Gladstone Mountain (Boundary)—Chimney of lead ore struck within short distance of Electric Point line. Ore is of similar grade to that found in chimneys on Electric Point ground. Body 26 ft. wide and of unknown length. Shaft will be sunk 100 ft. and at same time crosscut will be run into chimney from 260-ft. level in main shaft. Holdings surround Electric Point on three sides.

Electric Point (Northport)—Ore accumulated in bunkers before temporary suspension is being shipped. Ore chimney recently opened being developed. Mine now developed to 800 level. Aerial tramway to Leadpoint successful and 7-mile extension to Woodspur being surveyed.

CANADA

British Columbia

Cork-Province (Ainsworth)—Shipments suspended since August. Considerable ore and several carloads of concentrates on hand.

Snowstorm Group (Ashcroft)—Diamond-drill exploration by the Provincial Government in Highland Valley disclosed high-grade copper, and will be resumed after further surface work on Iona claims of this group. W. S. Drury will survey the property.

Lenora (Cowichan, Vancouver I.)—Being opened up by G. D. B. Turner, who is now on the ground. A. Meagher in charge.

North Star Mine (Kimberley)—Operations affected by strike of metal miners. Was expected to regain a shipping basis shortly, as damage from recent fire has been repaired. O. C. Thompson and J. L. McKinney, owners.

Gold Plate-Humming Bird (Nelson)—Group of claims at head of Roaring and Five Mile creeks being reopened and developed by owners.

Ontario

La Rose (Cobalt)—Has unwatered and started to work No. 3 shaft of University Mine, which has been under water for ten years.

Mining Corporation (Cobalt)—Shipped 100,000 oz. of silver bullion.

Nipissing Extension (Cobalt)—Has arranged to start development of its properties.

Hunton-Kirkland (Kirkland Lake)—Shareholders have rejected offer of H. Cecil to take option on property.

Lake Shore (Kirkland Lake)—Has resumed operations. Property has been closed for several months on account of strike.

Argonaut (Larder Lake)—Former Mine d'Or Huronia, has completed changes and extensions to mill, and is now ready to operate. Main shaft will be sunk to 200 level.

La Mine d'Or Huronia (Larder Lake)—Taken over by Argonaut Gold Mines, Ltd., as close corporation organized in Montreal. J. E. Hardman is consulting engineer, and John W. Morrison, formerly manager of Lake Shore Mine, Kirkland Lake, is general superintendent. Much exploration work already done. Property close to Beaverhouse Lake.

Clifton (Porcupine)—Has cut main vein on 100-ft. level, where it shows much free gold. In 1913 open cut on this vein shipped 80 tons to smeltery, average \$155 per ton.

Davidson (Porcupine)—Will do large amount of diamond drilling to explore vein on 1,200 level.

THE MARKET REPORT

Daily and Weekly Metal and Mineral Prices
 Metal Market Conditions, Average
 Monthly Prices, Stock Quotations

Silver and Sterling Exchange

Oct.	Sterling Exchange	Silver		Oct.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence

15	21 ³ / ₄	54 ¹ / ₂		6 ¹ / ₄ @6 ¹ / ₂	6.15@6.20		7.40@7.50	

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—Oct. 15, 1919

The markets for copper and lead were in great confusion this week. Producers and consumers were equally uncertain in determining the real positions. In some quarters copper was viewed as being stronger, while in other quarters it was held to be weaker. With respect to lead, however, there was no doubt as to the strength.

Transatlantic freight rates were about the same as in the previous week, but with a leaning toward easier tendency. The rates from San Francisco to Hongkong and Kobe remained unchanged at \$18.

Copper

A larger business was done by producers this week than for a long time

previously, and a good many producers figured in the market. The buying was mainly by wire-drawers, but some business in cakes was done. There was also some small export business, both through the Association and outside of it. Japan bought early for delivery and Germany bought several lots, and probably would buy more at 21³/₄.

The prices realized this week varied widely, some business being done as high as 23c, but a great deal larger business at lower figures. The old asking price of 23¹/₂c, delivered, has now been forgotten. Producers were trying to find a market, and each one being ignorant of the actions of others, and buyers being completely in the dark, all

kinds of prices were asked and were realized. This condition prevailed right through the week and as late as this afternoon had not cleared up. Taking into account the volume of transactions at different prices, we average the market throughout the week at 21³/₄c.

Copper Sheets—33¹/₂c per lb. Demand is strong. Wire, 25@26c.

Tin

This market was erratic, under the influence of the longshoremen's strike. It rose sharply and then declined with the probability of termination of the strike. The amount of business transacted was light.

Lead

There was a very large inquiry for consumption, especially at interior points, which caused a sharp advance in the St. Louis market, which at present is the market most truly indicative. The satistical position is very strong, and lead is wanted in large quantities by corrodors, the manufacturers of blue-lead products, and by the makers of storage batteries. There are only a few producers who have any lead to sell, and they apparently are not anxious to dispose of it. The A. S. & R. Co. maintains its price at 6¹/₄c, New York, but yesterday and today it seemed to be impossible to buy any lead under 6¹/₂c. The quotation for lead in the New York market this week is more nominal than anything else, scarcely any business having been transacted here.

For bonded lead for export 5¹/₂c is asked.

The St. Joseph Lead Co. began producing lead at Herculanum on Oct. 9. The labor troubles in the Coeur d'Alene are reported settled. At Alton, Ill., however, there is still trouble and that plant is producing at only partial capacity.

Zinc

In rising to the neighborhood of 7.50c, such free selling was encountered that the buyers withdrew, and consequently prices eased off a little, but toward the close sales were made again at 7.40c for October and 7.50c for November-December. There was only a little inquiry by domestic consumers. The outstanding feature of the week was widespread inquiry from foreign countries, which resulted in the

sale of several thousand tons to Great Britain. Large inquiry from Great Britain, Belgium and France is still pending. At present export business can be done only via Galveston, which confines it to smelters in Arkansas and Oklahoma, smelters east of the Mississippi being unable to pay the freight rates from New York or Baltimore and meet the European market.

The zinc smelting works at Donora and Terre Haute are idle owing to strikes.

Zinc Sheets—\$10.50 per 100 lb.

Other Metals

Aluminum—33c per lb.

Antimony—Unchanged at 8½c for spot. Futures were quoted at 8½c. In some quarters 9c for futures was asked, but no business was reported done at that price.

Bismuth—Unchanged at \$2.96.

Cadmium—Unchanged at \$1.40.

Nickel—Ingot, 42c; shot, 43c; electrolytic, 45c.

Quicksilver—Following very heavy reduction in the price for quicksilver in the London market, our own market declined sharply. On Tuesday afternoon sales were made at \$85. This morning the price dropped to \$75. San Francisco telegraphs \$80, soft.

Silver—Market showed some decline until Oct. 14. Orders from China in London found supplies very scant, and accounted for the advance on the 15th to 63¼d. Exports of bar silver to London and the Continent, week ending Oct. 11, 287,000 oz.

The general stock of money in the United States on Oct. 1, 1919, totaled \$7,662,898,238; of this, \$2,905,726,555 was in gold coin and bullion, \$308,145,759 in standard silver dollars, and \$243,380,383 in subsidiary silver. The money in circulation on Oct. 1 was \$5,806,571,880, or \$54.58 per-capita circulation.

Mexican dollars at New York: Oct. 9, 90¾; Oct. 10, 91; Oct. 11, 91¼; Oct. 13, holiday; Oct. 14, 91¾; Oct. 15, 92¾.

Platinum—Unchanged at \$130@135 for refined ingot. The demand from jewelers is active.

Palladium—Unchanged at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., Oct. 11.—Zinc blende, per ton, high, \$46.80; basis 60 per cent zinc, premium, \$45; prime Western, \$45; fines and slimes, \$42.50@40; calamine, basis 40 per cent zinc, \$32@33. Average selling prices: Blende, \$43.93; calamine, \$34.13; all zinc ores, \$42.59.

Lead, high, \$78.70; basis 80 per cent lead, \$77.50@75; average settling prices, all grades of lead, \$76 per ton.

Shipments the week: Blende, 8,089; calamine, 107; lead, 1,480 tons. Value all ores the week, \$471,410.

Sellers tried to set the price at \$47.50 to \$50 basis, but buyers "sit tight" on \$45 basis, some sellers coming across late today with offers to accept \$45. A report of \$46 basis for some ore high in iron is circulated without verification. Buyers of premium ore were limited to a \$45 basis, and their buying was light. In fact, at noon today all buying was light, but the offers of sellers to accept the basis may sell a large tonnage tonight.

Platteville, Wis., Oct. 11.—Blende, basis 60 per cent zinc, \$46@47 base, both for premium grade and prime Western grade. A temporary shortage of blende, particularly prime Western grade, caused sharper competition among buyers wanting the ore. Lead ore, basis 80 per cent lead, \$72 per ton. Shipments reported for the week are 2,059 tons blende, 199 tons galena, and 349 tons sulphur ore. For the year to date the totals are 78,066 tons blende, 5,017 tons galena, and 13,232 tons sulphur ore. Shipped during the week to separating plants, 2,273 tons blende.

Other Ores

Tungsten Ore—But very little business was done, and there seem to be no very good prospects. Chinese ore was quoted at \$7.25, with intimations that concessions might be obtained.

Molybdenum Ore—Quoted nominally at 75c.

Chrome Ore—Rhodesian ore, basis 45 per cent, was reported offered at \$7 per long ton, c.i.f., Eastern ports.

Manganese Ore—Quoted nominally at 50c per unit.

Pyrites—Spanish pyrites is quoted at 17½c per unit for furnace size ore, free from fines, c.i.f. New York or other Atlantic ports.

Iron Trade Review

Pittsburgh—Oct. 14

The steel strike, now in its fourth week, is losing ground, but only slowly. Production, taking the industry as a whole, is still not up

to 60 per cent of normal, although employment is perhaps at a trifle over that figure.

Working forces are commonly inefficient, so many new men having been taken on, and at a number of works men are employed at odd jobs without there being regular production. Employment in Western Pennsylvania has continued to increase, whereby the Shenango Valley is operating almost full, and municipal Pittsburgh is operating nearly full, but mills in the lower Monongahela Valley are still somewhat shorthanded, and at Monessen, the head of the valley, the men have not stampeded to work, as was expected when the return began last week.

Both in Youngstown and Cleveland, however, which were closed tight, the beginnings of resumption have just occurred. One blast furnace is operating in Cleveland, and at Youngstown about four furnaces are operating, with a few openhearth steel furnaces and one bessemer converter. The Wheeling district remains tightly closed.

Steel consumers are not importuning mills for deliveries, but, instead, are expressing their sympathy and anxiety to co-operate. Jobbers are parceling out their stocks to regular customers.

Pig Iron—Several merchant furnaces closed by the strike have resumed, and production of merchant iron is not nearly as much under normal as is the case with steel. Bessemer and basic are fairly plentiful, though foundry iron is somewhat scarce. Prices are unchanged: Bessemer, \$27.95; basic, \$25.75; malleable, \$26.25@27.25; foundry, \$26.75; forge, \$25.75, f. o. b. Valley furnaces, \$1.40 freight to Pittsburgh.

Steel—Billets and sheet bars have grown extremely scarce, as steel-producing mills are more affected by the strike than are finishing mills. Prices are largely nominal, and no attempts are made to secure premiums. Regular prices, now largely nominal, are: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; rods, \$52.

Ferromanganese—There is practically no inquiry. One or two of the English producers are quoting \$95, c.i.f. Nominal quotation of domestic producers is \$110, delivered.

Coke—Coke is weak, but not much is being dumped on the market. Consumption of merchant coke is somewhat heavier than it was a fortnight ago. Production in the Connellsville region is sharply curtailed in an effort to meet condition. Foundry coke consumption is as heavy as formerly, but offerings are larger. We quote furnace coke at \$4 and foundry at \$5.50@ \$6.25 per net ton at Connellsville ovens.

Number 17

Our Invisible Government

THE steel strike continues to dwarf in interest various other strikes in the mining and metal industries, being, indeed, of such national importance that much of the future history of the country depends on its outcome. We are heartily in sympathy with the attitude of Judge Gary and the principles of local and individual freedom for which he is holding out. Nothing could be fairer and more patriotic than the final manifesto to the Employers' Group before they left the Industrial Conference in Washington, out of which they were forced by the quitting of the Labor Group. On the other hand, the stand of the latter group, not for collective bargaining but for Union rule, is not calculated to win public sympathy. More than that, their action in bolting the conference rather than submit to an adverse vote does not augur well for their ability to bargain fairly and moderately. The action smacks of the Mexican idea of elections, where the candidate who is defeated at the polls takes to the hills with his riflemen and harries the successful administration till another election gives him a new opportunity. No system can cure social and industrial disorders unless the right kind of manhood is behind it. Witness the failure of collective bargaining system in the case of the coal strike. This system has obtained, we are informed, between coal operators and miners since 1878; and now it takes the form, on the part of the miner, that he makes his demands for acceptance without change, discussion, or delay, and with the alternative of disaster to the whole United States.

Surely the organization of labor for mutual protection and improvement is a desirable thing; and during the war our labor organizations were loyal and helpful. That steel workers should not be allowed to adjust conditions by local "works" committees, and local collective bargaining with their employers, but must walk out to allow some higher council, composed of men perhaps unfamiliar with their conditions, to dictate to the industry, is not, in our opinion, fair; as a matter of fact, it is not even collective bargaining, but the principle of surrendering local and individual rights to the manipulation of labor bosses.

It is increasingly certain that the steel strike is being engineered by the Bolshevik organization, as testified by a member of General Wood's staff before a Senate committee; and that the coal strike and others are part of a widespread revolutionary program. The exponents of the Plumb plan of buying the railroads, the common carriers for a hundred-

odd million Americans, and turning them over to 300,000 brakemen and conductors, announced darkly to a Congressional Committee that if the plan was not accepted it would mean revolution. They should have said that if the plan were accepted it would mean revolution. The fear of a revolution initiated by labor if its demands are not granted in the case of strikes like those covering steel and coal is not a factor to be considered; for if their present methods succeed, it means an overthrow of constitutional government. It would mean the triumph of one of the great parties in what we may call the invisible government, which has grown up gradually, side by side with our regular political system.

It must seem strange to thoughtful members of Congress to be bereft of all power but that of despairing speech-making, while the real issues and future government of the country are debated upon by a conference of private chieftains, acknowledged by Washington as the real powers; and to have these powers threaten and defy Congress as the American Federation of Labor is doing in regard to the possibility of including anti-strike provisions in the pending railroad legislation. Modern methods of organization have led to the growth of these powerful leagues, while the Constitutional government that was ideal for the newly liberated thirteen colonies has become more and more inadequate. Like the Western judge who could find in his printed code nothing that covered the killing of a Chinaman, and so freed the accused, Congress finds no precedent that covers interfering with the assassination of the prosperity and liberty of the country by a conspiracy of strikes and the substitution for the American government of the dictation of an increasingly effective and arrogant labor faction, directed by its own secret system.

The fair American way to such power as its numbers and rights merit is open to Labor. Let Labor, if it will, elect its own delegates to Congress, and so secure fair representation commensurate with that of the rest of the population of the United States. It is a fact that our legislators are representatives of sections rather than groups, classes, or principles; that they consist in undue proportion of lawyers and professional politicians; and this defect is doubtless due to machine politics in the case of both great political parties. These parties will do well if they value representative government and wish to defeat the seizing of power by a minority faction, to see that their candidates represent the majority group or class in each section, and that labor, the professions, business and agriculture are fully represented.

The Mining Bureaus at Washington

CONDITIONS in those government bureaus in Washington which have to do with the mining industry are not highly satisfactory in the present stage. Not only does Congress go through the annual allotment of appropriations to the Geological Survey and the Bureau of Mines without careful, intelligent, and sympathetic consideration, but it fails to provide properly for the housing of the geologists and engineers who are the life of these organizations. Evil days have come upon us. Formerly, learning and technical skill were most highly esteemed popularly, and the man of attainments enjoyed distinct rewards of many kinds in comparison with others. Our progress in the direction of materialism has changed this. No class is relatively so poorly paid, whether in Washington or elsewhere, as the scientific or learned class; and pure learning, or research for Truth's sake, is no longer really respectable. The geologists and engineers have in desperation joined the Federation of Labor, an act at once poetic and sad—poetic because it emphasizes the brotherhood and equality of all men; sad because it expresses their vain hope of thriving and benefiting therefrom as the carpenter and the barber have done.

The modern tendency of Congress and the higher government officials, political appointees, is to classify these professional workers on the same basis with clerks, and to crowd them together so that efficient research, study, comparison, and the preparation of results are greatly impaired. The organizations in question, especially the older one, the Geological Survey, have a wonderful record and a traditional esprit de corps. The dignity of the position of the government geologist, his love and enthusiasm for his work, and fairly pleasant working conditions, formerly kept him contented with a relatively small wage. Today, with his still hardly larger wage halved as to its purchasing power by the depreciation of the dollar, his working comfort destroyed by close crowding by a Congressional committee, and his dignity attacked by the tendency of those government officials who owe their positions to politics to regard him as a kind of clerk, it is not surprising if, at some time, the final straw falls, and he leaves for some more profitable and less irksome private position.

Many of the best men in the Survey and the Bureau have left this fall. The Survey averages a loss of 20 per cent per year, or, theoretically, a complete renewal in five years. Is it not possible to have a campaign of education among the political throng in Washington, to teach them the great importance of this handful of trained and efficient scientific experts, and the basic distinction between them and the multitude of careless clerks who pack the rooms of the departments and furnish so convincing an example of the inefficiency of a bureaucracy? These two organizations represent, in the government, the greatest basic industry of the country, and the great influence of that industry should be applied toward securing them more intelligently dispensed appropriations, appropriate quarters, and a comprehending

and sympathetic direction. A separate government building for mining and geology should be provided for at once; and a separate entity within the executive organization.

Dedication of the Bureau of Mines Pittsburgh Station

THE recent dedication of the Bureau of Mines Building in Pittsburgh brings to mind the purpose and accomplishments of this useful institution, which was organized in 1910 and which since its inception has become recognized as a valuable and necessary complement to the industries of the United States. It is a trait of human nature that, when enterprises have passed the experimental stage and have proved successful, they are too often accepted as facts, and due consideration is not accorded to the efforts that called them into being, and the benefits derived from them are too often accepted in a "taken for granted" spirit.

Much of the good feeling that the Bureau has created is based upon service rendered in conserving human life and in developing natural resources. Those spectators at the first-aid and mine rescue contests conducted during the three days of the exercises at Pittsburgh were much impressed by the skill and enthusiasm of the members of the 101 teams which participated. The teams came from many sections of the country, one team journeying from the State of Washington and two teams from Colorado. Montana sent the Butte district team, the membership representing six different mining companies, and that team captured the second prize in the first-aid contest.

The pageant, "The Hidden Treasures of Earth," presented on the night of the second day of the meeting, deserves especial commendation, and the author, Thomas Wood Stevens, is to be congratulated. Any agency which directs attention to the romance in the every-day work of mining and preparing the products of that industry for consumption makes the worker's world a more pleasant place in which to live. The interest in the pageant, and the artistic excellence that marked its presentation, suggest that similar entertainment features would contribute highly to the enjoyment of dedicatory and convention ceremonies in general.

Wartime Manufacture of Refractories in Britain

Soon after the outbreak of hostilities in 1914, many British industries found themselves deprived of essential raw or semi-manufactured materials of mineral origin. Great impetus was given to the working of home supplies of metallic minerals, such as the ores of iron, lead, zinc, tin, and tungsten and of deposits of barytes, fluorspar, and quartz.

In discussing the subject in an article prepared for the Journal of the Society of Chemical Industry, P. G. H. Boswell mentions particularly the dearth of refractory materials and describes some of the work accomplished in efforts to add to the supply. In consequence of the cutting off of supplies of

Austrian and Greek magnesite, the home resources of dolomite were successfully developed. Mention is made of a similar impure artificial product of dolomite, silica, and iron oxide prepared in American cement kilns and sold under such trade names as cinderlag and magdalite.

Geo-chemical research on silica bricks showed that the quality of those burned at over 1,300 degrees C., the temperature commonly employed, could be materially improved by longer burning at a higher temperature. Greater inversion of the quartz to other low-density forms of silica known as tridymite and cristobalite was thus insured, with the consequence that less expansion of the brick occurred when it was set in the furnace. To quote further:

"The investigation by the geologists and mining engineers of home supplies of potash-bearing minerals, such as feldspar, and the recovery by the chemist, in co-operation with the geologist, of potash from blast-furnace flues in Britain and cement-kiln flues in America, temporarily overcame the difficulties produced by the absence of German salts. The coprolite-bearing deposits of the Cambridge greensand were, after some delay, opened up for the purpose of obtaining the contained phosphate of lime, and at the date of the armistice were yielding helpful supplies."

The Lure of Gold

SINCE days of old the lure of gold has excited men to pioneer in far-distant lands. Be it a sunken treasure ship or the vague rumor of a gold discovery, there will be some one, or there may be many, who will gladly exchange their sure-thing, humdrum occupation for the shoestring of a chance in the bleak stretches of the Arctic or the humid, parboiled tropics. A quick but seldom an easy path to fortune is ostensibly the motive, but we believe that this apparent motive is merely an accessory. It is primarily the love of adventure that impels men to venture forth on this quest for gold. It is the same spirit that drove the old vikings away from their home shores to distant, unknown lands.

The latest expedition of the kind is the cruise of the "Casco." This small schooner, once used by Robert Louis Stevenson, has finished its romantic career by being pounded to pieces in Bering Strait, north of Nome. It was outfitted and started on a gold-seeking expedition to the Kolyma River, in Siberia. The party of adventurers, under Captain C. L. Oliver, left San Francisco in June. North Cape, 400 miles west of Bering Strait, was reached. Ice floes and an early winter stopped further progress, and the return ended in disaster. Twelve of the party were left in Arctic Siberia, where they will prospect for gold. The remainder returned to outfit another vessel.

There are now fewer places for the adventurous gold seeker. Both the North and South poles have been discovered. The in-between places remain to be explored in detail. The problems of arctic travel have been successfully solved, and the tropics do not

present the extreme difficulties they once did. But in both the tropics and the arctic there will be for a long time to come open places for the adventurer and the gold seeker.

Time in Engineering Calculations

TIME is a flow. Matter cannot be destroyed, but time flows by ceaselessly, never to return. The time element enters into the calculations of the engineer as it does into practically all affairs of human life. An expenditure of 100,000 ft. lb. of work is a definite quantity, a 100-lb. weight lifted 1,000 ft. or a 1,000-lb. weight lifted 100 ft. The time within which this work is done determines intensity, and the rate, or the number of foot-pounds of work per minute, is power.

A hundred horsepower motor will give forth 3,200,000 ft. lb. of work per minute at the pulley. The present value of an ore deposit containing \$1,000,000 worth of recoverable metal is dependent upon the time element. If it were mined in an extremely short time it would command a value closely approximating \$1,000,000. If it required ten years to mine it, its present value would be materially less. Labor is bought at a given price per hour or per day. For the use of capital a given rate of interest per unit of time, six months or a year, is paid.

In selecting materials for underground structures, the time element is often a determining factor. How long is the working to remain open? How long is the structure to be used? Innumerable examples might be given, but enough has been said to emphasize the prominence of the time element in engineering. The clock should be placed alongside of the engineer's scale, and he should think in terms of this as well as other dimensional units.

Work and Play

HOW easy it is to please some men. One man will indulge in an automobile. He will pick it from among the multitude of designs. It will be of a certain style and kind which bears about the same relation to the personality of the owner as does his hat, or his necktie, or even his clothes. He takes a great pleasure in operating it. He cleans and fixes it with much the same solicitude that a mother takes with her child. It becomes a hobby with him.

In sharp contrast, another man makes his work his hobby. If he be the manager of a mine, he takes delight in all the many activities above and below ground. A thousand men may be under him. He feels a certain responsibility for them. Their welfare appeals to him. If one becomes sick or meets with an accident, he is among the first to concern himself with the affair. He goes among his men imparting enthusiasm. His interest becomes theirs, and the whole project keys into harmony with the spirit he brings to his trust. It is all worth while, whether it be a play or a work hobby. It is this spirit that leavens the day and smooths out the inequalities. All men ought to make their work as well as their play a hobby.

SMOKER OF THE AMERICAN ELECTROCHEMICAL SOCIETY IN THE FLORENTINE ROOM OF THE CONGRESS HOTEL, CHICAGO, THURSDAY EVENING, SEPT. 25, 1919.

Development of the Rock Drill in America

Progress in Invention and Manufacture of Rock Drills Has Been Rapid Since the Inception of the First Machine, and Today a Number of Types Are Suitable to the Requirements Demanded by Various Operations

BY CHARLES AUSTIN HIRSCHBERG

COLORADO, known to many as the land of scenic beauty and mountain grandeur, is not only the playground of the tourist and the Mecca for the followers of Izaak Walton, but also the school of the inventor, brought about perhaps by the great industry of mining gold, silver, platinum, radium, zinc, lead, and many other minerals employed by man in the useful arts. What better

In 1871 another power rock drill was invented by Simon Ingersoll, and other similar drills, such as those of Wood, Sergeant, Waring, Halsey and Githens, made their appearance. From this time on, man's primitive hand methods of mining faded rapidly, giving away to the so-called reciprocating piston rock drill, which comprised a cylinder carrying a piston with a projecting end, to which was rigidly fastened a drill steel.

The year 1894 ushered in another period in the history of the State of Colorado, with silver mining predominant. It was about this date that J. George Leyner, a native of Colorado, born in Boulder County, opened the shop shown in Fig. 5, in the City of Denver, for the repair of mining machinery. This enterprise led him into numerous experiments with the power rock drill, finally culminating in the invention, about 1897, of the first hammer drill, a type in which the piston moves freely in the cylinder and strikes upon the drill steel instead of being attached fixedly to it, and pushing it as in the reciprocating type of drill, a direct reversion to the principle

FIG. 1. SKETCH OF PROSPECTOR AND BURRO

incentive could man want to spur him on to the ultimate goal of success than the knowledge of that state's vast stores of wealth, and sunshine glowing from the heavens upon him like a benediction throughout 365 days of the year?

Cunning nature, running true to form, hid her treasures deep amid the hills, so that man must seek and toil to realize his desires, and so, from the green valley to timber line and over the snow-capped range, tawny men beat trails to Colorado's treasure store in the '50s of the last century, bringing with them the pick and the shovel and the single-jack and steel. This was the start of the gold fever in the State of Colorado.

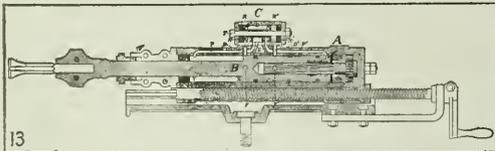

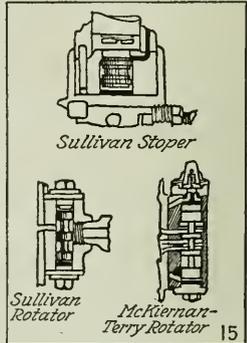

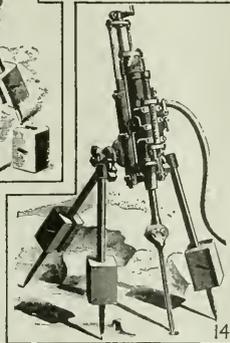

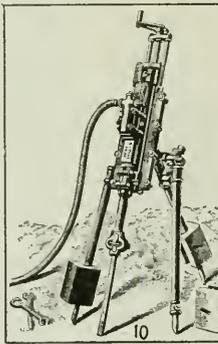

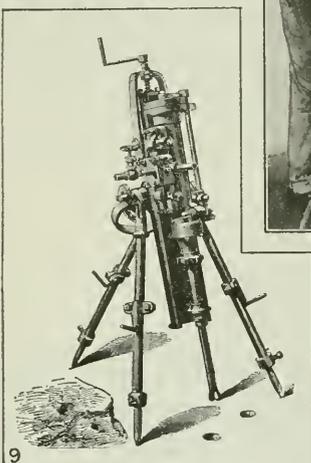

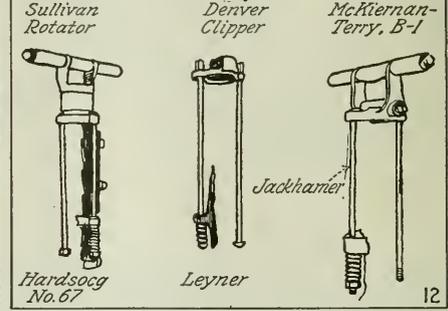

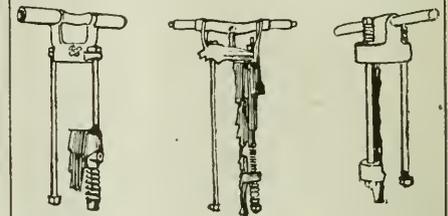

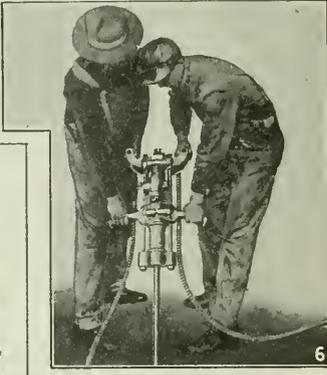

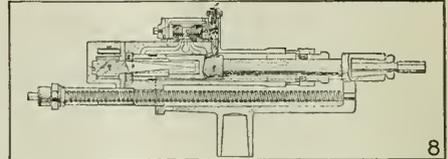

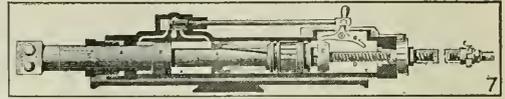

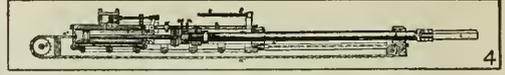

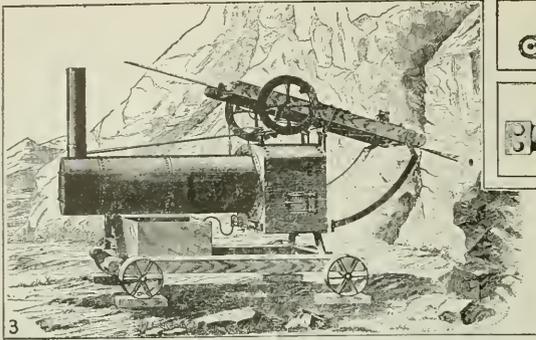

Event succeeded event rapidly until 1879, when a new period set in with the discovery of the lead-carbonate silver ores of Leadville. It was about this time that man put aside his single-jack and steel in favor of the power rock drill, invented by J. J. Couch, of Philadelphia, in 1849, and perfected during the intervening years by Couch and J. W. Fowle, of Boston, patent rights finally being purchased by Charles Burleigh, about 1866. The Burleigh drill was used in driving the Hoosac Tunnel in 1867. Fig. 3 shows Couch's first rock-drilling machine, and Fowle's first rock-drilling machine is shown in Fig. 4.

FIG. 2. MINER WITH SINGLE-JACK AND STEEL

involved in the primitive method of single-jack and steel.

There is no questioning the debt which the mining industry owes to the invention of the reciprocating type of rock drill, but it remained for a Western man, Mr. Leyner, born and raised amidst the hustle and bustle of the mining camps of Colorado, to take a real scientific step forward in the art of drilling

GENERAL TYPES OF POWER ROCK DRILLS AND PARTS—I

Fig. 8—The First Wood Drill. Fig. 9—The Ingersoll Drill. Fig. 10—The Rand Little Giant. Fig. 11—Cross Section Rand Little Giant. Fig. 12—Side Rod Construction of Modern Drills. Fig. 13—Ingersoll Eclipse Drill, with Air-thrown Valve. Fig. 14—The Rand Slugger Rock Drill. Fig. 15—Modern Valve Actions of the Piston or Spool Type.

rock. It is not necessary to dilate at length upon the things he accomplished in the invention and development of the hammer drill—the introduction of water and air through hollow drill steel for cleaning the hole, automatic lubrication, enclosed-in-the-machine throttle control, mechanical rifle-bar-rotating drill steel chuck—in fact all hammer drills of the present day, irrespective of maker, have borrowed their most important features from the Leyner hammer drill.

In testimony of the value and correctness of Leyner's theories, his business grew to a point at which, in 1905, he was forced to build a modern manufacturing plant at Littleton, Col., to take care of a rapidly growing enterprise, finally ending in the purchase of license rights by the Ingersoll-Rand Co. of New York, since which time many modifications and refinements have been made, as typified in the Leyner-Ingersoll drill.

Still another product of Colorado's inventive genius is the creation of the stoper drill, which depends for its success upon an air-feed attachment to a drill cylinder, first experimented with by C. H. Shaw, of the C. H. Shaw Pneumatic Tool Co., Denver, Col., about 1906, followed rapidly by the Waugh slugger, also an air-feed type of machine; then the Crown air-feed drill of the Ingersoll-Rand, the Hardscog Wonder rock drill, the Sullivan, the Cleveland, the Leyner Stoper, and the Chicago.

The inventions chronicled proved the precursors of other styles of hammer drills; and the latter may fairly be termed modifications of design of these first types. For instance, the majority of the early hand hammer drills (excepting plug drills, employed for drilling shallow holes in granite and stone) were patterned largely after the air-feed stoper, the air feed being eliminated and a spade handle substituted; in fact, the manufacturers of these early stopers advertised the interchangeability of handle and air feed as a feature.

This early practice of interchangeability was, however, soon abandoned, for, though good in theory, it proved impracticable, and there is to be noted the appearance of the Little Jap drill, an Ingersoll-Rand product, followed rapidly by such machines as the Sullivan hand hammer drill, the Hardscog Little Wonder, Cleveland hand drill, Leyner Brownie, and numerous others.

In 1909 the first real self-rotated hand hammer drill made its appearance. Following the practice of making hand drills out of stopers, Mr. Leyner conducted extensive experiments with a Leyner drill cylinder removed from its shell. As will be seen from the illustration, Fig. 6, he placed a T-handle at the back, with additional handles part way down the cylinder. He built several of these machines, more particularly for shaft sinking. However, before he had gone very far the Ingersoll-Rand Co. obtained a license to manufacture and sell under the Leyner patents, and as early as 1912 the Jackhammer, the first self-rotating hand hammer drill employing Leyner rifle bar and sleeve chuck rotation, was placed

on the market. It proved such a success, that other manufacturers brought out modified designs.

It is often said that there is nothing new under the sun. To some extent this saying may be applied to present-day drill designs. Things which had been tried and tested in the early struggle with reciprocating drills, and later with the first Leyner drills, but abandoned because of their failure to perform as expected, and again in the latter case, because of the impossibility of securing suitable materials and a lack of knowledge in those days of refined methods of heat treating to enable materials to stand up under the particular work they were to perform, are today making their appearance in the designs of many drills and exploited as new.

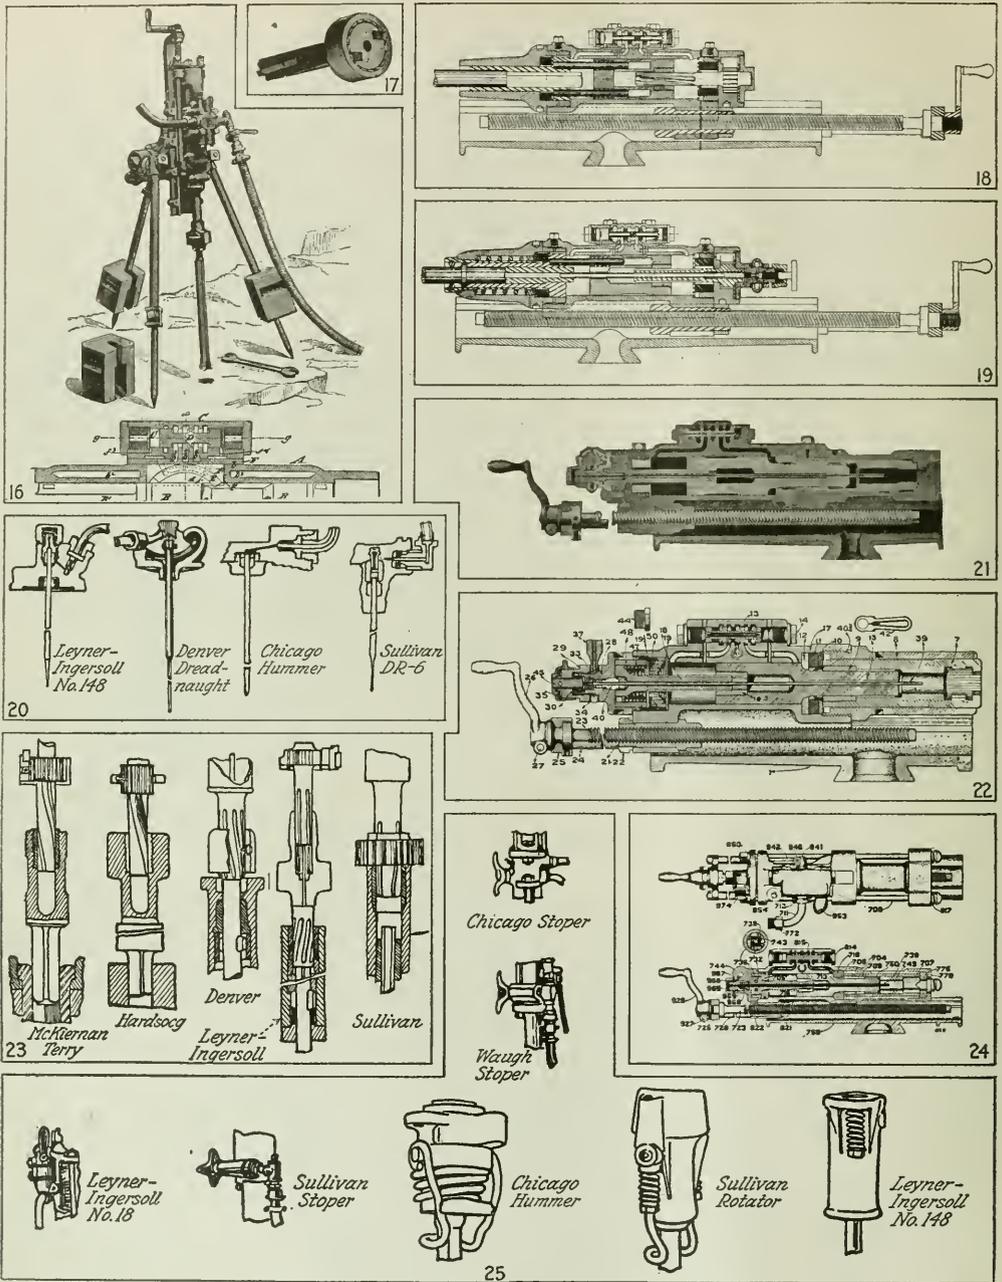

Fig. 7 shows the first reciprocating rock drill, as used by Burleigh in driving the Hoosac Tunnel in 1867, a project of construction fathered by the State of Massachusetts. The tunnel was five miles long, and was driven through hard rock. It was an ambitious scheme for those days, involving at its start the employment of hand drilling. That the work in driving this tunnel was carried to a successful conclusion was due largely to the efforts of J. W. Fowle, of Boston, who invented the Burleigh rock drill. Burleigh's part in the development of this first rock drill rested with certain improvements which he made as a mechanic in the shops of the Fitchburg Machine Works, where the machine was built.

The Wood drill shown in Fig. 8 was brought out soon after the Burleigh drill had made its appearance on the Hoosac Tunnel. In the testimony before the Massachusetts Legislature appears the following statement: "We were satisfied that this drill was an entire infringement on Mr. Burleigh's patents, and that our obligations to Mr. Burleigh ought not allow us to suffer the Michigan drill (Wood) to be used by our contractors."

The Ingersoll drill as shown in Fig. 9, which employed a tappet valve action and followed somewhat new lines of design in that it utilized a guide shell with feed screw for feeding the machine forward, making it much lighter and, therefore, possible to mount on a so-called bar mounting in place of a carriage mounting, came next. It was employed in the Musconetcong Tunnel of the Lehigh Valley R. R. This was about the year 1871.

Fig. 10 shows the Rand Little Giant drill as developed by A. C. Rand and George Githens in 1875. This drill also employed a tappet valve action controlled by the motion of the piston to operate a flat slide valve, as shown by the cross-sectional view Fig. 11. It was with this type of machine that the side-rod construction made its appearance, which is found even today in later drills, such as the present day Leyner-Ingersoll, the Sullivan Water drill, the Sullivan Piston drill, the Denver Dreadnaught, and many others. (See Fig. 12.)

The Rand Little Giant drill was adopted largely throughout the Lake Superior iron country, as well as in certain sections of the copper region. Some of

GENERAL TYPES OF POWER ROCK DRILLS AND PARTS—II.

Fig. 16—The Sergeant Rock Drill. Fig. 17—Sergeant Release Rotation. Fig. 18—Leyner's First Hammer Drill. Fig. 19—Leyner's Drill, the first hammer drill with the water feature. Fig. 24—Cross Section No. 7 Water Leyner Drill. Fig. 25—Throttles and Front Heads, Modern Hammer Drills.

its notable work is the Hell Gate Channel excavation and the Weehawken Tunnels.

Fig. 13 shows the Ingersoll Eclipse air-thrown valve drill, which was an improvement over the Ingersoll drill invented by Henry C. Sergeant in 1873 and brought to its final state of development in 1878. This was the first independent valve motion control. The Ingersoll Eclipse drill was employed in driving such tunnels as the Cascade, Bozeman, Silverbow, Siskiyou, Snow Shoe, Vosburg, Coosa Mountain, Wickee, and Croton Aqueduct.

Fig. 14 shows the Slugger rock drill invented by Halsey and introduced by the Rand Drill Co., now the Ingersoll-Rand company, in 1883. This machine, it will be noted, is equipped with side rods and a flat-back head-spring to absorb shocks. The valve is of the piston or spool type. Though having an independent valve action, it was without variable stroke. It was used largely in mine work and in some of the big aqueduct tunnels.

Many modern day drills employ independent air-thrown valve actions patterned largely after these first two types. Even the first Leyner hammer drill borrowed the spool valve from these early constructions. Fig. 15 shows the valve action of a number of drills of today which fall under the same classification.

In 1884 the Sergeant auxiliary-valve drill came to the front, bringing with it the release rotation and a spool-valve motion controlled by a crescent-shaped piece in contact with the main piston, as shown in Fig. 16. This type of drill replaced to a considerable extent the Little Giant in the Lake Superior mines and drove the Catskill Aqueduct tunnels and many others, among them the Pennsylvania Tunnel under the East River, New York. The release rotation feature of this type of drill, shown in Fig. 17, gradually found its way into other makes of drill, including the No. 6 Water Leyner drill, brought out by Leyner in 1906.

From 1898 up to the present time many revolutionary changes in the mechanics of the rock drill are to be noted. This is the period of hammer drills, and during these years there was a gradual passing of the piston drill. Leyner's drill as shown in Fig. 18 made its appearance in 1897, followed by the type of drill shown in Fig. 19, in 1898, it being the first of his or any other drill to employ water and air through the drill steel.

Referring to Fig. 20 it will be observed that present day builders of hammer drills borrowed in its essential details the water-and-air principle of the Leyner drill. Fig. 21 illustrates the No. 5 Leyner drill, brought out about 1903, showing substantially the same type of rotation first employed in the later models of Leyner drills, except that it had a locking key for holding the steel in the chuck, which feature was abandoned in the Model 6, Fig. 22, already referred to, and later types.

Fig. 23 shows the rotations of various makes of hammer drills, which it will be noted correspond in main essentials to the Leyner type. In Fig. 24 is

shown the No. 7 Leyner drill, which may be said to be the real father of all present-day hammer drills. It includes in its design the Sergeant release rotation feature, the rifle-bar rotating-sleeve chuck feature, the water-and-air feature, and the first automatic lubricator, as well as inclosed machine throttle construction, and one piece solid front head, and, finally, split front head with through bolt retained by the front head cap. It is interesting to note the variations of features of these designs as found in other makes of machines, as shown in Fig. 25, including the mounted hammer drills, self-rotating hand-hammer drills, and stoper drills, with their air-feed attachments as well.

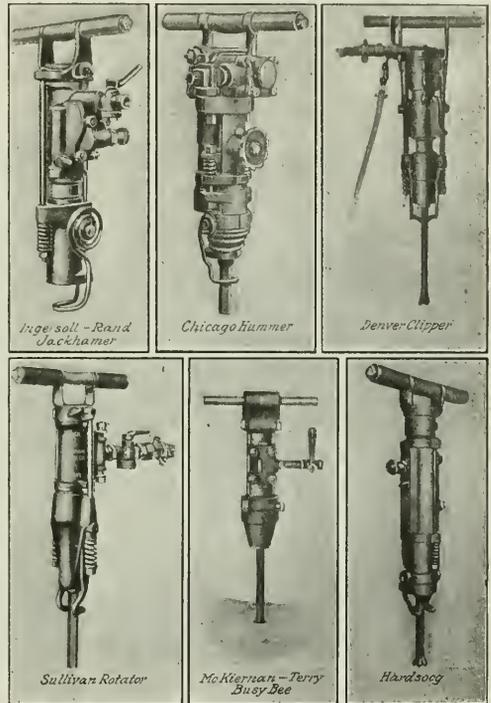

FIG. 25. MODERN SELF-ROTATING HAMMER DRILLS

The Leyner drill has been used in such notable work as the Newhouse tunnels, the Lucania Tunnel, the Los Angeles Aqueduct tunnels, the Laramie Poudrie Tunnel, as well as in some of the biggest mines of the country, numbering among others the Calumet & Hecla, Anaconda, Homestake, as well as many other large mines abroad.

It is interesting to compare the advance which has been made in the self-rotating hand-hammer drill, starting with Leyner's first experiment in 1909, shown in Fig. 6, on through to the Ingersoll-Rand Co.'s various Jackhammer types, Sullivan Rotator, Denver Rock Drill Co.'s Clipper drill, Chicago Pneumatic Co.'s Hammer, McKiernan-Terry Busy Bee, and many others, as shown in Fig. 26.

Dedication of Pittsburgh Bureau of Mines Building

Exercises on September 29, 30 and October 1, Largely Attended. Speakers Praise Work of Bureau. Interesting Demonstrations at Experimental Mine and Explosives Testing Station at Bruceton, Pa.

BY EUGENE P. McCORKEN

THE new Bureau of Mines Building in Pittsburgh, Pa., was dedicated on Sept. 29, the ceremonies being attended by a large number of engineers and mining men from all parts of the United States. Representatives of Federal and state departments, of the engineering profession, and of labor delivered addresses, the tenor of which attested the great importance of the work of the Bureau in the conservation of human life and natural resources. These ceremonies were followed by an

exhibition of explosions of coal dust and black powder, demonstrating in a realistic manner the ever-present danger and the imminence of such occurrences in practical operations. The utility of liquid oxygen as an explosive was also demonstrated. Of especial interest was the presentation of the pageant, "The Hidden Treasures of Earth," by Thomas Wood Stevens.

burgh Chamber of Commerce, Sept. 29, 30, and Oct. 1, and the various events were of the highest technical and dramatic interest to the attending delegates. The dedicatory exercises were held at 10:30 a. m. in the rear of the Bureau of Mines Building. After the invocation by Chancellor McCormick of the University of Pittsburgh, Chairman Gillespie introduced E. V. Babcock, Mayor of Pittsburgh, who made the address of welcome, extending the hospitality of the city to the visitors. Mr. Babcock

PANORAMIC VIEW OF FORBES FIELD, SHOWING FIRST AID TEAMS ON FIELD

referred to the efforts of the civic authorities, beginning ten years ago, to secure the new building for Pittsburgh, which is a strategic center of the great mining and manufacturing industries. Alexander T. Vogelsang, First Assistant Secretary of the Interior, representing Secretary Franklin K. Lane, responded. Mr. Vogelsang read a message from the Chief Executive, dated Sept. 23, from Ogden, Utah, as follows: "Will you not be kind enough to convey my most hearty greetings to the assemblage at Pittsburgh next Monday? I wish that I might be present to express my very deep interest in the work being done by such instrumentalities for the increase of production, the safeguarding of life, and the raising of the standard of labor and scientific endeavor. It is a very happy circumstance that with this

exhibition of explosions of coal dust and black powder, demonstrating in a realistic manner the ever-present danger and the imminence of such occurrences in practical operations. The utility of liquid oxygen as an explosive was also demonstrated. Of especial interest was the presentation of the pageant, "The Hidden Treasures of Earth," by Thomas Wood Stevens.

The fourth national First Aid and Mine Rescue Contest was held on Sept. 30 and Oct. 1, and was the largest safety meet so far held in the United States, the teams coming from every section of the country and representing the coal and metal-mining and metallurgical industries.

The celebration of the dedication and the safety contest were held in co-operation with the Pitts-

burgh Chamber of Commerce, Sept. 29, 30, and Oct. 1, and the various events were of the highest technical and dramatic interest to the attending delegates. The dedicatory exercises were held at 10:30 a. m. in the rear of the Bureau of Mines Building. After the invocation by Chancellor McCormick of the University of Pittsburgh, Chairman Gillespie introduced E. V. Babcock, Mayor of Pittsburgh, who made the address of welcome, extending the hospitality of the city to the visitors. Mr. Babcock

meeting should be associated the ceremonies connected with the dedication of the new building in Pittsburgh of the Bureau of Mines."

In his address, Mr. Voglesang said that the work of the Bureau was greatest in times of peace, but that during the war the Bureau "gave the country a service that was excelled by no mechanical or scientific association to any other country at war in any part of the world." In referring to the work of the Bureau, the speaker said, "If an industry does not elevate labor and prevent waste, it alone is responsible if the Government takes over and operates that industry." Mr. Voglesang also urged that all industrial differences be settled, and expressed the hope that this country might have a year of industrial peace.

Following Mr. Voglesang, William C. Sproul, Governor of Pennsylvania, spoke on the necessity of the Government teaching safety and rendering assistance in development of mechanical devices in the arduous labor of mining. The Governor said the question of housing was of much importance and that he was prepared to make recommendations at the next legislative session, which might be considered radical, but which would bring about better home conditions.

J. Parke Channing, representing Horace V. Winchell, president of the American Institute of Mining and Metallurgical Engineers, was then introduced. Mr. Channing chose for his topic "The Engineer in Industry," and in his address discussed the distribution of wealth, presenting statistics from an investigation made by W. R. Ingalls. Mr. Channing's speech will be published in a succeeding issue of the Journal.

John L. Lewis, president of the United Mine Workers of America, was represented by the next speaker, Van A. Bittner, who delivered an address, making a strong plea for improvement in certain sections of the country where loss of life and wastage of coal in mining were comparatively high. He referred to the work of the late Joseph A. Holmes, the first Director of the Bureau of Mines, which was received with applause. The record of the Bureau of Mines since its organization in 1910 was truly remarkable, the speaker said, in the saving of life. In 1909, there were killed in the coal mines of the United States 3.96 men per 1,000 employed, or one death per 174,416 tons produced. In 1918, the death rate was 3.39 per 1,000 men, or one death per 266,000 tons.

At the conclusion of the addresses, the key of the building was turned over to Director Van. H. Manning by Assistant Secretary Voglesang. Mr. Manning in receiving the key said: "It is indeed to me a very high privilege to accept from you this key to this magnificent structure which has been contributed to the cause of humanity by our Government. It is an honor to be the representative who has been selected to accept this emblem which stands for safety and efficiency in the universal industry, and I hereby pledge to you, Mr. Secretary, and to you who represent capital and labor, employer

and employee, in the mining and allied industries, my allegiance to the cause we represent."

Experimental Mine and Explosive-Testing Station

After the conclusion of the dedicatory exercises, the delegates were taken on two special trains to Bruceton, Pa., to the experimental mine and explosives-testing station, where actual demonstrations of various explosions and causes in connection with mining work were made. Also, a rockdust barrier for flame and the use of the "geophone" were shown. The program, which gives in detail the various events, follows:

(a) Explosion in experimental mine.

Pulverized Pittsburgh coal dust was used, placed on cross shelves overhead and on the floor and side shelves. Two pounds per foot of entry was applied from the mouth of entry to station 450, and one pound from 450 to 650, a total of 1,100 pounds.

The cannon loaded with three pounds of FFF black blasting powder was situated on the floor of the entry, 225 feet from drift mouth, pointing outby.

VAN H. MANNING RECEIVING THE KEY OF THE BUILDING FROM ALEXANDER T. VOGLESANG, FIRST ASSISTANT SECRETARY OF THE INTERIOR

Pressure manometers (gages) were situated 550 and 750 feet respectively from the mouth of the drift; flame recorders were placed near the dust barrier and matches were used throughout the test zone to indicate the presence of flame.

- (b) Inspection of and demonstration of rockdust barriers on outside of the mine.
- (c) Inspection of the interior of the experimental mine. Demonstration of the "geophone," an instrument used for locating imprisoned miners.
- (d) Demonstration of the use of liquid oxygen explosives (blasting stump).
- (e) Demonstrating the danger of an electric current making a circuit through metal powder containers.
- (f) Demonstrating the danger from the flame of miners' open-flame lamps coming in contact with kegs containing black blasting powder.

Fourth National First Aid and Mine Rescue Meet

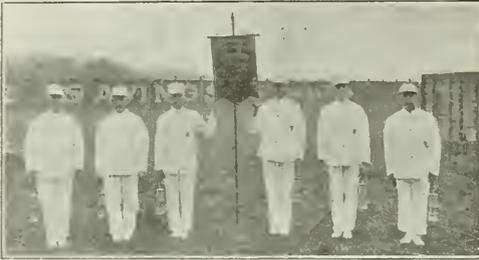

The fourth National First Aid and Mine Rescue meeting, in connection with the dedication, was the largest gathering of its kind ever held. Eighty-one teams, from fifteen different states, competed

for first place in First Aid, and twenty teams entered the Mine Rescue contest. The events, both in the eliminations and finals, were close, and a number of ties resulted, which were worked off in special events.

A feature of the events was a contest in artificial resuscitation, in which ten teams entered in the First Aid finals took part. It was won by the United States Coal & Coke Co., Inc., Gary, W. Va., of which F. S. Hock was captain. The team was awarded a large silver loving cup, to be held until the next national contest. The judges of this contest were Captain C. C. Gans, Medical Corps, U. S. Army; Dr. S. L. Underwood, and Dr. A. E. Torrence. The practical nature of the events is shown by the two problems given the Mine Rescue teams. The first was the recovery of a worker from under a fall of slate following a mine explosion, the teams being required to rescue the man and treat his injuries. The other

and Edward H. Cox, general manager of the Snowden Coke Co., Braznell, Pa., chief judge of the Mine Rescue events. D. J. Parker, chief safety engineer, Bureau of Mines, headed the committee on grounds. E. E. Bach, director of the State Americanization Bureau, was chief recorder.

A smoker in the Chamber of Commerce rooms was the closing event of the meet, and here the winners were announced and the prizes awarded. The winning team in the First Aid contest received the Colliery Engineer cup, to be held till the next meet, and the National Safety Council cup, which becomes its permanent property. Each member of the winning team received a bronze medal from the American Red Cross and a gold medal from the National Safety Council, and the members of the second and third teams silver and bronze medals, respectively. The winner in the Mine Rescue contest received the Colliery Engineer cup and the gold cup

FIRST AID TEAM NO. 51, STANDARD MINE, H. C. FRICK CO., MOUNT PLEASANT, PA. WINNER OF FIRST PRIZE

problem dealt with the rescue of two men from a tunnel in which dynamite was burning. These problems were prepared by the Bureau of Mines.

The First Aid problems, five in all, were chosen by Major M. J. Shields, of the American Red Cross. These problems were also as practical as possible and covered treatment of a number of injuries frequently met in mine and mill accidents. The Standard Mine team of the H. C. Frick Co., of Mount Pleasant, Pa., won the First Aid contest in competition with twenty teams which survived the eliminations. J. C. Spence was captain of the team, which won with an average of more than 99 per cent in the five problems given. Second place was won by the Butte District team, of Butte, Mont., of which Joseph E. Watson was captain. A team representing the Roslyn Fuel Co., Seattle, Wash., was third. W. J. Evans was captain.

Unusually high percentages were made by the winning teams in the Mine Rescue contest. First place was captured by the Acme Mine No. 2, Union Coal & Coke Co., Bentleyville, Pa., headed by Mark Jones, with 99 per cent. The team representing Leisenring No. 1 Rescue Station, H. C. Frick Co., won second, with 98 per cent. The captain was Patrick Bradley. Buffington Rescue Station, H. C. Frick Co., led by Frank Hyde, won third. Major Shields was chief judge of the First Aid contests,

EXPLOSION OF 25-LB. KEG OF F.F.F. BLACK BLASTING POWDER PRODUCED BY OPEN FLAME LAMP

presented by Coal Industry. The members of the winning team received gold medals from the National Safety Council and the members of the second and third teams silver and bronze medals, respectively. The teams winning the championship of their respective states, as determined by their rating in the first day's contest, received state championship pennants and merchandise prizes contributed by firms in Pittsburgh and elsewhere. The list of state champions among metal-mining companies is as follows: Mine Rescue—Alabama, first prize, Republic Iron & Steel Co., Birmingham; Montana—first prize, Butte district. First Aid—Colorado, first prize, Primos Chemical Co., Vanadium; New Jersey—first prize, Raritan Copper Works, Perth Amboy;

second prize, New Jersey Zinc Co., Franklin; Montana—first prize, Butte district; Tennessee—first prize, American Zinc Co., Mascot.

Man's Conquest of Nature's Forces Shown Dramatically in Pageant at Forbes Field

The romance of the mining industry was portrayed on the night of Sept. 30 in the pageant "The Hidden Treasures of Earth," which was presented at Forbes Field under the auspices of the Pittsburgh Chamber of Commerce. It was written and directed by Thomas Wood Stevens, and some of the

Emperor, who places it in the lap of the idol of the country. As the bystanders and the emperor kneel with bowed heads, the slave stabs the ruler and escapes with the nugget.

The third scene represented the development of iron. King Edward III visits the furnaces in Sussex, England, and is incensed at the cutting of his forests for fuel, but is so impressed by the development in the production of iron that he forgives the people and grants them the freedom of the forests.

The fourth scene portrays moments in the progress towards the safety of life in coal mining, begin-

SPECTATORS VIEWING MINE RESCUE TEAM LEAVING THE GAS GALLERY

actors of the company were employees of the Bureau of Mines, students of the Carnegie Institute of Technology and University of Pittsburgh, and members of the United Mine Workers of America. The pageant was composed of four episodes, depicting figuratively the discovery by man of the treasures of the earth.

