. Poison-ivy or poison-oak is a climbing sumach whose leaflets somewhat resemble those of Virginia creeper, but are in threes instead of fives (see POISON-IVY).

Iwakura, Tomomi, Japanese reformer and statesman: b. in Kioto in 1825 of illustrious ancestry, one of the Kuge or court nobility, chamberlain of the imperial household, and at first in favor of the expulsion of foreigners. He never saw a foreigner until he was 43 years old. Becoming a Progressive, he was banished into exile and shaved his head, but his real aim was to restore the lustre of the imperial throne by the overthrow of the Yedo Shogunate. Entering into communication with the leaders of the confederation of southern daimios, he became the link between court nobility and the progressive samurai or gentry, and took a prominent part in the Restoration of 1868. He was one of the first to send his three sons to be educated under Verbeck and to America. He received high office and salary, and in 1870, as envoy of the mikado to the recalcitrant Satsuma leaders, led in the movement to abolish feudalism, and was prominent in securing the formation of a new national army. As minister of foreign affairs and junior premier, he was visited by his sovereign. He went to Europe and America as head of the great embassy of 1872. He admired greatly the government at Washington. He left a powerful impress on the nation and the sovereign, and received the highest honors due to a subject. Escaping all attempts at assassination, he died quietly in his bed 20 July 1883. Of his children, a son, Prince Iwakura Tomosada, of the House of Peers, is special attendant upon the emperor, and the other, a daughter, is at the head of the Red Cross work in Japan.

WILLIAM ELLIOT GRIFFIS,
Author of 'The Mikado's Empire.

Ixion, ĭks-ī'ŏn, in Greek mythology, king of the Lapithæ in Thessaly, son of Phlegyas. He married Dia, daughter of Deioneus. He became enamored of Hera, and attempted to seduce her. Zeus made a cloud in the shape of Hera, and carried it to the place where Ixion had appointed to meet her. Ixion was caught in the snare, and from his embrace with the cloud were born the Centaurs. (See CENTAURS.) Zeus banished him from heaven;

struck him with his thunder, and ordered Hermes to tie him to a winged or fiery wheel in Hades.

Iyar, the eighth month of the Jewish year, corresponding, at the earliest, with April; but it may be as late as May; it has only 29 days.

Iz'ard, George, American general: b. Richmond, Surrey, England, 1777; d. Little Rock, Ark., 22 Nov. 1828. He was a son of Ralph Izard (q.v.). He was graduated from the College of Pennsylvania in 1792, and after a tour in Europe was appointed in 1794 a lieutenant in the regiment of artillerists and engineers in the United States army. Upon the breaking out of the War of 1812 with Great Britain he served as colonel of the 2d artillery, and was successively promoted to be brigadier-general and major-general. At one period of the war he held chief command of the northwest frontier. In 1825 he became governor of Arkansas Territory, in which office he died.

Izard, Ralph, American statesman: b. near Charleston, S. C., 1742; d. South Bay, near Charleston, 30 May 1804. He was educated at Christ's College, Cambridge, England, and, inheriting an ample fortune, established himself in 1771 with his family in London, whence the troubled condition of American politics induced him in 1774 to retire to the continent. He subsequently endeavored to impress upon the British ministry the ill-advised nature of the course they were pursuing, but without effect. In 1780 he returned to the United States, and found occasion to serve the country in various ways, having been instrumental in procuring the appointment of General Greene to the command of the southern army, and having once pledged his whole estate as security for funds needed in the purchase of ships of war in Europe. In 1781 he entered the Continental Congress, of which he remained a member until the peace; and upon the adoption of the Federal constitution he was elected a United States senator from South Carolina. As a legislator he was able and eloquent and in the senate possessed the confidence of all parties. The 'Correspondence of Ralph Izard from 1774 to 1804, with a Short Memoir,' was published by his daughter (1844).

Izard, the chamois (q.v.); so called in the Pyrenees.

J

J the tenth letter of the English alphabet, was unknown to the ancient Latins and Greeks as an alphabetic character and representative of a vocal sound.

Till the 16th century the Latin and other alphabets of western Europe had only the letter i to represent both the vowel sound i and the consonant sound now represented by j: at least in fonts of type of that century, and till the end of that century or later, the character i served to represent both the vowel and the consonant, though a distinction was made between them in manuscripts of the previous century by continuing the stroke of the i a little below the line when it stood for the consonant. This letter j from the first represented in English the sound of dzh, in French that of zh; in German and other languages its value is that of the consonant y; for example, Julius, pronounced yulius, jacio, pronounced yacio.

For speakers of the modern European languages the j in Latin has usually the same value as in their native tongues. But though for Spaniards j in Latin is equal to y, in their own speech j is a strong guttural aspirate that might be represented in English by kh. The sound of j in English is always represented in Italian by g: the French and English journal is in Italian *giornale,* the Latin *judex,* English judge is in Italian *giudice.*

The sound of dzh is represented in English not only by its proper letter j, but also by g and by dg: jest, gem, edge.

Jabiru, jab'ĭ-roo, a large species of stork (*Mycteria americana*), somewhat resembling the adjutant, found nearly throughout South America and northward into Mexico and Texas. It is about five feet high, with stilt-like legs, and massive, slightly upcurved beak; the plumage is white and the naked head and neck black. In habits it resembles the other storks (q.v.). Several related Oriental species have received the same name.

Jaborandi, a Brazilian shrub (*Pilocarpus pennatifolius*) of the order *Rutaceæ,* which yields a volatile oil from which is derived a principle (pilocarpin) in the form of an amorphous white powder having properties similar to atropine. It is the basis of the drug jaborandi, which is diaphoretic and sialagogic in its effects. Other "jaborandis" are obtained from species of *Serronia, Aubletia* and *Piper.*

Jac'amars, a group of small, gaudy, South American birds of the family *Galbulidae,* and related to the puff-birds and woodpeckers. Their plumage is highly colored, reds and bronzy greens and blues predominating. They live mostly along the outskirts of forests, and feed upon large insects caught in flight. White eggs are laid in holes in earthen banks; and a whistling song is given during the breeding season.

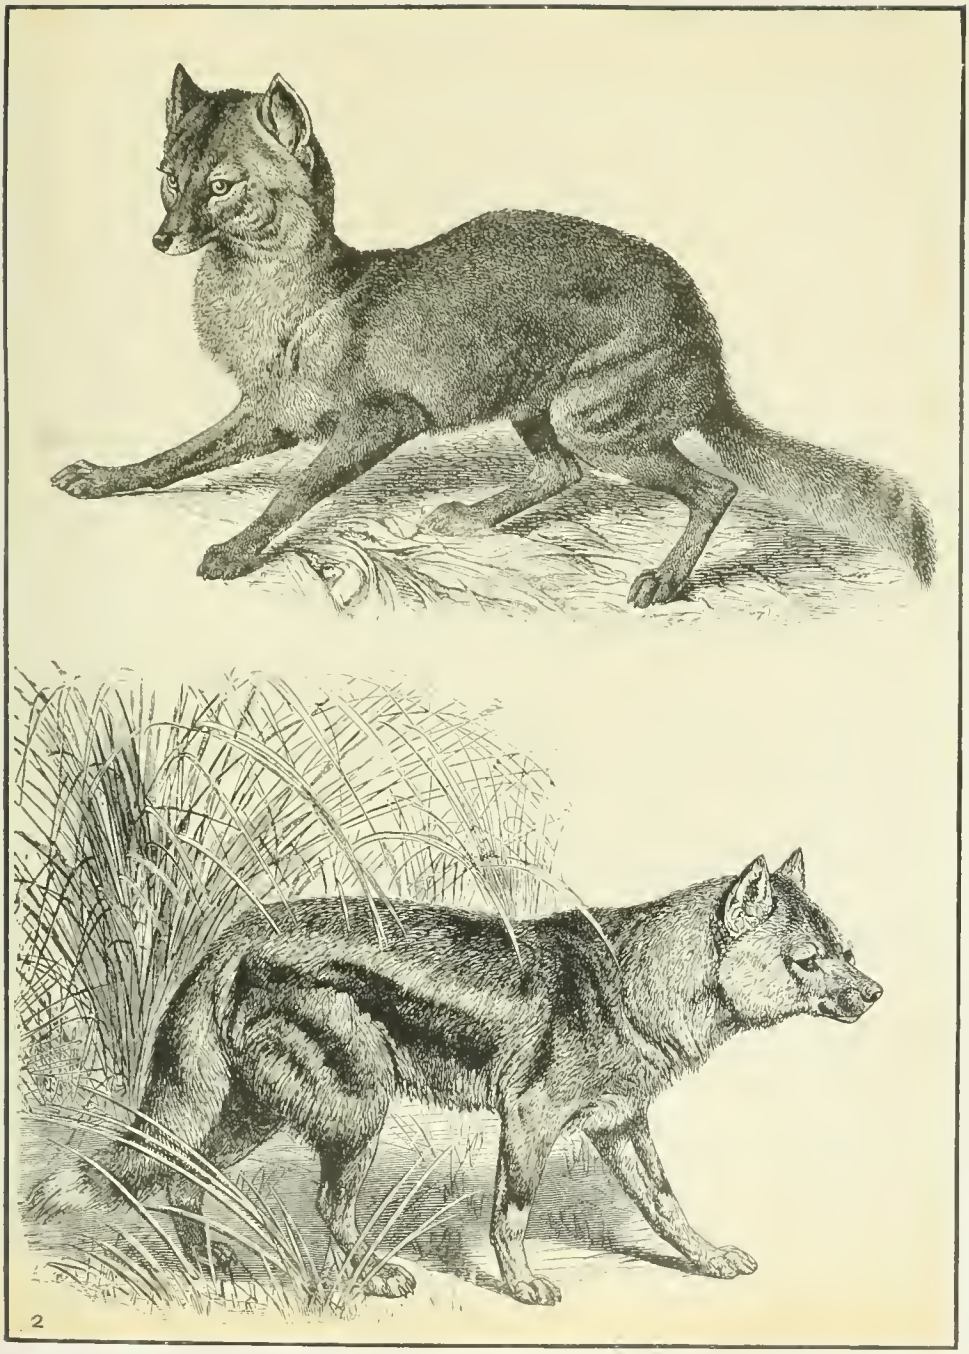
Jaçanas, zhä-sä'nä or jä-kä'nạ, a group of birds (*Parridæ*) related to the rails, and remarkable for the extraordinary length of the toes, which are further extended, especially the hallux, by long, slender claws. There are four genera and about a dozen species, most of which inhabit the Old World—Africa, India, and Australia. The genus *Parra* is American, and one Mexican species (*Parra spinosa*) enters Texas. The beak is plover-like and the bend of the wing bears a stout and acute horny spur; the plumage is of a rich purplish brown with the wings green and black. The great spread of the toes enables these birds to walk with ease on the floating leaves of water lilies and similar plants, otherwise their habits are much like those of rails (q.v.).

Jacaran'da, a genus of tropical American trees of the Bignonia (q.v.) family. One (*B. brasiliana*) yields the wood called jacaranda wood, or blue ebony, which is very hard and capable of receiving a fine polish. The name is carelessly applied to several other South American woods used in cabinet-work.

Jacaré, zhä-kä-rā' or jăk'ạ-rĕ, a South American name for an alligator of the genus *Caiman,* of which the large black species (*C. niger*) reaches a length of 20 feet and is called on the upper Amazon jacaré-nassu, while the jacaré-tinga (*C. trigonatus*) is only six feet long, and has a slender muzzle and black-banded tail. See CAYMAN.

Jack, a pike; in the United States, the common eastern pickerel (q.v.) is most usually meant. The wall-eyed pike (q.v.) is called "jack salmon" in some parts of the West. Several marine fishes are known as jack fish, amber jacks, etc., especially among the lively sea-bass, groupers, amber-fish and the like. The term, as in other cases, implies a quality in the animal exciting friendly interest and admiration.

Jack, or **Jack-tree** (native name *Jaca*), a tree (*Artocarpus integrifolia*), related to the bread-fruit (q.v.), a native of India and south-eastern Asia. The fruit grows to a larger size than the bread-fruit of the Southern Pacific islands, often weighing more than 30 pounds, and containing from 200 to 300 seeds, each of them four times as large as an almond. The seeds or nuts are eaten after being roasted or boiled, and the sweet fleshy pulp of the fruit is also eaten. When the tree is young the fruit



1. Common Jackal.

2. Side-striped Jackal.

grows from the twigs; in middle age it grows from the trunk; and when the tree gets old, from the roots. It forms a great part of the food of the natives in some portions of India, Ceylon, etc. The yellowish timber is used for almost every purpose, being strong and ornamental, and yields a yellow dye.

Jack and the Beanstalk, an English nursery tale relating to the heroism of a boy. Its analogue occurs in many national folk-lore legends. It is supposed to represent in a figure the restoration to the earth of those fertilizing and elemental activities, which are necessary to human life. The harp is the wind, which drives the ships and turns the mills to grind the wheat. The bags of treasure are the raindrops that scatter wealth and plenty. The red hen is the sun that brings life to birth by its fostering heat.

Jack and Jill, the first words of an old nursery rhyme, of considerable folk-lore interest. Jill is a corruption of the French Julienne, once common in England under the form Gillian. It also appears in the legend of St. Kilian, where Geilana vindictively causes the good bishop's death. This incident of Jack and Jill is probably based on one of the moon myths of Scandinavia. The Norse peasant sees in the spots on the moon the two children rescued by the moon from their father, who had forced them to draw water all the day.

Jack the Giant Killer, the hero of an English nursery story, which reflects triumph of skill over strength and bulk such as makes the point of the story in David and Goliath, Ulysses and Polyphemus, etc. The English form is based upon the legend that St. Michael's Mount, in Cornwall, was once the fortress or castle of a giant, who was dislodged by the valor of an English knight. In adapting the story so as to claim the sympathies of children the knight is made to take the shape of a child.

Jack Horner, the first words of an old nursery rhyme. The rhyme is said to be based on a historic fact. Horner was the messenger whom the abbot of Glastonbury sent to Henry VIII. with the deeds of certain manors involved in the dissolution of monasteries. Horner obsequiously handed the parcel to the royal spoliator, but first of all managed to abstract the deeds of the manor of Wells, a "plum" indeed, and the abbot was afterward punished on the charge that he had withheld them.

Jack-in-the-Pulpit, or **Indian Turnip,** a perennial herb (*Anisæma triphyllum*) of the arum family (see *Araceæ*). Its name is derived from its spadix, which is upright, with the spathe surrounding and arching over it, suggesting a preacher in an old-fashioned pulpit with a sounding-board. It is common in the United States, east of the great plains, in damp, shady woods and in moist garden soil; and when the spathe falls away in early summer, the red berries are prominently shown in the form of a dense ovoid head. Its acrid tuber or corm is valued for its medicinal properties, and may be made edible by boiling.

Jack-snipe, a gunner's term for a shore-bird, also called grass or meadow snipe, which is in reality a sandpiper, named in books the pectoral sandpiper (*Tringa maculata*). The perversion of names is due to its somewhat game-like habits of lying to a dog and flushing correctly from the grass, like a true snipe which render it an attractive object of pursuit; beside which, in the fall it becomes very fat, and it is then excellent eating. Unlike most sandpipers, it does not flock, at least to any extent, being oftenest found scattered singly or in pairs. In the United States it is chiefly, if not wholly, a bird of passage, breeding in Canada and wintering in the tropics. It is nine inches long, clay-colored, striped with blackish above; breast ashy and sharply streaked; belly white. Consult authorities mentioned under shore-birds.

The English "jack-snipe" is a true snipe (*Gallinago gallinula*) of very small size, and therefore also known as "half-snipe."

Jack'al, a small active wild dog or wolf of the warmer regions of the Old World, found in southeast Europe, Africa, Syria and southern Asia. The common jackal averages about 2 or 2½ feet in length, and about 14 inches in height, with a bushy tail about 8 inches long. The eyes are small, and the pupil is round. The general color of the body is a dirty yellow or brown, lighter on the throat and belly. Jackals inhabit holes and burrows whence they come forth in the evening to hunt in packs. Their cry consists of a series of prolonged howls, followed by shorter yelps, much like that of the American coyote. The jackal subsists largely upon carrion, often that left after the repast of the fiercer and larger carnivora; but it also kills prey for itself, a pack hunting down antelopes, deer, or other animals, besides getting much small fare, as mice, lizards, insects and the like. They also eat certain kinds of vegetable food, and sometimes they do considerable damage to sugar and other plantations. The jackal is susceptible of being tamed, but its odor makes it by no means a desirable domestic animal. It is believed to be exceedingly cunning, and in many Eastern tales, especially among the people of India, plays exactly the same part as the fox does in those of Europe. It is probable that jackals have contributed frequently to the commingled stock represented in our domestic dogs, some of which betray very jackal-like points. They inter-breed with domestic races.

The common jackal (*Canis aureus*) is the most widely distributed species; but another species, found mostly in southern Africa, is the blackbacked jackal (*C. mesomelas*). This latter form has the back and end of the tail black, the other parts mostly red or yellowish-red. A third species of jackal found in South Africa is the canduc (*C. adustus*), marked by a light stripe on the sides. Consult: Mivart, 'Dogs, Jackals, Wolves and Foxes' (London 1890).

Jackass Kingfisher, or **Laughing Jackass,** the name of a large inland kingfisher (*Dacelo gigas*) of Australia, given by the colonists in allusion to its loud, hoarse cry. It is about 17 inches long, brown in general color, does not frequent water or catch fish, but lives on insects, small reptiles, etc., and lays its eggs in a hole in a tree.

Jack'daw, a small, black European crow (*Corvus monedula*), with black legs and feet

and grayish neck. They inhabit towers, spires, and like elevated situations, and even in towns and populous cities are present and breed freely. The nests and eggs are like those of other crows (q.v.) which they resemble in general habits. Jackdaws are easily tamed, learn to pronounce many human words, and are most amusing pets, but are mischievous and thieving, like magpies.

Jack'man, Wilbur Samuel, American educator: b. Mechanicstown, Ohio, 12 Jan. 1855. He studied at Allegheny College (Meadville, Pa., 1880–2), was graduated from Harvard in 1884, and later became dean of the school of education in the University of Chicago, and head of the natural science department of the school. In 1899–1900 he visited Holland, France, and Germany for the study of educational methods. In addition to many articles on pedagogical topics, he has published: 'Nature Study for the Common Schools' (1891); 'Number Work in Nature Study' (1893); 'Field Work in Nature Study' (1894); 'Nature Study Record' (1895); 'Nature Study and Related Subjects' (1898); and 'Nature Study for the Grammar Grades' (1898).

Jackrabbit. See HARES.

Jack'son, Abraham Valentine William, American Indo-Iranian scholar: b. New York 9 Feb. 1862. Graduated from Columbia in 1883, he was Fellow in letters there (1883–6), instructor in Anglo-Saxon and the Iranian languages (1887–90), and, after study at Halle (1887–9), adjunct professor of English language and literature (1891–5). In 1895 he was appointed professor of Indo-Iranian languages at Columbia. By way of recognition of the instruction given by him in their ancient books, the Parsees made to the Columbia library the gift of an important manuscript collection of Zoroastrian works. He appeared also as a public lecturer, became one of the directors of the American Oriental Society, and in addition to numerous contributions to the 'Journal' of that society and other learned periodicals, wrote: 'A Hymn of Zoroaster, Yasna XXXI.' (1888); 'An Avestan Grammar' (1892); 'An Avestan Reader' (1893); 'Zoroaster, the Prophet of Ancient Iran' (1899).

Jackson, Abraham Willard, American Unitarian clergyman and author: b. Portland, Maine, 7 April 1843. He was graduated from Colby University (Waterville, Maine), entered the Union army as private in the 8th Maine volunteers, became captain in the 33d United States colored troops, in 1872 became pastor of the Unitarian Church at Peterboro, N. H., and subsequently of that at Santa Barbara, Cal. In 1894–5 he was acting professor of philosophy in the Meadville Theological School. Among his writings are: 'The Immanent God' (1889); 'James Martineau: a Biography and Study' (1900); 'Deafness and Cheerfulness' (1901).

Jackson, Andrew, seventh President of the United States: b. Waxhaw settlement, N. C., 15 March 1767; d. near Nashville, Tenn., 8 June 1845. He was of north of Ireland ancestry, his father emigrating to America from Carrick Fergus in 1765. As a boy Jackson was reckless, impetuous, quarrelsome, and passionate in temper; thoroughly disinclined to learning of any sort, his favorite pursuits were racing, gaming, and cock-fighting, but he was possessed of invincible determination, dauntless courage, and excelled in marksmanship and riding, qualities which later served him well. After some desultory law study in Salisbury, S. C., he became in 1788 public prosecutor of the Western District of North Carolina (that is Tennessee). In 1791 he married Rachel Robards, both supposing the latter's husband, Lewis Robards, had secured a divorce by act of the Virginia legislature. This proving not to be the case, they were remarried in 1794. This incident was frequently used against Jackson in his political campaigns, but his only fault was in not ascertaining more surely the exact terms of the Virginia act. A member of the Knoxville convention which drafted a constitution for Tennessee, Jackson was elected the first Federal representative of that State after its admission to the Union, June 1796. Appointed U. S. Senator in 1797 he resigned in April 1798 to become judge of the Tennessee supreme court, holding the position until 1804 when he retired to devote himself to settling his private affairs which had become heavily involved in debt. Between 1806–11 he led the life of a planter, storekeeper and private citizen without noticeable incident. Upon the outbreak of the war of 1812 Jackson, then major-general of Tennessee militia, promptly offered his services with those of 2,500 volunteers. New Orleans being considered a probable objective of the enemy, Jackson was sent there, 7 Jan. 1813, but was soon ordered to dismiss his troops and return. Thoroughly enraged, he hired transportation on his own authority and marched his men home in a body, refusing to disband them without pay or rations, five hundred miles fro home. In June the government reimbursed him for the expenses incurred. It was during this expedition his soldiers bestowed on him the affectionate name of "Old Hickory." On 30 Aug. 1813, the massacre of the garrison and refugees at Fort Mims, at the junction of the Alabama and Tombigbee rivers occurred. Tennessee at once voted men and money to aid in suppressing the Indian outbreak. Jackson, though suffering from a wound received in a tavern brawl, took the field, and in a whirlwind campaign completely crushed the Creeks at Horseshoe Bend, Alabama, 27 March 1814. On 14 March 1814, he ordered John Wood to be shot for insubordination and assaulting an officer, the first of the military severities afterward brought up against Jackson during his Presidential campaigns. On 31 May 1814 he was appointed major-general of the United States army, commanding the department of the South. In November, without orders from Washington he marched against the English at Pensacola, easily stormed the town and compelled their withdrawal. Proceeding to New Orleans he began energetic preparations for its defense, amid the greatest difficulties and wholly lacking in proper means and materials. On 23, 28 Dec. 1814 and 1 Jan. 1815 he gained minor successes against the British. On 8 Jan. 1815, General Pakenham with 10,000 veteran troops delivered a grand assault upon Jackson's works. The result was a complete defeat and rout of the British, they losing over 2,600 in killed, wounded and prisoners, while Jackson's loss was seven killed and six wounded. The treaty of peace

ANDREW JACKSON,

SEVENTH PRESIDENT OF THE UNITED STATES.

had been signed at Ghent 24 Dec. 1814, but Jackson did not learn of it until 6 March 1815. Accordingly he relaxed none of his vigilance, but kept the city under martial law, during which his characteristic highhandedness brought him into sharp conflict with the civil authorities. For disciplinary reasons six soldiers were court-martialed and shot on 21 February. But Jackson's brilliant and unexpected victory, the one great land success of the War of 1812, set the country afire with enthusiasm. From an obscure planter he immediately became the most popular man in the country. Resolutions of thanks and praise poured in on him from State legislatures; Congress voted him its thanks and a gold medal, and his exploit was the political salvation of the tottering administration. During the Seminole war Jackson was ordered to take command in Georgia, December 1817. Within five months he broke the Indian power completely, established peace on the border, and practically conquered Florida. His hasty measures, undertaken on inadequate facts and information, caused considerable anxiety and discussion in the government. His invasion of Florida and capture of St. Marks, a Spanish possession, and his summary execution of Arbuthnot and Ambrister, two British subjects, seemed likely to raise delicate diplomatic situations. Upon the acquisition of Florida Jackson was appointed its first territorial governor, April 1821, with almost the powers of a Spanish captain-general, but, disgusted with the office, he resigned in October. Parton describes his conduct while governor as "arrogant and disgraceful." In 1823 he declined the mission to Mexico, and was an unsuccessful candidate for the presidency in 1824. But in 1828 backed by the powerful influence of Van Buren in New York and his own popularity in Pennsylvania, which thus assured him the support of the two largest eastern states, Jackson was triumphantly elected President, the first representative of the new West and the masses. In 1832 he was re-elected by a larger electoral vote than in 1828. His first cabinet was composed of almost unknown men. For advice and counsel he relied chiefly on a group of personal friends and intimates, among them being Wm. B. Lewis, Amos Kendall, a representative of all that was vicious in American political methods, Duff Green and Isaac Hill, partisan editors, and later Francis P. Blair, who edited the 'Globe' in Jackson's interest. This group formed what came to be known as the "Kitchen Cabinet." In 1830 Jackson endeavored without success to enforce the social recognition of the wife of his secretary of war, John H. Eaton. The chief features of his administrations may be briefly summarized. That to him is due the shackling of the spoils system upon the country may be seen from the fact that between 1789 and 4 March, 1829, there were only 74 removals from office, while during Jackson's first official year there were some 2,000. He vigorously opposed the second bank of the United States, and vetoed the bill renewing its charter, 1832. He put a prompt end to South Carolina's nullification proceedings by his proclamation of 10 December 1832, declaring nullification contrary to the Constitution and incompatible with the existence of the Union, and his active preparations to execute the laws, by force if needful. In 1834, as a result of his action in ordering the secretary of the treasury to cease making deposits of government funds in the Bank of the United States, the Senate censured him for usurpation of powers not conferred by the laws or Constitution. His Specie Circular of 11 July 1836 directing that only gold and silver be taken at the land offices in payment for public lands was an important factor in the causes leading to the financial crash of 1837. His foreign policy was firm and successful. The disputes with Great Britain over the northeast boundary and the trade between the United States and British colonies, and with France over the indemnity for spoliations committed on American commerce early in the century, were dealt with shrewdly and with success.

Opinions will always be divided regarding Jackson's character. For thirty years he was a popular idol and the typical man of the "Fourth of July" period in American history. His countrymen easily forgave his faults and warmly admired his incontestable virtues. Extraordinarily illiterate, irascible in the highest degree, intensely patriotic, absolutely honest, terrible in the inflexibility of his purposes, faithful and devoted in his domestic life, a firm friend and implacable enemy, reckless and unflinching in the performance of what he conceived to be his duty, restless under any restraint calculated to hamper him in the discharge of that duty, an autocrat by nature yet a sincere lover of the common people,— such are some of the qualities which will always make Andrew Jackson one of the most picturesque figures in American history.

Bibliography.— Numerous biographies of Jackson exist. The best is still that by James Parton (3 vols., New York 1861); the life by Prof. W. G. Sumner in the 'American Statesman Series' is a careful study of his career as a public man (Boston 1883); the lives by John H. Eaton (Philadelphia 1817), and by Amos Kendall (New York 1843) have value as being written by men who knew him intimately. An excellent working bibliography for the study of Jackson's life and time will be found at the end of Professor Sumner's work.

W. N. C. Carlton,
Librarian, Trinity College, Hartford.

Jackson, Charles Thomas, American scientist: b. Plymouth, Mass., 21 June 1805; d. Somerville, Mass., 28 Aug. 1880. He was graduated at Harvard Medical College in 1829, and practised for a time in Boston. He claimed to have been the first to indicate, in 1832, the applicability of electricity to telegraphic use, and also claimed, in 1842, to have been the discoverer of the anæsthetic effects of the inhalation of ether. He received the monthly prize of 2,500 francs from the French Academy of Sciences in 1852. He published a 'Manual of Etherization, with a History of its Discovery' (1861), and several 'Reports.'

Jackson, Edward Payson, American educator and author: b. Erzerum, Turkey, 15 March 1840. He was educated at Amherst College; served in the Union army during the Civil War as private of the 45th and lieutenant of the 5th Massachusetts; was principal and superintendent of various educational institutions, and in 1877 was appointed master in the Boston Latin School. His works include:

'Mathematical Geography' (1873); 'A Demigod' (1886), a story published anonymously, and at first attributed to various well-known authors; 'The Earth in Space' (1889); and 'Character Building' (1892), to which was awarded a prize of $1,000, offered by the American Secular Union, jointly with N. P. Gilman's 'The Laws of Daily Conduct,' with which it was also published in the volume, 'Conduct as a Fine Art' (1894). He also became the editor of 'The Bohemian,' a Boston magazine of short fiction.

Jackson, Frederick George, English Arctic explorer: b. Alcester, Warwickshire, 1860. He was educated at Denstone College and the University of Edinburgh, made journeys across the Australian deserts and the Great Tundra of Siberia, in 1894–7 was leader of the Jackson-Harmsworth expedition to Franz Josef Land, and during the second Boer war was in command of a company of mounted infantry. During his stay in Franz Josef Land he mapped the region, which he proved to be a collection of islands, and made valuable magnetic and meteorological observations. He was awarded the gold medal of the Paris Geographical Society in 1899, and wrote: 'The Great Frozen Land' (1895); 'A Thousand Days in the Arctic' (1899).

Jackson, Gabrielle Emilie Snow, American writer for young people: b. New York 13 Oct. 1861. Among her many publications are 'Denise and Ned Toodles (1897); 'The Colburn 'Prize' (1899); 'Pretty Polly Perkins' (1900); 'Laddie and Lassie' (1900); 'Mother and Daughter' (1905).

Jackson, George Anson, American Congregational clergyman: b. North Adams, Mass., 17 March 1846. He was graduated from Yale in 1868, from the Andover Theological Seminary in 1871, was ordained to the Congregational ministry, and in 1872–97 held pastorates successively at Leavenworth, Kan., Southbridge, Mass., and Swampscott, Mass. In 1897 he became librarian of the General Theological Library of Boston. He wrote: 'The Apostolic Fathers' (1879); 'Fathers of the Third Century' (1881); 'Post-Nicene Greek Fathers' (1883); 'Post-Nicene Latin Fathers' (1883); 'The Son of a Prophet' (1894), a historical novel.

Jackson, Helen Maria Fiske Hunt, "H. H.," American novelist and poet: b. Amherst, Mass., 18 Oct. 1831; d. San Francisco, 12 Aug. 1885. At 21 she married Captain Edward Hunt (d. 1863) of the United States army, and began the wandering existence of an army officer's wife. From 1867 to her death, 16 years later, her pen hardly rested. She wrote verses, sketches of travel, essays, children's stories, novels, and tracts for the time, generally over the pen-name "H. H." Her life in the West after her marriage to W. S. Jackson, a banker of Colorado Springs, revealed to her the wrongs of the Indian, which she set herself at once to redress. Newspaper letters, appeals to government officialism, and finally her 'Century of Dishonor' (1881), a sharp arraignment of the nation for perfidy and cruelty towards its helpless wards, were her service to this cause. Her most popular story, 'Ramona,' (1884), a romance whose protagonists are of Indian blood, was also an appeal for justice. This book, however, rose far above its polemic intention; the beauty of its descriptions, its dramatic movement, its admirable characterization, and its imaginative insight entitling it to high rank. Two novels in the 'No Name Series'—'Mercy Philbrick's Choice' (1876) and 'Hetty's Strange History' (1877)—show the qualities that infuse her prose: color, brilliancy of touch, grace of form, certainty of intuition, and occasional admirable humor. She had not the gift of construction, and lacked the power of self-criticism; so that she is singularly uneven. It is no doubt chiefly her poems which have gained for "H. H." a place in literature. They reveal genuine lyrical power, although at times marred by defective technique. Among books of hers not already named are: 'Bits of Travel' (1873); 'Glimpses of Three Coasts'; 'Sonnets and Lyrics.' To her have often been attributed the noted 'Saxe Holm' stories.

Jackson, Henry Rootes, American diplomat and soldier: b. Athens, Ga., 24 June 1820; d. Savannah, Ga., 23 May 1898. He was graduated at Yale in 1839, admitted to the bar in Georgia and for several years was district attorney. He served in the Mexican War, became judge of the superior court, and in 1853 went to Vienna as *chargé d'affaires,* and the following year was made minister resident there. Before the outbreak of the Civil War he seceded from the Charleston Convention and, when his state seceded, joined the Federal army. He eventually resigned, and joined the Confederate forces. Near the close of the war he was made a brigadier-general in Hood's army and was captured with his whole command at Nashville after the battle of Franklin. In 1885 he was appointed United States minister to Mexico. He was the author of 'Tallulah, and Other Poems' (1850).

Jackson, Howell Edmunds, American jurist: b. Paris, Tenn., 8 April 1832; d. West Meade, Tenn., 8 Aug. 1895. He was graduated from the University of Virginia in 1854, from the law department of Cumberland University in 1856, began practice in Jackson, and later in Memphis, and upon the organization of the Confederate government became receiver for property in West Tennessee confiscated to the purposes of the Confederacy. Subsequent to the war he became a member of the court of referees of Tennessee, a tribunal which acted as a provisional supreme court in the hearing of cases that had arisen during the war period. Elected to the State legislature in 1880, he took his seat in the United States Senate in 1881, afterward left the Senate to become United States circuit court judge for the West Tennessee district, and in 1893 was appointed an associate justice in the United States Supreme Court.

Jackson, James, American soldier and statesman: b. Moreton Hampstead, Devonshire, England, 21 Sept. 1757; d. Washington, D. C., 19 March 1806. He emigrated to America with his father in 1772, and studied law in Savannah. In March 1776 he aided in repelling a British attack upon that town, and subsequently was appointed brigade major of the Georgia militia. In 1781 he aided in the capture of the fort at Augusta, and was left in command of

the place, and upon the evacuation of Savannah by the British in 1782 was appointed by General Wayne to receive the keys of the town. In 1789 he was chosen a representative in Congress, and from 1792 to 1795 was a member of the United States Senate. He had the principal share in the framing of the Georgia constitution of 1798, and upon its adoption was elected governor of the State, and held that office until his reelection in 1801 to the United States Senate.

Jackson, James, American physician, brother of Charles Jackson (q.v.): b. Newburyport, Mass., 3 Oct. 1777; d. 1867. He was graduated at Harvard College in 1796; studied medicine in London, and on his return to Boston in 1800 commenced practice there, devoting himself entirely to medical practice, to the exclusion of surgery and other branches. In 1803 he became a member of the Massachusetts Medical Society. In 1810, with Dr. John C. Warren, he brought before the community a proposition for establishing a hospital in the city of Boston. The first result of this was the organization of the asylum for the insane at Somerville, then included in Charlestown, and afterward of the Massachusetts General Hospital in Boston. Dr. Jackson was the first physician, and Dr. Warren the first surgeon, to this institution. In 1810 he was chosen professor of clinical medicine in Harvard, and in 1812 professor of theory and practice, becoming professor emeritus in 1835. His principal publications were: 'On the Brunonian System' (1809); 'Remarks on the Medical Effects of Dentition'; 'Letters to a Young Physician' (1855). Of the last work several editions were printed.

Jackson, Patrick Tracy, American merchant, brother of Charles Jackson (q.v.): b. Newburyport, Mass., 14 Aug. 1780; d. Beverly, Mass., 12 Sept. 1847. At the age of 15 he was apprenticed to a merchant of Newburyport, and subsequently established himself in Boston in the India trade, in which he acquired a handsome fortune. In 1812, at the invitation of his brother-in-law, Francis C. Lowell, who had recently examined the process of the cotton manufacture in England, he engaged in a project to introduce the power loom, then newly invented, and the mode of constructing which was kept secret, into the United States. After repeated failures they succeeded in 1812 in producing a model from which a machine was subsequently constructed by Paul Moody. In 1813 they built their first mill at Waltham, near Boston, the first in the world that combined all the operations for converting the raw cotton into finished cloth. In 1821 Jackson made large purchases of land on the Merrimack River near the Pawtucket canal, on which a number of mills were constructed by the Merrimack Manufacturing Company, a corporation organized under his auspices. This settlement formed the germ of the present city of Lowell. He procured in 1830 a charter for a railroad between Lowell and Boston, the construction of which he directed until its completion in 1835.

Jackson, Samuel Macauley, American church historian: b. New York 19 June 1851. He was graduated from the College of the City of New York in 1870, from the Union Theological Seminary in 1873, and after further study at Leipsic (1873–6), held the pastorate of the Presbyterian Church at Norwood, N. J., in 1876–80. In 1895 he became professor of church history in New York University. He was assistant editor of Schaff's 'Bible Dictionary' in 1878–80, associate and managing editor of the 'Encyclopædia of Religious Knowledge' in 1880–4, and edited 'A Concise Dictionary of Religious Knowledge' (1891). He also prepared the first important bibliography of foreign missions (1891), wrote 'Huldreich Zwingli' (1901), the first original English biography of its subject, and was chosen secretary of the church history section of the American Historical Association.

Jackson, Sheldon, American educator: b. Minaville, N. Y., 18 May 1834. He was graduated at Union College in 1855, at Princeton Theological Seminary in 1858; was ordained to the ministry of the Presbyterian Church in the latter year; and was missionary to Western Wisconsin and Southern Minnesota in 1859–69. In 1869–82 he was superintendent of Presbyterian missions in western Iowa, Nebraska, the Rocky Mountain territories, Wyoming, Colorado, New Mexico, Arizona, Utah, and Montana, and from 1877 in Alaska. In 1885 he became United States general agent of education in Alaska, and in 1887 organized the Alaskan society of natural history and ethnology at Sitka. He aided in founding a Christian college in Utah in 1896, was moderator of the Presbyterian General Assembly in 1897, and wrote: 'Alaska and Missions on the North Pacific Coast' (1880); 'Education in Alaska' (1881); annual reports on 'Education in Alaska' from 1886; and annual reports on the 'Introduction of Domestic Reindeer into Alaska' (1891–1901).

Jackson, Stonewall. See JACKSON, THOMAS JONATHAN.

Jackson, Thomas Graham, English architect: b. Hampstead 21 Dec. 1835. He was educated at Oxford University and became the pupil of Sir George Gilbert Scott (q.v.) (1858–61), making a specialty of the Gothic style. He has designed most of the new buildings in Oxford, Cambridge, Eton, Westminster School, Rugby, Harrow, etc., and has restored Great Malvern Priory and Bath Abbey, besides building many new Gothic churches. He has written: 'Modern Gothic Architecture' (1873); 'Wadham College, Oxford: its History and Buildings' (1893); 'The Church of St. Mary the Virgin, Oxford: its History and Architecture.'

Jackson, Thomas Jonathan, commonly called "STONEWALL JACKSON," American general: b. Clarksburg, Harrison County, W. Va., 21 Jan. 1824; d. near Chancellorsville, Va., 10 May 1863. Lieutenant-General Thomas Jonathan Jackson was one of the most unique, romantic characters of the War between the States, and crowded into the two years in which he served more brilliant achievements which won him wider fame than any other soldier on either side. Descended from Scotch-Irish stock and inheriting many of the qualities of his ancestry, he was left a penniless orphan when three years old, and soon showed "the stuff of which heroes are made," in his manly self-reliant efforts to

support himself. Learning of a vacancy from his Congressional District in the military academy at West Point, he determined to make the journey to Washington and seek the appointment, and set out at once — traveling a part of the way on foot — appearing before the member of Congress from his district in his suit of homespun, and with his leathern saddlebags over his shoulders. The Congressman presented him to the secretary of war, who was so much pleased with the youth's determination that he at once made out his appointment to West Point. He was very badly prepared to enter the academy and barely "squeezed through" on his entrance examination, but by persevering work he gradually rose in his grade until in July 1846 he was graduated No. 17 in a brilliant class containing such men as McClellan, Foster, Reno, Stoneman, Couch, Gibbon, A. P. Hill, Pickett, Maury, D. R. Jones, Wilcox, and others; and one who knew him intimately expressed the confident belief that if the course had been longer "Old Jack" would have graduated at the head of his class. He immediately reported for duty in Mexico, and serving in the artillery won distinction on every field, always seeking the post of danger, being made first lieutenant at the siege of Vera Cruz, brevetted captain at Contreras and Churubusco, and major at Chapultepec, rising to this rank in seven months, and being promoted more rapidly than any other officer of his grade in the Mexican War. He was frequently and honorably mentioned in the official reports, and John B. Magruder, his immediate superior, wrote of him: "If devotion, industry, talent, and gallantry are the highest qualities of a soldier, then he is entitled to the distinction which their possession confers." In the City of Mexico, after its capture and occupation, he had under the influence of that earnest Christian soldier, Colonel Taylor, become deeply concerned on the subject of personal religion and made a profession of faith in the Lord Jesus Christ. At West Point he had adopted as his motto: "You may be whatever you resolve to be," and now he added to this motto the saying of the great Apostle: "I can do all things through Christ which strengtheneth me." These two mottoes were the keynotes of his life and led the penniless orphan boy to become one of the immortals.

On the earnest recommendation of his old comrade, D. H. Hill, whose brother-in-law he afterward became, Jackson was elected, in 1851, professor of natural science and instructor of military tactics in the Virginia Military Institute, Lexington, Va., being elected over McClellan, Reno, Rosecrans, and G. W. Smith, whose names were submitted by the faculty at West Point. He made little reputation as a professor, for while thoroughly acquainted with his subject he lacked that "aptness to teach" so essential to a successful teacher, and the cadets were always playing pranks upon him, and laughing at his eccentricities. But he became one of the most consecrated active members of the Presbyterian Church, and left his impress as a Christian upon the community. From his habit of instructing his own servants in Scripture lessons every Sunday afternoon grew his famous negro Sunday school to which he devoted so much time and thought, to which he contributed so liberally of his moderate means, — sending his pastor checks for it in the midst of his most active campaigns, — and which made such an impress upon the negroes and gave Jackson so warm a place in their affections that the first contribution to his monument was made in 1887 by the negro Baptist Church of Lexington. Jackson was a Union man, opposed to secession as a remedy for Southern wrongs, though thoroughly believing in the abstract right of a State to secede, and greatly deprecated the war which he predicted would follow; but when the news reached the quiet little town of Lexington that Mr. Lincoln had called for 75,000 troops to coerce sovereign States, and that the Union Convention of Virginia had passed an ordinance of secession, Jackson said in a speech before a public meeting: "I have longed to preserve the Union and would have been willing to sacrifice much to that end. But now that the North has chosen to inaugurate war against us, I am in favor of meeting her by drawing the sword and throwing away the scabbard." Governor Letcher, his old neighbor and friend, who had a high estimate of his abilities, commissioned him colonel in the Virginia forces; but his brilliant record in Mexico had been forgotten — he was only thought of as the quiet, eccentric professor, and when his name was presented to the Virginia convention, a prominent member arose and asked: "Who is this Major Jackson, anyway?" and it required all the eloquence of the Rockbridge delegates to secure his confirmation.

Marching the corps of cadets to Richmond where he remained for a brief season assisting in organizing and drilling the raw recruits in the "Camp of Instruction," he was ordered to Harper's Ferry on 3 May, where the skill he showed in reducing the high-spirited rabble who had rushed to the front at the first sound of the bugle to the respectable Army of the Shenandoah, which he turned over to the command of General J. E. Johnston 23 May, showed clearly that he was a soldier. Placed in command of the Virginia brigade which afterward became so famous, he met the advance of General Patterson at Falling Waters on 2 July, gave them a decided check, and captured a number of prisoners. Soon after he received his commission as brigadier-general in the following characteristic letter from General Lee:

> RICHMOND, 3rd July, 1861.
>
> MY DEAR GENERAL:— I have the pleasure of sending you a commission of brigadier-general in the Provisional Army; and to feel you merit it. May your advancement increase your usefulness to the State.
>
> Very truly,
>
> R. E. LEE.

But it was in the battle of first Manassas (Bull Run) that Jackson won his new name and fame, and the ringing words of the gallant Bee: "There stands Jackson like a stone wall," changed the name of "Thomas Jonathan" into the immortal "Stonewall" Jackson. He was wounded in the hand but refused to leave the field, and while the surgeons were dressing his wounds President Davis rode on the field, and Jackson, pushing aside the surgeons, tossed his cadet cap in the air and exclaimed: "Hurrah for the President. Give me ten thousand men and I will be in Washington to-night!" In September he was made major-general, and was sent on 4 October to command the "Valley District" and enter in the early part of 1862

GEN. THOMAS J. ("STONEWALL") JACKSON

on that famous "Valley Campaign," which is now studied in military academies in Europe as illustrative of able strategy, rapid movements, and heroic fighting. In March he fell back before Banks' army of 35,000 men, and Banks reported him "in full retreat from the valley" and started a column to cross the mountains and attack Johnston in flank as he was falling back from Manassas, when Jackson suddenly turned, marched 18 miles in the morning, and with 2,700 men fought at Kernstown, near Winchester, 8,000 of the enemy, and though sustaining the only defeat that ever befell him he accomplished his purpose in recalling the column which was moving on Johnston's flank, quietly moved up the valley and took a strong position in Swift Run Gap from which he could easily defend himself or strike the enemy if he attempted to move on Staunton. Ewell's division coming to take his place, he left this grim soldier to watch Banks, and moved so secretly that neither friend nor foe had divined his plans until he thrilled the Confederacy and sent terror to the North by the following laconic and characteristic despatch:

Valley District, May 9th, 1862.

GEN. S. COOPER:— God blessed our arms with victory at McDowell yesterday.

T. J. JACKSON, Major-General.

He had defeated the advance of Fremont under Milroy and driven it back in great confusion. Then followed in rapid succession the uniting of Ewell's division with his at Luray, the driving in of Banks' flank at Front Royal, the cutting of his retreating column at Middletown, and on 25 May the rout of Banks' army from the heights of Winchester, and driving him pellmell across the Potomac. He was about to cross the Potomac into Maryland in pursuit of Banks when he learned that Fremont from the West, and Shields, the head of McDowell's column, from the East, were marching to form a junction in his rear at Strasburg. He at once put his army in motion and by forced marches (one of his brigades marched 52 miles in one day) he reached the point of danger in time to hold Fremont in check with one hand and Shields with the other until his whole army, prisoners, and immense wagon trains loaded with captured stores passed on in safety. He then moved leisurely up the valley, burning the bridges over the Shenandoah to prevent a juncture between Fremont and Shields — his rear being protected by that chivalrous knight and brave soldier, General Turner Ashby, who filled the valley with the fame of his brilliant achievements, and whose fall in a severe fight near Harrisonburg on 6 June was sadly lamented as a great calamity to the Confederate cause. On 7 June, at Cross Keys, Ewell badly defeated Fremont, and on 8 June, at Port Republic, on the opposite side of the river, Jackson routed Shields, and the armies sent to "crush" him were soon rapidly retreating down the valley, while "Stonewall" — that name will cling to him, but "Thunderbolt," "Tornado," or "Hurricane," would be more expressive of his character,— remained master of the situation. This campaign may be thus summarized: In 32 days Jackson and his "foot cavalry" had marched nearly 400 miles, skirmishing almost daily, fought five battles, defeated three armies, two of which were completely routed, captured 20 pieces of artillery, 4,000 prisoners, and immense quantities of stores of all kinds, and had done all this with a loss of fewer than 1,000 men killed, wounded, and missing, and with a force of only 15,000 men, while there were at least 60,000 men opposed to him. He had spread consternation throughout the North and had neutralized McDowell's 40,000 men at Fredericksburg, who were about to march to the aid of McClellan in investing Richmond. Jackson now rested for a brief season, was reinforced from Lee's army, made the impression on the enemy that he would advance down the valley again, and managed matters so secretly that Banks at Strasburg was busily engaged in fortifying against an expected attack from him at the very time he was thundering on McClellan's flank at Richmond over 200 miles away. The part he bore in the Seven Days around Richmond, the second Manassas campaign, and the Maryland campaign was so conspicuous and so important that it would be, indeed, to write the history of the army to give it in detail. His skill and daring in the Seven Days battles, his defeat of Pope's advance under Banks at Cedar Run, his flank march to Pope's rear, and the pertinacity with which he held him at bay along the Warrenton road until Lee could come up with Longstreet and drive him into the fortifications around Washington, his capture of Harper's Ferry with 11,000 prisoners, 13,000 stand of small arms, 73 pieces of artillery, and large quantities of provisions and stores of every description, and his conduct on the field of Sharpsburg, all added greatly to the fame of Stonewall Jackson and his grand old corps of "Foot Cavalry." It was the privilege of the writer of this sketch to be under Jackson during the whole of his brilliant career, and it may not be amiss to describe him as he appeared at the head of his victorious legions: About 37 years old, six feet high, medium size, gray-blue eyes, light brown hair, a rough mouth, iron jaw, and nostrils as big as a horse's. He wore a plain gray uniform which soon became faded and soiled, cavalry boots, and an old gray cadet cap with its rim tilting on his nose. He rode a raw-boned sorrel horse which the men said "could not run except toward the enemy," but whenever he appeared among the troops they would begin to give the Confederate yell, and he would take off his cap, put spurs to "Little Sorrel" and gallop away from them as rapidly as possible. This was so well understood that, when cheering was heard, some soldier would say: "There comes old Stonewall, or an old hare, one," and it was said that "the appearance of those personages never failed to elicit the genuine old Confederate yell." On 10 Oct. 1862 he was made lieutenant-general, and his corps made to consist of his old division, under W. B. Taliaferro, Early's division, A. P. Hill's division, and D. H. Hill's division, Colonel Brown's regiment of artillery, and numerous light batteries. At Fredericksburg, 13 Dec. 1862, he held the extreme right of Lee's army, and defeated with great slaughter Franklin's attack upon him. The following winter and spring Jackson spent in improving the organization, discipline, and efficiency of his corps, and as, in his judgment, a most important means of accomplishing this, he labored to have chaplains in every regiment and missionaries to visit the army, and did everything in his power to promote the religious welfare of his soldiers. It was largely through

his influence that a chaplains' association was formed, and he had regular prayer-meetings at his headquarters during the weeks and preaching on Sundays. But the end hastened on, Gen. Hooker threw Sedgwick across the river below Fredericksburg the latter days of April 1863, crossed the bulk of his army above and strongly fortified his lines at Chancellorsville in the confident hope that Lee would either retreat on Richmond, or attack him in his strong position, where a crushing defeat would await him. But instead of doing either of these things Lee left Early to watch Sedgwick, moved up to Hooker's front, and sent Jackson with 22,000 men to make a march to Hooker's flank and rear. This was brilliantly executed and Jackson routed that flank of Hooker's army, and was proceeding to cut him off from his line of retreat and take a position where Hooker would have been compelled to attack him, when in returning from one of those bold reconnoissances which he so frequently made, his party was mistaken for the enemy and fired on by his own men and he was very severely wounded. His left arm was amputated, his other wounds dressed, and he was doing well and gave every promise of recovery, when pneumonia, brought on by exposure before the battle, set in and he died at a quarter past three P.M., Sunday, 10 May 1863.

The great soldier had fought his last battle, won his last victory, and gone to wear his glittering "crown of rejoicing." He was buried as he had requested, in "Lexington in the valley of Virginia"; a beautiful bronze statue marks his grave; on the hill at the Virginia Military Institute has been reared the stately "Jackson Memorial Hall," and in the capitol square of his native State stands the noble bronze statue, the gift of English admirers. Lee spoke his fittest eulogy when he wrote him after hearing that he was wounded: "Could I have dictated events I should have chosen for the good of the country to have been disabled in your stead."

J. Wm. Jones, *Author and Lecturer.*

Jackson, William Hicks, American soldier and stockman: b. Paris, Tenn., 7 Oct. 1836; d. Nashville, Tenn., 30 March 1903. He was graduated from West Point in 1856, entered the Confederate army in 1861 as captain of artillery, and rose to be brigadier-general. Subsequent to the war he was proprietor of the Belle Meade stock-farm, near Nashville, Tenn., which sent to the races some of the greatest running horses of the American turf. He was president of the National Agricultural Congress, and high in the councils of the southern Democracy.

Jackson, Mich., city and county-seat of Jackson County; situated on the Grand River, about 37 miles south of Lansing and 76 miles west of Detroit, and on the main line of the Michigan Central Railroad. It is the termini of the Air Line, the Grand River Valley, and Jackson, Lansing & Saginaw railroads, branches of the Michigan Central; of the Toledo and Fort Wayne branches of the Lake Shore & Michigan Southern; the Cincinnati Northern, a branch of the Big Four, and the Michigan Air Line, a branch of the Grand Trunk railroads; and is connected with Detroit, Battle Creek, and Kalamazoo by traction lines.

Manufactures, Industries, etc.—Jackson is situated in a rich agricultural region and carries on an extensive trade in fruits, grains, and vegetables. Its chief manufactures are sewer pipe, flour, soap and starch, automobiles, pianos, oil stoves, corsets and underwear, wheels, engines and motors, locomotives, foundry products and agricultural implements. The car shops of the Michigan Central railroad, employing 1,200 men, are located here. Among the important industries are carriage- and wagon-making, manufacture of textiles, iron and steel, cigar-making, Portland cement, and mining, together employing about 6,000 hands, and with a yearly output of over $10,000,000. Coal and clay, the latter useful for pottery, are found near by.

Banks.—There are four banks, with a combined capital of $450,000, surplus and undivided profits of $275,000, and deposits of over $4,000,000.

Churches and Educational Institutions.—Nearly all denominations are represented and worship in 28 church edifices. The school system is exceptionally fine, there being two high schools and 17 graded public schools. There are also three Catholic schools.

Public Buildings, etc.—Among the prominent buildings are the Michigan State prison, Carnegie Library, the United States government building, Elks Temple, Masonic Temple, courthouse, and City Club. The city also has a hospital and two sanitariums, and Young Men's and Young Women's Associations.

Newspapers.—There are two morning and two evening dailies, with an aggregate circulation of 12,000, two semi-weeklies and three weeklies, one of which is German.

Government, Public Works, etc.—The executive authority is vested in a mayor and a council of 16 members, elected for a term of two years. The city is lighted by gas and electric light, and owns and operates its waterworks. It has a fire department with four well-equipped engine-houses, and an excellent police department. There is also an electric trolley system operating about 10 miles of track.

History.—The first permanent settlement was made by Horace Blackman in 1829, and was first called Jacksonburgh in 1830. In the same year a post-office was established and named Jacksonapolis. In 1831 the township of Jacksonburgh was formed, and remained such until 1838, when the name was changed to Jackson. When the Michigan Central Railroad was constructed through the southern part of the State, in 1841, Jackson grew rapidly, became a village in 1843, and an incorporated city in 1857.

Population.—The inhabitants are mainly native born, though about one third are of foreign descent, Irish, German, Polish, and Italian predominating. Pop. (1890) 20,798; (1900) 25,180; (1905) 28,000.

Thomas A. Wilson.

Jackson, Miss., capital of the State, county-seat of Hinds County; on the Pearl River, and on the Yazoo & M. V., the Illinois C., and the Alabama & V. R. R.'s; about 40 miles east of Vicksburg, on the Mississippi. The first permanent settlement was made in 1828 or 1829, and it was incorporated in 1840. In 1863 it was occupied for some time by Union forces under Gen. Grant, and the ruins of the fortifications erected at the siege are still in existence.

The city was nearly destroyed in 1864, by Gen. Sherman.

Jackson is situated in an agricultural region in which a large amount of cotton is raised. It is the commercial centre for a large section. The good railroad facilities and the advantage of traffic on the Pearl River are stimulating the increase of marketable agricultural and manufactured products. The chief industrial establishments are cottonseed-oil mills, fertilizer factories, sash, door, and blind factories, foundries, brick-yards, a cotton-compress, a plow and harrow factory, a broom factory and cooper shops. Some of the principal public buildings are the State capitol, State charitable institutions for the blind, insane, deaf and dumb, the State library, and the James Observatory. Among the private educational institutions of learning are the Millsaps College, founded in 1892 under the auspices of the Methodist Episcopal Church; and the Bellhaven College for young ladies. Pop. (1890) 5,920; (1900) 7,816; (1903) 12,000.

Jackson, Ohio, city, county-seat of Jackson County; on Salt Creek, and on branches of the Baltimore & O. S. W., the Hocking V., and the Ohio S. W. R.R.'s; about 100 miles east of Cincinnati and 70 miles southeast of Columbus. Jackson is located in the vicinity of the early routes of travel from the Ohio River to the interior of what is now the State of Ohio, and on to the Great Lakes. The first permanent settlement was made in 1795, but it was not incorporated until 1847, several years after the limits of Ohio were decided. It is situated in a coal and iron mining section, but there is a large amount of good farming land in the vicinity. The chief industrial establishments of the city are foundries, machine-shops, furnaces, woolen-mills, a tannery, and lumber-yards. The coal and iron ore-mining of the vicinity contributes largely to the industrial wealth of the city. Pop. (1900) 4,672.

Jackson, Tenn., city and county-seat of Madison County, situated about 80 miles northeast of Memphis, on the South Fork of the Forked Deer River, and on the Illinois C., Mobile & O., and Nashville, C. & St. L. R.R.'s. It is the trade centre of a large and fruitful agricultural region, is an important cotton market, and has manufactures of engines and boilers, cotton goods, lumber, machinery, flour, cottonseed-oil, furniture, trunks, spokes and skewers, plows, carriages, bricks, and other products. Here are located the Southwestern Baptist University, the Memphis Conference Female Institute, and Lane University. Jackson has a fine park, Carnegie Library, and modern municipal improvements, the waterworks and electric-light system being owned by the city. It has five banks with a combined capital of $400,000. The government is by mayor and a council of eight aldermen. Jackson was first settled in 1818. Pop. (1900) 14,511.

During the Civil War Jackson was at times the headquarters of Gen. Grant. It was captured by Union troops 7 June 1862. On 19 Dec. 1862, Gen. Forrest sent detachments of cavalry to destroy the railroad to the north and south, and with 400 men advanced on Jackson and had a running fight with two regiments of Union infantry and detachments of cavalry under Col. Engelmann of the 43d Illinois, who disputed Forrest's advance until the fortifications of the town were reached, when Forrest withdrew and moved on Humboldt and Trenton. On 13 July 1863, a Confederate cavalry force held the town and guarded a large number of conscripts. Col. Edward Hatch with 1,160 men of the 3d Michigan, 2d Iowa, 1st West Tennessee, and 9th Illinois cavalry regiments attacked the Confederates and drove them from the town, releasing about 450 conscripts, and capturing 250 horses and nearly 400 stand of small arms. Hatch's loss was very slight. The Confederates had 38 killed and about 150 wounded. Consult: 'Official Records,' Vol. XXIII.

Jackson (Miss.), Battle of. After the battle of Raymond (q.v.), 12 May 1863, Gen. Grant, having provided for the safety of his rear and left from the direction of Vicksburg, turned McPherson's and Sherman's corps and part of McClernand's on Jackson, 12 miles northeast of Raymond, to capture the place without delay. On the 13th McPherson moved from Raymond to Clinton, and then turned east on Jackson. Sherman moved through Raymond to Mississippi Springs on the 13th, and that night arranged with McPherson that both columns should arrive at Jackson about the same hour next day. McClernand closed up to Raymond and sent one division to Clinton to support McPherson. Gen. J. E. Johnston had arrived at Jackson on the evening of the 13th and, hearing next morning of the Union approach on the Raymond and Clinton roads, ordered Gregg's brigade to take position on the first-named road, and Walker's brigade on the latter, with instructions to each to delay the Union advance as long as possible, to give time for the removal of public property from the city. The combined strength of Gregg and Walker was about 6,000 men. About 9 A.M. of the 14th McPherson's advance on the Clinton road came upon Walker's pickets and drove them back upon the main body, posted in works on the crest of a semicircular ridge 2½ miles west of Jackson, the front covered by a marshy creek lined with dense willows, and artillery commanding the bridge over the creek. At the end of nearly two hours Crocker's division of three brigades was deployed in line, with one brigade of Logan's in reserve. At 11 A.M. the skirmishers advanced to the creek and were checked, upon which the entire division went forward, drove in Walker's skirmishers, and advanced over the open ground beyond the creek, meeting a stout resistance; but Walker's men soon retreated, abandoning seven guns. They were pushed more than a mile by Crocker; but his men fell into some disorder, and were finally brought to a stand by artillery posted in an inner line of works close to the town. While Crocker was reforming, Walker made his escape to the Canton road. Crocker's loss was 265 killed and wounded. On the Raymond road Sherman encountered Gregg and, by a flank movement, compelled him to abandon his entire line and ten guns, with the loss of nearly 200 prisoners and 81 in killed and wounded. Sherman's loss was 32. Johnston retreated northward on the Canton road. McPherson and Sherman entered Jackson between 3 and 4 P.M.; Sherman was left in the city to destroy the railroads, bridges, factories, arsenals, and everything valuable. On the morn-

ing of 15th Grant turned the rest of his army west, defeated Pemberton at the battle of Champion's Hill (q.v.) on the 16th, drove him across the Big Black on the 17th, and began the siege of Vicksburg. The Union loss at Jackson was 42 killed, and 251 wounded. The Confederates make their loss less than 400, but Sherman estimated it at 845 killed, wounded and missing. Consult: 'Official Records,' Vol. XXIV.; Johnston, 'Narrative'; Sherman, 'Memoirs, Vol. I.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. CARMAN.

Jackson, Siege of. The battle of Jackson (q.v.), 14 May, 1863, was followed by the movement of Gen. Johnston northwest, with Gregg's and Walker's brigades, to form a junction with Pemberton, who had been directed to join him; but early on the 19th he received word from Pemberton that he had decided to hold Vicksburg instead, upon which Johnston marched his troops to Canton. He was reinforced, and 29 June he marched west to operate in the rear of Grant, who was besieging Vicksburg. He was about to move on the morning of 5 July to the south of the Vicksburg and Jackson Railroad, when he heard that Vicksburg had fallen, whereupon he fell back to Jackson and occupied a line of works covering the town, with both flanks on Pearl River. Gen. Sherman had been held in readiness to move back and drive the Confederates from the State, and when Vicksburg fell he moved promptly with his own corps and those of Gen. Ord and Parke, crossed the Big Black at three different points, and by 11 July was close up to Johnston's works and shelling the city with nearly 100 guns. Ord's Thirteenth corps was on the right, the Fifteenth corps in the centre, and Parke's Ninth corps on the left. On the 12th the fire of the artillery was increased, reaching every part of the town, and Lauman's division of Ords' corps, moving in dense woods, came too close to the Confederate works, was struck in flank and driven back in disorder, losing over 500 men killed, wounded, and captured, together with the colors of three regiments. The siege was prosecuted night and day, and on the morning of the 17th Jackson was found evacuated, Johnston having retreated on the road to Brandon, and thence to Morton, where he arrived on the 20th. Steele's division pursued Johnston as far as Brandon, 14 miles from Jackson; Sherman remained five days at Jackson, destroying much property of every description, and then returned to Vicksburg. The Union loss at Jackson, 11–16 July, was 129 killed, 762 wounded, and 231 missing or captured. The Confederate loss, 5–25 July, was 71 killed, 504 wounded, and 764 captured or missing. Consult: 'Official Records,' Vol. XXIV.; Johnston, 'Narrative'; Grant, 'Memoirs,' Vol. I.; Sherman, 'Memoirs,' Vol. I.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. CARMAN.

Jacksonville, Fla., one of the most important and rapidly growing ports of the southeastern United States; chief city of the State, and seat of Duval County in the northeastern corner; on the west bank of the St. John's, 24 miles from the ocean by water, 14 direct. It is one of the chief southern railroad centres, six important lines converging there, three of them great trunk lines: the Southern, Seaboard Air Line, Atlantic Coast Line, Georgia Southern & Florida, Florida East Coast, and Jacksonville & Southwestern. It is 138 miles south of Savannah, 212 north of Tampa, and 165 east of Tallahassee; and about 1,000 from New York, with train service of 25 to 28 hours. It is also connected with all the Atlantic coast cities by the Clyde, Mallory, and Ocean Steamship lines; and with the picturesque St. John's and its tributaries by six daily and tri-weekly lines of steamers. The fascinating rivers, lakes, Everglades, etc., of Florida, the best hunting and fishing grounds east of the Mississippi, with Jacksonville's mild and healing winter and even summer climate, make it one of the leading tourist resorts in the country, some 50,000 to 60,000 stopping annually at its numerous large and well-equipped hotels.

Jacksonville's position makes it the business key and metropolis of the peninsula, the great shipping point for Florida's exports, and the distributing point for its purchases. Of the former, the chief are lumber, shingles, and ties, mainly yellow pine from the great Florida forests, to nearly $2,000,000 a year; next come naval stores — turpentine, rosin, and rosin oil — of over $1,000,000, and rapidly increasing, a company with $3,000,000 capital having been recently organized for it; cotton has also risen to over $600,000 a year; and an extremely heavy element is the shipping of fruit — oranges, pineapples, and a great diversity of tropic fruits, for which see FLORIDA — and garden vegetables to the North. In a suburb of the city is the largest ostrich farm in the United States, and the only one east of California, whose products form part of the shipments; these also include great quantities of phosphates and fertilizers, and kaolin. As a jobbing centre for interior trade, it has the immense advantage of having practically no competitor in the State, and is rapidly becoming one of the foremost in the South; there are 19 large wholesale grocery houses alone, and the freight entries of grain, hay, and milled products amounted in 1900 to over $12,000,000. Its gross annual trade exceeds $75,000,000. This business implies large banking facilities; and there are now two national and three State banks in the city, besides a savings bank, with over $1,100,000 of capital and undivided profits.

In manufacturing, Jacksonville's chief specialty is lumber and timber products, which in 1900 amounted to nearly a third of the entire output of $2,312,309; there are ten large saw and planing mills. Of the other industries, the most considerable was the manufacture of ice, five establishments producing $87,647 worth; a witness to the needs of thronging tourists in a warm climate. But there were also foundry and other iron products, steam engineering works, brick and tile, paving and roofing materials, wooden ship and boat building, carriages, saddlery, mattresses and palmetto fibre products, pulp, patent medicines, confectionery, cigars, and other articles. There are about 200 different establishments in all.

As a port, it has long been hampered by shoals in the river, and the bar outside the St. Johns. The river is a magnificent estuary, a mile wide for many miles up, and with a channel deep enough for the largest ocean vessels; but it

was not until 1896, by combined government and local efforts, that a channel 19 feet deep was obtained from Jacksonville to the ocean, admitting vessels of 3,800 tons. The National government, at last, in 1901, appropriated $1,300,000 to deepen it to 24 feet all the way, by a permanent system of jetties and dredging. It has over seven miles of water front. The city, 7.6 square miles in area, is handsomely laid out, and its business section is almost entirely new, having been practically obliterated by a fire on 3 May 1901, which destroyed 148 blocks, covering 455 acres and including 2,361 buildings, a property loss of over $15,000,000. With astonishing energy up to 25 Oct. 1903, 3,361 new buildings had been erected, 1,000 more than were destroyed, and greatly improved ones. Among the finest buildings are the Union station, United States post-office and custom-house, Masonic Temple, St. Luke's hospital, National Bank of Jacksonville (which were spared by the fire). Among the public buildings since erected are the Windsor hotel, Seminole, Elks, Woman's and Wheelmen's club-houses, Mercantile Exchange Bank, Board of Trade, and Duval High School. A $50,000 Carnegie free library is being erected. The religious denominations have built a number of fine churches, costing from $25,000 to $100,000 each. Notable among them are the Congregational, Baptist, Christian, McTieire Memorial (M. E. South), Snyder Memorial (M. E.), Presbyterian, St. John's Episcopal, Church of Good Shepherd, Episcopal, and three fine colored churches. There are five parks of 57 acres in all, "Hemming" having a Confederate monument; and 14 miles of shell streets and drives, besides a general macadamizing of paving with vitrified brick. The ocean beaches, 18 to 20 miles off, are among the finest on the Atlantic coast. The sanitation of the city is perfect. After the yellow fever epidemic of 1888 it installed a fine thorough system of sewerage, drained and filled in the swampy tracts around, and replaced the water supply with one almost chemically pure, drawn from artesian wells 500 to 1,000 feet deep. Its death rate has sunk to 10 in 1,000, one of the lowest in the country. There are 20 miles of trolley tracks, and the city owns electric-light works and waterworks; both light and water are extremely cheap. The finances of the city are in the best condition. It has never defaulted its bonds, which are for the waterworks and electric plant, and amount to $1,368,000, payable 15 May 1904 at 5 per cent. There is no floating debt. The assessed valuation is $15,000,000; tax 16.02 mills on the dollar, or 11 mills if beyond the hydrants. Jacksonville was settled in 1816 by Lewis Z. Hogans, whence Hogans' Creek, dividing the city, is named. In 1822 it was laid out and named after Andrew Jackson, the first territorial governor of Florida. It was incorporated in 1833. The Seminole War prevented its development, but it revived in 1842 and has grown steadily since. Its population in 1850 was 1,045, in 1860 2,118, in 1870 6,912, the war having been an immense gain instead of loss; 1880 7,650, 1890 17,201, 1900 28,429, of whom 16,271 or 57 per cent were colored. At present (1903) is over 35,000.

CHAS. H. SMITH,
Secretary Jacksonville Board of Trade.

Jacksonville, Ill., city, county-seat of Morgan County; situated on the Mauvaisterre Creek, a branch of the Illinois River, about 34 miles southwest of Springfield and 88 miles north of St. Louis, Mo.; on branches of the Wabash, the Chicago & A., the Burlington, the Chicago, P. & St. L., and the J. & St. L., the last of which is also a part of the Burlington system. Jacksonville was laid out as early as 1825, about seven years after the admission of the State of Illinois into the Union, established as a town in 1840, and incorporated as a city in 1867. It was made the county-seat of Morgan County in 1825. The origin of the name of the city is somewhat uncertain, but the most probable tradition seems to indicate that it was named in honor of Andrew Jackson, who was a prominent Presidential candidate at the time when the town was founded. Jacksonville is noted for its institutions of learning, its wide, prettily shaded streets, and its handsome residences. It is the seat of Illinois College, the oldest college in the State, founded through the efforts of local residents and a band of students from Yale College. Originally non-sectarian, the college has recently become Presbyterian, has absorbed the Jacksonville Female Academy, and become affiliated with the University of Chicago. Among the other institutions are: the Illinois Woman's College, established in 1847 under the auspices of the Methodist Episcopal Church; the State Central Hospital for the Insane; the State School for the Blind; the State School for the Deaf and Dumb; Our Saviour's Hospital, in charge of the Sisters of the Holy Cross; the Passavant Memorial Hospital; a Carnegie Free Public Library; the Conservatory of Music; and Whipple Academy, a preparatory school. The last two are connected with Illinois College. The city-hall, the court-house, and the high school are the most prominent public buildings. Besides these, there are numerous church edifices, the most attractive of which is the Westminster Presbyterian. The most important industrial establishments of the city are the woolen mills, and the car-shops of the Chicago, Peoria & St. Louis Railroad. Other manufactures include machine-shop products, bricks, candy, paper, and flour. The executive head of the city government is a mayor, who holds office for two years, and a city council composed of 12 members elected for two years by the four wards. The mayor appoints the administrative officials, subject to confirmation by the council. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 12,935; (1900) 15,078.

C. H. RAMMELKAMP,
Head of Department of History and Political Science, Illinois University.

Jacob (Heb. *Yaqōbh*, the supplanter), the son of Isaac, and the grandson of Abraham, the last of the Jewish patriarchs, and the real ancestor of the Jews. He died at the age of 147 years, about 1860 B.C., and was buried in the tomb of Abraham, before Mamre in Canaan.

Jacob Tome Institute, an institution of secondary education located at Port Deposit, Md. It was founded 1894 by Jacob Tome. When Mr. Tome's gift was made, only five other citizens of the United States — Stephen Girard, Anthony J. Drexel, Johns Hopkins,

Charles Pratt, and John D. Rockefeller — had made greater gifts to educational institutions. The endowment and other property of the school are estimated at more than $3,000,000. The Jacob Tome Institute was incorporated in 1889. The boarding school for boys, founded in 1900, is located on the hills overlooking the historic Susquehanna River. The grounds of the institute include about 160 acres. The principal buildings are Memorial Hall, erected in memory of the founder, two dormitories, gymnasium, the Inn, power plant, and infirmary. The school consists of six classes, each requiring one year. The studies of the last three years are arranged in five groups which prepare students for college, technical schools, or for active business life. The institute confers no degrees, although a certain amount of collegiate work can be and is done in the regular courses: Students must be not less than 10 years of age in order to gain admission. Special scholarships are offered to boys from Maryland. There is also a kindergarten, Junior School, and Senior School for girls.

Jacobi, jạ-kō'bĭ, Abraham, American physician: b. Hartum, Westphalia, 6 May 1830. He was educated at the universities of Greifswald, Göttingen, and Bonn, and was graduated as M.D. from the latter in 1851. Those were years of revolutionary ferment in Germany and Jacobi, becoming identified with the movement, was held in detention for "high treason" at Berlin and Cologne (1851–3). In 1853 he settled in practice in New York, where his abilities soon brought him into notice. He was appointed professor of diseases of children at the New York Medical College (1860–5) and held a similar chair in the medical department of the University of the City of New York (1865–70). Some years later he became professor of the diseases of children at the College of Physicians and Surgeons. He has held many important appointments, and was president of the New York State Medical Society (1882) and of the New York Academy of Medicine (1885–9). In 1900 his 70th birthday was made the occasion of a public demonstration in his honor. Author: 'Dentition and its Derangements'; 'Infant Hygiene'; 'Diphtheria'; 'Therapeutics of Infancy and Childhood'; 'Infant Diet.'

Jacobi, Friedrich Heinrich, German philosopher: b. Düsseldorf 25 Jan. 1743; d. Munich 10 March 1819. He was educated at the University of Geneva, and in 1764 entered upon a commercial career in his native town; after a few years, he retired from business, and in 1770 became a member of the councils for the duchies of Juliers and Berg. From his university days he was actively interested in literature and philosophy, and with Wieland started a journal in which some of his own writings were first published. In 1779 he went to Munich for a short time; and in 1793 left Düsseldorf and settled in Holstein. In 1804 he was called to Munich as a member of the Academy of Sciences then newly established; from 1807 to 1812, he was president of the academy; and in 1812 retired to prepare a collected edition of his works, which, however, was not finished before his death. His writings include two philosophical romances, 'Allwills Brief-Sammlung' (1774), and 'Woldemar' (1779); and the more important philosophical treatises 'Briefe über die Lehre Spinoza's' (1785); 'David Hume über den Glauben oder Idealismus and Realismus' (1785); 'Von den Göttlichen Dingen' (1811). In these treatises he defines his theory that man's thought — or reason — is by its nature partial and limited, and can only connect facts, not explain their existence; and that the higher truths must be understood through another different faculty which he calls "faith" or "belief" ("Glaube"); he does not, therefore, seek to establish a systematic philosophy. His theories involved him in considerable controversy, especially with the adherents of the critical philosophy.

Jacobi, Herman Georg Jakob, German Sanskrit scholar: b. Cologne 11 Feb. 1850. He was educated at Cologne Gymnasium, and later took up a course of studies in Sanskrit and allied languages at the universities of Bonn and Berlin. After spending a year (1872–3) in the Indian office in London on the old Sanskrit manuscripts, he went to India, making a tour of Rajputana. In 1875 he became a docent in Sanskrit at Bonn; from 1876–85 was professor extraordinarius of Sanskrit and Comparative Philology at Münster, Westphalia; in 1885 was made professor ordinarius of Sanskrit at Kiel, Holsatia; and in 1889 was appointed professor of Sanskrit at Bonn. He made a particular study of Jainism and Prâkrit grammar, writing exhaustively on those subjects as well as on the Sanskrit poetical languages. Among the most important of his works are 'The Indian Antiquary' and the 'Epigraphia Indica', published in 1892, in which he gives two sets of tables showing the Hindu dates in inscriptions, a work of much value. His other works include: 'De Astrologiæ Indicæ, Horâ appellatæ originibus' (1872); 'The Kalpasûtra of Bhadrabâhu' (1879); 'The Âyaramgo Sutta of the Çvetâmbra Jains' (1882); 'Gaina Sûtras' (1884); 'Ausgewählte Erzählungen in Mâhârâshtrî. Zur Einführung in das Studium des Prâhrit' (1886); 'The Porisishtaparvan by Hemachandra' (1891); 'Sthavirâvali Charita' (1891); 'Das Râmâyana Geschichte und Inhalt, nebst Concordanz der gedruckten Recensionen' (1893); 'Kompositum und Nebensatz, Studien über die indogermanische Sprachentwicklung' (1897); etc.

Jacobi, Johann Georg, German poet: b. Düsseldorf 1740; d. 1814. He was a brother of the philosopher, Friedrich Heinrich Jacobi (q.v.) He was educated at Göttingen and in 1766 was appointed to the chair of philosophy and oratory at the University at Halle. In 1784 he became professor at Freiburg. He edited 'Iris' with Gleim (1774–6); and published in 1786 his correspondence with Gleim. An edition of his collected works was published at Zürich in 1882 and his 'Ungedruckte Briefe von und an Johann Georg Jacobi' appeared in 1874 edited by Martin.

Jacobi, Karl Gustav Jakob, German mathematician: b Potsdam 10 Dec. 1804; d. Berlin 18 Feb. 1851. He obtained his education at the University of Berlin, where he studied especially mathematics and philosophy, later in 1824 becoming a privat-docent there. In 1825 he became assistant professor of mathematics at Königsberg and in 1827 was appointed professor. He was appointed a member of the Prussian Academy of Sciences in 1836 and from

1842 till his death in 1851 lectured at the University of Berlin. His most important work was on the theory of elliptic functions but he also made some valuable contributions to the theory of numbers and determinants. Only a small portion of his writings and lectures were published during his lifetime and the greater part of these were published in the *Crelles Journal.* Among these are: 'Fundamenta Nova Theoriæ Functionum Ellipticarum' (1829); 'Canon Arithmeticus' (1839); 'De Formatione et Proprietatibus Determinantium' (1841); 'Mathematische Werke' (1846–71). A complete edition of his works 'Gesammette Werke' was published in seven volumes by the Berlin Academy of Sciences (1881–91). His 'Vorlesungen über Dynamik' did not appear till 1866, long after his death, and later in 1895, his essay 'Uber die vierfach periodischen Functionen Zweier Variabeln' was translated into Latin and published.

Jacobi, Mary Putnam, American physician: b. London, England, 31 Aug. 1842. She was graduated from the New York College of Pharmacy in 1862, from the Woman's Medical College of Philadelphia in 1864, and from the Ecole de Médecine of Paris in 1871. She then entered practice in New York, in 1881 was appointed clinical professor of the diseases of children in the New York Post-Graduate Medical School, where she lectured for three years. In 1874 she established an association for the promotion of the medical education of women, and became its president. In 1873 she was married to Abraham Jacobi (q.v.) She became a member of the American Medical Association, and published several works, including: 'The Question of Rest for Women during Menstruation' (1877); 'Acute Fatty Degeneration of New Born' (1878); 'The Value of Life' (1879); 'Cold Pack and Anæmia' (1880); 'The Prophylaxis of Insanity' (1881); 'Common Sense Applied to Woman's Suffrage' (1894).

Jacobi, Moritz Hermann, German physicist: b. Potsdam 1801; d. 1874. He was appointed professor of physics at the University of Dorpat in 1835 and while there did important work in scientific research, especially along the line of physics. He was the inventor of new processes in galvano-plastics and electrotyping, and in 1842 was made a member of the Academy of Sciences at Saint Petersburg. The most remarkable and important of his works was an essay published in 1835, 'Memoire sur l'application de l'électro-magnetisme au mouvement des machines,' which was shortly afterward in 1840 followed by 'Die Galvanoplastik.'

Jacobi, Otto R., Canadian landscape painter: b Königsberg, Prussia, 27 Feb. 1812. After executing several important water-colors for the crowned heads of Europe, he was appointed court painter at Wiesbaden. In 1860 he came to Canada, where his ability won him membership in 1880 to the Royal Canadian Academy of Art, and in 1890 he was elected president.

Jacobins, jăk'ō-bĭnz, the most famous of the clubs of the first French Revolution. When the States-General assembled at Versailles in 1789, it was formed and called the Club Bréton. On the removal of the court and national assembly to Paris it acquired importance and rapidly increased. It adopted the name of Société des Amis de la Constitution, but as it met in a hall of the former Jacobin convent in Paris, it was called the Jacobin Club. It gradually became the controlling power of the Revolution, and spread its influence over France, 1,200 branch societies being established before 1791, and obeying orders from the headquarters in Paris. The Jacobins were foremost in the insurrectionary movements of 20 June and 10 Aug. 1792; they originated the *commune de Paris,* and changed their former name to Les Amis de la Liberté et de l'Egalité. For a while they ruled supreme, and the Convention itself was but their tool. Robespierre was their most influential member; they ruled through him during the Reign of Terror, and were overthrown after his downfall in 1794. In that year the Convention forbade the affiliation of societies; the Jacobin Club was suspended and its hall was closed. The term Jacobin is now often used to designate anyone holding extreme views in politics. Numberless pamphlets were then published in regard to the Jacobins, the most noted being 'La Jacobinade,' 'Le secret des Jacobins,' and 'Les crimes des Jacobins.'

Jac'obite Christians, a subdivision of the sect of the Monophysites (q.v.) comprising those who dwelt in Syria, Mesopotamia, and Babylonia, organized by a certain Jacobus Baradæus, in the reign of Justinian, somewhat later than the middle of the 6th century. Jacobus had been a monk whose poverty-stricken asceticism gained for him the title of Jacobus Baradai (Ragged James). He had been appointed bishop of Edessa in 541, and from that year to 578 he traveled round gathering the members of his heretical sect, until they formed a compactly ordered body which has survived to the present time. They now number about 80,000, and are governed by two so-called Patriarchs, one of Antioch, the other of Jerusalem.

Jac'obites, a party in Great Britain (so styled from Lat. *Jacobus,* James), who after the revolution in 1688 continued to be the adherents of the dethroned King James II. and his posterity. In Ireland they were soon put down by conquest. In England the revolution was accomplished with the apparent consent of all parties; but in a year or two the Jacobite party gained considerable influence, and continued to disturb the government of William throughout his reign. After the accession of Anne and the death of James their efforts slackened for a time; but toward the close of her reign they revived. Bolingbroke and Oxford, with others of the Tory ministers of Anne, were in treaty with the son of James II., and either really or pretendedly negotiated for a restoration. On the arrival of George I. in 1715 a rebellion broke out in Scotland, supported by a more insignificant rising in the north of England. The failure of both these movements damped the enthusiasm of the English Jacobites, but in Scotland the party maintained its influence until the unsuccessful rebellion of 1745 put an end to its political importance, though some ultra-Jacobites did not think themselves justified in transferring their allegiance to the house of Brunswick till the death of Cardinal York in 1807. The hopes and wishes of the

Scottish Jacobites found expression in many beautiful songs, which form an interesting feature of the national literature.

Jacobs, Henry Eyster, American Lutheran clergyman and theologian: b. Gettysburg, Pa., 10 Nov. 1844. He was graduated from Pennsylvania College (Gettysburg) in 1862, from the Lutheran Theological Seminary at Gettysburg in 1865, was professor of Latin and history in Pennsylvania College in 1870–80, of ancient languages in 1880–1, and of Greek in 1881–3. In 1883 he became professor of systematic theology in the Lutheran Theological Seminary, and in 1894 dean of the faculty of that institution. His publications include: 'The Lutheran Movement in England' (1891); a 'History of the Lutheran Church in America' (1893); 'Elements of Religion' (1894); a 'Life of Martin Luther' (1898); and 'The German Emigration to America 1709–40' (1899).

Jacobs, Joseph, Anglo-American author and journalist: b. Sydney, New South Wales, 29 Aug. 1854. He was graduated from St. John's College, Cambridge, was at various times editor of 'Folk Lore,' the 'Literary Year-Book,' and the 'Jewish Year-Book,' was elected president of the Jewish Historical Society, and became literary editor of the 'Jewish Encyclopædia.' In 1896 he lectured in the United States. His publications include, beside translations and editions of English classics: 'Celtic Fairy Tales' (1891); 'Indian Fairy Tales' (1892); 'The Jews of Angevin England' (1893); 'Studies in Biblical Archæology' (1894); 'Literary Studies' (1895); and 'Jewish Ideals' (1896).

Jacobus, Melancthon Williams, American Presbyterian clergyman and educator: b. Allegheny, Pa., 15 Dec. 1855. He was graduated from Princeton in 1877, from the Princeton Theological Seminary in 1881, and after study at Göttingen and Berlin (1881–4), was pastor of the Presbyterian Church at Oxford, Pa., in 1884–91. In 1891 became professor of New Testament exegesis and criticism in the Hartford (Conn.) Theological Seminary. His Stone lectures at the Princeton Theological Seminary (1897–8) appeared as 'A Problem in New Testament Criticism' (1900).

Jaco'by, Harold, American astronomer: b. New York 4 March 1865. On his graduation from Columbia University in 1885, he determined to apply himself to astronomical research, a subject in which he had always evinced interest, and he was appointed assistant astronomer United States eclipse expedition to West Africa (1889–90). He has been professor of astronomy at Columbia since 1894 and is an active member of the leading astronomical and scientific societies at home and abroad. He has written numerous technical monographs in astronomical photography, stellar parallax and star clusters which have been published by French, English and Russian societies. He has also been a frequent contributor to the periodical press on popular astronomy.

Jacotot, Jean Joseph, zhŏñ zhō-zĕf zhä-kō-tō, French educator: b. Dijon 4 March 1770; d. Paris 30 July 1840. He was successively soldier, secretary to the minister of war, and deputy-director of the Polytechnic School, where he was also professor of mathematics. He went to Brussels in 1815, in 1818 was appointed lecturer on the French language in the University of Louvain, and in 1827 director of the Military Normal School. The fundamental principle upon which his system of education rests is that every person is able to educate himself, provided he is once started in the right way. Knowledge should first be acquired through instinctive experience, or by the memory. For example, in imparting a knowledge of a language, Jacotot began by making the pupil commit to memory a single passage; he then encouraged him to study for himself, first the separate words, then the letters, then the grammar, and lastly the full meaning and import. His steps were learn, repeat, reflect, and verify. He expounded his views in 'Enseignement Universel' (1822). Consult: 'Life,' by A. Guillard (1860); Quick, 'Educational Reformers' (1868); Payne, 'Lectures on Education' (1892).

Jacquard, Joseph Marie, zhō-zĕf mä-rē zhä-kär, French inventor: b. Lyons 7 July 1752: d. Oullins, near Lyons, 7 Aug. 1834. His parents were silk weavers, and he learned the same trade. After a long period of hardship, during which he shared in some of the campaigns of the Revolution, he made his name famous by the invention of his new loom, which was publicly exhibited in 1801. He endeavored to introduce it into general use in Lyons, but was mobbed, and all but lost his life. Ultimately, however, his invention was bought by the French government, and he was able to spend the latter part of his life in comfortable independence. The subsequent prosperity of Lyons is largely attributable to his invention, and a more enlightened generation erected a statue to him in 1840 on the very spot where his loom was publicly destroyed. See LOOM.

Jacquard Machine. See DAMASK MANUFACTURE.

Jacquerie, zhäk-ē-rē, the name given to the rising of the French peasantry in the 14th century after the battle of Poitiers. They committed great devastations and outrages — burning castles, murdering men and violating women — particularly in the northeast of France. They were at length quelled by the Captal de Buch and Gaston Phébus, count of Foix, who slaughtered 7,000 of them near Meaux. The term *Jacquerie* is derived from *Jacques Bonhomme,* a familiar epithet for a peasant.

Jade, a remarkably tough, compact, ornamental stone, of green to white color and vitreous lustre, used by the prehistoric peoples of Switzerland, Mexico, Alaska, and other countries for axes, utensils and carvings. It is still highly prized in the East, especially in China and New Zealand. Jade is a general term including two distinct minerals, jadeite and the more common nephrite. Jadeite belongs to the pyroxene group and chemically is a soda-spodumene, easily fusible (at 2.5) and having a specific gravity of 3.3 to 3.35. Nephrite is a variety of amphibole identical with tremolite when of white color, or with actinolite when green, fusing much less easily (at 4) and with specific gravity of 2.95 to 3.0. Much information as to jade and implements made from it may be found

in the publications of the Smithsonian Institution, especially a paper by S. Blondel, 'A Historical, Archæological and Literary Study of Jade,' in the annual report for 1876.

Jad'win, Edgar, American military engineer: b. Honesdale, Pa., 1865. He studied at Lafayette College, was graduated from West Point in 1890, was an assistant in government engineering in 1890–1 and again from 1893, in the Spanish-American War was successively major and lieutenant-colonel of the 3d United States volunteer engineers, and for a time commanded a battalion of this regiment in the sanitation of Matanzas, Cuba. Promoted captain in the corps of engineers, U. S. A. (1900), he was appointed (1902) to direct all Pacific coast fortification and river and harbor work south of San Francisco.

Jæger, yā'gėr. See GULL; SKUA.

Jaffa, jăf'fą or yăf'fā (ancient JOPPA; Ar. *Yafa;* Heb. *Yapho,* beauty), Asiatic Turkey, in the western part of Palestine on the Mediterranean Sea; about 35 miles from Jerusalem. Jaffa is an old Phœnician town mentioned in several places in the Bible. It was the port of entry for Jerusalem and for several of the interior cities of Palestine. Here the cedars from Lebanon were landed and then carried overland for the building of the Temple in Jerusalem. The house where Simon the tanner lived, and where Saint Peter lodged, is still pointed out. In 1187 it was taken by Saladin, in 1191 by Richard I. In 1799 it was captured by Napoleon, who here put to death 1,200 Turkish prisoners. The narrow entrance to the harbor is extremely dangerous. The city is built on a high rocky coast, and presents today the same irregular arrangement of streets, and unattractive looking houses that it may have had hundreds of years ago. The remains of Roman fortifications and dwellings are in the vicinity. The old road to Jerusalem is extremely interesting; but a railroad, built in 1892, connects the city with Jerusalem. The chief exports are oranges (said to be the finest in the world), other fruits, soap, sesame, wine, oil, raw silk, and nuts. The chief imports are sugar, rice, lumber, cotton goods, petroleum, tobacco, and silk goods. The city contains several mosques, a Franciscan monastery, and a mission school. Some attempts have been made to establish colonies of Jews on land near Jaffa. Pop. (1903) estimated, 30,000.

Jagannath, or **Juggernaut** (Sanskrit, *Jagannâtha,* lord of the world, one of the names of Vishnu), called by the natives Purí, a town and celebrated temple of Hindustan, in the presidency of Bengal, province of Orissa, on the Bay of Bengal, 48 miles south of Kattack. The town derives all its importance from the temple. This, the most celebrated shrine in Hindustan, was completed in the 12th century, at an enormous expense. The main street, at the extremity of which the temple stands, consists entirely of religious structures built of stone. The gardens here produce the finest fruits in the province. The temple stands near the shore, in a waste, sandy tract, and appears like a shapeless mass of stone. The idol is a carved block of wood, with a hideous face, painted black, and a distended blood-red mouth, and is magnificently dressed. On festival days the throne of the image is placed on a high tower moving on wheels. Long ropes are attached to the tower, by which the people draw it along. The belief that devotees used to cast themselves headlong in front of this car to be crushed to death probably grew out of the accidental fatalities sometimes occurring. Every year pilgrims flock in crowds to the temple.

Jagersfontein (yā'gėrz-fŏn-tīn) **Excelsior, The,** a name given the largest known diamond; found in the mine of the Jagersfontein Company, Orange Free State, South Africa, in 1893; weight, 971 carats; color, blue white.

Jag'ger, Thomas Augustus, American Protestant Episcopal bishop: b. New York 2 June 1839. He was graduated from the General Theological Seminary, New York, and ordained deacon in the Protestant Episcopal Church 1860. While serving as rector of Holy Trinity parish, Philadelphia, Pa., he was elected to the newly formed diocese of Southern Ohio, and consecrated May 1875. He is the author of 'The Men of the Ages'; 'The Ministry of Phillips Brooks'; 'The Personality of Truth,' the Bohlen lectures for 1900.

Jag'gery, a coarse brown sugar made in the East Indies by the evaporation of the juice of several species of palms, chemically the same as cane-sugar. The sap which yields jaggery becomes by fermentation palm-wine, and from it arrack (q.v.) is distilled. See PALM.

Jaguar, jăg'ū-ăr or jăg'wär, a great American spotted cat (*Felis onca*), once numerous as far north and east as Arkansas, but since the early part of the 19th century rare even in Mexico. It resembles the leopard, but is more robust (exceeding the cougar in weight), has a rounder head, relatively shorter legs and a shorter, thicker tail. The tawny yellow hide is spotted with black, the spots larger than those of the leopard, and inclined to form broken rings with a spot in the centre. Jaguars abound in the tropical forests, especially along the great rivers, where they find most prey. They subsist largely on capybaras, agoutis, etc., but frequently pounce upon deer when they come down to drink. They seem to be more arboreal than most large cats, and a favorite method of obtaining their food is to lie along a tree-limb in some favorable spot and leap down upon the victim. But jaguars also abound in the treeless morasses of the Gran Chaco, and even on the dry uplands of Paraguay and Argentina, where their food and habits are entirely different from those who dwell in the forests. In view of the great extent of country and variety of circumstances in which this animal occurs, formal statements as to its habits are rarely more than locally true; and much error and superstition encumbers popular accounts. In general the jaguar has the manners and disposition of other great cats, changing with environment, season and circumstances. It submits grudgingly to captivity, and gives the same reluctant submission to the training of the circus as is exhibited by other great cats. In some regions it is greatly feared by the people, while in other places it is regarded as little to be feared. Its greatest peculiarity, perhaps, is the tendency to terrific roars and cries, more loud and continuous than those of cougars or leop-

ards. Consult the works of South American travelers and naturalists, especially Humboldt, Azara, Walterton, Wallace, Bates, and W. H. Hudson. Their accounts are well summarized by Porter in 'Wild Beasts' (New York 1894).

Jahn, Otto, German classical scholar: b. Kiel 16 June 1813; d. Göttingen 9 Sept. 1869. The education which he received at the university in his birthplace, Kiel, and later at those in Leipsic and Berlin, he supplemented by wide travel in Italy. In his profession he rose rapidly from the position of docent at Kiel to professorial chairs at Greifswald and Leipsic. His share in the political troubles of 1848–9 caused his removal from the professorship at Leipsic, hut he later received an appointment at Bonn. His works in philology, classical archæology, and the fine arts are of great value to the specialist, but too numerous to list here.

Jains, jīnz, or **Jainas,** jī'näz, a Hindu religious sect, which in union with the Buddhists opposed Brahamanism. They are numerous in the great cities of western and northwestern India, as well as in the Dravidic states of the South. The name signifies a follower of Jina ("conqueror of the world"), one of the denominations of their apotheosized saints. They have many fine temples built in different parts of the Deccan, as well as elsewhere. The Jains deny the divine origin and infallible authority of the Vedas; they reverence certain holy mortals, now termed Tirthankara or saints, and they manifest extreme and even ludicrous tenderness for animal life. They positively affirm that the world exists from all eternity, not being created by God or any other being, and that it will exist forever. This world is divided into three parts — the upper, the middle, and the lower worlds. The Jains believe that not to kill any sentient being is the highest virtue. They believe in a sort of nirvâna (like the Buddhists). Those who attain to this nirvâna, this extinction of action, this final liberation, do not return to a worldly state, and there is no interruption to their bliss; they have perfect vision and knowledge, and do not depend upon works. The Jains are split up into two principal divisions, Digambaras and Svêtâmbaras; the points of difference between them are said to comprehend a list of 700 topics, 84 of which are considered of paramount importance. The Digambara (sky-clad, naked) now wears colored garments, confining the disuse of clothes to meal hours; the Svêtâmbara wears, as the name signifies, white garments. Both the parties have the same sacred books, which they style "angas," but no sacerdotal caste.

Jal'ap (so called from Jalapa, or Xalapa, Mex., whence it is imported), the tuberous roots of several plants of the order *Convolvulaceæ*, that of *Ipomœa purga* being the most important. This is a twining herbaceous plant with cordate leaves and deep pink flowers, growing naturally on the eastern declivities of the Mexican Andes, at from 5,000 to 8,000 feet. The jalap of commerce consists of irregular ovoid dark-brown roots, varying from the size of an egg to that of a hazel-nut. The drug is one of the most common purgatives, but is apt to produce griping and nausea.

Jalapa, hä-lä'pä, or **Xalapa** ("a place of water and sand"), Mexico, city, capital of the state of Vera Cruz; on the railroad which extends from the city of Vera Cruz across the state of Vera Cruz and Puebla; about 50 miles northwest of Vera Cruz. Jalapa is situated about 4,340 feet above the sea, at the base of the basaltic mountain, Cofre de Perote, which rises about 14,300 feet. Before the advent of railroads, the route from Vera Cruz to Mexico City was through Jalapa, which was then of considerable importance. It is a favorite mountain resort for the inhabitants along the coast and in the valleys. The irregularity of the streets, the gardens which surrounded the city, the well-built houses, the parks, and promenades, all make the place most attractive. It was once the capital of the state. It is one of the oldest cities on the continent; one of its churches is said to have been built by Cortes, who found here an Indian town. The Franciscan convent was built in 1556. The great annual fair held here between the years 1720–77 made Jalapa a place of note. People came from far and near to see and purchase goods brought from Europe, mostly from Cadiz. In the city there are three hospitals, a number of good schools, and several fine church buildings. Pop. (1903) 20,500.

Jalisco, hä-lēs'kō, Mexico, a state bounded on the west by the Pacific Ocean, and on the north, east, and south by the states of Durango, Zacatecas, Aguascalientes, San Luis Potosí, Guanajuato, Quenetaro, Michoacan, Colima, and the territory of Tepic. The Sierra Madre range in the eastern portion of the state includes the active volcano Colima (about 14,238 feet) and other high mountains. The largest river is the Santiago, or Lerma, which forms the cascades of Juanacatlan in the vicinity of the city of Guadelajara. At that point the river is 520 feet wide, and falls 65 feet. A large electric plant utilizes the force generated by these falls, supplying electric power to a number of factories. Lake Chapala, the source of the Santiago, is the largest body of water in the republic. The total mineral production of the state is somewhat more than $2,250,000 Mexican silver. There are numerous silver, gold, copper, iron, lead, and cinnabar mines. The high table-lands of the eastern regions have a temperate or cold climate, and produce cereals; in the valleys and on the hot lowlands of the coast sugar-cane, cotton, vanilla, tobacco, oranges, and coffee are cultivated. The maguey plant is one of the chief products of the district of Tequila. The annual output of sugar is 11,000 tons of the raw, and 15,000 tons refined. The capital of the state, Guadalajara (q.v.), has become in recent years one of the chief manufacturing centres in Mexico, producing large quantities of *manta*, or unbleached cotton, and leather goods. More than $300,000 Mexican silver is appropriated annually for the maintenance of schools, which are attended by 31,725 pupils. Private and church schools have an attendance of 14,106. The population of the state in 1900 was 1,137,311.

Jalla'o, a West Indian market-name for the margate-fish (q.v.).

Jamaica, ja-ma'ka, the largest of the British West India Islands. It occupies the central position in the Antillean region, being nearly equidistant from Florida and the northern point of South America; from the mouths of the Orinoco and Galveston; from the head of the

SOUTH AMERICAN JAGUAR AND TAPIR.

Gulf of Honduras, on the west, and St. Thomas, on the east. Its greatest length is 144 miles; greatest breadth, 49 miles; area, 4,200 to 4,218 square miles. The eastern part of the island has, as its most commanding feature, the Blue Mountain range (highest peak 7,360 feet). The centre and west, an elevated plateau of later geologic formation, show the characteristic Antillean limestone, and, more perfectly here than elsewhere in the West Indies, the extraordinary results of exposure of that soluble material to the tropical rainfall. This upland plain, by the action of the elements, has been carved into hills, basins, called "cockpits," 500 feet or more in depth, and much larger and deeper valleys, in which the plantations are situated, and from which the numerous streams often find their way to the sea by underground passages. One of these depressions, the Clarendon Valley (drained through a cañon), is 25 miles wide and 50 miles long; another, St.-Thomas-in-the-Vale, is circular in form, with a diameter of about 10 miles. Throughout the western half of the island such valleys occur, some with, others without, apparent drainage outlets. Coastal plains are most extensive on the south side, where the largest, the plain of Liguanea, has an area of 200 square miles. There are no navigable rivers, but a great number of small streams, pools, and thermal springs. In the limestone region there are many caverns, interesting on account of their size, beauty, or the relics of the old Indian population which they contain. The mean temperature at the coast is very little more than 78° F.; that of the larger part of the habitable regions (1,000 to 3,000 feet above sea-level) is about 73° F.; and at the altitude of 5,500 feet it is 60° F. The maximum for a period of 10 years at Kingston, on the south coast, averaged 87.8° F., and the minimum 70.7° F. On the plateau the annual variation is scarcely 9°; for example, at St. Elizabeth the maximum is 75° F. and the minimum 67° F. As a whole, the island has a pleasant climate. The average rainfall is 66 inches, the extremes being 100 inches on the high mountains and 44 inches at Kingston. The death-rate is 20.9 in 1,000; but this favorable showing, as compared with the other islands of the Antilles, is due much less to natural advantages than to the strict enforcement of local sanitary and quarantine regulations. The total number of inhabitants in 1903 is estimated at about 780,000. The census of 1891 showed 639,491, five sixths of the entire population being blacks or colored people; the whites numbering 14,692, and East Indian coolies 10,116. The birth-rate is little less than twice the death-rate. The Jamaican negroes are fairly good laborers when well fed; the menial work of the island is performed by them, and they are regarded as cheerful, honest, and respectful servants. They have no share whatever in the government.

Fauna, Flora, and Agriculture.— Jamaica has no native mammals. There are many species of lizards, including the large iguana, a few harmless snakes, and the slightly poisonous centipede and scorpion; in the lowlands mosquitoes, ants, and sand-flies are common; butterflies, fireflies, and beetles, parrots, pigeons, water-fowls, and 20 different kinds of song-birds are enumerated. Edible marine fish are seldom caught near the island, but the streams contain a few fresh-water species. The flora is distinguished from that of the other Antillean regions by the total absence of the royal palm, and by the abundance of pimentos, or allspice-trees, which are found nowhere else. Common trees are the ceiba, mango, wild orange, cocoa-palm, plantain, fustic, logwood, and cedar. Begonias, orchids, ferns, and grasses abound, except on the southern coast, which has a flora of the arid type, including the cactus, thorny acacias, etc. There are 739,256 acres under cultivation (tillage 200,168, pasturage 413,152, etc.). Of this total, 83,549 acres are devoted to pimento (allspice), but chiefly as a by-product on lands also used for stock-raising. Since the abolition of slavery the production of sugar has fallen off very greatly. In 1805 Jamaica exported 151,000 hogsheads of sugar, and 5,000,000 gallons of rum; in 1897 the cultivation of sugar-cane constituted only 19 per cent of the whole agricultural industry; in 1902 only 27,342 acres were under this crop. Other products have gradually taken its place, as shown in the following statement of areas devoted to them: Ground provisions, 91,733 acres; coffee, 31,265 acres; bananas, 32,842 acres; cocoanuts, 13,244 acres; etc. Since the great frosts in Florida (1895–6) the exportation of oranges from Jamaica has been carried on profitably; since 1886 tobacco has been grown and cigars for exportation made on a large scale. Coffee from the Blue Mountain estates is of fine quality. The cultivation of cocoa has increased in recent years; ginger grows most readily in the rich soils on the mountains; and among the other exports may be mentioned annatto, lime-juice, tamarinds, nutmegs, a number of dye-woods, cabinet-woods, etc. Special instruction in agriculture is given at the schools, and agricultural and horticultural interests are encouraged by the government and active private associations.

Commerce, Railways, Roads, etc.— The United States has the most important trade relations with Jamaica, furnishing a large part of the staple food supplies, and affording the best market for the island's fruit and sugar. Thus, in 1895–6, the total exports were valued at $8,900,000, the United States taking 57 per cent, and Great Britain 27.6 per cent. Imports in the same year amounted to $13,722,500, Great Britain, Canada, and other British possessions furnishing about 55.6 per cent, and the United States 41.8 per cent. There are about 185 miles of railway, 683 of telegraph, and 154 of telephone. In the year 1901–2 the number of letters and postal-cards transmitted by the post-office was 5,424,814. The system of public highways (3,600 miles), extending into all parts of the island, is admirable: the roads are thoroughly well built and graded, have substantial bridges, and are kept in good repair. The principal line of steamships is the Royal Mail, with fortnightly sailings between England and the Caribbean ports. The Atlas Line and the Boston Fruit Company's steamers maintain communication with New York, Boston, Philadelphia, and Baltimore. A steamer from Kingston circumnavigates the island once a week.

Government, Education, and Religion.— The executive authority is vested in a governor, appointed by the king. He is assisted by a secretary, attorney-general, director of public works, collector-general, and the commanding officer of the military forces. The legislative council consists of 29 members, with the governor as

president; of the whole number 14 are elected (term 5 years), 10 nominated, and 5 are the administrative officers mentioned above. Admittance to the lower grades of the civil service is gained through competitive examinations. The government medical service has in charge 18 public hospitals. The police system includes more than 100 stations in different parts of the island; a force of more than 1,500 men (769 district constables); several prisons, reformatories, and industrial schools. In 1902 the strength of the regular forces stationed in Jamaica was 1,866 officers and men; militia, 763. Fortifications and batteries are at Port Royal, Rocky Point, Salt Pond's Hill, Rock Fort, Fort Augusta, Fort Clarence, and Apostles' Battery. Ships of the royal navy on the North American and West India station are 13 in number (see also below in connection with Kingston). The judicial department includes a high court of justice (9 members), circuit courts, and a magistrate in each parish. Public revenue and expenditure in recent years, each about $3,000,000; the public debt in 1897 was given as $7,581,000. Government schools in 1902 numbered 728, with 84,779 pupils. There are four government training colleges for teachers; several endowed secondary, industrial, and high schools; a public lyceum and museum, with a valuable library, etc. Local examinations are held on the island by the University of Cambridge. In 1870 the Church of England was disestablished and disendowed on the island; in 1902 churches and chapels were: Church of England, 219; Baptist, 189; Methodist, 128; Presbyterian, 73; United Methodist Free Church, 43; Roman Catholic, 28; Moravian, 27; Congregational, 26; Christian Church, 20; and Church of Scotland, 10.

Dependencies.— The Cayman Islands, Turks, and Caicos Islands, and the Morant and Pedro Cays are attached to Jamaica for administrative purposes. Of these, the first group lies in the Caribbean Sea, 180 miles northwest of Jamaica, and comprises Grand Cayman, 17 miles long, 4 to 7 broad; Little Cayman, 9 miles long and about 1 mile broad; and Cayman Brae, 10 miles long and 1 mile broad. The government is administered by a commissioner, and magistrates are appointed by the governor of Jamaica. The population will be referred to under *History*. The second group, Turks and Caicos Islands, situated nearly 500 miles northeast of Jamaica, geographically belongs to the Bahamas; but the governor of Jamaica exercises a supervising power over the local authorities (a commissioner and legislative board of 5 members). Area, 165½ square miles; population, 5,350; capital, Grand Turk; products, salt, sponges, pink pearl, etc. The Morant Cays and Pedro Cays are situated, respectively, about 33 miles southeast, and about 45 miles southwest, of Jamaica.

Chief Towns.— Kingston, the capital, has 46,542 inhabitants, a good water-supply and system of sewerage, well-lighted streets, large shops, a street-railway, etc. The town is, however, unattractive; residences of the officials and wealthy merchants are built in the suburbs. Public institutions are the museum, library, colonial offices, schools, churches, almshouse, penitentiary, asylum, and Victoria Market. Four miles away is the important naval station of Port Royal, headquarters for the British West India naval forces, and a strongly fortified place. Spanish Town, population 5,019, at one time the capital, is situated 15 miles west of Kingston. Port Antonio, on the northeast side of the island; Montego Bay, population 4,803; Savanna-la-Mar, Falmouth, Lucea, St. Ann's Bay, Buff Bay, Port Morant, Black River, etc., are distributed among the three counties of Surrey, Middlesex, and Cornwall.

History.— The native word from which we have the name Jamaica signifies "island of fountains." Names recalling the old Spanish occupation of the island are Montego (Spanish Manteca), Bog Walk (Spanish Boca del Agua), Wag Water (Spanish Agua Alta), and others. As a Spanish colony (1509–1665) Jamaica was backward and of little consequence; the total population in the year last mentioned, when an English fleet captured it, was only 3,000. One half of that number took refuge in Cuba. The settlers who arrived subsequently were peasants from Scotland, Ireland, and England, English subjects from the other West Indian islands, and Jewish traders from Minorca. Negroes were brought from Africa in great numbers; the old town of Port Royal being chosen as a convenient point from which to reship slaves to the other islands and the mainland. That town, once a place of great wealth and importance, was ruined by repeated calamities. "On 7 June 1692 happened that earthquake which swallowed up great part of Port Royal," says Edwards, who explains that the town "was chiefly built on a bank of sand, adhering to a rock in the sea, and a very slight concussion, aided by the weight of the buildings, would probably have accomplished its destruction." Hurricanes in 1712 and 1722, and a conflagration 13 July 1815, completed the work of obliteration. Toward the close of the 18th century the island was occupied by large plantations, and was exceedingly productive. Before that time 610,000 slaves had been landed at Port Royal. The freeing of the negroes (see EMANCIPATION) resulted in the abandonment of the island by many landlords. The effort to regain the lost prosperity through diversified agriculture has already been mentioned. In August 1903 a hurricane inflicted great injury at several points in Jamaica, and destroyed life and property on the Cayman Islands. The population of the latter was 4,322 according to the census of 1891, and the productions tropical fruits.

Consult: Hill, 'Cuba and Porto Rico, with the other Islands of the West Indies'; and Edwards, 'History of the British West Indies.'

MARRION WILCOX,
Authority on Spanish America.

Jamaica, a part of the borough of Queens in the city of New York. Prior to 1 Jan. 1898 Jamaica was the county-seat of Queens County on Long Island, but that portion of Queens County in which Jamaica is situated has been incorporated in the city of New York (Greater New York). The town was settled as early as 1656. Several houses built before the Revolutionary War are in a good state of preservation. In the vicinity there are a large number of market gardens. One of the New York State normal schools is situated in Jamaica.

Jamaica Bay, an inlet of the Atlantic Ocean which indents the southeast shore of Long Island. It is nearly circular in shape; the Rockaway Beach extends across the side toward the ocean and makes of the bay a land-locked body

of water. A number of islands are in the middle and at the entrance. The whole of the bay, except an inlet, Head Bay on the east shore, is within the limits of New York city; Coney Island is near the entrance to the bay.