The scene of the first episode was in the bronze mines of Tarshish, Spain, at the time of Solomon. The second episode was laid in India, where a Greek slave finds a gold nugget by mining, instead of washing the sand for gold, as his comrades were doing. The nugget is taken from him, finally reaching the

mine with the invention of the safety lamp and finally the modern methods of First Aid and Mine Rescue.

Two of the Old Mill Sites of the East Rand Proprietary Mines are being cleaned up to recover the gold and amalgam, which, in the course of many years' working, have escaped recovery and accumulated. Colonel Bottomley described the process in his last annual report, which was abstracted in the South African Mining and Engineering Journal. The location of the deposits is determined by panning promising waste material. The rubbish is burned and sluiced, the sluices being about 100 ft. long, set at an angle of 15 degrees.

E. and M. J. Quotations Recognized by Court

Price Disturbances Due to Government Control Did Not Render Contract Void—How Market Price of Copper During War Was Determined—The Question of Embargo

A CASE arising out of the disturbances of war upon the market price of ore was recently decided in the Appellate Division of the Supreme Court of New York. Incidentally, the decision handed down shows the regard in which the Engineering and Mining Journal is held in the metal trades and industries (Boret et al vs. L. Vogelstein & Co., Inc., 177 N. Y. S., 402).

In this issue plaintiffs were doing business in London, England, and made contracts with the defendants, doing business in New York City, whereby the defendant agreed to purchase from the plaintiffs the total production of copper ore, or copper matte, in seller's option, produced by the South American Copper Syndicate, Ltd., from its Aroa mines, or other mines in Venezuela, for a period of eight years beginning Jan. 1, 1918. Also, contracts were made regarding the freights, which provided for the transportation of the ore or matte from Tucacas, Venezuela, to New York at a specified freight charge, payable on delivery at Chrome, N. J., or at any port other than New York, as ordered by defendant. The contracts were entered into on March 20, 1916. The controversy arose over that provision relating to the fixing of the price to be paid for the ore. No price was named, but it was "to be paid for at the average price of electrolytic wire bars as published in the Engineering and Mining Journal of New York. . . ."

Referring to the agency named in the contract through which the price was to be established, the court said: "The Engineering and Mining Journal, which was and is recognized by the metal trades and industries as a standard and reliable source of information, published the daily current market price of metals, including refined copper (electrolytic wire bars) as bought and sold and dealt with in the open market, and based said quotations on information obtained from the trade and sales reported by producers, agencies, and dealers in the open market, and correctly stated how quotations were obtained as follows: 'The above quotations are our appraisal of the average of the major markets. . . .'"

After making of the above contracts, war was declared between the United States and Germany, and in the statement of facts as agreed upon between the parties it is said that in September, 1917, the President and Government of the United States established, fixed, and prescribed the amount of 23½¢. per lb. at which refined copper should be bought and sold in the United States, which sum was less than the market price prevailing before that time; and, says the decision, "Since that time the Engineering and Mining Journal of New York has quoted from day to day the sum thus fixed by the Government as the quotation on copper."

Now, the plaintiffs notified the defendant that they accepted all the modifications introduced by Government regulation of copper prices, and insisted that the written agreements between them were valid and enforceable. This was before any copper ore or matte had been shipped to the defendant. Prior to plaintiff's notice, however, the defendant had notified plaintiffs it regarded the contracts null and void by reason of the conditions created by the action of the United States Government, and it thereupon declined and refused to accept or transport any ore under the contracts. However, in June, 1918, a shipment of copper ore and matte made by the plaintiffs arrived in the United States, and by mutual consent of the parties, and without prejudice to the rights of either of them, and without recognizing any contract as existing, the defendant consented to receive this shipment, pay the freight and dispose of the ore "for the account of whom it may concern," and in accordance with this agreement defendant handled this shipment, remitting the net remaining proceeds to the plaintiffs in London.

During all of 1918 and later, the Federal Government refused to allow shipments of copper from South America to this country, except by special permit obtained from the War Trade Board. During this time plaintiffs, and defendant on plaintiff's behalf, made numerous requests for permits to import copper from South America, all of which were refused, except for the importation of the shipment the payment for which is the subject of this action, and one later shipment.

There was no controversy, said the court, as to the disposition of this shipment of ore, but the controversy submitted for the decision was whether or not, upon the foregoing facts, the plaintiffs were entitled to judgment against the defendant in the sum of \$9,996.80, being in addition to the amount remitted before to plaintiffs on account of the one shipment of ore dealt with as above stated; and the further deciding whether the agreements entered into in 1916 between the parties, relating to the sale of copper ore or matte, were valid and enforceable contracts under all the conditions, provisions, and circumstances specified above. If no such valid and enforceable contracts existed by virtue of the agreements as originally entered into, due to the intervention of governmental power and authority regulating the importation and price of copper, then the plaintiffs, the court held, were not entitled to recover.

The claim of the plaintiffs was that their acceptance of the lower price, as fixed by governmental orders, precluded said acts of the United States Government affecting the validity of the contracts, and also that any restriction imposed as to importation of copper was immaterial for the purposes of the cause, for the reason that the particular shipment which was the subject of this action reached the United States, as before stated.

In opposition, the defendant claims that under all the conditions, provisions, and circumstances, including the acts of the President of the United States and the Federal Government, these agreements had

been rendered void, the voiding of the smelting contract necessarily voiding the freight contract, without which there was no material to be transported.

The case was submitted to the court upon an agreed statement of the facts. Regarding the fixing of the price of copper at $23\frac{1}{2}c.$ per lb., in one place it was stated that the President and Government of the United States fixed and established the price; then again it was stated the price was fixed by agreement between American copper producers and the United States Government. However, the court held that from the stipulated facts the parties agreed that the conditions and regulations existing fixed and determined their rights to the same extent as if the price had been fixed by the Congressional action and Presidential proclamation; and the court stated that a careful search failed to reveal any act of Congress that either fixed the price of copper, or authorized the President or any executive department or commission to do so.

Further in its opinion, the court said that the establishment of $23\frac{1}{2}c.$ per lb. for copper was a fact, and this price was quoted in the Engineering and Mining Journal as the prevailing market price at the time of the delivery of the copper in question. The plaintiffs had accepted this and notified defendant. The contract had provided for a contingency of the price dropping as low as $16c.$ per lb. The contract did not fix the price. It clearly expressed the intention of the parties that the copper was to be paid for at the prevailing market price at the time of the various deliveries. The contract was to extend eight years, and was entered into after most of the great powers were at war with Germany. The parties may have contemplated that unusual and abnormal market conditions would be occasioned by the war, that the United States might become involved, and that the performance of the contract might become both difficult and burdensome. But, said the court, parties cannot be relieved from the performance of their contracts for those reasons, but only where, by acts of law, the performance therefore has become impossible or illegal.

If the contract had fixed the price of copper at a figure higher than $23\frac{1}{2}c.$, and the Government of the United States had thereafter legally fixed the price at $23\frac{1}{2}c.$, and forbidden sales at any other price, the contract would have been rendered illegal and unenforceable, said the court. But that was not the case.

The defendant contended that the parties had designated the Engineering and Mining Journal as a valuer to fix the price, and also argued that the price was to be fixed by the prices established in an open and competitive market. Neither contention was correct, said the court. The Engineering and Mining Journal was not to value and fix the price of this copper. Its statement of the prevailing market price was recognized and adopted by the parties as a correct statement, and payments were to be made on the basis of the market price as stated therein. Whether there was competition or agreement among the sellers of copper was immaterial. The price that other purchasers paid at the time of the various de-

liveries, as ascertained and published in the said Journal, was the price defendant agreed to pay, held the court.

As the shipment sued on was delivered despite the restrictions against importation, the effects of the embargo need not be determined, said the court, it merely holding that in so far as the contract was executed by the plaintiffs the defendant on his part was bound to pay. The final contention of defendant was that the freight contract was void, as the plaintiffs were not bound to furnish any specified quantity of copper for shipment; that is, this contract was void for the lack of definiteness. But it was held that the freight and ore agreements were so mutually interdependent as to constitute a single contract. In the ore contract the plaintiffs agreed to sell the entire production of the mines, and therefore the court held it was the entire production of the mines that the defendants were to transport. Said the court: "It is well settled that, where a party agrees to purchase the entire production of a plant, the seller impliedly agrees to deliver the entire production, and that the contract is not unilateral."

Judgment was accordingly rendered for plaintiff.

The Vapor Pressure of Lead Chloride

During the past few years interest has been revived in the possibility of treating certain complex ores, especially those of lead, zinc, silver, and copper, by a process involving a chloridizing roast, and subsequent volatilization of part or all of the valuable metallic constituents. In order to make a technical study of this process, a knowledge of certain fundamental data, such as the vapor pressures of the chlorides of the metals involved, is essential. There is a decided lack of such information in the literature. The Bureau of Mines has been making an experimental study of the volatilization process to determine its possibilities and limitations, and has also undertaken to determine the vapor pressures of the important metallic compounds concerned in the process. The vapor pressure of lead chloride was the first to be investigated.

The results of the work have been published by the Bureau of Mines as Technical Paper No. 225, which may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., for five cents. The vapor pressures for lead chloride at temperatures from 500 to 850 degrees c. are given, together with the weights of lead chloride in unit volumes of saturated vapor between 500 and 950 degrees, and the vapor pressures of the solid salt down to 400 degrees. The melting point was found to be 498 degrees, and the heat of vaporization at that point 40,600 calories.

During the Daylight-Saving Season last year, according to the Compressed Air Magazine, the Edison Electric Illuminating Co., of Boston, saved 4,420 long tons of coal because of the extra hour of daylight utilized by turning the clock one hour forward. The decrease in kilowatt-hours from this cause was 5,000,000, representing a loss of revenue of about \$350,000.

Plans for the Fourteenth Census of Mines and Quarries

Census Bureau, Geological Survey, and Bureau of Mines
to Co-operate—State Surveys Also to Assist in
Collating Statistics

FOR some months negotiations have been in progress between the Bureau of the Census, the U. S. Geological Survey, and the U. S. Bureau of Mines, looking toward a fuller utilization of the technical experience and facilities of the two mineral bureaus of the Government in the coming Fourteenth Census than in previous censuses. An agreement covering this co-operation has finally been perfected. The co-operative arrangements are based upon the recognition of the necessity for eliminating duplicate work, the need of uniformity in the compilation of statistics, and the desirability of focusing upon this difficult task all the technical experience already available in the Government service.

Harris and Ewing

F. J. KATZ

Under the co-operative arrangements as finally perfected a considerable number of the technical specialists and statistical clerks of the Division of Mineral Resources of the Geological Survey, together with some trained specialists and clerks in the Bureau of Mines, will be assigned to duty with the Division of Mines and Quarries of the Census, although probably retained upon the payroll of the first-mentioned bureaus. This staff will be fused with the existing staff of the Division of Mines and Quarries of the Census, the entire organization, augmented by the addition of new members, to constitute the fusion statistical organization.

F. J. Katz, who for a number of years has been one of the specialists of the Division of Mineral Resources of the Geological Survey, and who re-

cently has been associated with the administrative work of that division, has been appointed chief of the Division of Mines and Quarries of the Census, effective Oct. 1, and will have immediate charge of the fusion statistical organization. Mr. Katz, in his new capacity, will be entirely a census official, but his long experience in the mineral statistical work of the Federal Survey will insure a sympathetic utilization of the organized experience of the Survey in the forthcoming mineral census.

The joint supplemental schedules relating primarily to the mineral production will receive the benefit of the technical knowledge of the Survey specialists in their preparation, and after they have been filled in they will be edited and criticised by the same technical specialists and statistical clerks of the Survey who for years have been intimately familiar with the particular subjects involved. The general schedules which will accompany the supplemental schedules will cover some of the broader features of the mineral industry, such as capitalization, and will be edited and tabulated by the Bureau of the Census in co-operation with the technical specialists of the Bureau of Mines and, in some cases, the Geological Survey. The technical talent of the two mineral bureaus will also be used in the preparation of the final report of the census dealing with the mineral industry during 1919. Though the Geological Survey will thus contribute heavily of the time and knowledge of its technical staff to the census work, the regular Survey reports dealing with various phases of the mineral industry will be continued and published in the usual form.

A significant feature of the Fourteenth Census is the fact that it will be conducted so far as possible by mail, and the field agents will be used only in the collection of delinquent schedules. In previous censuses virtually all of the census information was obtained through field agents. It is believed that the use of the mails will not only facilitate the co-operation between the census and the Survey, which has for years obtained its statistical returns largely by mail, but that this arrangement will also expedite the work.

For many years the statistics of the production of gold, silver, copper, lead and zinc in the Western states have been obtained by the Survey through branch offices at Denver, Salt Lake City, and San Francisco. During the census year the statisticians in charge of these offices will be designated as census agents, and the joint schedule covering the mineral production of the Western states will be sent out from and returned to these cities, thus insuring the full utilization of the intimate relationships between the statisticians in charge of these offices and the mining industries of the states which they serve.

That the delinquent mineral schedules shall be handled as intelligently as possible, it has been arranged that the field agents operating in states where mining is the predominant industry shall, as far as practicable, be men of some experience in mineral matters.

The Geological Survey has co-operative arrangements with a considerable number of state surveys, to insure complete co-ordination between the mineral statistical work of these state organizations and the Federal organization. Though it will be impossible during the census year for any of the mineral schedules to be returned to state organizations before they are sent to the Census Bureau, authorization has been secured whereby the Geological Survey may continue to furnish state surveys tabulations of the mineral production to such states as desire to continue such co-operation. In such cases the joint Census-Survey or Census-Bureau of Mines schedules will be rubber stamped to indicate co-operation with the state.

San Francisco Engineers Hear Hoover

At a Recent Dinner He Renews Acquaintances With Pacific Coast Colleagues—Discusses European Economic Conditions—Favors League of Nations

BY LEROY A. PALMER

THE engineering organizations of San Francisco gave a dinner to Herbert Hoover at the Commercial Club on Oct. 7. It was the first time that I had seen Mr. Hoover, and it may be that the impressions that he made on a fellow-member of his profession will be of interest.

As our guest passed through the gathering of 300 representatives of the engineering professions, who rose and applauded enthusiastically, my first thought was: In this the man who has done all of those wonderful things of which we have read, even to taking liberties with our menus, which no one, at the outset, supposed he or any one else could get away with? The man who passed my table was not of great stature, or of stern face and dominating appearance, but of average height, with a rather serious and almost quizzical expression of countenance that seemed to betray embarrassment, or perhaps a wish that the walk to the speaker's table was over and that we would let him move about without so much fuss.

After the dinner, T. A. Rickard made an address in which he referred to Hoover as "the most useful man in the world, whose name is known wherever civilization has spread. . . . The man with a million children who pray for him every night and whom a million mothers bless every day."

During this address Mr. Hoover studied the table cloth directly in front of him and toyed with a lead pencil. He smiled in rather an embarrassed manner at an occasional personal sally, such as the reference to "this shy, stubborn fellow," and I could feel that under any turning over in his mind of what he was to say himself was an undercurrent of thought to the effect, "What does he want to spill all of that stuff about me for? Why doesn't he cut it short?"

I had heard that Mr. Hoover is not an especially brilliant speaker. I do not agree entirely. He is not an orator, but speaks in a low-pitched conversational

tone, with clear enunciation and without hesitation. The first person singular is noticeably inconspicuous. A sense of humor crops out, more in manner perhaps than in speech, and he impresses one as being thoroughly human.

In his address he paid tribute to engineers as a class as men of "quantitative" rather than "qualitative" minds, and stated that for this reason he had found them particularly helpful in carrying on the work he had been called on to do in Europe. He spoke briefly of what had been accomplished by the Commission for Relief in Belgium and by other relief organizations with which he has been connected since the armistice.

The burden of Mr. Hoover's address was the necessity for greatly increased productivity to meet the present unstable economic conditions. To this end we must set aside sentiment and revenge and re-establish trade relations with the Central Powers, assisting them to rehabilitate themselves so that they may discharge their obligations to the rest of the world. He favors the Peace Treaty and the League of Nations as they stand. Not that they are perfect, but that until peace is a definitely accomplished fact no one will extend to the Central Powers the financial assistance without which they cannot get into the producing class. Hence we should overlook the imperfections of the treaty and accept such risk as may be involved in order that we may effect a stabilization of economic conditions as soon as possible.

After the address, Mr. Rickard stated that Mr. Hoover would be willing to answer questions. It was here that we obtained an insight into his quick mind and extraordinary range of information. Without hesitation, he skipped from Russia to the famous telegram consigning the obnoxious German officials to "that place paved with good intentions"—to quote the questioner—from Silesia to prices of foodstuffs at home.

I think most of us were somewhat amused at one question as to the source of the power by which he had accomplished his ends, particularly when, as chairman of Allied Relief, he had had to deal with certain recalcitrant states. Mr. Hoover modestly assured us that he had found almost every one willing to co-operate; but when not, he had been in a position, through his control of foodstuffs, to apply pressure. I am sure that most of the audience would have answered that question with one word—"Hoover."

With respect to Russia, he expressed the opinion that Bolshevism is tottering, that Lenine has confessed its failure in certain vital respects, and that it will be better to let it fall of its own weight than to give any occasion for holding its leaders up as martyrs.

Doubtless the questioning would have continued indefinitely had Mr. Rickard not suggested that Mr. Hoover had been very generous in the matter, so what every one felt to have been an unusually interesting and satisfactory meeting broke up with "He's a Jolly Good Fellow."

Bankers and Mining

Successful Mining Investment Requires Discrimination Between Prospects and Mines—Meritorious Mining Enterprises Compared to Other Commercial Ventures—Basis for Bank Loans—Mining Risks are Reduced to a Minimum by Able Management

By H. A. WHEELER
St. Louis, Mo.

THE average business man may be forgiven for his frequent inability to distinguish between a prospect and a mine, or between "wild-cat" drilling and developing a proven oil field. His knowledge of such matters is usually so superficial that he fails to recognize the great intervening gulf until after he has lost his money in trying to bridge over from the prospecting to producing stage. But a mining engineer is trained to discriminate clearly between *hunting* the game and *eating* the game, and he is not accustomed to regard a meritorious mining enterprise as being too hazardous for bank loans.

By the term prospecting, or "wild-cattng," I mean the searching or hunting for ores, minerals, or oil, which must always precede mining, or the *winning* or *production* of ores, minerals, or oils.

All mines were once prospects and all oil wells were originally "wild-cats," and the searching for properties that can subsequently be developed into paying mines or profitable wells is a hazardous venture. Time and money, no matter how liberally spent, cannot make a mine out of a prospect, or a well out of a "wild-cat," if the mineral or oil is not there in sufficient amount and under such economic conditions as to make it a profitable producer. Patience, persistence, and ample capital may finally succeed in discovering a prospect that can be developed into a mine, but the percentage of such successes is so small, and the risk is so hazardous, that only those who can afford thus to gamble the time and money should undertake it. It is a game for optimistic, red-blooded, strong men, who can afford to speculate with more or less of their capital and continue smiling if it results in total loss. However, the stakes are usually so large, if crowned with success, that, most fortunately for the progress of the human race, there are plenty of men who have the requisite nerve and backbone to "buck the tiger."

Prospecting, or "wild-cattng," is a genuine gamble, and although with good judgment and the accumulation of a ripe experience the chances of success can be greatly improved, it is hazardous to expect banking aid. But this applies exclusively to prospecting or "wild-cattng," or the searching for profitable deposits or pools.

After a deposit has been proven up by a prospector, or a pool of oil has been located by a "wild-catter," it becomes as legitimate a field for the consideration of the banker as any new enterprise. By proving up a prospect I mean the requisites of good modern mining practice that demand sufficient development work in shafts, drifts, and crosscuts, or ample drill holes, to demonstrate an orebody of sufficient size, richness, and character to make a paying mine—not an over-grown, excessively worked prospect that may count drifts by the mile, as the famous Sierra Nevada mine, on the Comstock lode. For the latter has never been more than a huge prospect, although more or less continu-

ously worked for fifty years through incessant assessments. It is extremely unfortunate that the term mine, without any qualification, is so loosely applied by the market to all underground workings, whether mere prospects or developed producers.

It is not surprising that the layman, who accepts the term mine without investigating whether it is a prospect or a producer, has been so frequently misled into a prospecting proposition under the supposition that it was a producing mine.

When the tonnage actually demonstrated by developments, whether by drifts or drilling; when the grade of the ore and working conditions show that it can be profitably operated—then, indeed, is the banker leaning backward if he is too conservative to advance the funds to assist in producing plant equipment or working capital.

With all precautions, there are still uncertain factors—risks that do not render the enterprise as safe as a Government bond, some of which are more or less inherent to mining, whereas others are due to changes in markets and local conditions that affect all mercantile business. But if those behind the enterprise have good judgment, ample experience, and integrity, without which any enterprise is a dangerous hazard, whether mining, manufacturing, merchandising, or banking, mining loans should be as favorably considered by the banker as those in any other mercantile calling.

The conservative investor is likely to be more familiar with the financial failures of mining enterprises than with those in general business. For the mortality record of the mercantile world, according to Dun and Bradstreet, shows that it is only a question of years when over 90 per cent fail or go out of business, and this merely means that the retiring party foresees the impending bankruptcy and quits before it overtakes him.

Every new business enterprise is a speculation as to its ultimate success, yet most banks are willing to grant more or less credit to the young merchant or manufacturer, who often struggles for several years before he has built up an organization and a sales record that assures success and independence of banking assistance. In fact, few mercantile houses, especially the growing ones, ever reach the stage where their working capital is sufficiently large that they can successfully carry on their business without substantial aid from the banker, and the larger the firm the larger the bank loans usually are to tide it over its lean and stocking-up periods.

In many lines of mercantile life there is nothing tangible, beyond goodwill and reputation, on which to make bank loans; whereas, in most mining enterprises, there are also real estate and plant investments, besides reputation, to furnish security for a bank loan. The vicissitudes and constantly changing factors in mercantile life make all mercantile paper more or less speculative, and the watchful banker is never free from

anxiety as to whether some of his best customers will be able to take up their notes promptly when they become due.

To say that no mining proposition can be called an investment—that money put into mining should only be for the purpose of reselling at a profit—is ultra conservatism. About fifty years ago, when producing mines were few, and legions of prospects were being floated as mines, there would have been a better foundation for an over-cautious attitude toward mining. But with the great strides that have been made toward putting mining on a healthy plane—with the large outlays in development work to prove up the magnitude and profitable character of ore-bodies before attempting to put them on a producing basis—such excessive conservatism is unwarranted.

A timid investor or speculator would have sold Calumet & Hecla stock, bought as a speculation for \$12 in 1872, for \$25 a share, and thus doubled his money. But the Boston investors who put it in their safes have seen it advance to \$1,000 a share, and have taken out over \$1,550 per share in dividends (\$10 to \$100 a year), besides being able to sell it today for over \$400 a share in the present depressed condition of the copper industry. Yet few mines have been more unfavorably received by the market than was the stock named when it was floated, and few mines have been more conservatively managed in carrying large ore reserves and in frequently re-equipping the property with improved plants at the expense of junking earlier machinery.

The stock of the Homestake mine could have been sold at a profit in 1885, but those who locked up their stock have drawn about \$6 a year in dividends since then, and it is selling around \$80 a share today (the par value being \$100).

Quincy copper stock could have been sold at a profit in 1862, when it paid its first dividend after organizing in 1848, but those who held their stock have drawn dividends of \$2 to \$18 a year (par value \$25) since then that total over \$250 per share, and today can realize over \$70 a share.

The St. Joe lead stockholder who in 1876 had held his stock for about ten years while the property was slowly being converted from a prospect into a mine could have sold at an attractive profit, but those who held their stock have received 60c. to \$40 annually in dividends that aggregate over \$21,000,000, and today can get about \$14 for the stock (par value \$10).

Though the number of mining stocks that could be held for years for their dividend return—held as investments for their income returns—is large, I emphatically disagree with those who assume that any investment—of whatever nature—“can be locked up in a safe for five years.” No investments—no matter how seemingly safe and secure—can be ignored and forgotten for even a year, much less five years. New conditions are constantly arising in the life of all enterprises that are likely to affect their value greatly, and he who thinks that any investment is absolutely safe is woefully ignorant, and will probably receive severe jolts and losses. Perpetual vigilance is the price of success in any investment, no matter on what industry it is based.

The New England families who put all their savings into the New Haven railroad stock, as a life-long investment based on a dividend record of 10 to 8 per cent per annum from 1887 to 1912, have received no dividends

for the last five years. Stock for which they paid \$150 to \$255 a share is selling around \$30. St. Paul railroad stock that paid continuous dividends from 1895 to 1917, and cost the “sleeping investors” \$80 to \$199 per share, is no longer paying dividends and is selling around \$45, although it was recently enlarged into a trans-continental system in order to protect its traffic.

British consols—the staunchest, safest bond known to the investment world—were selling a 113 in 1897, and today they are below 50. They sold as low as 54 in 1815 and were up to 102 in 1852. Absolute safety is unknown in any investment, as the only two sure things in this world are death and taxes, and even the former cannot be dated. Everything is speculative to a greater or less degree. We are always surrounded by risks and changing conditions—the latter sometimes moving very slowly and sometimes abruptly—and the successful investor is he who is constantly on the alert to foresee impending changes, and who buys or sells accordingly.

Anticipate—anticipate—anticipate—is the keynote of successful investment, whether it is in mining, manufacturing, railroading, merchandising, or banking, and the mining world, including oil, has as many opportunities for reasonably safe investment as any other industry, if intelligence and good judgment are exercised. Hence it is in equity as much entitled to receive intelligent banking support as any other line of business.

Discrimination must be shown by the banker in making any loan in any line of business, and all his loans are more or less speculative. When the mining business is conducted on conservative lines, with its normal risks reduced to a minimum by able management, efficient plants, large reserves, and ample working capital, it is fully as worthy of the confidence of the banker as any other industry.

Metal Production in Ontario In First Half of 1919

Returns received by the Ontario Bureau of Mines from the mines and metallurgical works of the province for the first six months of 1919 are as follows: Gold, \$4,666,759, an increase of only \$18,595 as compared with the corresponding period of 1918; silver, 5,744,172 oz., compared with 8,736,002 oz.; metallic cobalt, 59,337 lb., a decrease of 59,552 lb.; metallic nickel, 5,147,745 lb., an increase of 4,938,943 lb.; nickel oxide, 5,503 lb., a decrease of 16,265 lb.; cobalt oxide, 202,912 lb., a decrease of 56,459 lb.; other cobalt and nickel salts, 160,021 lb., compared with 222,039 lb.; pig lead, 1,481,204 lb., an increase of practically 100 per cent in quantity; blister copper, 3,080,491 lb., against no production in the corresponding period of 1918; nickel in matte, 7,072 short tons, as compared with 21,393 tons for the same six months in 1918; copper in matte, 4,341 tons, as compared with 10,708 tons; pig iron, 24,095 tons, compared with 38,130 tons.

The figures throughout show a serious decrease, owing to after-war conditions. The drop in silver is due to Cobalt being a declining camp. The decrease in nickel and copper is also serious, as it runs into such large figures. It is altogether likely that the next six months will show further decreases in copper and nickel, as production fell as low as 2,000 tons of matte a month. From that figure it is showing a slow increase, and at the present time is up to about 2,500 tons a month. The consumption is altogether domestic, however, and there have been no foreign orders.

Colorado Section; A. I. M. E.

National Department of Public Works and the Engineers' Licensing Bill Impel Action by Local Members—Co-operation of Other State and National Bodies Solicited

A MEETING of the Colorado Section of the American Institute of Mining and Metallurgical Engineers was held at 6:30 p. m., Sept. 19, 1919, at the Savoy Hotel, Denver. Thirty-three members and guests were present at the dinner, which was followed by a business session. U. S. Senate bill 2232, creating a department of public works, was discussed and explained in detail, and a motion in support of the bill creating such a department, now before Congress, was passed.

A motion instructing the secretary to write a letter to all members of the Colorado Section, explaining the purpose for which subscriptions from the members are asked, in connection with securing the passage of Senate bill 2232, was also passed.

Colorado Senate bill No. 339, creating a state board of engineers' examiners, and licensing engineers in the State of Colorado, was discussed. A motion was passed that the sentiment of the meeting was unanimously in favor of the repeal of this bill. A motion was passed that the chairman appoint a committee of three members to endeavor to secure the repeal of the engineers' license bill, and to communicate with the local sections of other national societies with a view to securing their assistance; and that every member of the Colorado Section of the American Institute of Mining and Metallurgical Engineers assist in this matter as far as possible. In accordance with the motions passed at the meeting, the following two letters, under date of Sept. 30, were sent to members of the Colorado Section:

Gentlemen: At the meeting of the Colorado Section held in Denver on Sept. 19 the following resolution was unanimously adopted:

"Whereas, There exists today in our Government in Washington a state of chaos in various departments, divisions and bureaus, caused by conflicting or overlapping calls for engineering services, therefore be it

"Resolved, That it is the sense of this meeting that no effort should be spared in securing the passage of Senate bill 2232, believing that economy in operation and co-ordination of government agencies affected will be secured by its passage; that the Secretary of this local section of the American Institute of Mining and Metallurgical Engineers be instructed to inform our various Representatives in Congress of this belief, requesting their wholehearted aid and assistance in obtaining its adoption; and that a copy of this resolution be sent to M. O. Leighton, Esq., chairman at Washington of the Engineers', Architects' and Constructors' Conference on National Public Works."

Senate Bill No. 2232 changes the name of the Department of the Interior to the Department of Public Works. It transfers the non-engineering activities of the Interior Department to other appropriate branches of the Government, and, in turn, transfers to the Department of Public Works the following bureaus:

A. The Supervising Architects' office from the Treasury Department.

B. Construction Division, U. S. Army, River and Harbor Improvements, Mississippi River Commission and California Debris Commission, from the War Department.

C. Coasts and Geodetic Survey and Bureau of Standards from the Department of Commerce.

D. Bureau of Public Roads and Forest Service from the Department of Agriculture.

The bill provides that all secretaries of public works shall be qualified by "training and experience" to administer the affairs of the department, and that there shall be four assistant secretaries, each especially qualified by experience and training to administer the functions under his control. These assistant secretaries are to serve an indeterminate period, and can only be removed for cause.

The Department of Public Works is necessary for the following reasons:

1. The United States is, with one exception, the only nation of importance not now administering its public works through such a department.

2. The public works activities are now spread out over many departments, with no co-ordination of effort. Duplication necessarily results as well as conflict of authority and great waste of public funds.

3. Public works are strictly technical in their character and require the services of a permanent and skilled personnel for their efficient construction and operation.

4. The creation of such a department would result in the formation of a technical organization competent to administer the engineering work of peace and further to provide the nucleus of an organization capable of being expanded immediately to meet the war construction and research needs of the country.

5. The formation of such a department would attract to its service competent men of a calibre not now available for Government work, and would create a permanent body of skilled, experienced men, competent to undertake new enterprises, whose permanence and pride of accomplishment would create an excellent esprit de corps.

6. There is no Government organization in existence capable of rendering this service.

7. It would permit of a unified control over public works and a comprehensive plan for their continuance over a term of years, according to a modern and businesslike financial plan based on an annual budget.

Any private or corporate business conducted according to the methods of the Government would speedily become bankrupt, and would deserve such a fate. There are twelve federal organizations engaged in making surveys, more than a score in chemical investigations, some of them competing and quarreling for preference under the same departmental rule. In the "Congressional Directory" there are listed twenty-nine bureaus and agencies of the Government engaged in construction of one or another kind, while four Government departments are engaged in fuel tests. To educate the people concerning the need of consolidating the vast public enterprises of the nation under one central department, which would be known as the Department of Public Works, there has been organized the Engineers', Architects' and Constructors' Conference on National Public Works. At the formation of this conference in Chicago in April, 1919, there were represented seventy-four technical societies, with a membership of 105,000.

At a recent meeting of the Engineering Council of the State of Colorado the movement to obtain the passage of this bill was unanimously endorsed. The Engineering Council consists of representatives of all the national engineering societies and several local societies. The purpose of the Engineering Council is to secure greater co-operation among engineers in matters of public policy, and the enactment of laws which concern the welfare of the engineering profession.

To carry on successfully the work of securing the passage of the above-mentioned bill, a minimum of \$100,000 is necessary for educational purposes. These funds must be furnished by professions and industries making up the conference. For the first time there is a united movement of the engineering professions and industries to support a movement of national interest and importance. To succeed, it must be supported with our efforts and with our money. We as engineers cannot afford a failure. The funds will be controlled and accounted for by men of national standing. The quota of Colorado is about \$900, which means a minimum contribution of \$1 from each engineer in the State. Send it today to our State Chairman, Mr. Richard A. Parker, 802 Equitable Building, Denver, Col.

Yours respectfully,

Robert M. Keeney,
Secretary.

Gentlemen: At a meeting of the Colorado Section of the American Institute of Mining and Metallurgical Engineers, held on Friday, Sept. 19, 1919, a resolution was unanimously passed condemning the Engineers' Licensing Bill passed at

the last session of the State Legislature, and requesting the chairman to appoint a committee to act in conjunction with the other national engineering societies and the Colorado Metal Mining Association, with a view to securing its repeal at the extra session of the Legislature which the Governor has expressed his intention of calling.

It may be within your knowledge that the bill in question was passed by the Legislature and signed by the Governor without the knowledge of any of the national societies, and of few if any of their members. Under its provisions residents of other states cannot even come into this to examine a mine without securing a license, and aliens (among whom are many honored members of the profession in Colorado) cannot obtain such a license at all. The mining industry in this state needs the co-operation of outside engineers, and we should welcome any assistance from them that will tend to develop our resources. To attempt to discourage the activity of visiting engineers will inevitably react on us, and brand the state as being hostile to brains and capital from outside.

The difficulty of securing a license will prove a serious handicap to young engineers starting out in the independent practice of their profession. Moreover, a license issued to an engineer qualified in one branch will entitle him to practice in any other; so that the license is apt to mislead the public.

All members of the Institute are requested to communicate immediately with State Senators and Representatives, and to request them to write to the Governor expressing their readiness to co-operate in the repeal of this obnoxious measure.

The Governor of the state has expressed a willingness to include the repeal of this bill as one of the objects of the special session of the Legislature which he is about to call together, if a general sentiment is shown to exist sufficient to assure him that its repeal is generally desired.

Yours respectfully,

George E. Collins,
Robert Hursh,
J. C. Roberts,
Committee.

Tungsten Bill Protested

At a recent meeting of consumers and importers of tungsten and tungsten ore, the following resolution was passed in protest against the tungsten ore tariff as proposed in the Timberlake bill, H. R. 4437, which has been passed by the House and is now pending before the Senate Finance Committee:

Resolved, That this meeting, representing a large majority of tool-steel manufacturers, exporters of finished tools, ferro-tungsten producers and refiners, and consumers of tungsten ore in the United States, unanimously declare its undivided and determined opposition to the Timberlake tungsten tariff bill, H. R. 4437, as passed by the House of Representatives, as being against the spirit of the time as indicated by the balance of trade exchange, etc.

It is further resolved, That in the opinion of this meeting no case has been made out by the Western producers before the Ways and Means Committee during the consideration of this measure in Washington in favor of such an exorbitant duty as \$10 per unit and per ton of tungsten ore.

It is further resolved, That it is of vital interest to the country that the small and available deposits of tungsten ore in the United States, which were estimated by such a high authority as Frank L. Hess, of the U. S. Geological Survey, as sufficient to last only for three years, be conserved to meet the emergencies of the steel industry should foreign supplies of tungsten ore be cut off by reason of international complications.

Resolved, further, That this resolution be brought to the attention of Senator Penrose, Chairman of the Committee on Finance, and to each member of the committee.

David Dows,
Secretary.

Monthly Copper Production in 1919

The table which appears herewith is compiled from reports received from the respective companies (expect in the cases noted as estimated), together with the reports of the U. S. Department of Commerce as to imported material, and in the main represents the crude-copper content of blister copper, in pounds.

Production of the United States by months since the beginning of the year and the corresponding figures for 1918 were as follows:

	1918	1919
January	166,431,668	135,733,611
February	169,011,364	111,649,512
March	185,625,168	102,040,460
April	163,207,096	98,808,998
May	181,070,360	92,662,975
June	166,723,699	96,856,570
July	159,329,031	100,569,247
August	165,560,799	107,994,040

The grand total includes, under "Imports in ore and blister copper," the production of such companies as Granby, Cananea, Braden, Cerro de Pasco, and Chile. As a matter of record, however, the individual figures are given after the total. We also report the copper output of the Boleo and Katanga companies, which does not come to the United States.

MONTHLY CRUDE COPPER PRODUCTION, 1919

	June	July	August	September

Chile	5,003,430	7,161,444	8,594,210	7,034,000
Katanga	4,619,430	4,442,270	5,026,488	4,440,064
Bakus & Johnston	2,107,000	2,174,000	2,118,000	1,280,000

(a) Only electrolytic cathodes are entered. New Cornelia also produces some copper from ores sent to Calumet & Arizona smelter. (b) Estimated. (c) Official figures of the U. S. Department of Commerce; includes Kennecott production from its Alaska mines.

The Federated Malay States in 1918 exported the following metals, according to Commerce Reports: Gold, 18,309 oz.; wolfram, 710 tons; scheelite, 111 tons; tin and tin ore, 37,370 tons. In 1917, the metal exports were: Gold, 18,154 oz.; wolfram, 421 tons; scheelite, 340 tons; tin and tin ore, 39,833 tons.

PETROLEUM SECTION

Engineering Notes and Equipment Details
Production Statistics—Progress
in Important Fields

West Virginia Oil Output

West Virginia now ranks higher than Pennsylvania, according to information by Henry L. Doherty & Co., in both quantity and value of oil produced. In 1918, the state produced 7,868,000 bbls. valued at \$31,652,000, or \$4.02 a bbl.; Pennsylvania produced 7,408,000 bbl., valued at \$29,606,000, or \$4 a bbl. West Virginia did not begin to produce oil until 1876, and oil was not found in important quantities until 1891. Pennsylvania began producing oil in important quantities as early as 1861.

The West Virginia fields have declined greatly since 1900. In that year production reached its high point, amounting to 16,200,000 bbl. Efforts are being made to find additional oil-producing territory, and some wells have been put down 7,500 ft., but with no success up to the present. The theory is that the rich Clinton sand of Ohio can be reached in the state at a depth of between 7,000 and 8,000 ft.

West Virginia has produced 294,745,000 bbl. of oil since 1876. The state's production in recent years is shown in the following table:

1918.....	7,867,000	1911.....	9,795,000
1917.....	8,379,000	1910.....	11,753,000
1916.....	8,731,000	1909.....	10,745,000
1915.....	9,265,000	1908.....	9,523,000
1914.....	9,680,000	1907.....	9,095,000
1913.....	11,567,000	1906.....	10,120,000
1912.....	12,129,000	1905.....	11,578,000

The West Virginia fields produce oil which is especially good for lubricating purposes. This oil is worth more than \$4 a bbl. at this time.

Latest Gusher of the Standard Oil

California's oil production was increased during the week ended Oct. 7 by more than 12,000 bbl. of oil daily as a result of the Standard Oil company's gusher which was brought in on Section 36 of the Elks Hills district, about ten miles northeast of Taft. The well is known as the Carmen No. 1 well. It has been spouting oil 30 to 40 ft. above the derrick, and the flow has varied from 10,000 bbl. to more than 15,000 bbl. It is probably the largest gusher since the famous Lakeview No. 1 was brought in, in the Sunset field, on Mar. 15, 1910. The Lakeview spouted from 35,000 to 60,000 bbl. daily for six months.

This is the first big gusher in the Elk Hills field, although several big gassers have been brought in. The well is regarded as an indication of unusual development activity in this section in the near future. It is situated about one mile east of the big gasser brought in in June of this year, and the oil is of high gravity.

This well has been under drilling operations for about six months, and has a 6-in. drill casing with a 10-in. well casing at the mouth. The crown of the

casing was left intact by the blow-off, and this facilitated the work of bringing the enormous producer under control.

Anglo-Persian Oil Co. Plans Pipe Line to Mediterranean

Plans are under way for the construction by the Anglo-Persian Oil Company of a pipe line, 350 to 400 miles in length and costing approximately \$48,665,000, to provide an outlet for the company's products on the Mediterranean, according to a report received by the Bureau of Foreign and Domestic Commerce. It is anticipated, according to the report, that the saving in freight on oil for European countries would more than compensate for the heavy initial cost.

No decision as to the route of the pipe line has yet been reached. It is understood that the terminus of the line will be at Haifa, whether the route is along the Bagdad railroad or a direct line across the country. In the event that the direct line be chosen, it is reported that an all-British railroad across Mesopotamia from side to side may become probable.

Distillation of Oil Shale in Germany

Prior to the outbreak of the Great War, shale was worked in the Rhine provinces and near Reutlingen, but only one company was occupied in producing paraffin and mineral oils, according to an article in the Zeit. d. Ver deut. Ingen. of July 19, 1919, abstracted in the Journal Soc. Chem. Ind. From the bituminous shale which occurs near Messel (containing 40 to 45 per cent water, 6 to 10 per cent tar and 40 to 50 per cent residues), the following yields per ton of shale are obtained: 32 gal. of crude oil, together with 71 gal. of ammonia water and 1,900 cu. ft. of gas, which is burned as fuel in gas engines or under the vertical retorts. During the war the oil-shale deposits in South and North Germany have been investigated in regard to their yield, but the results have not been published.

El Progreso District, Mexico

In answer to inquiries from American firms regarding the mining probabilities in the Progreso Consular District, Mexico, the American Consul at Yucatan, Mexico, in a report to the Department of Commerce, states that there is no mineral production in that district.

The efforts of several Americans, the report states, who have worked in connection with oil production and who have prospected through portions of that district, led to no discovery of formations that would indicate the existence of mineral oil.

Two large tanks and a pumping station, which are owned by the Compania de Fomento del Suresta de Mexico, in the district of Progreso, it is reported will be offered for sale.

Fuel Supplies For the New American Oil-Burning Ships

Greater Cruising Radius Reduces the Number of Fuel Stations Necessary—The Need of Foreign Supplies For American Ships—Advantages of Oil-Burning Type

During the early stages of the war, Great Britain put into effect a system of bunker license as a necessary military measure. The United States Shipping Board realized that after-war conditions might develop a situation with respect to coal supplies which would dictate the necessity of a modified application of bunker license at British stations. In that event we would have been at a serious disadvantage unless immediate steps were taken to assure unrestricted operation of our ships in the world's trade. To accomplish this it was necessary to have oil-burning steamships, instead of coal burners, with a large steaming radius, and so far as practicable, this to be fixed at a minimum of 10,000 miles. The British order of Sept. 29, 1919, justified these apprehensions.

The next task was to find suitable places for the establishment of fuel stations along the trade lanes or adjacent to them. At the Panama Canal, the turn at the world's cross road, facilities already existed and only required to be amplified. To take care of the east coast trade of South America, a station was erected at St. Thomas. This station, which had an initial capacity of 15,000 tons of storage, was opened on Oct. 2.

Arrangements have been made for establishing a station at the Azores and another at Bizerta, a small French island off Tunis and situated on the ocean highway to the Indies. Material has been assembled at Manila where another large storage tank is to be erected.

"Despite what has been done," said J. H. Rosseter, Director of the Shipping Board's Division of Operations, "we feel that we are still at the threshold of the major part of the question, this involving an increase in storage capacity of fuel stations and additional tank steamships for transporting oil to them. We must also take into account the fact that we must now carry oil to our Atlantic seaports, not only from Mexico but from the Texas and Louisiana fields as well.

"Finally we must awake to the importance of encouraging the establishment of national interest in other known and probable oil regions of the world. For two years our British friends have been admirably directing their attention to new oil regions, notably those of Colombia, Venezuela and Ecuador, and also to the fields of the Levant in which it is surmised that the fields of Turkey promise results exceeding the output of the great oil fields of California, which the Turkish fields are said to resemble. It has become necessary for us to look far afield, to safeguard the future. The value of this great mineral wealth can fairly be stated as three to one for sea use as compared with use on land."

Today, the United States possesses a fleet of 486 oil-burning steel steamships, representing 3,798,733 deadweight tons of new construction. In addition,

there are forty-nine freighters of the oil-burning type which have been reconveyed by the Shipping Board to their American owners, and still another group of eighteen which have been sold by the board and which are under the American flag. Of the 720 steel vessels under construction and contracted for, 636 are oil burners, these aggregating 4,691,659 deadweight tons. When the steel program has been completed there will be a total of 1,731 of the oil-burning type under the American flag.

Our new merchant marine was a by-product of the war and its creation brought with it this problem of bunker facilities, one that demanded immediate consideration, for upon its solution depended the success or failure of our re-entry upon the seas. Great Britain's control of the supplies of bunker coal along the main trade routes of the world has been one of the chief factors in the maintenance of her maritime supremacy. The other lies in the fact that the imports of Great Britain consist largely of produce and raw materials requiring a large amount of tonnage and that the British use coal as cargo for the outward voyage.

Coal does not command a high freight rate, but by carrying this product on their outward voyages, British ships are able to bring back raw materials at a rate that shows a profit for the round trip. After being worked into finished products by British labor, these imports are exported in British bottoms at rates remunerative to the ship operators, and so the cycle goes.

With the United States, shipping conditions are practically the reverse. The bulk of this nation's trade comprises exports rather than imports; moreover, the goods moving in the export trade have been of a greater value than coal, and have borne a higher rate of freight. This American coal has not had a ballast value comparable to that of the British product.

With Shipping Board fuel stations established on the important trade routes, the enormous advantages which this fleet of oil burners will possess, may be summarized as follows:

Oil requires less bunker space than coal for a given steaming radius.

It can be carried between double bottoms and in other places where neither coal nor cargo can be stored.

The space usually given to coal can be occupied by freight-paying cargo.

Bunkering can be effected with greater dispatch, and is not interfered with by darkness or the state of the weather.

It is not attended with the dirt and other discomforts incident to coal bunkering.

Labor and machinery are not required for handling ashes.

Oil fuel eliminates stoking, thus reducing the size of the crew and labor costs.

It possesses greater thermal efficiency than coal and reduces fuel costs.

Uniform steam pressure is easily maintained, thus insuring a steady rate of speed.

Oil and Gas in Utah

U. S. Geological Bulletin Summarizes the Possibilities of Petroleum and Gas Production of the Farnham Anticline and Reviews Natural Conditions*

BY FRANK R. CLARK

THE Farnham anticline, about ten miles south-east of Price, Carbon County, Utah, is structurally favorable for the accumulation of oil and gas. It is a small uplift in a great north-westward-dipping monocline. The south and east flanks are short compared with the north and west flanks, and within a short distance from the crest of the anticline conform to the regional monoclinical dip. If petroleum were present in any of the underlying rocks and were associated with water under pressure it would migrate up the dip. Under such conditions the west and north flanks would afford a good gathering area, and oil might be expected to accumulate in the crest of the anticline and on its north-west flank. The Farnham fault, west of the axis of the anticline, may, however, have cut off any migration, and petroleum may have accumulated on the west or down-dip side of the fault unless the displacement dies out below the surface or unless the oil- and gas-bearing stratum is offset and abuts against a higher or lower porous rock on the east side of the fault.

The known occurrences of petroleum in the Rocky Mountain States in rocks older than Cretaceous are few and widely separated. In Utah A. R. Shultz noted considerable evidence of petroleum in the Nugget sandstone and Park City formation on the south flank of the Uinta Mountains. The Nugget sandstone in many places is highly saturated with asphaltic substances, and the Park City formation contains cavities filled with asphalt, gilsonite, and related hydrocarbons. In some places the material is soft and waxy, and in others it is hard and brittle. Schultz considers it unlikely that the asphaltic material originated in the Nugget, and states that it may have migrated from the beds beneath, probably the Park City. This suggestion seems improbable, however, because the Nugget and Park City are separated by 1,000 to 1,200 ft. of impervious shale.

In southeastern Utah asphaltic-saturated sandstones are reported in the Jurassic of Castle Valley. Oil is reported in the Permian in the Virgin River field; several sandstones in the Pennsylvanian are oil bearing in the San Juan field; and oil seeps are reported in the Shinarump conglomerate (Triassic) and in the Pennsylvanian (?) in the Green River Desert. The only other known occurrences of petroleum in beds older than Cretaceous in southeastern Utah are several reported oil seepages along Colorado River, probably in rocks of Carboniferous age.

From the above descriptions it seems possible that in eastern Utah the upper Carboniferous and in places the Triassic rocks may yield petroleum in commercial quantities. The Farnham anticline is structurally favorable for the accumulation of oil and gas, and the nearest exposures of Triassic and Pennsylvanian rocks contain oil seepage. These conditions appear to warrant one or more test holes of this fold, though

it should be clearly understood that such tests would be purely "wildcatting."

San Juan Field—Oil occurs in the San Juan field in rocks of upper Pennsylvanian age (Goodridge formation), which contain five reported oil-bearing sands at about the following depths below the top of the Goodridge formation: Baby, 29 ft.; Goodridge, 74 ft.; Third, 190 ft.; Mendenhall, 231 ft.; Little Loop, 381 ft. Oil seepages are reported to occur at several localities in the Goodridge formation along San Juan River westward from Goodridge to the boundary of the field. At some places the oil seeps from crevices and at others it saturates the unbroken rock, but the oil impregnation seems to be local and to occur at no definite horizon in the sand. Several wells were drilled no deeper than the Baby sand, but most of them went as far as the Goodridge sand and a few penetrated to a depth of 1,425 ft. E. G. Woodruff believes that as all the wells with more than a good showing of oil are in the syncline, the area of basin structure contains most of the oil. In this field during 1916 one dry hole was completed and one well formerly classed as a producer was abandoned. The five other wells in the field reported as capable of producing were closed through lack of marketing facilities.

Green River—Prospecting for oil near Green River has extended over twenty years, and interest has several times been revived by the increasing demand for petroleum and by the discovery of other oil seeps. Two wells, Levi No. 2 and Collins, have penetrated Lupton's McElmo and entered the underlying La Plata sandstone. The Levi well, in Sec. 35, T. 22 S., R. 17 E., was drilled to a depth of 1,500 ft.; and the Collins well, in Sec. 20, T. 21 S., R. 17 E., to a depth of 2,100 ft. No oil or gas was reported from the Levi well, but gas was reported in the Collins well at 850 ft., (in Dakota sandstone) and at 976 ft., gas and salt water at 1,840 ft., and dry gas at 1,980 ft. Rainbow colors on the water accompanied each flow of gas. Most of the other wells in this area were drilled into the McElmo, but a few stopped in the overlying Mancos shale, from which most of the gas was derived.

The results of drilling up to 1912 gave little encouragement for further exploration, because three out of seven wells proved to be dry holes, three encountered traces of oil and small quantities of gas, and one struck "pockets" of gas without oil. The Green River field contains no anticlines or domes favorable for large accumulations of oil or gas.

San Rafael Swell—Several wells have been drilled for oil or gas southeast of the San Rafael Swell and northeast of Hanksville, near the junction of Fremont and Dirty Devil rivers, in T. 26 and 27 S., R. 12 and 14 E., in Emery and Wayne counties. A well 600 ft. deep was drilled just south of the "Flattops" in Sec. 18 or 19 (unsurveyed), T. 26 S., R. 13 E., which possibly passed through Lupton's McElmo formation and penetrated about 35 or 40 ft. into the La Plata sandstone, but found no oil or gas. The Des Moines Oil Co.'s well near the center of Sec. 29, T. 26 S., R. 14 E., had in November, 1912, been sunk to a depth of 2,140 ft. but did not obtain oil or gas. It is estimated that the upper 600 ft. of this well was in the Navajo and Todilto; from 600 ft. to 1,325 ft., the drill penetrated the Wingate. Fresh water was

*Excerpt from Bull. 711-A, U. S. Geological Survey.

encountered at several horizons from 310 ft. down. The Mount Vernon Oil Co.'s well, ten or twelve miles southwest of the Des Moines well, in the NE. $\frac{1}{4}$ Sec. 9, T. 27 S., R. 12 E., probably started in the Navajo and penetrated to a depth of 2,715 ft. Oil is reported to have been found in this well at 2,175, 2,530, and 2,655 ft. below the surface, all of which may be in the Pennsylvanian (?), but it is possible that the first show of oil, at 2,175 ft., was in younger rocks. These wells, according to C. T. Lupton, are near the axis of a broad, nearly flat east-west anticline which connects the San Rafael Swell, on the west, with another reported anticline occupying a position near the junction of Grand and Green rivers on the east.

Southwestern Utah—The rocks exposed to the Virgin River field range in age from Carboniferous to Eocene, and so far as known contain oil only in the lower red beds, of probable Permian age. Oil seepage near Virgin, on Virgin River in Washington County, southwestern Utah, has probably been known for many years, but no prospecting by drilling was undertaken there until recently. The first well, in the flood plain of North Creek about two miles north of Virgin, was drilled in the summer of 1907 to a depth of 610 ft. and struck oil in the Permian (?) rocks at 556 ft. This well yielded oil at the rate of ten barrels a day and stimulated the drilling of six other wells, none of which produced oil in paying quantities, but it is reported that some oil was found in all the wells. Interest in the Virgin River field has again been revived, but, although some drilling is reported, at the date of writing (September, 1918) there had been no commercial production. The oil has a specific gravity of 0.9225 (22° Bé.), contains some paraffin and a large percentage of asphalt, and is essentially a fuel oil. G. B. Richardson believes that the source of the oil is in the underlying Carboniferous limestone, that the oil-bearing rocks occur as lenses rather than as persistent beds, and that oil accumulated in this field only in lenticular beds and not in folds, because the rocks are flat-lying.

Great Salt Lake and Sevier Lake Basins—At many places in the Great Salt Lake and Sevier Lake basins considerable drilling for oil and gas has been done, but, so far as I know, oil has not been encountered in commercial quantities.

Juab Valley—Several holes have been drilled in Juab Valley, near Juab, in Juab County, but no production of oil has been reported. The rocks exposed in the valley are probably Lake Bonneville beds. Rocks of Eocene age dip westward from Gunnison Plateau beneath the valley floor, but I have no knowledge of the local structure of the rocks in the vicinity of the wells.

San Pete Valley—A hole was drilled in the north end of San Pete Valley near Mount Pleasant, but no information is available regarding the results. The beds that crop out on both sides of the valley are Tertiary.

Shores of Great Salt Lake—More or less interest and some excitement has for many years attended the drilling for oil and gas along the shores of Great Salt Lake. Oil has not been encountered in commercial quantities, but considerable gas was produced by wells about twelve miles north of Salt Lake City. This drilling has probably been stimulated at various times by the gas bubbling from hot-water springs, by reports regarding "showings" of oil in water wells and springs, and by the occurrence of solid asphalt deposits such as those

south of Rozel Hills, on the west side of the Promontory Range, on the north shore of the lake.

A well was drilled to a depth of 2,480 ft. near the Southern Pacific R.R. track at Lemay, about eighty miles west of Ogden, but found no oil or gas. The drill penetrated, according to reports, 850 ft. of clay carrying gypsum, fossiliferous limestone, and brown sandstone. Another well along the same railroad was drilled to a depth of 800 ft. at Strong Knob, at the north end of the Lakeside Mountains, about fifty-two miles west of Ogden, and obtained some gas but no oil. Several shallow wells were drilled south of the Rozel Hills, on the west side of the Promontory Range, to test the extent of asphalt beds, but no wells deep enough to test the oil or gas possibilities of this region are reported.

A well about one mile southwest of Farmington was drilled to a depth of 2,000 ft. in unconsolidated lake beds, but found no oil or gas. It is reported that another well is now (September, 1918) being drilled near the site of the old well, but no information is available regarding the results. Several wells drilled a few miles south of Farmington and about twelve miles north of Salt Lake City produced considerable gas. The deepest well was 1,400 ft. deep, but did not pass through the unconsolidated lake beds. The gas in most of the wells came from depths of 500 to 700 ft. below the surface and was piped to Salt Lake City, where it was used for about nineteen months, until the wells failed to yield sufficient gas to pay the costs of operation. A deep well has been drilled on the south shore of the lake near Grants Station, on the Western Pacific R.R., and in April, 1916, oil was reported to have been encountered at a depth of 1,900 ft. Many shallow wells have been drilled for water on the east and south sides of the lake, but so far as known these wells have found no oil or gas.

Drilling in the Lake Bonneville beds for oil or gas is attended with great uncertainties and is purely "wild-cattin'" because the nature and thickness of the lake beds and the underlying bedrock are not known.

California Crude-Oil Prices

Prices offered by the Standard Oil Co. of California under date of June 10, 1919, and which prevail at present for crude oil delivered at the well in California oil fields, according to the *Standard Oil Bulletin*, are as follows:

CRUDE-OIL PRICES IN CALIFORNIA FIELD	
SAN JOAQUIN VALLEY FIELDS	
(Kern River, Midway-Sunset, McKittrick, Lost Hills-Bchidge, Coalinga)	
	Per Bbl.
14° to and including 17.9° gravity	\$1.23
18° to and including 18.9° gravity	1.24
19° to and including 19.9° gravity	1.25
For each increase in gravity of one (1) full degree above 19.0° gravity, up to and inclusive of 36.9° gravity, two (2) cents per barrel additional	
37° to and including 37.9° gravity	1.62
For each increase in gravity of one (1) full degree above 37.0° gravity, three (3) cents per barrel additional	
WHITTIER-FULLERTON AND SANTA MARIA FIELDS	
	Per Bbl.
16° to and including 17.9° gravity	\$1.23
18° to and including 18.9° gravity	1.24
19° to and including 19.9° gravity	1.25
For each increase in gravity of one (1) full degree above 19.0° gravity, up to and inclusive of 36.9° gravity, two (2) cents per barrel additional	
37° to and including 37.9° gravity	1.62
For each increase in gravity of one (1) full degree above 37.0° gravity, three (3) cents per barrel additional	

Good Analytical Weights are made of three metals: 2 gr. and over of brass, gold plated; 0.05 to 1.0 gm. of platinum; and 0.001 to 0.02 gm. of aluminum.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

War Minerals Relief

Legislation which will liberalize the War-Minerals Relief Act is to be considered at once by the Committee on Mines and Mining of the House of Representatives. The bill which will be taken up by the committee is House Joint Resolution 170, which was introduced by Representative Garland, the chairman of the Committee on Mines and Mining. Mr. Garland states that he is not wedded to the terms of this bill, but has introduced it as a basis for such action as the House may see fit to take. In the bill he brings out that war-minerals claims in excess of \$15,000,000 were filed, but that a considerable proportion of the claims are being denied because of the Attorney General's interpretation of the act. He also includes in the bill the statement that it was the intention of Congress in passing the War-Minerals Relief Act "that all producers of the minerals mentioned should be repaid such sums as they were in equity and good faith entitled."

Mr. Garland's resolution provides that all claimants "who in response to any personal, written or published request or demand from any of the Government agencies mentioned in said act in good faith expended money in producing or preparing to produce any of the ores or minerals named therein, . . . and have heretofore filed their claims within the time and in the manner prescribed in said act," are to be reimbursed for the net losses incurred.

Another important feature of Mr. Garland's resolution is that in the event that the appropriation is not sufficient to liquidate all claims allowed, a pro-rata share of the appropriation is to be awarded to the claimants. The resolution also provides that 50 per cent of the amount of any adjudicated claim is to be paid immediately.

American Petroleum Institute

Details are now available regarding Van. H. Manning's proposed plan of organization for the Division of Research and Statistics of the American Petroleum Institute, which it is understood will be accepted. The amount to be expended is placed at about \$500,000 annually, which the industry can well afford, as this sum is only one-fiftieth of 1 per cent of the value of the 1918 output of crude oil and refined products in the United States.

The plan provides for a technical director, in general charge of all the work, assisted by consulting experts, who are to serve without pay. In addition, there will be an advisory committee, to meet regularly, consisting of one representative from each of the following: Bureau of Standards, Bureau of Mines, Geological Survey, Society of Automotive Engineers, National Automobile Chamber of Commerce,

American Institute of Mining and Metallurgical Engineers, American Society for Testing Materials, American Chemical Society, and the National Research Council.

The principal officials under the director are to be the chief economist and an engineer. The economist will be in charge of statistics, economic phases of the industry, and publicity. He will also give particular attention to international policies affecting the petroleum industry of the world. It is suggested that the petroleum industry in the United States, following the example set by other governments, "should unite to see that Americans engaged in development of foreign oil fields are protected properly, and that this country act as a unit to that end." Agents will be stationed in important foreign commercial centers in order that economic studies of the petroleum industry in foreign countries may be made. Uniform cost accounting and uniform laws and regulations in the industry are to be sought.

The engineer of the division is to co-ordinate the research work undertaken by the subdivisions of production, chemical engineering, utilization, and correlated activity. Systematic study will be made of the questions of leasing and bonuses, drilling, pipe lines, storage, and tank cars, and active steps will be taken in an effort to improve the internal-combustion engine for use of heavy oils.

The policy of the American Petroleum Institute, it is announced, will be to employ only the highest type of men and to pay them salaries attractive enough to insure continued service.

Leasing Bill Reported in the House

After extended consideration, the general mineral leasing bill has been reported out by the Committee on Public Lands of the House of Representatives. The committee struck out all of the bill passed by the Senate and rewrote the text. Though the general features of the Senate bill were maintained, material changes were made by the House committee. The Senate bill provides maximum as well as minimum royalty. This was changed by the House committee to provide for a minimum royalty only. The determination of the maximum royalty is left to competitive bidding or to the discretion of the Secretary of the Interior. Changes were made in the matter relating to alien ownership, due to the fear that retaliatory action against American investors in foreign countries might result.

Sections 40 and 41 of the Senate bill, which were attached to that measure in the form of a rider, are stricken out.

At the request of the Secretaries of War and Navy, the House committee added a provision reserving to

the United States all deposits of helium in public land. The United States is to have preferential right to remove helium from all lands and all deposits leased under the act.

Safety Meet at Cleveland

Sessions Marked by Lively Discussions of Numerous Papers on Various Phases of Accident Prevention—Election of Officers

THE eighth annual safety congress of the National Safety Council was held on Oct. 1 to 4 at the Hotel Stattler, Cleveland, Ohio. More than 2,100 persons registered, and it is estimated that 3,000 attended the sessions and many more witnessed the safety show.

The annual meeting took place on Oct. 1. It was opened with an invocation pronounced by Ferdinand A. Blanchard, president of the Federated Churches of Cleveland, and was followed by an address of welcome delivered by Harry L. Davies, Mayor of the convention city, to which President D. Van Schaak of the National Safety Council responded. Mr. Van Schaak then read his annual report. He referred to the removal of the council to larger and more adequate offices, the resignation of W. H. Cameron, "that far-seeing enthusiast whose works justified his faith"; the appointment of C. W. Price, "whose administration of his new office has proved, even in a few months, that we made no mistake in advancing him to a wider field of opportunity"; the addition to the staff of a new safety engineer, a librarian, a director of publicity, two regional secretaries, and a public-safety field secretary.

The meeting of the mining section was called to order by B. F. Tillson, the chairman, on Oct. 2, and after the annual reports of the committees had been made, A. H. Fay read an article on "Mine Accidents of English Speaking and non-English Speaking Employees." Five papers followed, one by W. W. Gidley, safety inspector of the Phelps-Dodge Corporation, Copper Queen Branch, Bisbee, Ariz., entitled "The Management and Training of Men," and one by Charles F. Willis, consulting supervisor of industrial relations of the Phelps-Dodge Corporation, Bisbee, Ariz., on "Industrial Relations in the Mining Industry." These were followed by "Labor Turnover and Its Relation to Mine Accidents," by E. E. Bach, chief of the Americanization Bureau of the State of Pennsylvania, which was read by B. F. Tillson. C. W. Goodale, in discussing this paper, said that turnover certainly did increase accidents, but not altogether in proportion to the degree of turnover. The peaks of turnover and the peaks of accident frequency of the Anaconda Copper Mining Co. occurred on the same ordinates of the time curve, but did not seem in any way proportional. Mr. Goodale also said that 52½ per cent of the Anaconda Copper Mining Co.'s employees were from non-English speaking countries. B. F. Tillson commented upon the fact that people were willing to spend large sums of money for accident prevention and yet had little inclination

to install a complete accounting system of accidents which would show the results obtained from the expenditure.

On Thursday afternoon, a luncheon was held by the Employee's Publications Section and a general session dealt with Americanization. Four speakers were on the program.

On Friday morning, the mining section held a meeting at which the following papers were presented: "The Desirability of Standardizing Mine Rescue Training and a Plan for Standardization," by D. J. Parker, mine safety engineer of the U. S. Bureau of Mines Experiment Station, Pittsburgh, Pa. In the absence of the author, the article was introduced by A. F. Knoefel, of Terre Haute, Ind. A lively discussion followed on the proper use and care of the oxygen breathing apparatus and training of rescue crews.

Other papers presented at the meeting were: "Effective Use of Rescue Apparatus in the Fighting of Mine Fires," by J. T. Ryan, of the Mine Safety Appliance Co., read by Mr. Riggs, followed by discussion by J. C. Roberts, F. F. Morris, J. L. Boardman, Robert H. Seip, and Mr. Woodburn; and "Fire Prevention in Anthracite Coal Mines and Necessary Equipment for Fighting Mine Fires," by N. W. Price, which was read by the chairman.

On Saturday morning, B. F. Tillson read for C. A. Mitke a paper entitled "A Compilation of Chute Types for Loading Ore Into Tram Cars in Metal Mines," which paper will be republished in the Journal. This was followed by an extended discussion. Major Arthur S. Dwight read an article on the "Importance of Safety Measures to the Miner."

Oil Resources of the United States

ACCORDING to an estimate of David White, oil geologist of the U. S. Geological Survey, the amount of oil underground in the United States is equal to about sixteen years' supply at the present rate of consumption. The total amount existing underground is estimated at 6,740,000,000 bbl., distributed as follows: California, 2,250,000,000 bbl.; mid-continent (excluding Texas), 1,725,000,000 bbl.; North Texas, 450,000,000 bbl. The following table has been compiled from figures of the Geological Survey, and shows the available oil left in the ground and the oil production in the United States in 1917 and 1918, in barrels:

Field	Marketed Production, 1918	Marketed Production, 1917	Available Oil in Ground
Appalachian	25,300,000	24,900,000	550,000,000
Lima, Indiana	3,100,000	3,700,000	40,000,000
Illinois	13,300,000	15,800,000	175,000,000
Mid-Continent	139,600,000	144,000,000	1,725,000,000
North Texas	15,600,000	10,900,000	400,000,000
North Louisiana	13,900,000	8,500,000	190,000,000
Gulf Coast	21,700,000	24,300,000	750,000,000
Wyoming	12,400,000	9,000,000	400,000,000
California	101,300,000	93,000,000	2,250,000,000
Alaska, Colorado, Michigan, Montana, etc.	230,000	230,000	350,000,000
Totals	345,530,000	335,330,000	6,740,000,000

The present conditions have been summed up by Mr. White in the following:

"To fill the gap between our actual domestic production and the requirements of domestic consumption, it has been necessary to reduce oil in storage to the extent of 27,000,000 bbl. and to supplement this

with a net importation of 31,000,000 bbl., chiefly from Mexico. The deficiency of our current production during 1918 has, therefore, amounted to 58,000,000 bbl., nearly half of which has been withdrawn from storage.

"According to general expectations, the consumption curve is destined during the next year, and probably longer, to continue its present upward trend beyond the 400,000,000 bbl. mark.

"The situation demands not only prevention of waste, but the most economical and efficient use of our oil. Also, it warns operators to consider more thoughtfully and promptly the acquisition of foreign oil reserves. Mexico, to which the American public looks optimistically, probably contains less oil than remains in the ground in the United States.

"The discovery of deep sands in this country is likely to give new life to many old or even abandoned fields. Pools will be found after prolonged search and repeated wildcatting in old as well as new regions, and this is probably especially true of the Gulf Coast, where, unless geologic discovery and consequent new methods of search, come to the aid of the driller, it may be seventy-five years before some of the productive salt domes are revealed.

"The most significant feature of the prospect, however, is the probability that the peak of production will soon be passed—possibly within three years."

27th Engineers

The administration of the Comfort Fund for the 27th Engineers was considered to have ended with April 30, 1919, the demobilization of the regiment having been completed a few days previously. The fund was solicited and administered under the auspices of the Engineering and Mining Journal, and the promise was made that all contributions should go to the regiment, for its purposes, without any deductions for administrative expenses. Judd Stewart, at the request of the officers of the Association, as a personal contribution of his own, arranged to have the accounts audited by Loomis, Sufferin & Fernald, Certified Public Accountants, 54 Wall St., New York. Their report follows:

Oct. 29, 1919.

Walter R. Ingalls, Esq.,
President, Association of the 27th Engineers, 115 Broadway, New York City.

Dear Sir:

We have audited the cash records of the Comfort Fund of the 27th Engineers for the period from February 6, 1918, to April 30, 1919. The receipts of cash as shown by the cash book were traced into the bank, and all disbursements reported were supported by vouchers or other evidences of payment and by canceled checks returned by the bank. The balance of cash shown to be on hand at April 30, 1919, \$6,894.32, was reconciled with the balance reported by the bank at that date, as follows:

Balance of cash—April 30, 1919, as per cash book.....	\$6,894.32	
Outstanding checks:		
No. 51 H. Hanks	5.00	
No. 52 W. A. Holt	5.00	10.00
Balance of cash—April 30, 1919, as per statement of Guaranty Trust Co.		\$6,894.32

The following is a statement of the receipts and disbursements to April 30, 1919:

Receipts		
Contributions	\$20,853.26	
Less check of W. R. Davis, protested and uncollected	590.35	\$20,262.90
Dues	10.00	
Sales of wool	651.28	
Interest on bank balances	250.45	
Repayment of portion of money granted to Mrs. K. for assistance	10.00	
Repayment of loan to Pvt. M.	75.00	
Total receipts		\$21,269.63

Disbursements	
Athletic goods	\$2,054.68
Musical instruments and music	2,809.84
Cigarettes, tobacco, etc.	2,165.97
Games	95.75
Typewriters	341.50
Wool, garments and knitting apparatus.....	1,834.82
Assistance to men and families.....	958.65
Miscellaneous purchases, etc.	28.95
Company funds, representing remittances to the companies for purchases made by them in camp and abroad	1,501.62
Special 1918 Christmas remittance through Lieut.-Col. O. B. Perry, disbursed for dinners, presents, and sundries.....	2,500.00
Total Disbursements for account of the members of the Detachment	\$14,291.78
Bank exchange and charges	15.53
Protest fees—check W. R. Davis.....	3.00
Loan to Pvt. M.	75.00
Total Disbursements.....	14,385.31
Balance of Cash on hand—April 30, 1919.....	\$ 6,894.32

The distribution of the receipts and disbursements in the above statement is substantially the same as shown in the reports rendered by the treasurer and is a verification of the totals so reported.

No charges were made for the collection or administration of the fund, and the entire revenue accrued to the benefit of the Association.

Respectfully yours,
(Signed) Loomis, Sufferin & Fernald,
Certified Public Accountants.

The mission of the original Association having been fulfilled, the Association was reorganized in such a way that the former members of the regiment participate in it, in order to keep alive their regimental associations, and the balance of cash, as of April 30, 1919, was taken over by the reorganized association and has been used in part for the issuance of a service medal to the men, in part for the relief of men and their families, who were in need, and a further part will be appropriated to the publication of the regimental history. The remainder will be reserved as a relief fund. Members of the regiment are now paying dues of one dollar per annum to the association, which payment is, however, optional, and the money received from that source pays for postage, stationery and sundry expenses of administration.

W. R. Ingalls.

Measuring Liquid Flow by the Orifice Method

The selection of the type of meter to be employed in measuring the flow of liquid through a pipe should be based upon a consideration of the difficulties of installation, permanency of operation, accuracy of measurement, and the cost of installation and maintenance. Tests to determine the practicability of employing thin-plate orifices in pipe lines, and the conditions most favorable for their use as measuring devices, have been completed by the Engineering Experiment Station of the University of Illinois. The results are given in detail in Bulletin 109 entitled, "The Orifice as a Means of Measuring Flow of Water Through a Pipe," copies of which may be had without charge by addressing the Engineering Experiment Station, Urbana, Ill.

A Process for the Treatment of Zinc Retort Residues has been patented by Spitzer and Conover (U. S. Patent No. 1,315,349, Sept. 9, 1919). Instead of burning up the carbon, sintering the residues, or washing out the carbon, the residues are first artificially cooled in a non-oxidizing atmosphere and then subjected to magnetic separation before the magnetic particles become sufficiently oxidized to lose their magnetic permeability. This leaves the metals in a condition to be sent direct to the smelters without further treatment, and the unconsumed carbon is in a condition to be used again in charging of the retorts.

BY THE WAY

Tin for War Memorials

Cornish mining authorities, suggests the Financial Times, of London, would welcome the adoption of the suggestion made by Sir Herbert Maxwell that tin should be used as a material for war memorials. "It does not tarnish," he says, "but retains its beautiful silvery appearance for an indefinite period." Adoption of this suggestion would certainly be a more practical way of assisting the Cornish tin-mining industry than any proposal the government has yet made.

Welcoming Hoover in Verse

An incident in the rousing welcome given Hoover upon his return to the United States a short time ago, was the following poem which was published anonymously in the A. I. M. E. bulletin "Mining and Metallurgy" for October:

HAIL HOOVER!

Old Abou Ben Adhem, in his "deep dream of peace,"
Had nothing on Bert Hoover with his bread recipes;
For Abou loved his fellow men, according to the scribe,
While Hoover loved and fed them too, of every race and tribe.
Through war's dread reign he garnered grain in all the seven
seas;
To every famine-stricken land he sent his argosies.
That he's our leading dough-boy is clearly manifest;
In head-lines and in bread-lines "his name led all the rest."
Then cheer, cheer for Hoover, the mining engineer,
Philanthropist and statesman and matchless financier!
No chronicle of history a worthier feat narrates.
Thrice welcome, Herbert Hoover, home to United States!

Apologizing in Advance

American aviators flying into Mexico will be fired upon by Mexican troops according to a message received recently from Mexico City by El Nacional, a Mexican newspaper published at El Paso, which stated that Ignacio Bonillas, Mexican ambassador at Washington, had been instructed to convey this information to the State Department. It will be recalled that shortly after the wounding of an American lieutenant while flying over American territory, first it was denied that the firing was done by Mexican troops; then it was asserted that he was flying over Mexican territory; and finally an apology was proffered and the incident was happily closed as far as our Government was concerned. Present conditions recall an anecdote of the penitentes of the Vermejo district of northern New Mexico, where the custom of self-torture with barbed whips was prevalent. A mestizo was trudging along the road with bowed head, going through the orthodox motions of torture without inflicting any visible wounds. Interspersing some explanatory remarks with his mumbled prayers, he chanted "That lashing was for the sheep that I stole last week from the gringo at Laguna Colorado." Then, with an extra flourish of the whip that never touched his skin, he grimaced, "This is for all the sheep I am going to steal from him next month."

The Great Divide

"Speaking of the latest Nevada mining-stock boom," said a canny mining engineer who sometimes takes a flier himself, "I know of one stock booster who may be regarded as quite reliable when it comes to the point of collecting accurate information about mining prospects. In fact, he is almost too conservative nowadays. You see, he had his lesson. In the early days of —field, the telephone service was not what you might call perfection. Most of us had to be contented with being tacked on to a party line already loaded up with subscribers. It got to be as bad as one of those farmer lines where every Jane, Samantha and Maria cuts in and listens to the neighborhood gossip every time the bell rings. Well, the buying and selling activities of this wise guy gave our crowd the impression that he was getting the habit of using the gossip he milked from our telephone talk. So one day we framed up a highly-confidential talk about a deal being made for some \$50,000 to be spent in developing a certain hole in the ground. Care was taken not to give the actual name, under the guise that secrecy would be essential if we hoped to buy in much stock below 10c. per share; but the description of the worthless prospect was unmistakable. Our little group had corralled all available certificates for practically nothing. Next day various agents of our dupe took it off our hands at rising prices that averaged a little better than 6c. per share. We whacked up a net profit of about \$12,000 on the practical joke."

Gold Placers in Sonora

An item in the New York Sun of Sept. 22, purporting to be a despatch from Guaymas, Mexico, dated Sept. 21, announces the discovery of gold deposits in the district of Altar in the State of Sonora as having caused considerable excitement in that region. It is stated that the best deposits have been discovered near Sauqui (sic), northeast of Hermosillo and that only the lack of water has prevented a great rush of gold seekers to the region. A glance at the map of Sonora and a careful perusal of the report of Consul Bartley F. Yost, dated Guaymas, Sonora, July 8, 1919, and published in Commerce Reports of Sept. 12, 1919, leads one to remark, "Oh, scissors."

In the consular report the lack of water in the Altar district is emphasized; but it is stated definitely that there is plenty of water in the Sauqui district, northeast of Hermosillo, where the 18c. gravel can only be worked by dredges. The Altar field was described in the Journal, vol. 63, 1897, by W. George Waring. In the Boletin Sociedad Geografica, vol. 11, 1865, p. 138, M. Parades had a few words to say about silver placers, as well as gold placers of Sonora. Doubtless a reference to the personal narrative of John Russell Bartlett, on explorations in connection with his work as Boundary Commissioner during 1850, '51, '52 and '53, might demonstrate that the gold placers of the Altar region of northwest Sonora were not unknown at an even earlier date.

PERSONALS

J. A. Battle, Jr., who has been acting as chief engineer in the investigation of claims filed with the War Minerals Relief Commission, has resigned to enter private practice. Prior to entering the Government service, Mr. Battle served in a managerial capacity at several Canadian mines. His professional education was obtained at Cornell and Columbia Universities.

H. R. Plate is in New York in consultation with his associates concerning their Western properties.

Louis A. Wright sailed from New York on Oct. 22 for Italy. His address will be Via Parlamento 22, Rome, Italy.

C. V. Corless, General Manager of the Mond Nickel Co., Coniston, Ontario, was in New York the first week in November.

Edward H. Benjamin, of San Francisco, and Mrs. Lucile Joullin were married in Pacific Grove, Cal., on October 17.

Harley E. Hooper, of the Kanbauk (Burma) Wolfram Mines, Ltd., Tavoy, Burma, is returning to Australia on six months' furlough.

N. H. Kuryla, general manager of the Sunnyside Department of the United States Refining & Mining Co., left for the East on Oct. 7.

Orvil R. Whitaker recently returned to Denver after a tour of inspection of the properties of the Cia de Minerales y Metales, in Mexico.

Montrose L. Lee, who has been on examination work in the Far East, is en route to London, where his address will be 47 Parliament St., S. W.

C. W. Van Law has an executive engagement on the staff of the Sinclair Consolidated Oil Corporation, and has moved from Boston to New York.

Russel B. Paul, general superintendent of mines of the Empire Zinc Co., is making a tour of inspection of the company's properties in the Southwest.

Max W. Ball, general manager of the Rocky Mountain Division of the Roxanna Petroleum Co., is making a tour of inspection of the company's holdings.

E. H. Jones, assistant superintendent of the International Nickel Co. at Copper Cliff, Ontario, arrived in New York on Nov. 3 for a stay of two or three weeks.

C. Quimby Schlereth, general manager of the Cia de Minerales y Metales, South America, is in the United States on a short vacation from Monterey, Mexico.

W. H. Wright, of the Malm-Wolf Co., has returned to New York from Alaska, where, for three months, he had been engaged in examining power and gold-dredging projects.

Alpheus F. Williams, general manager De Beers Diamond Mines, Ltd., Kimberley, South Africa, concluded his stay in San Francisco on Oct. 15., when he left for New York.

K. H. Matheson, superintendent of the San Marcos mine, Sabana Grande, Honduras, is in Denver on a vacation. Mr. Matheson expects to return to Honduras when the revolution subsides.

J. W. Bennie, for fourteen years manager of Shannon Mines and Smelter at Metcalf and Clifton, has moved to Gleason, Cochise County, Ariz., to take charge of the Amster interests there.

Harris and Ewing
JOHN A. DAVIS

John A. Davis, the superintendent of the Alaska Mining Experiment Station, is in Washington discussing plans for an expansion of the work being done at his station. The certainty that the railroad is to be completed in the near future is stimulating mining activity in the Fairbanks region, making advisable Government assistance in solving the various problems which confront the mining industry in Alaska.

Charles W. Wright, formerly a geologist of the U. S. Geological Survey, who has been visiting the United States for a month, has returned to Sardinia and Rome, where he has offices as consulting mining engineer.

E. P. Mathewson has been engaged to act as consulting engineer of the Consolidated Coppermines Co. Under Mr. Mathewson's direction plans will immediately be prepared for the construction of the reduction works at Kimberley, Nev.

Wallace Macgregor, who was formerly with Phelps-Dodge Co., and more recently acting as consulting engineer in Nevada, has opened an office at 2120 Channing Way, Berkeley, Cal., as consulting engineer and metallurgist.

R. T. Walker has resigned as superintendent of the Virginia-Louise Mining Co. at Pioche, Nev., to accept the position of manager of the ore-purchasing department of the United States Smelting, Refining & Mining Co. at Salt Lake, Utah.

R. C. Allen was incorrectly reported to have taken a position as secretary of the Lake Superior Iron Ore Association in the Sept. 13 issue of the Journal. Dr. Allen has been elected vice-president of the Association and **W. L. Tinker** is secretary.

George K. Burgess, chief of the division of metallurgy of the Bureau of Standards, has accepted an invitation to speak before the members of the Royal Canadian Institute, Toronto, during the early part of December. Dr. Burgess will talk on recent metallurgical developments at the Bureau of Standards.

E. C. Morse has been appointed director of sales of the War Department. He succeeds **C. W. Hare**, resigned. Mr. Morse has been assistant director of sales since the organization of the office. The director of sales is in immediate charge of all the surplus property which the War Department is called upon to sell.

SOCIETIES

Society of Chemical Industry failed to hold the general meeting on Sept. 5, as previously announced. The meeting was postponed to Oct. 23.

Mining and Metallurgy Society of America, New York section, held a meeting at the Columbia Club, 4 West 43d St. on Oct. 21. **Walter Renton Ingalls** addressed the meeting on "The Wealth and Income of the United States."

Associated Engineers held the annual excursion, Oct. 10-11. The itinerary included visits to the Loon Lake Copper Mines, Northwest Magnesite mill and quarry, United Silver Copper Mine, American Minerals Production Co.'s property, and Colville Valley coal mine.

American Institute of Mining and Metallurgical Engineers, New York Section, will hold a meeting at the Machinery Club, 50 Church St., on Nov. 5. The dinner will be at 6.30 p.m. with a program devoted to the subject of Oil at 8 p.m. **Chester W. Washburne** will make an address on oil prospecting, to

be followed by a discussion by prominent oil geologists and operators. Captain Altmayer, late of the French Army, will give his impressions of United States metallurgical plants.

OBITUARY

Captain Kenneth A. Mickle, D.S.O., R.G.A., metallurgist, died in Melbourne on July 30, aged thirty-three. Captain Mickle served two years in France with the 9th Division of the British army, and was invalided home after having been severely gassed. He was a government research scholar at the Melbourne University, and in 1912 won the Grimwade prize. Captain Mickle as a young man was employed by the Cassilis Gold Mining Co., and there gained experience in the treatment of complex ores. Subsequently he carried out a great deal of experimental work in connection with the flotation of minerals and contributed a paper on the subject to the Royal Society of Victoria in 1910. At the outbreak of the war he was on the staff of the Burma Mines.

TRADE CATALOGS

National Tube Co., Pittsburgh, Pa., has recently issued its National Bulletin No. 7 describing the manufacture and advantages of "National" welding scale free pipe.

Davis Bournville Co., Jersey City, N. J., has issued an eight-page pamphlet describing a portable cabinet truck for oxy-acetylene welding and cutting, made in large and small wheel types.

Steel Gears. R. D. Muttal Co., Pittsburgh, Pa. Bulletin 25, covering the heat treatment of steel gears for mining and electric railway purposes. Bulletin 26 describes the use of helical gearing.

The **New Jersey Zinc Co.**, New York, has issued a series of five books, "Rolled Zinc," "Zinc Dust," "Metals," "Chemicals," and "Pigments," which describe in detail the various products manufactured by this company.

"Asbestos" is the name of a monthly market journal devoted to the interests of asbestos and magnesia industries recently published by Secretarial Service, 721 Bulletin Building, Philadelphia, Pa. Price, \$1.00 per year in advance.

Typical Graphic Records. The Esterline Co., Indianapolis, Ind. Describes the applications of curve-drawing instruments to particular problems. In-

strument engineers and files of data on graphic meters are available upon request.

Fluid Meters. Bailey Meters Co., Cleveland, Ohio. Bulletin No. 30; 8 x 10½; 16 pp.; illus. Describes fluid meters for low-pressure gas and air, the design of which, it is claimed, will give the same power and accuracy on a two-inch water differential as the standard fluid meter gives on two pounds' differential.

Alberger Centrifugal Pumps. Alberger Pump and Condenser Co., New York. Catalog F; 64 pp.; illus. Describes the various types of centrifugal pumps and steam turbines for pump drives manufactured by the company. Designs and construction of pumps for different uses and information required for making estimates, along with formulae and tables, are included.

Weber Chimneys. The Weber Chimney Co., Chicago, Ill. Catalog 19; 56 pp.; illustrated. Describes the reinforced-concrete construction of coniform chimneys, using a series of wooden units held together in a rigid manner which is claimed to be superior to iron or steel forms. The chimneys are stated to be monolithic, airtight, smooth inside, to possess a high working capacity and to be unaffected by the influence of the atmosphere. Illustrations of a number of the 1200 chimneys of this company's construction are reproduced, including what is said to be the highest chimney in the world, 570 feet, at Saganoseki, Japan.

INDUSTRIAL NEWS

Chicago Pneumatic Tool Co. has appointed C. W. Cross the manager of Western Railroad Sales, with headquarters at Fisher Building, Chicago.

The **Oliver Continuous Filter Co.** announce the removal of their New York offices to the Aeolian Bldg., No. 33 42nd Street, New York City. The rapidly increasing business of the company requires much larger space than they were able to obtain at the old quarters. Gordon Walker is in charge of the New York office.

Westinghouse Electric and Manufacturing Co. has announced the awards of four annual War Memorial Scholarships of \$500 each. Each scholarship carries with it an annual payment of \$500 for a period not to exceed four years, the payment to be applied toward an engineering education in any technical school approved by the scholarship committee.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Roasting—Process of Roasting Ores, Furnace Products, Ore Mixtures and the Like. Edmund B. Kirby. (1,316,726; Sept. 23, 1919.)

Screen—Gyratory Screening Device. Henry William Falcker. (1,314,135; Aug. 26, 1919.)

Screening—Portable Screening Apparatus for Coal and Other Materials. Charles Milton Morton, Newcastle, and Charles Herbert Steavenson. (1,315,835; Sept. 9, 1919.)

Separating and Grading Material—Process of and Apparatus For. Henry M. Sutton, Walter L. Steele and Edwin G. Steele. (1,315,881; Sept. 9, 1919.)

Separation—Process of and Apparatus for Sizing and Separating Comminuted Material. Henry M. Sutton, Walter L. Steele and Edwin G. Steele. (1,315,880; Sept. 9, 1919.)

Settling Tank. Lachlin Donald MacRae and Peter A. MacEachern. (1,313,714; Aug. 19, 1919.)

Sintering Machine. William Miller Davison and Guy Crosby Riddell. (1,315,910; Sept. 9, 1919.)

Smelting Furnace or Cupola. Andrew Poulson and William Charles Augustus Mate. (1,311,711; July 29, 1919.)

Smelting Process and Apparatus. Frank H. Franklin Hampton. (1,315,551; Sept. 9, 1919.)

Steel—Manufacture of Steel. Charles Albert Keller. (1,316,724; Sept. 23, 1919.)

Steel Alloy. William C. Honhorst. (1,313,894; Aug. 26, 1919.)

Sulphide Ores—Process for Treating Ores and Concentrates. Melville F. Coolbaugh. (1,315,761; Sept. 9, 1919.)

Sulphur—Apparatus for Fusing Sulphur from Low-Grade Ores. Paul P. Austin, Jr. (1,315,940; Sept. 16, 1919.)

Sulphur—Process of Extracting Sulphur from Ore. (Jesse Coffeen. (1,314,856; Sept. 2, 1919.)

Sulphur—Process for the Extraction of Sulphur from Metal Sulphids. Max Helbig. (1,315,496; Sept. 9, 1919.)

Tempering Machine (Automatic) for Tools, Such as Rock Drills. Clarence Orrin Stee and Karl Holger Kolhede. (1,311,722; July 29, 1919.)

Titanium—Pigment and Paint. Louis E. Barton, assignor to the Titanium Alloy Manufacturing Co. (1,313,874; Aug. 26, 1919.)

Tools From Wells—Device for Recovering. Augustus B. Scott, Burkburnett, Tex. (1,315,581; Sept. 9, 1919.)

THE MINING NEWS

New York, October 25, 1919

Hayden, Stone & Co. Have Option on Flin Flon Property

Deposit Has Been Diamond Drilled, But Further Investigation Is to Be Made

It is understood that Hayden, Stone & Co., of New York, who have conducted an extensive campaign of diamond drilling on the Flin Flon property near the border of Saskatchewan and Manitoba, Canada, have an option for \$1,500,000 on the property that is good until January. However, they wish to do some sinking, and the owners are prepared to grant an extension for this purpose. No payment has been made, and, as a matter of fact, although the price is \$1,500,000 for the whole property, one of the owners will stay in for part of his interest at least, so that the actual amount of money to change hands will be less than the amount stated.

to construct a railroad for one hundred miles or more, probably from the northern termination of the Canadian Northern R. R. at The Pas, Manitoba. It is understood that either the Canadian Northern R. R. or the Province of Manitoba, or both, are willing to construct the railroad if the building of a smelter at Flin Flon is assured.

Coeur d'Alene Strike Off

Strikers Lose, Returning to Work on Old Terms—Mines Shut Down for Almost Two Months

The strike of miners and millmen in the Coeur d'Alene district, Idaho, which resulted in closing down the Morning, Hunter, Hecla, Hercules, Interstate-Callahan, and Tamarack mines, was officially called off by the district organization of the International Union of Mine, Mill, and Smelter Workers on Oct. 8. The strike began on Aug. 15,

companies would not recognize the union, though willing at all times to meet their employees and adjust working conditions and discuss matters in which they were mutually interested. Subsequently, and before the strike was called, the companies advanced wages 50c. per day, making the rate \$5.25. This did not satisfy the union, however, and the men were called out.

Cleveland-Cliffs Co. Wins Suit Brought by Arctic Iron Co.

Celebrated Iron Country Case Decided After Fifteen Years of Litigation

The United States Circuit Court of Appeals, Cincinnati district, has rendered a decision in favor of the Cleveland-Cliffs Iron Co. and W. G. Mather in the case of the Arctic Iron Co. vs. The Cleveland-Cliffs Iron Co. and Mr. Mather. The decision was handed down on Oct. 7, after the case had been in the Federal courts since 1904. The Arctic Iron Co. holds the fee to the Regent group of mines, Negaunee, Mich., which are now idle, the available ore supply having become exhausted, and never did any mining itself, merely leasing the lands and collecting and distributing the royalty. The Breitung-Kaufman interests hold three-fourths of the stock of the Arctic company, the remainder being in the hands of the Cleveland-Cliffs Iron Co.

In 1902 the Oliver Iron Mining Co. took a lease on the lands to mine the ore, but prior to the drawing of the agreement, the Cleveland-Cliffs Iron Co. entered into a separate agreement with the Oliver company, the terms specifying that the Cleveland-Cliffs Iron Co. was to have one-quarter of the stock in the Regent Iron Co., which was organized as a subsidiary of the Oliver Iron Mining Co. to operate the mines, and that one-quarter of the ore mined was to be delivered to the Cleveland-Cliffs Iron Co. at the cost of mining. Some time later the Breitung-Kaufman interests learned of the separate agreement and began suit against the Cleveland company and its president, W. G. Mather, who was also trustee for the Arctic Iron Co., for an accounting of profits and interests received because of the agreement entered into outside of the lease granted by the Arctic Iron Co. in its corporate capacity. It really meant that the Cleveland-Cliffs Iron Co. was sued by a company in which it held a one-quarter interest.

The Federal court for the western district of Michigan, which first heard the

VIEW IN THE COEUR D'ALENE DISTRICT, IDAHO, SHOWING SURFACE PLANT OF SUCCESS MINING CO., AT WALLACE

The Flin Flon property is an immense deposit of primary sulphides carrying copper, gold, silver, and zinc. The diamond drilling indicates 20,000,000 tons of ore running 1.7 per cent copper, 1.5 oz. silver, and \$1.40 gold. The deposit was discovered in 1914 by Tom Creighton and Jack Mosher, of Toronto. It takes its name from Flin Flon Lake near by. The Mandy mine of the Tonopah Mining Co. is in the same region, being situated on Schist Lake. The ore of the latter is high-grade copper.

If it should be decided to develop and equip this property, it will be necessary

its duration thus being almost two months. The strikers won no concessions from the mining companies, and returned to work on the same terms that prevailed when they walked out. Their failure has given a serious setback to organized labor in the Coeur d'Alene district. The union demanded 50c. a day increase in wages, eight hours a day "from portal to portal," and recognition of the union. In a public statement following these demands, signed by all mining companies, the increase of wages was refused, claim was made that the eight-hour day law was being strictly observed, and that the

case, gave a decision in favor of the Arctic Iron Co., and the master of chancery set the amount of profits derived from the separate bargain at a figure in excess of \$800,000. The case was then appealed to the Circuit Court of Appeals, being argued in 1916, and that court certified to the United States Supreme Court certain findings of fact which exonerated the Cleveland-Cliffs Iron Co. and Mr. Mather in having participated in any actual fraud. Six questions of law were certified, and the Supreme Court was asked for guidance in rendering a decision. This latter the Supreme Court refused to do, and instructed the Circuit Court of Appeals to render a decision and dispose of the case. The final decision is that there was no cause for action, and the case has been dismissed. It was one of the most important mining suits which ever originated in the Lake Superior district, and probably occupied the courts for a longer time than any other piece of mining litigation.

Butte & Superior Accounting Deferred

The Butte & Superior Mining Co. has secured an extension to Dec. 1 in which to file an accounting made necessary through mandate of the U. S. Supreme Court in the litigation against it by the Minerals Separation-North American Corporation. The time was originally set for Oct. 27. Upon the figures revealed in the accounting, which will be submitted to Judge George M. Bourquin of the U. S. District Court of Montana, as master, will be determined the amounts due the Minerals Separation for infringement of its patents over a series of years.

The Nevada Consolidated Copper Co., which has been sued in the U. S. District Court at Portland, Me., for alleged infringement of patents, has received an extension of time in which to make answer to the charges.

Montana Southern Ry. Completed to Elkhorn Mines

The proposed ore-carrying road of the Boston & Montana Development Co. has been completed from Divide, Mont., on the Oregon Short Line, to Elkhorn, where the company's Beaverhead County properties are situated. The road is narrow-gage. W. R. Allen, president of the company, in an announcement to stockholders dated Oct. 21, stated that ore shipments will begin to go forward almost immediately. There will be some ballasting and leveling up, which, however, will not interfere with transportation. Mill construction will be pushed with all possible speed. In the meantime the company will ship the higher-grade ores direct to the smeltery. From now on, production will be the sole object, increasing monthly.

According to the general manager's report, in crosscutting the central vein on the 300 level, ore assaying 100 oz. in silver and 16 per cent copper per ton was met. The central vein is from 20 to 30 ft. wide. Crosscutting on this level should reach the Park vein in about forty-five days, where more high-grade ore is expected.

Hancock Consolidated Resumes Operations

Operations of the Hancock Consolidated Mining Co., which were suspended last May, were recently resumed. Production, however, will be deferred for at least ninety days, according to present plans of the company. All miners will be put at work in development of new territory to the south of the shaft. It is expected that by Jan. 1 next enough new ground will be opened so that when production begins it will be maintained on a more substantial basis than was previously possible. Since last May, Hancock has made a sale of land to the Quincy Mining Co., whose property adjoins, receiving therefor \$250,000 in cash.

The reopening of the Hancock mine recalls the fact that it is the only property in the district in which John D. Ryan has an interest. Years ago Mr. Ryan's father and uncle tried to make the mine pay but without success, and for forty years the property was idle. The corporation was then reorganized and refinanced, largely through the instrumentality of Mr. Ryan. It is believed that the property can be put on a paying basis, if the tonnage can be worked up to the capacity of the shaft.

Colorado Engineers at Odds Over Licensing Law

Opposition to the law enacted by the last Colorado Legislature requiring all engineers practicing in the state to secure a license came to a head recently when the Colorado section of the A. I. M. E. passed a resolution condemning the act and asking all members to work for its repeal.

The principal contention is said to have arisen over that section of the bill which stipulates that the engineer who receives a license to work in Colorado must be a citizen of the United States. It is maintained that, according to this, residents of other states cannot come into Colorado to examine a mine without securing a license, and that aliens, among whom are many honored members of the profession in Colorado, cannot obtain such a license at all.

Bureau of Mines May Select Joplin for New Station

If Congress passes an appropriation bill now pending, an experiment station will be established at Joplin, Mo., by the U. S. Bureau of Mines.

Trail Smeltery's Schedule C Revised

In response to numerous complaints from shippers, the Consolidated Mining & Smelting Co. of Canada, has announced in a recent circular that a definite settlement for the lead and silver contained in shipments of lead ores to the Trail smeltery will be made at the end of the second calendar month succeeding the date of sampling. The circular referred to amends certain clauses of Schedule C, according to which settlements have been for shipments received since July 1, 1919. Schedule C was published in the Journal of Aug. 9, 1919.

The circular is as follows:

"In addition to the Mexican competition for Canadian domestic business, considerable quantities (of lead) had to be exported at the open market price to reduce stocks and take care of current production. This was due to the light Canadian demand. In spite of these adverse features we have been able to average in each month's sales considerably more than the New York price for lead. We are, therefore, changing our method of lead settlement commencing with shipments received here on Oct. 1, and are amending Schedule C as follows (The clauses which follow include):

"The price for lead to be used in settlement will be our average sales price delivered at destination in Canada, for the second calendar month succeeding the date of sampling, or the American Smelting & Refining Co.'s New York average quotation for the said second calendar month, whichever is the greater, less a deduction in either case of $1\frac{1}{2}$ ¢ per lb. for refining and marketing.

"There will be deducted also from the settlement price \$2.30 per ton on sales at Toronto and common points, and \$4.50 per ton on sales at Montreal and common points, and similar differentials to other points. This freight adjustment is to cover actual increases in freights.

"Settlement—(a) Shortly after sampling, an advance payment of 90 per cent of the apparent value will be made. The prices used in estimating the apparent value will be the New York price of silver of the date of sampling, and the previous month's sales price for lead.

"(b) Shortly after the close of the second calendar month after sampling, when the data is available, the final value will be computed and any adjustment necessary will be made between the smelter and the mine.

"Settlements for monthly receipts prior to October will proceed under the pooling scheme until fully liquidated."

PROGRESS OF MINING OPERATIONS

Important Events of Interest
Condensed and Classified
for Easy Reference

ALASKA

Alaska shipments of domestic copper ore to United States in September totaled 7,366 tons, containing 6,208,840 lb. copper, valued at \$1,376,257.

ARIZONA

Cochise County

Phelps-Dodge (Bisbee)—September production of copper was as follows: Copper Queen branch, 5,056,000; Burro Mountain, 203,000; custom ore, 506,000; Moctezuma Copper, 2,827,000; total for Douglas smeltery, 8,592,000; Detroit Copper (Morenci branch), 637,017; total all branches, 9,229,017.

Commonwealth Development (Pearce)—Milling ore in Commonwealth mill from Commonwealth mine, as well as old tailings. Lessees getting out siliceous ore for shipment to smeltery.

Republic (Johnson)—Resumed shipping copper ore at rate of 2,000 tons a month. New three-compartment shaft to be sunk to 800 ft.; seventy men employed.

Middlemarch (Pearce)—Mill repairing damage caused by carborundum thrown into bearings of Diesel engine.

Gila County

Gibson (Bellevue)—Mill running three shifts on dump ores; producing car of concentrates every three days.

Arizona-Globe (Globe)—On 480 level struck low-grade chalcopryrite. P. J. Hickey, Jr., superintendent.

Inspiration Cons. (Inspiration)—September production of copper was 5,800,000 lb.; August, 6,500,000.

Golden Eagle (Kirkland)—To install hoist and compressor. Small force working on development.

Zonia (Kirkland)—Being worked by three groups of leasers, who are taking out copper carbonates of shipping grade.

Miami (Miami)—Installing headframe and machinery at new No. 5 shaft.

Van Dyke (Miami)—Shaft below 400 level. Contract is for 1300 ft., taking it through ore proven on contact of Pinal schist by drilling.

Mohave County

Diana (Chloride)—Native and ruby silver cut at 200 ft. when sinking shaft.

Fountain Head (Kingman)—Property at Stockton Hill shipping high-grade lead ore to smeltery. A. C. Goodwill,

lessee, has tunneled to vein, 125 ft. below outcrop.

Oatman Amalgamated (Oatman)—Will develop to 500 ft. at point where management believes Tom Reed and Gold Road vein systems converge.

Pinal County

Arizona Hercules (Kelvin)—Four modified Callow flotation cells completed and put in use, replacing original rougher cells in one unit of mill. Jigs in Marcy mill circuit also in operation, recovering most of the native copper.

Gila Development (Kelvin)—Equipment for 25-ton milling plant has begun to arrive. Mill consists of crushers, rolls, Lane mill and amalgam plates. Considerable tonnage of ore already broken, and development work will be resumed when mill starts.

Gross Group (Kelvin)—Engineers have been examining Gross group, two miles east of Kelvin. Principal metals found thus far are silver, lead, and molybdenum. Other rare metals said to occur in quantity sufficient to warrant exploitation.

Ray-Boston (Kelvin)—Power plant being overhauled, and building new wagon road to county road. Expects to have two diamond drills in operation Nov. 1. C. E. Hart, in charge.

White Metals (Kelvin)—About twenty men working in old Pioneer group in Dripping Springs Mountains recently taken over by this company. Old workings in order, and development proceeding rapidly with modern equipment. About 40,000 tons of ore developed. J. C. Devins in charge.

Ray Broken Hills (Ray)—Operations suspended on original holdings after unfavorable report by C. P. Berkey and L. D. Huntoon. Other properties of company will be developed.

Magma (Superior)—Has acquired noted Reymert silver mine, 15 miles southwest of Superior. Consists of ten patented claims, with 28 more claims located by Magma. To be developed by drilling.

Magnetic (Superior)—Extending tunnel. Has cut 4-ft. iron-manganese body.

Potts Canyon (Superior)—Power house and new headframe equipment being installed. Sinking has cut silver-lead stringers.

Silver King of Arizona (Superior)—Crosscut from old shaft in chimney cut

new shaft Oct. 18 at 415½ ft. point. Station being cut. Company has 19½ tons concentrates on hand. In cleaning 4½ x 4½-ft. Marcy mill recently 1,400 lb. of sand was recovered running 4,700 oz. silver per ton.

United Superior (Superior)—Reported to have been financed in Michigan for development of group of 32 claims.

Magma Chief (Winkelman)—Recently opened up high grade ore in new shaft, has begun to ship to Hayden. Property, formerly known as Sombrero Butte group, is managed by Charles Kumke.

Santa Cruz County

Tres de Mayo (Nogales)—Sinking shaft; now down about 150 ft. Drifting on 100 level disclosed ore sampling high in silver, lead, and vanadium. Property leased by A. L. Peck and associates, of Nogales, to Dr. O. B. Bachman and others, of Los Angeles.

Hardshell (Patagonia)—Three-compartment shaft down 400 ft.

Duquesne (Patagonia)—Under lease to Panick & Curry, who are shipping 400 tons a month.

World's Fair (Patagonia)—Again in operation after shutdown due to litigation. Lower levels being pumped out.

Yavapai County

Consolidated Arizona (Humboldt)—Experimenting in leaching low-grade carbonate copper ores. One car load received from surface capping of Dundee property, Jerome.

Jerome-Grande (Jerome)—Reported financed in Troy, N. Y. Company is reorganization of Verde Grande. Development comprises 800-ft. shaft, and 500-ft. crosscut, latter to continue to contact. J. C. Cain, of Jerome, president.

Shea (Jerome)—Electric transmission line completed and mine pumped out. Ore shipment awaits completion of new road and construction of ore bins.

American Eagle (Prescott)—Group lying partly in Maricopa County and partly in Yavapai County, southeast of Hot Springs, sold to Montana people. Active development will be started at once under direction of Howard Winthrop, of Butte.

Arizona Victory (Prescott)—Arizona Victory Mining Co. has been organized in Prescott by Mark Bradley and associates to operate Swiggert property in Walker district.

Calcium Fluoride Development Co. filed a petition in Prescott asking dissolution. Organized in 1908 as Illinois Fluorspar Co. Claims all debts paid.

Poland (Prescott)—Mill and camp buildings being torn down and taken to Prescott for re-use.

Thumb Butte (Prescott)—Operations to be resumed on Thumb Butte Consolidated, better known as Anderson group.

Tiptop-Heath (Prescott)—Meeting called in Prescott Nov. 1 for dissolution of corporation. Mine in Tiptop section operated for silver and tungsten. Assets include hoist, small mill and electric plant.

Blue John-Wedge (Walker)—Bonded by Joe Cavanaugh and Harold Colwell, who will ship silver ores.

Yuma County

Quartzsite badly damaged by cloudburst. Rich gold ledge near camp reported revealed by flood.

Bullard (Salome)—Noted property reported bonded from Bullard brothers by number of Los Angeles and Denver mining men, represented by Frank H. Sawyer, of Phoenix.

CALIFORNIA

Amador County

Keystone Mining (Amador)—Timbers of main shaft being replaced by reinforced concrete throughout. System proved very satisfactory in neighboring Bunker Hill Consol.

Calaveras County

Utica Mining (Angels Camp)—Sinking shaft at Gold Cliff mine, present depth 1,900 ft. Fifty-stamp mill crushing 240 tons good quartz ore daily. Good grade of ore exposed in bottom levels. Faulted main orebody recovered after crosscutting 800 ft.

Morgan Mine (Carson Hill)—New mill crushing approximately 300 tons a day. High-grade ore maintained on 685 level, the lowest. W. J. Loring, manager.

Sheep Ranch (Sheep ranch)—Down to 1,700 ft. and employing 55 men, but has not resumed milling.

San Benito County

Klau Quicksilver (Paso Robles)—Being reopened; planned to erect camp buildings, engine house, and to sink shaft. E. W. Carson, manager.

Sierra County

Tightner Mine (Alleghany)—Sold to interests represented by Fred Searles, Jr., and controlled by Senator Clarke of Montana. Work starts within thirty days. Cash consideration small, payments to extend over four years. Equipment includes twenty-stamp mill and hoisting machinery.

COLORADO

Clear Creek County

Capital M. & T. (Georgetown)—Rich strike made on Aetna vein after

over 2,000 ft. of fruitless development. Vein three feet wide and carries gold, silver, lead and copper.

Lake County

Paul Morel Placer Ground in McNulty Gulch in Birdseye section taken over by Milwaukee interests. Several test pits sunk and 130-ft. drift driven in gravel. Dredging planned.

Western Mining (Leadville)—Wolf-tone mine has resumed operations after being idle for several months. About fifteen men employed mining zinc carbonate above water level.

Ouray County

Kansas City (Ouray)—Mine in Red Mountain district leased and bonded to Everett J. Sloane by Paul J. Walker, owner. Company organized to operate property.

Pitkin County

Midnight (Aspen)—Pushing tunnel since strike of high-grade ore in adjoining Oakland mine.

IDAHO

Adams County

Red Ledge (Landore)—Hydro-electric plant being installed on Deep Creek to furnish plant for mining operations. Property owned in Duluth, Minn., and situated on Idaho side of Snake River, seventeen miles from Homestead, Ore., nearest railroad point.

Shoshone County

Columbus (Murray)—Eight men to be employed during winter. Will drift on lead-silver ore in main tunnel and continue crosscut to parallel vein. Vein outcropping in creek will be developed. Thirteen claims at junction of Eagle and Tributary creeks owned by company. E. P. Gallagher, of Philadelphia, chief owner.

Interstate-Callahan (Wallace) — A Crosscut north on 600 level encountered 9-ft. of high-grade zinc ore with some lead. Raise has been driven in ore to 400 level, where drifting eastward is in progress. Strike is east of fault, cutting vein, and ore is identical with famous orebody west of fault. This is most important development in recent years, adding greatly to known resources. Development of Niosie property will continue.

North Bunker Hill (Wardner)—Electric hoist, compressor, and pump recently installed. Unwatering 300 ft. shaft and will deepen 200 ft. Will also explore vein on 300 level, where lead-silver ore of good grade has been reported.

KANSAS

Joplin-Miami District

Crescent L. & Z. (Waco)—New mill near Waco in operation. Only mill in field using classifier ahead of rougher jig. Overstrom tables used in sludge department.

MICHIGAN

Copper District

Calumet & Hecla (Calumet) September production of copper was as follows: Ahmeek, 1,378,987 lb.; Allouez, 362,562; C. & H., 4,504,464; Centennial, 95,050; Isle Royale, 1,287,228; La Salle, 14,600; Osceola, 849,100; Superior, 14,000; total, 8,505,991.

Franklin (Houghton) — Crosscut should cut vein on 39th level within 30 days, having 40 ft. yet to go. Shaft will sink to 41st level, and another crosscut will be run to vein. Still has unsoft copper.

Winona (Winona)—Two shafts working one shift, and underground force increasing steadily. Small shipments of mineral made to Quincy smeltery from mill.

Gogebic Range

The State Tax in Gogebic County Mich., is about \$270,000, an increase of more than 90 per cent over 1918, and the greater part of this has to be paid by the iron mines. The city tax in Ironwood has increased about 25 per cent and the rate is considerably over 3 per cent.

Ashland (Ironwood)—Purchased Corliss hoist from Norrie-Aurora, which will be installed soon. Drift on 20th level in ore for several hundred feet; width and depth of orebody not yet proved. Raising from 24th level through dike where bottom of orebody is expected.

Oliver Iron (Ironwood) — Electric hoists completed and in operation in Norrie-Aurora mine.

MINNESOTA

Mesabi Range

Billings (Chisholm) — New underground property of Tod-Stambaugh Co. rapidly becoming large producer. Now loading about ten cars per day for direct shipment, besides placing some ore on stockpile.

St. James (Aurora)—Mine closed down during slack period early in season, resumes operations. McKinney Steel Co., operators.

Williams (Biwabik)—Thomas Furnace Co. shipping stock-pile of old-abandoned property to their furnaces at Milwaukee. Mine abandoned in 1912 on expiration of lease.

Hobart (Gilbert)—Filling in stock-pile grounds. Timber shaft will be extended from 133 to 200 level.

St. Paul (Keewatin)—Shipped 25 cars siliceous ores for test run at Trout Lake concentrator.

Vermilion Range

McComber (Armstrong Lake)—Cutting station and pump room at 400 level. Will drift and develop northward; expect orebody at 180 ft.

Pioneer (Ely)—This mine, also Sibley, Chandler, Pattison, and Zenith closed down indefinitely because of miners' strike. These mines represent entire production of Ely district, and all shipments suspended. Eight hundred miners out of work, and all business at standstill.

Phoenix (Mud Creek)—Pumping out old workings well under way. Plan to pump out down to old 300 level and redevelop.

MONTANA

Beaverhead County

Boston & Montana Dev. (Wise River)—Montana Southern Railway completed from Oregon Short Line at Divide to Elkhorn properties. Crosscut on 300 level in central vein showed ore running 100 oz. silver and 10 per cent copper. Vein 20 to 30 ft. wide. Crosscut should reach Park vein within 45 days.

Jefferson County

Legal Tender (Clancy)—Three hundred sacks of ore, estimated to run from \$300 to \$400 in silver, ready for shipment, with half carload of second-class, running about \$40 per ton.

Liverpool Mining (Clancy)—Good grade ore in shoot being mined on 200 level. Water in shaft lowered near 700.

Jefferson (Whitehall)—Raising for shaft started from 35-ft. level. Engine will be installed at this level and sinking to 200 level begun.

Silver Bow County

Butte Copper and Zinc (Butte)—Emma mine kept clear of water, but no decision on date for resuming mining operations.

Davis-Daly (Butte)—Installation of skips begun. Steel for enlarging bins is on ground, and construction has started. September tonnage about 9,300, against 7,900 for August and 4,900 for July. Average copper content in September was 6.6 per cent.

North Butte (Butte)—Large body of native copper ore opened on 900 level at Sarsfield property.

NEW MEXICO

Grant County

Republic M. and M. (Hanover)—Plan installing 100-ton concentration and flotation mill for zinc sulphide ores.

Lucky Bill Group (Silver City)—At Bayard station being developed by Black Hawk M. & M. Co. Lead carbonate ores on both 200 and 300 levels. E. D. Lidstone, manager.

Sierra County

Silver Monument Metals (Chloride)—Plan installing small concentrating-flotation mill for silver ores.

Lady Franklin (Lake Valley)—Test to determine best treatment of these ores by Texas State School of Mines. W. H. Paul, engineer for company.

UTAH

Beaver County

Golden Reef (Frisco)—Shaft now down 540 ft. Will continue to 700 level where drifting will be started. Equipment will be electrified.

Salt Lake County

South Hecla (Alta)—September shipments were 1,000 tons. Development work in progress. Rapid advance being made in tunnel to cut Albion workings.

Wasatch Drain Tunnel (Alta)—Tunnel in 5,000 ft. and within 700 to 800 ft. more will be under old Columbus Consolidated workings abandoned years ago owing to water. Columbus Consolidated shaft now unwatered 200 ft.

Cardiff (Salt Lake City)—Orebody recently opened on 800 level about 280

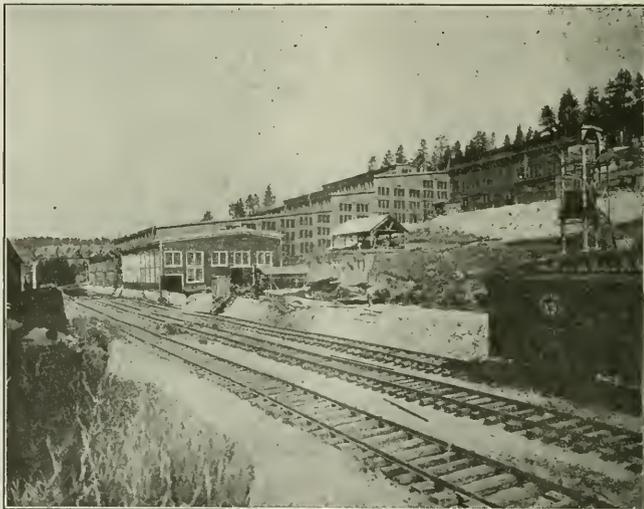

CANADA

British Columbia

Florence Silver (Ainsworth)—F. R. Wolfe states average of 100 tons has been daily delivered to mill during last five or six months. Intends to increase rate of output. Large ore reserves opened up by recent work.

Highland (Ainsworth)—Concentrator is being operated after standing idle seven months. Ore developments have been made and group increased to seven claims. Consolidated M. & S. Co. of Canada, owners.

Dolly Varden (Alice Arm)—Has shipped over 1,000 tons averaging \$50 since taken over by Taylor Engineering Co. using entire capacity of its railroad to tidewater.

CANADA COPPER CORPORATION'S NEW 2,000-TON MILL AT ALLENBY, B. C.

ft. from shaft. About 50 men at work. Shipping 50 to 60 tons silver-lead ore daily. Mine work recently held up by snow drift.

Tar Baby (Salt Lake City)—Tunnel being driven in hard limestone and believed to be approaching contact. Situated in Big Cottonwood Canyon.

Summit County

Park City Shipments week ended Oct. 4 amounted to 3,949,240 lb. of ore and concentrates. Shippers were as follows: Silver King Coalition, 1,221,520 lb.; Ontario, 1,303,400 lb.; Judge M. & S., 1,001,680 lb.; Daly West, 208,640 lb.; Silver King Consolidated, 110,000 lb.; Daly, 104,000 lb.

Glen Allen (Park City)—Excellent progress being made on mill.

Utah County

Treasure Hill (American Fork)—Shipping silver-lead ore. Will work through winter.

Royal Group (Alice Arm)—These five claims sold to J. Miller, of Prince Rupert. Adjoins Dolly Varden.