James, Saint, called the "Greater," the son of Zebedee. He was called to be an apostle, together with his brother Saint John, as they were mending their nets with their father, who was a fisherman. They then followed Christ, were witnesses with Saint Peter of the transfiguration, and accompanied our Lord in the garden of Gethsemane. In the lists of the apostles given in the synoptic Gospels and in the Acts the names of Peter, Andrew, James, and John stand first: and it is plain that these four were at the head of the 12 throughout. After the ascension Saint James persevered in prayer with the other apostles and the women and the Lord's brethren. Nothing further is certainly known of him till the passover of 44, when, being in Jerusalem, the Jews stirred up Herod Agrippa I. against him, who put him to a cruel death. Thus Saint James was the first of the apostles who suffered martyrdom. There is a legend that he went to Spain, and that his bones lent miraculous aid to the Spaniards against the Saracens.

James, Saint, called the "Less," an apostle, the brother or cousin of Jesus. He is called in Scripture the "Just," and is probably the apostle described in Matt. x. 3 and elsewhere as the son of Alpheus. He was the head of the church in Jerusalem when the Scribes and Pharisees threw him down from the gable of the temple, and a fuller dashed out his brains with a club, about the year 62. This is the account of his death given by Hegesippus, a Christian of Jewish origin, who lived in the middle of the 2d century, and it differs somewhat from the narrative of Josephus. Some critics maintain that James, the son of Alpheus, was one person, and James, the brother of Jesus, another. Whether James was the author of the epistle which bears his name is considered doubtful.

James I., king of England, and VI. of Scotland, the only child of Mary, Queen of Scots, by her cousin Henry Stuart, Lord Darnley: b. Edinburgh Castle 19 June 1566; d. palace of Theobalds, Hertfordshire, 27 March 1625. In 1567 he was solemnly crowned at Stirling, and from that time all public acts ran in his name. His childhood was passed in civil wars, under the regencies of Murray, Mar, and Morton, during which time he resided in Stirling Castle, under the tuition of the celebrated Buchanan. From the first he seems to have imbibed those exalted notions of the royal authority and divine right which proved so injurious to his posterity. But James soon found it advisable to ally himself with Queen Elizabeth and accept a pension from her. When, however, it became apparent that the life of his mother was in danger from the sentence of an English judicature, James sent representatives to England to intercede with Elizabeth; but his whole procedure in the matter shows a singular callousness. As a matter of form he ordered the clergy to pray for his mother, but when the news of Mary's execution arrived James was not much moved, though he attempted to make a show of indignation by condemning one of the commissioners to death, a sentence which, however, he commuted to banishment. On 23 Nov. 1589 James married Anne, daughter of Frederick II., king of Denmark. On his return home, after passing the winter in festivities at Copenhagen, he was in some danger from the unruliness of the nobles; and for several succeeding years of his reign the history of Scotland displays much turbulence and party contest. In 1603 James succeeded to the crown of England, on the death of Elizabeth, and proceeded amidst the acclamations of his new subjects to London. One of his first acts was to bestow a profusion of honors and titles on the inhabitants of both countries. At a conference held at Hampton Court between the divines of the Established Church and the Puritans James exhibited the ill-will he bore to popular schemes of church government. The meeting of Parliament also enabled him to assert those principles of absolute power in the crown which he could never practically maintain, but the theoretical claim of which provided the increasing spirit of freedom in the House of Commons with constant matter of alarm and contention. Although James had behaved with great lenity to the Catholics in Scotland, those in England were so disappointed in their expectations of favor, that the famous gunpowder plot was concerted in 1605, the object of which was to blow up the king and Parliament. (See GUNPOWDER PLOT, THE.) In 1612 he lost his eldest son Henry, a prince of great promise, then 19; and in the following year the eventful marriage of his daughter Elizabeth with the elector palatine took place. No circumstance in the reign of James was more unpopular than his treatment of the celebrated Sir Walter Raleigh (q.v.). James had set his heart on marrying his son Charles to a Spanish princess, but the negotiations failed through the overbearing temper of Buckingham, the royal favorite, who quarreled with the grandees of the Spanish court. The close of the life of James was marked by violent contests with his Parliament. He was also much disquieted by the misfortune of his son-in-law, the elector palatine, who, having been induced to accept the crown of Bohemia, and to head the Protestant interest in Germany, was stripped of all his dominions by the emperor. Urged by national feelings for the Protestant cause, he was at length (10 March 1624) induced to declare war against Spain and the emperor; and troops were sent to Holland to act in conjunction with Prince Maurice. James was not destitute of abilities nor of good intentions, but the former were not those of a ruler, and he was neither beloved at home nor esteemed abroad. He received during his lifetime a great deal of adulation on the score of his literary abilities. Consult: Aikin, 'Memoirs of the Court of King James the First' (1822); Burton, 'History of Scotland' (1873); Macaulay, 'History of England' (1858); S. R. Gardner, 'History of England from the Accession of James I. to the Spanish Marriage' (1863–9); ibid., 'The First Two Stuarts' (1876).

James II., king of England, second son of Charles I. and of Henrietta of France: b. London 15 Oct. 1633; d. St. Germain, France, 16 Sept. 1701. He was at once declared Duke of York, though only formally raised to that

dignity in 1643. At the Restoration in 1660 he took the command of the fleet, as lord high-admiral, and was also made Warden of the Cinque Ports. He had previously married Anne, daughter of Chancellor Hyde, afterward Lord Clarendon (q.v.). In 1671 the Duchess of York died. Before her death she declared herself a convert to the Roman Catholic faith, which had been secretly that of the duke for many years, and was now openly avowed by him. This declaration laid the foundation of the opposition which finally drove him from the throne. A test act being soon after passed, to prevent Roman Catholics from holding public employments, the duke was obliged to resign his command. On 21 Nov. 1671 he married Mary Beatrice of Este, daughter of the Duke of Modena, and in 1677 his eldest daughter, Mary, was united to William, prince of Orange.

On the death of Charles II., 6 Feb. 1685, the duke succeeded, under the title of James II., and from the time of his ascending the throne seems to have acted with a steady determination to render himself absolute, and to restore the Roman Catholic religion. At variance with his Parliament he was under the necessity of accepting a pension from Louis XIV. He sent an agent to Rome to pave the way for a solemn re-admission of England into the bosom of that Church, conduct which encouraged the rebellion of the Duke of Monmouth. The unrelenting temper of James was again exhibited in the executions on this account. The legal proceedings under Jeffreys were brutal in the extreme; and no fewer than 320 persons were hanged on the western circuit alone, which attained an unenviable notoriety as the Bloody Assize. He gradually proceeded to a direct attack on the Established Church, by the formation of an ecclesiastical commission, which cited before it all clergymen who had done anything to displease the court. Apparently to conciliate the Puritans a declaration of indulgence in matters of religion was ordered to be read by the clergy in all the churches of the kingdom, but its real object, however, was to favor the Roman Catholic element. Seven bishops met and drew up a loyal and humble petition against this ordinance, and for this act they were sent to the Tower, on a charge of seditious libel. On 29 June 1688 they were acquitted amid the most enthusiastic rejoicings of the populace. The innovations, in regard both to the religion and government, gradually united opposing interests, and a large body of nobility and gentry concurred in an application to the Prince of Orange, signed by seven of the most prominent and influential political leaders, to occupy the throne. James, who was long kept in ignorance of these transactions, when informed of them by his minister at the Hague, was struck with terror equal to his former infatuation; and, immediately repealing all his obnoxious acts, practised every method to gain popularity. All confidence was, however, destroyed between the king and the people. William arrived with his fleet in Torbay 5 Nov. 1688, and landed his forces, amounting to 14,000 men. Several men of rank went over to William, and the royal army began to desert by entire regiments. Incapable of any vigorous resolution, and finding his overtures of accommodation disregarded, James resolved to quit the country. He repaired to St. Germain, where he was received with great kindness and hospitality by Louis XIV. In the meantime the throne of Great Britain was declared abdicated, and was occupied, with the national and parliamentary consent, by his eldest daughter, Mary, and her husband, William, conjointly; Anne, who had equally with her sister been educated a strict Protestant, being declared next in succession, to the exclusion of her infant brother, known in history as the Pretender, who had been born on 10 June of that year. Assisted by Louis XIV., James was enabled, in March 1689, to make an attempt for the recovery of Ireland. The battle of the Boyne, fought 1 July 1690, compelled him to return to France. All succeeding projects for his restoration proved equally abortive. Consult: Burnet, 'History of the Reign of King James the Second'; Cavelli, 'Les derniers Stuarts à Saint Germain-en-Laye' (1871); Klopp, 'Der Fall des Hauses Stuart' (1875–88).

James I., king of Scotland, of the house of Stuart: b. Dunfermline 1394; d. Perth 21 Feb. 1437. He was the son of Robert III. In 1406, while on his way to France, he was taken by the English and carried to the Tower of London. For the next 18 years he remained a prisoner in England, being confined during part of his captivity in Nottingham Castle, Evesham, and Windsor Castle, where he wrote the 'King's Quhair' and other poems. Robert III. died very shortly after learning of his son's captivity, and James was proclaimed king; but during the remainder of the reign of Henry IV., and the whole of that of Henry V., he was detained in England, with a view to prevent the alliance of Scotland with France. In 1424, under the regency of the Duke of Bedford, he was restored to his kingdom, at which time he was in his 30th year. Previous to his departure he married Jane or Joanna Beaufort, daughter of the Earl of Somerset, a lady of the blood royal of England, who is the fair dame alluded to in his poem 'The King's Quhair.' On his return to Scotland he restored Scotland to some degree of order, but so severe was his treatment of his turbulent nobles that he was at last murdered by their emissaries at Perth in the 13th year of his reign.

James II., king of Scotland, son of James I.: b. 16 Oct. 1430; d. Roxburgh, Scotland, 3 Aug. 1460. During the minority his kingdom was distracted by struggles for power between his tutors Livingston and Crichton and the great house of Douglas. In 1449 he assumed the government and married Mary of Guelderland. He had latterly allied himself with the Douglases, but being deprived of all real power, he resolved to free himself from their yoke. This he did in 1452 by inducing the Earl of Douglas to come to Stirling Castle, where he stabbed him with his own hand. He then quelled a powerful insurrection headed by the next earl, whose lands were confiscated. In 1460 he infringed a truce with Henry VI. of England by besieging the castle of Roxburgh, and was killed by the bursting of a cannon in the 29th year of his age.

James, III., king of Scotland, son of James II.: b. 10 July 1451; d. 11 June 1488. He was crowned at Kelso on his father's death, but in 1465 came under the influence of Bishop Ken-

nedy and the Boyd family, one of the latter espousing the king's sister in 1467. James married Margaret of Denmark in 1469 and dismissed the Boyds from favor only to advance other favorites. Prominent among these was Cochrane, through whom one brother of James was obliged to flee the kingdom, and another was put to death. The nobles seized Cochrane and five others and hanged them. Subsequently a plot was formed to dethrone the king, and though many peers remained loyal to him the royal army was defeated at Sauchie, near Stirling. James escaped from the field, but was murdered during his flight.

James IV., king of Scotland: b. 17 March 1473; d. Flodden 9 Sept. 1513. He was the son of James III. He commanded the nobles who vanquished and killed his father at Sauchieburn, and was crowned at Scone in June 1488. He married Margaret, the daughter of Henry VII. of England, but taking umbrage at the hostile attitude of his brother-in-law, Henry VIII., allied himself with France. He was defeated and slain at the battle of Flodden (q.v.) during an invasion of England.

James V., king of Scotland, son of James IV.: b. Linlithgow, Scotland, 10 April 1512; d. Falkland Palace 14 Dec. 1542. He came to the throne under the regency of his mother in 1513 and assumed the reins of government in 1528. He married Madeleine of France in 1537, and on her death married the daughter of the Duke of Guise, Mary of Lorraine, in 1538. He ruled with much vigor and decision, and on account of his mingling freely with his people was called "the king of the commons." Becoming entangled in war with England in 1542 he was defeated at the battle of Solway Moss and died a month later. He was succeeded by his daughter, Mary, Queen of Scots, who was but seven days old at his death.

James, Bushrod Washington, American oculist: b. Philadelphia 25 Aug. 1836. He was graduated from the Homœopathic Medical College of Pennsylvania in 1857, became well known as a practitioner, was elected president of the Pennsylvania Homœopathic Medical Society in 1873, of the American Institute of Homœopathy in 1883, and in 1896 was vice-president of the Homœopathic Medical Congress held at London, England. His publications include: 'American Climates and Resorts' (1889), a manual of climatology (1889); 'Alaskana' (1892); 'Echoes of Battle' (1895); and 'Alaska: Its Neglected Past and its Brilliant Future' (1897; rev. ed. 1901).

James, Charles, English novelist and playwright: b. London 26 Dec. 1858. He received a private education, became lieutenant-colonel of the Royal West Kent regiment, and published: 'A Bird of Paradise' (1889); 'The New Faith' (1890); 'Honors Easy' (1892); 'A Worker in Iron' (1894); 'At the Sign of the Ostrich' (1895); and 'Where Thames is Wide' (1896); etc.

James, Edmund Janes, American college president: b. Jacksonville, Ill., 21 May 1855. He was educated at Northwestern University and at Harvard, was principal of the high schools at Evanston and Normal, Ill. (1878–82), professor of public finance and administration in the Wharton School of Finance and Economy of the University of Pennsylvania (1883–95), and professor of political and social science in the university (1884–95). In 1896 he became professor of public administration in the University of Chicago and director of the extension division; in 1902 president of the Northwestern University; and in 1905 president of the University of Illinois. He became president of the American Academy of Political and Social Science in 1889, and in 1891–5 was president of the American Society for the Extension of University Teaching. His writings include: 'The Legal Tender Decisions' (1887); 'The Canal and the Railway' (1890); 'The Federal Constitution of Germany' (1890); and 'The Growth of Great Cities in Area and Population' (1900).

James, Florence, "Florence Warden," English novelist: b. Hanworth, Middlesex, 16 May 1857. She taught as a governess, 1875–80, and was on the stage, 1880–5. Her novels, many of which are strongly sensational in tone, have been very popular in this country as well as in England. They are published under the pseudonym "Florence Warden," and among them are: 'At the World's Mercy'; 'The House on the Marsh,' which established her reputation; 'A Prince of Darkness'; 'Scheherezade'; 'A Perfect Fool'; 'Pretty Miss Smith'; 'A Lady in Black' (1897); 'A Very Rough Diamond'; 'Morals and Millions'; 'One too Often' (1901); 'A House with a History.'

James, George Payne Rainsford, English novelist and historian: b. London 9 Aug. 1801; d. Venice 9 May 1860. As a young man he traveled widely on the Continent. He began his writing under the influence of Scott's novels, and wrote in all over 100 novels; he was also known as the author of popular historical books, and in 1839 was appointed historiographer royal, in this capacity writing 'History of the United States Boundary Question' and 'The Corn Laws.' In 1850 he was British consul in Massachusetts, two years later was transferred to Norfolk, Va., and in 1856 became consul general at Venice. His novels include: 'Richelieu' (written 1825, published 1829); 'Darnley' (1829); 'DeLorme' (1830); 'Philip Augustus' (1831); 'Henry Masterton' (1832); 'The Gypsy' (1835); 'Attila' (1837); 'Man at Arms' (1848); 'King's Highway' (1848); 'Agincourt' (1844); 'The Smuggler' (1845); 'Ticonderoga' (1854). His historical works include: 'Memoirs of Great Commanders' (1832); 'Life of the Black Prince' (1836); 'Life of Richard I.' (1842–9). James' novels were very popular when first written, and a new edition appeared in 1903.

James, George Wharton, American explorer, lecturer and ethnologist: b. Gainsborough, Lincolnshire, England, 27 Sept. 1858. He has spent many years in making geological and other researches in California, and elsewhere in the southwestern United States, and is a member of various learned societies in this country and England. He has published: 'The Lick Observatory' (1888); 'Nature Sermons'; 'Picturesque Southern California'; 'Missions and Mission Indians of California'; 'From Alpine Snow to Semi-Tropical Sea'; 'In and Around the Grand Canyon' (1900); 'Indian Basketry'

(1900); 'The Indians of the Painted Desert Region' (1903).

James, Henry, American Swedenborgian theologian: b. Albany, N. Y., 3 June 1811; d. Cambridge, Mass., 18 Dec. 1882. He was educated at Union College and Princeton Theological Seminary, traveled abroad and became a Sandemanian and later a Swedenborgian. He subsequently lived in New York, Newport, R. I., and lastly at Cambridge. Among the most noted of his works on morals and religion are: 'What is the State?' (1845); 'Moralism and Christianity' (1852); 'Lectures and Miscellanies' (1852); 'The Nature of Evil' (1855); 'Christianity the Logic of Creation' (1857); 'Substance and Shadow' (1863); 'The Secret of Swedenborg' (1869). His 'Literary Remains,' edited by William James, appeared in 1885.

James, Henry, American novelist and essayist: b. New York 15 April 1843. He was the son of a clergyman, Henry James (q.v.), who gained fame as a writer on philosophico-theological subjects, first from the Sandemanian, and afterward from the Swedenborgian standpoint. The novelist, known until his father's death as Henry James, Junior, was educated under his father's guidance in New York, Geneva, Paris, and Boulogne. He lived in Europe with his parents during the years 1855–9, and after his return to the United States studied in the Harvard Law School in 1862. He began his literary career about 1865 as a contributor to American magazines, and soon afterward published 'The Story of a Year, a tale of the American Civil War.' In 1869 he took up his residence in Europe, and since then he has resided chiefly in England and Italy. 'Roderick Hudson' (1875) was his first long novel. His subsequent novels include: 'Watch and Ward' (1878), originally published in 1871 in the 'Atlantic Monthly'; 'The American' (1877), by some regarded as his best; 'Daisy Miller' (1878); 'The Europeans: a Sketch' (1878); 'Confidence' (1880); 'Washington Square' (1880); 'A Bundle of Letters' (1880); 'Diary of a Man of Fifty' (1880); 'The Portrait of a Lady' (1881); 'The Bostonians' (1886); 'Princess Casamassima' (1886); 'The Tragic Muse' (1892); 'The Other House' (1896); 'The Spoils of Poynton' (1897); 'What Maisie Knew' (1897); 'The Awkward Age' (1899); 'The Sacred Fount' (1901); 'The Wings of a Dove' (1902); 'The Better Sort' (1903). He has also written a great many short stories, among which are: 'A Passionate Pilgrim, and other Tales' (1875); 'Pension Beaurepas' (1878); 'An International Episode' (1879); 'The Madonna of the Future, and Other Tales' (1879); 'The Siege of London' (1883); 'The Point of View' (1883); 'Tales of Three Cities' (1884); 'The Author of Beltraffio, and other Stories' (1885); 'Stories Revived' (1885); 'The Aspern Papers, and other Stories' (1888); 'The Reverberator' (1888); 'A London Life, and other Stories' (1889); 'The Lesson of the Master, and other Stories' (1892); 'The Real Thing, and other Tales' (1893); 'Picture and Text' (1893); 'The Private Life' (1893), a collection of stories; 'The Album' (1894); 'The Reprobate' (1894); 'Tenants' (1894); 'Disengaged' (1894); 'Terminations, and other Stories' (1896); 'In a Cage' (1898); 'The Two Magics' (1898), consisting of two stories; and 'The Soft Side' (1900), a series of stories. In very many of his stories he describes the life of Americans in Europe, and they depend for much of their interest upon the contrasts between American and European character and institutions. Though a very prolific writer, he is never careless, his style being always felicitous, while in respect to the substance of his work he ranks as the subtlest of American novelists. A dramatic version of 'The American' was produced in London in 1891, but neither it nor his subsequent play 'Guy Domville' (1895) was successful. He has turned his intimate knowledge of modern French literature to good account in his volume of essays entitled 'French Poets and Novelists' (1878). Other works of a similar kind are 'Transatlantic Sketches' (1875); 'Portraits of Places' (1884); 'A Little Tour in France' (1884; new ed. 1900); 'Partial Portraits' (1888); 'Essays in London and Elsewhere' (1893). He also contributed the volume on 'Hawthorne' (1879) in the 'English Men of Letters' series, and in 1903 published 'William Wetmore Story and his Friends,' a notable biography.

James, Thomas Lemuel, American banker: b. Utica, N. Y., 29 March 1831. He early learned the printer's business and bought out a weekly Whig paper, the 'Madison County Journal,' at Hamilton; and in 1856 changed its name to the 'Democrat-Republican,' which was for 10 years the most powerful Republican organ in Madison County. He was collector of canal tolls at Hamilton 1854–85; was appointed inspector of customs in New York 1861; weigher in 1864; and in 1870 was promoted to be deputy collector in charge of the bonded warehouse, which department he immediately proceeded to arrange according to a new system. In 1873 President Grant appointed him postmaster of New York, and he was reappointed by President Hayes in 1877. He filled this office with signal success and originated improvements in the delivery system involving the whole postal methods of the United States. President Garfield in 1881 gave him the portfolio of postmaster-general, and his chief important service during his 10 months' incumbency was his initiation of inquiries which led to the investigation of the Star Route frauds. In 1882 he became president of the Lincoln National Bank of New York.

James, William, American psychologist and philosopher: b. New York 11 Jan. 1842. He is the son of Henry James, theologian (q.v.), and brother of Henry James, novelist (q.v.). He was educated in private schools and by tutors in New York and abroad, studied in 1861–3 at the Lawrence Scientific School of Harvard University, accompanied the Thayer expedition to Brazil in 1864–5, was graduated from the Harvard Medical School in 1870, in 1872 was appointed instructor in anatomy and physiology at the school, and in 1876 assistant professor of physiology. In 1885 he was appointed assistant professor of philosophy in the university, in 1889 professor of psychology, and subsequently professor of philosophy. He was Gifford lecturer on natural religion in the University of Edinburgh in 1899–1901. His best known work has

been done in the domain of analytical psychology, in which he won European recognition. His works are marked by a most readable style and skilful exposition of different topics. He was a founder of the American Society for Psychological Research in 1884, and published: 'Principles of Psychology' (1890); and 'Psychology, Briefer Course' (1892), both popular text-books: 'The Will to Believe' (1897); 'Human Immortality' (1898); 'Talks to Teachers on Psychology' (1899); and 'The Varieties of Religious Experience' (1902).

James Bay, an inlet of Hudson Bay, in the southern part. The bay was named in honor of Captain Thomas James, an English navigator, who explored this body of water in 1631–3. The bay is about 320 miles long and from 140 to 160 miles wide. It contains a number of islands, the largest, Agomska, being about 70 miles in length. Several large rivers flow into James Bay; the Albany, Moose, Noddawai, and East Main are the largest. Moose Factory, at the mouth of Moose River, on the southern shore, is the most important Canadian trading station, next to York Factory, of the Hudson's Bay Company.

James, Epistle of, an encyclical letter addressed to the Jews of the Dispersion. It was written by a Jew for Jewish readers, all of whom are supposed to be subject to the Jewish law. Its date is about 50 A.D., at latest, certainly before the fall of Jerusalem. The epistle was not at first admitted into the canon, and it is not much quoted by the earlier writers, Origen indeed being the earliest we find quoting it by name. Eusebius places it in his list of books controverted but recognized by most (*Antilegomena*), and Jerome expresses the doubt more strongly still. It was finally declared canonical by the third Council of Carthage (397), and already we find it acknowledged by Cyril of Jerusalem, Epiphanius of Cyprus, Athanasius, Gregory of Nazianzus, and all later theologians, down to the time of the Reformation, when it was rejected by Erasmus and Cardinal Cajetan, and stigmatized by Luther as "a downright epistle of straw . . . with nothing evangelical about it," although Calvin thought that it was worthy of an apostle.

The aim of the epistle is throughout ethical rather than doctrinal, Christianity being prominently put forward as the ethical fulfilment of the law, the perfect man being he whose faith has constantly proved itself in practice, and who is patient under all tribulation. It echoes closely the language and method of Christ himself; as Beyschlag says, "essentially it is the teaching of Christ, and thus there is little teaching about Christ." Besides the discourses of the Master, especially his Sermon on the Mount, we find distinct traces of familiarity with the Wisdom of Solomon, and the Ecclesiasticus of the son of Sirach. Formalism, greed of gain, respect of persons, falsehood, evil-speaking, boasting, wrangling and bitterness in debate, attention to dogmatic definitions instead of holiness of life — such are the sins against which the author inveighs with vivid and abrupt invective. His Greek is unusually pure, and some scholars, as Schmidt, Bertholdt, and Bishop Wordsworth, have supposed that the epistle was first written in Aramaic and afterward translated.

The passage in the second chapter (14–26) has been interpreted by many theologians as a direct attack on the Pauline view of faith and justification, that Christ by his death had accomplished a new order of salvation, in which the law, which was merely temporary, was now abrogated, and that thus Christianity had fitted itself to become a universal religion; but Paul's conception is more philosophical and comprehensive, although it by no means excludes the conception of James, whose faith without works is not Paul's justifying faith at all, but the profitless faith without love condemned in 1 Cor. xiii.

The Tübingen school, as might have been expected, claimed the Epistle of James as a polemic against Paul, and made its author a pseudonymous writer of later time, who employed the name of James as an accepted type of spiritualized Jewish Christianity.

Bibliography.— Besides the general introductions of Bleek, De Wette, S. Davidson, Hilgenfeld, Holtzmann, Salmon, Dods, and Weiss, and the works on the New Testament canon by Kirchofer, Overbeck, Westcott, and Zahn, may be consulted the special commentaries by Bassett (1876), Reuss (1878), Erdmann (1881), Schegg (1883), E. H. Plumptre (1884), Beyschlag (1888; the 5th ed. of the commentary in the 'Exegetisches Handbuch'), and R. Johnstone (2d ed. 1888).

James Island, an island in Charleston harbor, in South Carolina. It is separated from the city of Charleston by the Ashley River and the South Channel of the harbor, here a little over a mile wide. On the northeast coast of the island is Fort Johnson and nearby a quarantine station. Just northeast of the island is Fort Sumter (q.v.). The battle of Secessionville, fought on 16 June 1862, and several other engagements of the Civil War, took place on this island.

James Milliken University, an organization which includes three institutions of learning: the Lincoln College, located at Lincoln, Ill.; the Industrial School and the Decatur College, at Decatur, Ill. The synods of the Cumberland Presbyterian Church of Iowa, Indiana, and Illinois, founded, in 1865, the Lincoln College. Schools of art, music and elocution, a classic college, and a preparatory department, at times a commercial school, all made up Lincoln College. The Decatur College and Industrial School are endowed institutions opened in 1903. In 1900–01 a fund for a university was provided by gifts from James Milliken, an appropriation from the Cumberland Presbyterian synods of Iowa, Illinois, and Indiana, and donations from the citizens of Decatur. The three schools mentioned were united in the James Milliken University, but each one retains to a certain degree its own independence.

James River, a stream which has its rise in Wells County, in North Dakota, and flows south into South Dakota, and in a southerly direction across the State into the Missouri River. Some of the largest cities and towns of the interior of both North and South Dakota are on or near the James River; Aberdeen, Huron, Mitchell, and Yankton near the mouth, in South Dakota; and Jamestown in North Dakota. It is about 450 miles long.

James River, the largest river in Virginia, has its rise in the western part of the State, in

the Alleghany Mountains; the head-waters are the Jackson and Cowpasture rivers which unite at Covington, in Virginia. The James flows southeast to Buchanan, in Botetourt County, then northeast to Balcony Falls, where it breaks through the Blue Ridge Mountains, again southeast to Lynchburg, then northeast to Scottsville, from which point the general course is southeast to the Chesapeake Bay. Its length is about 456 miles. At the Rocketts, just below Richmond, where the river becomes a tidal stream, is the head of navigation for steamboats of 130 tons, about 150 miles from the mouth. Ocean steamers come up the river as far as City Point, at the mouth of the Appomattox River. From City Point to the mouth, 66 miles, the stream is really a broad, deep estuary with Hampton Roads (q.v.) at its entrance to the Chesapeake. The falls in the river at Richmond, about 100 feet in six miles, furnish a large amount of water power. From Richmond to Buchanan, a distance of nearly 200 miles, the Kanawha Canal follows the course of the river and utilizes extensive reaches of slack water navigation. The chief tributaries of the James are the Chickahominy (q.v.) from the north, and the Appomattox from the south. The broad body of water at the entrance into Chesapeake was early explored by European navigators, and Jamestown (q.v.), the first permanent English settlement, was located on this river.

Jameson, jā'mē-sŏn, **Anna Brownell Murphy,** English author and art critic: b. Dublin 17 May 1794; d. Ealing, Middlesex, England, 19 March 1860. In 1827 she was married to Robert Jameson, afterward speaker of the House of Assembly of Upper Canada, and attorney-general, but the union proved unhappy. She made her first appearance as an authoress by the publication of the 'Diary of an Ennuyée' (1826), which was very favorably received. Her 'Loves of the Poets' appeared (1829), and was succeeded by 'Memoirs of Female Sovereigns' and 'Characteristics of Shakespeare's Women.' In 1836 Mrs. Jameson visited her husband in Canada, and published 'Winter Studies and Summer Rambles in Canada' (1838). Later works of hers include: 'Handbook to the Public Picture-galleries of Art' (1842); 'Companion to the Private Galleries of Art in London' (1844); 'Memoirs of the Early Italian Painters' (1845); 'Memoirs and Essays on Art, Literature, and Social Morals' (1846); 'Sacred and Legendary Art' (1848); 'Legends of the Monastic Orders' (1850); 'Legends of the Madonna' (1852). In these the author has given admirable expositions of the works of the old masters and the religious bearings of mediæval art. Few writers have done so much to refine the public taste, and diffuse sound canons of art criticism. Consult: Macpherson, 'Memoirs of the Life of Anna Jameson' (1878).

Jameson, John Franklin, American historical writer: b. Boston 1 April 1859. He was graduated from Amherst College in 1879 and was professor of history at Brown University 1888–1901. He has been managing editor of the 'American Historical Review' from 1895 and the head of the department of history at the University of Chicago from 1901. He has published 'History of Historical Writing in America' (1891); 'Dictionary of United States History' (1894); etc.

Jameson, Leander Starr, Scottish physician, administrator, and freebooter: b. Edinburgh 8 Feb. 1853. He studied medicine in Edinburgh and London, began professional practice at Kimberley, Cape Colony, in 1878, in 1891 became administrator of Rhodesia for the British South Africa Company, and in 1895 led the now well known raid into the Transvaal. During disturbances between the Boers and the Uitlanders, or foreigners, in the South African Republic, Jameson had, by order of Cecil Rhodes (q.v.), then premier at the Cape, assembled a Rhodesian military force on the Transvaal border, to act in case of emergency. On 29 December, with 600 troopers, Jameson, proceeding on his own judgment, entered the South African Republic for the support of the Uitlander party. His force was compelled to surrender to the Boers at Doornkoop on 2 Jan. 1896. Jameson, with his officers, was handed over by President Kruger to the British government for trial. He was sentenced, May 1896, to ten months' imprisonment, but in December was released because of illness. In 1897 he returned to Rhodesia, and in the second Boer war served in the English army. Jameson's surrender was followed by a congratulatory message to Kruger from the German emperor which for a time threatened serious consequences.

Jameson, Patrick Henry, American physician: b. Monroe Township, Jefferson County, Ind., 8 April 1824. At 19 he went to Indianapolis, taught school there four years, studying medicine meanwhile, and was graduated from Jefferson Medical College, Philadelphia, in 1849. He then returned to Indianapolis, where he became very prominent as a physician. During the Civil War he served as military surgeon and was commissioner of the Indiana hospital for the insane, 1861–80. He was likewise active in the establishment of the Indianapolis city hospital and in the organization of the University of Indianapolis, and was for 30 years a director of Butler College, at Indianapolis. From 1863 to 1869 he was a member of the Indianapolis common council and compiled the city ordinances in 1865. He has published 'Memoirs of Prominent Physicians of Indianapolis.'

Jameson Raid, The. See JAMESON, LEANDER STARR.

Jamestown, jāmz'town, N. Y., city in Chautauqua County, on the Conewango Creek, which is the outlet of Chautauqua Lake; and on the Erie and the Jamestown & C. L. R.R.'s; about three miles from Chautauqua Lake, 25 miles from Lake Erie, and 70 miles, by rail, southwest of Buffalo. Lake steamers and trolley cars connect it with a number of the nearby towns. The first permanent settlement was made in 1810, by settlers in search of agricultural lands. The location, so near the outlet of the lake and in the midst of a fertile agricultural region, attracted settlers, and in 1815 the town was planned; and was incorporated as a village in 1827. The country around developed rapidly, but Jamestown was not chartered as a city until 1886. The chief manufactures are furniture, woolen goods, photographic paper, metallic goods, boots and shoes, agricultural implements, and brooms. It has saw-mills, canning factories, lumber and brick yards. The city has the James Prendergast Free Library, containing about 17,000 volumes, and an excellent high school.

The municipal officers are a mayor, who holds office two years, a city council, a clerk, overseer of the poor, sealer of weights and measures, constables, assessors, justices of the peace, and police justices, all of whom are elected by the people. Other subordinate officials are appointed by the mayor subject to the approval of the council. Jamestown was the home of Reuben E. Fenton (q.v.). There are about 8,000 Swedes now living in Jamestown. Although they are adopted citizens, those born in Sweden still use their native language in the homes; and they have their own Swedish papers and literature. Pop. (1890) 16,038; (1900) 22,892.

Jamestown, N. D., city, county-seat of Stutsman County; on the James River, and on the main line and a branch of the Northern Pacific railroad; about 80 miles west of Fargo, on the Red River of the North, and 100 miles east of Bismark on the Missouri River. It is situated in an agricultural region, noted for its extensive wheat fields and large stock farms. Some of the industrial establishments are flour-mills, grain elevators, stock-yards, wholesale groceries, lumber and brick yards. It is the trade centre for a large extent of country, and the small towns off the railroad procure their local supplies of manufactures and groceries from Jamestown. Pop. (1900) 2,853.

Jamestown, Va., in James City County, the first permanent English settlement in the New World, and capital of Virginia 1607–98; on what was a peninsula of the James River some 32 miles from its mouth, nearly opposite the present Williamsburg, with a neck overflowed at high tide, and since then washed away, leaving the place an island; the front also has been eaten away by the river, so that the site of the original huts is submerged. It was ill chosen and malarious, and the place never prospered; but no towns did in early Virginia. It was founded 13 May 1607 by the company of Gosnold, Wingfield, John Smith, etc., with Capt. Newport; and was first a triangular wooden blockhouse called Fort James, after the king, around which some huts sprang up. These were entirely destroyed by fire in 1608, but soon rebuilt. In 1609 there were 50 or 60 wooden houses of one and two stories, with a chapel and a storehouse, surrounded by a log palisade 15 feet high, and with a fort at the neck. During the Starving Time of 1609–10 it was nearly depopulated, and on 7 June 1610 the remnant deserted it and started for England; but meeting Lord Delaware with provision ships at the mouth of the river, all turned back and reoccupied it. Delaware found the chapel "ruined and unfrequented." In 1616 John Rolfe says there were 50 inhabitants. By 1619 a church of hewn timber 50 x 20 had been built; in July 1619 the first legislative assembly in America was held there. A timely warning enabled its inhabitants to escape the great Indian massacre of 1622, and it was a place of refuge for those outside it. The first brick edifice in Jamestown was erected in 1640; a brick church some time after; between 1676 and 1684 was built the brick church whose ivy-mantled tower still stands, and which is incorrectly supposed by many tourists to be the one in which Rolfe married Pocahontas. About the same time a more ambitious fort was begun, with a magazine still traceable; but so injudiciously located for guarding the river-channel that it was above instead of below the place to be defended. Jamestown has little history separate from the colony thence till Bacon's Rebellion (q.v.); as Berkeley's capital, it was burnt to the ground by Bacon, that it might no longer "harbor the rogues." Again rebuilt, in the last decade of the century it was once more destroyed by fire, and never rose from its ashes. It had long been dwindling, and removal of the capital had been mooted, and in 1698 Williamsburg was made the capital. Till very recent years the ruins of Jamestown were left to sink gradually into the encroaching river; but some years ago the Association for the Preservation of Virginia Antiquities bought it, and with the help of the national government have built a sea-wall and saved the relics from further destruction. Besides the church tower, a few tombstones and remains of two or three houses still exist. Consult Tyler, 'Cradle of the Republic' (1900).

Jamestown Weed. See DATURA.

Jamieson, jā'mĭ-sŏn, **Cecila Viets Dakin**, American novelist: b. Yarmouth, N. S., 1848. She was married in 1878 to Samuel Jamieson of New Orleans. She has published 'The Story of an Enthusiast': a novel (1887); 'Lady Jane'; 'Toinette's Philip'; 'Seraph'; 'The Little Violinist'; 'Woven of Many Threads'; 'The Lily of San Miniato'; etc.

Jan Mayen, yän mī'ĕn, an island in the Arctic Ocean, about 250 miles northeast of Iceland; area, about 160 square miles. It is volcanic, with an irregular surface, mountainous near the extinct volcano, Beerenburg, about 6,500 feet in height. One of the active volcanoes is about 1,500 feet high. There are some large glaciers on the island, one near Beerenburg. Vessels from Norway and Scotland occasionally visit the island. In 1882–3 scientists from Austria lived on the island for some months, engaged chiefly in making meteorological observations. The island was named after Jan Mayen, a Dutch navigator, who discovered the land in 1611. Later it was ascertained that Henry Hudson visited the island in 1607.

Janauschek, yä'now-shĕk, **Fanny** (FRANZISKA MAGDALENA ROMANCE). American actress: b. Prague, Bohemia, 20 July 1830; d. Amityville, L. I., 28 Nov. 1904. She first went upon the stage in Cologne, playing in that city and also in Frankfort, 1848–60, and subsequently played in Dresden and the principal cities of Germany. In 1852 she was married to Captain Frederick Pillot, of the Germany navy. She made her first tour in America, 1867–9, playing in the German language and securing most favorable notice. Returning to Germany she studied English, and in 1873 made her second visit to the United States, when she played in English the most exacting Shakespearian roles. She was also very successful in such roles as Meg Merrilies, Mary, Queen of Scots, and in double roles, as in 'Bleak House' and other plays. She retired from the stage in 1898.

Jane Eyre, ār, a famous novel by Charlotte Brontë, published in 1847. In the character of Jane Eyre, the young authoress first found an outlet for the storm and stress of her own

nature. The book is therefore autobiographical in the truest sense.

Janes, Edmund Storer, American Methodist Episcopal bishop: b. Sheffield, Berkshire County, Mass., 27 April 1807; d. New York 18 Sept. 1876. In 1830 he entered the Methodist ministry in the Philadelphia conference, in 1835 became financial agent for Dickinson College, in 1840–4 was financial secretary of the American Bible Society, and in 1844 was elected bishop. In connection with his episcopal duties he traveled widely in the United States and abroad, and subsequent to the Civil War aided in the reorganization of his Church. He had some reputation as a preacher.

Janes, Lewis George, American scholar and author: b. Providence, R. I., 19 Feb. 1844; d. Greenacre, Maine, 5 Sept. 1901. He was president of the Brooklyn (N. Y.) Ethical Association in 1885–96, lecturer on sociology and civics in the School of Political Science there in 1893–6, and in 1896 became director of the Cambridge (Mass.) conferences and the Monsalvat school of comparative religion. In 1899 he was elected president of the Free Religious Association of America. Among his works are: 'A Study of Primitive Christianity' (1887); 'The Evolution of Morals' (1889); 'Life as a Fine Art' (1891); 'War and Progress' (1893); 'Cosmic Evolution as Related to Ethics' (1895); 'Social Ideas and Social Progress' (1899); and 'Health and a Day' (1901).

Janesville, jānz'vĭl, Wis., city, county-seat of Rock County: on the Rock River and on the Chicago, M. & St. P. and the Chicago, N. W. R.R.'s; about 85 miles northwest of Chicago and 60 miles southwest of Milwaukee. The first permanent settlement as a village was in 1837, and it was chartered in 1853. Janesville is located in an agricultural region, noted for the amount and quantity of tobacco raised. The chief manufactures are agricultural implements, foundry products, wagons and carriages, furniture, cotton and woolen goods, boots and shoes, flour, fountain pens, and school supplies. It has large lumber and brick yards, storage houses, and stock yards. Its principal trade is in its own manufactured goods, farm and dairy products. Some of its principal buildings are the State School for the Blind, the Saint Joseph's Convent, the Y. M. C. A. buildings, two hospitals, the churches, high school, public library, court house, and city hall. The mayor holds office for two years. The mayor, council, board of education, attorney, city clerk, treasurer, sealer of weights and measures, and justices of the peace are chosen by popular election. The mayor appoints, subject to confirmation by the council, the directors of the public library; the council elects the city engineer, the assessors, and the street commissioners. The members of the fire and the police departments are selected from the eligible civil service lists. From 1885 to 1903 there has been a constant and healthy expansion in industrial and commercial lines. Pop. (1890) 10,836; (1900) 13,185.

Janiuay, hä-ne-wī', Philippines, a pueblo of the province of Iloilo, Panay, situated 18 miles northwest of the town of Iloilo, near the Jalaur River. It lies in a hilly country and petroleum has been reported in the vicinity. Pop. 28,700.

Janizaries, jăn'ĭ-zā-rĭz (Turkish, *jeni-tcheri,* new soldiers), an infantry force of Turkey, first organized by the Sultan Orkhan about 1330, and in 1362 increased to about 10,000 by Amurath I., who gave them considerable importance by bestowing on them special privileges. The janizaries thus became a class of warriors so deeply imbued with the military spirit that they proved in many instances a means of salvation to the empire. It was their boast that they had never fled in battle, and they were the nerve and sinew of the Ottoman army. The regular troops of janizaries at one time amounted to 60,000 or more, but they were afterward reduced to 25,000. They were kept in barracks in Constantinople and a few other cities. The irregular troops amounted to 300,000 or 400,000, and were scattered among all the cities of the empire, in time of peace performing police duties. The janizaries who constituted the sultan's bodyguard became in time so dangerous and their insurrections so frequent that several unsuccessful attempts were made to reform or disband them. In 1826 they rebelled on account of a proposal to form a new militia, when the sultan, Mahmoud II., having displayed the flag of the Prophet, and being supported by their commander-in-chief, defeated the rebels and burned their barracks, when many of them perished in the flames. A royal proclamation abolished the corps. As many as 15,000 were executed, and fully 20,000 were banished.

Janko (yŏn'kō) **Keyboard,** a keyboard for the pianoforte, invented 1882 by Paul von Janko; introduced in London 1888, in New York in 1890. It consists of six rows or banks of keys arranged like a fan, placed in a semi-circle. Each note has three different keys. The keyboard can be attached to any pianoforte, grand, upright or square.

Jans, Anneke, ăn'nā-kė yāns (or ANNETJE), Dutch colonist in America: d. Albany, N. Y., 1663. She came from Holland to New Netherland in 1630 with Roeloff Jansen, her husband, who secured in 1636 a grant of a tract of land containing 62 acres and reaching from the Hudson to the present Broadway and from a point near Desbrosses Street to Warren Street. In 1654, Anneke, upon the death of her second husband, Everardus Bogardus (q.v.), obtained in her name a patent-right to the tract. In 1671 the land was sold by the heirs to the English Governor Lovelace. Three of the heirs, however, did not sign the document. Subsequently the property was confiscated by the English government and deeded to Trinity Church corporation (1705). From 1749 the possession of the property has been the subject of numerous suits by the heirs, based chiefly on the omitted signatures, and all decided for the defendants.

Jansen, yăn'sĕn, or jăn'sĕn, **Cornelius,** Dutch theologian: b. near Leerdam, Holland, 28 Oct. 1585; d. Ypres, Belgium, 6 May 1638. From his 17th year he applied himself to the study of theology and first came into notice while professor of theology at Louvain (1630), as a teacher of the most rigid Augustinianism, especially in connection with the doctrine of free will and divine mercy. This brought him into conflict with the Jesuits. He was appointed (1636) bishop of Ypres, where he completed his famous work, on which he had labored for 22 years, under the title 'Augustinus, sive Doctrina Sti. Augustini de Humanæ Naturæ Sanitate, Ægritudine, Medicina.' In this he

declared philosophy, especially that of the Aristotelians, to be the source of Pelagian error, and in accordance with rigid Augustinianism, maintained the utter corruption of human nature and the extinction of free will, together with predestination. The school of thought he thus founded is now known as Jansenism (q.v.).

Jansenism, jăn'sen-ĭsm, the teaching of the Jansenists, a sect of Christians still existing in the Netherlands and named after Cornelius Jansen, bishop of Ypres. They profess to hold the truth as it was taught by Augustine, bishop of Hippo, and prefer to be called 'Disciples of St. Augustine.' The free grace of God, the free will of man, and predestination, in the Augustinian sense, formed the main articles of their belief. The Jansenists were, however, accused of reviving the teaching of Michael Baius (1513–89) which had been pronounced heretical by Popes Pius V. and Gregory VIII. Baius taught that original justice is an integral part of human nature, and not a free gift of God; that fallen man, being utterly depraved in his nature, is incapable of doing good; that all actions of man in the natural order are sinful, and that divine grace compels men to be and do good, without the concurrence of their will. The book of Jansen was condemned by Urban VIII. in his 'In Eminenti' (1642), but the pope's decree was not generally accepted in Flanders. The Jesuit Molina and the Molinists, his followers, supported views opposed to those of Jansen. Alexander VII. declared that the errors attributed by the Molinists to Jansen, and which the Jansenists said could not be found in 'Augustinus' were held and enunciated by Jansen. The Port Royalists, Arnauld, Nicole and Pascal, wrote famous books defending Jansen against the Jesuits.

In 1679 Arnauld and his followers were constrained to take refuge in the Netherlands. In 1702 the Sorbonne decided that a priest accused of Jansenism could grant absolution. In 1694 Quesnel's 'Moral Reflections' were published and the controversy had been revived. In his bull 'Unigenitus,' Clement XI. condemned the Jansenist passages in Quesnel's work and the author fled to Brussels, and died in Holland 1719. The Jansenists of Utrecht number about 8,000; they profess to be Roman Catholics, are governed by an archbishop, to whom, however, the pope always refuses confirmation and the gift of the palla. They reject the bull 'Unigenitus' and published a protest against the dogmas of the Immaculate Conception, and Papal Infallibility. Consult: Reuchlin, 'History of Port Royal' (1844); Fuzet, 'Les Jansenistes du 17me Siècle' (1877); Jervis, 'History of the Church of France' (1872). See PASCAL, BLAISE; ARNAULD.

Jans'sen, John, American Roman Catholic bishop: b. Keppeln, Rhine Province, 3 March 1835. He pursued theological courses in the seminary of Münster, and in 1858 in the United States, was ordained priest in 1858, was in missionary work at Springfield and Alton, Ill., was vicar-general of Alton diocese in 1870–7 and 1879–86, and in 1888 was consecrated bishop of Belleville, Ill.

Januarius, jăn-ū-ā'rĭ-ŭs, **Saint:** b. Naples or Benevento, Italy, 21 April 272; d. Pozzuoli, Italy, 19 Sept. 305. He became bishop of Benevento in 303 and at the time of the persecution of the Christians by Diocletian was beheaded. He is the patron saint of Naples. His body lies in the crypt of the cathedral at Naples; and two phials of his blood which a pious matron caught, according to tradition, at his execution, are preserved in a chapel in the south aisle. It is asserted that the blood liquefies on being brought near the head of the saint. A trial is made on three festivals of each year, the chief of which is the anniversary of the martyrdom, and also when public danger and calamity exists or is impending. It is believed that the patron saint is particularly propitious if the blood moves briskly in the phials and appears of a clear red, while the opposite is regarded as presaging some ill to the country.

Jan'uary, the first month of the year, was by the Romans held sacred to Janus, from whom the name was derived. The Roman year originally began with March, and consisted of only ten months. Numa is said to have added January and February to the calendar; but although the Romans as early as 251 B.C. accepted January as the first month of the year, the nations of Europe did not universally adopt it as such till the 18th century. The 25th of March was the beginning of the ancient Jewish year, and that day, instead of 1 January, long held a legal position in Christian countries as the opening of the new year.

Janus, jā'nŭs, an ancient Latin divinity, after whom the first month of the year was named. He was held in great reverence by the Romans, and was represented with two faces, one looking forward, the other backward. All doors, passages, and beginnings were under his care. His principal festival was New Year's Day, when people gave each other presents. The temple of Janus, which was open in time of war and closed in time of peace, was shut only three times in the long space of 700 years.

Janvier, jăn'vĭ-ā, **Thomas Allibone,** American author: b. Philadelphia, Pa., 16 July 1849. He received a common school education; was an editorial writer for the Philadelphia *Press, Bulletin,* and *Times* in 1870–81; lived in New York during most of the period 1884–94, and then made his residence in France and England. Among his works are 'The Mexican Guide' (1887), 'The Aztec Treasure House' (1890), and 'Stories of Old New Spain' (1891), material for which was largely derived through visits to Mexico and New Mexico; 'An Embassy to Provençe' (1893), the chronicle of a European journey; 'In Old New York' (1894), popular historical sketches; 'The Passing of Thomas, and Other Stories' (1900); 'In Great Waters' (1901); 'The Dutch Founding of New York' (1903).

Japan, an empire off the northeast coast of Asia, consisting of an archipelago in the North Pacific Ocean. Besides Nippon or Hondo, Kiusiu, and Shikok, three large mountainous and volcanic islands, with about 500 smaller islands, forming Old Japan or Japan proper, it comprises the outlying large island of Yezo or Hokkaido, north of Hondo, separated by Tsugaru Strait; the long chain of the Kurile Islands between Yezo and Kamchatka; the Loo-choo or Liu-Kiu Islands, stretching southwestward toward Formosa, and lastly Formosa and the Pescadores Islands, acquired as a result of the

war with China in 1894, together with the southern part of Sakhalin, ceded by Russia in 1905. The Japanese dominions are separated from the Asiatic continent by the Sea of Okhotsk, the Sea of Japan, the Strait of Korea, Tong Hai or the Eastern Sea, the Strait of Tokien or Formosa, and are distant from China 420 miles, from Kamchatka 270 miles, and from California, 5,000 miles. The area of Japan proper is estimated at 111,239 square miles, of which Hondo, the main island, occupies 87,846; Kiusiu 16,839, and Shikok 6,932 square miles. Yezo has an area estimated at 36,300 square miles; adding the Kurile and Liu-Kiu Islands, Formosa, and Sakhalin (25,000 square miles), the total area of the empire is fully 185,000 square miles. The native term *Niphon, Nipon,* or *Dai Nippon* — "Great Nippon," the latter word meaning "Sunrise" or "East," a former specific name for the largest island of the group, is really the name of the empire, the Japanese now calling this island Hondo or Honshiu. The capital of the empire is Tokio or Yeddo; other important towns are Osaka, Kioto, Nagoya, Kobé, Yokohama, Hiroshima, Nagasaki.

Political Divisions.— Japan anciently divided by native geographers into the eight great divisions of Gokynay, Tokaydo, Tosando, Fukurokudo, Sanindo, Sanyodo, Nankaydo, and Saykaydo, subdivided into 68 provinces or principalities, and these again into 622 districts, now comprises for Japan proper the three great fu or residential districts of Tokio, Kioto, and Osaka, and 43 ken or rural prefectures, Yezo and Formosa having minor subdivisions for administrative purposes.

Physical Features.—The largest island, Hondo, is upward of 700 miles long northeast and southwest, breadth varying from 50 to 100 miles; Kiusiu, on the southwest, separated from Hondo by the Strait of Shimonoseki, which in one part is narrowed to 2 miles width, is about 200 miles long north to south and 120 miles broad; Shikok, the third and smallest of the three principal islands, is 140 miles long by 60 miles broad. It lies east of Kiusiu, and is separated from it by the Strait of Bungo, which at its narrowest part is not more than 10 miles broad. The straits which divide Shikok from Hondo are scarcely broader, and are thickly set with small islands. The more or less enclosed stretch of sea between Kiusiu, Shikok, and Hondo is known as the Inland Sea. Yezo is of a roughly triangular form, having its sides respectively 300 miles, 260 miles, and 220 miles in length. It is separated from Hondo on the southeast by the Strait of Tsugar, Matsmai, or Sangar, about 8 miles broad in the narrowest part. West of Hondo lies the important island of Sado. The coasts of the larger islands are extremely irregular, being deeply indented with gulfs, bays, and inlets, which form magnificent harbors, although in the north especially, they are difficult of access; not only from the multitude of rocks and islands that surround them, but from the prevalence of gales and fogs. Though there are some large plains, the surface of the islands generally is broken by hills and valleys, in many instances rising into high mountains. The main island is traversed throughout its whole length by a regular chain of mountains, the highest peak of which variously called Fuji-san, or Fuji-yama,— "Matchless Mountain," a dormant volcano, covered with perpetual snow — is 13,977 feet high; but the elevation of the range is in general so low as to admit of cultivation up to the watershed of its streams. The Japanese islands form a part of the line of volcanic action which commences, in the north, with the Aleutian Isles, passes through the Philippines, Sumbawa, and Java to Sumatra, and then in a northwest direction to the Bay of Bengal. The volcanic vents, which indicate the direction of the line, are numerous in Yezo, Hondo, and Kiusiu; earthquakes, often causing great devastation, are of frequent occurrence, and it is calculated that every seven years a Japanese city is destroyed by their agency. In Yezo some dreadful eruptions have occurred — one in 1783 destroyed 23 villages; and the volcano of Wunzendake, one of five active in the island of Kiusiu, is the terror of the surrounding inhabitants — an eruption of it in 1792 having destroyed 53,000 people. Almost equally disastrous was the tidal wave in 1896, which, besides causing the death of over 26,000 people, injured many thousands more, and destroyed a vast amount of property.

Hydrography.— Streams are numerous in Japan, but have very short courses, and are for the most part rather torrents than rivers. Though valueless as channels for the development of commerce they are of great value for the purposes of irrigation. The principal rivers or gawas of the main island are: the Shinanogawa, which rises in Shinano, and after a northwestward course of 320 miles flows into the Sea of Japan; the Tonegawa, which rises in Kodzuke, and after a course of 170 miles flows into the Pacific near Tokio; the Kisogawa, which enters the gulf of Izeh; and the Yodogawa, the outlet of Lake Biwa, which flows into Osaka Bay. Ishikari in Yezo is the longest river of Japan, having a course of 407 miles. There are a number of lakes scattered throughout the islands, the largest being Biwa or Omi, in the southern part of Hondo, 40 miles long.

Geology and Mineral Resources.— The prevailing formations in these islands are trachyte and basalt; plastic clay, marl, and feldspar occur in various localities; and there are whole mountains of porcelain earth. The metallic wealth of the empire is considerable and comprises gold, silver, copper, tin, lead, and iron. The island of Sado is particularly rich in auriferous ore. Both the tin and copper of Japan are of superior quality. Coal is found in several districts, and the output is gradually increasing, in 1902 amounting to over 9,700,000 tons. Petroleum is becoming a product of some consequence. Sulphur abounds; thermal and mineral springs are of frequent occurrence; and ambergris is met with on some of the shores. Among the precious stones are agates, carnelians, and jaspers, while pearls are found in the shell fisheries around the islands.

Climate.— The climate of Japan, though extremely various — being intensely cold in the north and warm in the south — is, on the whole, much milder than its latitude would indicate; owing, chiefly, to the influence of the surrounding ocean. A remarkable difference of climate exists also between the east and west shores; the cold being more intense on the

JAPAN AND KOREA.

0 50 100 150 200

latter than the former, owing to the proximity of the Asiatic continent; while the east coasts are protected from the cold continental winds by the lofty central ridge of mountains that traverses the islands north to south. From March to the second half of May a splendid spring prevails; from June to September summer extends, introduced by heavy rains followed by intense heat; from September to the end of November there is a brilliant autumn; and three months of winter succeed, rendered not unpleasant by the continued serenity of the sky. In Kiusiu, and in the south parts of Hondo, the thermometer ranges between 29° and 104° F., 80° being the average in the middle of summer, and 35° in the coldest months of winter. In lat. 32° N. ice is formed of several lines in thickness; in lat. 36° the lakes are covered with a sheet of ice, and in 38° to 40° the ice becomes so thick that the rivers may be crossed upon it; while in Yezo, near Cape Saga, lat. 45° 21′ N., winter is so severe as to drive the hardy Ainos to the protection of caverns. Rain is very frequent; hurricanes and water-spouts also occur often, and typhoons and equinoctial gales frequently sweep about the change of the monsoons.

Forestry.— The forests of Japan cover an area of 20,062 square miles and, especially in Yezo, form a source of wealth which is being increasingly exploited. Japan produces most of the trees common to temperate regions. The fir and cedar grow to immense size, the latter sometimes to the diameter of 18 feet. Of the oak, two species are peculiar to the country; their acorns when boiled form a palatable and nutritious article of food. The mulberry and the varnish tree grow wild. The nuts of the latter yield solid oil for candles, as do those of the camphor tree, which lives to a great age, and attains a great size. A camphor tree observed by Kämpfer in 1691 was then 36 feet in circumference, the same tree measured by the Dutch traveler Siebold in 1826 was 50 feet in circumference. Camphor has long formed an important article of commerce, the value of the exported product in 1903 amounting to over $1,750,000. Chestnut and walnut trees also abound.

Flora.— The flora as a whole resembles that of a great part of North America. The vegetation is exceedingly various, the products of the tropics being intermingled with those of the temperate and frigid zones. The palm, banana, bambpo, bignonia, and myrtle flourish. Sweet oranges, pomegrantes, pears, apricots, peaches, and above 500 of the principal ornamental and useful plants are of foreign origin, having probably been introduced from Korea and China. The *kadsi*, or paper-tree, a species of mulberry, grows naturally in the fields, and furnishes textile fibres from which paper is produced; paper is also made from various other plants. The chrysanthemum is a common and favorite plant, and has become an emblem of Japan. The camellia, cultivated in several hundred varieties, grows to a large size, and is a great favorite both for the beauty of its leaves and of its flowers.

Fauna.— In consequence of the general cultivation of the soil the wild animals are necessarily few in number; hut bears, hyenas, deer, hares, foxes, and wild boars are still found in the north of Hondo. Dogs are common; there is a small highly prized species of spaniel, from which it is supposed was derived the English variety known by the name of King Charles. Rats infest the houses in great numbers, notwithstanding the abundance of cats. Flying squirrels and monkeys are faunal features. There is a great variety of birds — including song-birds, birds of prey, birds of the pheasant kind, and in particular numerous water-birds, of which the cormorant is trained to catch fish for its owner. Snakes are not unfrequent, and at least one species is venomous; there are also tortoises, lizards, scorpions, and centipedes; and of the insect tribes there are white-ants, winged grasshoppers, and several beautiful varieties of moths.

Fisheries.— The rivers of Yezo supply abundance of salmon. The surrounding seas abound in great varieties of fish constituting important sources of food supply and fertilizing agents which are receiving systematic and scientific exploitation. Within a decade raw and manufactured fishery products doubled in value, reaching a total of $35,000,000 annually, to which are added since 1905 the Sakhalin fisheries conservatively estimated at $5,000,000 a year.

Agriculture.— The soil of Japan is naturally indifferent; but the patient industry of the agriculturists, favored by the genial climate, has covered with vegetation every spot capable of bearing anything. The rugged mountain sides, where the plow cannot be used, are often built up in terraces, and tilled by hand. Agriculture is greatly promoted by a law which provides that land remaining unused for more than a year shall become forfeited to the public. The agriculture of the Japanese is conducted with diligence and skill. Irrigation is judiciously applied, and manure of all kinds is carefully collected and used in the production of generally abundant harvests. In the south the sugar-cane is cultivated with success; and rice yields two harvests, and constitutes the chief article of food. Wheat and barley, maize and millet, are grown to an important extent, and buckwheat, potatoes, melons, pumpkins, and cucumbers in great abundance. Ginger, pepper, cotton, hemp, and tobacco are cultivated in considerable quantities; and there are extensive plantations of the tea plant — yielding, however, a product inferior to that of China. Silk is also a product of importance. Horticulture is highly developed and Japanese gardeners have long attained the art of dwarfing and unnaturally enlarging vegetable productions.

Stock-raising.— Buffaloes and zebus are common and are used principally as beasts of burden and for agricultural purposes. Horses of various breeds — but generally small — in 1902 amounted to 1,515,373; the cattle numbered 1,275,382; pigs 213,417; goats 62,203, and sheep 2,289. Poultry-farming is also receiving increased attention.

Commerce.— In 1852 American diplomacy succeeded in removing the restrictions which for centuries hampered foreign intercourse with Japan. Prior to that date the foreign commerce of Japan was limited to the Chinese and the Dutch. The Chinese trade was confined to Nagasaki, where a few junks arrived annually from the ports of Amoy, Ningpo, and

Shanghai. The Dutch were allowed to visit the port of Nagasaki, where they had a factory on a small island called Desima, in which 12 or 13 merchants lived, closely watched by the Japanese, and allowed very little liberty. Two ships were annually sent from Batavia. Goods were conveyed by land on pack-horses and oxen. But the principal carriage of merchandise was by water, for though the peculiar construction of the Japanese vessels unfitted them for long sea voyages, they were well enough adapted to the navigation of lakes and rivers, and for coasting from port to port, and crossing from island to island. The rapid introduction of railways particularly throughout the main island greatly stimulated trade and as Japan progressed in its career of modern expansion, each year showed a substantial increase in exports until in 1895 they exceeded the imports by $3,411,789. In 1894 the total exports reached $67,813,776; ten years later they had more than doubled, in 1904 reaching $158,995,795.71. The leading items of export then were: Raw silk, $44,000,000, of which the United States took $30,000,000; silk manufactures, $22,000,000, three per cent of which came to the United States; cotton yarns, $14,500,000; copper, $6,500,000; coal, $47,500,000; cotton fabrics and matches, each $5,000,000; tea, $6,000,000; mats and matting $2,500,000; rice, $2,300,000; camphor, $1,500,000; cuttle fish, $1,300,000; cigarettes, $1,250,000; porcelain and earthenware, $2,000,000. With abundance of low priced and efficient labor, convenient ports of entry, ambitious leaders, and in fact, practical government supervision, the country's commerce grew rapidly in volume, and notwithstanding the Russo-Japanese War of 1904–5, which severely taxed the nation's resources, no commercial loss was sustained. War supplies increased the imports, but with the advent of peace, a balance in favor of the exports was re-established with increased business in almost all lines of trade. In the six months ending with June, 1905, the exports and imports totaled $213,757,006; the United States led in the export trade, taking from Japan in that period merchandise valued at $32,518,509, China being second with $21,931,507. British India led in the import trade with $34,030,288; Great Britain being second with $32,623,660; and the United States third with $20,304,294. The foreign trade is carried on chiefly through the ports of Yokohama and Kobé. For the fiscal year 1904 the former exported $85,104,726, and imported $68,132,505; Kobé exported $43,988,089, and imported $87,427,600. The ports of Osaka, Nagasaki, and Moji-Shimonoseki had an aggregate export trade of $24,698,205, and imports $24,480,246. The chief items of import are metals and metallic ware, machinery, arms, cottons, woolens, etc.

Manufactures.— The Japanese work admirably in iron, silver, gold, and all metals. Manufactures are carried on in every part of the country, and some of them are brought to such a degree of perfection as to surpass those of any other part of the world. Their lacquering in wood excels that of all other nations. They work with great skill in *sowas*, a mixture of gold and copper, which they color blue or black in a manner unknown elsewhere. Their silk and cotton goods are well made, and glass, pottery, and porcelain in all their branches are of superior manufacture. Their steel swords are unapproachable in quality, and they make excellent mirrors of steel. Paper is made from the bark of the mulberry tree in great abundance and of remarkable strength; it is used not only for writing and printing, and for wrapping goods, but for handkerchiefs and napkins. Paper began to be used in Japan as early as the 7th century, and printing from engraved wooden blocks in the Chinese manner was introduced about 1200 A.D. Kioto is the chief seat of the book trade, and is eminently a literary city. The Japanese are skilful in carving and die-sinking, and in the casting of metal statues, which are extensively used for idols. Their iron works, tobacco factories, breweries, distilleries, and other manufacturing establishments on a large scale, employ hundreds of workmen. The cities of Kioto, Tokio, and Osaka are the great seats of manufactures. At Kioto are made damasks, satins, taffetas, and other silk fabrics of every kind, lacquered articles, caps, scarfs, screens, fans, pins, bow-strings, paints, tea-boxes, grindstones, and porcelain and earthenware; at Osaka cotton goods and iron ware; and at Tokio nearly every species of manufacture is carried on. Government ownership of public utilities and manufactures such as railroads, telegraphs, and telephones, salt, tobacco, and camphor, and governmental supervision of industries, control and foster their development. Great progress has been made in the production of iron, steel, electric-light appliances, wire, rails, and cars, cottons, and these with other lines are assuming commercial independence of foreign-made articles. Ordnance, firearms, ammunition, and supplies are made at the Tokio, Osaka, Shimose, and Senji arsenals, and steel and iron ware and merchant vessels at the Yokosuka, Kuré Maizura, Takeshiki, and Ominato shipbuilding and dockyards.

Shipping and Navigation.— Exclusive of Formosa and the coasting trade, in 1903, 9,038 vessels, including 3,827 Japanese steamships, 1,717 Japanese junks and sailing ships, 3,420 foreign steamships and 74 foreign sailing ships, with a total tonnage of 13,571,389, entered Japanese ports; 3,848 Japanese steamships, 1,833 Japanese junks and sailing ships, 3,406 foreign steamships and 77 sailing ships, giving a total of 9,164 vessels of 13,584,079 tonnage, cleared the ports. The British ships numbered 1,777 of 4,758,534 tons; 427 were German with 1,277,278 tons; 407 were Norwegian with 392,343 tons; 284 were American with 975,834 tons; 265 were Russian with 353,667 tons; and 113 of 234,408 tons were French. The mercantile navy in 1903 comprised 1,088 modern steamers of 657,269 tons; 3,514 modern sailing vessels of 322,154 tons, and 1,114 native craft above 8 tons.

Railways, Roads, Posts, Telegraphs, and Telephones.— In 1904 there were 4,651 miles of steam railroad in operation, several extensions and new tracks projected and building, and over 300 miles of electric street railroads. In March 1906, the Imperial Diet promulgated a bill nationalizing the railroads. The chief highways or roads comprised 4,481 miles of government roads and 15,362 miles of prefectural roads. In 1904–5 there were 6,524

HIS IMPERIAL MAJESTY MUTSUHITO,
The Emperor of Japan.

post-offices throughout the empire handling annually a mail of 920,280,136 pieces.

In the same year there were 10,482 miles of telegraph lines and 2,173 miles of submarine cable. The number of telegrams delivered in the year was 10,410,674. The telephone service consisted of 5 bureaus, 323 call offices, 35,065 subscribers, and 3,021 miles of communication.

Weights, Measures, and Money.— The chief obstacle to profitable trade after the opening of the ports was the conflict between native and foreign ideas on the subject of currency. The money of Japan consisted of a great variety of gold, silver, and copper coins. The largest gold coin was the obang, a piece 6 inches in length and 3½ in breadth, worth about $100. It was not in common use. The largest gold coin in ordinary circulation was the cobang, which was 2½ inches in length, 1½ in breadth, and worth about $7.50. A still more common coin was the itzibue, which when of gold was worth intrinsically about $1.75. The silver itzibue was the common silver coin, and worth about 20 cents. Foreign coins were not allowed to circulate, and foreigners were compelled to exchange their own money for Japanese coins, at a valuation which rendered it difficult to carry on a profitable trade. Arrangements, however, were made which remedied these difficulties, and a modern monetary law based on the metric system came into force in October 1897. The unit of value is the yen, equaling 0.75 grammes of pure gold, for which however there is no corresponding coin, the former one yen silver piece having been withdrawn. The gold coins consist of 20, 10, and 5 yen pieces, the silver coins of 50, 20, and 10 sen pieces, a nickel piece of 5 sens, and bronze coins of 1 sen and 5 rin pieces. The yen is divided into a hundred sen, and the rin is the tenth part of a sen. The weights are the mommé 0.2666 mommé = 1 gramme; the kin (160 mommé) = 1.325 pounds avoirdupois; and the Kwan (1,000 mommé) = 8.21 pounds avoirdupois. The measures are the shaku = .994 foot, 3.3 shaku equaling 1 metre; the Sün = 1,193 inches; the ken (6 shaku) = 5.965 feet; the chô (60 ken) = $\frac{1}{15}$ mile; the ri (36 chô) = 2.44 miles; the square ri = 5.9552 square miles; the chô land measure = 2.45 acres. The liquid koku = 39.7033 gallons; the dry koku = 4.9629 bushels; the liquid to = 3.9703 gallons, the dry to = 1.9851 peck.

Banking.— The principal bank of Japan is the Nippon Ginko or National bank, founded in 1882 and authorized to issue notes convertible to gold on presentation. The notes in circulation on 1 April 1904 amounted to $106,574,593. Besides the National bank there are the Nippon Industrial bank, the Yokohama Specie bank, the Hokkaido Colonization bank, and the Taiwan bank. There are also an Agricultural-Industrial bank with 46 branch offices, a Common bank with 1,754 head offices, 1,441 branch offices, a paid-up capital of $129,198,932, and deposits amounting 31 Dec. 1903 to $288,113,870, and savings banks with 469 head offices, 586 branch offices, a paid up capital of $14,765,199, and deposits amounting 31 Dec. 1903, to $23,007,396. In the post-offices which also act as savings banks 2,335,173 persons in 1900-1 deposited $19,717,006 and withdrew $7,350,281.

Government and Administration.— The government of Japan was, until 1889, a hereditary absolute monarchy, vested in the mikado, or emperor. This was the ancient form, but in 1585 the emperor's commander-in-chief usurped the governing power, and for nearly three centuries reduced the mikado to a secondary position. The latter resided in the royal and sacred city of Miako (or Kioto), where he was kept secluded, under the guise of a mysterious sanctity; while the shogun, living at Yeddo, exercised imperial authority, and was regarded, by foreigners at least, as a second and supreme sovereign. In 1868, however, a revolution overthrew the power and office of the shogun — he had been usually, but erroneously, called by a Chinese title, tycoon — and the mikado was restored to his ancient supremacy. In 1889 Japan received a constitution, becoming a constitutional monarchy. The mikado is sovereign of the empire, can declare war, make peace, and conclude treaties; and exercises executive powers with the advice and assistance of his cabinet, who are appointed by himself. He is also assisted by a privy-council, who give their advice in important matters when consulted. The cabinet includes the prime minister, and the statesmen at the head of the foreign office, treasury, war, navy, education, public works, etc. The legislative power is vested in the mikado and the diet or parliament, which consists of two houses, a house of peers and a house of representatives. The former consists of members of the imperial family, princes, and marquises; counts, viscounts, and barons elected by their respective orders; and a certain number of persons nominated by the emperor and by a few wealthy taxpayers, the total number being about 300. The house of representatives numbers 300; the members being elected for a period of four years, so many from each electoral district. They are paid, as are also the nominated members of the house of peers.

Finances.— The estimated revenue for 1905–6 was $189,231,398 and the expenditure $105,262,218. The chief items of revenue are the land tax, 2½ per cent of the market value of the land, the taxes on saké and other liquors, the tobacco monopoly, customs dues, stamp duties, income tax, and the profits on the public utilitarian services controlled by the government, telegraphs, posts, railways, mines, etc. The principal items of expenditure for 1904–5 were the army $18,635,686, navy $10,908,976, justice $5,098,526, communications $9,971,933, finance $29,712,626, etc. War finance representing the conflicts with China and Russia is treated separately; receipts and expenditure for war purposes to April 1904 amounted to $288,000,000; the public debt to $282,459,475.

Army and Navy.— Every male Japanese of the age of 17–40 is liable to military service, and after reaching the age of 20 has to undergo three years' army training. The army on a peace footing in 1900 numbered 632,007 of all ranks, including 11,611 officers. The cavalry mounts [illegible]. In war the total strength of position of the recruits is high. They are very well educated, as a rule, nearly 8 per cent being graduates of the higher common schools, 8 per cent of equivalent education (though not graduates), 25 per cent graduates of the lower common schools, 16 per cent of equivalent edu-

cation (though not graduates), 27 per cent (besides the foregoing) can read and do ordinary sums in arithmetic, while only 16 per cent cannot read or write.

The Japanese navy has its ministry and department of naval command in Tokio. The expansion of her naval resources as exhibited in the Chinese war of 1894–5 and the war with Russia, 1904–5, has been such as to give Japan a fleet that is equal to any in the world of the same size. With the vessels captured in her naval battles, the fleet in 1906 comprised 11 battleships and 4 coast defense vessels, 9 first-class armored cruisers, 20 protected cruisers of the second-class, 17 torpedo-boat destroyers and 67 torpedo-boats, all of the most modern type of naval constructive science. A programme laid down for strengthening the Japanese navy began with the year ending 31 March 1904 and provided for an expenditure of $49,930,152 to be spread over 11 years. Of this $31,174,134 was to be spent on warships. The facilities for naval construction and repair possessed by Japan are exceptional. The naval arsenal at Yokosuka, the foundations of which were laid by French engineers, has grown to great dimensions, and there is no work connected with the construction and equipment of a war vessel that cannot there be accomplished satisfactorily. The principal dockyard is large enough to admit the heaviest battleship afloat, and in 1906 there was building on the stocks a warship of the enormous displacement of 19,000 tons to carry an armament of four 12-inch, twelve 10-inch, and twelve 4.7-inch guns. Yokosuka lies inside the Gulf of Tokio, the narrow entrance to which is defended by heavy batteries, mounted both on the surrounding hills, and by forts built on islands in the gulf. Other fully equipped imperial dockyards are situated, that of Kuré with fortifications on adjacent islands, near the west entrance to the Inland Sea, and that of Hiogo-Kobé, protected by forts at Wakawama and on the island of Awaji, near the eastern entrance. Sasebo, a fortified naval port approached by narrow winding channels, is on the west coast of the southern island of Kiusiu. The Tsugaru Strait separating Hondo and Yezo is fortified at Omazaki and Hakodate.

Ethnology.— The Japanese belong to the great Mongolian family of peoples (apart from the Ainos of Yezo, who belong to a prehistoric aboriginal race). The Japanese are of middling size, and generally of a yellow color, though some are brown and others nearly white. Their eyes are small, oblong, and deeply sunk in the head. Their noses are short and thick, and their hair thick, black and glossy. The people of rank have generally fair complexions, and ladies who are not exposed to the sun have sometimes perfectly white skins and blooming cheeks. The men are vigorous and active, and the women well-formed and graceful, while both sexes are of a higher degree of intelligence than is common among Asiatic nations. Their chief characteristics are courage, frankness, and perseverance, with good humor, natural politeness and a large measure of self-confidence. The agricultural population in particular, are distinguished for their industry, temperance, and courteous hospitality.

Population.— On 31 Dec. 1903, the population of Japan amounted to 46,732,841, showing an annual increase in six years of 1.54 per cent. The population consisted of 23,601,571 males and 23,131,270 females, divided among the various classes as follows, the 63 members of the imperial family not being included: 5,055 kwazoku or nobles, 2,167,389 shizoku or knights; 44,551,830 common people, including 17,783 Ainos in Yezo. Also included in the population were 153,785 Japanese resident in foreign countries, of whom 109,643 were in the United States or in United States colonies. On 31 Dec. 1903, there were 13,709 foreigners in Japan, of whom 7,423 were Chinese, 2,113 English, 1,624 Americans, 640 Germans, 554 French, 195 Russians, 176 Portuguese, 120 Swiss and 89 Dutch.

Sociology.— Apart from members of the imperial family, the people are divided socially into three classes: *kwazoku* or nobles, comprising five ranks, corresponding with prince, marquis, baron, etc.; *shizoku* or knights, and *heimin* or common people; the classes are kept distinct with all the strictness of caste. Before 1868 feudalism prevailed in Japan, and the chief nobility were feudal princes called *daimios,* who kept as military retainers, the celebrated *samurai* (q.v.); the distinctive mark of rank was the sword, the wearing of which was strictly prohibited to the lower orders; the middle classes carried one, and the higher ranks two swords, which were worn on the same side, one above the other. The uniforms of both the army and the navy are now fashioned on western patterns; western dress is commonly worn by the upper classes on formal occasions and during the discharge of official duties, and the western method of dressing the hair is almost universally adopted. The national costume, however, has by no means been totally discarded, and is not likely to be among the mass of the common people. The ordinary native dress of both sexes and of all ranks is very similar in form, differing chiefly in the colors, fineness, and value of the materials, those of the higher orders being generally of silk, and of the lower orders of linen or calico. The dress consists of a number of loose, wide gowns worn over each other, with the family coat of arms woven or worked into the back and breast of the outer garment, and all fastened at the waist by a girdle. The sleeves are very long and wide, and the part of the sleeve that hangs below the arm is made to serve as a pocket. The dress of the women very much resembles that of the men, but is usually of brighter colors, and the robes bordered with gay embroidery or gold. Upon occasions of full dress a cloak is worn together with a trousers-like garment called *hakkama.* Indoors, socks are the only covering of the feet. Shoes are worn abroad with soles of straw matting or of wood, which on entering a house are always taken off. Formerly hats were worn except in rainy weather, and the whole front and crown of the head was shaved, the rest of the hair being formed into a tuft on the bald skull. The women keep their hair very long, and usually wear on their heads numerous costly ornaments of tortoise-shell. A singular custom which still lingers among the

GATE OF THE GOLDEN TEMPLE, TOKIO.

FUJIYAMA, FROM TOKAIDO ROAD.

women of the lower classes is that of blackening the teeth and shaving or pulling out the eyebrows when they are married. Married women also tie their girdles before and single women behind. Polygamy is not permitted, but the power of divorce on the part of the husband is limited only by the requisition that he shall provide in a suitable manner for the support of the repudiated wife; though in case she is divorced for barrenness, or for other reasons recognized by the tribunals as sufficient, she has no claim upon the husband for maintenance. Under no circumstances whatever can a wife demand to be separated from her husband. Legal concubinage was abolished in 1880. Prostitution is permitted by law, and the profession of the courtesans or geishas is not deemed particularly disreputable; they are destined to their trade from infancy, and, being generally well educated and accomplished, are often selected as wives by respectable men.

The Japanese are very punctilious in all matters of etiquette, and the rules that govern social intercourse are formed into a regular system, and published in books, which are diligently studied at school. Though much has been borrowed from the Western nations in recent times, the Japanese will not be likely to give up many of their manners, customs, and ways of living, their foods and methods of cooking, their lightly-constructed houses, etc. The houses of the Japanese are low, and built of wood. The walls are coated with a cement that gives them the appearance of stone. In the windows the place of glass is supplied by very fine strong paper, which is protected from rain by external wooden shutters. Verandas encircle the houses, and to almost every dwelling, even in the cities, there is attached a garden. Store-rooms or warehouses made fire-proof by copper shutters and a thick coating of clay are numerous in the cities, where the tradesmen keep their stock of goods, and private families their valuable effects, as pictures, books, etc. Fires are frequent, and from the combustible nature of the common buildings are often terribly destructive. Conflagrations consuming thousands of houses sometimes occur. It is the custom on the completion of a new dwelling house to give a house-warming, for which purpose the neighbors and friends of the master of the new house send him liberal presents of eatables and drinkables. Tea is a universal beverage, and smoking is general among the men. In a morning call pipes and tea are served to the guests as regularly as pipes and coffee are among the Turks. At the conclusion of the visit sweetmeats are handed to the visitor on a sheet of white paper ornamented with tinsel. Fish is a general article of diet, and is varied with game, venison, poultry, and all sorts of vegetables, including a kind of sea weed. Food is eaten out of light lacquered bowls and dishes made of papier maché. Feasts are followed by music and dancing, and are commonly closed by drinking tea and a spirit called saké. Though industrious, the Japanese are eminently a social and pleasure-seeking people, are fond of feasts and frolic, and have frequent national holidays. Music, dancing, and the theatre are favorite amusements with all classes. Mummers, mountebanks, tumblers, conjurers, and all manner of jugglers are seen in the streets of the cities, and are highly popular with the people. Their jugglers surpass those of all other countries. Among their wonderful feats is the formation from pieces of tissue paper of artificial butterflies, which, guided by the motions of a fan, fly about, advance, retreat, appear to sip the honey from flowers, and display all the airs and graces of real butterflies. The ladies of the upper classes spend much of their time in the fabrication of pretty boxes, artificial flowers, pocketbooks, and purses, and in the painting of fans and pictures of birds and animals. In fine weather they join with the men in all sorts of outdoor and rural amusements, taking especial delight in fishing on the lakes and rivers, in vessels elegantly fitted up and adorned. The Japanese gentleman is invariably described as a person of pleasing address and most polished manners; even the commonest people are scrupulously observant of the forms of politeness. All classes are remarkably cleanly in their houses and persons, and bathe frequently. There are many public bath-houses in the towns open to all comers for a fee generally equal to the 8th of a cent, where the sexes, prior to its legal prohibition in 1880, bathed together entirely nude, without apparently the slightest idea of impropriety. Suicide formerly was common by the fashionable mode of hari-kari or "happy despatch" which was generally committed by cutting open the abdomen by two gashes in the shape of a cross. It was tolerated, if not in some cases approved by the laws, and was common as a means of escaping disgrace or avenging an affront, the adversary as a point of honor being obliged to follow the example. It is now legally forbidden. There are numerous benevolent and charitable institutions throughout the empire, workhouses and foundlings established by local corporations and private persons, while the central government provides funds for sufferers from extreme calamities and grants relief to the indigent, the helpless and friendless. Famines frequently occur owing to failures of the rice crop; that of 1906 in northern Japan was greatly alleviated by American benevolence.

Education.— Education is almost universal, the poorest and lowest laborers being taught to read and write. The women are educated with nearly as much care as the men, and there are extraordinary facilities for elementary, secondary and university instruction. During 1902–3 the percentage of children of school age receiving the prescribed course of elementary instruction was 90.35 for boys and 71.75 for girls. The total number of elementary schools was nearly 27,000. The number of teachers fell but a little short of 93,000, and the total number of children in the schools exceeded 4,683,000. The percentage of the enrolled pupils who attended daily was 84.61 per cent. The training of teachers receives careful attention, conditions of the school buildings are undergoing continual improvement.

There are seven secondary schools, in different parts of Japan, which are intended as preparatory for the universities. There are also a number of special schools in which the direct practical applications of the subjects studied are kept in view. In the Tokio Foreign Languages School, English, French, German, Russian, Ital-

ian, Spanish, Chinese and Korean are taught. The Tokio Fine Arts School provides five courses of study, including painting, designing, sculpture, architecture and industrial fine arts. The Tokio Academy of Music furnishes complete instruction in both Japanese and foreign music. There are technical schools intended to prepare men to take charge of industrial operations. The agricultural school at Supporo trains agriculturists for the island of Yezo, which is to Japan what Alaska is to the United States. The Tokio Technical School trains managers and foremen of factories, and a similar institution, already fully equipped, has been started in Osaka. Even the commercial aspect of education is not overlooked; the higher commercial school in Tokio has 53 instructors and 666 pupils.

There are in Japan two universities, the Imperial University of Tokio and the Imperial University of Kioto. The former comprises a University Hall and six colleges of law, medicine, engineering, literature, science and agriculture. The college of engineering offers nine courses: civil engineering, mechanical engineering, electrical engineering, naval architecture, technology of arms, civil architecture, applied chemistry, technology of explosives, and mining and metallurgy. In 1903 the total number of resident instructors was 222, and there were 35 assistant professors now studying in foreign countries. The students numbered 2,880, and included eleven foreigners, one of them a native of the United States. The University of Kioto, though founded much later than that of Tokio, includes, besides the University Hall, colleges of law, of medicine, and of science and engineering. The college of science and engineering provides courses in mathematics, physics, pure chemistry, chemical technology, civil, mechanical and electrical engineering, and mining and metallurgy. In 1903 there were 25 professors and 186 students.

There are laboratories for special purposes and many public libraries, and the combination of educational forces exhibits the astonishing progress in education made by Japan within 30 years.

Religion.— The chief religion is that of Buddha, which is, however, exotic and comparatively modern. Another and older faith exists, called Shinto or Shin-Syu. The word *shinto* is equivalent to spirit worship. The Shinto belief supposes the existence of an infinite number of spirits, exercising an influence over the affairs of the world, who are to be propitiated by prayers and the observance of certain rules of conduct, by cleanliness of person, and purity and cheerfulness of heart. The chief of these spirits is the sun, and after him the elements. These are called Dai Zin, "great spirits." The inferior spirits, who are very numerous, are chiefly heroes canonized for their worthy deeds or illustrious qualities. The most prominent and popular of these minor deities is Fatsman, the god of war, who is an apotheosis of the 16th emperor of Japan. He is supposed to have been born in a supernatural manner, and is universally honored throughout the empire. Although there are a large number of nominal Christians in Japan, it is not believed that Christianity has made many real converts, motives of self-interest — such as the obtaining of a free western education in the mission schools — often underlying so-called conversions to the Christian faith. There are no fewer than 12 sects of Buddhists with 32 creeds. Freedom of religious belief and practice when not prejudicial to peace and order is ensured by the constitution.

Judiciary.— A modern system of justice comprising four classes of courts has been established. Throughout the empire (exclusive of Formosa) there are 302 subdistrict courts for all petty, civil, and criminal cases; 49 district courts exercising a more extensive jurisdiction in civil and criminal cases, and a revising jurisdiction over the subdistrict courts; seven courts of appeal from the decisions of the district courts; and one court of cassation in Tokio, the supreme court exercising an appellate jurisdiction over the courts of appeal, and an original jurisdiction in serious crimes against the imperial house and state, and in serious charges against members of the imperial family. Seven judges preside in the court of cassation; five judges in the courts of appeal; three judges in the district courts, one being chief judge, and one judge in the subdistrict courts. A court under the direct supervision of the emperor deals with disputes respecting administrative affairs.

Local Government.— In 1876 a new division of the empire into districts or prefectures for local govern. ent was made, namely, 43 *ken* or rural districts, and 3 *fu* or residential districts: Tokio (Yeddo), Osaka, and Kioto. The prefectures are subdivided into *shi* = municipalities, and *gun* = counties; the counties are again subdivided into *chō* = towns, and *son* = villages. The units of local government are village, town and municipality, forming local corporations of the same name; supervising all are the prefectural governor, assembly and council. Citizenship and electoral qualifications are conferred on all male Japanese not less than 25 years of age who for two years reside in a municipality, town, or village, share its burden, and pay land tax or not less than $1 direct national tax annually.

History.— The history of Japan, like that of other ancient nations, begins with a mythical period, during which gods and goddesses mingled openly in the affairs of men. The authentic annals of the country commence with the reign of Sin Mu, who was at the same time high priest and emperor, about 660 B.C. He is said to have civilized the people, and to have established laws and a settled government. For many centuries his posterity reigned on the throne he had founded, bearing the title of mikado, and claiming to rule by divine right and inheritance. They were worshipped as gods upon earth, and long exercised the most absolute power. Women were not excluded from the succession, and in ancient Japanese history there are many famous empresses. The most celebrated of these was the Empress Singokogu, who began her reign in the 3d century of the Christian era. She conquered Korea, and gave birth to a son who succeeded her. He was so successful and renowned that at his death he was deified, and is now the Japanese god of war. In this early period a free intercourse appears to have been carried on with China, from which country about the middle of the 6th century Buddhism entered Japan, and was extensively spread among the people. Toward the end of the 7th century the claims of two

OSAKA CASTLE.

brothers to the throne led to a great civil war, which was ended by the defeat and suicide of the younger. About the end of the 8th century a foreign people of whom nothing more is known than that they were not Chinese, but natives of some more distant country, invaded Japan, and being constantly reenforced from home, maintained hostilities for 18 years before they were entirely expelled. Between the 9th and 12th centuries several new religions were introduced by foreign priests or by Japanese returning from foreign countries. The reign of the emperor Itsi Sio (987–1012) was remarkable for a great epidemic over the whole country, and for the number of learned men who adorned the court. In the reign of Go Rei Sen (1046–69) a great rebellion took place in the province of Osju, which lasted for five years, and is much celebrated in Japanese literature. Another famous rebellion was headed by Kyomori, a prince of the blood, in the reign of To Ba (1108–24). About the middle of the 12th century, during the reign of the Emperor Kon Yei, the authority of the mikado began to decline. The vassal princes took advantage of the weakness of the imperial government to strengthen their own power, and great confusion ensued. To remedy these evils, the court of the mikado created the office of shogun or commander-in-chief of the army, and appointed to the post Yoritomo, one of the most celebrated characters in Japanese history. He was a young soldier of high birth, related to the imperial family, and was successful and ambitious, so that after quelling the turbulence of the great vassals and restoring the authority of the crown, he contrived to concentrate in his own hands the real power of the government, without, however, depriving the mikado of his nominal rank, dignity, and religious supremacy. The office of shogun was made hereditary in the family of Yoritomo, whose descendants became in fact joint emperors with the mikado. The Mongols having invaded China in 1260 and conquered the greated part of it, their leader Kublai Khan sent envoys to Japan in 1268, and again in 1271 and 1273, summoning the Japanese government to enter into an alliance with him. The Japanese dismissed the envoys without any answer. The Mongol conqueror, irritated at their insulting indifference to his proposals, sent against them a great fleet and army in 1274, or according to Marco Polo in 1264. This expedition landed in Japan, but was defeated and the army cut to pieces. A still greater expedition was despatched in 1281, and met a similar end, the Japanese sparing only three of the invaders to carry back to China the news of the fate of the rest. Japan from that time to the present has not been molested by invaders. In the 16th century civil wars broke out, and a revolution took place, by which Faxiba, a man of extraordinary ability and energy, originally a private soldier, was raised to the supreme command, and became shogun, under the name of Taiko Sama or Lord Taiko, with the additional title of tycoon, which is now the appellation commonly given to the emperor at Yeddo, or lay emperor. He was the first secular monarch who assumed entirely the absolute control of the empire, some share in the government having been hitherto granted to the mikado, who was now reduced to the condition of a merely nominal monarch. Taiko Sama is regarded by the Japanese as the greatest character in their history, at least since the mythical period, and was eminent not only as a warrior and statesman, but as a legislator. His laws and policy until modern times were observed by the government of Japan, and secured to the nation an almost unequaled permanence of peace and prosperity. The turbulence of the vassal princes, who were then only 60 in number, and were individually powerful, was the chief source of the troubles that had afflicted the empire, and Taiko Sama took the decisive step of reducing their forces by dividing each principality into several. This policy, steadfastly carried out by him and his successors, resulted in establishing 604 distinct principalities and lordships, none of which was of sufficient magnitude to be formidable to the imperial power. It was during the confusion that preceded the rise of Taiko Sama that the Europeans began to be connected with the affairs of Japan. The existence of that empire was first made known to Europeans by Marco Polo, who in his narrative, written about 1298, mentions it under the name of Zipangu, a modification of the Shipen-kue of the Chinese, from whom he had obtained his information. He says: "Its inhabitants have fair complexions, are well made, and are civilized in their manners. Their religion is the worship of idols. They are independent of any foreign power, and governed only by their own kings. They have gold in the greatest abundance, its sources being inexhaustible; but as the king does not allow of its being exported, few merchants visit the country, nor is it frequented by much shipping from other parts." The Portuguese, after Vasco da Gama had doubled the cape of Good Hope in 1497, rapidly extended their discoveries and conquests in southern Asia. In 1542, three Portuguese sailors, who had deserted their ship and taken possession of a Chinese junk, were driven by storms upon the coast of Japan, and to them is ascribed its European discovery. About three years later a Portuguese adventurer, Fernam Mendez Pinto, while cruising with some companions of his own nation in the vessel of a Chinese pirate, was driven by foul weather into a harbor in one of the smaller Japan islands. He was well received, and carried back to the Portuguese settlements in China such a report of the riches and magnificence of Japan that great numbers of traders and adventurers flocked thither, and an active commerce soon sprang up. Missionaries speedily followed the merchants, and in 1549 Japan was visited by the celebrated "Apostle of the Indies," St. Francis Xavier. Both merchants and missionaries were favorably received, and while the one class found a ready and most profitable market for their goods, the other rapidly converted vast numbers of the natives to Christianity. Three of the most powerful of the Japanese nobles, the princes of Bungo, Avima, and Omura, were among the converts. In 1582 the Japanese Christians sent an embassy with letters and presents to Rome to do honor to the Pope, and assure him of their submission to the church. In the two years which followed their return (1591–2) it is said that 12,000 Japanese were converted and baptized. Tempted by the success of the Portuguese, the Dutch East India company in 1598 despatched five merchant vessels to Japan, one of which reached it in 1600. In 1609 other Dutch ships

arrived, and were well received by the Japanese, who conceded to them the port of Firando for a factory or settlement, with considerable privileges. Before the arrival of the Dutch, who were then at war with Portugal, the Japanese government had become distrustful of the Portuguese, whose astonishing success made them haughty and disdainful of the feelings and prejudices of the natives. Portugal was at that time united with Spain, and a Spaniard, when asked by Taiko Sama: "How is it that your king has managed to possess himself of half of the world?" indiscreetly answered: "He sends priests to win the people; his troops then are sent to join the native Christians, and the conquest is easy." This answer, it is said, made a deep impression on the Japanese government. In 1587 Taiko issued an edict for the banishment of the missionaries; the edict was renewed by his successor in 1596, and in 1597 23 priests were put to death in one day at Nagasaki. The Christians on their part took no measures to pacify the government, but defied it, and began to overthrow idols and pull down heathen temples. This led to dreadful persecutions in 1612 and 1614 when many of the Japanese converts were put to death, their churches and schools destroyed, and their faith declared infamous and rebellious. The Portuguese traders were no longer allowed free access to the country, but were confined to the island of Desima at Nagasaki. In 1622 a frightful massacre of native Christians took place in the neighborhood of Nagasaki, and horrible tortures endured with heroic constancy were inflicted on multitudes in the vain effort to make them recant. In 1637 it was discovered by the Japanese government that the native Christians, driven to despair by persecution, had entered into a conspiracy with the Portuguese and Spaniards to overthrow the imperial throne. The persecutions were renewed with increased rigor. Edicts were issued banishing the Portuguese forever from Japan, and prohibiting any Japanese, or any Japanese ship or boat, from quitting the country under the severest penalties. By the close of 1639 the Portuguese were entirely expelled, and their trade transferred to the Dutch, who, as enemies to the Portuguese and to the Roman Catholic faith, were not involved by the Japanese in their condemnation. In 1640 the oppressed native Christians rose in open rebellion in the province of Simabara. They seized a fortified place, made a long and gallant stand against the imperial troops, and were at length subdued only by the artillery and military science of the Dutch, who were either persuaded or compelled by the Japanese to cooperate against the rebels. The Christian stronghold was finally carried by storm, and all within its walls, men, women, and children, to the number of many thousands, put to death. In the next year the Dutch were ordered to quit their factory at Firando, and take up their residence, under very rigid inspection, in the island of Desima at Nagasaki. There they remained for more than two centuries in undisturbed monopoly of the entire European trade of Japan, notwithstanding occasional efforts of the Russians and English to obtain intercourse with the secluded empire. These efforts were resolutely repulsed, and led in one case to the imprisonment for two years in Japan of the Russian Captain Golownin and several of his companions. In 1852 the United States government, in consequence of complaints made to it that American seamen wrecked on the coast of Japan had been harshly treated by the authorities of that country, despatched an expedition under the command of Commodore M. C. Perry, who was instructed to demand protection for American seamen and ships wrecked on the coast, and to negotiate if possible a treaty by which American vessels should be allowed to enter one or more ports to obtain supplies and for purposes of trade. In February 1854, Commodore Perry, with a squadron of seven ships of war, entered the bay of Yeddo and came to anchor within a few miles of that capital. During the previous year he had entered the same bay and delivered to the Japanese a letter to the emperor from the President of the United States. On 31 March 1854, after much difficult negotiation, a treaty was agreed upon, dated at Kanagawa, the nearest large town, though really signed at the village of Yokohama. By this treaty the ports of Simoda and Hakodadi were appointed for the reception of American ships, where they can be supplied with wood, water, provision, coal, and other requisite articles, and protection and assistance were guaranteed to shipwrecked seamen. Liberty to trade under certain restrictions was also granted, and an arrangement made for the residence of American consuls at Simoda and Hakodadi. In September 1854, a British squadron commanded by Rear-Admiral Sir James Stirling entered the harbor of Nagasaki, and a treaty was soon concluded between Great Britain and Japan, by which Nagasaki and Hakodadi were opened to foreign commerce. Subsequently the Russians made a similar treaty and obtained equal privileges; and by a treaty dated 9 Nov. 1855, the Dutch in Japan were relieved from most of the restrictions so long imposed upon them at Desima. On 17 June 1857, a new treaty was negotiated at Simoda with the Japanese government on behalf of the United States by Mr. Townsend Harris, United States consul-general for Japan, by which the port of Nagasaki, in addition to those of Simoda and Hakodadi, was opened to American trade, and additional privileges granted to American merchants. In 1858 Mr. Harris succeeded in reaching Yeddo, where he concluded a still more favorable treaty. In the same year a British squadron conveyed a British ambassador, the earl of Elgin, to Yeddo, where, on August 26, a new treaty was concluded between Great Britain and Japan, by which the ports of Hakodadi, Kanagawa, and Nagasaki were opened to British subjects after 1 July 1859, Nee-e-gata or some other convenient port on the west coast of Niphon after 1 Jan. 1860, and Hiogo after 1 Jan. 1863, and various commercial privileges granted to British merchants. In 1860 a Japanese embassy visited the United States, and in 1861 an embassy was sent to the European courts. The rebellion of 1868 already referred to under the paragraph *Government*, followed on the deposition of the shogun, and the reform movement for modernizing Japanese institutions organized by Iwakura, Okulo, Saigo, and Kido.

This progressive movement was chiefly, if not solely, the result of political foresight. The Japanese were at heart as anti-foreign as their Chinese neighbors; but, unlike the latter, they grasped the fact that western encroachment could only be checked by western methods.

SCENE ON THE BAY OF YEDDO, JULY 11, 1853.

LIEUT. BENT IN THE MISSISSIPPI'S CUTTER PASSING THROUGH A FLEET OF JAPANESE BOATS.

FIRST LANDING OF AMERICANS IN JAPAN, JULY 14, 1853.

When the progressive and sagacious statesmen of Japan perceived that their existence as a nation depended upon meeting the great powers of the West on their own ground, they determined upon a thorough and comprehensive metamorphosis. Not only was the youth of Japan sent to Europe for the purpose of acquiring western sciences, but foreign advisers were called in wholesale to reorganize the army and to instruct the nation in the ways of the West. The first innovation was the construction of a railway in 1869, and since that date an immense railway system has been developed, chiefly for strategical purposes, and latterly with but little assistance from foreign engineers.

The building up of a powerful and efficient navy was one of the first considerations of the Japanese government; and not contented with merely organizing a fleet, they prepared for the chronic industrial warfare, which is the inevitable condition of modern life, by subsidizing the construction and the maintenance of a mercantile marine. Determined to make themselves independent of Europe and America, the Japanese established dockyards and arsenals, at which modern ships and armaments are now turned out under foreign supervision, and frequently by native engineers unaided by Europeans. Although the workmanship attained in the latter case is not, generally speaking, on a level with that of the West, it is admitted that the Japanese are making rapid progress in engineering and ship-building. The problem of education received the early attention of Japanese reformers, Commissioners were despatched to Europe in 1871 charged with the task of mastering the essential points of Western education. On their report an educational code, which has since been frequently revised, was drawn up. The new conditions of life necessitated the abolition of Japan's traditional code of laws, which she proceeded to replace with a legal code borrowed from the West; and to these laws foreigners in Japan since the nullification of extra-territoriality in 1899, are now obliged to submit themselves. Although the native industries may be said to die hard in Japan, the country has undergone during the last few years little short of an industrial revolution. In 1897 Japan adopted a gold currency, and placed herself thereby on a financial level with the civilized powers of the West. Side by side with the modern development of their country the Japanese have preserved a remarkable spirit of patriotism. These reforms were not effected without considerable opposition and several risings of the nobles, who, in consequence of the revolution of 1868, were deprived of their privileges, and to a large extent of their incomes, took place. That of 1876–7, headed by the reformer Saigo, taxed the resources of the government pretty severely before it was quelled. In 1894 war with China broke out, ostensibly owing to disturbances in Korea, over which both China and Japan had long claimed a suzerainty, and which had been a frequent source of friction between the two countries on former occasions. Active hostilities began in Korea, from which the Japanese gradually drove out the Chinese troops. A great naval engagement took place off the mouth of the Yalu River, which separates Korea from China, and the result was entirely in favor of the Japanese, who then pushed their way into Manchuria, driving the Chinese before them. Further great successes were the capture of the Chinese fortified port and arsenal of Port Arthur, at the entrance of the Gulf of Pe-chee-le of New-chwang, Wei-hai-wei, and great part of the Chinese fleet. China then saw that it was hopeless to continue the struggle, and in March 1895, Li Hung Chang was sent to Shimonoseki to sue for peace. Japan demanded, in addition to a heavy war indemnity, the cession of the Liao-tung peninsula. To these terms China's plenipotentiary ostensibly agreed, but it had been secretly arranged that Russia should step in and forbid the alienation of territory on the mainland. Accordingly Japan found her demands opposed by Russia, France, and Germany, and was compelled to forego the legitimate fruits of her victory. There is no doubt that Japan's primary object in making war was to check the advance of Russia to a threatening position on the mainland of Korea. Her statesmen hoped, by the insistence on Western reform, to make Korea a powerful buffer state between their own country and Muscovite aggression, and after the conclusion of the war there began a constant — and singularly even — struggle of diplomacy between Japan and Russia for paramount influence in Korea. Instead of the Liao-tung peninsula, the island of Formosa and the Pescadores Islands were ceded to Japan, who was thus obliged to relinquish her design of thwarting Russia's objects in Northern China. A subject which constantly occupied the attention of Japanese statesmen during the 12 years that preceded the war with China was treaty revision. Japan had sacrificed national pride in order to place herself upon an equality with the West, her progress had been serious and genuine, and her statesmen protested against the continuation of extra-territorial privileges which relegated the country to the level of barbarous and uncivilized states. Great Britain was the first power to acknowledge Japan's claims to equality, and in July 1894, a new treaty, which was not to take effect for five years, was concluded by the two governments. Other powers followed suit, and on 17 July 1899, Japan attained her international majority. The principal effect of treaty revision was to abolish extraterritoriality, and to throw open the whole of Japan to foreigners for purposes of travel, trade or residence. The differences with Russia in regard to Manchuria and Korea, came to a crisis on 6 Feb. 1904, when after due notification, Japan broke off diplomatic negotiations. War ensued on the battlegrounds of Korea, Manchuria, and in the adjacent waters, until peace was re-established 5 Sept. 1905, Japan strengthening her position by a new treaty of alliance with Great Britain. See ANGLO-JAPANESE TREATY; KOREA; MANCHURIA; PORTSMOUTH, TREATY OF; RUSSIA.

Language and Literature.— Though the Japanese language is grammatically analogous both to those of the Mongolo-Tartaric and Manchu-Tungusic families, it differs radically from them. The Japanese language is not monosyllabic (like Chinese), but agglutinate, and has an alphabet of 47 letters, which are written in two different forms, one rendered complex by the addition of variations, known as the Fira-Kana form of character; and the other, the Kata-Kana character, entirely without variations, and consequently much simpler. Its claim to be akin to

the Chinese is invalidated by the essential characteristics of the Niphonese tongue, which differs from the Chinese as to the etymic import of its elements and in its polysyllabism. The genuine portion of the former is called *Yomi*, while the Chinese superfetation goes under the name of *Koye*. Siebold endeavors to establish genetic connections of the Japanese with various other languages, as for instance with that of the Ainos inhabiting the northern part of the island of Yezo and the southern point of Saghalien (Tarakai); with that in Santam on the coast of Manchuria, south of the Amoor; with those of the Incas of Peru and the Bochicas of New Granada; with that of the Muiscas of Brazil, etc. Although the Korean languages have many features in common with the Japanese, their divergence is radical. The area of the Japanese comprehends the three great islands with some parts of Yezo and other southern Kuriles, of South Saghalien, and also the Loo Choo group of islands, where a dialect or closely related language is spoken. The vernacular idiom differs remarkably from the written, by peculiar terminations, particles, and construction. The written language has also a peculiar style, named *naiden*, for religious and mystical subjects, and another, called *gheden*, for profane composition. There are also two styles of allocution, the one of etiquette, the other vulgar. The speech of women also differs in some particulars from that of men. The Yomi is sonorous, soft, and agreeable; almost all words end in vowels, which, however, are often dropped, and in *m* and *n*. Some sounds are of difficult pronunciation to us. A too soft utterance of consonants produces vagueness between the sounds of *p, b, f,* and *v;* between *s* and the English *z, sh* and the French *j*. Although there are no decided *h* and *l*, some Europeans fancy they hear them, while better phonetic authorities credibly assert that they are really *f* and *r* respectively. The initial *r* sounds almost like *dr*. The number of original vocables is inconsiderable. Technical terms are generally Chinese, and often much altered. There are two graphic systems. (1) Sinography, somewhat modified. At the request of Ozinteno, the 16th Daïri, Kieu-su-wang (Jap. Kosuvo), king of Pe-tsi (Takusai, in Korea), sent Wang-jin (Jap. Vonin), in 285 A.D., to Japan to introduce there the *Tshin-tse* (Jap. *Sinzi*, China letters), which were afterward named *Han-tsé* (Jap. Kanzi). From that time both the *Tshin-tsé* and the Chinese language became common in Japan; although the former are peculiarly pronounced, as may be seen in the examples within parentheses below. This divergence is, however, scarcely greater than that of the Chinese dialects from the Mandarin idiom. The sinograms of the learned are called *Taf* and *Sso*. With the varieties of sounds there are about 380 Japanized sinograms, beside the unaltered *Tshin-tsé*. The former are explained by the *Kata-kana* (see below); thus: *kekkō*, beautiful, by the Jap. *birei; mei-fit* (celebrated pencil), fine writing, by *nō-zio*, etc. Sinograms are sometimes pronounced very differently from their proper sounds; thus: *ye* (the 27th Chinese syllable), river, from the sinographic *sin-kiang; me* (17th Chinese syllable), woman, sinogr. *niù*. Synonyms are often written with the same sinograms. Prefaces of books are commonly written in sinograms. (2) As these did not altogether suit the peculiarities of Japanese phonetism and grammar, Kibi or Kibi-ko (733), who had been educated in China, selected 47 sinograms, and simplified them into syllabic signs, in analogy with their original sounds. This syllabary was named *I-ro-fa*, from the first 3 syllables, just as our alphabet is named from the first two letters. This Irofa, surnamed *Kata-kana* (half letters or signs), is used collaterally with sinograms, explaining their sounds, and serving beside for the indication of grammatical particles; in the same manner as the Manchu interlinear or marginal letters serve in Chinese texts. This form is called sometimes the writing of men. The 2d Irofa, surnamed *Fira-kana* (expanded letters), was contrived by the celebrated bonzes Comiu and Kobo (774–835), and became so manifold by the licenses of the pencil as to be almost illegible, especially owing to additions by a third bonze, Kiakuso, who added a 48th sign for a nasal sound. This is the cursive writing for daily transactions, sometimes called the writing of women. The 3d Irofa is *Mun-yo-kana* (myriad-leaves-letters, so called from the poem *Mun-yo-sio* by Tatsi-bana-no Moroye, about the middle of the 8th century, containing 10,000 verses), and is almost a sinogrammatic prototype of all the Irofas. The 4th is the *Yamato-kana*, a simple cursive script, which is used promiscuously with all the others. The original idea of the Irofa is Buddhistic and Indian. The varieties of form in all the Irofas are a great impediment to expeditious reading, the difficulty of which is increased by the many ligatures between the letters. Writing and reading proceed in vertical columns downward and from right to left. There are also some other diacritic as well as punctuating signs. The former are two, namely: the *nigori*, which is almost like our quotation mark (″), and indicates that the hard or rough sound of a letter is modified, so as to cause the *ko, fo, to,* etc., to be pronounced *go, bo, do;* and the *maru* (°), which indicates tenuification, or hardening, for instance of *fo* into *po*. The marks of punctuation denote also the transposition, repetition, etc., of syllables; they also separate sinograms from Irofas. The order of syllables is as follows: *i, ro, fa, ni, fo, fe, to,* and so on, without any symmetry or analogy. Properly classed, they are: the 5 Latin vowels, *a, e, i, o, u;* the labial *f* with these vowels suffixed (*fa, fe, fi, fo, fu*); the guttural *k* with the same; the *m* with them; then the *s* with them (and modified by diacritics into *z*, French *j*, Eng. *sh*); then *y, t, r, n*, all with those vowels attached; lastly, two more, *n'a, n'e*. The *t* is sometimes *ts, dz*, etc. The transcription by Europeans is variable. There is, beside, a kind of metaphony, by which *fò* becomes *fau* and *fafu; riò, riyau; kvo, kavau, kafau*, etc. This is similar to the Latin *lavo, lavatum* and *lautum, lotum; favco, fautum, fotum, fœtus*, etc. Dialectic variations depend chiefly on modifications of sounds; in Yeddo, for instance, *r* predominates; elsewhere *f* is pronounced *v; fu* like *u*, etc. In the grammar, there is no gender; the male sex is indicated by *vo*, the female by *me*. Substantives do not differ on the whole from adjectives. The latter are often replaced by qualitative verbs or by the particle of the genitive, and are euphonically varied, according to their position; thus, for instance; *akae fana*, red flower; *akashe fanava*,

AMERICAN SAILORS IN THE TEMPLE GROUNDS, SIMODA, JULY 8, 1854.

RELIEF MAP OF THE FIELD OF RUSSO-JAPANESE WAR.