United Metals (Alice Arm)—Has two 12-horse pack trains transporting to tidewater.

MEXICO

Baja California

Boleo (Santa Rosalia) — September production of copper was 1,477,280 lb.

Chihuahua

Cusi (Cusihuiriacic)—Building flotation mill, 200 tons' capacity daily.

San Patricio (Parral)—Building 800-ton cyanide mill.

Sonora

Greene Cananea (La Cananea)—September output was 4,200,000 lb. copper, 177,500 oz. gold, and 940 oz. gold.

CHOSEN

Oriental Cons. (Unsan) — September clean-up was \$89,500; August, \$62,500.

22	21 $\frac{3}{4}$	54 @54 $\frac{1}{4}$	6.50 @6.60	6.35@6.40	7.75			

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, Oct. 22

Copper was dull, and there was a good deal of uncertainty as to the true position of the market. In lead and zinc, there were spectacular advances, with the probability that in both cases the rise will continue. Tin was irregular, especially as to the spot market, under the varying influences of the longshoremen's strike.

Transatlantic freight rates were about the same as in the previous week, with an easier tendency, however, especially owing to the large number of steamships now in the harbor. The rates from San Francisco to Hongkong and Kobe advanced to \$20.

Copper

There was the same irregularity in the market that we reported for the previous week, but the range of prices was not so great. The major part of the business was done at prices ranging from a little above 22c. to a little below 21 $\frac{1}{2}$ c., with 21 $\frac{1}{4}$ c. as an average, taking into account not only the extremes, but also the volume of business. In the previous week some considerable sales to domestic manufacturers were made. This week the aggregate of the domestic business was much less. Such as was done was largely with consumers, i. e., those concerns that manufacture the last marketable products into which copper enters. Such concerns buy wire-bars and have wire drawn on toll.

A few good sales at good prices were effected in that way.

Though the domestic demand on the whole was sluggish and inconsequential, a fair business for export was done, mainly with countries on the Continent of Europe. However, both Great Britain and Japan bought some copper. This business was done chiefly through the Export Association, but some was done outside of it. The Continental countries bid prices higher than what could be realized in this country, and their orders were promptly accepted. Great Britain, on the other hand, would not pay anything above the lowest of our market.

Germany was a buyer of copper here, and also has been trying to buy in Great Britain. The stocks of copper in Great Britain and Australia are being used to control the British market, and, American producers being under-sold, their failure to export anything more than small quantities of copper to Great Britain is explained. However, the British stocks are running down more rapidly than has been commonly supposed.

Copper Sheets—32 $\frac{1}{2}$ c. per lb. Wire, 25@25 $\frac{1}{2}$ c. Domestic buying dull.

Tin

The steel strike being practically over, manufacturers of tin plate evinced more interest in buying tin, and on the whole there was a pretty good demand. The vagaries of the longshoremen's strike in New York created a good deal of unsettlement in the spot position and explain the erratic fluctuations up and down.

Singapore quoted, c.i.f. London, £288 $\frac{1}{2}$ on Oct. 16, 17 and 20; £287 $\frac{1}{2}$ on Oct. 21; and £286 $\frac{1}{2}$ on Oct. 22.

In our issue of Oct. 4, the price of tin at New York on Sept. 20 was incorrectly printed at "55 $\frac{1}{2}$ c." The correct figure is 54 $\frac{1}{2}$ c.

Lead

As was anticipated, the A. S. & R. Co. advanced its price to 6 $\frac{1}{2}$ c., which was done the afternoon of Oct. 16. The St. Louis market steadily showed increased strength, and during the last two days independent producers realized prices in the New York market above that named by the A. S. & R. Co. Speculators and dealers bid even higher prices, but all possible efforts to prevent lead from falling into their hands will be made. The position in the lead market is acute, and any injudicious behavior might easily lead to excitement. It

is expected that the price will go higher, but much will depend on buyers keeping their heads, as well as producers.

Bonded lead for export is quoted at 5% c. France inquired for a large quantity, and Belgium for a little. Great Britain made some inquiries but was unwilling to pay the price asked. Germany also would like to buy lead.

The strike at Alton, Ill., continues.

Zinc

Up to the last fortnight, American producers apparently did not understand the situation of the zinc industry in Europe, and by making relatively low and erratic offers over there confidence abroad was rather upset. With a better appreciation of the European situation, however, American producers became firm in their attitude and buying for speculative account, which had temporarily halted, was resumed here. Great Britain bought a further large quantity in this market this week and the inquiries from France and Belgium took more definite forms. France in particular, seems to want a large tonnage. Our advices from Europe are to the effect that zinc will surely be scarce there by the end of the year. There is no chance of Europe producing much at current prices. There was not much domestic business done in this country this week, but toward the close, galvanizers became buyers in a small way and the steel strike being practically over, further buying by them is to be expected. With this combination of bullish influences it was only natural that a sharp advance in the spelter market should have been experienced. There is much reason to expect that it will go further.

In our Market Report published Oct. 11, the price of zinc at St. Louis on Oct. 7 was incorrectly given as 7½ to 7% c. This should have read 7¼ to 7½ c.

Zinc Sheets—\$10.50 per 100 lbs.

Aluminum—33c. per lb.

Antimony—There was a distinctly better tone, and more business was done. We quote spot at 8% c. Futures were quoted at 9c., duty paid.

Bismuth—Unchanged at \$2.96.

Cadmium—Unchanged at \$1.40.

Nickel—Ingot, 42c.; shot 43c.; electrolytic, 45c.

Quicksilver—Following the sharp decline to \$75 last week, no considerable quantities were offered, and the market rallied to \$80 to \$85 for quicksilver to arrive. There seems to be an actual scarcity of spot metal, and from \$95 to \$102 was reported realized. San Francisco telegraphed \$82.50, strong.

Silver—Market has advanced, owing to an insistent demand from China. It is understood that much of the bullion shipped to Hongkong and Shanghai is

for mintage purposes, and the coin is attracted to the interior, where the demand has been large. No shipments were made to Europe in the last week, owing to the longshoremen's strike.

Mexican dollars at New York: Oct. 16, 92½; Oct. 17, 92; Oct. 18, 92; Oct. 20, 93; Oct. 21, 94¼; Oct. 22, 93.

Platinum—Continued in good demand, but nevertheless the market was distinctly easier. We quote refined ingot at \$130.

Palladium—Unchanged at \$120.

Tungsten Ore—More interest in this market seems to be developing. European buyers are reported to have been making inquiries. Some Chinese scheelite is reported sold at \$7 per unit.

Molybdenum Ore—Unchanged at 75c. per lb. of molybdenum sulphide.

Pyrites—Spanish pyrites is quoted at 17½c. per unit for furnace size ore, free from fines, c.i.f. New York or other Atlantic ports.

Zinc and Lead Ore Markets

Joplin, Mo., Oct. 18.—Zinc blende, per ton, high, \$47.40; basis 60 per cent zinc, premium \$46; Prime Western, \$45; fines and slimes, \$42.50 to \$40; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$44.84; calamine, \$34.15; all zinc ores, 44.56.

Lead, high, \$79.35; basis 80 per cent lead, \$80 to \$77.50; average settling price, all grades of lead, \$77.74 per ton.

Shipments the week: Blende, 8,896; calamine, 245; lead, 1,342 tons. Value, all ores the week, \$511,570.

Sellers continue to sell lightly, holding the bulk of ore for advance prices, which they believe will come with the nearer approach of winter. Buyers continue firm in refusing to advance prices further this week, and purchases are reported light. The works of the Illinois Zinc Co., at Peru, Ill., are closed by a strike and no buying is done by the local company. Ore on hand has been turned to other buyers.

Lead is selling for next week's delivery on \$80 basis.

Platteville, Wis., Oct. 18.—Blende, basis 60 per cent zinc, \$48 to \$48.50 for both premium and Prime Western grades. Lead ore, basis 80 per cent lead, \$75 per ton. Shipments reported for the week, 1,690 tons blende, 206 tons galena, and 397 tons sulphur ore. For the year to date totals are 79,756 tons blende, 5,223 tons galena, and 13,629 tons sulphur ore. Shipped during the week to separate plants, 2,645 tons blende.

The zinc and lead ore markets for Sept. 27 were inadvertently omitted from the market report which we issued on Oct. 4. They are given below in order that the record may be complete.

Joplin, Mo., Sept. 27.—Zinc blende, per ton, high, \$46.90; basis 60 per cent zinc, premium, \$43.50; Prime Western, \$42.50; fines and slimes, \$40 to \$37.50; calamine, basis 40 per cent zinc, \$28 to \$26. Average settling prices blende, \$45.60; calamine, \$25.96; all zinc ores, \$44.64.

Lead, high, \$71.40; basis 80 per cent lead, \$70 to \$67.50; average settling price, all grades of lead, \$68.47 per ton. Shipments the week: Blende, 6,749; calamine, 353; lead, 1,104 tons. Value, all ores the week, \$392,540.

Shipments nine months: Blende, 358,293; calamine, 10,110; lead, 53,922 tons. Value all ores nine months, \$18,474,730.

An effort to reduce the price level to \$40 basis failed because one buyer desired a heavy tonnage and was willing to pay \$42.50 basis. All buyers "on the market," and expecting settlements on \$40 basis, changed their basis to conform to the same price level current the previous week. About 8,000 tons reported sold for next week's delivery.

Platteville, Wis., Sept. 27.—Blende basis 60 per cent zinc, \$43.50 base for premium grade and \$42.50 base for Prime Western grade. Lead ore, basis 80 per cent lead, \$70 per ton. Shipments for the week are 1,719 tons blende, 167 tons galena, and 296 tons sulphur ore. For the year to date, the totals are 73,632 tons blende, 4,696 tons galena, and 12,582 tons sulphur ore. Blende shipment to date decreased 23 per cent from that of 1918 to corresponding date. During the week, 2,506 tons blende was shipped to separate plants.

Iron Trade Review Pittsburgh—Oct. 21

Ferromanganese—The market remains stagnant. English 80 per cent could probably be had at \$95, c.i.f.; the asking price of domestic producers remains at \$110, delivered.

Steel—There is an acute scarcity of sheet bars, as sheet and tin mill operations have been in greater ratio than operation of steel mills producing sheet bars. Sales of sheet bars are reported at \$44.50 and at \$45, Pittsburgh, against the Mar. 21 price of \$42. Billets remain nominally at the old price of \$38.50, with slabs at \$41 and rods at \$52.

Coke—The Connellsville coke market has stiffened further. The curtailment in output in the first fortnight was sufficient to balance the reduced consumption due to the strike, and as furnaces resume, the consumption increases, and operators increase output only as they can obtain a fair price. Foundry coke is easy. We quote furnace at \$4.25 and foundry at \$5.50 to \$6.25, per net ton at ovens.

The Turn of the Tide

OUR editorial of Oct. 18 on "The Steel, Strike and Others," which defined strikes establishing economic blockades against the public as conspiracies and acts of civil war which should be promptly punished, anticipated by only a week the proclamation of the President in which he enunciated similar principles and warned the conspirators implicated in the threatened coal strike that any attempt to carry out their attack on the public would be punished by the full exercise of his Executive power. This firm attitude met with a hearty response all over the country. Governors of many states in which coal was mined lost no time in making public announcements that they were prepared to back the President's attitude with the full power of their state authority; and a feeling of relief was felt throughout the nation.

The foreboding induced by the constant aggravation of the industrial situation and the revelation of the nation-wide and world-wide underlying anarchistic plotting, changed to a consciousness of a firm footing discovered in the morass. Such progress as our subterranean conspirators had made had been partly under favor of the usual public sympathy with the cause of the workingman; and to the subsequent gloom that followed the revelation of the ringleaders as "red" revolutionists succeeded the calm of the fighting American spirit.

The President's analysis of the "Labor" conspiracies as directed against the commonwealth was verified by the defiance of the President and the law, which was the answer of the organizers of the coal conspiracy to the President's message, which defiance is in harmony with that of the railroad brotherhoods to Congress and the law, in regard to the intention of Congress to include an anti-strike provision in the Railroad Act. Nevertheless, a weakening all along the line has been pronounced. The latest public sentiment is that if there is to be actual conflict between the traitorous organizations and the forces of Americanism, the sooner it comes the better; and that in any case the ringleaders and as many of their followers as need be should be deported; and this change of feeling was not lost on the secret councils of Bolshevism.

Immediately the labor leaders proceed to give the public the inside facts. It appears that the coal strike was incited at this time by the operators, that they might put the miners in a false position before the country. In regard to the steel strike, Samuel Gompers has revealed the astounding fact that paid agents of the United States Steel Corporation have

brought this on; that the Steel Corporation has subsidized Bolshevist periodicals and revolutionary agitators, so that a trial of strength between Capital and Labor might be had, and Labor not only crushed once for all, but stigmatized as anarchistic and disloyal. Simultaneously there is revealed by Mexican authorities the fact that the American Consul who was kidnapped and ransomed at Puebla had arranged to have himself kidnapped by orders from Washington, in order to create a grave international situation. These are the angry recriminations of losing parties, who acknowledge that they have been wrong by accusing the other side. We are sorry for Mr. Gompers, whom we believe to be a lover of mankind, as Secretary Wilson called him. He was put in an awkward position between Scylla and Charybdis, between the devil and the deep sea, between Bolshevism and Capital; and he has chosen the untenable ground of approving the actions of the steel strikers while denouncing the strike as the work of anarchists and the Steel Corporation.

Meanwhile, to carry out the President's intention, the Attorney General has found that the Lever War Food Control Act applies, so that under it the ringleaders of the coal strike can be indicted and imprisoned; and he has announced that he will so proceed. At last we have reached, we trust, the turn of the tide.

Emerging from its former position of helplessness under employers, Labor has gradually grown, through exemption by complaisant Congresses from the anti-trust, or anti-conspiracy laws which were imposed upon Business, till it hit upon the weapon of hostile conspiracies called strikes, by which it now proposes to dominate all other classes and defy the Government of the United States. The Executive, listening to the voice of the majority of the people, has indicated that the patience of the lawful Government with the anti-government or anarchistic elements is necessarily at an end; and Congress, if in any degree awake, can do no less than follow the same course.

Bolshevism at Kyshtim Copper

AT THE meeting of the New York Section of the Mining and Metallurgical Society in New York Oct. 21, Mr. F. J. Jones, manager of the copper works at Kyshtim in the Ural region of Russia, gave a simple and instructive account of the changing conditions there since the fall of the Russian Empire. Under the Kerensky regime, conditions remained

fair; the workmen rejoiced in their newly won liberty, but remained industrious and friendly. They made moderate demands for higher wages, which they obtained. With the progress of Bolshevik (radical) doctrines and control, their attitude passed through independence to insolence; they made repeated demands for shorter hours and higher pay, with no opportunity to the employers for discussion, the alternative being the pulling down of the works.

Under these conditions, production fell off from a thousand tons of copper a month to three hundred; and the stage was soon reached when the expenditures of the plant for labor exceeded the income. The deficit was made up by the Bolshevik "government" at Petrograd, which regularly remitted, in order to maintain the needed production of copper. The management were relegated by the dominant workmen to a state of gentle slavery: they were informed that their business was to direct, and that they would not be allowed to leave their work. The problem finally became how to close down without rioting and destruction, a difficulty which was finally solved by getting word to Petrograd not to send the regular funds, and then obtaining permission from the workers to go to Petrograd to investigate!

That is the end of the tale for the present. Mr. Jones observed that in the incessant radical demand in America for shorter hours and higher pay, regardless of economic laws, he saw little difference from the march of events which he had witnessed in Russia; but he was confident that the intelligence and good sense of the American people would prevent the extremes to which Russia had fallen.

That is the comforting and optimistic reflection with which we all close our investigations into the present alarmingly unsound industrial conditions in America, just as, for example was done in our editorial of Oct. 13. Senator Frelinghuysen, speaking in the Senate the other day, characterized the radical campaign accurately and without mincing; and stated that the only thing that would avert the impending catastrophe was the force of Public Opinion.

Unfortunately for our comfortable optimism over the coffee and cigars, facts do not really warrant this reliance. Mr. Jones stated that only 8 per cent of Russians were radicals, and that the 92 per cent were overcome because they would or did not fight until it was too late; and the Bolsheviks disarmed them, and so it became possible for Russia to exhibit for so long a classic example of the rule of a tyrannical minority.

The proportion of radicals in the United States has not been stated. Labor unions and those controlled thereby have been estimated at 4 per cent of the total population, but, together with the families, must make up around 20 per cent. As is well understood, however, there are two distinct factions in the labor unions, of which the radicals are one; and from the strength they are showing in their effort to overthrow conservative unionism and the American government, their proportion to the whole population would seem not to be far different from that quoted for Russia.

Now, what effect will Public Opinion have on this movement? This is already as decided as it can be; but as such it manifestly does not influence the disturbing element, whose reply "The public be damned!" has been actually voiced in recent strikes both in Chicago and New York, and laid down as a principle in the books of their leaders. A supine and complaining public, a supine and threatening Congress, a supine and admonishing Executive Department, will deter this militant radical element about as much as the Aztecs throngs in Mexico stopped the progress of the little band of Spanish invaders under Cortez; or about as much as was the case in Russia. As has often been pointed out, these radicals are aliens. They do not understand English in many cases; they do not understand Public Opinion; they do not understand nor revere the Constitution, Congress, the Executive, nor the will of the majority. Whatever message the above institutions wish to convey to them must be translated into a language which they do comprehend—Action.

By all means, let us trust implicitly in the American people as a whole; but it is not too soon for the Executive, Congress, and the governing Majority to act decisively.

Indian Mineral Lands And the Apex Law

THE regulations covering the working of mineral lands in Indian reservations, which hitherto had not been available for development, were promulgated by the Indian Bureau of the Interior Department on Oct. 11.

A feature of the regulations, in interpreting the law, is that although mining claims may be located in the usual way and of the usual size, these are leased from the Government by the locator, instead of becoming his property; moreover, the mineral leased is only that within the boundaries of the claim, vertically projected downward.

From the legal point of view we have nothing to contribute to this question. From the viewpoint of the engineer and geologist, however, we would consider it unfortunate if the Apex Law were to obtain for these newly released lands. Our opinion is that the Apex Law is and was from the beginning a monstrosity and a mistake, the results of inexpert legislation. To be sure, not very much was known about mineral veins and ore deposits when this law was proposed and carried through by a Western lawyer in the Senate; but this should have indicated the wisdom of corresponding conservative legislation, which would have meant the vertical boundaries determined upon, earlier and since, in most other countries.

The Apex Law was based upon an ideal conception of the nature, form, and extension of an ore deposit, a conception so simplified and conventionalized as to be hardly recognizable in comparison with the facts, which have been established by the process of observation, by miner and engineer. Were all mineral deposits straight and of tabular form—narrow,

regular zones, like sheets of cardboard—passing through the end lines of claims located to cover them, then the Apex Law would have in it the element of equity to the discoverer of an ore deposit which was contemplated by those who enacted it. With the actual endless diversification of form and extent of orebodies, however, the law has at times become a farce, a source of perplexity and inequity, and occasionally a tool in the hands of those who keep within the law by twisting it so as to cover them.

The lack of correspondence between the ideal application of the law and the local facts has given rise to a vast deal of hard-fought litigation, in which justice is often conspired against with fantastic theories; and lawyers, mining engineers, and geologists alike sometimes find themselves perforce so far removed from the realms of reality that there is little if any strain on their consciences if they seek out and recognize only those geological phenomena which will support the side they are fighting for. The mass of legal opinions and decisions has reached formidable proportions, and the courts have turned out, and are still in desperation emitting, in the case of certain special problems, solutions that from the standpoint of the uninvolved geologist are sometimes grotesque. When we reflect upon Anglo-Saxon racial superiority, let us remember with humility the greater good sense of the mining laws of Mexico, as compared with those of our own country; and among the provedly superior features of the Mexican law is the limitation of mineral rights by vertical boundaries of claims.

The elimination of the right of extralateral mining in those mineral lands of the United States last thrown open is therefore, in our opinion, an enlightened act; and we trust that Secretary Lane is correct in so interpreting the law.

Whether anything can be done to correct the situation in the case of older claims, located under the Mineral Law, has long been a subject of debate, many holding that it would be worse confusion to try to simplify the law at this late date than to let it take its own mad course to the end. Some time ago, the Mining and Metallurgical Society addressed itself to this problem, with the co-operation of other societies interested in the welfare of the mineral industries, and made recommendations to Congress; but our impression is that the seed fell upon a stony ground.

Settlements at Trail

THE prominent place that the Consolidated Mining and Smelting Co. of Canada occupies in the affairs of the independent ore shippers of British Columbia makes its methods of settling for shipments, especially of lead ores, of considerable importance. There was much dissatisfaction on the part of shippers with the lead-pooling scheme and the scale of treatment charges set forth in the so-called Schedule B that was in effect at the Trail smeltery up to July 1 last. So pronounced did this become as to lead to the appointment by the Do-

minion Government of a special committee to investigate the rates charged.

This committee, consisting of S. S. Fowler, Ivan de Lashmutt and James Anderson, with A. G. Langley representing the British Columbia government, met at Nelson, B. C., on Jan. 21 of this year and, after carrying the investigation to Trail itself, reported that no undue margin from increased treatment rates had been derived by the smeltery and that furnace operation under the schedule had greatly improved. Concessions were obtained for shippers, however, which were embodied in the revised schedule known as Schedule C, which became effective on July 1, 1919. This provided the promised reduction in ore-treatment rates, more especially affecting those ores containing zinc and sulphur.

Many complaints have continued to come in, however, from shippers who desired a more definite method of settlement than that afforded by the lead-pooling scheme outlined in Schedule C. In a circular recently issued, certain clauses of Schedule C have been amended. The Consolidated company now guarantees that it will not settle for lead on a lower price than the American Smelting & Refining Co.'s average New York quotation. Soon after sampling, 90 per cent of the apparent value will be paid the shipper, and soon after the close of the second calendar month after sampling the final value will be computed and adjustments made.

The relations between shipper and smelter are vital, to the former at least. A narrow policy on the part of the smelter can greatly retard the development of mining properties in the district that is tributary to it. The act of the company in question in voluntarily easing the situation for shippers augurs well for the mining industry of British Columbia.

Welding Pipe for Oil and Gas Lines

THE practice of electric or acetylene welding of pipe used in the construction of oil and gas pipe lines is growing. This method will be employed upon a ten-inch gas line soon to be under construction in California. There are other examples of its use. Though it cannot now be considered standard, it is the practice of some of the most advanced engineers to specify the method. The use of a welded joint saves the coupling and the threading of the ends of the pipe. The pipe ends require "scarfing" only, the metal for welding being worked into the V produced by the butting of the pipe ends together.

According to experienced engineers, the joint made by the weld is as strong as the pipe itself. On a pipe line a hundred or more miles in length the saving of weight is an important item. We are of the opinion that welding would be a good thing for compressed-air columns in mine shafts and for air lines of more than nominal size where they have to be placed on the surface and where they are of considerable length. Such a practice would be a saving in first cost, but, more than that, leakage would be reduced to nil by efficient welding.

No. 1—The Tungsten Resources of the World*

BY FRANK L. HESS

THE world's known large tungsten fields are grouped along the shores of the Pacific Ocean—not always very close to it, but somewhere in the great mountain masses paralleling its margin, and the western shore is much richer than the eastern shore. In 1918, fully 92 per cent of the world's tungsten came from the Pacific's shores, of which more than 61 per cent was from the west side and more than 56 per cent from the Asiatic border. The east coast produced a little less than 31 per cent, nearly equally divided between the United States and South America. There is only one considerable tungsten-bearing area not situated close to the Pacific, that of the Iberian Peninsula, mostly in Portugal but partly in Spain. Of the less than 8 per cent not produced around the Pacific, it contributed nearly 5 per cent. There are, of course, small deposits in England, Germany, and other places near the Atlantic, but together they produce less than 3 per cent of the world's tungsten ores. The huge continent of Africa has only negligible known deposits; none of consequence are found on the borders of the Arctic, Antarctic, or Indian oceans, except along the narrow Malay Peninsula dividing the Indian and Pacific oceans, and only minor deposits are known in Siberia.

Geographical Distribution

The distribution of tungsten ores is far from being as wide as the distribution of the granitic rocks, and some countries with large areas of granite have almost no tungsten minerals, such as the Scandinavian peninsula, large stretches of Canada, the eastern United States, and Brazil.

Considered as a single metallogenic province, by far the greatest production comes from the region in southeastern Asia which includes the Malay Peninsula, Burma, the Shan States, Siam, Tonkin, and southeastern China. The second largest producing metallogenic province is the Cordilleran, including Bolivia and the adjacent closely related areas of Peru, Argentina, and Chile, to which the United States and Mexico would be a close third. Portugal, Spain, and Italy form the fourth province, to which are closely related the Cornish-French producing areas. Australia, including Tasmania, is next in importance, and is a distinct province, practically all the ores being found in the ranges of the eastern side of the continent. Japan and Korea also form a rather distinct province, which may continue into Manchuria. Mexico, as has been indicated, should be included in the same province as the western United States.

Tungsten, even more than tin, is found almost exclusively with granitic rocks. In a few places tungsten deposits are found in volcanic sedimentary, or metamorphic rocks, but, as is postulated with certain tin deposits, many of these cases may be explained on the supposition that it is not far vertically to underlying granite. There is among the deposits themselves a considerable variety of forms, and they may be classed as segregation deposits, pegmatite dikes, veins, replacement deposits, contact metamorphic deposits, and placers.

Segregation deposits are few and of little importance, and constitute those deposits in which wolframite is segregated in granite like biotite or hornblende. A closely related form is the occurrence of tungsten minerals in aplitic granite, and this grades almost insensibly into the second type, the pegmatites. The pegmatites are also of comparatively small importance, but do yield certain quantities of tungsten minerals. The pegmatites also grade into the next type, the veins, which have heretofore furnished the greater part of the tungsten minerals of the world. Intimately connected with the veins are the fourth type, replacement deposits, in which the country rocks alongside the veins, though the veins may be very small, are replaced by various minerals, including those of tungsten.

Closely related to the replacement deposits are the contact metamorphic deposits, the fifth type. These only recently have begun to be of commercial importance, but promise to be among the greatest, if not the greatest, producers of this country and possibly of other countries. The tungsten mineral in such deposits is invariably scheelite. Placers, the sixth type, are formed from all grades of deposits, but their value depends largely on local conditions. They are both residual and fluvial deposits, and have been large producers of tungsten minerals, especially of wolframite.

Uses of Tungsten

The essential uses of tungsten are as an alloy in high-speed tool steel, for the making of filaments for incandescent lamps, for targets and cathodes of Roentgen ("X") ray tubes, for electric contacts to be used in explosion engines, and whenever an intermittent electric contact is needed. Other uses are the addition of tungsten to saw and some other steels, as a constituent of stellite, in a tungsten iron alloy for valves in automobile and airplane engines, for kenotrons and similar instruments, in a manganese-chromium-tungsten-iron alloy for wire drawing dies, wire cloth, luminescent screens for Roentgen ("X") rays, mordants, and minor chemicals. The use of tungsten in high-speed steels is as standard as the use of yeast in bread and, though assiduously

*Department of the Interior, Political and Commercial Control Series No. 15, revised by the author and somewhat abridged for publication by the Engineering and Mining Journal.

hunted, no substitute is known which will satisfactorily take its place. The Alloys Steel Co., one of the larger producers, makes a large part of its steel in the electric furnace, and it is understood that the Crucible Steel Co. and some other steel companies also make a part or all of their steels thus. The removal of tin, copper, and other impurities from ferrotungsten by grinding and chemical treatment has made possible the use of impure ores in the production of high-grade ferrotungsten in the electric furnace.

Production

The world's production of tungsten ores by metallogenic provinces and political areas is shown in the following table. Unless otherwise noted, the short ton of 2,000 pounds is used throughout this paper, and the term "tungsten ores" denotes material carrying 60 per cent WO_3 .

Developments and Changes in Geographical Distribution in the Near Future

The increase of output from eastern Asia has been marvelous. In 1913 it amounted to 2,497 tons, and in 1918, to 20,228 tons—more than 56 per cent of the world's production. As in other parts of the world, production must decrease until the accumulated stocks in the reducing centers are used; then it will again proceed as it has in the last few years. The alluvial deposits of China are by no means exhausted, the veins are scarcely touched, the tungsten-bearing area is large and only partly prospected, and such prospecting as there has been has been almost wholly for placers. Labor is cheap, and a large future output is sure. Although proceeding slowly, more liberal ideas of trade and government are taking root in China, and educated Chinese or trained foreigners will in time work the deposits, and the output will be large for a long time, though it may never again be as large as it was in 1918.

So far as can be learned, the easily worked placers of Burma and the upper parts of the veins are becoming exhausted rather rapidly,¹ and recourse must therefore be had in the future more and more to the mining of those parts of the veins below water level and in harder rock, and this will probably mean a diminution rather than an increase in output. Siam seems to be a country which should give an increased production, as the mines are comparatively new, and there still should be opportunity for discoveries. The Federated Malay States and the unfederated states—Johore, Kedah, and Trengganu—should produce at least as much in the immediate future as in the past—given demand and an equal price.

Like other British possessions, Australia labored under the handicap of a comparatively low fixed price for tungsten ores during the war. This price, at first 55s. per long ton unit c.i.f. London, was later raised to 60s. The price paid in Australia during the earlier part of the war averaged less than one-half that paid in the United States, and only a little more than half that paid in regions other than the British provinces, with the result that the Australian tungsten production did not increase as it might have done during the war, had prices been higher. The cream of the known deposits is gone, except in Tasmania, where contact metamorphic deposits on King Island have quadrupled the Tasmanian output. The tungsten minerals produced in Australia are largely wolframite, with smaller quantities of huebnerite and scheelite. The huebnerite is apparently rarely recognized as such in the British market, but is all sold as wolframite. Except for the contact metamorphic deposits on King Island, Tasmania, the deposits worked are mostly veins, with some pegmatites.

In New Zealand, the production is wholly scheelite, and increased considerably during the war until its last year—1918—when, apparently owing to a lack of efficient labor, it fell to the lowest point since

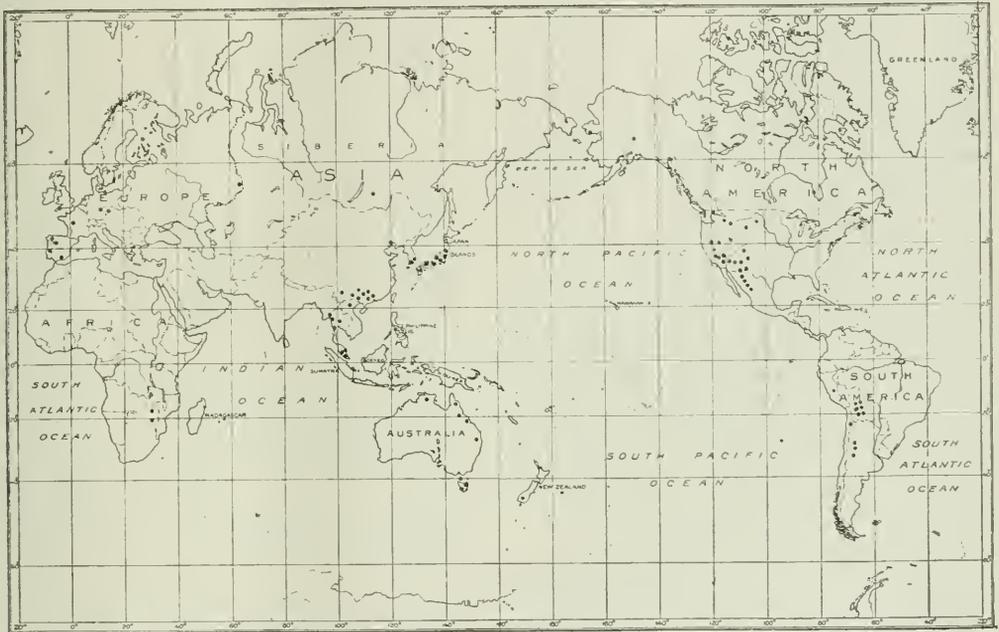

¹ Burma Chamber of Commerce and Tavoy Chamber of Mines, Memorial to Sir George Barnes, Mining Journal, London, Vol. 121, May 4, 1918, p. 261

1909. The probabilities are that there will be a stoppage of output for the present.

The increase in production of Bolivia has been very great. The deposits seem to be wholly veins and derived placers. The veins are closely connected with the tin deposits, and tin and tungsten are frequently found in the same veins, but many tungsten deposits contain little or no tin. The tungsten minerals mined are ferberite, wolframite, scheelite, and some huebnerite, mixed in some veins and in others wholly separate. The mines occur in and on both sides of the eastern Cordillera of the Andes through a distance of nearly 400 miles from a point near Puerta Acosta on the northwest to Chorolque on the southeast. Prices for mining during the war rose greatly, in sympathy with the rise in other parts of

The Peruvian output as now produced is apparently dependent upon high prices, and could probably remain at the level of 1916 for several years if prices were sufficient. The Huaura deposits are reported to be large, though of low grade, and may, under proper management, yield largely even at lower prices. They have been under the control of German firms during the war, and probably still are.

Until 1911 the United States was the leading tungsten-producing country, but in that year was passed by Burma, which kept the lead until 1916, when the United States again became the principal miner of tungsten ore, but in 1918 China came into the excessively high-priced market with a production that exceeded by nearly 1,000 tons the world's production of any year before 1915. North America

GEOGRAPHICAL DISTRIBUTION OF THE TUNGSTEN RESOURCES OF THE WORLD

Frank L. Hess

the world. Wages did not rise to great heights, but the cost of materials increased materially. Transportation conditions are always bad in most of Bolivia, and heavily increase expenses. These circumstances cause great sensitiveness to a decrease in demand or prices, and the output from Bolivia fell quickly after the armistice, but should high prices come again, the output will probably again increase quickly. Some modern plants were placed at mines before or just as the armistice was signed, and when world stocks of tungsten are used, and there is again a demand, some ore will be produced at even less than \$10 a unit, though the average cost seems to be about \$12 a unit, at the mine.²

increased its output from 1,549 tons in 1913 to 6,512 tons in 1917, but it dropped back nearly 1,000 tons in 1918 (to 5,567 tons). The decrease of production in the United States was due almost wholly to the fall in price, and only partly to exhaustion of deposits. Although the Boulder tungsten field has seen the exhaustion of some of its best deposits, and the cost of production has become much greater, owing to the impoverishment of others, and though the same thing is true in some other places, it seems possible that in the country as a whole the production can temporarily be made about equal to the highest made before, providing prices are as high as at that period, owing to the discovery of the contact-metamorphic deposits of the Great Basin.

In Mexico the tungsten deposits are apparently a continuation of those of southern Arizona. So far

² Hazeltine, Ross, United States Consul, La Paz. Report dated May 14, 1919.

as known, all the Mexican deposits carry scheelite, in places partly replaced by cuprotungstite. The known worked deposits are in the Sahuaripa district of Sonora and are described as veins in which scheelite is found with copper minerals and a pegmatite dike in which large masses of scheelite and molybdenite are found.

European Tungsten Production

European production increased about 50 per cent between 1913 and 1918, mostly in Portugal, and the production of tungsten ores in Portugal apparently did not reach its maximum. The deposits exploited have been both placers and veins, and there still seems to be placer material to be worked, as well as the veins, which are said to be far from exhausted.

For the Spanish output it is difficult to prophesy, because the data concerning the mines are meager. It seems probable that from the English and French deposits, under similar prices, about the same output as in the past may be expected. The English output decreased in 1917 and raised only a little in 1918, despite the British government's interest in a larger quantity of concentrates. No accurate data are available from France. The German and Austrian deposits have probably been worked so hard during the Great War that less is to be expected from them than they have heretofore produced.

The principal changes in the distribution of production during the next few years would seem to be: Further development of veins and contact-metamorphic deposits in Korea; the possible development of veins in Manchuria; development of new placers and veins in southern China and Siam; both veins and placers in Bolivia; a tendency in our own country to largely increased production from the contact-metamorphic deposits of the Great Basin; and both veins and contact-metamorphic deposits in Mexico. There will possibly be a decrease in the Atolia and Boulder fields of the United States; in Australia, Japan, Germany, and Austria.

Political and Commercial Control

Actual control of the world's tungsten deposits is considerably different from that indicated by the production within political areas. That actual control is justly obtained through ordinary competitive purchasing, ownership, by nationals (sometimes by governments) of deposits, and through commercial alliances. Control through ownership of banks and transportation lines may be just, or it may be bulldozing and commercial brigandage, such as that made possible by seized ports used for coaling and repair stations which command the junctions of trade routes—methods that are merely refinements evolved since the days when "They sought their fortunes as they pleased abroad, the crown annoying them with no inquiry to embarrass their search for Spanish treasure ships, or their trade in pirated linens and silks."

Owing to the close relationships between foreign governments and private firms, illustrated by the German government's interest in dye, potash, and shipping firms, and the British government's partici-

part in nickel mining and ferrotungsten-making companies, it is not practicable entirely to separate governmentally and privately controlled deposits. Under the weaker governments, deposits owned by British subjects are to all intents and purposes British, but owing to the difference in national policies, foreign deposits owned by Americans are not necessarily under American control; in fact, instead of helping and encouraging our pioneers in foreign trade, we are likely to harass them and destroy their business with drastic tariff laws.

THE ACTUAL CONTROL OF THE WORLD'S TUNGSTEN OUTPUT IN 1917 AND 1918

The above table practically shows only where the ores of various countries go for treatment, and is, of course, only a generalization, and is obsolete before it is made, for trade conditions change constantly. For instance, Japanese electric furnaces are beginning to smelt tungsten ores, though at present to the extent of only 10 or 15 tons of contained tungsten per month, but it is conceivable that the output may be greatly increased. Although

¹ Wilson, Woodrow. "A History of the American People," Vol. 1, p. 25.

Japan could control the disposition of its ore, it is given credit for control only of its smelted ore. It is impossible properly to divide the ores from Argentina, Bolivia, Peru, Portugal, and Spain among their customers; and other weaknesses, those inherent to most statistical studies, are also present. The table is approximate only, but is thought to furnish instructive data.

British Control

The British government during the war demanded and obtained all of the tungsten ores produced in its colonies and possessions. This restriction was later lifted as applied to Canada, and the new rule allowed Canada to ship tungsten ores to other Entente nations, but as Canada was not a producer the license granted amounted to nothing except as it eased the feelings of the Canadians. Scheelite deposits have been discovered in Manitoba, however, that for a time seemed to be potential producers. Nominally, Siam has remained free from British control, because more or less under the zone of influence of the French, but diplomatic pressure seems to have been exercised at Bangkok. Most Siamese tungsten-bearing ores contain some tin, and have gone to Singapore for separation, and when once within the British possessions, of course, the ores could not be shipped out of them. British control of Siamese shipments is thus apparently as complete as if the shipments were made from a British province.

In southern China, Hongkong being the port of Kwangtung and Kwangsi, and parts of southern Kiangsi and Hunan, the British exercised control over the export of ores produced in those districts, for a while⁴ refusing to allow the re-shipment of ores unless they were sent to England. Foreigners, including Americans of course, are not allowed to own mining property in Burma, the Federated and unfederated Malay States, or Australia, territory producing nearly all the tungsten ores of the British Empire. In Argentina small tungsten mines are owned by English companies.⁵ In Bolivia the English and French governments during the war leased mines directly, and came into direct competition with American business men engaged in the buying or production of tungsten ores.

British Efforts to Extend Control

British traders are constantly striving to increase their control of Bolivian tungsten ores, and the efforts are not confined to the control of properties through buying. The English apparently have complete control of the financial system of Bolivia so far as foreign exchange is concerned. An American interested in a tungsten mine in Bolivia has stated to the writer that it is almost impossible to do business with English banks, because they insist that if they extend commercial courtesies, even for pay, the recipient must buy only English mining machinery. If miners do not wish to deal through English banks, they are compelled to cable money to and from New York at a considerable expense. The

American banking interests represented in Bolivia are apparently too conservative to advance money on ore shipments, as have German and English representatives, who, I am told, advance up to 80 per cent of the market value of ores shipped. This is good business. Mining corporations are also controlled by English firms, and, of course, the material is then shipped to England, and it is impossible for Americans to compete for the production. The control of the Bolivian mines by the English is not yet dangerous to American interests, except through the banking system, but entire control may be passed to them, to the Germans, or the French through American tariff legislation.

In Portugal, English companies control a number of the mines, and it has been alleged by at least two Americans⁶ that the British government, through its representatives at Lisbon, for a period of more than two years, prevented title passing to American companies. The Thermo Electric Ore Reduction Corporation, Ltd., seems to be the principal English owner of Portuguese tungsten mines. In the Dutch Indies, the British are understood to have control at present of the wolframite production, which, however, is comparatively small, about five tons a month.

French Control

French control of tungsten deposits is not large. It includes the production of France and that of Tonkin, a part of that from Portugal, and a comparatively small interest in Bolivia. During the war, control in Portugal was attempted by England and France. The prices offered by the English and French were much below the market prices of New York, and the Portuguese government stepped in and raised prices to a point somewhat lower than those of the United States, but 20 per cent higher than the prices offered by England and France.

Japanese Control

Japan has within her own borders a considerable number of tungsten deposits situated in the southern part of the islands, but all are small. In Korea important deposits have been discovered and actively worked, especially within the last two years. Deposits in Manchuria are also said to be controlled by the Japanese, but little is known of them, and if they exist they are probably small. Japanese ores have come largely to the United States for several years. As has been said, Japanese firms have erected electric furnaces in which a part of the tungsten ores are reduced, probably the equivalent of 25 to 35 tons per month of concentrates carrying 60 per cent WO_3 .

American Control

The United States controls entirely the tungsten deposits within its own borders and Alaska. Americans operating in Mexico have produced 200 to 300 short tons of scheelite concentrates per year from deposits in the Sahuariipa district, Sonora. Wolframite is said to have been shipped from Sinaloa to the United States, but its real origin is unknown. Contact metamorphic deposits carrying 0.7 per cent

⁶ Personal communications.

WO₃ and 1 to 2 per cent copper have been found about sixty miles southwest of Nacozari and are owned by Americans, but are not now productive.

In Bolivia, Americans own some of the more important tungsten mines. The American firms known to own tungsten properties in Bolivia are W. R. Grace & Co., local address, La Paz; Stewart, Wilson & Hepburn, Oruro; Easley & Inseele, La Paz; and C. Dillon, Oruro. Their total output is estimated to amount to about 1,600 tons, out of a total output of more than 4,000 tons for the country.

In southern China, as already noted, American firms have worked up the tungsten trade extensively, so that, through this source, the United States controls (or, more properly speaking, Americans control), unless interfered with, a trade of possibly 9,000 short tons of tungsten concentrates per year. In Siam one or two United States companies have attempted to produce tungsten, but British influence during the war made it difficult to ship even small lots of ores to this country.

Because it offered higher prices than other countries, and because the trade route was more direct and shorter, so that it was to the advantage of the Japanese to trade with this country, the United States largely controlled the Japanese output of tungsten ore in 1918. This trade probably has been somewhat and will be further curtailed through the erection of electric furnaces in Japan.

United States Imports in 1918

The United States imported in 1918 36 per cent of the tungsten output of the world, and adding this to the domestic output makes a total of 17,921 tons, or 50 per cent of the world's production. There is a lag in the shipments from South America of about two months and from China of about three months, so that the South American ores received in January and February were from the output of 1917, as were the Chinese ores arriving up to the end of March. Subtracting the ores from the two regions arriving during the first two and three months respectively of 1918, and adding the ores arriving during a like period in 1919, the quantity of ore controlled by the United States in 1918 was equivalent to 21,131 tons of concentrates carrying 60 per cent WO₃, amounting to 59 per cent of the world's production. These ores were all controlled through the private initiative of American firms, which offered better prices and better terms than could be obtained abroad. Probably a larger proportion could be handled in the future should interference not come from within our own borders. It is now proposed to put a tariff of \$10 a unit on tungsten ores, without regard to purity or quality, and a bill providing such an impost has passed the House of Representatives, with a correspondingly high tariff of \$1 a pound, plus the 15 per cent ad valorem duties now in force, on metal in any form—element, alloy, or salt. It is believed by its advocates that the price, now about \$7 a unit in New York, will be raised to \$17 a unit.

Hereafter the quantities of tungsten ore handled will be much smaller than during 1916, 1917, and 1918, and will be confined to peace-time needs, un-

less an unforeseen war should occur. England has at present two years' supply on hand, according to government estimates. France is probably equally well supplied. The United States presumably has on hand an equivalent of 8,000 tons of ore carrying 60 per cent WO₃. Tool-steel makers have figured on a consumption of 7,500 tons during the current year, but, as shown by the lack of market for ore, this is undoubtedly much too high, and probably 4,000 tons is amply large, so that there will likely be little if any market for new supplies for nearly two years, except as ore may be bought speculatively. During this time, mines everywhere must close and remain so until a demand again arises, except for the number required to furnish the tungsten to be taken by Germany, Austria, and Russia, and the small quantity required by Sweden, Norway, and Italy.

If Germany, Austria, and Russia recover economically, so that they can buy and use tungsten, Germany will have regained, in the ores that will be eagerly offered by producing nations needing a market, a part of the trade she has lost. Traders of England, France, and the United States will be glad to sell tungsten and ferrotungsten, but Germany will undoubtedly reach out for raw material in order that she may make as much use as possible of her abundant unemployed labor. Should a tariff law like that now proposed be passed, the United States will have cut off its foreign supplies and will have ended its control of any considerable part of them. However, should a high price be maintained, artificially or otherwise, the development of other alloy steels for use in multiple-edged tools may have reached a point where not so much tungsten will be needed.

German Control

Germany has had no considerable tungsten deposits at home and none in the foreign territory which she held, but her control of the tungsten trade through business alliances covered in 1913 about two-thirds of the entire tungsten-ore output. In that year, according to the German official figures, 5,295 short tons of tungsten ores were imported. Most of this probably carried 65 per cent or more WO₃, equivalent to, say, 5,736 tons of concentrates carrying 60 per cent WO₃. Adding the 106 tons of Saxon concentrates produced in that year, it is apparent that Germany treated a total of approximately 5,840 tons out of a world's output of 8,864 tons, or about 66 per cent of the total. The United States in the same year produced 1,537 tons and imported 449 tons of unknown content, but the whole was probably equivalent to more than 2,000 tons of ore carrying 60 per cent WO₃, leaving only about 1,000 tons for other countries, most of which seems to have been treated in France. This trade Germany lost when, with Austria, she started the Great War, and control shifted to England and the United States. With the cutting off of all shipments by ocean to Germany, most of the foreign ores were denied to her, but undoubtedly small quantities leaked in through Sweden and Norway for a considerable time after the beginning of the war. The small output of Austria was always available, but it is said that a

considerable amount of ore was smuggled over the border of Portugal into Spain, thence by water to the western frontier of Italy, into Switzerland, and from there shipped direct to Germany. A large part of the Spanish production is said to have reached Germany in this way also, and the "crippled" submarines which landed at Spanish ports are reported to have carried out cargoes of tungsten for Germany.

In the Allied countries and the United States, the German interests were taken over by the respective governments, but in South America, German firms still hold some control of tungsten-bearing properties. In Bolivia four German firms are said to have an output of about 600 metric tons of ore per year. In Peru what is said to be the larger part of the tungsten deposits have been controlled by firms thought to be German, E. y W. Hardt and Carlos W. Weiss y Cia. In Argentina the Hansa Mining Co., a German company, is the principal producer, and is said to have an output of about 500 tons of concentrates a year. Even this firm's output is said to have come to the United States during the war. If the United States is placed under the prohibitive tariff passed by the House of Representatives, German control of the world's tungsten trade may be in large part easily recovered.

What Control Means in the United States

In good business years before the Great War, the United States used an equivalent of 3,000 to 4,000 short tons of concentrates carrying 60 per cent WO_3 per annum. When the war began, there was a lull while the attacked countries caught their breath and prepared for a long struggle. After plans had been made, and the manufacture of munitions began on a great scale, the demand for tungsten ores rose enormously. All kinds of ores were taken at fabulous prices. Ores carrying tin, phosphorus, sulphur and bismuth, that before would not have been considered by steel makers, were bought with avidity, and there was a great scramble for deposits. In October, 1918, the United States was using tungsten ores at the rate of 20,000 tons per annum. Meanwhile, prospecting had uncovered so many new deposits, and they were so actively exploited, that great stocks of ore were accumulated in the Entente countries. On the other hand, in this country many of the known deposits showed signs of impoverishment, a number which gave a profitable production for a short time became wholly imperative, and it is likely that some of the deposits that have seemed to be the richest will never again produce largely. Among the new discoveries were the contact metamorphic deposits of the Great Basin—California, Nevada, and northeastern Utah. They were partly developed, and several promise well, but the irregularity of contact metamorphic ore deposits is notorious.

In 1916, under prices ranging from \$15 to \$93.50 per unit, the United States produced 5,969 tons of concentrates; in 1917, while still under the impetus of the 1916 boom and prices ranging about \$25 per unit, 6,144 tons; and in 1918, still under a price averaging about \$25 per unit, 5,041 tons, though

little was produced in December. Under a price of \$17 per unit, which tariff advocates think can be reached by means of a tariff of \$10 per unit, it seems improbable that the United States can depend on a production of more than 3,000 tons a year for the next three years. There are, of course, possibilities of larger production, and there are equal possibilities that it would not be so large. Should another great war takes place and, in the belief of many, this does not seem beyond the range of imagination, instead of gradually working up to such a consumption, the United States would probably begin by using tungsten at the rate of 20,000 tons of concentrates per annum. Unless the price were even more extravagant than the highest price in 1916, \$93.50 per unit, the United States would not produce half of its needed concentrates, and the time required to reach that output would be far too long for safety. Of course, such a production would be much better than none, but the United States should, for safety, have within reach at least a year's supply.

The Pacific, around the borders of which are the largest tungsten deposits, is by many looked upon as the next theatre of war, and, however vitally needed, it might not be possible to get supplies of tungsten ores, owing to the blocking of trade routes. It would, therefore, seem vastly better that, instead of putting a premium on the quick depletion of our own already too meager supplies, we should use the rich low-priced ores now being produced in the Orient. These cheap ores we may have in trade for the asking, and it would be one of the best forms of national life insurance were the government to store 10,000 tons of these ores while they may be had.

The argument is often made that by putting a high tariff on tungsten ores we would have our own deposits developed so that quick production could be made when needed; also that with the need we would find more ores. Both arguments are specious. What is meant is not development but removal. No one will open up a tungsten mine to let the ores stand against the country's day of need. The finding of new ores is a probability, but the quantity is wholly a question. Few tungsten mines of the United States can be profitably operated at the present price of less than \$7 per unit, and the mines are now closed. The number of persons dependent on the mining of American tungsten ores is small, probably less than 900 in peace times. At present most tungsten miners have already obtained other-employment, and practically all could obtain employment fully as profitably in other mines, many of which are short handed, so that no great hardship would be worked, though the inconvenience of moving a family must be recognized. As a matter of national economy, the United States cannot afford to throw away its chance to buy cheap tungsten ores while they are available. Aside from the question of national life insurance as meaning a guarantee of mere existence, not to buy South American ores is to throw away South American trade. In a degree this is also true of Chinese and Japanese ores.

Metallurgy of Tungsten

The metallurgy of tungsten, like that of other metals, is being improved constantly, and should our ores remain in the ground for a time they will be of greater absolute value when mined, because they can be utilized to better advantage, for there will be less waste in conversion. If our ores are mined now under an artificially high price, we will always pay a high price for tungsten ores, for when ours are used the ores in other countries will have diminished in quantity and increased in cost, and therefore become higher in price, and we must buy at the advanced rate. On the other hand, by holding our markets open to cheap ores from any quarter, we will stand on an equal footing with other countries and will always have a reserve of high-priced ores to fall back on when necessary.

There is but one crop of ore. To turn over deliberately all the cheap tungsten ores of the world to our competitors, allowing them this advantage in making high-speed steels with which to compete in foreign trade with our steels and with all products on and in which they are used; to put a premium on the early depletion of our own deposits, leaving us without resources of this indispensable material for peace and war; and to compel our use always of high-priced ores would be economic crimes.

Copper Producers Hope for an Early Improvement in Market Conditions

There are many influences at work at the present that are affecting the copper producers in the United States, both directly and indirectly, and which they are endeavoring to surmount, according to an October report on copper by Eddingfield and Wormser, issued by the Bureau of Mines. The industry's own labor troubles, the effect of the steel and coal strikes, the vicissitudes of other metal markets, and the outlook for copper itself all bear upon the situation. The large unsold stock of copper in the United States, estimated in some quarters at half a million tons, represents a reserve accumulation that can be marketed if necessary. During a session held a few weeks ago, the International Trade Conference echoed the impression felt in this country that the European nations are in need of large quantities of copper.

It is reasonable to suppose that producers prefer to continue at their present output rather than increase the cost of their copper by turning out a smaller amount of metal each month. Until the market improves, little increase in production is to be looked for.

The Utah Copper Company is milling 17,000 tons per day, about half its normal output. In Michigan, where the output is about 75 per cent of normal, it is not expected that production will return to normal until the Central Powers become a factor in the market. The Michigan copper country fortunately lays in a store of coal in the summer sufficient to carry operations through the winter, and hence will not be affected by the coal strike as seri-

ously as some other districts. Michigan formerly sent most of its copper to Germany.

The order of the Railroad Administration requiring the metal mines to use closed cars, to leave the open cars available for coal and sugar-beets, if carried out, will not tend to help production, for a number of the metal mines are not equipped to load into closed cars, and it would be difficult for the smelters to unload sufficient ore to run at normal capacity.

World-Wide Demand for Iron and Steel Expected to Continue for Some Time

The demand for iron and steel products in this country and abroad should tax the capacity of all the steel plants for an extended period of time, according to the October report of Investigation issued by the Bureau of Mines. The greatest domestic demand for steel comes from the railroads, the oil industry, the manufacturers of automobiles and agricultural implements, and for use in construction work. Foreign business, as a consequence, will be subject to rather indefinite future delivery, and thus the rehabilitation of foreign countries affected by the war will in a great measure be dependent on the resources of Continental mills.

Germany, being stripped of her largest iron-ore reserves, is prospecting for new iron deposits within her own borders. The Idarwald, near Coblenz, is a field in which exploration has recently been taking place. Although the deposits have long been known, it was not considered feasible to exploit them while the more profitable Lorraine fields were available.

The Swedish iron industry, according to "Commerce Reports," during the first half of 1919, has been operating under adverse circumstances. This is due mainly to industrial difficulties and sales in the British market of government stocks which accumulated during the war. The exports of pig iron during the second quarter of 1919 were only 23,100 tons, against 54,900 during the same period in 1918.

Tungsten Imports

The following table gives the imports of tungsten-bearing ore into the United States in 1917, 1918, and the first seven months of 1919, as reported by the U. S. Department of Commerce:

Country or Origin	Long tons 1917	Long tons 1918	Long tons Jan.-July 1919
Portugal	107	24
Argentina	192	479	65
Chile	1,723	1,116	387
Peru	1,071	1,631	299
Japan	538	1,215	515
Other Countries	726	5,897	3,296
Total.....	4,357	10,362	4,472

Coarse Ore Weighs More Than Fine Ore of the same composition. Sometimes it is thought that the opposite is true, on account of the comparatively large size of the voids which occur in a pile of coarse ore, but the larger number of voids in a mass of fine particles more than compensates for their small individual volume. Often, however, the fine ore contains more mineral, and is heavier on that account.

Rand Ore Reserves

A Complete Analysis, Made Upon the Basis of Present Economic Conditions, Showing the Decrease in Tonnage on Account of Higher Working Costs Eliminating the Low-Grade Ore.

BY A. COOPER KEY
Johannesburg, South Africa

THE gradual though insistent advance in the rate of working costs of the Rand gold mines has led to the elimination from ore reserve estimates of considerable tonnages of rock which under earlier normal conditions were considered to be commercial. From the pre-war figure of 17s. per ton, the rate advanced last year to 21s. 7d., and in March, 1919, the average was 22s. 6d. To put it another way, the rise is equivalent to 1¼ dwt. When it is stated that 40 per cent of the aggregate ore reserve has a value of 6½ dwt. or under, the incidence of such a rise, equivalent to a fifth of the value stated, will be apparent. Besides this economic elimination of tonnage, some of the older mines are completely opened up, and little ground remaining to be explored, there has been considerable encroachment into the reserves previously accumulated. Some of the tonnage now excluded will automatically re-enter as costs recede. Whether they will ever come back to the 1913-14 level is extremely doubtful, in view of the increased rate of wage of the white workers (there has so far been no advance in wages paid to the unskilled native workers) and, what is a far more serious item, the enhanced prices of all necessary stores.

A Classification of 89,250,000 Tons

Analysis of the figures for about fifty mines shows an aggregate of 89,300,000 tons as at December, 1918, which compares with 95,700,000 tons for the same companies the previous year, and 102,000,000 tons at the end of 1916. Values are assigned to the whole of this tonnage, except in respect of 322,000 tons at Robinson, the historic mine of the Rand, now fast approaching exhaustion. With the exception of rather less than 1,500,000 tons at the Cinderella Deep, which has been closed down for some years, and the Modder East, the figures apply to producing mines.

The ore reserves may be classified thus:

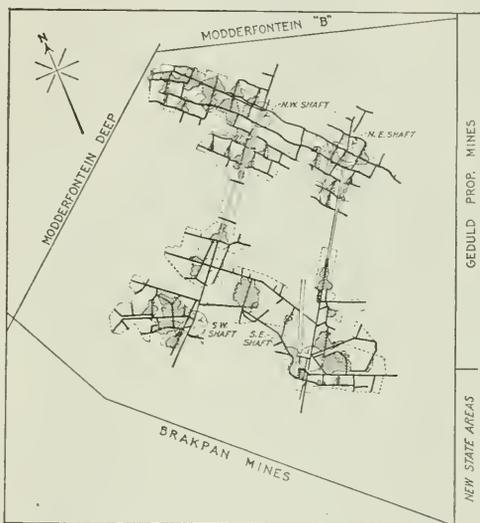

Companies	Tons	Value, Dwt.
1	1,882,000	Below 5
15	15,780,600	Between 5 and 6
10	17,932,500	Between 6 and 6½
6	10,171,800	Between 6½ and 7
5	5,157,400	Between 7 and 7½
3	10,725,500	Between 7½ and 8
1	605,000	Between 8 and 8½
4	17,613,000	Between 8½ and 9
2	5,746,000	Between 9 and 9½
1	3,378,700	Between 9½ and 10
2	891,500	Over 10

It will be seen from the table that about 35,500,000 tons (representing about 40 per cent of the whole) has a value of less than 6½ dwt. per ton, or an actual value of 27s. 6d. per ton, without allowing for mining and metallurgical losses. Putting these at 10 per cent as a rough average, it is evident that there is a small margin with costs in the neighborhood of 22s. 6d. Going up 1 dwt. in the classification, there are

39,000,000 tons valued at over 7½ dwt. Of this, 27,500,000 (as valued at over 8½ dwt.) can rightly be considered as high grade.