FROM A MAP PREPARED BY THE INTELLIGENCE BUREAU OF THE WAR DEPARTMENT OF JAPAN.

red is flower-the; *akovo naru*, red becomes it (as in Magyar *vörössé lesz*); *aka irono fana*, Lat. *rubri coloris flos*. There is no proper article, but the suffix *va* sometimes determines the acceptation, or shows the French *partitif;* and *sya* signifies "as regards." Cases are indicated by suffixes, as in the following example: *sten*, or *sten-va*, Lat. *cælum; sten-no* (oftener *sten-ga*, as in Korean), *cæli, sten-ni, cælo, versus*, and *ad cælum; sten-ye, in cælum; sten-vo, cælum*, accusative (also *sten-voba*); *sten-de, cælo*, ablative; *sten-yori, ex cælo; sten-kara, de cælo, per cælum*, etc. The plural is formed by suffixes, as *tatsi, domo, ra, syo*, which signify all, much, many; or by reduplication, as *fito-bito*, men, from *fito*, man, with altered initial. The genitive precedes: *fitono yomi*, Lat. *viri arcus; anagono, fana, mulieris flos*. The numerals are various. We give here the Koye in the first place, and within parentheses the Yomi or common ones first, and after them those of days, namely: 1, *itsi* (*fitots', tsuitats*); 2, *ni* (*fotats', futska*); 3, *san* (*mits', mika*); 4, *si* (*yots', yokka*); 5, *go*, (*itsots', itska*); 6, *vok* (*mots', muika*); 7, *sitsi* (*nanats', nanuka*); 8, *fats* (*yats', yòka*); 9, *kŏ* (*kokonots', kokonoka*); 10, *yo*, (*tovo, tovoka*), etc. The other Koye are: 11, *zyo-itsi* (10 + 1); 12, *zyo-ni* (10 + 2), etc.; 20, *ni-zyo* (2 × 10); 30, *san-zyo* (3 × 10), etc.; 100, *fyak;* 1,000, *sen;* 10,000, *man;* 100,000, *vok* (and *roksya*, Sanskrit *lak-sha, a lac*); 1,000,000, *teô;* 10,000,000, *kei* (*kotsi*, Sanskrit *kōti*). There are 3 sets of figures of numbers. Many particular words are also used in the sense of numerals, as in Chinese. Of pronouns, those of the 1st and 2d person seem to have been lost in the words of etiquette. I, to equals and inferiors, is *vasi*, to a superior, *vatakusi;* we, to equals or inferiors, *vasi-domo*, to superiors, *vatakusi-domo*. There are more than 12 ceremonious quasi-pronouns for the 2d person. The 3d is *ano fito*, this man, etc. (as in Korean). There are many demonstratives. Relatives are wanting, being supplied by participles or understood from the context of the phrases, thus: *vasino miru sto*, Lat. *mei* (*mihi*) *visus vir*, for *vir quem vidi;* but *vasivo viru sto, me videns, vir*, for *vir qui me vidit*. The verb is the most perfect part of Japanese speech. *Aru* (to be, or to act), united with nouns, produces many compound verbs. It is affected by many moods, voices, and other logical categories, as in the Altai-Uralic and in many American languages; as for instance: *tata-ku*, Lat. *fer-ire, percut-ere; tata-keru, ferire posse; tata-kerareru, percuti jubere; tata-eteoru, percutientem esse; tata-kau, se mutuo ferire, pugnare; tata-sashereau, facere ut inter se pugnent, bellum ciere*, etc., to a greater extent than the Semitic *kal, piel, nifol, hifil, hithpael*. The suffixes of the tenses are: present, *ru*, past *ta*, future *o;* of negation, *nu, zu*. Persons and the plural are indicated by pronouns. The theme of the verb, which is also a substantive noun, is employed without alteration if others follow, and receives the suffixes only when it is not followed by others, or when it is the last word in the phrase. Various euphonic modifications take place in such a combination with the suffixes. Certain particles denote the moods. The participle is of very extensive application, rivalling that of the Greek. Adverbs are like adjectives, as in certain German phrases. The syntax adheres to a strict order, which is: first the subject (nominative), then the object, attributes, the verb, and the conjunction last. Many of the simple words abound in significations, which must be discriminated by sinograms. Compounds and derivatives are as frequent and easy as in Greek or German. Examples of the former are: *kara-mi*, Lat. *corporis truncus; kono-mi, arboris fructus; futa-no, telæ paginæ; tsi-sivo, pectoris liquor* (blood); *yamabato*, mountain bird, wild pigeon. Derivatives from *stat*, under, below, inferior, are: *statva*, humility; *statno*, humble; *statni*, humbly; *stat-nisheru*, to humble; *stat-ninaru*, to be humbled; *stat-vonarsu*, to cause humiliation, etc. Other derivatives are: *yomo*, to read, *yomi*, reading, *yomite*, reader; *itomo*, to afflict, *itami*, affliction; *orano*, to hate, *orani*, hatred; *kako*, to write, *kakite*, writer, etc. The following are paraphrases for avoiding ambiguity: *fai-tori-gumo*, fly-catch-spider, for *kumo*, which means cloud as well as spider; *ine-kari-gama*, rye-cut-scythe, for *kama*, scythe, frog, dish, etc. Many synonyms need explanation, as given in lexicons, where they are determined by sinograms, as for instance *ka-yari-bi*, fire-drive-gnats, because each of the three words has different meanings; *kami-fusuma*, a paper cloak, because *kami* signifies paper, god, head, above; *kino-doku*, mind-poison, grief; *ine-bikari*, rye-splendor, lightning; *issun-bōsi*, one-inch-bonze, for dwarf, etc. The following are examples of plurisignificants: *in-yen*, cause, banquet; *idziu*, to inhabit, to leave the house; *kanten*, heat and cold (so in Latin, *altus*, high and deep, *calidus* and *gelidus*, Eng. *coal* and *cool*, etc.). Many Yomi and Koye coincide, others diverge altogether in signification; thus: *kiba*, Japanese, tool, Chinese, cavalry; *kido*, Japanese, city-gate, Chinese, joy, anger, etc. The adoption of Roman script of the English alphabet as a substitute for her ancient system of ideography, is one of the most remarkable and not least important of all Japan's steps toward harmonizing herself with the highest civilization of Europe and America. For several years a knowledge of Roman script has been increasing in Japan among the most highly educated. Now it is proposed by the most influential educational organization in the empire to make the teaching of our alphabet and of our mode of word formation compulsory and universal in the public schools. It seems probable that the government will adopt the proposal, in which case, of course, all private schools will have to do the same, with the result that all the children of Japan will be learning to write and read their own language in English fashion.

At present the great stumbling block in the way of mastering Japanese is the necessity of learning a multitude of different ideographs. Once Japanese words are expressed in letters like our own, the task of learning will become immeasurably easier. It will then also be much easier for the Japanese to learn our language, for of course our alphabetically formed words seem as strange to them as their ideographs do to us. Moreover, it will cause a change amounting almost to transformation in the Japanese mind, or in the linguistic functions of that mind. The Japanese will for the first time regard words not as indivisible integers of speech, but as composite things formed of letters.

The literature of Japan comprises works of all kinds, histories, geographical and other scientific treatises, books on national history, voyages and travels, moral philosophy, dramas, romances, poems, dictionaries, and cyclopædias. A collection of the works of their poets, accompanied by short memoirs, has been made, and almost every Japanese is familiar with the best passages of the principal poets, and fond of quoting them in conversation. Many of their novels are of an interesting character and exhibit a higher imagination and more truth to nature than is found in the fictions of other Oriental nations. Their dramas, of which the people are passionately fond, are generally founded on national history or tradition, or the exploits, lives, and adventures of Japanese heroes and gods. Some of them are designed to illustrate and enforce moral precepts. Their general tendency is of an elevating, patriotic, and decorous nature, though some are strongly tainted with the national passion for revenge, and have horrible exhibitions of cruel punishments. The unities are totally disregarded, and the scene shifts from country to country and flies over great spaces of time without much regard to probability. Only two actors are usually upon the stage at the same time, and the female parts are performed by boys, as was formerly the case in Europe. The actor is most esteemed who can most frequently change parts in the same piece, and the leading actors receive very high pay.

Art.—Japan is in every sense an artistic nation. Owing to the timber construction that prevails in the buildings, which are marked by the characteristics of braced uprights, the overhanging curved roof, and an absence of arches, the architecture of Japan presents no very striking features except in the wealth of ornamental detail and brilliant color. The most imposing architectural monuments are various temples of which two of the earliest and finest are the 7th century hondo or chief temple of Horinji, Yamato, and the pagoda of Yakushiji, near Nara. In sculpture and carving, however, their work is fine almost to microscopic detail, while still preserving the big effect. Their statuary, dating from the 8th century, is marked by a vigor and freedom of design which has resulted in a standard of high artistic merit. In their bronze statuettes and in carving in wood and ivory they are unsurpassed. The artists love to represent Japanese life as it exists, and the incidents of every-day life, more especially the comical and grotesque, are worked out in wood with extraordinary skill. But it is by painting, especially, that Japanese art is best exemplified.

In Japan the art of painting is of such ancient date that its origin is enshrouded in the mists of antiquity. China, India, Korea, and Persia exercised a notable influence upon early Japanese art, but its history cannot be traced back farther than the 9th century.

In the Japanese dwelling there are no pictures, according to the conventional acceptation of the term, in their place is the kakemono, a gay and pleasing mural hanging, consisting of a strip of silk, satin, or crêpe, painted in a bold design of flowers, birds, or figures. This silk, often of thin or transparent texture, is sized in such a manner that it becomes an excellent vehicle for the retention of transparent washes in India-ink or water-colors.

The kakemono is appropriately framed in bands of rare brocade, gold or silver cloth, or of silk or paper decorated with a painted pattern. The bordering usually harmonizes in design and color with the subject. A glittering golden network is sometimes placed at the top or bottom, a silken fringe or other suitable finish. It rolls up like a map, and is weighted at the bottom with a cylinder of wood, bone, or ivory. From this cylinder sometimes depend handsome tassels of silk or carven ornaments of bronze, bone, or ivory; but these ornaments are admissible only on very expensive examples. When not in use the panel is carefully rolled up, deposited in a box covered with silk or paper, and put away until it is needed.

The kakemono has no determinate dimensions, the size being governed by the whim of the artist, or the space in which it is to be hung.

The kakemono is invariably assigned to the place of honor in a home, and is hung in a receptacle known as the tokonoma. This is a hooded and partitioned recess made of bamboo or some light wood, built at right angles with the wall of the room, and so constructed that it always commands a good light. These panel pictures are changed as often as three times a week, changes being governed by the season, occasion, or rank of company expected. The kakemono is a favorite adornment for the tea-house, the gayest ones being selected for this purpose.

Some of the finest ancient examples are enshrined in sacred temples, many of them being representations of Buddha and the numerous pagan gods worshipped by the Japanese; others are emblematical, consist of holy symbols, and are bordered with the most expensive fabrics.

Kosé Kanaoka is said to be the father of Japanese painting; he was the painter and poet-laureate of the imperial court and is regarded as the most eminent artist of antiquity. But few of his works are extant, and they are treasured with such veneration that they are dedicated to the sacred shrines.

Up to the beginning of the 17th century the Japanese painters disdained to reproduce any but heroic and religious subjects. It was not until the 18th century that any paintings portrayed the every-day life of the common people. Four artists soon became celebrated as prominent exponents of this new school of art. Iouasa Matahei was the founder of it, and has presented to posterity the pictorial history of the common people. He shows the peasant laboring in the field, the shopkeeper vending his wares, the artisan plying his various vocations, and the courtesan with her painted cheeks and gorgeous raiment. Hence the kakemonos of Matahei are of inestimable worth to the antiquarian, as they depict with admirable fidelity the manners and costumes of old times.

Motonobou was another able exponent of the realistic school; he began life as an art-embroiderer, and the embellishment of textile fabrics with fine needlework was due to his influence. It was he who created the fashion of the sumptuous trained robe still worn by the women of Japan.

Katsou-Kava was also a realist or impressionist. He devoted his talents to painting scenes from the theatre, and also pictures of women engaged in various occupations, with a smiling landscape or a sumptuous interior for a background. These paintings of picturesque peasant

girls, these counterfeit presentments of gaudily apparelled actors, are mostly to be found decorating the walls of tea-houses. Katsou-Kava was an able exponent of this school of art, which had many followers; he revelled in brilliancy of color, and under his skilful fingers the saffron yellows, the turquoise blues, and the rich violets were blended into a harmonious ensemble with consummate skill; his figures seemed imbued with life and motion.

Yeisai was one of the most delicious colorists of the latter-day impressionistic school, and is responsible for originating the exaggerated type of female who soon became the fashion in the cities of Japan. Although these exaggerations shock our refined tastes, we cannot fail to admire the voluptuous grace of his women, clad in the sumptuous stuffs that the looms of the Orient alone can produce. Another painter fond of portraying females of the refined aristocratic type was Outamaro, whose women are imbued with a languid sensuous charm. His paintings greatly resemble those of the modern French school, and remind one of a mellow rhythmical harmony in music.

Hakousai is undoubtedly the greatest painter, from a European standpoint, that Japan has ever produced, and may justly be compared with the most distinguished painters of Europe. His works are a veritable encyclopædia of dress and customs, but he was pre-eminently the artist of the people, and died unrecognized by the aristocratic classes.

Science.—In science the Japanese cultivated particularly medicine, astronomy, and mathematics. Superstitious prejudices prevented them from studying anatomy by dissection, and they therefore were but little skilled in surgery, but as physicians were able to cope with the most difficult and dangerous diseases. Chemistry also was imperfectly studied, but botany was successfully pursued. Great advance has been made along all scientific lines under the modern regime, as demonstrated during the war with Russia, and especially in the wonderful results achieved in the saving of life through the improved surgical methods of treatment of the wounded.

Music.— Native music is almost identical with that of China, having the same scale of five tones with an invariable common time. Marked by monotonous melodies chiefly in a minor key, and by an excessive use of chromatics, it is generally disagreeable to occidental ears. The use of the samsie or native guitar is an invariable part of female education. Old standards, however, are being abandoned, and western music introduced into schools and colleges is gradually gaining ground.

Japanese Art. See JAPAN.

Japanese Deer. See SIKA.

Japanese Fern-balls. See FERNS.

Japanese Quince, a small species of *Pyrus* (*P. japonica*), closely related to the typical quince, but cultivated wholly as a flowering shrub, as its small apple-like fruit is of little value. The flowers are large, numerous, early, vary from white to deep crimson, and universally admired.

Japan'ning, the art of varnishing in colors. All substances that are dry and rigid, or not too flexible, as woods, metals, and paper prepared, admit of being japanned. Paper is rarely japanned till converted into *papier mâché,* or wrought into such a form that its flexibility is lost. The article to be japanned is first brushed over with two or three coats of seed-lac varnish to form the priming. It is then covered with varnish, previously mixed with a pigment of the tint desired. This is called the ground color; and if the subject is to exhibit a design, the objects are painted upon it in colors mixed with varnish, and used in the same manner as for oil-painting. The whole is then covered with additional coats of transparent varnish, and all that remains to be done is to dry and polish it. Japanned works are chiefly of iron and tin, such as coal-boxes, trays, tin canisters, etc., which are both rendered ornamental and protected from rust. Much care is necessary to secure a high and equal polish. For a description of the Japanese process see LACQUERING; also see VARNISH.

Japheth, jā'fĕth, the second of the three sons of Noah, Gen. x. 1. His descendants peopled Europe and northern Asia. The Armenians, Medes, Greeks, Thracians, etc., were of the stock of Japhet. In Arabian legend he is said to have had 11 sons, each of which was the founder of a nation. Some philologists designate the Indo-Germanic languages by the term Japhetic, thus identifying his progeny with the Aryans; and the patriarch is said by others to be represented by the Japetus of Greek mythology, whose wife was Asia, and bore him a son Prometheus, the founder of civilization.

Japp, Alexander Hay, English editor and author: b. Dun, Forfarshire, 25 Dec. 1839. He was educated at Edinburgh University, and was for several years sub-editor of 'Good Words' and the 'Contemporary Review' and editor of the 'Sunday Magazine.' Several of his works have appeared over various pseudonyms — "H. A. Page," "Benjamin Orme," and others. He wrote: a 'Life of Thomas De Quincey' (1874); 'Thoreau: his Life and Aims' (1878); 'German Life and Literature' (1881); 'De Quincey Memorials' (1885); 'Cuckoos and other Parasitical Birds' (1899); 'Darwin and Darwinism' (1900); 'Darwin as Ethical Thinker (1901), and other volumes.

Japura, zhä-pŏŏ-rä'. See YAPURA.

Jararaca, zhä-rä-rä-kä', a venomous crotaline serpent (*Lachesis jararaca*) of northeastern South America. Compare BUSHMASTER.

Jaro, hä'rō, a pueblo of the province of Iloilo, Panay, situated on the Jaro River four miles northwest of Iloilo, the provincial capital. It is one of the earliest Spanish settlements in the Philippines, having been founded in 1584; in 1865 it was made an Episcopal see. The river is navigable for native boats and there is considerable trade. Pop. 10,400.

Jarool', an English spelling of the native name of an East Indian tree (*Lagerstræmia flos-reginæ*). It has large purple flowers, and yields valuable timber.

Jarves, järv'vĕs, **James Jackson**, American art writer: b. Boston, Mass., 20 Aug. 1818; d. Tarasp, Switzerland, 28 June 1888. In 1838, in consequence of ill health, he sailed for the Sandwich Islands, and resided for several years in Honolulu, where he published the first newspaper ever printed there, the *Polynesian*. Before returning to the United States he traveled extensively in California, Mexico, and Central America, and subsequently published a 'History of the Hawaiian or Sandwich Islands' (1843); 'Scenes and Scenery of the Sandwich Islands' (1844); and 'Scenes and Scenery in California' (1844). He afterward resided in Europe, chiefly in Florence, devoted to the study of art and engaged in making a collection of old masters which eventually became the property of Yale University. For his services to Italian art the king of Italy made him a chevalier of the Crown of Italy. His later works include: 'Parisian Sights and French Principles' (1855–6); 'Art Hints' (1855); 'Italian Sights and Papal Principles' (1856); 'Kiana, a Tradition of Hawaii' (1857); 'Confessions of an Inquirer' (1857); 'The Art Idea'; 'The Old Masters of Italy' (1861); 'Glimpses at the Art of Japan' (1876); 'Italian Rambles' (1884).

Jar'vis, Abraham, American Protestant Episcopal bishop: b. Norwalk, Conn., 5 May 1739; d. New Haven, Conn., 3 May 1813. He was graduated at Yale in 1761, and in the autumn of 1763 sailed for England, where he was ordained deacon in February, 1764, and priest a few weeks later. He left England in April, and was settled as rector of Christ's church, Middletown, Conn., the same year. In 1797 he became the second bishop of Connecticut.

Jarvis, John Wesley, American painter: b. South Shields, England, 1780; d. 1840. John Wesley was his uncle and sent him in his fifth year to Philadelphia, where his father, a seafaring man, had settled. Jarvis had but little regular art training, but was encouraged by Malbone. He had a studio in New York and painted portraits of statesmen, preachers and soldiers, some of which are in the City Hall, New York, and in the collection of the New York Historical Society.

Jasher, Book of, a lost book of the Hebrew Scriptures, twice mentioned in the Bible (Josh. x. 13, and 2 Sam. i. 18), and about which various conjectures have been made. It was most probably a national song-book of post-Solomonic age, whose contents were partly secular, partly religious. From the mention of the book in Joshua and 2 Samuel it has been inferred that the book of Joshua could not have been written before the time of David's lamentation. But this assumes that the book of Jasher was all written at once, an assumption which in our ignorance regarding it we are not at liberty to make; for the book of Jasher may have been written at different times. The theory of Dr. Donaldson as to its scope and contents, in conformity with which he proceeded to reconstruct it from the fragments which he thought he could trace throughout the several books of the Old Testament, has met with little favor either from English or Continental scholars. See Donaldson, 'Fragmenta Archetypa Carminum Hebraicorum in Masorethico Veteris Testamenti Textu passim tessellata.'

Jasmin, Jacques, zhäk zhäs-măn (Provençal, JAQUOU JANSMIN), Provençal poet: b. Agen 6 March 1798; d. there 4 Oct. 1864. In his 'Mous Soubenis' (My Recollections) he gives a humorous description of the humility of his origin and of the poverty of his kindred. All his poems and songs are written in the patois of the peasantry on the banks of the Garonne, supposed in its purest state to be identical with the old Provençal, the language of the troubadours. His poetry deserved and acquired more than a local celebrity, and was warmly welcomed not only in Southern France, but throughout the whole of Europe. He was elected a member of the academies of Agen and Bordeaux; the city of Toulouse awarded him a gold laurel; and in 1846 he was created a Knight of the Legion of Honor. The poetry of Jasmin is distinguished by beauty and power, and though his genius inclined him to gaiety rather than to pathos, yet perhaps his most striking and successful passages are those in which he addresses himself to the feelings. His principal works are: 'The Charivari', (1825), a mock-heroic poem; 'Lou Tres de May' (1830), an ode; 'The Blind Girl of Castel Cuillé' (1836), his masterpiece in poetry, which has been translated by Longfellow; 'The Curl-papers of Jasmin' (1835); 'Françouneto' (1842); 'The Two Twin Brothers' (1846); 'Maltro L'Innoucento' (1847); and 'La Semmano d'un Fil' (1849). Consult Rabain, 'Jasmin, sa vie et ses oeuvres' (1867); Montrond, 'Jasmin, poète d'Agen' (1875); Andrien, 'Vie de Jasmin' (1882); Smiles, 'Barber, Poet, Philanthropist' (1892).

Jas'mine, or Jessamine, a genus (*Jasminum*) of beautiful plants of the olive family, including many cultivated species and varieties. Most of these are shrubs with long twining branches bearing usually compound leaves and panicles of fragrant white or yellow flowers. They are natives principally of the East Indies. The common jasmine (*J. officinale*) has become naturalized in the south of Europe, where it grows eight or ten feet tall, and is practically an evergreen. The oil of jasmine is obtained from *J. officinale* and *J. grandiflorum*, but it is usually imitated or adulterated. *J. sambac* also furnishes an oil in the East; and a very common greenhouse species is *J. humile*.

Several shrubs are called jasmines which are only loosely related to the true jasmine. Thus the red jasmine of the West Indies (*Plumeria rubra*), the source of the perfume frangipanni, is of the oleander family; the Chile jasmine, *Mandevillea suavolens*, is another fragrant species of the same family, widely cultivated, and others might be mentioned. Two of these outside "jasmines" are familiar in the United States, one of which is a native. The Cape jasmine

(*Gardenia florida*) is a Chinese (not South African) shrub of the madder family, which found its way to England and America about the middle of the 18th century; it is cultivated everywhere in greenhouses, in a double-flowered variety; and it grows out of doors along the southern seaboard, it being the special pride of Charleston, S. C., after one of whose citizens the genus *Gardenia* was named by Linnæus.

The native species is the Carolina or yellow jasmine (*Gelsemium sempervirens*), an exceedingly odorous climbing plant of the family *Loganiaceæ*, common throughout the South Atlantic States. It is a vine, whose blossoms grow in axillary racemes of from one to six vivid yellow tubular flowers; and "evening trumpet-flower" is a common name. "Early laden, indeed, is the warm air of spring with its delicious perfume. . . . Through woods and thickets it wends its way vigorously and gleams as brightly as does later the Cherokee rose. It is one of the joys of the season." The roots are regarded by the country people as possessed of medical virtues.

Ja'son, in Greek legend, the son of Æson, king of Iolcos in Thessaly, a hero of ancient Greece, celebrated for his share in the Argonautic expedition, before which he had distinguished himself in the Calydonian hunt. He belonged to the family of the Æolidæ at Iolcos, and his instructor was the centaur Chiron, who educated most of the heroes of that time. (For his adventures in the Argonautic expedition see ARGONAUTS.) On his return to Iolcos with Medea as his wife he avenged the murder of his parents and his brother by putting Pelias to death. But he was unable to retain possession of the throne, and was obliged to resign it to Acastus, son of Pelias, and flee with his wife to Corinth. Here they passed ten years, till Jason, wearied of Medea, fell in love with Glauce (Creusa, according to some accounts), daughter of Creon, king of Corinth, married her, and put away Medea and her children. Medea, having revenged herself on her hated rival, fled from the wrath of Jason in her car drawn by winged dragons, the gift of Helios, to Ægeus, king of Athens, after she had put to death Mermerus and Pheres, her sons by Jason. According to some, Jason killed himself from grief; but others relate that, after passing a miserable wandering life, he came to his death by accident. Others say that he was reconciled to Medea, and returned with her to Colchis, where he ruled many years.

Jas'per, William, American soldier: b. South Carolina about 1750; d. Savannah, Ga., 9 Oct. 1779. At the commencement of the revolutionary war he enlisted in the 2d South Carolina regiment, in which he became a sergeant. Subsequently, in the attack upon Fort Moultrie by a British fleet, he distinguished himself by leaping through an embrasure to the ground, under a shower of cannon balls, and recovering the flag of South Carolina, which had been shot off. Governor Rutledge presented him with his own sword, and offered him a lieutenant's commission; this, however, Jasper declined, saying: "I am not fit to keep officers' company; I am but a sergeant." His commander gave him a roving commission to scour the country with a few men, and surprise and capture the enemy's outposts. His achievements in this capacity seem to belong to romance rather than history and in boldness equal any recorded in the revolutionary annals of the southern States. Prominent among them was the rescue by himself and a single comrade of some American captives from a party of British soldiers, whom he overpowered and made prisoners. At the assault upon Savannah he received his death wound while fastening to the parapet the standard which had been presented to his regiment. His hold, however, never relaxed, and he bore the colors to a place of safety before he died. A county of Georgia and a square in Savannah have been named after him.

Jasper, Ind., town, county-seat of Dubois County; on the Patoka River, and on a branch of the Louisville, E. & St. L. railroad; about 47 miles northeast of Evansville. Jasper is situated in an agricultural region. The chief manufacturing establishments are saw-mills, lumbering and planing-mills, flour-mills, a furniture factory, and a brick-yard. Pop. (1900) 1,863.

Jasper, an impure quartz, less hard than flint or even than common quartz, but which gives fire with steel. It is entirely opaque, or sometimes feebly translucent at the edges, and presents almost every variety of color. It is found in metamorphic rocks, and often occurs in very large masses. It admits of an elegant polish, and is used for vases, seals, snuff-boxes, etc. There are several varieties, as red, brown, blackish, bluish, Egyptian. Ribbon or agate jasper is jasper in layers.

Jassy, yäs'sē, Rumania, the former capital of Moldavia; on the Bahluiu River. The churches and educational institutions are quite noted; the industrial enterprises are few; but the commerce is extensive and important. The chief exports are petroleum, grain, meat, and salt; the chief imports are coal and clothing. It was in Jassy, in 1821, that Alexander Ypsilanti really began the work for Greek independence. About one-half the population are Jews. Pop. (1902) 80,500.

Jastrow, jăs'trō, **Joseph,** American psychologist: b. Warsaw, Poland, 30 Jan. 1863. He was a son of Rabbi Jastrow (q.v.) and came to America in childhood. He was graduated from the University of Pennsylvania in 1882 and has been since 1888 professor of psychology at the University of Wisconsin. He became president of the American Psychological Association in 1900. He has published 'Time-Relations of Mental Phenomena' (1890); 'Epitomes of Three Sciences' (1890); 'Fact and Fable in Psychology' (1900); 'Modern Psychology.'

Jastrow, Marcus M., American rabbi and lexicographer: b. Rogasen, Posen, 1829; d. Germantown, Philadelphia, 13 Oct. 1903. After the usual rabbinic and academic studies he graduated from the University of Halle in 1854, became a barber in Berlin, and then rabbi at Warsaw. After five years he was obliged to leave by reason of his political opinions, after being subjected to arrest. He was called to the Congregation Rodef Sholen, Philadelphia, in 1866, with which he was connected until his death, within recent years as rabbi *emeritus*. Besides some monographs and contributions to the press, he is best known for his 'Dictionary of the Targumim, the Talmud Bahli and Yerushalmi, and the Midrashic Literature,' which is nearing

completion (1903) and is a monument of untiring erudition and broad scholarship.

Jastrow, Morris, Jr., American Orientalist: b. Warsaw, Poland, 13 Aug. 1861. He was a son of the preceding, and coming to Philadelphia with his parents in early childhood, he was trained in the schools of that city, graduated from its university in 1881, and from the University of Leipsic 1884. He has been for many years professor of Semitic languages and librarian of the University of Pennsylvania. He was originally trained for the Jewish ministry, studying for some time at the Jewish Seminary of Breslau, Germany, and was appointed assistant to his father's synagogue, Philadelphia, which position he voluntarily resigned. His published works are: 'Religion of the Assyrians and Babylonians' (1898); 'Two Grammatical Treatises of Abu Zakariyya Hayyug' (1897); 'A Fragment of the Babylonian Dibbarra Epic' (1891); 'The Study of Religion' (1901). He has edited 'Selected Essays of James Darmesteter' (1895). He is a frequent contributor to learned periodicals and to various encyclopædias.

Jatropha, jăt'rō-fạ, a genus of euphorbiaceous plants of the tribe *Crotoneæ,* tropical and chiefly American. They are of interest principally for their medicinal properties, which reside mostly in the seeds. These, in the case of *Jatropha curcas,* are called Barbados or physic nuts,—the last in allusion to their purgative power. The so-called jatropha-oil is extracted from the seeds of the coral-plant (*J. multifida*) and of the East Indian *J. glauca,* and is used externally as a stimulant. A common species in the southern United States is the spurge-nettle or tread-softly (*J. stimulosa*). Compare MANIHOT.

Jats, jâts, the most numerous of the agricultural population of the Panjab, India, numbering about four and a half millions. They are by many identified with the *Getæ;* and some of the best authorities accept the theory that they are descended from Scythian invaders of India in prehistoric times. Some scholars believe them cognate with the Gypsies (q.v.).

Jaundice, jân'- or jân'dĭs, a morbid condition arising from the circulation of bile in the blood, with consequent staining of the tissues and a peculiar train of symptoms resulting from the poisoning. The tint of the skin and certain mucous membranes varies from a light yellow to a brownish or saffron hue. Staining of the conjunctiva is first observed, and is most intense. Jaundice, with reference to its origin, may be either obstructive or toxic. The term obstructive means causing a hindrance to the outflow of the bile from the gall-ducts into the intestine, with its consequent absorption into the hepatic vein and general circulation. Not only is the skin stained, but all the secretions as well, the urine becoming dark brown. As no bile is thrown into the intestine, the stools become clay-colored and usually hard. There is frequently distressing cutaneous itching, and other skin-maladies are not uncommon. The blood partially loses its power of coagulation, and the vessels are apt to allow the escape of blood into the tissues, giving rise to purpuric spots. The pulse is usually slow, and the patient somewhat melancholic. In bad cases death may follow a period of convulsions, delirium or coma. The cause of this obstruction may be anything occluding the lumen of the ducts from within, as catarrh of the membrane of the intestine, where the bile-ducts open, or catarrh anywhere along the course of the ducts; stones or thickened bile may block up some part of the tubes, or they may be occluded from pressure on the outside by tumors, constricting bands, or shrinking of the liver-substance. (See LIVER, DISEASES OF THE.) The toxic form of jaundice is due to the circulation of poisons in the blood which break down the red cells or, more rarely, destroy the liver cells. The jaundice in this form is not so intense, and the other symptoms caused by the poison are of more importance. Many of the infectious diseases, such as influenza, typhoid fever, yellow fever, pneumonia, pyæmia, and acute atrophy of the liver, cause this form. Mineral poisons, particularly phosphorus, act in the same way. Jaundice in the new-born is so common as to be considered a natural condition, and usually lasts but a few days. It is evident from the many conditions that may give rise to jaundice that it must be considered as a symptom, and treatment should be directed to aiding the bodily functions until the exact cause can be determined.

Jaurés, Jean Leon, zhŏñ lā-ôñ zhō-rā, French Socialist: b. Castres 1859. He taught at Albi and Toulouse, and in 1885 entered politics and was elected to the Chamber of Deputies from Tarn; at this time he was a moderate Republican. In 1889 he failed of re-election, and returned to Toulouse, where he was active in the establishing of a college of medicine. Becoming a Socialist, he defended the strikers at Carmaux, and in 1893 was again elected to the Chamber, where he became one of the leaders of the Socialists. He failed of re-election in 1898, but was again elected in 1902. When the Socialist Millerand accepted a position in the cabinet, Jaurés defended his action, thus opposing Guesde and the *Parti Ouvrier,* but sought at the same time to reconcile the factions. He also took an important part in obtaining a revision of the Dreyfus case. He still holds a position of leadership and influence in the Socialist party of France, and is acknowledged to be one of the best orators in the chamber of deputies.

Java, jä'vạ (native, *Siti-Java* or *Yava,* land of millet), an island of Dutch East India; situated between lat. 5° 52′ (Saint Nicholas Point), and 8° 50′ (South Cape) S.; and lon. 105° 13′ and 114° 39′ E. The island is bounded on the north by the Java Sea, on the east by Bali Strait, which separates Java from Bali Island, on the south by the Indian Ocean, and on the west by Sunda Strait which separates the island from Sumatra. It extends east and west, declining 15° toward the south. It is about 660 miles long, from 40 to 125 miles wide, and the area, including Madura Island, off the east coast, is about 50,554 square miles. The Indian Ocean, which beats with great force along the south coast, has prevented the formation, on that side, of such alluvial plains as extend along the north coast. From the same cause the south coast is generally unsafe for shipping, while the north affords excellent anchorage at almost all times and places. The south presents a continuous front of crags and rocks, forming the outer edge of an extremely mountainous country; the north is flat and low, and covered in

many places with mangrove swamps. The chief harbors on the north are those of Surabaya and Batavia; on the south that of Chilatjap, formed by the small island Kambangan.

Topography and Hydrography.— The whole configuration of the island has been transformed by volcanic action. There are at least 50 volcanoes in Java, of which half are active. In the western end of the island they are grouped in a mass and attain a height of 10,000 feet, but in the eastern portion, though more scattered, they are generally higher, one, Semeru, 12,044 feet, being the highest in the island. Among the chief are Salak (7,266), near Batavia, now extinct; Gedé (9,720); Tjirmaj (10,075); Marbabu (10,670); Raun (10,820); Slamar (11,250). Papandayang, in the southwest, destroyed about 3,000 persons in 1772. In 1822 great damage was done by the eruption of Galungung, one of the volcanoes in the western part of the island. In 1686, about 10,000 lives were lost by the eruption of Ringghit, once over 12,000 feet high, but now a low mountain. The eruption of Kloet (q.v.), in 1901, was most disastrous. The eruption of Krakatoa (q.v.) in 1883, was one of the horrors of modern times.

The island is subject to earthquakes, usually not severe. Three earthquakes are known to have preceded and 19 accompanied volcanic eruptions. In 1867 occurred a most destructive earthquake. A low range of non-volcanic hills, about 3,000 feet high, extends along the south coast. The crater of an extinct volcano called Guwa Upas, or the Vale of Poison, about one half mile round, is held in horror by the natives. It is said that every living creature that enters it drops dead, and the soil is covered with the carcasses of deer, birds, and even the bones of men, killed by the carbonic acid gas which lies in the bottom of the valley; but its terrors have been much exaggerated. "In another crater in this land of wonders," says Sir Charles Lyell, "the sulphureous exhalations have killed tigers, birds, and innumerable insects; and the soft parts of these animals, such as the fibres, muscles, hair, etc., are very well preserved, while the bones are corroded and entirely destroyed." Numerous rivers flow from the north and south sides of the mountains, carrying fertility with them, and affording supplies to innumerable artificial water-courses used in irrigation. These streams are generally rapid, shallow, and so encumbered with sandbanks as not to be navigable; so that only two rivers, the Solo and the river of Surabaya, are navigable for large boats; the others are only suitable for proas or canoes of the lighest draught, or for floating down timber from the mountains. The Tji Tarun and the Tji Manuk are navigable a part of the year.

Climate.— Java is considered fairly healthy, but proper care must be taken to avoid the excessive heat of midday and the night air from the marshes. The temperature of the plains and valleys is during the day from 85° to 94° F., and during the night from 73° to 80°. At an elevation of 6,000 feet the thermometer descends to 60°, while the tops of the highest peaks are often covered with ice but no snow falls. The breezes from the water modify the temperature. There are two seasons; the dry from April to October, and the rainy season from October to April. During the rainy season there is an almost continuous rainfall except for a short time in the morning. The annual rainfall is about 80 inches. The island is not subject to storms which injure life or property, but near the high mountains there are frequently thunder storms.

Geology.— Java is formed mainly of tertiary, though partly of post-tertiary strata; but by volcanic action the arrangement has been much disturbed. Rocks containing fossil invertebrates are common, but the fossils of vertebrates have not been discovered. There are no metallic veins of sufficient length or depth to be profitable for mining; the Bantam coal-mines, in the northwestern part of the island, yield only lignite; sulphur, naphtha, and asphalt are found in several places, and small quantities of salt saltpeter, and magnese. Limestone and marble are in the southern part. Its minerals are not considered of sufficient value to be classed among its natural wealth-producing resources.

Vegetation.— With a temperature ranging from 94° to the freezing-point, a volcanic soil plenteously watered naturally and artificially, it is not surprising that Java should be of astonishing fertility; the range of its vegetation naturally follows that of its temperature, from the palms of the tropics to the mosses of the temperate zone. The coast is fringed with cocoanut trees; behind them the ground rises gently to the foot of the mountain chain, and is completely cultivated. Vast fields of rice, artificially watered, distributed amphitheatrewise on the flanks of the hills, yield often three harvests annually. In the same altitude are found the cotton plant, the mangoes, sugar-cane, indigo, palm-trees, and other tropical vegetation. Higher up than the rice-fields the bases of the mountains are covered with vast forests of the fig-tree tribe of different species, remarkable for their great height and vigorous growth. Tea, coffee, fruits, cinchona, sandalwood, mahogany, camphor, bamboo, rattan, and many other forms of vegetation are found in this altitude of from 2,000 to 4,000 feet. These are followed still higher up by the plane-like liquidambars, with their erect stems covered with parasites, also rattans and *Rubiaceæ*, the latter of numerous species, some of them exhaling a very fœtid odor. Along the upper limits of the liquidambars about 4,000 feet above the sea, lofty trees are still plentiful; here may be seen *Podocarpus cupressus*, with its lofty straight stem, a tree allied to the yew, and furnishing the best timber in Java; the Dammar pine, rhododendrons, laurels of numerous species, chestnuts, oaks, and several others, magnolias, myrtles, tobacco, maize, potatoes, and other vegetation common to the temperate zones. About 7,000 feet high the vegetation changes its aspect, and mosses appear, which, with heaths, are the principal plants found on the loftier elevations. Before leaving the natural vegetation the famed poison-tree, the chettik or upas (*Antiaris toxicaria*), may be named as a noted Javanese plant. The vast forests likewise claim notice; they are 791 in number, and cover a very extensive surface in 13 of the provinces, and consist mainly of teak. To prevent the waste which was going on, the government has placed them under superintendence,

and draws from them a large amount of revenue.

Animals.— Including domestic and marine animals 100 kinds of mammalia inhabit Java. In the west part the one-horned rhinoceros is not uncommon; and in the higher districts the royal tiger, panther, and tiger-cat keep the inhabitants in constant alarm by their depredations. The babiroussa and two kinds of wild hog form the large game of the island. There are only two species of the ape kind, but they people the forests in countless numbers. Two kinds of lemurs inspire the inhabitants with superstitious fear by their mysterious nocturnal habits; and this island may be esteemed the native seat of the largest bats, some of which measure five feet across the wings. They may be seen suspended from the branches in hundreds during the day, and at night they devastate the orchards and gardens. Two civets are common, and supply a perfume of which the Javanese are passionately fond; the wild ox abounds in the woods; and the buffalo is the only animal used in agricultural labor. The horses are small, but vigorous, and, as in India, are not used for agricultural purposes. Two species of wild dogs and six species of deer are found here. Among the domestic animals are the buffalo, ox, horse, goat and sheep. The ornithology of Java is rich and varied, both in genera and in species. About 300 species of land birds have been found on the island, among them the peacock, partridge, quail, 10 different species of pigeon, 11 species of heron, two of cuckoo, the woodpeckers, the black and crimson oriole, the hornbill, eagle, owl, the brilliant looking, and appropriately named minaret flycatcher, the "swift" (q.v.), and the minor bird so apt in learning to mimic human speech is common. Almost all the known generic groups of rapacious birds are found here in great numbers, and gallinaceous fowls are plentiful. A variety of reptiles are found on the island, among them the python. Insects cover the grounds and plants in countless numbers; but few are distinguished for brilliancy or variety of color, or are remarkable in form. Fish are plentiful in the rivers and along the coast; but those of the rivers are of inferior quality for food. Excellent oysters are abundant on the north coast, and prawns, from which a condiment called trasi is prepared and considered delicious by the natives. Crocodiles from 20 to 30 feet in length inhabit the water courses.

In 1895 there were in Java in all about 2,643,000 buffalos; 2,572,000 oxen and cows; and 485,500 horses.

Occupations and Productions.— The Javanese are almost entirely occupied in agriculture. There is a small class of fishermen on the north coast, and a few artisans in the towns, but the great bulk of the people live directly or indirectly by the cultivation of the land, in which they have made greater progress than any other Asiatic nation except the Chinese and Japanese. The chief crop is rice, of which with the aid of irrigation, industriously and almost universally applied, two crops are raised in a year. Lands that cannot be irrigated are used for growing pulses, oil-giving plants, cotton, sugar-cane, and tobacco; and on the mountain slopes, at an elevation of 2,000 or 3,000 feet, coffee is cultivated. "In the most fertile parts of Java," says Crawfurd, "and these from the neighborhood of the high mountains are usually also the most picturesque, the scenery is at once agreeable and magnificent, and certainly for grandeur and beauty excels all that I have seen even in Italy, that country which in summer bears the nearest resemblance to Java. In such situations we have mountains 10,000 feet high, cultivated to half their height, the valleys below having all the appearance of a well watered garden, in which the fruit trees are so abundant as to conceal the closely packed villages." The mechanic arts among the Javanese are not so far advanced as their agriculture. About 30 crafts are practised among them, of which the principal are those of the blacksmith or cutler, the carpenter, the sheath maker, the coppersmith, the goldsmith, and the potter. Bricks and tiles are largely made. The carpenters are skilful in house and boat-building. They make vessels of all sizes from 50 tons down to fishing canoes, and under European superintendence build large ships. The ordinary dwellings of the people are built of a rough frame of timber, thatched with grass or palm leaves, and with walls and partitions of split bamboo. The Javanese excel all other nations of the Malay archipelago in the working of metals. They are especially skilful in the manufacture of the national weapon, the kris or dagger, which is worn by every man and boy above 14 years as part of his ordinary costume, and by many ladies of high rank. They make also excellent gongs of brass, and these with other musical instruments of the same metal have long been exported to the neighboring countries. The only native textile material woven by the Javanese is cotton, of which they make only a stout durable calico, and this is purely a domestic manufacture, carried on exclusively by the women. From raw silk imported from China, the silkworm not being reared in Java, a coarse cloth is woven by the women. Paper of the nature of the ancient papyrus is a manufacture peculiar to the Javanese.

The greater part of the agricultural lands of Java is claimed by the Government of the Netherlands and the private estates are principally in the residencies in the western part of the island. The government or the private landowners can enforce one day's gratuitous work out of seven, and in some cases more, from all the laborers on their estates. In 1882 the greater part of the enforced gratuitous labor for the government was abolished in return for the payment of one guilder (40 cents) per head yearly. In 1900 the natives had under cultivation 7,073,036 acres. Prior to 1891, the government raised sugar; but since 1891 the sugar is all raised on private properties and on lands hired by the natives, or on lands held on emphytentic tenure from the government. In 1900 the number of sugar estates was 191 and in 1901 the yield of sugar was 766,238 tons. The yield of cinchona for 1900 was 1,415 tons; of tobacco, 5,435 tons; of tea, 1,659 tons; of indigo, 180 tons.

Trade and Commerce.—The trade of Java is now large, and what was once a burdensome colony has become one of the principal sources of wealth to Holland. The great bulk of the

foreign trade is carried on through the ports of Batavia, Samarang, and Surabaya. The principal exports are sugar, coffee, cinchona, indigo, nutmegs, mace, cloves, cinnamon, pepper, tea, rice, cocoa, tapioca, cochineal, cubebs, arrack, tobacco, hides, india rubber, and tin. The exports, in 1900, of sugar, and coffee, nearly all of which was sent to Holland, amounted to nearly $55,000,000. A large amount of rice is sent to Borneo and China. The principal imports are cotton yarns and cloth, machinery, iron, coal, and woolen goods.

Education.— The Europeans and the natives have separate schools with a slight difference in their methods of government. Ample provisions are made by the government for the education of the natives. There are public and private schools, about 20 schools for girls only, and one normal school for the training of teachers for the natives, and two for the training of teachers for the schools for Europeans and those assimilated with them. There is an agricultural college, a museum, and a fine botanical garden at Buitenzorg, and a gymnasium at Batavia. In science the people have made little progress, possessing only a rude notion of astronomy and a slight knowledge of arithmetic. Their architecture at present day hardly deserves the name, though the country abounds with remarkable remains of temples built many centuries ago by the ancestors of the present inhabitants. Of the other fine arts, music is the one in which they have made the greatest progress. They are passionately fond of it, and have generally good taste. Their melodies are wild, plaintive, and interesting, and more pleasing to the European ear than any other Asiatic music. They have wind and string instruments, but their best and most common instruments are drums and gongs.

Religion.— All religious denominations are allowed perfect freedom in Java. The Javanese are Mohammedans, which faith was established by Arab conquerors in the 15th century and has almost displaced Brahminism and Buddhism, the ancient religions of the country. In 1896, in Java and Madura, there were 19,193 native Christians. In 1900 there were about 100 missionaries working among the natives.

Banking.— The "Java Bank," established in 1828, has a capital of $2,400,000 and a reserve of about $480,000. The government of the Netherlands has control over the administration. Two fifths of the amount of credits, notes, and assignats must be covered by bullion or specie. In March 1901, the notes in circulation amounted to $22,534,000, and the bank operations to $18,637,200. There are postal savings-banks and other savings-banks have been established. The legal coins are the same as those of Netherlands.

Weights and Measures.— The legal weights and measures are the same as those of Netherlands (q.v.).

Ethnology.— The native population of Java comprises two distinct nations, the Sundese and the Javanese. The Sundese occupy the western end of the island, and are greatly inferior in number to the Javanese, and less advanced in civilization. They speak a distinct language. Both nations are of the Malayan race. They are generally about two inches shorter than the men of the Mongolian and Caucasian races, with round faces, wide mouths, high cheek bones, short and small noses, and small, black, deep-seated eyes. The complexion is brown with a shade of yellow, and is never black. The hair of the head is thick, black, lank, and harsh, and is either scanty or altogether wanting on other parts of the body. A few short, straggling hairs compose the beard. The people are not active, and make but poor runners or wrestlers. They are described as a peaceable, docile, sober, simple, and industrious people. Mr. Crawfurd, author of 'A Descriptive Dictionary of the Indian Islands,' who lived several years in Java, says: "From my own experience of them, I have no difficulty in pronouncing them the most straightforward and truthful Asiatic people that I have met. The practice of running amuck, so frequent with the other cultivated nations of the archipelago, is of very rare occurrence with them." They are patient, enduring, and easily led when convinced that the orders given are not contrary to the ancient laws and customs of the country, which are held in religious reverence. They are very susceptible of affronts, which they are not slow to avenge with the kris, which is invariably worn, and they are frequently likewise armed with the sabre or pike. The mass of the Javanese take only one wife, but people of quality and wealth take advantage of the latitude allowed by the Koran, and practise polygamy. All, without distinction, are passionately fond of gaming, more especially of cock-fighting.

Population.— Java is one of the most densely peopled countries of the world. The population in 1900 was 28,745,698. The population of the principal towns in Java, January 1900, was:

	Europeans	Natives	Chinese	Arabs	Other Orientals	Total
Surabaya...	8,906	121,886	13,035	2,791	326	146,944
Batavia....	8,893	77,700	26,817	2,245	232	115,887
Samarang..	4,800	70,426	12,372	724	964	89,286

The whole population of Java is legally divided into Europeans and persons assimilated with them, and natives and persons assimilated with them. The Europeans and those assimilated with them are generally living under the laws which prevail in Netherlands, while the natives and those assimilated with them observe the customs and laws of India. The division of the population into the two classes mentioned is in accordance with the code which specifies the limits and conditions for legislation in Dutch East India. The governor-general, together with the council, has power to make individual exceptions to the general rule.

Government and Revenue.— The most important feature of Javanese society is the village, which forms a complete body politic, with considerable powers of self-government. Its officers are elected by the people, and are charged with the collection of the taxes and the maintenance of public order. The general government of the island is entrusted to a governor-general, appointed by the king of Holland. He is commander-in-chief of the army and navy, and possesses nearly absolute power. Justice is administered to the European inhabitants by a supreme court at Batavia, and by three provincial courts at Batavia, Samarang, and Surabaya. There are besides these other courts for the Asiatic population. In 1832 Gen. Johannes Graaf Van den Bosch introduced into Java a system of government known as the

"culture system." In principal, it was based upon the officially superintended labor of the natives, directed so as to produce not only a sufficiency of food for themselves, but a large revenue for Netherlands. This obligatory labor was applied to the culture of coffee, sugar, indigo, pepper, tea, tobacco, and some other products; but at present the labor of the natives is required only for the culture of coffee which is marketed by the Government. By the terms of a bill which passed the legislature of the Netherlands in 1870, the obligatory cultivation of the sugar-cane is now totally abolished.

Java, including the island of Madura, comprises 17 residencies, each governed by a resident, assisted by assistant residents, and other officials. Before receiving government appointments, these officials must first have had examinations. The resident and his assistants, together with a number of native officials, exercise almost absolute control over the province in charge. The native officials are remunerated for their services by salaries or by a per cent on the amount of taxes collected. No law can be enacted or enforced by any governor-general which will conflict with the "Regulations for the Government of Netherlands India," laws passed in 1854 by the king and states-general of Netherlands.

The revenues are derived from the government monopolies of railroads, salt, opium, and from the sale of government products obtained under the "culture system." Other revenues are obtained from taxes on houses and estates, sale of government lands, custom duties, licenses, personal tax, and from a number of indirect taxes. The greatest expenditures are for the general administration, about one third, and for the army and navy another third.

Defense.— The army and navy of Java form a part of the defense of the whole Netherlands India. The army is colonial, and the regular army of Netherlands is not allowed on duty in any part of Dutch East India. The commissioned officers are Europeans, except a few prominent natives to whom honorary offices have been given. One half the non-commissioned officers must also be Europeans. There is a school attached to every battalion, and a military academy on the island of Java, at Meester Cornelis, a place near Batavia.

History.— Ancient Javanese history is written in the still existing magnificent remains of temples and other public buildings, which are plentifully scattered over the island. These attest that the worship of Brahma and Buddha once prevailed in the island under the Hindu empire of Modjopahit, the dismemberment of which was consummated by the Arabs 1478 A.D., by the destruction of a vast capital of that name. Islamism had previously supplanted the rival worships, and had driven their last adherents into the neighboring island of Bali. The island then fell under the dominion of numerous petty chiefs, and was found in that state by the Portuguese, the first European settlers on the island, who arrived in 1511. They were followed in 1595 by the Dutch, who soon eclipsed them. Though their views were at first directed wholly to commerce, the Dutch merchants, like the British East India Company, soon found it necessary to assume the position of a governing power, and treated accordingly with the native princes, with whom they were frequently at war. In 1811 Java was taken from the Dutch by the British, who, however, restored it after the Peace of 1816, since which time it has remained in their hands. Up till 1825 various portions of the island were still under native princes, who paid tribute to Holland; but in that year a revolt took place, which resulted in the whole island falling under the Dutch sway; although two provinces have been left, but only nominally, under the government of Javanese princes—Surakarta and Jokjokarta. Both princes have a court, nobles, ministers, etc., but are the mere instruments of the Dutch government, by whom they are allowed handsome pensions. Since the close of this war the island has been rapidly increasing in population and prosperity. On 20 Sept. 1859 the Dutch legislature totally abolished slavery in Java. The natives never had slaves, and there never were but a few thousand on the island.

Language and Literature.— It is not certain whether the name of Java be connected with the Sanskrit Javana and Yavana, both of which, beside being related to Ἰωνία as names of Greece, also signify (especially the latter) Bactria, Arabia, and other foreign countries, and, moreover, swift, horse, etc.; or whether its etymon be of a different origin. As regards the affinities of the Javanese language, Roorda considers it as a branch of the Malay. Crawfurd derives it from the vernacular of the aborigines, to whom he attributes the primitive culture of the Malayan islands. Domeny de Rienzi supposes it to have arisen from the language of the Bugis of Celebes, by an admixture of Malay and Sanskrit. Humboldt connects it, both as to words and grammar, with the Tagala, the most developed Malayan tongue of the Philippine Islands, as well as with other Malay idioms and with Sanskrit. Others see in it a type of the unmixed tribes of Oceania. It certainly shows all these affinities, and contains also some Arabic elements. The Javanese is the most cultivated of all Polynesian languages, owing to the very early intercourse of the island with the continent of India, whose Aryan as well as Dravidan influence is attested by the presence of Malabaric words along with those from the Sanskrit, not only in Javanese, but also in the idioms of Sumatra, Madagascar, etc. Both religious and political revolutions have served to modify the condition of the languages. There are four dialects, according to Raffles, on the three islands which form the linguistic group in question, namely: (1) The tongue of the mountaineers of Sunda, in the western part of Java, east of Tagal, probably vernacular through this whole region before the introduction of Mohammedanism, now spoken by about one tenth of the population of the island; it contains many Malay and some Sanskrit words, stands in the same relation to the principal language as the Welsh does to the English, and is best spoken at Bantam, sluggishly at Bogor and Chianjore, and verging to the Javanese at Cheribon. (2) The Javanese proper, east of the last named city, extending through the rest of the island, especially along its north shore; its words are long at Tagal, shorter at Samarang, full, short, and strong at the courts of Sura-

karta in the centre, and Jokjokarta in the south; it approaches the Madurese at Surabaya, and the Balian at Banyu-Vangi. (3) The dialect of Madura and Sumanap, which has many Sunda words, with more of Malay, and with peculiar endings. (4) That of Bali, little different from the general Javanese. This island preserves the ancient letters as well as Brahminism, both expelled from Java in the 15th century. A sort of jargon, analogous to the *lingua franca*, is spoken at Batavia, being a medley of Dutch, Portuguese, Javanese, and Malay. Along with the preceding there are also peculiar styles or idioms of speech, varying in accordance with social position and age, as the *madhjo* (intermediate), between equals; the *bâsa* or *bohoso-ngoko* (language popular), to inferiors; the *bâsa-kramo* (language superior), urbane, court idiom, about three fourths of it Sanskrit, used by poets as the speech of gods, heroes, and ghosts. As to locality, there are also two vernacular idioms, namely, the *bâsa-dalam* of the interior, and the *bâsa-luar*, spoken along the shores. The Kavi (learned, wise, poet) is the ancient sacred language of Java, and consists of about six parts of Sanskrit, less altered than in the Pali, to four of Javano-Malay. It owes its origin to Brahminic immigration, about the beginning of our era. It is to the Javanese what Sanskrit is to the Hindostanee, and Pali to the Indo-Chinese languages. Declining in the 14th century, it took refuge in Bali, and was imperfectly known by the Panambahan at Sumanap at the time when Raffles was in Java. Passages in the Kavi are sometimes quoted on peculiar occasions, as for instance in fables and dramas; the term itself is employed as a title of works, etc., such as *Sekar-kavi*, flowers of poetry, whence *Sekarini*, a Kavi metre; *Rama-kavi*, the Javanese Ramayana; *Kavindhra*, principal singer or poet (named *ma-kathā*, narrator, in Tagala). A few specimens of words may show the relation of the Javanese to the common Malay, where the difference, if not specially noted, is sometimes more in the accent than otherwise: *langit*, heaven; *tanah*, earth (Mal. also *benua*, region); *ayer* (Jav. also *banyu*), water; *laut* (Jav. *lahut*), sea; *dhina*, (Mal. *hāri*), day; *bengi* (Mal. *mālam*), night; *vūlan* (Mal. *būlan*), moon; *terang* (Mal. *trang*), light; *mati*, to die; *lulat* (Mal. *kāsih*), to love; *dara*, virgin; *dhēva* (Mal. *tuhan*), god, lord; *mangan* (Mal. *mākan*, *santap*), to eat; *bāpa*, *pak* (Mal. *pā*, politely *ayah*), father; *ma*, *bok* (Mal. *mā*, *amā*, politely *ibu*, *bonda*), mother, etc. Compounds and derivatives abound, but the latter are more frequently formed by suffixes than by prefixes, in which the Tagala is very rich. There are many contractions into *tr*, *ngl*, *ngr*, with the dropping of short vowels, together with the alteration of the initial sound (similarly to the Celtic), and other variations which obscure the etymic origin, thus: Sans. *nātha*, master, lord, becomes *tata*, order, to reign; Jav. *neda*, to eat, *teda*, food; *nulis*, to write, *tulis*, scripture; *nitik*, to prove, *titik*, proof. The prefix *n* denotes verbs, *t* substantives; other changes are: *nyatur*, to tell, *chatur*, tale; *nyerrat*, to write, *serrat*, writing, etc. The doubling of the first syllable makes verbs, as *tutulung*, to help, from *tulung*, aid; *gagriya*, to dwell, from *griya*, house. The insertion of *in* is the sign of the passive voice. Substantives are also made by prefixing *pem* (*pen*, *pe*), denoting an agent; thus: *pem-pekto*, carrier, from *pekto*, to carry; *pen-dahar*, eater, etc.; by prefixing *ka*, a sign of the past participle; *ka-bekto*, Lat. *allatum;* by suffixing *n* (*en*, *an*): *bakt-en*, the carrying, *dahar-an*, Lat. *cibus;* and by both prefix and suffix: *ka-dahar-an*, an eatable. Articles, gender, and the dual number are wanting. In the plural, cases are denoted by particles, and also by reduplication, as in the Japanese. The genitive relation is shown by the precedence of the noun or by inserting *ing*. The other relations of case are indicated by means of verbs. The adjective is unchanged after the substantive. Pronominal forms are fewer than in Malay: *kita*, we in Malay, means I in Javanese. The numerals are: (1) *sidshi*, (2) *loro*, (3) *telu*, (4) *papat*, (5) *limo*, (6) *nem*, (7) *pitu*, (8) *volu*, (9) *songngo*, (10) *sepuluh*, (11) *savelas*, (12) *volas*, etc. Ordinals are formed by prefixing *ping* or *ka-ping*. The figures of numbers are modified letters. The person, number, tense, mood, and voice of verbs are indicated by certain particles. Many verbs and nouns are expressed by the same word, others are distinguished as stated above. The suffixes of the imperative are *o*, *ono*, *en*, *enno*. The following are examples of a verb in various forms: *ningngalli*, to see; passive, *dhipun*, *tingngalli*, *katingallan*, etc.; *kula*, *tingngalli*, I have seen; *badē kula tingngalli*, I shall see; *tinningngallam*, to see one another; *sampeyan tingngalli*, see; *kula tingngallana*, that I may see, etc. The construction is as follows:

Rama kahuta kang vonten ing surga, vasta andika dadi clapienno.
Father our who art in heaven, name thy be hallowed.

As regards the shape and employment of letters, the graphic system is derived from the Devanagari, but not as regards their order, which is as follows: *'ha, na, tcha, ra, ka, ḍa, ṭa, sa, va, la, pa, da, dja, ya, ṉya, ma, ga, ba, ṭa, ng'a.* These 20 *Akshara* (letters) are consonants with an adherent *a* in the general language, or *o* at the courts of princes, which, when not suppressed, gives to the syllabarium the epithet of *lagana*. As many *Pasangan* (consonants) are vowelless, three of them are annexed, the others subscribed to other letters. This peculiar succession of letters must have originated prior to that of the organic scheme of the Devanagari, and it is explained by its signifying: "There were two messengers, disputing, equally courageous, till both died." The *Akshara-Buddha*, being ancient, differ in form from the later *Aksharagede*. Some Kavi letters are almost like those of the Sanskrit, while the more recent resemble the square Pali. The vowels are called *Sandang'an* (connection), namely, *a*, *i*, *u*, *ē*, *ĕ* (almost French *muet*), *o*, either used as initials or (except *a*) attached to the consonants instead of the inherent *a*. The diacritic signs are analogous to those of the Devanagari. There are also characters for the quasi-vowels *lc* and *re*. The writing runs from left to right, each letter being connected with the others in words, and these following one another without any space left between them. Tradition assigns the introduction of writing as well as of Brahminism

and political institutions to Aji Saya Baya. Palæography finds a rich harvest in Java, its subjects being distributed in four classes: (1) inscriptions in ancient Devanagari near the ruins of Brambanan and Sinagasari; (2) those in square Kavi letters, from which the cursive are derived, mostly on stone and metal; (3) those in a dialect resembling the language of Sunda; (4) the *Chandra-Sangkala* (light of royal times or dates), which consist in selecting such words, symbolic of numbers, as may also express a fact that is to be recorded. Thus, for instance, the date of the destruction of Majapahit, a fact most important in Javanese history, is thus inscribed (1400, reading from right to left):

Sirna (0) *ilang* (0) *kertāning* (4) *bumi* (1)
Lost and gone (is) (the) work, (pride of the) earth (land.)

The date of certain long graves at Gresik, near the tomb of the princess of Chermai (1313), is thus written:

Kāya (3) *vulan* (1) *pūtri* (3) *īku* (1).
Like (to the) moon princess (that) was.

The literature, which is in Kavi, dates from about the commencement of our era, and is rich, especially in legends concerning cosmogony. The subjects of the works are mostly either of a mythical or ethical character. Prominent among the former are: the *Kānda* (Sans. *Khandata*, fragment, section) *Pepakem* (book), or *Sejarah* (history); *Manek-Maya*, a mythical genesis, in which Buddhism predominates; *Vivaha-Kavi* (matrimonial poem), about a *Rasaksa* (evil spirit) who courts a *Vidaduri* (nymph); *Rama-Kavi*, the Javanese *Ramayana; Parikespit*, "Arjuna's Grandson;" *Mintaraga*, a poem on Arjuna in the Indra mountain. This kind of composition comes down to the time of Aji Saya Baya. Of the ethical order are the *Niti Sastra Kavi*, in the purest style, of about the 13th century; and *Srūti*, which already alludes to Islam. But the *Brata Yudha* ("Holy War") is an epos mostly on the deeds of Arjuna; being an episode of the Mahabharata, in 712 stanzas, with varying rhymes. The *Sastra Menava* is a Javanese imitation of the ordinances of the Indian Menu. Indeed, most of the Kavi works are such imitations. Whether mere versions of Sanskrit works have been made or still exist is not precisely known; but there are many Javanese versions from the Kavi. Javanese literature abounds in romantic compositions, mostly of elegiac form. Among these, the adventures of the popular hero Pandji are most prominent. Dramas, and especially puppet shows, called *vayang* (shadows), and with figures of either leather or wood personating heroes, are popular.

Java Almond. See KANARI.

Java Fowls. See POULTRY.

Java Sea, a body of water with Borneo on the north, Celebes on the east, the island of Java on the south, and Sumatra on the west. It borders on a number of other islands, all small. The direct route from Singapore to Australia is through Java Sea; and it is crossed by two approved routes to China, one by Pitt's Passage and the other through the Straits of Macassar.

Java Sparrow, a species of Oriental weaver-bird (*Munia oryzivora*), called rice-bird or paddy-bird by the British in India and China, where it has become naturalized from its original home in Java. It has a poor song but is kept in cages for its beauty and liveliness, and is sold by bird-dealers all over the world. Its colors are slate-blue and black, with conspicuous white cheeks and a swollen rosy bill.

Javary, zhā-vä-rē', a river which has its rise in the northwestern part of Bolivia, flows northwest, then north and northeast into the Amazon River. The greater part of its course of 350 miles, it forms the boundary line between Brazil and Peru. It is navigable from the mouth to the Anahuacas Mountains. By treaty between the governments of Brazil and Bolivia, the source of the Javary is the demarkation of the boundary line between the countries.

Jav'elin, a short and light spear thrown from the hand, and in ancient warfare used by both horse and foot soldiers. The *pilum* of the Romans was a weapon of this description, and was used either to throw or to thrust with. The shaft was 4½ feet long, and the barbed iron head was of equal length, but as it extended half way up the shaft, the whole length of the weapon was nearly 7 feet. The shaft, made of some tough wood, often cornel, was an inch in diameter. The use of the javelin was not confined to the Roman legionaries, for many barbarous tribes, and especially the Goths, employed this weapon in their military operations.

Jaws, Anatomy of the. The upper jaw is formed by the union of the two superior maxillæ; these bones each form part of the cheek, the outer wall of the nasal cavity, the hard palate, and the lower part of the eye-socket. The lower jaw is formed of one bone, the inferior maxilla, which presents a horseshoe-shaped body, and vertical plates of bone ascending from the body posteriorly. The top of these vertical plates is widened into a knob-like end for articulation with the skull.

Dislocation of the jaw may take place during excessive laughter or yawning. The articular knob slips forward and the jaw is held open. Reposition is accomplished by placing the thumbs on the back teeth and making forcible downward and slightly backward pressure until the bone is felt to snap into place.

Fracture of the upper jaw is uncommon except when the face is crushed in. Usually in fracture it is the body of the lower jaw near the front that is broken. Besides the usual signs of fracture (q.v.) the attitude may be character-

istic; the patient is unable to shut the jaw; and the difference in the line of the teeth may show clearly. Repair of the fracture is facilitated by fastening the upper jaw with a sling-bandage carried around the head, and keeping it so fastened until union is established. During this time the patient is forced to eat liquid foods almost entirely.

Jaxartes, jăk sär'tēz. See Syr Darya.

Jay, John, American statesman and jurist: b. New York 12 Dec. 1745; d. Bedford, Westchester County, N. Y., 17 May 1829. His father was a wealthy merchant of Huguenot stock, and his mother a daughter of Jacobus Van Cortlandt. His father,—early discovering, to use his own words, that Jay was of "a very grave disposition, and took to learning exceedingly well"—sent him to a school in New Rochelle something like Dotheboys Hall in 'Nicholas Nickleby.' Three years at school were followed by study under a tutor until he entered King's College at 14. He was graduated in 1764, the subject of his oration being the blessings of peace, of which he was to have still keener appreciation. Two weeks later, on payment of £200, he entered the office of Benjamin Kissam, a prominent lawyer of New York, as an apprentice bound to serve five years, the last two years to be devoted to the study of the law. Admitted to the bar in 1768, he soon attained prominence in the profession, forming a partnership with Robert R. Livingston, afterward chancellor of the state, and secretary of foreign affairs. In 1773 he began his public career, as secretary to the Royal Commission to determine the boundary between New York and Canada; and for the following 28 years his public services were constant, varied and of supreme importance to the country so fortunate in being his birthplace. All his duties in the many fields covered by him during his splendidly successful life were performed in a manner indefatigable, zealous and faithful, and with marked ability.

Bound by no ancestral ties to England, and having married in 1774 a daughter of the famous Whig, and Revolutionary Governor of New Jersey, William Livingston, many would suppose that in the conflict impending between the colonies and mother country, Jay's voice, like those of James Otis and Samuel Adams, would have been from the first "still for war." But he was constitutionally so calm and conservative that he was unwilling to be too precipitate in determining upon a change in the mode of government. When, however, the colonists decided that their only safety lay in separation, Jay was found to be as staunch and aggressive a patriot as any, and represented the citizens of New York on the committee to settle the question arising out of the Boston Port Bill. Jay drafted the suggestion of that committee that "a Congress of Deputies from the Colonies in general" be convoked — in fact, the convocation of the Continental Congress. He was a member of that congress, and met with it in Philadelphia on 5 Sept. 1774. Congress at once appointed a committee to "state the rights of the colonies in general," of which Jay was made a member. This committee designated him to draft an address to the people of Great Britain, which was so satisfactory that it was at once reported to Congress, and adopted by it. Jefferson, without knowing who was the author, pronounced it "a production certainly of the finest pen in America."

Jay was also sent to the 2d Continental Congress, but in the interim devoted himself to shaping the public mind in the direction of obedience to Congress and in hostility to enforcement of Parliamentary taxation. When the 2d Congress convened, the signal shot — "heard round the world" — had been fired at Lexington, and Congress, realizing that a condition of war existed, deputed Jay to draft an address to the people of Canada, which was prepared and adopted, and circulated in that country. He also wrote an address to the people of Jamaica and Ireland by request of Congress, but the second petition to the King that he prevailed upon Congress to make was written by Dickinson. Other important and effective work by him in that general direction might be cited, but I shall be content with the assertion I deem supported by the facts, that as a creator and molder of public opinion at that particular juncture Jay stands unrivalled; and all this was in the main accomplished through the wise use of his pen, the efficacy of which was strongly presented by John Adams when he wrote regarding it to Jefferson, "I never bestowed much attention to any of those addresses, which were all but repetitions of the same things; the same facts and arguments; dress and ornaments rather than body, soul or substance. I was in great error, no doubt, and am ashamed to confess it, for these things were necessary to give popularity to the cause, both at home and abroad." Jay's contribution to the debates in Congress, like all his public work, showed that he followed in all things and upon all questions the path illuminated by the light of his well balanced judgment, and his conscience, thinking not of personal popularity, but simply of the right. He served actively upon the committee that carried on negotiations with foreign powers friendly to America and inimical to England. Indeed, during the year 1775 he was a member of so many committees, each having different and important objects, that it is difficult to understand how he was able to accomplish so much important and laborious work.

If it be asked why so good a patriot as Jay was not a signer of the Declaration of Independence, the answer is, that in 1776, while a member of the Continental Congress, Jay was also elected to the New York Provincial Congress, and the Continental Congress having directed the colonies to each adopt a government, Jay, on the call of his colony, proceeded to New York to take part in the formation of the local government, where he was forced to remain while the Declaration of Independence was being signed. During 1777, and while the war was going on in the vicinity of New York, the Provincial Congress, then styled the Convention of the Representatives of the State of New York, was laboring with exceeding difficulty, the members, as is recorded, performing "all the various and arduous duties of legislators, soldiers, negotiators, committees of safety and ways and means, judges, juries, fathers and guardians of their own families, flying before the enemy, and then protectors of a beloved commonwealth." Yet amid all this turmoil and unrest a constitution was drafted by Jay which was, in the main, adopted as drafted, and was published upon 22 April 1777, by being read in front of

the court-house in Kingston. A committee was at once appointed, Jay being a member, to organize a new government; and a council of safety was created to act until the legislature should meet. Robert R. Livingston was appointed chancellor and Jay chief justice, and the judicial department of government was temporarily organized.

Jay was urged to be a candidate for governor at the first election under the Constitution, but declined. General Clinton was elected over his opponent, General Schuyler, and took the oath of office, it is said, while "clothed in the uniform of the service, standing on the top of a barrel in front of the Court-House in Kingston." On 9 September following, Chief Justice Jay delivered an address to the grand jury at Kingston, which is to be found in the first volume of his correspondence and public papers. The address is a much prized document of revolutionary times, and was, undoubtedly, intended to reach and affect a much larger constituency than the grand jury to whom it was delivered. Of course, in those unsettled days, with the struggle between the old and the new countries raging, but little litigation of importance came before the supreme court, so that during Jay's chief justiceship the work of the court was mainly confined to criminal trials, and the court never sat in banc. During 1778 he was active in the Council of Revision, of which he was a member ex-officio. The legislature in 1779 appointed Jay to Congress without requiring him to vacate the office of chief justice, it being resolved that owing to serious questions between certain States "a special case" obtained under the Constitution. Shortly afterward Congress elected him its president. Later in the year, however, he resigned the office of chief justice, designing, he said, to recoup his failing fortunes. But his desires in that direction were not to be gratified. More than 20 years elapsed before the public he had served so well would submit to be deprived of his services.

In October, 1779, Jay resigned the presidency of Congress to accept the office of minister to Spain. His instructions in part were to secure if possible a commercial treaty with Spain similar to that existing with France, to acquire a port in Spanish dominion on the Mississippi, and to negotiate a loan of $5,000,000. That his mission was not entirely successful, and was personally disagreeable, was due to the fact that Spain disliked the new nation because it occupied lands formerly held by Spain, and it was apprehended that with increasing strength it might reach out and take more — fears that we know now were not groundless. While minister to Spain, Jay was appointed, with Franklin, Jefferson, Adams, and Laurens, commissioner for a general peace. Their instructions rested on the mistaken theory that France would aid in procuring for us the best possible terms. In June, 1782, Jay joined Franklin, then minister to France, in Paris, and promptly but cautiously entered upon an investigation which disclosed that France had other interests to serve than those of the United States. Possessed of the situation, he boldly entered upon negotiations with England's representative without even consulting his only colleague in Paris, whom he regarded as necessarily embarrassed by his position as minister to France, and his instructions. With firmness, and yet with great tact, he conducted the negotiations alone until joined by Adams, who enthusiastically approved of his action, and so advised Mr. Franklin, who, after consultation, agreed that the negotiations should be concluded without consulting the French court. The result of these most interesting negotiations with England was a treaty by which the United States gained more than Congress had ever ventured to propose. And Jay's part in this great triumph of diplomacy is well summed up in a letter written by his fellow commissioner John Adams to Jonathan Jackson, "a man and his office were never better united than Mr. Jay and the commission for peace. Had he been detained at Madrid, as I was in Holland, and all left to Franklin, as was wished, all would have been lost." When he returned New York gave him the freedom of the city in a gold box, and he found that he had been appointed by Congress secretary of foreign affairs. This office he filled with his usual ability, settling international questions, and advocating the building of a navy, and the organization of a federal government under a constitution. His papers in the 'Federalist' evidence both his activity and forcefulness in this direction, and his influence contributed in no small degree in bringing New York to the support of the Federal Constitution.

It is said that after the first election of Washington to the presidency he offered Jay the choice of any office in the government, and that he chose that of chief justice of the Supreme Court of the United States, which he justly regarded as the most exalted position next to the presidency; but be that as it may, Washington appointed him to that position, and in his letter to Jay, advising him of the nomination, said, "I not only acted in conformity with my best judgment, but I trust I did a grateful thing to the good citizens of these United States." The opportunity to contribute largely toward the development of the law in this country did not come to him, however. Had it, his success in other fields and his well poised mind assure us that Washington's judgment would have been triumphantly vindicated. Only a few causes came before the court during his incumbency, and the record of those, with a single exception, are preserved only in the minutes of the clerk, but his every step was in the right direction, whether taken while holding a circuit or sitting in banc with associates, and had effect in shaping the foreign policy of the United States as well as in establishing the dignity and independence of the Federal judiciary. He continued to hold the office until he resigned in 1795; but in the meantime and in 1792 the Federalists supported him unsuccessfully as against Governor Clinton for the governorship of New York, and in 1794 President Washington urged him to go to Great Britain as special envoy to settle differences growing out of the failure of that country to keep the obligations of the Treaty of 1784; differences which had aroused a strong war spirit all over the land. It was easy to foresee, as Jay forsaw, that the outcome of the situation would in all probability be unpopular with the people, but he did not hesitate to meet the responsibility that Washington believed he could meet better than any other man, partially because of the reputation he had established in England while negotiating the Treaty of Peace of 1784. A treaty

JOHN JAY.

CHIEF JUSTICE OF THE UNITED STATES SUPREME COURT, 1780-1795.

resulted, known on this side of the ocean as "Jay's Treaty," which settled the eastern boundary of Maine, recovered for illegal captures by British cruisers $10,000,000, secured the surrender of the Western forts still garrisoned by the British, and contained an article about the West India trade. With the exception of the latter article the treaty was approved by the President and ratified by the Senate. But many were not satisfied, and they denounced him with tongue and pen, and even burned him in effigy in Boston, Philadelphia and at his own home, New York. How different was the homecoming from that after the negotiation of the other treaty, when the freedom of the city was presented to him in a gold box, and each one seemed to vie with every other in extending a welcome. In a letter to a friend, Jay said at that time, "Calumny is seldom durable, it will in time yield to truth"; and he bore himself at that time as one having full confidence that he had acted both wisely and skilfully, and expected the people to realize it in time.

He found on his return that he had been elected governor of New York — before the public had knowledge of the terms of the treaty, of course. Before the close of that term, and in April 1799 he was re-elected by a majority so large as to constitute a personal triumph. During this term the statute was passed providing for the gradual emancipation of slaves within the State, then numbering about 22,000. The six years of his incumbency of the office of governor were crowded with interesting legislative and executive events in which he performed his part with that staunch devotion to the public interests which ever characterized his efforts throughout his career as a servant of the public, as is well illustrated by his refusal to be a party to the scheme of certain leaders of the Federalists to secure the electoral vote of New York for the ensuing election. The unexpected result of the spring elections of 1800 assured the Republicans of a substantial working majority on joint ballot, and hence of the Presidential electors under the law as it then stood. It was generally conceded that New York would determine the choice of the next President. Although the Federalists had, in March prior to the elections, defeated the attempt of the Republicans to redistrict the State, and had insisted that it was necessary that the State should act as a unit in the choice of Presidential electors, the leaders changed their position after the election had gone against them, and insisted that the electors should be chosen by districts. Alexander Hamilton wrote Governor Jay on 7 May advising that he call an extra session of the Legislature to enact such a statute before July first, the end of the legislative year. Philip Schuyler also wrote a letter strongly urging that such a course furnished the only means of saving the "nation from more disasters." But Jay, although a staunch Federalist, who had received the votes of New Jersey and Delaware, five votes from Connecticut and one from Rhode Island for the Presidency in the preceding electoral college, refused to take such action, and endorsed on Hamilton's letter these words: "Proposing a measure for party purposes which I think it would not become me to adopt." He refused a renomination for the office of governor on the ground that he now intended to retire from public life, and his purpose was unshaken by President Adams announcing to him his nomination and confirmation a second time as chief justice of the United States.

For 28 years he had been a good and faithful public servant. To him indeed had public office been a public trust, in which he had toiled faithfully and intelligently, having only in view his duty and the public good, unmoved by desire for great emolument or popularity. Naturally conservative he carefully examined every situation before acting, but when he had determined the proper course to take he acted promptly and boldly, and without regard to the effect of his course upon himself. His perfect self poise had its effect upon associates and subordinates, and the value he placed upon it may be inferred from his letter of instructions to William Carmichael in which he said, "Command yourself under every circumstance; on the one hand avoid being suspected of servility, and on the other let your temper be always even and your attention unremitted." This great patriot gave to the public service the day of his vigorous manhood, the best years of his life, covering the period of the struggle for independence and the formation of our complex system of government, the years when his country most needed the faithful service of her sons. He set aside every personal interest, laboring with fidelity and unselfish effort, and showing himself willing to "spend and be spent" for his country. Having borne his portion of travail at the birth, and done his part in the nurture of the early infancy of this great nation, he retired at last to his farm at Bedford, Westchester County, where he lived a restful life, indulging his agricultural, philanthropic and religious tastes, and enjoying the confidence, esteem and affection of the people until he went to his last rest at the age of 84 years, leaving behind him

> "A name that shall live through all coming time,
> Unbounded by country, by language, or clime."

Consult: 'Correspondence and Public Papers of John Jay' edited by H. C. Johnston (1890–3); William Jay, 'Life of John Jay' (1833); Whitelocke, 'Life and Times of John Jay' (1887); Pellew, 'John Jay' (1890).

Alton B. Parker,
Late Chief Judge of the Court of Appeals of the State of New York.

Jay, John, American diplomatist: b. New York, 23 June 1817; d. there 5 May 1894. He was the son of William Jay (q.v.) He was graduated from Columbia in 1836, studied law in New York, was admitted to the bar in 1839, became a prominent opponent of slavery, was secretary of the Irish relief committee in 1847, and was counsel for several fugitive slaves. He organized the meetings at the Broadway Tabernacle, New York, in 1854, and took a leading part in the organization of the Republican party at Syracuse 27 Sept. 1855. From 1869 until his resignation in 1875 he was United States minister to Australia, in 1877 was appointed chairman of the so-called Jay commission for the investigation of the New York customs-house administration, and in 1883 was appointed the Republican member of the New York State civil service commission. He was long corresponding secretary of the New York Historical Society, and published several pamphlets, among them: 'The Dignity of the Abolition Cause' (1839); and 'The American Church and the American Slave-trade' (1860).

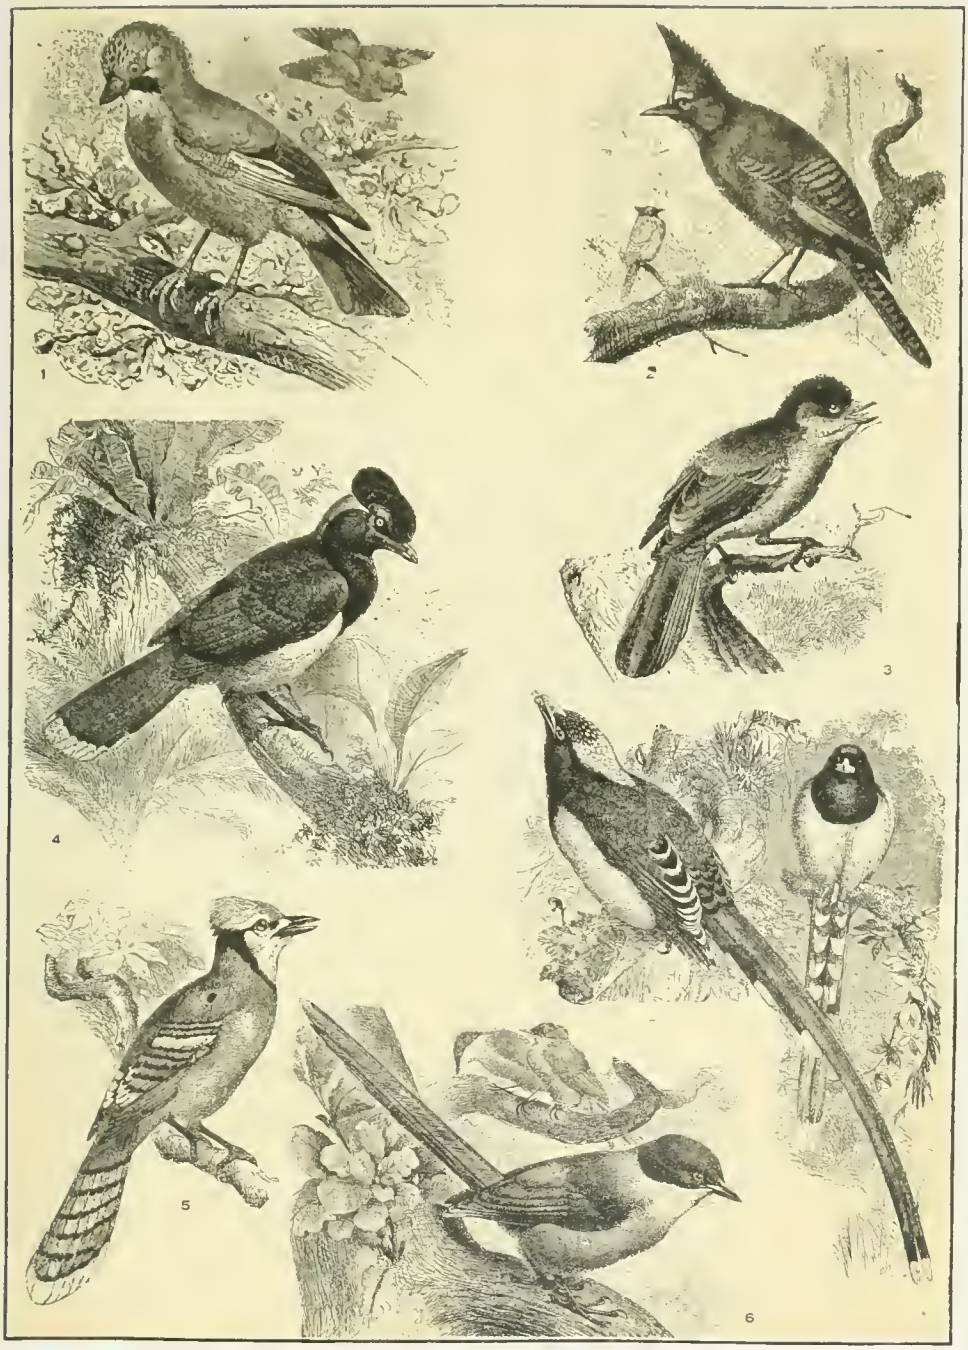
Jay, William, English Congregational clergyman and writer: b. Tisbury, Wiltshire, 8 May 1769; d. Bath, 27 Dec. 1853. After studying for the Congregational ministry, he officiated at Hope chapel, near Bristol, and became pastor in 1789 of Argyle chapel, Bath, where he remained till 1852. As a preacher he not only enjoyed a high celebrity in his own denomination, but won the applause of critics like John Foster, Sheridan, and Beckford. His published sermons are esteemed as well for their catholic spirit as their practical earnestness and simplicity of style. They have passed through many editions, and besides them he wrote 'Essay on Marriage'; 'Lectures on Female Scripture Characters' (1854); 'Morning and Evening Exercises' (1854). His autobiography, in the form of letters, appeared in 1854.

Jay, William, American jurist: b. New York, 16 June 1789; d. Bedford, N. Y., 14 Oct. 1858. He was the son of John Jay, statesman and jurist (q.v.). Graduated from Yale in 1808, he studied law with J. B. Henry at Albany, was obliged by defective eyesight to withdraw from the profession, and became interested in various philanthropic movements, including the anti-slavery cause. He was a founder of the American Bible Society (1816), which he greatly promoted and long defended against High Church attacks led by Bishop Hobart. In 1818–21 he was judge of common pleas in New York, and in 1835–7 corresponding foreign secretary of the American Anti-Slavery Society, in the drafting of whose constitution he had assisted. He wrote much on anti-slavery, and was recognized as a leader of the more conservative of the Abolitionists. Among his publications were: 'The Life and Writings of John Jay' (1833); 'An Inquiry into the Character and Tendency of the American Colonization and American Anti-Slavery Societies' (1834): 'A View of the Action of the Federal Government in Behalf of Slavery' (1837); 'War and Peace' (1848).

Jayhawker, a name originating in Kansas during the slavery and anti-slavery warfare; applied to a few Free State men who organized a system of retaliation against pro-slavery outrages. Gov. Lane of Kansas, in 1861, declared that "the people of Kansas were neither thieves, plunderers, nor *jayhawkers.*"

Jays, a group of birds forming with the magpies a sub-family (*Garrulinæ*) of the *Corvidæ*, or crow family. They are readily distinguished from the true crows (*Corvinæ*) by their relatively short wings, long conspicuous tails, and usually showy plumage, in which blue colors are prominent. They are generally smaller than the crows, have weaker bills, and feet better adapted to the more completely arboreal life which they lead. Jays are found throughout the greater part of the world, but America leads in number and variety of species. North America has four genera and ten species with many additional local varieties. A familiar representative is the bluejay (*Cyanocitta cristata*), which is numerous throughout the eastern half of the United States and Canada. It is about one foot long, of which the tail is nearly half; the head conspicuously crested; purplish-blue above with a slight tinge of the same color on the generally gray underparts; the wings and tail are a nearly saturated blue in the males, duller in the females, cross-barred with black and with white markings especially conspicuous on the end of the tail; a rich black collar encircles the neck. The bluejay eats all kinds of nuts, fruits, large insects, and at times the eggs and young of other birds; it seldom leaves the trees in search of food, and when on the ground hops instead of walking like the crow. Except in Canada it is resident, and it breeds throughout its entire range. The nest, a large structure of twigs, grass, leaves, etc., is built in trees, bushes, or old buildings. Five is the usual number of eggs. Like the magpie this jay is known to collect and hoard various glittering or brightly colored objects, but is chiefly noteworthy on account of the variety and quality of its notes which range from the harshest cries to full flute-like tones. On the Pacific Coast this species is replaced by the darker and duller Steller's jay (*C. stelleri*). The Canada jay, or whiskey jack (*Perisoreus canadensis*) is, as its name indicates, a northern bird, found within the United States only along the northern border, and occasionally breeding in northern Maine. This is a dull-colored gray bird, without a crest, and with soft, lax plumage. It is well known to hunters and lumbermen whose camps it haunts with great boldness; and in manners and voice resembles the bluejay. It nests very early in the spring. Related species are the Oregon jay (*P. obscurus*) and the Siberian jay (*P. infaustus*) of boreal Eurasia. Several species of crestless deep-blue "Florida" jays (*Aphelocoma*) inhabit Florida and the west and the southwest. The brilliant green jay (*Xanthura luxuriosa*) is an example of the gorgeous tropical jays which just enter the United States in Texas. Consult the works: Wilson, Audubon, Nuttall and American ornithologists generally; for western species in particular, Coues, 'Birds of the Northwest' (1874), and 'Birds of the Colorado Valley' (1878).

Jay's Treaty, 1794. The Articles of Confederation provided that the States might nullify at will any provisions of whatever commercial treaty Congress might negotiate; of course therefore no nation with much commerce to be disturbed by our competition would make such treaties with us. Our chief commerce was with Great Britain; and that country would make no commercial treaty whatever with us, even for years after the Constitution had given Congress power to enforce its treaties. There were two main reasons for this: first, that Great Britain had valuable commercial monopolies (especially in the West Indies) for which she thought we could return no equivalent; second, she was angry over the *sequelæ* of the peace of 1783. She had agreed to surrender the border forts on the Great Lakes, the St. Lawrence, and Lake Champlain, and carry off no negroes, on condition that Congress "recommend" to the States to restore confiscated Tory property, and agree to confiscate no more. Congress did so twice emphatically, but the States paid no attention to it; the British government, though it knew very well how much the recommendation meant, made this an excuse to retain the forts and refuse payment for 3,000 negroes carried off; this in turn hardened the States to refuse compliance with the treaty, and the forts being



1. European Jay (Garrulus glandarius).
2. Mexican Long-crested Jay (Cyanocitta diademata).
3. Canada Jay (Perisoreus canadensis).
4. Blue-capped Jay (Cyanocorax chrysops).
5. American Bluejay (Cyanocitta cristata).
6. Spanish Jay (Cyanopica cooki).
7. Red-billed Jay (Cissa erythrorhyncha)

made a basis for Indian outrages winked at by the British commandants enraged the country still more. The Republicans, who sympathized with the new French Republic and hated Great Britain, held the House; the Federalists, whose sympathies were exactly opposite, the Senate by a small majority. On 16 Dec. 1793, Jefferson made a famous report on a House resolution, recommending retaliatory duties; and after an acrid debate the Republicans pushed through a non-intercourse resolution, only defeated even in the Senate by Vice-President Adams' casting vote. But Washington threw his weight into the scale of peace, and nominated Chief Justice John Jay as envoy extraordinary to negotiate a commercial treaty. With Lord Granville he drew up one on 19 Nov. 1794, which removed the chief American grievance by surrendering the forts, but refused compensation for the negroes and referred all other claims to commissioners; and as to commerce, allowed direct but not coasting trade between the United States and the British East and West Indies (the latter in vessels of not over 70 tons), but denied the United States the right to export sugar, molasses, coffee, cocoa, or cotton to Europe — in other words, to become an intermediary for the British colonies to evade the British commercial monopoly; and limited even this provision to two years after peace with the powers then at war with Great Britain. There were also clauses which impliedly recognized British right of search and impressment, and power to make anything contraband. The treaty was ratified by the Senate in secret session (8 June 1795), but when published excited an uproar of public indignation; Jay was burned in effigy, and even Washington vilified incredibly. The Virginia legislature and the Federal House practically passed votes of censure; but the people gradually came to recognize that it was the best thing to be had, hard as were the terms; the commercial bodies in the States openly commended it; Hamilton wrote his «Camillus» letters in its favor; and after a bitter struggle for many weeks in the House to refuse compliance with the Senate action, the treaty won by 51 to 48.

Jean Paul. See RICHTER, JEAN PAUL FRIEDRICH.

Jeanne d'Arc, zhän därk. See JOAN OF ARC.

Jeannette, jĕn-nĕt', Pa., borough in Westmoreland County; on the Pennsylvania railroad; about 22 miles southeast of Pittsburg. The natural gas which supplies the borough has contributed somewhat to its development. It is situated in a fertile agricultural region, which is also a coal mining section. The government is vested in a burgess, who holds office three years, and a council. Pop. (1890) 3,296; (1900) 5,865.

Jeannette Expedition, an enterprise, projected 1879 by James Gordon Bennett of the New York *Herald*, who sent out an Arctic expedition from San Francisco in the steamer Jeannette, under command of Lieut. De Long, U. S. N. The Jeannette was early caught in the icepack, drifted for nearly two years, and never escaped from its grip. After the wreck of the Jeannette the crew embarked in two cutters and a whaleboat. Lieut. Danenhower and a portion of the Jeannette's crew reached New York in May 1882. The bodies of De Long and his men were finally discovered in the snow, with evidences that all had perished from cold and hunger. See POLAR RESEARCH.

Jebb, SIR **Richard Claverhouse,** English Greek scholar: b. Dundee, Scotland, 27 Aug. 1841; d. 9 Dec. 1905. He was educated at the Charterhouse, London, and Cambridge University, and in 1869 became public orator there. In 1875 he was called to fill the Greek chair in Glasgow University, which he resigned in 1889, on being appointed Greek professor at Cambridge. He several times visited the United States, and in 1874 married the widow of a general in the United States army. He was lecturer at Johns Hopkins University, Baltimore, in 1892. His best known works are: 'The Attic Orators' (1876); 'Modern Greece' (1880); a 'Life of Richard Bentley' (1882); 'Homer: an Introduction to the Iliad and Odyssey' (1886); 'Lectures on Greek Poetry' (1893); 'Humanism in Education' (1899); and an addition of Sophocles, with notes and translation. After 1891 he represented Cambridge University in Parliament. He was knighted in 1900.

Jefferson, jĕf'ĕr-sŏn, **Charles Edward,** American Congregational clergyman: b. Cambridge, Ohio, 29 Aug. 1860. He was graduated from Ohio Wesleyan University (Delaware, Ohio) in 1882, from the School of Theology of Boston University in 1887, was ordained to the Congregational ministry in 1887, and became pastor of the Broadway Tabernacle, New York. Among his writings are: 'Quiet Talks with Earnest People in My Study'; and 'The Broadway Tabernacle of the Past and Future' (1901).

Jefferson, Joseph, American actor: b. Philadelphia 20 Feb. 1829; d. Palm Beach, Fla., 23 April 1905. He was privately educated and was early upon the stage, among his first public appearances being that as a miniature of T. D. Rice in one of the latter's «Jim Crow» entertainments at Washington, D. C. In 1843 he became a member of a band of strolling players that gave primitive entertainments through Mississippi and Texas, and followed the United States army into Mexico. On his return to the United States he appeared at the Arch Street Theatre, Philadelphia, directed the performances at Peale's museum in that city, became known as an excellent stock actor, and in 1851 played Marroll in 'A New Way to Pay Old Debts' to the Sir Charles Overreach of Junius Brutus Booth. His prominence began with his creation of Asa Trenchard in 'Our American Cousin,' which eliminated from the stage the traditional caricature of Yankee character. He then appeared in the parts he afterwards made famous: Newman Noggs in 'Nicholas Nickleby'; Caleb Plummer in 'The Cricket on the Hearth'; Dr. Pangloss in 'The Heir at Law'; Dr. Ollapod in 'The Poor Gentleman'; Mr. Golightly in 'Lend Me Five Shillings'; Salem Scudder in 'The Octoroon'; Bob Acres in 'The Rivals'; and, above all, Rip Van Winkle in the play of that name. Dissatisfied with his own dramatization of Irving's sketch, in which he had appeared at Washington in 1860, Jefferson had the play re-written by Dion Boucicault, and in Boucicault's version, with slight changes,

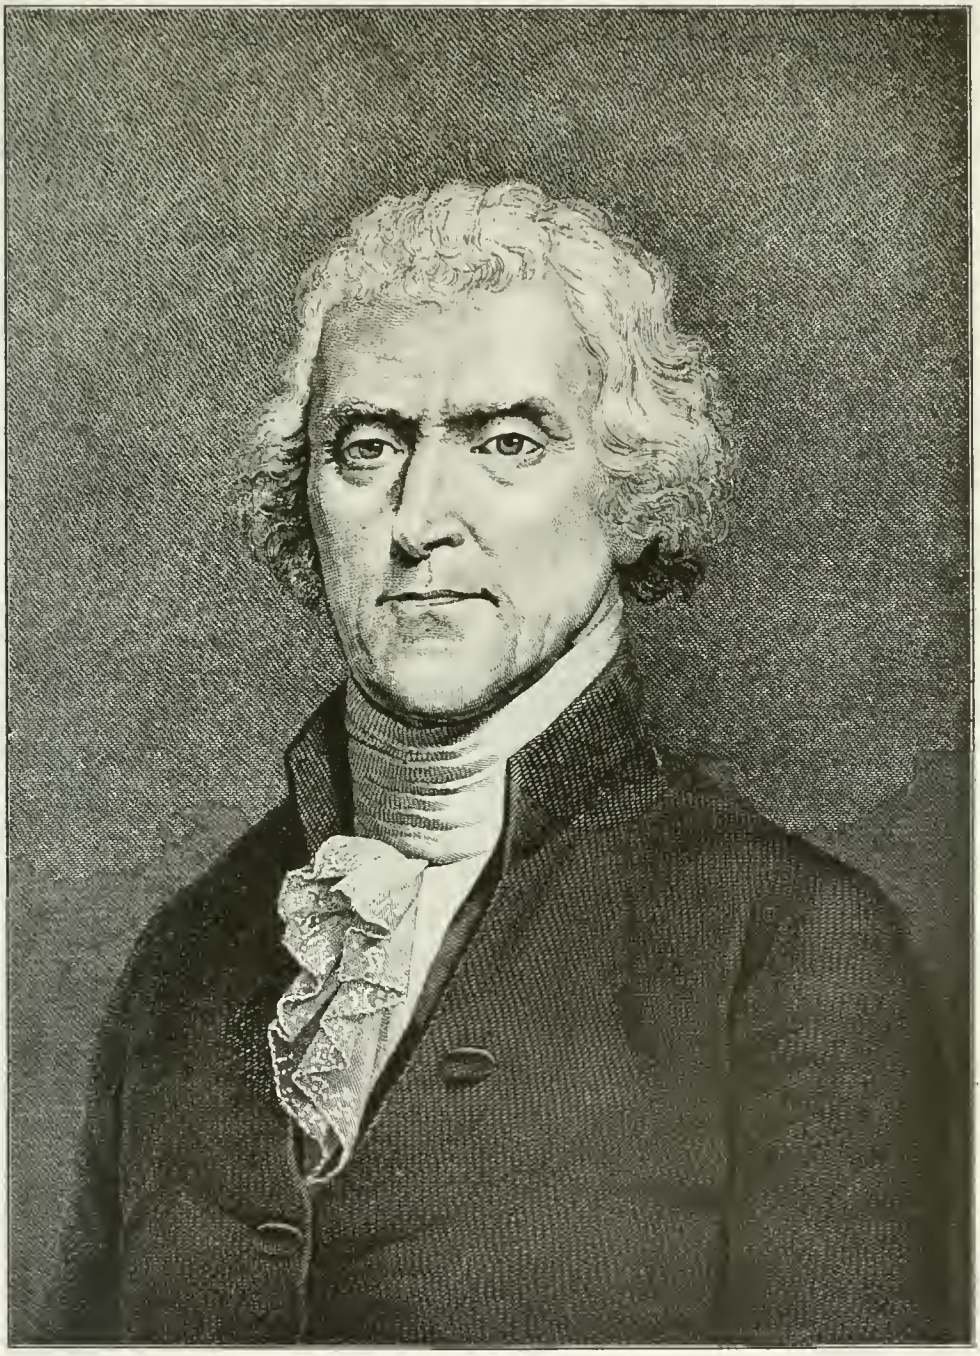
afterward acted. The drama ran for 170 nights at the Adelphi, London, in 1865, and in the United States was so successful that for years Jefferson appeared there in nothing else. Jefferson's Rip established itself as one of the classic creations of the stage, and outside of Shakespeare probably no character ever attained so wide and permanent a recognition among the American public. In the later years of his life he played but a few weeks annually in a repertoire of favorite parts. He also made a considerable reputation as an artist by his impressionist landscapes in oils. His acting method was distinguished by ease, verisimilitude, and perfection of finish. In the plays used by him he, for artistic purposes, introduced several admirable changes and additions. He published an interesting 'Autobiography' (1890); and a 'Reply to Ignatius Donnelly on the Shakespeare-Bacon Argument.' Consult the 'Autobiography,' and Carroll, 'Twelve Americans' (1883).

Jefferson, Thomas, American statesman, third President of the United States: b. Shadwell, Albemarle County, Va., 13 April 1743; d. Monticello, Albemarle County, Va., 4 July 1826; student at William and Mary College, Williamsburg, Va., 1760–2; student of law 1762–7; member of House of Burgesses 1769–74; member of Virginia Conventions 1774 and 1775; of the Continental Congress 1775–6; of Virginia Legislature 1776–9; governor of Virginia 1779–81; member of Congress 1783–4; minister to France 1784–9; secretary of state 1790–3; Vice President 1797–1801; President 1801–9; in retirement at Monticello 1809–26.

Early Life.— Thomas Jefferson was the son of Peter Jefferson, a planter of Albemarle County, Va. His mother was Jane Randolph, daughter of Isham Randolph, who was a descendant of William Randolph of Turkey Island, the progenitor of that family so well known in Virginia history. Jefferson's birthplace was Shadwell, about four miles from the city of Charlottesville. At this homestead he resided until it was destroyed by fire in 1770; thereupon Jefferson selected a low mountain about two miles from Charlottesville, where he built that now famous mansion, "Monticello." Albemarle County, Va., has the proud distinction of being the section in which Jefferson was born, reared, lived, died and lies buried. Jefferson's early education, as was usually the case with Virginia planters, was entrusted first to a private tutor, from whom he learned Latin, Greek, French, and mathematics. At 14 his father died, and after two years in a school conducted by the Rev. James Maury, he entered in 1760 William and Mary College, at that time the best institution of learning in America. The student Jefferson is described as tall and raw-boned, with reddish hair and grayish hazel eyes. He was not then regarded as handsome, though in after years he was considered as probably the most attractive in appearance of the great Virginia statesmen. As a youth he was noted for his intelligence, and while at college, he was in constant association with such men of culture as George Wythe (q.v.), the eminent lawyer; Professor William Small, the profound scholar, and Governor Francis Fauquier (q.v.), the gay and accomplished gentleman. With these gentlemen, many years his senior, he was accustomed to discuss the deepest questions of philosophy and government. In Williamsburg, Jefferson was one of the leaders in all social functions, and always attended the balls given in the Apollo Room of the Raleigh Tavern. Probably his first year at college was spent among too many festivities, but during his second year he is said to have been a most diligent student, often devoting 15 hours a day to his books. After two years of college work, he commenced the study of law under George Wythe, but did not apply for admission to practice before the general court of Virginia till 1767. Jefferson was now 24 years of age; he had a large farm of 1,900 acres (soon increased to 5,000 acres) to which he gave his personal supervision. Though he devoted much time to this farm, he succeeded so well as a lawyer that his profession soon paid him $3,000 annually.

A Revolutionist.— In 1769 he was returned by Albemarle County a member of the House of Burgesses, an honor which his father had had before him. This was Jefferson's beginning as a statesman. He had stood in 1765 in the hallway of the House of Burgesses when Patrick Henry (q.v.) offered his famous Resolutions against the Stamp Act, and from Patrick Henry he imbibed the spirit of revolution. Just as soon as he became a member of the Burgesses, he joined the party of resistance to England. He was by nature a bold and fearless thinker, and when a mere boy he had had engraved on a seal as his motto, "Resistance to tyrants is obedience to God," a principle to which he held throughout his long and eventful life. Jefferson was present when the House of Burgesses passed the resolutions of 1769. He was one of those who signed the agreement not to import goods from England. He was also a member of the House of Burgesses when, in 1773, it established a Committee of Correspondence between Virginia and the other colonies. Some think that the resolutions for such a committee were drawn by Jefferson, though they were offered in the house by his kinsman, Dabney Carr (q.v.). Of this committee Jefferson was a member. He served again in the House of Burgesses in 1774, and was one of those who voted for the resolution appointing a day of fasting and prayer because of the oppressive measures which England had passed against the city of Boston. When the governor dissolved the assembly, Jefferson met with those discontented members who called for a general congress of the colonies and asked the freeholders of Virginia for a convention to consider the state of the colony. To this convention Jefferson was returned by the people of Albemarle. The convention of 1774 was the first extra-legal assembly to meet in Virginia. Jefferson was unable to be present, having been taken ill on his way to Williamsburg. However, his influence was felt through a document called "The Summary View of the Rights of British America," which was intended to be a series of instructions to the Virginia delegates to the First Continental Congress. The instrument marked him as a revolutionist, and as an advocate of independence from England, for in it he distinctly claimed that the colonies had a right to govern themselves without interference from the English Parliament. His views were too radical for the Virginia convention to give them its official stamp.

Jefferson was also elected a member of the



THOMAS JEFFERSON,

THIRD PRESIDENT OF THE UNITED STATES

convention of 1775, which met at St. John's Church, Richmond, and when Patrick Henry by his eloquence carried the colony into open rebellion against the mother country, Jefferson was appointed a member of the committee to devise a plan for organizing the militia of the colony. Shortly after this he became a member of the Second Continental Congress. When he entered that body, he was 32 years of age, being one of the youngest three members. Here he was placed on such important committees as those which drafted a paper to explain the rebellious attitude of Massachusetts at Lexington and Concord, and to reply to Lord North's "Conciliatory Policy." On each committee he showed such a strong republican tendency that his suggestions were not accepted. The members of the Continental Congress of 1775 were not far-sighted enough to see that independence was the only course. Finally, in the spring of 1776, there came to the Virginia members of Congress instructions from the Virginia convention of 1776 that the united colonies should be declared free and independent States; and accordingly Richard Henry Lee, called the American Cicero, moved that a Declaration of Independence should be adopted. In accordance with the motion, a committee was appointed and the members were elected by ballot. Jefferson's facility for writing was so well known to the Congress that he received the highest number of votes and was named as chairman of the committee over such men as John Adams, Benjamin Franklin, Roger Sherman and Robert R. Livingston. To him as chairman fell the task of drafting that immortal document which stands in the history of the world as the most revolutionary political paper ever written. On 4 July 1776, the instrument, practically as offered by Jefferson, was unanimously adopted and to it were placed the signatures of all the members of Congress then present, except one. The principles set forth in that document mean a government by and for the people, and show that Jefferson was far ahead of his day; for it is only at the dawn of the 20th century that we are beginning to comprehend the great and universal truths that Jefferson made known to the world. (See Declaration of Independence.) Jefferson retired from Congress in 1776, and, on returning to his native State, entered the Virginia legislature with the hope of revising and modifying her laws so that they might accord with republican government. For three years he served in the House of Delegates. During this time he succeeded in breaking down the laws of primogeniture and entail, in practically disestablishing the English Church, and in passing one of the best laws that the world has ever seen for public education providing an ideal system from the primary school to the university. Through his influence the legislature appointed a committee to revise thoroughly the laws of Virginia. The committee was composed of Edmund Pendleton, George Wythe and Jefferson. After two years, the revision, chiefly done by Jefferson, was submitted to the General Assembly, but it was not adopted *in toto*. Finally, however, in 1785, while Jefferson was in France, his faithful friend and political follower, James Madison, secured the passage of nearly all of Jefferson's work. It was at this time that the legislature approved the famous Statute for Religious Freedom, by which the complete separation of Church and State was accomplished, except the taking away of the *glebe* lands, a thing which was done in 1802. Jefferson wished even more radical changes in Virginia, such as the equalizing of representation on population instead of having two representatives from each county. He also desired that the suffrage should not be restricted to land owners, but that it should be extended to all men who might be subject to military duty. He likewise advocated more local self-government in the counties and towns of the State. He even went so far as to advocate the emancipation and the deportation of the slaves from Virginia. These measures were too radical for the Virginia Assembly, and were rejected. It is interesting to note, however, that all of them have since been accomplished save the deportation of the negroes.

Governor of Virginia.— Jefferson was governor of Virginia from June 1779 to June 1781. These were trying times; Virginia was invaded by British troops under Cornwallis, and Jefferson lacked money and resources with which to defend properly the State. His administration has often been criticised, some claiming that he was a mere doctrinaire and not a practical man; but close scrutiny shows that he did all that then lay in his power.

In Congress and at the French Court.— In 1783 Jefferson entered the Congress of the United States. To this body he proposed in 1784 a plan for the government of the Northwest Territory which Virginia so generously gave to the Union. One clause of this plan provided for the prohibition of slavery in that territory after 1800, and for this reason the plan was not adopted. In 1787, however, Congress enacted a bill for the government of the Northwest much like the original draft of Jefferson. From him Congress had the plan of our present decimal monetary system. In 1784 Jefferson was sent to France to join Benjamin Franklin and John Adams in negotiating commercial matters with foreign countries, and in 1785 he succeeded Franklin as our minister plenipotentiary to the French court. Through his efforts many unjust impositions on American commerce were removed by the French government.

Secretary of State.— In October 1789 he returned to America, and the following year became secretary of state in Washington's cabinet, in which position he opposed Hamilton (q.v.), who favored the exercise of extensive powers by Congress. Jefferson believed in a real federal relation between the States, and in a restricting of the congressional powers to purely constitutional authorizations. The final line of cleavage came when Congress passed a bill to establish a national bank. Hamilton submitted to Washington a paper asserting that such a step was legal, while Jefferson made a vigorous written protest showing that the bill was unconstitutional. Washington approved the measure, thus accepting Hamilton's views as correct. The Bank Bill, along with similar congressional acts, caused the establishment of two distinct parties — the Federalist or Loose Construction Party, headed by Hamilton, and the Anti-Federalist or Strict Construction Party, with Jefferson as its leader. Jefferson's followers were usually called the Democratic-

Republicans. (See BANKS AND BANKING, AMERICAN.)

In December 1793 Jefferson resigned from the cabinet and returned to Monticello, where he remained for four years, studying farming. His estate at this time contained 10,647 acres of land, worked by 154 slaves, and stocked with 34 horses, 5 mules, and 249 cattle. Among the negroes he had a sort of industrial (manual-training) school, and taught them to be cabinet-makers, bricklayers, masons and smiths.

Vice President.— From his retirement at Monticello, Jefferson was called to become Vice President in 1797, a position which he held till 1801. During these four years, he bitterly opposed the so-called monarchical tendencies of the Federal party as seen in the Alien and Sedition Acts (q.v.), and he boldly asserted the compact theory of State sovereignty in the Kentucky Resolutions of 1799. The Kentucky Resolutions and Virginia Resolutions of 1798-9 (the latter framed by Madison after a copy of the Kentucky Resolutions sent him by Jefferson), made the platform, so to speak, of the Democratic-Republican party which elected Jefferson as President in 1801.

President.— From 4 March 1801 to 4 March 1809 Jefferson was President. He was the first President to be inaugurated in Washington City. He believed in rotation in office, and in pursuance of this idea, removed a number of Federalists from their positions. His great act, however, was the purchase of the Louisiana Territory from France for the sum of $15,000,000. This vast territory was acquired for two reasons: (1) In order that the United States might have control of the Mississippi River, and the port of New Orleans; and (2) that the United States might not be hampered by European countries in the development of a republican form of government. As secretary of state in Washington's cabinet, Jefferson had practically asserted what was afterward known as the Monroe Doctrine, when he claimed that the United States should see that no European countries, other than those already holding possessions, secure a foothold in America. In 1801 Jefferson viewed with alarm the transfer of the Louisiana Territory from Spain to France, for he feared that, with France added to Spain, England and Russia, in control of colonies in America, republican government would have a hard struggle. Jefferson was accused of inconsistency for having sanctioned the Louisiana Purchase (q.v.), for if he had applied the strict construction principle of the Constitution here as in such acts of Congress as the establishment of the national bank, this Territory could not have been purchased, there being no provision in the Constitution allowing territorial expansion. But Jefferson's political sagacity kept him from refusing this great opportunity, and his wish of expansion caused him to advocate earnestly the purchase of Florida from Spain. It was 13 years later before his desire was accomplished. The second administration of Jefferson was not so successful as the first. It opened with a war against the Tripolitan pirates who were plundering American commerce. The outcome of this war was to increase our influence among the nations of the world. The last years of the second term were marked with difficult complications arising out of the Napoleonic wars. Napoleon tried to prevent the United States from trading with England, and England retaliated by attempting to cut off all commercial relations between the United States and France. Many American vessels were seized by both England and France. Adding to this indignity, England claimed the right to search American vessels for English seamen, and an English war vessel actually fired on an American man-of-war, killing three of the crew and wounding 18. Jefferson tried to meet the restrictions on American commerce by the Non-Importation Bill and the Embargo Act. To enforce the measures all of the New England ships would have been shut up in American harbors. The New England merchants preferred to run the risk of losing their ships to keeping them without traffic; therefore they began to abuse the President and his policy. The result was that Congress felt forced to repeal the Embargo Act. Jefferson always claimed that had the embargo been enforced the United States would have gained its rights without the second war with England in 1812. (See EMBARGO IN THE UNITED STATES.)