Higher Values Caused by Eliminating Low-Grade Ore

The shutting out of low-grade tonnage has, automatically and mathematically, had the general effect of increasing the value assigned to ore of commercial grade. But there are exceptions to this, as the values at Brakpan and Springs have each dropped by ½ dwt. and at the Van Ryn (where, in addition, a

THE GOVERNMENT GOLD MINING AREAS (MODDERFONTEIN) CONSOLIDATED LTD.

Areas stoped out are shaded. The ore reserves are indicated within the dotted lines.

more stringent safety factor has been employed) by practically a pennyweight.

In one or two instances improved values are in evidence, and, as this applies to the whole tonnage developed, both in the past and currently, it means that the latter has been exceptionally favorable. A case in point is that of the City Deep, the most important mine in the vicinity of Johannesburg, where the value of the whole reserve has increased from 9 to 9.6 dwt. That improvement is in respect of no less than 3,350,000 tons. The advance is owing to the fact that the previous estimate, including ore conservatively valued pending further work, and now

found to be higher in value than anticipated, and the year's development (8,500 ft.) has exposed satisfactory values, namely 19 dwt., over 28 in. Even more striking is the rise of $\frac{1}{2}$ dwt. in the assessed value of the 9,500,000 tons at the Government Gold Mining Areas. Here 23,600 ft. of development was accomplished, of which 17,250 was commercial grade, showing 16 dwt. over 43 in.

One Mine Showed Over 15 Dwt.

The Meyer & Charlton stands in a category of its own, the single representative on the Rand proper of a mine showing more than 10 dwt. (though there is also the Sub-Nigel, at Heidelberg, giving just over that value). The ore reserve value is now slightly under 16 dwt., instead of just over $17\frac{1}{2}$ a year previous, but this is mainly owing to an increase of $4\frac{1}{2}$ in. in the stopping width assumed.

Government Areas' Huge Increase

The outstanding feature of the whole ore reserve position is the remarkable advance of nearly 2,500,000 tons shown by the Government Gold Mining Areas, besides the improvement of $\frac{1}{2}$ dwt. At the year end it had 9,500,000 tons "in sight," valued at 8 dwt., over a stope width of 78 in. In the March quarter a further 230,000 tons was added. The aggregate is now the largest on the Rand, exceeding that of the New Modderfontein, which had for some years held the premier position, with a huge ore reserve, by 445,000 tons. The increase achieved in the year would constitute in itself a handsome reserve. To particularize in respect of far-Eastern concerns, it approximates to the total of such important mines as Brakpan, Geduld, Van Ryn Deep, and Springs. Leaving out the New Modderfontein, whose reserve position, as stated, is practically as sound, the aggregate at Government Areas is as great as that of the next three largest mines of the Benoni district, namely Modder Deep, Modder B., and Brakpan Mines, combined.

A General Decrease at Central Western Mines

The decrease of 6,400,000 tons in respect of the same companies in each period is spread over about thirty-three companies. The drop has been general, inasmuch as the rise in costs has affected all companies without exception. The largest individual drop is in the case of the Randfontein Central, whose total is 4,254,000 tons, as against 5,185,000. Besides economic elimination, recurring strikes have prevented development being upon such a scale as might have been wished. Before the war the former control (the J. B. Robinson group) claimed a reserve of 8,665,000 tons. Fortunately, driving exposed a reef of consistent value, of good commercial grade even upon a cost figure which is 3s. 4d. per ton higher than that of four years ago.

The Crown Mines has decreased 700,000 tons, owing to shortage of development. The South reef, which was such a fine gold carrier in the Crown reef, is becoming patchy and losing its value at depth. Included in the 8,300,000 tons reserve are 3,275,000 tons on this reef, valued at only 5.6 dwt. over 64 in. With costs at the present level, the profit obtainable from ore of this value is either negligible or entirely absent. Almost as great a decrease in

tonnage is shown by the Nourse Mines; though expressed proportionately it is far greater, inasmuch as the reserve at the Crown Mines is four times as large. At the Robinson there is an apparent drop of 620,000 tons, of which, however, only 121,000 is in respect of the Main reef leader and South reef. A year ago a tentative figure of 500,000 tons main reef was included, but it is highly problematical if in these times and under existing conditions any considerable portion of this could be worked with profit.

Low-Grade Mines in Difficulty

As might have been expected, the low-grade mines of the Germiston district have had to reduce their ore reserve estimates, owing to economic elimination of tonnage. In the case of the Simmer & Jack—the first exponent on the Rand of the big-battery policy—the largest decrease was shown, namely 514,000 tons. In that of the Simmer Deep it was 418,000; in the Jupiter, 230,000. The former has been doing so badly of late that there is a probability of its having to close down. In this district, the Glencairn and Ginsberg have stopped milling, owing to the exhaustion of their mines, and the New Primrose's ore reserve has dwindled to 65,700 tons. Wit Deep's ore reserve has dropped from 1,383,000 to 953,500 tons. Only 111,000 tons was developed during the year, in contrast with 377,000 tons milled. Several blocks of ore have been excluded, owing to high working costs and to unsatisfactory disclosures made in them during the year.

Ore reserves at the East Rand Proprietary Mines, one of the great consolidations, have fallen by 465,000 tons, the total now being 2,250,000 tons "scattered over an enormous area; indeed, the whole of the mine workings," three and a half miles along the strike of the reef. It has been found impossible to proceed with the southern development scheme, and the policy of the company is to work out the existing reserves, which will enable milling to be continued during the greater part of next year. At Knights Deep, the decrease has been even greater, 574,000 tons.

Some Western Companies

In the West Rand, in addition to the Randfontein Central, already referred to, there are recorded decreases of over 300,000 tons in the fully developed ore reserve of that low-grade mine, the Roodepoort United. The Bantjes Consolidated has suspended crushing, and its reserves have been reduced to 95,000 tons, a drop of 375,000 tons. Adjacent, the Aurora West comes down from 400,000 to less than 250,000, in this case owing to the exclusion of several blocks of South reef ore. Another West Rand concern, the Luipaardsvlei Estate, decreased 150,000. In all these instances the declines are serious, as the companies, unlike those of the far East Rand, never possessed large ore reserves in the best of times.

Mines Nearing Exhaustion

A considerable number of mines opened in 1887 or thereabouts, at the time of the discovery of the Rand blanket deposits, are fast approaching exhaustion, and rapidly dwindling ore reserves are naturally to be expected. In this category we have the City &

Suburban and New Heriot. But for amalgamation, several of the earlier deep levels would be nearing the end. This represents the case of the Ferreira Deep, whose reserves dropped 375,000 tons last year. The company was formed in 1898, and will rather bear out the original idea of putting down plants with a twenty-year life, allowing for the hiatus of the Anglo-Boer War. The Van Ryn, another old company, shows a reduction of 385,000 tons, owing to higher working costs, to low values in one of the sections, and to the limited number of working faces available. Three other mines, the Wolhuter, Village Main Reef, and New Goch, have limited development faces, and show decreases of 215,000 tons in the case of the first named and of about 120,000 tons in the latter cases.

Some Other Far East Mines

Mines in the Far East tract, apart from the great advance shown by the Government Areas already referred to, show in the aggregate little change. Brakpan Mines figures are down by 550,000 tons, owing mainly to elimination of tonnage previously included, but which, as stoping progressed, proved to be below the commercial limit. It must not all be considered as definitely discarded. Springs Mines records a drop of 200,000 tons, in spite of an increase of 3 in. in stoping width.

An estimate made by Mr. Davis, who has succeeded Mr. Knecht as consulting engineer, confirmed the figures, but revealed the important fact that 1,117,000 tons was not available for stoping. Of this, 65,000 tons was in shaft pillars and 325,000 tons in haulage pillars. The remainder of 727,000 tons comprises blocks which will become available on the completion of subsidiary development or as stoping in contiguous areas progresses. It is the practice of the Central Mining-Rand Mines Group to state the block ore comprised in safety pillars, and some other companies mention ore partially developed, but it is usually an insignificant portion of the whole. The Geduld mine reveals an increase of over 300,000 tons in the ore reserve, Van Ryn Deep one of nearly 200,000 tons, and Modder Deep—the two latter among the most prosperous mines of the Rand—one of 130,000 tons.

The Village Deep forms a gratifying exception to the general run of decreases in bulk reserve. No less than 1,160,000 tons was developed during the year (practically double the quantity crushed). This is partly explained owing to the fact that the company secured rights from the government under Springfield Extension permitting ore partly developed to be transferred to the definite reserve. Unfortunately, it is accompanied by a decrease in value.

New Method of Determining Chromium

A new method of determining chromium is described by Terni and Malaguti in Gazz. Chim. Ital., 1919, 49, I., pp. 251-256, abstracted in Jour. Soc. Chem. Ind., Sept. 15, 1919. A solution of a chromic salt is boiled with 20 c.c. of nitric acid (sp. gr. 1.4)

and about 1 gm. of lead dioxide until reduced to a few c.c. of water, and treated with sufficient sodium hydroxide solution (25 to 30 per cent) to redissolve the precipitate of lead chromate. The solution is heated nearly to boiling and filtered, and the residue washed with boiling water rendered slightly alkaline with sodium hydroxide. The filtrate is diluted to 150—200 c.c., and treated with nitric acid (sp. gr. 1.2), free from nitrous acid, until the lead chromate has dissolved, when a further 25 c.c. of the same acid is added. The solution is treated with 5—10 c.c. of 10 per cent potassium iodide solution, and the liberated iodine is titrated with a solution of sodium thiosulphate (about 25 gm. per litre), which has been standardized against N/10 potassium bichromate solution in the presence of 25 c.c. of nitric acid (sp. gr. 1.2). The method is applicable in the presence of iron, manganese, and aluminum.

Head-Box Capacity in Hydro-Electric Mine Power Plant

In hydro-electric mine power plants, the importance of having a large surplus supply of water in the head-box supplying the penstock is sometimes overlooked. Under normal operating conditions this surplus water is used to overcome peak loads that overload the power plant from 10 to 25 per cent. If the overload covers only a short period, one-half a minute to two minutes, or even a longer time, this surplus capacity will prevent drawing down the head of water in the penstock, with consequent loss of considerable head and a sharp, continuing drop in power output. If an excess of water is flowing into the head-box, a peak load operates merely to reduce the excess flow. The following table indicates the quantity of water per minute for 100 brake hp. or 125 water hp.:

Head Water in Cu. Ft. per min.	QUANTITY OF WATER PER MINUTE PER 100 BRAKE HORSEPOWER (80 PER CENT EFFICIENCY)						
	30	40	50	60	75	100	200
	2,210	1,650	1,320	1,100	880	660	440
	330	240	192	165	132	99	66

Under low water conditions this surplus capacity of the head-box is especially important, for an overload may empty the head-box and penstock, necessitating a shutdown of the turbine. The best way of providing for the surplus capacity will be determined largely by the topographic conditions in the immediate vicinity of the head-box. The upper part of the head-box should provide for the surplus capacity. This is best obtained by making it as wide as possible, and, with this as one limiting dimension, to increase the length sufficient to provide an excess of water that will carry the maximum overload. The surplus capacity portion of the head-box should be as wide and as shallow as possible, so as to supply the excess volume of water with little loss of head.

Transvaal Gold Production in September, 1919, amounted to 698,558 fine oz., according to report by the Transvaal Chamber of Mines. This was a decrease of 8,111 oz., compared with August. Total for the first nine months of this year is 6,273,208 fine oz., compared with 6,440,949 fine oz. in the corresponding period last year.

Mine Accidents

English Speaking vs. Non-English Speaking Employees—Conditions that Retard Americanization of the Foreign-Born Worker—Importance of Adapting the Immigrant to His New Environment

BY ALBERT H. FAY,
Mining Engineer, U. S. Bureau of Mines.

THE employment of non-English speaking labor in American mines has been brought about by reason of the rapid expansion of the mining industry, beginning in the early 80's. The Americanization of this great body of labor, and its relation to accidents in the mining industry, are two problems of prime importance—the first as affecting citizenship and the growth of this Republic, and the second as an economic problem in mining costs. The former exerts an influence upon the latter, for the former implies education, social welfare, civic pride, and a general uplift to the ideals for which America stands. Ignorance, dirty and filthy living conditions, ill-health, disregard for law and order, discontent, and lack of civic interest lead to indifference and carelessness, perhaps the greatest of all accident causes. Eliminate carelessness and at least 50 per cent of the accidents will disappear from industries.

Immigration to American Mines

During the decade previous to the year 1880 (as well as in earlier years), the greater part of the employees in the coal and metal mines were Americans or representatives of the English, Scotch, Welsh, German, and Irish races.¹ The majority of the men of foreign birth had been in this country for some years previous to the great expansion of the mining industry which began about this time. English speaking miners continued to immigrate, and to find employment in the mines in large numbers, until about 1890. Since that year comparatively few immigrants from Germany and Great Britain have entered this industry, although Swedes and other Scandinavians have been constantly employed since the early 80's.

The employment, in the mining industry, of immigrants from southern and eastern Europe began about 1880. The Slovaks were the first arrivals, and immigrated in considerable numbers. They were followed within a year or two years by a few Magyars, and the number of immigrants of this race gradually increased each year. The Polish immigrants began to come about 1890, although individual members of the race had been coming for a period of nine or ten years. After the year 1890 Poles and Slovaks arrived in great numbers. A few Italians were employed before the year 1895, but the immigration of this race did not begin upon a large scale until about 1900. They were at first engaged in railroad construction and maintenance-of-way work, and gradually drifted into the mines.

¹Many of the statistics given herein are from "Immigrants in Industries," a report of the Immigration Commission, 1911, Senate Document No. 663, 61st Congress, 2d Session; Vols. 6, 7, and 16.

Croatians were employed in some districts before 1890, and Serbians began to arrive in small numbers in the early 90's. The great bulk of all the immigration from southern and eastern Europe, however, has occurred within the last eighteen years. Russians, Bulgarians, Rumanians, Ruthenians, Syrians, Armenians, Macedonians, Croatians, Serbians, as well as Poles, Magyars, Slovaks, and Italians, have been among the recent arrivals. The races of southern and eastern Europe continued, up to the time of the war, to find employment in the mines in increasing numbers in almost every important mining district in the Eastern states and the Lake district. Many of these recent immigrants have found their way to the Central and Western states. As a result of the rapid expansion of the mining industry, many mining communities have been founded, the population of which are largely made up of immigrants who have arrived during recent years.

The pioneer American, English, Irish, German, Scotch, and Welsh miners are thus outnumbered and their positions filled by the more recent immigrants. It is not difficult to account for this racial change, which is still going on. The former operatives and their descendants had opportunities to secure more congenial and safer work in other industries. Many of them advanced in the industrial scale, becoming foremen and attaining other responsible positions. A large number have abandoned the occupation of miner for positions as day or shift men. Many also migrated and established themselves in the Middle West and Western states.

A considerable number of the former miners who left the industry entirely because of change in mining methods or the employment of immigrants entered mercantile, clerical, mechanical, or more pleasant work of other kinds. Many of the business and professional men in the mining towns were formerly mine workers. Their places were filled without difficulty with recent immigrants, who were content with the wages and working conditions which prevailed in the mines. The wages paid in American mines seem very attractive to the recent arrivals of agricultural laborers from southern Europe.

Failure of Native Born to Enter the Industry

Another noteworthy tendency is seen in the fact that the racial displacement has occurred not only through the departure from the industry of the former employees, but also through the refusal of their children to enter the industry and the attitude of the parents themselves, who frequently discourage them. Of the total native born, of fathers who were miners, a large percentage enter occupations other than mining. The conclusion from the

limited data, therefore, seems to be that though the foreign-born males of more than sixteen years of age, whenever employed, work in the mines, the persons native born of native father, together with the second-generation immigrants, are entering the mines only to a limited extent. This inference bears out in a large measure the experience of the mine operators, who state that the native born and the second-generation immigrants are not entering the mines in the same numbers as formerly and that the industry is receiving a constantly decreasing number of employees of these classes.

There exists a prejudice against recent immigrants, which also operates to an important extent in the displacement of former employees. Many Americans, English, Germans, Scotch, Irish, and Welsh did not and do not desire to be associated in the mines with the recent immigrant, and the feeling has become prevalent that a sort of reproach attaches to an intimate working relation with the foreigner. The races of former immigration have, therefore, left the industry and have entered other work, which, they feel is more dignified and congenial.

The relatively small number of American miners who remain in the industry must work side by side with the recent immigrant. To a greater or less degree the standard of safety in the mine is set by the demands of the ignorant and inexperienced immigrant, not by the more intelligent American, and the standard of life is decided to a large extent by those conditions which will be accepted by the same recent immigrant. In short, to work in the coal-mining industry, the American must compete with the recent immigrant, who, as a rule, is not particular as to the living and working conditions. These conditions, however, are in most cases far better than in factory towns where congestion prevails.

Another effect of recent immigration from central and southern Europe has been the preventing of the English, Irish, Scotch, and German immigrant from entering the mining industry. As already noted, these western European races were coming to the industry in large numbers prior to the early 80's, but began to decline toward the end of the decade and practically stopped about 1893 or 1894. There can be no question that the immigration of the Slovaks, Poles, Magyars, and other races operated to prevent the further coming of these older immigrants to the industry, precisely as it operated to drive out of the industry those already employed, together with the native Americans. There is, therefore, no incentive for the English or German miner to migrate to the mining regions and compete with the Slovaks, Croatians, Italians, and other foreign laborers.

Citizenship

A point of general interest is the tendency on the part of the different races of foreign birth working in the mining industry to acquire citizenship, and their general interest in public and civic affairs. The recent immigrant manifests little real or intelligent civic interest. This may be ascribed to his igno-

rance of our political methods, his inability to read or speak English, the social and political aloofness of these races in the more or less remote mining villages, and a desire to avoid taxation. Those who reside in or near the cities seem to exhibit more interest than do those of the isolated communities. It seems that the Bohemians and Moravians, 94 per cent of whom can read some language, take a much more active part in civic affairs than any other race of recent immigration in the bituminous districts of Pennsylvania. Among the other Slavic races, the Slovaks (82 per cent read) and Poles (77 per cent read) lead in this regard, whereas the Croatians (67 per cent read) make the poorest showing. It is almost the universal statement that this latter race shows little civic interest and that few become naturalized.

The Italians (81 per cent read), both North and South, are more active than the Slavic races in their efforts to become citizens, and appear to take a more active part in civic affairs. In cases where there seems to be encouraging civic activity it is nearly always due, not to their own intelligent efforts to attain citizenship and exercise its privileges, but to the influence of interested politicians, who in many cases may be leaders of their own race; for example, an intelligent banker and steamship ticket agent. It seems true of all the later immigrating races that they take far less interest in civic affairs than did the German (97 per cent read) and English (98.5 per cent read) immigrants.

The foreigner should be taught that the laws of America were made to protect, and not harass, every good citizen, rich and poor alike, and it is the duty of well-informed Americans to make this understood. If well-meaning foreigners, the making of good citizens, are left entirely to their own devices, they fall an easy prey to the designing I. W. W. and the Bolsheviks. Somebody who understands their language fully, and in whom they have confidence, should explain to them that they are being deceived so long as they listen to anti-American propaganda.

Church and the Immigrant

The church association between the native Americans and the southern and eastern European immigrants is limited. The general attitude of the native churches toward the immigrants is one of indifference, and there is a strong inclination in many communities to shun association with the immigrant in church activities. In many cases where missionary efforts are made by native churches of any denomination, services for the immigrants are held in barns, stores, or other unattractive places, thereby lessening the interest in them. The races from the southern European countries, which compose a large portion of the mining population, have been reared where there is no social caste in religious organizations, and have worshipped in buildings which are unsurpassed in beauty and grandeur the world over. When these people are offered services held in stores, barns, and similar buildings, their interest in the services naturally is slight, and they become indifferent. Lack of interest in church

affairs tends to decrease activities in civic matters. The church and its allied organizations can be an important agent in teaching immigrants the rudiments of the English language and pointing out to them their duties as American citizens.

Lack of Mining Experience on the Part of Recent Immigrants

Men of the races of the old immigration (western Europe) have been employed in the mines of the United States for many years. As a result of their experience, both in this country and abroad, they are far better qualified as miners than are the southern and southeastern Europeans. The older immigrants speak English, either as their native tongue, or, as in the case of the Germans and Scandinavians, because of long residence in this country. They may be treated in almost every respect upon the same basis as the American miners.

The employees of recent immigration, on the other hand, have been in the United States for so short a period that, even though it be assumed that they have been employed in mining ever since their arrival, they must have had only a brief experience at most in the mines of this country. The data further show that few of their number had mining experience abroad. Over 80 per cent of the Scotch and English miners had mining experience in their native country before entering the American mines, whereas of the south Italians and Croatians, less than 5 per cent have had mining experience. Most of the latter were farm laborers in their native countries. Upon coming to the United States they decided to follow the occupation of mining because the work was better paid than any other obtainable, although many of them had been here only a few months and many more only a year or two years. Under these circumstances it is not surprising that they know little or nothing of rock formations, of fire damp, of the properties of coal dust, and of the handling of explosives,—matters about which every coal miner should be thoroughly informed. To determine whether a piece of slate or roof is or is not likely to fall, often requires a considerable degree of experience, and the majority of the Slavs, Magyars, and Italians have not this experience.

Immigration in Its Relation to Mining Accidents

The mines are presumably less safe than they would be with native American, English, Irish, Scotch, Welsh, or German labor, because recent immigrants often accept more dangerous working conditions than the first-named employees. Furthermore, the later immigrants are ignorant and untrained, and are a source of danger to themselves and to the other workmen. Among the older mine workers the feeling is strong that the employment of non-English speaking races has complicated the problem of safety in the mines. They assert that carelessness on the part of recent immigrants, and the ignorance of those who are suspected of having obtained their places without having had the required experience as miners, have tended to render the mines less safe, and thus to increase accidents.

A large proportion of the deaths and injuries reported for the coal mines of the United States occur among the non-English speaking miners. The employees consisting of the races of southern and eastern Europe, having had little experience in mining either in this country or abroad, are particularly liable to accidents, and as the responsibility for accidents rests in many cases with the men injured, to state that they are particularly liable to accidents is in effect to say that they are responsible for a considerable proportion of all the accidents occurring in the mines.

The mine accidents for which the workmen are themselves responsible fall naturally into two classes—those caused by carelessness and those due to ignorance. As regards the first of these, it is probable that the foreigner is no greater offender than the person of native birth. Many of the Americans and other English speaking miners are undoubtedly reckless, and a large proportion of all the accidents occurring among their number seems to be attributable to this cause. Grave risks are often incurred for the sake of avoiding a little extra labor. Props are left unplaced, open lamps are used instead of closed lamps, cars are driven in a careless manner, explosives are handled recklessly—all in defiance of the most elementary rules prepared by men of long experience in the industry.

Among the recent immigrants, on the other hand, many of the accidents are unquestionably due to ignorance, for by reason of their lack of experience, they do not see nor realize the dangers that confront them; nor do they readily comprehend the necessary precautions that must be taken to make their working places safe.

Lack of experience in the mines has a marked effect upon the high accident rate, as indicated by a study of accidents among the immigrants whose experience in mines, before coming to this country, was known. The fatal, serious, and non-fatal injury rates in the coal mines of Pennsylvania and West Virginia are approximately 14.5 per 1,000, for those of whom 10 per cent had mining experience prior to coming to the United States. The accident rate for those of whom 10 to 20 per cent had mining experience is about 12 per 1,000, showing a rapid decrease as mining experience increases. It would seem from this though their experience is limited, these immigrants soon gain sufficient knowledge to use a certain amount of caution, thus giving a decline in accident rate.

Carelessness of Experienced Miners

As contrasted with the decrease in accident rates among those of whom 5 to 30 per cent have had mining experience, the accident rate based on similar data for those of whom 50 to 60 per cent have had mining experience prior to coming to this country is 10.5, whereas the rate is 12 for those of whom 80 to 90 per cent have had experience in the mines—a marked increase with the extra experience. This is due largely to the tendency of those with considerable experience to become more or less careless or reckless and to think that they can slight certain

features of work without an accident. A new man entering the mine would not consider for a moment crimping a cap with his teeth, whereas many of the men who have been in the mines for eight to ten years would not hesitate and do not hesitate to crimp caps with their teeth. Other instances of carelessness might be cited. The available data, therefore, seem to indicate that inexperience is responsible for many accidents, and that a little experience begets much caution on the part of the recent or new employee. As indicated, there is thus a tendency toward a rapid reduction in accident rates to a point where between 30 to 40 per cent of the employees have had mining experience. Beyond this percentage, caution wanes and is replaced by carelessness, with a resultant increase in accidents. The green miner may be over-cautious, but he lacks experience. The seasoned miner has the experience, but too often caution is replaced by carelessness. Caution combined with experience will go far toward accident reduction.

Another element of danger is contributed by the fact that few of the recent immigrants speak or understand English, and almost none are able to read or write the English language, and placards of warning do not reach them. It is probable that the instructions of the mine bosses and inspectors are, because of this fact, frequently misunderstood. An inspector, for example, tells an immigrant miner, in English, of course, that his roof needs propping. The miner seems to understand, but does not, and a fall results.

In some mines printed signs are used to indicate the presence of gas or other peril. These signs are quite unintelligible to most of the foreigners. A common language is absolutely necessary in every safety-first campaign. Accident rates are much lower in England, France, Belgium, Germany, Austria, and Japan than in the United States. In these countries but few foreigners are employed, a common language being used in each country. The difference in fatality rates cannot be entirely attributed to the lack of mixed languages, but certainly a large percentage of the accident reduction may be attributed to the "common language" mines.

A comparison of accident rates with the ability of the miner to read some language or to speak the English language shows that the ability to read, although it may not be English, has a greater influence on accident reduction than the ability to speak English. This may be accounted for by the fact that ability to read develops a higher degree of intelligence and places the employee in a better position to realize dangers more readily than one who cannot read. Furthermore, if he is able to read, he is more likely to heed danger signs put up in certain places.

The recent immigrant, because of his lack of experience, his inability to speak English, and his keenness for earning money, is often willing to work in places where more experienced or more intelligent men would refuse to work. For the same reasons he

will frequently be satisfied with and accept mine equipment too defective for safety.

Comparative figures by occupations, based on the payroll of ten typical coal mining companies in Pennsylvania, show that about 33 per cent of the English speaking employees are employed as pick miners, as compared with about 52 per cent for the southeastern Europeans. As a matter of fact, from trackman to loader, the English speaking employees represent about 61 per cent of the total, as compared with 82 per cent for the southeastern Europeans. These figures, therefore, indicate that the non-English speaking foreigner is employed in the most hazardous of the mine occupations; hence one reason for the higher accident rate.

Accidents by Nationality, in Pennsylvania and West Virginia

In the Pennsylvania anthracite mines 43 per cent of the employees are English speaking, and this number is charged with only 28.8 per cent of the fatalities, whereas the other 56 per cent (representatives of Continental Europe) sustained 71 per cent of the fatalities. Likewise in the Pennsylvania bituminous mines the English speaking employees represent 35 per cent of the total and are charged with 27 per cent of the fatalities, whereas the other 65 per cent (representatives of Continental Europe) are charged with 73 per cent of the fatalities. As regards the figures for West Virginia, the English speaking employees represent 67 per cent, and, notwithstanding the fact that this includes 17 per cent of colored employees, only 53 per cent of the fatalities are charged to the English speaking employees, whereas the other 33 per cent sustained 47 per cent of the fatalities. Almost the same ratio holds for non-fatal injuries in the three groups of mines cited.

Had the fatality and injury rate for the English speaking American been maintained throughout the three groups of mines, there would have been a saving of 716 fatalities and 900 serious injuries, a strong argument for Americanization and education of the miner.

The Permeability of Zinc Retorts

Experiments on the permeability of zinc retorts, reported in an article in *Metal and Erz*, Vol. 16, pp. 323-326, and abstracted in the "Journal of the Society of Chemical Industry," showed that with increasing pressure in the retort less gas flows out of the condenser, and not only the amount but the nitrogen content of the retort gases decreases. Using a new retort and diminishing the pressure in the furnace, the permeability decreases toward a minimum value, with increasing density of the walls of the retort, due to shrinkage and to formation of a skin of silicate. Penetration of certain components of the gases of combustion leads to the formation of larger quantities of zinc dust, which tends to stop up the muffle and condenser, and the increase in pressure in the distillation apparatus inducing diffusion of the gases of reduction into the combustion chamber causes greater metal loss.

The Use of Naphthylamin and Xylidin in Flotation

Improved Recoveries and a More Easily Dewatered Concentrate Result From Substitution of These Chemicals for Oil in Several Western Mills No Special Apparatus¹
Required—Crude Compound Is Known as X-Cake

BY EDWARD H. ROBBIE

THE study of the agents used to secure a mineral-bearing froth forms one of the most interesting branches of the technology of the flotation process. In the vast amount of experimental work that has been done in flotation, more attention has been given to this subject than to any other, for every investigator has been anxious to find the one oil, or whatever it may be, that will give the best results. Two general classes of substances have been demonstrated to possess the widest field of usefulness in practice. One of these, the coal and petroleum distillates, has been found to be suitable as "collecting oil" to coat the sulphide particles. The other class consists of the volatile constituents obtained in wood distillation. These substances, agitated with ore pulp, form a foam or froth in which the "oiled" mineral particles are carried upward.

Some years ago Colonel William Boyce Thompson and associates established a fellowship at the Mellon Institute of Industrial Research at Pittsburgh, for the investigation of the flotation process and of the reagents which might be used in this connection. A large number of experiments were carried out, and, among the numerous compounds tested, certain coal-tar derivatives were found to give particularly good results when used in laboratory flotation machines. The most promising from all standpoints was crude alpha-naphthylamin, which could be used alone as a flotation agent, apparently functioning as both a collector and a frother. After the laboratory tests had been completed, this compound was given a trial on a commercial scale at the experimental plant of the Magma Copper Co.

Alpha-naphthylamin being a somewhat unwieldy name, the term "x-cake" has been adopted for the crude product, and it will be so called hereafter in this article. The raw material for its manufacture is naphthalene. This is first treated with a mixture of sulphuric and nitric acids to form nitro-naphthalene, from which x-cake is produced by reduction, usually by the use of iron turnings and hydrochloric acid. X-cake is a non-oleaginous solid, melting, when pure, at 122 degrees F. and boiling at 572 degrees F.

Discovery of Xylidin as a Flotation Agent

The problem of solution made the use of x-cake somewhat difficult in the ordinary flotation mill, as large tanks had to be provided and steam furnished for heating. No particular difficulty was encountered once the apparatus was set up, but the ordinary millman does not care to go to much expense in trying out a new flotation agent. In view of these conditions, the problem was attacked of finding something similar to x-cake in metallurgical results,

but more convenient to use, requiring a minimum of change in the standard methods employed by mills using oils as flotation agents. Several substances appeared promising in further trials at the Mellon Institute. The conclusion was reached that crude xylidin met the requirements better than any other substance of the kind. In itself it is not as good a flotation agent as x-cake, but when mixed with the latter excellent results are obtained. The x-cake is easily soluble in xylidin and the solution is a liquid of such consistency that it can be handled easily in any of the usual oil feeders with which all flotation mills using oils are equipped. No changes in the flow sheet are necessary, the x-cake-xylidin mixture being simply poured in after the oil tanks are emptied.

Crude xylidin is a liquid made up of different xylidins which have the same ultimate chemical composition but differ from one another in the arrangement of the atoms in their molecular structure. It is manufactured from xylol in much the same manner as is x-cake from naphthalene.

The favorite proportions for the mixture are 60 per cent x-cake and 40 per cent xylidin, but these can be varied considerably. If the pulp feed to the cells is reasonably warm, and the flotation agent is introduced at such a point that it may become thoroughly mixed with the pulp before entering the cells, less xylidin may be used. The addition of the mixture to the ball-mill feed is not necessary in any case; commonly it is added in the launder preceding the first flotation cell. The mixture is non-volatile, non-inflammable, and chemically inactive. X-cake has a very offensive odor, which, strange to say, is most disagreeable when very slight. In mills where it is employed, the odor is neither objected to nor noticed, but the odor from the small amount which will be picked up by a shoe sole in walking through a mill where x-cake is used will be noted in a large room. The mixture of x-cake and xylidin may be made by putting the proper proportions of the two substances together in a suitable container and heating and stirring for a few minutes. Heating is unnecessary if the lumps of x-cake are broken up and the mixture allowed to stand for a day or two with occasional stirring.

Neutral or Alkaline Pulp Is Preferred

Experience with these agents has shown that a neutral or slightly alkaline pulp is necessary for the best results. This has usually been accomplished by adding a small amount of lime to the ball-mill feed at intervals of five minutes or so. This, however, has been found to have certain disadvantages, as it tends to form crusts on the tables, if the latter

are used before flotation, and also the canvas cell blankets require more frequent cleaning than when lime is not used, acidulated water being used for scrubbing. The addition of the lime to the settling pond which furnishes the return water has been found more advantageous. Any precipitation caused by the lime will then be made in the pond, and still the mill water will have the neutrality or slight alkalinity desired.

When operating with x-cake-xylidin, economy requires the use of the largest possible amount of return water. Flotation operators have found that when oils are used in a closed circuit only a little less oil is required than when the mill-feed is made up entirely of new water. The insoluble parts of the oil are probably lost entirely, and only a part of the soluble constituents is returned to the cells with frothing properties unimpaired. With x-cake, this has not been found to be the case. Whatever amount is returned in the water from concentrate or tailing seems just as efficient as ever. Apparently little or no deterioration occurs in settling ponds, although the water gradually turns a dark brown. Considerably less of the agents under discussion are therefore required if the make-up water is kept at a low proportion of the total.

X-Cake First Used by Magma Copper Co.

The first test of x-cake on a commercial scale was made at the mill of the Magma Copper Co., Superior, Ariz. Results have been so satisfactory on the bornite-chalcopyrite ore that it is still being used there, a solution apparatus having been erected so that xylidin is not required. During the year 1918 the results obtained by the use of x-cake in the Magma mill were as follows: Feed, 4.50 per cent cu.; tailing, 0.35 per cent; concentrate, 10.78 per cent; recovery, 95.33 per cent. Besides the high recovery shown by these figures, some operating advantages have resulted from the substitution of x-cake for oil. In handling the concentrates with vacuum filters the time of filtering was reduced to one-sixth, or less, of the time necessary for filtering oil concentrates, and a drier filter cake is also obtained.

Last year, tests were carried on at Superior with a mixture of x-cake and xylidin. The mixture gave a slightly more voluminous froth than had been obtained with x-cake alone, but this was the only noticeable difference. The metallurgical results were practically identical, and so, on account of the slight additional cost of the mixture, the use of straight x-cake was continued.

X-Cake and Xylidin Displaced Oil at the Consolidated Coppermines Mill

The mixture of x-cake and xylidin has been commercially applied at the mill of the Consolidated Coppermines Co., Kimberly, Nev., and at the mill of the Arizona Copper Co. at Clifton. At the former plant, the flotation department operated until Sept. 1, 1918, with a mixture of coal tar, coal tar creosote, and pine oil. After Sept. 1, x-cake-xylidin in alkaline circuit was used to the extent of a little less than $\frac{1}{2}$ lb. per ton of ore. The copper occurs as chalcocite, with some chalcopyrite and oxidized mineral.

The following table shows a comparison of the results obtained with oil as against the x-cake-xylidin mixture:

CONSOLIDATED COPPERMINES MILL DATA			
		Using Oil	Using X-cake-Xylidin
Mill Feed			
Per cent Cu		1.19	1.34
Ounces Au		.02	.02
Ounces Ag		.06	.07
Per cent SiO ₂		87.1	85.9
Per cent Al ₂ O ₃		1.5	2.5
Per cent Fe		3.5	3.7
Per cent CaO		2.1	2.5
Per cent S		2.1	2.5
Mill Tailing			
Per cent Cu		0.28	0.21
Ounces Au		.01	.01
Ounces Ag		.04	.04
Per cent SiO ₂		91.5	90.1
Mill Concentrate			
Per cent Cu		13.52	18.33
Ounces Au		.44	.21
Ounces Ag		.33	.44
Per cent SiO ₂		27.3	13.5
Per cent Al ₂ O ₃		7.2	4.5
Per cent Fe		20.9	27.6
Per cent CaO		1.3	0.3
Per cent S		22.9	32.1
Recovery			
Cu		78.22	82.81
Au		52.95	69.30
Ag		38.11	40.34
Ratio of concentration		14.68	17.00
Per cent H ₂ O in conc.		17.15	9.39
Cost of flotation agents per ton milled		7.46c.	15.6c.

1. A smaller tonnage of concentrate was dewatered and handled in the mill.

2. A smaller tonnage of concentrate was treated by the smelter, cutting freight and treatment charges per ton almost in two.

3. The higher-grade concentrate was made largely by the elimination of colloidal matter, giving a more granular product. This, combined with the smaller tonnage to be handled, made it possible to filter the concentrate in one shift with one or two filters, whereas with the old concentrate, produced with coal-tar reagents, three shifts with three filters were required to handle the concentrate produced.

4. Owing to the more granular nature of the concentrate, a thicker, dryer cake was produced by the filters, thus saving freight on moisture.

The Arizona Copper Co., which has a 4,000-ton concentrating plant at Clifton, Ariz., is now using x-cake and xylidin in the entire mill. The use of these compounds was decided upon after a careful test, the results of which showed sufficient improvement over those obtained by the use of oil, to justify the additional cost of the new agents.

In general, x-cake froths are much more easily broken down than oil froths and the thickened concentrate is more readily filtered. Improved recovery is obtained on many ores, particularly those containing considerable colloidal matter. The cost of the x-cake-xylidin mixture per ton of ore treated is in general greater than that for the oil mixtures commonly employed.

X-cake and xylidin are manufactured by several companies, among whom are the Barrett Co., the Newport Chemical Works, the Butterworth-Judson Corporation, the Calco-Chemical Co., and the National Aniline and Chemical Co., all of whom have offices in New York City. The price of 60 per cent x-cake-40 per cent xylidin mixture, in tank-car lots, is 35c. per lb., f.o.b. New York. A royalty of $2\frac{1}{2}$ c. per ton of ore treated by the agents named is also payable.

In view of the results which have been obtained with x-cake-xylidin in pneumatic flotation cells, they will no doubt find considerably wider commercial application. X-cake-xylidin can easily be tested in a commercial mill or in a laboratory flotation machine, but it must be remembered that when the agent is not present in the return water, a greater quantity will be required. Oils giving excellent results on one kind of ore are not necessarily adapted to another, and the probability is that x-cake will also find its commercial application limited to those classes of ore in which recoveries or concentrate handling charges can be materially improved by its use.

Difficulties of Unloading Merchandise in South American Ports

The following illustrations contain suggestions of value to mining men in regard to the shipment of material to South American or other ports where facilities for the discharge of cargoes are limited.

DISSEMBARKING AT MOLLENDO, PERU

One illustration shows the method of disembarking passengers and merchandise at Mollendo, Peru, which at present is the only available means. It clearly portrays the difficulties involved, and perhaps will suggest precautions which could be taken in the method of boxing to prevent damage to machinery or perishable merchandise. Frequently, because of the contour of the shore line, the sea is rough and the goods are exposed to the danger of becoming water soaked. Furthermore, increased bulk and

weight render the operation more difficult. The other illustration shows passengers going aboard at Salaverry. The illustrations are reproduced through the courtesy of H. Secchi, of W. R. Grace & Co., New York.

METHOD OF PUTTING PASSENGERS ABOARD AT SALAVERRY

An American Miner

I feel sure that there are quite a number of mining men, like myself, willing and in a position to lend their services to help the country through this crisis by service with the coal mines. Personally, I am a good miner. Have worked in that capacity throughout the continent in a considerable variety of metal mines, but never in a coal mine. At present I am ready to serve as miner in the coal mines, but am ignorant as to where my services would be most acceptable. A little direction by you in this line might induce a number of good miners and patriotic men to volunteer their services at this time when they are most needed. A notice in your issue to this effect might be of value, and for my own part any direction which you can give me as to where I might apply to advantage for employment as a coal miner would be appreciated by me, and I trust would be a service to the country.

Allow me to congratulate your publication for the splendid stand it is taking against the Nihilist movement which is now shaking the civilized world.

Arthur O. Christensen.

Beaufort, S. C., Nov. 7, 1919.

New Angles to the Apex Law*

Exceptions of Known Veins From Land Patented as Placer Renders Titles Uncertain—Community Injured by Such Instability—Exchange of Placer Patent for Lode Patent Must be Safeguarded To Prevent Loss of Rights

BY JOHN A. SHELTON
Attorney and Counsellor at Law, Butte, Montana

ONE of the heaviest burdens uselessly cast by our mineral laws upon the holder of the title by a patent from the United States is due to the provision excepting known veins from land patented as placer. In many instances the expense of defending such titles from the assaults of the owners of lode locations, made upon the theory that the veins so located were known to exist at the date of the placer application for patent, has exceeded many times the value of the land in question. Neither the lapse of time, however long after the issuance of the patent, nor repeated adjudications by the courts serve to quiet such titles or to prevent them from being questioned.

In the passage of laws providing for the acquisition of the title to the mineral lands of the United States, Congress provided that the title to known veins should not pass from the United States by a patent based upon a placer location. As constructed by the courts, the law (Sec. 2,333 R. S. U. S.) provides that the applicant for a patent upon a placer claim may, if any vein of sufficient value to justify the expenditure of money in its development is known by him to exist within the boundaries thereof, include in his patent application an application for patent upon this vein as a lode claim; and failure to do so is to be deemed a conclusive declaration that the applicant makes no claim to the vein nor to an area of surface ground extending for 25 ft. (7.6 m.) on each side of its middle or center. As to such vein and such area of inclosing surface ground under the circumstances stated, the title remains in the United States, notwithstanding the issuance of a patent that purports to convey the entire surface of a described area and everything beneath it, excepting only the segments of veins the apices of which lie outside of such area. Such known veins, with such area inclosing surface ground, are, of course, at any time, so long as they remain unlocated, subject to location and appropriation in the same manner as other veins upon the public domain.

Bad Effect of the Law Demonstrated in Butte

The history of the operation of this law in one district will serve to illustrate its effect generally throughout the mining regions of the United States. In the Butte district, the mineral that first attracted the attention of the miner was placer gold and not until some years later were attempts made at quartz mining. A few years after the discovery of mineral, practically the whole district, embracing several square miles of territory, was covered with mineral locations, upon which patents were afterward issued. Roughly speaking, the low-lying land along Silver Bow Creek and its branches extending part way up the slope in the direction of the Butte hill

comprised the portion of the district within which the placer-mining operations were carried on. There the surface and subsurface for several feet generally consisted of loose earth and gravel or boulders in which was found the deposit of placer gold and beneath which was the solid formation or bedrock. As to that land covering about one-half of the district, the patents issued were placer patents or patents based upon placer locations. Though the apices of the veins showed in the surface of bedrock generally throughout the whole district, their existence in ground covered by placer wash could not have been known until bedrock was exposed by the removal of the placer wash in the placer-mining operation or otherwise. When discovered in the early days, they were not generally considered worth development. Frequently they did not contain mineral, on or near the surface, that could be profitably mined. Later development showed that many veins carrying little mineral at the surface were rich in copper at depth, after which it became a practice in the district to sink on veins that had no showing of surface mineral, with the hope of discovering paying ore at depth. As time went on, copper smelteries were built and underground explorations were extended, and it was proved that some of the veins in ground held under placer patents were of considerable value because of the facilities then existing for the treatment of ore of such character. This circumstance, coupled with the fact that the surface had in many instances been built upon and improved, and had greatly increased in value, furnished the inducement to lode claimants to appropriate and obtain title to veins held under placer patents.

The litigation resulting has been carried on more or less continuously ever since, and, after a lapse of forty years from the issuance of the placer patents, still continues. As the title to all veins known to exist at the date of the placer application for patent remained in the United States, no statute of limitations would bar such suits; and as a judgment in one suit will bind only those who are parties to it, or their privies, a judgment in favor of the placer owner in one suit does not prevent a new lode location by another party, and a new suit concerning it. The judgment in such cases in every instance rests chiefly, if not solely, upon the determination of a question of fact; namely, whether or not the vein in question was a vein known to exist; that is, whether or not it was known to exist by the applicant for placer patent at the date of his application and was, under the then prevalent conditions, of sufficient value to justify exploitation and development. In every case it is necessary to call those as witnesses

*Presented at the Chicago meeting of the A. I. M. E., Sept. 22-26.

who at the date of placer application possessed such knowledge of the ground in question as qualified them to testify whether or not the vein was known to exist. Upon this point the testimony generally consisted of either affirmative or negative statements as to whether or not the vein outcropped on the natural surface of the ground or was exposed by the removal of the placer wash, so that its existence was known prior to the date of the placer application and visible to the placer applicant, and whether, if it was known, it was of such character that it would have justified exploitation and development under the conditions then existing.

Outcome of Such Litigation Uncertain

As might naturally be expected, those who were called as witnesses in any particular case were in direct conflict in their statements upon such questions. It is scarcely necessary to remark that in many instances the witnesses testifying were mistaken as to the matters concerning which they testified, and, such is the weakness of human nature, in other cases their testimony appeared to be knowingly false. As the litigation concerning such question was carried on, those who were called as witnesses became divided into hostile camps. Partisanship was not confined to those testifying as witnesses. The sentiment in the community concerning the merits of such controversies was divided. Under such circumstances it is not surprising that the outcome of such litigation was, in most cases, uncertain. Occasionally different courts gave directly opposite decisions. To illustrate, a portion of one vein was involved in litigation in a case in the Federal court and an adjacent portion of the same vein was involved in litigation in a state court. The two portions were covered by different lode locations, both included within the same placer patent. The testimony relied on in each case was substantially the same, but the decision in one case was in favor of the known existence of the vein at the date of the application for the placer patent, and in the other case it was against such known existence.

The importance of the stability of titles is recognized by everyone. It is needless to point out that if the title is uncertain, development of the property is in consequence discouraged. As a large proportion of the titles acquired under the mineral laws of the United States are held under placer patents (so called), the effect of such uncertainty of title in the sections of the country where such titles are held is very considerable and must necessarily retard the development of those sections.

Uncertainty as to Titles Injures Community

Although what has been said about the importance of the stability of titles acquired and held under patents of the United States is everywhere recognized, it is also true, probably, that a large proportion of the people are not conscious of the extent to which the prosperity of the community may be unfavorably affected by such uncertainty of titles. It is possible to gain a better conception of such effect by considering a similar, though extreme, case. Much

of the land of Mexico is more fertile than any land of the United States. The country is richer in its deposits of oil and minerals, and it has, besides, a great capacity for the production of rubber, for which there is a great and constantly increasing demand. In a word, Mexico is potentially a richer country than ours. But, with all of such natural wealth, a large proportion of the Mexican people are in a pitiable state of abject poverty. There is no reason why they should be, except for their government or lack of government, and uncertainty of title is one of the principal consequences of their unstable government.

It is certainly true, though the confession is decidedly humiliating, that by reason of the provision which excepts veins known to exist from land patented as placer, and because of the lack of a provision by means of which any such defect may be cured or an attack upon the placer title barred by the lapse of time, a portion of the territory of the United States has been, to a limited extent, Mexicanized. Congress has been asked to pass a law that would prevent an attempted lode location upon ground patented as placer after the expiration of some fixed limit of time from the issuance of the placer patent; but for some reason no relief has been given.

The title held under a placer patent covering land within which there is a vein sufficient to support a lode location is uncertain, and cannot be rendered otherwise.

Exchanging Placer Patent for Lode Patent

In procuring a lode patent to be issued covering land as to which a placer patent has already been issued two different courses have been followed. While the placer patent is outstanding, whatever land was conveyed by it has passed from the public domain and is not subject to disposal by the Government, and an application for a second patent upon the same land will not be entertained by the Land Department of the Government. There is nothing, however, to prevent the officers of the Land Department from accepting, on behalf of the United States, a deed from the owner of the placer title conveying back to the Government whatever was conveyed by the placer patent, and the land, having been in that manner restored to the public domain, is again subject to disposal by the Government, and the necessary preliminary steps having been taken, a lode patent covering the same ground may be issued.

In practice, the placer owner, in following such course, may first make a lode location or locations covering the ground, perhaps embracing in a single location the same extent of surface area as in the case of a lode location made upon unpatented land. Then, having in other respects complied with the law entitling him to a patent upon his lode claim or claims, application for such patent is filed and with it a deed is tendered conveying to the United States the title conveyed by the placer patent or such part of it as is covered by his lode location or locations. In the absence of any adverse claim, the Land Department will treat such location as though made

upon unpatented land, and, the deed being accepted, there is no longer an outstanding patent and no obstacle to the issuance of a second patent.

Of course all precautionary measures necessary to prevent a loss of rights are taken. The deed tendered becomes effective only when accepted by the Government. Immediately upon its acceptance, the placer owner makes a lode location covering the ground for the purpose of preventing an adverse location by some other person, upon the theory that until the acceptance of the deed the land was not subject to location.

If within the land covered by the placer patent there is a vein that was, in fact, known to exist at the date of the placer application, the titles to such vein and to an inclosing strip of surface ground fifty feet in width in the United States, and the placer owner, equally with any one else, may locate it as a lode claim and, by performance of the acts required by law to enable him to procure patent, may procure the issuance of a lode patent on such location in the same manner that patent is procured upon a lode claim made outside of the limits of ground patented as placer, except that in connection with the application for patent, satisfactory proof must be furnished the Land Department, by affidavit or otherwise, of the known existence of the vein, and except, of course, that the extent of area that may be embraced in such location is limited to twenty-five feet on each side of the middle or center of the vein. If the question of the known existence of the vein is involved in doubt, the placer owner may proceed upon the theory that it was known, provided that satisfactory evidence is procurable to the effect that it was known.

When such a lode location is made by a person other than the placer owner, and judgment is recovered in his favor against the owner of the placer title that such vein was known to exist, and such lode locator then institutes proceedings to procure patent, such judgment is entitled to be given a conclusive effect in the Land Department, as elsewhere, upon the question of the known existence of the vein, and may be relied upon as proof of such fact, dispensing with the necessity of affidavits.

If such judgment is rendered as the result of a compromise of a lawsuit, or is rendered in a suit in which the placer owner does not resist the demands of the lode claimant, such facts in no way affect the question of the effect to be given such judgment. If the placer owner has a good title, but allows it to be taken, the United States or any private individual is not thereby the loser, and if his placer patent did not convey title to him, and the title remained in the United States, the vein was subject to location, and its locator upon compliance with the law is entitled to a patent to it.

Of course, the owner of the lode patent has extralateral rights, though the owner of the placer patent has not, and assuming that the vein was in fact not known to exist, the lode locator who procures a lode patent on it on the theory that it was a known vein thereby may procure a greater right in the vein

than was held by the placer owner. The segments of any veins lying outside the placer boundaries, the apices of which are within the placer boundaries, which veins were not known to exist at the date of the placer application for patent, of course do not belong to the placer owner, but the title thereto is in the United States, and they are something, therefore, which the placer owner does not lose by allowing such judgment to be taken against him, and the lode locator does acquire them by his lode location and patent. The fact remains, however, that the recovery of the judgment affects the rights of no one except the lode locator and the placer owner, for such segments of veins are not, as something separate and distinct from the veins of which they are a part, subject to appropriation by private individuals or to disposal by the United States under existing laws.

October Mining Dividends

Dividends disbursed in October, 1919, by 16 United States mining and metallurgical companies making public reports, amounted to \$4,792,394, as compared with \$5,628,584 paid by 29 companies in October, 1918. Canadian, Mexican, and Central American companies paid \$1,450,918, as compared with \$1,131,950 in October, 1918. The only holding company to pay this month was the California Exploration Co., which disbursed 1s. per share (about \$28.140).

Homestake Mining Co. found it necessary to omit its dividend in October after a long record of continuous payments. The rate on the common stock of United States Smelting, Refining, and Mining Co. was increased to \$1.50 per share. Tonopah Belmont reduced from 10c. to 5c. per share, on account of the strike.

MINING DIVIDENDS

United States Mining and Metallurgical Companies		Situation	Per share	Total
Am. Smelters, pfd. A.	U. S.-Mex.		\$1.50	\$146,071

British Petroleum Policy

Control Sought by Great Britain of Oil-Producing Areas of Canada, Trinidad, Persia, North Borneo and of All Prospective Petroleum Territory of the Empire

BY A LONDON CONTRIBUTOR

FOR a number of years Great Britain has been slowly maturing plans having for their object the domination of the world's oil supplies. Great Britain needs oil for her navy, for her mercantile marine, and for her industries, and the demand is that the sources of supply should be under British control. In this the British Admiralty has led the way.

For example, in the early exploration of Trinidad it was possible for American companies, either directly or through British subsidiaries all of whose stock was frankly owned by Americans, to obtain oil rights on Crown lands in Trinidad. The General Asphalt Co., of Philadelphia, which through a British subsidiary operating the Pitch Lake, was already established in the island, secured rights to 2,500 acres about 1909. The company has been refused further areas, and no American company can now secure oil rights in Trinidad, either directly or indirectly.

In 1912, the British government put into force in Trinidad a form of lease containing clauses referred to in the government departments as the "Admiralty Clauses," which require that any company holding a lease must be a British company, with the chairman, the majority of the board, and the managing director, British, and that "neither the lessee nor the premises, liberties, powers, and privileges granted, or any land occupied for any purpose under the lease, should, at any time, be or become directly or indirectly controlled or managed by foreigners or a foreigner or any foreign corporation or corporations."

Under this form of lease exclusive exploration rights for oil over about 200,000 acres were granted to the United British West Indies Petroleum Syndicate, Ltd., composed of representatives of the Burma Oil Co., Royal Dutch Shell, and a British investment house. Subsequently, a similar area was granted to a company organized by S. Pearson & Son, Ltd.

During the first year of the war, the policy crystallized to cover all British possessions so far as the home government had any power, and was so extended as to secure oil lands in other countries. The policy was adopted not only with respect to the war, but for the period after the war, that no rights would be granted in any British possession except to a British company whose antecedents, and par-

ticularly whose thoroughly British character or control, were entirely satisfactory to the specially created department called the Petroleum Executive, which was responsible to the War Cabinet and which was placed in charge of Professor John Cadman, since made Sir John Cadman. This special Petroleum Department has, among its objects, to control the granting of oil rights in the British Empire, and to assist British companies in securing concessions in other countries. The department has been energetically and systematically canvassing the potential oil possibilities of the world and suggesting to its pioneering companies projects, in particular in South America and Asia.

In Trinidad, where there was a slight loophole for the entrance of foreign capital, owing to the fact that in all lands alienated prior to Feb. 17, 1902, the surface owner was also the owner of the oil, it was provided that any grant of oil rights by a landlord was void except with the special approval of the government, which approval would be granted only in the case of British companies undertaking all the obligations of nationality required by the government lease. As a general measure, the sale by British subjects to a foreigner of any oil shares was prohibited. Under this Order in Council, the British Admiralty prohibited the sale of the Mexican Eagle to American capitalists.

The British Admiralty has already secured a controlling interest in the Anglo-Persian Oil Co., which held a concession covering the southern half of Persia. The D'Arcy Exploration Co., a subsidiary of the Anglo-Persian, now has a concession covering 10,000 square miles in Canada and one of 30,000 square miles in British North Borneo.

Of even greater significance is the relation between the British government and the Royal Dutch Shell, which is today easily the most powerful oil company in the world. Theoretically this is under Dutch control, and there have been many allegations and denials in respect to the relation between the British government and this group. In considering the denials one must bear in mind the little-known fact that the management of this company is vested not in the shareholders but in a dozen management shares. Whoever owns a majority of these management shares controls the company, whatever the ownership of the share capital.

Knowing how thoroughly the British government, the British Admiralty, and the special division of the Petroleum Executive, under Sir John Cadman, is committed to the policy of British control of the oil resources of the world, the following facts are explicable only on the basis that the majority of the

management shares of the Royal Dutch are owned either directly or indirectly by the British government:

1. The British government, with the entire concurrence of the Admiralty and Sir John Cadman, granted permission for the sale of the Mexican Eagle to the Royal Dutch.

2. The British government has made recommendations to the Canadian government for the granting of a large concession to the Royal Dutch in the Peace River district, Canada.

3. It is announced that the important oil area of Mesopotamia "will be shared between the Royal Dutch Shell, Burma, and Anglo-Persian groups."

It is of interest to America to define clearly, and maintain what, in the opinion of its government, constitutes a "mandate." It would seem that the British and European conception of a mandate is nothing short of annexation, for with regard to Mesopotamia the British papers speak of this as theirs "by right of conquest."

It is the adopted policy of the British government that no foreigners, or any but thoroughly accepted British companies or companies under the control of the British government, should obtain any rights in any part of the British Empire. It is also the policy of the British government to further, by every means within its power, the bringing of prospective oil territory in other countries under British control.

In order that Americans may combat this British program, it is essential that the American Government recognize, as the British government has done:

1. That foreign petroleum development rests on a very different basis from the foreign marketing of petroleum or any other commodity.

2. That for the good of all concerned, including the country in which the development takes place, large areas are necessary.

3. That in such development honest enterprises require the protection and continued support of their own State Department.

Explorations for Oil in Sumner County, Tenn.

Government Geologist's Advice to Drillers—Better Locations for Wells Suggested—Limits of Depth for Prospecting—Drilling Done at Unpromising Places.

THE success of oil operators in Allen County, Ky. has naturally led to considerable exploration for oil in the adjoining counties of Tennessee. At least thirty wells have been drilled in the northeast quarter of Sumner County, but no producing well has yet been completed.

The part of Sumner County that lies north of the Highland Rim, or "The Ridge," as it is locally called, is recognized as prospective oil territory, for it is underlain by the geologic formations from which oil in Allen County is obtained. To ascertain why no oil has been found in this part of Sumner County the State Geological Survey co-operated with the U. S. Geological Survey in sending a geologist to investigate the area, Kirtley F. Mather, of the last-named

Survey, who has just completed several weeks' field work in the northern part of Sumner County.

Mr. Mather reports that the geologic conditions in the Highland Rim section are practically the same as those in the oil-producing territory immediately across the state line, in Kentucky. In this area there are at least four anticlinal folds that are well suited for the concentration and storage of oil. Well records and cuttings from wells now being drilled indicate that in at least a part of this area the formations beneath the "black shale" are well adapted to serve as oil reservoirs. Five drilling machines are now at work in this area, and further explorations will soon be made.

Of the four anticlinal folds that Mr. Mather has mapped, only one has been tested by the drill—one that may be called the Westmoreland dome, as it extends from the western outskirts of the town of Westmoreland in a general northwesterly direction for about a mile. Two dry holes were drilled a few years ago on the property of the New Hope Church near the crest of this anticline. A dry hole that was drilled on the Escue farm, two miles northwest of Westmoreland, is on the northwestern flank of the Westmoreland dome. None of the other dry holes in Sumner County north of the Highland Rim escarpment and east of the main line of the Louisville & Nashville R. R. were drilled at places where the structure is in the slightest degree favorable to the accumulation of oil, nor are any of the machines now drilling in places where the structure is favorable. The failure of these wells to find oil in paying quantities should therefore not be a sufficient reason for regarding Sumner County as unfavorable oil territory.

It is suggested that future exploration should be made on or near the crests of three untested anticlinal folds that Mr. Mather has mapped, which may be called the Dutch Creek anticline, the Big Trammel Creek dome, and the Garretts Creek anticline.

The Dutch Creek anticline trends in general from northeast to southwest and is crossed by Dutch Creek, $1\frac{1}{4}$ miles downstream from the Westmoreland-Portland pike. This fold has a large feeding ground, and the results obtained by drilling in that general vicinity indicate that the rocks beneath the "black shale" are probably suitable to serve as an oil reservoir. This fold should be tested by at least two holes. A good location for one of these is a point $1\frac{1}{4}$ miles south and $1\frac{1}{4}$ miles west from Turner's station. A second test should be made at a point about 2,500 feet southwest of the first.

A smaller but more pronounced dome lies in the drainage basin of Big Trammel Creek, northeast of Westmoreland. Its summit is one mile north and two miles east from that town. Test wells should be sunk near that point and at places not far north and west of it. Good locations will be found between $1\frac{1}{4}$ and $1\frac{1}{2}$ miles south-southwest of Pleasant Grove Church.

The Garretts Creek anticline is another northeast-southwest fold, which lies almost in a line with the Dutch Creek anticline. It has a closure toward the

southeast of nearly twenty feet and a large drainage area toward the northwest. The wells recently abandoned or now being drilled in the region northeast of Sugar Grove are far down the northwestern flank of this fold, and the reported showing of oil in Carter well No. 1 suggests the presence of oil nearer the summit of the fold. Good locations for test wells are close to Garretts Creek Church or on the Marsh property, a short distance to the northwest.

There seems to be little use of drilling to depths greater than 125 or 150 ft. below the base of the "black shale" in this part of the county, for the formations below those depths are probably not oil reservoirs. The formation known to geologists as the "Corniferous" limestone, which carries the top pay sand in the vicinity of Scottsville, Ky., is not found in this region, but at least two pay sands may be looked for in the Louisville limestone, which underlies the "Corniferous" in the Scottsville fields, but lies immediately beneath the "black shale" in Sumner County. Both these pay sands should be penetrated by the drill within 125 ft. below the bottom of the "black shale," and if either of them gives a showing of oil the well should be shot before it is abandoned.

The Economic Position of Great Britain With Respect to Petroleum Products

The United States, under war conditions, became the principal exporter of mineral oils to Great Britain, according to a bulletin recently issued by the Department of Commerce, entitled "The Economic Position of the United Kingdom: 1912-1918."

Before the war the United States led in the exportation of kerosene, lubricating oil, and gas oil, and in 1917 the United States was still the principal exporter in each commodity, with no other country even a close second. In that same year, Great Britain received 85.9 per cent of the fuel oil that she imported from the United States. The most striking development in the mineral-oil trade of the United Kingdom was the sharp increase in the receipts of fuel oil in the last two years. In 1918, imports of fuel oil by Great Britain were more than 1,700 per cent of the 1912 total and 900 per cent of the 1913 figure. The need for fuel oil in industry and as ship fuel under war conditions, it is pointed out, was responsible for this development.

Another striking feature of the mineral-oil trade of Great Britain is the insignificant imports of crude petroleum. In 1913, importations of crude petroleum amounted to something more than a million gallons, and in 1914 approximately 15,000,000 gallons was received. Since that date, however, importations of crude petroleum have been slight, indicating a small oil-refining industry in the United Kingdom.

"The only mineral oil produced in the United Kingdom," the report reads, "is secured by the reduction of the oil shale mined from the shale beds of Scotland. About 3,000,000 tons of shale is produced each year, furnishing from 70,000,000 to 80,000,000 gal. of oil. This means that the United

Kingdom is dependent upon the outside for 85 per cent of her normal petroleum requirements. Recently there has been a good deal of discussion as to the possibilities of developing a petroleum industry in England. Lord Cowdray has offered a large sum for experimental purposes, and has secured the services of American oil experts in locating oil deposits and in doing the preliminary drilling. Thus far this matter is entirely in an experimental stage, and it is impossible to predict what effect it may have upon the British oil trade."

Texas Oil Production

According to information sent out by Henry L. Doherty & Co., New York, large quantities of light oil that has been discovered in North and Central Texas promises to put that state in a position to compete with California in importance as an oil producer. Predictions have been made placing Texas production for 1919 at more than 90,000,000 bbl. This is not based on mere prospects, for Texas had produced so far this year more oil than in the entire year 1918. Texas production is estimated at 34,000,000 bbl. in the first six months.

The Burkburnett district, Ranger and Breckenridge, as well as Desdemona, the principal light-oil fields of Texas, are bringing in new wells at from 1,000 to 5,000 bbl. daily output, and there is no doubt that Texas production for the latter part of this year will exceed that of the first six months. The following table shows production in the principal fields of Texas for the first six months of 1919, and the years 1918 and 1917, in barrels:

Field—	First Six Mos., 1919	Yr. 1918	Yr. 1917
Ranger	9,621,115	3,784,434	29,055
Wichita County (Burkburnett).....	8,640,110	11,527,034	9,541,535
Breckenridge	1,505,470	598,437	35,219
Goose Creek	3,362,580	8,943,635	7,300,279
Damon Mound, West Columbia.....	2,933,420	283,527	124,325
Humble	1,765,805	6,655,173	7,389,831
Sour Lake	1,302,215	3,407,696	4,763,904

In 1918 the production of Texas was divided into 17,280,612 bbl. of light oil and 21,469,419 bbl. of heavy oil. This year the light-oil output of the state will total more than twice that of heavy oil. Texas has produced a total of 327,500,000 bbl. of oil since oil was first struck in the state in 1889. The state's production by years since that date is shown in the following table:

1918.....	38,750,000	1910.....	8,900,000	1902.....	13,100,000
1917.....	32,410,000	1909.....	9,530,000	1901.....	4,330,000
1916.....	27,540,505	1908.....	11,200,000	1900.....	840,000
1915.....	24,940,000	1907.....	12,320,000	1899.....	670,000
1914.....	20,100,000	1906.....	12,570,000	1898.....	540,000
1913.....	15,010,000	1905.....	28,100,000	1897.....	65,000
1912.....	11,740,000	1904.....	22,240,000	1896.....	1,400
1911.....	9,630,000	1903.....	17,950,000	1889-1895	360
Total					327,547,760

Texas did not come into great importance as an oil-producing state until 1901, but from that year to 1905 her output increased from 4,000,000 to 28,000,000 bbl. Following 1905 a decline took place until 1910, when 8,900,000 bbl. was produced. From 1910 to 1918 the state's production increased from 9,000,000 bbl. to 38,000,000 bbl., or more than 300 per cent.

CORRESPONDENCE AND DISCUSSION

Letters From the Mining and Metallurgical
Industry Dealing With Pertinent
Subjects of Interest

Mexican Issue Must Not Be Sidetracked ¹

Several groups of intellectual Mexicans, we among them, have undertaken the duty to write to all so-called technical papers in the United States, in order to rectify the erroneous ideas, which they are recently publishing, referring to our country. We belong to a social class which has always tried to establish a current of sympathy and good-will between the two nations, and for this reason, first of all, we are sorry that the American technical papers heap outrages upon our country and do their best to destroy all the ties of union which some men, who in both countries pursue high ideals, have tried to establish.

The Engineering and Mining Journal publishes in its issue of Aug. 16, 1919, an article called "The Mexican Issue Must Not Be Sidetracked." Your correspondent, who has informed you that there is "no noticeable improvement in conditions" in Mexico, is misinformed, for it is understood by thousands of Americans who live among us, and whom we meet daily, that our situation, in every sense, even if we still suffer great evils, has greatly improved, compared with the state of affairs prevailing two years ago. We do not want to make this letter too long, and for this reason we cannot go into details of all the points we think are necessary in order to make the intelligent people of your country acquainted with our true situation. Suffice it to say that, with the exception of a few well-known regions, everybody can travel and work in full security, especially all foreigners.

We, the same as you, desire that no more Americans be killed by bullets bought in the United States, and for this reason we wish that you would insist that in the future the rebels in Chihuahua and the oil region of the Gulf receive no more protection from American business men. Besides, we also wish that the American gold, proceeding from Mexican oil, be not used any more to pay newspapers who insult Mexico, publishing even grave errors. We are referring principally to the use made of the now fashionable word "confiscation," employed always to point out legitimate acts of the Mexican nation in order to maintain her sovereignty.

In the actual state of human civilization no nation can live in isolation. There exists a respective dependence, interpreted by economical, social and moral ties, in virtue of which humanity aspires to the supreme ideal of good will and peace, proclaimed by President Wilson, which includes, as an indispensable factor, the respect of weak nations. If a nation, supposing she is very big and powerful, pre-

tends to appoint herself tutor and guardian, and even imposed administrator, with no other right than the one derived from power, this only means the destruction of the basis of this beautiful ideal of human solidarity. And this role of imposed tutor benefits still less a country which, like the United States, has still many interior problems to solve and many vices to cure.

The same number of your paper in which the article referred to was published gives us notice of the appointment as Editor of the Engineering and Mining Journal of Mr. J. E. Spurr, prominent geologist, well known in Mexico through his books, his studies in the mining camp of El Oro, and his many articles in different technical papers. Our desires are that Mr. Spurr, upon taking charge of his post on Oct. 1, 1919, will introduce a radical change in your paper, making it a purely scientific and technical one.

L. Perez Castro, C. E., Mem. Am. Soc. C. E.,
Apartado 1394, Mexico City.

Santa-Ana Almada,
P. O. Box 2049, Mexico City.

J. Vasquez Schiaffino, C. E.
P. O. Box 1204, Mexico City.

S. Suluguis, M. E.
El Oro St., No. 11, Mexico City.

The following is the reply to the above letter:
New York, Oct. 15, 1919.

Sr. L. Perez Castro,
My Dear Senor Castro:

Your recent letter, of yourself and associates, addressed to Mr. Parmelee, has been turned over to me. I am taking the liberty of making extracts from your letter and publishing these under your signature. I hope that you will approve of my rather severe editing, but I wish to eliminate statements that might cause prejudice.

The mining industry, and the Engineering and Mining Journal as its representative, is vitally interested in industrial or political problems which affect it, and I think our policy must be to continue to cover all these problems in the future even more fully than in the past. Rest assured, however, that this journal is not controlled or in the pay of oil interests or any other interests, that I myself have a feeling of friendship toward Mexico and the Mexicans, and it is for this reason that I am publishing extracts from your letter, in order to give our readers your point of view.

I must confess that my own feeling has been that Mexico, since the days of the successful administration of Diaz, has been unable to gather enough strength to restore a peaceful and prosperous administration, and that it can hardly do it without the friendly assistance of other powers. It has never been my thought, however, that any such assistance should be taken with any other view than to assist in establishing a state of good government which the Mexican people might thereafter carry on unaided.

If this point of view is in error, I should like very much to know the facts, and I think you may believe that the American people, as a whole, are very far from wishing to do anything that is not for the advantage of Mexico and the betterment of the world.

Thanking you for your letter and hoping for further correspondence from you and other intelligent Mexican citizens, I am,

Very truly yours,
J. E. Spurr,
Editor.

Geological Survey Reports

Your suggestion that it would be helpful to have a review of the oil possibilities of Nevada appears to me excellent. In fact, such reviews are needed for all the states, outlining the portions of the state where prospecting may be regarded as money wasted and other portions where information is either insufficient to permit definite statements regarding oil possibilities or where it is believed there is at least a chance for the production of oil and gas.

There is a particular dearth of information on the oil and gas possibilities of Nevada, and, even though all the available data were assembled, there are large portions of the state which are terra incognita so far as their oil and gas prospects are concerned. It is known that much of the state is mountainous and that in these mountainous regions the formations either are not of a character to contain petroleum or else deformation has been so severe that any oil which may once have existed in the strata must be reduced to residuum, so there can be no chance of commercial production from them. In other parts of the state it is known that there are Tertiary formations which might possibly be petroliferous. However, these formations are of fresh-water origin, and it has not been established that petroleum can be derived from fresh-water organisms, although it is the belief of many of the geologists of the Survey that this is entirely possible or even probable.

It may be possible some time later in the year to assign a geologist to the task of constructing "safety maps" for some of our Western states, outlining the areas which are believed to be unfavorable for prospecting, those concerning which the prospects are indeterminate, and those where conditions are most favorable. At present, however, the work in hand exceeds the capacity of the available force.

In planning a series of reports on the geology and ore deposits of individual states, New Mexico was chosen as the subject of the initial volume of the series, because the general geology of the state is

more simple than that of many parts of the West and the mining districts are less numerous than in most of the other Western states. Consequently, no special effort at condensation was required to keep the report down to a reasonable size.

The report on Utah, by B. S. Butler and others, now in press, is much larger than that on New Mexico, and this difference suggests that it may be necessary, if reports on other states are not to become too unwieldy, that some more definite policy must be followed in planning these reports. Are they, for example, to be essentially encyclopedias within which is to be found in condensed form practically all that is known of the geology and ore deposits of a state, or are they to be readable outlines rather than comprehensive reference books? The report on Utah is partly a compilation of published material on the more productive districts, with considerable original description of less known or less developed districts and with discussion of the general relations of the ore deposits to geologic structure and history.

It appears to me that the ideal to be aimed at in these reports is the elimination, so far as is practicable, of detailed description, this being published elsewhere in special reports devoted to particular districts or problems. The state report should contain a clear and comprehensive account of the geology of the state and should show how the ore deposits are related to geologic structure and history. It should contain, also, a history of mining within the state—condensed, generalized accounts of the principal mining districts, with complete references to other publications that treat these in greater detail. If a district has not previously been studied in detail, it is likely to be difficult to decide how comprehensively it shall be treated in a report on the state as a whole. The geologist is tempted to present his facts and conclusions in full, but I am inclined to think that the main purpose of such a report as I have in mind will be better fulfilled if he exercises considerable restraint and emphasizes his general conclusions rather than the facts upon which they are based. At times, especially if a district is of particular interest and there seems to be no likelihood of giving it adequate description in the near future in a separate publication, it may be advisable to compromise between thorough detailed treatment and a generalized outline.

The report on the Geology and Ore Deposits of Utah to be published as Professional Paper 111, should be ready for distribution in about three months. By comparing it with the report on New Mexico (Professional Paper 68), geologists and mining engineers will be able to appreciate some of the questions to be answered with respect to reports planned for other states. Expressions of opinion in your columns, from men of these professions, as to how these reports can be made most useful to them, will be heartily welcomed.

George Otis Smith,
Director U. S. Geological Survey.
Washington, D. C., Sept. 22, 1919.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Centralization of Government Statistics Suggested

Great saving of public money and increased efficiency will result, in the opinion of Representative Good, chairman of the Committee on Appropriations of the House of Representatives, if all statistical activities of the Government are concentrated in a single bureau. He believes that the Bureau of the Census would be the best agency in which to assemble all the statistical work. He also is of the opinion that the industries of the country are entitled to more prompt statistical returns, which, in most cases, he is convinced, should be made every ten days.

Basing Point for Steel

Useless agitation, with no prospect whatever of benefiting the great body of consumers, according to disinterested specialists, is certain to result from the proposal to have the Federal Trade Commission pass on the matter of abolishing the system of basing prices of raw steel on Pittsburgh. Though it is admitted that a few communities might benefit, it nevertheless must be recognized, it is said, that the raw materials used in the making of steel can be assembled more cheaply at Pittsburgh than at any other point. In addition to the necessity of making over the whole economic structure on which the steel industry operates, there would be long litigation, which Judge Gary predicts would be the greatest lawsuit in the history of the country. The Federal Trade Commission has given out a statement in connection with the matter.

Economy Liaison Committee

Official status for the Economy Liaison Committee of the State Department is suggested by Van H. Manning, Director of the Bureau of Mines, in a letter to the President of the Senate. He points out that that committee, despite its informal status, has done a great deal to promote foreign commerce in mineral and other commodities by acquainting the representatives of the various departments with the current situation with respect to foreign trade. The Liaison Committee, made up of representatives from interested bureaus, has been operating under the direction of Wesley Frost, Chief of the Economic Intelligence Section of the State Department. The Bureau of Mines and the Geological Survey have taken active part in the work pertaining to foreign trade in minerals. The committee already has issued reports on the situation pertaining to coal, petroleum, potash, cotton, finance, and credits.

Phosphate Not Under Government Control

Reports that phosphate rock and bulk acid phosphate were to be subjected to Government control have been denied at the Department of Agriculture. Following a conference on Oct. 6, the Secretary of Agriculture decided that no effort would be made to name fair profits for any fertilizer ingredients. He will, however, stand ready to exercise his powers under the licensing system against profiteering in acid phosphate or any other fertilizer ingredients.

The matter of undertaking a special investigation of the recovery of petroleum from oil shale is receiving the active attention of the Mines and Mining Committee of the Senate. Senator Henderson has asked that \$140,000 be authorized for that purpose, but some members of the committee are of the opinion that the work should be started with a lesser amount.

New Process for Roasting Lead-Zinc Sulphides

M. F. Coolbaugh has patented a process for the roasting and sulphatizing, followed by the leaching and smelting, of sulphide ores and concentrates containing lead, zinc, copper, and iron (U. S. Patent No. 1,315,761, Sept. 9, 1919). The ore is first roasted in the ordinary type of mechanically rabbled furnace for the purpose of changing the sulphides to oxides. The calcined material is then transferred to a second similar furnace, through which passes the gaseous products from the first treatment. The temperature and time of treatment are so regulated that in the second furnace the oxides of zinc, copper, and lead and the silver chloride are changed into sulphates. The resulting product is treated with water, the sulphates of zinc, copper, and silver being dissolved and the metals later electrolytically recovered. The insoluble residue containing the lead sulphate, iron oxide, and metallic gold and silver is smelted.

Lead and zinc in many cases cannot be efficiently separated by mechanical means. Under present processes any lead going to the zinc retorts makes the recovery of the zinc more difficult, and vice versa. Commercially, the ore of either metal is penalized for containing appreciable amounts of the other. These difficulties, it is claimed, are overcome by the process described.

Trade with Yugoslavia.—The import and export of all mine products and the importation of machinery and appliances for mining purposes have been declared free of duty by the Ministerial Council of Yugoslavia, according to a report recently received by the Bureau of Foreign and Domestic Commerce.

BY THE WAY

Hoover and the Geological Survey

A large photograph of Herbert Hoover, appropriately framed, has been hung in the conference room of the U. S. Geological Survey. This was done because Mr. Hoover formerly was an employee of the Survey. In 1895 he served with that organization as a field assistant with a geological party in Nevada.

Gold

The dross of droning commerce! No more than gilded lead!
The tinsel-foil that sweating toil must count the worth of bread!

No longer virgin metal—stained with minted brands—
That each in turn, to save or earn, must wrest from other hands!

To seek you—there the splendid game! From fissures thinly run

In deepest mine—such treasure fine is ever cleanly won!
A smiling nature yields you—her gracious gift to men
Who dare to choose—who risk and lose—yet seek and find again!

W. H. Gardner.

Poisonous Plants

At the cyanide plant of the Empire mine in Grass Valley, Cal., particular care has been taken to post conspicuous signs calling attention to the poisonous nature of the solutions and the cyanide salt used. In the West, botanists have for a long time been investigating "poisonous plants" but no mention has been made of the "cyanide plant," which flourishes in some silver mining districts and more often than not can be found in gold mining camps. Their attention is called to the excellent specimen at the Empire mine.

Twenty-five Cents Par Value

A Chicago dispatch states: "A new alloy that can be substituted for platinum or gold where acid-resisting metals are required has been discovered by Prof. W. S. Par, of the department of chemistry of the University of Illinois. The alloy, which Prof. Par has named "illium" in honor of the University, costs approximately 25c. an ounce, whereas platinum costs \$140 and gold \$40."—Illium may possibly find a market in our Troy laundry where we believe that acid-resisting metals must be needed. At any rate, gold at \$40 will interest the members of the National Gold Conference which recently met in St. Louis.

What's in a Name?

With an airy wave of the fairy wand that turns deficits into profits, Divide, Nev., becomes "Sigold" at the command of the Post Office Department. The new name is apt if not euphonious, for it is derived from "silver" and "gold" which metals brought the camp its fame. Would that this same felicitous touch might tame the wildcats! But it is to be regretted that the change is made so late. Under the name of Divide the camp has acquired a reputation that for both practical and sentimental reasons

the Post Office Department might well have retained. There is magic in the word "Divide," as brokers all will testify.

From Sourdough to Earldom

One of the recent boats out of Dawson, Y. T., carried Robert Leeson, who has followed mining and prospecting in the North for twenty-one years. Leeson was on his way to Ireland to claim the title and estate of the Earl of Milltown, it is said. His elder brother is believed to have lost his life in a shipwreck, having been missing for ten years. Leeson has never known the thrill of a big strike, though he has spent the better part of his life in the quest for gold. He knew the town of Dawson when it was the Mecca of the world's greatest gold stampede, and was there recognized as the champion chess player of the Yukon. He left Dawson in the garb of the frontier, and was given a rousing send off, as, carrying his own baggage, he boarded the boat for the "outside." Leeson said that if he secured the estate he will satisfy his ambition to cruise round the world—and then return to the Klondike.

An Old Report

In the days before the great uplift in technical writing, the report of even a competent engineer was sometimes a crude affair. In such a report written in 1876 we read the following:

Your lowest level and adit have reached the deposit, and I saw the galena in the heading, 220 ft. from the surface. I believe the lode to be a regular true-fissure deposit and therefore, with the consentient opinion of all authorities, likely to continue in depth.

The underground works you have already accomplished which have enabled me to inspect the conditions and form the foregoing opinion, are as follows: A vertical shaft in the vein, with five levels and certain cross cuttings. The shaft being now 230 ft. deep, and the levels on the chimney averaging 100 ft. in length, it is evident that the laying open of the mine is adequate to afford an intimate examination and pretty general conclusions.

You have now connected your first level with shaft No. 2, 150 ft. west of your actual service shaft. We may say that the ore in sight on your first level is 1,500 cu. yd.; on the second, 2,500 cu. yd.; on the third, 5,000; on the fourth, 7,500; and on the fifth, 10,000; in all—say 40,000 gross tons, which, according to your own experience at your mill will concentrate into not less than 4,000 tons of dressed ore, the average sale value of which has hitherto been \$94 per ton.

As for the underground works themselves, their disposition and execution deserve nothing but praise. Your shaft No. 1, which has been sunk in the best manner by Burleigh drills moved by compressed air, is solid and well timbered, 12 ft. by 4, divided into three compartments, in one of which is your Cornish pump, established in perfect condition; in the other two, your hoisting, which, although it will later be modified, has now one excellent guided cage and one bucket in service. Ultimately the hoisting apparatus, amplified only by replacing the bucket by a cage, will serve in that shaft for any extraction you will probably desire to attain.

Your levels, when somewhat enlarged for the accommodation of cars, will satisfy also the most complete and rapid stopping, so that, so far as preparation is concerned, you have little farther to expend in order to break down, transport and hoist 100 tons per day.

PERSONALS

M. Leopold is installing the Bureau of Mines exhibit.

Colby Dodge, of Los Angeles, was in Lovelock, Nev., on professional business on Oct. 20.

H. A. Megraw, metallurgical engineer for Kennedy-Van Saun Mfg. & Eng. Corp., was recently in San Francisco.

Rene de Sallier du Pin has accepted a position with the Societe Franco-Americaine de Metaux, at Paris, France.

E. J. Schrader, of Herbert Humphrey's engineering staff, was examining mines in Pershing County, Nev., during October.

Ralph T. Hirsh arrived in Havana, Cuba, early in October. Mr. Hirsh intended to leave on a professional trip into the interior.

William Sharp, engineer for George Wingfield, made a general examination of the Loring district in Nevada during the latter part of October.

W. T. Lundy, of San Francisco, Cal., and C. S. Boalich, of the State Bureau of Mines, are in the southern part of Nevada on mine-examination work.

Stanley Mahon has returned to Virginia, Minn., having completed the installation of a mill to treat pyrites at a Georgia property of the Hanna interests.

John Butler, of Butler Bros., is inspecting the various ore-drying plants of the Lake Superior district with a view to installing one at the Margaret mine.

Marion L. Thomas expected to return to New York during the last month after investigating mining properties in Nevada and other states for several months.

C. N. Schuette is leaving San Francisco, Cal., to accept the position of superintendent of the Mariscal Mining Co.'s quicksilver mine, at McKinney Springs, Tex.

Frank Billings and Carmi Thompson, president and vice-president respectively of the Tod-Stambaugh Co., have completed a tour of inspection of the company's Minnesota holdings.

P. S. Smith, the administrative geologist of the Geological Survey, is installing the Survey's exhibit, which will be shown at the convention of the American Mining Congress at St. Louis.

C. W. Newton, of Wallace, Idaho, manager of the Consolidated Interstate-Callahan Mining Co., has gone to Rochester, Minn., where he will sub-

mit to an operation at the Mayo hospital.

Emmett Flynn, safety inspector for the northern mines of the Republic Iron & Steel Co., represented that company at the safety conference recently held at Pittsburgh by the U. S. Bureau of Mines.

Harris & Ewing
R. B. MOORE

R. B. Moore, superintendent of the Golden station of the U. S. Bureau of Mines, has been appointed chief chemist of the bureau, succeeding Charles L. Parsons. Dr. Moore will leave for Washington about the middle of November. S. C. Lind, assistant superintendent, has been appointed to Dr. Moore's place, and Will C. Coghill, of the Seattle station, will succeed Dr. Lind.

Major W. H. Ferguson, who was with the 317th Engineers in France, was in the Loring district in Nevada during the latter part of October, to examine the Treasure Hill property for New York clients.

SOCIETIES

The National Safety Council in accordance with the action of the annual meeting on Oct. 1 through its Executive Committee has approved the organization of an engineering section for the purpose of bringing together the mining, civil, mechanical, electrical, and chemical engineers among the membership. The membership qualifications are similar to those of the national engineering societies. Among the functions of the section will be the following: To furnish technical information

as desired; to perform technical services for the council such as the development of standards and by inquiry or research to solve special engineering problems arising in safety work.

American Institute of Mining and Metallurgical Engineers, Colorado Section, held a meeting at the Denver Club, Denver, on Oct. 15, in honor of Horace V. Winchell, president of the Institute. The gathering was informal.

American Institute of Mining and Metallurgical Engineers, Montana Section, will hold the Fall meeting on Nov. 8 at the Montana Hotel, Anaconda, Mont. The following papers will be read: "The Reverberatory Furnace for Treating Converter Slag at Anaconda," by Frederick Laist and H. J. Maguire; "The Dust Problem and Cottrell Treater Installation at the Washoe Smeltery" by James K. Murphy.

The Mining and Metallurgical Society of America will hold a reception and dinner in honor of Eugene Schneider, head of Schneider & Co., operating the Creusot and other steel works of France; honorary member, American Iron and Steel Institute; president, Iron and Steel Institute of London; president, Comite des Forges de France, on Nov. 24, 1919, at the Hotel Biltmore, New York. The gold medal of the society will be presented to him on this occasion.

OBITUARY

Herbert G. Thompson, for several years superintendent of the Nevada Packard mine, in the Rochester district, Nevada, was killed on Sept. 25 as the result of a fall from the 300-ft. level. Mr. Thompson was thirty-one years old and is survived by his wife, child, and mother. The funeral was held in Oakland.

INDUSTRIAL NEWS

W. D. Ward has been transferred from the San Francisco office of the Pelton Water Wheel Co. to their New York office, where he will have the title of manager of the Atlantic department, which includes the territory east of the Mississippi, Europe and South America. Mr. Ward has been with the Pelton company for twenty-five years and until recently held the position of contract and sales engineer. In New York he succeeds F. W. Gay.

Collins & Webb, of Los Angeles, Cal., have opened offices at 229 Rialto Building, San Francisco, with G. A. Fisher in charge.

Walter Hasendahl, formerly in charge of Allis-Chalmers Mfg. Co. district office in Los Angeles, has entered the firm of Rosenberg & Co. as consulting engineer. Rosenberg & Co. have offices and warehouses in Los Angeles and Congress Junction, Ariz., and handle both new and used mining, crushing, power and pumping machinery.

Smith, Booth, Usher Co. announce the removal of their San Francisco offices and warehouse to 140-42 Fremont Street.

The Pacific Tank and Pipe Co., a California corporation, has issued \$750,000 of first mortgage, 7% sinking fund gold bonds of date Sept. 1, 1919, and due Sept. 1, 1929.

The Merchants' Association recently issued its year book, which covers the year ended April 30, 1919. The book contains a list of members and the reports of the president, the secretary, the chairman of the member's council, and the heads of the various bureaus.

The Dickey Steel Co., Inc., Woolworth Building, New York, has been appointed eastern sales and export representative of the Hammond Steel Co., Inc., of Syracuse, N. Y., manufacturers of high-speed, alloy, and straight-carbon tool steels. The alloy steels are manufactured in bars, weldless rings, die blocks, and special shapes.

Parsons-Moorhead Machinery Co., Hostetter Building, 237 Fourth Ave., Pittsburgh, has been organized to do a general machinery business. William L. Moorhead, of this company, was formerly vice-president of the Duquesne Electric & Manufacturing Co., and Mr. Parsons has been engaged in a general machinery business for several years.

Black and Decker Manufacturing Co., Baltimore, Md., is erecting a new plant at Towson Heights, Md. The new building will be 100 x 200 ft., erected on the west side of the present plant and planned to conform architecturally to the residences being erected on Joppa Road. The general offices have been removed from Baltimore to Towson Heights.

The Lidgerwood Manufacturing Co., of New York, announces the opening of a branch office in the Hammond Building, Detroit, Mich., for the sale of the company's contractors' hoists, derricks, and cableways, mine hoists, ships winches and steering gear, and logging machinery. R. S. Hutchinson, formerly of the Lidgerwood office in Philadelphia, will have charge of the Detroit office,

under the direction of F. B. Knight, of the Chicago office, who previously handled this business in Detroit.

The Electric Furnace Co., Alliance, Ohio, has announced the installation of nine new Bailey electric furnaces for melting non-ferrous metals and alloys as follows: The Drew Electric and Manufacturing Co., Cleveland, Ohio; the Nolte Brass Co., Springfield, Ohio; Kennedy Valve Co., Elmira, N. Y.; American Bronze Corporation, New York City; Dominion Steel Products Co., of Brantford, Ontario; the Deming Co., Salem, Ohio; Miller Pasteurizing Co., Canton, Ohio, and Landers, Frary & Clark, New Britain, Conn.

H. A. Wilson Co., Newark, N. J., have recently placed on the market a new product known as "Wollaston" wire. It has a platinum core and a silver exterior. It is drawn to about .004 in. diameter of silver, and the platinum core is reduced to the extremely small size of .00006 in. diameter. The silver outside may be dissolved off in acid, leaving the platinum core intact. This wire is manufactured in long lengths with a continuous platinum core. Wire of this description was made in Germany before the war and exported to other countries.

Western Wood Pipe Publicity Bureau has been formed by the four largest manufacturers of wood pipe upon the Pacific slope, for the purpose of disseminating information about Western wood pipe. The bureau will make an especial effort to have wood pipe properly installed and to promote its use for purposes for which it has proved suitable. The four companies are: Continental Pipe Manufacturing Co., of Seattle; the American Wood Pipe Co., of Tacoma; and the Redwood Manufacturers Co. and the Pacific Tank and Pipe Co., both of San Francisco. Offices of the bureau have been established in the White Building, Seattle, with E. J. Bartells, manager.

TRADE CATALOGS

Magnetic Manufacturing Co., Milwaukee, Wis., has sent out a circular describing the Type L separator, which, it is claimed, possesses a large capacity for handling material efficiently. A high-duty magnetic pulley is also described, as well as Type F separator for steel and iron.

Steam Shovels, Cranes, and Dredges. The Osgood Co., Marion, Ohio; 8 3/4 x 11; 31 pp.; illustrated. Describes revolving and railroad types of shovels for various kinds of work. The catalog is

written in Spanish, with an English translation on the opposite page.

The Terry Turbine. Terry Steam Turbine Co., Hartford, Conn.; 8 1/2 x 11; 30 pp.; illus. Describes the company's non-condensing turbine, possessing particular features, which it is claimed results in increased efficiency and economy in space. A condensing type which is built in sizes from 1 to 1,500 hp. is also described.

Champion Kerosene-Burner Co., Kenton, Ohio, has sent out information describing a new portable furnace claimed to generate a temperature of 3000 degrees within five minutes. This heating unit, which is self-contained, has been designed for heating rivets, heat-treating tools, "shrinking-on" processes, and similar operations requiring an intense heat in a small portable furnace.

Milliken Buildings. Milliken Brothers Manufacturing Co., Woolworth Building, New York. Catalogs Nos. 10 and 11; 8 1/2 x 10 3/4; 44 and 32 pp. respectively; illustrated. Contain complete foundation plans, erection diagrams, construction details, and directions for the erection of buildings. It is stated in the introduction that this is a supplement to Catalog No. 10 and is designed to be a complete guide for the erection of Milliken buildings, including, as it does, in simple and ready reference form, the essential information needed for the erection of the building from foundation to completed structure. This has been made possible by the use of the standardized truss-unit system.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Tools—Pneumatic-Tool Handle. Morton C. Hutchinson, assignor to Chicago Pneumatic Tool Co. (1,315,554; Sept. 9, 1919.)

Tungsten—Compressed Tungsten Powder. Carl A. Pfanstiehl. (1,315,859; Sept. 9, 1919.)

Welding—Method and Compound for Welding Steel and Other Metals. Hughes L. Siever, Erie, Pa. (1,315,611; Sept. 9, 1919.)

Zinc-Retort Residues, Treatment of. Oscar Spitzer, New York, N. Y., and Cairy Clyde Conover, Springfield, Ill. (1,315,349; Sept. 9, 1919.)

Zirconium—Basic Sulphate of Zirconium and Method of Making the Same. Edward J. Pugh, assignor to Pennsylvania Salt Manufacturing Co. (1,316,107; Sept. 16, 1919.)

THE MINING NEWS

New York, November 1, 1919

Disaster in Cornish Tin Mine

Rod of Man Engine Breaks as Shifts Are Changing—Many Lives Lost

A large number of men were killed on Oct. 20 when the man engine of the Levant mine, at St. Just, Penzance, Cornwall, broke down as the crew was being raised to the surface. The Levant man engine is said to be the only survivor of the type in the world. The rod broke at the nose at the moment when the engine was at the top of its stroke, thus permitting the giant lift ladder, a ponderous beam 300 "fathoms" long, on which were over 100 men, to drop the length of the stroke, a distance of 12 ft. Consequently some of the men were knocked off and squeezed against the sides of the shaft, and some of the ladder sollars were smashed, as well as the platform on which the men stood. The passage up the shaft was thus blocked in places.

Surfacemen were at once organized into rescue parties and sent to various levels leading into the man-engine shaft to get out any injured, other shafts being used for the purpose. The rescuers were within speaking distance of the men in the 12 and 24 levels, but the platforms had been knocked out, and it was impossible for them to go up or down. A road, however, was put in for these men and they were freed. Most of the men who were on the man engine are stated to have again returned to the levels to help in the rescue work.

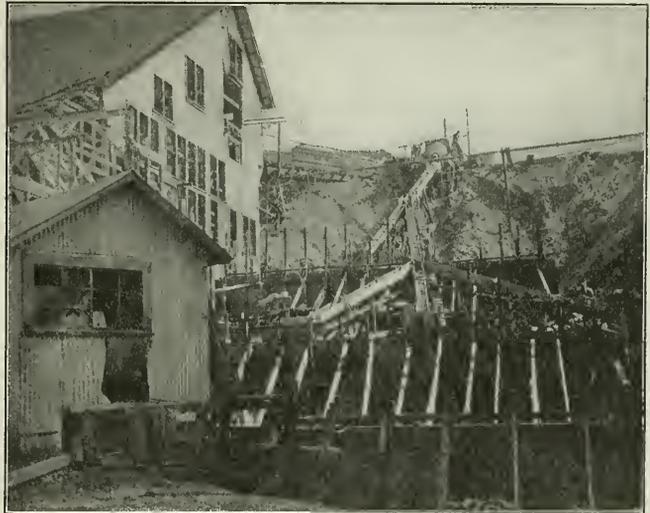

It was stated by the manager that the engine was inspected and oiled every day. At the place where the breakage occurred a new beam was put in a short time ago, and the iron rod and two iron caps were practically new. This method of raising and lowering men has been in use at Levant about seventy years.

Improvements at Empire Mine at Grass Valley, Cal.

An addition is being made to the Empire Mines & Investment Co.'s stamp mill at Grass Valley, Cal. The number of stamps will be increased from 60 to 80. The cyanide plant is being enlarged to a corresponding extent. Between the mill and the Pennsylvania shaft a narrow-gauge trolley line is under construction and has been

practically finished. All of the ore produced from the Pennsylvania shaft will be transported over this line to the mill at the Empire shaft. The effect of this will be to concentrate all milling in one plant instead of at two plants, as at present. The addition to the mill, which is shown in the accompanying cut, is of substantial construction, retaining walls and mortar block being of concrete. A new tailings dam is also being constructed. It is expected that this dam will provide ample storage for tailings for a long time.

carry over. One mine on the Marquette Range has over 300,000 tons of crushed hard ore awaiting a market. The lump ore from this property finds a ready buyer, but the crushed is not in demand, owing to changes in furnace practice in recent years. Another Marquette Range property which produces high-grade Bessemer hematites must carry most of the 1919 output over for another year at least. This mine never had difficulty in finding furnaces to take its ores, but the open-hearth furnace has brought about the change.

CONSTRUCTION OF 20-STAMP ADDITION TO CYANIDE MILL OF EMPIRE MINES & INVESTMENT CO., GRASS VALLEY DISTRICT, CALIFORNIA

Iron-Ore Shipments Curtailed by Steel Strike

It is estimated that Lake Superior iron-ore shipments will be in the neighborhood of 47,000,000 tons in 1919, or 13,000,000 tons short of last year. A tonnage of 50,000,000 would probably have been attained if the steel strike had not occurred, as the Lake movement has slowed up considerably since the strike was declared. The September shipments totaled 8,178,483 tons, a decrease of 816,531 tons from the figures for the same month of 1918. The total movement to Oct. 1 was 37,776,531 tons. It is because of the hopeful outlook for next season that the operators are stocking at the mines, although many of them have considerable ore to

Employment Office Re-established at Wallace, Idaho

1. W. W. to be Barred From Mines—George T. Edmiston Will Again Take Charge

The employment office has been re-established at Wallace, Idaho, in the Coeur d'Alene district. The office opened on Oct. 21 in charge of George T. Edmiston. The plan, in fact, was never wholly abandoned, for after all other companies had discontinued it, the Bunker Hill & Sullivan company stuck to it, which to a large extent explains why that company alone was not involved in the recent strike. Following the trouble twenty years ago, when the miners' union blew up the Bunker Hill & Sullivan mill, a permit system was

devised by the military authorities through which all mines were supplied with men, the purpose being to prevent the employment of all those members of the Western Federation of Miners who were in sympathy with the lawless element. With the withdrawal of the military, the permit office was succeeded by the employment office. This was a voluntary arrangement among the operators to prevent the lawless element from gaining control. An office was established at Kellogg and at Wallace, and all companies employed their men through one of the offices except the Hercules, which was controlled by the Days.

The Wallace office was discontinued about three years ago, but the Bunker Hill company continued the Kellogg office. The chief purpose of the office at this time is to guard against the employment of members of the I. W. W. The mines to be served by the Wallace office are the Morning (Federal) and Hunter, at Mullan; Hecla and Hercules, at Burke, and Tamarack and Interstate-Callahan, at Nine Mile.

Sampling Charges on Nevada Ores Announced

Announcement has been made for the benefit of Nevada ore producers by F. C. Lincoln, State Ore Sampler of Nevada, that at Hazen, Nev., there is a minimum charge of \$5 on small lots of ore and 25c. per ton is charged on lots in excess of twenty tons. At the Selby smeltery and at the Nichols plant of the General Chemical Co., in California, there is a minimum rate of \$7.50 on small lots and a charge of 25c. per ton on lots in excess of thirty tons. At the Mammoth smeltery in California and the Garfield and Murray smelteries in Utah, the minimum rate is \$6.25 on lots of less than twenty-five tons. Minimum rates at other points will be fixed as rapidly as possible, but, at present, rates at purchasing points not mentioned are actual costs of supervision for lots of less than fifty tons, and 25c. per ton on lots of fifty tons or more. Special low rates may be made upon large lots to suit local conditions.

Mr. Lincoln recently made the following announcement of appointments at smelteries and ore buying establishments outside of Nevada: Abbot A. Hanks, of San Francisco, is deputy for the Selby smeltery and Nichols plant of the General Chemical Co. Charles Kunze, of Kennett, Cal., is deputy for the Mammoth smeltery. W. E. West, of Salt Lake City, is deputy for the American Smelting & Refining Co.'s Murray and Garfield plants, for the U. S. Smelting & Refining Co.'s Mid-

vale smeltery and for the Utah Ore Sampling Works. George Howarth is deputy for the International Smelting Co.'s Tooele plant.

New Capital Enters Eureka District, Nevada

The Mining & Development Corporation, of Maine, has acquired a large interest in the Richmond-Eureka Mining Co. which owns several of the old mines in the camp of Eureka, Nev. The buying company, which is controlled by the E. A. Holter and H. P. Henderson Syndicate, of New York, will spend a large sum in equipping and developing the property. The stockholders of the Richmond-Eureka company include the U. S. Smelting, Refining & Mining Co., Henry C. Frick, J. H. MacKenzie, and others.

Utah Mines Pay Seven Taxes

Seven different kinds of taxes are among the burdens with which Utah mines are struggling during the period of reconstruction. This means not only a large pecuniary outlay on the part of mining companies endeavoring to adjust themselves to present labor conditions, slowness of delivery of materials, and high costs, but also a large amount of clerical labor, which is an additional expense.

The heaviest taxes are the Federal income and excess-profits taxes. The remaining five forms of taxation, including the cost of workmen's compensation as a tax, are briefly: The state property tax, based on the valuation of ground purchased from the Government and the tax on equipment; the tax on the net proceeds of mines, which is based on three times the net proceeds of mines, the rate of taxation being that of the county in which the mine in question is situated; the Federal capital stock tax, on which the rate has been increased to \$1 per \$1,000, this year on everything over \$5,000, the basis of valuation of stock being the market value, capitalization, or capitalization of earnings; the Federal tax of 10 per cent on the corporation's undistributed earnings, carried from year to year; and, lastly, the cost of workmen's compensation.

Mayflower Lode Proved to Have Been Cut Two Months Ago

Unusual interest is taken in the fact that development operations in the Mayflower-Old Colony shaft, near Calumet, Mich., show, beyond a doubt, that the shaft cut through the lode at 1,403 ft. Diamond-drill exploration, upon which the shaft work was based, showed the lode at two points, 1,400 ft. and

1,700 ft. There was a peculiar geological condition in the shaft. Physical developments at 1,550 ft. verify the assumption that the lode was cut in the shaft proper sixty days ago.

Although this work has not resulted in opening the lode to an extent which will assure its commercial operation on a successful basis, the mere fact that this formation has possibilities is increasingly important in its bearing on the future of the district, particularly because the Mayflower is outside the accepted limits of the mineralized area.

Mason Valley Smeltery May Be Re-opened on Custom Basis

Freight Rates on Ore Must First Be Lowered on Western Pacific Railway

One of the important matters brought to the attention of the Nevada Public Service Commission is the application of the management of the Mason Valley Mines Co. for satisfactory railroad rates covering the movement of ores from Plumas County, Cal., north of Reno, over the Western Pacific Ry., to the smeltery at Wabuska.

Contingent upon the securing of such rates the company has declared its intention of reopening the smeltery for operations on a custom basis, something that it has not done heretofore, its operations having been confined to smelting its own ores from the Mason Valley mines. This change would necessitate the installation of reverberatories. It is claimed that the success of the project would mean much to the State, as it would make possible the mining of low-grade ore deposits situated at or near points along direct railroad lines, but that will not bear the cost of transportation to either Salt Lake or California smelteries.

The rates in question, in this particular application, are interstate, and are not within the jurisdiction of the Nevada Public Service Commission. However, the commission may act as attorney in fact, and Commissioner Shaugnessy has been authorized and directed to take the matter up with the regional committee of the U. S. Railroad Administration at San Francisco.

Yukon Navigation Closed October 8

Navigation on the Yukon River was closed on Oct. 8. The movement of Yukoners to the coast for the winter was not as great as usual, owing chiefly to reports of unrest on the outside and to the fact that silver-mining prospects are very bright in Mayo, Twelve Mile, and Fairbanks camps, where many will be engaged. The usual winter gold mining also requires many men.

PROGRESS OF MINING OPERATIONS

Important Events of Interest
Condensed and Classified
for Easy Reference

ALASKA

Kennecott Copper Co.'s production, including that of the Braden Copper Co., was 9,928,000 lb. in September, compared with 8,224,000 lb. in August and 5,508,000 lb. in September, 1918.

ARIZONA

GLOBE-MIAMI DISTRICT

Inspiration—The Inspiration Consolidated Copper Co. is operating fourteen of the twenty sections of its concentrator and milling about 13,500 tons of ore per day, which is about two-thirds capacity. The company is preparing to resume churn-drilling operations to check up data already obtained and to complete its records. Drilling will start in the vicinity of the Bull Dog fault. The data obtained will enable the engineering staff to complete its work of preparing sections of the orebodies.—At Miami, the new 50-ton concentrator of the Miami Mining & Milling Co. will be ready for operation Nov. 1. Equipment for a second 50-ton unit has been ordered. The shaft of the Van Dyke Copper Co. has reached the 450-ft. point.

Globe—Excavations for the foundations of the Iron Cap Copper Co.'s new concentrator are nearly complete and the concrete work will be started soon. Extension of the power line to the new mill is under way. A new sump and pump station have been cut on the 130 level, where a large Aldrich quintuplex, electrically driven pump will be installed, which will deliver 18,000 gal. of water per hour for use in the mill.—Operations at the Superior & Boston are confined to development work, except for two leases. Diamond drilling to pick up the eastern extension of the Old Dominion vein is being done from the 12th level.—At Bellevue, the Arizona Globe's shaft entered the hanging wall of the vein at 480 ft. disclosing high-grade milling ore. The Gibson Consolidated's new mill is operating three shifts on dump ores and turning out three cars of concentrates per week. The company is planning to treat a limited tonnage from the Arizona Globe. The "A" shaft of the Old Dominion company is down to about the 20th level, sinking being impeded by a flow of 2,000,000 gal. per day.

PIMA AND MARICOPA COUNTIES

Silver Bell—Percy Williams and associates leasing the old El Tiro mine near the Silver Bell have opened up 35 ft. of 8 per cent copper ore at the 100

level. Eight cars a week are being shipped to the Hayden smeltery.

Tucson—Suit has been entered against the operating company of the Reiniger-Freeman property by William L. Wakefield, alleging forfeiture by reason of non-payment of instalment on purchase due Oct. 9. Damages of \$5,000 are claimed for alleged removal of machinery.—The Silverita property is shipping ore valued at \$250 a ton in copper and silver. This property was formerly known as the Yellow Bird.

CHLORIDE, KINGMAN, AND HACKBERRY

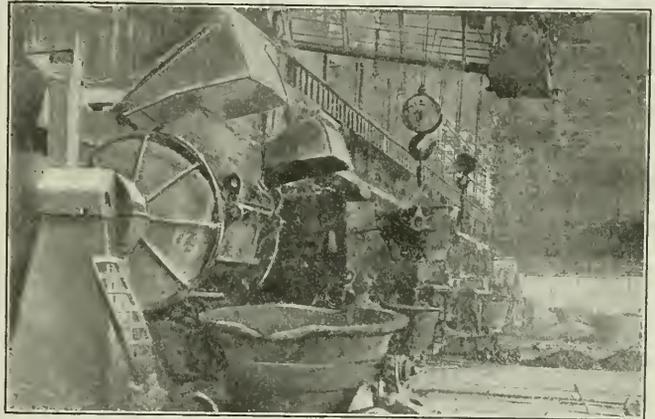

Chloride—The Chloride tunnel project is reported by J. C. Rankin, manager, to have been financed through T. B. Scott, of New York, for \$100,000 subscribed by companies controlling the

shaft is planned to permit exploration without interfering with hoisting.—The Senate Silver company now has a station completed at the bottom.

PRESCOTT AND CROWN KING

Copper Basin—This district west of Prescott is showing much activity with development work being done on the J. & J., L. L. Le Varr, and Martin Shuber groups. The J. & J. has a strike of rich silver ore at 270 ft.

Crown King—The Montezuma property has been taken over by a Colorado company.—The Philadelphia Mining Co., operating the Nelson property, has cut ore 3,000 ft. from the tunnel portal and 700 ft. below collar. A raise will be started as well as a crosscut toward several parallel veins.

CONVERTER BUILDING, MAMMOTH

COPPER MINING CO, KENNETT, CAL.

CALIFORNIA

MINING ON THE MOTHER LODE

Plymouth—The Plymouth Consolidated Gold Mines encountered very heavy ground in deepening its shaft from the 2,600 to 2,700 level. Other means of support than wooden sets was necessary. Sixty feet of the worst ground is now carried by steel girders in the form of ordinary shaft sets. Girders rest on concrete pillars placed on each side of the shaft. The experimental work will be finished soon and if found successful other parts of the shaft will be treated likewise. The shaft will be flattened to 45 deg. to pass through the broken ground as soon as possible. When the hanging wall is reached the shaft will be straightened and sinking

Samoa, Lucky Boy-Brighter Days, and Rainbow properties, to be benefited by the tunnel.—Sinking on the Diana property has cut the ledge on the dip at 370 ft., the ore running well in silver and gold. Water is giving trouble.

Kingman—The new electrically driven hoist and compressor plant of the Rural-Buckeye property at Mineral Park is now in operation. The Buckeye tunnel is to be driven further. This property was taken over by M. B. Dudley and associates.—The Catherine gold mine west of Union Pass has developed 12 ft. of good ore in a 30-ft. vein on the 200 level.

Hackberry—The Hackberry Consolidated Mining Co.'s new mill is operating and making good recovery. A new

continued. The nature of the foot-wall country makes it impossible to turn the shaft to follow the foot wall, where it should be, for the economical working of the vein.

Jackson—The 3,700 level south drift of the Central Eureka Mining Co. at 240 ft. south of crosscut has the vein 18 in. wide but low grade. The north drift 92 ft. from the station has 3 ft. of milling ore. The two-compartment, north foot wall raise, from the 3,700 level is up 41 ft. This will connect with the winze from the 3,500 level. The 3,350 south drift is cleaned out and the track laid to grade. Ten stamps have been hung up to permit replacing rotten mortar blocks with concrete. Thirty stamps will be used.

Angels—The Morgan mine's production for September was over the August record of \$105,000. The force will be doubled to increase production. Diamond drilling is under way in the search for the downward extension of four known oreshoots.—The Lee mine has purchased the Utica chlorination plant and will use the lumber for building purposes.

Alleghany—William Simpkins will make arrangements for immediate resumption of work under option to Fred Seales, Jr.

Grass Valley—The Central Consolidated Mines Co. has acquired the Central, Banner, and North Banner properties. A development campaign is being planned as well as the erection of a mill.

THE COPPER DISTRICTS

Kennett—The Mammoth Copper Co. has increased its force to sixty men, and placed four drills in operation. Development of new territory is claiming principal attention. Shipments of silicious ores from the Reid mine and other properties are being received at the smeltery and stored in yards for future use. The smeltery has been idle since the strike of last spring.

Engelmine—The Feather River Copper Co. has taken over the Snowstorm group adjoining the property of Engels Copper Co. Orders have been placed for mining machinery and compressors.

BISMUTH IN INYO COUNTY

Keeler—Bismuth has recently been found in the Silver Reef property, occurring as tetradymite. Leases have been granted.

COLORADO EMPIRE—TELLURIDE

Empire—The Primos Chemical Co. has about seventy men on the payroll at its plant at Urad, near Empire, Col., employed on development in both upper and lower tunnels, on mill repairs, and on tramway construction. The 60-ton plant, which has been idle since June, is said to have two Marcy

mills, flotation equipment, and concentrating tables. The new tramway is 1,200 ft. long, with steel towers and concrete footings. The vein worked is said to be 43 ft. wide and porphyritic and runs about 2 per cent molybdenum sulphide. Commercial lead-silver ore was recently cut. Appearances indicate company is planning steady operation.

Telluride—Concentrate shipments from the station in September were: Tomboy 55 cars; Smuggler-Union 41; B. Perrino 2; and John M. Wagner shipped 3 from Cimarron. Shipments were larger than last year's.

MICHIGAN GOGEBIC RANGE

Bessemer—The Tilden company plans to sink another shaft about 500 ft. deep west and north of No. 10 shaft near 11th level ore. No. 10's hoist is working to capacity. Extent of the 11th level orebody has not been determined.

MARQUETTE RANGE

Ishpeming—It is impossible to work the plans of the Cleveland Cliffs Iron Co. to capacity, owing to lack of rain, which has lowered the streams supplying the power plants. A new and larger storage basin is to be created on the Dead River, north of Ishpeming.

MENOMINEE RANGE

Vulcan—The Penn Iron Mining Co. is working all mines on a basis of four days a week, because of large stocks of ore on hand. This is the first Michigan company to reduce to this basis. Some have closed and others have reduced forces.

NEVADA

VIRGINIA CITY—MCGILL—DIVIDE

Comstock Lode—Active development has been resumed on all properties in the district. A feature of the week was Consolidated Virginia's production of 457 tons of ore, valued at \$12,000, from the new vein on the 2,150 level.

McGill—The September production of the Nevada Consolidated Copper Co. was 4,250 lb. copper, against 6,670,415 lb. a year ago. There was no production in August, owing to the strike.

Divide—The Post Office Department has given the townsite in the Divide district the name of "Sigold," instead of Divide City, as the promoters wished.

NEW MEXICO

Santa Rita—The September production of the Chino Copper Co. was 3,538,704 lb., against 3,321,857 in August and 7,936,000 a year ago.

UTAH

TINTIC DISTRICT—BINGHAM CANYON— PARK CITY

Eureka—Tintic shipments for the week ended Oct. 18 were 114 cars. The May Day company has let a contract for 500 ft. of drifting to the west on the 1,800 level, starting from the Yan-

kee side line. The Pinion Queen is said to have let a contract for sinking a shaft the first 500 ft. to Jack Aho.—The Tintic Standard will deepen the south shaft, now down 1,050 ft., by 500 ft.

Bingham C. nyon—The Utah Apex company recently resumed shipments, and expects to reach 500 tons daily. Preparations are being made under Waldemar Lindgren for the suit with Utah Consolidated to begin Nov. 6.

Park City—The Silver King Coalition Co. was granted a writ of certiorari in its suit with the Conkling company, claiming damages for ore illegally extracted from adjoining claims.

WISCONSIN

ZINC-LEAD DISTRICT

Platteville—The Wisconsin Zinc Co. has just started a 170-ft. shaft on the Booty land one-half mile west of the Winskell. The C. A. T. No. 2 mine has been connected by a 700-ft. drift with the old workings of C. A. T. No. 1, on the C. A. Thompson land at New Diggings.—The Vinegar Hill Zinc Co. has proved up an extension of the Hoskins Range for 550 ft. by drilling on the William Fields land; a shaft will be sunk and the Meloy mill equipment utilized. A new run has been proved up on the Houghlett and Gray land at Days Siding where a new shaft is being sunk. The new shaft on the James Copeland land at Shullsburg is completed. The Dale Rundell mill has just been placed in operation at Livingston.

Linden—The new Fearless company began milling on the Rule land with equipment newly assembled on the Optimo No. 4 tract at Linden.—McKay Brothers are operating the mine and mill recently purchased from Ross Bros., of Mineral Point.

Cuba City—The old Beacon Hill property one mile south of Cuba City is being developed by Newton Varker and others. The Anthony mine is being reopened by Baldwin and Uren.

MEXICO

The American Smelting & Refining Co. started up its Velardena smeltery at Asarco, Dgo., with one furnace on Oct. 23. For several months the company has been working on the construction of the Veta Grande 600-ton cyanide plant near Parral as steadily as conditions would permit. This plant may be ready for operation by Mar. 1, 1920.

The El Oro Mining & Railway Co. recently declared a dividend of 5 per cent, or 1s. per share, which was payable on Oct. 31, absorbing £57,375.

CHILE

Chile Copper Co. produced 7,044,000 lb. copper in September, compared with 8,994,210 in August, and 7,346,000 in September, 1918.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.15c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, Oct. 29, 1919

The quotation for zinc blende of Prime Western grade in the Joplin market for the week ending Aug. 30, 1919, should have been \$45 basis, instead of \$47.50. Our attention was called to the error soon afterward, and some settlements were held in abeyance on account thereof. It was necessary for us to make an investigation of the situation; wherefore the delay in making the correction, which is now formally made.

Copper was very dull and was weakish. In lead a further sharp advance was recorded. In zinc there was a sharp recession, with rather active business.

Transatlantic freights were un-

changed. The rates from San Francisco to Hongkong and Kobe continued at \$20.