Private Citizen.— On 4 March 1809, Jefferson retired from the White House, and spent the remaining 17 years of his life at Monticello. In these latter days he was known as the "Sage of Monticello," and to his home came people of prominence from all parts of the world to consult with him on great questions of politics and economics. Often his housekeeper had to provide beds for 50 guests. The demands which were made on his hospitality were so great that he died a bankrupt. During this period of his life he did all that he could to encourage better methods in agriculture, to reform the government of Virginia, and to develop in it a better system of education. The crowning event of his life was the establishment of the University of Virginia (q.v.) in 1819. He died on 4 July 1826, just 50 years from the day that has made him famous in all history, and by a singular coincidence his old rival and political antagonist, John Adams, passed away on the same day. Jefferson asked that three things be inscribed on his tomb: "Author of the Declaration of Independence; of the Statute for Religious Liberty in Virginia, and Founder of the University of Virginia,"— three acts which have made him famous.

Jefferson's Principles.— Jefferson stands in history for: (1) Republican government and the sovereignty of the people; (2) Opposition to privileged orders of nobility and the entail system; (3) Universal education and local circulating libraries; (4) Separation of Church and State; (5) Freedom of thought and speech; (6) Local self-government; (7) Economy in government and small public debt; (8) A policy of peace; (9) Political equality and universal suffrage; (10) Strict construction of the Constitution and the sovereignty of the States; (11) Well-trained militia and small standing army; (12) Metallic money, either gold or silver, as a standard, and no paper legal tender; (13) Opposition to bounties and monopolies; (14) Emancipation and deportation of slaves; (15) Expansion of the United States to include Louisiana, Florida, Cuba, and Canada; (16) Maintenance of Indian reservations; (17) Judiciary beyond the control of the legislative or executive branches of government; (18) Small navy; (19) Opposition to nepotism; (20) Rotation in

office; (21) Opposition to all secession movements, North or South. This review will show that Jefferson probably gave to the world more broad principles of government than any other man. Wherever republican forms of government exist there the name of Jefferson will always be uttered with reverence and respect.

J. A. C. CHANDLER,
Of Richmond College, Richmond.

Jefferson-Burr Imbroglio, ĭm-brō'lyō, a disputed Presidential election which resulted from a defective clause in the Constitution and caused its amendment in 1800. By its original provisions, the person who received the highest number of electoral votes should be President, the next highest Vice-President. Each set of electors had informally agreed that to save the pride of the leading candidates (Jefferson and Burr, Adams and Pinckney) each pair should have equal votes, and with one exception never reflected that this meant a tie; one Rhode Island Federalist elector cast his second vote for John Jay instead of Pinckney, and there is an unproven charge that Burr intrigued for an extra vote over Jefferson. They, however, received 73 each, and the Federalist House had to choose between the two Democratic candidates. Rules were adopted for the balloting, among the chief being that the Senate should be admitted, that the balloting should be in secret session, and that the House should not adjourn till a choice was made. The Federalists in caucus decided to vote for Burr; perhaps partly to spite the Democrats — Jefferson being their great national leader and the great Federalist terror, and the man the Democrats had intended to vote for as President — and partly because Burr as a New York man would consult Northern commercial interests, which the Virginian Jefferson might antagonize. They were right in this; Burr would not have laid the Embargo. Their solid vote would have elected Burr by one (nine out of 16 States); but they could not hold their members, three of whom bolted and voted for Jefferson to satisfy public feeling in their districts. Thus Jefferson had eight States, Burr six, and Vermont and Maryland were divided. But the Burr electors in the last two secretly agreed with Bayard of Delaware, who had also voted for Burr, that if there were likely to be bad blood and danger from prolonged balloting, they would stop it by voting for Jefferson. The casting vote thus lay with Bayard, who justly commanded confidence; but as the agreement was not known, the situation seemed much more perilous than it was. The balloting lasted a week without change. Some of the Federalists plotted to have it last till John Adams' term expired, and then let the others fight it out, or leave it by special act to Chief Justice John Marshall (Federalist), as a sort of regent trustee. The Democrats countered by resolving either to have Jefferson and Burr jointly (one of them certainly being President) call a special session, or to seize the capital by a militia force, call a convention, and revise the Constitution. Finally, after 34 ballots, the confederate electors decided that if Jefferson would give a guarantee for the civil service, he should have the election after one more ballot; he gave the guarantee, and was elected on the 36th ballot by 10 to 6 (States). Burr became Vice-President; that the attempt to put him at the head was mainly due to real fear for commerce is made probable by the fact that every New England State except the one (Vermont) which had no commerce, voted for him to the last. This affair resulted in the passage of the Twelfth Amendment (see CONSTITUTION OF THE UNITED STATES), which obliged the electors to specify their choice for the offices on distinct ballots, and enlarged the range of choice to three candidates in case of tie.

Jefferson, Texas, city, county-seat of Marion County; on the Cypress Bayou, and on the Missouri, K. & T. and the Texas & P. R.R.'s; about 20 miles from the eastern boundary of the State and 142 miles east of Dallas. It was settled in 1850 and incorporated in 1866. It is situated in an agricultural and stock-raising region with rich iron ore deposits in the vicinity. Some of the principal industrial establishments are furnaces, machine-shops, foundries, sawmills, cottonseed-oil mills, and large storage houses. The shipments are chiefly articles manufactured in the city, vegetables, grain, cotton, live stock, and fruit. The principal buildings are a government building, the city and county buildings. An iron bridge across the Bayou and good roads assist in making Jefferson the trade centre for a large part of Marion and Cass counties. Pop. (1900) 2,850.

Jefferson, Wis., city and county-seat of Jefferson County, at the junction of the Rock and Crawfish rivers, 50 miles west of Milwaukee; and on the Chicago & Northwestern railroad. It was settled in 1837 and is governed by a mayor and a council elected every two years under a charter of 1893. It has pork-packing plants, flour-mills, tanneries, brick and tile works, carriage and wagon factories and other industries. The city owns and operates the waterworks and the electric-lighting plant. Pop. (1900) 2,584.

Jefferson City, Mo., city, capital of the State, and county-seat of Cole County; on the Missouri River, and the Chicago & A., and the Missouri P. R.R.'s; 125 miles west of Saint Louis. It is the farming and manufacturing trade centre for Cole and adjacent counties; has manufactories of flour, shoes, clothing, beer, brooms, bricks, farming implements, carriages and wagons, and iron foundries. It is the seat of Jefferson City College, the general western offices of the Standard Life Insurance Company, Lincoln Institute, State Capitol building, State penitentiary, State armory, governor's mansion, Supreme Court building, United States courthouse, and the Carnegie Public Library. It has gas and electric light plants, 2 national banks, daily, weekly, and monthly periodicals, and an assessed property valuation exceeding $800,000. Jefferson City was settled in 1826 and was first incorporated in 1839. A mayor and council elected every two years administer the affairs of the city. Pop. (1890) 6,742; (1900) 9,664.

Jefferson River, Montana, a stream about 200 miles long, formed by the union of the Beaver Head and Wisdom (or Big Hole) rivers in Madison County. It unites with the Madison and Gallatin to form the Missouri.

Jeffersonton, Engagement at. Early in October 1863 the Army of the Potomac, under command of Gen. Meade, lay around Culpeper Court House, with the advance of two corps on the Rapidan. Gen. Lee, who was south of the Rapidan, determined to flank Meade's position, seize the Orange and Alexandria Railroad north of the Rappahannock, and intercept his retreat upon Washington. Informed of the movement, Meade withdrew his army to the north side of the Rappahannock, 11 October, his rear-guard of cavalry having a sharp engagement with the Confederate cavalry at Brandy Station. Believing that the Confederate army was moving upon Culpeper, Meade turned about and on the 12th, threw three infantry corps and a cavalry division south of the Rappahannock, with instructions to push forward and find and strike Lee, if at Culpeper. When they reached Brandy Station the Confederate army was nowhere in that neighborhood. At this time Gen. Gregg's division of Union cavalry was guarding the upper fords of the Rappahannock and Hazel rivers; on the morning of the 12th Col. Gregg's brigade crossed the Rappahannock near Sulphur Springs; his pickets at Jeffersonton being driven in, he marched for that place, found it in possession of the enemy, drove them from the town, and occupied it. That morning Fitzhugh Lee's cavalry division, leading the Confederate advance from near Madison Court House, crossed Hazel River at Starks' Ford and pressed on toward the Rappahannock. The 11th Virginia cavalry drove Gregg's skirmishers into Jeffersonton and attacked the two regiments in the town, but was driven out after losing several men. The 7th and 12th Virginia were now sent to the left and right, encircling the town, a combined attack was made, and Gregg was utterly routed and driven across the Rappahannock, with a loss of about 400 men, most of them captured. The Confederate loss was about 40 killed and wounded. When Meade heard of the engagement, and that Lee was crossing the Rappahannock at Warrenton Springs, he hastily recrossed the river, withdrew to Auburn and Catlett's Station and, on the 14th, to Centreville, Lee following closely and attacking his rear at Auburn and Bristoe Station during the day. Consult: 'Official Records,' Vol. XXIX.; Walker, 'History of the Second Army Corps.'

E. A. Carman.

Jef'fersonville, Ind., city and county-seat of Clark County; on the Ohio River, and the Baltimore & O. S. W., the Pittsburg, C. C. & St. L. and several other railroads; 50 miles southwest of Evansville. It is opposite Louisville, Ky., with which it is connected by railroad bridges. It contains the Southern State penitentiary, high school, public library, prison library, United States quartermaster's supply depot, and has waterworks, gas and electric lights, street railways, large car works, 2 national banks, daily, weekly, and monthly periodicals, and an assessed property valuation of about $1,700,000. Being at the head of the Ohio falls excellent water power is obtained here and the city has numerous industries, among them extensive works for freight and passenger cars and for building river steamboats. The mayor and council are elected biennially; the police commissioners are appointed by the governor of the State. Pop. (1890) 10,666; (1900) 10,774.

Jeffrey, jĕf'rĭ, **Francis,** Lord, Scottish judge and critic: b. Edinburgh 23 Oct. 1773; d. Craigbrook Castle, near Edinburgh, 26 Jan. 1850. He was educated at the University of Glasgow, and Queen's College, Oxford, and was admitted to the Scottish bar in 1794. He assisted in establishing the 'Edinburgh Review' in 1802 with Sydney Smith, Lord Brougham, and others, and after two numbers had been issued became its editor, a position which he held till June 1829. In 1831 he was made lord-advocate, and sat for several years as member of Parliament for Edinburgh. He was made a lord of session in 1834, and continued during a period of 16 years to be one of the ablest and most popular judges of the supreme court in Scotland. Consult: Cockburn, 'The Life of Lord Jeffrey' (1852); Gates, 'Three Studies in Literature' (1899).

Jeffreys, jĕf'rĭz, **George,** Lord, English judge: b. Acton, near Wrexham, Wales, 1648; d. London 19 April 1689. He was called to the bar in 1668, and soon after was chosen recorder of London. He was appointed, successively, a Welsh judge and chief justice of Chester, created a baronet in 1680, and became chief justice of King's Bench in 1683. He was one of the advisers and promoters of the arbitrary measures of James II.; and for his sanguinary and inhuman proceedings against the adherents of Monmouth on the famous 'Bloody Assize,' was rewarded with the post of lord high chancellor (1685). After the abdication of King James the chancellor, who had disguised himself as a seaman, was detected by a mob and carried before the lord mayor, who sent him to the lords in council, by whom he was committed to the Tower, where he died. Consult: Woolrych, 'Memoirs of the Life of Judge Jeffreys' (1827); Campbell, 'Lives of the Lord Chancellors,' Vol. IV. (1849–57); Macaulay, 'History of England,' Vols. I. and II. (1856); Irving, 'Life of Judge Jeffreys' (1898).

Jeffries, jĕf'rĭz, **John,** American physician: b. Boston, Mass., 5 Feb. 1744; d. there 16 Sept. 1819. He was graduated at Harvard in 1763, studied medicine at London and Aberdeen, and returning to Boston in 1769 he entered upon a lucrative practice, which continued until the evacuation of the town by the British troops, whom he accompanied to Halifax. After serving as surgeon-general of the troops in Halifax, he was appointed in 1779 surgeon-major of the forces in America. In the succeeding year he established himself in London in the practice of his profession, but also occupied himself much with scientific studies, and in the prosecution of his experiments in atmospheric temperature undertook 7 Jan. 1785, a remarkable voyage in a balloon from Dover cliffs across the British channel, landing in the forest of Guiennes in France. This was the first successful attempt at aërostation on an extended scale, and Jeffries in consequence received many attentions from the learned societies of Paris. In 1789 he returned

to Boston, where he practised his profession until the close of his life. He announced a course of lectures on anatomy in Boston in 1789, but so great was the prejudice against the practice of dissecting, that on the evening of the second lecture a mob broke into his anatomical room. The course thus interrupted was never resumed, and the single lecture delivered by Jeffries is said to have been the first public one on anatomy given in New England.

Jehovah, jẹ-hō'vạ, the most sacred name applied to God among the Jews, though the Hebrew word in the English Bible is generally translated by LORD (in small capitals). The case is similar with the Greek version (the Septuagint), which renders this word by *Kyrios,* and with the Latin Vulgate, which translates it by *Dominus,* both these words signifying Lord. The proper form of the name is now generally believed to be *Yahveh* or *Yahweh.* Why there should be any doubt about the matter is explained by the fact that in Hebrew only the consonants were written, giving the form *Yhvh,* and the name itself was never uttered, the Jews in reading substituting another divine name, usually *Adonai.* The exact meaning of the word is doubtful, but as a form of the Hebrew verb "to be" some explain it as, He who is, was, and will be, or the Eternal and Unchangeable, and it seems certainly to imply existence. The awe which the Hebrews cherished for this name led them to avoid pronouncing it, as they still do. The monotheistic conception of the Jehovah of the Israelites differs from all other theological conceptions of that age. No image of him was allowed. He was the invisible protector and king of Israel, worshipped by obedience to his commandments, and an observance of the ceremonies established by the law. As is well known, in some parts of the Pentateuch *Elohim* is used almost exclusively, in others *Jehovah,* and this has led many to imply a corresponding difference of authorship. Others deny that this is at all a necessary deduction, maintaining that either name might be used by the same writer according to the conception of the Most High that was in his mind at the moment, Elohim being the abstract expression for absolute Deity, apart from the special notions of eternity, unity, holiness, etc.

Jehovist, jẹ-hō'vĭst, sometimes called JAHWIST, a hypothetic author of the Pentateuch, who used the word Jehovah, or Jahweh, as the name of God instead of Elohim, which term denotes the Supreme Being in other passages of the sacred canon. To the writer who employs the latter designation is applied the term Elohist. According to the theories of many modern Biblical critics the present Pentateuch is a compilation from two original records, one made by an Elohist, the other by a Jehovist. The Jehovist history is supposed to be the older of the two (by some critics it is dated 950 B.C.), and to have consisted of an account of Jehovists dealings with the chosen people up to the conquest of Palestine west of the Jordan. It is a religious history of the attainment of the Promised Land. In this history was emphasized the supremacy of Jehovah as the one God, creator of the world, and the national God and Father of the chosen people, in whose affairs He interposes as He appeared to their early forefathers in the shape of a man or an angel. In the Elohist record, which is supposed to cover the same period and to have been written 700 B.C., there is a more modern interpretation of history attempted. The anthropomorphic suggestions of deity are softened, Elohim interposes merely by a voice, speaking to his people in words of encouragement or rebuke. Through the narrative of the hypothetical Elohist there runs also a tone of sadness, there are anticipations of coming disaster and disappointment.

The Jehovistic or Jahwistic editor who combined these two histories is supposed to have lived in the 7th century B.C., while in the 4th century B.C. a third post-exilic writer added to these combined elements the legal codes which swelled the Pentateuch into the Hexateuch.

Jehu, jē'hū, general of the army of Joram, king of Israel. The prophet Elisha sent one of the school of the prophets to annoint him king over Israel, and in a sudden revolution Joram was slain and Jehu reigned in his stead. He was the first of a new, the fifth, dynasty, and reigned 843–815 B.C. On his accession he massacred all the family of Ahab, including his wretched wife Jezebel, and put the priests of Baal to the sword. In order to obtain possession of the kingdom of Judah he slew Ahaziah the king, and 42 of his family. But his reign was not a prosperous or successful one, and by an invasion of the Assyrians he lost all the territory east of the Jordan. His name has been found on the black obelisk discovered by Layard at Nineveh, and now in the British Museum. This obelisk was set up by Shalmaneser II., and the inscription refers to the tribute paid by Jehu to the Assyrian monarch.

Jejeeb'hoy, SIR Jamsetjee, Parsee merchant and philanthropist: b. Bombay 15 July 1783; d. there 15 April 1859. By his energy and business talents he succeeded in achieving for himself the position of the first native merchant in India, and realizing a fortune of nearly a million sterling. The munificence displayed by him toward all benevolent and public objects, without regard to class or creed, was of the most princely kind, his donations from first to last being estimated at about $1,500,000. Among benevolent institutions founded by him are the great hospital at Bombay which bears his name, the establishment in the same city for the education of poor Parsee children, and the *dhurumsallas,* or places of refuge for travelers in various parts of the country. He also constructed the causeway uniting the islands of Bombay and Salsette, the waterworks at Poonah, the bridges at Earla, Parta, and Bartha, and other public works. He was knighted in 1842, and in 1857 made a baronet. A statue was subsequently erected in honor of him in the town-hall of Bombay.

Jejunum, jẹ-joo'nŭm (Latin, *jejunus,* empty), the second portion of the small intestine, succeeding the duodenum, and so named from its generally being found empty after death. The duodenum extends to about 12 inches in length, and the jejunum forms two fifths of the remaining portion of the small intestine. See INTESTINE.

Jekyll, jē'kĭl, **Gertrude,** English horticulturist: b. London 29 Nov. 1843. She holds the

gold medal of the Royal Horticultural Society and has published: 'Wood and Garden' (1899); 'Home and Garden' (1900); 'Wall and Water Gardens' (1901); 'Lilies for English Gardens' (1901); 'Roses for English Gardens' (1902).

Jelliffe, Smith Ely, American physician: b. Brooklyn, N. Y., 27 Oct. 1866. He was graduated from the Brooklyn Polytechnic Institute in 1886, and in 1889 the degree of M.D. was conferred upon him at Columbia University. He is instructor in Materia Medica in Columbia University and has done much original work in botany, pharmacognosy, therapeutics, and nervous and mental diseases. He has published numerous writings on those subjects. Some of his more important works being 'The Flora of Long Island'; a text-book of botany; a text-book of pharmacognosy; and a text-book of nervous and mental diseases; as well as translations from French and German writers on nervous and mental diseases. He is editor of the 'Medical News,' and managing editor of the 'Journal of Nervous and Mental Diseases,' and is also medical editor of the 'Encyclopedia Americana.'

Jelly includes every translucent juice so far thickened as to coagulate when cold into a trembling mass; as the juices of acid or mucilaginous fruit, currants, etc., which, by the addition of one part of sugar to two parts of juice, and, by boiling, have obtained a proper consistence.

1. *Animal Jelly.*— The soft parts, such as the muscles, skin, cartilage or integuments of animals, when boiled in water, yield a solution which on cooling solidifies to a tremulous jelly. Seventy pounds of bones, when treated with 1 pound of water in the form of steam, at a pressure of 4 pounds to the square inch, and simultaneously digested in 5 gallons of water, will yield about 20 gallons of a strong jelly.

Animal jelly seems to be nearly identical in composition with the tissues which yield it, so that we are unable to trace any chemical change, except, perhaps, the assimilation of water during the process of its manufacture. The following analysis shows the average percentage of carbon, hydrogen, and nitrogen in animal jelly:

	Carbon	Hydrogen	Nitrogen
(1)	49.0	7.0	19.4
(2)	50.0	6.5	17.5

2. *Vegetable Jelly.*— When the juice of fruits is heated with sugar, the liquid forms a stiff jelly on cooling. It appears from the researches of Frémy and others that unripe fruits contain a compound of carbon, hydrogen, and oxygen, called *pectose;* as the fruit ripens, this substance is transformed into *pectin,* the change being brought about chiefly by the influence of a peculiar ferment called *pectase,* which is contained in the fruits. As pectin is soluble in water, the expressed juice of ripe fruits contains a large quantity of this substance, which on heating to a temperature of about 105° F. is converted into one or more substances which have not as yet been completely studied, but which have the property of gelatinizing on cooling. The principal of these substances are *pectosic* and *metapectic* acids. This latter acid, when boiled along with another strong acid, whether mineral or organic, is decomposed, one of the products being pectin sugar, a substance which is closely allied to glucose, so that in all probability there is produced in the very process of manufacturing jellies more or less of this sugar, which certainly is not cane-sugar, and which might, therefore, be by some regarded as an adulteration. The processes which, in the living plant, result in the transformation of pectose into pectin may be imitated on a small scale by heating the juice of unripe fruit with the pulp, which contains the ferment pectase, or with a dilute acid which induces the same change as this substance. Alkalies also produce a similar effect. The exact composition of these various pectous substances yet remains a matter of doubt.

Jel'lyfish, the medusa-stage of *Hydrozoa* (q.v.), but more especially the common name of *Scyphozoa* (formerly *Discomedusa*), the second class of the phylum *Cœlenterata* (q.v.). A familiar example is the common large jellyfish of the coast of New England, *Aurelia flavidula.* It sometimes reaches the diameter of 10 inches; its umbrella-shaped body is convex and smooth above, and from the under sides hang down four thick oral lobes which unite to form a square mouth-opening also giving off four tentacles. The margin of the umbrella or disk is fringed and bears eight eyes which are covered by a lobe. Just under the surface are seen the water-vascular canals, branching out from four primary canals radiating from the stomach. When in motion, the disk contracts and expands rhythmically, on the average from 12 to 15 times a minute.

The *Aurelia* spawns late in the summer, the females having yellowish ovaries, while the sperm glands of the males are roseate in hue. The eggs are fertilized in the sea, and the ciliated pear-shaped larva by October sinks to the bottom, attaching itself to rocks or shells, finally assuming a hydra-like shape, with often as many as 24 long slender tentacles. This is the *Scyphistoma* stage in which it remains about 18 months. From this it passes into the *Strobila* stage in which the body divides into a series of cup-shaped disks, each of which is scalloped on the upturned edge. These disks separate one after the other in March, and swim away as miniature jellyfishes called *Ephyræ.* The *Ephyra* is at first about a fifth of an inch in diameter, and becomes a fully formed *Aurelia* in April, reaching maturity in August. Another but less common jellyfish on the coast of New England and in the North Atlantic is the great *Cyanea arctica,* or "blue jelly," which is nearly two feet in diameter, sometimes from three to five, and with very long string-like tentacles, sometimes extending from 20 to 100 feet, which are filled with stinging or lasso-cells (*trichocysts*), so that the animal is poisonous to fishermen and bathers. While these forms undergo a metamorphosis, in fact, an alternation of generation; other kinds, as *Pelagia,* etc., are known to develop directly from the egg, and even the aurelia under exceptional circumstances does not pass through the scyphistoma stage. The jellyfishes are divided into a number of groups. They are most numerous in the tropical seas, comprising forms of great beauty. Consult: Romanes, 'Jellyfish, Starfish and Sea Urchins' (1885); Packard, 'Zoology' (1897); Arnold, 'The Sea Beach at Ebb-tide' (1902).

FORMS OF DISCOMEDUSÆ.

1. Pilema giltschii. (¼ natural size).
2. View of the same from above (the organs seen through the transparent convex disk or "umbrella").
3. View of the same from beneath.
4. Rhopilema frida (⅛ natural size).
5. Brachiolophus collaris (½ natural size).
6. Cannorrhiza connexa.
7. The same, from beneath, (½ natural size).

Jena, yā'nä, Germany, town 12 miles east of Weimar, on the left bank of the Saale. It consists of the town proper and of four suburbs, and is a dull antiquated place. It contains a famous university which was opened in 1558, and attained its highest prosperity toward the end of the 18th century, when it numbered Schiller, Humboldt, Fichte, Schelling, and Griesbach among its teachers, and was attended by above 1,000 students. In 1844 the number had dwindled down to 411; but in 1902 it had about 800. It has 98 professors and instructors, who teach the different branches of law, medicine, philosophy, and theology; and possesses an anatomical theatre, botanical garden, observatory, good physical and chemical cabinets, and a library of 200,000 volumes. Pop. 15,499.

Jenckes, jĕnks, **Joseph**, American inventor: b. Hammersmith, London, England; d. Lynn, Mass., 16 March 1683. About 1645 he came to the Massachusetts Bay colony, and in that year settled at Lynn, where he established the first iron-foundry in the colonies. He was also an inventor, and in 1646 obtained on an improved water-wheel the first recorded patent in America. He secured a patent also for an improved grass-scythe, and originated other improvements and inventions in machinery and tools. In 1654, under contract with the Boston selectmen, he built the first fire-engine in this country. In 1652 at the Lynn iron-works he cut the dies for the Massachusetts coinage, the first executed in America. Among these coins were the so-called "pine-tree" shillings, deriving their name from that emblem on the obverse side.

Jenkin, jĕng'kĭn, **Henrietta Camilla Jackson**, English novelist: b. Jamaica about 1807; d. Edinburgh 8 Feb. 1885. In 1832 she was married to Charles Jenkin, an English naval officer. Her novels were lively studies of character and popular in their day, among the best being: 'Cousin Stella' (1859), a portrayal of West-Indian life and manners; 'Who Breaks, Pays' (1861), in which the flirt is admirably pictured; 'Skirmishing' (1862); 'Two French Marriages,' issued in New York as 'A Psyche of To-day' (1868); 'Within an Ace' (1869).

Jenkins, jĕng'kĭnz, **Charles Jones**, American jurist and statesman: b. Beaufort County, S. C., 6 Jan. 1805; d. Summerville, Ga., 14 June 1883. He was graduated from Union College, Schenectady, N. Y., in 1824, and after the study of law began practice in Augusta, Ga. He was a member of the Georgia legislature in 1830 and after a short service as attorney-general of the State was a member of the legislature 1836–50, and a leader of his party there. He was State senator 1856–60, and was a judge of the Georgia supreme court 1860–5. He became provisional governor of his State in 1865, holding office till 1868, and presided over the Constitutional Convention of 1877. Consult: Jones, 'Life of C. C. Jenkins' (1884).

Jenkins, John Edward, English political and social writer: b. Bangalore, India, 28 July 1838. He was educated at McGill University, Canada, and the University of Pennsylvania, and sat in Parliament for Dundee 1874–80. He became famous by the publication of his 'Ginx's Baby, his Birth and Misfortunes' (1870), a clever satire aimed at the clumsy handling of the problem of English pauperism. Among later works of his which have circulated widely are: 'Lord Bantam' (1871); 'Little Hodge' (1872); 'Jobson's Enemies' (1879–82); 'A Paladin of Finance' (1882).

Jenkins, John Stilwell, American biographer: b. Albany, N. Y., 15 Feb. 1818; d. Weedsport, N. Y., 20 Sept. 1852. He was a lawyer by profession, and at one period edited the Cayuga 'Times.' Among his works are: 'Generals of the Last War with Great Britain' (1841); an abridgment of Hammond's 'Political History of New York' (1846); 'Alice Howard' (1846); 'Life of Silas Wright' (1847); 'History of the Mexican War' (1848); 'Heroines of History' (1853).

Jenkins, Thornton Alexander, American naval commander: b. Orange County, Va., 11 Dec. 1811; d. 9 Aug. 1893. Entering the United States navy as a midshipman in 1828, he served therein during the war with Mexico. Appointed to investigate European lighthouse systems he framed the law passed in 1852 under which the existing lighthouse board is managed. He saw active service during the Civil War and was chief of the bureau of navigation 1865–9. From 1869 to 1871 he was naval secretary of the lighthouse board and commanded the East India squadron 1871–3. In 1870 he was appointed rear admiral and retired from active service in 1873.

Jenkins Ferry, Battle of. During the winter of 1863–4 the Union forces of Generals Steele and Blunt held the line of the Arkansas River, with headquarters at Little Rock; the Confederates, under Gen. Sterling Price, held that of the Washita, with headquarters at Camden, which was strongly fortified. On 23 March 1864 Steele started from Little Rock southward with about 8,000 men to co-operate with Gen. Banks' expedition up Red River, the objective point of both being Shreveport, La. Gen. Thayer, with 5,000 men, left Fort Smith on the 21st to join Steele at Arkadelphia, and Col. Powell Clayton, with a small cavalry force, marched from Pine Bluff in the direction of Camden, which was Steele's first objective. Steele reached Arkadelphia on the 28th, was joined near Elkins' Ferry, on the Little Missouri, by Thayer, and, after several severe skirmishes, in which the Confederates were defeated, flanked Price out of Camden, 15 April, and occupied it. Here he was fully informed that Banks had been defeated on Red River and was retreating, and his own position became very precarious. Gen. E. Kirby Smith, who had been opposing Banks, marched rapidly with three divisions of infantry — 8,000 men and 14 guns — to join Price and crush Steele. Steele was too strongly entrenched at Camden to be attacked, but he was greatly harassed and nearly surrounded by the gathering Confederates, his forage-trains, with their guard, were cut off and captured, and, the loss of a large supply-train at Marks' Mills, 25 April, with nearly an entire brigade and a battery, determined him to fall back to the Arkansas River. He left Camden on the night of the 26th, crossed the Washita, and had hardly begun his movement northward when Smith and Price pressed him vigorously and kept up a running fight, which was particularly sharp on the 29th, when Steele reached Jenkins' Ferry, on the Saline River. The river was swollen,

and Steele had crossed only part of his army when his rear brigade, commanded by Gen. S. A. Rice, was fiercely attacked by Price, and yielded some ground. But the brigade rallied, and, supported by a part of Engelmann's that had not yet crossed the river, engaged in a sanguinary fight lasting the greater part of the day. Three times the Confederates charged and were repulsed, and the Union line advancing, the Confederates fell back and did not renew the fight. Steele now crossed the river without further molestation, and moved leisurely to Little Rock, which was reached 2 May, and Thayer's division was sent back to Fort Smith. Price was so badly defeated that he made no effort to follow Steele north of Saline River. The Union loss at Jenkins Ferry was 63 killed, 413 wounded, and 45 missing. The Confederates report a loss of 86 killed, 356 wounded, and 1 missing. The Union loss during the entire campaign (23 March–2 May) was 102 killed, 601 wounded, and 1,072 missing, a total of 1,775. Consult 'Official Records,' Vol. XXXIV.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. Carman.

Jenks, Edward, English publicist: b. Clapham, Surrey, 20 Feb. 1861. He was educated at Dulwich College and Cambridge University, and was dean of the faculty of law in the University of Melbourne 1889–92, and Queen Victoria professor of law in University College, Liverpool, 1892–6. He is now reader in English law at Oxford, and widely known as a writer on English law, his published works comprising: 'Constitutional Experiments of the Commonwealth' (1891); 'The Doctrine of Consideration in English Law' (1893); 'The Government of Victoria (Australia)' (1893); 'History of the Australasian Colonies' (2d ed. 1896); 'Outlines of English Local Government' (1895); 'Law and Politics in Middle Ages' (1897); 'A Short History of Politics' (2d ed. 1900); 'Edward I.' (1902); 'Parliamentary England 1660–1832' (1903).

Jenks, Jeremiah Whipple, American political economist: b. St. Clair, Mich., 2 Sept. 1856. He was graduated from the University of Michigan in 1878, and subsequently studied in Germany, at the University of Halle. He then studied law and was admitted to the Michigan bar. In 1886 he became professor of Greek, Latin, and German in Mount Morris College, Ill.; in 1886–9 was professor of political science and English literature at Knox College, Galesburg, Ill.; in 1889–91 professor of political economy and social science at Indiana University; and in 1891 became professor of political economy and politics at Cornell University. In 1899–1901 he was expert agent for the United States Industrial Commission on investigation of trusts and industrial combinations, and was also expert for the Department of Labor on the same subject. In 1902 he was commissioner of the United States War Department to the Philippines and other Oriental nations to investigate the condition of labor and other economic subjects. In 1903 he went to Mexico to consult with the minister of finance in regard to a change of the financial system. He has written: 'Henry C. Carey als Nationalökonom' (1885); 'The Trust Problem' (1900); 'Trusts and Industrial Combinations' (1900); a part of the report of the Industrial Commission; and 'Report on Certain Economic Questions in the English and Dutch Colonies in the Orient' (1902); besides many magazine articles. He is recognized as one of the foremost authorities on the trust question, and his writings are marked by scholarly and accurate investigation, combined with unusual simplicity and clearness of statement.

Jenks, Tudor, American editor and author: b. Brooklyn, N. Y., 7 May 1857. He was graduated from Yale in 1878, from the Columbia Law School in 1880, studied art in Paris in 1880–1, practised law in New York in 1881–7, and in 1887 became a member of the staff of the 'St. Nicholas Magazine.' His writings include many magazine contributions in prose and verse, and 'The Century World's Fair Book' (1893); 'Imaginations, or Truthless Tales' (1894); 'The Boys' Book of Explorations' (1900), and 'Galopoff, the Talking Pony' (1901).

Jenner, jĕn'ĕr, **Edward,** English physician, discoverer of vaccination as a preventive of the smallpox: b. Berkeley, Gloucestershire, 17 May 1749; d. there 26 Jan. 1823. Having adopted the medical profession, he visited London to attend the lectures of the celebrated anatomist John Hunter, in whose family he resided for two years. Returning to the country, he settled at Berkeley, to practise the various branches of his profession. His investigations concerning the cowpox were commenced about 1776, when his attention was excited by the circumstance of finding that some individuals to whom he attempted to communicate the smallpox by inoculation were not susceptible of the disease; and on inquiry he found that all such patients, though they had never had the smallpox, had undergone the casual cowpox, a disease common among the farmers and dairy-servants in Gloucestershire, who had some idea of its preventive effect. Other medical men were aware of the prevalence of this opinion, but treated it as a popular prejudice; and Jenner seems to have been the first who ascertained its correctness, and endeavored to derive from it some practical advantage. He discovered that the *variolæ vaccinæ,* or cowpox, as the complaint has been since termed, could be propagated from one human subject to another by inoculation, rendering all who passed through it secure from the smallpox. In 1798 he published a short treatise—'An Inquiry into the Cause and Effects of the Variolæ Vaccinæ'—and in July 1798, Cline, surgeon to St. Thomas's Hospital, introduced vaccination into that institution. The practice was adopted in the army and navy, and in the country generally, and soon spread to other countries, and honors and rewards were conferred on the author of the discovery. In 1802 a parliamentary grant was made to him of the sum of £10,000, and five years later a second grant of £20,000. Besides the treatise already mentioned, and 'Further Observations on the Variolæ Vaccinæ or Cow-Pox,' Jenner also published various letters and papers on the same subject, as well as on others. A famous paper of his on the cuckoo appeared in the 'Philosophical Transactions' in 1788. Consult: Baron, 'Life of Jenner'; Creighton, 'Jenner and Vaccination' (1889); Crookshanks, 'History and Pathology of Vaccination' (1890). The

last-named work contains reprints of the 'Inquiry,' the 'Further Observations,' and other papers by Jenner. See VACCINATION.

Jenner, Katherine Lee Rawlings, English novelist: b. Hayle, Cornwall. She was married to Henry Jenner, and has published: 'A Western Wildflower' (1882); 'In London Town' (1884); 'Katharine Blythe' (1886); 'An Imperfect Gentleman' (1888); 'Love or Money' (1891); 'When Fortune Frowns' (1895); 'In the Alsatian Mountains.'

Jenner, Sir William, English physician: b. Chatham 1815; d. London 12 Dec. 1898. He was educated at University College, London, became in 1848 professor of pathological anatomy, and in 1857 of clinical medicine in that institution, and in 1861 physician to the queen. In 1862 he was appointed professor of the principles and practice of medicine in University College; in 1868 was created a baronet, and in 1872 a K.C.B., in recognition of his services during the severe illness of the Prince of Wales, now Edward VII. In 1881 he was elected president of the College of Physicians. He wrote various papers on specific diseases, and was the earliest to establish the difference in kind between typhus and typhoid fevers.

Jennings, jĕn'ĭngz, **Samuel,** American colonial Quaker preacher: d. 1708. In 1680 he came from Buckinghamshire, England, to Burlington, N. J., and was governor of West Jersey in 1683. Becoming entangled in religious controversy he opposed the Quaker schismatic, George Keith, and in London in 1694, supported the action of the American Friends in regard to Keith. On returning to America he often made preaching tours through the various colonies, and after the recall of the English governor, Lord Cornbury, aided in restoring public order in the affairs of West Jersey.

Jennings, Sarah, DUCHESS OF MARLBOROUGH. See MARLBOROUGH, DUKE OF.

Jephson, jĕf'sŏn, **Arthur Jermy Mounteney,** English writer of travels. He commanded a detachment under the explorer, Stanley, in the Emin Pasha relief expedition, was queen's messenger 1895–1901, and has been king's messenger from the latter date. He has published: 'Emin Pasha and the Rebellion at the Equator'; 'Stories Told in an African Forest'; 'The Story of a Billiard Ball' (1897).

Jephthah, jĕf'thą, in Jewish history one of the judges of Israel (Judges xi., xii.). He was a son of Gilead, and was driven from home by his brothers, but when the Ammonites made war against Israel was summoned to defend his countrymen. Jephthah after trying conciliatory measures without success, put himself at the head of the Israelites, and defeated the enemy. He had made a vow that if he was victorious he would sacrifice to God as a burnt-offering whatever should first come to meet him from his house. He was met by his daughter, his only child, whom he accordingly sacrificed to the Lord (Judges xi. 29, 40). The way in which the vow was kept has given rise to much controversy, some authors maintaining that Jephthah put his daughter to death; others that he devoted her to perpetual virginity; others that he actually sacrificed her as a burnt-offering, and that, though prohibited by law of Moses, these human sacrifices occasionally took place.

Jep'son, Edgar, English novelist: b. London 28 Nov. 1864. He was educated at Oxford and has published: 'Sibyl Falcon' (1895); 'The Passion for Romance' (1896); 'The Keepers of the People' (1898); 'On the Edge of the Empire' (1900); 'Lady Noggs, Peeress' (1904).

Jerboas, jĕr-bō'ąz or jĕr'bō-ąz, small rodents of the family *Dipodidæ*, found in the sandy plains of Africa, Russia and southern Asia, and represented by a few species in North America. Their most prominent peculiarity is the great length of the hind legs, especially in the metatarsal portion, so that they look like miniature kangaroos. They walk ordinarily on their two hind feet, but when alarmed escape danger by long leaps. They are fawn-colored, as a rule, with long slender tails, large ears, big eyes, and nocturnal habits. They dwell in underground burrows and tunnels, many of which, more or less connected, are likely to be found together. Their food is mainly vegetable, but they also eat insects, eggs, etc.; they hibernate in cold climates, do not store food, and are the prey of foxes, jackals, wildcats, serpents, and Arab children. The most familiar species of jerboa is the Egyptian form (*Dipus ægypticus*), found in North Africa in arid places. The jumping-hare of South Africa (*Pedetes capensis*), and its ally, the jumping-mouse of North America (*Zapus hudsonius*), are also well-known examples of the family. The latter is a reddish "mouse," white underneath, which abounds all over the temperate parts of the country, and is easily recognized by its bounding gait. It is one of the longest and soundest of winter sleepers, preparing for its dormancy a warm ball-like nest of grass lodged in a bush or among strong weeds. Gerbils (q.v.) of Africa and India are often confused with jerboas, but are a group of true mice. Consult Lydekker, 'Royal Natural History,' Vol. III. (1895).

Jeremiah, jĕr-ę-mī'ą, the second of the four major prophets of the Old Testament, the son of Hilkiah, of the priests that were in Anathoth, a town about three miles from Jerusalem. He flourished during the darkest period of the kingdom of Judah, under Josiah, Jehoiakim, Jeconiah, and Zedekiah, having been called to the prophetic office in his youth, in the 13th year of the reign of Josiah 626 B.C. He continued in it till the 11th year of Zedekiah, when Jerusalem was taken by Nebuchadnezzar (588 B.C.). His task was to deliver messages and warnings to a corrupt people and to foretell the destruction of the nation. In Judah were two political parties — the one favoring an Egyptian alliance, the other a Chaldæan. Jeremiah repudiated both at first, but was driven over to the latter and unpopular party. He became the leader of this minority in contending with three features of popular infatuation — religious apostasy; neglect of justice; and false patriotism, which led the people frequently to break faith with Babylon, by bursting into revolt. He characterized Nebuchadnezzar as the servant of God, and prophesied the approaching burning of the temple. A cry for his life arose from the priests and prophets, and he escaped with difficulty. At last Jerusalem with its temple and palace was consumed with fire. Jeremiah was favorably

treated by the Babylonian conqueror, and offered a home at Babylon, but preferred to stay among the people left in Judah. One section of this party thought they saw in Egypt a safe place of refuge from the power of Nebuchadnezzar, and led the people together with Jeremiah to Tahpanhes, where, according to Christian tradition, the prophet was stoned to death by his countrymen, who were incensed by his rebukes. According to the Rabbinical tradition, however, he and Baruch made their escape on the conquest of Egypt by Nebuchadnezzar.

Jeremiah, Lamentations of, the title given by the Septuagint translators, by the Vulgate and English Bible, to a book of songs and dirges which is placed next to the book of the prophecy of Jeremiah. The book is divided into five chapters each of which contains a complete composition. In I., II. and IV. the death of the Jewish nation is bewailed with the utmost abandonment of grief. The form of each elegy is poetry of the most strictly artificial kind. The metre is that of the Kinah (q.v.), the metre employed in dirges from immemorial time in the east. As if to run down the whole gamut of sorrow each verse begins with a different letter of the Hebrew alphabet, arranged, generally, in the usual order.

The whole work may be thus briefly analyzed. Elegy 1: Lamentation over the city after the people have been swept off into captivity. Help is asked from Jehovah. Elegy 2: The destruction of the city mourned over. Jehovah again called upon as alone able to save. Elegy 3: Sufferings of "Jehovah's servant," a personification of the whole pious multitude, described. Elegy 4: Contrast between former gladness and the present misery, which is attributed to national transgression. Elegy 5: A final appeal for help in prayer to Jehovah.

The date and authorship of the Lamentations are matters of dispute. Few modern critics attribute them to Jeremiah. They show traces, however, of that prophet's language and sentiment, but internal evidence is not conclusive. Some think that they are referred to in 2 Chronicles xxxv. 25. Consult: 'Commentaries' of Payne Smith; Cheyne; Plumptre; and Löhr, 'Die Klagelieder Jeremias' (1894).

Jeremiah, The Prophecy of, a book of the Old Testament containing the utterances of that prophet. The writings of Jeremiah, or certain of them, were taken down by his pupil and friend Baruch. They must therefore have been originally spoken without being previously written out, although it is possible that the scribe or secretary took them down at his master's dictation. The roll of Baruch contained all that Jeremiah had spoken for 23 years; probably, therefore, many of the prophecies may have been sketched merely as outlines. The substance of these impassioned appeals is imbued with firm belief in God's unfailing covenant with Israel and with David. Although Jeremiah is not so often quoted by New Testament writers as is Isaiah, yet there is abundant evidence in their writings that they read him, and he is not only a prophet of denunciation and warning but also of Messianic hope and promise. He shows, moreover, an intimate acquaintance with Deuteronomy, the utterances of his prophetic predecessors, and the book of Psalms.

The books seems naturally to be divided into five parts, the first of which contains six discourses, each of the last three introduced by the formula of sanction, "The word which came to Jeremiah from the Lord." Each of these discourses includes sketches, outlines or skeletons of different prophecies each by a distinct formula of sanction. Take for instance, the first discourse (1 ch. to 20 ch.), the first sketch would be in the first chapter, verses 4 to 10, introduced by the formula, "The word of the Lord came unto me saying." There are at least four of these brief sketches in the first chapter.

The second part of the book consists of 15 prophecies, which are fuller and completer than those of the first part, each with its formula of sanction. They include poems, appeals, allegorical object-lessons, historic narratives, and one letter. The third part is a connected narrative in classic Hebrew, different in style from that of the first 20 chapters. The fourth part contains poetic invectives against Egypt, Philistia, Moab, Ammon, Edom, Damascus, Hazor, Elam and Babylon. The fifth part is a supplementary, adding details to the description of Jerusalem's downfall.

Jerfalcon, jĕr'fâ"kn, or **Gyrfalcon,** a large and bold falcon of the Scandinavian mountains (*Falco gyrfalco*), represented by closely allied species or varieties in Iceland, Greenland and the Hudson Bay region, whose plumage is prevailingly white, with more or less blackish markings, especially about the face. It is one of the largest, strongest and most impetuous of its race; and has always been highly prized by falconers, among whom, by ancient laws, its use was restricted to men of ducal and princely rank. The bird is a rare winter wanderer to the United States from arctic Canada, where it breeds, and survives the winter mainly by killing ptarmigan.

Jericho, jĕr'ĭ-kō, a once important city of ancient Palestine, near the foot of the mountains, on the west side of the Jordan plain, northeast of Jerusalem. Its name means "city of palms." The site is marked by mounds of sun-dried bricks, and called Tel es-Sultan; gardens and a fine spring are found there. The palms and balsams for which Jericho was formerly famed have disappeared. At the conquest of Palestine by Joshua, Jericho was the key to the country and was miraculously captured, destroyed by fire, and its rebuilding forbidden under a curse. It is now a poor village, much visited by tourists. It has two hotels, a Russian monastery and church.

Jerked Beef, beef cut into strips of about an inch thick, and dried in the sun. This method of preserving meat has been largely adopted in South America and Australia. Cut from the animals when in good condition these strips of flesh dry in the sun before decomposition commences, and will keep for any length of time. In the United States, jerked beef is common in the southwest, where the Indians prepared buffalo, deer and bear meat by cutting in strips and curing in the sun.

Jeroboam (jĕr-ō-bō'am) **I.,** the first king of Israel, the northern kingdom. Having conspired against Solomon, he was obliged to escape to Egypt, where he remained until the monarch's death. He then returned to lead an insurrection

against Rehoboam, which ended in the formation of the kingdom of Israel, composed of the 10 revolted tribes. These tribes worshipped at Bethel and Dan, instead of going to Jerusalem. Jeroboam reigned from about 937 B.C. to 915 B.C.

Jeroboam II., king of Israel. He was the son of Joash. He reigned from about 782 B.C. to 741 B.C. His reign was evidently an active one. He was a skilful warrior, and regained territory which had been captured by the king of Aram in previous reigns. It was during Jeroboam's time that Hosea and Amos announced their prophecies.

Jerome, jĕ-rom' or jĕr'ōm, **Saint** (EUSEBIUS HIERONYMUS SOPHRONIUS), a father of the Latin Church: b. Stridon, between Styria and Hungary, about 331. His parents educated him with care in literary studies and he read the Greek and Roman classics at Rome under the famous grammarian Donatus. He did not escape uncontaminated by the licentiousness of the capital; but soon became inclined to the Christian faith. The catacombs and tombs of the martyrs first excited his devotion. His travels on the Rhine and in Gaul made him acquainted with several Christian preachers, and he was eventually baptized. After a long residence at Aquileia he went in 373 to Antioch in Syria, where he passed through a spiritual crisis and renounced pagan learning, and in 374 retired to the deserts of Chalcis. There he spent four years as a hermit in the severest mortifications and laborious studies. He left his solitude again to be ordained priest at Antioch, but soon after went to Constantinople to enjoy the instruction of Gregory Nazianzus. In Rome, where he became literary secretary to Pope Damasus, he made his appearance as a teacher. His exposition of the Holy Scriptures found favor with the Roman ladies. Marcella and Paula, rich patricians, are celebrated for the learned and ingenious theological epistles he wrote them, and for their rare monastic piety. Paula accompanied him to Palestine in 386, where he founded a convent at Bethlehem; here he remained till his death in 420. His writings show his active participation in the controversies of his day, and his letters give a very vivid idea of the condition of society at Rome. They are full of satiric strictness on the corrupt clergy, and are often as biting as Juvenal or Martial. Many of them are profoundly touching and full of fervent piety; others are lampoons traversed with vehement invective with the spirit of Plautinian ribaldry. His Biblical labors are highly valuable; his Latin version of the Old Testament from the original language is a marvellous achievement, and it may be said that ecclesiastical Latin, originated with Jerome's Vulgate. His principal claim to the gratitude of the Church is that he was the founder of Latin monasticism. Consult Largent, 'Saint Jerome' Sanders, 'Etudes sur Saint Jerome' (1903).

Jerome, Jerome Klapka, English humorist: b. Walsall 2 May 1861. He was at first a clerk in a railway office, afterward actor, schoolmaster, and journalist by turns. After many discouragements he succeeded in making a popular hit with his book, 'On the Stage — and Off' (1885), largely autobiographical; and his 'Idle Thoughts of an Idle Fellow' (1889) and 'Three Men in a Boat' (1889) made him famous in America as well as at home. He edited the 'Idler' with Robert Barr (q.v.) (1892–7); 'To-Day' (1892–7); and has published several successful comedies: 'Sunset' (1888); 'New Lamps for Old' (1890); 'Miss Hobbs' (1900); etc.; and also 'John Ingerfield and Other Stories' (1894); 'Sketches in Lavender' (1897); 'Observations of Henry' (1901); 'Paul Kelver' (1902); etc.

Jerome, William Travers, American lawyer and politician: b. New York, 18 Apr. 1859. He entered Amherst College, but failing heart compelled him to leave. He graduated from the Columbia Law School in 1884. In 1888 he was appointed assistant district attorney, in which position he saw much of the political corruption prevailing in the city. In 1890 he was active in the Municipal League, which opposed Tammany; in 1893 was assistant counsel of the Lexow Committee, in 1894 a member of the committee of 70, and manager of the campaign which resulted in the election of Mayor Strong. In the same year the mayor appointed him judge of the court of special sessions. In 1901 he was active in the Fusion campaign against Tammany; and in 1902 was elected district attorney of New York County; immediately after his election he established headquarters in the East Side of New York, in order to be within easy reach of the people who most needed his assistance; in this official position he has done very effective work in the breaking down of the system of protection of vice and maladministration of justice. In 1905 he was again elected district attorney on an independent ticket by 16,255 plurality.

Jerome of Prague, Bohemian religious reformer: b. Prague about 1370; d. there 30 May 1416. He was educated at the universities of Prague, Paris, Oxford, Cologne, and Heidelberg; and was in faith and sufferings the companion of the famous John Huss, whom he excelled in learning and eloquence, and to whom he was inferior only in moderation and prudence. His reputation for learning was so great that he was employed by Ladislaus II. of Poland to organize the University of Cracow; and Sigismund of Hungary caused Jerome to preach before him in Buda. He took a zealous part at Prague in the contest of his friend Huss against the authorities, and not unfrequently proceeded to violence, causing the monks who opposed him to be arrested, and even had one thrown into the Moldau. He publicly burned in 1411 the bull of the crusade against Ladislaus of Naples, and the papal indulgences. When Huss was imprisoned in Constance he could not remain inactive, and hastened to his defense. But attempting to return to Prague the Duke of Sulzbach caused him to be arrested in Hirschau and carried in chains to Constance. After an imprisonment of half a year he consented on 11 Sept. 1415 to recant the heresies with which he and Huss were charged. But this recantation did not deliver him, and after languishing a year, he solemnly retracted his recantation. On 30 May he was burned at the command of the council, and his ashes thrown into the Rhine.

Jerrold, jĕr'ōld, **Douglas William**, English dramatist and humorist: b. London 3 Jan. 1803; d. Kilburn Priory, near London, 8 June 1857. He was a midshipman in the navy 1813–15, and

then quitting the service, was bound apprentice to a printer in London. By hard study he made himself master of Latin and Italian, besides acquiring an extensive knowledge of general literature, and at first attempted dramatic criticism. The bent of his genius, however, lay mainly in the direction of dramatic writing. Numberless pieces were produced by him before he was 20, but the first which won decided popularity was 'Black-eyed Susan,' represented for 300 successive nights at the Surrey Theatre in 1829. Among Jerrold's subsequent dramas were the 'Rent-day'; 'Nell Gwynne'; 'The Housekeeper'; Prisoner of War'; 'Bubbles of a Day' and 'Time Works Wonders,' the last named one of the most successful comedies on the English stage. He founded and conducted successively the 'Illuminated Magazine' and 'Douglas Jerrold's Shilling Magazine,' also acting as a most important member of the literary staff of 'Punch.' To this he contributed 'Mrs. Caudle's Curtain Lectures'; 'Punch's Letters to his Son'; the 'Story of a Feather.' He wrote several novels, among which are 'The Mad Mode of Money'; and 'Chronicles of Clovernook' (1846). A selection of his essays edited by his grandson, Walter Jerrold, appeared in 1903. Though a powerful master of satire, he never allowed his wit, whether as an author or in private life, to be tinged with malevolence. Consult: W. B. Jerrold, 'Life and Remains of Douglas Jerrold' (1859).

Jerrold, Walter Copeland, English author and journalist: b. Liverpool 3 May 1865. Since 1890 he has been connected with the editorial staff of the London 'Observer,' and beside editing several reprints from the works of his grandfather, Douglas Jerrold (q.v.); Thackeray's prose works, etc., has published: 'Michael Faraday: Man of Science' (1891); 'Gladstone: England's Great Commoner' (1893); 'Oliver Wendell Holmes' (1893); 'The Triumphs of the Printing Press' (1896); etc.

Jerrold, William Blanchard, English journalist and miscellaneous writer, son of Douglas Jerrold (q.v.): b. London 23 Dec. 1826; d. there 10 March 1884. He edited Lloyd's newspaper for a long period and published: 'Cool as a Cucumber,' a novel (1851); 'Swedish Sketches' (1852); 'Life of Douglas Jerrold' (1858); 'At Home in Paris' (1866); 'Up and Down in the World' (1866); 'Paris for the English' (3d ed. 1868); 'The Cockaynes in Paris' (1871); 'The Best of all Good Company' (1871); 'Life of Napoleon III.' (1874–84).

Jersey Cattle. See Dairy Cattle.

Jersey (jėr'zĭ) **City,** N. J., the most important suburb of New York since the annexation of Brooklyn, the second largest city in New Jersey, and seat of Hudson County. It occupies about five miles of the Hudson River frontage opposite lower New York: Paulus Hook, its starting point, is exactly opposite the Battery. It lies on a peninsula between the Hudson and New York Bay on one side, and the Hackensack and Newark Bay on the other; and is limited on the south by Bayonne, which takes up the lower end of the peninsula, and on the north by Hoboken. It has several ferry lines to different portions of New York, some of them operated by the great railroads which have their terminals here — all the roads from the south and west: the Pennsylvania, Erie, Baltimore & Ohio, Lehigh Valley, Delaware, Lackawanna & Western, New York, Susquehanna & Western, Central of New Jersey, and the West Shore line of the New York Central. The Morris Canal ends here. Jersey City is also the terminal of several of the most important steamship lines between New York and Europe. Its area is 12,228 acres, or 19.1 square miles.

The city lies on a flat meadow about a mile wide from the river back to a sharp bluff; the business section occupies the former, the residence district the latter, with some very handsome streets of costly dwellings — though Grand Street in the business section is a notably beautiful residence street. The municipal improvements are of a high and thorough grade: paving (nearly all the streets are paved, largely with granite and asphalt), sewerage, water supply, etc. The trolley service extends to all the neighboring section of New Jersey. The parks are few and very small, less than in almost any other large American city; but along the ridge in the western part extends the magnificent Hudson County Boulevard, 19 miles long (the entire length of that county from Bayonne up, and five miles of Bergen County), 100 feet wide, and with a noble view of the river and upper New York, as well as the country west. The city hall with the soldiers' monument, the public library, and the Fourth Regiment armory, are among the conspicuous buildings. The intellectual facilities of the city are good, aside from its proximity to New York. It has 27 public schools, besides 10 Roman Catholic parochial schools, and for higher education a public high school, Hasbrouck Institute (1856), St. Peter's (Roman Catholic) College (1878), St. Aloysius Academy, and the German-American School. There is a public library with over 100,000 volumes; and a historical museum rich in colonial documents. The hospitals are the City, St. Francis, and Christ; there are several homes and asylums, and some convents.

The immense commercial and shipping interests of the city, though second only to those of New York, have no separate statistics, the customs report being included in that of the latter city. Its position on the great river, with Newark Bay in the rear and the entrance of Kill van Kull on the south, give it a most favorable commercial position, which has been improved by properly equipped wharves. The Pennsylvania and Erie roads have large grain elevators here. Among the leading industries are those of slaughtering and meat-packing: Jersey City is the meat depot of New York, and has two huge abattoirs, one on the river front and the other on the Hackensack meadows in the northwest. Its slaughter-house products in 1900 amounted to $5,708,763. Its other manufactures are enormous, the total amounting to $77,225,116 in 1900. They are exceedingly varied, no one having a great predominance except the tobacco manufacture, over $6,000,000 a year; other important branches are iron and steel goods, locomotives, boilers, and heating apparatus; bridges, ships, and windmills; planing-mill products, cars, carriages, boxes, and cooperage; brass, copper, and zinc goods, electrical and scientific apparatus; pottery and glass; lead-pencils, and famous crucibles used in all chemical laboratories and smelting works; watches,

jewelry, and musical instruments; sugar, and confectionery; mineral waters and patent medicines; soap and candles (a natural annex to the abattoirs), and perfumes; compressed gas; chemicals, paints, and roofing materials; paper, and window-shades; rubber goods; silk thread and goods; oakum; fireworks; printing and writing inks, and varnish; and hundreds of others. There are four national banks, and several State and private banks, with loan and trust companies.

The city has a two-year mayor and a council with only one chamber, called the board of aldermen; most of the other officials are appointed by the mayor, only the city clerk being appointed by the aldermen, and the street and water board elected. The assessed valuation in 1902 was $100,550,026; the total public debt, excluding the water debt, $16,205,325; the sinking fund is above $3,000,000. The expenditures are about $8,000,000 a year. The largest single item is $460,000 for schools.

The population in 1850 was 6,856; 1860, 29,226; 1870, 82,546; 1880, 120,722; 1890, 163,003; 1900, 206,433; 1905, 232,699. Of these 3,704 were colored, 58,224 foreign-born, 19,314 Irish, 18,820 German, 4,642 English, 3,832 Italian.

The site of the city was used only as farming land till into the 19th century despite its remarkable position. In 1802 the entire population was 13 in one house with outbuildings; this was on Paulus Hook, the point opposite the Battery, named after the Dutchman Michael Pauw, who formerly owned it. Here in the Revolution the American fortifications had been taken by the British, and retaken and destroyed in a most brilliant action by "Light Horse Harry" Lee. In 1804 the "associates of the Jersey Company" bought the land, and laid it out in streets, incorporating it as a village with a board of selectmen. In 1820 it was incorporated as the "City of Jersey," still with a board of selectmen; in 1838 it was reincorporated as Jersey City, with a mayor and aldermen. Repeated annexations have brought it to its present territory: Van Vorst in 1851, Hudson City and Bergen in 1869, Greenville in 1873. It obtained a new charter in 1889. Consult: McLean, 'History of Jersey City' (1895); Eaton, 'Jersey City and its Historic Sites' (1899).

Jersey, Island of, the largest and most important of the Channel Islands, lying in the English Channel, and belonging to Great Britain. It is 12 miles long and from 4 to 7 miles wide, and has an area of 45 square miles. The distance to the coast of France is about 12 miles. The interior is mostly table-land and is well-wooded. The principal town is Saint Helier. The island is famous for a breed of cattle. Pop. (1901) 52,796.

Jersey Prison Ship, a notorious, unseaworthy ship, lying in New York harbor from 1776 to 1783, and used by the British as a prison for captured American sailors. Over 11,000 are said to have died of cold, starvation, and inhuman treatment.

Jer'seyville, Ill., city and county-seat of Jersey County, on the Chicago & A. and the Chicago, P. & St. L. R.R.'s., 66 miles southwest of Springfield. It was settled in 1839, incorporated in 1867, and adopted a new city charter in 1897. It has a public library and court-house, and being the centre of a rich agricultural district, has an established trade in produce, fruit, grain and live-stock. The waterworks are owned by the city. Pop. (1900) 3,517.

Jerusalem (Greek *Hierousalem.* Old Hebrew pronunciation, *Yurushalem.* Tel-el-Amarna tablets, *Uru-sa-lim*; Assyrian monuments, *Ur-sa-li-im-mu.* Meaning certainly "city of Salim"; meaning of *Salim* disputed — probably an Assyrian god; usually assumed as Hebrew "peace," but the name antedates Hebrew. The Greek and Latin *Hierosolyma* is a corruption, from the erroneous supposition that the first syllable is Greek *hieros,* sacred. Hadrian renamed it *Ælia Capitolina,* and its official name was long *Ælia,* even Arabicized into *Iliya;* the Greeks called it *Kapitolias.* Arabic name, *Beit el-Makdis,* or simply *el-Mukaddas,* modern vernacular *el-Kuds,* "the sanctuary," or *el-Kuds esh-sherif*).

The "Holy City" is 33 miles from its port of Jaffa on the Mediterranean, 15 from the Dead Sea, 18 from the Jordan, 19 from David's first capital, Hebron, and 34 or 35 from the old kingdom of Samaria: the pregnant Hebrew history was transacted in the space of a county. It is 126 miles from Damascus. The position of the dome of the Church of the Holy Sepulchre is lat. 31° 46′ 45″ N., lon. 35° 13′ 25″ E. The city lies in the midst of an infertile, ill-watered district, once (under good government) made prosperous by irrigation, now blighted by Turkish possession. The rainfall is about 23 inches. The climate is hot and irregular — rising to 112° and not sinking below 25°, with an annual mean of 62° — but not malarious; the city is unsanitary and plague-stricken, but from dirt, lack of sewerage, bad water, and unhygienic habits. The only natural water-supply (the drainage sinking in the soft limestone) is from the Virgin's Spring (Gihon), an intermittent natural siphon on a dolomite floor, in a rocky cave 12 feet deep in the face of the eastern ridge; this was carried by a rock and masonry conduit to the rock and masonry Pool of Siloam, 52 x 18, and thence to another, the Old Pool; a shaft within the walls led down to a rock channel communicating with the spring. At present the water-supply is from rain-tanks or "pools," in and out of the walls. The remaining one of three old aqueducts, which carries water when in repair, was built by Pilate. There is little trade except that of local shops for supplying tourists; and the manufacture is chiefly of souvenirs, as olive-wood and mother-of-pearl articles. Indeed, as a commercial location it never possessed any merits, and its greatness was due to original political situation, and partly to its very defects. It is connected with Jaffa (west), Bethlehem and Hebron (south), and Jericho (north) by carriage-roads; and in 1892 a narrow-gauge railroad to Jaffa, with a circuitous course of 54 miles, was opened by a French company.

Jerusalem lies on several hills, rising from a steep plateau (see below), and the floor and slopes of a valley between the two main divisions. The modern city, much less extensive than the old in its best estate, is a rough quadrangle surrounded by a very irregular wall, built in the 16th century by Solyman I., on the lines of the Crusaders' fortifications. It has nominally eight gates, two on each side; the

Jaffa and Abd-ul-Hamid on the west (the latter very recent), the Zion and Dung on the south, the Golden (closed up) and St. Stephen's on the east, and the Damascus and Herod's on the north. The city is unevenly divided, by the main street running from the Damascus gate south to near the Zion gate, and that running east from the Jaffa gate to the Haram-esh-sherif, into four "quarters" in which the great religious divisions are segregated: the Mohammedan, much the largest, on the northeast, adjoining the original holy places; the Christian next, on the northwest, where is the Church of the Holy Sepulchre; the Armenian on the southwest; the Jewish on the southeast. The streets are crooked, narrow, ill-made, and dirty, and the city has few except historical attractions; the stream of tourists, however, has developed civilized conveniences such as hotels, banks, mercantile establishments, etc. Several Jewish colonies have been settled in the environs; and since 1858 a quarter has grown up outside the walls on the northwest, approached by the Jaffa Gate, and containing consulates, Christian churches, schools, charitable institutions, etc., but not more sanitary than the old. The city is the capital of an independent sanjak, or Turkish administrative district, immediately subject to the government at Constantinople, and has an executive and a town council with representation of the great religious divisions. It is the seat of Roman Catholic, Greek Catholic, and Armenian patriarchs; the smaller Eastern churches have resident bishops; and till 1887 a joint Protestant bishopric was supported by England and Prussia, with alternate bishops, but on the death of the then incumbent Prussia withdrew from the arrangement, and England continues it alone. The population of the city at the last returns was as follows: Jews, 41,000; Mohammedans, 10,000; Christians, 12,800 — made up of 6,000 Orthodox Greeks, 4,000 Roman Catholics, 1,400 Protestants, 800 Armenians 200 Uniat Greeks, and small bodies of Syrians, Copts., etc. Total, over 60,000.

The intense historical interest is centred on memorials of the time or localities of David and Solomon, and of the life and death of Christ. Of the former, the supreme interest is in the Haram-esh-Sherif, the site of the temple, and palace of Solomon and of the later temples. It is a walled area about 527 x 330 yards, with an elevated platform in the centre reached by steps; in the centre is the beautiful Kubbet es-Sakhra, or Dome of the Rock — a wooden octagon with sides of 66 feet 7 inches, decorated on the outside with marble and porcelain tiles, each of the four sides which face the cardinal points having a square gate surmounted by a vaulted arch. Just east of this is the Chain Dome, or David's Place of Judgment. Other domes of interest are near; but the next most notable structure in the Haram is the mosque El Aksa, at the south end. Within it are also a beautiful 15th-century fountain, a pulpit of the same date, a modern mosque called the Throne of Solomon, and the fortress of Antonia. Of the Christian monuments, the most noteworthy is the Church of the Holy Sepulchre, in the Christian quarter, originally built by Constantine the Great over the supposed place of the Ascension; after long oscillation of views, and for a time a general abandonment of the site as the true one, opinion is again favoring its authenticity. Most of the present structure, however, dates only from the 19th century. There is a rotunda, with a dome 65 feet in diameter, above a small Chapel of the Sepulchre; a number of church buildings, said to include the site of Golgotha or Calvary; and 22 chapels. The Via Dolorosa, along which Jesus is said to have carried the cross to Calvary, follows the present street Tarik Bab Sitti Maryam from St. Stephen's Gate. Several modern churches and other institutions are also worth visiting; but the thronging Scriptural associations — besides those mentioned above, the Mount of Olives, the Pool of Bethesda, the Vale of Hinnom, etc. — overshadow all else.

Topography and History.—About a mile north of Jerusalem, the main north and south watershed ridge of Palestine turns to the west; while a spur called Olivet, having three pinnacles, runs first southeast 1½ miles, and then south 1¼ miles. The space between the two is occupied by a plateau sloping southeastward, and separated on each side from the bounding ridges by a ravine 300 to 400 feet deep, with steep and often precipitous sides. The eastern ravine, separating it from Olivet, is the "brook" Kedron or Kidron (Cedron), which was always a dry bed; the western is the Wady el-Rabābi (probably the vale of Hinnom), which after skirting it on the west, turns east along the southern scarp of the plateau and joins the Kedron. Through this plateau from north to south runs a broader and much less deep and precipitous valley, the Tyropœon ("cheese-makers' place") 100 to 150 feet deep, thus dividing it into two uneven sections: the east ridge is continuous, and its northern part was the first occupied; the western part, the "new city," is divided by a lateral branch of the Tyropœon into two summits, a north and a south, connected by a narrow saddle separating also Tyropœon from el-Rabābi. The general height may be stated as about 2,500 feet; the eastern ridge is 2,440 feet at the north, and descends southward; the western north summit is 2,490 feet, south summit 2,520. The accumulation of 3,000 years' rubbish, however, has greatly modified the contours of the hills and ravines, obliterating some minor ones altogether. The average depth over the rock levels is 30 to 40 feet, and in the valleys 70, in one case reaching 120.

This plateau, surrounded on three sides by steeply scarped bluffs and crested with hills, was a natural fortress; but it had two defects — it commanded nothing in particular, and its water-supply (one spring intermitting for hours or even a day or two, and that at the foot of a bluff) was very scanty. Probably at the first, as many times since, army after army marched around it, and left it untouched as of too little military significance. We first hear of it on the Tel el-Amarna tablets (about 1400 B.C.), when it is seemingly a little hill fort with a small garrison, possibly with a village also, and the capital of the "land of Jerusalem," apparently a small territory along the watershed. The king, Abd-Khiba, is a vassal of the king of Egypt, and begging assistance against the Khabiri (Hebrews?). Later it is a minor "Jebusite" citadel: Hebron, Bethlehem, Bethel, Gibeah, Jericho, are all more important. But when David undertook to form a consolidated Hebrew kingdom, Jerusalem had the transcendent merit that it lay on the border between Judah and the northern tribes, not historically identified with either; it

THE MOSQUE OF OMAR, JERUSALEM.

was also fairly on the central line of communication, and convenient for action against the Philistines and the desert tribes at once. He made terms with the Jebusites and occupied the hill-fort of Zion on Ophel, near the only available water-supply. Possibly a village grew up on the eastern slope of the hill; but it was small, for the whole levy of Palestine was but 30,000 men (*2* Sam. vi. 1), and other places held the trade. Solomon greatly increased the size of the town, and built a stone temple for Yahweh and a great palace. Under Rehoboam the place was captured by Shishak of Egypt; under Amaziah by Jehoash, and its walls partly leveled. During the palmy times of the northern kingdom it was held of small account except by the Judahites: it was only one of many places of pilgrimage down to Hezekiah's time, and the northern prophets ignore it and speak of Bethel, Gilgal, and Beersheba. With the fall of its northern neighbor, for the moment its importance and wealth increased; especially it became the one undefiled shrine, never mixed with rites of the native religions, the centre of Jewish religious life, the one place where sacrifice might be offered. In the later days of the monarchy the town spread beyond the east ridge into the Tyropœon; a second town and a trading quarter grew up. For a long time after its destruction by Nebuchadnezzar in 586 the history is scant and dubious. It suffered heavily under the Persian empire; under Artaxerxes Ochus the temple *may* have been destroyed. Alexander's sacrificing in the temple is mythical; and in 320, Appian says, Ptolemy Soter destroyed the city. Then there was a time of peace and prosperity, culminating in the high-priesthood of Simon II. (219–199 B.C.); after a series of struggles between the Ptolemies and the Seleucids, in which the former took and garrisoned the place and the Jews helped drive out the garrison, the Seleucids obtained Palestine by treaty in 197. When Antiochus Epiphanes undertook to Hellenize Palestine in 169, he took the city, destroyed the walls, plundered the temple, and erected an altar to Zeus in place of that to Yahweh. Judas Maccabæus rebuilt the temple and the walls; again razed by the Greeks, they were again rebuilt by Jonathan. Under the Hasmonæan dynasty it extended to the western ridge; there was a new palace and royal quarter of great splendor; the city became the metropolis of the Jewish world, and the one great pilgrim shrine. Then it became tributary to Rome, but at least still a kingdom governed by its own sovereigns; such it was when Jesus was born; but it shortly after became a province governed by a Roman procurator. The Roman system and Jewish feeling were incompatible, aside from any actual misgovernment; and a grand national revolt took place, which in 66 A.D. gained possession of Jerusalem. Vespasian was appointed to repress it; and in 70 A.D. his son Titus, after one of the most frightful sieges in history, with unimaginable horrors, took it, burned the temple, and leveled the city to the ground. Josephus says the city's population was 1,000,000, and Tacitus (probably from Josephus) 600,000; both are absurd, and Josephus' figures are always Oriental. From 30,000 to a maximum 45,000 may be estimated. It remained a ruin for many years. In 131 Hadrian visited the site and ordered it rebuilt; apprehending a restoration of pagan worship, the Jews broke out in rebellion under Bar-Cochba; and Hadrian, not caring to set up a new centre of Jewish propaganda, made it a Roman colony called Ælia Capitolina, and forbade Jews to enter it on pain of death. Thence till the time of Constantine nothing is known of it; except as a Jewish shrine it was nothing. When the empire became Christian, Constantine's mother, Helena, induced him to cherish the seat of Christ's ministry and death; and he built the Church of the Holy Sepulchre (see above). Pilgrims flocked to Jerusalem from all parts, and it became the shrine of Christendom. Captured by Khosru of Persia in 614, it was retaken by Heraclius in 628; but in 637 was taken by the Moslems under the caliph Omar. The line of Arabian caliphs of different dynasties was succeeded by the Seljuk Turks. The Christians were oppressed, the sacred places defiled; to crown all, the overland caravan trade was cut off. Religious feeling and mercantile interest together roused Europe to the crusades, and Jerusalem was taken by Godfrey of Bouillon in 1099, becoming the capital of a Christian monarchy. This maintained a precarious existence till 1187, when the great Saladin put an end to it.

Among the many excellent works on the subject see, for topography and ancient history, the article Jerusalem in the 'Encyclopædia Biblica,' by W. R. and G. A. Smith and Col. Conder; also for topography, Col. Conder in Hastings' 'Dictionary of the Bible.' See also Warren and Conder's 'Jerusalem' (1884, Palestine Exploration Fund), containing a large portfolio of plates; Wilson's 'Ordnance Survey of Jerusalem' (1868), the basis of all modern work; De Vogue's 'Temple de Jérusalem' (1864); Le Strange's 'Palestine under the Moslems' (1890, Palestine Exploration Fund), the only book based on Arabic writers; Besant and Palmer's 'Jerusalem, the City of Herod and Saladin' (4th ed. 1899); and the 'Quarterly Statement' of the Palestine Exploration Fund.

Jerusalem Oak. See GOOSEFOOT.

Jerusalem Plank Road, Engagement near. After the battle of Cold Harbor (q.v.), 1–3 June 1864, Gen. Grant crossed to the south of James River, made unsuccessful assaults upon the Petersburg intrenchments, 15–18 June, and then determined to invest the city partially by a line of works toward the South Side Railroad, and by the evening of the 21st the Fifth corps rested its left on the Jerusalem Plank Road. The Second corps, followed by the Sixth, was moved across the road with the intention of seizing the Weldon Railroad at a point near Globe Tavern next day, and with the expectation of seizing also the South Side Railroad, and cutting Lee's communication with Lynchburg. At night the Sixth corps was in rear of the left of the Second. The orders for the 22d were that the Fifth corps should hold fast its position in front of the Confederate intrenchments, while the Second and Sixth swung to the right, and forward on its left, each division intrenching as it came into line. In the movement the corps commanders at first were directed to keep up connection, then they were ordered to move without regard to each other, each taking care of his own flanks. The Second and Sixth corps moved chiefly through densely wooded thickets; the Second on the right and near the Confederate works; the Sixth at right angles to the Second

toward the Weldon Railroad. Gibbon's division of the Second corps had swung in on the left of the Fifth and intrenched, Mott's division was intrenching, and Barlow's division, on the left, was not yet in position, when the last named was attacked. Gen. A. P. Hill had been sent down the Weldon Railroad to oppose Meade's attempt upon it. He had the three divisions of Wilcox, Mahone, and Bushrod Johnson. Leaving Wilcox to oppose the Sixth corps, which had not come up on the left of the Second, Hill, about 3 P.M., passed Mahone and Johnson through the opening between the two corps and struck Barlow in flank and rear, driving him back in confusion to the position from which he had advanced in the morning, and taking many prisoners. Mott's division, on Barlow's right, fell back precipitately, and then Hill struck Gibbon's left brigade in front, flank and rear, causing it to give way and abandon a battery of four guns. So sudden and unexpected was this attack upon Gibbon that the greater part of several regiments were captured with their colors. Gibbon made an unsuccessful effort to recover the lost portion of his line. Hill returned to his intrenchments, leaving some force on the railroad, and toward evening the Second corps was thrown forward; but it was not until next morning that it occupied the ground from which it had been driven, the Sixth corps, forming on its left, thrown back facing the Weldon Railroad, and about a mile from it. The Union loss on the 22d, confined almost entirely to the Second corps, was nearly 2,000, of whom about 1,700 were prisoners. The Confederate loss is unknown. Consult: 'Official Records,' Vol. XL.; Humphreys, 'The Virginia Campaign of 1864–65'; Walker, 'History of the Second Army Corps.'

E. A. CARMAN.

Jervis, jĕr'vĭs, **John Bloomfield,** American civil engineer: b. Huntington, N. Y., 14 Dec. 1795; d. 12 Jan. 1885. He was employed as axeman on the route of the Erie Canal in 1817; in 1819 became a resident engineer of the middle portion of the canal; was chief engineer of the Delaware and Hudson Canal and Railroad Company, 1825–30; and chief engineer of the Croton Aqueduct, 1836–43. In later life he was consulting and chief engineer of the Cochituate water works, Boston, and of several important railways. He built the Croton dam, the High Bridge at New York, and other notable structures. The town of Port Jervis (q.v.), N. Y., was named for him. He published: 'Railway Property'; 'Construction and Management of Railways'; 'Labor and Capital.'

Jesse, jĕs'ĕ, in the Bible stands at the head of the house of David, who was his son. While Saul was persecuting David he took refuge in the land of the Moabites, where Ruth the Moabitess, his grandmother, had lived. In the genealogy of Jesus Christ as given in the Gospels of SS. Matthew and Luke he is mentioned as one of the ancestors, as Christ in the New Testament is hailed "Son of David." This fact has suggested some of the most interesting creations of mediæval art, and what is called a "Jesse window" is a stained glass church window in which Jesse is depicted as the root of a tree which bears as its fruit David and other heroes and saints of the Old Testament, with the infant Jesus in the arms of his mother on the highest branch.

Jesse, Richard Henry, American college president: b. Epping Forest, Lancaster County, Va., 1 March 1853. He was graduated from the University of Virginia in 1875, was dean of the academic department of the University of Louisiana from 1878 till its union with Tulane University in 1884, in which institution he was professor of Latin till 1891. Since January 1891 he has been president of the University of Missouri.

Jes'sop, Augustus, English Anglican clergyman and author: b. 20 Dec. 1824. He was educated at Cambridge and after taking orders in the English church was curate of Papworth St. Agnes, Cambridgeshire, 1848–54; head master of Helston Grammar School, Cornwall, 1855–9; and head master of King Edward VI.'s School, Norwich, 1859–79. He has been rector of Scarning, Norfolk, from 1879, and is an honorary canon of Norwich Cathedral. As a writer he became widely known by his 'Arcady for Better for Worse' (1881), studies of agricultural life in Norfolk; and among other works of his are: 'Studies by a Recluse'; 'Trials of a Country Parson'; 'The Coming of the Friars' (1885); 'John Donne.'

Jest Book, a compilation of witty sayings and practical jokes. The oldest known English jest book is 'A Hundred Mery Talys' (about 1525). The best known collection is 'Joe Miller's Jest Book, or the Wit's Vade Mecum' (1739).

Jesuit (jĕz'ū-ĭt) **Relations and Allied Documents, The,** a series of 72 volumes on the travels and explorations of the Jesuit Missionaries in New France (1610–1791). The original French, Latin, and Italian texts, with English translations and notes; illustrated by portraits, maps, and facsimiles, and edited by Reuben Gold Thwaites. A republication of great magnitude and importance. The very great value of the work is that of original materials of the most interesting character for the history of North America from 1611, the date of the first landing of Jesuit missionaries on the shores of Nova Scotia. The reproduction of documents takes them in chronological order. The execution of the work by translators, editors, and printers (at Cleveland, Ohio) is every way admirable; and its completion will make a monumental addition to American historical libraries.

Jesuits, a religious order of the Catholic Church whose members, like those of similar societies, solemnly bind themselves to aspire to perfection by leading a life of chastity, by renouncing the possession of all personal property, and by obedience to lawful superiors in all that does not contravene the law of God. A certain number of them add a special vow of obedience to the Pope. They are called the Society or Company of Jesus, the latter designation expressing more correctly the military idea of the founder, which was to establish, as it were, a new battalion in the spiritual army of the Catholic Church. There are no female Jesuits, nor are there crypto or secret Jesuits. Romances are mostly responsible for such myths. Nor does the Society form, as is sometimes fancied, a sort of sect within the Church. R. W. Thompson, ex-secretary of the United

States navy, in his 'Footprints of the Jesuits' asserts that they are such, and independent of the pope, and in one instance he accuses them of being idolaters. As a matter of fact the Society of Jesus has always inculcated ardent devotion to the pope, the most uncompromising orthodoxy and an intense Catholic spirit. The descriptions of Jesuits as crafty, unscrupulous men constantly engaged in dark plots against all who stand in their way, are inventions of their enemies and have no foundation in fact. Finally they are not monks, as they are sometimes described. Technically they are classed among churchmen as clerics, living according to a rule and are properly regular clerics.

The special object of the Society beside the personal sanctification of its members is to propagate the Christian faith chiefly by teaching and preaching. Their teaching is restricted mainly to the higher studies, and includes literature, mathematics, science, philosophy, theology, and the cognate branches. Their preaching addresses itself to all classes, but, by predilection, and at stated periods in a Jesuit's life, by express injunction, it concerns itself with catechizing the ignorant, and instructing the inmates of hospitals and penal institutions, while it addresses itself also to more cultured and spiritual audiences. One special and characteristic feature of its ministry is known as the "Spiritual Exercises" or "Retreats" which it may be regarded as having introduced, or revived in the modern church, and are now a universal ascetic practice with the clergy and religious communities as well as with a considerable number of the laity. A "Retreat" is a withdrawal from worldly occupations for a more or less protracted period in order to scrutinize the state of the soul and to take means to amend one's life, or to strive for higher Christian perfection. The method of these "Exercises" is laid down in a small manual written by the founder of the Society. The book itself, which is at first sight fragmentary, and only suggestive in its character, is not easily understood or explained except by those who are trained to interpret it.

The Society was founded by Ignatius Loyola, a Spanish nobleman, who after being disabled in fighting for his country, betook himself to the solitude of a cave near the little town of Manresa, Spain, where he passed some months in prayer and severe bodily austerities. Later, desirous of working more effectively for the salvation of his fellow men, he determined to become a priest, and for that purpose studied in the universities of Alcala and Salamanca, and finally in Paris, where he gathered about him six companions, among whom were Francis Xavier, the future Apostle of Japan, Peter Faber, whom, with Ignatius and Xavier, the Church was to honor subsequently as a saint, and also Salmeron and Laynez, who were conspicuous luminaries at the Council of Trent which was then about to be convened against the doctrines of Luther, Calvin, and others who had just then arisen.

On 15 Aug. 1534 these seven men organized themselves into a society, and pronounced their vows in the crypt of a little chapel in what is now Rue Antoinette, a short distance below the crest of the hill of Montmartre in Paris. It was only six years afterward that Pope Paul III. gave them and the others who had joined them meantime his solemn approval.

The peculiarities of their organization were the occasion of much antagonism at the very outset on the part of some of the most eminent men of the Catholic Church. The Inquisition strongly suspected its purposes and doctrines. The name of the "Society of Jesus" was objectionable to Pope Sixtus V. Unlike other orders they were to be dispensed from reciting the divine office in common, and were to wear no distinctive habit. The length of probation and the general structure of the Society were unusual. The members were first the professed who were relatively few. In them the governing power resided, and they were distinguished by a special vow of obedience to the pope. Then came the spiritual coadjutors, or priests, who did not take the special vow of obedience to the pope. Preparing for either category were the students or scholastics, and lastly there were lay brothers who were to devote themselves to domestic duties. Those who applied for admission were to pass two years of noviceship, and not one as in other religious orders, and were then admitted to what are called simple vows which could be easily dispensed with by proper authority if the subject were subsequently found unfit. Following the noviceship, two years were given to a review of the classical studies; then came three years of philosophy, mathematics, and the physical sciences; five years of college teaching and four years of theology, to end only with another year of seclusion and prayer, after which the candidate was permitted to take the solemn vows which bound him irrevocably to the order as a spiritual coadjutor or professed. The probation of the lay brothers was protracted to ten years. The Jesuit renounces by vow all ecclesiastical dignities, and accepts them only in unusual circumstances and by express command of the pope, under pain of sin in case of refusal. As the establishment of the Society of Jesus coincided with the Protestant Reformation the efforts of the first Jesuits were naturally directed to combat that movement. Under the guidance of Canisius so much success attended their work in Germany and other northern nations, that, according to Macaulay, Protestantism was effectually checked. In England where Elizabeth had inaugurated a movement against her Catholic subjects, and previous to that under Henry VIII. the Jesuits stopped at no danger to go to the rescue of their brethren in the faith; and what they did there was repeated in other parts of the world. "In spite of oceans and deserts, of hunger and pestilence, of spies and penal laws, of dungeons and racks, of gibbets and quartering blocks, the Jesuits were to be found under every disguise, in every country; scholars, physicians, merchants, servingmen, in the hostile court of Sweden, in the old manor houses of Cheshire, among the hovels of Connaught arguing, instructing, consoling, animating the courage of the timid, holding up the crucifix before the eyes of the dying."

Such is the testimony of Macaulay, a Protestant historian. Though many died as martyrs on the scaffolds and in the prisons of England and elsewhere, yet their skill in evading detection as well as their courage in living in the midst of their enemies and their great success in winning converts well explain the hatred with which they were regarded in Protestant countries from the very beginning, while it gives us

the historical origin of the tradition of cunning and deceit which has always been associated with the name of Jesuit.

Under James I. they were accused of complicity in an alleged attempt to blow up both houses of Parliament, and though clearly proven to be innocent of the charge, Father Garnet, who was said to have been cognizant of the plot, was executed, and the accusation is still believed. Guy Fawkes' Day commemorates the event and perpetuates the calumny. It is probably in connection with this occurrence that the supposed Jesuit doctrine of "the end justifying the means" was first accredited to them and the accusation made that "it was their office," as Macaulay assures his readers, "to plot against the thrones and lives of apostate kings, to spread evil rumors, to raise tumults, to inflame civil wars and to arm the hands of the assassin." The first one who is accused of formulating the doctrine of the end justifying the means is Father Wagemann of Innsbruck 1762. Even the murders of Henry III. and Henry IV. of France were ascribed to them, and under Charles II. of England six Jesuits were accused by Titus Oates of conspiracy and put to death. These and other charges have been repeatedly disproved, yet writers of romance, and even writers of history, never fail to find readers credulous enough to accept them as true.

While the Jesuits were propagating the faith in Europe they were sending missionaries to every part of the world to preach the Gospel to heathen nations. Greatest of all these apostles was St. Frances Xavier whom all Protestant writers unite in glorifying and whom the pagans almost worshipped as a deity. His name is still mentioned with enthusiasm among the pagans in Japan and the Occident. The conversions which he effected and the miracles he wrought almost defy belief. It is a testimony to the solidity of his teaching that although Catholicity was apparently obliterated in Japan by a series of bloody persecutions, the French missionaries who entered the country in 1860 found 30,000 Japanese Christians there. In spite of the absence of priests, the doctrines and practices received from Francis Xavier which meant death to profess openly had been handed down from father to son for a period of nearly 300 years. One blot on the reputation of the Society in this field was the shameful apostasy of one of their superiors; but he atoned for his sin by a subsequent martyrdom.

In America the French Jesuits undertook the task of evangelizing the Indians, and at one time had 3,000 civilized and christianized Hurons under their control. In what is now New York, Father Jogues was cruelly tortured and slain on the banks of the Mohawk in 1646. In 1649 Garnier, Daniel and others were shot to death; and at the same time De Brébeuf and Lallemant were burned at the stake while their flesh was slashed with knives and their hearts cut out and eaten by the Indians of Lake Superior. Others died from want and exposure. It was Jogues who discovered Lake George to which he gave the name of Lac du St. Sacrement. Later on Le Moyne came upon the salt springs near Syracuse. Marquette discovered the Mississippi which he named the River of the Immaculate Conception. He explored it as far as the mouth of the Arkansas, and returning home was the first white man with his companions to travel over the territory of what is now the city of Chicago. Wisconsin has erected a statue to his honor. Other Jesuits reached the Pacific coast and established the missions of California which they handed over to the famous Franciscan Junipero Serra when the Society was suppressed. English Jesuits had come over with Lord Baltimore; and before that five Spanish members of the order had been slain by the Indians on the banks of the Rappahannock. The "Relations" of the French Missions have been recently published by an American publishing house and form 72 volumes of missionary and scientific information which the 'Atlantic Monthly' considers the most precious material that could be desired for the history of this country. Similar records have been kept by the Jesuits of other nationalities. Marquette's diary and maps of the discovery of the Mississippi decided the controversy between France and England about the possessions of the western territory.

The missions of South America conducted by the Spanish and Portuguese Jesuits were remarkable in their character and extent. Father Anchieta, a native of Brazil, was particularly distinguished for his missionary success as well as his gift of miraculous powers. Peter Claver devoted himself to the thousands of negro slaves who were brought to the port of Cartagena. Other Jesuits traveled through Chile and Peru. Seventy of them on their way thither were said to be killed by Calvinists who intercepted them at sea. But their most famous work was what are known as the 'Reductions' or Christian Commonwealths of Paraguay. The description of these missions forms one of the most brilliant chapters of Chateaubriand's 'Génie du Christianisme;' but a recent work entitled 'A Vanished Arcadia' by Cunningham-Graham gives a more reliable and scholarly account of what was accomplished there. Voltaire says: 'When in 1768 the missions of Paraguay left the hands of the Jesuits, they had arrived at perhaps the highest degree of civilization to which it is possible to conduct a young people."

"For nearly two hundred years they controlled a district as large as France," writes Cunningham-Graham, "where they had established 32 towns in which there were 160,000 Indians whom they had converted and civilized, teaching them agriculture, the mechanical arts, commerce, and even forming among them a small army of defense. The annual income of the country was about 1,000,000 reales. The missionaries were finally expelled by Charles III. and the country fell back into its primitive condition of a tangled wilderness."

The reasons of their expulsions were first the jealousy of the Spaniards at being excluded from the territory, secondly the anger of the colonists at being prevented from enslaving the Indians, and thirdly the ungrounded suspicion that there were gold mines in the missions. An impression in the royal mind that the Jesuits had reflected on the circumstances of his birth made him an easy instrument in the hands of the enemies of the Society. "Curious as it may appear," writes Cunningham-Graham, "the bitterest opponents of the Jesuits were Catholics, and Protestants have often been their apologists. Buffon, Raynal, and Montesquieu with Voltaire, Robertson, and Southey have written favorably of the internal gov-

ernment of the mission and the effect it produced. When the Spanish general was sent to dispossess them, he set about it with more preparation than Cortes or Pizarro made for the conquest of Mexico or Peru. But there was no resistance, and all the wealth the fathers had was the poor clothes on their backs." The destruction of these missions was probably a part of the prearranged plan for the annihilation of the whole Society.

The missions of Japan which Francis Xavier had inaugurated continued after his death in spite of the fierce persecutions in which many Jesuits perished. He had been unable to reach China and died on a lonely island off the coast. Ricci, Verbiest, Schall and others carried out his project and became the advisers of the emperor as well as his astronomers, mathematicians and mechanicians. The great bronze astronomical instruments carried off by Germany on the occasion of the recent invasion of that country by the allied powers of Europe were the work of the Jesuits of the 17th century. As soon as the mission was started, great numbers of Jesuits came from Europe, half of them generally dying on the passage. In 1661 they possessed 151 churches and 38 residences there, and had written as many as 131 works on religion, 103 on mathematics, and 55 on physical and moral sciences.

Numberless other missions were established elsewhere; de Nobili for instance lived like a Brahman in India to reach that particular caste, and was almost suspected of apostasy for doing so. He is said to have made 100,000 converts. Jesuits overran the whole Indian peninsula and crossed the Himalayas into Tibet. Africa had long before been penetrated, and one of the first members of the Society was Patriarch of Ethiopia. The present explorers of the Dark Continent find remnants of former missions far in the interior. They had gone from Mexico to the Philippines in the earliest days; they had entered Tartary and Lebanon, and when their own efforts were thwarted they induced others to take their places. Thus De Rhodes, a Jesuit expelled from Japan, founded the Société des Missions Etrangères, a body of secular priests who have given a great number of saints and martyrs to the Catholic Church.

While the Jesuits were engaged in missionary work among the uncivilized peoples of the world they erected splendid churches all over Europe, and furnished such orators to the pulpit as Bourdaloue in France, Vieyra in Portugal, and Segneri in Italy. The 'Book of Spiritual Exercises," according to St. Francis de Sales, "has converted as many souls as it has letters." But their apostolic work was not restricted to preaching, and we hear of a single French Jesuit who during his 40 years of ministry had established as many as 146 hospitals for the poor. They founded orphan and Magdalen asylums. They were the confessors of kings and princes and delegates of the Holy See, but they extricated themselves from these honorable charges as soon as it was possible to do so. At the time of the suppression they controlled and directed the majority of the ecclesiastical seminaries of Europe.

The success of the Society in the work of education forms a great chapter in its history. Their method is found in what is known as the 'Ratio Studiorum' or Plan of Studies. It is a complete system of pedagogy and covers the whole field from the lowest class of grammar up to philosophy and theology. The plan was first conceived by Ignatius himself, and subsequently elaborated by one of his successors, Claudius Aquaviva. Compayré, one of the chief pedagogists of the present time, denounces it as a mere system of memorizing. Bacon says of it: "never has anything more perfect been invented." Their colleges at one time covered all Europe, and in the single school of Louis le Grand they had as many as 3,000 students. Kings assisted at its public academic exercises. Among their scholars they can claim some of the greatest men of modern times, as for instance Popes Gregory XIII., Benedict XIV., Pius VII., St. Francis de Sales, Bossuet, Fleury, Flechier, Montesquieu, Malesherbes, Tasso, Galileo, Corneille, Descartes, Molière, Mezzofanti, Muratori, Buffon, Gresset, Canova, Tilly, Wallenstein, Condé, the emperors Maximilian, Ferdinand and others. Even Voltaire was one of their pupils. The disturbed conditions of modern times prevent a similar brilliant showing, but many of the most distinguished Catholic churchmen of to-day have studied in their schools, and notably Leo XIII. who was trained by them from his college classes to the end of his theological course.

Within their own ranks they have furnished great scholars in all branches of philosophy, theology, history, philology, literature, and science. It is sufficient to name such men as Suarez, De Lugo, Bellarmine, Toletus, Lessius, á Lapide, and to note that the treatises of Jesuit writers form the text-books in all the theological seminaries of the Catholic Church to-day. They have written in almost every language and on every conceivable subject, and the mere catalogue of their writers, though not yet complete, already fills more than seven large quarto volumes. Their missionary enterprises were never disjoined from scientific investigation.

Their history is marked by ceaseless activity in launching new schemes for the spread of the Catholic faith, and by absolute fearlessness in opposing error regardless of any consequences to themselves. These two characteristics may explain why even by some Catholics they are regarded as a disturbing element in the church. One of their most noted disputes with churchmen was with the Dominicans on grace, during which the Jesuit doctrine of grace was formulated. The contest lasted for nine years, and although great theological learning was adduced on both sides a truce was imposed by the Pope without any decision being arrived at. Of far greater consequence was their war with the Jansenists. It was chiefly on this occasion that the Society was accused of laxity in their moral code and that their great antagonist Pascal won fame by his 'Lettres Provinciales,' which like the famous 'Monita Secreta' of former times purported to be the private instruction of superiors to members of the order. After this contest their expulsion from France was an easy task, as the Jansenists wielded great political influence and were backed by the irreligious element which was growing rapidly there.

They have been expelled over and over again from almost every Catholic country in Europe, always, however, coming back again to

renew their work when the storm had subsided; and this fact has been adduced as a proof that there is something iniquitous in the very nature of the organization. Worse still in 1773 the entire order was suppressed by a brief of Pope Clement XIV. and all their goods confiscated. They then numbered 24,000 members and had establishments in all parts of the world and flourishing missions, all of which were immediately destroyed, but not one Jesuit uttered a word of complaint or protest. What is remarkable is that while Catholic popes expelled them they were protected by the schismatic Catherine of Russia, and the Protestant Frederick of Prussia, the friend of Voltaire. This very protection was urged as a reproach against them and as a proof of their guilt.

With the exception of the disastrous financial speculation of Lavalette, which was the sin of an individual and not imputable to the entire Society, as commercial transactions were absolutely prohibited by the statutes, the Society is proved to be guiltless both in its partial suppressions and in its total abolition. This is clear from the very brief of Clement XIV. which dealt the blow. In that document all the charges are enumerated, but not one is pronounced to be true. The Society was suppressed as a political necessity and for nothing else. The encyclopædists of France regarded it as their most redoubtable opponent and had vowed its destruction. "Destroy the Jesuits," said Voltaire, "and we shall make an end of the beastly Church." In this work the Bourbon kings had to be enlisted. Madame de Pompadour, the king's mistress, whom the Jesuits had refused to absolve, influenced Louis XV.; the Spanish and Portuguese ministers wrought on the fears of their sovereigns by forged documents containing threats and plans of assassination, and when all was ready the monarchs gave the pope a choice of suppression of the Society or schism. The pope yielded, and is said by Pius VI. and Pius VII. to have lost his mind in consequence. The vindication of the Society came immediately. The very pope who suppressed them approved of their corporate existence in Russia. Pius VI. who succeeded him in the following year readmitted them into Italy, and Pius VII. on the fall of Napoleon re-established the Society in all its integrity on 7 Aug. 1814.

Since its rehabilitation the Society has continued to increase in spite of constantly increasing difficulties. In the beginning of 1902 it counted 15,231 members, of whom 6,743 were priests, and 4,542 scholastics in preparation for the priesthood. The general of the Society is Louis Martin, a Spaniard, who was elected in 1893. In the United States they number about 1,800, with colleges and churches in the principal cities and with flourishing missions among the Indians of the Rocky Mountains and Alaska. In Cuba and the Philippines their schools have achieved remarkable success, and the great meteorological observatories of Havana and Manila were established and are at present controlled by them. The chief houses for studies for the American members of the order are at Woodstock, Md., St. Louis, Mo., and Montreal, P. Q.

In some countries of Europe the same hostility still pursues them. In the revolutions of 1830 and 1848 their houses were closed and the members driven out of the country. In the Kulturkampf inaugurated by Bismarck they were the first victims, and all the efforts of the Centre party have hitherto failed to secure their re-entrance into Germany. Similarly they were the first to be struck in the present religious persecution in France. On the other hand they have been the recipients of countless marks of esteem and affection on the part of Leo XIII., and he has placed the stamp of his approval on the Society by adding very many new names to its already long list of canonized saints and martyrs.

T. J. Campbell, S. J.

Jes'up, Morris Ketchum, American banker: b. Westport, Conn., 21 June 1830. He was engaged in banking in New York 1852–84, but retired from business in the latter year. In 1881 he became president of the New York City Mission and Tract Society, for which he subsequently erected the DeWitt Memorial Church in Rivington Street, in memory of Rev. T. DeWitt, his father-in-law. He was made president of the Five Points House of Industry in 1872; was a founder of the Young Men's Christian Association, of which he was president in 1872. He was also elected president of the Metropolitan Museum of Natural History in 1881, and of the New York Chamber of Commerce in 1899. To the Metropolitan Museum of Art he has given a collection of native woods valued at $100,000; to the Woman's Hospital in New York city, $100,000; and to Yale University and Williams College, large sums likewise.

Jesup North Pacific Expedition, The, an American organization for archæological research, supported by Morris K. Jesup (q.v.), and conducted under the auspices and direction of the American Museum of Natural History. The work began in 1897 in British Columbia. In that year Prof. Harlan I. Smith began to dig in the Thompson River district. In successive years he worked a little farther east, and also around Puget Sound, and down the west coast of Washington. Results of these explorations have been compared and conclusions drawn as to the class of people who inhabited these regions in prehistoric times. Very interesting differences were found among them. Some were more highly developed than others. In particular, one small section east of the city of Vancouver was found to reveal traces of a people much more highly developed than any others of the section, and interesting in many ways to the archæologist. Some of the regions explored revealed the remains of coast tribes; others of interior tribes. At some points these characteristics merged, producing a different

type. New discoveries of one season explained things not understood in previous explorations. So to gather up missing links and further elucidate the whole region, especially that interesting little people near Vancouver, it was necessary to take up some new territory and thoroughly explore it. Prof. Smith, therefore, went into the Yakima Valley in northern Washington in 1903. On the map this section does not look far from the Thompson River district in British Columbia. And when one reflects how very similar are the white people now inhabiting the two sections and how near the two districts are, it is interesting to find that the prehistoric peoples inhabiting them differed at least as much as the Spanish and the Germans, according to Prof. Smith's conclusions. Not only their culture, but their skulls were different, as known by the skeletons brought back by the expedition. These ancient tribes seemed to have lived, each in its little nook of coast or river valley, for unnumbered ages, never going to see what was on the other side of the mountain; developing each its own little morsel of civilization in its own little way, its life and culture and development modified by the little corner of the earth's surface in which it sat down, seemingly to stay forever. Sometimes shell heaps are found miles in length, and with tree stumps six feet in diameter standing on nine feet of these layers, of which each is only an inch or two in thickness. It took a good many generations of Indians to pile up those successive layers with the shells from their shell-fish dinners. A stump of Douglas fir, over six feet in diameter, stood on a shell heap eight feet below the surface which contained human remains. The tree indicated an age for the top layers of more than 500 years. The material brought back included carved and sculptured pipes, stone mortars, pestles, and sinkers, bone implements used on spears, deer antlers used as handles, stone adzes differing from those found anywhere else, bone needles, shell ornaments, and the like. The expedition also found many paintings and sculptures on rock walls, which were photographed.

Jesus Christ, the founder of the Christian religion. Four documents dating from the second half of the 1st century, the "Gospels," give some account of the life of Jesus, chiefly confined to his brief public work and death. Beyond what they give little is known as to his history. Some of the most important facts are referred to in other writings of the New Testament, especially in the letters of Paul; secular history contains mere references to him; a number of later writings, the so-called "Apocryphal Gospels," purport to give additional information, but they are fictitious and worthless; and beyond a very few sayings which were probably rightly attributed to Jesus, called "Agrapha," tradition has preserved nothing of value which was not embodied in the Gospels. These narratives vary, but are rarely inconsistent: usually they may best be regarded as complementary, and the picture of the life and work of Jesus which may be drawn from them has been accepted as trustworthy throughout Christendom in all centuries, and while on many points confirmation from other sources cannot be expected, the investigations of impartial scholars have rather confirmed its accuracy than invalidated it.

Birth and Parentage.—According to the Gospels, Jesus was born in the family of a carpenter named Joseph, living in Nazareth (q.v.), a small town in southern Galilee. Descent from the line of kings of Judah which began with David is positively claimed for Joseph, and, as some understand the genealogical tables, for Mary, his wife, as well, but during the centuries of national disaster the descendants of David seem to have sunk into poverty and inconspicuousness. While Nazareth was the family home, the birthplace of Jesus was Bethlehem (q.v.), the village of Judea in which David himself was born, a fact which is explained by mention of a census said to have been made under Roman authority while Quirinius was Roman representative in Judea, and to have required that all citizens should be enrolled at the original home of the family. Though no other record of this enrollment has yet been discovered, late discoveries make the fact seem more plausible than it was formerly regarded by some scholars.

The Gospels represent Jesus as born of a virgin, conception having been due to special divine power. The date of his birth cannot be given with certainty as to day, month or even year. Since it must have somewhat preceded the death of Herod (April 4 B.C.), it probably occurred sometime in the year 5 B.C. (possibly 6). It is reported that Mary, in a village strange to her, and at the time overcrowded with visitors, could find no place to lay her new born babe but in a manger. But at the presentation in the Temple for the offering of the sacrifices which Jewish ritual prescribed after childbirth, the infant was joyously hailed by Simeon and Anna, aged saints profoundly possessed by the common Messianic expectation of the nation at that time, and, as shepherds from not far away had come in the night of his birth in obedience to a vision of angels, so, later, the Magi (q.v.) from afar guided by a star sought the child to offer him obeisance and rich gifts. This visit of the Magi, however, made Herod aware of the birth of a child who might grow up to be a dangerous rival of the dynasty which he hoped to found, and it is handed down to us that unable to trace it he ordered the slaughter of all the infants of the village up to the age of two years. But his parents, divinely warned, had taken the child to a safe refuge in Egypt, where they remained till the death of Herod, presumably only a short time. If they returned in the expectation of bringing him up in the ancient home of his line, they were deterred by fear of Archelaus who had succeeded his father as ruler in Judea, and consequently they turned aside to Nazareth where they were secure under the milder rule of Antipas.

Early Manhood.—Of the life of Jesus up to manhood nothing is known, except the mere mention of his visit to Jerusalem when 12 years old. It can be supposed only that he was subjected to the natural influences of a religious Jewish family of the time, of synagogue and of school, of a village at once quiet and yet close to the thronging traffic on one of the great thoroughfares of that age, and finally of the work of a carpenter, for such he is said to have been, till 30 years of age. It was about this time, possibly in the year 26 (or 27) that John the Baptist (q.v.) began his public career, and at once aroused great religious and patriotic fervor in the nation.

The careers of neither John nor Jesus are intelligible without an understanding of the expectant attitude of the Jewish people in the 1st century. The ancient prophets of the nation had centuries earlier foretold a renaissance of the Hebrew kingdom under a descendant of David, through the generations this hope smouldered in the hearts of the people, only fanned to a brighter flame by blasts of persecution and national disaster, and the whole influence of the sect of the Pharisees (q.v.), popular and powerful out of proportion to their numbers, increased its intensity under Herod and his successors. The people were ready to be fired by the proclamation so strikingly made by the gaunt desert-dweller that the fulfilment of the national hopes and dreams was near: "The kingdom of heaven is at hand." The preaching of John was, however, no less moral and religious than patriotic. His message was "Repent"; let the nation prepare by penitence to meet the king coming in his kingdom. This prophetic voice set the country in a blaze. Throngs gathered to listen to the new preaching and by a striking symbol, a plunge in the rushing Jordan, to pledge themselves to the new movement. After a time Jesus joined the crowds which attended the ministry of John. It is impossible to say what connection may have existed between John and Jesus. Not only were their families related, but there may have been constant intimacy. John, however, based his later testimony as to Jesus, not at all on his own knowledge of him, but entirely on the divine revelation which was his commission. Jesus offered himself for baptism, insisting that the reluctant preacher should perform the rite, and thus pledged himself to the Coming Kingdom. While it is not claimed that the wonders which attended the baptism were known to others than John and Jesus himself, the story of the Gospels is that a heavenly voice asserted the Messiahship of Jesus, and that with the appearance of a dove the Divine Spirit came to him. The conviction of his mission to his nation and the world was no new thought to the carpenter of Nazareth, and it was with this thought in mind that he recognized the significance of the Baptist's public appearance, joined his auditors, and submitted to the ordinance which he administered. Yet it is not surprising, on the other hand, that he felt constrained, when his own conviction was confirmed, to seek the desert of Judea that alone he might adjust himself to the new responsibilities and burdens of the mission which he must undertake. Amid the solitude of the barren rocks and gloomy caves of that desolate region he meditated and struggled. Of this period we know only the striking story, necessarily autobiographic in origin, in which he depicts the struggles which he underwent as due to Satan's influence. Temptations thus forced in upon him to selfish use of his power, to sensational fanaticism and to compromise with evil in order to advance his ends, were successively resisted, and at the end of 40 days he came forth the victor in all these spiritual conflicts, ready to enter actively on his ministry.

The Ministry.—Jesus returned to the Jordan where John was still at work, and aided by his testimony associated with himself a little group who instinctively recognized in him a future leader of the nation. He went from there first to his home district, where he and his companions were guests at a wedding at Cana, a little town which has been hallowed in all the Christian centuries by John's report of the changing of the water into the wine needed for the entertainment of the company in the prolonged merrymaking incident to such an occasion. Then, as it was near the Passover time, Jesus, accompanied by his mother and brothers as well as his few followers, after staying a short time at Capernaum, went on to Jerusalem. How long he remained in or near the capital city must continue a matter of inference from a few doubtful phrases, but it seems most probable that he remained in Judea for some months, perhaps from April to December. The chief events ascribed to this period are the first cleansing of the Temple and the night interview with the influential rabbi, Nicodemus, and while the effect on city or nation was not great, it was presumably at this time that Jesus formed the strong friendships in Judea, to which incidental reference is often made afterward. The closing of this portion of his ministry seems to have been due, on the one side, to the hostile jealousy of the dominant Pharisees which would hinder success in Judea, and, on the other, to the imprisonment of John the Baptist which made it possible for Jesus to work in Galilee without what might have seemed competition, and, indeed, made it advisable for him to take up the work which John had been obliged to drop.

On his return to Galilee Jesus soon recalled his disciples, who, if they had accompanied him throughout his work in Judea, had scattered for a time to their homes, and associated himself with them in a companionship which was thereafter unbroken till his death. He made Capernaum the central point of his ministry, returning thither from each of his repeated tours throughout the many scores of cities and villages which then existed in Galilee. Wherever he went the keynote of his preaching was the same as John's had been, "Repent, for the kingdom of heaven is at hand:" but as time passed his instructions, exhortations and warnings swept throughout the whole scale of human experience and touched every note of religious and moral truth. The keynote of his teaching about God was his love, infinite, untiring, eternal. On the ground of this love he proclaimed pardon to every penitent, even though a harlot or an outlaw. But this certainty and freeness of forgiveness was not allowed to diminish the loftiness and imperativeness of the standard of duty which he held up. Indeed, the high moral tone of his teaching, accompanied as it was by a constant and insistent demand for absolute sincerity, and his disregard for all mere forms, without the spirit in particular, his teaching and practice in reference to fasting, ceremonial purifications and Sabbath keeping, combined to set against him the Pharisees and through their influence the leaders and officials of the nation.