Copper

Scarcely any business was done by the principal producers. The report that one of them had cut prices and secured a large order was entirely unfounded. However, one agency succeeded in disposing of two or three round lots. Among producers and agencies there is active competition, and any one of them is ready to meet the market. The latter eased off a little from day to day, and at the close 21¹/₂c., f.o.b. refinery, could be done in any quarter, with the probability that 21¹/₄c. would be accepted. Business was actually accepted at 21¹/₄c. by some of the smaller agencies.

United States copper production in August, 1919, amounted to 107,994,040 lb., compared with 100,369,247 lb. in July, 1919, and 165,550,799 lb. in August, 1918. Imports of copper in ore and concentrates, and blister, during August, 1919, amounted to 23,389,574 lbs.

Copper Sheets—32¹/₂c. per lb. Wire, 25c. Domestic buying dull.

Tin

The market for spot tin was erratic, owing to conditions resulting from the longshoremen's strike, which continues.

Singapore quoted £287¹/₂, c.i.f. London, each day of the week.

Lead

The A. S. & R. Co. advanced its price to 6¹/₂c. early on Oct. 23. Demand continued good, and later in the week independent producers began to realize higher prices. At the same time there were a few transactions in lead at prices below that of the A. S. & R. Co.

These represented metal in out-of-the-way places, and to some extent probably were the re-selling of lead purchased from the Government.

The demand for lead products continues very large, especially from the building trade. The requirements for pipe, lead traps, and other plumbing supplies, is extraordinary. Business in white lead also continues good. The demand from the storage battery people is insatiable. An active business in shot is going on, and there is a good deal of foreign demand for that manufacture.

Zinc

Some further large quantities were sold for export, especially to England, these transactions occurring at the beginning of the week, and the market advanced to about 7.80c. on the average. At that level very free selling was encountered, this representing in part the liquidation of a good many small speculative accounts, but there was also considerable selling by the smaller producers. These free offerings resulted in a sharp decline, but the metal that was offered was readily taken by strong hands, and there is no reason to suppose that the reaction of this week was anything but a temporary setback. Economic conditions making for a strong market continue unchanged. It is certain that Europe is going to require a good deal more of our zinc than it has yet bought in this movement.

Business in high-grade zinc was done this week at 8½c., delivered, but it is understood that there is still a tonnage in New York that can be bought at 8c.

The following zinc smelters are now idle, owing to strikes: Donora, Terre Haute, Peru. Labor troubles at La Salle were reported this morning.

An active foreign demand for American sheet zinc is developing.

Zinc Sheets—\$10.50 per 100 lbs.

Aluminum—33c. per lb.

Antimony—Unchanged at 8¼c. for spot. Futures were quoted at 9@9¼c., duty paid.

Bismuth—Unchanged at \$2.96.

Cadmium—\$1.40@1.50.

Nickel—Ingot, 42c.; shot, 43c.; electrolytic, 45c.

Quicksilver—Quicksilver to arrive was quoted at \$80@85. San Francisco telegraphs \$82.50, steady.

Silver—Owing to limited supplies, London has advanced rapidly during the last few days. With no shipments at present from New York, London is dependent on the white metal from other sources. It is understood that Canada, Australia, and France have been making moderate consignments to that quarter. China is still a buyer, and has been the chief factor in causing the advance.

Mexican dollars at New York: Oct. 23, 93; Oct. 24, 93½; Oct. 25, 94½; Oct. 27, 95¼; Oct. 28, 95¾; Oct. 29, 97.

Platinum—Shortage in the supply continues, and the market responds quickly to any increase in demand. This week it was a little stronger. We quote refined ingot at \$130@135.

Palladium—Unchanged at \$120.

Manganese Ore—Brazilian ore of 45 per cent grade was offered at 50c. per unit, c.i.f. Atlantic ports, without finding buyers.

Tungsten Ore—Some business in Chinese ore was done at \$7.

Molybdenum Ore—Quoted nominally at 75c. per lb. of molybdenum sulphide.

Pyrites—Spanish pyrites is quoted at 17½c. per unit for furnace size ore, free from fines, c.i.f. New York or other Atlantic ports. Sulphur companies reported to be selling at prices as low as 14@15c. Market unsettled.

Zinc and Lead Ore Market

Joplin, Mo., Oct. 25.—Zinc blende, per ton, high, \$49.50; basis 60 per cent zinc, premium, \$48.50; Prime Western, \$47.50; fines and slimes, \$45@42.50; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$45.09; calamine, \$32.20; all zinc ores, \$44.64.

Lead, high, \$86.15; basis 80 per cent lead, \$85@80; average settling price, all grades of lead, \$82.58 per ton.

Shipments the week: Blende, 8,231; calamine, 285; lead, 1,646 tons. Value, all ores the week, \$517,230.

Shipments ten months: Blende, 392,229; calamine, 10,865; lead, 59,944 tons. Value, all ores ten months, \$20,472,800.

The rumored transfer of the Ontario lead smelting plant to the Eagle-Picher Lead Co. is denied by the retiring President, Mr. Jones, who acknowledges he may go with the Eagle-Picher Lead Co., but asserts the plant will be continued as an independent concern.

Platteville, Wis., Oct. 25.—Blende, 60 per cent zinc, \$50@51 was paid for Prime Western grade, due to keen competition among buyers who had to get ore. Lead ore, basis 80 per cent lead, \$80 per ton. Shipments for the week are 2,527 tons blende, 115 tons galena, and 328 tons sulphur ore. For the year to date the totals are: 82,283 tons blende, 5,338 tons galena, and 16,457 tons sulphur ore. During the week 2,934 tons blende was shipped to separating plants. (A total of 2,500 tons sulphur ore shipped previously and not before reported is now included in year to date.)

Iron Trade Review

Pittsburgh—Oct. 28

The iron and steel strike, now in its sixth week, is receding somewhat less slowly than in the first three or four weeks. The Lackawanna Steel Co., in the Buffalo district, has made a fair start at resuming. There is a little operation at Cleveland, formerly closed tight. In the Mahoning Valley not less than six blast furnaces are operating, against none during the first three weeks, together with about a dozen open-hearth furnaces and one bessemer converter. The Wheeling district remains tightly closed. At Chicago and Gary operations are better, the district as a whole now running at nearly 50 per cent in point of tonnage. In western Pennsylvania production of pig iron, unfinished steel and finished products is between 85 and 90 per cent of normal. The last report as to the Homestead Steel Works showed production at 83.3 per cent of rated capacity, and the plant was not producing at capacity before the strike. The Sheriff of Allegheny County testified to the Senate committee investigating the strike that not more than 5,000 strikers remain in the county, but up the Monongahela, beyond the county line, Monessen remains almost closed, one plant doing nothing, another operating 10 per cent and the third doing about 15 per cent in its primary operation but not finishing the material. The Shenango and Allegheny Valleys are almost normal.

The United States Steel Corporation is positively opposed to there being any steel price advances at this time, and some of the leading independents are probably of the same mind. As the end of October is already at hand this means that in due course regular customers will be booked for first quarter or first half of 1920 at March 21 prices. The free play of demand and supply would easily force much higher prices, and some of the smaller independents, which do not normally sell far ahead, will probably secure stiff delivery premiums, as it is probable there will not be enough steel to go around.

Pig Iron—An advancing tendency is noted in the local market, following advances in Philadelphia, Chicago, Birmingham and other markets, and some sales at advanced prices are reported, but in the main the market is quotable at Mar. 21 prices: Bessemer, \$27.95; basic, \$25.75; malleable, \$26.25@27.25; foundry, \$26.75; forge, \$25.75, f.o.b. Valley furnaces, with \$1.40 freight to Pittsburgh.

Ferromanganese—English ferromanganese has sold at \$100, c.i.f., against \$95 quoted at the end of August and for some time afterwards, and it is difficult now to secure a quotation at \$100. Domestic producers continue to quote \$110, delivered, as their regular figure, but the price has sometimes been shaded slightly. Spiegeleisen remains in no demand for domestic consumption, but some export demand has sprung up lately, and one lot of 16 to 18 per cent has gone at \$33, f.o.b. furnace.

Steel—The Steel Corporation is operating 88 per cent of its sheet mills, while 52 per cent of the independent sheet mills are operating, and tin mill operations are about 55 per cent. This means much more consumption than production of sheet bars and stocks are beginning to play out. Occasionally a lot of sheet bars can be picked up, at \$2@3 premium. We quote Mar. 21 prices: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; rods, \$52. Rods for export have brought \$60.

Coke—The threatened strike of union coal miners has stiffened Connellsville operators' views, as there would be a heavy demand for Connellsville coal, and the strike might even extend into the Connellsville region, though it is nonunion. Furnaces are unwilling to stock up except at bargain prices and would pay above \$4.75 only in exceptional cases, while there is hardly any coke available at that price. Foundry coke is very strong, regular quality commanding \$6@7 depending on brand and whether open top or box car loading.

An Announcement to Our Readers

We desire to thank each one of our readers personally for the gratifying support that has been given us during our fight with the radical printing unions, which has now been successfully terminated with the complete vindication of the "Engineering and Mining Journal." Despite the fact that a number of issues of the "Journal" have been delayed on account of this trouble, we have not received a single letter reproaching us for this delay or exhibiting any impatience from our subscribers. On the other hand, we have received many letters encouraging us and exhorting us to stand pat, as we have done.

Our advertisers have been equally generous with us. They have told us to go ahead and repeat their copy as often as expedient. Combined co-operation of subscribers and advertisers has, in short, been most gratifying.

It required a good deal of effort for us to take up publication in San Francisco, and that this was successfully accomplished is due in a large measure to those editors who took charge of this work in San Francisco—Mr. Charlton and Mr. Young—and also the hearty co-operation which we received in the plant of the "Journal of Electricity," both from the management and from the workmen. It may take some little time before things settle down to normal in our New York printing office, and considerable adjustment will be necessary before transferring the publication back to New York, which we will do as soon as possible.

Our problem now is to catch up as fast as we can with the delayed issues. On account of the limitation of our plant, it is hardly possible to get out an issue in less than five days, and we have decided to double up the editorial section for two issues, thus bringing the reader up to date by the beginning of January.

This expedient of double issues, it is hardly necessary to say, is vastly more expensive, inasmuch as we, by so doing, omit the equivalent of two complete issues of advertising. We feel, however, it is a matter of duty on our part to bring the reader up to date on his issues just as soon as possible, and also a duty, on our part, to pay the cost of this strike out of our own pockets and not to pass it along to the advertisers. It is the "Engineering and Mining Journal's" cash contribution to the cause of sane American industrialism. In this issue, therefore, we are publishing an enlarged editorial section covering the issues of Nov. 8-15, but the advertising section corresponds to one issue only. We plan to double up again in this way in the near future, and then, having caught up with the current issue, we hope to greet you as regularly and heartily in the future as we have in the past.

THE growth of the Journal calls for an expansion of its staff, which is already so adequate that it has been divided between New York and San Francisco without interfering with efficiency at either end. We should like applications for the position of an editor to take especial charge of our

petroleum section and another to take special charge of the non-metallic mining section, which we purpose introducing as soon as present mechanical difficulties have been passed. Applications for either of the above-named positions should be addressed to the New York office.

The Gold Mining Problem

HIGH prices for other metals and other commodities only mean decreased earnings or downright disaster to the gold miner, for they increase the cost of his supplies and labor, whereas the price of his product is fixed. More accurately speaking, his product correspondingly decreases in price. The price of potatoes or wheat or iron is expressed in terms of gold, the standard measure of value. A quotation of potatoes at \$2 a bushel means that a bushel of potatoes will buy a tenth of an ounce of gold; when potatoes are \$1 a bushel, a bushel will buy only one-twentieth of an ounce. Conversely, the price of gold may not be determined by the arbitrary and fixed quotation of \$20.67, which means nothing—saying in effect that an ounce of gold is worth twenty times one-twentieth of an ounce of gold—but by its purchasing power of some other standard commodity.

At present, then, an ounce of gold will buy ten bushels of potatoes, though a few years ago it would buy twenty bushels. Therefore, gold is worth roughly only half what it was previously. The price of gold may be determined more closely if we find its average purchasing power of various commodities, weighted according to the relative quantities ordinarily required by an individual.

Gold is not a symbol but a commodity; the idea that it is a substance of intrinsic value, worth what it is exchanged for, is a sound one, as every gold miner knows. Real machinery, supplies, and labor are necessary for its production and, once produced, it is an object of utility and real value—if not comparable in point of necessity with wheat and potatoes, certainly to silver, nickel, lace, paintings, and Venetian glassware, all of which have a well-understood, real exchange value in return for other commodities, whether pork, feathers or lumber. Therefore, the logic and the stability of its immemorial use as a standard commodity for exchange purposes.

To go back, then: Wheat at \$2 a bushel means that a bushel of wheat will buy a tenth of an ounce of gold. If it does not mean that, it means nothing. But will it? Try and see, friend miner, farmer, or seller of your own labor. Bring to market your apples and your potatoes or your copper and lead, and ask for the corresponding gold. You will not get it. You will get paper instead; and you cannot exchange this paper for dollars—twenty to an ounce. Some of the paper carries the Government promise so to be exchanged on demand; more of the paper contains no such pledge. If your dollars, then, are not gold dollars, what are they? Nothing. We are on a gold standard; the dollars are gold or nothing. Have they, then, no value? They have indeed. They are the I O U's of a strong and prosperous government—temporarily bankrupt, having out far more paper promises than it can redeem. They are worth the amount they stand for, less a substantial discount due to the fact that they are only promises. This discount varies with the prospect men see of having the commodity, gold, delivered to them—if and when. The more I O U's there are in circula-

tion, and the more they become disproportionate to the Government's present ability to deliver the gold, the greater the discount—the less the barter value of these paper promises.

The United States is not the only nation on a gold basis. England, France, Germany, Russia, and many other countries have the same system, and all have reserves of gold on which they found their paper currency. They promise to pay five, fifty, five hundred gold dollars to one dollar which they actually have to pay with, and the trading discount of this paper varies accordingly. We hear much of prices in Europe, which tell us nothing. Bread is \$36 a loaf in Petrograd; clothes are \$1,000 a suit in Constantinople. It simply means that the people of Russia and Turkey have not that faith in their governments' promises that we have. But our own faith is not 100 per cent. It would only be that if we could get the gold at once. Do you not think that an ounce and a half of gold would buy more than a loaf of bread in Petrograd? Doubtless it would buy hundreds of loaves and doubtless fifty ounces (\$1,000) would buy fifty suits of clothes in Constantinople. If our own paper money were withdrawn, and all available gold was put into circulation, do you suppose you could buy an ounce with ten bushels of potatoes? By no means. Gold is comparatively scarcer than recently. There is less of it, and there are more potatoes than formerly, and according to natural laws of supply and demand, it might cost you forty bushels to buy an ounce of the metal. The fact is that gold is not traded in, but is hoarded by the governments and withdrawn from the market, so that the gold miner cannot trade his product for powder, steel, and bacon; nor is any other commodity standard of exchange substituted for gold; and we buy and sell on a basis of I O U's which grow less and less likely of redemption as their number increases and the supply of the nominal standard exchange commodity decreases, and so are offered more and more cheaply in exchange for real goods like cabbages and coal.

Once we get away from tangible assets as a basis for business, the little golden anchor drags after the balloon of reckless promises to pay, till it clears the ground and mounts higher and higher, with no means of measuring its probable ascent. Under these conditions, prices, here as in Europe, mean nothing; nor with a fluctuating discount which we have no means of quoting accurately, can we tell whether a given thing is dear or cheap, except by comparison with other real commodities. Wages may be doubled, but if the average cost of necessities is more than doubled, wages are lower than formerly. You may give labor any wage it asks: as the prices of necessities will rise accordingly, it makes no difference to labor or to the country, except to such as are tied down to the anchor of the now inactive gold commodity standard by investments in Liberty Bonds or other stable and fixed securities. But such a process of raising wages and prices is confusion itself, and all the rational adjustment between various classes of wage-earners and various kinds

of commodities, according to their relative true value, which came about when they were exchangeable on the basis of a real commodity, vanishes in the effort to adjust prices piecemeal to a great and shifting discount rate.

Europe is truly bankrupt. She has destroyed more wealth than she possesses, and has bought the surplus by promises to pay more than she will have in the form of commodities of any kind (to spare) for a long time. But the United States is rich and prosperous: although she has destroyed much wealth in war, she has produced enormously; she is only gold bankrupt, and, even so, by no means to such a degree as the countries of Europe. But her plight in this respect is getting worse instead of better. As the governments have destroyed the market for gold by hoarding it as theoretical "reserves" for mountainous piles of I O U's, the gold miner cannot, as before stated, trade his gold for other commodities. For his ounce of metal he can get only twenty paper promises, secured mainly by other promises, to pay one dollar each—never; and those whose commodities of timber or quicksilver he must have, require twice as many of these as if they considered them absolutely safe. In other words, gold has been practically demonetized, and no tangible substitute has been provided. The result is that its production is growing less and less, whereas, if it were employed as an actual medium of exchange, it would grow larger and larger, on account of its relative scarcity and greater demand; and, with the dwindling production, the golden anchor to the balloon grows less and less restraining.

Certainly no safe outcome of this solution is indicated without some new move. The gold miners are striving to find a remedy by means of which they may be able to live; the nation, by which it may obtain more gold and so weight its anchor. Secretary McAdoo recognized this and stressed it, in the thick of the war, and gold mining was given the privileges of a necessary war industry.

As one solution, it has been proposed to increase the price of gold from \$20.67 per ounce to, say \$40 per ounce, to keep pace with the other prices. That is to say apparently, that an ounce of gold shall be worth forty one-fortieths of an ounce of gold; but the plan has this in it, that it recognizes the discounted I O U currency and proposes for an ounce of gold to exchange forty promises to pay one-fortieth of an ounce of gold some day, provided somebody else pays somebody else the said gold, according to their several I O U's; so that the gold market is temporarily pegged somewhere near the current valuation of Uncle Sam's promises. But the pegging will not adjust itself, any more than before, to the fluctuations of the discount rate, and only adds to the confusion, if we are searching not only for the relief of gold mining but for a way to get upon a real commodity basis of exchange. Internationally, it would not help; for the gold miner in Russia, in order that he might resume business, gold would have to be pegged at, say, \$6,000 per ounce, and so on.

Another plan proposed is not to meddle with the gold standard, but for the Government to pay the miner temporarily, and while the inflation continues, a corresponding bounty—say \$20 per ounce—which relieves the miner as above, giving him his forty discounted promises. This plan seems fair, but we fear it may not be practicable.

The Government must thus give its note without date for double the amount of gold that it receives; it agrees to pay 100 per cent "commission" for the loan, but it is doing that on all other commodities that it purchases, and, of all these, gold is the most valuable permanent asset. But this practice would not help it to reduce inflation nor to progress with its process of paying its obligations. To buy gold at 100 per cent premium for the purpose of paying at par its debts of Liberty Bonds and Treasury notes would be doing a rushing business but not one calculated to increase its financial standing.

The one partial remedy would appear to be to put all gold into circulation; but the governments dare not do this; otherwise they would hold the paper and some one else the gold—they know a good thing, even when they expect their publics not to know how essential it is. The fact is that there is not enough gold for this purpose. Better to keep up the fiction of the validity of the I O U's indefinitely.

If, then, our wealthy and prosperous nation has not enough gold to serve as a current medium of exchange, and if, as seems to be the case, there is no likelihood of having enough, both on account of the discouraged production and the fact that the gold mines of the world are being exhausted, the obvious thing would seem to be to provide some more abundant commodity medium of exchange, whether it be copper or wheat. Silver is obviously the most convenient, already a preferred commodity exchange medium among millions of people. The monetization of silver would, with gold, give the so-called bi-metallic system; it would increase the supply of real money, would at once add great weight to the balloon's anchor, and so tend to deflate prices; moreover, it would tend to increase the price (purchasing value) of gold, and so to increase the production of gold, and still further bring down the balloon. In a word, we submit that the monetization of silver would be the most substantial help that can be devised for the gold industry and for the general economic condition of the country.

Such a move is understood to be impending in Europe, where it is even more needed than here, as we have a far larger gold "reserve" than any other country. The loss of this fancied advantage should not worry us, for our great problem, even for our own interest, is to rescue Europe from its present bankruptcy.

The Petroleum Policy of England

PETROLEUM, as is well recognized by students of the subject, is the most important basic factor on which pivots future military and commercial power. In the immediate past the wealth and power of a nation have varied in direct proportion to its

coal and iron resources (granting that it retained control). That was the fundamental truth of the Age of Steam, with the use of coal as the highest form of fuel. Now, however, we are in the first flush of the Age of Gasoline and fuel petroleum, and oil outranks coal in immediate strategic importance. The petroleum resources of the world are mainly under the control of two great powers, both Anglo-Saxon—England and America. The latter predominates at present, because of the vast oil resources which have been discovered within her own boundaries, and because of the organizing genius of her private business concerns. The control of England is growing by leaps and bounds, because of a fixed national policy and, to a considerable degree, of direct government ownership and control.

America has had no government policy regarding oil since the government dissolved the Standard Oil Company. Since then the warfare against great and powerful business combinations has been neglected, but nothing new has been developed. England, on the other hand, has frankly adopted the opposite plan, of encouraging and even forming great oil monopolies, under government auspices. The power of this organized efficiency, with the great strength of the British government behind it, as compared with the weakness involved in the negligent policy of America, needs no explanation; and the result is that we must acquiesce in the prediction of various conservative American petroleum experts that before long the preponderant control of the world's petroleum, and with it the military and commercial domination of the world, will pass to Great Britain, and that if the United States sits down to the table of equal political and commercial power anywhere in the world, even at home, it will be by favor of England's request only.

These facts have been known for a long time in private as well as government circles; there is no secret about them, and the magnitude of England's official program in this respect is so great that it could not be concealed, even if she so desired.

We presented in our last issue an article written by an author whom we know personally, and who states a few plain facts and inferences as plain.

This British petroleum policy, it was shown, is frankly nationalistic and imperial, and bluntly discriminatory, against the United States in particular and all other powers in general. This is part of a similar nationalistic policy in regard to other minerals, the details of which we shall point out from time to time. Plainly, England desires to profit both by the threat and lesson of Germany. Plainly, she is determined that no other nation, Anglo-Saxon or otherwise, shall again put her into the extreme danger to which carelessness regarding Germany's schemes and methods submitted her. Her solution for the future, as to plan, is to dominate the world, not only by her old device of a twice preponderant fleet, but by political and commercial control of the fundamental mineral resources of the world. Her solution, as to method, is to adopt the efficient German system of state controlled monopolies; and to

further safeguard herself by discriminating against non-British investors.

This program was evident during the war, when the nationalistic sentiment was perforce stiffened, as in other countries, by the necessity of strengthening to match the unhealthy German nationalism; and was the cause of much dismay on the part of Americans who found themselves discriminated against by the program. For the United States to have made a strong point and issue of this condition during the war would have been to play into the hands of the Germans, who were endeavoring, without success, to promote the anti-British sentiment, for their own ends. The ultimate American belief in the fairness of Britain and the inevitable common destiny of America and England remained and still remains unshaken; but now that we two, standing together, have conquered the common enemy, it is opportune to have a plain talk as between friends and partners. America must not submit to be put in such a position as to risk being told by England that such a talk is unnecessary, since she has arranged matters with entire satisfaction to herself. There has been and is much talk of American world domination, which is as indiscreet as England's present policy. Partners in the world's wars, peace, and business must not seek to eliminate or dominate one another, but to divide activities, responsibilities, and profits equably.

Meantime, in view of America's sluggishness of insight and action, we can hardly blame England's vigorous and progressive nationalism (we believe it to be fundamentally against the Teuton and not primarily the American), so much as we do America's inactivity; and the firm yet fair method of joining issue with England in regard to her discrimination, in those countries which she controls, against American progress in the ownership and control of petroleum, would be to adopt corresponding retaliatory legislation, thus putting each on an equal footing as business rivals, but making it clear that we prefer that both should abandon selfish and domineering methods, and become true partners instead. In the shoulder to shoulder forward march of America and Britain, we firmly believe, lies the hope of the world; and not less important is the preservation of the dignity, independence, and power of America.

The Chrome Tariff Problem

WE ARE GLAD to publish in this issue an argument by W. P. Lass, a mining engineer interested in chrome mining in Alaska, in favor of an import tariff on chrome ores, as it presents the point of view of many domestic producers.

When our country entered the Great War, unprepared and at a time when Germany's star was in the ascendant, those mining engineers who were serving or advising the Government saw the necessity for an abundant supply of the necessary metals, without which our high-speed production of arms, supplies, munitions, and ships would slacken and the cause of democracy be lost. Heavy as this responsibility lay upon the miners, it lay still more heavily and directly upon those manufacturers of metal and

metal products upon whom the Government directly leaned and upon whom it made most imperative demands. The head of a great steel company frequently observed in conferences: "They say that gold will win the war; that this and that will win the war. I tell you it is through steel that we must win the war." That was his battle cry, and that of the Army and Navy—steel, chrome steel, manganese steel, vanadium steel, low-phosphorus steel, in quantity, immediately and continuously.

And the other metals were, and were recognized, as of supreme importance. The Army and Navy must have enough; too much was excellent, but not enough meant disaster. The one thought of all, miner and manufacturer, and Government man of every type (unless there existed traitors, of which there is no evidence), was to drive through a belated attack, which looked almost a forlorn hope, to victory against the Hun. Had Germany conquered Europe, America was preparing to fight her single handed.

To depart from this program, for the protection of this or that industry, at that critical period, would have been stupidity and folly. Sacrifice of life, wealth, and industry was the daily program—not protection; only the protection of humanity in the mass.

When a nation's life's in danger
We've no time to think of men.

Such regulations regarding minerals as were made by the Government, and such legislation as was introduced looking toward a war-mineral control, was simply with the above view, and no other. Certainly no restrictions on imports would have been desired or attempted had there been ships available. But the shortage of shipping, and the necessity for throwing an army into the battle line in France at once, and assuring its supply and support later, meant the forced withdrawal of ships from import trade for transatlantic service; and instead of such a withdrawal without plan, the withdrawal was made at once, under as good a plan as could hastily be drafted and agreed upon, for the exclusion of unnecessary imports, and for the reduction to an agreed program of such necessities as could, under the stimulus of Government appeal and high prices, be produced in the United States more abundantly than before. In the latter category was chromite.

The formulated program was abundantly justified and successfully carried out in that the dreaded shortage did not materialize; nor would it have done so had the war continued. Domestic production exceeded expectations, although not till the close of the war did it begin to assume proportions approaching the total necessity of war demands. Importations from overseas in New Caledonia and Brazil (little came from Rhodesia) were necessary during the conflict to maintain a safe reserve, and imperative in the beginning of the crisis. Had the German submarine campaign, which dismayed to the point of panic the steel manufacturers by the sinking (as commonly believed) in the Caribbean of a great cargo of Brazilian manganese bound for the United States, expanded and similarly blocked other ship-

ments of manganese and chromite, we should have been, to say the least, in a very unsafe position.

It is true that the program of importation of chromite was prolonged, and exceeded the estimate of those who had been commissioned to work out a schedule, and this contributed to the surplus which began to accumulate, which was added to by the domestic production being so far in excess of the most optimistic estimates made by the producers or the Government engineers, and further greatly increased by the campaign of economy in the use of chromium in steel making, demanded by the Government, and loyally carried out by the steel manufacturers; and in this element of importation the program announced to the miners as one on which they could count in their plans was departed from, due to the lack of sufficiently close co-operation between war committees and war boards in the intense drive of war activity. In war time this jar in the machinery was of minor importance beside the fact that the net results were an abundance of the metallic sinews of war; and would have been adjusted by special war remedies had the conflict continued.

With the war victoriously concluded, however, the time comes for readjustment and repair. The dead have been buried, the crippled sent to their homes with their trifles of insurance money; the homes of France will one day be rebuilt, and the mines of Belgium will eventually be unwatered. Unhappy should be the American who cannot count sacrifices made for what has been attained, and most happy is he if he has not received cash in full compensation. What of the host of volunteers and no less eager drafted men who forfeited their business and their acquired positions, to dodge shrapnel at \$30 per month? Do not worry about them. They have been paid in full (such as came back), although minus a limb or so, gay young d'Artagnans of the air, land or sea; stanch doughboys or graying resolute older men; and their message is that they will do it again if necessary. But the discharge of commercial debts and obligations legally contracted, or morally incurred, by the Government, is apparently not a difficult thing; and for this reason we have supported the plan to compensate chrome miners for their losses, for the reason that the strict letter of the assurances made to them by their government was not kept, and because they have, in many cases, suffered cash losses thereby.

So much for the past. We have only referred to it because it rankles so persistently and is viewed so disproportionately in discussion, of the present and the future, and because bitter feeling concerning it has been fanned by an uninformed and sensation-seeking press. The only constitutional method of discharging the debt of honor to the miner lay in Congress, which passed a bill that, under the back-and-forth battering of many views, emerged in a form so restricted as not to present an equitable and uniform remedy, but which must be administered as directed. So much for the present.

The question of the tariff is the question of the future, and should not be linked sentimentally with

the past. It is now proper, as the nation has been saved, for classes, industries, and individuals to consider their needs, advance their welfare, and argue for a recognition of their rights. Various domestic industries accordingly demanded protection from foreign competition through a tariff, following a well-established American principle. Among those asked for is the tariff on chrome, arguments in favor of which are presented by Mr. Lass. We should like to receive contributions of further discussions of this vital question, and from various points of view; and at a later time should like to make further comment.

Control of Spanish Potash

THE Spanish potash deposits, which were recently visited by Hoyt S. Gale, of the U. S. Geological Survey, and described by him in this issue, are of considerable interest to Americans. The pre-war German potash monopoly was held by the Germans to be one of their lasting assets, and a club to reduce refractory nations like America to submission and to force an exchange of raw materials like copper and cotton, which Germany needs. For America, looking forward during the war to the post-war period, relief from this monopoly was sought in the development of our own potash-producing industries, mainly as byproducts; but there was also taken into consideration the little-known deposits of Spain. The defeat of Germany and the acquisition by France of Alsace, broke up the German monopoly, however, so that we may now buy either from France or Germany. The development of Spanish deposits opens up a new field.

The strategic control of these Spanish deposits is of special interest to us. The Spanish government, as stated by Mr. Gale, has provided that the mines shall be grouped in a syndicate, in which the government shall own a share and have a voice—in other words, a state-controlled monopoly, patterned after the German Potash Syndicate. The law further specifies that the domestic prices shall be less than the export prices and that the government shall fix the maximum domestic price and the minimum price for the exported article; also that it shall fix the approximate output of each mine. Potash lands may be held for operation by the government, and all mining concessions are under supervisory control of the government.

Mr. Gale enumerates the principal owners of concessions. They include a Franco-Belgian syndicate, a Spanish chemical company with German affiliations, a Spanish-French chemical company, a German company allied to the German Potash Syndicate, and an American company. This is another instance of the adoption of the German system of state-controlled monopolies for strategic economic power for nationalistic purposes, which we have previously pointed out in the statement of the British petroleum policy. The Spanish program nullifies any attempt at commercial control by aliens, discriminating between foreign and domestic purchasers in favor of the latter, in order to give economic advantage to Spain through a protective

export tariff; and prevents competition between producing companies unless through political intrigue and favoritism. There would appear to be little attraction for American capital in this field.

The great business combination was the result of American inventiveness. Disowned in the land of its birth, it was adopted by the German state with that Teutonic faculty for utilizing the inventions of other nations, and was used as a means of strengthening an offensive and defensive nationalism. Demonstration of the centralized effectiveness gained thereby has been well noted by various nations, whose policies as regards mineral supplies as well as other resources it is worth our while to observe and consider. There is the germ of much international politics in such arrangements as this Spanish potash syndicate. Secret rebates to favored nations could easily be arranged. We can easily conceive, in view of Spain's unsatisfactory war record, secret understandings between the potash syndicates of Germany and of Spain in regard to the country that will probably be the chief customer, the United States. The organization of the French potash industry will be looked forward to with interest. It is for the benefit of France, and indirectly of the United States, that the latter should, under present economic conditions, purchase from France as much potash as possible, and France should not adopt the Spanish plan of charging a special price to us.

The 1918 Price of Copper, Compared With Its Cost

WE PUBLISH on another page a summary of the report of the Federal Trade Commission which assisted the Price-Fixing Committee of the War Industries Board in determining a fair price at which copper should be sold during the war. The report contains several interesting tables, some of which we reprint.

The price of copper for the year 1918 was 24.7c., and the average cost, as determined by the commission, was a trifle over 16c. The profit was therefore about 8.5c. per lb. As 85 per cent of the copper sold was produced for less than 20c. per lb., a certain amount of criticism, largely for political effect, has been directed at the Government price-fixing board for setting the price at too high a figure. The fact must be kept in mind, however, that the Government fixed price, which became effective Sept. 21, 1917, was over 7c. less than the average market price which had prevailed during the preceding nine months. Moreover, had the price been set at, let us say, 21c. per lb., 39 of the 85 companies, or 46 per cent, would have operated at a loss, and many would have been compelled to suspend operations. Yet these 39 companies produced only 14 per cent of the total copper. With the exception of some of the Michigan companies whose orebodies do not justify the investment, they are the younger properties still in the course of development. The Government happily did not set the price so low as to kill off the children of the industry.

Potash Deposits in Spain *

Extensive Salt Basin, the "Salina de Cardona," a Possible Source of Chloride of Potassium—
Government Restrictions and Details of Plans for Development
Now in Process of Execution

BY HOYT S. GALE

THE announcement of the discovery of potash in deposits in the Province of Barcelona, in Catalonia, in the northeast corner of Spain, appeared in print in 1913 with the publication of the first of two excellent reports on the subject by engineers of the Instituto geologico de Espana.¹ There has been much discussion of the salt deposits of the region, which have long attracted attention as showing remarkable features. The potash associated with these salt deposits was recognized in 1912, and then only by accident, as a result of development to enlarge the production of salt.

The Spanish potash field, as now defined, lies northwest of Barcelona. The area is about seventy-five miles long, and forms a practically continuous

twenty miles north of Manresa. A branch railway is now under construction from Manresa to Suria, put in primarily on account of the potash developments now going on at Suria.

A large area of concessions has already been ceded to private claimants by the Spanish government. After the first rush to appropriate these mineral lands, restriction was put on the granting of further rights. A tract reserved by the state includes a total area of about 1,800 square miles. Much of this tract is undoubtedly not potash-bearing, but it includes in a general way the formations similar to those containing the salts at Cardona and Suria, and is a provisionally outlined field reserved for further exploration. An area of 350 to 400 square miles is outlined in the map of concessions already granted.

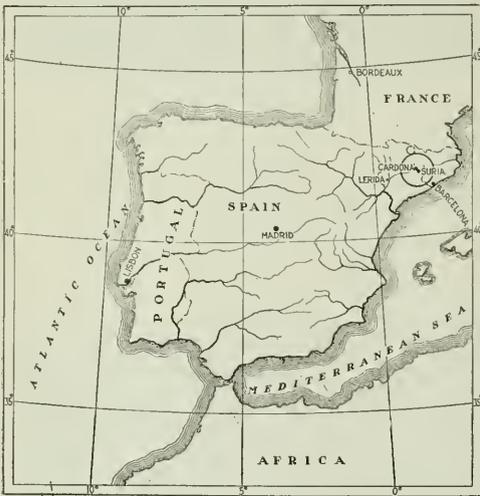

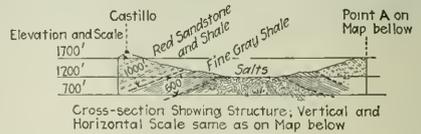

FIG. 1. INDEX MAP OF SPAIN, SHOWING THE SITUATION OF THE POTASH DEPOSITS OF CATALONIA.

belt, with a maximum width of fifteen to eighteen miles. The general situation of the field is represented on the accompanying index map (Fig. 1).

The principal discoveries of potash have been made in the immediate vicinity of the villages of Cardona and Suria. Both lie in the valley of Cardoner River and are reached by motor omnibus or "diligence" over an ordinary country road following the river. Manresa is forty miles by rail from Barcelona, and train service is frequent and fairly satisfactory. Suria is nine miles and Cardona about

Cross-section Showing Structure; Vertical and Horizontal Scale same as on Map below

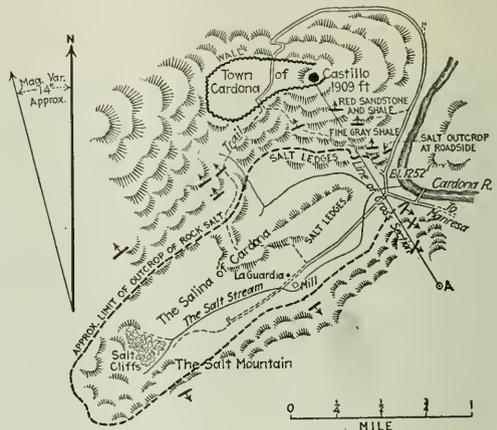

FIG. 2. SKETCH OF THE "SALINAS DE CARDONA."

Private interests or foreign governments are invited to participate in the development or operation of the field, under specific regulations of the state and local governments as to the manner and regularity of operation and the price and distribution of the product. This phase of the subject is discussed at greater length in the section entitled "Spanish Legislation."

*Abstracted from a forthcoming paper of the U. S. Geological Survey.

Inst. geol. Espana Bol., Vol. 34, pp. 173-230, 1913; "Sales potasicas de
Cataluna"; Idem, Vol. 39, pp. 1-38, 1918.

The principal owners of concessions in the Spanish potash field are as follows:

Solvay & Cie., 33 Rue du Prince Albert, Brussels, Belgium. This is the well-known Franco-Belgian syndicate, which already operates in Spain in the subsidiary soda works at Santander.

La Sociedad Fodina, which has engaged in exploring concessions ceded to Francisco Ripoli and Ignacio

isyndikat. La Minera controls an extensive area of concessions in various parts of the Spanish field.

The American Agricultural Chemical Co., 92 State St., Boston, Mass., holds concessions in the name of Roberto Sturz Bradley. Two properties called the Filadelfia and the Boston cover territory adjacent to or intermediate between areas in which the recorded discoveries of potash salts have been made.

Besides those named above there are other less extensive holdings, listed under the names of Juan Vives, Rene Paulus, and Demetrio Castellana Moreno, and there are also some concessions originally held for coal that may include potash.

"La montana de sal de Cardona," described by Calderon² as a veritable mountain of salt eighty meters high and four kilometers in circumference, shown in Fig. 3, has been one of the renowned natural features of Catalonia since a very early date. Baedeker says that this phenomenon is mentioned by Strabo, quoting a reference to Book III of his geographical works. The mining of salt from the Cardona deposit is an old industry and is still carried

FIG. 3. VIEW OF LA MONTANA DE SAL AT CARDONA

Marinello, of Barcelona. This concern is understood to be a subsidiary of or closely allied to the Sociedad Electro-Química de Flix, Calle de la Princesa 21, Barcelona. The last-named company is listed as a manufacturer of caustic and industrial chemical products, presumably fertilizer materials, and is said to have strong German affiliations.

La Sociedad General de Industria y Comercio, a Spanish and French company, with headquarters at Villanueva 11, Madrid. This company is engaged in the manufacture of fertilizers, explosives, and other chemical products, and has plants at Bilbao, Barcelona, and in other parts of Spain.

La Compania de la Salina de Cardona, the old salt company that has been mining and shipping rock salt for many years from the celebrated salt mountain of Cardona. The property belongs to the Duque de Tarifa. The local administrador is Juan Ratera Cendra, at Cardona.

La Minera, a German organization, is reported to be a subsidiary of one of the potash companies in Germany, and therefore allied to the German Kal-

FIG. 4. OUTCROP OF SALT AND THE OVERLYING SHALES AND GYPSUM.

on, both for local consumption and for export. The title to this property is apparently a local hereditary right, having recently passed from the Duque de Medinacelli to the Duque de Tarifa.

Cardona is an old fortified town perched on the summit of an almost isolated hill in a bend of Cardoner River, 600 feet above the river level. The town

²"Los minerales de Espana," Vol. 1, p. 385, 1910.

is surrounded by a wall and dominated at the very summit by an interesting old castle. In clear weather there is a wonderful view from the castle, with Cardoner River stretching away in either direction in the foreground, and, beyond it, to the north, the distant snow-capped peaks of the Pyrenees. To the south and southwest the town overlooks, at the very foot of the hill on which it is situated, a peculiar depression which is the salt basin, the "salina de Cardona." At the farther end of this basin is a great whitish-looking scar lying against the mountain side, and this is the famous mountain of salt. It is a great natural outcrop of rock salt which occurs as an interstratified part of the sedimentary rock section. It is brought to the surface along the crest of a distinct anticlinal fold, the structure of which is perfectly evident in the dip and stratification of the series of sandstones and shales which overlie it and whose outcrops encircle the basin in regular form. Smaller exposures of rock salt occur at many places in the bottom or on the lower slopes of the basin. Just at the foot of the hill below the castle is a large funnel-shaped sink hole.

The salt is mined in solid form and is sawed or hewn into regular-sized blocks for shipment. The Spanish yearbook "Anuario general de Espana" for 1917 says in reference to Cardona: "It owes its renown to its famous mountains of salt, from which there are extracted 40,000 quintals annually." The salt blocks are said to be chiefly exported to Africa, where salt is prized in this form. The industry is limited, however, by the cost of transportation. Salt from this source was supplied to the American army in France during the recent war, and it is said that production was pushed to the capacity of the equipment.

The upper layers of the deposit are a composite of relatively thin bands of variously colored salts and interstratified layers of gypsum and clay. These upper salt layers appear in a strangely contorted mass. Under them there is a great compact mass of white transparent salt, which is very pure. According to report, the mining was formerly done in a large open pit, the salt being cut in steps or terraces, but now it is obtained by underground methods. The workings have a depth of fifty meters, and the whole depth, it is claimed, is cut in solid salt without the intercalation of any other substance.

The accompanying sketch map, Fig. 2, I prepared from a pocket-compass traverse made at the time of my visit. It shows the general outline of the outcrop of the salt and the situation of the basin with respect to the valley of Cardoner River and the town of Cardona.

The salt basin is the eroded axis of a well-defined anticline. Apparently the massive rock salt is the lowest member of the section exposed by erosion and solution along the axis of this fold.

The view in Fig. 4 shows the outcrops of salt and the overlying shales and gypsum in the bluff at the base of the hill below the castle, at the outlet to the salt basin. The stratigraphic section exposed in the bluff below the castle is represented in the cross-section attached to the sketch map of the salt basin.

By rough computation from the data obtained in making the sketch map, the section exposed here totals about 1,800 feet of stratigraphic thickness, but the thickness can be obtained much more accurately with more careful measurements.

Little seems to be known about the total thickness of the salt beds. The cliff at the head of the salt basin is made up of banded salts in a strangely contorted mass. This contortion illustrates the plasticity of salt under such compression as has been exerted on it in the folding of these rocks. No estimate of the normal thickness of the whole could be obtained from such a mass. The folding is probably extreme in the axis of the fold, and possibly would not extend far on either flank. Fig. 5 is a view of the contorted bedding in the salt cliffs at the head of the salt basin.

Extent of Potash Occurrence Uncertain

The evidence of the existence of potash in the Cardona deposit is not very definite. This may be because of lack of adequate investigation at this locality, or the potash may not be present in large amount in this part of the field. As has been said, this exposure gives one of the most favorable opportunities in the field for observation of the general relations of the salt and the overlying beds. It is geologically an epitome of the Spanish field, whether the potash is found in commercial quantity at this locality or not.

Rubio, in his report, already referred to, quotes some analyses of samples from both red and white specimens from the Cardona deposit, which show the existence of pure chloride of potassium at this locality. He states, however, that these were found only in a small area, and it was said locally that the potash had so far been found only in thin seams in this deposit. Analysis of the salts in solution in the little brine stream that flows from the big salt cliff is stated to have shown 81.65 grams of potassium chloride per liter of the solution. This seems to be saturation with respect to potassium chloride, but in any solution this depends on the amount and nature of the other salts present, particularly magnesium chloride, the amount of which is not stated in this analysis. The amount of the potash indicated is high in any case. The value and workability of the potash beds in the Cardona region is therefore still problematical, but there is an excellent prospect at this locality that seems worthy of exploration.

Potash Prospects at Suria

The discovery of potash in the Spanish field was first made at Suria in 1912, by accident. In attempting to open a mine for common salt, at a site where there had been some ancient salt workings, Macary & Viader sunk some borings and a shaft that revealed the potash salts, and it appears that these were soon recognized as potash. An investigation carried out in 1913-14 by a French association resulted in the application for and granting of a concession near the village of Suria, which concession was later enlarged, and concessions in other parts of the field were added to it. This group combined

interest with the Belgian Solvay Co., and the subsequent explorations in the field have been conducted by the Solvay Co., principally in the immediate vicinity of Suria. The discoveries at Suria, of which there are now available only the records of the old shaft sunk for salt, and the borings sunk on the Solvay Co.'s concessions, constitute about the only evidence of the existence of potash in quantity in the Spanish field. These holes have been filled and carefully sealed to prevent damage to the deposit by water, and no new evidence is to be had from them. The records available have been published in the reports of Rubio and Marin already referred to. There is no doubt that the existence of potash in considerable masses has been demonstrated.

An old shaft, sunk at the edge of the river-bottom lands, has now been supplemented by about fifteen borings, mostly in the immediate vicinity of Suria, and nearly all of these are reported to have shown sylvinite and carnallite in fairly regular beds, so that in the main these beds could be correlated from place to place. The contorted beds, it is said, are confined to the axes of the folds. There are in general two beds of carnallite and a lower bed, in some places two, of sylvinite. The carnallite zone, containing workable beds three meters or more in thickness, averages 12 per cent potash (K_2O) as shown by taking a weighted average from the core samples so as to represent all the material removed from the section indicated. The sylvinite, in beds of two meters or more in thickness, is reported as averaging at least 20 per cent potash, and certain portions containing much purer material were found. Tonnage estimates of the reserve supply in the concession at Suria have been based on the evidence that is here summarized. The evidence was deemed sufficiently good to justify a company with a reputation for competence and conservatism in proceeding with some rather extensive plans for actual commercial operation in its property.

Standard Mining Shaft Put Down and Plant Erected

At the time of my visit, in May, 1919, a standard mining shaft, which was begun in April, 1918, had reached a depth of about sixty meters. Permanent foundations for a refining plant and substantial dwellings and offices for staff and employees were also being erected. The shaft had not yet reached the depth at which it was expected to encounter the potash, but water was flowing from a zone at about the level of the river, and the work going on at the time consisted chiefly in the attempt to seal this out. The new shaft at Suria is about 1,500 ft. from the old shaft. It lies in approximately the same stratigraphic position as the old working, and probably encounters a similar geologic section, with some variation in detail.

The area at Suria considered as proved by these prospects is about 3,500 hectares (75,145 acres), which, according to optimistic reports of interested engineers, establishes the existence of potash-bearing strata of an aggregate thickness of 80 to 200 meters, having a potential production of 200,000,000 tons of pure potash (K_2O).

Aside from the two localities at Suria and Cardona, which are only seven or eight miles apart in an air line, the field covered by concessions reaches about thirty miles to the east and forty-five miles to the west, the locations being based rather on the extension of similar geologic formations, with some evidence of salt, gypsum, and the shales associated with the salt, than on specific discoveries of the potash. A good deal of boring has already been done throughout this area, mostly with essentially negative results, but a few more positive indications have been found. The principal evidence of the existence of potash outside the valley of Cardoner River is at Villanueva de la Aguda, a village situated near a locally well-known brine spring a little over twenty miles west of Cardona. The brine is reported to carry 4.1 gm. of potassium chloride per liter, which

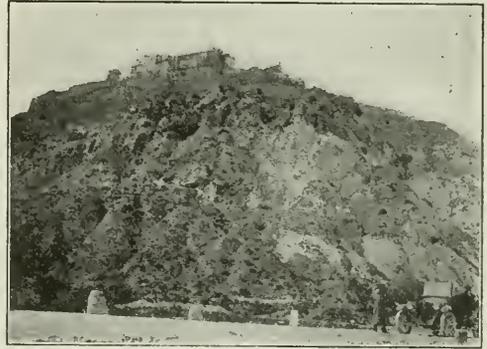

FIG. 5. CONTORTED BEDDING IN THE SALT CLIFFS.

is not necessarily an exceptional indication. However, a boring put down by La Sociedad Fodina is reported to have cut two layers of potash salts, the first at a depth of 303 meters and the second at 654 meters. The boring was continued to a depth of 737 meters, and was discontinued while still penetrating massive salt. The information as to the thickness or character of the potash seems to be rather meager. Many of the borings have shown the extension of the massive rock-salt deposits or of gypsum and salt mixed, and there is always the possibility that the record is incomplete through failing to reach sufficient depth or for other reasons.

General Geology of the Field

An extensive basin of Tertiary sediments in north-eastern Spain is limited on the north by the east-west axis of the Pyrenees Mountains, which is a well-defined anticlinal fold exposing the Paleozoic rocks, gneisses, and granitic rocks along its crest. This great low area extends eastward from the valley of Ebro River, and is sharply delimited on the south by the coast ranges of Catalonia.

From the conditions present it seems probable that during some portion of earlier Tertiary time in this region the Ebro basin may have been occupied either by a continental sea or by a great gulf with narrow passages connecting it with the ocean. According

to the observations of European geologists, the uplifting of the great anticlinal folds that give rise to the Pyrenees Mountains began in the Eocene but took place principally in Oligocene time. Thick salt and gypsum deposits are found among the sediments laid down in this basin during Eocene and Oligocene time. Thus the earth movements gave rise to inclosed areas where the evaporation of saline waters left thick deposits of crystallized salts, and in at least some parts of these areas this process was continued to a stage at which the potash and magnesian residues of the mother liquor brines were also crystallized. The historical record seems fairly clear in its major aspects. The section of Tertiary rocks, which is well exhibited, includes near its base a great mass of thick-bedded sandstones and conglomerates with interbedded shales.

To identify the position of the salt beds and the associated potash, and to trace the extent of the field in which they will be found, it seems necessary that the section beginning with the sandstones and shales exposed at Manresa as a base and extending to the top of the series represented in the field should be studied in detail. These Tertiary rocks are made conspicuous by a prevailing deep-red color in the weathered surfaces, so that the series superficially resembles the so-called red beds of the Triassic or Permo-Triassic of the United States. Aside from the general similarity of the rocks and their manner of exposure, both periods were characterized by the deposition of salts and gypsum. The salt, including the potash, occurs rather low in a complex series of sandstones, conglomerates, shales, clays, and some limestone and gypsum. A more favorable field for the study of both structure and stratigraphy is seldom found.

Although there appears to be little information about the total thickness of the beds overlying the salts, it seems likely that this section is thick enough to bury the salts deeply in a great part of the Tertiary basin. In at least the two places, however, that have been described folds have brought the salts to the surface along the Cardoner River channel, and the salts are relatively shallow in many other parts of the field.

Spanish Legislation Concerning the Potash Lands

Soon after the general announcement of the discovery of potash in Catalonia, efforts were made to put through special legislation concerning these deposits. This was in principle a perfectly natural and appropriate step, as applications for extensive areas and rights of a class without precedent in the country would naturally require special consideration.

In 1915, a bill was presented to the Cortes, the national legislature of Spain, by the Minister of Public Works. This bill seemed to place such restrictions on ownership, development, and operations that it aroused protest, and apparently was not passed. It was replaced, however, by a royal order dated June 10, 1915, which was in harmony with the general provisions of the bill still pending. It provided that

the concessionnaires in the potash field must work uninterruptedly either in exploration or by mining. According to this order, if regular production had been established under it the concessionnaires would have been obliged to reserve for consumption in Spain such part of the potash recovered as the government might require.

Another royal decree, published on Oct. 1, 1914, permitted the Spanish government to reserve the right of private concession in the potash field until investigations by the technical departments of the government had been carried out. This also granted a right for permanent withholding of land in the field for operation by the government, if that should seem desirable. Rewards for further discoveries of value in this field were offered.

These orders remained in force until increasing activity in the developments at Suria during the early part of 1918 again attracted attention to the subject, and on May 2, 1918, another potash bill was published in the "Gaceta de Madrid." This contained much of the original bill of 1915, including the obligation on the part of concessionnaires to continuous operation, protective measures in favor of internal consumption of potash, a provision that export prices for the potash produced shall be greater than the domestic, and annual regulation of the maximum price for the home market and the minimum price for export. The government is also directed to fix the maximum and minimum annual output of each mine. The Spanish government assumes supervisory control of all mining concessions granted or to be granted, and work on such properties must be under the supervision of the mining inspector of the district in which the concessions are situated. Provision is made that the government shall own a share in a syndicate of owners of the mines and shall have a voice in the administration of this syndicate—regulations evidently patterned after those of the German Kalisyndikat.

Quotations from royal order dated Dec. 14, 1918, state that conditions have been specified under which foreign and Spanish companies can compete for concessions to work the potash deposits.

The restrictions placed by the acts of the Spanish government have undoubtedly impeded progress in the development of the field, and the price-fixing feature of the present act must prove a deterrent to foreign capitalists desiring to enter the field. It is of course fair that Spain should safeguard her own interests, as, for instance, in providing against passing the ownership of these properties too largely into foreign hands and in insuring preferential treatment for domestic potash requirements from these deposits. However, assurance is needed that the conditions under which developments in the field are undertaken will be stable.

Prospects for Production

Production of potash for commercial use from the Spanish field is not expected during 1919, and, even with good fortune attending the work now going on, it seems unlikely that potash will be shipped from

these deposits before the middle of 1920 at the earliest. It is still too early to estimate with much confidence what the future of the Spanish field as a factor in the world production of potash will be. The prospects of production to meet Spanish needs seem promising, particularly as the lower grades of crude salts that may be obtained at first may be available locally before it may be possible to carry out the refining processes successfully.

Statements estimating tonnage reserves are accepted with considerable reservation, until some verification is obtained from underground development by mining. Well records in regions of such structural complications as are exhibited in these salt deposits must be very difficult of interpretation, and the thicknesses recorded for the potash beds encountered must be largely dependent upon the angle at which these beds are penetrated, which is often not determinable. It appears that the more regular parts of the deposits, if such exist, have not been explored.

For the reasons stated above, it still seems necessary to reserve judgment as to the magnitude or importance of the Spanish potash field. The prospects are excellent, and the development now going on should settle the matter in a practical way very soon. Although there is abundant potash in both the German and Alsatian potash fields, and in other possible sources to supply the world's needs for as long as there is now need of estimating, it is far to be preferred that the world should be supplied from numerous and abundant sources than that there should be any danger of monopolizing this resource. Further news of the success attending the development of this field is to be awaited with interest.

Caisson Alluvial Diamond Recovery*

New Plant, Designed for the Purpose of Recovering Diamonds From Vaal River, Provides Diving Bell with Tubular Shaft and Air Lock

AN INVENTION of Fabian M. Cox, consisting of a pontoon with a caisson attached, is expected to solve the problem of recovering diamonds from the deep pools of the Vaal. Briefly, the plant comprises two pontoons, rigidly connected by decks, between which a roomy caisson or diving bell is sunk to the river bed. The caisson is connected by means of a tubular shaft to a chamber above the water level, and the whole is air locked. In order to keep the caisson submerged, it is weighted with heavy iron ballast, and the upper chamber, above the water level, is similarly weighted by an outer concentric chamber or tank filled with water, which can be regulated as to quantity and adjusted to carry the necessary weight.

Compressed air is forced into the interior of the upper, or air-lock chamber, the shaft and the bell, or caisson, and the river water being thus forced out below it is possible to carry on digging and loading operations conveniently. The gravel is hoisted

up the shaft and delivered into a chute which holds about a ton. When filled, it is discharged by a mechanism of double doors, which prevents the escape of compressed air from the interior of the various caisson compartments. Safety is provided by means of the free communication of the bell with the upper or air-lock chamber through the shaft and ladderway and by an easily opened manhole above.

The following notes are taken from the provisional patent specification: The present invention has reference to caissons or diving bells of the air-lock type, and in this instance is designed for the recovery of gold or precious stones from deep waters. The invention consists of providing a diving bell having a tubular shaft and air lock with means of quick vertical adjustment through the agency of solid and liquid ballast and suitable guiding frame, and means of elevating minerals by (a) submerged pump, or (b) suitable hoist.

Apparatus Involves Diving-Bell Principle

The following is a description of apparatus constructed according to this invention, and in this instance it is presumed to be for purposes of diamond recovery: A metal cylinder or bell, having a dome roof which is surmounted with a tubular shaft in sections to suit the depth of water to be worked, is terminated by an air-lock chamber surrounded by a water-ballast tank. The dome roof of the bell is provided with means of securing and at will releasing a quantity of solid ballast. The tubular shaft is furnished with external runners, which engage in rollers or guides attached to the deck of a pontoon or raft, which carries an engine, air compressor, and centrifugal pump, and possibly a plant for the treatment of the gravel or material recovered. The air-lock chamber is provided with the usual man-hole door and equalizing valve, together with an air-lock chute for discharging gravel, a special door closing the entrance to the tubular shaft, which latter is furnished with ladder rungs and runners for skipway, operated by a hoist fixed in the air-lock. The base of the shaft where it enters the bell is fitted with an air-tight door, which may be used when it is necessary to lengthen the shaft. The bell is provided with collapsible seats attached to the wall for the accommodation of workers during lifting operations, and with a centrifugal pump or hydro-ejector having a flexible suction, by means of which the loosened gravel is deposited in the kibble or skip hoisted to the air lock or elevated direct above water level to the deck of the pontoon.

Bell Submerged and Held on River Bottom

Sufficient solid ballast, partly to submerge the bell, is placed on the dome roof; water ballast is then pumped into the tank surrounding the air lock in order to sink it and hold it securely on the river bed or sea bottom, and the gravel is elevated to the surface by pump or ejector direct, or hoisted to the air lock and thence discharged through the air-lock chute projecting through the water-ballast tank.

* From the S. A. Mining and Engineering Journal, Sept. 6, 1919.

Copper Costs Average 16c.

Federal Trade Commission Publishes Results of An Investigation of the Books of 85 Domestic and Foreign Companies for Year 1918

THE Federal Trade Commission has published a report on the cost of producing copper in 1918 which covers 85 companies, responsible for 95½ per cent of the total copper production in the United States, 94 per cent of that in Chile, 71 per cent of that in Peru, 58 per cent of that in Mexico, 50 per cent of that in Canada and 20 per cent of the copper production of Cuba.