Popularity.— For a long time his popularity was great and throngs gathered to see and hear him, attracted in part by the reports of his miracles. Far and wide the stories were told that diseases yielded to his command, that the fevered, the palsied, the blind, the deaf and dumb, the lepers, the demonized, were restored to soundness, and, later, that on repeated occa-

sions he brought the dead to life. But these great works were distinctly secondary. He was first and foremost the Prophet of Nazareth, the Preacher. As such he spoke with peculiar attractiveness and power. His style was simple and direct, and his discourse was frequently adorned with unequaled parables, illustrations drawn from nature or common life, which, though sometimes veiling the truth from the thoughtless, sometimes added immensely to its clearness and effectiveness. His activity as a preacher at first won him steadily increasing popularity among the people at large, until, about two years after his work began, 5,000 men, whose hunger had been satisfied by his power on the lakeside, determined to make him king. But in this purpose they lacked all real sympathy with the character and aims which Jesus exemplified. The kingdom which centuries before the prophets of the nation had foretold was a kingdom to be sure, but a kingdom which should be based on a right relation of its subjects to God and existing only to serve the divine ends. The Jews as they read these prophecies had seen in them, only something political, worldly and selfish. Now when Jesus in fulfilment of prophecy had come to offer himself to the nation as its promised king, he would be king only as his kingdom might be the expression and instrument of a religious people, deeply, purely, unselfishly religious. So at the very climax of popular favor his clear vision instantly recognized how widely their ideals and purposes differed from his.

The Twelve Apostles.— For some time this condition of affairs had been anticipated, and Jesus had laid his plans and shaped his work accordingly. Since the Jewish people would have no such kingdom as he was about to establish, he had several months previously organized under the name of apostles a group of 12 of his disciples, to whom he would impart himself, and on whom he would so far as possible stamp himself, that they in turn might repeat his activity in their relations to others. Although he retained the name kingdom, what he looked forward to establishing was not a political but a spiritual community or body.

After the choice of the apostles the discourses of Jesus had been largely shaped for their special benefit: after his rejection of the offer of kingship from the unappreciative multitude, who in turn instantly deserted him when they saw that he would refuse to gratify their selfish hopes, his work was mainly for the benefit of the twelve, although he neglected no opportunity which came within his reach of trying to touch the soul of the nation or of individuals. Much of the last year of his life Jesus spent in seclusion. He made a journey, doubtless traveling in leisurely fashion, northwest from Capernaum to Sidon, returning as it appears by a roundabout route through the Decapolis, and another journey northeast to Cæsarea Philippi; some time was spent in Perea to the east of the Jordan; and though he seems more than once to have shown himself conspicuously in Jerusalem or its immediate neighborhood, yet during most of the time which he spent in Judea he secluded himself in an obscure village named Ephraim.

So far as the work of Jesus was concerned, the most significant event of the last year, if not of all the three years of his ministry, was the conversation with the apostles near Cæsarea Philippi as to the opinion of him which generally prevailed and as to their own convictions. While Jesus is reported at least once to have claimed to be the expected Messiah, and while this claim was necessarily implied in much that he had said of himself, and while some of the twelve had very early expressed the opinion that they had found the one of whom Moses and the prophets had spoken, yet this view had never found expression as their matured conviction. Such expression Jesus at last sought. His first question was as to the common sentiment concerning him, and the frank answer was that while he was generally recognized as one far beyond the ordinary, he was not at all recognized as the Promised One. In face of this answer Jesus pressed the further question, "What am I to you?" and the answer of Peter, one speaking for all, was that he was the Christ. This answer assured the ultimate success of his mission, for these followers would win more. But he could not fail at the same time to foresee the irrepressible conflict between himself and the leaders of the nation, and so, relying on their faith in him as the Christ, he immediately began to familiarize them with the fact of his death, though this only confused and offended them, and at the same time to add promises of resurrection which they do not seem to have grasped at all.

The apparent failure of the mission of Jesus which he thus foretold, culminating as it did in his rejection and death, was due alike to what he was, what he taught and what he demanded. He himself was devoted with absolute singlemindedness to his work, sincere, unselfish, loving, beneficent, and pure with such perfect and manifest purity that only a few voices of detraction have ever been out of harmony with the else unanimous recognition and assertion of the sinlessness of his whole life. His teaching, while not in all respects original in matter or form, was in spirit and effectiveness such an advance on the Old Testament which he confirmed or the rabbis with whom he largely agreed that it seemed "a new teaching." He demanded of others the same perfection of sincerity, altruistic self-forgetfulness and supreme devotion to the will of God which he himself practised, and he as sternly denounced hypocrites as he tenderly welcomed penitents. All his teaching came with a unique tone of authority and this was made more significant by the claims which he advanced for himself. He occasionally asserted and constantly implied that he was a special messenger from God and unique representative of him, and from time to time he distinctly claimed divine attributes and powers. Thus he spoke; to confirm this he pointed to his miracles; as such he held himself up as the proper object of supreme and absolutely limitless devotion: the recognition of this supremacy he demanded of all and gladly accepted from his disciples, a self-assertion which in view of his sincerity and simplicity of soul is as significant as in view of his transparent honesty coupled with unsurpassed sensitiveness to evils is the absence of ever confessing a fault. Between such a one with such a message and such demands and the rulers of the nation at the time there was necessarily an irreconcilable antagonism which could end in no way but in his death.

The Messiah.— In the spring of the year 29 (possibly 30), after Jesus had been before the public for three years, the task of implanting the spiritual kingdom in the hearts of the select 12 was so far completed that it would be permanent, and at the same time the conflict with the authorities could not wisely be longer postponed. Accordingly Jesus went up to Jerusalem to the Passover with the throngs which assembled at that time from every part of the country. While he gave repeated proofs that in spirit he was walking in the shadow of the cross which he foresaw at the end of the road, yet this journey, unlike those which had preceded it, was intentionally made, by the sending of 70 messengers before him to proclaim his coming, a significant progress through the country. Reaching the neighborhood of Jerusalem, he stopped for the Sabbath at the neighboring village of Bethany, to which he returned each night till the end, and then on the following day he made a somewhat formal entry into the capital city. It needed only that he should mount a riding ass that those who accompanied him should be reminded of an ancient prophecy, and they, with another throng which came out from Jerusalem to meet him, acclaimed him as the promised and coming king, carpeting the road before him with green branches from the trees at the roadside and with their own clothes thrown before him in the zeal of their loyalty. Thus they led him to the Temple, where the procession dispersed. While informal and at first thought only a failure in its lack of definite result, this "triumphal entry" had deep significance as a public claim of his right to rule the nation as God's appointed representative, and he stopped short of assuming this office only because he desired and demanded first the acceptance of him by the nation. During the days that followed he repeated this claim in various ways; again he drove out of the Temple the huckstering crowds so out of harmony with its proper use, and in prolonged controversy with the representatives of all the parties of the time he bore himself as their Master and proved himself such. All this goaded his enemies at last to action, and through the treachery of Judas Iscariot, one of the inner circle of 12 disciples, almost at once an unlooked-for opportunity presented itself to them.

The Last Supper.— On Thursday evening of Passover week, after special precautions to keep secret the place of their assembling, Jesus sat down at a last supper with his apostles to what he knew would be his last interview with them before his death. While the traitor has gone out to secure his arrest, he pours out his soul to the others in words too tender and profound for their comprehension; he warns them that they will speedily desert him to go alone to his fate; he tells them something of the unique significance of his death in language which contains in germ the later doctrines of the Church, on this point; presenting them bread and wine, he instituted the second of the two rites of the universal church and finally commends them and all future believers in him to God in a prayer of incomparable elevation and pathos. He then went out to a resort familiar to him and his friends, an olive grove named Gethsemane in a valley close to the walls of the city. There the horror of the coming hours, not craven fear of death, but distress at the very thought of the tremendous experience which he must undergo in soul, drew from him a thrice repeated prayer of such intensity that the very blood was forced through the pores of the skin, but on the prayer followed serenity of resignation and purpose which continued unruffled to the end. Then he awakened his disciples who to his disappointment had repeatedly been overcome by sleep and so had left him to his spiritual distress without even the sympathy of his friends, and went to meet the force of Roman soldiers and Temple guards which in needless precaution the officials guided by the traitor brought to seize him. He quietly submitted to arrest, and his followers struck but a single blow in his defense and then scattered in the darkness, two of them, however, John and Peter, following at a distance, the latter only to deny later all discipleship and even acquaintance.

Trial for Blasphemy.— While some details of the four accounts of the trials of Jesus are obscure, if not inconsistent, yet their general course may easily be made out. At the house of the high priest Caiaphas, or of the still more influential Annas, his father-in-law, and an ex-high priest, there was before daylight an informal session of all the Sanhedrin who could be gathered. Unable to find even perjured testimony which was sufficiently consistent to warrant his condemnation, the high priest as president of the great court of the nation put Jesus under oath, and asked him if he claimed to be the Christ. Firmly and positively Jesus answered that he was, whereupon his enemies without even pretense of investigation declared this claim to be blasphemy for which according to Jewish law he must die. But this verdict would be legal only if rendered in the daytime, and so, having been left during the interval to be the object of mockery by the guards, as soon as the day broke, he was formally arraigned and condemned. As, however, the right to inflict the death penalty had been reserved to himself by the Roman procurator, in order to accomplish their purpose they must secure his condemnation of Jesus in addition to their own, and accordingly the Sanhedrin conduct him to Pilate and demand his execution. But Pilate refused to order his execution without investigation, and when they charged him with instigating sedition against the Roman government, the judge instantly recognized their malicious insincerity and the innocence of the prisoner. In his consequent desire to release him Pilate in turn pronounced him innocent; sent him to Antipas, who only made sport of him and returned him; vainly tried to stir up the populace to demand his release according to the custom that a prisoner should be released at Passover time; ordered him scourged in hope that that cruelty would satisfy his enemies; displayed him bloody from the torturing lash and crowned by the soldiers with thorns in cruel jest, fancying that this sight would surely evoke pity; but finally, terrified at the mutterings of the crowd and fearing lest should he persevere charges might be made to the emperor against himself, Pilate ordered the crucifixion of Jesus.

The Crucifixion.— The execution took place at once, scarcely later than the middle of

the forenoon. Although so far weakened by the sufferings of the night and morning that the sufferer fainted under the cross which, as was customary, was laid on him to bear to the place of execution, he bore himself throughout with majestic patience and dignity. Under the jeers of his triumphant enemies, in sight of his mother and friends, in the unexplained and portentous darkness which beginning at noon lasted for hours, amid the indescribable physical tortures of the cross, he spoke but to pray forgivingly for those who were the agents of his suffering, and to commend his mother to John, her nephew and his most intimate and beloved disciple. At mid afternoon he uttered a cry to God, "Why hast thou forsaken me?" which can be understood only as expressive of intensest soul agony. As if this agony culminated and ended with the cry, he then spoke calmly of his thirst and took the drink which a sympathetic bystander pressed to his lips, then commended his spirit to God, and with a loud shout expired, it would seem with a literally broken or ruptured heart. Although death seldom came so soon to the crucified, yet the fact is undeniable in the case of Jesus, for when somewhat later the criminals who had been crucified with him received a blow intended to hasten their death, the soldiers recognized that he was already dead, and yet one of them thrust a spear deep into his side, apparently touching the heart, and on Pilate's inquiry the officer in charge certified to his death. By leave of the governor two members of the Sanhedrin, who were secretly disciples, took down the body and hurriedly but reverently buried it at the close of day not far from Calvary, where he had been crucified, in a rockhewn tomb, which later was officially sealed.

Of the facts relating to Jesus during the next few weeks, no less than five (if the last verses of Mark are by another hand, then six) separate accounts are preserved, no two precisely agreeing, but, on the other hand no two being mutually contradictory, and one of these accounts, that of Paul, was written within 25 years of the events narrated. It is told that first women going at the dawn of Sunday entered the open tomb but found not the body of Jesus; that later Peter and John also found it empty; that Peter, then ten of the apostles together, and also two other men miles from Jerusalem, as well as Mary Magdalene, saw Jesus that same day in recognizable human form and talked with him; that these appearances and conversations were repeated at different places and in varying circumstances for about six weeks; that on one occasion he was seen by as many as 500 at the same time, some of whom were at first doubtful as to the facts: and that then these manifestations entirely ceased, except for the experience of Paul. It is certain that the disciples in these few weeks had come to be convinced that Jesus had actually been with them and that consequently they passed out of a state of gloom and despair into joyous and unflinching boldness; that the belief in the physical resurrection of Jesus was an essential part of the creed and preaching of the primitive church; and that the first day of the week became the Christian day of worship. No plausible explanation of these facts, of the empty tomb; of the reports and convictions of the disciples; who claimed to have seen and talked with Jesus in human form, especially of the case of Paul; of the revulsion of feeling on their part; of the consequent foundation of the Christian Church, and of the consecration of the first day of the week, has ever been given except that after his death Jesus, in this as in so much else unlike all other men, entered by resurrection and later ascension upon a new course of life and a new course of activity. Without the resurrection as well as the life and death of Jesus historical Christianity could never have come into existence; by it he became the founder of the Church and the dominating personality of the ages.

David Foster Estes,
Professor of New Testament Interpretation, Hamilton Theological Seminary, Colgate University.

Jesus Christ, Logia of, the sayings of Christ, a title given to certain first century papyri, discovered in the course of excavations at Oxyrrhynchus carried on under the direction of Professors Grenfell and Hunt. The first find of these logia was made in 1897, but in 1903 a second collection was discovered. It has been suggested that these may be remains of the so-called Gospel of St. Thomas. Each of the recently unearthed sayings, like those of 1897, is introduced with the sentence 'Jesus saith.' These sayings are for the most part new, though one of them is in part known to have occurred in the Gospel according to the Hebrews. The new sayings are not so well preserved as the 1897 papyrus, in which the deep blackness of the ink was wonderful. In the later discovered papyri the ends of the lines are lost throughout, but there is this advantage: the introduction to the entire collection of sayings, of which both papyri are probably a part, is given, stating that these were the sayings in the logia which Jesus spoke through Thomas and perhaps another disciple.

The first saying is that one of which a part is already known to have occurred in the Gospel according to the Hebrews. It is one of the most remarkable sayings ascribed to Christ. It says: "Let not him that seeketh cease from his search until he find and when he finds he shall wonder; wondering he shall reach the kingdom and when he reaches the kingdom he shall have rest."

The kingdom of heaven is also the subject of the second saying, which is much the longest and most important. The kernel of it is that most remarkable and profoundly mystical saying recorded by St. Luke alone: "The Kingdom

of God is within you,» but the saying in the papyrus appears in quite different surroundings from those attributed to it by St. Luke and extends far into another region. When published the sayings will doubtless be widely discussed by the critics as the logia of 1897 were. They are of enormous interest on account of the variations they disclose from the accepted texts.

One variant which Prof. Hunt quotes as of great value is Luke xi., 52, which reads: «Woe unto you, lawyers; for ye have taken away the key of knowledge, ye entered not in yourselves, and them that were entering in ye hindered.» The papyrus, however, reads: «Ye have hidden the key of knowledge, ye entered not in yourselves and to them that were entering in ye did not open.»

The recently discovered papyrus contains part of the discourse of Christ closely related to certain passages in the Sermon on the Mount in St. Matthew and to the parallels thereof in St. Luke; and secondly, part of the conversation between Christ and his disciples. The latter presents a striking resemblance to the well known story recorded in the Gospel according to the Egyptians and in the uncanonical gospel used side by side with the canonical gospels by the author of the Second Epistle of Clement, which was written about the middle of the second century. It consists of an answer to the question put in the Gospel according to the Egyptians into the mouth of Salome; in the uncanonical gospel quoted by Clement into the mouth of some unnamed person, but by the recently discovered papyrus into the mouth of the disciples. The question, with some variations of form between the three, was: «When will Christ's kingdom be realized?» The answer as recorded in the Gospel according to the Egyptians was: «When ye shall trample on the garment of shame; when the two shall be one and the male as the female neither male nor female.» The papyrus differs somewhat from this, and incidentally shows that the interpretation generally given to «When ye shall trample on the garment of shame» is incorrect. It is usually considered to signify «when ye put off the body; that is, to die.» But the papyrus shows that the real point lies in a mystical allusion to Genesis iii., the phrase meaning, «When ye have returned to the state of innocence which existed before the fall.»

Jesus College, Cambridge, England, founded by Alcock, bishop of Ely, in 1496. It has 16 foundation fellowships, open without restriction to all his majesty's subjects. Five were of the original foundation, and the others have been added by subsequent benefactors. Six of the fellows are required to be in orders. The mastership and one fellowship are in the absolute appointment of the bishop of Ely. To the other fellowships on a vacancy the master and fellows nominate two candidates, one of whom is elected by the bishop. There are numerous scholarships.

Jesus College, Oxford, England, founded by Queen Elizabeth in 1571 on the petition of Dr. Hugh Price, treasurer of St. David's, Wales, who left lands for the maintenance of a principal, eight fellows, and eight scholars. It was increased by different benefactors until it came to consist of a principal, 19 fellows, and 18 scholars; but by the ordinance of the university commissioners the fellowships have been reduced to 13, a half of which as near as may be are to be filled up by natives of Wales, the other to be under no restriction by reason of birth. A fellowship founded by Charles I. for natives of Guernsey and Jersey has been converted into two scholarships for natives of these islands or persons educated at Elizabeth College, Guernsey, or Victoria College, Jersey. This was the first college founded on Protestant principles.

Jesus Island, Canada, an island in the Saint John River not far from where it joins the Saint Lawrence River; area, about 1,200 square miles.

Jet, a mineral, which is found in compact masses so hard and solid as to be susceptible of being turned on a lathe and manufactured into ornamental articles. It has been worked for centuries in Whitby, England. It is found in thin laminations, which subsequently thicken out to 2 or 3 inches in the upper lias strata in that neighborhood; a lower bed, from which the best quality is obtained, has a thickness of 20 feet, and is known as jet rock. Jet is supposed to have been worked in England as far back as the time of the Romans. Jet rosaries and crosses were common in the Abbey of Whitby when it was a resort of pilgrims. The jet manufactures of Whitby fell away about the time of Queen Elizabeth, and were revived in 1800. It is also manufactured at Scarborough, England.

Jetties are dikes at the mouth of a river or across a harbor bar to increase the riverine or tidal current by narrowing the channel, and thus scour out a deeper bed, to accommodate navigation. Single jetties are solely at the mouths of rivers with strong currents, to deflect these to one side of its natural channel, but in most rivers, and in all harbors they are double, forming an entire artificial channel. Briefly, the physical principles are: The power of water to transport solid matter varies as the square of its velocity, so that increasing the strength of current two fifths will about double its sand-carrying capacity; the velocity increases with increase of slope and decrease of friction; the slope is increased by narrowing the channel, since it forces flood waters inside or outside to rise higher at the entrance, and the friction decreases as the width of the channel; and lastly, if a channel of a given depth and width passes a given quantity of water, then a narrower channel involves either a permanently greater height of water if the bed were rigid, or the scouring of the bed to a depth which, multiplied by the new width, will produce an equal cross-section with the old. The increased slope and the correspondent velocity vanish as the water cuts a deeper basin; but the velocity due to lessened friction does not, nor do the deepened channel, the greater discharge through it, and the greater tidal fluctuation due to the larger basin. The channel is scoured along until the deepening sea establishes an equilibrium of action.

The system is not new. A number of important European rivers were jettied even before the middle of the last century, and others not much later. The Danube at Sulina had been deepened to 21 feet, from 8 feet before; and in 1874 Eads found seven German rivers, including the Oder and Vistula, improved so that with

initial channels of 4 to 7 feet, they then had 13 to 23.5. Several of these are still deeper now, the result increasing somewhat for many years under the same conditions. The Neva in Russia has also such works; as also the harbors of Calais and Dunkirk in France. In the United States a very great number have been constructed, both for rivers and harbors; the greatest of all are the jetties at the mouth of the Mississippi, and as the general principles are alike in all, these may be briefly described.

The Mississippi discharges its waters to the Gulf not by one channel, but in the main by three, running through "passes" 12 to 17 miles long from the delta land to the sea, and widely divergent. The largest is the Southwest Pass; next the easternmost, Pass à l'Outre, with two branches. In the middle is the smallest, South Pass, 600 to 800 feet wide, and taking not over a tenth the total discharge, with a shoal at its head only 15 feet deep, and a bar at its mouth only 8 feet; so that, with 30 feet of water through the delta, it was unserviceable for deep-water navigation. Capt. James B. Eads offered to build jetties to deepen the bar at Southwest Pass from its then 13 to 28 feet; but Congress preferred South Pass, as cheaper and simpler, needing work only at the head and foot. Work was begun in June 1875, and within nine months the water was 13 feet on the bar; by 1879 it was 29 feet; it is now over 30.

The west side of the pass had silted up into land 4,000 feet farther out than the east, so that the west side of the two parallel dikes built out to 30 feet depth in the Gulf was about 7,800 feet, while the east was 11,800. First piles were driven in two rows 1,000 feet apart (the piles 12 feet apart) to mark the lines of the projected jetty-walls. Then mattresses were built, of willow branches, or young willows 15 feet long, cut with the leaves on, laid in four courses, each crosswise to the next, and fastened together at top and bottom by pine planking 2½ inches thick, doweled with hickory pins; this compressed the willows to a thickness of about 2 feet, and their brush-ends projected 3 or 4 feet. These mattresses were 100 feet long; for the bottom course they were made 50 feet wide, but steadily narrowed for each of the four courses at first needed to bring them to the surface of the water, the top one being 20 feet wide. Wider ones were used in deep water. These were built on shore, on ways as for launching boats; towed by tugs to the places indicated by the line of piles, and sunk by loading one or two tons of stone on top. Once down, they speedily filled with sediment and became solid. At the sea ends foundations of mattresses 200 to 300 feet broad were laid. For two or three years these stone-laden mattresses gradually sunk in the soft bottom, and new ones were added at the top to bring the surface even. The willows not imbedded in sediment were revetted with stone. Where exposed to storms, they were considerably sloped, and more thoroughly revetted. The sea ends were afterward capped with concrete blocks. The jetties have undergone considerable repairs since then, but have essentially done their work of making the river navigable for large vessels.

One of the difficulties was this: If obstacles were placed in the way of a free flow of water, the river would by so much at least desert this pass and run through the others; so that their heads had to be closed up to a sufficient extent to prevent this. Plans for improving the Southwest Pass in like manner have been prepared by the government engineers, but have not been executed.

At the mouth of the Brazos, west of Galveston, Texas, an ingenious plan was adopted for avoiding interference in the work by flood-tides: A long trestle was built out to deep water above high tide, the mattresses hung under it by ropes, and the stone dropped on them from above to sink them. Instead of being launched from shore and towed, they were carried on a portable railway running on top of the trestle, and let down.

The Columbia River jetty is the most conspicuous example of the single instead of the double dike. It is 4234 miles in length, the longest in the world. The bar at the mouth of the river, ever shifting and sometimes not over 12 feet deep, had half spoiled this superb river for navigation, and was greatly dreaded. But the river has a mean high-water discharge of 600,000 cubic feet per second, a mean tidal ebb of 1,000,000, with tides of 6.2 feet; and in 1884 a single curved line of brush mattresses with rubble-stone copings was begun, completed in 1894, to turn the current away from spreading itself on both sides and scour out the channel on one. This was finished in 1894; it has formed a permanent channel 30 feet deep, and made the river a highway of the heaviest ocean commerce, with lines to all Pacific lands.

Others are too numerous for more than brief mention. At Yaquina Bay, Oregon, 115 miles south of the Columbia — an estuary 20 miles long discharging into the sea through a narrow, tortuous, shifting channel, and over a sand-bar with 7 feet of water — parallel jetties about half a mile long, one of rubble-stone on a rock bed, one of brush and stone on a sand bed, have doubled the depth of water and made the channel calculable. At Galveston, the single jetty was a relative failure, it needing a double one to converge the tides; and in 1896 the government completed it, with sides of 35,000 and 25,000 feet, costing over $8,000,000, and furnishing 27 feet of water between the island and the mainland. Other notable ones are at the mouth of St. John's River, Florida, beginning at the sides of the river-mouth and converging to 1,000 feet apart at the crest of the bar. Charleston's double one has sides of 15,000 feet each.

Jeune, Lady **Mary Stewart-MacKenzie,** English writer on social topics. She is the wife of Sir Francis Jeune and has long been prominent in efforts to relieve the condition of the poor of London. A volume of essays selected from her contributions to periodicals has been published under the title 'Lesser Questions' (1894).

Jev'ons, William Stanley, English logician and economist: b. Liverpool 1 Sept. 1835; d. Bexhill, near Hastings, 13 Aug. 1882. He was graduated from University College, London. Having obtained an appointment in the Royal Mint, he went to New South Wales in 1854, but afterward returned to England, and in 1866 became professor of logic, philosophy and political economy in Owens College, Manchester, and this post he held until his resignation in 1876 in order to accept the chair of political economy in London University. He retired from this

position in 1880 for the purpose of devoting his whole time to literary pursuits. His writings include: 'Pure Logic' (1864) and 'The Substitution of Similars' (1869), in which he sought to popularize symbolic logic through a modification of Boole's mathematical methods; 'Elementary Lessons in Logic' (1870); 'Theory of Political Economy' (1871); 'The Principles of Science' (1874); 'Money and the Mechanism of Exchange' (1875); 'Primer of Logic' (1876); 'Primer of Political Economy' (1878); 'Studies in Deductive Logic' (1880); and 'The State in Relation to Labour' (1882). Among works published posthumously are: 'Methods of Social Reform' (1883); 'Investigations in Currency and Finance' (1884); and 'Pure Logic' (1890). In a pamphlet on the 'Coal Question,' he presented a mass of evidence to show that England's progress would be checked by want of coal; in his work in political economy he attempted to put the chief definitions in the form of mathematical quantitative formulæ, and in this way did important work in revealing the nature and relations of economic facts; he also developed the theory of marginal utility. His 'Life and Letters' edited by his wife were published in 1886.

Jew, The Wandering, a poetical personage of popular traditions, who owes his existence to a story connected with the well-known scene in the history of Christ's passion. As Jesus was on the way to the place of execution, overcome with the weight of the cross, he wished to rest on a stone before the house of a Jew, whom the story calls Ahasuerus, who drove him away with curses. Jesus calmly replied, «Thou shalt wander on the earth till I return.» The astonished Jew did not come to himself till the crowd had passed and the streets were empty. Driven by fear and remorse, he has since wandered, according to the command of the Lord, from place to place, and has never yet been able to find a grave. Shelley, Lewis, Croly, and Mrs. Norton in England, Schubart and Schlegel in Germany, and Sue in France, have turned this legend to account. Goethe has sketched Ahasuerus with great spirit and humor as a philosophic cobbler at Jerusalem who opposes Christ with a cold worldly logic which will not look above the things of earth.

Jew of Malta, The, a tragedy written by Marlowe (q.v.) about 1587, first acted 1592, and first published in 1633, edited by Heywood. Shakespeare was largely indebted to Marlowe's play for his 'Merchant of Venice.'

Jewel-weed, Touch-me-not, or **Snap-weed,** popular names for two plants, *Impatiens aurea* and *I. biflora,* of the natural order Geranaceæ, well known in damp shady places throughout the cooler parts of North America, where they form dense masses. They are characterized by sac-like pendulous yellow or orange, more or less spotted flowers, and by their sensitive seed pods which when mature burst with the slightest touch and throw the seeds to a considerable distance. Hence the second and third names above. The first name is probably a survival of their use as antidotes for so-called Rhus poisoning.

Jewell, joo'ĕl, **Marshall,** American statesman: b. Winchester, N. H., 20 Oct. 1825; d. Hartford, Conn., 10 Feb. 1883. He learned the tanning trade in his father's leather belting business; went West, where he was a telegraph operator for three years, and in 1850 returned and re-entered his father's business. In 1868 he was the unsuccessful Republican candidate for governor of Connecticut, but in 1869 he was elected, and re-elected in 1871. During his administration as governor the present militia system was adopted, and the erection of the new State House begun. In 1873 he was appointed United States minister to Russia, and was recalled to become postmaster-general in President Grant's cabinet in 1874. He resigned in 1876 on account of disagreement with the President's policy in the Whiskey Ring frauds. His work in the Post-office Department was very effective and led to the discovery of the Star Route scandal, and to the introduction of several reforms. In 1880 he was chairman of the Republican National Committee and managed the Garfield campaign.

Jew'elry, ornaments for personal adornment, usually made of gems and precious metals. At some remote period primitive man gradually migrated northward from the tropical belt in which he probably first came into existence, and as he felt the colder temperature inconvenient, especially at night, he found it advisable to invent some sort of covering or clothing, by means of which he could obtain warmth. What the first clothing was it is of course impossible to say, but it may be conjectured to have consisted of belts of grass or leaves knotted together either by their own stocks or by accessory vegetable fibres. When men became hunters, which they did not do until they had progressed far enough to have invented offensive weapons, they no doubt soon used dried skins for clothing. A rough tanning of such skins could have been managed by rubbing them with fat. Then came the difficulty of fastening them. Some savage tribes still wear cloaks which have only a hole cut for the head to go through, and this is likely enough to be a primitive type; then also they might have been tied up with strips of sinew, but at an early stage they were pinned together with a bone or large thorn. Here is the germ of the brooch. Numbers of such pins have been found in all places where the remains of primitive man exist, and they range from the simplest forms to quite ornamental ones. The heads of the carved specimens show a certain amount of progression, and are often decorated with engraved lines, dots, and circles. Ivory, wood, and bone are all commonly used, and in time, as metal workings became known, these carved pins are imitated in bronze or gold. From the Stone Age, through the Bronze Age, up to the Iron Age, in which we are still considered to be, pins and their derivatives, brooches and buckles, have been universally used, and it is an interesting study to endeavor to trace their utilitarian development as well as their artistic and technical beauties. Starting with the earliest metal pins, which are of bronze, it soon appears that the head or thickened end is treated ornamentally, hammered flat, and pierced. Into the pierced hole in the top of pins are often found wire rings coiled several times, or single rings, as in plenty of specimens found in Ireland. In other cases of Roman pins found in Britain, there are chains of which a few links

only are left, and in one case at least a pin the head of which was threaded with a chain of several links, was found among the debris of one of the Swiss lake dwellings. The modern safety-pin is quite the same in all essential points as one which was found by Dr. Schliemann at Mycenæ, and the same form, with the arch more or less specialized in design, has been very largely used North and South, East and West. The Greeks made the arch short, and enlarged and ornamented the nose or hollow for the pin to rest in; the Romans made the arch big, and set it with beads of amber and bronze, and fretted it out in innumerable ways, curves, spirals, and all sorts of twists and turns which the fancy of the artist could devise. The Roman fibulæ are more usually made of bronze or silver, but the Greek are largely of gold, and of exquisite workmanship.

Among the Romans of about the Augustan age, cameos were largely used as pendants; coins also, richly set, were so used. Charlemagne, in the 8th century, wore a splendid reliquary as his necklace, which was sent to him by Haroun-al-Rashid. This was buried with him, and was found on his neck when the body was exhumed in 1169. The use of ornamental monograms in jewelry began during the 14th century. Diamonds used in jewelry before the beginning of the 17th century are always cut, either as "tables" or "roses," the "brilliant" not being then invented, and all colored stones were cut in the rounded form known as "cabochon."

A French jeweler, named Daniel Mignot, during the beginning of the 17th century, is supposed to have first set rows of jewels close together in consecutive order. This notion was, of course, very suitable for working the monograms then so prevalent, and it has been more or less used ever since. From the 16th century pearls were much in fashion, and pendants commonly have single pearls or groups of pearls dependent from them. Toward the end of the 17th century pendants are found made of gold only, but exquisitely pierced, chased, and engraved, and some specimens of Portuguese work are remarkable for delicacy of execution; these are sometimes set with very small diamonds. Sprays of leaves and flowers, and knots of ribbon, during the 17th century, are made in metal, and thickly set with crystals — paste or real jewels — particularly by Venetian, French, and Portuguese, followed at a safe distance by English workmen. The best of these are by Giles Légare, and in the 18th century his follower, Pierre Bourdon.

The jewelers of the beginning of the 18th century did not hesitate to mix gold and silver in their jewelry. Gold was commonly used for the settings of colored stones, and silver for diamonds. Summarized briefly: (1) Savage tribes have used for their ornaments natural objects easily worked. (2) The cultured nations of antiquity have generally made their finest pieces of personal ornament of gold. (3) During the period of the Renaissance gold and silver, colored precious stones, and vitreous enamels were very largely used. (4) During the 19th century the diamond particularly claimed the attention of jewelers. See DIAMOND; GEMS; PEARL, etc.

Jewelry Trade, The. The making of jewelry is one of the oldest trades of which the American historian can find record, for while the manufacture of such articles of adornment occupied a position of little commercial importance until several years after the settlement of this country by the colonists, the fact remains that jewelry was made by the native Indians many years before the first European set foot upon American soil.

Prim and precise as the Puritans are supposed to have been, it is a mistake to imagine that they were too primitive in their opinions to appreciate the advantages of a little jewelry in the adornment of their persons. Both the Dutch and the English brought such ornaments with them to the new world, and one's personal attire was considered incomplete without the buckles, brooches, and rings which were in vogue at that time. As the natural result gold and silver smithing was one of the first industries to be established in the colonies, and every large town had its smiths who produced the most popular articles of jewelry, as well as certain kinds of trinkets for the Indians, medals, snuff-boxes, etc.

One of the most important products of the early silversmith's art was the making of elaborate boxes from rare woods, or sometimes, shell, inlaid with gold or silver. Snuff-boxes were manufactured in this way, while other boxes were made to contain the parchments which conferred the freedom of the city upon distinguished guests. Sometimes these boxes were made entirely of silver and were lined with gold. Occasionally the metal was gold, studded with precious stones. It was such a box as this in which the people of New York presented the "freedom" to Alexander Hamilton, after his elaborate defense of the liberties of the press in New York, in 1784; while similar boxes were later conferred upon Lafayette, Washington, and Scott. The making of such boxes and other ornamental insignia conferred upon distinguished men represents but one of the branches of the art of the smith, for there were so many demands made upon the craft that its ranks were constantly extending. In 1788, when the adoption of the Federal Constitution was celebrated in Philadelphia, there were no less than 35 goldsmiths and jewelers in the procession, while, more than 20 years before, it had been the profuse display of jewelry, silverware, etc., in the homes of the prominent New Yorkers that had incited Townshend to introduce the historic bill known as the "Stamp Act," which was undoubtedly the entering wedge in the struggle which finally separated the colonists and the Crown. At this period in the history of the nation the colonies that could boast of the richest inhabitants, and which could, therefore, afford to spend the greatest amount of money for jewelry and other articles of personal adornment, were South Carolina, Virginia, Maryland, New York, Pennsylvania, and Massachusetts.

When compared to the facilities afforded to jewelers at the present day the tools of the old-time silversmiths were crude enough. The only noticeable difference between them and those used by workers in other metals was in their size, a factor which fitted them for finer work.

The extreme tenuity and the lack of brittleness of gold and silver gave room for the exhibition of great ingenuity on the part of the artist who aspired to forget the ordinary patterns in the creation of more fanciful designs, while the attainment of the polished, or burnished surface, made a more tender treatment imperative. In the beginning of the century the art of frosting gold, like that of satin-finishing silver, was unknown. Gold and silver both came from the workshop with a glittering surface, and such ornamental and decorative work as may then have been attempted, was either crude enameling, applied work, or engraving. Later, of course, came all the new processes by means of which the precious metals have been used conjointly with other metals, or with wood, mother-of-pearl, glass, porcelain, pearls, and gems.

In those days everybody who engaged in the industry of jewelry-making learned his trade so thoroughly and in such an old-fashioned manner that it was impossible to draw the close distinctions between the several different but associated occupations that are so clearly drawn to-day. At that time, to say that a man was a "jeweler" indicated that he was a goldsmith and silversmith, a watchmaker and clockmaker, and a maker of fine mechanical instruments, for each of these branches involved a knowledge of the others. At the same time the trade was thoroughly a mechanical one, and any attempt to realize a higher ideal in the making of jewelry and other ornaments was most unusual. Instead of "wasting his time" over such inventions the artisan devoted all the hours of labor to such work as might be assigned to him, even dividing his time and skill between his own and kindred trades. To a similar degree the seller of such goods was more frequently a workman than a dealer. While a merchant in the strict sense of the word, he was unusually a person who could take his place at the bench if necessity required, and who owed his success as a salesman to his knowledge of the various kinds of metal and fancy work for the adornment of the person. Gradually, as the demand for such goods increased, the more progressive of these merchants began to manufacture the simple articles which they sold, although it was some time before this branch of the industry had extended beyond the making of spoons, forks, rings, and similar small pieces.

From the earliest days in the history of the jewelry trade, Providence, R. I., has been one of the great centres of this industry. It was shortly after the close of the Revolutionary War that Messrs. Sanders & Pitman and Cyril Dodge began to make silverware in that city. As early as 1805 there were no less than four establishments located there. They were operated by Nehemiah Dodge, John C. Jenckes, Ezekiel Burr, and Pitnam & Dorrance, and their product, to make which they employed about 30 men, included silver spoons, gold beads, and the simplest designs in finger rings. A few years later some of these manufacturers began to turn their attention to cheap jewelry in which silver and other alloys were used with a small fraction of gold. These included many small articles like breast-pins, ear-rings, key-rings, sleeve-buttons, etc., as well as some large articles which were plated by the hammering process. The first jewelry establishment at Attleboro, Mass., a town which has continued to hold pre-eminence in the trade, was opened about 1805, while the establishment of the busines in Newark, N. J., by the firm of Hinsdale & Taylor, dates from about the same time. Philadelphia also became identified with the early jewelry interests. The firm of Bailey & Company, a house which is still conducting business, although under another name, was one of the first manufacturers in that city, and its trade with the west and south soon became so extensive that the concern became known as one of the most prosperous in the business.

Maiden Lane, New York, did not become the centre of the American jewelry trade until about 1830. The steady increase in the demand for jewelry inspired new ideas in manufacture, and, as much of the desire for novelties originated in New York, that city naturally became the market for the introduction of such products. In the New York "Mercantile Register" for 1848–9, one may find the advertisements of the following houses, which were then prominently identified with the manufacture of jewelry, watches, and silverware: Ball, Tompkins & Black (late Marquand & Company), 247 Broadway; Allcock & Allen, 341 Broadway; Gale & Hayden, 116 Fulton street; Tiffany, Young & Ellis, 271 Broadway; Wood & Hughes, 142 Fulton street; Samuel W. Benedict, 5 Wall street; George C. Allen, 51 Wall street; Squire & Brother, 92 Fulton street and 182 Bowery. Some of these houses have since gone out of existence; only one now retains its original name, but three are still conducted under firm names which retain some portion of the early title.

Although great advances have been made in every branch of American art there is no particular in which it is more pronounced than in the metal work which is so conspicuous a part of the art of the gold and silver smiths, and the fact that the American product is now regarded as superior to that of any other country of the world is not only due to our knowledge of the art in itself, but is largely the result of our wider knowledge of the articles into whose manufacture good taste enters. To-day the designers employed by the great gold and silver smiths of America are not only men of refinement and liberal education, but they are so truly artists, in the best sense of the word, that they could, if required, draw or model from life, or paint in oils or water-colors. It is largely due to the efforts of such men that so much advance has been made in the making of ornamental gold and silver ware during the past half century, a progress which is indicated by our exhibitions of such articles as loving-cups, vases, and presentation pieces, among which one may mention the gold medals, valued at $1,000 and $500, which were presented by the State of New York to Dr. E. K. Kane and Commander H. S. Hartstein, the Arctic explorers, in 1858; the silver vase made in honor of William Cullent Bryant, now a part of the exhibit at the Metropolitan Museum of Art, and the several testimonials presented to Cyrus Field, upon the completion of the transatlantic cable, in 1866. Among the other conspicuous specimens of this art are the silver service which was presented to the arbitrators of the Alabama claims, in 1873, the silver centrepiece duplicating the statue, "Liberty Enlightening the World,"

which was presented to August Bartholdi, in 1886; the elaborate testimonial presented to William Ewart Gladstone, in 1877; the Edwin Booth loving-cup, and the many yachting trophies that have been manufactured on the occasion of international and other important regattas.

The discovery of gold in California, in 1848, naturally gave a great impetus to the manufacturing jewelry industry, for it gave assurance of an ample supply of metal needed for all purposes without the cost of importation, and, if, at that time, we were lacking in knowledge as to the various forms in which the art of the smiths had been developed, it needed but such expositions as those at London and Paris to perfect our education in that respect. With such secrets revealed to us, however, it took but a comparatively short time for us to acquire the inventions in machinery and tools necessary to the reduction of the cost of production, and it is largely due to our success along these lines that we have been able to lead the nations of the world in this branch of the fine arts.

The process of electro-metallurgy was introduced about 1860, and since that time all kinds of goods in which plating has been employed have been made by this method, the centres of production being located chiefly throughout Connecticut, although there are other large plants at Newark, N. J., and Providence, R. I. Speaking from a strictly commercial point of view it is almost impossible to overestimate the value of this process, for it has brought within the reach of people of limited means an attractive line of tableware and other articles of utility that are now deemed indispensable in every household. If not as artistic and as highly finished as solid silverware they are extremely serviceable and there can be no question but that the better grades of such goods possess considerable artistic merit. In fact, for a time at least, the silver-plated ware encroached upon the province of solid silver, but during more recent years the low valuation of silver bullion, and the mechanical inventions which have further reduced the cost of production, have tended to reverse the tables.

The production of watches is so closely related to the jewelry trade that some reference must be made to it in any review of that industry. It was but a comparatively short time ago that all watches were imported, whereas, to-day we have progressed so far that it is only some very small watches for ladies' use and some particularly complicated chronographs that are now obtained in Europe. All others are made in this country, the industry being largely centred in New Jersey, Massachusetts, and Illinois. In its consumption of diamonds and other precious stones America will also compare favorably with other nations, New York being the largest market for such gems in the world. Although it was but a few years ago that the art of diamond cutting and polishing was established in the United States, our wise tariff regulations have given such an impetus to this branch of the trade that some of the most expert cutters from Holland have now located in this country.

So far as statistics go we have but little material concerning the early history of the jewelry industry. We know that, in 1812, the value of the Providence product was but $100,000, and that, as late as 1860, the returns from all parts of the country were small as compared to those of the present day. In that year, for example, the jewelers and watchmakers of Philadelphia produced but $691,430 worth; the silverware manufacturers, $516,000 worth, and the makers of watch-cases and chains, $1,714,800. The production of gold chains and jewelry at New York was $2,497,761; of gold watch-cases, $337,690, and of silverware, $1,250,695. In Newark, the total product was $1,341,000, while Providence produced $2,251,382 in jewelry, and $490,000 in silverware. The following census statistics, covering the years from 1880 to 1900, indicate the great advances which have since been made in the trade:

	1880	1890	1900
Establishments	739	783	908
Capital	$11,431,164	$22,246,508	$28,120,939
Employees	12,697	13,880	20,676
Wages	$6,441,688	$8,038,327	$10,746,375
Value of product	$22,201,621	$34,761,458	$46,501,181

Unfortunately, however, such statistics cannot indicate what great things have been accomplished from an artistic standpoint, for the time has now come when the American jeweler, instead of going to Europe for his ideas and models, leads the best European producers in both correctness and originality of designs and workmanship. More than 12 years ago the London "Art Journal" summarized America's progress in this branch of the fine arts, as follows: "Judging by the productions exhibited, one may well be in doubt whether our much-boasted European pre-eminence in these things is to last much longer, and whether, after all, we shall not in the near future be compelled to regard the firms of New York as at least our equals, if not our superiors, in the production of high-class gold and silver work."

These words written in October 1893, were a prophesy which has certainly been realized, as is evidenced by the victories of the American jeweler, both at home and abroad.

Jewett, joo'ĕt, **Milo Parker,** American educator: b. Saint Johnsbury, Vt., 27 April 1808; d. Milwaukee, Wis., 9 June 1882. He was graduated from Dartmouth College in 1828, from the Andover Theological Seminary in 1833, and was professor of rhetoric and political economy in Marietta College (Ohio) in 1833–8. Having become a Baptist, he resigned his professorship, in 1839–55 was principal of the Judson female institute established by him in Marion, Ala., and at the same time edited the 'Alabama Baptist.' He then established a young ladies' seminary at Poughkeepsie, N. Y., assisted Matthew Vassar (q.v.) in founding Vassar College, was its first president in 1862–4, and subsequently was active in educational and religious work at Milwaukee, Wis. Among his writings are a treatise on 'Baptism' (1840), and pamphlets on 'The Relations of Boards of Health and Intemperance' (1874) and 'The Model Academy' (1875).

Jewett, Sarah Orne, American novelist and writer of short stories: b. South Berwick, Maine, 3 Sept. 1849. She was educated at Berwick Academy and became a contributor to the 'Atlantic Monthly' in 1869, in which periodical the larger part of her work has appeared. Her usual theme is the New England character seen

from its most attractive side, its gentler aspects given greater prominence, and its harsher ones not unduly emphasized. Her works include: 'Deephaven' (1877); 'Play Days' (1878); 'Old Friends and New' (1879); 'Country By-Ways' (1881); 'The Mate of the Daylight, and Friends Ashore' (1883); 'A Country Doctor,' a novel (1884); 'A Marsh Island,' a novel (1885); 'A White Heron and Other Stories' (1886); 'The Story of the Normans,' an historical work (1887); 'The King of Folly Island, and Other People' (1888); 'Betty Leicester' (1889); 'Strangers and Wayfarers' (1890); 'A Native of Winby, and Other Tales' (1893); 'The Life of Nancy' (1895); 'The Country of the Pointed Firs' (1896); 'The Queen's Twin and Other Stories' (1899); 'Betty Leicester's Christmas' (1899); etc. Her literary style possesses great charm.

Jew'fish, a huge Californian game-fish (*Stereolepis gigas*) of the sea-bass family (*Serranidæ*). It has a single dorsal fin, the soft part of which is shorter than the spinous portion, and is brown with black blotches and becomes much darker with age. Among the dense growths of kelp in moderately deep water along the coast of southern California the jewfish finds a congenial home. It haunts the neighborhood of islands and is especially abundant about Santa Catalina. Belonging to a family of game-fishes and reaching a weight of 300 to 500 pounds, it has long been a favorite object of sport for ambitious anglers. It is commonly taken on hand-lines baited with small fish, is exceedingly gamy, and brings a good price in the market.

Two other fishes of the same family but more closely related to the groupers are known as the Florida or black jewfish (*Garrupa nigrita*) and the spotted jewfish (*Promicrops guttatus*). The former ranges from Florida to Brazil, and the latter widely through the warm parts of both Atlantic and Pacific oceans. The black jewfish is quite common about the coral reefs, in the caverns of which it lurks. Although not especially gamy, its enormous size and weight, sometimes reaching even 1,000 pounds, have induced a few anglers to essay its capture with rod and reel. It is easily distinguished from the Californian jewfish by its greater robustness, strong canine teeth, and rounded caudal fin. Consult Jordan and Evermann, 'American Food and Game Fishes' (1903); Holder, 'Big Game Fishes of the United States.'

Jewish Calendar. The Jews date their era from the Creation, which according to their tradition was 3760–1 years before the Christian era. The Jewish year is a lunar year and consists of twelve months, with an additional one for leap year. The months have alternately 29 and 30 days, the first and thirtieth days being called New-moon. Each cycle of 19 years has 7 leap years, the 3d, 6th, 8th, 11th, 14th, 17th, and 19th. The spring months are called Nisan (in which the Passover is celebrated), Iyar, Sivan; summer includes Tammuz, Ab, Elul; autumn Tishri, Heshvan, Kislev; and winter Tebeth, Shebat, Adar, with 2d Adar for leap year. The civil year began with the month of Nisan; the religious with Tishri. Rules for the computation of the calendar were issued, after various methods had been employed in earlier centuries, by Hillel II. (330–365). The date usually assigned by Jewish writers to the year when Hillel fixed the calendar is 670 of the Seleucidan era, or 4119 A.M., or 359 of the Christian era.

Jewish Charities. On 26 April 1655, the board of directors of the Dutch West India Company wrote to Governor Stuyvesant as follows: "After many consultations, we have decided and resolved upon a certain petition made by said Portuguese Jews, that they shall have permission to sell and to trade in New Netherland and to live and remain there, provided the poor among them shall not become a burden to the company, or to the community, but be supported by their own nation."

The records of the Department of Charities of the city of New York on 31 Dec. 1902 show that in a Jewish population approximating 600,000 in Greater New York, in the almshouse on Blackwell's Island there were 17 pauper Jews, of whom the majority were blind, idiotic or possessed of some peculiar defect which prevented admission to existing Jewish charitable institutions. These figures indicate how thoroughly the Jews of New York have assumed the responsibility imposed upon them over 250 years ago. The same is true of Jews throughout the United States. In our modern day, under more favorable conditions and auspices, the Jew has, to some extent, become non-sectarian in his philanthropies. Hospitals, as a rule, supported and endowed by Jews, throw open their doors to sufferers irrespective of creed, color or nationality. Other instances could be cited of charities not medical, organized along similar lines. The free employment bureau of the United Hebrew Charities of New York makes no distinction with its applicants. The Educational Alliance in the same city offers its clubs and classes to Jew and Gentile alike. Jewish agencies, giving material relief, or to use a better term, those which care for the needy in their own homes, in the main confine their work to beneficiaries of their faith, without, however, making any rigid distinction. On the other hand, the trend of Jewish charity has been in the direction of caring for the Jewish poor, solely through Jewish agencies, and without the intervention or co-operation of other sectarian or non-sectarian societies or institutions.

The problem of the Jewish charitable societies of the United States to-day is the problem of the care of the immigrant. As such, it passes beyond merely local lines. In some of its manifestations it is national in character and in a few it has an international significance. The fact that the large bulk of the needy Jews in the United States reside in New York is accidental, and concerns the Jews of Denver and San Francisco equally with those of the eastern seaboard cities. In so far the problem is a national one. Moreover, to deal intelligently with the question requires a knowledge of the immigrant's antecedents, the impelling motive which brought him to the United States, and an acquaintance with his previous environment. And here the international phase of the question comes in. Roughly speaking, it may be said that there are no American-born Jewish poor. Of the 10,924 families who applied for assistance to the United Hebrew Charities of New York during the year ending 30 Sept. 1903, 2 per cent

were born in the United States. And of these the majority of heads of families were of the first generation. Jewish dependents who have an ancestry in the United States of more than two generations are practically unknown.

In the year 1881 began that great wave of emigration from eastern Europe, the end of which is not yet. Driven by a relentless persecution, which endangered not only their homes but frequently their lives, thousands of Jews were compelled to flee from their homes to seek new residence on these shores. The Russo-Jewish committee which originally undertook the work of caring for these immigrants turned it over very shortly to the Hebrew Emigrant Aid Society, which came into existence in December 1881. In one year this society spent $250,000, $50,000 less than had been spent by the United Hebrew Charities of New York in the seven years of its existence. In the first and only annual report of the Emigrant Aid Society, its president outlined as tersely as possible the efforts that had been made to provide homes and occupations for the thousands of fleeing exiles who reached these shores during the momentous summer of 1882. In the month of July the committee spent for board and lodging alone over $11,700.

With the gradual falling off in immigration, the Emigrant Aid Society went out of existence, and the care of the needy immigrant who remained in New York and who became impoverished after residence, reverted to the United Hebrew Charities. In 1885 immigration again began to grow heavier and continued to grow in such numbers that in the following five years over 120,000 immigrants arrived at Castle Garden. In 1890 the immigration reached the figures of 32,321, the largest number ever recorded up to that time. With all that had been done, the real work of the charities was but to begin. In 1891 the religious persecution of the Russian Jews reached a climax. In the year ending 30 September 62,574 immigrants arrived at New York, of whom nearly 40,000 arrived between June and September. The entire charitable effort of the New York Jewish community was for the time directed out of the ordinary channels and applied to this monumental question of caring for the arriving Russian Jews. The Baron de Hirsch Fund, instead of utilizing its income for its educational work, appropriated over $67,000 to the United Hebrew Charities to assist in the work of the immigration bureau. Over $175,000 was spent by the United Hebrew Charities during this year. In September of 1891 it became apparent that there would be no cessation to the immigration, and that much larger funds would be necessary to give anything like adequate assistance to the unfortunates who were arriving at the rate of 2,000 per week. The enthusiasm which was aroused at a banquet tendered to the late Jesse Seligman brought into existence the "Russian Transportation Fund," which added over $90,000 to the revenues of the United Hebrew Charities and which was given by citizens of New York, irrespective of creed. Later in the year, a standing committee of the society, known as the Central Russian Refugees Committee, was organized and was made up of representatives of the Baron de Hirsch Fund, the Russian Transportation Fund, the United Hebrew Charities and the American Committee for Ameliorating the Condition of the Russian Exiles. The last committee was organized to secure the co-operation of relief societies in other cities, in order that the various European societies who were assisting the persecuted Russians to emigrate should thoroughly understand the attitude of the New York organization. The year, October 1891 to September 1892, will ever be a memorable one in the history of Russian emigration and of Jewish philanthropy; 52,134 immigrants arrived at the Barge office in that time. The treasurer of the United Hebrew Charities paid out the enormous sum of $321,311.05, of which $145,200 was spent by the Russian Refugees Committee between February and September.

Since the year 1881, fully 600,000 Jewish immigrants have arrived at the port of New York alone. Of these the bulk comprise refugees from Russian and Rumanian persecution, Austrians and Galicians. They came from countries in which many of them lived under conditions of appalling poverty. The records of the immigration bureau show that from the standpoint of material wealth, these immigrants are below the average of immigrants from other European countries. Due to their previous condition, a goodly percentage is illiterate. On the other hand, the number of skilled artisans and craftsmen is so large as to be distinctly noticeable. From the standpoint of dependency, it will be of interest to study to what extent this large body of immigrants has added to the dependent and delinquent classes of the communities in the United States. The only figures that are at hand are those of New York, which are higher than would be found in other cities and towns for reasons that are obvious.

In December 1899 a study was made of 1,000 families who had originally applied to the United Hebrew Charities for assistance in October 1894. Of these 1,000 applicants it was found that 602 had not applied for assistance after December 1894. Of the balance, 67 families were dependent on the society to a greater or lesser extent in January 1899. More detailed investigation disclosed the fact that nearly all of these 67 applicants were made up of families where the wage-earner had died, leaving a widow with small children, or of respectable aged and infirm couples unable to be fully self-supporting, or of families in which the wage-earner had become incapacitated through illness. In other words, after five years over 93 per cent of the cases studied were independent of charitable interference. The marked feature in the care of the Jewish poor in the United States is the almost entire absence of the so-called pauper element. Even the 67 families above mentioned cannot be included in this category. Widowhood is the resultant of purely natural conditions, and when it afflicts the poor mother with a family, it frequently produces a condition of dependence which has in it no characteristics of demoralization.

If there is one cause more than another leading up to this condition, it is the absence of the drink evil among Jews. The instances in which drunkenness lies at the bottom of Jewish dependency are so infrequent that they may be ignored. Combined with the absence of this vice, there are other virtues engrafted on the Jew for centuries, all of which tend to the preservation of his self-respect and his self-esteem. Among these are the love of home,

the inherent desire to preserve the purity of the family, and the remarkable eagerness which he shows for education and self-improvement.

From what has preceded, it will be comprehensible that the Jewish charities of the United States, having a special problem with which to deal, have instituted special methods for its solution. In the main, relief organizations have followed the organized methods of sister societies. In the past 25 years, new organizations of all kinds have sprung into existence to meet the demands made by the constantly increased immigration. To revert to New York, when the Central Russian Refugees Committee went out of existence in January 1893, the decrease in immigration no longer warranting its continuance, the active work of assisting the arriving immigrants devolved upon the United Hebrew Charities. The work of this society is typical of similar Jewish organizations throughout the United States. The report of the fiscal year ending 30 Sept. 1903, shows that 10,924 individuals and families applied for assistance. Of these, 6,260 had applied for the first time. Material relief was granted to 7,290; 1,802 were found not to require assistance of this kind, and 1,202 were refused assistance for some cause or other. The society conducts an employment bureau which is free to employer and employee, and during the last fiscal year found employment for 3,892 applicants. It grants relief in kind, including groceries, clothing, shoes, furniture, etc. The extent of the society's work in this direction will be gathered from the statement that 51,875 garments and pieces of furniture were distributed last year. The annual disbursements for material relief alone amount to over $150,000 per annum. Ever since its organization 30 years ago, the society has endeavored to uphold the principles of organized charity. In some instances it has antedated the charity organization societies themselves; as in the giving of relief in amounts adequate to make the recipient independent of further intervention on the part of the relief-giving agency, and the establishment of a graded, carefully regulated and supervised system of pensions covering if necessary a long period of years. As a rule, these pensions are given only to families where the wage-earner has died, and where, unless such provision were made, no recourse would be left, except the breaking up of the family and the commitment of the children to orphanages and similar institutions. To obviate the necessity of such commitment, the United Hebrew Charities disburses annually over $35,000 in pensions. In the history of the society there is no form of relief which shows such good returns for the investment made. Families so supported do not become pauperized, since the subsidy which is granted enables the surviving parent to devote her time to the proper rearing of her children so that they may become useful and intelligent citizens.

Along the lines of making families self-supporting the United Hebrew Charities frequently grants assistance, presumably as a loan, in amounts varying from $50 to $250. These loans are made in special cases where it is not possible to make the applicant self-supporting through the ordinary channels of employment, etc. A wage-earner who has been incapacitated through illness or injury and hence unable to follow any routine work, may still be established in some small business venture and be able to support his family. Thousands of dollars have been spent by the United Hebrew Charities along these lines with the most gratifying results —not only have beneficiaries become independent of the society, but many of them have managed to repay the loans made to them. Of all the problems which confront the average charity organization, possibly the most perplexing is the one of the family in which the mother must be the wage-earner. The kindergarten and the day nursery have by no means solved the problem. They are at best but makeshifts in an attempt to solve a situation which has its root in economic and industrial conditions. Again, the factory removes the mother from her sphere of influence over her children, and opens up opportunity for the growth of incorrigibility and waywardness on the part of the latter. In the hope of partially overcoming this difficulty, the United Hebrew Charities has for some years conducted a work-room for unskilled women in which the latter are taught various needle industries, in the hope that they may eventually be sufficiently accomplished to work in their own homes, and in this fashion supplement the family income. The amount of such work that can be found is limited. More and more, daily, the factory is competing with home industry to the exclusion of the latter. A study made by the society in 1902 showed that work could be obtained for women to do at home in industries such as silk-belt making, men's and women's neckwear, garters and hose supporters, paper boxes, slip covers for the furniture trade, overgaiters and leggings, dressing sacques, hats and caps, flowers and feathers, beaded purses and other beadwork, dress shields, incandescent light mantles, embroidery and art embroidery, passementerie work, bibs, knit goods, etc. In the society's work-room the effort has been made to teach such industries to unskilled women, so as to enable them to become at least partially self-supporting.

It is needless to state that in a system as comprehensive as the United Hebrew Charities desires to be, provision has been made to alleviate distress in all its forms. Under the plan of dividing the city into districts, immediate relief can be given to emergency cases. These districts are in charge of co-operating societies known as Sisterhoods, who are responsible for the condition of the poor who have been placed in their care. Each of these agencies is practically a miniature United Hebrew Charities. Not only have they organized centres for the distribution of material relief, but along the lines of a more progressive philanthropy, the sisterhoods have developed day nurseries, kindergartens, clubs and classes of various kinds, employment bureaus, mothers' meetings, and in fact have become a social centre for the poor of their neighborhoods. Since a large percentage of the distress which is met with is occasioned by illness, medical relief of all kinds has been organized. Each district as a rule has its physician and its nurse, and where these are not at hand, co-operation has been effected with other organizations specially equipped for such work.

In very recent years, the spread of tuberculosis among Jews has merited the earnest attention of the society, and among its other activities it has been a pioneer in developing a

systematic plan for caring for such tuberculous applicants in their own homes, for whom no provision could be made in existing sanatoria. The campaign thus begun has been not only a charitable, but a social one. Not only have these unfortunates been given food, nourishment and medical care to aid them toward recovery, but in addition thereto, instruction has been given them in the rudiments of sanitation, and in the prevention of infection. It is significant that the work of the United Hebrew Charities in this field has been followed to some extent by the recently organized Committee on Tuberculosis of the Charity Organization Society.

The name "United Hebrew Charities" as applied to the New York organization is somewhat of a misnomer, since it does not include all Jewish charitable agencies in the city of New York. It would be more proper to speak of it as the consolidation of all the purely relief societies which existed in New York prior to 1874. Aside from these, there are to-day hospitals, orphanages, technical schools for boys and girls, trade schools, day nurseries and kindergartens, guilds for crippled children, burial societies, loan societies, societies for maternity relief, and a goodly number of smaller organizations which have been founded by the immigrants of the last twenty years. Among the most important large organizations and institutions in New York may be mentioned: The Mount Sinai Hospital, Lebanon Hospital, Beth Israel Hospital, Montefiore Home, Hebrew Orphan Asylum, Hebrew Sheltering Guardian Society, Hebrew Infant Asylum, and Hebrew Free Loan Association. It is estimated that there are over 1,000 Jewish organizations and societies in the city of New York to-day, whose activities to a greater or lesser extent are directed along philanthropic lines. Practically all of the larger organizations, such as the hospitals, etc., work in co-operation with the United Hebrew Charities. In some of the other cities in the United States, where the question of the care of the poor is not so complex as in New York, closer co-operation has gone by leaps and bounds. In cities like Philadelphia, Cincinnati, Chicago, Cleveland, and others, the individual societies have formed federations of charities, the purpose of the federation being to express the philanthropic impulse of the community in terms of greatest economy, the smallest amount of friction and the highest possible efficiency. In Philadelphia the federation is the common treasury. It acts as the common collection agency of all moneys and distributes them pro-rata among the various societies and institutions whose autonomy is not impaired by this method. In other cities, this plan with some slight variations is in force. In New York sporadic attempts to form a federation have been unsuccessful owing to the immensity of the problem. There are indications at present that federation may become a possibility in the near future.

In addition to these local federations, the various societies throughout the United States have joined together to form a national body known as the National Conference of Jewish Charities. At present it comprises the relief organizations of 53 cities. Two biennial conferences have been held and the third will be held in the city of New York in May 1904. The published reports of these meetings indicate conclusively the wisdom and the necessity of founding such a national organization. The rules governing the transportation of dependents which have been in force in the National Conference of Jewish Charities since its inception were adopted with alterations and additions at the last meeting of the National Conference of Charities and Correction at its meeting in Atlanta in May 1903. At the meeting of the National Conference of Jewish Charities held in Detroit in May of the same year, the writer introduced a resolution advocating the establishment of a central bureau for the placing out and boarding out of dependent Jewish children in private homes. At that time the work of devising such a plan was delegated to the Independent Order B'nai B'rith, a fraternal Jewish order, which at present has the entire subject under discussion, and has drafted a plan which has been submitted to the various Jewish societies and institutions throughout the country. In New York city, under local auspices a similar movement has been inaugurated. Since July 1903, at which time work was begun, applications have been received for children from 84 Jewish families. Sixteen children have been placed in boarding homes and four in free homes.

Some idea of the extent to which Jewish charities have been developed in the United States may be gathered from the following: In practically every city and town there are benevolent societies which look after the interests of the poor in their midst. Jewish orphan asylums are established in the cities of Atlanta, Baltimore, Boston, Brooklyn, Chicago, Cincinnati, Cleveland, Newark, New Orleans, New York, Philadelphia, Pittsburg, Rochester, and San Francisco. In New York there are three institutions and in Philadelphia there are two. New York has four Jewish hospitals and Philadelphia has two. Baltimore, Chicago, Cincinnati, Denver, New Orleans, and San Francisco have each one. Homes for the aged and infirm are found in most of the large cities. Similarly, educational movements along philanthropic lines are developing throughout the country. These include organizations such as the Hebrew Educational Society of Brooklyn, the Hebrew Education Society of Philadelphia, the Jewish Training School of Chicago, the Hebrew Free and Industrial School Society of Saint Louis, the Hebrew Industrial School of Boston, the Clara de Hirsch Home for Working Girls, the Hebrew Technical School for Girls, the Hebrew Technical Institute and the Baron de Hirsch Trade School, the last four being situated in the city of New York. The Maxwell Street Settlement of Chicago and the Neighborhood House in Saint Paul are under Jewish auspices. Cincinnati, Milwaukee, and Cleveland have Jewish settlements. In New York the Educational Alliance, the largest institution of its kind in the United States, has within the past few years developed a settlement with resident workers. Along educational lines, the Jewish Chautauqua Society, a national organization, has for the past two years conducted a summer school in philanthropy in connection with its summer assembly held in Atlantic City, N. J. At these sessions, important communal problems of interest to Jewish workers in philanthropy have been considered.

Other national organizations of importance are the Jewish Agriculturalists' Aid Society, the

Baron de Hirsch Fund, and the Jewish Agricultural and Industrial Aid Society. The first named, with headquarters in Chicago, is engaged in placing farmers throughout the Northwest, particularly in Dakota. The work of this society while not on an extended scale, has nevertheless given results and has demonstrated the fact that it is possible to take residents of congested centres, remove them to country districts, and make farmers of them. The Baron de Hirsch Fund was established under a foundation of the late Baron de Hirsch, the deed of trust being incorporated in March 1890. Its activities at present are directed to the conduct of the Baron de Hirsch Trade School in New York city and the Agricultural Colony at Woodbine, N. J., where the Fund has an Agricultural and Industrial School. The Fund likewise gives moneys to co-operating societies in various cities for the purpose of granting tools and teaching trades to recently arrived immigrants. The Jewish Agricultural and Industrial Aid Society is an off-shoot of the Baron de Hirsch Fund, receiving money from the latter society and from the Jewish Colonization Society, which was created under a de Hirsch endowment. Its purpose is to find agricultural and industrial positions for Jewish immigrants. Under the care of this organization are the various colonies in south Jersey, aside from Woodbine, and the organization has made farm loans to farmers in various parts of the United States, particularly in Connecticut. Probably the most important phase of this organization's work is the attempt to remove residents of the congested centres of large cities to places throughout the United States, where work has previously been found for them. In the first year the organization sent away 1,800 persons. In the second year 3,200 persons. During its present fiscal year, beginning 1 Jan. 1903, it has sent out 5,190 individuals, and its work is constantly increasing. The plan of the society is to find industrial positions anywhere in the United States, and having found them, to obtain individuals able to fill them from New York and other large cities like Philadelphia, Chicago, and Boston. In order to carry on the work as effectively as possible, the society co-operates with the Independent Order B'nai B'rith, which has lodges distributed throughout many of the smaller towns and communities in the United States, and with the benevolent organizations and societies represented in the National Conference of Jewish Charities. It has an office in New York city known as the Industrial Removal office, which is the centre of the activities of the society. From here all applicants who desire to leave the city are sent away, provided with the necessary transportation and with the guarantee that provision will be made for them at their destination until such time as they become full-fledged wage-earners. Should conditions require it, it is not uncommon for the society to send the wage-earner in advance and to make provision for the care of the family remaining here through the United Hebrew Charities. As soon as the society hears from its correspondent that the wage-earner is in a position to care for his family the latter is sent on and a reunion of the family accomplished.

On the literary side of Jewish philanthropy, it is interesting to note that the United Hebrew Charities of New York city is publishing a monthly magazine, 'Jewish Charity,' which is devoted to the consideration of all topics of interest to workers in Jewish philanthropic fields.

LEE K. FRANKEL,
United Hebrew Charities, New York City.

Jewish Chautauqua, founded in 1893 by Rev. Dr. Henry Berkowitz of Philadelphia, and incorporated in 1899, with a body of officers representing the chief cities in the United States. This society has about 3,000 members, divided into various sections. Its courses include preparatory, two years, with readings in Jewish history and literature; Bible, four years; and special courses in post Biblical history and literature, 'Jewish Characters in English Fiction,' 'Beginners and Advanced Hebrew.' Its chief work of late years has been embodied in its summer assembly, at Atlantic City, N. J., which is held annually in July and lasts three weeks. It includes a summer school, popular lectures and conferences, literary and social entertainments, in which many prominent speakers participate. During the session of 1903 the condition of religious schools, dependent and delinquent children, how to relieve congestion in large cities, the status of the Jews of Russia, the attitude of Jewish university students toward Jewish problems, were the topics discussed. The average attendance at the morning sessions was from 150 to 350 persons and at the evening from 300 to 800 persons. During the summer of 1903 an English organization on the plan of the Jewish Chautauqua was formed at Ramsgate.

Jewish Exchequer, a special division of the Court of Exchequer of England (1200–90) which dealt with lawsuits between Jew and Christian, chiefly in reference to debts due the former, and recorded the taxes imposed on the Jews. The fact that it was found necessary to have a centre for Jewish business indicates the prominence in trade and finance of the Jews in England from the reign of Henry II. to the period of their expulsion (1290). The court did not long survive their departure. Many important data from its records have been jointly published by the Selden Society and the Jewish Historical Society of England.

Jewish Fraternities. While societies for mutual benefit exist in large numbers among the Jews in every land, in the United States, the fraternities or orders have acquired special popularity, and promote not alone Jewish solidarity but aid in maintaining many charitable institutions. These organizations as a class give pecuniary benefits in case of illness, and death-endowments, which latter insurance feature is now being made optional. The oldest and most influential is the Order of Benai Berith ("Sons of the Covenant"), formed 60 years ago, and having a membership of 30,000. Its 315 lodges extend over the entire country, and it has 13 lodges in Algeria, Bulgaria, Egypt, Turkey, and Palestine, 42 in Germany, 16 in Rumania, and 10 in Austria. It supports orphan asylums in Cleveland, Ohio, Atlanta, Ga., San Francisco, Cal., a home for the aged at Yonkers, N. Y., a free library in New York, while it co-operates with an orphan home in New Orleans, a technical school in Philadelphia, and a hospital for consumptives in Denver, Colo. The next leading order is the Free Sons of Israel, founded in 1849, with 103 lodges and 11,000 members. The Free Sons of Benjamin (1879) has 192 lodges; 14,088 male and 1,361

female members. The Berith Abraham (1859) has 288 lodges and 42,000 members. The I. O. Berith Abraham, with 302 lodges and 56,949 members, was founded in 1887. The Ahavas Israel Order (1890) counts 124 lodges. In addition there are seven other fraternities which have been recently started. The Order of Kesher Shel Barzel, founded a home for the aged at Cleveland. Special efforts are now being made by the Benai Berith to institute lodges among the Russian and Rumanian immigrants, and the project of establishing a Jewish University of the highest rank has been brought to its attention.

Prof. German Literature, New York University.

Jewish Sects. To the fact that Judaism has never been a sluggish stream, but was ever in active movement, we owe the existence of sects among the Jews. The right of liberty of thought was always exercised, and to the conflict of opinion the survival of Judaism is largely due. Apart from the individualism which is a marked element in Jewish character, the influence of surroundings has had a formative effect, and the rise of sects in the nations among which he lived accustomed the Israelite to the spectacle of sects in his own community, due usually to the interpretation of text or ceremony, or to the initiative of some resolute leader. The history of Jewish sects displays the same bitterness and hostility that characterize sectarian feuds in general, although since the dispersion there has been more rattle than fang in the conflict between schools and parties in Jewry. The synagogue has never proclaimed any dogma of infallibility, and the rabbi was never regarded as absolute authority over conscience and soul. Climate, temperament, and environment were often the determining factors in precipitating the conflict which was waged, not by fierce encounters on the bloody field, but by debate in the schools and in polemical treatises that aroused partisan outcry and led to peaceful secession within the fold. Judaism and the law were never at stake — it was only the interpretation of one body of teachers or individual opinion which had to shift its ground.

Samaritans.— A brief summary of Jewish sects may best begin with the oldest of all. The Samaritans, termed in the Talmud (q.v.) "Cuthim," are traced to the mixed multitude who were made to settle in Samaria on the fall of the kingdom of Israel. The religion of the new colonists was a blending of Mosaism and heathenism, which led to a gradual separation from the Jewish body. They took no part in the revived commonwealth under Ezra and Nehemiah, but formed their own community, with their own temple, which was destroyed about 120 B.C. by John Hyrcanus I. (q.v.). The Samaritans gradually lost whatever prestige they had claimed. They now exist as a small sect, with constantly dwindling numbers, at Nablûs (the Arabic form of Neapolis, the name given to Shechem under Vespasian). Here perhaps 100 survivors follow their traditional rites, and sacrifice as of old on Gerizim. The Samaritans now possess interest only from an archæological point of view, although their ritual and literature have value for students of the Bible and of post-Biblical history.

Pharisees.— This party, often misunderstood and maligned, and which has had the ill-fortune (similar to that of the Jesuits, for example), of supplying the term "pharisaic," in the sense of hypocritical, was the great popular party in Judea, including the representative leaders and men of learning in the Asmonæan era, who strove to maintain the traditional faith and ceremonies at all hazards and despite political entanglements. It is the opinion of Graetz, the best-known Jewish historian, that, deriving their name from *Perushim,* "the explainers" (of Scripture), they formed the learned body of the nation, and can only be called a party by way of distinction from the Sadducees and the Essenes. The Pharisees were the religious enthusiasts of their day, loyal to every traditional observance, naturally with the defects of their virtues when such rigid adherence became formalism. But it is faulty generalization to stigmatize all Pharisees as hypocrites because some were insincere, as occurs in the history of every creed.

Sadducees.— This sect, probably named from one of their leaders, Sadok, constituted the party of wealth and political power, who made the law subordinate to the exigencies of the national life, and to whom the traditions of their religion were secondary when the independence of the nation was to be upheld. Hence the differences in interpretation of the law, which led to violent feuds and internecine conflict at a critical era when union might have checked the advancing Roman legions.

Essenes.— Sprung from the Assideans of the early Maccabæan days, resembling in some respects the Nazarites, the Essenes were rigid separatists from contamination, large numbers of whom were ascetics, favoring celibacy and forming a kind of religious brotherhood whose relation to early Christian practices, like baptism, is a suggestive topic for study. They were mystics, too, the logical forerunners of the sect of Chasidim, which was to acquire more notoriety than good repute in later centuries. The Essenes exercised no political influence. It was reserved for the Pharisee and the Sadducee to employ intrigue, hatred, and bloodshed against each other until Jerusalem fell.

Karaites.— About the middle of the 8th century this important sect arose among the Jews in Moslem lands. Their name means "readers," and they were followers of the Old Testament, but not the Talmud or rabbinical interpretations. Just as a sect in Islam rejected the traditional ruling, so almost contemporaneously a sect in Jewry abandoned rabbinical tradition. The leader in the movement was Anan ben David, a native of Babylon, who, chagrined at his failure to become an ecclesiastical dignitary, resolved to organize a revolt against tradition. For a time the movement made headway, but it never gained many adherents, and to-day exists in remnants only in Jerusalem and parts of Turkey, in Egypt, Galicia, and the Crimea. The Karaites, however, contributed largely to the study of the Old Testament, for the conflict between the Talmudists and their opponents led to closer and more accurate inquiry, and Scriptural investigation was followed with scientific thoroughness. The Karaites were keen disputants, and their polemical onslaughts on the Talmudists furnish a piquant phase in the history of Jewish thought. They failed, however, in their protest, and no reformation resulted. It is of interest to note that to-day in Russia the Karaites receive special consideration from the government, and

apparently are not subjected to all the harsh exactions under which the rabbinical Jews suffer. Their very limited numbers, however, may account for the toleration.

Sabbatians.— In the 17th century a remarkable sect arose among the Jews, the followers of Sabbathai Zebi (1626–76), who was born in Smyrna, went to Jerusalem in 1664, and there proclaimed himself the Messiah and predicted his approaching rule over the universe, with his headquarters in Jerusalem, restored and made glorious. The news spread rapidly and produced profound excitement in Turkey and elsewhere. It was a century of gloom and anxiety for the Israelite, the era of Jewish massacres in the Ukraine, and with the greater avidity he turned to hopes of a revived nationality; many in sober European lands began to prepare for the journey eastward. Such Zionistic dreams are of frequent recurrence, and numerous have been the false Messiahs in Jewish history. Sabbathai's career, however, was to receive a sudden check: the Sultan of Turkey, Mahomet IV., disliking popular excitement, imprisoned the prophet when he visited Constantinople, and after two months' confinement his pretensions faded away. He made a tame confession of his dishonesty and became a convert to Islam when the Sultan suggested the step. Many of his adherents in Turkey, Poland, Italy, Austria, Holland, and Germany were not discouraged by his conversion, but still believed in his Messiahship. In 1668 on the Passover he declared that he had received revelations from the Holy Ghost and was permitted by the Turks to preach in the synagogues. A sect of Sabbatians was gradually formed, with special doctrines and rites of their own, gradually dissolving into minor bodies of no influence. The Sabbatians in Turkey adopted Islam in 1687, with Sabbathai's successor, his brother-in-law Jacob Querido, at their head. On his death, his son became their Messiah (1695–1740). This Jewish-Turkish sect still exists and numbers about 4,000 adherents. Sabbathai's followers in Poland fell into crass mysticism, with harmful influences on Jewish development. In Italy they soon ran their course, and in Holland and Germany they were unmasked and sought flight.

Frankists.— These were a sect named after their founder, Jacob Leibovicz Frank, born in Podolia about 1726, died at Offenbach 1791, who was one of the apostles of Sabbathai Zebi. His vagaries were as pronounced as those of his master. Ultimately, after heated disputes with the rabbinical Jews, he abolished the law, and his sect became Catholic and was absorbed by the dominant religion in Poland.

The Chasidim.— The people who bear this name, meaning "the pious ones," constitute a sect dating from about the middle of the 18th century, and which exercised a profound influence on the Jews of eastern Europe. In its inception, as Dr. Schechter states in his 'Studies in Judaism,' it was a revolt against the excessive casuistry of the contemporary rabbis and "a protest of an emotional but uneducated people against a one-sided expression of Judaism" without feeling and affection. It was to develop rapidly into mysticism, the reveries and revelries of the Cabala, which produced incalculable evil wherever it spread. Its founder was Israel Miedzibocz (1698–1759), later called Israel Baal Schem, shortened into Bescht, born in a small village in Bukowina, and about whose childhood and youth wondrous legends are narrated. He became a rabbi in Podolia and Wallachia, teaching his doctrines to eager disciples and working miracles. In some respects he was an Essene of the 18th century, and he has been both condemned and admired. A religious revivalist, he drew much of his inspiration from the 'Sohar,' aptly called the Bible of the Cabalists, a clever literary forgery of the 13th century; but his idealism became a downward development in the sect's subsequent history. Under his successor, Beer of Mizriez, Chasidism extended to a more learned circle, who in their turn exercised a wider influence which led to many divisions and degeneracy. They were fiercely opposed by the rabbinical Jews. In Wilna their writings were publicly burnt (1772), and they were put under the ban. Solomon Maimon in his autobiography gives an account of this sect. It is still in full swing in eastern Europe, an aberration that will pass away with the spread of modern culture.

Other Sects.— The Falashas of Abyssinia, the Daggatouns of the Sahara, the Black Jews of India and Cochin-China, may be regarded as sects or colonies, along with the few remaining Jews in Kai-Fung-Fu, Province of Honan, China, and are mentioned to show the variety of type in present-day Israel. The divisions into "orthodox," "conservative" and "reform" Jews are largely arbitrary, and await more exact classification.

Prof. German Literature, New York University.

Jewish Women's Council. Founded September 1893, this organization has been of marked value in awakening the interest of American Jewesses in the history and literature of their special creed as well as in developing among them modern methods in educational and charitable. Affiliating with the National Council of Women it has arrayed on a common platform its representatives. The latest survey of its condition and workings was given at its third triennial in Baltimore, Md., 2–11 Dec. 1902. There were present 3 officers, 7 directors and 52 delegates from 26 sections, with 2 delegates from Junior sections. Addresses were made by Miss Jane Addams, of Hull House, Chicago, on 'The New Social Spirit'; other topics discussed were: 'Aspects of Judaism in Cities and Small Towns,' 'Federated Charities,' 'The Juvenile Court.' The Council consists of 64 active sections, with about 8,000 members, and 16 junior sections, with about 500 members. There are 82 study circles, 2,000 members, studying Jewish history and literature, and 12 circles studying methods in philanthropy. It has 18 religious schools among the poor, with 19 paid and 141 volunteer teachers, reaching 2,500 pupils. Thirty-three sections carry on activities in philanthropy, with settlements, sewing and industrial schools, five kindergartens, one manual training school, two gymnasiums, two free baths, two day nurseries, four personal service groups, two kitchen gardens, and other forms of useful activity, often open to all creeds. Cooperation is encouraged with the State Federation of Women, International Congress of Women, the National Jewish Hospital for Consumptives at Denver, Colo.,

the National Needlework Guild and the Consumers' League. Mrs. Hannah G. Solomon, of Chicago, is president of the organization (1902–5).

Jews and Judaism, the religion of the Jewish people — whether called Jews, Israelites, or Hebrews — based upon the Old Testament, and developed in their ages of alternate wandering and settlement in various lands. Judaism presents a series of changes from age to age, and is inseparable from the history of the Jewish race. The story of Judaism is the story of the Jew. From its rude beginnings in the era of Abraham the Patriarch, down through the centuries of Bible environment; from the formation of a kingdom to the final destruction of Jerusalem by the Romans; from the period of dispersion East and West to the dawn of the Middle Ages; then through successive social and political upheavals to the birth of modern times and the gradual shifting of nations and ideas until the present day; — through all these vicissitudes Judaism has ever been moving, influenced by every current and new condition. In the days of Abraham it was ethical Monotheism; in the era of Moses, Mosaism; in later ages, when it was likely to degenerate, Prophetism arose to inspire new life. When the national existence was reaching its end Talmudism was its protecting garment, to continue as Rabbinism for a long period, and it is still vital in many lands. Then with Moses Mendelssohn (q.v.) and the French Republic, modern Judaism began a new era, which was to develop still further with the spread of individualism in life and thought, under whatever names, conservative or reform, it was known. To realize what Judaism is, it must be studied in its broader range as well as in close detail. It must not be limited to one period, and it must not be made co-extensive merely with its Biblical or post-Biblical epoch. Judaism awaits its historians, and their task is one that demands not only the exact knowledge of the origin, growth, and development of Jewish tradition, customs, rites, and laws, but also a comprehensive survey of the civilizations with which the Jew came into contact, and to which he gave and from which he received so much. Judaism may be only on the threshold of its influence, for at no period since its beginning has it been more diffused and universalized through the planting of the Jew in every land on the globe.

Ancient Jewish History.— The early history of the Jews is identified with that of Palestine, as told in the Old Testament. The narrative proper begins with Abraham and the Patriarchs, and continues through the story of Joseph in Egypt, to which Israel and his family remove, and the years of oppression under the Pharaohs. Then Moses appears as a deliverer, the revelation on Mt. Sinai follows, and a code of laws is given to the people, who form a theocracy, with rites sacrificial, after the fashion of their day, and a hereditary priesthood. The conquest of Canaan begins a new era — the period of the judges — but as the nation grows more warlike and becomes envious of its neighbors, the judge must give way to a king, and Saul, David, and Solomon successively reign. The builder of the temple, the central figure in Oriental legend, could not assure peace to his kingdom, and a division followed. Of the two kingdoms that of Israel, with its capital first at Shechem and later at Samaria, was the more extensive and populous, embracing 10 of the tribes; but it was addicted to idolatry and fell captive to Sargon of Nineveh (721 B.C.). The kingdom of Judah, consisting of the tribes of Judah and Benjamin, was more faithful, but deplorably weak, and was conquered by Nebuchadnezzar, by whom the temple was destroyed (586 B.C.). In 536 B.C. Cyrus allowed the temple to be rebuilt, and in 516 B.C. it was finished under Ezra and Nehemiah.

Persian rule and influence, to which the Jew owed much, were succeeded by the sway of Egypt, not less vital for Judaism's growth. Under Ptolemy II. (Philadelphus), the Septuagint version of the Old Testament was written, which familiarized the Greek world with Jewish thought. Another change of masters subjected the Jew to Syrian supremacy, under which occurred the Maccabean revolt, followed by internal schism and a gradual weakening of national vitality under Herod, with Rome eager to despoil.

The Final Dispersion.— A fierce struggle to regain fatherland and liberty in the last days of Nero was fruitless. The temple was again destroyed, Jerusalem reduced to ruins, and the dispersion began in earnest (70 A.D.). A further revolt by Bar-Cochba, in the reign of Hadrian (132–135 B.C.) was ineffective. Jews were forbidden to enter Jerusalem, whose very name was changed to Ælia Capitolina.

A period of intense significance for Judaism had now arrived. It was to exchange one strip of land for the wide world, and for better or worse encounter new currents which were to change its form and destiny. The Palestinian phase was to give way to a broader development, which might have been a dangerous experiment if the Old Testament basis, the sacredness and authority of the law (*torah*) had not been retained. The remnant of Judah, however, met the issue with courage, and in every land of their dispersion managed to preserve a certain national character, due to their observance of national customs and traditions, while the ages of persecution only made them more firmly attached to their religion.

Jewish Learning.— The story of the Jews in the dispersion is a record of varied experience, a history written in sadness. The dispersion was a *via dolorosa* from land to land. Long before the final overthrow Jewish settlements were made in Italy and Asia Minor, in Egypt, North Africa and Babylonia. But now enforced exile scattered them in all directions. Happily the leaders concerned themselves with intellectual and spiritual factors, and in Palestine and Babylonia schools arose which were to preserve the religion and national consciousness more effectually than priest and sacrifice ever could have done. When Johanan ben Zakkai founded his school at Jamnia, while the ruins of Jerusalem were still smoking, the Romans were unaware that a power had arisen which was to maintain Judaism through centuries of Roman, Christian, and Mohammedan sway, and amid every mediæval and modern condition. The study of the law, the interpretation of tradition, the development of custom and prayer, the rise of synagogues, the organization of a distinct religious hierarchy, the birth of Talmudism; these were

the factors which made the vanquished victors, and gave them life and influence when conquering races had passed away. It was fortunate that in the struggle between the Persian and Byzantine empires, as in later centuries between Caliph and Christian, or between rival pontiffs and emperors, the Jews were largely students, and had no "dark ages," such was the marvelous influence of their torah and Talmud, while in the conflict of opinions they preserved their intellectual vitality and breadth.

In the Middle Ages.— It is impossible within present limits to give more than a brief outline of the history of the Jews in the dispersion. With the breaking up of the Roman empire and the rise of Islam, the Jews began to feel the pressure of still other new masters, whose rule was not without its occasional gleams of sunshine. In the East, with Islam firmly settled in Persia and Mesopotamia, the condition of the Jews improved, their academies flourished, and a line of famous scholars, the gaonim, kept alive Jewish learning until 1036 A.D. In the West, chiefly in southern Europe and Spain, the spirit of persecution was rarely absent, although there were golden centuries in Spain under the caliphs, and learning flourished in France and Italy despite the enmity of pontiff and king. Jewish traders became the intermediaries in commerce; Jewish physicians were notable figures at the courts; and Jewish teachers gave instruction to lovers of learning. The liberal spirit of the caliphs at Bagdad, Cordova, and Cairo was emulated in Christian countries. In Spain, the Hebrew "Sepharad," the Jews enjoyed a high degree of favor under the caliphs (711–1150). They furnished ministers of state, scholars, scientists, poets of distinction. For 150 years (1150–1300) their condition under the Catholic kings was fairly prosperous. But soon restrictions became the order of the day, they lost the rights of Spanish citizens, were secluded in special quarters of their own, and massacres ensued, while some of their stateliest synagogues were converted into churches. This was the period when many Jews yielded to baptism, practising in private, however, Jewish rites: they were called "Maranos," or secret Jews, and included some of the noblest families in Spain. With the birth of the Inquisition at Seville in 1480, conditions became still more intolerable, and expulsion followed in 1492, 300,000 Jews leaving Spain. Four centuries later Spain was to offer shelter to Jewish refugees from Russian persecution; and its government is now restoring the famous synagogue at Toledo, which had been turned into a church, and showing a spirit of reparation that tells the story of humanity's progress.

The Jews in Modern History.— The exiles from Spain, the Sephardic branch of modern Jewry, found refuge in Italy and Holland, after a temporary stay in Portugal, where they took active part in the Renaissance. Great numbers, too, emigrated to Turkey. It was Elias Levita who, through his students, Sebastian Münster and Paul Fagius, introduced Hebrew studies into Germany, while Leo Hebræus (Judah Abrabanel) was a famous Neoplatonist. Luis de Torres, a Jewish youth, participated in the quest of Columbus, and a Jew, the pilot Gaspar, aided Vasco da Gama in his search for a water-route to the Indies, whose plans, too, were assisted by Abraham Zacuto, the scholar and astronomer, a teacher of the University of Salamanca, and later astronomer and chronographer to Manuel the Great of Portugal. Dark days followed the exile from Spain, and in the general sorrow mysticism spun its weird spell as the Cabala gained adherents, while the methodical study of the Talmud was to degenerate into one-sided scholasticism and intellectual jugglery. It was an era relieved, however, by some bright names. Joseph Nasi, Duke of Naxos, was a favorite of Sultan Selim II., who wished to make him king of Cyprus; Solomon Ashkenazi was Turkish ambassador to the republic of Venice; Benedict Spinoza, the thinker, and Sabbathai Zebi, the pseudo-Messiah, were products of the same century. Manasseh ben Israel, whose features were painted by Rembrandt, opened negotiations with Oliver Cromwell for the return of the Jews to England, from which land they had been banished in 1290. With the further migration of the Jews into Slavic countries and their closer segregation, due to the spirit of persecution, which was as bitter as in the era of the crusades, a new language or jargon — the Jewish-German — arose among them, which is now (1903) receiving careful scientific study. In the year of Luther's Pentateuch translation (1523) a Jewish-German dictionary appeared at Cracow, and in 1540 the first Jewish-German translation of the Pentateuch was issued there.

In the Middle Ages the charge of usury was often brought against the Jews, and doubtless was a motive for popular outbreaks against them. Usury is strictly prohibited by the Mosaic law. If, in ages when the Jew was disqualified from following agriculture or other ordinary pursuits, he had recourse to finance and often lent money at excessive rates, kings, nobles and priests were just as guilty, although the Jew was usually the scapegoat. "Every country has the Jews it deserves," is Karl Emil Franzos' pertinent saying. With civil and religious liberty there would be no cause for the ghetto, for narrow exclusiveness, for charges of usury, and other accusations. The 17th century, with the Thirty Years' War, which made nearly all of central Europe a battle-ground, had its full share of persecutions for the Jews, and many of the fairest communities were despoiled, the Jews in Poland losing 200,000 men, women, and children in the Cossack invasion (1648–51). That century marked the lowest ebb of Jewish life and aspiration. It was, fortunately, to be succeeded by the dawn of a new era. It was Moses Mendelssohn (1729–86) who strove to awaken his coreligionists to new life, and to rise to the level of the highest culture of their time, without abandoning the essentials of their religion. As his friend Lessing sought to emancipate German literature from French models, so Mendelssohn labored to free the Jew from mediævalism in thought and custom. It was a return to Jewish idealism and humanity that he advocated, a departure from the social and intellectual ghetto forced upon them by bigotry from within and without. From him dates the era of emancipation which was ushered in as well by the French Revolution. With their gradual acquirement of full citizenship in European lands, resolute changes in forms and ritual were imperative; and the mediæval atmosphere in prayer and ceremony was to pass away. Scholasticism was also to be overcome by Leopold Zunz (1794–1886) and the coterie of well-equipped scholars who opened

a new path in the study of Jewish history and doctrine and showed the evolution of prayer and ceremony. With him were ranged S. L. Rapoport (1791–1867), S. D. Luzzatto (1800–65), Zacharias Frankel (1801–75), Abraham Geiger (1810–74), Samson R. Hirsch (1808–88), H. Graetz (1817–91), L. Loew (1811–75), Samuel Holdheim (1806–60), and the still surviving Moritz Steinschneider (1816).

To-day the condition of the Jews abroad may thus briefly be summarized: In Russia, Rumania, and Galicia, which contain the great majority of Israelites, they suffer social and political exactions, and are under strict mediæval restraint so far as their religious state is concerned. They are more or less rigid Talmudists, and are least influenced as a whole by the modern movement, although there are signs among them of new life. The revolution of 1848 completed the work of the French Revolution in assuring political equality to the Jews in Western Europe. In 1858 Lionel de Rothschild was the first Jew to take his seat in the English Parliament. London has had several Jewish lord mayors and a Jewish master of the rolls (Sir George Jessel). Anti-Semitism has rapidly lost its fangs in France, Austria, Hungary, and Germany, whose Jewish citizens are indistinguishable, save in religion, from those of other creeds. In Italy, Rome grants a site for a new synagogue not far from the Arch of Titus, mute witness of Israel's vitality. A Jew is Italian minister of war. What a transformation since the days when Jews were thrown to the lions or forced to live in the catacombs! As a result of the admission of Jews to every field of activity, they furnish their quota of famous names in all lands in music, art, science, literature, philanthropy, commerce, and politics.

Zionism, etc.— The Zionistic movement of the past decade, so far as it aims at a restored Jewish nation in Palestine, numbers the largest body of adherents in Russia and Rumania; but with their full acquirement of political rights their attitude will change. Great Britain's offer of land in East Africa for a Jewish settlement under British sway is seriously considered by Dr. Herzl and the Zionists (1903), and may pave the way for practicable colonization both there and elsewhere, which will materially lighten the Jew's burden in persecuting lands, and give him new life and activity under more favorable conditions.

Continuity of Judaism.— The outline of Jewish history from the earliest times to the present, with observation of conditions throughout the world, proves that Judaism has always been a living religion in every environment and despite the cross-fertilization of ideas that it has encountered in Babylonia, Rome, Egypt, Persia, Arabia, Spain, mediæval Germany, and Italy. The law of adaptation has left its mark on the thought and principles of the Jewish belief. While the sources are in the Pentateuch or torah, the stream of Jewish tradition is continuous, and Judaism, practically the tradition of the Jews, may be defined as ethical monotheism illumined by national customs and observances. A double stream of thought is to be discerned — a particularistic and a universal, exclusiveness and breadth, Jewry and the wide world, the God of Israel and the God of humanity. These tendencies appear not only in the Old Testament, but throughout the entire stretch of Jewish literature, and are still to be met in the views of modern rabbis of the various schools, old and new. But Judaism is none the less a fixed religion, even if it is difficult to define, and demands no assent to formal articles of belief. Its first intuition is belief in God, no blind power, but with the attributes of unity, incorporeality, eternity, omniscience, and omnipotence, and whose justice is tempered with mercy. The reality of revelation is its second principle, the revealings on Sinai through Moses, and their confirmation through the prophets of laws and statutes, the moral and ceremonial law — the immutability of the torah. As a necessary corollary comes a third principle, future reward or punishment for those who obey or transgress the law. Compensation in the hereafter implies the soul's immortality. Whatever varying views were held as to these principles and their interpretation by earlier and later rabbis, amid all exaggerations and aberrations to which they were subjected, giving rise to sect and schism, the ethical basis of Judaism was unquestioned, and action, not moralizing, was always the highest duty. The creed of Judaism has been defined from time to time by different rabbis, the most famous of whom, Maimonides (1130–1205), gave the most widely accepted exposition in 13 articles embodying these points: Belief in a creator, in His unity, incorporeality, eternity, and that He alone is to be worshipped; belief in prophecy, and that Moses was greatest of all prophets, both before and after him; that the torah was revealed on Sinai, and possesses immutability; that God knows the thoughts and actions of men; belief in reward and punishment, in the coming of the Messiah, and in the resurrection of the dead. These articles were opposed by some of his contemporaries, as they have also been by some later rabbis, who frame different classes of doctrine or dogma and otherwise modify Maimonides' principles, which are still, however, regarded as authoritative by the large majority of Jews to-day. (See MAIMONIDES.)

Ceremonial and Festival Usages.— The ceremonial code and historic ritual are vital factors in the preservation of Judaism — "signs," and observances like circumcision, the Sabbath, the festivals, and the dietary laws. Their aim is to quarantine the Jew from idolatry and secure the permanence of his God-idea, and to ensure self-control over passion and appetite, promoting physical and moral growth, and maintaining family happiness and purity.

The chief Jewish festivals are the New Year, the Day of Atonement, Tabernacles, Passover, and Pentecost, with Purim, Hanukkah (to celebrate the victory of the Maccabees), and Fast of Ab, in memory of the fall of Jerusalem.

The breadth of Judaism is not to be lost sight of amid the many observances that are part of its historic programme. The Jew's original Semitism has developed into a cosmopolitanism which makes him a citizen of every land that assures him civil and religious liberty. He can be conservative in England, liberal in Germany, a formalist in France, a pietist in Poland, a mystic in Turkey, and can wear in the United States an intellectual coat of many colors that would astound his brethren in India. The breadth and catholicity of Judaism are organic; the Jew does not seek proselytes; he believes with Maimonides that "the pious of all nations

have a share in future bliss." His aspirations are not tribal; he believes in the perfectibility of humanity; and whether his Messiah be a person or an epoch, he holds that the time will come when all men will acknowledge the unity of God and the brotherhood of man.

Jewish Statistics.— The figures of Jewish population, as contained in the 'American Jewish Year Book' for 1900–01, are herewith given. For the British Empire the total is 148,149, divided as follows: England, 97,350; India, 17,194; Australia, 15,268; Canada, 6,414. For other countries: Austria-Hungary, 1,871,414; Russia, 5,700,000; Rumania, 300,000; Germany, 567,884; Turkey, 350,000; France, 72,000; Italy, 50,000; Netherlands, 97,324; Egypt, 25,200; Morocco, 150,000; Belgium, 4,000; Argentina, 6,735; Denmark, 4,080; Greece, 5,792; Persia, 50,000; Servia, 4,652; South Africa, 10,000; Switzerland, 8,069; Sweden and Norway, 3,402; Spain, 2,500; Peru, 498; Bulgaria, 22,617; Venezuela, 411; Abyssinia, 120,000; China, 300; Algeria, 43,500; Tunis, 4,500; Curaçao, 831; Surinam, 1,250; making, with the United States (1,200,000), a total of about 11,000,000 for the world. For Jewish statistics of the United States see JEWS IN AMERICA.

Bibliography.— Among the more important ethical and philosophical writings of the rabbis which are generally regarded as setting forth what is characteristic in Judaism — not to refer to special works of one-sided tendency — the following are recommended: Saadya (10th century), 'Emunoth Vedeoth' (Beliefs and Opinions); Bachya (11th century), 'Choboth Ha Lebaboth' (Duties of the Heart); Hallevi (12th century), 'Cuzari'; Maimonides (12th century), 'Morê Nebuchim' (Guide of the Perplexed); Albo (15th century), 'Sefer Ikkarim'; Troki (16th century), 'Chizzuk Emunah'; Mendelssohn (18th century), 'Jerusalem.' For general information on the subject of Jews and Judaism may be read: Graetz's 'History of the Jews'; Morris Joseph's 'Judaism as Creed and Life'; Stanley's 'History of the Jewish Church'; Daly's 'The Settlement of the Jews in North America'; Kayserling's 'Christopher Columbus and the Participation of the Jews in the Spanish and Portuguese Discoveries'; 'Publications of the American Jewish Historical Society'; Schechter's 'Studies in Judaism,' and many issues of the American Jewish Publication Society. Within recent years in particular a rich and extensive literature has sprung up in this line of study in England, Germany, France, Russia, Italy, and elsewhere.

A. S. ISAACS,
Prof. German Literature, New York University.

Jews in America. Although the Jewish population of America has been greatly increased by immigration only since 1881, Jews have been closely identified with American history for centuries, and some of that race even settled in this country in Columbus' day.

Before taking up the history of the Jews in America, some statistics concerning the American-Jewish population at various periods will be in order, as tending to throw light on more isolated historical incidents relating, for the most part, to the experience of a small fraction only.

Statistics.— The latest and most authoritative statistics as to the present Jewish population of the United States are furnished by the 'American Jewish Year Book' (September 1903), wherein it is computed that the total number of Jews in this country is 1,127,268, of whom 500,000 are credited to New York State, 28,000 to California, 75,000 to Illinois, 25,000 to Indiana, 26,500 to Maryland, 60,000 to Massachusetts, 50,000 to Missouri, 25,000 to New Jersey, 50,000 to Ohio, and 95,000 to Pennsylvania; all the other States and Territories, including Hawaii, Porto Rico, and the Philippine Islands, and also the District of Columbia, likewise containing some Jewish residents. In making up this total, account is taken of the fact that 761,598 Jewish immigrants arrived at the ports of New York, Philadelphia, and Baltimore from 1881 to 1 July 1903. The same authority computes the Jewish population of America, exclusive of the United States, as follows: Canada and British Columbia, 25,000; British West Indies, approximately, 2,500; Argentina, 22,500; Brazil, 3,000; Cuba, 4,000; Mexico, 1,000; Curaçao, 103; Surinam (Dutch Guiana), 1,121, and Venezuela 411; making 1,186,903 in all for America. These figures are mere estimates, than which nothing more accurate is at present obtainable; but they are no doubt approximately correct, being based upon partial actual counts, analyses of death-rates, and reports of competent judges in the various localities; and having also been reviewed from time to time in the light of criticism and new data. If anything, the figures are probably somewhat too low, the city of New York, in its five boroughs, being credited by competent judges in 1903 with a population of over 600,000 Jews, which would make the estimate for the State above quoted about 150,000 too low. Estimates for other districts are also likely to be low; although that given for Cuba is undoubtedly too high. In rough figures, then, the Jewish population of the United States to-day may be estimated at 1,200,000.

The first systematic attempt to secure statistics of the Jewish population in the United States culminated in the publication of a report by the Union of American Hebrew Congregations in 1880, giving estimates for each State and city in the Union, and aggregating 230,257 persons. In connection with the national census of 1890 statistical information was gathered regarding Jewish congregations in the United States, and the total number of Jewish communicants was estimated at 130,496, belonging to 533 church organizations. Of these, 316 organizations, having 122 church edifices, valued at $2,802,050, and 51,597 communicants, are to be credited to Orthodox Judaism, while Reform Judaism counted 217 organizations, having 179 church edifices, valued at $6,952,225, and 72,899 communicants. A very large majority of the Jewish immigrants arriving in the United States since 1890 belong to the orthodox wing, and even the figures of 1890 undoubtedly disregard numerous small, often unorganized, orthodox congregations, from whom it was relatively more difficult to secure reports. In 1818 the Jewish population of the United States was estimated at 3,000 only; in 1848, at 50,000. In South America there were several thousand Jews prior to 1650, the greater part of whom were in Brazil, as noted below; but hostile laws and the persecutions of the Inquisition, while driving some

to the West Indies, and even as far north as New Netherlands, caused several thousand Jewish settlers in Spanish and Portuguese territories to totally give up their Jewish identity.

It might be said that there were successive tides of Jewish emigration to America from European countries, fairly well separated from each other in point of time. During the first 250 years after the discovery of America the settlers were mainly Jewish immigrants of Spanish-Portuguese stock, with only an occasional sprinkling of German, French, English, and Polish Jews. German Jewish emigration becomes considerable only a short time before the American Revolution (though evidence is accumulating that it took upon itself larger dimensions and at an earlier period than is commonly believed); it was stimulated by the reactionary measures following the Napoleonic wars and the revolution of 1848, and began to include emigrants from the Austro-Hungarian empire, and later on an increasing number of Poles. The Russian-Jewish exodus, which began about 1881, was by far the heaviest of these various currents of emigration, and was itself succeeded or joined by a Rumanian-Jewish wave about 1900. For Jewish statistics of other countries see JEWS AND JUDAISM.

Jews in the Spanish and Portuguese Colonies.— Before the discovery Jews were actively identified with the fate of America, as may be said without reference to the curious and once widely accepted theory that the American Indians are descendants of the lost Ten Tribes. Emilio Castelar, the late Spanish statesman and historian, referring to the coincidence that the Jews were expelled from Spain in the year that Columbus started on his first voyage of discovery — a circumstance noted by Columbus himself in his journal, and repeatedly thereafter commented upon by Jewish historians — makes this observation:

> It chanced that one of the last vessels transporting into exile the Jews expelled from Spain by the religious intolerance of which the recently created and odious Tribunal of the Faith was the embodiment, passed by the little fleet bound in search of another world, whose creation should be new-born, a haven be afforded to the quickening principle of human liberty, and a temple reared to the God of enfranchised and redeemed consciences.

But Jewish aid to Columbus was not limited to Jews accompanying him on this first voyage (including Luis de Torres, a new convert to Christianity, who went as interpreter because of his knowledge of Arabic, and settled before 1500 in America), nor to the circumstance that Columbus carried with him, as aids on his voyage, a sea-quadrant called "Jacob's Staff," invented by a Spanish Jew, and astronomical tables and charts invented by another Jew. The more significant and important fact is that Jewish financiers at the Spanish court were his leading patrons, and advanced the money for his voyage, as evidenced by original account-books still found in the Spanish archives; so that it was a mere recognition of this circumstance that induced him to address the first two letters (now justly famous, and the earliest copies of printed editions of which command thousands of dollars from book-fanciers) narrating his discovery to those two secret Jewish friends, Louis de Santangel, chancellor of Aragon, and Gabriel Sanchez, royal treasurer. In the light of such facts the late Herbert B. Adams wrote that "not jewels, but Jews, were the real financial basis of the first expedition of Columbus." The revenues needed to fit out the second expedition were secured from the proceeds of the property, of which the expelled Spanish Jews were despoiled by the Inquisition at the time of their expulsion from Spain.

In spite of prohibitions upon Jewish settlement in Spanish and Portuguese America, many Jews rapidly emigrated to the New World from among those exiled from Spain and Portugal; occasionally, in spite of the inconsistency involved, in view of those prohibitions, Jews and Jewesses were forcibly transported to America by the state through the agency of the Inquisition. By 1548 Jews are referred to not merely as having settled in Brazil, but as introducing sugar-culture there, which they transplanted from Madeira. The smoking of tobacco had been introduced to Europeans even before 1500 by Luis de Torres, a companion of Columbus. Occasionally, enormous sums of money had to be raised and given to the crown in order to effect suspensions or revocations of prohibitions upon Jewish settlement in the Spanish and Portuguese colonies. But the Inquisition and its terrors were introduced even into the New World; hence Jews found it advisable to try to conceal their faith under the cloak of Christianity; and it is principally in the records of the Inquisition that we find proofs of the Jewish practices of many of these settlers — called Marranos or secret Jews — whose trials commonly resulted in imprisonment, frequently in death at the stake, and were at all events followed by confiscation of their property.

In Brazil, Jewish settlers actively aided the Dutch in effecting their conquest of that country, about 1620, after which the Jews *en masse* threw off their Christian disguise and publicly professed their own religion. The Dutch West India Company (q.v.), which obtained the proprietorship of Brazil, had many influential Jewish stockholders, and under their auspices large numbers of Jews from Portugal, Holland, and Germany immigrated. Jewish residents are referred to about 1640 as owning the principal sugar-plantations of Brazil, and as heavily interested in the diamond industry then developing there; and there is also evidence that a Jewish literature sprang up in Brazil at this time. Some idea of their numbers may be gathered from the fact that at the time of the surrender of Recife (Pernambuco) to the Portuguese, after its recapture from the Dutch, soon after the middle of the 17th century, that city alone contained about 5,000 Jews, even after many had departed from the city. In smaller numbers they were also established in other cities of Brazil, in Mexico, Peru, the West Indies, and at other points. The Dutch capitulation of Brazil in 1654 led to their flight in large numbers from that country, their migrations leading them northward, particularly to the West Indies, and one party of refugees even becoming the nucleus of a Jewish settlement at New Amsterdam (New York city) in 1654. Many, however, remained in the South American colonies, and their Jewish identity was gradually lost under the hostile influences at work. The settlements under Dutch auspices at Surinam,

Cayenne, and Curaçao, are deserving of particular attention.

Of the professing Jewish inhabitants now to be found in these districts, enumerated in the statistics just considered, very few are descendants of the original Spanish settlers, the great bulk of them being comparatively recent arrivals from Germany, Russia, and Rumania. Through the munificence of Baron de Hirsch (q.v.) millions of dollars were employed about 1891 in the purchase of land and equipment for the use of agricultural colonies of Russian Jews established under his auspices in Argentina, where several thousand Jews settled, though they have met with only moderate success.

West Indies.— Reference has already been made to early settlements of Jews in Cuba and other West Indian islands. Their settlement in Jamaica was particularly important on account of their numbers and the once great commercial importance of the island. For the latter reason, their residence in the Barbados, at St. Eustatius, Martinique, and in the Danish West Indian colonies also led to important consequences. Reference will be made hereafter to this circumstance. Except in Cuba, the decline of the above named places commercially has caused a decided diminution in the number of their Jewish inhabitants, and to-day the chief interest in the settlements is historical.

Early Settlements in the United States before the Revolution.— There are indications of some isolated and casual arrivals of individual Jews within the present limits of the United States prior to the arrival of the party from Brazil in colonial New York during the Dutch régime, in 1654; these were in Maryland, Virginia, and New England, to say nothing of a party of Jewish soldiers and sailors who seem to have reached New Netherlands (New York) in 1652. These instances (other than those in the Dutch colony) are purely casual, however, and unimportant, because Jews were not allowed at this time to live as avowed Jews in any of the principal countries that then had colonies in America except Holland. Prohibitions against their settlement were in force (though occasionally ignored) in Spain, Portugal, England, and to some extent in France. Holland alone at this time welcomed the Jewish refugee, to her great commercial advantage; and this "common harbor of all opinions and of all heresies" was, logically enough, destined to establish a precedent for granting religious liberty also in the New World. It is true that in New Netherlands Governor Peter Stuyvesant (q.v.) was decidedly hostile to the Jewish arrivals, as were also some of the early Dutch ecclesiastical authorities; but, thanks to the leveling and humanizing influence of commerce, and to Jewish holdings of stock in the Dutch West India Company, the directors of that company, 26 April 1655, instructed their governor that the "Jews shall have permission to sail to and trade in New Netherlands, and to live and remain there, provided the poor among them shall not become a burden to the company, or to the community, but be supported by their own nation"; and Stuyvesant was strongly reproved soon after for seeking to thwart these clearly expressed wishes of the company. The emancipation of Jews was, however, only gradual; certain restrictions were continued through the whole colonial period, though they decreased from time to time, and in importance. Public worship, as distinguished from private religious services, was forbidden them till near the close of the 17th century, as was also selling at retail, and certain political rights of citizenship were also denied; but these restrictions in the course of time were largely removed in practice, so that the adoption of the first constitution of the State of New York, in the Revolutionary period, which established absolute religious liberty, conferred in effect few, if any, privileges on the Jewish residents of that State, which they had not already virtually enjoyed. In the interior, the number of Jewish residents had grown somewhat by emigration from Germany, Hungary, Poland, and also from England, which, under Cromwell, readmitted the Jews soon after the time of their settlement in New Netherlands; but the increase in numbers through immigration was not great till after 1800, for there were few Jews in England, and still fewer who desired to emigrate from there, while emigration to New York and New England prior to the above date from any of the other designated countries was very small.

To Newport, R. I., Jews emigrated very soon after they first settled in New Amsterdam, and Roger Williams (q.v.) in terms included them in his programme for establishing a colony where religious liberty would be accorded to all sects and creeds. In the course of time they erected a synagogue here also, as well as in New York, and established a community which contributed most materially to the commercial prosperity of Newport, which city far outrivaled New York for some decades before the Revolution, and until, during that struggle, its shipping interests received a blow from which they never wholly recovered. Here also, there were some retrogressions during the colonial period from Roger Williams' enlightened declaration of principles; but on the whole, Jews were most prosperous residents of Newport during the latter portion of the colonial period. Even though the colony never was numerous, it embraced such merchant princes as Aaron Lopez and Jacob Rodrigues Rivera, and its fortunes were commemorated, after all the old-time residents had departed, in Longfellow's famous lines on "The Jewish Cemetery at Newport." Already in the colonial period Jewish settlers occasionally found their way into Connecticut, also to Boston, and even, it would seem, to Maine, but they were very few in number, and the present Jewish residents of New England date almost entirely from the period of German settlement after 1848, followed by a much more considerable Polish and Russian-Jewish settlement toward the end of the 19th century. About 1820 Major Mordecai M. Noah, at one time United States Consul to Tunis, developed a fantastic plan for founding a Jewish state for the oppressed Jews of other lands under his own "judgeship," near Niagara Falls, at a place he named, "Ararat, City of Refuge," and attempted to tax all the Jews throughout the world for this purpose, but the scheme merely aroused amused attention. Other less ambitious early colonization schemes also were formed.

Pennsylvania, under William Penn's generous plan for founding a home for victims of persecution, attracted Jewish settlers, and in the early

decades of the 18th century a little stream of immigration began which brought a number of German, English, and Polish Jewish settlers to the colony, whose numbers were increased, after the capture of New York by the British in 1776, by the arrival of Portuguese Jews from that city. The Jewish settlement in Lancaster, Pa., was made about the time of the American Revolution; and there was a small Jewish immigration into Maryland and Virginia, with communities in Schaefersville, Easton, Baltimore, and Richmond. Before the close of the Revolution a Portuguese synagogue had been erected in Philadelphia; soon a German Jewish congregation was established there; and about the same period one was erected in Richmond, Va. The laws of Maryland prohibited Jewish settlement, and as early as 1658, Dr. Jacob Lumbrozo, "the Jew physician," figured there as defendant in a blasphemy trial, which nearly cost him his life. Baltimore is of particular interest because it was the only city in the United States in which systematic and long-continued efforts were necessary, subsequent to the Revolution, in order to secure full civil and political rights for Jews as such: they acquired them finally in 1826. Georgia attracted Jews almost immediately after the founding of the colony, parties of both German and Portuguese Jewish settlers having arrived at Savannah in 1733. Some of these were indigent Jews, who were assisted to emigrate by coreligionists in England. Offshoots from this colony migrated to South Carolina before the first half of the 18th century, and a congregation was formed in Charleston in 1750. By the time of the Revolution, and for some decades thereafter, Charleston contained one of the most important and prosperous Jewish communities in the United States. In both of these colonies Jews seem to have figured as holders of responsible civil office before the close of the Revolutionary War.

The various places which contained Jewish communities prior to the Revolution have now been enumerated; the total Jewish population embraced in them and in other and more isolated settlements was, as seen, somewhat less than 3,000 in the year 1800.

Interior Settlements.— Space does not permit consideration of the various Jewish settlements and their date of establishment outside of the limits of the 13 colonies. The great majority of Jewish residents of the United States still reside along the eastern coast-line. In time, the westward movement carried Jewish settlers along with it, some into interior cities in the original 13 States, others farther west. By 1800 there were several Jewish residents at Pittsburg. Judah Touro (q.v.), the well-known Jewish philanthropist, went to New Orleans about 1801, and Jews were destined, during the latter half of the 19th century, to achieve considerable political distinction there, though probably there were some Jewish settlers in the Louisiana Territory nearly a century earlier, who were persecuted by reason of the prohibitions in the French "Code Noir" upon Jewish settlement. The first indisputable Jewish resident of Kentucky seems to have settled there about 1808. Ohio appears to have received its first Jewish residents about 1817–19, and after 1830 a considerable tide of German-Jewish immigration flowed toward Cincinnati. In Illinois, which has to-day a considerable number of Jewish inhabitants (see above), especially in and about Chicago, the first Jewish settler probably arrived about 1841; and after a couple of years, numbers of German Jews began to come. A little later this same tide reached Detroit, Mich. Texas, while still belonging to Mexico, had quite a contingent of Jewish settlers, who began to arrive about 1821. California attracted a considerable number of Jews at the time of the gold discovery in 1849, and in 1850 they had two congregations in San Francisco. It will be observed that the great majority of Jews in the United States are to be found in the large cities.

The reactionary movement that followed the Napoleonic wars in Germany, early in the 19th century, and particularly the barbarous Jewish marriage laws of some of the German states (which, among numerous disabilities from which Jews suffered, were possibly the most objectionable, as they forbade more than a certain number of Jewish couples to live in any district), greatly stimulated German Jewish emigration to the United States from about 1815. After the revolutions of 1848 the political and economic unrest in Germany and throughout Europe caused a particularly valuable and intelligent class of Jewish immigrants to come to this country, including, in addition to Germans, also Hungarians, Poles, and Bohemians; while after 1881 the Russian-Jewish exodus assumed large dimensions, and the Rumanian-Jewish emigration began to be heavy about 1900. The volume of these tides can be gauged by comparing the estimates of Jewish population at various periods, already quoted, with these various dates. The forced emigration of recent years from Russia and Rumania has naturally had the effect of bringing to these shores persons less adequately equipped, and who had known fewer opportunities for development and self-improvement than the earlier immigrants, generally speaking, had enjoyed.

The Jews in American Commerce, Industries, and the Professions.— Reference has already been made to early Jewish activities in the field of commerce, exhibited in Brazil and the West Indies particularly. It is most important here to note the consequences which followed the dispersion of the Jews throughout so many different lands and districts, resulting in their opening of international and intercolonial trade relations with each other long before those having no such ties of relationship or confidence, and no such common language or commercial abilities, were ready for any such mutual intercourse. The result was that in early colonial days Jews were pioneers and prime promoters of intercolonial and foreign commerce in America, which became not merely profitable, but actually indispensable, for the maintenance of the colonies. The most distant points thus became interlinked by means of their Jewish residents. Every industry and branch of trade engaged their attention. Among persons who were particularly prominent in these fields, besides Lopez, Rivera and Touro, already referred to, were Lewis Gomez and his sons, who were exporters of wheat on a very large scale in colonial New York, early in the 18th century; Hayman Levy, the fur-dealer of New York, who had close relations with the

American Indians, and was at one time the employer of the first John Jacob Astor; David Gradis of Bordeaux, who is described as having "controlled the trade of France with the West Indies," in the 18th century, etc. Aaron Lopez of Newport had a fleet of over 30 vessels shortly before the Revolution, engaged in trade between Newport, the West Indies, and Africa. Newport Jews also created the spermaceti industry. Jews were among the founders of the New York Chamber of Commerce, and one figures on its seal as a member of the committee receiving its charter from the colonial governor. They were also among the founders of the New York Stock Exchange, and ever since that time have been growing in importance in America as bankers, brokers, financiers, and railroad magnates. They have been particularly influential in certain lines of trade, including the cotton, tobacco, sugar, coffee, jewelry, leather, hides, meat-packing, and clothing industries, and department-store activities.

The Jews of America have produced distinguished inventors, lawyers, physicians, rabbis, journalists, scientists, artists, dramatists, and professors, filling chairs at all the leading universities, far in excess of the proportional number of their race in the population of the country. On the other hand, the large immigration of unskilled laborers into the United States has led to the employment of thousands of Jews here in every industrial pursuit, frequently at very low wages and under unfavorable conditions.

Jews in the Army, Navy, and Public Service Generally.— Prior to the American Revolution there were Jews serving in the militia and in the colonial wars. During the Revolutionary War, their numbers on the army rolls far exceeded their ratio to the total population, and a number achieved distinction above the ranks. The New York Jewish congregation concluded, by a decisive majority vote, to disband, rather than to sacrifice patriotism on the altar of religion, and many of its members fled to Philadelphia, just prior to the British occupancy of New York. In the South a corps of volunteer infantry, known as Captain Lushington's company, composed principally of Jews, was organized in Charleston in 1779, and fought in the patriot ranks. A number of Jews had figured as signers to the Non-Importation Agreement of 1765. Among those on the Revolutionary rolls who achieved military distinction are Col. Solomon Bush; Col. David S. Franks, aide-de-camp to Gen. Arnold before the latter's treason, and who was the bearer of the signed definitive treaty of peace, sent abroad by Congress for delivery there; Isaac Franks, who became colonel of Pennsylvania's volunteers soon after the Revolution, after having served long during the war in the ranks; Capt. Jacob de la Motta; Maj. Nones; Lieut. Seixas; and Deputy Commissary-General of Issues Sheftall, of Georgia. During our War of 1812 and the Mexican War many Jews served in the ranks, and occasionally as holders of important military positions; while during the Civil War the number of Jewish soldiers in the field far exceeded their ratio to the whole population of the country, and they held military positions from brigadier-general down. Hon. Simon Wolf, in his work, 'The American Jew as Patriot, Soldier and Citizen,' has, by means of enormous labor and investigation, collected available names and records of Jewish soldiers in the Federal army and navy, in which he reports that during the Civil War, no fewer than 7,884 Jews served, and even these numbers are necessarily incomplete. As the Jews were Union men in the North, so those living in the South generally espoused the cause of the Confederacy; but Mr. Wolf's figures include less than 2,000 Confederate Jewish soldiers. The number included by him as serving in the Union and Confederate navies is almost negligible. A similar list of Jews who served during the Spanish-American War has been compiled (American Jewish Year Book 1900–01, pp. 527–622), and includes thousands of names, again exceeding the relative ratio based on that of the total number of persons serving to the total population; and President Roosevelt, years later, felt called upon to compliment them publicly upon their bravery, as indicated by instances of Jews who served under him and were commended for gallantry. Neither have Jews failed to enlist in our navy, for since the latter was instituted, a number of Jews have notably risen from the files to naval distinction, as witness the careers of Capt. Etting, Maj. David M. Cohen of the United States Marine Corps, Capt. Levi M. Harby, Capt. Jonas P. Levy, and "Commodore" Uriah P. Levy, who at the time of his death in 1862 was the ranking officer in the United States navy. Nor have Jews failed to render the government signal services in private life. Haym Salomon, the associate of Robert Morris and Madison, was broker to the Office of Finance, and it was through his hands that the loans from France and Holland to the infant republic passed; he made heavy advances to the government, which at the time of his death was indebted to him in hundreds of thousands of dollars, which have never been repaid, in spite of repeated Congressional reports in favor of the claim. During the Revolutionary period, there were still others who aided the government's hazardous financial fortunes. Among the most distinguished Jewish patriots of the Revolution stands Francis Salvador, who was a member of the South Carolina Provincial Congress and of the General Assembly of that State. On the other hand there were, naturally enough, also a few Tories among the Jews, chief among whom were David Franks of Philadelphia, who had been British commissary-general, during the French and Indian war, together with his father, Jacob Franks. David Franks' daughter, Rebecca Franks, was one of the leading belles and wits of Philadelphia and New York during the Revolution. A number of Jews have served in Congress, both in the Senate and the House of Representatives, the most prominent among them having been Judah P. Benjamin (q.v.), who resigned his seat in the Senate to become attorney-general, secretary of war, and then secretary of state of the Confederate States, and subsequently became leader of the English bar. Several Jews have been U. S. ministers to Turkey and consuls-general, one of the former, Oscar S. Straus, now being a member of the Permanent Court of Arbitration at The Hague. Many have been judges in different States, and several have been attorneys-general of their States. A number have been mayors of leading cities, while many others have held local and

State offices. Among those who rendered our government most valuable services in trying financial times are J. & W. Seligman & Co. Several Jews, particularly Moritz Pinner, David Einhorn, and M. Heilprin, were active workers for individual liberty in the anti-slavery movement.

Charities and Other Institutions.— The Jewish charities of the United States are unequaled in magnitude and efficiency, compared with the total Jewish population. Naturally enough, the enormous exodus of well-nigh indigent Jews to these shores has greatly increased the burden falling on their more fortunate coreligionists. The amounts disbursed by the organized Jewish charities in New York city alone exceeds $1,000,000 per annum. Almost every possible field of charitable endeavor is attended to. New York city, for example, contains three Jewish hospitals, a home for incurables, two Jewish orphan asylums, two Hebrew technical schools, an educational alliance, a home for aged and infirm, and an organization of United Hebrew Charities for direct relief; and these are but a few out of scores of charitable societies and institutions. The pure milk depots opened by Nathan Straus, at a heavy loss to himself, in New York — an example which has been followed in other cities — is one of the most effective forms of charitable endeavor, and has saved thousands of infant lives. Various Jews of the United States have contributed hundreds of thousands of dollars at a time in individual instances to charitable purposes, best known among whom Mr. Jacob H. Schiff of New York, who is credited with observance of the old Jewish practice of giving a tithe of his income to charity. The arbitration movement for settling controversies between capital and labor, known as the Civic Federation, has enlisted several Jews in its directorate. The Jewish charities of the United States are being systematized and organized more and more from year to year; aid is being afforded by the newly instituted annual national conferences of Jewish Charities, and under their auspices, removal offices have been opened within the United States to aid indigent immigrants after arrival, to seek locations for them in the interior of the country, and thus somewhat relieve the congestion of the large Eastern cities. Of course all the local New York charities deal particularly with recent arrivals, but the Baron de Hirsch Fund and the Educational Alliance especially address their efforts toward them.

A number of very large mutual benefit and mutual development societies, taking the form of fraternities of Jewish lodges, exist within the United States and do much good, chief among them being the Independent Order B'nai B'rith, the Independent Order Free Sons of Israel, and the Independent Order Sons of Benjamin. The recently organized Zionist movement has appealed greatly to many thousands of Jews in America, particularly to the more orthodox, and they have organized numerous societies to aid in establishing a Jewish state, in Palestine or elsewhere, for the benefit of the persecuted Jews of eastern Europe.

MAX J. KOHLER, A. M., L.L. B.
Cor. Sec. American Jewish Historical Society.

Jew's Harp, a small musical instrument held between the lips, the sound coming from the vibrations of a tongue of metal, bent at a right angle, which is set in motion by being twitched with the fore-finger. The sound is increased in intensity by the breath, and altered in pitch by the shape of the cavity of the mouth, which acts as a reflector. The name some derive from *jeu*, play, from the fact of its being a toy; but more probably it is a derisive allusion to the harp of David.

Jew's Mallow, a pot-herb. See CORCHORUS.

Jex-Blake, Sophia, English physician: b. Sussex January 1840. She was the daughter of a physician, studied medicine in Boston, Mass., 1866–8, and returning to England matriculated at the University of Edinburgh, but was not allowed to complete her studies there and take the degree of M.D., which she subsequently obtained at the University of Bern. She founded the London School of Medicine for Women, the Edinburgh School of Medicine for Women in 1886, and retired from active practice in 1899. She has published 'American Schools and Colleges' (1866); 'Medical Women' (1872); 'Puerperal Fever' (1877); 'The Care of Infants' (1884).

Jez'ebel, the Phœnician wife of Ahab, king of Israel. She was the evil genius of her husband, favored the idolatrous worship of Baal in Palestine, and persecuted the prophets of Jehovah. Her name left a dark stain upon the annals of Israel and survived to the later dispensation where it occurs in the Book of Revelations (Rev. xi., 20) as a symbol of feminine depravity and impiety.

Jhelam, jē'lam, or **Jhelum** (ancient HYDASPES), a river which has its rise in Kashmir. An octagonal tank has been built in a garden at Vernag, and into this reservoir flow springs

from the Western Himalayas, which form the head waters of the Jhelam. The river flows northwest to the Wulur Lake, about 10 miles from Srinagar; then southwest and northwest, forming a curve from Wulur Lake through Barambula Pass to Mazufurubad, where it turns south, and flows along the boundary between Punjab and Kashmir, a distance of about 100 miles. Leaving the boundary line at Jhelam it flows southwest into the Chenab River. Its whole course is about 500 miles, nearly all of which is navigable. The first part of its course is through remarkable mountain scenery and the last through a rich agricultural region. It is the thoroughfare for a number of large cities and small towns. This is the river upon the banks of which Alexander the Great built a war fleet in 326 B.C. and fought a battle with Porus.

Jig, a light quick tune or air to be found in the sonatas of Corelli, Handel, and other composers till toward the middle of the 18th century. The Irish jig, played to a dance also called a jig, is a lively tune of two or three sections written in 6–8 time. The jig is popular among many nations, is distinguished by various titles, and has a certain amount of difference in the steps according to the habits and customs of the people by whom it is adopted. With some it is a sober, steady country dance; with others it is a wild, savage exercise, without point of meaning. With some it is made a means of displaying the agility of the lower limbs of a combined company of dancers; with others it is a terpsichorean drama for two performers, in which all the emotions excited by love are represented by gestures and cries.

Jig'ger, the corrupt current form of "chigoe," the South American name of a small arachnid, or red bug (*Sarcopsylla penetrans*), which abounds in tropical America, and is troublesome by working its way under the skin, especially of the feet, where, unless speedily removed, it produces eggs and forms a bad sore.

Jihad, jĭ-häd', **Jehad,** or **Tihad** (Arab. "zeal, endeavor"), the term applied to the religious war, as undertaken by Mohammedans against those who did not believe in the mission of the Prophet, for the purpose of promoting the spread of Islam. The Jihad was a religious duty, imposed upon the faithful both by the Koran and the concurrence of sacred tradition. Its purpose was ostensibly the Mohammedanization of the unbelieving, and it was carried on in a systematic manner. The disposition of the peoples conquered in the Jihad was prescribed by law. Captives and others who fell into the hands of the Mohammedan hosts had the choice of three things given them. Either they were to deny their own faith and accept that of Islam, or to consent to pay a toll tax to their conquerors. If they refused both of these alternatives they were put to death by the sword. Consult: Baillie, 'Of Jihad in Mohammedan Law' (1871); T. T. Hughes, 'Dictionary of Islam' (1886).

Jim'son-weed. See DATURA.

Jingal, jĭn'gâl, a large heavy musket used in eastern Asia, especially by the Chinese. It is fired on a rest, or swivel, from a wall, or the bulwark of a boat or ship.

Jingo, a word first used as a political term in the Russo-Turkish War of 1877–8, and was applied to a class of British politicians who continually urged on Disraeli, then the prime minister, the necessity of taking sides with the Turks. The word was adopted from "McDermott's War Song"—that is, the song sung in music halls by McDermott and very popular at the time. The chorus ran thus:

> We don't want to fight, but, by Jingo! if we do,
> We've got the ships, we've got the men, we've got the money, too.

Jinrikisha, jĭn-rĭk'ĭ-sha ("man-power vehicle"), a two-wheeled carriage, resembling a gig, and drawn by a human runner between the shafts, universally used in Japan since 1868.

Jiu Jitsu, the Japanese method of personal attack and self-defense, literally means the gentle art of making one's opponent use his strength to his own disadvantage. There are many methods, but only one is recognized as official, that devised by Prof. Jiguro Kano, principal of the High Normal School of Tokyo, and is taught to every officer and enlisted man of the Japanese army, navy and police departments. Included in the one hundred and sixty feats of the Kano system are the "serious tricks," by which death may be caused at the will of the adept, and the process of kuatsu or revivification, by which the apparently lifeless victim is restored to the full use of his functional powers. Jiu Jitsu is not a system of muscle building by physical training, but rather a means of offsetting the effectiveness of powerful muscles, by performing the most skilful yet simple maneuvers. The United States Government has recognized its importance as science by having it taught at West Point and Annapolis as a special training. Consult Skinner, 'Jiu Jitsu' (New York 1904).

Joab, jō'ăb, the son of King David's sister Zeruiah, and commander-in-chief of David's army. He is first mentioned as the leader of David's men in an expedition against Abner. When Joab treacherously murdered Abner in revenge for the death of Asahel, David dared not punish the deed, and thus showed the ascendency which Joab had acquired over him. After David had been established king in Jerusalem, Joab conducted all his wars with uniform success. He remained faithful to him during the rebellion of Absalom. When he had slain that ungrateful son, David made a weak attempt to supersede him in favor of Amasa, the general of Absalom. Joab slew Amasa and resumed his post, a proceeding in which the king tacitly acquiesced. He further supported David by assisting in the murder of Uriah the Hittite. Toward the close of David's reign he joined in the rebellion of Adonijah, for which Solomon, by the advice of David, put him to death.

Joachim, yō'ä-hĭm, **Joseph,** Hungarian violinist: b. Kittsee, near Presburg, 28 June 1831. He studied under Szervaczinsky, the opera concert-meister at Budapest, with Böhm at Vienna, and Hauptmann at the Vienna Conservatory, and after appearances in concert, continued his studies at Leipsic. In 1849 he became concert-meister of the Weimar grand-ducal orchestra, of which Liszt was then conductor, in 1854–66 was solo-violinist and conductor of concerts to the king of Hanover, and in 1868 became director of the Hochschule für ausübende Tonkunst at Berlin. He became known, both

as an interpreter of the best music and as an executant, as the greatest violinist of his time, and particularly as a quartette player gained an almost classic reputation. His compositions include the 'Hungarian Concerto' in D-minor for violin and orchestra, his most important work; ballads, trios, overtures, marches, and works for violin and pianoforte.

Joachim, jō'ą-kĭm, Saint, Order of, an order of knighthood founded 20 June 1755, under the title "Order of Jonathan for the purpose of defending the honor of Divine Providence." It consisted of 14 dukes, princes, counts and nobles, and its grandmaster was Prince Franz Christian of Saxe-Coburg. Its object was by the establishment of commanderies to stir up the rich to philanthropic work among the lower classes. This order was still in existence in 1820, but it has since then been dissolved.

Joan (jo-ăn or jōn) **of Arc** (JEANNE D'ARC — properly DARC), the Maid of Orleans, heroine in French history: b. Domrémy, Basse Lorraine, now department of the Vosges, 6 Jan. 1412; d. Rouen 30 May 1431. While she was still a girl she began to be deeply affected by the woes of her country, much of which was conquered by the English and their Burgundian allies, leaving only a small portion to the French king, Charles VII. From about 13 she declared she heard heavenly voices, which at last became very definite in their commands to go to the aid of Charles and liberate France. At first she was regarded as insane, but eventually she found her way to the king and his councillors, and having persuaded them of her sincerity, received permission to hasten with Dunois to the deliverance of Orleans. In a male dress, fully armed, she bore the sword and the sacred banner, as the signal of victory, at the head of the army. The first enterprise was successful. With 10,000 men she marched from Blois, and on 29 April 1429 reached Orleans with supplies. By bold sallies, to which she animated the besieged, the English were forced from their intrenchments, and Suffolk abandoned the siege (8 May 1429). Other successes followed; Charles entered Rheims in triumph; and at the anointing and coronation of the king, 17 July, Joan stood at his side. She then asked to be allowed to return home, but at the urgent request of King Charles, remained with the army. She was later less successful and failed to capture Paris. On 24 May 1430 she entered Compiègne, then besieged by the Burgundians, and on the same day, in a sally from the town, was taken prisoner. Subsequently she was delivered to the English, who, with the University of Paris and the bishop of Beauvais, demanded her execution as a sorceress. She was taken to Rouen, and after a long mock-trial, accompanied with many shameful circumstances, condemned to death. On submitting to the church, however, and declaring her revelations to be the work of Satan, her punishment was commuted to perpetual imprisonment. But pretexts were soon found to treat her as a relapsed criminal, and as such she was burned at Rouen, and her ashes were thrown into the Seine. She died with undaunted fortitude. Her recantation is now doubted by some historians. Voltaire, in a notorious burlesque, 'La Pucelle,' Southey, Schiller, and others have made her the subject of their verse. Schiller's drama, 'Die Jungfrau von Orleans,' still remains the worthiest monument of her fame. A revision of the trial was later had, and she was declared innocent (1456). From 1875 the question of her canonization was discussed at Rome, and in 1902 she had been pronounced "venerable." Consult: Quicherat, 'Condemnation et Rehabilitation de Jeanne Darc' (1841–9); Marin, 'Jeanne Darc, Tacticien et Stratégiste' (1891); Oliphant, 'Jeanne d'Arc' (1896); Murray, 'Jeanne d'Arc' (1902).

Joan of Arc, Personal Recollections of, a historical novel by "Mark Twain" (S. L. Clemens), published in 1896. It professes to be a translation by Jean François Alden from the ancient French of the original unpublished MS. in the national archives of France, written by the Sieur Louis de Conte, her page and secretary. The historical facts are closely followed.

Job, jōb, Book of, title of a book in the Old Testament, so called from the man whose history it relates. It cannot be ascertained with certainty when the book was produced. Job himself belongs to the patriarchal age, but the book was written at a period when great calamities had fallen upon the people of God, and they had been driven by bitter experience to consider the nature and object of His providential workings. It is probably later than Jeremiah (626 B.C.) or Habakkuk (604 B.C.), both of whom had paid some attention to this problem.

The prologue (ch. i. ii.) is written in prose. Satan is permitted to test Job's trust in God, and the patriarch is suddenly stripped of his possessions and bereaved of his children. Yet Job ascribes no wrong to God. He himself is smitten with deadly leprosy. Job's three friends came to see him and he bursts into a despairing cry for death.

The debate between Job and his three friends (ch. iv.–xxxi.) is written in poetry. These friends attribute Job's affliction to his sin and hypocrisy. They are answered by Job's self-vindication; he adjures God to reveal the cause of his chastisement. In the speech of Elihu, a youth, who has listened to the debate, the goodness of God is asserted. He afflicts men to deter them from sin.

Then the Lord speaks out of the whirlwind (ch. xxxviii.–xlii. 6) and shows his power as Creator and Preserver of all things in the material world. Job answers, "I have heard of Thee with the hearing of the ear, but now mine eyes see Thee." The epilogue is in prose. Job is restored to health and prosperity.

The meaning of the book seems to be, that suffering or calamity is not a proof of guilt in the sufferers; the ways of God are so high, His power so vast in creation, in the government of nations and in the realm of mind, that man is incapable of gauging His methods of overruling human life.

Job's Tears, a stout grass (*Coix lachryma-jobi*), allied to maize, and which is sometimes seen six or eight feet in height. It is a native of southern Asia, is naturalized in Spain, and in other countries is sometimes grown in hothouses. The hard, round, shining seed-capsules, from whose fanciful resemblance to tears the plant derives its name, are used in making rosaries and ornamental articles, as medicine by the Chinese, and as a staple food among some of

the hill-tribes of northern India. See also, GRASSES IN THE UNITED STATES.

Jocelyn, jŏs'ĕ-lĭn, **Ada Maria Jenyns,** English novelist: b. Aldershot, Hampshire, 7 Sept. 1860. She was married to Colonel R. J. O. Jocelyn in 1892. Among her numerous fictions may be mentioned 'A Distracting Guest' (1889); 'Only a Horse Dealer' (1892); 'Pamela's Honeymoon' (1894); 'Lady Mary's Experiences' (1897); 'The Seat of Fortune' (1901).

Jocelyn, Nathaniel, American portrait painter: b. New Haven, Conn., 31 Jan. 1796; d. there 13 Jan. 1881. At 18 he was apprenticed to an engraver, but after three years his early love for painting asserted itself and he established himself as a portrait painter at New Haven in 1820. He was for some time resident in Savannah, where he painted many portraits, but returned to his native town where his work was very popular and where from 1825 to 1835 he painted the portraits of many notables, not a few of which are preserved in Alumni Hall at Yale. His fame extended beyond the limits of his State and he exhibited at the Academy of Design on several occasions. At the age of 80 he painted 'Ocean Breezes,' a successful work of fancy, and his only one. His portraits have been greatly prized by critics. Jocelyn was a staunch anti-slavery man, and his home in New Haven was long one of the stations on the Underground Railroad. He was for many years the senior partner of a bank-note engraving company in New York which subsequently became the American Bank Note Company, resigning from the latter in 1867.

Joe Miller, the name attached to a well known collection of jests, first published in 1739. The name belonged to a comic actor, Joseph Miller (1684–1738), who had then a great reputation as a wit and humorist. The real compiler, however, was a certain John Mottley, an obscure author (1692–1750). The term is now often applied to any stale or worn out jest.

Joe Pye Weed. See EUPATORIUM.

Joel, jō'ĕl, one of the minor prophets. He most probably flourished about 770 B.C., a few years before Amos and Hosea, whose writings have many correspondences with his. Joel's prophecy is full of Oriental symbolism, and is pervaded by a tone of solemn warning. He announces what he calls "a day of Jehovah," that is, a day of judgment and vengeance for Judah and Jerusalem. This is typified by a plague of locusts whose devastations are vividly described. The prophet appeals to the people to meet the impending judgment by prayer and fasting. Jehovah himself is represented as giving his answer to the cry for help; relief from famine, abundant rain, rich harvests are to bring relief. Moreover a new spirit is to be poured out upon the people so that in the day of trial they shall call upon God and be saved. The people of Jehovah sold into captivity by Phœnicians and Philistines are to be restored. The nations are to be called to judgment, and in that fearful day Jerusalem shall find refuge in Jehovah. The style of the prophet is gorgeous in its profusion of imagery; metaphor and hyperbole have to be interpreted, and fact discerned amid the maze of fancy. Yet the language is smooth and flowing without the strain and abruptness of Hosea and Jeremiah, and we are compelled to look upon Joel as a man of calm and settled mind, without any of the doubts and struggles that racked the minds of other Hebrew poets and prophets.

Jogues, zhōg, **Isaac,** French missionary among the North American Indians: b. Orleans 10 Jan. 1607; d. Ossernenon, near the present Awnesville, Montgomery County, N. Y., 18 Oct. 1646. He became a Jesuit at Rouen in 1624, and, after some years passed in study and teaching, was ordained in 1636. At his own request he was immediately sent to the Huron mission in Canada. In 1639 he undertook a mission to the Tobacco Nation, in 1641 preached to the Algonquins at Sault Sainte Marie, not long after went to Three Rivers for supplies for the Huron Mission, and upon his return was captured by the Mohawks and severely tortured. He remained among the Indians as a slave, until the summer of 1643, when he made his escape to the Dutch settlement of Rensselaerswyck (Albany), and was conveyed thence to New Amsterdam. He finally reached France, where he was treated with great consideration, and invited to court. Returning to Canada, he traveled to the Mohawk country in May 1646, in the capacity of an ambassador to conclude a treaty between that people and the French. Ascending the Sorel, he passed through Lake Champlain and Lake George, which he named Lac Saint Sacrement. Having ratified the peace he returned to Quebec, and after a few days' rest set out for the Mohawks again, this time as the founder of the Mission of the Martyrs. He was soon tortured as a sorcerer, and finally killed. Consult: Martin, trans. by Shea, 'Father Isaac Jogues' (1896); Parkman, 'The Jesuits in North America' (new ed. 1898).

Johannesburg, yō-hăn'nĕs-boorg or jō-hăn'nĕs-bĕrg, South Africa, the metropolis of the Transvaal Colony, situated 5,500 feet above the sea, about 30 miles southwest of Pretoria, with which and with Delagoa Bay 397 miles, Durban 483 miles, East London 668 miles, Port Elizabeth 715 miles, and Cape Town 1,015 miles, it is in railway communication. It is the recognized business centre of the rich gold fields of the Witwatersrand, and the largest town in the Transvaal. In 1886 it was represented by a few shanties, but the discovery of gold and the development of gold mining made it within a comparatively few years one of the most important towns of South Africa. Municipal government was conferred upon the city by the Transvaal authorities in 1896, when the population within a three-mile radius was 102,078, of whom 50,907 were whites, 67 per cent of these being of British origin, while the Boer citizens numbered 6,205. The great Uitlander agitation which culminated in the Transvaal war 1899–1902, centred in Johannesburg, which was occupied by Lord Roberts in 1900. Since the close of the war, important public improvements to cost $30,000,000 have been begun. These include many miles of well-paved streets, an elaborate electric car system, new waterworks, sanitation system, a factory section, and handsome suburbs. Mementoes of the former Boer rule are an imposing but dismantled

fortress which dominates the town, and the monument near Krugersdorp which commemorates the declaration of Boer independence in 1880. Among the notable buildings and institutions are: many fine hotels, clubs, etc.; a handsome railway station lighted by electricity; the market buildings, in the large Market Square, where also are the post and telegraph offices and the buildings of the chamber of mines; the fine public library building; the stock exchange; the court-house; many churches; a synagogue; a good hospital; a jail and a police barracks, and a new theatre and opera house. The town is lighted partly by gas but mainly by electricity.

In 1903 there were 160 incorporated mining companies employing 40,000 natives. Prior to the war 96,000 natives were working in the mines; 124 of the mining claims are located on the main reef and the others in the neighborhood of Klerksdorp. Prior to the war the gold production was valued at $7,000,000 a month, and the machinery employed was estimated at $100,000,000. The industry is fast recovering itself, and it is estimated that within a few years the annual production of gold will be equal to $121,500,000. The international peace exhibition of South Africa, to be held at Johannesburg 1904–5, is expected to fully rehabilitate commercial interests, and it is predicted that within six years Johannesburg will have a population of 200,000.

John, the name of 23 popes, as follows:

John I., Saint: b. Tuscany; d. 526. He succeeded Hormisdas in 523, and was a friend of Boethius, who dedicated to him several of his works. Theodoric sent him to Constantinople, to induce the Emperor Justin to adopt milder measures toward the Arians. Though received with uncommon pomp, his mission was fruitless, and on his return Theodoric threw him and his companions into prison, where he died. He is commemorated by the Roman Catholic Church 27 May.

John II. (Mercurius, mẽr-kū'rĭ-ŭs): d. Rome 27 May 535. He was a Roman and was surnamed Mercurius by reason of his eloquence. He became pope in 532.

John III.: d. Rome 12 July, 572. He was a Roman and became pope in July 560. During his time the Lombards frequently ravaged Italy.

John IV.: b. Salona in Dalmatia; d. Rome 11 Oct. 642. He was elevated to the papal chair in December 640 and was noted for zeal and orthodoxy. He formally condemned the Monothelitic statement of faith which Sergius had drawn up at the desire of the Emperor Heraclius.

John V.: b. Antioch, Syria; d. Rome 2 Aug. 686. He was the earliest of several pontiffs of Oriental origin and had been sent to the sixth General Council by Pope Agatho as legate. He became pope, 24 July 685.

John VI., he was a Greek by birth; d. Rome 9 Jan. 705. He became pope in 701, and when appealed to with reference to the long dispute between Saint Wilfred of York and the archiepiscopal see of Canterbury, decided in favor of the latter.

John VII., a Greek: d. Rome 17 Oct. 707. He became pope 1 March 705.

John VIII., a Roman: d. Rome 15 Dec. 882. He became pope in 872. The Saracens during his pontificate pushed their ravages to the gates of Rome, and he was compelled in 877 to pay them tribute. He crowned three emperors, Charles the Bald, 875; Louis the Stammerer, 878; and Charles the Fat, 881. He attempted, but unsuccessfully, to unite the Greek and Latin churches.

John IX.: b. Tibur; d. May 900. He belonged to the Benedictine order and became pope, as the choice of the Frankish party, in June 898.

John X.: b. Romagna; d. July 929. He was a man of great ability and of virtuous character notwithstanding the aspersions Liutprand casts upon him. He was archbishop of Ravenna in 905 and became pope in 914. He placed himself at the head of an army and drove the Saracens from Italy, but his determination to rule independently of any faction aroused the anger of his opponents and he was imprisoned, and at length murdered, by Theodora's daughter, Marozia, whose ambitions he had thwarted.

John XI.: b. 906; d. 936. He was the son of Marozia (q.v.) and Guy, duke of Spoleto. He was elected pope while under age in 931, and governed through the influence of his mother. His brother Alberic II. revolted and imprisoned the pope and his mother in the castle of San Angelo, where John died.

John XII. (Octavian): d. Rome 14 May 964. He was the son of Alberic and grandson of Marozia. He became pope in 956, after the death of Agapetus II., though only 18, and was the first pope who changed his name on accession to the papal dignity. He applied to the emperor Otho I. for assistance against Berengarius II., crowned the emperor 962, and swore allegiance to him, but soon after revolted against Otho, who caused him to be deposed by a council, in 963, and Leo VIII. to be elected. On Otho's death, in 964, John returned and excommunicated his rival.

John XIII., a Roman: d. Rome 6 Sept. 972. He was bishop of Narni, was made pope in 965 by the influence of the emperor Otho I., and was expelled by the Roman nobles. Otho II. restored him to Rome, and was crowned by him. The Poles and Hungarians were converted during his pontificate.

John XIV. (Peter): b. Pavia; d. Rome 20 Aug. 984. He was bishop of Pavia and had been chancellor to Otho II. who made him pope in November 983, in place of the anti-pope Boniface VII. The latter had seized the papacy after the death of Otho I. Boniface now returned from Constantinople and imprisoned John in the castle of San Angelo, where he died soon after.

John XV.: d. Rome April 996. He did not reach the blood-stained throne of his predecessor. He died within the month of his election, even before his consecration.

John XVI. (Philag'athus), a Greek of Calabria: d. 996. He became pope in 986. He solemnly canonized St. Udalbric, bishop of

Augsburg. This is the first historical mention we find of a solemn pontifical canonization.

John XVII. (Sic'co): b. Ripa Jani; d. Rome 7 Dec. 1003. An anti-pope intruded during the pontificate of Gregory V.

John XVIII. (Phasianus, fa-sē-ā'nŭs). He became pope on Christmas Day 1003, and in May 1009, resigned his office and entered a monastery.

John XIX., a Roman: d. January 1033. He succeeded his brother Benedict VIII. He was disposed to concede the title Ecumenical to the Patriarch of Constantinople, but this met with so much opposition from the Latin Church that he was obliged to withdraw the concession.

John XX., frequently called **John XXI.** (Pedro, pā'drō): b. Lisbon, Portugal; d. Viterbo, Italy, 20 May 1277. He became in 1273 cardinal-bishop of Frascabi and pope in September 1276. He was learned in philosophy and medicine and wrote several treatises still of interest as showing the status of mediæval medicine.

John XXI. See John XX.

John XXII. (Jacques D'Euse, zhäk dēs): b. Cahors about 1244; d. Avignon 4 Dec. 1334. He was archbishop of Avignon, and was elected pope at Lyons 1316, after the death of Clement V. He resided at Avignon, but had many adherents in Italy. He is important in German history on account of the active part he took in the disputes of the emperors Louis of Bavaria and Frederick of Austria. Louis intruded the anti-pope Nicholas V. and declared John XXII. deposed. Several theological controversies filled his pontificate with ecclesiastical strife, the most notable being the question of absolute Evangelical poverty raised by the Franciscans and that of hominalism led by William Ockam. He published in 1317 the 'Constitutions of Clement V.,' a manual of canon law, since known by the title 'Clementines' (q.v.). He was also the author of the decretals called 'Extravagantes.' See Canon Law.

John XXIII. (Baldassare Cossa, bäl-däsä'rā kōs'sä): b. Naples; d. Florence 22 Dec. 1419. He was elected pope in 1410, by the Council of Pisa, after the death of Alexander V., on condition that, if Gregory XII. and Benedict XIII. would resign, he would also retire to end the schism. He summoned the Council of Constance, demanded by the Emperor Sigismund, in 1415, where he confirmed his resignation 2 March; but 20 March he fled secretly from Constance to Schaffhausen, and revoked his resignation. He was cited before the council, but not appearing, he was suspended, and finally deposed. He was imprisoned four years. Pope Martin V. subsequently pardoned him and made him cardinal bishop of Tuscoli, and dean of the college of cardinals.

John, king of England: b. Oxford 24 Dec. 1166; d. Newark, Nottinghamshire, 19 Oct. 1216. He was the youngest son of Henry II., by Eleanor of Guienne. Being left without any particular provision he received the name of *Sans Terre* or Lackland; but his brother, Richard I., on his accession conferred large possessions on him. He obtained the crown on the death of Richard in 1199, although the French provinces of Anjou, Touraine, and Maine declared for his nephew, Arthur of Brittany, who was lineally the rightful heir, then with the king of France. A war ensued, in which John recovered the revolted provinces and received homage from Arthur. In 1201 disturbances again broke out in France, and Arthur, who had joined the malcontents, was captured and confined in the castle of Rouen, and never heard of more. John was universally suspected of his nephew's death, and in the war which followed, he lost Normandy, Anjou, Maine, and Touraine. In 1205 his quarrel with the pope began regarding the election to the see of Canterbury, to which the pope had nominated Stephen Langton. The result was that Innocent III. laid the whole kingdom under an interdict, and 1211 issued a bull deposing John. Thereupon John made abject submission to the pope, even agreeing to hold his kingdom as a vassal of the pope (1213). His arbitrary proceedings led to a rising of his nobles, and he was compelled to sign the Magna Charta or Great Charter 15 June 1215. But he did not mean to keep the agreement, and obtaining a bull from the pope annulling the charter, raised an army of mercenaries and commenced war. The barons, in despair, offered the crown of England to the dauphin Louis, who accordingly landed at Sandwich 30 May 1216, and was received as lawful sovereign. The issue was still doubtful when John died. Consult: Stubbs, 'Constitutional History of England,' Vol. I.; Norgate, 'England under the Angevin Kings' (1887), and 'John Lackland' (1902).

John II., king of France, surnamed the "Good": b. about 1319; d. London 8 April 1364. He was the son of Philip VI. and was a monarch distinguished alike for his incapacity and his misfortunes. In 1356 he was defeated and taken prisoner by the Black Prince at the battle of Poitiers, and detained at Bordeaux and at London till released at a heavy expense to his country by the Peace of Brétigny in 1360. On learning that his son, the duke of Anjou, who had been left as a hostage in England, had effected his escape, he returned to London, where he died.

John III. (Sobieski), king of Poland: b. Olesko, Galicia, 2 June 1624; d. 17 June 1696. John Casimir appointed him standard-bearer to the crown, and he distinguished himself in the war against the Russians and Swedes, which terminated with the Peace of Oliva in 1660. In 1669 Michael Koribut was chosen king on the resignation of John Casimir against a party who preferred Sobieski. On the death of Michael he was chosen king, 21 May 1674. A new war with the Turks was concluded after varying success by a peace, 27 Oct. 1676. The anarchy in which Poland was constantly kept by the turbulence of its aristocracy was aggravated during the reign of Sobieski by the intrigues of his wife, and his own talent for administration was not equal to his capacity as a general. Besides internal troubles, European politics at this time occupied the attention of Sobieski, whose alliance was solicited both by Louis XIV. and the emperor. He at length concluded (31 March 1683) an alliance with the latter against the Turks, who had allied themselves with the

malcontents in Hungary and threatened a most formidable invasion of the empire. Uniting with the Austrian forces 9 September, at the head of a combined force of 83,000 men, he inflicted a decisive defeat on the Turks, and compelled them to raise the siege of Vienna, 12 Sept. 1683. He terminated the campaign with the capture of Gran (27 October), which had been in the possession of the Turks for nearly a century and a half. In 1686 he overran Moldavia and Wallachia, but failed to make a permanent conquest.

John of Austria, commonly called **Don John of Austria,** Spanish general: b. Ratisbon, Bavaria, 24 Feb. 1547; d. near Namur, Belgium, 1 Oct. 1578. He was an illegitimate son of the emperor Charles V. In 1570 he conducted a campaign against the Moors of Granada with great vigor and relentlessness, and in the following year commanded the allied fleet which won the great naval battle of Lepanto over the Turks (7 Oct. 1571). In 1576 he was appointed governor of the Netherlands, and had won with the Prince of Parma the victory of Gemblours (1578) over William the Silent, when he died, not without suspicion of having been poisoned by his jealous half-brother, Philip II., but for this belief there is no evidence. Consult: Motley, 'The United Netherlands'; Stirling-Maxwell, 'Don John of Austria' (1883).

John of Gaunt, gänt or gânt, DUKE OF LANCASTER, English soldier: b. Ghent, Flanders, (whence his name) 1340; d. London 3 Feb. 1399. He was the fourth son of Edward III. and his queen, Philippa of Hainaut. He was created Duke of Lancaster in 1362; served in the French wars, and became governor of Guienne. He assumed in right of his wife the title of King of Castile, invaded that kingdom to assert his claims, but relinquished them in favor of Prince Henry of Castile, his son-in-law. He was a supporter of the reformer John Wiclif, and a patron of the poet Chaucer. Shakespeare introduces him as a prominent figure in the play of 'Richard II.' His eldest son, Bolingbroke, became king of England as Henry IV. Consult: Longman, 'Life and Times of Edward III.' (1869); Trevelyan, 'England in the Age of Wycliffe' (2d ed. 1899).

John of Leyden, lī'dĕn. See ANABAPTISTS.

John, Epistles of, three letters upon Christian doctrine and conduct attributed to Saint John the Divine, the fourth Evangelist.

The First Epistle of Saint John.—This epistle was attributed to the apostle and evangelist by writers of the generation succeeding that in which he lived. Its thought, diction and style are those of the fourth gospel, though nothing indicates whether it was written before or after that book. Its date cannot be earlier than 90 A.D. nor later than 100 A.D. Critics generally agree that it was written from Ephesus. It was addressed to certain Christians of Ephesus and its vicinity who had fallen into error. These were Docetæ (q.v.) and failed therefore to reach true fellowship in Christ. The apostle presents Jesus as Christ and shows that we come into fellowship with God through Him, and inculcates faith in a real Redeemer, as a means of crushing the practical error whose result was barrenness in religion.

The book is a pastoral letter of instruction and exhortation, not a theological tract or a commentary on the Gospel. The purpose is set forth in chapter v. 13. The epistle falls into three main divisions: (1) God is light (i. 5–ii. 28), (2) God is righteous, or God is love (ii. 29–v. 5), (3) Jesus is the Son of God; fellowship with God comes through him. Sometimes the second division is subdivided under the headings (1) God is love, (2) God is righteous. But the writer evidently intends these two truths to stand as different aspects of the same truth, for as the love of God springs from his righteousness so his righteousness is the outcome of his love.

The Second Epistle of Saint John.—All evidence conclusively points to the apostle Saint John as author of this epistle. It is directed "to the elect lady and her children," who must have been an individual Christian woman; other views are attended with grave grammatical difficulties, whether we translate it to "the lady Elect" or "the elect Kyria." Her name is in fact unknown. The apostle had been met by some of her children and had rejoiced in their conduct, but warns them against defection.

The letter opens with a greeting; expresses joy in her sons' behavior (verse 4); exhorts all to abound in love (verses 5, 6); warns against deceivers (verses 7, 8), in closing the writer expresses a hope of visiting her, and delivers her sister's greeting.

The Third Epistle of Saint John.—It is addressed to Gaius, who cannot be identified with any person of that name mentioned in the New Testament (Acts xix. 29; xx. 4; Rom. xvi. 23; 1 Cor. i. 14). He lived near Ephesus, and was hospitable to the preachers sent by the apostle (verses 2–4). The character of Diotrephes (verses 9–11) Demetrius, who probably bore the letter is commended (verse 12). A vivid glimpse of church life at the close of the 1st century is given in these letters which reveal the Church in Asia Minor infected with speculative error, personal ambition, and insubordination to apostolic authority, and points to opposition which local leaders sometimes exhibited toward the delegates of the central authorities.

John, Order of Saint, a military religious order of mediæval origin. The Knights Hospitallers of Saint John, subsequently known as Knights of Rhodes, and lastly as Knights of Malta, were once a great power in Christian Europe. The origin of the order is unknown, but most probably it was early in its history that a rich merchant of Amalfi built not far from the Holy Sepulchre at Jerusalem a certain church known as Santa Maria della Latina, with a monastery for monks, under the rule of Saint Benedict, and a hospital for pilgrims. The first patron of the order seems to have been Saint John the Compassionate, patriarch of Alexandria in the 7th century. Afterward Saint John the Baptist was chosen patron, and the Benedictine brethren assumed the title of Johannites, or Brothers Hospitallers of Saint John. Pope Paschalis II. in 1113 gave them the privilege of electing their own rector. Later, in addition to the vow of poverty, chastity and obedience they were pledged to make war upon the infidels, and assumed a black cloak with a white cross on the left side. The members were divided

into three classes, knights of noble birth, the fighting class, priests bound to the service of the church, and brethren of service who took care of the sick and acted as guides to the pilgrims. In 1291 the order was driven from Palestine by the conquests of the Saracens, and after holding Cyprus for a time they occupied Rhodes in 1309, from which they were ultimately driven by Sultan Soliman II. in 1522. After that the knights retired to Candia and other places, but finally to Malta, which Charles V. granted them in 1530. Here they continued to be a bulwark of western Europe against the Turkish navies till modern times. The chief of this order, which had great possessions in almost every part of Europe, was called "Grandmaster of the Holy Hospital of St. John of Jerusalem, and Guardian of the Army of Jesus Christ." He lived at Valetta, in the island of Malta.

The military duty of the knights consisted in taking the field at least three times against the Turks or the pirates of Barbary. In war they wore a red jacket or tabard, charged with a white cross. In 1798 Malta was unexpectedly attacked and taken by Bonaparte, and about the same time the extensive properties belonging to the order in various countries were confiscated. This may be considered the end of the order as a vital institution, although shortly after the capture of Malta, Paul I., who had been chosen grand-master, took the order under his protection, and it still exists nominally at least. After the death of Paul the nomination of the head of the order was vested in the pope.

John, yōn, Eugenie, "E. MARLITT," German novelist: b. Arnstadt, Thuringia, Germany, 5 Dec. 1825; d. there 22 June 1887. She was the daughter of a portrait painter, and after pursuing the study of music at Vienna, lived at court for some years. She then returned to her native town and took up novel writing, using the pseudonym of "E. Marlitt." Her works, which are very numerous, have been translated into English by Mrs. A. L. Wistar, and have been very popular in this country. Among them are 'Gold Elsie' (1868); 'Old Mamselle's Secret' (1868); 'Countess Gisela' (1870); 'Princess of the Moor' (1872); 'The Second Wife'; 'In the Counselor's House'

John, Saint. See SAINT JOHN.

John, Saint, Gospel of. See GOSPELS.

John B. Stetson University, a coeducational school founded in 1883, at De Land, Fla., under the auspices of the Baptist denomination. The institution was first called De Land University, but in honor of John Batterson Stetson (q.v.), who has given large gifts to the institution, nearly all of the buildings and the campus, the name has been changed. The departments are a preparatory, schools of music, law, art, and technology, a normal and practice school for teachers, a business college, and a college of liberal arts. The courses lead to the degrees of bachelor of arts, laws, and philosophy, and to degrees of bachelor of civil, electrical, and mechanical engineering. The school in 1898 made arrangements with the University of Chicago, whereby the graduates of the college of liberal arts, who have a high standing in their studies, may receive corresponding degrees from the Chicago institution. In 1902 the number of students in attendance was nearly 450, the number of professors and instructors 40. The endowment fund amounted to about $210,500.

John Baptist, the forerunner of the Messiah and the Elijah, or Elias of the New Testament. About five years before the Christian era the Angel Gabriel, according to St. Luke's Gospel, appeared to the aged priest Zacharias and announced the birth of John by Elizabeth, the priest's wife. John was to be filled with the Holy Ghost and to go before the Lord in the spirit and power of Elisha to prepare a people for Him. This was some months before the angel announced in Nazareth, to a maiden called Mary that she should bear a son, whose name was to be Jesus, "the son of God." John Baptist, born 5 B.C. spent his early manhood in the desert. He announced the coming Messiah, and preached repentance, baptizing as a symbolic rite of purification and pardon. He was naturally the first publicly to recognize Jesus Christ and salute him as the "Lamb of God." Herod Antipas (q.v.) then ruled Palestine, his throne being under the protection of Augustus, and he imprisoned the Baptist in the gloomy fortress of Machaerus, east of the Dead Sea, being offended by the plain speaking of the stern ascetic. At a birthday feast given to his Galilean nobles Herod was fascinated by the dancing of Salome, the daughter of Herodias, the wife of his brother Philip, whom he had taken to wife, although her lawful husband still survived. The rebuke administered to Herod for his adultery by John had incensed Herodias and she was bent on vengeance. When Antipas swore to give Salome whatever she might ask to the half of his kingdom, she at her mother's suggestion, asked for the head of John Baptist on a charger or large dish. This was the occasion of the Baptist's martyrdom. The place where this incident happened was the Golden House of Tiberias, whose ruins are still pointed out as Kasr Bint-el-Melek, "Palace of the King's Daughter."

John Brown's Body, a famous marching song of the Civil War, the origin of which has for years been in dispute. It has been generally credited to C. S. Hall of Charleston, Mass., (1861). The words were applied to an old tune common in England in the 18th century.

John Bull, a name first used by the English humorist, Arbuthnot, and since popularized as a typical name suggesting a humorous or burlesque representation of the English character. He is represented as a bluff, jolly, bull-headed farmer.

John C. Green School of Science. See GREEN, J. C.

John Chrysostom. See CHRYSOSTOM, JOHN.

John Doe, a fictitious name given to unknown plaintiffs or defendants in law. In former times the name was applied to the fictitious lessee of the plaintiff in the mixed action of ejectment, that of the fictitious defendant being "Richard Roe."

But if the lessor made out his title in a satisfactory manner, then judgment and a writ of possession were awarded to John Doe, the nominal plaintiff, who by this trial had proved the right of John Rogers, bis supposed lessor.— Blackstone.

John Dory. A fish. See DORY.

John Halifax, Gentleman, a novel by Dinah Maria Muloch Craik (1856), in which the hero, John Halifax, one of "nature's noblemen," beginning life as a poor boy, works his way up to prosperity and happiness, by means of his high principles, undaunted courage, and nobility of character. The heroine is Ursula March; and the simple domestic story includes few minor characters. The interest lies in the development of character: and the author's assertion is that true nobility is of the soul, and does not inhere in wealth, in learning, or in position; and that integrity and loftiness of purpose form the character of a true gentleman.

John Paw, a large and beautiful grouper (*Epinephelus Drummond-Hayi*), which is dark umber brown densely covered with small white pearly spots. It inhabits the Gulf of Mexico and is valued as a food fish in Florida. It is also known in the Bermudas, where it is called "speckled hind."

John Strange Winter. See STANNARD, HENRIETTA.

John Ward, Preacher, a novel by Margaret Deland, published in 1888. A Presbyterian minister named Ward, a logical Calvinist, is assured that belief in election and reprobation, eternal punishment, and kindred doctrines, is necessary to salvation; and so preaches them with force and conviction. While his congregation agrees with him, his wife entertains decidedly broad theological views in general. The couple love each other with that singleness of devotion without which the course of the story would be manifestly improbable; for it depends upon the question whether love will be able to hold together what conscientious habits of thought and ethical convictions tend to drive apart.

John's, Eve of Saint, the survival of a popular celebration of remote antiquity, held on the 23d of June, which in Christian times became the vigil or eve of the feast of the nativity of St. John Baptist, 24 June (Midsummer Day). On the eve of the feast it was the custom in former times to kindle fires called St. John's fires. This was indeed a continuance of those Teutonic and Scandinavian pagan festivals, which at the winter solstice were observed with Yule-fires, and at the summer solstice with similar beacon-fires, originally intended to communicate through the country the changes in the seasons announced by the priesthood, so as to direct the activities of agriculture and navigation. The burning of the Yule log at Christmas is a survival of these observances.

Johns Hopkins University, a university at Baltimore, Md., founded by Johns Hopkins, who was born in Maryland and amassed a fortune in Baltimore. He died in 1873 and bequeathed $3,500,000 to found a university. Opened in 1876, it is now one of the foremost universities in the United States. The students are distinguished by the title of graduates and undergraduates, the former being such as have received a degree at this university or elsewhere, and who desire to carry their studies further, special attention being here given to the most advanced subjects, as well as to original research. The buildings of the university include McCoy Hall, in which are the library, assembly room, and rooms appropriated to literary and historical studies; Levering Hall, the building of the Young Men's Christian Association; Hopkins Hall, equipped for the study of geology and mineralogy; a chemical laboratory; a biological laboratory; a physical laboratory; a gymnasium; an administration building; and four buildings for medical instruction.

In 1902 a large tract of land in the suburbs of the city, comprising 176 acres, was presented by several friends as a future site for the University, and it is expected that before many years it will be possible to remove the philosophical department thereto. This noteworthy gift was followed within a few months by a generous contribution, from alumni and citizens of Baltimore, of $1,000,000 toward the permanent endowment of the institution.

Connected with the university is the Johns Hopkins Press, from which issue the 'American Journal of Mathematics'; 'The American Chemical Journal'; 'The American Journal of Philology'; 'Memoirs from the Biological Laboratory'; 'Studies in Historical and Political Science'; 'Journal of Experimental Medicine'; 'Beiträge zur Assyriologie'; 'Modern Language Notes'; 'Johns Hopkins University Circulars'; 'Terrestrial Magnetism and Atmospheric Electricity'; etc.

The degrees of Bachelor of Arts, Doctor of Philosophy, and Doctor of Medicine are conferred. Advanced and graduate students have elective courses, but each instructor has a discretion of his own with regard to admission to his classes. The university reported at the close of 1903: Professors and instructors, 147; students, 695; number of graduates, 1,535; volumes in the library, 115,000; productive funds, $3,488,843; grounds and buildings valued at $1,157,881; value of books and apparatus, $350,000; income, $250,454.

An important place at Johns Hopkins University has always been held by the "fellows." Twenty fellowships are awarded each year to the most promising among the many candidates, without preference of college; each fellowship is of the annual value of $500, though it does not exempt from charges for tuition. In the language of the official announcement of the university, the fellowships are bestowed "almost exclusively on young men desirous of becoming teachers of science and literature, or proposing to devote their lives to special branches of learning which lie outside of the ordinary studies of the lawyer, the physician and the clergyman." The university also extends the privilege of "fellowships by courtesy" (without emolument) to certain individuals.

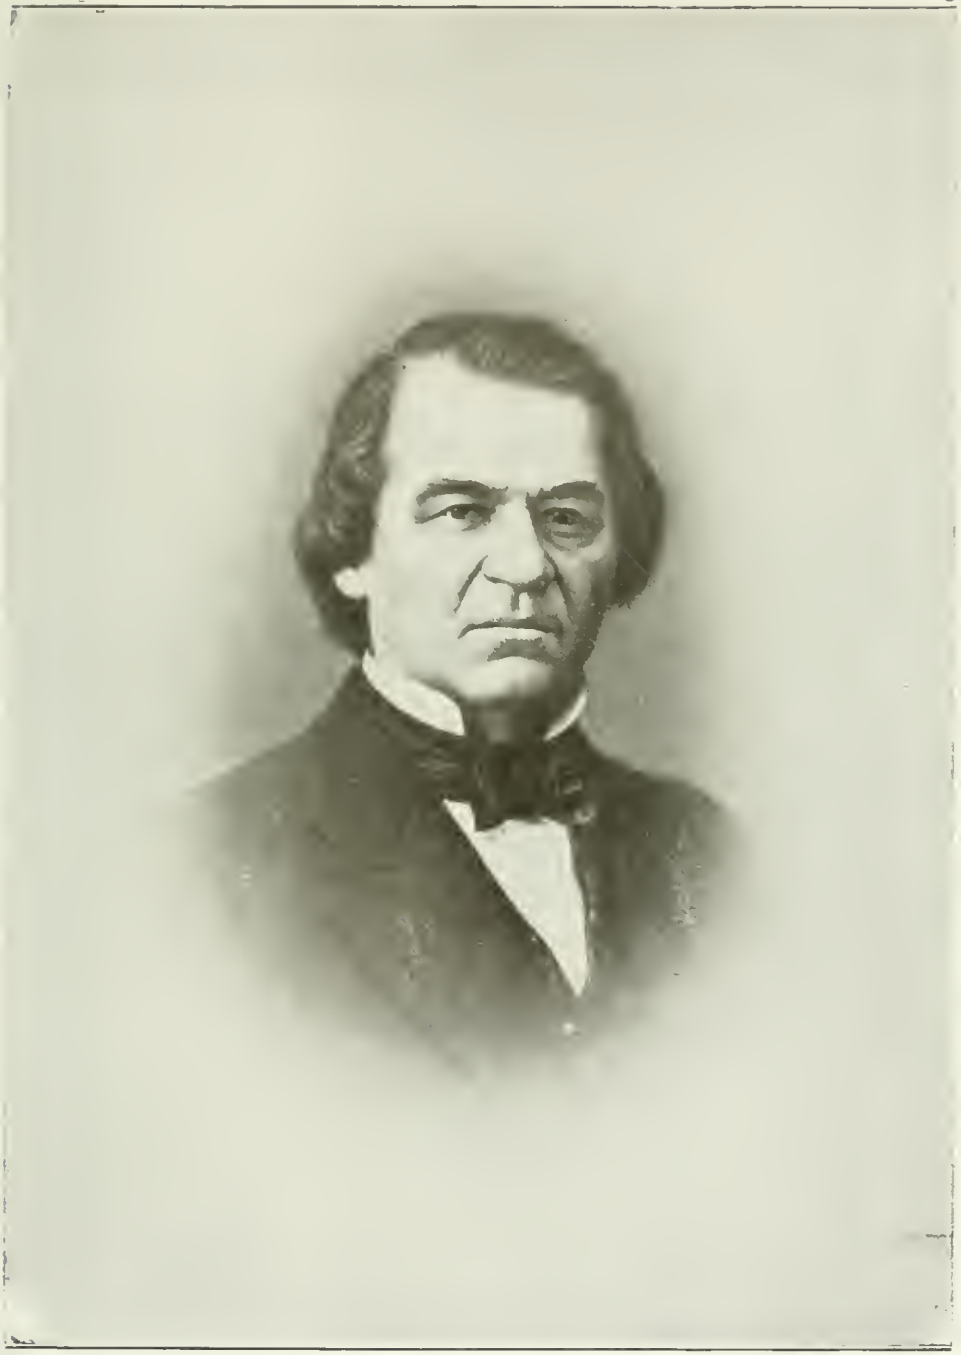
The university receives as students the following classes: (1) College graduates, who may proceed to the degree of doctor of philosophy, or may work for longer or shorter periods in the various seminaries or laboratories without reference to a degree. (2) Undergraduate students looking forward to the degree of bachelor of arts and following one of seven parallel groups of study. (3) Candidates for the degree of doctor of medicine, for whom a four-year course is provided, and who may be either men or women. (4) Doctors of medicine desiring to pursue certain special courses. (5) Students

who have not taken a degree, and are not looking forward to a degree, but who desire to avail themselves for a brief period of the opportunities here offered. The courses of study under 1, 3 and 4 are entirely closed to those who are still candidates for a baccalaureate degree. The Johns Hopkins University, although giving little attention to applied science and technology, has been a very large factor in determining the character and methods of instruction to which these schools owe their success. It is impossible to overestimate its influence upon higher education in this country, and especially is this true in all things relating to science. There is scarcely an American college faculty that has not been enriched by the presence of one or more of its graduates, bringing with them at least something of the spirit of that institution, its respect for exact scholarship and regard for scientific truth.

Johnson, jŏn'sŏn, **Alvin Jewett,** American publisher: b. Wallingford, Vt., 28 Sept. 1827; d. New York 22 April 1884. He worked on a farm, taught school in Virginia, went to New York in 1853, published 'Johnson's Illustrated Atlas,' a reconstruction of 'Colton's Atlas,' and thereafter several works, including 'Johnson's Universal Cyclopædia,' now known in a revised form as 'The Universal Cyclopædia.'

Johnson, Andrew, the 17th president of the United States: b. Raleigh, N. C., 29 Dec. 1808; d. near Carter's Station, Tenn., 31 July 1875. In 1818 he was apprenticed to a tailor at Raleigh, in 1824–6 worked as a journeyman at Laurens Court House, S. C., and then removed to Greenville, Tenn., where also he worked at his trade. At that time the State of Tennessee was controlled by the landed proprietors, who formed an aristocratic class. Johnson made himself the leader of an opposition or workingman's party, in 1828–30 was an alderman of Greenville, and in 1830–3 its mayor. In 1834 he was a leading advocate of the new State constitution, by means of which the power of the greater landholders was reduced. He was elected to the State legislature in 1835 and again in 1839, as a Democrat of the Jacksonian type. A Democratic elector for the State in 1840, he stumped effectively for the Van Buren ticket, and gained considerable reputation as an orator. In 1840 he was elected to the State senate from the counties of Greene and Hawkins, and during his term urged that the basis of representation should be the white vote without consideration of slave-ownership. In 1843 he was chosen to Congress, to which he was four times re-elected. While in the House he supported the restoration to General Jackson of the fine imposed upon him for the imprisonment of a judge at New Orleans in 1815; the annexation of Texas; the homestead law, distasteful to the Southern slaveholding class; the compromise of 1850; and the presidential veto-power. He was opposed to disregard of economy in the expenditure of public moneys. In 1853 he was elected governor of Tennessee, and in 1855 re-elected after a bitter campaign. He sat in the United States Senate in 1857–62, and there opposed the grant for the construction of a Pacific railway and strongly attacked secession. His vigorous Union attitude rendered him so unpopular in the South that he was several times burned in effigy, and upon his return to Tennessee his life was endangered. Appointed military governor of the State, with rank of brigadier-general of volunteers, 4 March 1862, he displayed great prudence in the employment of his autocratic powers. On 6 June 1864 he was nominated Vice-President of the United States by the national Republican convention assembled at Baltimore, and, elected with Lincoln, entered on his office 4 March 1865. President Lincoln died by assassination 15 April, and Johnson became President. His policy toward the seceded States was, contrary to expectation, one of leniency. On 22 May he opened all Southern ports save four in Texas, to foreign commerce, and 29 May he proclaimed general amnesty to all except 14 specified classes. These and similar measures aroused the opposition of the majority of Republicans in Congress, and thenceforward differences between the executive and legislative branches of the government were constantly arising. Johnson established provisional governments, afterward disallowed by Congress, in seceded States, and Congress retaliated by passing over his veto of 27 March 1866 the civil rights act, admitting freedmen to full citizenship rights. In August 1866 he undertook a tour of the Northern States which became known as "swinging 'round the circle," and in the course of which he denounced Congress and advocated his own plan of reconstruction. Other bills, including one for the arrangement of the Southern States, with the exception of Tennessee, into military districts; and the tenure-of-office act, were passed over the President's veto. In August 1867 Johnson removed from office Stanton, secretary of war, and appointed Grant to the post; but in September following Congress refused to ratify the removal, Grant resigned, and Stanton resumed his former duties. On 21 Feb. 1868 Johnson dismissed Stanton and appointed Gen. Lorenzo Thomas secretary ad interim. Two unsuccessful attempts to impeach the President had already been made. On 24 February a resolution of impeachment was passed by the House and on 5 March the trial began. Eleven articles charged the President with high crimes and misdemeanors in connection with five various matters, most important of which were the removal of Stanton in disregard of the tenure-of-office act and the appointment of Thomas. The trial was presided over by Chief Justice Chase. On 16 May a test vote resulted in 35 for conviction, 19 against; and the requisite two thirds vote not having been obtained, the President was acquitted. The result is now generally approved. "The single vote by which Andrew Johnson escaped conviction," says Dunning, "marks the narrow margin by which the Presidential element in our system escaped destruction." In January 1875 he was chosen to the Senate, and 5 March took his seat in the extra session. He was sincere and able, and if Congress viewed his procedure as usurpation no less did he believe that of Congress to be unconstitutional. Consult: Dunning, 'Essays on the Civil War and Reconstruction' (1898); and Dewitt, 'The Impeachment and Trial of Andrew Johnson' (1903), a spirited defense. See also United States — Reconstruction.

Johnson, Bradley Tyler, American lawyer: b. Frederick, Md., 29 Sept. 1829; d. 5 Oct. 1903.



ANDREW JOHNSON,

17TH PRESIDENT OF THE UNITED STATES.

He was graduated from Princeton in 1849, studied law at Harvard in 1850–1, entered practice at Frederick in 1851, became in that year State's attorney for Frederick County, was a delegate to the National Democratic Convention at Charleston and Baltimore in 1860, withdrew from the convention, and supported the Breckenridge and Lane ticket. At his own expense he organized a company for the Confederate service, in which he rose to be brigadier-general of cavalry (1864). Subsequent to the War he practised law at Richmond in 1865–79, at Baltimore in 1879–90; and was a member of the State senate of Virginia in 1875–90. His works include: 'Reports of Chase's Decisions' (1875) 'Memoir of J. E. Johnston' (1891); a 'Life of General Washington'; etc.

Johnson, Bushrod Rust, American soldier: b. Belmont County, Ohio, 7 Oct. 1817; d. Brighton, Ill., 11 Sept. 1880. He was graduated at West Point in 1840. He saw service in the Florida and Mexican wars, resigning his commission in 1847 to become professor in the Western Military Institution of Kentucky, at Georgetown. He entered the Confederate army as a brigadier-general at the commencement of the Civil War, and in 1864 became a major-general. He commanded a division under General Lee till the surrender at Appomattox. He subsequently became superintendent of the Military College in the University of Nashville, and chancellor of that institution.

Johnson, Cave, American politician: b. Robertson County, Tenn., 11 Jan. 1793; d. Clarksville, Tenn., 23 Nov. 1866. Admitted to the bar, he practised at Clarksville, in 1820 became a judge of the State circuit court, and was a Democratic representative in Congress in 1829–37 and again in 1839–45. In 1845 he was appointed postmaster-general, from which post he retired at the close of Polk's administration (1849). He was president of the Tennessee State bank in 1850–9, and was elected to the State senate as a Unionist in 1863, although unable to serve because of ill-health.

Johnson, Clifton, American author and illustrator: b. Hadley, Mass., 25 Jan. 1865. He obtained a secondary education, worked on a farm, was clerk in a book-shop and school-teacher, studied in the New York art-schools, published in 1892 'The New England Country,' an illustrated study of farm-folk, and later was much abroad obtaining notes and pictures for works on foreign life. Other volumes of which he is author and illustrator are: 'The Country School' (1893); 'The Farmer's Boy' (1894); 'What They Say in New England' (1896); 'Among English Hedge Rows' (1899); etc.

Johnson, David, American painter: b. New York May 1827. He was self-taught, excepting for the few lessons he received from Jasper F. Cropsey, and chose American landscape as his specialty. Among his works are: 'Echo Lake' (1869); 'Lake George' (1876); 'Greenwood Lake' (1878).

Johnson, E. Pauline, Canadian poetess: b. Chiefwood, Ont., 1862; the daughter of George Johnson, head chief of the Mohawk Indians, and of his English wife. She has written several striking poems on Indian subjects and has given public recitals from her works. 'The White Wampum' appeared in 1894.

Johnson, Eastman, American painter: b. Lowell, Maine, 29 July 1824; d. New York City 5 April 1906. He began his art studies at the Royal Academy, Dusseldorf (1849–51) and developed a distinct talent for genre. He afterward traveled in France, Italy, and Holland, and spent four years at The Hague. Among his pictures painted in Europe are the 'Savoyard,' and the 'Card Players,' in which he showed the influence of the Dutch school. He returned to the United States in 1856 and devoted himself for some years to the study of rustic and negro life and he painted some of the most popular pictures ever produced by a native painter; many of them have been engraved and chromolithographed. The best known are 'Old Kentucky Home'; 'Husking Bee'; and the 'Boyhood of Abraham Lincoln.' He also produced excellent likenesses of Grover Cleveland, Benjamin Harrison and other eminent men.

Johnson, Edward, American colonial historian: b. Herne Hill, Kent, England, about 1599; d. Woburn, Mass., 23 April 1672. He emigrated to America probably with Governor Winthrop in 1630. In 1632 he was engaged in trade at Merrimack, and was on the committee appointed to superintend the foundation of a new town and church at the place now called Woburn. In 1643 he was elected by the town of Woburn a member of the legislature of Massachusetts, in which he continued to sit till 1671, with the exception of 1648. In 1655 he was chosen speaker of the house. He was recorder of Woburn from the time of its incorporation till his death. In 1665 he was one of the members deputed to hold conference with the commissioners sent from England by Charles II. He wrote a 'History of New England from the English Planting in 1628 till 1652, or Wonder-Working Providence of Zion's Saviour' (1654).

Johnson, Edward, American soldier: b. Chesterfield County, Va., 16 April 1816; d. Richmond, Va., 22 Feb. 1873. Graduated from the United States Military Academy in 1838, he fought in the Florida wars, for his services in which he was brevetted captain, and subsequently in the Mexican War, being brevetted major for his conduct at Chapultepec. He received his captain's commission in 1851, but in 1861 resigned to enter the army of the Confederate States as colonel of the 12th Georgia volunteers. He was promoted brigadier-general in 1862 and major-general in 1863. At Gettysburg he commanded a division. He was captured with his entire force at Spottsylvania (12 May 1864) and retaken in the following December. Subsequent to the war he was a farmer in Chesterfield County, Va.

Johnson, Franklin, American Baptist clergyman and scholar: b. Frankfort, Ohio, 2 Nov. 1836. He was graduated from the Colgate Theological Seminary (Hamilton, N. Y.), in 1861, held pastorates in Michigan, New Jersey, and at Cambridge, Mass., in 1862–88, was co-editor of 'The Watchman' in 1876, and in 1890–2 president of Ottawa University. In 1892 he was appointed professor of history and homiletics in the University of Chicago. Among his writings, besides translations and an annotated edition of St. Matthew, are: 'Moses and Israel'; 'Heroes and Judges from the Lawgiver to the

King'; 'The New Psychic Studies in their Relation to Christian Thought.'

Johnson, Helen Kendrick, American author: b. Hamilton, N. Y., 4 Jan. 1843. She was the daughter of A. C. Kendrick (q.v.) and was married to Rossiter Johnson (q.v.) in 1869. Beside editing several compilations of verse she has published 'The Roddy Books,' popular juvenile tales (1874–6); 'Our Familiar Songs' (1881); 'Raleigh Westgate' (1889); 'Woman and the Republic' (1897). She has been an active member of the Association Opposed to the Extension of Suffrage to Women.

Johnson, Hĕrschel Vespasian, American jurist and politician: b. Burke County, Ga., 8 Sept. 1812; d. Jefferson County, Ga., 16 Aug. 1880. He was graduated from the University of Georgia in 1834, studied law, practised there, from 1844 at Milledgeville, and in 1848 was appointed to the Senate of the United States to fill the seat of W. T. Colquitt, resigned. A strong advocate of Clay's compromise scheme, he identified himself with the Southern Unionists. In 1849–53 he was a judge of the Georgia superior court, in 1853–7 governor of the State. He was nominated by the northern Democracy in 1860 as vice-president on the presidential ticket with Douglas. Though opposed to secession, he followed his State, and in 1862 was elected to the Confederate Congress. Elected United States senator in 1866, he was refused his seat because of war disabilities. He was a judge of the Georgia superior court from 1873 until his death.

Johnson, Horace Chauncey, American artist: b. Oxford, Conn., 1 Feb. 1820. He was a pupil of A. H. Emmons at Hartford, and of the antique school of the National Academy, New York; studied also in Rome (1856–8); established his studio in Italy, and later at Waterbury, Conn. His works include: 'Roman Peasants on the Campagna'; 'Grape Gatherers of Gensano'; 'Italian Kitchen'; 'Azrael'; etc.

Johnson, Sir John, American colonial soldier: b. near Johnstown, N. Y., 5 Nov. 1742; d. Montreal 4 Jan. 1830. He was the son of Sir William Johnson (q.v.), was knighted in 1765 and succeeded to his father's estates and baronetcy in the Mohawk Valley in 1774. When the Revolution came on he escaped to Canada in 1776 with 700 loyalists. He organized the corps known as the Queen's Own American Regiment, of which he was commissioned colonel. In July 1777, he took part in the siege of Fort Stanwix (q.v.). He defeated General Herkimer in the latter's brilliant attempt to cause the besiegers to abandon their operations; but was himself subsequently defeated. During the next two years he continued active in northern and central New York, and the Indian massacres of Cherry Valley and Wyoming formed some of the most painful incidents of the war. He was, however, crushingly defeated at Newton 29 Aug. 1779, and retired to Montreal. His influence over the Indians had always been remarkable and the British government appointed him superintendent-general of Indian affairs in British North America, besides making him extensive land grants, to replace the Mohawk family estates which had been confiscated.

Johnson, Lionel Pigot, English poet: b. Broadstairs, Kent, March 1867; d. 9 Oct. 1902. He was educated at Winchester College, and Oxford University. He published 'Poems'; 'Ireland and Other Poems'; and 'The Act of Thomas Hardy'; and contributed to 'The Academy' and other literary journals. His verse though often obscure exhibited much command of metre and was full of promise.

Johnson, Oliver, American reformer and editor: b. Peacham, Vt., 27 Dec. 1809; d. Brooklyn, N. Y., 10 Dec. 1889. He became editor of 'The Christian Soldier' in 1831, and from that year to 1865 was engaged in the anti-slavery cause as a lecturer and editor. He was one of the founders of the New England Anti-Slavery Society in 1832. He was editor of the 'Independent' from 1865 to 1870; became editor of the 'Christian Union' in 1872; and published 'William Lloyd Garrison and his Times' (1880).

Johnson, Owen, American novelist: b. New York 27 Aug. 1878. He is a son of R. U. Johnson (q.v.) and was graduated from Yale in 1900. He has published 'Arrows of the Almighty' (1901).

Johnson, Reverdy, American jurist: b. Annapolis, Md., 21 May 1796; d. there 10 Feb. 1876. He was educated at St. John's College in that city, and at 17 began to study law. In 1815 he was admitted to the bar, in 1817 removed to Baltimore and subsequently devoted his time mainly to the arguing of cases before the United States Supreme Court. He reported seven volumes of the decisions of the Maryland court of appeals, known as 'Harris's and Johnson's Reports,' 1820. In 1821 he was elected a State senator, and at the expiration of his term in 1825 was re-elected for a second term. In 1845 he was chosen a United States senator, resigning in 1849 on being appointed attorney-general of the United States. On the succession of Mr. Fillmore, after the death of President Taylor, he resigned that office, and resumed in Baltimore the practice of the law. In 1861 he was a member of the peace commission, was United States senator 1863–8, and succeeding Charles Francis Adams as minister to England in 1868 negotiated the treaty for the adjustment of the Alabama claims, afterward rejected by the Senate.

Johnson, Richard Mentor, American statesman and soldier: b. Floyd's Station, near Louisville, Ky., 17 Oct. 1780; d. Frankfort, Ky., 19 Nov. 1850. He was educated at Transylvania University, and subsequently studied law and practised with success. He commenced his public career as a member of the Kentucky legislature, to which he was elected at 23, and in 1807 was returned to Congress, and remained a member of the House until 1819. He was a firm supporter of the administration of Madison, and upon the commencement of the War of 1812 raised a body of Kentucky mounted riflemen, whom he commanded, on the Canadian frontier. The decisive charge of his mounted volunteers mainly contributed to the brilliant victory gained over the British and Indians at the battle of the Thames, 5 Oct. 1813, and it was by his hand that the Indian leader Tecumseh is commonly supposed to have fallen. In 1819 he was elected to fill a vacancy in the United States senate, of which he continued a member until 1829, when he was again returned to the House of Representatives. He remained a member until his election by the Senate in March, 1837, as Vice-President of the United States.

He discharged the duties of presiding officer of the senate for four years, and in the Presidential election of 1840 was an unsuccessful candidate of the Democratic party for Vice-President. He thenceforth lived chiefly in retirement. He was, however, serving a term in the State legislature at the time of his death. In Congress his chief efforts were against the discontinuance of the Sunday mails, and in behalf of soldiers of the Revolution or of the War of 1812, who applied for pensions. He was the author of the law abolishing imprisonment for debt in Kentucky.

Johnson, Richard W., American military officer: b. near Smithland, Ky., 7 Feb. 1827; d. St. Paul, Minn., 21 April 1897. He was graduated at West Point in 1849, in 1861 became colonel of the 3d Kentucky cavalry, 11 October was appointed brigadier-general of volunteers, and later commanded a division at Murfreesboro, and with his division fought under Thomas at Chickamauga (19–21 Sept. 1863). He commanded the 12th division of the Army of the Cumberland in the invasion of Georgia and a division of cavalry at Nashville, was brevetted brigadier-general, United States army, for his services (13 March 1865), and, having been mustered out of the volunteer service, became provost-marshal of the military division of the Tennessee. In 1867 he resigned from the service with rank of major-general, changed by act of Congress (1875) to brigadier. Among his writings were: 'Life of Gen. G. H. Thomas' (1881); and 'A Soldier's Reminiscences' (1886).

Johnson, Robert Underwood, American editor and poet: b. Washington, D. C., 12 Jan. 1853. He became associate editor of the 'Century Magazine' in 1881. His efforts as secretary of the American Copyright League in behalf of the establishment of international copyright greatly aided in obtaining the law of 1891. He edited, with C. C. Buel, the notable 'Battles and Leaders of the Civil War' (1887–8), and has published three volumes of verse: 'The Winter Hour and Other Poems' (1891); 'Songs of Liberty and Other Poems' (1897); and 'Poems' (1902).

Johnson, Rossiter, American author and editor: b. Rochester, N. Y., 27 Jan. 1840. He was graduated from the University of Rochester in 1863 and was associate editor of the Rochester *Democrat* 1864–8. From 1869 to 1872 he edited the Concord (N. H.) *Statesman;* and in 1873–7 was associated with George Ripley and Charles A. Dana in editing the American Cyclopædia, while in 1879–80 he aided Sydney Howard Gay in his 'History of the United States.' Since 1883 he has been editor of the 'Annual Cyclopædia.' He edited the series of 'Little Classics' (8 vols. 1874–80), and was editor-in-chief of the 'World's Great Books' (50 vols. 1898–1901). His original works include 'Phaeton Rogers,' a novel of boy life (1881); 'A History of the French War ending in the Conquest of Canada' (1882); 'History of the War of 1812' (1882); 'Idler and Poet,' verse (1883); 'Short History of the War of Secession' (1888); 'The End of a Rainbow,' a story (1892); 'The Hero of Manila' (1899); 'Short History of the War with Spain' (1899).

Johnson, Samuel, American college president, first president of King's College (now Columbia University): b. Guilford, Conn., 14 Oct. 1696; d. Stratford, Conn., 6 June 1772. He was graduated at Yale College in 1714, and two years later appointed tutor there. In 1720 he resigned to receive ordination as a Congregational minister, and settled at West Haven. He relinquished his charge in 1722, and soon after sailed for England, where he received Episcopal ordination in 1723. Shortly after he returned to America, bearing a commission as missionary of the Society for the Propagation of the Gospel in Foreign Parts, and settled in Stratford, Conn., as rector of an Episcopal church there. In 1743 he received the degree of D.D. from the University of Oxford. In 1746 he published 'A System of Morality,' and in 1752 a compend of logic and metaphysics, and another of ethics; the two latter were printed in Philadelphia by Franklin as text-books for the University of Pennsylvania. In 1755 he was offered the presidency of that university, but declined it. In 1753 he was invited to accept the presidency of the newly founded King's College in New York, in all the plans for which he had been consulted. He did so, but in 1763 resigned and returned to Stratford, where he resumed his parochial duties, revised his previous works, and published an 'English and a Hebrew Grammar' (1767). Consult Beardsley, 'Life of Samuel Johnson, D.D.' (1876).

Johnson, Samuel, English lexicographer, poet and essayist: b. Lichfield, Staffordshire, 19 Sept. 1709; d. London 13 Dec. 1784. He was the son of a Lichfield bookseller and was educated mainly in the grammar school of that city; although perhaps the best part of his education he gave himself, in the free run which he had of the books in his father's shop. Lichfield was the literary centre of a large district and old Michael Johnson supplied scholars with their folios, as well as less severe readers with romances, poems, essays, and pamphlets. Samuel read with wonderful rapidity, ravenously as if he devoured the book, and what he read his powerful memory retained. At 19 he entered Pembroke College, Oxford, «the best qualified for the university that his tutor had ever known come there.» Thence he was driven by poverty after a residence of only 14 months. During the next few years he lived partly by teaching. At 26 he married. Two years later he went up to London with a half-finished tragedy in his pocket, and David Garrick as his companion. There for five-and-twenty years he lived the hard life of a poor scholar. His wife died after a long illness. In this period of his life he did most of his work. He wrote the 'Debates of Parliament,' which were wholly in form and mainly in substance his own invention; his great 'Dictionary'; his two poems 'London' (1738); and 'The Vanity of Human Wishes' (1749); the 'Rambler,' the 'Idler,' and 'Rasselas' (1759), and numerous minor pieces. He published moreover 'Observations on Macbeth,' and made a beginning of his edition of Shakespeare. In 1762 a pension of £300 from the king freed him from the pressure of poverty and the rest of his life he passed in modest comfort. A friendship which he formed a little later added greatly to his happiness. A wealthy London brewer of the name of Thrale, a man of such rugged strength that he sought a comrade in his rough genius, gave him a second home. His pen had

long intervals of rest. He finished his Shakespeare, wrote four political tracts which added nothing to his reputation, and his 'Journey to the Western Islands' (1775). Happily he was roused from his indolence by the request of the booksellers that he should undertake that one of all his works by which he is best known,—the 'Lives of the English Poets' (1779–81). "I wrote it," he says, "in my usual way, dilatorily and hastily: unwilling to work, and working with vigor and haste." The indolence into which he seemed to have sunk was more apparent than real. That powerful mind was seldom long at rest. "He was a kind of public oracle, whom everybody thought they had a right to visit and consult." David Hume might complain that "men of letters have in London no rendezvous, and are indeed sunk and forgotten in the general torrent of the world." They who knew Johnson felt no such want. "His house became an academy." So did the taverns which he frequented, whose chairs he looked upon as so many thrones of human felicity. Among his friends he numbered Reynolds, Burke, Goldsmith, Garrick, and Boswell. They were all members of that famous club of which he was the light and centre. In the world of letters his opinion was eagerly awaited. "'What does Johnson say of such a book?' was the question of every day." This, the happiest period of his life, was brought to an end by the death of Mr. Thrale in 1781. Though the ranks of his friends were thinning and his strength was failing he did not lose heart. He tried "to keep his friendships in constant repair," and he struggled hard for life. "I will be conquered," he said; "I will not capitulate." Death had always been terrible to him. He now faced it month after month in the gloom of solitude. "His death," wrote one of his contemporaries, "kept the public mind in agitation beyond all former example." "It made a kind of era in literature," said Hannah More. Harriet Martineau was told, by an old lady who well remembered the time, that "the world of literature was perplexed and distressed as a swarm of bees that have lost their queen." High as Johnson still stands as a writer, his great reputation rests mainly on his talk and on his character as a man, full as it was of strange variety, rugged strength, great tenderness, dogged honesty and truthfulness, a willingness to believe what was incredible combined with "an obstinate rationality" which ever prevented him, and Toryism with the spirit of a rebel glowing beneath. It is in the pages of his friend and disciple that he lives for us as no other man has ever lived. Of all men he is best known. In his early manhood he set up an academy, and failed. The school which he founded in his later years still numbers its pupils by thousands and tens of thousands. "We are," said Sir Joshua Reynolds, "of Dr. Johnson's school. He may be said to have formed my mind, and to have brushed from it a great deal of rubbish. He qualified it to think justly." He still qualifies the mind to think; he still clears it of cant; he still brushes from it all that rubbish which is heaped up by affectation, false sentiment, exaggeration, credulity and indolence in thinking. Even in his lifetime his written style was censured as "involved and turgid, and abounding with antiquated and hard words." Macaulay went so far as to pronounce it "systematically vicious." In the structure of his sentences he is as often at fault as in the use of big words. He praised Temple for giving a cadence to English prose, and he blamed Warburton for having "his sentences unmeasured." His own prose is too measured and has too much cadence. It is in his 'Ramblers' that he is seen at his worst, and in his 'Lives of the Poets' at his best. He often rose to noble heights of eloquence; while in the power of his honest scorn he had scarcely a rival. His letters to Lord Chesterfield and James Macpherson are not surpassed by any in our language. In his criticisms he is admirably clear. Whether we agree with him or not, we know at once what he means; while his meaning is so strongly supported by argument that we can neither neglect it nor despise it. He may put his reader into a rage, but he sets him thinking. Of his original works, 'Irene' (1749) was the first written, though not the first published. It is a declamatory tragedy. He had little dramatic power, and he followed a bad model, for he took Addison as his master. It was in his two imitations of Juvenal's Satires, 'London' and the 'Vanity of Human Wishes,' that he first showed his great powers. In their kind they are masterpieces. Sir Walter Scott "had more pleasure in reading them than any other poetical composition he could mention. In the 'Rambler' he teaches the same great lesson of life as in his serious poems. He gave variety, however, by lighter papers modeled on the 'Spectator,' and by critical pieces. 'Rasselas,' struck off at a heat when his mother lay dying, tells in prose what the 'Vanity of Human Wishes' tells in verse. It is little known to the modern reader, who is not easily reconciled to its style. At no time could it have been a favorite with the young and thoughtless. Nevertheless, as years steal over us, we own, as we lay it down with a sigh, that it gives a view of life as profound and true as it is sad. His 'Dictionary,' faulty as it is in its etymologies, is a very great performance. Its definitions are admirable; while the quotations are so happily selected that they would afford the most pleasant reading were it possible to read a heavy folio with pleasure. That it should be the work of one man is a marvel. He had hoped to finish it in three years; it took him more than seven. In the notes to his edition of Shakespeare he anticipated modern critics in giving great weight to early readings. He was unwilling to meddle with the text so long as it gave a meaning. Many of his corrections are ingenious, but in this respect he came far behind Theobald. In his 'Journey to the Western Islands' he describes the tour which he made with Boswell in 1773, and takes the part of the oppressed tenants against their chiefs. His narrative is interesting; while the facts which he gathered about a rapidly changing society are curious. His last work was the 'Lives of the English Poets.' It was undertaken at the request of the chief London booksellers, "who had determined to publish a body of English poetry," for which he was to furnish brief prefaces. These prefaces swelled into Lives. For payment he had required only two hundred guineas. "Had he asked one thousand, or even fifteen hundred," said Malone, "the booksellers would doubtless readily have given it." In this great work he traveled over the whole field of English poetry, from Milton who was born in 1608 to Lyttleton who died in 1773. To such a task no man ever came better equipped. In these 'Lives,' and in

his own 'Life' as told by Boswell, we have given us an admirable view of literature and literary men, from the end of the age of Elizabeth to close upon the dawn of the 19th century. Consult: Boswell, 'Life of Johnson' ed. by Hill (1887); Hill, 'Dr. Johnson, his Friends and his Critics' (1878); 'Lives' by Stephen (1878); Grant (1887).

Johnson, Samuel, American preacher and author: b. Salem, Mass., 10 Oct. 1822; d. North Andover 19 Feb. 1882. He was graduated from Harvard in 1842, and from the Harvard Divinity School in 1846. He joined no religious denomination, and save for one year with a Unitarian church in Dorchester, was not settled as a minister until 1853, when he established in Lynn, Mass., an independent society, with which he remained till 1870, then withdrew to complete studies of many years, the results of which appeared later in his publications. With Samuel Longfellow (q.v.) he compiled a 'Book of Hymns' (1846) and 'Hymns of the Spirit' (1864). Some of his own inspiring hymns in these books are now found in the collections of various denominations. His critical study 'The Worship of Jesus' (1868), written in accordance with his views of universal religion, is described by O. B. Frothingham as "perhaps the most penetrating and uplifting essay on that subject in any language." He printed notable essays on religion, reform, etc., in 'The Radical' and other periodicals. His great work 'Oriental Religions,' including 'India' (1872), 'China' (1877), and 'Persia' (1885) — the last containing an introduction and a critical estimate of Johnson by O. B. Frothingham — represents what Johnson himself calls his "purely humanistic point of view." His philosophy was highly transcendental; but being versed in many languages, he was acquainted with all schools, and with the results of history, literature, science, and criticism in every department. 'Oriental Religions,' in the task of writing which scholars have compared his competence, patience, and thoroughness with the same qualities in Darwin, has taken its place among the most learned and liberal contributions to the study of comparative religion and civilization. Prof. E. J. Eitel, the German Orientalist, wrote of "Johnson's pre-eminent merits as the historian of universal religion," and F. Max Müller paid him tribute as the finder of "a religion behind all religions." His 'Theodore Parker' (1890) is a profoundly spiritual interpretation of that preacher and reformer, whose work on the intellectual side was surpassed by Johnson's, while on the moral side, as in the anti-slavery conflict, they stood as equal comrades. A little volume of Johnson's hymns, with other poems, was published in 1899. Consult Longfellow, 'Lectures, Essays, and Sermons by Samuel Johnson, with a Memoir.' This volume contains some of Johnson's best papers, including brilliant lectures on 'Switzerland' and 'Florence,' the outgrowth of searching observations in Europe, 'Equal Opportunity for Woman,' 'Labor Parties and Labor Reform,' and an illuminative essay on 'Transcendentalism.'

Johnson, Samuel Frost, American painter: b. New York 1835. He received his art education in New York, Düsseldorf, Antwerp, and Paris, in which last place he was a pupil at the Ecole des Beaux Arts. He afterward went to Ecouen and worked under the direction of Edouard Frère, the celebrated painter of children. He produces genre, still life and portraits. Among his genre subjects may be mentioned 'Caught at It'; 'Study of an Interior'; 'Roasted Chestnuts'; 'Good Night'; and 'A Thirsty Party.'

Johnson, Samuel William, American chemist: b. Kingsboro, N. Y., 3 July 1830. He studied at Yale Scientific School and the Universities of Leipsic and Munich. In 1856 he became professor of analytical and agricultural chemistry in the Sheffield Scientific School of Yale and since 1896 professor emeritus. He has published 'Essays on Peat Muck and Commercial Manures' (1859); 'How Crops Feed' (1870); etc.

Johnson, Thomas, American statesman: b. St. Leonard's, Md., 1732; d. 1819. He studied law at Annapolis, was elected to the first Continental Congress (1774), was again sent to Congress in 1776, and in the latter year became brigadier-general of Maryland militia. In 1777 he was chosen governor of Maryland, remaining in office until the close of 1779. In 1780 he entered the provincial congress and the house of delegates, in 1781–7 was in the Continental Congress, in 1791 became an associate justice of the United States Supreme Court, and later declined the office of chief justice.

Johnson, Tom Loftin, American capitalist and politician: b. Georgetown, Ky., 18 July 1854. He was clerk in a street railway office (1869–75), and invented several street railway devices; became owner of a street railway in Indianapolis and later acquired large interests in Cleveland and other cities; he was also interested in the iron manufacture in Cleveland. He has been prominent in politics as a member of the Democratic party, and is known as an advocate of the single tax (q.v.), and public ownership of public utilities. Though opposed to the free coinage of silver, he supported Bryan in 1896 and 1900, and the State convention which he controlled unanimously endorsed the Kansas City platform. He was a member of Congress from 1891–5. In 1901 he was elected mayor of Cleveland, and was reelected in 1903 and 1905. In this position he has been an advocate of three cent street railway fares. In the fall of 1903 he was Democratic candidate for governor of Ohio, but was defeated by a large plurality.

Johnson, Virginia Wales, American novelist: b. Brooklyn, N. Y., 28 Dec. 1849. Since 1875 she has lived in Florence, Italy. Her publications include: 'Kettle Club Series' (1870); 'Travels of an American Owl' (1870); 'Joseph the Jew' (1873); 'A Sack of Gold' (1874); 'The Catskill Fairies' (1875); 'The Calderwood Secret' (1875); 'A Foreign Marriage' (1880); 'The Neptune Vase,' her finest work (1881); 'The Fainalls of Tipton' (1885); 'Tulip Place' (1886); 'Miss Nancy's Pilgrimage' (1887); 'The House of the Musician' (1887); and other fictions, and several descriptive works, such as 'Genoa, the Superb'; 'The Lily of the Arno'; 'Lake Como.'

Johnson, Walter Rogers, American chemist: b. Leominster, Mass., 21 June 1794; d. Washington, D. C., 26 April 1852. He was graduated from Harvard in 1818, taught for many years in Framingham, and Salem, Mass., and in

Philadelphia, and was professor of physics in the University of Pennsylvania, 1839–43. He was the first secretary of the Association for the Advancement of Science, and published 'Use of Anthracite' (1841); 'Report on Coals' (1844); 'Coal Trade of British America' (1850); etc.

Johnson, Sir William, British superintendent-general of Indian affairs in North America: b. Smithtown, County Meath, Ireland, 1715; d. near Johnstown, N. Y., 11 July 1774. His uncle, Sir Peter Warner, offered his nephew the management of his entire property in New York, if the latter would undertake its improvement and settlement. Johnson accepted the offer, and in 1738 established himself upon a tract of land on the south side of the Mohawk, about 25 miles from Schenectady, which Sir Peter had called Warrensburgh. In addition to the settling and improving of the country, he embarked in trade with the Indians, whom he always treated with perfect honesty and justice. He became a master of their language, speaking many of their dialects as perfectly as they did themselves, and was thoroughly acquainted with their beliefs and customs. He was adopted by the Mohawks as one of their own tribe, chosen a sachem, and named Wariaghejaghe, or Warraghiaghy, "he who has charge of affairs." In 1744 he was appointed colonel of the Six Nations, in 1746 commissioner of New York for Indian affairs. In 1750 he became a member of the provincial council. In 1754 he attended as one of the delegates from New York the congress of Albany, and also the great council held with the Indians on that occasion, at which they strongly urged his reappointment as their superintendent. At the council of Alexandria, 14 April 1755, he was sent for by Braddock and commissioned by him "sole superintendent of the affairs of the Six United Nations, their allies and dependents." He was also, pursuant to the determination of that council, created a major-general, and commander-in-chief of the provincial forces destined for the expedition against Crown Point. At the head of these forces, in September 1755, he defeated Baron Dieskau at Lake George. This victory saved the colony from the French, and Johnson received the thanks of parliament for his victory, was voted £5,000, and on 27 Nov. 1755, created a baronet of Great Britain. On his arrival at Lac St. Sacrement a few days before this battle, he gave to it the name of Lake George, "not only in honor of his majesty, but to assert his undoubted dominion here." In March 1756 he received from George II. a commission as "colonel, agent, and sole superintendent of the affairs of the Six Nations, and other northern Indians." He held this office for the rest of his life. In 1758 was present with Abercrombie at Ticonderoga. General Prideaux led the expedition against Fort Niagara in 1759. Johnson was second in command, and upon the death of Prideaux, before that fort, succeeded to the command in chief. With upward of 1,000 Indian allies he continued the siege with great vigor and cut to pieces the French army. He led the same Indian allies the following year in the Canadian expedition of Amherst, and was present at the capitulation of Montreal and the surrender of Canada to the British arms in 1760. The war was now at an end, and the king granted to Sir William for his services a tract of about 100,000 acres of land, north of the Mohawk. In 1764, the country being at peace, and the Indians perfectly contented, Sir William erected Johnson hall, a large wooden edifice still standing. The village of Johnstown, with stores, an inn, a court-house, and an Episcopal church, was soon laid out. In 1772 it became the shire town of Tryon County. Johnson lived in the style of an old English baron of former days, and exercised a liberal hospitality. In 1768 he concluded the treaty of Fort Stanwix. Consult the 'Life' by Stone (1865).

Johnson, William Henry, American historical novelist: b. Beaufort, S. C., 29 March 1845. He studied for the Episcopal ministry in the Theological Seminary of Virginia, served in the Confederate army during the Civil War, and in 1872 took orders in the Episcopal Church. In 1886 he withdrew from the Episcopal Church to enter the Unitarian, and was pastor for several years of a Unitarian church at Wilmington, Del. He has published 'The King's Henchman' (1898); 'King or Knave: Which Wins?' (1899); 'The World's Discoverers' (1900).

Johnson, William Samuel, American jurist: b. Stratford, Conn., 7 Oct. 1727; d. there 14 Nov. 1819. He was graduated from Yale in 1744, was admitted to the bar, practised in the New York and Connecticut courts, in 1761 and 1765 represented Stratford in the Connecticut general assembly, or lower house, and in the latter year was a Connecticut delegate to the Stamp-act congress at New York. In 1766 he became a member of the governor's council, or upper house of the Connecticut legislature, in 1766–71 was in England as special agent for the colony in defense of its title to land obtained from the Mohegan Indians, in 1771 re-entered the council, and for a time in 1772 was a judge of the superior court of the colony. After Lexington, he was a member of a committee sent to General Gage on the unsuccessful mission of inquiring into possible means of peace. Opposed to the Revolution, he remained in private life during its progress, but in 1784–7 was a member of the Continental Congress, in 1787–9 sat in the Connecticut assembly, in 1787–1800 was president of Columbia College, and from 1789 to 1791, when he resigned, was the first United States senator from Connecticut. His letters to the governors of Connecticut during his residence in Great Britain have been published in the 'Collections' of the Massachusetts Historical Society, 5th series, Vol. IX. (1885).

Johnson City, Tenn., city in Washington County, on the Southern railroad, 106 miles north of Knoxville. Its elevated location and picturesque mountain scenery make it a favorite summer resort for Southern people. Here is located the mountain branch of the National Soldiers' Home. The manufacturing interests include iron furnaces, rolling mills, machine shops, tanneries and brickmaking plants. The city was settled in 1870 and is governed under a charter of 1897, by a mayor and council elected biennially. Pop. (1890) 4,161; (1900) 4,645.

Johnson Grass. See GRASSES IN THE UNITED STATES.

Johnson's Island, Ohio, an island located at the mouth of Sandusky Bay, overlooking Lake Erie, about a mile long and a mile and a half wide. The island was used during the Civil War as a prison for captured Confederates. It

was an ideal spot for a prison post. No prisoner was ever known to escape from it. The grounds were enclosed within a fence 12 feet high, with a platform top, upon which sentinels paced to and fro day and night. To the north Lake Erie stretches away for 50 miles; on the east, separated by three miles of water, lies Sandusky, while west and south of the island are broad stretches of Sandusky Bay. The island was used almost exclusively as a prison for officers, the total number confined there from first to last aggregating over 15,000. The first prisoners were taken there in April 1862, and in September 1865 the last of them were sent to Fort Lafayette, and Johnson's Island was abandoned as a prison post. The men confined on Johnson's Island represented the flower of the chivalry of the South. They were largely professional men and planters, among them being many who were prominent in science, literature and art.

Johnston, jŏn-stŏn, **Albert Sidney**, American general: b. Mason County, Ky., 3 Feb. 1803; d. Shiloh, Miss., 6 April 1862. General Johnston had but a brief career in the Confederate army, and the first part of that career was one of great disaster and consequently of severe criticism; but he fell "on the field of glory" at Shiloh, and not a few endorse the opinion of President Davis that he was the greatest general whom the war produced. Descended from a long line of illustrious ancestors, he obtained his literary education at Transylvania University, and was graduated at West Point 30 June 1826, being number eight in a brilliant class of which Jefferson Davis was a member. He was brevetted second lieutenant in the 2d infantry, transferred to the 6th infantry in 1827, was regimental adjutant from 1828 to 1832, aid to General Atkinson a year, and acting assistant adjutant-general to Illinois volunteers during the Black Hawk War — in all of which positions he showed the qualities of an accomplished soldier. He resigned his commission in the United States army 31 May 1834, having determined to settle in Texas and cast in his fortunes with the "Lone Star" Republic.

The battle of San Jacinto was fought 21 April 1836, and soon after Johnston arrived in Texas and enlisted as a private soldier in the Texan army. His merit soon brought him promotion, and he was made adjutant-general of the Army of Texas, and not long after brigadier-general and chief commander of the army in the place of General Felix Houston. As a result of jealousy growing out of this promotion there was an unfortunate duel between Houston and Johnston, in which the latter was wounded. He continued in command of the Texan army until 1838, when he was made secretary of war of the Republic of Texas. In 1839 he led an expedition against the hostile Cherokee Indians, and in a battle on the Neches, defeated and routed them with great slaughter. He used all of his abilities and wide influence in bringing about the annexation of Texas to the United States, and promptly enlisted when the Mexican War broke out, being colonel of a regiment of Texas volunteers. He was distinguished in various battles, especially at Monterey, where he had three horses shot from under him, and was highly complimented by General Butler on whose staff he was serving.

On 31 Oct. 1849 he was appointed by President Taylor paymaster in the United States army, with the rank of major, and when the 2d cavalry regiment was formed he was appointed, 3 March 1855, its colonel on the recommendation of his old classmate and lifelong friend, Jefferson Davis, who was at that time the able and efficient secretary of war. In 1857 he was put in command of an expedition to Utah to force the Mormons to submit to the laws of the United States Government, and overcame great difficulties and showed such ability and tact in the delicate mission that he was made brevet brigadier-general. When the War between the States broke out General Johnston was in command of the department of the Pacific, but he very promptly resigned his commission, and with a small party made his way across the plains, passing through New Orleans and reached Richmond on 2 September, where he had a cordial reception and was made a full general, and assigned to the command of the department of Kentucky, whither he went at once, beginning the able and efficient discharge of his duties there.

It could not be published at the time that he had a force barely 20,000 to defend that long line against overwhelming numbers of the enemy, and he was severely criticised in the newspapers for not being more aggressive, and when Forts Henry and Donelson fell, and he was compelled to fall back and abandon to the enemy so large a section of Confederate territory that abuse and severest criticism were heaped upon him, he was denounced as incompetent and his removal from command was demanded. President Davis calmly said: "If Albert Sidney Johnston is not a general, then I have none to put in his place." He wrote his old friend a noble letter, and Johnston replied in the same spirit, concluding with this sentiment: "The test of merit in my profession, with the people, is success. *It is a hard rule, but I think it right.* If I join this corps to the forces of General Beauregard (I confess a hazardous experiment), then those who are now exclaiming against me will be without an argument." He alluded to his plan of uniting with Beauregard to strike Grant before Buell and Mitchel could join him, and in pursuance of which plan he marched from Corinth, Miss., on 3 April, intending to attack Grant at Pittsburg Landing, or Shiloh Church, twenty miles off, on 4 April. There was delay on the part of some of the troops so that the attack could not be made until the morning of the 6th, but with his 40,000 men Johnston attacked Grant's 50,000 with such impetuosity, skill, and dash, that the Federals were driven back at every point, were huddled together at Pittsburg Landing, and there seemed to be lacking at 2.30 P. M. only one more vigorous advance to annihilate Grant's army. But just at this moment the great commander who had just remarked to one of his staff: "The victory is ours. We shall soon water our horses in the Tennessee River," was struck by a minie ball in his leg, and bled to death in 15 minutes. In the confusion which followed, the advance was not made. Beauregard (who had been ill in his ambulance all day and did not appreciate the real situation) ordered the Confederate lines to fall back. Buell and Mitchel came up that night with 55,000 fresh troops, and thus the fruits of Johnston's great

victory were lost, and the next day the Confederates were compelled to fall back to Corinth.

No nobler eulogy could be pronounced on Albert Sidney Johnston than that of President Davis in a special message to the Confederate Congress, in which he said: "Without doing injustice to the living, it may safely be said that our loss is irreparable. Among the shining hosts of the great and good who now cluster around the banner of our country, there exists no purer spirit, no more heroic soul than that of the illustrious man whose death I join you in lamenting. In his death he has illustrated the character for which, through life, he was conspicuous — that of singleness of purpose and devotion to duty with his whole energies. Bent on obtaining the victory which he deemed essential to his country's cause, he rode on to the accomplishment of his object, forgetful of self, while his very life blood was fast ebbing away. His last breath cheered his comrades on to victory. The last sound he heard was their shout of victory. His last thought was his country, and long and deeply did his country mourn its loss."

It is scarcely extravagant to say that had Albert Sidney Johnston lived the victory at Shiloh would have been complete, the whole character of the campaign in the West would have been changed, and with Lee in Virginia and Johnston in the West, the result of the War might have been different. The monument to Albert Sidney Johnston in New Orleans is one of the most beautiful in the country; he is buried in Austin, the capital of his adopted State, and Texas proposes to honor herself by erecting to his memory a fitting monument.

J. Wm. Jones,
Author and Lecturer.

Johnston, Alexander, American historian: b. Brooklyn, L. I., 29 April 1849; d. Princeton, N. J., 21 July 1889. He was graduated from Rutgers College, N. J., in 1870, studied law and was admitted to the bar in 1876. He did not practise, however, and was professor of jurisprudence and political economy at Princeton University from 1883 till his death. He was the author of 'History of American Politics' (1879); 'Connecticut: a Study of a Commonwealth-Democracy' (1887); 'History of the United States for Schools' (1886); and 'The United States: its History and Constitution,' reprinted from the 'Encyclopædia Britannica' (1887).

Johnston, Alexander Keith, Scottish cartographer: b. Kirkhill, Edinburgh, Scotland, 28 Dec. 1804; d. 10 July 1871. His first important work, the 'National Atlas,' was published in 1843. At the suggestion of Humboldt, he visited Germany and gathered material for his 'Physical Atlas of Natural Phenomena' (1847–9), and his 'Royal Atlas of Geography' (1861) was one of the most beautiful and minutely accurate atlases ever published up to that time. His son of the same name (b. 1846; d. 28 June 1879) continued his father's enterprises.

Johnston, Gabriel, American colonial governor of North Carolina: b. Scotland 1699; d. 1752. Very little is known of his personal history. He was educated at the University of St. Andrew's, with a view to the medical profession, which he seems not to have practised. He was for a while professor of Oriental languages at St. Andrew's, and then removed to London, where he was engaged with Pulteney and Bolingbroke in writing for the 'Craftsman.' By the influence of the Earl of Wilmington he was appointed governor of North Carolina, and took the oath of office at Brunswick 2 Nov. 1734. He was the ablest and most successful of all the colonial governors, holding the reins of power up to the time of his death.

Johnston, Harriet Lane, American gentlewoman: b. Mercersburg, Pa., 1833; d. Narragansett Pier, R. I., 3 July 1903. She was the niece of James Buchanan, afterward President of the United States, and on the death of her mother, Buchanan's sister, in 1839, was brought up under the care of her uncle. When the latter was minister to Great Britain, the niece presided over the hospitalities of the legation in London, and during his occupancy of the White House was its mistress, receiving among other distinguished guests the Prince of Wales, now Edward VII. On the occasion of his coronation in 1902 she was among the specially invited guests in recognition of the courtesies extended to him at the White House so long before. In 1866 she was married to Henry Eliott Johnston of Baltimore.

Johnston, Sir Harry Hamilton, English traveler: b. London 12 June 1858. He was educated at King's College, London, and the Royal Academy of Arts, traveled in North Africa, 1879–80, and Portuguese West Africa, and the Kongo region, 1882–3. He commanded a scientific expedition to Mount Kilimanjaro in 1884 and has held various consular posts in Africa. He has published 'Essays on the Tunisian Question' (1880–1); 'The River Congo' (1884); 'Kilimanjaro' (1885); 'History of a Slave' (1889); 'Life of a Livingstone' (1891); 'British Central Africa' (1897); 'History of the Colonization of Africa by Alien Races' (1899); 'The Uganda Protectorate' (1902).

Johnston, Henry Phelps, American historical writer: b. 1842. He is professor of history in the College of the City of New York, and has published 'The Battle of Harlem Heights'; 'Loyalist History of the Revolution'; 'The Yorktown Campaign'; etc.

Johnston, James Steptoe, American Episcopal bishop: b. Church Hill, Miss., 9 June 1843. He was educated at the University of Virginia, served as 2d lieutenant in the Confederate cavalry during the Civil War, subsequently studied law and was admitted to the bar. After practising for a short time he took orders in the Episcopal Church in 1869 and after holding rectorships at Port Gibson, Miss., six years; Mount Sterling, Ky., four years; and Mobile, Ala., eight years, became bishop of western Texas in January 1888.

Johnston, John, American Indian agent: b. Ballyshannon, Ireland, March 1775; d. Washington, D. C., 19 April 1861. He came to Cumberland County, Pa., in 1786, obtained a post in the War Department, in 1792 went to the Ohio Valley, later became a United States factor at Fort Wayne, Ind., and at the beginning of the War of 1812 was appointed Indian agent for Ohio, with headquarters at Piqua. President Harrison appointed him agent to the Senecas, with headquarters at Upper Sandusky, and in that capacity negotiated with the Senecas the

treaty whereby they agreed to move westward across the Mississippi. He was president of the Historical and Philosophical Society of Ohio, and wrote: 'Present State of the Indian Tribes Inhabiting Ohio,' printed in 'Archæologia Americana' (transactions and collections of the American Antiquarian Society), Vol. I. (6 vols., 1820–74).

Johnston, Joseph Eggleston, American soldier: b. Cherry Grove, Va., 3 Feb. 1807; d. Washington, D. C., 21 March 1891. He was graduated at West Point in 1829; and served with distinction in the Black Hawk and Seminole wars. In the Mexican War he distinguished himself also and was brevetted major and colonel United States army for bravery at Cerro Gordo. He was promoted quartermaster-general of the army with the rank of brigadier-general in June 1860, but resigned his commission when Virginia seceded. He was then made major-general of Virginia volunteers and later full general in the Confederate service, taking an active part in the first battle of Bull Run, 21 July 1861, where he personally led a charge with the colors of the 4th Alabama regiment in his hands. At the battle of Fair Oaks, 31 May 1862, Johnston was severely wounded and was disabled for service for several months. In November he again reported for duty and was assigned to the Military Department of Tennessee. In the operations of Grant before Vicksburg he did everything possible to prevent the shutting up of General Pemberton in Vicksburg, telegraphing him May 2: "If Grant crosses, unite all your troops to beat him. Success will give back what was abandoned to win it." Although similar orders were repeatedly sent to Pemberton, they were disregarded; Pemberton allowed himself to be shut up in Vicksburg, and the siege and surrender on 4 July followed. In December of the same year he took command of Bragg's army at Dalton, Ga., and by the spring of 1864 brought it to a state of efficiency which it had not previously had, though it contained only 45,000 men against Sherman's 98,797. The campaign from Dalton to Atlanta, a distance of 100 miles, was a series of severe engagements without a general battle, Johnston's friends claiming "the retreat had been the masterpiece of Johnston's life, and one of the most skilful and successful that had ever been executed." On 17 July 1864 Johnston was superseded in this command by General Hood. In the early part of 1865 he was several times defeated by Sherman, to whom he surrendered at Durham Station, N. C., on 26 April, the terms of capitulation resembling those granted to Lee at Appomattox. After the war Johnston engaged in business, and was member of Congress 1876–8. He was United States Commissioner of Railways 1885–9, and the author of 'A Narrative of Military Operations During the Late War' (1874). Consult: Hughes, 'General Johnston' (1893).

Johnston, Mary, American novelist: b. Buchanan, Botefourt County, Va., 21 Nov. 1870. In 1898 she became suddenly famous through her 'Prisoners of Hope: a Tale of Colonial Virginia,' and her next book 'To Have and to Hold' (1900) was even more popular. She has since published 'Audrey' (1902).

Johnston, Richard Malcolm, American author: b. Powelton, Ga., 8 March 1822; d. Baltimore, Md., 23 Sept. 1898. He was graduated at Mercer University in 1841; was admitted to the bar in 1843; and began practice in Sparta, Ga., the same year. He was professor of literature in the University of Georgia in 1857–61 and served as colonel in the Confederate service during the Civil War. At its close he established a boys' boarding school at Sparta, which he removed in 1867 to Baltimore, and of which he was the head for many years. His publications include: 'Historical Sketch of English Literature'; 'Life of Alexander H. Stephens' (1883); 'Dukesborough Tales' (1883); 'Old Mark Langston'; 'Ogeechee Cross-Firings' (1889); 'Mr. Absalom Billingslea and Other Georgia Folk' (1887); 'Studies Literary and Social' (1891–2); 'The Primes and Their Neighbors'; 'Mr. Billy Downs and his Likes.' The usual theme of his longer as well as his shorter fictions is the life of the middle class Georgian in the ante-bellum period.

Johnston, Samuel, American lawyer and statesman, nephew of Gabriel Johnston (q.v.): b. Dundee, Scotland, 15 Dec. 1733; d. near Edenton, N. C., 18 Aug. 1816. His father, John, came to North Carolina in 1736, became surveyor-general, and acquired large landed estates. The son chose the profession of the law, and was clerk of the superior court in Chowan County for five years from 1767, and served there also as naval officer under the crown. Elected to the assembly in 1769 from the first he espoused the popular side, and in 1773 the assembly placed him on its standing committee of inquiry and correspondence, the organ by which it sought to co-operate with the other provinces. This was the first decisive step toward revolution taken by the legislature of North Carolina. He was an active member of the first two provincial congresses in this province. The 3d and 4th met at his summons, and he presided over the deliberations of both. In the 3d, August 1775, the political organization of the province was decided on, and the supreme executive authority was entrusted to a provincial council, of which he was made the chairman, and so virtually the governor of the province. In September 1775 he was chosen treasurer for the northern district of North Carolina. In 1781–2 he was a member of the Continental Congress. In 1787 he was elected governor of the State, and in 1788 presided over the convention which rejected the Federal Constitution, which, however, he supported with all his influence. He was United States senator 1789–93, and judge of the superior court 1800–03.

Johnston, William Preston, American educator: b. Louisville, Ky., 5 Jan. 1831; d. Lexington, Va., 16 July 1899. He was a son of A. S. Johnston (q.v.) and was graduated at Yale in 1852 and from the Louisville Law School in 1853. He served as colonel and aide-de-camp to Jefferson Davis in the Confederate army during the Civil War, and soon after its close became professor of history and literature at the Washington and Lee University, remaining there till 1877. In 1880 he became president of the Louisiana State University, and after its union with Tulane University, New Orleans, in 1884, was president of that institution till his death. His

publications include: 'Life of General Albert Sidney Johnston'; 'The Johnstons of Salisbury'; 'The Prototype of Hamlet'; and 'Seekers after God' (poem).

Johnstown, jŏnz'town, N. Y., city and county-seat of Fulton County, on Cayadutta Creek, and on the Fonda, J. & G. railroad, 44 miles northwest of Albany. In 1771, a few years after its settlement, it was named after its founder, Sir William Johnson, whose mansion, built here 10 years earlier, still stands almost as it was left by him. In 1808 Johnstown was incorporated as a village, and in 1895 it received a city charter. The court-house and jail, built by Sir William Johnson in 1772, occupy with Johnson Hall an interesting place in local history. The city has a public library building which was the gift of Andrew Carnegie. The industries of Johnstown include a variety of important manufactures, chief among which are those of gloves and mittens, knit goods of different kinds, leather, gelatin, lumber, grist-mill and machine-shop products, etc. The municipal government is well supported by public spirit, and the city's affairs are efficiently managed. The people elect the water board and the school board, and the waterworks are owned and operated by the city. Pop. (1890) 7,768; (1900) 10,130.

Johnstown, Pa., city, county-seat of Cambria County; on the Conemaugh River, and on the Baltimore & O. and the Pennsylvania R.R.'s; about 80 miles east of Pittsburg. The Little Conemaugh River and Stony Creek unite at Johnstown and form the Conemaugh River. The area of the city is about five square miles, and the valley in which it is located is about 1,200 feet above sea-level. Johnstown was settled about 1790, but was not incorporated until 1889. Its situation, in a coal and iron ore region, combined with its great water power, has made it an important manufacturing centre. Fire-clay and limestone are also found in the vicinity. Some of its industrial establishments are the Cambria Steel Company works, where about 10,000 men are employed, the Lorain Steel Company, iron and steel works, iron-plate mills, street-car rail factory, planing-mills, cement works, furniture factories, potteries, breweries, brick-yards, machine-shops, foundries, furnaces, wire works, leather, and woolen goods. Some of the noted public buildings are the Cambria Free Library, the Conemaugh Valley Memorial Hospital, several churches, the Franciscan Monastery, the city hall, and the high school. The number and arrangement of the parks add to the beauty of the place. In Grand View Cemetery are the graves of 800 unidentified dead who perished in the "Johnstown Flood." This disastrous flood occurred on 31 May 1889, and was the result of the destruction of a dam across South Fork, a small branch of the Conemaugh River. Heavy rains had fallen and the mountain streams of the vicinity had become roaring torrents. The dam kept back the waters of Conemaugh Lake, about two and one half miles long, one and one half miles wide, and averaging over 50 feet in depth; in some places the water of the lake was 100 feet in depth. The direct distance from the city was about 12 miles, but along the river the distance was five or six miles longer. In a very short time after the dam had burst, the valley was flooded and Johnstown and several small village were under water. The loss of lives was 2,235 or more, and the loss of property was estimated to be about $10,000,000. Aid for the sufferers came from all parts of the country; and the city was soon rebuilt, and its industries re-established. Pop. (1890) 21,805; (1900) 35,936.

Joint, in anatomy, an articulation or connection between bones. Many of the immovable joints are so close in their union that the two bones practically become one, as in the dovetailed sutures of the skull. In the make-up of a movable joint there are the two bones, and covering the surface of each a layer of tissue of rubbery consistency called cartilage; binding the bones together are firm inelastic bands of tissue called ligaments. Over the surface of the cartilage and the inner surfaces of the ligaments there is a thin smooth layer of tissue, the synovial membrane, which is kept constantly moist with an oily fluid to prevent friction. Joints are classified according to the variety of motions they allow: the freest is the ball-and-socket joint, as seen in the hip and shoulder.

Diseases of Joints.— Joint-diseases are distinguished by names that indicate the principal structure involved and the causes of disease. Where the cause is a specific disorder, as tuberculosis, rheumatism, syphilis or gonorrhœa, the name of that particular malady is given to the inflammation. The only structure of a joint that is apt to be involved alone is the synovial membrane, and inflammation of this structure is called synovitis. Inflammation of all the joint-structures is called arthritis, and where the bone is the primary seat of the trouble, or is principally involved, the name osteo-arthritis is used.

Synovitis.— This condition results from injuries (sprains, bruises, and wounds), from overuse, acting as an injury, and from poisons circulating in the blood. The joint is painful, moves with greater pain, and may be red outside. Blood-serum is poured out, and the synovial sac is distended. (This condition constitutes "water on the knee.") The general symptoms and severity depend on the cause of the trouble. Absolute rest of the joint and pressure by a snug bandage hasten recovery. When such injuries are repeated, or when the inflammation is slight but persistent, painting with iodine tincture may be of value. When the condition of inflammation reaches the suppurative stage all the structures of the joint are involved, and the condition is considered under the term "arthritis."

Arthritis (non-specific).— This is due to the extension of disease of contiguous bone, or it may result from wounds or in the course of various diseases. The joint becomes swollen, red, very painful, and the general symptoms are severe. When the poison is sufficiently virulent, suppurative arthritis results, and the pus collects in the synovial sac. (See INFLAMMATION.) In this condition the joint becomes "boggy," and the poisoning of the entire system is so severe as to warrant the most radical measures for relief. Opening the joint and allowing the escape of the pus, with thorough cleansing, may be sufficient, or the limb may have to be sacrificed. See ARTHRITIS; ARTHRITIS DEFORMANS; GOUT; RHEUMATISM; SYPHILIS.

Knock-knee.— This is a deformity of the legs, consisting in the angular projection of the knee inward, and is sometimes called in-knee. It arises in children learning to walk who are affected with rickets (q.v.). The deformity is due to the faulty growth of the bones which enter into the joint. In early life, correction of it may be secured by splints and braces; but when the bones become less pliable, the femur, the tibia, or both may have to be severed by chiseling and the bones held in the normal line by plaster casts until union has taken place.

Charcot's Disease.— The peculiar form of arthritis thus named occurs in the course of locomotor ataxia, the knee-joint usually being the one affected. The joint swells painlessly, the structures are worn away, and the function of the joint is lost.

Injuries of Joints.— See DISLOCATION.

Sprains.— These are wrenches resulting in more or less stretching or laceration of ligaments, hemorrhage in and around the joint, and sometimes the displacement of tendons. The part usually swells at once, and movement causes severe pain. This injury may closely resemble a joint-fracture. Absolute rest of the joint must be insisted upon, as synovitis may follow. Alternating hot and cold applications, if started early, lessen the damage. The joint should then be snugly bandaged and kept so until swelling and tenderness disappear.

Wounds of Joints.— Injuries of this nature may cause damage directly to the structures or by infecting the joint and producing arthritis. Penetration into the synovial sac is indicated by an escape of the viscid fluid.

Floating Cartilages.— These are rarely seen except in the knee-joint, where they are ordinarily due to a small portion of cartilage being bitten off between the bones; this piece then floats around in the synovial sac, and causes trouble when the bones lock together on it. When this occurs, the patient falls to the ground because of the severe pain. The synovial membrane is injured, and is apt to be mildly inflamed. These bodies may sometimes be felt through the skin, and can be held, by holding the joint in the same position, until an opening is made; but ordinarily when the attacks become so frequent as to be unbearable the joint has to be opened and searched.

Joint or Knot Grass. See GRASSES IN THE UNITED STATES.

Joint-snake. See GLASS-SNAKE.

Joint Tenants, persons who hold or own lands jointly, by title created expressly by one and the same deed or will. It has been uniformly held by the courts that a unity of possession derived by several and distinct conveyances does not constitute a joint tenancy, but rather a tenancy in common. Joint tenants must have the same interest, derived from the same conveyance, commencing at one and the same time, and held by a united possession. The duration of the estates must be alike in both, and also the interest. Should one hold under the conveyance for a term of years, and the other for life, the possession even for a term of years would not be a joint tenancy. The estate must vest in each tenant at the same time. In the case of a will which gives one an interest to commence at a day named and another an interest to commence a year later, no joint tenancy is created thereby. Should one receive an interest absolute and another an interest for life, the relation of joint tenants would not be created. The doctrine of survivorship is the distinguishing incident of title by joint tenancy. In the event of the death of one of the joint tenants, the survivor is entitled to the whole property, and the full title immediately vests in him. This is not an incident of tenancy in common. Many of the States of the Union have abolished title by survivorship in joint tenancy by constitutional provisions or by express statute enactments. In other States acts have been passed abrogating the distinction between joint tenants and tenants in common; and inheritance by survivorship not being an incident of tenancy in common, such acts are construed by the courts as abolishing such inheritance. Such acts do not apply to existing joint tenancies, but only to such as may be created after the enactment.

Joint-worm, the larva of chalcid flies (see CHALCIS) which make galls near the "joints" of grass-plants, and thus are sometimes of great injury to cereal crops, especially wheat and barley. See WHEAT INSECT-PESTS.

Jointure, join'tūr, a settlement of lands and tenements made to a woman in consideration of marriage, as a substitute for dower. Originally it was a joint estate limited to both husband and wife as a joint tenancy and subjected to survivorship. The wife takes nothing under the settlement until after the death of the husband, unless special provisions are incorporated, which in reality modifies the effect of a regular jointure. In some settlements, denominated jointures, provisions are inserted to the effect that they are not to exclude enjoyment of dower; but such provisions are an innovation upon the established province of jointures. A good jointure must provide that it shall take effect, in possession and profit, immediately after the death of the husband; that it shall be for the life of the wife herself, and cannot be left in trust for her use and benefit. It should be provided that it is in settlement of all dower interest, in order to maintain its distinctive features of jointure. The settlement must be executed before marriage, as marriage constitutes the entire consideration for the jointure. Such an instrument properly executed before marriage is binding on the wife and a complete bar to dower in any dowable lands owned or conveyed by the husband during the marital relations. Without the intervention and assistance of legislative action, no other form of agreement is effectual to bar dower. It sometimes happens that the wife is deprived of her jointure by lawful acts to which she is not a party, as by the lands being taken for public purposes, or in some other manner equally legitimate. In such a case the settlement does not bar her claim against the husband's estate to the extent to which she is deprived of her jointure.

Joinville, Jean, zhŏń zhwän-vēl, SIEUR DE, French historian: b. Champagne 1224; d. 11 July 1317. He early entered the service of Thibaut, king of Navarre, and in 1248 raised a troop of 9 knights and 700 armed soldiers, and accompanied Louis IX. in his first crusade to

the Holy Land. He rose high in favor with Louis, shared his captivity, returned with him to France in 1254, and spent much of his time at court. His 'Histoire de St. Louis,' which is one of the most valuable specimens of early French prose, has been often reprinted.

Jokai, yō'kä-ĭ, **Maurus,** Hungarian novelist: b. Komorn 19 Feb. 1825; d. Budapest 5 May 1904. In 1846 he received his advocate's diploma, but never practised, and from a very early age devoted himself to literary work. In 1842 he produced a drama, 'The Jew Boy,' in 1846 his first novel, 'Work-days,' was published, and in 1847 he issued a collection of stories entitled 'Flowers of the Desert.' His 'Revolution and Battle Pictures' appeared in 1849, and after that he devoted himself with extraordinary energy to journalistic and literary work, producing in all more than 300 volumes. He was a member of the Hungarian parliament and the recognized leader of the Liberal opposition since the restoration of the constitution, and in 1897 was appointed a life member of the House of Magnates. He was a successful newspaper editor continuously from 1858 till his death, his last paper being the 'Nemzet' (Nation). He is best known by his numerous romances and novels. Among the latter are 'Transylvania's Golden Age' (1851); 'The Man with Two Horns' (1852); 'The Turks in Hungary' (1852); 'A Hungarian Nabob' (1854); 'Kárpáthy Zoltan' (1855); 'Political Fashions' (1861); 'The New Landlord' (1862); 'Dr. Dumany's Wife' (Eng. trans. 1891); 'In Love With the Czarina' (Eng. trans. 1894); 'The Nameless Castle' (Eng. trans. 1891); 'The Green Book' (Eng. trans. 1897); 'The Lion of Janina' (Eng. trans. 1897); 'The Poor Plutocrats' (Eng. trans. 1899); 'Debts of Honor' (Eng. trans. 1900); 'The Baron's Son' (Eng. trans. 1900); 'The Day of Wrath' (Eng. trans. 1900). His best plays are: 'King Kolomon' (1855); 'Manlius Sinister' (1856); 'Georg Dózsa' (1858); 'The Martyrs of Szigetvár' (1859); and 'Milton' (1878). His 'Political Poems' appeared in 1880. Consult Nevai, 'M. Jokai' (1894).

Joliet, jō'lĭ-ĕt, Fr. zhō-lē-ā, **Louis,** American explorer: b. Quebec 21 Sept. 1645; d. Canada May 1700. He was educated at the Jesuit College of Quebec, and subsequently engaged in the fur trade on the western frontier, thereby becoming familiar with the missionaries and tribes. He was selected by the governor Frontenac to ascertain the direction and mouth of the Mississippi, a few of whose affluents had already been visited by missionaries and traders. Starting with his companion, the illustrious Father Marquette (q.v.), and five other Frenchmen, from Green Bay in June 1673, he ascended the Fox River, and descended the Wisconsin to its confluence with the Mississippi, down which they sailed as far as the country of the Chickasaws, below the entrance of the Arkansas. Having ascertained with tolerable accuracy the general course of the stream, they returned to Green Bay, by the way of Illinois River, Chicago, and Lake Michigan, whence Joliet started alone for Quebec. The whole route traveled by them is estimated at 2,500 miles. He lost his journal and other papers in the rapids above Montreal, but wrote out from recollection a few pages of manuscript, which agree with the narrative of Marquette. In the same manner he prepared a map of the region explored. The French government inadequately rewarded him for his services with the Island of Anticosti at the mouth of the St. Lawrence, where he built a house and fort for his family, intending to embark in trade. He appears, however, to have been subsequently employed in the West. In 1691 his island was captured by a British fleet and his property destroyed. In 1697 the seignory of Joliet, Canada, was assigned to him. Joliet, the capital of Will County, Ill., is named after him. Consult: Parkman, 'La Salle' (1869); Winsor, 'Narrative and Critical History of America' (1884–7).

Joliet, jō'lĭ-ĕt, Ill., city, county-seat of Will County; on the Des Plaines River, and on the Chicago, R. I. & P., the Michigan C., the Atchison, T. & S. F., the Elgin, J. & E., the Lake Shore & E., and the Chicago & A. R.R.'s; about 30 miles southwest of Chicago. The first permanent settlement was made in 1831 and the city was chartered in 1859. The places was named in honor of Louis Joliet, a Canadian navigator and one of the party who with Marquette visited this place in 1673. The Illinois and Michigan Canal and the Joliet River supply the city with good water power. The city is situated in a rich agricultural region, and large limestone quarries are in the vicinity. Its chief manufacturing establishments are the American Steel and Wire Company works, the Illinois Steel Company factory, the American Tin Plate Company, machine-shops, agricultural implement works, foundry and furnace products, breweries, flour-mills, boot and shoe factories, and furniture factories. Some of the public institutions are the State penitentiary, Silver Cross and Saint Joseph's hospitals, Saint Mary and Saint Francis academies, and a public library which contains about 16,000 volumes. The Illinois Steel Company Athenæum, a club-house for workingmen, is a fine institution. The city owns and operates the waterworks. Pop. (1890) 23,264; (1900) 29,353.

Joliette, or Industry Village, Canada, town and county-seat of Joliette County, Quebec; on the L'Assomption River, at the junction of a branch of the Canadian Pacific with the Great Northern Ry. of Canada; 40 miles north of Montreal. It is an important market town, has fine water power, and has a good trade in lumber and farm products. It has large foundries, saw, paper, and grist mills, and manufactories of woolen goods, leather, boots and shoes, biscuit, agricultural implements, carriages, and tobacco and cigars. Limestone for building is quarried in the vicinity. It has two churches, a college, hospital, convent, orphan asylum, and mechanic's institute; an industrial school, banks, and weekly newspapers. The municipality controls the waterworks and electric light. Pop. (1901) 4,220, almost entirely French Canadian.

Jolly Balance, a spring balance devised by Prof. Philipp von Jolly, of the University of Munich, for determining the specific gravities of small objects. In its usual form it consists essentially of a long spiral spring of fine wire, to the lower end of which two pans are attached, one above the other. The lower pan is kept immersed in water, while the upper one remains in the air. The object whose specific gravity is to be determined is placed in the upper

pan first, and the extension of the spring due to the weight of the object in the air is noted. The specimen is then transferred to the lower pan (where it will be under water), and the extension of the spring under these new conditions is also noted. The specific gravity of the specimen is then obtained by dividing the extension of the spring when the object is in the air by the difference between the two extensions as observed for air and water, respectively. The extension of the spring is observed by means of a graduated scale engraved upon a mirror that is placed back of the spring, and parallel to it. In taking a reading, the eye is brought into such a position that the image of the pupil is seen in the mirror directly behind the image of the pointer at the lower end of the spring. In this way errors of parallax are avoided in the readings. The Jolly balance is chiefly used for the rapid determination of the specific gravities of minerals and similar objects, where great precision is not essential.

Jonah, jō'na, a Hebrew prophet: b. Gath-Hepher, Galilee. He flourished in the early years of Jeroboam II., king of Israel, who acceded to the throne 781 B.C. In 2 Kings xiv. 20 we are told that Jonah predicted to Jeroboam his victories over the Syrians. In the narrative of this so-called prophecy of Jonah we see the son of Amittai despatched on an errand of unique importance. He is to go to Nineveh to warn the inhabitants of the destruction of their city, which is to follow within 40 days. The Assyrians at that time were in a reduced condition, their power was broken, and they were inclined to heed the warning. A fast was proclaimed and the threatened judgment was thus averted. Chapter 1st of the book tells the story of Jonah's refusal to obey the command to go to Nineveh; his flight westward, his miraculous arrest, ending in his imprisonment in the belly of a large fish. Then follows a psalm of thanksgiving for deliverance from the fish. The 3d chapter relates to the preaching of Jonah and the repentance of the Ninevites followed by the reprieve of their city. Finally Jonah is rebuked for his anger at the sparing of Nineveh, by which his prophetic reputation ran the risk of being discredited. The book is in no proper sense a prophecy, but is intended to rebuke the haughty exclusiveness of Israel. The Jews were inclined to rejoice at the calamities of the heathen, and the present reprimand is all the more severe because the Assyrians had been and were afterward again to be the most powerful and dangerous foe to the peace of Palestine.

Jonah Crab, a crab of southern New England (*Cancer borealis*) related to the common edible species, but more robust, and with a thicker, harder shell. It is eaten locally.

Jo'nas, Benjamin Franklin, American lawyer and politician: b. Williamston, Ky., 19 July 1834. He was graduated from the law department of the University of Louisiana in 1855, and on the outbreak of the Civil War entered the Confederate army as private and rose to the rank of adjutant. In 1865 he was elected to the Louisiana legislature, to the State senate in 1872, and was then chosen city attorney of New Orleans. After a second term in the State legislature, he was elected to the United States Senate from Louisiana and served from 1879 to 1885. He was appointed by President Cleveland collector of the port of New Orleans (1885–9).

Jonas, yō'näs, Justus (originally JOBST KOCH), German religious reformer: b. Nordhausen, Saxony, 5 June 1493; d. Eisfeldt 9 Oct. 1555. He accompanied Luther to the diet at Worms, assisted him in translating the Old Testament, took part in the Marburg Conference as well as in drawing up the so-called articles of Torgau and was present at the Diet of Augsburg. He did good service to the cause of the Reformation not only by his preaching but by his vigorous translations into German of the Latin works of Luther and Melanchthon.

Jon'athan, son of Saul, king of Israel. He carried on the war against the Philistines for some time with victorious success, but in the battle of Gilboa (1033 B.C.) was slain. His friendship for David is one of the most beautiful incidents in Old Testament history, and the elegy or dirge composed by David on his death — 'The Song of the Bow' — is in the highest strain of Hebrew poetry.

Jonathan. See BROTHER JONATHAN.

Jones, Alexander, American inventor and journalist: b. North Carolina about 1802; d. New York 25 Aug. 1863. He studied medicine in Philadelphia, entered practice in Mississippi, there became interested in cotton cultivation, and made important improvements in the cotton-gin. He invented also a street-sweeping machine. He became an agent of the Associated Press in 1850, and subsequently commercial reporter of the New York *Herald*. His published volumes are: 'Cuba in 1851' (1851); 'Historical Sketch of the Electric Telegraph' (1852); and 'The Cymri of '76' (1855).

Jones, Alfred Gilpin, Canadian statesman: b. Weymouth, Nova Scotia, September 1824; d. Halifax, 15 March 1906. After a secondary education, he entered mercantile life, opposed confederation in 1865, sat in the Dominion Parliament for Halifax in 1867–72 and again in 1874–8, was a member of the privy council, and in 1878 was minister of militia. In 1887–91 he was a third time in Parliament. In 1900 he was appointed Lieutenant-Governor of Nova Scotia. At first a Conservative, he later identified himself with the Liberals, and favored a trade-union with the United States.

Jones, Amanda Theodosia, American poet: b. East Bloomfield, Ontario County, N. Y., 19 Oct. 1835. Some of her war songs were very popular. She published: 'Ulah and Other Poems' (1860); 'Atlantis and Other Poems' (1866); 'A Prairie Idyl, and Other Poems' (1882).

Jones, Anson, last president of the Republic of Texas: b. Great Barrington, Mass., 20 Jan. 1798; d. Houston, Texas, 7 Jan. 1858. He commenced the study of medicine in Litchfield, Conn., in 1817, and in 1820 was licensed to practise. He established himself in 1833 in Brazoria, Texas, and upon the outbreak of the troubles between Texas and Mexico, became one of the earliest advocates of the severance of the two countries. In the succeeding war of independence he served as a private soldier, and as surgeon in the Texan army. In 1837–8 he

was a representative in the Texan congress from Brazoria County; in 1838 was sent as minister to Washington, where he endeavored, though unsuccessfully, to secure the annexation of Texas to the United States, and on his return to Texas took his seat in Congress as senator from Brazoria, and in 1841 was appointed by President Houston his secretary of state, which office he filled three years. In September 1844 he was elected President of Texas for three years from the ensuing December, and held that office until the annexation of Texas to the United States. He succeeded in maintaining a footing of equality in negotiations with England, France, and the United States; and by the intervention of the two former powers the government of Mexico was induced to acknowledge the independence of Texas.

Jones, Charles Colcock, Jr., American author: b. Savannah, Ga., 28 Oct. 1831; d. 19 July 1893. He was graduated at Princeton (1852), at Harvard Law School (1855), and was admitted to the bar in 1856. He served as colonel of artillery in the Confederate army during the War for the Union, and on the return of peace removed to New York, where he practised law. In 1877 he returned to Georgia and devoted his time to the study of the history and archæology of that State. He wrote: 'Negro Myths from the Georgia Coast, Told in the Vernacular' (1888); 'The History of Georgia' (1883).

Jones, David Phillips, American naval engineer: b. Philadelphia 1841; d. Pittsburg 30 Jan. 1903. He entered the navy in 1862, during the Civil War took part in the operations on the James (Va.) and the St. John's (Fla.), and was present at Bermuda Hundred, and in 1889 attained the grade of chief engineer. In 1874–9 he was instructor in steam engineering at the Naval Academy, Annapolis, and from 1889 to 1892, when he was retired, was on duty at the naval training-station at Newport, R. I. He was chief inspector of steel for the district at Pittsburg during the Spanish-American war.

Jones, Edward Franc, American soldier and manufacturer: b. Utica, N. Y., 3 June 1828. He was colonel of the 6th regiment of Massachusetts volunteers, which he led through Baltimore at the opening of the Civil War, and which was attacked by the mob. He was subsequently brevetted a brigadier-general of United States volunteers. He was a member of the Massachusetts Legislature in 1865, but removed to Binghamton, N. Y., the same year. He was lieutenant-governor of New York 1886–91, and originated the phrase, "He pays the freight." He published 'The Origin of the Flag'; etc.

Jones, Henry Arthur, English dramatist: b. Grandborough, Buckinghamshire, England, 28 Sept. 1851. After a secondary education, he took up writing as a means of livelihood, and in 1879 appeared as playwright with 'A Clerical Error,' performed by Wilson Barrett at the Court Theatre. He followed this by a series of comedies of modern life, clever in dialogue and stagecraft, which have been very popular, particularly with English audiences. They include: 'Silver King' (1882); 'Saints and Sinners' (1884); 'Middleman' (1889); 'Judah' (1890); 'The Dancing Girl' (1891); 'The Tempter' (1893); 'The Masqueraders' (1894); 'The Triumph of the Philistines' (1895); 'The Rogues' Comedy' (1896); 'The Liars' (1897); 'The Manœuvres of Jane' (1898); 'Carnac Sahib' (1899); 'The Princess' Nose' (1902); 'Chance, the Idol' (1902); 'Mrs. Dane's Defense' (1904).

Jones, Inigo, English architect: b. London July 1573; d. there 21 July 1652. He was the son of a clothworker and began life as a carpenter, but showing a taste for painting, William, earl of Pembroke, supplied him with the means of visiting Italy for the purpose of studying landscape painting. At Venice, the works of Palladio inspired him with a taste for architecture. He was appointed first architect to Christian IV., king of Denmark, but in 1605 he returned to his native country. After being employed for a time as a scenic and stage artist, he was appointed in 1610 surveyor of the works to Henry, Prince of Wales. After the death of the prince he again visited Italy, and extended his knowledge and improved his taste from the examination of the models of ancient and modern art. The banqueting house at Whitehall is a monument of his skill and science. At Winchester Cathedral he erected a screen in the style of classic antiquity. Like Wren he seems not to have duly appreciated the Pointed style of building. He built the front of Wilton House, in Wiltshire, for Philip, earl of Pembroke, and was much employed by the court and by many of the nobility and gentry. He also designed the scenery and decorations for masks — a species of dramatic entertainment fashionable in the early part of the 17th century. In these pieces the dialogues and songs were composed by Ben Jonson, who quarreled with Jones, and abused him in epigrams and satires. Being a Roman Catholic, and a partisan of royalty, he suffered in the civil war, and in 1646 was forced to pay a heavy fine as a malignant or cavalier. As an author he is known by a work on Stonehenge, composed by command of King James I., in which he undertook to prove that Stonehenge was erected by the Romans, and was a hypæthral temple dedicated to the god Cœlus. He was the reviver of classical architecture in England, but he blended Gothic elements with the Italian style. Among his works besides those mentioned are the Greenwich Hospital, the old London Exchange, and the portico of St. Paul's Church, and Earl Pembroke's house.

Jones, Jacob, American naval officer: b. near Smyrna, Del., March 1768; d. Philadelphia 3 Aug. 1850. He entered the United States navy in 1799 as a midshipman and while serving in the war with Tripoli, was captured in 1803 and held a prisoner for 18 months. In 1812 he became commander of the Wasp and with her captured the English brig Frolic 18 Oct. 1812, but on the following day encountered the English war vessel Poictiers, 74 guns, by which both the Wasp and its prize were taken. He was released on parole at Bermuda and for his victory over the Frolic was voted a gold medal by Congress, and $25,000 was granted to him and his crew in payment of the personal loss they had sustained. He subsequently commanded squadrons in the Mediterranean and the Pacific.

Jones, Jenkin Lloyd, American Unitarian clergyman: b. Llandyssil, Cardiganshire, Wales, 14 Nov. 1843. He came to America with his

parents while an infant, served in a Wisconsin regiment during the Civil War, and was graduated from the Meadville (Pa.) Theological Seminary in 1870. He was pastor of All Souls Unitarian Church, Janesville, Wis., 1874–83; was secretary of the Western Unitarian Conference for nine years, and since 1883 has been pastor of All Souls Church, Chicago. He has been prominent among the more radical members of the Unitarian body, and has published: 'The Faith that Makes Faithful,' with W. C. Gannett (1886); 'Practical Piety' (1890); 'Word of the Spirit' (1897); 'Bits of Wayside Gospel' (1899); etc.

Jones, John, American surgeon; b. Jamaica, L. I., 1729; d. 1791. He studied medicine in Europe, and, returning to America, practised in New York, becoming professor of surgery in King's College, and, with Dr. Bard, founding the New York Hospital in 1771. After the occupation of New York by the English Forces in 1777 he removed to Philadelphia, there being one of the physicians of the Pennsylvania Hospital, and in 1787 vice-president of the College of Physicians. He was the friend and physician of both Washington and Franklin, attending the latter in his last illness. He published 'Plain Remarks upon Wounds and Fractures' (1775).

Jones, John Paul, the first of the great American sea fighters, and not the least splendid in the long line, was born John Paul — the name Jones being a subsequent assumption — on 6 July 1747 on the estate of Arbigland, in the parish of Kirkbean, in the County of Kircudbright, Scotland. His family was obscure, his circumstances narrow, his advantages meagre, his opportunities limited. At the age of 12 he became a sailor. Genius rose superior to adverse circumstances, however, and before he died he was one of the most accomplished officers who ever served the United States. The greatest men of America and France took pleasure in his society and were proud of his friendship.

He progressed rapidly in his chosen career. At 19 he was chief mate of a slaver, a legitimate occupation in his day, but one that filled him with disgust. At 21 he was captain of a trader. In 1773 he came to America, forsook the sea, and settled in Virginia.

He was still poor and obscure when on 7 Dec. 1775 he was appointed a lieutenant in the new Continental Navy, and was ordered to the Alfred, a small converted merchantman, Commodore Hopkins' flagship, on which, in the latter part of December, he had the honor of hoisting with his own hands the first naval flag of an American squadron. This was the famous yellow silk banner with a rattlesnake, and perhaps a pine tree, emblazoned upon it, with the significant legend, "Don't tread on me!"

Hopkins made an abortive expedition to New Providence, in which Jones had but one opportunity to distinguish himself. At the peril of his commission, when the regular pilots refused to do so, he volunteered to take the Alfred through a difficult and dangerous channel. Needless to say, he succeeded — he always succeeded!

His first independent command was the little brig-ship Providence, of 70 men and 12 4-pound guns. In the fall of 1775 he made a notable cruise in this vessel; he skirmished with, and escaped from, by seamanship and daring, two heavy frigates, the Solebay and the Milford; in four months he captured 16 vessels, 8 of which were sent in as prizes, 5 burned, 3 returned to certain poor fishermen; and he destroyed property aggregating $1,000,000.

Later, in command of the Alfred, with a short crew of 150 when he should have had 300, he made another brilliant cruise in which he burned several British transports, captured one storeship laden to the gunwales with priceless munitions of war and supplies, cut out three of the coal fleet from under the guns of the Flora frigate, and had another smart brush with the Milford.

He was commissioned captain in the navy on 10 Oct. 1776, and on 14 June 1777, in the same resolution that established the form of the American flag, he was ordered to the Ranger, a small ship-rigged corvette of 300 tons and 18 6-pounders. In her, at Portsmouth, N. H., on 4 July, he hoisted the first Stars and Stripes that ever flew from the peak of an American man-of-war. Sailing for European waters, he carried to France the official despatches announcing Burgoyne's surrender, which brought about the Franco-American alliance.

In Quiberon Bay, late on the evening of 14 Feb. 1778, in the Ranger, he received the first formal recognition ever given by a foreign fleet to the United States in a salute to the American flag. As it was after sunset when the salutes were exchanged, in order that there should be no mistake about it, the next morning, 15 February, Jones transferred his flag to the Independence, a small privateer, and deliberately sailed through La Motte Piquet's fleet of battleships, saluting and receiving salutes again.

In April 1778, still on the Ranger, he left Brest on a cruise in British waters, which took him around Ireland. During this cruise he made daring but abortive attempts to burn the shipping at Whitehaven, and to capture the Earl of Selkirk at Saint Mary's Isle. On the evening of 24 April, off Carrickfergus, he fought the British sloop-of-war Drake, of equal force and larger crew, to a standstill in an hour and five minutes. When the Drake struck her flag, her rigging, sails, and spars were cut to pieces. She had 42 killed and wounded — more than one fifth of her crew — and was completely helpless. The Ranger lost 2 killed and 6 wounded.

In 1779 Jones hoisted his flag on the Duc de Duras, a condemned East Indiaman, which would have been broken up had he not turned her into a makeshift frigate by mounting 40 guns in her batteries — 14 12-pounders, 20 nines, and 6 eighteens. This, in honor of Franklin, he renamed the Bon Homme Richard. Accompanied by the fine little American-built frigate Alliance, 32, commanded by Pierre Landais, an incompetent and unbalanced French naval officer in the American service, the French corvette Pallas, 30, Captain de Cottineau, with the brig Vengeance, 12, and the cutter Cerf, 16, Jones cruised around England and Scotland, taking many valuable prizes and striking terror all along the shore, in spite of constant mutiny and insubordination among the ships, officers, and men of his heterogeneous squadron.

On the evening of 23 September, off Flamborough Head, he fell in with the valuable Baltic convoy. He was accompanied at the time only by the Alliance and the Pallas. The Baltic convoy was protected by the Serapis and the Scarborough. The Serapis was a brand-new double-banked frigate of 800 tons, carrying 20 18-pounders, 20 nines, and 10 sixes. Inasmuch as the 18-pounders on the Richard burst and were abandoned after the first fire, the Serapis could and did discharge nearly twice as many pounds' weight of broadside as the Richard — say 300 pounds to 175. The Pallas grappled with the Scarborough — a more equal match — and Jones attacked the Serapis, which was not unwilling — quite the contrary — for the fight.

The battle was one of the most memorable and desperate ever fought upon the ocean. The Richard was riddled like a sieve. Her rotten sides were literally blown out to starboard and port by the heavy batteries of the Serapis. Jones had several hundred English prisoners on board. The master-at-arms released them, but with great readiness and presence of mind Jones, who was brilliantly supported by Richard Dale, his first lieutenant, sent them to the pumps while he continued to fight the English frigate, his own ship kept afloat by their efforts.

Captain Pearson, of the Serapis, was a brave man, but no match for the indomitable personality of the American commander. After several hours of such fighting as had scarcely been seen before on the narrow seas, he struck his flag. The Alliance, commanded by a jealous and incapable Frenchman, had contributed nothing to Jones' success. Indeed, she had twice deliberately poured her broadsides into the Richard in spite of frequent warning. The American vessel was so wrecked alow and aloft that she sank alongside, and Jones had to transfer the survivors of his crew to the English frigate. The aggregate of the two crews was nearly 700, of which about 350 were killed or wounded. The Scarborough was captured by the Pallas after a smart action.

Jones took his prizes into the Texel, when, after showing himself as vigorous and able in statecraft in maintaining American honor in diplomatic intrigues as he was at sea in battle, he was forced to turn over the Serapis and Scarborough to France.

The poverty of America did not permit Jones to get to sea in adequate ships thereafter, although he subsequently commanded successively the Alliance and the Ariel, a small sloop-of-war, in which he caused the British letter-of-marque Triumph to strike her flag after a brief action, from which she escaped by a clever ruse, he performed no other conspicuous service.

After the Revolution, he took service under Catherine of Russia, carefully reserving his American citizenship. In her service, in June and July 1788, he fought four brilliant actions in the Black Sea, in which he had to contend with the usual discouragement of indifferent personnel and wretched material, and in which he displayed all his old-time qualities, winning his usual successes, too.

Worn out in unrequited service, disgusted with Russian court intrigues of which he was the victim, resentful of the infamous Potemkin's brutal attempts at coercion, he asked leave of absence from Catherine's service and went to Paris, where in the companionship of his friends and in the society of the beautiful Aimée de Telison, the one woman he loved, he lived two years, and died of dropsy on 18 July 1792, at the age of 45.

Besides the memory of his battles, Paul Jones left a collection of immortal sayings, which are the heritage of the American navy and the admiration of brave men the world over.

"I do not wish to have command of any ship that does not sail fast, for I intend to go in harm's way!"

"I have ever looked out for the honor of the American flag."

"I can never renounce the glorious title of a citizen of the United States."

Last, but not least, the curt phrase which comes ringing through the centuries like a trumpet call to battle; the words with which he replied to the demand of the astonished Pearson, who saw the enemy's ship beaten to a pulp, and wondered why he did not yield:

"I have not yet begun to fight!"

Never in his long career did Jones have a decent ship or a respectable crew. His materials were always of the very poorest. His officers, with the exception of Richard Dale, were but little to boast of. What he accomplished he accomplished by the exercise of his own indomitable will, his serene courage, his matchless skill as a sailor, and his devotion to the cause he had espoused. After his death, among his papers, the following little memorandum of his services, written in his own hand, was found:

In 1775, J. Paul Jones armed and embarked in the first American ship of war. In the Revolution he had 23 battles and solemn rencontres by sea; made 7 descents in Britain and her colonies; took of her navy two ships of equal, and two of superior force, many store-ships, and others; constrained her to fortify her ports; suffer the Irish volunteers; desist from her cruel burnings in America, and exchange, as prisoners of war, the American citizens taken on the ocean, and cast into prisons of England, as "traitors, pirates, and felons!"

Paul Jones was accused of being a pirate. The charge was a long time dying, but it is to-day generally withdrawn. His status was clear and unequivocal. He was a regularly commissioned officer in the navy.

In person Jones was a small, slender, well-made man, about 5 feet 7 inches high. His complexion was dark, his features were regular, and his eyes black and brilliant. He had acquired a charming manner, especially with women, and not a little education and polish in his varied career. He wrote and spoke fluently, and, like Nelson, sometimes amused himself by making indifferent verse. His chief fault was his vanity. In morals he was rather above the custom of the time and the society in which he mingled. He had one child by Aimée de Telison, which died in infancy.

As a strategist, tactician, and fighter he stands high among naval captains. Louis XVI. conferred on him the Order of Military Merit and presented him with a magnificent sword; the Empress Catherine appointed him a rear admiral and created him a knight of Sainte Anne, and Congress formally thanked him and awarded him a gold medal for his services. He was accorded the honor of a public funeral by the French Assembly, and was buried in a Protestant cemetery at the corner of the Rue

de la Grange aux Belles and the Rue des Ecluses Saint Martin, in Paris. In the spring of 1905, through the efforts of Gen. Horace Porter, American ambassador to France, his remains were discovered and identified and brought to America in the armored cruiser Brooklyn, flagship of Rear Admiral Charles D. Sigsbee's accompanying squadron. They are interred at the United States Naval Academy at Annapolis, Md., awaiting the completion of a suitable resting place for them.

There is one mystery connected with Jones' life which has never been cleared up. No one knows why John Paul assumed the name Jones. There have been two attempts at explanation: one that he took it in testamentary succession to his brother, William Paul, who had taken the name Jones to inherit property from one William Jones, a Virginia planter. This is now disproved, and the prevailing theory is that the name was assumed by John Paul out of respect and affection for the Jones family of North Carolina, from whom he had received much kindness.

Consult: Brady, 'Commodore Paul Jones'; Buell, 'John Paul Jones, the Founder of the American Navy'; Hapgood, 'Paul Jones'; Laughton, 'Studies in Naval History'; etc.

CYRUS TOWNSEND BRADY.

Jones, John Percival, American politician: b. Herefordshire, England, 1830. He came to the United States in 1831, was educated in the schools of Cleveland, Ohio, in the early days of California gold-mining went to that State where he acquired mining interests, and in 1863–7 was a member of the State senate. In 1867 he removed to Nevada, where he became a proprietor and the superintendent of the "Crown Point" silver mine, through which he realized a fortune. He was elected to the United States Senate from Nevada in 1873, and this office he held by re-election until 1903. He was originally a Republican, was elected to the Senate as a "Silverite" in 1897, and from 1900 was a "Silver" Republican.

Jones, John William, American Baptist clergyman and author: b. Louisa, Va., 25 Sept. 1836. He was graduated from the University of Virginia in 1859 and from the Southern Baptist Theological Seminary, and during the Civil War served as private and then chaplain in the Confederate army. He was pastor of a Baptist church in Lexington, Va., 1865–71, and chaplain of Washington College during Lee's presidency, and since the last named date has been successively agent of various Southern institutions, chaplain of the University of Virginia, and pastor of several churches. Besides editing 14 volumes of the 'Southern Historical Papers' he has published 'Personal Reminiscences, Anecdotes and Letters of R. E. Lee' (1874); 'Christ in the Camp, or Religion in Lee's Army'; 'Memorial Volume of Jefferson Davis'; 'School History of the United States'; etc.

Jones, Joseph Stevens, American playwright: b. 1811; d. Boston, Mass., 30 Dec. 1877. After his graduation from the Harvard Medical School in 1843, he practised medicine for several years; but was subsequently proprietor and manager of the Tremont, Old National, and other theatres in Boston at various times. Among the nearly 200 plays of which he was the author may be named: 'Solon Shingle'; 'The Liberty Tree'; 'The Siege of Boston'; 'Moll Pitcher'; 'The Last Dollar'; 'The People's Lawyer'; 'Paul Revere'; 'The Silver Spoon.'

Jones, Leonard Augustus, American jurist: b. Templeton, Mass., 13 Jan. 1832. He was graduated from Harvard in 1855 and from Harvard Law School in 1858. He was admitted to the Suffolk bar in 1858 and since 1884 has been one of the editors of the 'American Law Review.' Among his many legal works are: 'Law of Mortgages and Real Property' (1878–94); 'Law of Mortgages of Personal Property' (1881–94); 'Law of Easements' (1898). He was appointed judge of the court of land registrations in 1898.

Jones, Owen, English architect: b. London 15 Feb. 1809; d. there 19 April 1874. In 1834 he traveled in Spain and studied the art monuments of Granada, after which he visited Egypt. On returning to England he published his great work on the Alhambra. In 1851 he undertook the decoration of the Crystal Palace at the first Universal Exhibition. He also furnished the various courts of different architecture, notably the "Alhambra Court." His researches and publications had a wonderful influence on the decorative art of England, especially his 'Grammar of Ornament,' in which he illustrated the decorative devices of all nations. He published 'Plans, Elevations, Sections and Details of the Alhambra' (1845).

Jones, Samuel M., American manufacturer and politician: b. 3 Aug. 1846 in Wales; d. Toledo, Ohio, 12 July 1904. He came to the United States with his parents when three years old; at 18 he was working in the oil-fields of Titusville, Pa. In 1893 he invented improved oil-well apparatus and set up the Acme Sucker Rod Factory in Toledo, Ohio. Here he introduced reforms in the condition of his employees, fixed a minimum wage, gave an eight-hour day, and introduced a system of profit-sharing; he also opened a pleasure ground adjoining the factory, known as "Golden Rule" Park. In 1897 he was nominated for mayor of Toledo by the Republican party and elected; but his subsequent advocacy of municipal ownership of public utilities and of the abolition of the system of private contract in doing city work alienated the support of his party. His administration was, however, very popular, and he was re-elected as independent candidate in 1899 and 1901. In 1900 he was non-partisan candidate by petition for governor of Ohio, but was defeated.

Jones, Samuel Porter, commonly known as SAM JONES, American Methodist revival preacher: b. Chambers County, Ala., 16 Oct. 1847. He was admitted to the Georgia bar in 1869, but his drinking habits put an end to his career as a lawyer. Becoming converted in 1872 he was admitted to the ministry of the Methodist Church South, the same year, and has since devoted himself to evangelistic work, his marked eccentricities of speech and manner probably contributing somewhat to his popularity. He has published: 'Sermons and Sayings'; 'Music Hall Sermons'; 'Sam Jones' Own Book'; etc.

Jones, Thomas ap Catesby, American naval officer: b. Virginia 1787; d. 1858. Having entered the navy in 1805, he was employed in

police duty in the Gulf, saw service in the latter part of the War of 1812, and was unsuccessful in an attempt to prevent the passage of Vice-Admiral Cochrane's fleet across Lake Borgne. In 1826 he was sent to the Hawaiian Islands to settle the difficulties arising through the efforts of a local party to make the islands a British dependency. Upon the declaration of war between the United States and Mexico, he feared that the British man-of-war Dublin intended the annexation of California, and imprudently landed at Monterey and took possession. He was therefore removed temporarily from his command.

Jones, Sir William, English lawyer and Oriental scholar: b. London 28 Sept. 1746; d. Calcutta 27 April 1794. He was educated at Harrow and Oxford, and early acquired a reputation as a linguist, Hebrew, Persian, Arabic, and even Chinese, besides German, Italian, French, Spanish, and Portuguese, being among his acquisitions. In 1770 his translation (in French) of the life of Nadir Shah from the Persian appeared; in 1771 his grammar of the Persian language; in 1774 his 'Poeseos Asiaticæ Commentariorum Libri Sex,' and in 1781 his translation of the seven Arabic poems known as the 'Moallákat.' He had been called to the bar in 1774, and in 1783 was nominated judge in the supreme court of judicature, Bengal, and knighted. Here he did much for the furtherance of Oriental studies, being one of the first Europeans to study Sanskrit, founding the Royal Asiatic Society, in 1784 translating the Sakuntala, the Ordinances of Manu, besides tales, poems, extracts from the Vedas, etc. He also undertook a digest of the Hindu and Mohammedan laws, which he did not, however, live to complete.

Jonesboro, jōnz'bŭr-ō, Ark., city, county-seat of Craighead County; on the Kansas City, Ft. S. & M., the St. Louis S. W., and the Jonesboro L. E. R.R.'s; about 120 miles northeast of Little Rock. It was first settled in 1870, although some settlements had been made earlier on farms in the vicinity. It was incorporated in 1882. It is situated in an agricultural and lumbering region, and the railroad facilities make it the trade centre for quite an extent of country. The chief manufactures are flour, lumber, staves and headings, boxes, and wagons. In addition to the manufactures there is considerable trade in grain, live stock, and some dairy products. Pop. (1890) 2,065; (1900) 4,508.

Jonesboro, Ga., city, county-seat of Clayton County; on the Central of Georgia railroad; about 16 miles south of Atlanta. It is situated in a fertile agricultural region, but its nearness to Atlanta and lack of water power are hindrances to manufacturing. Its chief trade is in fertilizers, cotton, and farm products. At this point, August 1864, was fought a hotly contested battle with Gen. Howard of Sherman's army, in command of the Federal troops, and Gen. Hardee of Hood's army, in command of the Confederates. See Jonesboro, Battle of.

Jonesboro, Battle of, and Fall of Atlanta. After the battle of Ezra Church (q.v.), 28 July 1864, Gen. Sherman, unable fully to invest Atlanta, drew the Fourteenth corps and Schofield's Army of the Ohio from the left, and extended his lines on the right nearly to East Point, about six miles below Atlanta, the junction of the two railroads leading from the south, upon which the city and Hood's army depended for supplies. Hood made a corresponding movement to cover the roads, meeting Sherman's advance with strong, well-intrenched lines, and, 6 August, severely handling two of Schofield's brigades that had crossed Utoy Creek, killing and wounding over 300 men and taking two colors. To compel Sherman to relinquish his movement and raise the siege of Atlanta, Hood, 10 August, sent Wheeler with about 5,000 cavalry to operate upon his line of communication with Nashville. Wheeler moved promptly, struck and destroyed the railroad near Marietta, Calhoun, Adairsville, and Dalton, captured over 1,000 head of beef-cattle and other supplies, and, after demonstrating on Dalton and Resaca, was driven into East Tennessee. Sherman had issued an order, 16 August, for a general movement on the 18th upon the West Point and Macon railroads, for the purpose of forcing Hood from Atlanta, but hearing of Wheeler's raid, he suspended the order, and directed Gen. Kilpatrick, with 5,000 cavalry, to move on the night of the 18th against the West Point and Macon roads and destroy them completely. Kilpatrick started from near Sandtown, crossed the West Point road at Fairburn, and struck the Macon road a short distance north of Jonesboro, some 26 miles from Atlanta, where he encountered Ross' brigade of cavalry, which was driven through Jonesboro. But little of the railroad had been destroyed when Jackson's brigade of cavalry and an infantry brigade, coming up from the south, compelled Kilpatrick to retreat. Making a circuit, he again struck the railroad at Lovejoy's, about six miles south of Jonesboro, and encountered a Confederate force, through which he cut his way and reached Decatur, near Atlanta, on the 22d. As Sherman was satisfied that Kilpatrick had not greatly damaged the railroad, he renewed his order for the movement of the whole army. On the night of the 25th the siege of Atlanta was raised. The sick and wounded, spare artillery, and surplus transportation were sent back to the Chattahoochee bridge; Stanley's Fourth corps drew out from the left and moved to the right, closing up with the Fourteenth near Utoy, and the Twentieth corps fell back to an intrenched position covering the Chattahoochee bridge and the hospitals. On the night of the 26th the Army of the Tennessee (Gen. Howard) drew out, rapidly made a wide circuit, and came up on the right of the Army of the Cumberland, under Gen. Thomas, along Utoy Creek, facing south. The Army of the Ohio remained in position, now on the extreme left. On the 28th, making a general left wheel, pivoting on Schofield's army, both Thomas and Howard reached the West Point road extending from East Point to Red Oak and Fairburn, Schofield closing in upon the left of Thomas, but a short distance from the Confederate works covering the junction of the road at East Point. The next day was devoted to the railroad, of which nearly 13 miles was destroyed, and on the 30th the entire army moved eastward for the Macon railroad. Schofield, on the left, approached it near Rough and Ready, and presented a bold front toward East Point; Thomas, in the centre, reached Couch's, on the Fayetteville and Decatur road, with but little opposition; and Howard, on the right, driving before him the enemy's cavalry, saved the bridge

over Flint River after a sharp engagement, then, crossing part of his command, halted at night within half a mile of Jonesboro. On the morning of the 31st Howard, finding himself in the presence of a large force, disposed the Army of the Tennessee for battle and intrenched: Logan's Fifteenth corps on the left, Ransom's Sixteenth corps on the right, and Blair's Seventeenth corps in rear of Logan's left. When Sherman began his movement on the night of the 25th S. D. Lee's corps of Hood's army covered the railroad from near Atlanta to a place nearly a mile south of East Point. Hardee's corps was on Lee's left, while Hood held Atlanta with Stewart's corps and the Georgia militia. Hood had been deceived; he knew of Sherman's earlier movement, but misinterpreted it as preliminary to a retreat across the Chattahoochee; but when undeceived on the 30th, he ordered Hardee with his own corps and Lee's to move rapidly to Jonesboro and crush Howard on the morning of the 31st. Hardee, who was near Rough and Ready, four miles below East Point, began moving about 4 P.M., followed later by Lee, and at noon of the 31st both were in Howard's front. At 3 P.M. Hardee attacked with Lee's corps and part of his own, under Cleburne, with the expectation of driving Howard into the river, and for two hours the fighting was severe, but Hardee was repulsed. Lee, who, on the Confederate side, bore the brunt of the fight, says: "The attack was a feeble one and a failure, with a loss to my corps of about 1,300 men killed and wounded." Hardee's entire loss was about 1,700. The Union loss was 179 killed and wounded, almost entirely of Logan's corps.

When Sherman heard the noise of this battle he was with Thomas, who, with Schofield, had reached and was destroying the road from Rough and Ready southward. Thomas and Schofield were marched to the assistance of Howard, and Kilpatrick was sent down the western bank of the Flint to strike the road south of Jonesboro. Davis' Fourteenth corps joined Howard's left at noon of 1 September, relieving Blair, who was disposed to support Kilpatrick. Lee's corps had gone, but Hardee's was still in position and intrenched, covering Jonesboro on the north. At 4 P.M. Davis charged Hardee's works and, after a hard fight, carried parts of them, capturing Gen. Govan and the greater part of his brigade and two batteries of four guns each. Stanley and Schofield reached the field too late to take part in the engagement. During the night Hardee retreated to Lovejoy's station, and next morning Sherman started in pursuit. The Union loss 1 September was 223 killed, 946 wounded, and 105 missing. The Confederate loss is not fully known; of the three divisions engaged Cleburne's sustained a loss of 55 killed, 197 wounded, and 659 missing. There is no return of losses in the other two divisions.

The result of the battle of Jonesboro was the fall of Atlanta. Six hours before Hood heard of the result of Hardee's attack 31 August, he sent an order to Lee to return in the direction of Atlanta, to make a movement on Sherman's flank, or to cover the evacuation of the city. Lee received the order at midnight, and was halted next morning about six miles from Atlanta. Meanwhile Hood had heard of the result of Hardee's attack; its "failure necessitated the evacuation of Atlanta." Lee was ordered to join Hardee, which he did on the 2d, and at 5 P.M. of the 1st Hood marched out of the city with Stewart's corps on the McDonough road; the Georgia militia was sent to Covington, and at night the rear-guard blew up some abandoned ammunition-trains. Slocum's Twentieth corps entered the city on the morning of the 2d. Sherman received the news on the 4th, and, turning his back on the Confederates at Lovejoy's, marched his army to East Point and Atlanta.

The campaign for Atlanta, which began 6 May 1864, was marked by brilliant flanking movements, on both sides, by almost uninterrupted skirmishing, growing at times to the dimensions of a battle, and by many heavy engagements, most of them of a desperate character. The Union losses in the entire campaign were 4,423 killed, 22,822 wounded, and 4,442 missing, a grand aggregate of 31,687. The Confederate losses were 3,044 killed and 18,952 wounded. Add to this the number of prisoners captured, 12,938, makes a grand aggregate of 34,979. Consult: 'Official Records,' Vol. XXXVIII.; Cox, 'Atlanta'; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; 'Life of Gen. George H. Thomas'; Bowman, 'Sherman and his Campaigns'; Sherman, 'Personal Memoirs,' Vol. II.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Jonesville, jōnz'vĭl, Va., the scene of a Civil War action. On 1 Jan. 1864 Major Beeres, who had been operating with a battalion of the 16th Illinois cavalry and a battery, near Cumberland Gap, attacked and drove a small Confederate cavalry force from Jonesville and occupied the place. On the morning of the 3d he was attacked by Gen. W. E. Jones' cavalry brigade and, after a spirited resistance, continuing nearly the entire day, in which he lost 10 killed and over 40 wounded, was finally surrounded and obliged to surrender. The Confederates reported that he surrendered 383 officers and men, 45 of whom were wounded, 3 pieces of artillery, and 27 wagons. The Confederate loss was about 30 killed and wounded. Consult 'Official Records,' Vol. XXXII.

E. A. CARMAN.

Jonquil, jŏn'kwĭl. See NARCISSUS.

Jon'son, Ben or **Benjamin,** English dramatic poet, the contemporary and friend of Shakespeare: b. Westminster 1573; d. London 6 Aug. 1637. He was the posthumous son of a clergyman, and was placed at the Westminster grammar-school, where he laid the foundation of his learning, but was ultimately withdrawn, it is said, by his stepfather, a master bricklayer, who wanted his assistance in the business. He soon tired of this occupation, entered the army as a private soldier, and showed much personal courage during a campaign in Holland. Returning to England he began his career as an actor, and in 1598 his drama, 'Every Man in his Humour,' was performed at the Globe, with Shakespeare in the cast. About this time Jonson killed an actor, Spenser by name, in a duel, was branded on the left thumb, and deprived of his personal effects. In 1599 he brought out his comedy of 'Every Man out of his Humor,' followed by 'Cynthia's Revels' (1600); the 'Poetaster' (1601); 'Sejanus,' a tragedy (1603); 'Volpone' (1605); 'Epicœne, or the Silent Woman' (1609), the best of his comedies; 'The

Alchemist' (1610); and 'Bartholomew Fair' (1614). The festivities which welcomed the new king, James I., gave a new impulse to the representation of masques, in the composition of which the ready talent of Jonson was employed by the court itself, the celebrated Inigo Jones doing the decorations. In 1604 he had some share with Chapman and Marston in writing 'Eastward Ho,' certain passages of which, reflecting satirically on the Scottish nation, drew down the anger of the king. Chapman and Marston were imprisoned, and Jonson voluntarily served the sentence with them. In 1613 Jonson made a tour in France as governor of Sir Walter Raleigh's eldest son. In 1618 he visited Scotland, staying for some time with Drummond of Hawthornden, whose notes of his guest's conversation are amongst the best accounts we have of Jonson's personality. In 1619 he returned to England, and on the death of the poet laureate was appointed his successor, and the salary raised to the sum of £100 by Charles I. Much of his time was spent at the Apollo, Mermaid, and other taverns, engaging in those brilliant contests of wit in which in earlier days Shakespeare also took part. His latter days were spent in fame and honor, as the acknowledged chief of English literature, and he enjoyed a pension of £200 from the crown. He died leaving behind him an unfinished pastoral drama of great beauty, 'The Sad Shepherd.' He was buried in Westminster Abbey, where a monument was erected to his memory with the inscription, 'O rare Ben Jonson.' Jonson's best dramas are based on the method of ancient comedy, are excellent in plot and development, and have strongly conceived characters and excellent traits of humor. He is sometimes forced and unnatural, and deals perhaps too much with passing manners and eccentricities. He had a genuine lyrical power, seen in his short poems and the songs such as 'Still to be neat, still to be drest,' interspersed in his masques. Jonson was also considered one of the leading scholars of his time, and his own dramatic works evince profound knowledge of the classical literatures. There is a collective edition by Gifford (9 vols. 1716; 2d ed. 1875). Consult the 'Life' by Symonds (1886); Swinburne, 'Study of Jonson' (1889); Fleay, 'English Drama' (1891); Koeppel, 'Quellen-Studien zu den Dramen Ben Jonsons' (1895).

Jop'lin, Mo., city and one of the county-seats of Jasper County, in the southwestern portion of the State. It is the metropolis of the richest zinc and lead mining camp in the world and the largest city in Jasper County or southwest Missouri. The county of Jasper, in which it is located, is the richest county in the State of Missouri in surplus products, having produced during the year ending July, 1904, a surplus of all products amounting to about $15,000,000, which was about four times the surplus product of any other county in the State of Missouri, except one, and was more than double the surplus produced by that county. The larger portion of this surplus was derived from the zinc and lead mines in and around the city of Joplin. Joplin is only six miles from the eastern line of the State of Kansas and about ten miles north of the Indian Territory. It was first settled in 1870 by native American citizens, and was organized as a city in 1873. The city government is composed of a mayor and city council, who are alternately elected annually; the mayor being elected every two years. There are four railroads entering Joplin at the present time as follows: Missouri Pacific; St. Louis & San Francisco; Missouri Kansas & Texas, and the Kansas City Southern; the Arkansas, Missouri & Kansas Ry. is now under construction and is expected to be in operation during 1905. There are six banks, four of which are State banks, and the other two national banks, all having a combined capital of $400,000, with deposits amounting to $2,500,000 annually. The chief business of the city is zinc and lead mining. There are a number of large foundries and other industries supported by the zinc and lead industry. Joplin has a very fine system of public schools, consisting of a high school and 14 other graded schools. It has a Carnegie public library (cost about $50,000); a United States government building (cost $150,000); a county circuit court-house, a Y. M. C. A. building, and a public hospital, and is well supplied with churches. Pop. (1900) 26,023; (1904 est.) 30,000.

HORACE MERRITT.

Jop'pa. See JAFFA.

Jo'ram, or **Jehoram**, name of two Hebrew kings, one of Israel (851–842 B.C.) and the other of Judah (848–844 B.C.). (1) JEHORAM king of Israel was the second son of Ahab, and succeeded his brother Ahaziah. He revived the worship of Jehovah, and repressed the worship of Baal. He joined with the king of Judah in a war with the Moabites. In his reign Benhadad king of Damascus invaded Israel, and besieged Samaria, but retreated to meet a hostile invasion in his own country. In a battle with Hazan king of Syria Jehoram was wounded and retired to Jezreel, where he was slain by Jehu whom Elisha had anointed king over Israel.

(2) JORAM king of Judah was the son and successor of Jehosaphat and for four years from 848 B.C had a luckless reign. The Edomites revolted in the land and Libna joined them, while Bedouin tribes of Arabia sacked Jerusalem and carried off the wives and son of the king, who died horribly of an intestinal disease, as had been foretold by the prophet Elisha.

Jordaens, Jacob, yä'kōb yōr'däns, Flemish painter: b. Antwerp 19 May 1593; d. there 18 Oct. 1679. From his early boyhood in 1607 he was the pupil of Van Noort, whose daughter he afterward married, and in 1615 was made master in the Guild of St. Luke at Antwerp. He was the most eminent painter of the Flemish school next to Rubens. While he painted religious pictures his strength lies in his humorous delineations of popular life. These spirited, genial and lifelike genres are found in all the principal galleries of Europe. The most renowned among his religious pictures are 'The Last Supper' in the Antwerp Museum; and 'The Martyrdom of St. Apollonia' in the church of the Augustines, Antwerp.

Jordan, Conrad N., American financier: b. New York 20 April 1830; d. there 26 Fed. 1903. He entered a printing office, but soon exchanged this for a banking establishment, was cashier of a New York bank in 1864–80, and in 1880–4 was treasurer of the New York, Ontario and Western railroad. In 1885–7 he was treasurer of the United States, and introduced in the accounts of the treasury a revised

DAVID STARR JORDAN.

PRESIDENT LELAND STANFORD JUNIOR UNIVERSITY

SCENE ON THE JORDAN RIVER.

form of debt and cash statements. He was an organizer of the Western National Bank of New York and for a time its president. In 1893 at the recommendation of all important New York banks, he was appointed assistant United States treasurer in New York, and this post he held until his death.

Jordan, David Starr, American college president and naturalist: b. Gainesville, N. Y., 19 Jan. 1851. He was graduated from Cornell University in 1872 and was instructor in botany there 1871–2. He was professor of natural history at Lombard University, Ill., 1872–3, and taught the same subject in the Indianapolis High School, 1874–5. From 1875 to 1879 he was professor of biology at Butler University, Indianapolis; professor of zoology at Indiana University 1879–85, and president of the last named institution, 1885–91. Since 1891 he has been president of Leland Stanford Junior University. Beside innumerable scientific monographs and reports, among which may be named 'Synopsis of the Fishes of North America' with C. H. Gilbert (1882); enlarged in 1896 with title 'Check List of the Fishes and Fish-Like Vertebrates of North and Middle America'; and 'Report of Fur Seal Investigations'; he has published 'Science Sketches' (1896); 'Footnotes to Evolution' (1898); 'Imperial Democracy' (1899); etc. He was president of the California Academy of Sciences 1896–8 and 1901–3, and has been commissioner in charge of the United States Fish Commission investigations in the Pacific Ocean from 1901, and of the salmon investigations for Alaska from 1903.

Jordan, Elizabeth Garver, American journalist: b. Milwaukee, Wis., 9 May 1867. She is editor of 'Harper's Bazaar' and has published 'Tales of the City Room' (1898).

Jordan, Jules, American composer: b. Willimantic, Conn., 10 Nov. 1850. He is the author of several cantatas, including 'Barbara Frietchie' and 'Wind Swept Wheat'; and many sacred and secular songs.

Jordan, Thomas, American soldier: b. Luray, Va., 30 Sept. 1819; d. New York 27 Nov. 1895. He was graduated from West Point in 1840; and distinguishing himself in the Mexican War, was promoted captain in March 1847. He was stationed on the Pacific coast in 1856–60, during which time he introduced steam navigation above the Dalles, on the Columbia River. He served in the Confederate army during the Civil War and was promoted brigadier-general for gallantry at the battle of Shiloh. In 1869 he went to Cuba, where he was made chief of the general staff of the insurgent army and soon afterward commander-in-chief of the revolutionists, winning a battle at Guarmaro, in January 1870. In the following year he resigned and settled in New York, where he became editor of 'The Financial and Mining Record.' He published 'Campaigns of Lieutenant-General Forrest' (with J. B. Pryor, 1868).

Jordan, William George, American journalist: b. New York 6 March 1864. He was graduated at the College of the City of New York; and became managing editor of the 'Ladies' Home Journal' in 1897, and was editor of 'The Saturday Evening Post' in 1898–9. He has published 'Mental Training by Analysis, Law and Analogy'; 'Mental Training a Remedy for Education'; 'The Kingship of Self Control'; and 'The Majesty of Calmness.'

Jordan, the largest river of Palestine, and one of the most celebrated in the world. It rises from three main sources at the foot of Hermon, and these upper streams unite in Lake Hulch, the ancient Waters of Merom. From this point it sinks with a rapid current in a narrow rocky bed below the level of the sea, and falls after a course of 9 miles into the Lake of Galilee. Shortly after leaving the south end of this lake it enters a broad valley called by the Arabs Ghôr, and in the Bible "the plain"; and continuing a singularly crooked course of about 65 miles direct distance, or 200 including windings, falls into the north end of the Dead Sea, having received the Zerka or Jabbok and numerous smaller affluents. The Ghôr expands at Bethlehem and Jericho into a wide plain, but elsewhere is from three to five miles across. The upper part of the valley of the Jordan is hilly, arid, and barren, but it becomes more level and fertile as it approaches the Zerka. The river is muddy and full of small fish. In the dry season it is shallow, with an average width of from 30 to 50 yards. At its mouth it is about 180 yards broad and about 3 feet deep. It is subject to great inundations during the winter season. The valley of the Jordan forms one of the most remarkable depressions in the world, the Dead Sea being 1,312 feet below sea-level, and the total fall of the river being about 2,300 feet.

Consult: 'Official Report' (Washington, 1852); 'Survey of Western Palestine' (London, 1859); Smith, 'Historical Geography of the Holy Land'; Molyneux (in the 'Journal' of the Royal Geographic Society 1848); Lynch, 'Narrative of the United States Expedition to the River Jordan and the Dead Sea' (1849); McGregor, 'Rob Roy on the Jordan' (1870); Costello, 'Gospel Story'; Macmillan, 'Guide to Palestine and Egypt'; Thomas, 'Two Years in Palestine.'

Jorullo, hō-rool'yō, a volcano of Mexico in the State of Michoacan, 160 miles southwest of Mexico, and 80 miles from the Pacific. The district had continued undisturbed from the discovery of the New World when, in June 1759, earthquakes occurred, followed 29 September by one more violent. On the line of a chasm which was made, six volcanic cones were formed, the loftiest, Jorullo, 1,600 feet above the plain. The total height of the volcano above the sea is 4,265 feet. It shows but few signs of activity at present.

Joseffy, yō-sĕf'ĭ, **Rafael,** Hungarian-American pianist: b. Miskolcz, Hungary, 1853. He was a pupil of Moscheles at the Leipsic Conservatory and of Tausig at Berlin, won distinction in a concert tour of Holland and Germany, and later appeared with large success throughout Europe and the United States. For several years he was a professor in the National Conservatory at New York, where he resided from about 1880. As a virtuoso he evinces great facility and technical finish, and won particular recognition through his interpretations of Chopin. His compositions include: 'Ungarisches Album' (6 works for pianoforte); 'Die Mühle' (op. 23); a 'Marche Turque'; and 'Concert-Studien nach Chopin.'

Joseph, Saint, the husband of Mary the mother of Jesus Christ, was a descendant of the

house of David, born at Bethlehem, but resident at Nazareth, where he practised the trade of a carpenter. Tradition and art represent him as an old man at the time of Christ's birth and he is said to have died before the beginning of Christ's public ministry. His day in the Roman Catholic calendar is 19 March.

Joseph, a son of the patriarch Jacob by his favorite wife Rachel. His father's preference for him and his own relation of dreams which predicted his future exaltation above those of his household drew upon him the envy of his brothers, who sold him to Ishmaelitish and Midianite slave-dealers, by whom he was sold to Potiphar, a captain of the guard in Egypt. The story of his condemnation to prison on the false accusation of Potiphar's wife, of his release and subsequent elevation to the position of vice-regent of Egypt and the final settlement there of his father and brothers is related in the Book of Genesis. Authorities still differ as to the period in Egyptian history to which Joseph's life belongs, but the majority agree in placing it under the Hyksos or shepherd kings.

Joseph of Arimathæa, member of the Jewish Sanhedrim, who believed in Jesus, but had not the courage to make profession of faith. He was born in Rathaim, a city of Benjamin, near Lydda. After the crucifixion he went to Pilate, begged the body of Jesus, wound it in fine linen and buried it in his own new tomb. According to tradition he came as apostle to Glastonbury, England. His day is 17 March in the Roman Catholic calendar, and 31 July in the Greek Church.

Joseph I., emperor of Germany: b. Vienna 26 July 1678; d. 17 April 1711. He succeeded his father, Leopold I., and was employed for nearly the whole of his reign in war. With England and Holland he continued the war against France, to seat the Archduke Charles on the throne of Spain. The great victories gained by the allies under Marlborough in the Low Countries, and Prince Eugene on the Rhine, made the reign of Joseph especially noteworthy. He was equally triumphant in Italy and Hungary; in the latter kingdom driving the revolted Bagotski from the country, and forcing him to seek safety in Turkey; while in the Italian peninsula, great cities from Mantua to Genoa were laid under heavy contributions.

Joseph II., German emperor, son of Francis I. and Maria Theresa: b. Vienna 13 March 1741; d. there 20 Feb. 1790. He was elected king of the Romans in 1764, and on the death of his father, 1765, German emperor. His mother declared him co-regent in the hereditary states of the house of Austria, and gave him the command of the army; but the real authority remained in her hands. In the earlier part of his reign he employed his time in traveling and becoming acquainted with his states. In 1780 Joseph came into the possession of full dominion over his hereditary states. He allowed a greater freedom of the press, put an end to the connection between Rome and the religious orders, diminished the pensions, placed the Jews on a better footing, abolished bondage, suppressed all nunneries, and many monasteries, particularly those of the purely contemplative orders. All branches of the government, public education, the police, and the peasantry, were reformed. By a new code of laws capital punishments were abolished. On 9 Feb. 1788 he declared war against the Turks. By the defeat at Lugos (20 Sept. 1788) the army was obliged to retreat, but in the following year fortune favored the Austrian arms, and Belgrade surrendered. With the tax law, introduced in November 1789, nobility and peasantry showed themselves equally dissatisfied, and the signal was given for open rebellion. The Netherlands declared themselves independent, and expelled the imperial forces from all the provinces, and Luxemburg alone remained in the possession of the imperial troops. The Hungarians also rebelled, and demanded the restoration of their ancient rights and constitution. Joseph, in January, 1790, declared all the acts of his government in that country revoked, even to the edict of toleration (22 June, 1781). Joseph was a man of considerable ability, but arbitrary and despotic. Whatever his own reflections or his knowledge of other countries showed to be useful, he wished to introduce. But he did not sufficiently consider that he had to do with men who would not see things in the same light as himself; and that long habit rendered it difficult to change, at once, usages sanctified by time. Being a freethinker he often grossly overrode the rights of the Church. Consult Gross-Hoffinger, 'Lebens- und Regierungs-Geschichte Josephs II.' (1835–7); Brunner, 'Joseph II.' (1885); Schlitter, 'Pius VI. und Joseph II.' (1894).

Josephine (Fr. zhō-zĕ-fēn), empress of the French: b. Trois Islets, Martinique, 24 June 1763; d. Malmaison, near Paris, 29 May 1814. She was the daughter of Lieutenant Tascher de la Pagerie, and was married in 1779 to Vicomte Alexandre Beauharnais, by whom she had two children, Eugène and Hortense. In 1794 her husband, who had been commander of the army of the Rhine, was executed by order of the Convention. She herself had a narrow escape, having been included in the list of proscription. After the fall of Robespierre she paid a visit to Napoleon to thank him for restoring the sword of her husband, and so pleased him that he soon after married her (1796). When Napoleon became emperor in 1804 she was crowned with him. But the fact that the union was childless stood in the way of Napoleon's ambition to become the founder of a dynasty, and accordingly in 1809 Josephine was divorced, retiring to her seat of Malmaison, with the title of empress-queen-dowager and an annual grant of two million francs. Consult: Aubenas, 'Histoire de l'Impératrice Josephine' (1859); Welschinger, 'Le Divorce de Napoléon I.' (1889); Ober, 'Josephine, Empress of the French' (1901).

Josephus, jō-sē'fus, **Flavius** (Jewish name, JOSEPH BEN MATTHIAS), Jewish historian: b. Jerusalem 37 A.D.; d. about 95 A.D. He was carefully educated and in 64 A.D. he made a journey to Rome. On his return he found his countrymen preparing to throw off the Roman yoke, and having tried in vain to persuade them of the hopelessness of such a struggle, accepted the post of defending the province of Galilee, and actually held the fortified town of Jotapata against the whole Roman army for 47 days. He was captured at the fall of the city, was afterward present in the Roman army at the destruction of Jerusalem (70 A.D.), and went with Titus to Rome, where, assuming the family name

of his patron, Flavius, he lived in learned leisure. Here he wrote (in Greek) 'The History of the Jewish War' and 'The Antiquities of the Jews,' giving a history of the Jews from the earliest times to the reign of Nero.

Josh Billings. See SHAW, HENRY WHEELER.

Joshua, the leader of the Israelites after the death of Moses. He was the son of Nun, of the tribe of Ephraim, and upon him fell the task of conducting the people over the Jordan, and commanding their armies in battle against the heathen they were ordained to dispossess. He succeeded in ravaging a large portion of Palestine, and dividing it among the people. He died at the age of 110 and was buried at Timnath-Serah, in Mount Ephraim.

Joshua, Book of, a historical book of the Old Testament, sometimes classified as the last division of a Hexateuch, and containing an account of Joshua's leadership in Israel from the death of Moses until his own death. While it has many resemblances in style and arrangement to the Pentateuch, or first five books of Moses, it must have been early separated from them, if ever it was included in the same series, for the Samaritans, though they have had the Pentateuch since the 8th century before Christ, have never acknowledged the Book of Joshua. The contents of the book may be divided into three parts: the conquest of Canaan; the partition of the land among the 12 tribes; and the parting address made by Joshua to the assembled people. The first part is a narrative of the manner in which Joshua prepared to cross the Jordan at the head of the Israelites. The miraculous passage of the Jordan is accomplished, circumcision is performed, and the Passover observed on the soil of the Promised Land. Jericho and Ai are captured; the covenant confirmed at Ebal and Gerizim; the Gibeonites secure a treaty of peace through guile. The decisive battle of Bethhoron ends in the rout of the leagued kings. The second part is topographical and statistical, gives a general view of the land, with some account of its apportionment, and the setting aside of the Cities of Refuge. The third and concluding section is in the style of Deuteronomy. The people are exhorted to remain faithful to Jehovah, to eschew idolatry, and at Shechem, to which place the bones of Joseph had been brought, the covenant is renewed. The death and burial of Joshua and Eleazar make up a narrative which closes the book.

Josiah, king of Judah. He succeeded his father Amon (638 B.C.). He is said in the Scriptures to have done "that which was right in the sight of the Lord." He took an active part in the reform of temple worship, and in the abolition of idolatry throughout the land, and commenced the restoration of the temple, during the progress of which the high-priest Hilkiah discovered the book of the law, that is, the book of Deuteronomy. In his 30th year he marched out against Pharaoh Necho, king of Egypt, who was on his way to attack the kingdom of Assyria. Josiah was slain in the battle at Megiddo where he had attempted to check the northward march of the Egyptians.

Josiah Allen's Wife. See HOLLEY, MARIETTA.

Joss, the penates of the Chinese; every family has its joss. A temple is called a joss house. The joss is an idol, usually of wood and decorated in colors, mostly in gold and red. There are three large joss houses in San Francisco, one in Chicago and two in New York. A Chinese upon entering the presence of a joss falls upon his knees, and touches his forehead thrice upon the floor, as a preliminary of worshipping the joss. See CHINESE; IDOLATRY; IMAGE WORSHIP.

Jo'tham, king of Israel and Judah, who succeeded (735 B.C.) Uzziah, his father. He ascended the throne at the age of 25 and reigned 16 years.

Joubert, yow'bĕrt, **Petrus Jacobus,** Boer military officer: b. Cape Colony 1831; d. Pretoria 27 March 1900. After an elementary education he settled as a farmer in the Wakkerstroom district of the Transvaal, about 1863 was elected for that district to the Volksraad, and in 1870 became attorney-general of the South African Republic. During the visit of President Burgers to Europe in 1874 he was acting president. In 1880 he became commander-in-chief of the Boer forces at the outbreak of the war with England, and three times defeated the British, at Laing's Nek, Ingogo, and Majuba Hill, the last battle (27 Feb. 1881) deciding the war in favor of the Boers. He was again acting president during the absence of President Kruger in Europe in 1883–4. He twice unsuccessfully contested the presidency with Kruger, the vote being 7,881 to 7,009 in 1893 and 12,858 to 2,001 in 1898. In the second Boer war also he was commandant-general, and directed the campaign in northern Natal which resulted in a succession of disasters for the British. He became ill early in 1900, however, and was obliged to withdraw from active service. He was the ablest of the Boer military leaders.

Jouett, jow'ĕt, **James Edward,** American naval officer: b. Lexington, Ky., 27 Feb. 1828; d. Sandy Spring, Md., 1 Oct. 1902. He entered the navy in 1841, served during the Mexican War, was graduated from the United States Naval Academy in 1847, in 1861 with a detachment of marines entered Galveston harbor and destroyed the Confederate war-vessel Royal Yacht, and for his services was appointed to the command of the United States steamship Montgomery. As lieutenant-commander, he was prominent in Farragut's entrance of Mobile Bay (August 1864), and in 1885, when in command of the North Atlantic squadron he opened the transit across the Isthmus of Panama, closed by the rebels. He was promoted rear-admiral in 1886, subsequently president of the Board of Inspection and Survey, and in 1890 was retired.

Jouffroy d'Abbans, Claude François Dorothée, klōd frăn-swä dō-ro-tā zhoo-frwä däb-băn, MARQUIS DE, French inventor: b. Franche-Comte 30 Sept. 1751; d. Paris 1832. He is claimed by the French as the inventor of steam navigation. He served in the army, and in 1783 succeeded in propelling a small paddle-wheel steamboat up the Rhone at Lyons — the connection between piston and paddle-wheel axle being rack-and-pinion.

Joule, James Prescott, English physicist: b. Salford, Lancashire, 24 Dec. 1818; d. Sale, Cheshire, 11 Oct. 1889. He was chiefly his own educator, but received special instruction in

physics from John Dalton (q.v.). While associated in business with his father, a brewer, he early developed an enthusiasm for original scientific research, and described in the 'Annals of Electricity' (January 1838) an electromagnetic engine he had invented. While it was afterward found that this invention was impracticable as a substitute for the steam-engine, the further investigation to which it led brought to light many important facts concerning the laws of heat, its electrical and mechanical nature and evolution, chemical affinity as related to heat, etc. The mechanical equivalent of heat (see HEAT) was first ascertained by Joule, who also, in 1847, announced the doctrine of the correlation and conservation of energy, in a paper read at Manchester which failed at the time to impress men of science, as did also an address of like import before the British Association, but which was taken up by William Thomson (Lord Kelvin), by whom its momentous significance was brought home to the scientific world. No principle of science is now more fully established than Joule's law for determining the energy developed by an electric current in overcoming the resistance of a circuit, a law which he verified by experiment. He received the highest honors of scientific bodies and universities, and in 1873 was made president of the British Asociation for the Advancement of Science. His writings are to be found mainly in the proceedings of scientific societies and in English periodicals, but in 1885 and 1887 appeared, in two volumes, his 'Scientific Papers.'

Journalism. Journalism is a comprehensive term which signifies the business of producing a public journal. In a general way it is applied to the vocation of making newspapers. Broadly speaking it is both a business and a profession, though the name of journalist as commonly understood is limited to those who are engaged on the editorial or news or literary side of the production rather than on the business side. While editor and journalist are not strictly synonymous — the former meaning the head of a paper or a department and the latter any literary worker on a newspaper — they are often used as convertible terms.

In a large sense the subject involves the functions of journalism as collector and purveyor of news and as leader and exponent of public opinion; the ethics of journalism in its various fields of political, religious, literary, social and commercial aim and representation; the relations of the counting room to the editorial department; the training and qualifications of the journalist; in short, the mission, methods, responsibilities and obligations of journalism. All of these general phases are deeply affected by the physical conditions of the business. Within the last twenty-five years these conditions have been practically revolutionized. In the mechanical facilities of production, in the cheapening of white paper and in the instrumentalities of news collection there has been an extraordinary advance. This great change in the material factors has wrought a corresponding change in the scope and character of journalism. Not only as a business enterprise but as a public influence it takes on new aspects.

The remarkable development of later years touches every side of the material production of a newspaper. The old, limited, slow-moving printing press has been transformed into the ingenious and gigantic quadruple or octuple which converts the plain white roll into complete, folded papers, at the rate of thirty to forty thousand an hour. The number of pages may be determined at will, even at the last moment before going to press, thus responding to the exigencies of the news; and the application of the half tone and of color at undiminished speed permits pictorial effects. Simultaneously with this improvement in the printing press has come the linotype which substitutes machine type setting for hand composition. A third vital advance has been the perfection of the process of making paper out of wood-pulp which has vastly increased the supply and greatly decreased the cost of white paper.

These radical changes in the elemental business factors have largely modified the conditions of journalism. They have opened the way to unlimited production and have enormously cheapened the cost of the single copy. Penny and two-cent papers have become the prevailing rule. Immense circulations have thus been rendered possible, and where twenty-five years ago the edition even of the most widely read papers was comparatively limited, not a few now issue scores and even hundreds of thousands of copies a day. At the same time the initial cost of the newspaper plant with its expensive machinery and the magnitude of the daily transactions require a far larger outlay than in the earlier time and the business has come to be one demanding much greater capital.

All of these circumstances have inevitably and powerfully moulded the course and character of journalism. They have given increased importance to its business side, and have tended to make business considerations in the publication still more dominant. The effect has been two-fold and somewhat contradictory. The great capabilities of the business with the reduced cost of telegraphing have stimulated and quickened journalistic enterprise and have broadened the range of the journalistic field. The scope of journalism has been enlarged and in many cases its standard has been elevated. Within a sphere, perhaps too limited, the best and worthiest effort is accepted as the best business. But, on the other hand, the competition for great circulations has bred sensationalism and a pandering to the taste for personal and piquant matters. There is an eager and feverish struggle for the unusual, the dramatic and the spectacular, a constant straining for effect, a lavishness of "scareheads" and garish pictures, a studied and persistent search for objects of criticism and attack. The appetite for the effervescent grows by what it feeds on, and must be met by new excitation. This rivalry of explosive and paroxysmal journalism is carried on with too little sense of responsibility and verification, and while the notable manifestations are exceptional, and it would not be just to say that the infection has extended through journalism, it is nevertheless true that its injurious influence is widely perceptible.

In one important and conspicuous respect the development of journalism as a business has palpably improved its character. It has produced a greater degree of independence than

ever distinguished it before. In the earlier days political and official advertising might be a large item in the income of a newspaper. Its monetary value gave it potency in controlling editorial policy. But in the expansion of the business under modern conditions official patronage is unimportant compared with general commercial advertising, and its relative decline in value has greatly reduced its power of influencing newspaper expression. The favor of the public is far more advantageous than that of the party manager. It brings popular circulation and consequently business advertising, and there is less concern about the crumbs that fall from the official table. Even party journalism has greatly advanced in independence. While standing as the recognized exponents of party principles and policies the important party papers have become much more free in their judgment of men, methods and measures. A more critical standard is applied and a more rigorous public accountability is enforced under which there has been a visible improvement in general civic administration.

Under the same influences distinctive independent journalism has increased. It professes to have no connection with any party and disclaims a representative party position. Its theory is that it addresses itself not to party sentiment but to independent public judgment, and its claim for support is based on its journalistic quality without regard to political association. It is the extraordinary advance of newspaper-making as a business that has rendered independent journalism on a large scale possible. A quarter of a century ago it would have been difficult to name more than two or three important examples in the United States. Now there are many conspicuous and successful papers which are thus classed, and even more significant of the change in journalism is the greater independence of the party journals already referred to. Indeed, in essential independence, which consists of free judgment and candid expression on public questions, the line of demarcation between the better class of party papers and the professedly independent papers is scarcely perceptible and it would be hard to distinguish between them.

There has been a signal advance in other directions. Against the false and meretricious tendencies to sensationalism which have been indicated must be placed a higher and broader treatment of all the varied interests of life. In news collection the journalism of to-day is as much ahead of that of 25 years ago as the railroad express is ahead of the stage coach. It spares no expense, reaches everywhere, sends its correspondents to all parts of the world, employs the best experts and specialists, caters equally to the lover of literature and the lover of sports, keeps pace with scientific discovery and development, rivals the best periodicals in commanding the most famous writers and artists, makes its own special missions of public service, reports all business, social, educational, philanthropic and religious movements, and, in short, treats whatever concerns mankind as within its boundless domain. Its range, enterprise and comprehensiveness are a constant marvel. With all its faults the breadth, fullness and accuracy which are combined with so much celerity of action attest a thoroughness of organization and extent of resources never before equalled.

There are marked differences, however, in its development in different lands. Continental journalism in Europe is of a type quite distinct from English journalism, and that again is unlike American. In Paris the news is not the conspicuous feature of the newspapers. It holds a subordinate place and is limited in its quantity. Literary and dramatic criticism and political discussion command the first rank, and the feuilleton is a popular and important part. Literary excellence with a flavor of characteristic French wit is the dominant trait. The Parisian type with variations, generally soberer and heavier, is the prevailing continental model. English journalism is weightier and more enterprising in news. It covers the field of international politics and war with special thoroughness. It lacks the variety and vivacity of American newspapers, but within its chosen and more limited range it is more complete. Its reports of parliamentary proceedings and of important political, social and scientific meetings are copious and intelligent, and its discussions are distinguished by sobriety and information.

In life, spirit, minuteness of news gleaning, emphasis of display, and preponderance of personal flavor American journalism far outstrips all others. It does not surpass, oftentimes does not equal, British journalism in the presentation of great events, but in the multiplicity of its news of all sorts not only from its own country, but from all the world, there is no approach to it elsewhere. Its dominant tone is a light and airy freedom. There is a manifest tendency even on the part of the most respectable newspapers to avoid being heavy. The general aim is to be breezy, pungent and picturesque, and this often leads to the flippancy which is remarked in American papers. Perhaps the public taste which is thus indicated and cultivated will serve to explain in part why there are no serious and masterful weekly journals of literary and political discussion in the United States like the 'Spectator' and the 'Saturday Review,' and why even the monthly periodicals run chiefly to fiction and light matter. There are excellent trade journals of a high grade, showing a demand for the searching and careful treatment of special interests, but outside of these immediate respresentatives of the stupendous material enterprises of the land, the trend is towards the lighter vein.

Somewhat analogous is the explanation of the fact that journalism has grown more impersonal in its sources and impress. It is no longer distinguished by the great overshadowing personalities which marked it a generation ago. No editorial chief puts his individual stamp on a paper as Horace Greeley did, with his controversial power, his moral earnestness and his incisive force, which seemed to make the whole paper breathe his spirit and speak his voice. There are no successors to Raymond, Bennett, Weed, Bowles, and Dana. Henry Watterson is perhaps the only survivor of the old school of journalists. The difference is due, however, not so much to the lack of men as to the change of conditions. In its immeasurably wider range and larger demands the great journal of to-day is the product of no single mind, but of a vast organization and of a whole galaxy of stars. The elder journalism was largely political

pamphleteering. The later journalism is the complete mirror of daily life, and no individual throws so great a shadow across its comprehensive face.

It is a question much mooted whether journalism has declined in influence. It never was as universally read as now; it never was so much a common practice to read several newspapers; and whether in this multiplicity of reading and frequent contrariety of representation as serious an impression is made as when the appeal was more earnest and less divided may well be doubted. The editorial page has not actually fallen off in interest and importance; on the contrary, it is all in all better written, more varied and more instructive than when it had more of a polemic character. But in the broad development and great advance of the news departments the editorial page has receded in relative importance, and the drift to the light treatment of topics has tended to detract from its distinct and superior position. The greater absorption of the public mind in multiplied interests operates in the same direction. In the stress of modern business life and in the variety of diversions the body of readers have less time to follow public discussion. If it be true, as it often is, that the favorite journal does the thinking for its readers on current questions, it is equally true that many of the questions take less hold than when life was more simple and feeling more tense. When the press is in substantial accord on any public matter, except where party tradition rules, it generally carries the public judgment, and united expression makes it invincible; but when there is a discord of journalistic voices little heed is apt to be paid to any. The power of the press in its aggregate force, in the sweep of its activities and in a certain apprehension of its publicity, has steadily augmented; but at the same time the impression that it is too intrusive, too little restrained, too little governed by a just sense of responsibility, has grown and has impaired the influence it would otherwise exert.

It remains true, however, and probably grows more true with the decadence of other influences, that the press is the most effective force in protecting the moral and social well-being of the community. It is the belief of many observers that under our modern conditions the weight of mere authority is declining. In the intense strife and eagerness of the times the efficacy of the old standards in enforcing true principles and restraining wrongdoing grows weaker. With this advance of individual assertion and independence the power of public opinion is becoming the surest defence of social and business morality. The blaze of publicity gives a protection which nothing else furnishes. In the financial and social world there is a wide margin along the shadowy and undefined line between law and lawlessness, between ethical duty and questionable interest, where the search-light of exposure is the only security. Much would be done under cover of darkness which fears the light. Despite a freedom which often degenerates into license the press is thus recognized not only as the most effective safeguard against political and administrative debauchery but as the best bulwark against that social and business misconduct which becomes a public offence.

The relation of the counting-room to the editorial department involves both the business and the ethics of journalism. The business side cannot be disregarded. In its ultimate purpose it is a commercial proposition. Newspapers are published to make money. The counting-room considers both income and outgo. It adjusts expenditures to receipts. It properly studies to augment revenue in every legitimate way. But while newspapers are business enterprises they are such with recognized limitations and obligations. They are not simply business undertakings but public representatives, and the former object, while consistent with the latter, is subordinate to it. The foundation of the newspaper is the confidence of the public. It is the history of yesterday and the interpreter and teacher of to-day. In the very nature of the relation it assumes distinct obligations. It is bound to give the news and to treat public questions in absolute good faith. The counting-room is warranted in doing business in every way compatible with the fulfillment of that duty, but in all legitimate journalism it is a fundamental rule that editorial opinion and news publication must be beyond the reach of any questionable influence. The editorial department must be entirely free from commercialism. Public confidence and moral power depend on full faith that editorial and news conduct is honest, fearless and upright. The publication of a newspaper, like any other enterprise, is founded on business principles; its sphere or field of operations, whether general, political, literary or other, is chosen; the relation of counting room and editorial room in organizing and maintaining it on a sound business basis is of the most intimate character; but when the general lines of the enterprise are determined, the independence and integrity of the editorial management and fidelity to its declared aim as a public representative within its chosen sphere are absolutely indispensable. This rule lies at the foundation of the whole ethical code of journalism.

The question of the training and qualifications of the journalist has assumed new interest and importance both through the general growth of the profession and through special movements for its advancement. Schools or chairs of journalism have been established in a few instances and in a limited way, and the munificent endowment by Mr. Pulitzer of a College of Journalism in Columbia University — the first large and distinct project of the kind — has presented the proposition in a practical and definite form. There are two systems of thought on the subject. The first holds that the best and most efficient school of journalism is the newspaper office. It believes that the true journalist is born, not made; that knack, aptitude, native talent, the sense of news and proportion lie at the foundation of success; and that the most useful training is that of actual experience. It does not dispute that broad education and culture are essential to the journalist, and recognizes that particular studies, like history, political economy, the fundamentals of law, social science, and kindred matters, may be followed with special advantage. But it urges that these may be gathered from the general college course, and that the college or university has no distinctive professional knowledge to teach journalists in the special sense that it has to teach lawyers or physicians. The technical-

ities of the newspaper art — a suitable style, phonography, proof reading, the treatment of news and the like — are best acquired in practice, and the rest is the quickest and surest application of knowledge which is power, and of instinct or intuition which in dealing with public intelligence and currents is no less power, to the activities of the world.

The other system of opinion is represented in the scheme and scope of Mr. Pulitzer's College of Journalism. It is based on the theory that the journalist can be prepared for his vocation, like the lawyer, by a special course of study adapted to its requirements. Its aim and its tendency are to elevate and dignify the profession, and to establish a higher standard both of obligation and of performance. It seeks to teach not merely the technical necessities in newspaper-making but the true ideals of public service to which the newspaper should be dedicated, and the wide range of knowledge with which the journalist should be equipped. This includes style, ethics, law, literature, history, sociology, statistics, and particularly the principles and methods of journalism. It embraces an examination and comparison of existing newspapers by experts, an exposition of the functions of editor, correspondent and reporter, and the production of an experimental journal under the necessary limitations with its practical application of the instruction. In its main features this plan is an enlargement of the ordinary academic course directed to a particular end, and it is claimed that the establishment of such a college with liberal endowment would not only provide a large body of trained journalists but would set a standard for the profession.

On the whole, notwithstanding the faults of the "new journalism," the position of the press in the public estimate is increasing. One evidence of this truth is the more liberal character of libel legislation. In some States the greater license has prompted efforts at more restrictive measures, but the general trend of legislation has been toward reasonable liberality with just accountability. The prevailing movement has been to provide reparation for any wrong or injury that may be done, to assure just restitution for actual damages, but not to permit punitive damages or trammel the free expression of opinion. Journalism is advancing and is acquiring a higher position and recognition as a distinct profession. With the enlightened spirit of the age and with the marvellous agencies of instant and united expression the power of public opinion steadily grows, and the journalist is its medium and prophet. See American Newspapers; Periodical Literature.

Charles Emory Smith,
Editor 'The Press,' Philadelphia

Journalism, School of, a college of journalism, endowed by a gift of $2,000,000 by Joseph Pulitzer, editor and proprietor of the New York *World,* to Columbia University, New York, in 1903. With the advance of civilization and general culture and intelligence the demands upon the journalists of the present day are constantly becoming greater and this college is the recognition of the importance and place of journalism as a profession, and a practical endeavor to equip those who adopt it, by a course of thorough instruction for its exacting and laborious duties. Mr. Pulitzer considers the creation and rendering effective of public opinion (see Public Opinion, Power of) a task of which the press alone is capable of successfully accomplishing. The College of Journalism will therefore be a means to an end — to raise the character and standing of journalism, to increase its power and prestige, and to attract to the profession men of the highest capacity and the loftiest ideals, who, because of special training, will advance the professional to a higher standard of thought and action. This school is the first institution of the kind in the world. See Journalism.

Joveite, jōv'īt, is a nitro-substitution explosive used in blasting, and as charges for high-explosive shells, which was invented by J. E. Blomen, Washington, D. C. It consists of nitro-naphthalenes 6 to 8 per cent, nitro-phenols, 16 to 30 per cent, and nitrate of soda 64 to 76 per cent. It is made by melting the nitro-naphthalenes in a steam-jacketed kettle, adding the nitro-phenols and continuing the heating until they are melted, and then stirring into this liquid mixture the solid nitrate of soda in a finely ground and perfectly dry condition until each of the solid particles of the nitrate is coated and impregnated with the liquid. On cooling, the particles of the nitrate are protected from deliquescence by the coating of scarcely soluble nitro-substitution compounds, while on explosion, the nitrate causes the reaction to be most complete. For blasting purposes this explosive is used in a granulated condition, but in loading armor-piercing projectiles it is poured into the shell while in the plastic condition and on cooling sets to a hard mass which completely fills the cavity except for a canal in the centre where the fuse is placed. For blasting purposes the explosive is fired by means of a mercuric fulminate detonator, but the charges in shells are fired by means of gunpowder fuses. In tests of the explosive by the United States navy, made at Indian Head, Md., in 1897, a 10-inch Carpenter armor-piercing shell containing 8.25 pounds of joveite, fired with a velocity of 1,860 foot-seconds at a Harveyized nickel-steel armor plate, 14.5 inches thick, passed completely through the plate and burst on the other side. See Explosives.

Jovianus, jō-vī-ā-nŭs, **Flavius Claudius,** Roman emperor: d. Dadastana, Bithynia, 17 Feb. 364 A.D. He was originally captain of the household troops of the emperor Julian, whom he accompanied in the disastrous campaign against the Persians in which Julian lost his life (363 A.D.). After Julian's death he was proclaimed emperor by the troops, but could only extricate his army by ceding to the Persian monarch the five provinces beyond the Tigris. He was succeeded by Valentinianus I.

Jovellanos, hō-vĕl-yā'nōs, **Gaspar Melchior de,** Spanish statesman and writer: b. Gijon, Spain, 5 Jan. 1744; d. Vega, Spain, 27 Nov. 1811. He was educated at the universities of Oviedo, Avila, and Alcalá, became in 1770 a member of the Royal Academy, in 1778 chief justice of the criminal court at Madrid, and in 1780 a member of the council of state. Subsequently he was for a time minister of justice, but in 1801, through the agency of his enemy, Don Manuel Godoy (q.v.), was imprisoned at Majorca. Released at the French invasion (1808),

he joined the patriots, and became a member of the supreme junta. His writings are various, including treatises on political economy, a dissertation on English architecture, a 'Memoir on Law Applied to Agriculture,' the tragedy 'El Pelayo,' and 'El Delincuente Honrado' ('The Honorable Delinquent'), a comedy.

Jow'ett, Benjamin, English scholar and educator: b. Camberwell, London, 1817; d. Oxford 1 Oct. 1893. He studied at Oxford, was ordained in 1842, and became regius professor of Greek in 1855. In 1855 he published a notable commentary on the Epistles of St. Paul. In 1860 he contributed an essay 'On the Interpretation of Scripture' to the celebrated volume 'Essays and Reviews,' for which he was tried on a charge of heresy before the chancellor's court, but was acquitted. In 1870 he became master of Balliol College, and in 1871 published his most important work, a translation of the 'Dialogues of Plato,' of which a fifth edition was issued in 1892. He subsequently published translations of Thucydides (1881) and the 'Politics' of Aristotle (1885). He was vice-chancellor of the university in 1882–6.

Joy, Charles Arad, American chemist: b. Ludlowville, N. Y., 1823. He was educated at Union College and the Harvard Law School, and after a few years spent as professor of chemistry at Union, became in 1857 professor of chemistry at Columbia, where he remained for 20 years. In 1866 he became president of the Lyceum of Natural History and was long one of the editorial staff of the 'Scientific American.'

Joy, George William, English painter: b. Dublin, Ireland, 1844. He was educated at Harrow, and studied art at Kensington, at the Royal Academy, and under Charles Jalabert and Bonnat, at Paris. He has won gold medals at Paris, Munich and Berlin. His principal pictures are 'Domenica'; 'Chess Players'; 'Laodamia'; 'Young Nelson's First Farewell'; 'Wellington at Angers'; 'Prince Charlie and Flora Macdonald'; 'The Death of General Gordon'; 'Princess Alice of Albany' (for Queen Victoria); 'Reverie' (for the New Zealand Government); 'Truth' (German Government); 'Joan of Arc' (bought by French Government); 'Lear and Cordelia'; etc.

Joy, Thomas, American colonist: b. Norfolk, England, 1610; d. Boston 1678. Upon emigrating to America in 1635 he established himself in Boston as an architect and builder, and in 1657 erected the Townhouse of Boston, the earliest civic structure of any note in New England. In 1646 for his share in the 'Child Memorial,' protesting against both the civil and ecclesiastical government of the Bay Colony, he was fined and imprisoned.

Joyce, Robert Dwyer, Irish poet and physician: b. in County Limerick, September 1836; d. Dublin 23 Oct. 1883. In 1866 he came to the United States and practised medicine for several years in Boston, Mass., contributing during that period to the 'Pilot' and other Irish journals. He published 'Ballads, Romances, and Songs' (1872); 'Deirdré,' a much admired epic poem, which appeared anonymously as one of the 'No Name Series' (1876); Legends of the Wars in Ireland' (1868); 'Fireside Stories of Ireland' (1871); 'Blanid,' a poem (1879); 'The Squire of Castleton'; etc.

Joyeuse Entrée, zhwä-yēz ŏn-trā, the name given to the important privileges of the estates of Brabant and Limburg, with Antwerp, which the dukes were obliged to swear to maintain before they were allowed to enter the ducal residence, from which circumstance the name was taken. The most important of these privileges was that the people were released from an allegiance whenever the duke should attempt to violate their rights. So important were these privileges considered that many women went to Brabant to be confined there, that their children might enjoy the rights of a citizen of Brabant.

Joynes, Edward Southey, American educator: b. Accomac County, Va., 2 March 1834. He was educated at the University of Virginia and at Berlin, in 1858 was appointed professor of Greek at William and Mary College, in 1866–75 was professor of modern languages at Washington College (now Washington and Lee University, Lexington, Va.), and subsequently held chairs in Vanderbilt University and the University of Tennessee. In 1882 he became professor of modern languages in South Carolina College (Columbia). He published text-books of French and German, most important of which is the 'Joynes-Meissner German Grammar' (1887).

Juan Fernandez, joo'ăn fĕr-năn'dēz (Sp. hoo-ăn' fĕr-năn'dĕth), so called from the name of its discoverer, also sometimes Más-á-Tierra, an island in the South Pacific Ocean, about 350 miles west of the coast of Chile, to which it belongs. It is 12½ miles long and 5 miles broad at the broadest part, mountainous, and of rugged aspect. Parts of it are fertile, producing various kinds of timber, peaches, figs, grapes, cherries, etc. There are excellent fish. The island is inhabited by a few settlers, whose chief occupation is the providing of fresh vegetables, water, and wood for the whaling or other vessels that call here. Defoe is said to have founded his 'Robinson Crusoe' on the history of the solitary residence here for over four years (1704–9) of a Scotch sailor, Alexander Selkirk.

Juan de Fuca, joo'ăn dĕ fū'kă (Sp. hoo-ăn' dā foo'kä), **Strait of,** an ocean passage between the State of Washington and Vancouver Island. It connects the Pacific with the Strait of Georgia on the north and Puget Sound on the south. It is 100 miles long and about 15 miles wide. It contains several islands, some of which were at one time in dispute between the United States and Great Britain.

Juarez, Benito Pablo, bā-nē'tō păb'lō hoo-ä'rĕth, Mexican statesman: b. San Pueblo Guelatao, Oajaca, 21 March 1806; d. Mexico 18 July 1872. He was admitted to the bar in 1834; became a judge of the civil court in 1842; in 1847–52 was governor of the state of Oajaca, in which post he greatly improved provincial conditions; and after a period of exile (1853–5) joined the revolutionists under Alvarez, by whom he was later made minister of justice and ecclesiastical affairs. In 1855 he was appointed provisional governor of Oajaca by Comonfort, the successor of Alvarez, and in 1857 elected constitutional governor. He was made secretary of the interior and chief justice in the latter

year (the office of chief justice being by the constitution the equivalent of a vice-presidency), and when Comonfort was driven from power (1858), duly succeeded to the presidency, was recognized by the Mexican states and the United States, but was opposed by the conservatives in a long civil war, and did not enter Mexico City until 11 Jan. 1861. In March he was elected president for a four-years' term. The bankrupt government published a decree suspending for two years the payment on the foreign debt, and an alliance of intervention was at once entered into by England, Spain, and France. On Juarez' agreement to protect the interests of foreign debtors, the English and Spanish troops evacuated the country, but France proceeded to a war of conquest. Juarez was driven to the extreme north and Maximilian assumed imperial power. Upon the interference of the United States, however, the French troops were withdrawn in 1867, and in the same year Maximilian was executed and Juarez elected president. He was re-elected in 1871. His vigorous and liberal policy was of great benefit to the nation, and he has sometimes been called the "Mexican Washington." Consult Baz, 'Vida de Benito Juarez' (1874); and the 'Life' by Burke (1894).

Juarez Celman, Miguel, mē-gĕl' hoo-ā'rĕth sāl-mān', Argentine statesman: b. Cordoba, Argentina, 29 Sept. 1844. He was graduated from the university of Cordoba in 1870 and after holding several political posts became governor of his province of Cordoba, and in 1884 a senator in the national Congress. In 1886 he was chosen president and the speculation rife during his administration, as well as the inflation of the currency and the magnitude of the public works undertaken at this time, induced a financial panic in 1890. The Celman administration was held responsible for this disaster and the president himself charged with having amassed a fortune from sums known to have been taken from the treasury. The cabinet resigned, but revolt broke out in Buenos Ayres 26 July 1890, and fighting in the streets continued for several days. On 6 August, however, the president resigned and the vice-president, Pellegrini, assumed his duties for the remainder of the term.

Juba (joo'bä) **Islands.** See DUNDAS ISLANDS.

Juba River, in eastern Africa, a large stream which flows into the Indian Ocean at about lat. 0° 5′ S. Its mouth marks the north boundary of the coast placed under British control by the agreement with Germany in 1890. The river has been explored to beyond lat. 3° N., and Cecchi identifies the Umo as its upper waters; so that it probably takes its rise in the same mountains as the feeders of the Nile.

Jubal, joo'bal, or **Jabal,** son of Lamech and Adah. According to Genesis iv. 21, the inventor of the reed-flute and harp or lyre, and the father, or predecessor, of all them who play upon such instruments, that is, the discoverer of musical science.

Ju'bilee, an observance among the Jews which recurred every fiftieth year; the land was to rest, as in sabbatical years; land and houses in the open country and in unwalled villages reverted to their original owners or the heirs of such; all slaves were to go free. The law as a whole was distinctly theocratic; it vindicated the absolutism of Jehovah; it meant that Hebrews were the servants of Him, and could not therefore continue to be the slaves of their fellow men; the land belonged to Him, and was only lent to the Hebrew tribes and families, who could not therefore be driven out by any human arrangement.

In the Roman Catholic Church a Jubilee occurs every twenty-fifth year in which the Pope proclaims a remission, from Christmas to Christmas, of the penal consequences of sin, on condition of repentance, restitution and the performance of certain pious works. The first Roman Catholic Jubilee was given in 1300.

Juch, yook, Emma Johanna Antonia, American opera singer: b. Vienna 4 July 1863. She came with her parents to the United States when an infant and was educated in the public schools of New York. She studied singing under Murio-Celli for three years, making her concert début in Chickering Hall, New York, and her operatic début as Felina in 'Mignon' in London 1881. She sang for three seasons in the Mapleson opera company, and under the management of Theodore Thomas in the United States sang the part of Elsa in 'Lohengrin' on alternate nights with Nilsson. She was the prima donna of the American Opera Company for three seasons, and has sung in the Emma Juch English Opera Company and other organizations. She was married in 1894 to Francis L. Wellman, of New York.

Judaism, Reformed, in America finds its roots in the beginning of the Reform movement that took place in Germany in the first quarter of the 19th century. The cause of the religious advance of the Jew in Europe was the breaking up of the Ghetto in the latter half of the 18th century. As long as the Jew was excluded from the world, its culture and its opportunities, he found his greatest comfort in his Hebrew studies and in his religion. The latter developed only along its own narrow lines and was protected from every admixture of foreign elements. The Jew, as it were, built a "fence around the law." When the bars of the Ghetto fell and the Jew was initiated into a new world of thought, language, literature and activity, he found the old religion incongruous with modern life and the rabbinical law too rigid for the new conditions. Reconciliation between the two was difficult. A bitter struggle ensued between the old religion and the new life. A compromise was the only solution. Judaism was equal to the demand. Heartburnings, personalities, domestic schism, often followed in the wake of innovations. The wheels of progress, however, could not be stayed.

Moses Mendelssohn translated parts of the Bible into German and thus opened up a new field of study for the Jew. This was followed by a translation of the Prayer Book into German by David Friedlander. The Talmudic regulations were either openly isolated or interpreted in a liberal spirit. Religious schools for instructing the younger generation in the principles and practices of Judaism as well as in the literature and history of Israel, were instituted and conducted according to modern pedagogical methods. Religious services in many

synagogues were modified, rituals were shortened, objectionable features were omitted, and prayers, sermons and hymns in the vernacular were introduced. Israel Jacobson was the first who successfully established reformed religious schools and services in Germany and later built a Reform Temple at Sessan, which was consecrated 17 July 1810. This Reform movement soon spread to Berlin and Hamburg and before long it reached America and found expression here in 1788 in the city of Charleston in the organization of the "Reform Society" of Israelites, which instituted divine services that consisted of a short ritual with sermons, etc., in English and the abolition of offerings during the divine service. A great ecclesiastical battle resulted and many questions of reform were delayed for several years. An organ was purchased and the system of family pews adopted in spite of much opposition. It may here be mentioned to the everlasting credit of Reformed Judaism, that it instituted family pews and gave to women the right to worship in the same pew with their husband and sons. The practice of the orthodox wing, which still prevails in many congregations, of isolating women in a screened gallery, is both improper and without warrant in this age of enlightenment. Reform differs further from Orthodoxy in the interpretations put upon the Scriptures and the Talmud and the authority with which they are severally credited. Orthodoxy gives to both Scripture and Talmud a binding authority over Jews without regard to circumstances of time and place. Reform seeks to set up a higher standard of authority than merely the literal texts and to find a way of reconciling ancient laws and traditions, if possible, with modern requirements. The usual custom of Reformers is to be reasonable and to discriminate between the essentials and the non-essentials of Judaism. Reformed Judaism has discarded belief in bodily resurrection, in the coming of a personal Messiah, in the national restoration of Palestine and the re-institution of the ancient temple with its Levitical cults. Reformed Judaism is also manifested in a refusal to abide by the rigorous enforcement of the Mosaic and Rabbinical dietary laws and in certain changes in the ritual and religious observances. The reform instituted at Charleston soon spread to the North where in the city of New York the Temple Emanu-El was organized in 1845 under the leadership of Rev. Dr. Leo Merzbader who formed his own ritual for the congregation. Temple Emanu-El has led the van of the Reformed Jewish congregations of America for over half a century and has given much impetus to the progress of Israel. Under Dr. Samuel Adler and Dr. Gustav Gottheil, this congregation made vast strides and is now the largest and wealthiest Jewish congregation of the world. Its place of worship is situated at the corner of Fifth Avenue and 43d Street, and its present rabbi is the Rev. Dr. Joseph Silverman. Har Sinai congregation was soon organized in Baltimore under the banner of Reform and adopted the prayer book of the Hamburg Temple. Some of its noted rabbis were Dr. David Einhorn, Dr. Samuel Sale, Dr. D. Philipson, and Dr. F. Shanfarher. The present incumbent is Rabbi Charles Rubenstein. A stronger note than all these, however, was sounded in the early days of reform at Albany where Rev. Dr. I. M. Wise officiated from 1846 to 1854. He had come from Germany, impregnated with the new spirit of progress, and at once carried his cherished ideals into practice in this country. He fought some of the early battles of Reform in America which went far beyond the expectations or desires of the Reformers of Europe. He contended for choir and organ and for a prayer book in the vernacular and his *Minhag America* (the American Ritual) was acceptable to most American Reform congregations for almost 50 years. It later became the basis of the Union Prayer Book now generally in use. Wise was not alone in his strenuous battles for progress. Leo Merzbacher, Max Libienthal, Samuel Adler, David Einhorn, and Samuel Hirsch ably entered the lists and contributed valuable aid to the new movement. These men were later reinforced by such valiant Reform leaders as B. Felsenthal, J. K. Gutheim, and Gustav Gottheil. Rev. Dr. Isaac M. Wise rightly called the father of American Reformed Judaism, gave to this movement a greater impetus than it had ever received, when in 1873 he organized the Union of American Hebrew Congregations and under its auspices, in 1875, the Hebrew Union College, a theological seminary for the training of American rabbis. A great drawback to the progress of the reform element was the lack of leaders and rabbis with modern scholastic education who could enter into the spirit of American conditions and the needs of Israel in this country. In the last 25 years over 100 graduates of this college have found pulpits in reform congregations where, with their modern culture and the ability to appeal to the younger generation, they have had eminent success and have given reformed (or Progressive Judaism, as it is sometimes called) a firm foothold on American soil. The Union of American Hebrew Congregations is now actively engaged in providing circuit preachers for small congregations and in organizing congregations and religious schools in communities where none exist. Another source of active strength to Reformed Judaism has been the Central Conference of American Rabbis, which the late Rev. Dr. I. M. Wise called into existence in Detroit in July 1889. This had been preceded by several Reformed Rabbinical Conferences which from time to time discussed burning ecclesiastical and ritual questions. The most noted of the conferences was the Pittsburg Conference held in November, 1885, at which the following platform of Reformed Judaism was adopted and which in the main, has been approved by nearly all Reformed Rabbis and teachers and been generally accepted by the laity.

Act. 1.— Judaism conveys the highest conception of God and of his relation to Man. God is the Creator and Ruler of the world, Father and Educator of the human race.

Act. 2.— The Holy Scriptures are the record of Divine Revelation and of the consecration of the Jewish people as the missionaries of the one God. In composition and literary arrangement the Scriptures are only the work of men with the unavoidable limitations of their age.

Act 3.— The results of natural science are the best helps to the understanding of the working of Divine Love in the world, the Bible serv-

ing as guides to illustrate the working of Divine Power within us.

Act 4.—The Mosaic laws are intended for the training of the Jews of Palestine in their former surroundings; only the moral laws are divine; all social, political, and priestly statutes, inconsistent with our modern habits and views, are to be rejected.

Act 5.—The Mosaic-rabbinical laws on diet, purity and dress fail to imbue modern Jews with the spirit of priestly holiness; their observance to-day would obstruct rather than enhance moral and spiritual elevation.

Act 6.—Israel's Messianic hope relates to the establishment of the authority of peace, truth, justice and love among men. No return to Palestine is expected, nor the re-institution there of a Jewish state, or of a worship conducted by descendants of Aaron.

Act 7.—Judaism is an ever growing, progressive and rational religion of modern civilization and asserts the necessity of preserving identity with the great past of the Jewish nation.

Act 8.—Judaism hails the efforts made by various religious denominations toward removing the barriers separating sect from sect.

Act 9.—It is the duty of Jews to spread the knowledge of their religious truths and mission amongst Jews and non-Jews.

Act 10.—The present agitated state of Judaism is a period of transition from a blind belief in authority and exclusion to a rational and humanitarian conception of religion; the masses, therefore, should be enlightened as to the history and mission of the Jewish people and their social and spiritual condition elevated through press, pulpit, and school.

The Central Conference of American Rabbis has, under the regime of its founder and first president, Dr. I. M. Wise (1889–1898), and its second president, Dr. Joseph Silverman (1899–1903), formulated many decisions which have been put into practice by the people at large, the most important of which are the abrogation of circumcision for adult proselytes, permission to the rabbis to officiate at cremations, the interdiction of rabbis from officiating at intermarriages (between Jews and non-Jews), etc. The most important work of the Conference has been the publication of the Union Prayer Book and Union Hymnal both of which have become very popular and have been the means of bringing unity into the religious services of almost 200 reformed congregations and of abolishing the many different rituals which had been a source of confusion in modern Judaism. Of late years some reformed congregations have been holding Sunday services in addition to the regular Sabbath services and many people have had grave fears lest this movement might lead to the substitution of Sunday for the Jewish Sabbath. The Central Conference of American Rabbis at its convention at Detroit July 1903, allayed those fears by adopting a resolution to the effect that this Conference favors adherence to the historical Sabbath as the fundamental institution of Judaism, and that Sunday services, whenever held, must only be regarded as supplementary to the regular Sabbath services. The future of Reformed Judaism in this country is pregnant with great possibilities. It is to be shaped, in the main, by the Union of American Hebrew Congregations, the Central Conference of American Rabbis and the Hebrew Union College (Cincinnati, O.) presided over by Dr. K. Kohler, the successor of Dr. I. M. Wise, and by the graduates of this college of whom the older and more prominent are: A. Aaron, H. Berkowitz, Jos. Krauskopf, Louis Grossman, R. Grossman, M. Heller, David Phillipson, Jos. Stolz, Jos. Silverman. Among the scholarly and leading Reform rabbis of America may be counted E. G. Hirsch, K. Kohler, S. Sale, Leon Harrison, I. S. Moses, M. Samfield, J. Voorsanger, S. Shulman, M. H. Harris. It is hoped that the new Jewish Theological Seminary of America (New York), Dr. S. Schechter, President, will also in time add power and influence to progressive Judaism in America, notwithstanding its present conservative tendency. The main problem for the reformers of the future will be how to promote assimilation with modern conditions without sacrificing the integrity of Judaism. Consult: 'Reports of the Union of American Hebrew Congregations'; 'Reports of the Central Conference of American Rabbis'; 'Yearbooks of the American Jewish Historical Society'; 'Reminiscences of I. M. Wise'; Philipson Grossman, 'Life and Writings of I. M. Wise'; Kohler, 'Settlement of Jews in North America'; and 'The Jewish Encyclopedia.'

JOSEPH SILVERMAN, D.D.,
Temple Emanu-El, New York City.

Judas, or **Jude,** one of the twelve apostles. He appears in the apostolic catalogue of St. Luke as "Judas of James," that is, son or brother of James; in St. Mark's and St. Matthew's list he is styled Thaddæus, of which Judas may be an abbreviation. Nothing is known of his life except what is ascribed to him by widely spread tradition. According to western legend he went in company with Simon the Canaanite to evangelize the Persians, and closed his life by martyrdom. In the calendar of the Book of Common Prayer as well as in the Roman Catholic calendar the festivals of St. Simon and St. Jude occur together on 28 October, and in the Greek Church on 16 May.

Judas Iscariot, ĭs-kăr'ĭ-ŏt (that is, of the family of Cariot in the tribe of Judah). One of the twelve apostles of Christ. He is styled the son of Simon, and was treasurer to the little company that attended Jesus, whom he betrayed with a kiss into the hands of the Jewish priests, for thirty pieces of silver. His divine Master addressed to him the mild reproof—"Dost thou betray the Son of Man with a kiss?" Remorse drove him to suicide. Nothing is known of his life previous to the appearance of his name in the lists of the apostles.

Judas Maccabæus, măk-ạ-bē'ŭs. See MACCABEES.

Judas-tree. See CERCIS.

Judd, Garritt Parmlee, Hawaiian statesman: b. Paris, Oneida County, N. Y., 23 April 1803; d. Honolulu, Hawaiian Islands, 12 July 1873. In 1828 he went to Honolulu as a medical missionary, and in 1842 was appointed recorder and interpreter to the native government. He organized the first Hawaiian ministry for Kamehamaha III. in 1843, and held the portfolio of finance from 1844 until his retirement in 1853. He placed Hawaiian finance on a sound basis,

and was a predominant influence in native politics.

Judd, Norman Buel, American lawyer and politician: b. Rome, N. Y., 1815; d. 1878. After studying law he was admitted to the New York bar in 1836 and at once going to Chicago began practice there, being the first city attorney of that city. He sat in the Illinois legislature 1844–60, becoming a member of the Republican party in 1856. He was minister to Prussia 1861–5, and was successful in preventing Prussia from recognizing the Confederacy. He was collector of the United States customs at Chicago in 1873 and was long prominent as one of the foremost railway lawyers in the country.

Judd, Orange, American journalist: b. near Niagara Falls, N. Y., 26 July 1822; d. Chicago, Ill., 27 Dec. 1892. He was graduated from Wesleyan University in 1847, became editor of the 'American Agriculturist' in 1853, was its owner and publisher in 1856–81, and in 1855–63 was also agricultural editor of the New York *Times*. At Chicago he edited the 'Prairie Farmer' (1883–8), which became the 'Orange Judd Farmer.' In 1871 he gave to Wesleyan University the Orange Judd hall of natural science, in which he established in 1875 the first State agricultural experiment station. He did much to promote American agriculture.

Judd, Sylvester, American author and Unitarian clergyman: b. Westhampton, Mass., 23 July 1813; d. Augusta, Maine, 26 Jan. 1853. He was graduated at Yale College in 1836, and subsequently becoming a Unitarian studied theology at the Harvard Divinity School. In 1840 he was ordained as pastor of the East parish in Augusta, Maine, and continued to hold that pastorate till his death. In 1845 he published 'Margaret, a Tale of the Real and Ideal,' a very noteworthy example of American fiction, to which Lowell in his 'Fable for Critics' makes extended allusion and which was illustrated by a much admired series of outline drawings by Felix O. C. Darley (q.v.) (1856). In 1850 he published 'Philo, and Evangeliad,' a didactic poem in blank verse, and in the same year 'Richard Edney,' a romance. 'The Church,' a collection of sermons, appeared in 1855.

Jude, jood. See JUDAS.

Jude, Epistle of, a general or ecumenical letter reckoned among the canonical writings of the New Testament. The writer, while speaking with something like apostolic authority, does not claim to be an apostle. He is merely "the brother of James," probably James the Just, the author of another general epistle. Difficulties have been raised about this book because of its resemblance to II. Peter, and it is quite uncertain which epistle was written first. It also contains references to two apocryphal books, the 'Assumption of Moses' and the 'Book of Enoch,' but as in the New Testament citations are made not only from uninspired, but even from heathen writers, this does not impair the authority or authenticity of the epistle. As to its date, the earliest probable is 64 A.D. and the latest 67 or 68 A.D. The contents include address and salutation; false teachers are condemned, their fate illustrated by Biblical examples; their wickedness specifically described and woe is pronounced upon them. The letter concludes with an exhortation, to consider how the apostles predicted the coming of these mockers; to cling to the love of God; to treat such perverted ones with discrimination.

Judge, a public officer to whom is committed the exercise of judicial power of the State in the administration of justice in its courts. It is his province to decide questions of law, and in cases in which facts are to be decided by a jury to instruct the jury as to the law which is applicable and to point out to them what the exact questions for their determination are. (See JURY.) He pronounces the sentence, or enters the judgment, of the court. It is to be understood that the foregoing is an attempt to state the functions of a modern judge. In the early stages of society there are complexities of social relations which disappear with advancing civilization. In England, for example, there were formerly local courts and ecclesiastical courts, the judges of which can scarcely be said to have exercised the power of the state, if by state we mean the general government; nor were the judicial powers entirely distinct from the administrative. (See JURISDICTION.) But from the time when the King's Court began to assume importance in the 12th century, and to be held by professional judges, the judicial office began to approach its modern character. This character had long been established when the United States government was formed.

The word is not a technical one. The officers of the King's Court, when that tribunal began to take definite shape, were known officially as justices. Until the recent Judicature Acts in England it was customary formally, as well as popularly, to speak of the Judges of the superior courts at Westminster, though the members of the courts of King's Bench and Common Pleas were properly justices, and of the Court of Exchequer barons, and at the present time the members of the Supreme Court of Judicature, including the Lord Chancellor, the Lord Chief Justice, the Master of the Rolls and the Lords of Appeal are spoken of as the judges of that court. English judges are appointed by the Crown (this patronage being exercised by the Lord Chancellor, who is the head of the legal profession) from the leaders of the Bar, and hold office during good behavior.

In all the Federal courts, in all the higher courts of the several States and in most of the inferior courts, judges must be trained in the law, though lay judges were common in the State courts of first instance until quite recent times. Federal judges are appointed by the President, by and with the advice and consent of the Senate, and hold office during good behavior, being removable only by impeachment. Any Federal judge who has served for ten years and is 70 years of age may retire on full pay for life. The choice of judges in the States is determined by the State constitutions. As a general rule they are elected for a term of years. The fear was quite generally expressed at the time the tendency to make the office an elective one became general, that judges so chosen would be inferior to those apointed by the State governors, but does not seem to have been justified by the result. In most of the State courts the small salaries paid and

the limited terms of office prevent the leading members of the bar from seeking, and in many cases from accepting, the office of judge.

A judge must be impartial and any interest in the cause or the parties will disqualify him from presiding at the trial. While in office he is precluded from practising before the court of which he is a member, and he is commonly, and should be universally, precluded from practising before any court. He is not answerable to any suitor for the correctness of his rulings or decisions, and in the absence of positive fraud is not answerable in damages for any decision he may render. Every judge has power to punish for contempt of court in case of acts committed during the court's session, and even of such acts committed outside the court, though this latter power is to be exercised with care, and its limits are naturally not defined with certainty. For the peculiar functions exercised by American judges as interpreters of the Federal and State constitutions, see JURISDICTION.

JOHN DOUGLASS BROWN,
Philadelphia.

Judge-advocate, a title given the prosecutor in a court-martial or military commission. In the United States the judge-advocate is generally a member of the judge-advocate-general's department. In Great Britain the duties of judge-advocate usually devolve upon a detailed staff officer, or the prisoner's commanding officer. The prisoner has a right to call on any regimental officer to speak in his behalf. See LAW, MILITARY.

Judge Lynch. See LYNCH LAW.

Judges, Book of, a book of the Hebrew scriptures which relates the exploits of successive rulers of Israel who delivered the land from the heathen, 'judge' in the Hebrew sense being used to designate the defender of a cause, and not necessarily a judicial magistrate. These judges were raised up at times of national emergency to assert the independence of the nation. Abimelech attempted to maintain the succession to this office as being the son of Gideon, but he failed, and the office was never hereditary. Samuel did indeed appoint his sons judges, but the government was at that time undergoing a transition to the settled form of hereditary dynasty.

The period comprised in the book of Judges is from Joshua to Samuel and Saul. In 1 Kings vi. 1, it is stated that from the Exodus to the building of the first temple was 480 years, and the time enumerated by the writer of the Book of Judges amounts to 410 years, but on the very probable hypothesis that some of these judges were of merely local authority, and judged Israel contemporaneously, this will be reduced to 299 years. As the accession of Saul is reckoned at 1037 B.C., we may roughly estimate that the judges ruled Palestine from 1336 to 1037 B.C. The book opens with a preliminary review of the condition of the tribes at the close of Joshua's wars, for the purpose of showing how imperfectly they had carried out the command "Go in and possess the land." The succession of judges, occupied in repelling the encroachments, is the result of this dilatoriness and neglect. The main section of the work is taken up with the exploits of the judges, namely Othniel, who broke the yoke of Mesopotamia; Ehud, who threw off the oppression of Moab; Deborah and Barak, who drove off the northern Canaanites; Gideon, who repelled the Midianites; Jephthah, who fought with the Canaanites; and Samson, who contended with the Philistines. In regard to the public services of the other six we are told little. These are Shamgar, Tola, Jair, Ibzan, Elon, and Abdon. As an epilogue or appendix comes in the stories of idolatrous Micah, and the hideous outrage at Gibeah. The experience of Israel under the judges was educative. In their distress they appeal to Jehovah for deliverance and every answer to their prayer is a rebuke to their forgetfulness and a reminder of their duty to conquer and possess the land.

Judges' Cave, a crevice between some large fallen rocks on West Rock, New Haven, Conn., now a municipal park, which in 1661 was a temporary hiding-place for Goffe and Whalley, two of the English regicides.

Judgment, the decision rendered by the authority to which a question or issue has been submitted for determination. In a more restricted sense, the decision by a court of law of an issue raised by parties litigant, or the determination and declaration by such court of a legal right. There are many rulings by such a court which are not judgments, but determine merely some incidental question, and there are judgments which are interlocutory, as well as final judgments which put an end to the controversy. But every judgment in a judicial proceeding is an adjudication by the court of some right of a suitor, and until set aside or reversed, is the law governing such right.

In early times the solemn character of a court record and the means which the law furnished for the enforcement of an obligation thus established caused such a record to be adopted for the purpose of entering into an obligation as distinguished from resort to a court for the vindication of the obligation when disputed by the other party. A modern survival is found in the confession of judgment, by which a man causes his obligation to pay a sum of money to be entered upon the court records in the form of a judgment against him for the amount due. In consequence of the early practice — aided also by the fact that a judgment may be sued upon outside the jurisdiction of the court in which it was entered, like a contract — the older legal writers speak of judgments as a species of contract. But this classification has been shown to be unscientific by recent writers, since the courts have pointed out that these obligations are not contractual in either their origin or their incidents, and it is now customary to speak of them as *quasi*-contracts.

It is stated above that a judgment is interlocutory or final. In a suit for partition of real estate a judgment that partition be made is interlocutory, and is the basis of further

proceedings which result in the final judgment establishing the partition. A final judgment is one which ends the controversy, at least as to some of the parties. It is a general rule that no appeal can be taken, except from a final judgment, and while there can rarely be a case of doubt as to the finality of a technical judgment, that is the decision rendered by a court of common law jurisdiction, questions frequently arise as to the finality of decrees (which correspond to judgments) entered by courts of equity. The test is whether the right is finally settled by the decree; for example, when a creditor has claimed to intervene in an equity proceeding to establish his right to share in a fund being distributed, a decree excluding him is final as to him and appealable, though in all other respects the suit remains undetermined by the court below.

A judgment of a competent court having jurisdiction of the parties and the subject matter is conclusive, except so far as it may be the subject of appeal to a higher court. The direct issue thus determined will not be re-tried by another court, and such a determination cannot be attacked collaterally except on the ground of fraud or lack of jurisdiction of the court in which the judgment was rendered. A judgment *in personam* binds only parties to the cause and those in privity with them; a judgment *in rem*, which is a judgment determining the *status* of person or property, binds all the world. Decrees of courts of admiralty are judgments *in rem* and conclusive of the *status* of the subject-matter of the cause upon every one. Decrees of divorce are judgments *in rem*, and determine the *status* of the parties to the proceeding. In the United States they are pronounced by the State courts in the administration of very diverse statutes relating to the subject of divorce, and as the courts of all the States, in addition to the general principles of comity observed between courts of different jurisdictions, are bound by the mandate of the Federal constitution requiring that "Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State" many perplexing questions have arisen. These cases afford good illustrations of successful collateral attacks upon judgments on the ground of fraud or lack of jurisdiction of the court entering the judgment. It is now well settled that a decree of divorce may be successfully attacked collaterally on the ground of fraudulent collusion between the parties or lack of jurisdiction of the court pronouncing it over the person of the defendant. It is to be observed that a final judgment is conclusive of the particular cause, and finally determines the right therein litigated, and may be pleaded in bar of any future attempt to assert the right, except in a case in which there has been no determination on the merits; as for example, where the plaintiff has suffered a voluntary non-suit, that is, has elected in advance of a verdict to abandon his case. He loses that particular case and must pay the costs, but is not prevented from bringing another action.

In most of the United States a judgment for a sum of money found to be due, from the date of its entry, and without the issuance of a writ of execution, constitutes a lien upon the real estate of the judgment debtor; that is, a claim which must be paid out of the proceeds of any judicial sale of the property in its due order of priority as compared with other liens upon the same property. This lien usually extends only to real estate within the jurisdiction of the court in which the judgment was entered with provision for filing a transcript to create a lien in other counties of the same State in which the debtor owns real estate. A foreign judgment, in which are included the judgments of others of the United States, must be sued on and a judgment recovered upon it to make it effective in any of the States. In such suit no defense which could have been interposed in the original suit will be allowed to the judgment debtor.

JOHN DOUGLASS BROWN,
Philadelphia.

Judica, joo'dī-ka ("judge," or "give sentence"), the first word in the 43d Psalm, used as an introit in the Church of England (1549) for the 3d Sunday in Lent, and in the Roman Catholic Church for the 5th Sunday in Lent. Hence "Judica Sunday" as a term to designate those several days.

Judic'iary, that branch of government concerned with the administration of justice, in cases civil or criminal; the system of courts of justice in a country; the judges collectively. For judiciary in the United States, see COURT.

Judiciary in the Philippines. The United States government organized in 1902 a complete judicial system covering the whole archipelago, the municipal code providing for the trial of violators of municipal ordinances by the local *presidente*, other special laws authorizing the appointment of justices of the peace for trial of minor offenses, civil actions involving small amounts and the preliminary investigation of higher crimes, creating courts of first instance that are courts of record and of general jurisdiction, one being provided for each province, except in the city of Manila, where there are two judges. The courts of first instance hold sessions at least twice a year in the smaller provinces and in the more important ones three or four times. The archipelago is divided into 14 judicial districts outside the city of Manila, one judge for each judicial district, with a special tribunal for disposing of arrearages of litigation in the island of Negros. There is a Supreme Court, consisting of a chief justice and six associate justices, with adequate provisions for reporting the decisions of the court, and for representation of the government, general and local, in all litigation by the attorney-general, solicitor-general and their assistants, and provincial fiscals, with a special municipal system of courts for the city of Manila and with a notarial system for the archipelago. A considerable number of the judges in the various courts are native Filipinos. All the fiscals, or prosecuting officers in the islands are natives.

Judith, Jewish heroine. She was the widow of Manasses, a citizen of Bethulia. When Holofernes, general of King Nebuchadnezzar, according to the Book of Judith, besieged Bethulia, a city of unknown geographical position, she went armed with faith in Jehovah to the tent of the invader and was admitted because of her stately beauty. While he slept she cut off his head with his own sword, and thus de-

livered Israel. This incident has been a favorite subject with artists, for in the first place the Book of Judith is written with abundant literary point and skill and is naturally suggestive to the sculptor or painter. It is the subject of Donatello's bronze group in the Lanzi palace at Florence, and of many pictures, notably that of Cranach in the Dresden gallery, and those of Horace Vernet, 'Judith on Her Way to Holofernes'; and 'Judith in the Tent of Holofernes.'

Jud'son, Adoniram, American Baptist missionary: b. Malden, Mass., 9 Aug. 1788; d. at sea 12 April 1850. He was graduated from Brown University in 1807, and immediately after opened a private school in Plymouth, Mass. Skeptical views which he had held were overcome by his examination of the evidences of Christianity, and he was graduated from Andover Theological Seminary in 1810. With some of his fellow students at Andover he addressed a letter to the General Congregational association of Massachusetts which ultimately led to the formation of the American board of commissioners for foreign missions. Impatient at the slow progress of the American movement he embarked for England to consult with the directors of the London Missionary Society in regard to co-operation with that society by the newly formed American board. On his return to America he and three others were appointed missionaries to the Burman empire by the American board; they were ordained 6 Feb. 1812 and Dr. Judson, with his wife, sailed on the 19th for Calcutta. They were subjected for a full year to much annoyance by the East India Company's regulations, and finally took refuge in Rangoon (July 1813). Meanwhile they had adopted Baptist views, and had surrendered their connection with the American board. The Baptist general convention (now the American Baptist Missionary Union) organized in 1814 and immediately appointed Mr. and Mrs. Judson its missionaries. Established in Rangoon they applied themselves to the learning of the language, without grammar or dictionary; in April 1819 the first *zayat* was opened for Christian worship, and in 1820 the number of baptized converts was 10. The growth of the mission had excited the displeasure of the new viceroy, and Dr. Judson determined to appeal to the king for protection, but the plea was unavailing; later, however, their mission was transferred to Ava, at the request of the king. The sudden breaking out of war between the East India Company and the Burman government brought upon the missionaries the severest privations; in June 1824 Dr. Judson was arrested and thrown into prison, enduring the most brutal treatment until February 1826, when he was released on the demand of Sir Archibald Campbell, the English general. Removing to territory ceded by the Burman government to the English, he and his wife commenced missionary work at Amherst; shortly after Judson went with an embassy to Ava to negotiate a new treaty, and during his absence his wife died. On his return to Amherst he took up again his missionary work, where he was chiefly occupied in the translation of the Bible (completed 1834); and the preparation of a Burman-English dictionary. In April 1834, he married Mrs. Sarah Hall Boardman, and remained in Burma till 1845, when he visited the United States. Mrs. Judson died on the voyage. He was received in the United States with distinguished marks of respect by public meetings in many cities, especially by the Baptist missionary conventions at New York and Richmond. In July 1846, he again sailed for Burma with his third wife, Emily Chubbuck, and settled at Maulmain; took the pastorate of the Burman church there, and continued his work on the dictionary. In 1849, illness forced him to leave Maulmain, and he died on the voyage to the Isle of Bourbon. Consult: Lives by his son, Edward Judson (q.v.) (1883); Wayland (1853); Conant, 'The Earnest Man' (1856).

Judson, Ann Hasseltine, American missionary, wife of Adoniram Judson (q.v.): b. Bradford, Mass., 22 Dec. 1789; d. Amherst, Burma, 24 Oct. 1826. She was married to Dr. Judson in 1812, and sailed with him to Burma, where she took active part in all his missionary work. Her health compelled her to visit the United States in 1822–3, where her personal appeals were the means of largely increasing the missionary interest in the churches. Shortly after her return to Burma, her husband and other foreign residents at Ava were imprisoned, and she herself suffered many indignities; but by constant appeals to the king and the wise use of money and presents she was successful in relieving somewhat the sufferings of her husband and the other prisoners. She wrote 'History of the Burman Missions' (1822).

Judson, Edward, American Baptist clergyman: b. Maulmain, Burma, 27 Dec. 1844. He is the son of Adoniram Judson (q.v.) and came to the United States in 1850 after the death of his father. He studied at Madison (now Colgate) University, and was graduated from Brown in 1865. He was principal of the academy at Townsend, Vt. (1865–7) and subsequently professor of Latin at Madison (now Colgate) University. In 1875 he accepted the pastorate of the Baptist Church at Orange, N. J., then became pastor of the Berean Baptist Church, New York city, and later secured a site on Washington Square, New York, and erected the Judson Memorial Church (in memory of his father) of which he is pastor. Here he has built up an institutional church, with many different lines of work, including gymnasium classes, a dispensary, and a children's fresh air fund.

Judson, Emily Chubbuck ("Fanny Forrester"), American writer: b. Eaton, Madison County, N. Y., 22 Aug. 1817; d. Hamilton, N. Y., 1 June 1854. She was the third wife of Rev. Adoniram Judson (q.v.) to whom she was married in 1846. As "Fanny Forrester" she achieved some little reputation as a writer of graceful sketches and poems, and besides the life of the second Mrs. Judson (1850), published 'Alderbrook' (1846); 'The Kathayan Slave' (1853); 'An Olio of Domestic Verses' (1852); 'Trippings in Author Land' (1846); 'My Two Sisters' (1854).

Judson, Harry Pratt, American educator: b. Jamestown, N. Y., 20 Dec. 1849. He was graduated from Williams College in 1870, was professor of history in the University of Minnesota 1885–92, and has been professor of political science in the University of Chicago since the

latter date. His works include: 'Cæsar's Army, a Study of the Military Art of the Romans' (1888); 'Europe in the Nineteenth Century'; 'The Growth of the American Nation' (1895); 'The Higher Education as a Training for Business' (1896); 'The Government of Illinois' (1900); etc.

Judson, Sarah Hall Boardman, American missionary: b. Alstead, N. H., 4 Nov. 1803; d. St. Helena 1 Sept. 1845. She was married on 4 July 1825, to Rev. George Dana Boardman, and on 16 July they embarked for Calcutta. They established the mission station at Maulmain, and Mrs. Boardman made rapid progress in the acquisition of the language. Transferred to Tavoy for a similar service, they worked among the Karens partly at the schools at Tavoy and partly by visiting their villages in the wilderness. After two years Mr. Boardman died, but she continued her missionary labors, and beside managing a school with great success, was accustomed to make long journeys among the mountains. In these excursions, assemblies of hundreds gathered around her and she conducted the worship and gave them religious instruction. In April 1834, she became the wife of Adoniram Judson (q.v.). She was perfectly familiar with the Burman language, and translated into Burmese the first part of Bunyan's 'Pilgrim's Progress' and various tracts, prepared a hymn book, and several volumes of Scripture questions for Sunday schools. Before the Peguans had a missionary, she acquired their language, and translated or superintended the translation of the New Testament and the principal Burman tracts into the Peguan tongue.

Juggernaut, jŭg'ėr-nât. See JAGANNATH.

Jugular (joo'gū-lạr) **Vein,** one of the large trunks by which the greater part of the blood that has circulated in the head, face and neck is returned to the heart. There are two on each side, an external or superficial, and an internal or deeper.

Jugurtha, joo-gėr'thạ, king of Numidia: d. Rome 104 B.C. He was a natural son of Masinissa. Micipsa, his father's brother, and king of Numidia after Masinissa (149 B.C.), adopted him and brought him up with his own sons, Adherbal and Hiempsal. Micipsa did his best to conciliate him, and declared him joint-heir to the crown with his two sons. But after the death of Micipsa, Jugurtha had Hiempsal murdered and drove Adherbal from the country. Adherbal appealed to Rome, and after several Roman expeditions into Numidia, Jugurtha was captured (106 B.C.), led in the triumph of Marius at Rome, and finally thrown into a dungeon, where he was starved to death.

Jujube, joo'joob, a spiny and deciduous shrub of the order *Rhamnaceæ* and genus *Zisyphus,* a native of Syria, whence it was introduced into Europe. The fruit is blood-red or saffron-colored, with a sweet, granular pulp. The species are numerous, and of several the fruit is wholesome and pleasant to eat, both fresh and dried, and forms an article of commerce; and in southern Europe it is used at table in desserts as a dry sweetmeat. *Z. Lotus,* which gave its name to the ancient Lotophagi, a shrub 2 or 3 feet high, is a native of Persia and the north of Africa. Its berries, which are about as large as a sloe, are collected for food by the Arabs of Barbary, are made into cakes, and a kind of wine is sometimes made from them. *Z. spina-christi,* or Christ's thorn, is said to have furnished the branches of which Jesus' crown of thorns was made.

Jujuy, hoo-hwē', Argentine, a province situated in the extreme northwest of the republic, between Bolivia and the province of Saltá. Nearly the entire area, estimated at 18,977 square miles, is occupied by mountains in which are extensive deposits of gold, silver, copper, mercury, salt, petroleum, and asphalt. Fertile valleys in the eastern part of the province produce sugar-cane, wheat, tobacco, and rice. There are immense forests and an abundant supply of water. The provincial capital, also called Jujuy, a town of about 10,000 inhabitants, is connected by railway with Buenos Ayres, and has two banks, a custom-house, a national college, a normal school for girls, and 7 public schools. The population of the province, according to the census of 1895, was 49,713. Estimated population in 1903, about 57,000.

Jukes, The, the name given to a family of New York State that had an unusual record of crime and pauperism. In 1874, Mr. R. L. Dugdale, while making investigations in behalf of the New York Prison Association, found several of the same family imprisoned for various crimes. Becoming interested in the subject, he traced the history of the family through several generations; they were descendants of the two sons of a backwoodsman, called Max, who married two of the Jukes sisters, one of whom is known as "Margaret, the Mother of Criminals." Exact information was obtained in relation to 709 out of the 1,200 descendants and blood relations; of these, 140 had been imprisoned for crime, 280 had been paupers, dependent upon public support, and the large majority were of low physical and moral standard. Consult: Dugdale, 'The Jukes.'

Julia, only child of the emperor Augustus; b. 39 B.C.; d. 14 A.D. She was his daughter by his second wife Scribonia, and was first married (25 B.C.) to her cousin, the young Marcellus, and afterward to Marcus Vipsanius Agrippa, to whom she bore three sons and two daughters. On Agrippa's death, in 12 B.C., she was married to Tiberius, who left her on account of her licentiousness. Augustus banished her to Pandataria, a desolate island on the coast of Campania, ultimately allowing her to live in Rhegium. After the death of the emperor, Tiberius treated her with great severity. She died in poverty and distress. Her son, Agrippa, had been put to death by Tiberius shortly before.

Julia Domna, Roman empress: b. Emesa, Syria, 170 A.D.; d. 217 A.D. She was the second wife of the Emperor Severus, and mother of Caracalla and Geta, and a distinguished patroness of art and science.

Julian, joo'lyan, FLAVIUS CLAUDIUS JULIANUS), Roman emperor, surnamed the Apostate: b. Constantinople 17 November 331; d. 26 June 363. When hardly six years old his father and several members of his family were murdered by the soldiers of his cousin, the Emperor Constantius. He was brought up in the Christian religion, studied philosophy and letters,

and resided in Athens, where he was induced to embrace Paganism. Having received command of an army against the Germans, he defeated them at Strasburg, and drove them beyond the Rhine. He also displayed great talent as an administrator in Gaul. The emperor now became jealous of Julian, and recalled his best troops under pretense that he wanted to employ them against the Persians. This order caused a rebellion among the soldiers, who proclaimed their leader Julian emperor in March 360, in spite of his own resistance. Constantius prepared to proceed against him, but soon after died, and Julian was generally recognized as emperor. He began by putting a stop to many abuses, and limiting the splendor of his court, and was thus able to remit to the people the fifth part of all their taxes. He sought to restore the heathen worship in all its splendor, and on that account opposed Christianity as much as was in his power, without, however, persecuting the Christians themselves. In 363 he headed an expedition against the Persians and took several cities. He was an able ruler, and had also a reputation as an author. Some of his works have come down to us, including speeches, letters, and satirical pieces; the latter are distinguished for wit and humor. He wrote also a work against the Christian religion, of which we have yet some extracts. Consult: Schwartz, 'De Vita et Scriptis Iuliani Imperatoris' (1888); Hoffmann, 'Julianus der Abtrünnige' (1880); Gardner, 'Julian: Philosopher and Emperor' (1895); Dill, 'Roman Society' (1899).

Julian, George Washington, American politician: b. Centerville, Ind., 5 May 1817; d. Irvington, Ind., 7 July 1899. He studied law and was admitted to the bar at the age of 21. In 1845 he was elected to the State legislature, as a Whig, but being a strong opponent of slavery he severed his party connection with the Whigs and became one of the founders of the Free Soil party in 1848. In 1849 he was elected to Congress; in 1852 was candidate for vice-president of the Free Soil party, and in 1856 a delegate to the first national convention of the Republican party, where he was vice-president of the convention and chairman of the committee on organization. In 1860 he was again elected to Congress, and served continuously for ten years. He was a member of the committees on the conduct of the war, on reconstruction, on the preparation of the articles of impeachment against President Johnson, and on public lands, being chairman of the latter. He opposed any monopoly of the public lands, was an advocate of the homestead system, and strongly favored giving the franchise to the negro. In 1868 he proposed a constitutional amendment providing for woman's suffrage. In 1872 he joined the Liberal Republicans, and after that became a Democrat; in 1885–9 was surveyor-general of New Mexico; and after 1889 retired from public life. He published 'Speeches on Political Questions' (1872); 'Political Recollections' (1884); and 'Life of Joshua R. Giddings' (1892).

Julian Calendar. See CALENDAR; EPOCH.

Julien, Alexis Anastay, American geologist: b. New York 13 Feb. 1840. He was graduated from Union College in 1859, was resident chemist at the guano island of Sombrero 1860–4, studied geology and natural history there, and on the establishment of the Columbia School of Mines became an assistant in the quantitative laboratory. He was in charge of the department of microscopy there, 1885–97, and subsequently became instructor in geology. He has published valuable scientific reports included in the Geological Survey's 'Geology of Michigan,' vol. II. (1872); and 'Geology of Wisconsin,' vol. III. (1880); etc.

Julien, zhü-lĭ-ăn', **Stanislas Aignan,** French sinologist: b. Orleans 20 Sept. 1799; d. Paris 14 Feb. 1873. Possessed of an extraordinary linguistic faculty, he taught himself Greek, English, Italian, Spanish, Portuguese, and German, and in 1823 commenced the study of Chinese. At the end of a year he published a Latin translation of the philosopher Mencius. Henceforth ancient and modern Chinese, Manchu, the Mongolian tongues, and Sanskrit, were the subjects of exact and profound study. In 1832 he became professor of Chinese at the Collège de France; librarian at the Bibliothèque Nationale, 1839; president of the college, 1855; commander of the Legion of Honor, 1863. His most important works are: 'Voyages des Pérelins Boudhistes' (1853–8); 'Syntaxe nouvelle de Langue chinoise' (1869–70). Julien was the foremost Chinese scholar of his time.

Julius I., pope: d. 12 April 352. He became pope in February, 337, and was a staunch defender of Athanasius, who, under the protection of Julius, sought refuge in Rome against the enmity of the Eastern prelates.

Julius II., pope (GIULIANO DELLA ROVERE, joo-le-ä'nō dĕl'lä rō-vā'rā): b. Albezuola 1443; d. Rome 21 Feb. 1513. He was elevated by his uncle Sixtus IV. to the rank of a bishop and cardinal in 1471, and subsequently held eight bishopries and the archbishopric of Avignon. He was appointed papal legate to France in 1480 and in 1503 was elected pope. Immediately on his elevation to the pontificate he planned the complete re-establishment of the papal sovereignty in its ancient territory, and the extinction of foreign domination, and influence in Italy. Refusing to attend the Council of Pisa convened by the king of France, he in 1511 formed the "Holy League," to which Spain, England, and Switzerland were parties. In 1512 he made open war against Louis XII., and the Fifth Lateran Council was convoked by him in the same year. The French defeated the papal army near Ravenna, but were soon after driven out of Italy. He was a far-sighted and patriotic sovereign, and a liberal and judicious patron of art and literature, Michelangelo, Raphael, and other great artists of the time receiving commissions from him. To procure means for building St. Peter's he ordered the preaching of indulgences, which was one of the immediate causes of the Reformation. Consult: 'Life,' by Du Mesnil (1873); Brosch, 'Papst Julius II., und die Gründung des Kirchenstaates' (1878).

Julius III., pope (GIOVANNI MARIA DEL MONTE, gō-van'nē mä-rē'ä dĕl mōn'tā): b. Arezzo 10 Sept. 1487; d. Rome 23 March 1555. He was made archbishop of Siponto in 1512 and of Pavia in 1520, and was appointed cardinal by Paul III. in 1536. He took an active part in the Council of Trent as papal legate, was

elected pope in 1550, and in the following year reopened the Council of Trent, which had been suspended for two years. He endeavored to effect a union with the Nestorians, and commissioned Cardinal Pole to organize, in conjunction with Mary, the reunion of England with Rome.

Julius Cæsar. See CÆSAR, GAIUS JULIUS.

Julius Cæsar, Play of. The material for this stately drama, the noblest of Shakespeare's historical plays, was taken from Plutarch. The action covers nearly two years,—46 to 44 B.C. See CÆSAR, GAIUS JULIUS.

July, the 7th month of the calendar, which in the Roman year bore the name of *Quintilis,* as the fifth in the computation of Romulus, even after Numa had prefixed January and February. Mark Antony effected a change in its name in honor of Julius Cæsar, who was born on the 12th of the month, and thenceforward by a decree of the senate it was called *Julius.* It originally contained 36 days. It is said that Romulus reduced them to 31 and Numa to 30. Julius Cæsar fixed the number at 31, which is still retained. The Dog-days are supposed to commence on the 3d of this month.

Jumbo, the name of a large African elephant for 25 years on exhibition at the Royal Zoological Gardens in London. The animal was purchased in 1882 by P. T. Barnum (q.v.), American showman, for $10,000, and for three years was exhibited in the United States. Jumbo was killed in 1885 by a railroad train in Canada. He was 11 feet 6 inches in height, and weighed 6 tons. His skeleton is preserved at the Smithsonian Institution, Washington, D. C.

Jumel, zhū'mĕl, **Eliza,** American heiress: b. at sea 1769; d. New York 16 July 1865. Her maiden name was Capet, and after her mother's death she was adopted by Mrs. Thompson, of Newport. She was a wayward, beautiful girl; at 17 she eloped with a British officer named Peter Croix, with whom she lived in New York. There she was greatly admired, and soon after her first husband's death married Stephen Jumel, who took her to Paris, where her social success was as great as in New York. After Jumel's death, she married at 61 Aaron Burr (q.v.), from whom she separated soon afterward. Her home during her last years was the famous Jumel mansion, built by Roger Morris in 1758, the home of Mary Philipse Rogers (q.v.) and Washington's headquarters during the New York campaign. It was bought by Madame Jumel in 1810, and is still preserved, its site being in Roger Morris Park, New York, which was opened 28 Dec. 1903.

Jum'na, or **Jamna** (Sanskrit YAMUNA), a river of India which rises in the Himalayas, at the height of 10,849 feet. It flows in its upper course in a generally southwest direction, then bends to the southeast and, passing the cities of Delhi and Agra, falls into the Ganges, of which it is the chief tributary, at Allahabad (q.v.) after a course of 860 miles. Important irrigation works derive their supply of water from this river.

Jumpers, a class of religionists who manifest their devotion and feeling by jumping from the ground during the time they are assembled for worship and exhortation. They are said to have originated in the Methodist congregations of Wales during the preaching of Whitfield (1760). They were also called "Barkers" from the incoherent guttural sounds they uttered during their excitement. They still exist in some parts of the Eastern States, having emigrated to America after being repudiated by English Methodists.

Jumping Beans, various large seeds of euphorbiaceous plants infested with the larvæ of certain small moths (*Carpocapsa saltitans* and *Grapholitha sebastianæ*), which by their movements make the seeds roll, and even jump as if alive. The larvæ spin cocoons in the seeds, a large part of the interior of which they have devoured, and when ready to emerge as adults, push open a previously cut circular door which has been held shut by silken threads. Both species are found in Central America, Mexico, and the southwestern United States, where they are called "broncho beans."

Jumping Hare, or **Springhaas,** a jerboa-like animal (*Pedetes caffer*) of South Africa, as large as a hare, and much resembling one, which is now set apart in a family (*Pedetidæ*) by itself. It will leap 25 or more times its own length, and where numerous does great damage at night to growing crops.

Jumping Mouse. See JERBOA.

Jumping Shrew, a curious little animal of Africa, one of the insectivora of the Elephant-shrew family (*Macroscelidæ*), which has very large hindquarters and moves by leaping like a jerboa. They inhabit rocky and desert places, remain in holes and hiding places during the day and go abroad at night in search of insect food. The best known, perhaps, is the Cape jumping-shrew of South Africa (*Macroscelidus typicus*), which is tawny brown, about five inches in length, has a long, flexible proboscis and a long naked tail.

Jumping Spiders, small spiders of the family *Attidæ,* which dwell in low vegetation, and are exceedingly agile. They are usually short and stout in form, rarely more than a quarter of an inch long, and are often brightly colored, especially in the case of the males, which take curious attitudes in order to display their ornaments to the females. Consult Emerton, 'Common Spiders of the United States' (1902).

Jun'co, a genus of slate-colored and white sparrows, present in the United States mostly in winter. See SNOWBIRDS.

Junction City, Kan., city and county-seat of Geary County, at the junction of the Republican and Smoky Hill rivers, 135 miles west of Kansas City; and on the Missouri, K. & T. and the Union P. R.R.'s. The two rivers here form the Kansas River, and make an important shipping point for grain, flour and limestone. A government military post, Fort Riley, is located three miles east of the city. It was settled in 1858 and under a charter of 1870 is governed by a mayor and city council.

The city owns the waterworks. Pop. (1890) 4,502; (1900) 4,695.

June, Jennie. See CROLY, JANE G.

June, the 6th month in the calendar. The etymology is uncertain. Vossius gives three etymologies of the name — one from Juno; another from *jungo* (to join), referring to the union between the Romans and Sabines under Romulus and Titus Tatius; a third from *juniores* (the young men), Romulus having been said to have assigned the month of May to the elders, and that of June to the young men, when he divided the people into these two great classes, the former to serve in counsel, the latter in war. The name has also been traced to Junius Brutus, the first consul. It consisted originally of 26 days, to which it is said Romulus added four, and Numa took away one. Julius Cæsar again lengthened it to 30 days, and it has ever since remained unaltered.

June Beetle, or **Fig-eater,** a green and brown beetle (*Allorhina nitida*) of the family *Scarabæidæ* common in the central and southern United States. The adults often eat figs, peaches, small fruits, corn, etc. The larvæ are white grubs which resemble their northern relatives (see MAY BEETLE), but are far less injurious since they normally feed upon decaying vegetable matter in the soil and not on living roots of plants. The adults may be decoyed away from ripe fruit by placing little piles of decaying fruit within their reach; but since they are probably beneficial they should not be destroyed.

June Berry. See AMELANCHIER.

June Bug. See MAY BEETLE.

June Grass. See BLUE GRASS; GRASSES IN THE UNITED STATES.

Juneau, joo-nō', **Laurent Solomon,** American pioneer: b. L'Assumption parish, near Montreal, Canada, 9 Aug. 1793; d. Shawano, Wis., 14 Nov. 1856. He emigrated to Green Bay, Wis., and thence in 1818 to Milwaukee, where he was active in trade with the Indians. He was not, as has been sometimes stated, the first white settler on the site of Milwaukee. A grant of considerable land had there been made by the Indians to one Mirandeau, a previous resident, and of this grant, Juneau, on Mirandeau's death, secured possession. Juneau made the first survey of Milwaukee village, was its first postmaster and president, and the first mayor of the subsequent city. On ground presented by him, he helped to build the first court-house in the State. For years he was agent for the American Fur Company. A heroic statue of him was placed in Juneau Park, Milwaukee, in 1884. See MILWAUKEE.

Juneau, Alaska, city in the southern district, on a promontory between the Taku River and Lynn Canal, opposite Douglas Island, about 80 miles north of Sitka. It was settled in 1880, is incorporated, and has been selected by Congress as the capital of Alaska. From its situation in the mining region it has become a centre of trade in outfitters' articles and general supplies; while its exports, including gold, furs, and other products of Alaska, have grown to a considerable commerce. Among the manufactories are iron-works, breweries, sawmills, cigar factories, etc. In the vicinity are the Treadwell gold mine and the Silver Bow mines. Villages of the Auk and Taku Indians in the neighborhood are of interest to tourists. At Juneau is the United States land office for Alaska. Its public schools are well conducted, and its waterworks, electric-light system, and other public improvements give it all the essential conveniences of a modern American city. Cable service is established here. Pop. (1890) 1,253; (1900) 1,864.

Jung-Stilling, Johann Heinrich, yō'hän hin'riH yoong stil'ling, German mystical author: b. Grund, Hesse Nassau, Germany, 12 Sept. 1740; d. Carlsruhe, Baden, 2 April 1817. In the early part of his career he was by turns, a charcoal burner, school master, and tailor, and in 1771 went to Strasburg to study medicine. Here he became acquainted with Goethe, who has sketched him in 'Aus meinem Leben.' He was professor of political economy in the Universities of Marburg and Heidelberg, 1787–1806, and the remainder of his life was passed at the court of the Grand Duke of Baden. His writings, which include several romances as well as distinctly religious works, are more or less mystical in tone. Among them are 'Geschichte des Herrn von Morgenthau' (1770); 'Geschichte Florentins von Fahlendorn' (1783); 'Theobald' (1784–5, an English version of which appeared in New York 1846); 'Das Heimweh'; 'Theorie der Geisterkunde' (1808, in English 1834); 'Scenen aus dem Geisterreiche' (1797–1801), and his famous autobiography 'Heinrich Stillings Leben' (1806). In the publication of this he was aided by Goethe. The work was completed in 'Heinrich Stillings Alter' (1817).

Jungfrau, yoong'frow (Ger. "virgin," or "maiden"), a mountain of Switzerland, in the Bernese or Helvetic Alps, on the frontiers between the cantons of Bern and Valais, 12 miles southeast of Interlaken. It is one of the most magnificent mountains in Switzerland and the loftiest calcareous mountain in Europe; height 13,670 feet. It was first ascended in 1811.

Junghaus, yoong'hows, **Sophie,** German novelist: b. Cassel, 3 Dec. 1845. She became well known by the publication of 'Kathe, the Story of a Modern Maid' (1876). Later works of hers are: 'The House of Eckberg,' a study of life during the Thirty Years' War (1878); 'Die Erbin wider Willen' (1881); 'Die Gäste der Madame Santines' (1884); 'Der Bergrat' (1888); 'Zwei Brüder' (1889); 'Zu rechter Zeit' (1892); 'Um das Glück' (1896); 'Junge Leiden' (1900).

Jungle, an Indian term applied to a desert and uncultivated region whether covered with wood and dense vegetation or not, but in English it is applied to land covered with forest trees, thick impenetrable brushwood, or any coarse rank vegetation.

Jungle Books, The (1895), by Rudyard Kipling. The central figure in these books is the boy Mowgli, who, straying from his village home when an infant, had been lost in the forest, and there sheltered and nursed with her own cubs by a mother-wolf, and the hairy Orson. Joined to this element of human interest, and with the coloring of high romance, these

stories picture the personal characteristics and social and political life of the gaunt wolf-family in their cave and the free republic of wolves. Unlike the talking beasts in Æsop's fables, those of the 'Jungle Books' are not men in hides and on all fours discussing human problems. Kipling's genius represents them thinking and behaving each according to his own peculiar beastly habit and experience, with great dramatic skill.

Jungle-cat, or **Chaus,** the common wildcat of India (*Felis chaus*). It is 26 inches long in head and body, has a short tail, reaching only to the heel, and is yellowish gray, more or less dark and unspotted, tinged with reddish on the sides, marked by a dark stripe from the eyes to the muzzle, and with reddish black ears slightly tufted. Another Indian "jungle-cat" is the handsome *F. ornata,* which is profusely spotted; it dwells in the desert regions of the Northwestern provinces. Both these cats are said to interbreed with domestic cats, and thus no doubt long ago influenced the varieties of the tamed stock.

Jungle-fever, a severe variety of remittent fever, prevalent in the East Indies and other tropical regions. It is characterized by the recurrence of paroxysms and of cold and hot stages. The remissions occur usually in the morning and last from 8 to 12 hours, the fever being mostly typically developed at night.

Jungle-fowl, the English book-name of a genus of pheasants, the source of domestic fowls, characterized by a fleshy frontal comb and wattles, and the peculiarly laterally compressed tail with its long, drooping, curved feathers. This genus (*Gallus*) is represented by several species in southern Asia, especially India, and the Malay and Philippine Islands. The common jungle-fowl (*Gallus gallus* or *bankiva*) is especially noteworthy as the original stock of our barnyard fowls. The wild birds, which are quite common in cultivated parts of central India and about the bases of the Himalayas up to an elevation of 5,000 feet, closely resemble some of the varieties of game cocks and hens. The sexes differ as in the domestic birds in size, character of tail feathers, combs, wattles, spurs and color. Although naturally living in flocks in the jungles and forests, these haunts are often forsaken for the purpose of feeding upon grain in the cultivated fields. They run with great speed, are tolerably good flyers and roost in trees. The cock crows and the hen clucks and cackles much as domestic fowls do. In the wild state the jungle-fowl is said to be monogamous; eggs to the number of 10 or 12 are laid in a simple depression in the ground lined with leaves and grass. Consult Darwin, 'Animals and Plants under Domestication'; Tegetmeier, 'Ibis' (1891); and Blanford, 'Fauna of British India.'

In Australia this name is often given to the mound-birds.

Juniata, joo-nĭ-ăt'a, a river of Pennsylvania formed at Petersburg, about six miles northeast of Huntingdon, near the centre of the State, by two streams rising in the Alleghany Mountains — the Little Juniata and the Franks-town Branch. Its course is winding, but it flows in a generally eastern direction for about 150 miles, entering the Susquehanna at Duncannon, 14 miles above Harrisburg. Along the greater part of its course the scenery is picturesque, often marked by grandeur where the river breaks through the mountains that rise in parallel ridges across its path. The Juniata is not a navigable stream, but from its source to its mouth its banks are followed by the Pennsylvania Canal and the Pennsylvania Railroad, the latter crossing the river several times.

Juniata College, a coeducational institution, located at Huntingdon, Pa.; established in 1876 under the auspices of the German Baptist Brethren. Special attention is given to the religious education of the students; one of its principal courses is the history and literature of the Bible. It has art, music, normal, and commercial departments, also a preparatory school. The courses lead to the degrees of bachelor of arts, and of English and sacred literature. In 1903 there were in attendance 350 students, and 21 professors and instructors were connected with the school. There were about 21,000 bound volumes and over 4,000 pamphlets in the library.

Junin, hoo-nēn, Peru, department in the interior; has an area of 23,347 square miles. It is located in the wildest parts of the Cordilleras. Agriculture is neglected and large deposits of silver remain unworked. A railroad connects the southern part with Lima on the coast. The capital city is Cerro de Pasco. Pop. of the department 394,393.

Junior Order of United American Mechanics. See UNITED AMERICAN MECHANICS, JUNIOR ORDER OF.

Ju'niper, a genus (*Juniperus*) of ornamental evergreen trees and shrubs of the order *Coniferæ,* consisting of about 35 species distributed mainly throughout the cooler parts of the northern hemisphere, but also in America extending to Mexico and the West Indies. The species have branches which spread in all directions from the main trunk and limbs, small, rigid, needle-like or scale-like opposite leaves; unisexual flowers, the two sexes usually upon separate plants, the staminate, yellow and in catkins, the greenish pistillate ones followed by fleshy, berry-like cones containing from one to six, sometimes 12 seeds, which may not attain maturity until the second or third year. The best known species in the United States is probably the Virginian juniper, red cedar or savin (*Juniperus virginiana*), to be found everywhere east of the Rocky Mountains, upon rocky and sandy soils, mountain sides, etc. It often attains 100 feet in height, its upright or spreading branches forming a handsome conical head. Its numerous attractive horticultural varieties are largely planted in parks and cemeteries. The trunks are highly prized for fence posts, being exceedingly durable; the handsome, red, heart-wood is valued for turning, cabinet work, cooperage, and especially for lead-pencils; but the tree is looked upon with disfavor by the orchardist, because it is one of the hosts of apple rust. See APPLE, paragraph *Diseases.*

The common juniper (*J. communis*) is a smaller species, rarely reaching 50 feet in height and usually less than 25 feet tall, and many of its numerous varieties less than 10 feet. It is

widely distributed throughout the northern hemisphere, especially in the colder latitudes and altitudes. Like the preceding species its wood is valued, when of sufficient size, for posts, veneers, pencils, and for turning. The tree itself is also used for ornamental planting. Its bark is sometimes twisted into ropes and its long, tough, fibrous roots are used for making baskets. Its blue-black fruit, which it yields profusely, is used for flavoring certain liquors, as is also the oil obtained from them and from the twigs by distillation with water. This oil has been used in medicine as a stimulant, but is less popular than formerly. The Bermuda cedar (*J. bermudiana*) resembles the Virginian juniper, but is of stouter build, though it rarely exceeds 40 feet in height. Its wood is rather more fragrant than that of the preceding species, like which it is used. Formerly it was employed in the ships built in the Bermudas, but the forests which supplied this industry were mismanaged and the industry perished. Several other species are of more or less economic importance; for instance, the Spanish juniper (*J. oxycedrus*), a shrub which attains a height of about 12 feet, whose fruits yield a disagreeable smelling oil (oil of cade), used in veterinary medicine; and African juniper (*J. procera*), a useful timber species and probably the largest of the genus, often attaining heights of 150 feet in the mountains of eastern Africa, where it is native.

Junipers succeed best in moderately moist, sandy loam in open, sunny situations. They make excellent windbreaks and shelter belts, especially where the soil is too dry, rocky or gravelly for other trees. They may be propagated by seeds which, however, usually require two, sometimes three, years to germinate. Cuttings of almost mature wood are taken in the autumn from the needle-leaved kinds and grown under glass or in the open; species with scale-like leaves are generally side-grafted in the greenhouse during winter. Some of the shrubby species are propagated by layers.

Junipero, Miguel José Serra, mē-gĕl' hō-sā' sĕr'rä hoo-nē'pā-rō, Spanish missionary in America: b. island of Majorca 24 Nov. 1713; d. Monterey, Cal., 28 Aug. 1784. He became a member of the Franciscan order in 1729, in 1750 arrived in Mexico City as a missionary, and in 1750–69 was active among the native tribes. In 1769 he went to the site of San Diego Cal., where he founded a mission. He gathered about him a band of sixteen of his order, and these missionaries converted over 3,000 Indians, of whom Junipero himself is said to have baptized more than 1,000. Junipero instructed the natives in the arts of civilization, and the colonies which assembled about the mission stations constituted the first settlements in California. His headquarters were at Monterey, but he founded several other missions. Bret Harte incorrectly gives his name as Serro.

Ju'nius Letters, The. During the period between November 1768 and 21 Jan. 1772, there appeared in the London *Daily Advertiser* a series of mysterious letters aimed at the British ministry of that day, and signed by various pennames — the most remarkable of them by that of one "Junius." During the century ensuing, the authorship of these epistles has been assigned with some degree of probability. The merits of the 'Letters' have been sufficient to give them a life all the more vigorous, perhaps, because they have been conjecturally assigned to Sir Philip Francis. The author was a man thoroughly cognizant of British politics; a vehement opponent of the government, and a fiery pleader for popular liberty. The dominant message is sounded in these words from the first letter of the series: "The admission of a free people to the executive authority of government is no more than compliance with laws which they themselves have enacted." Much constitutional knowledge is shown in these trenchant attacks, which continually refer to the British Constitution as the bulwark of the people's rights. In manner, the letters are vigorous, bold, and among the finest specimens of impassioned invective and irony in English literature.

Junkers, yoong'kĕrz, a name given to the younger members of the nobility of Prussia and the adjoining states. "Junkerthum" was a term of reproach used in the 19th century to designate the party of reaction in Prussia, which found its most strenuous supporters among the nobility.

Junk'in, George, American Presbyterian clergyman: b. near Carlisle, Pa., 1790; d. 1868. He was graduated from Jefferson College (Pa.) in 1813 and entered the Presbyterian ministry in which he became prominent as a leader of the party known as Old School Presbyterians. He founded Lafayette College at Easton, Pa., in 1832, and was its president till 1841, returning thither in 1845, after three years spent as president of Miami College at Oxford, Ohio. In 1848 he became president of Washington College (now Washington and Lee). He was an outspoken upholder of slavery, but was opposed to secession, and on account of his Union sentiments resigned the presidency of the college in 1861. Consult: 'Life' by D. X. Junkin (1871).

Junks, large flat-bottomed vessels, from 100 to 150 tons burden, used by the Chinese. They have three masts, and a short bowsprit placed on the starboard bow. The masts are supported by two or three shrouds, which, at times, are all carried on the windward side. On the fore and main mast is a sort of lug-sail, of cane or bamboo.

Ju'no, the most exalted divinity of the Latin races in Italy next to Jupiter, of whom she was the sister and wife; the equivalent of the Greek Hera. She was the queen of heaven, and under the name of Regina (queen) was worshiped in Italy at an early period. She bore the same relation to women that Jupiter did to men. She was regarded as the special protectress of whatever was connected with marriage. She was also the guardian of the national finances, and a temple, which contained the mint, was erected to her under the name of Juno Moneta on the Capitoline.

Junot, Andoche, äṅ-dōsh zhü-nō, Duke of Abrantes, French marshal: b. Bussy-le-Grand 23 Oct. 1771; d. Montbard 22 July 1813. He was intended for the bar, but on the outbreak of the revolution joined a volunteer battalion,

and soon attracted notice. At the siege of Toulon, in 1793, he became secretary to Napoleon, and went with him into Italy and Egypt in the capacity of aide-de-camp. In Egypt he was advanced to the rank of general of brigade. In 1800 he was made commandant of Paris, and he particularly distinguished himself at the battle of Austerlitz in 1805. In 1807 he was sent with an army into Portugal, and made his entry without opposition into Lisbon, his success being rewarded with the title of Duke of Abrantes. On the arrival of the British he was defeated at Vimeira, and was then obliged to submit to the humiliating convention of Cintra. Although he subsequently took part in the campaigns (1809) against Austria, (1810) against Spain, and (1812) against Russia, he failed to retrieve his reputation. In 1813 he became insane, and lost his life by leaping from a window.

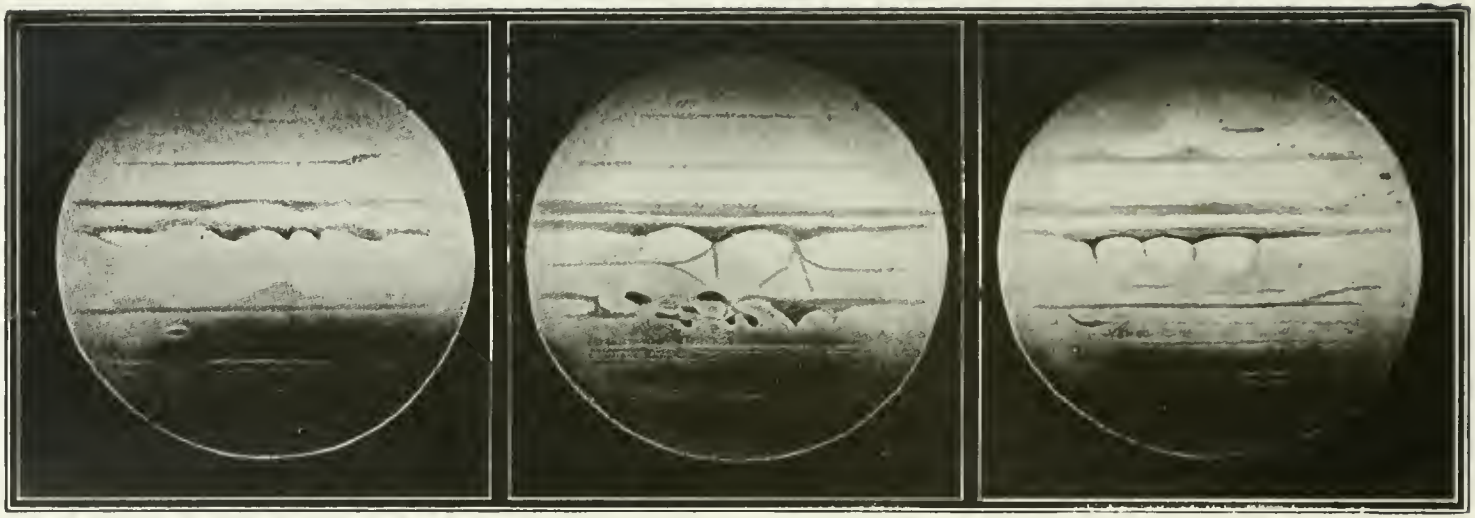
Junta, a high council of state; a term common in all Spanish-speaking countries. It was originally applied to an irregularly summoned assembly of the states, as distinguished from the cortes or parliament regularly called together by the authority of the king. In Cuba the term was adopted by the insurgents before the Spanish-American war, to designate the general legation of the Cuban republic abroad. This legation or junta was first appointed 19 Sept. 1895, by the Constituent Assembly that formed the insurgent Cuban government, which at the same time made T. Estrada Palma head of the junta and chief Cuban representative abroad, with authority to appoint ministers to all governments and to have control of Cuba's diplomatic relations and representatives throughout the world. The junta established its headquarters in New York, and was the organization through which the insurgents' friends outside of the island communicated with the Cuban soldiers in the field during the Spanish-American war. See CUBA.

Junto, The, a club formed in Philadelphia by Benjamin Franklin for mutual improvement. Morals, politics, and natural philosophy, as well as the social well-being of man, were the main subjects discussed. It continued for about 30 years. The name was also applied to an English Whig ministry in the reign of William III., the chief members of which were Admiral Russell, Somers, Lord Wharton, and Montague, the great financier. This was the first ministry ever made of one and the same party politics. It was the suggestion of Robert, earl of Sunderland, to William III., who shrewdly said, if all the ministers were of one party they would pull together.

Jupati, joo'pä-tē, a palm (*Raphia tædigera*) of the tide-flooded lands of the lower Amazon and Pará rivers, remarkable for its leaves, probably the largest in the vegetable kingdom. The trunk is only 6 or 8 feet high, and 1 foot in diameter. The leaves rise nearly vertically from the trunk, bending out on every side in graceful curves, forming a magnificent plume 70 feet in height and 40 in diameter. Leaves have been measured 50 feet long, and the leaf-stalk is often 12 or 15 feet long below the first segments of the leaf, and 4 or 5 inches in diameter, perfectly straight and cylindrical, and when dried light and strong as the quill of a bird. The Indians split it into laths for a variety of purposes — window-shutters, boxes, bird-cages, partitions, and even entire houses being constructed of it, with the addition of a few supporting posts at the angles. The fruit, a large oblong drupe, has a bitter oily flesh.

Jupiter, joo'pĭ-tẽr, or **Juppiter,** the supreme deity of the Latin races in ancient Italy, the same as the Greek Zeus. As the supreme deity Jupiter received from the Romans the title of *optimus maximus* (best greatest), and as the deity presiding over the sky he was considered as the originator of all the changes that took place in the sky. From him accordingly proceeded rain, hail, and the thunderbolt, and he it was that restored serenity to the sky after it had been obscured by clouds. Hence the epithets of Pluvius (rainy), Tonans (thundering), etc., were applied to him. The most celebrated of his temples was that on the Capitoline Hill dedicated to him as Jupiter Optimus Maximus, jointly with Juno and Minerva. He was represented with a sceptre as symbolical of his supreme authority. He was the guardian of all property; and every Roman was believed to be under his protection, and that of his consort Juno, the queen of heaven. White animals were offered up to him in sacrifice, his priests wore white caps, and his chariot was represented as drawn by four white horses. See JUNO.

Jupiter, the largest planet of the solar system, and the fifth (excluding the asteroids) in order of distance from the sun. Its mean diameter is about 85,000 miles; polar diameter about 82,000; its mean distance from the sun 475,692,000 miles; its period of revolution round it 11 years 10⅓ months; its orbit is inclined to the ecliptic at the angle 1° 18′ 40.3″. The inclination of its axis is 3° 5′ 30″, so that changes in the seasons must be almost unknown; its volume is 1,300 times that of the earth, but its mass is only 300.857 times. Jupiter has five moons, the last was discovered by Barnard, at Lick Observatory in 1892. The other four were discovered by Galileo in 1610 and are visible through an ordinary telescope. They are at average distances of from 267,380 to 1,192,820 miles from the planet; they appear to make one revolution on their axis while passing once round the planet. Europa, the smallest, has a diameter of 2,099 miles, somewhat less than that of our moon; Ganymede, the largest, has a diameter of 3,436 miles. The planes of their orbits are nearly the same as the ecliptic and the orbit of Jupiter. The disk of Jupiter is crossed in a direction parallel with the equator by three or four vividly marked bands or belts; other of these belts vary in density and distinctness. Spots also appear and remain for some time on its surface. In particular, a large red spot of varying dimensions has been observed from time to time. Professor George Washington Hough sums up the results of his 23 years of observations of Jupiter somewhat as follows: First, its equatorial belt changes both in size and position slowly and gradually. Second, the fainter belts also vary. Third, the circular white spots are very permanent in latitude, but are not fixed in position one with another. Fourth, the dark spots of the same size as the circular white spots are not so stable as they, and probably lie at the level of the equatorial belt. Fifth,



1896, MARCH, 2d. 6h, 30m. G.M.T. 1897, MARCH, 9d. 11h. 55m. G.M.T. 1898, APRIL, 4d. 9h. 55m. G.M.T.

CHANGES IN THE ASPECT OF THE PLANET JUPITER OBSERVED AT VARIOUS TIMES.

the large, irregular white spots near the equator make one rotation in 9 hours 50 minutes. As to the constitution of the planet, Prof. Hough concludes that the matter at the visible boundary of Jupiter has a density about half that of water (the average density of the planet is 1.37 times that of water). The medium at the boundary is in the nature of a liquid. In it the great red spot and the circular white spots are located. In such a medium all motions would be slow and gradual and the shape and size of an object would be very permanent. The equatorial and polar belts may be located on the surface or at a higher level than the red spot. In middle latitudes within 20° of the equator the higher atmosphere carries a layer of dark matter. In this envelope are formed the openings that we call white spots, and by unequal distribution black spots. The belts may be assumed to be some sort of vapor of considerable density. The planet is at a high temperature, but not self-luminous.

Jura, joo'rä, a chain of mountains in central Europe, partly belonging to France, partly to Switzerland, between which they form a sort of natural barrier, extending from southwest to northeast, and exhibiting a number of parallel ridges. The greatest length is nearly 200 miles, from Belley in France, department of Ain, to the banks of the Rhine; and the greatest breadth about 60 miles, between the Lake of Geneva and the banks of the Doubs. The principal geological formation is the Jura limestone, with greensand, belonging to the lower cretaceous series. Stalactite caves are numerous. The two chief rivers having their source in the chain — the Ain and the Doubs — are both French. They descend from its western slopes, and belong to the basin of the Rhone. The highest peaks of the Jura are Crêt de la Niège, Reculet, Mont Tendre, and Dôle, all over 5,500 feet.

Juras'sic, a system or series of formations with like characteristics, and containing fossil remains indicating a time occupying the first half of the Mesozoic period, and characterized by many changes in the distribution of sea and land, especially in the northern hemisphere, where the present continental areas were apparently represented by archipelagoes. The formations of this period take their name from their prominent exposure in the Jura Mountains; but are known in Great Britain as the Oölites because there made up of granular (oölitic) limestones below the Cretaceous and above the Lias, from the latter of which the series is separated by no very definite boundary. In America synchronous formations are, indeed, called "Juratrias" and represent the transition from the Permian to the Cretaceous. The Jurassic is represented somewhat in South America and in the western United States, as in the highly fossiliferous "Como stage" beds of Wyoming, and the auriferous state of California, but most strikingly in the brown "bird-track" sandstones of the Connecticut Valley, in Nova Scotia, and in the red rocks that crop out along the eastern foot of the Alleghanies from New Jersey to South Carolina. During this period most of the globe now dry land was covered with shallow seas which were the abode of a great variety of lowly fishes and reptiles. On land it was the height of the age of reptiles, and especially of dinosaurs (q.v.) and pterodactyls. Toward its close the progenitors of birds appeared in the shape of *Archæopteryx* (q.v.), and traces of mammals are found. Consult authorities mentioned under GEOLOGY.

Jurel, joo'rĕl, or **Xurel,** a fish of the genus *Caranx*, especially *C. crysos*, more widely known as the yellow mackerel and hard tail. Unlike most members of this tropical genus, the jurel is common as far north as Cape Cod. In Florida and the Gulf States it is an important food-fish, caught in seines during the spring and summer when in shallow water for the purpose of spawning. It is migratory, and like most wandering fishes carnivorous and voracious.

Jurisdiction includes both the right to exercise authority (*imperium*) and the field within which such authority may properly be exercised (*dominium*), whether its limits be territorial or personal. In early law, jurisdiction in the second sense was rather personal than territorial, and the same must be true wherever distinct races occupy together the same territory. While the tendency is to gradually work out a system of law applicable to all inhabitants, the state must of necessity recognize the fact that its subjects of different races will consent to be governed only by separate and often contrasting systems. Such is the case, for example, in British India to-day. So, too, jurisdiction was divided according to the subject matter, and the Church secured and jealously maintained authority over all matters of conscience, and managed to extend the jurisdiction of the ecclesiastical courts to very important questions, including marriage, legitimacy, wills, and administrations, and to actions affecting the personal rights of the clergy.

The Constitution of the United States discriminates clearly and sharply between the executive, the legislative, and the judicial powers of government, and its provision that the Constitution and the laws of the United States made in pursuance thereof shall be the supreme law of the land, taken in connection with the provision that the judicial power shall extend to all cases arising under the Constitution, forms the basis of a jurisdiction which, at least in the extent to which it has been carried, is without precedent outside of the United States. It is by virtue of these provisions that the Federal courts exercise the power of declaring void acts of Congress or of the State legislatures which conflict with the Constitution of the United States. To this power and the energy and ability of the Supreme Court in its exercise, are due the vigor and efficiency of the Federal government and the establishment of its supremacy within the field of its jurisdiction. This feature has been imitated in the several State constitutions with results unquestionably beneficial as a whole, and so important that the courts have come to be spoken of as the guardians of the constitution. But one result not so fortunate is that the legislative branch of the government, though in theory as much bound by constitutional restrictions as though there were no authority to which an appeal against the validity of its enactments can be taken, is manifesting a disposition to disregard them altogether, leaving the whole question of con-

stitutionality to the courts. As our system of government provides no method by which the question can be raised, except in the course of a litigation in which one party relies upon the right conferred by such a statute, there are possibly many unconstitutional acts in force in the various States. A more important consideration is that a disposition on the part of the judiciary to interfere with matters properly legislative may thus be created, and lead to forced constructions by which any law which the judges believe to be bad is held obnoxious to the constitution — resulting in illogical and inconsistent decisions, and a weakening of the authority of the courts.

The Constitution provides that the judicial power of the United States shall extend to controversies "between citizens of different States." The purpose was to open the way for legislation which would provide a tribunal in which the right of a citizen of any State to pursue his legal remedies could not be denied; probably, too, to afford him a tribunal less likely to be affected by local prejudice than a State tribunal of first instance, probably a county court. It is not contended that anything further was designed, but upon this clause depends the most extensive and, except for the provision as to constitutional interpretation which we have just considered, the most important, body of Federal decisions. The tendency of the Supreme Court was at first to hold that the Federal court should administer the law of the State in which it was sitting and that while a citizen of Pennsylvania, for example, having a claim against a citizen of New York, might, if he saw fit, bring his action in the Federal, rather than in the State, court — the law to be applied would be the law of the State of New York. But this rule has been departed from in the later decisions, and while the Federal courts still hold themselves bound to follow the interpretation put upon State statutes by the State courts (unless, of course such statutes are attacked as in conflict with the Constitution of the United States), they hold themselves free to disregard the interpretation of the common law by the State courts, and the system of law built up within the State by the adjudications of its courts, and to adopt their own interpretation, and follow their own judgment. That the Federal courts are popular is shown by the fact that the most important litigation, estimated on the basis of the amount at stake is, where possible, usually brought before them, notably proceedings against corporations and especially the foreclosure of corporation mortgages where it is quite common for the trustee for the bondholders to be a corporation or individual of another State, or where a committee of bondholders, or even a single bondholder, residing outside the State which is the domicile of the debtor corporation, is the plaintiff. This is sufficient to give jurisdiction to the Federal court.

We have therefore a most interesting condition of concurrent jurisdictions applying to every inhabitant of the United States. The Federal courts are courts of limited jurisdiction — limited to authority expressly conferred by the Constitution and laws of the United States, but once jurisdiction is established, unlimited in the scope of its exercise. Congress has prescribed that the jurisdiction shall only exist when the matter in controversy has a pecuniary value exceeding $2,000, and that actions shall be brought only in the district within which the plaintiff or the defendant resides, and has made provision for the removal from the State courts of causes which might originally have been brought in the Federal courts. Some of the States have attempted to prevent this increasing jurisdiction of the Federal courts; for example, by the passage of acts providing as a condition of a license to a foreign corporation to do business within the State, that such corporation, if sued, would not remove the cause into the Federal court. Such acts are manifestly unconstitutional, and have been so declared.

JOHN DOUGLASS BROWN,
Philadelphia.

Jurisprudence. See LAW.

Jury, twelve impartial men legally competent to act, who, under the sanction of their oaths, determine by their unanimous verdict the innocence or guilt of the accused in a criminal trial, or decide the issues of fact which are contested between plaintiff and defendant in a civil trial.

The jury is the characteristic feature of English or Common law, distinguishing it from the systems of Continental Europe derived from the law of the Roman Empire. It is peculiar in itself and incidentally it has produced characteristic developments of our law not found in the Roman or Civil law systems, of which perhaps the most noteworthy is our law of Evidence. The history of the jury system has been most thoroughly and ably investigated, especially in recent years.

Its function has completely changed. Originally those persons from the vicinity who had knowledge of the subject matter were summoned to court to state, upon their solemn oaths, what the common opinion of the neighborhood was as to those facts which formed the basis of the criminal charge to be tried, or the basis of the right to possession or enjoyment of land which was at issue, which were the typical cases of early days. It seems to have been soon established that 12 substantial men were a sufficient number to determine this question. As the judicial system developed, courts came to have more extended territorial jurisdiction, and litigation grew more extensive. Attendance of 12 persons acquainted with the facts of each cause to be tried would impose an intolerable burden upon the community, and our forefathers worked out the plan of submitting their legal controversies to the decision of an impartial jury sworn to determine the facts in issue upon testimony given under oath by witnesses summoned by the parties.

Students of English and American history would probably unanimously agree that as a part of our system of civil government the jury has been a valuable institution. There can be no doubt of its educational value, and of its importance in making each freeholder who served on a jury feel that he was individually performing an important public duty. Juries played a conspicuous part in defense of popular rights against attempts at tyrannical exercise of authority by the executive government. In the libel cases of the 18th century the contest was bitterly fought, the judges, under the lead of Lord Mansfield, maintaining that whether a document

was libellous or not libellous was a question of law for the court (that is, for the judge) to determine, the jury being limited to finding affirmatively or negatively the fact of publication; while the juries, on the other hand, contended for their right to find general verdicts ("guilty" or "not guilty"). The contest was settled by Fox's Libel Act in favor of the right of the jury to determine the guilt or innocence of the accused.

Students of law differ as to the merits of the jury system. Arguments drawn from the supposed mental inferiority of juries need not be considered, since this is not an inherent defect, and there is no more reason why a community should have inferior jurymen than inferior officials of any other class. But weighty objections of an essential character have been suggested. The chief is as to the requirement of an unanimous verdict, which, it is argued, must constantly produce a disagreement and failure to reach a conclusion, or the sacrifice of opinions conscientiously held by some of the jurors. There is no doubt that this requirement is an essential feature of the jury system as known to English law; it has been expressly so decided by the Supreme Court of the United States which, in interpreting the clause of the Federal Constitution which provides that in civil suits in the Federal courts "the right of trial by jury shall be preserved," has held that this requires the unanimous verdict of 12 men. A small number of the States have modified the system by providing for juries of less than 12, or of verdicts rendered by a vote less than unanimous. When such legislation is not in conflict with the State constitution it is lawful, as is doubtless the provision authorizing the service of women on juries.

Another objection is the doubt as to whether the jury is the best means of arriving at determinations of fact. This controversy has been bitterly fought, one side maintaining that the jury is not fitted, either by training or capacity, to decide fairly and intelligently doubtful questions of fact, and that one of its most important functions, that of assessing damages, is not properly performed, especially where the requirement of unanimity necessarily leads to compromise verdicts. On the other hand it is argued that the jury, if properly drawn, represents the average intelligence of the community, and that when it does so, no fairer tribunal can be discovered, and not, perhaps, very consistently, that in civil matters control of the case is really in the judge, who by careful instructions can usually so direct the jury as to bring about an intelligent verdict, or, as a last resort, can set aside one which is clearly wrong, and award a new trial.

A verdict of acquittal in a criminal proceeding finally disposes of the charge against the defendant both by the common law and, in this country, by the provisions of the Federal Constitution (and of most, if not all, of the State constitutions) that no person shall "be subject for the same offense to be twice put in jeopardy of life or limb." Doubtless from this arose the doctrine that in criminal cases the jury are judges both of law and fact, which caught the popular fancy, is not without the weight of respectable judicial authority to sustain it, from the time of Junius, who upheld it in opposition to Lord Mansfield, has been a favorite doctrine of popular leaders, and only in recent years may be regarded as finally disposed of. The doctrine was discussed by Chief Justice Mitchell, of Pennsylvania, in a capital case in 1891, and pronounced by him to be "unsound in every point of view, historical, logical, or technical," and in 1895 the Supreme Court of the United States (speaking by Mr. Justice Harlan) reached the same conclusion and held that in the courts of the United States it is the duty of the jury in criminal cases to receive the law from the court, and to apply it as given by the court, subject to the condition that by a general verdict a jury of necessity determines both law and fact as compounded in the issue submitted to them in the particular case. Mr. Justice Gray filed a long and able dissenting opinion concurred in by Mr. Justice Shiras, and in this case, reported in 156 United States Reports (page 51), all the arguments on both sides can be found.

The grand jury is, historically, a sort of representative committee of the people of the district throughout which the jurisdiction of the court extends, charged with the duty of reporting to the court offenses which have been committed which they consider should be inquired into, and persons whom they believe to have committed criminal acts for which they should be punished. Its development into the modern grand jury is not well understood. The highest authorities on our early legal history say of it, "The details of this process will never be known until large piles of records have been systematically perused. This task we must leave for the historian of the 14th century."

The grand jury as an existing institution consists of a number of persons drawn from the same class as the ordinary or petit jurors. At the common law the number summoned was 23. They are sworn to the faithful discharge of their duties, and the court then delivers a charge to them, calling their attention to the duties they are to perform, either generally or with reference to any matters of special public interest falling within their jurisdiction to which the court thinks proper to direct their attention, and they can then proceed to business. All indictments are submitted to them and, according as they determine, after hearing the prosecutor's evidence, whether they are well founded or not, they indorse them "true bill" or "ignoramus" (or equivalent words). In the former case the accused is held for trial, in the latter discharged. It is the custom for them to make report to the court on such matters as seem to them of public interest and importance, and to make such recommendations as seem good to them. The report made by them of any offense from their own knowledge or observation, without a bill of indictment laid before them, is called a Presentment.

For the history of the origin and development of the jury, consult: Pollock and Maitland, 'History of English Law'; Thayer, 'Preliminary Treatise on Evidence at the Common Law' (chapters ii.–iv.); Stephen, 'Commentaries on the Laws of England' (Bk. V., ch. xiv.); Stubbs, 'Constitutional History of England'; Cooley, 'Constitutional Limitations.' For a discussion of the merits of the institution under modern conditions which is generally accepted as full and impartial, consult 'The System of Trial by Jury,' by the late Mr. Justice Samuel F. Miller (21 Amer. Law Review, 859). For the origin of the grand jury: Pollock and

Maitland, 'History of English Law' (Bk. II., ch. ix., § 4).

JOHN DOUGLASS BROWN,
Attorney at Law, Philadelphia.

Jusserand, Jean Adrien Antoine Jules, zhŏn ädrēäṅ än-twän zhül zhü-sĕ-rän, French diplomat and author: b. Lyons 18 Feb. 1855. He was educated at the Faculté de Lyon, in 1878, entered the French ministry of foreign affairs as consul at London; subsequently held other posts in the ministry, among them that of chief of the bureau of Tunisian affairs, and that of associate sub-director of the protectorate; in 1887–90 was councillor of the French embassy in London. In 1890 he became minister to Denmark, and in 1902 ambassador to the United States. His best known work is his 'Les Anglais au Moyen Age: La Vie Nomade et les Routes d'Angleterre au 14me Siècle' (1884; trans. by Smith as 'English Wayfaring Life in the Middle Ages' 1892), which was crowned by the Académie. Of his further writings, the following have appeared in English: 'The English Novel in the Time of Shakespeare' (1890); 'A French Ambassador at the Court of Charles II.' (1892); 'Piers Plowman' (1894); 'English Essays from a French Pen' (1895); 'A Literary History of the English People,' vol. I. (1895); 'Shakespeare in France under the Ancient Régime' (1899).

Juste, Theodore, Belgian historian: b. Brussels 11 Jan. 1818; d. August 1888. He was secretary of the Belgian board of education and as such made many beneficial changes in the national methods of instruction. He was a prolific writer on Belgian and French history, the most noteworthy of his works being: 'Historie élémentaire de la Belgique' (1838); 'Histoire de la révolution Belge de 1790' (1846); 'Précis de l'histoire du moyen âge' (1847–9); 'Le soulèvement de la Hollande en 1813, et la fondation du royaume des Pays-Bas' (1870); 'Guillaume de Taciturne' (1873); 'Léopold I. et Léopold II., rois de Belges' (1878); 'Les fondateurs de la Monarchie Belge' (27 vols., 1865–81); 'La révolution de juillet, 1830' (1883); etc.

Justice, Department of, in the United States, an executive branch of the government, the supreme head of which, the attorney-general, is appointed by the President and confirmed by the Senate. He is a member of the cabinet, according to the provisions of the Act of Congress of 19 Jan. 1886, ranking fourth, after the Vice-President, in the line of succession to the Presidency in case of a vacancy in that office, and his salary is $8,000 a year.

The office of attorney-general was established in 1789, almost at the beginning of the government, being provided for by the great act that established the federal courts, but the department of justice was not organized into a separate department nor placed under the charge of the attorney-general until 1870, when by the act of 22 June of that year, the establishment of this department brought under his control all United States district attorneys and marshals and secured uniformity in the trial and prosecution of cases. By this act the solicitors from the interior, navy and treasury departments and the examiner of claims of the state department were also brought under the control of the department of justice.

As head of the department of justice, the attorney-general is the chief law officer of the government, is the legal adviser of the President on any questions of law which may arise in the conduct of administrative affairs, and is also required by statute to give his advice and opinion, when requested, to the head of any executive department on any question of law arising in his department. The attorney-general represents the government in all cases at law to which it may be a party, but he rarely argues the case in person, this work being performed by his subordinates, whom he appoints, or by special counsel whom he is authorized to employ in cases of especial importance to the government. The attorney-general passes upon the validity of the title to public lands or other property to be purchased by the government for the erection of public buildings or for other public purposes; he also exercises general superintendence and direction over the attorneys and marshals of all the districts in the United States and the Territories as to the manner of discharging their respective duties. The supervision of the penal and reformatory institutions of the United States, the supervision of the revision and codification of the criminal and penal laws, the recommendation of judicial appointments, the administration of the national bankruptcy laws, etc., are other duties which come under the direction of the department of justice.

The solicitor-general, whose office was created in 1870, ranks as second officer of the department of justice; takes the place of the attorney-general in the latter's absence, and also has charge of the conduct of cases in the courts at Washington.

Justice, Lord, a person invested with royal authority in England for a short time, during the absence of the monarch. Queen Victoria and her successor Edward VII. have never appointed lord justices in their absence; George IV. was the last king of England to do so. The powers of lord justices have been confined to pardoning or reprieving convicts, summoning or proroguing parliament, disposing of treasury funds, and making church preferments. In the absence of the viceroy from Ireland lord justices have sometimes been appointed to perform his functions.

Justice of the Peace. See COURT.

Justification. Under this head fall many intricate problems toward the solution of which theology contributes in its discussions of that very abstract subject: Grace. The term explains itself and no matter where it is applied the fundamental idea is the same and means pardon, acquittal, readjustment, restoration. In divinity it alines itself very closely with atonement and imputation (q.v.). No matter how opinions may differ as to its nature, there is agreement on this, that justification may be defined as that process whereby fallen man is forgiven his transgression and restored as much as is compatible with his changed condition to the state and privileges which were his before his disobedience. All Christians admit that this repristination came and comes through Christ. It has been and is the duelling ground of the two religions which have most largely divided the world. Relating to this topic the attitude

of Catholics and Reformers is antipodal. The leader of Protestantism is clear in his affirmation. Catholic teaching and dogmatic enunciation is not one whit less positive. The question is cardinal for both. In the process of justification the agent is God through Christ; the object, man. The crux of the difficulty is how does God effect it and how is man affected by it. Is righteousness imparted or infused? Luther and his disciples consider justification as imputed to the individual. This restored condition is something outside himself, with which he has nothing to do. "The justified man is not only acquitted as innocent but regarded as having perfectly obeyed the Law in the person of Christ. There is to him the non-imputation of sin and the imputation of righteousness." "The faith doth not shut out repentance, hope and the fear of God in every man justified, but it shutteth them out from the office of justifying." (Church of Eng. Homily.) It becomes imperative for every attempt to solve this problem to consider man's will and divine grace. Luther apprehensive lest by any concession he might minimize the value of the latter denied free will in human nature and asserted that by faith, a strong faith in the special mercy of God and by that alone man was justified. To use his own words (Cap. 2 ad Galat.): «Faith, without and antecedently to charity, justifies.» Faith does not cause justice in any way — it is not the cause but the organ of justification. Man is in no way intrinsically affected by it and its essence is in the imputation of the justice of Christ. Calvin referring everything to the elect teaches that faith once received can never be lost, that is, a man justified is so forever, independently of his actions. Baptism is not necessary for salvation. The predestination of the elect is their salvation. The breaking up of Protestantism into the many denominations which now exist, necessarily brought variants in this doctrine, yet it may be put down as the generally accepted formula. The idea was not new if we are to credit what Saint Augustine says (De fide et oper. 14) wherein he remarks that even in the time of the apostles some, not understanding, concluded from the epistles of Saint Paul that faith alone was necessary for salvation, whereupon Peter, James and Jude wrote to instruct the faithful that such was not the meaning of Saint Paul's words. The Catholic theology has been reproached with emphasizing the worth of man's works to the detriment of divine grace. The doctrine of Catholics is that the Pope, councils, the fathers, the doctors and the apostles, and hence Christ, affirmed that justification is of a nature to require, except in infant baptism, good works on the part of man to ripen unto salvation. Faith alone will not suffice. It is gratuitous and unmerited save through Christ. It is supernatural. It is a created gift and when bestowed, as in justification, the recipient becomes inherently just, not accidentally nor vicariously. Initial justification is infused in baptism, which sacrament incorporates the one baptized into and with the mystical body of Christ, his church, and lives by grace, which is living of the life of Christ as an engrafted branch lives the life of the vine. In this incorporation, since Christ is Son of God, is founded the adoption and heirship of the baptized as sons of God. What is said of baptism is held concerning justification as administered by the other sacraments. It is not contended that by it sin is blotted out "historically," that is, sins committed do not cease to be part of man's past, but are remitted in as much as they are provocative of God's anger and as truly pardoned as if the sinner had never rendered himself guilty of them; they are effaced in the moral order and in the physical order the stains they leave on the soul are washed out, stains which make the soul displeasing to God. Natural powers, no more than the Mosiac law, suffice for salvation which is to be reached through Christ only and for which in the adult some disposition of his own contributing is requisite. Moreover, while by justification sin is remitted, this remission calls for an interior disposition and renovation of soul, whence justification is a quality superadded to the soul to which it is inherent and therefore is more than transference or imputation. The fruits of justification are the rendering of man pleasing to God, just, beautiful, like unto Christ, a living member of Christ and God's son by adoption, heir to the kingdom of heaven, a participant in the divine nature (*consors divinæ naturæ*) and capable of condign merit. When a man is justified there is within him a special indwelling of the Holy Spirit. There is no understanding with accuracy these different theories of justification save by a thorough inquiry into the views of theologians on the very abstruse questions of the incarnation and grace.

P. A. Halpin,
Saint Thomas' Rectory, New York.

Jus'tin I., Byzantine emperor: b. 450; d. 1 Aug. 527. He was a peasant of Dacia and rose from the rank of a common soldier to be commander of the imperial guard, and on the death of Anastasius I. in 518 became emperor. He relegated the civil administration to the quæstor Proclus, and between them the empire was governed with a fair amount of success. Consult Bury, 'Later Roman Empire' (1889).

Justin II., Byzantine emperor: d. 5 Aug. 578. He succeeded his uncle Justinian I. in 565. Beset with enemies outside the empire and harassed with internal discord, he in 574 solved his difficulties by abdicating in favor of Tiberius, captain of the guard. During his reign northern Italy was conquered by the Lombards, and the Persians took possession of several Asiatic provinces of the empire.

Justin (Marcus Justinianus Justinus), a Latin historian, who probably lived at Rome in the 2d or 3d century A.D. He made an epitome of the general history of antiquity by Trogus Pompeius, a native of Gaul, who lived in the time of Augustus, and whose work is no longer extant. This epitome, although incorrect in detail, is valuable for its compressed reproduction of the old histories. The first English version, by Goldingé, appeared in 1574.

Justin Martyr (JUSTINUS MARTYR), a Christian apologist and martyr: b. Flavia Neapolis, Shechem, Palestine, 100 A.D.; d. Rome 165. He began active life as a professor of Platonic philosophy, and subsequently embraced Christianity without abandoning Platonism. He was a staunch adherent of the Christian party in the empire, a keen confuter of Gnosticism, and an unwearied defender of the Christian doctrine of the Logos. In every department of Christian dogmas he stood foremost as a teacher. Eventually he went to Rome (150 A.D.) and during ten years of activity he wrote his 'Apology,' with a supplement known as the 'Second Apology,' addressed to the Emperor Marcus Aurelius. He afterward had a controversy with a Jew, an account of which is embodied in his 'Dialogue with Trypho the Jew.' He was put to death for his faith, and his day on the Church calendar is 31 April. Consult: Migne, 'Patrologia'; Semisch, 'Justinus der Märtyrer'; Aubé, 'Justin, Philosophe et Martyr' (1874).

Justin'ian I. (FLAVIUS ANICIUS JUSTINIANUS), surnamed the GREAT, emperor of the East: b. of Gothic peasant parentage at Tauresium, Illyricum, probably 11 May 483 A.D.; d. 14 Nov. 565. Patronized by his uncle, Justin I., who, from a Thracian peasant, had become emperor, he so flattered the senate and dazzled the people that he was made consul, and took the title of *Nobilissimus*. On the death of his uncle, with whom he had latterly shared the imperial power, he was proclaimed emperor, and married an actress named Theodora. During his reign the party disputes of the Greens and the Blues became so violent, that in his attempt to quell the tumults the emperor's own life was in jeopardy, and a great part of Constantinople was destroyed by fire. Aided by his generals, he was able subsequently to restore to the Roman empire a part of its former possessions, as when Belisarius in 523 and 529 defeated the Persians, and achieved victories in Africa, and when Narses put an end to the Ostrogoth rule in Italy. Turning his attention to the laws, Justinian commissioned ten learned civilians to draw up a new code, and the result was the 'Corpus Juris Civilis,' or body of civil law. He took great interest in building cities, fortifications, and churches; among the latter he rebuilt the church of St. Sophia at Constantinople. To maintain his public munificence he oppressed the people with taxes. Consult Finlay 'History of Greece' (1880); Hodgkin, 'Italy and her Invaders,' Vol. IV. (1880); Bury, 'Later Roman Empire' (1889); Hutton, 'The Church in the Sixth Century' (1897); Gibbon, 'Decline and Fall of the Roman Empire' (ed. by Bury 1896–1900).

Justinian II., surnamed RHINOTMETUS, Byzantine emperor: b. 669; d. December 711. He succeeded his father, Constantine IV., in 685, and was deposed and banished for his cruelty, by his general, Leontius in 695. He regained his throne ten years afterward, and was overthrown by Philippicus Bardens and killed.

Jute. Two species of plants yield the jute of commerce, *Corchorus capsularis* and *C. olitorius*. They are tall shrubs, 8 to 15 feet high, the fibre being produced in the bark, and known as bast fibre. Supposed to be indigenous to India, where the species grows wild, cultivated to a limited extent by other Eastern people, as the Chinese and Malays, *C. olitorius* is naturalized in all parts of the tropics to the shores of the Mediterranean. Jute was introduced into the United States by the Department of Agriculture in 1870 (see various articles in Monthly Reports of this department 1870–5), and was found to be adapted to cultivation along the line of Gulf States from Texas to South Carolina. It should be noted that the China jute of commerce is not jute at all, but a similar bast fibre derived from *Abutilon avicennæ*. This plant was experimented with in New Jersey 25 years ago, though unsuccessfully, the fibre being wrongly called American jute. In India many kinds of jute are recognized, all being known under local trade names, which are unimportant here. The value of jute as a textile lies wholly in its fineness, silkiness and adaptability to spinning, low cost of the raw material being another advantage. Several American fibre plants classed as weeds yield a better, whiter, and stronger fibre, though they cannot be utilized for economic reasons. (See special report on bast fibres, No. 6, Office of Fibre Investigations of the Department of Agriculture.) The fibre of jute, compared with other textiles, is quite inferior, the bleached filasse soon losing its whiteness and becoming a dingy, dirty brown, while its strength rapidly deteriorates. Nevertheless it may be regarded as one of our most useful fibres — too useful in certain directions, as its fineness and lustre, as well as cheapness, adapt it most readily to purposes of adulteration, and as it takes colors easily it can be stained or dyed to imitate many of the other fibres, though such frauds can be readily detected. The uses of the fibre are many, and it enters into all classes of textiles from woven fabrics of great beauty to coarse ropes and bagging. In the manufacture of fabrics it goes into curtains, chair coverings, and other forms of upholstery, carpets, webbing, burlap and bagging (especially cotton bagging), and it has been employed for imitation silk fabrics, although for this purpose the fibre requires a special treatment in order to subdivide it more finely and render it more glossy. The fibre is also made into all kinds of cordage, either honestly, as jute, or as an adulterant, considerable quantities having been used in past time for the manufacture of binding twine. It is largely employed for fine and coarse twines, small rope, sash cords, etc., and where cheapness is a desideration it fills the demand. During the fiscal year ending 30 June 1902 we consumed 131,192 tons of jute and jute butts, costing $4,480,000. The jute was worth $48, and the jute butts $24 per ton. The commercial use of jute dates back less than a century, the first exports in noticeable quantity (about 18 tons) having been made, to England, in 1828. By 1850 the exports had reached 30,000 tons; in 1871, 310,000 tons. Now some 800,000 acres are cultivated in jute, more than half of this area comprising nine districts of northern Bengal. Both high and low lands are employed for this culture, although the larger part of the crop is produced upon the «churs» or lands of recent alluvial formation along the rivers. In this country the «river bottoms» would be favorable for the culture, in localities of the South, where the requisite conditions of heat and moisture prevail.

Twelve to fifteen pounds of seed is the average quantity sown per acre, though Spon gives nearly double this amount. In India the yield is

about 400 pounds of fibre per acre. Little or no cultivation is given the crop save thinning out where overcrowded. The plants mature in three months and the crop is harvested with a bill hook or sickle at the time when the flowers have begun to show and the seed has not yet appeared. If the plants are allowed to seed, the fibre will be stronger and heavier, but harsher. In some districts, after harvesting the stalks are stacked in the field, until the leaves drop off, while in other localities stacking is not practised. The stalks are sorted as to length into three sizes, and made into bundles that one man can carry. The extraction of the fibre is accomplished by steeping the bundles in stagnant water, covering them with jungle plants, clods of earth or cow dung. When the setting is completed the ryots go into the water waist deep, and by thrashing the surface of the water with the stalks, assisting the loosening of the bark with the fingers, the fibre is separated from the wood. Afterward it is wrung out and hung upon lines to dry. Little may be said regarding jute culture in this country. Machinery would need to be used for stripping the fibre, and there are no practical machines; furthermore at the low prices which prevail for the imported jute, it is doubtful if it could be made a paying crop. The plant is adapted to cultivation in the United States and produces a superb fibre, but it would not be able to compete with India jute at 1½ to 2½ cents per pound. See Special Report (No. 8) office of Fibre Investigations of the Department of Agriculture; 'Dictionary of the Economic Products of India' and various Bulletins of the Royal Gardens, Kew, England. See CORDAGE; CORDAGE INDUSTRIES; FIBRE; INDIA.

CHAS. RICHARDS DODGE,
Commercial Fibre Expert, Washington, D. C.

Jutiapa, hoo-te-ä'pä, Guatemala, a department bounded on the north by Jalapa and Chiquimula; on the south by the Pacific Ocean; on the southeast by Salvador; on the west by Santa Rosa. It has an area of 1,563 square miles. The principal industries of the department are cattle-raising and the cultivation of coffee. Sugar, tobacco, and fruits are also grown. Capital, Jutiapa. Pop. about 50,000.

Jut'land, the peninsular portion of Denmark (q.v).

Juvenal (DECIMUS JUNIUS JUVENALIS), a famous Roman satirist. The evidence for his life, while fairly abundant, is of so dubious and conflicting a character that it is impossible to reconstruct the poet's career with any certainty. It is probable, however, that he was born at Aquinum, about 60 A.D., and that he was known, during the first half of his life, simply as an accomplished declaimer and rhetorician. After the accession of Trajan in 98, he began to publish satires in which, with extraordinary force and indignation, he described the conditions of life at Rome, for the most part as they existed during the reign of Domitian, 81–96. An inscription found at Aquinum records an offering to Ceres by a certain Junius Juvenalis (the stone was broken, so that the first name is lacking), tribune of the first cohort of Dalmatians, *duumvir quinquennalis* of the town, and priest of the deified Vespasian. This man has been generally identified with the poet (cf. *Sat.* 3, 319–320), but may be only a kinsman of his. There is a consistent tradition that he was banished for a number of years because of offense given to an imperial favorite, the actor Paris, but neither the time nor place can now be determined. He was apparently an intimate friend of Martial (who mentions him in three epigrams, VII. 24 and 91; XII. 18), though the two men were widely different in their outlook upon human life. The date of Juvenal's death is not known, but the fifth and last book of satires, comprising 13–16, was published in 128, and he may have lived seven or eight years thereafter.

In the hands of Juvenal, satire becomes almost a new literary type. Horace, who brought to perfection the method and manner of Lucilius, the first of the Roman satirists, says of his art (*Sat.* 1, 10, 9–14) that it aims at terseness, at a style that changes from grave to gay, that suggests now an orator who is a poet also, now a polished and witty talker who masks his strength. But Juvenal's passionate revolt against the hideousness of a time of which he could see only the dark side, gives to his verse one unchanging tone. For him satire is invective, biting, pitiless, and unrestrained, the expression of a towering moral indignation. Such humor as there is is always grotesque or of the grimmest kind. This is true, at least, of the first nine poems, which alone are really satires upon the Roman life that he knew. The remaining seven (the sixteenth is, of course, a mere fragment) are rather moral essays of a general character. He is, however, singularly deficient in power to discriminate. Mere offenses against good taste are classed with atrocious crimes: "Orestes (unlike Nero) did not mix poison for any of his relatives; he never sang upon the stage; he did not write an epic upon the Fall of Troy" (*Sat.* 8, 219–221). Such passages (and they are numerous) have raised at times the question of Juvenal's sincerity. But this should not be doubted. He was, on the one hand, swayed by the intense and narrow prejudices of a Roman of the old school; on the other, his long rhetorical training had developed to the utmost an inborn capacity and love for epigrammatic phrase. The possession of this power, while it sometimes led him astray, is one of his just claims to greatness. No Roman writer lends himself more admirably to effective quotation, none can describe a scene with more graphic realism.

The best text is the Jahn-Bücheler (Berlin 1893). There are excellent editions by J. D. Lewis, with a translation (2d ed. New York 1882), J. E. B. Mayor (London, Vol. I., 4th ed., 1889; Vol. II., 3d. ed., 1881); Pearson and Strong (Oxford 1892); L. Friedländer (Leipsic 1895); J. D. Duff (Cambridge 1900); H. L. Wilson (New York 1903). Dryden translated five of the satires. There is a spirited verse translation by Gifford (London 1817); and good prose translations by Strong and Leeper (New York 1882), and S. G. Owen (London 1903). Dr. Samuel Johnson's paraphrases of the third and tenth satires in his 'London' and 'The Vanity of Human Wishes' are deservedly as famous as the originals. See also J. Dürr, 'Das Leben Juvenals' (Ulm 1888); C. Martha, 'Les Moralistes sous l'Empire Romain' (Paris 1865); G. Boissier, 'La Religion Romaine' (Paris 1884), and 'L'Opposition sous les Césars' (Paris 1892).

NELSON G. MCCREA,
Professor of Latin, Columbia University.

Juvenile Offenders. In the United States the law with regard to juvenile offenders varies in the different States. The number of reform schools reported in 1900 was 82; instructors employed 578; pupils attending school, 22,692, and 14,673 in industrial departments. The total number of inmates was 24,925. The value of grounds and buildings was $18,873,587. The expenditures on buildings and grounds amounted to $605,010; for salaries and other expenses, $2,800,281, making a total expenditure of $3,405,291. The number of assistants, not including instructors in school departments, was 1,788. There were 16,609 white inmates and 2,784 colored inmates; 8,514 were of native parents, and 4,122 of foreign-born parents. Those that could only read when admitted were 2,207 and 1,595 could neither read nor write. The number committed to the institutions during the year was 11,676 and the number discharged 11,990. When discharged from the schools many of the pupils possessed a trade and were provided with good homes; all could read and write; the majority had received the equivalent of a common school education.

In Great Britain, in the eye of the law persons are considered capable of committing crime at the age of 7, and are punishable like other persons. But in England and Ireland, whenever a person under the age of 16 is convicted and sentenced to be imprisoned, the court or magistrates may also sentence him to be sent to a reformatory school for not less than two or more than five years. Such sentence, however, cannot be passed on an offender under 10 years of age, unless his offense is by law punishable with penal servitude or imprisonment, or unless the sentence come from a superior court, such as a court of assize or of quarter sessions. Children who have not yet committed crime, but are in a vagrant and neglected state, may also be sent to an industrial school.

Jux'on, William, English prelate, archbishop of Canterbury: b. Chichester, Sussex, 1582; d. London 4 June 1663. He was educated at Oxford, took orders and after holding church livings (in 1609 at Oxford, and then in 1614 at Somerton), in 1621 succeeded Laud as president of St. John's College. In 1627 he was appointed vice-chancellor of the university, and about the same time chaplain in ordinary to Charles I., who gave him the deanery of Worcester, and then the bishopric of London (1633). He attended the king on the scaffold. His fidelity cost him his bishopric, but at the Restoration he was made archbishop of Canterbury.