TABLE I. QUANTITIES OF COPPER PRODUCED IN 1918 AT DIFFERENT RATES OF COST PER POUND

Item (a)	Number of Companies	Production 1918	Per Cent of Total	Accumulated Per Cent
Cost less than 12 c.	2	122,245,051	5.4	5
Cost between 12 and 13 c.	4	208,571,191	9.2	14
Cost between 13 and 14 c.	4	314,553,177	13.9	28
Cost between 14 and 15 c.	4	359,611,743	15.9	44
Cost between 15 and 16 c.	2	98,207,293	4.3	48
Cost between 16 and 17 c.	8	460,328,645	20.3	69
Cost between 17 and 18 c.	9	255,398,696	11.3	80
Cost between 18 and 19 c.	3	72,374,388	3.2	83
Cost between 19 and 20 c.	5	28,491,436	1.2	85
Cost between 20 and 21 c.	5	36,871,193	1.6	86
Cost between 21 and 22 c.	9	155,538,602	6.0	92
Cost between 22 and 23 c.	2	60,891,465	2.7	95
Cost between 23 and 24 c.	5	44,919,772	1.9	97
Cost between 24 and 25 c.	1	6,230,694	.2	97
Cost between 25 and 26 c.	3	7,695,224	.3	97
Cost over 26 c.	18	46,119,555	2.0	100
Total all companies reporting	85	2,258,234,125	100.0	
Approximate pounds duplicated		63,700,000		

(a) All costs show fractions of a cent.

The term "cost per pound" is indefinite. As used in this report it represents the cost per pound of copper at the Atlantic seaboard and includes all items of expenditure for labor, materials, supplies, and over-

their mineral land. This is one of the largest single factors accounting for the apparently large increase in the cost of producing copper in the last year or two.

The commission had considerable trouble in calculating costs on a uniform basis. The calculation of the charge for depletion of orebodies, which included a determination of the actual cost of the mineral land, and the quantity of ore in the ground, was particularly difficult.

The cost of the mineral land would appear to be easy to determine, but as interpreted by various companies it may or may not include items amounting to millions of dollars. As an illustration, Company A acquires its land and develops it by stripping the capping from the ore. The cost of this is charged to a deferred asset account, to be charged later to cost as the ore is removed. Company B, instead of charging development to a deferred account, makes the charge against its mineral land account, considering that until the mine is in actual operation, the capitalization of such expenditures is proper.

Development may also be accounted for in two distinct ways. One method, which is generally in use by the porphyry companies, is to set up as a deferred charge the entire cost of developing. This deferred-development account is credited and costs are debited periodically as the ore is removed. The other method, usually practiced by deep mines, is to charge the development to operations at the time incurred. This is often far less accurate than the preceding method, as during the past year or two the shortage

TABLE II. WEIGHTED AVERAGE COST OF PRODUCTION OF COPPER BY OPERATIONS AND BY GEOGRAPHICAL DIVISIONS FOR THE YEAR 1918

Operation	Arizona and New Mexico	Utah, Nevada, and California	Montana, Idaho, and Washington	Michigan	Other United States	Mexico, Cuba, and South America	Canada and Alaska	All Companies Reporting

TABLE III. WEIGHTED AVERAGE COST OF PRODUCTION OF COPPER BY ELEMENTS OF EXPENSE AND GEOGRAPHICAL DIVISIONS FOR THE YEAR 1918

Item	Arizona and New Mexico	Utah, Nevada, and California	Montana, Idaho, and Washington	Michigan	Other United States	Mexico, Cuba, and South America	Canada and Alaska	Total
	Cost per lb.	Cost per lb.	Cost per lb.	Cost per lb.	Cost per lb.	Cost per lb.	Cost per lb.	Cost per lb.
Labor	\$0.044	\$0.044	\$0.094	\$0.078	\$0.069	\$0.029	\$0.046	\$0.053
Materials and supplies	.032	.041	.042	.050	.065	.030	.043	.037
Overhead	.018	.014	.017	.010	.049	.048	.011	.021
Depreciation	.006	.006	.011	.012	.012	.012	.015	.009
Depletion	.006	.005	.012	.005	.003	.007	.009	.007
Tolls	.053	.063	.037	.020	.022	.053	.052	.049
Credits	.010	.012	.042	.002	.024	.023	.016	.017
Totals	.151	.168	.174	.176	.199	.156	.162	.161

head, but not interest or income and excess-profits taxes. Depreciation on plant and equipment are included as well as a charge for depletion of orebodies. Up to the year 1917, few companies reported depletion as a cost, whereas practically all companies now include such a charge, based on the valuation of

of labor has prevented most companies from doing a normal amount of development. If it had been done, the costs of production would have been somewhat higher.

The average cost of producing copper for the 85 companies reporting to the commission was 16c.

Table I shows how much copper was produced at various costs per pound and will prove interesting to those who wish to determine just what a low-cost or a high-cost producer is.

The division of these costs among the different operations and by geographical locations is brought out by Table II.

The costs in Arizona and New Mexico are low, on account of the fact that the majority of the low-cost porphyries as well as some high-grade mines are situated there. The high depletion shown in the Montana district is due principally to the comparatively high cost of mineral land of one of the companies. The high mining cost in the Montana and Michigan districts results from the extreme depth at which the ore is mined. Reduction costs are low in Michigan, because the metal occurs as native copper and after milling only needs to be melted out of the gangue.

Table III shows the same costs itemized by the elements of expense.

"Tolls" includes charges for smelting and refining of ores or concentrates paid by many companies, including most of the porphyries, and transportation to the Atlantic seaboard. The lowest cost for toll operations occurs in the Michigan district, as the copper is there produced as a finished product by the smelteries, which are generally owned by the producing or allied companies. The low labor cost for Mexico and South America is due partly to cheap labor and partly to the methods of reporting costs. The extremely high price of labor in the Montana district is partially offset by the credit for precious metals, whereas in Michigan the high labor cost is offset only by cheap reduction.

Table IV shows how the costs rise when low-grade ore is treated. This does not include the porphyry or Lake companies.

TABLE IV. COMPARISON OF THE PER CENT OF COPPER IN THE ORE WITH THE COST OF PRODUCTION OF COPPER FOR ALL COMPANIES, EXCEPT PORPHYRY AND LAKE, FOR THE YEAR 1918.

Companies other than porphyries and Lake	Number of Companies	Production	Per Cent of Production	Accumulative Per Cent of Production	Weighted Average Costs
Ore assaying below 2 per cent	9	121,431,566	9.69	9.69	\$0.205
Ore assaying between 2 and 3 per cent	16	178,742,438	14.26	23.95	.209
Ore assaying between 3 and 4 per cent	10	475,109,295	37.89	61.84	.168
Ore assaying between 4 and 5 per cent	8	130,474,902	10.41	72.25	.154
Ore assaying over 5 per cent	10	348,009,384	27.75	100.00	.134
Totals	53	1,253,767,585	100.00		.167

The aggregate investment was over \$672,000,000, which on the average for all companies was nearly 30c. per lb. of copper produced. In other words, copper producing companies on the average, need a profit of 3c. per lb. to net 10 per cent on the investment. The actual average rate of profit for the year was 28 per cent.

Rhodesia Gold Production in August, according to Financial America, was 49,621 fine oz., valued at £207,339. The production of gold in July was 51,176 fine oz., valued at £214,919.

Killing Off Our Enemies

Insidious Propaganda of the Shower-Bath Manufacturers and Tooth-Brush Makers, Spread by Dr. Darlington, Deserves Wider Publicity

BY MARK R. LAMB

"AT A meeting of the Mining and Metallurgical Society of America Dr. Thomas Darlington addressed the members. . . ."

It was a most interesting meeting. Dr. Darlington told his hearers many things which they did not know before. They were so important that it seems advisable to give them in more detail than has been done in most of the hitherto published reports.

His statement as to what makes people tired was at variance with the ideas of most of those present. Work does not do it. Though it is true that long

HYDRAULIC REGENERATION

hard work seems to precede a feeling of weariness, this is only in appearance or coincidental, and the way to be rid of the feeling is not to rest, but to take a shower bath,—and if one is not sufficient, take two. It will then be possible to go right back to the furnace and work another shift. If work is alternated with showers, there will be no opportunity to become tired. If those steel mill workers could be persuaded to take lots of shower baths, they would be so enthusiastic about their work that they would not want shorter days. It is up to the Steel Trust to put Dr. Darlington to work on that particular job.

He told all about blood counts and their importance, and it makes mine run cold to think of the terrible danger in which all those people are who do not know what a blood count of five million means! There are probably thousands of men in the Pitts-

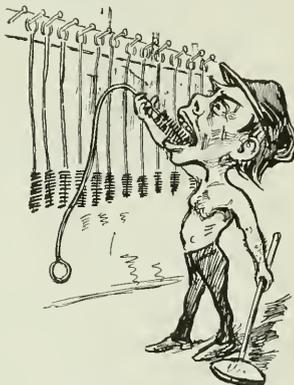

burgh district who never stop to count their blood! There may even be a few readers of the Journal who have not got clearly in mind just what a blood count is, though I hope not, for the sake of the standing of the profession!

And then the tooth brush! Heavens, to think how ignorant I was before Dr. Darlington began to talk! It was my custom, only one day before, to

PIE A LA MODE

use my brush only four or five times daily, and then merely as a habit. But it seems that all this time, during all my forty-six years (thank you, I know I don't look it) my life has been in constant danger from pneumonia! The Doctor told us that there are forty-eight varieties of bacteria in our mouths (Dr. Copeland says sixty, but a dozen more or less is of little importance), and he added that the beverages

ESOPHAGEAL ANTISEPSIS

in use before the late disaster had kept the number down. He now expects a great increase in variety and numbers. I know now that if I eat or breathe, with these bacteria in my mouth, some of them slip into my stomach and lungs and raise—trouble. For this reason it is best to fool them by brushing the teeth between bites.

Same with breaths. In spite of every precaution, some of them occasionally get past, but Dr. Darlington has provided even for that. As soon as one feels

a bacterium in his stomach, it is only necessary to use quickly Dr. Darlington's stomach brush, after first emptying the stomach. It is very simple, though at first, for lack of skill, the meals are long drawn out. And it looks funny, too. The brush has a long, flexible handle and tickles as it goes down, so it is best to practice alone. But think of the satisfaction of being immune to pneumonia and the flu! The lethal gas required to stop the bacterium which gets into the lung can be obtained from the War department.

I forgot the tonsils. They must, of course, come out first. And to think that the majority of the 600,000 people who died of the epidemic last year would be alive today had they brushed their teeth and stomachs thirteen times daily! Dr. Darlington says so. Copeland says twenty-three times.

The Doctor's story about little Adrenal is the best of the lot. What she did to those two soldiers was a plenty, but it was unfair of the Doctor not to tell how she could be employed in ordinary business affairs.

The Doctor seems to be an Irishman. The Journal published his remarks without a smile. It is difficult to understand why the members of the Mining and Metallurgical Society of America did not rise in their wrath (or amusement) and throw the Doctor out the window. It may be due to politeness, or hospitality, or habit, or simply to a lack of a sense of humor. Your mining engineer must under no circumstances display anything but complete, painful gravity, or he loses standing. A proof of this is that he cannot specialize successfully as a geologist unless he can grow a full beard.

The inventor among him will gravely shake up a few grams of hot silver ore in a test tube and announce a revolution in metallurgy, without planning the apparatus necessary for shaking up a thousand tons daily in like manner. If he had a sense of humor he would think of all those endless test tubes and laugh and drop the revolution.

It is no excuse to say that he is an ordinary human being, because he is not. He does not vote—he gets excused easily from jury duty, and he has never enjoyed a lawsuit. There is not one of him in Congress or the Senate, nor will there ever be.

The greatest joke of all is his innocent, flamboyant pride in Hoover. It reminds me of my ancestors. My uncle frequently found occasion to mention the illustrious members of our family and say how proud he was of them, but Dad would reply by wondering if the feeling were reciprocal. I am the original Hoover man for the next President, but when he is elected, I shudder to think how unbearably smug and self-satisfied your mining engineer will be.

The Best Time to Leave the United States on a trip to the Far East is the late summer, in time to arrive in China about the first of October, according to J. A. Fowler in Commerce Reports. April, May, and June are almost equally fine in most parts of northern Asia. December, January, and February are the comparatively cool months in the Philippine Islands.

Alaskan Railroad Makes Rich Country Accessible

Willow Creek and Broad Pass Districts of Great Promise as Producers of Both Precious and Base Metals—Much Prospecting Necessary—Government Railroad Now 80 Per Cent Complete

BY F. LE ROI THURMOND
Anchorage, Alaska

THE great territory of Alaska is today one of the few remaining storehouses of mineral wealth which has practically been untapped, and it offers a rare opportunity to the man with a lust for adventure and fortune. The mineral industry of the country is only in its infancy. In a territory one-fifth as large as the United States, in

silver mines of the Southwest having been formed at that time. It is highly probable that prospecting and exploration will prove another Goldfield or Tonopah to exist somewhere in this large area of granite and rhyolite.

On Iron creek, a tributary of the Talkeetna River, extensive copper prospects have been found in the form of contact, metamorphic deposits. A company headed by Joe Morris is preparing to drill this ground soon. Morris was the discoverer of the Le Roi mines, at Rosslyn, B. C., in the late '80s, which have produced \$70,000,000 in gold and copper.

Probably the most interesting and promising section of the highly mineralized Broad Pass territory is found among the headwaters of the Chulitna River. Here, on the west fork of the river, occur mineralized, acidic dikes, several hundred feet wide, the gold tenor of which is sufficiently high to indicate that they will very soon be explored. In the same vicinity are numerous outcrops of chalcopryite, most of which also contain gold and silver. This region was the scene of considerable excitement and activity in 1914 and 1915, when the railroad was projected through Broad Pass. About 200 men stampeded into the country, anxious to obtain claims on ground reputed to be enormously rich, but, as is usual in such cases, many of them were disappointed on finding that the precious metals did not grow on trees, and that the ores were complex and required the investment of much time and money to develop. Another factor of considerable weight was the un-

THE NEW MACHINE SHOP AND POWER PLANT OF THE GOVERNMENT RAILROAD AT ANCHORAGE

almost every part of which gold can be found, only thirty-one lode gold mines were operating in 1917. The difficulty has been one of transportation, and all of the lode mines so far developed are situated on, or close to, tidewater, or are naturally favored geographically, so as to render them accessible.

The government railroad now under construction inaugurates a new era in the history of Alaska. This railroad, with its terminus at Seward, a splendid year-round harbor, traverses and renders accessible a diversified region, with a wealth of mineral resources which offers great inducement to the prospector and investor.

One of the best-known districts along the railroad is that known as Willow Creek, where there are a number of mines and prospects in rich, free-milling gold ores. I recently made an important discovery in connection with this camp, the identification of the minerals nagyagite and calaverite, tellurides of gold, in specimens from one of the newer mines now being developed. This is highly significant as an indication of the continuity and persistence of the ore bodies, apart from the fact of exceptional richness. These mines are in the Talkeetna mountains, where the formations are largely of granite or other acidic, igneous rocks, of Jurassic to Tertiary age. The latter period was one of great gold deposition, some of the famous gold and

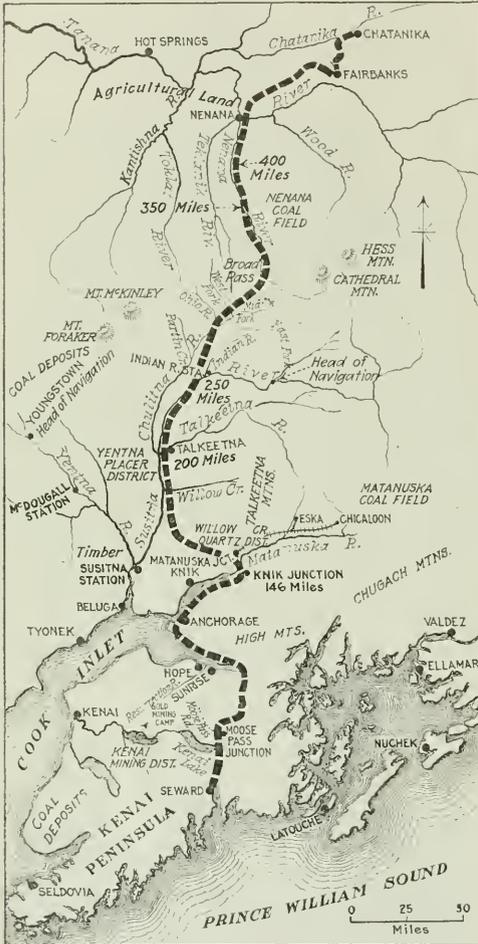

ANCHORAGE HARBOR, APRIL 22, 1919

certainly as to the time of completion of the Government railroad. A few of the more resolute and better informed have held their claims, and now, as the railroad nears completion, their reward is in sight.

On the Ohio River, fifteen miles from the west fork of the Chulitna, occur a number of veins outcropping on ground held by Dr. McCallie and associates, of Anchorage. I was commissioned to examine and report on these properties, and to obtain the necessary data made two trips to the region in 1918, one in the spring by dog team, and the other in August and September, going on foot

several ounces per ton. Copper and lead vary considerably, but I obtained 4 per cent copper over a width of 8 ft. where one of the veins outcropped. The ore, being complex and having the precious metals contained in the sulphides of the base metals, will require smelting, and the indications are that much of it will be rich enough to stand the long haul to the Tacoma smeltery without previous treatment.

MAP OF COUNTRY ALONG THE ALASKAN GOVERNMENT RAILROAD

with pack horses. The information gained on these expeditions was such as to warrant further work to determine the extent of the promising prospects.

The ores consist of sulphides of copper, lead, zinc, and iron, with high silver and gold content. Silver is associated with the lead sulphides, or carbonates where they have been formed by surface alteration, and the gold occurs with the copper. High assays of silver are common, and gold runs from a trace to

AT MILE 260 OF THE GOVERNMENT RAILROAD, MARCH 6, 1919

Still, large quantities will require enrichment by some of the standard concentration processes. Flotation probably will prove best adapted, as that process is fast displacing gravity methods on ores of a similar character.

On Partin Creek, ten miles from the Ohio River district, a large copper-silver-gold-bearing vein occurs in limestone. Not far from here, on Coal Creek, I discovered a granite-slate contact with a wide zone of massive pyrrhotite and sphalerite, carrying gold and silver.

I have mentioned only a few of the typical instances of mineralization which came under my own observation, but many other occurrences are known. Although little prospecting has been done, the mineralized area is known to extend about twenty-five miles from the headwater of the west fork to the head of Partin Creek, and almost no prospecting has been done outside of this area. Further and more thorough exploration which will follow the development of this region by the railroad, will undoubtedly uncover many more ore deposits. The number of prospectors in the region is ridiculously inadequate to the task in hand—about a dozen men on the whole southern flank of the Alaskan Range, west of Broad Pass.

The region is not a difficult one in which to work, there being no timber except along the larger streams. At elevations of 2,200 ft., only alder brush is found, and 500 ft. higher the mountains are bare. The rock formation consist of sedimentary beds, slates, cherts and limestones, which were tilted at

the time of the uplift of the Alaskan Range and intruded with granite and other acid eruptive rocks. These intrusions were of Jurassic age and are the cause of the mineralized veins found in the sedimentaries and along the contacts.

From the point of view of natural beauty the country is wonderfully attractive, containing inland seas, great rivers, glaciers, and mountains of unsurpassed grandeur. Mount McKinley, 20,300 ft. high, the loftiest peak in North America, is only thirty miles from some of the prospects named, and is visible from points 200 miles to the north or south. The

OUTCROP OF 15-FT. MINERALIZED VEIN NEAR HEAD OF OHIO RIVER

railroad, now 80 per cent complete, will render this region accessible to tourists and travelers, who will also be attracted by the big game which abounds on the slopes of the Alaskan Range, the big brown bear of the coastal regions, the moose, sheep, caribou, and goats in favored localities.

Following the prospector and miner, the tourist, and the hunter will come the tiller of the soil, the artisan, the home seeker. Industries will spring up, flourish, and cities be built in a day, and millions of people living and yet to live will find in this newer

land an inexhaustible supply of natural wealth, in return for faith and work.

"Long have I waited lonely, shunned as a thing accurst,
Monstrous, moody, pathetic—the last of the lands, and the first;

Visioning campfires at twilight, sad with a longing forlorn—
Feeling my womb o'er pregnant with the seed of cities unborn—
Wild and wide are my borders, stern as death is my sway;
And I wait for the men who will win me, and I will not be won in a day;

And I will not be won by weaklings, subtle, suave, and mild,
But by men with the hearts of Vikings and the simple faith of a child;

Desperate, strong, and resistless, unthrottled by fear or defeat,

Them will I gild with my treasure, them will I glut with my meat."
Robert M. Service.

Chilean Opinion Concerning the Nationalization of Mines*

Many have suggested the idea of nationalizing the mines, turning them over to the Treasury, with due respect, of course, to previously acquired rights, and, imitating the German and Prussian regime, to create a technical and administrative organization, as in the exploitation by the German State of the deposits of the Sarre Valley, the Hartz, and Upper Alsace. This system would be a complete failure in Chile, where politics controls everything.

Centuries will pass, perhaps, before the Chilean State will have acquired industrial capacity. It is enough to consider how many years the Railroad Administration has operated at a loss; and this is an enterprise that does not fail to yield profits in any part of the world. In Chile it leaves a deficit.

The better plan is to continue the working of the mines by private capital, without distinction to Chileans or strangers. Foreign capital, whether American, English, French, or of any other nationality, serves to increase the natural wealth in general, and although the greater part of the utilities are exported, in fact they remain in the country in salaries, freight charges, and the buying of national articles (coke, cement, and similar materials) in large quantities.

*Translated from the Bulletin of the National Mining Society of Chile, No. 243, p. 376.

Intercooling in Two-Stage Air Compression is particularly important, as on the efficiency of intercooling will depend the overall efficiency of the compressor and the equalization of the load between low-pressure and high-pressure cylinders. The intercooler should not only cool the air from the temperature at which it is delivered from the low-pressure cylinder, but it should also condense and remove the moisture from the air. The more efficient intercoolers will reduce the temperature of the air close to that of the cooling water with a minimum amount of cooling water. No intercooler should allow the cooling water in any part to become hot enough to precipitate scale. The air should be broken up into thin sheets in contact with the cooling surfaces. One square foot of cooling surface per six cubic feet of air passing through the intercooler per minute is given by one manufacturer as the ratio of cooling surface to air volume, and the same manufacturer claims that two and one-half gallons of cooling water per minute per 100 cu. ft. of air passing the intercooler will reduce the air temperature to within eight degrees of the cooling water if the intercoolers are properly constructed.

Standard Chutes for Metal Mines*

Several Factors Influence Selection of Those Used Underground for Loading Ore Into Tram Cars—Special Chute Doors Designed With Respect to Needs and Permanency of Chutes

BY CHARLES A. MITKE

CHUTES are used for the purpose of passing ore and waste to different levels in a mine. They are also utilized for storage, and frequently, when not necessary for ore or waste, are kept open entirely for ventilation purposes. In general, chutes are 100 ft. high (the usual distance between levels), although some are much longer, and others are shorter than this figure. When a raise is driven, it is customarily divided into two compartments, one for the manway and timberway, and the other (the chute), for the passage of ore or waste. Various types of raises which are in common use are as follows:

- Two-compartment raises (one for chute and the other for men and timber).
- Six-post, square-set raise, generally used in square-set stopes in medium ground.
- Four-post, square-set raise, occasionally used in caving methods. This raise is similar to the six-post raise, with the exception that the compartments are much smaller.
- Crib raise, used in square-set, top-slice, cut-and-fill, and shrinkage stopes in heavy or broken ground.
- Raw chute, usually oblong in shape, about 4 x 7 ft., with no timber except a partition between the chute and manway. Used only in hard ground mined by cut-and-fill, shrinkage, and to some extent by caving methods.
- One-compartment raises (chute only).
- Four-post raise, used in caving methods in medium ground.
- Crib raise, used in heavy ground mined by caving methods. In rare cases angle iron is used in its construction to prevent excessive wear.
- Raw chute, or "finger raise," circular, about three feet in diameter, no timber employed in its construction. Used only in medium or fairly hard ground.
- Rock-built chute. Constructed in the shape of a well, generally about six feet in diameter. This class of chute is built in loose ground.
- Concrete chute. For heavy ground. Usually circular. Used where there is a great deal of wear in the chute.

The requisites for a standard chute are as follows: Safety in situation and operation, efficiency in handling ore and waste, and economical construction and upkeep.

Formerly, chutes were placed in the center of drifts, to facilitate the dumping arrangements and permit the use of end-dump cars. Though this was a great convenience from the standpoint of haulage,

there was the constant danger of men falling into the chute. According to safety rules, boards were to be placed over these openings and to be removed only when cars were dumped but frequently miners would forget to replace them when the cars were empty with the result that many a man has lost his life by falling into the opening. In some states this practice is now prohibited, the law stating that the chute shall come up at the side instead of in the center of the drift.

The manway, adjacent to a chute, should be placed far enough from the haulage track so that the men climbing up and down the ladderway will not step directly in front of a moving train. One of the principal operating conditions to be avoided is the "hanging up" of a chute. It is usually a dangerous procedure for a chuteman to bring down a chute which has been choked or "hung up." Should the obstruction occur some distance up in the chute, say 80 to 100 ft., it may cause an air blast, which would break the chute and injure the trammer.

Sufficient Clearance Above Cars Is to Be Desired

The chute mouth should be high enough so that a man will not have his fingers caught between the chute and a car. This is sometimes difficult to arrange, as there are mines where five different kinds and sizes of cars are used, all being loaded from the same chute. Such a diversity in sizes of cars naturally results in insufficient clearance for the larger ones and too great a clearance for the small cars. This latter condition in itself creates a danger, as, when small cars are used, the ore, dropping from a distance at high speed, may injure the runner, especially when the car is nearly full and it is necessary for him to close the chute gate immediately.

In all average drifts provided with electric haulage, the trolley wire is immediately above the mouth of the chute. The larger drifts possess the advantage of an extra timber set above the trolley wire, upon which the chute runner works, there being a flooring between him and the wire, thus preventing his coming in contact with the electric current. Provision must always be made in the smaller drifts to protect the runner from the trolley wire. In some instances, the live wire is insulated and carried along the opposite side of the drift, the overhead wire being dead for a distance of about ten feet and acting merely as a guide for the trolley wheel. In other cases, the overhead live wire is boxed in with boards on the sides and has a hinged door beneath, which can be pulled up and hooked, in this way completely isolating the trolley wire. Another practice is to have a switch near the chute so that the current in this section of the wire can be turned off and on at will. In exceptional cases the trolley wire is cut

*From a paper, "Compilation of Chute Types for Loading Ore Into Tram Cars in Metal Mines," presented at the Eighth Annual Safety Congress of the National Safety Council, Cleveland, Ohio, Oct. 1 to 4, 1919.

about five feet on either side of the chute mouth, and may be detached and moved away bodily. This, however, involves considerable trouble.

Where Possible, Men Should Have Ample Working Room

A by-pass is frequently made by removing a half set of ground immediately opposite the chute, and a bench is provided upon which the runner stands. This should be high enough to enable him to reach across and tap the chute and also to use a pinch bar to advantage in loosening the large boulders which frequently clog up the mouth. The by-pass is an excellent safety provision as it gives the operator an opportunity to step out of the way in case there is an unexpected rush of ore out of the chute. In caving methods, where there are lines of chutes on both sides of the drift, a by-pass is impossible and the runner must load his cars by standing at the side of the particular chute from which he is drawing.

It is important that all chutes be properly situated with respect to the levels above and beneath the stope through which they pass. The convenience of the stopping arrangement depends on the placing of the chute as well as the tramping distance. A chute should be adapted to the particular needs of the orebody in question. In certain classes of ore large chutes are necessary, though in others smaller ones may be used to advantage. In some cases many thousand tons of ore must pass through before the chute is finally abandoned, and the tonnage grades down from this to but a few tons in other instances, consequently, the construction of the chute under the first-named condition must be stronger, more lasting, and naturally more expensive than the type of chute which would suffice in the second instance.

Unrestricted Flow of Ore Into Cars Is Desirable

The construction of a chute should also be such that the ore will flow readily into the cars. One of the difficulties with chutes that has not yet been overcome is the fact that all ore has a tendency to "hang up," or stick in the chute. A suggestion which has been made and tried is that of having a breaker staggered on each set throughout the chute. The ore, being dumped into the chute on the level above, strikes the first breaker and is thrown to the breaker on the other side, and from there zigzags down the entire length without stopping until it comes to rest near the chute mouth. These breakers impede the progress of the ore and prevent it from packing solid in the bottom of the chute, and naturally, the chute is less likely to "hang up." Good results were obtained from a trial of this chute, the only objection being the extra cost of construction in placing the breakers on the sides. The inclination of the chute mouth has considerable effect on its efficient operation, as certain classes of ore run more readily than others. The character of the ore, therefore, must be taken into account before adopting a standard chute and mouth.

The cost of constructing chutes should be kept at a minimum. It would be a waste of money to have

a chute constructed to last much longer than the life of the stope, while on the other hand, it would also be poor economy to build a chute of such light construction that it will need constant repairs long before that section of the stope has been abandoned.

Formerly chutes were provided with a wooden bottom and the ore was taken out immediately beneath the chute mouth. As a consequence, the ore dropping down the chute soon wore out the bottom and then filled in the sides of the drift. This practice is still continued in a number of districts, even though it involves an unnecessary expense to the company for upkeep and repairs, but it is obsolete in the most up-to-date mines. Wherever possible, the bottom of the chute should be in the solid ore or rock, which condition decreases the cost of upkeep, as ore striking on a wooden bottom would soon cut through.

After the size and character of the chute have been worked out with reference to the class of ore and decided upon, it is economical to have the timbers selected and cut to measure on surface, so that the total number of pieces necessary for its construction can be sent down at any time, and the chute mouth installed without any additional cutting underground.

General Types of Chutes Now Used

Fig. 1 illustrates a type of chute mouth used for loading small cars from stopes containing high-grade ore which are operated by the square-set method, or in stopes mined by caving methods where frequent blasting is done. The chute mouth is made of 3-in. boards, and the construction is such that the opening is given the proper inclination and a clearance of approximately 4 in. is allowed between the chute mouth and car. The door, which controls the flow, consists of three boards that operate in slots parallel to each other. The mouth of the chute is about 4½ ft. long, and the ore dropping down the raise strikes on the hard rock which has been left there for the purpose and then runs towards the car as the chute is drawn off. This type of chute mouth is generally used in small drifts ranging from 3 x 6 ft. up to 5 x 7 ft. in the clear.

In drifts where the ore is drawn from the square-set stopes the chute runner usually loads his car by standing on a bench opposite the chute mouth. Sufficient ground behind him has been taken out beyond the regular drift set so as to allow a certain amount of room for him to step aside in case of an unexpected run of ore from the chute. In caving methods, however, he loads his car by standing at the side of the chute instead of in front, for owing to the fact that the chutes are numerous, being generally placed opposite each other, there is no room for a bench. In loading, he uses a 5-ft. iron bar to pry up the three boards and allow the ore to run into the cars. In case a boulder should become stuck in the chute and hold up the ore, he uses his bar to dislodge it. Should he be unsuccessful, he must then get powder, tie it to the end of a stick and put it near the boulder. After the shot is fired, the boulder is usually broken and the ore

continues to run down the chute. When the car is full he uses the bar to strike each board in succession and cause them to drop, thus cutting off the flowing ore. In the event of one of the boards sticking fast and refusing to drop, enough of the chute mouth will be covered by the other two to stop the ore from running.

Another type of door is that shown in Fig. 2, which has an iron gate bolted to the sides of the chute. It is provided with a handle and can be raised by a man standing on the car or by the use of a bar operated when one is standing on the track. The gate has a bolt on each end and operates on hinges, and the result obtained is similar to that secured by use of the boards.

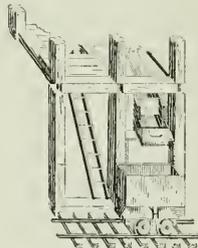

Fig. 2

GENERAL TYPES OF CHUTES IN METAL MINES

In drifts of this character, larger cars are used, the area of the drifts are larger than those of hand tramping and the chutes are either operated from the drift or from the extra pony set above the drift. The chute and chute mouth shown in Fig. 1 is frequently used in drifts of this character, being, of course, built in proportion to the size of the drift. Fig. 3 is the same kind of a chute and chute mouth as those shown in the preceding illustrations, but is provided with a different type of door. The door is built in the form of a sector, made of iron, and provided with a handle. A piece of iron pipe may be used on the handle in order to secure greater leverage. Built to a smaller scale this chute mouth and gate is occasionally used in hand tramping drifts in square set stopes, but more frequently in

the larger drifts, with, of course, proportionately greater dimensions. Such a door may be operated either from the level, in a hand tramping drift, or from the floor above, in a motor-haulage drift. In the latter case, the chute door is, of course, sufficiently high so that the operator can open it by standing in the pony set and also punch the chute from that floor. This class of door is in common use on main haulage drifts where block caving is the mining method employed. However, the chutes leading directly to the main haulage level are usually situated in ground that is not very heavy and will therefore not be subject to change.

Fig. 4 represents an iron door which is actuated by means of a slide and small gear wheels on the

ends. A large wheel, which may be operated from one side of the chute, serves to raise or lower the door.

The construction of the door shown in Fig. 5 is similar to that in Fig. 4, with the difference that it is operated by means of a compressed-air cylinder. The operator merely turns an air lever, which raises the slide and allows the ore to run through the chute. When the car is full and it is desired to close the chute, the air is turned off by reversing the lever. At the same time a second lever is turned on and air is forced into the rear end of the cylinder, closing the door. If a boulder should get caught it may then be necessary to open and close the door several times in order to dislodge the obstruction.

The principle used in the construction and operation of the chutes shown in Figs. 1 and 2, for use in hand tramping drifts, is practically the same. Both have rock bottoms, and the raises (which include chute and manway) are not immediately over the drift, but are placed at one side. Sufficient ground has been removed under the manway compartment so that the ladderway will be far enough from the drift to prevent a man from stepping out in front of a car. Fig. 1 illustrates the chute and door in use at most of the mines where block caving methods are used. Fig. 2 is used principally in top-slice stopes, and not so frequently in other caving methods, the reason being that the drifts in which Fig. 1 is used become heavy, and the chutes soon go out of shape and require a change made in the

size of the door, which can easily be done by cutting the wooden gates to suit the changes caused by crushing, whereas an iron door could not be so readily adapted. These represent two of the best types of chute mouths and gates for use in hand tramping drifts. They are economical, durable, and, if the bar is employed and the men use care, are comparatively safe.

Of the three iron doors shown in Figs. 3, 4, and 5, No. 5 is far superior to the two others and can be used in every instance where the others are employed. It is absolutely safe in operation and requires little repairing. The amount of compressed air used is also small. Its cost, as compared to the other doors is somewhat higher, but the expenditure is justified in places where a large amount of ore must be handled.

Clearance Dependent on Type and Height of Car

The matter of clearance for safety depends entirely on the type and height of car. As stated before, in one of the most up-to-date mines five different types and heights of cars are used, all loading from the same chute. In this instance it would be difficult to specify what amount of clearance between the chute and the car should be adopted as a standard. Therefore, before a standard clearance can be decided upon, it is first necessary to decide upon the standard size and height of car which is to be used on that particular level. The clearance between cars should be sufficient to permit of a man's passing between them.

Adoption of Standard Gage Underground

The discussion of a standard car raises at once the question of a standard gage. The 18-in. to 22-in. is still the practice and a standard gage of about 20-in. should be maintained in practically all metal mines. In deciding on a standard gage, the main consideration is that it must be suitable for the size of drift or tunnel which has been found to be the most practicable and economical for prospect work. The use of larger gage of from 24-in. to 30-in. is of advantage on main haulage drifts, where the ore has already been proved up and the expense of driving the large tunnel for the haulage train is absolutely justified. It would, however, be entirely out of the question to ask operators to drive large tunnels of this character for prospect work merely to standardize on the gage.

In general, a large number of companies use two gages, the 20-in. for all prospect and ordinary working drifts, and a larger gage, about 30-in. for the main extraction tunnels only. At the present time there are mines in the Southwest which have already standardized on the gage and type of car. In one particular mine, an 18-in. gage is used throughout the entire mine, with only two types of cars, both being the same height, which simplifies the matter of chutes and chute doors, the chute mouth shown in Fig. 1 being used throughout. It might well be said that this company has standardized on gage, cars, chute, chute door, and clearance.

The Mining Law

THE announcement that the Bureau of Mines will resume its efforts to draft a revised mining law—which work was set aside during the war period—will, it is believed, be received with general approval by the mining public. Whether or not Congress will see fit to act upon such suggestions as may eventually be made by the Bureau is another question.

In a country where it has become more or less customary to revise and amend laws and regulations relative to every phase of human endeavor, it is a matter of amazement when one realizes that the fundamental mining law, enacted in 1872, and inadequate and unsatisfactory in many ways since the day of its inception, has remained, year after year and Congress after Congress, unaltered and untouched by any hand, sacred or profane!

The mere miner or other layman unversed in the art of interpreting court decisions often stakes out his claim and starts to develop his ore, secure in the belief that his observance of the requirements of the law—as it appears to apply in his case—will give him ample protection and “make his title clear.” If his efforts remain uncrowned by success he will oftentimes proceed, unmolested, on his way. If not, however—if rich ore rewards his labors—fortunate, indeed, is he if “litigation” does not descend upon him and bind him hand, foot, and pocketbook.

This condition has long confronted the mining public. Thirty-five years ago that master engineer-humorist, Rossiter W. Raymond, offered a rhymed solution of the difficulties often attending the successful exploitation of a mining claim, which might still be apropos.

The surprising thing, from the 1919 standpoint, is the fact that Raymond's prospector had three friends! Whether the last remnant of the genus prospector, who was recently reported to have been seen at about Lat. 30 N., Lon. 40 W. from Washington, could muster a sufficient number of coadjutors to carry out the suggested plan remains a matter of grave doubt!

The bit of verse reads as follows:

THE LAW OF THE APEX

BY R. W. RAYMOND (1884)

There was a miner in the West, and truly wise was he;
His head it was the levellest that ever you did see.
Now he had found a silver ledge outcropping to the view;
And down he sat upon its edge, to muse what he should do.

This knotty question to decide, it was no joke, because
His reading had been deep and wide in all the mining laws.
The coast of his experience showed full many a gallant ship
Wrecked on those dangerous rocks, the Lode, the Apex, and
the Dip.

Quoth he unto himself, “Now, Jim, you ain't no saint, I fear;
But you just follow that old hymn, ‘an’ make your title
clear!”

Descending from the summit lone, he sought, that miner keen,
Three friends, Hans Breitmann, Mike Malone, and G. McClellan
Glean.

With them he shaped his wily plan; locations three they made;

And lo! the claim of every man across the rest was laid.
First, Breitmann claimed a mineral vein according to the strike;

But over this was spread again the placer claim of Mike.

And, pointing with a skillful aim to where the ore was seen,
Appeared the dangerous tunnel claim of G. McClellan Green.
Then in ejectment Mike brought suit to make Hans Breitmann quit

(And some revolvers they did shoot, but nobody was hit).

The lawyers they explained the law, the experts made the facts,

The judges they said "hum" and "haw," and quoted various acts.

The jury found against Malone, and he retired serene;
While Hans was left to pick a bone with G. McClellan Green.

This time the fight was harder yet; injunctions filled the air;
Old stakes were moved; new stakes were set; bold witnesses did swear.

A model for one side displayed the mine in minim size;
The other side a model made, which looked quite otherwise!

The experts brought their biggest books, to make the battle hotter—

Dana, Le Conte, De Beaumont, Jukes, Bischoff, Grimm,
Groddeck, Cotta,

Gaetzschmann, Pospny, Buratt, Lyell, Newberry, Whitney,
King,

Sandberger—and, in short, a pile of almost everything.

Stenographers took down the case, and made their talent felt
In jargon written out of place and proper names misspelt.
To try it without jury's aid both parties did agree;
Because a jury can't be paid with a contingent fee.

At last 'twas over; and the judge declared his final mind;
He thought the science mostly fudge; the models very blind;
He said that he had seldom heard such learned counsel speak.
(Though plaintiff's counsel was absurd, because his cause was weak.)

In short he gave to Hans the case; and surely ne'er was seen
A calmer man in his disgrace than G. McClellan Green.

With Mike and Hans that night he met their common partner
Jim.

"Old boy we've fixed it now, you bet," each partner said
to him.

"And when we want to stake OUR land, and own it without
fuss,

We'll come to you to take a hand and do as much for us."

Experts, and lawyers, paid in shares, soon looked exceeding
grim;

For Hans had made, all unawares, a previous deed to Jim.
So thus the prudent miner got a title without flaw,
In spite of every puzzling spot that marks the mining law.

True, when they came to work the claim, the ore soon petered
out,

And nothing but the silvery name showed silver was about.
But ere that time, the famous suit had brought the mine
renown—

Jim sold it to a Tenderfoot, and got his money down!

Unrest in Colorado

May I salute—"Hail the Chief!" and wish you a beaten trail, at the "New Discovery" (E. & M. J.)? May you always have a pay streak, as it is most discouraging to swing a Single Jack in barren rock. Be it "Silver Plum" granite on top the siliceous plate of your Mahogany.

It is because of profound respect, admiration of your teachings, that I have stepped into the limelight to offer my best wishes; though, as I write, its diffused rays hurt my eyes, since I am more used to the softer glow of carbide hanging at the tail end of the mine car as I muck down the pile. I have no alibi to offer for my rashness, since nothing has passed down my throat these many, long, weary days, but I suspect that while handling one of the Market Sheets sent out of late from your office, I must have contracted one of the unrest germs I read so much about. At this I am alarmed, and know not whither to turn for a remedy.

The doctors, I read, disagree in a diagnosis. The chief surgeon—a fellow named Woodrow Wilson, I am told—appears to be doing a lot of experimenting, by calling in a bunch of chronic belly-achers and dosing them with his nostrums (strictly private formulas) of five, six, seven and eight dollars per day, doses to be taken about every six hours, and each cautioned to as little exertion as possible.

A Swede came by the other day—before I contracted the germ. He was ailing; his head hurt; his muscles were tired, and his legs weary. I thought I could aid him with four Silver Dollars per day to lean on a shovel. But he told me a Prophet Divine by the name of Finlay, J. R., would give him a gold-cure receipt awful cheap, that would banish his ills and cover the patches on his seat. If that be the case, please send that receipt, for I've lots of gold but little to eat; and I beg of you to see Prophet Finlay and discover his wonderful remedy, since he would sell gold pills so cheap.

Yours very sincerely,

F. C. Grace.

Scotia Mine, Salena, Col., Oct. 22, 1919.

Will Co-ordinate Alloy Research Work

The Division of Industrial Research of the National Research Council is arranging for the formation of a co-operative association to plan and support fundamental researches in alloys. The office of the executive secretary is at 1201 Sixteenth St., Washington, D. C. Although much valuable work has been done in this field by scattered investigators, a well-planned and co-ordinated effort by a co-operative association working under the general guidance of the National Research Council, and composed of specialists representing both the manufacturers and the more extensive users of alloys, can produce additional results of great importance.

A special scientific staff is planned, composed of a director and assistant director of research and a group of technical experts who will give their whole time to the work.

Controlling a Gas Well

Details of a Method by Means of Which the Flow of Gas From a Large Well Was Effectually Checked

BY SETH S. LANGLEY

IN THE Journal of July 12, 1919, there was described the method by which a large gas well in the Elks Hills oil district of California, which had caught fire, was extinguished. The steps then taken to secure the well and put it under control are described in the following: After allowing the earth to cool for a few days, a drag-line excavator removed enough material to expose the first collar of the casing. The greater portion of the first joint had

When in position, the clamp came $\frac{1}{2}$ in. above the casing collar. Hydraulic packing was wrapped around the collar and in the space between the halves of the clamp, which was then bolted tight. A similar clamp was bolted to another $12\frac{1}{2}$ -in. collar, and the two clamps hinged by the latch arm at one end. The remaining fittings were then made, all of $12\frac{1}{2}$ -in. casing type—a short nipple, one cross, $12\frac{1}{2}\times 12\frac{1}{2}$ by 4x4 in.; a short nipple, gate valve, and 10-ft. joint of casing. On the cross were connected two 4-in. nipples with 4-in. gate valves; cribbing supported the made-up fittings. From the outer end a cable was rove over the crown pulley of a nearby derrick and another cable carried back to a hand windlass (Fig. 2). The fittings were then raised, both cables kept in tension, and when in a vertical position a drift pin was driven through the second latch

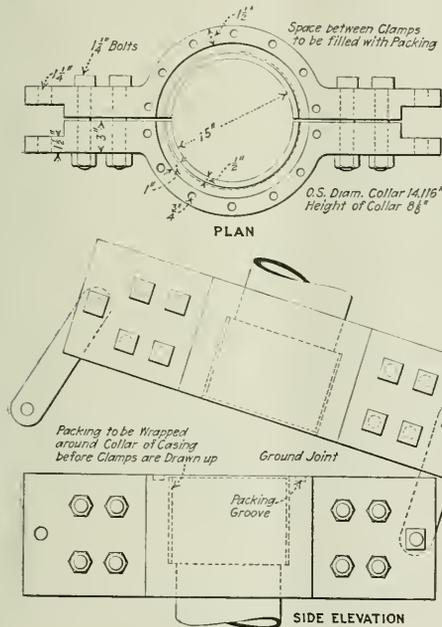

FIG. 1. PLAN AND ELEVATION OF CLAMP TO FIT $12\frac{1}{2}$ -IN. CASING COLLAR WITH LATCH FITTINGS

been worn away, but the lower collar was in good condition; the joint was broken at this point, leaving the collar on the second joint. A clamp was made in two parts to fit around the collar and with a shoulder to grip the casing below the collar; the collar served to hold the clamp from being torn off. On each end, the clamp was machined to take a latch arm, held with $1\frac{1}{4}$ -in. bolts, as shown in Fig. 1.

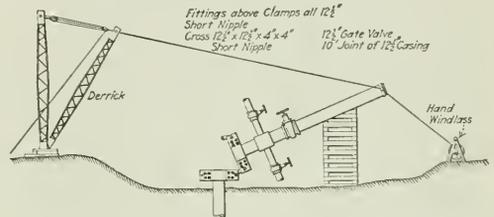

FIG. 2. METHOD OF RAISING FITTINGS INTO POSITION

arm and the $\frac{3}{4}$ -in. bolts were put in the clamps. Concrete was then poured in forms to make a block to come up over the clamps.

The well is gaged to be making 185,000,000 cu. ft. per day. This is considered to be the largest gaged gas well of which there is any knowledge.

Oil Struck in Montana

What is considered to be the most important discovery of oil in the history of the state of Montana was made recently by the S. Vandusen Oil Co. in Devil's Basin, twenty-seven miles north of Roundup. The bringing in of this well, with an estimated capacity of 500 bbl. per day, gives indication of substantial future production. The well so far has penetrated the oil sand for only a distance of several feet, and it is expected that an increased production will be obtained at greater depth. The sand has an estimated thickness of about 100 ft., according to indications found in the sand cut in Woman's Pocket field, twenty miles distant, where a well of 200 bbl. was brought in several months ago. It is expected by geologists that when the sand in the Devil's Basin district has been bored deeper, a possible capacity of 1,000 bbl. per day will be obtained.

Oil Operators and Workmen Reach an Agreement in California

Terms Governing Relations Between Producing Oil and Gas Pipe-line Companies and Oil Refineries Determined by President's Mediation Commission

AN INTERESTING memorandum of the terms governing the relations between producing pipe-line and refinery companies and their employees operating in California oil fields has just been agreed upon by the President's Mediation Commission, consisting of J. L. Spangler, E. P. Marsh, and Hugh L. Kerwin, and the operators' committee, consisting of A. L. Weil, chairman of the joint committee; L. J. King, C. A. Hively, E. S. Durwood, and F. F. Hill, of the field committee; A. F. L. Bell, E. I. Dyer, Lionel Barneson, and G. H. Van Senden, of the refinery committee, and R. E. Maynard, E. B. Part-ridge, F. A. Simms, and Max Dyer, of the pipe-line committee. The memorandum is made effective by the signature of individual operators. The general terms and Schedule A, together with general specifications applying to oil-producing companies, follow. Schedule B and C are omitted, as they apply to pipe-line and oil-refinery companies. The general terms of the memorandum are as follows:

I—That during the period ending at midnight, June 30, 1920, all matters of wages, working conditions, and any controversial matters which may arise between the operators and the workmen, shall be governed by the terms of this memorandum. There shall be no cessation of work through strikes or lockouts during said period of time.

II—The operators during said period shall pay to the workmen, as provided by the law of the State of California (until said law is changed, semi-monthly), the amount of wages for the various classes of workmen set out in the three schedules annexed hereto and marked Schedules A, B and C. Schedule A refers to oil fields, Schedule B refers to pipe lines, and Schedule C refers to refineries.

III—All workers covered in the attached schedules (not including unskilled laborers or skilled craftsmen who have been paid the prevailing locality rates for their crafts, or men employed in construction work, unless permanently employed) shall receive back pay of 50c a day for every day worked from Jan. 1, 1919, to June 30, 1919, both inclusive. Such payments shall be made by the employer or the employers of such men for the period of their employment; it being understood that where any employer has actually paid to any man an increased wage over the amount paid by such employer for like work on Dec. 31, 1918, such increase shall be credited on the amount of back pay. Each employee entitled to back pay must, on or before Dec. 31, 1919, make written application to each employer for whom he has worked during the period specified, for the back pay to which he is entitled, either by letter or on forms provided by the company, and any employee who fails to make such application within such time shall lose all right to such back pay.

IV—If the terms of this memorandum are fully and fairly lived up to by the men during the year ending June 30, 1920, the operators will, within forty-five days after June 30, 1920, pay to every man covered by the annexed schedules, who has been in the company's employ not less than thirty days during the period of this memorandum, 25c for every day worked by such man for the operator; provided, however, that such payments shall not be made to any man who leaves the company's employ through concerted action, or

under conditions that endanger the operator's operation, or who is discharged for willful misconduct. This does not cover men classed as roustabouts or men whose wage is determined by the Macy scale, or men who are paid 25c or more in excess of the wage stipulated for their class in the schedules. If any workman is paid more than the amount stipulated for his class in the annexed schedules, but less than 25c a day more than such stipulated wage, the excess so paid is to be credited to the operator on the additional pay referred to in this paragraph. The question as to whether the terms of the memorandum have been fully and fairly lived up to is to be conclusively determined by the present members of the President's Mediation Commission. In order to avoid any uncertainty, the classes which are to receive the additional pay referred to in this paragraph are specifically indicated in the schedules.

V—Eight hours' actual work at the plant or place of employment shall constitute the work day in the oil industry, subject to the provisions of the schedules hereto attached. Employees covered by any classification are expected to perform any duties to which they may be assigned. If work of a higher class is required of an employee he shall receive the wage of the position to which he has been assigned for as long a time as he occupies that position. If employees are temporarily shifted to any position paying a smaller wage, no reduction in wage will be made, but in case a man's services are no longer required in his class, instead of laying him off the management, with his consent, may transfer the man to any other position and rate the wage according to the position.

VI—Overtime shall be controlled by the regulations in the schedules hereto attached.

VII—Where boarding houses are maintained by the operators during the period of this memorandum, a flat charge not exceeding \$1.25 per day will be made for board. No rent shall be charged to the workmen for bunk-house or dormitory accommodations; but in the several oil-producing districts, on the pipe lines, at refineries and the allied branches of the industry, where cottages are provided, a reasonable rent may be charged therefor, not exceeding the amount now charged, except in case where no rental is now charged or where material improvements are made.

VIII—The wages specified in the schedules are minimum wages and are not to be considered as any restriction on either the operator giving or the workmen accepting any additional compensation either by way of a greater wage per diem, a bonus, a premium or a share of profits; but so long as the schedules are maintained, no increase in wages in one class or to the individual of a class shall necessitate a change in the wage of any other individual or class. Operators shall not, however, by reason of anything herein contained, be justified in reducing the wage of any individual below the amount now being received by him.

IX—Membership in any labor union affiliated with the American Federation of Labor shall not be a bar to employment, nor shall any man be discharged or discriminated against for membership in such labor union. No business between the union and any of the men shall be carried on at any time during a man's hours of employment except in matters of sickness or death. No intimidation or coercion of any kind shall be used for the purpose of inducing or compelling a man to join the union at any time.

X—The "adjuster" hereafter referred to shall be afforded every opportunity to familiarize himself with actual working conditions in the field. If, after such investigation, it appears to him that the classification as shown in the annexed schedules is inequitable in any particular, he shall call a meeting of the Operators' Committee and lay the matter before them, with his recommendations, and if it shall

appear to the Operators' Committee that the classification is inequitable in any particular, proper changes shall be made therein.

XI—Hywel Davies is hereby named as "adjuster." The duties of the adjuster shall be: First, to familiarize himself with operating conditions and from time to time make representations to the operators or to the men as to any matter which he deems should be changed for the welfare of the industry as a whole. Second, whenever in carrying out the provisions of this memorandum any controversies over questions of facts shall arise, and the individual workman or any group of workmen shall find himself or themselves aggrieved, after exhausting the remedies provided by the operator, the whole matter shall be submitted to the adjuster, who shall be given every assistance by both sides in the investigation of the matter. After hearing both sides, the adjuster shall make a written statement of his findings of fact on such controversy, and such findings of fact shall be conclusive on everybody concerned.

XII—This memorandum shall remain in full force and effect up to and including June 30, 1920.

XIII—Within sixty days of the expiration of this period the President's Mediation Commission, or, in the event of its incapacity to act, the Secretary of Labor, shall call a conference of operators and workmen in this district with a view to a renewal of this memorandum.

XIV—Each operator or operating company ratifying the action of the committee of operators as shown by the terms of this memorandum shall signify his assent by subscribing his name either personally or by his duly authorized officers.

Executed at Los Angeles, the 9th day of September, 1919.

Signed:

J. L. SPANGLER,

E. P. MARSH,

HUGH L. KERWIN,

President's Mediation Commission.

Signed:

A. L. WEIL,

For the Committee of Operators.

General Specifications—Schedule A

Employees not entitled to 25c contingent pay for the year ending June 30, 1920, under the general specifications in this memorandum: Roustabouts; teamsters (two-horse); truck drivers (up to and including one ton); stablemen; boiler washers (no chipping, employed continuously); tank-car loaders; electricians (journeymen). Also employees whose wage may be determined by the Macy scale; or men who are paid 25c or more in excess of the wage stipulated for their class in this schedule. If less than 25c in excess of the wage stipulated for their class in this schedule is paid, such amount shall be credited on the 25c payable as provided in this memorandum.

Roustabouts are defined as all semi-skilled laborers, not hereinbefore classified, and are not entitled to the 25c contingent pay.

Common labor (unskilled labor) is defined to be that labor employed in other lines of business, and not peculiar to the oil business; shall consist of the following classifications, and of such other classifications as have not been enumerated in the schedule of semi-skilled or skilled classifications, viz.: Gardeners; janitors; watchmen engaged at the usual watchman's duties, and not required to bleed or gage tanks; gatekeepers; swampers; auto and truck washers; water carriers; weed cutters; ditch diggers; pick-and-shovel men; clean-up men; yard laborers; tank, tank-car and pipe cleaners, scrapers and painters; men loading and unloading cars, trucks or other vehicles; men distributing material in warehouses, yards, storehouses, or about the fields or plants.

Working conditions to continue as heretofore determined by the Federal Oil Inspection Board, and as follows: (a) Drilling crews: All drilling crews to remain on duty until relieved by succeeding crew, and are expected to work eight full hours per day; i. e.: There must be no cessation of activities, but a period of one-half hour shall be allowed dur-

SCHEDULE A—CLASSIFICATION AND WAGE SCALE OF OIL-FIELD EMPLOYEES

Occupation—	Daily Wage Rate Effective July 1, 1919
Driller (cable tools).....	\$8.75
Tool dresser (cable tools).....	6.25
Circulator or third man.....	5.25
Driller (rotary tools).....	8.75
Bit dresser (only when bits are dressed in rig).....	6.75
Derrick man.....	6.25
Rotary helper (dressing bits in rig).....	5.75
Rotary helper (not dressing bits in rig).....	5.25
Head rig builder.....	8.75

Pipe machinist (under six inches; at bolt machines, and other work).....	5.75
Shop helpers.....	5.25

ing which the workers will, in turn, be permitted to eat their lunch or intermediate meal. All shifts to rotate once each month, in order that equitable working conditions may obtain. Preparations for work, as well as for leaving work, to be made on employee's time. (b) Pumpers and oilers: Where three shifts are employed, the preceding suggestions will apply. Where operations are conducted by two shifts, each shift will work eight hours on such reasonable hourly schedules as will best suit pumping conditions, conforming, so far as may be, with the working schedules of other departments. Where one shift only is employed, and on small prop-

erties where daylight men are used, time may be divided to conform to most economical pumping operations and the securing of maximum production. (c) Field shops: All shop employees to work a full day of eight hours. (d) Daylight employees: All daylight men to work a full day of eight hours. Where work is situated at a considerable distance from the boarding house or other central station, daylight men will go to their work on company time, and return on their own time, with the proviso that loss of time to workers is not to exceed twenty minutes per day. (e) Stablenmen: Split time for stablenmen is permissible; it being understood, however, that no longer than eight hours' actual work shall be required within any ten and one-half consecutive hours. (f) Truck drivers and teamsters: Owing to the exigencies of the service, truck drivers and teamsters may be required to work such additional time over eight hours as may be necessary, and shall be paid therefor on a pro-rata hourly basis of the day's wage. (g) Eight hours will constitute a day's work for all workers, and longer hours of labor will not be permitted, even though the employer desires and the worker is willing to work additional time, except in cases of emergency when life or property are in danger, and except as herein otherwise specifically provided. In cases of emergency, overtime may be compensated for by the allowance of an equivalent amount of time at some subsequent date, unless otherwise mutually agreed upon.

Notes from the Texas Oil Fields

Pipe-line companies in Texas on Sept. 30 held in storage 16,917,989 bbl. of oil, according to the report of the Railroad Commission. Of this amount, 8,911,899 bbl. was owned by the pipe-line companies and 2,310,166 bbl. held for others. Unfilled storage capacity amounted to 5,695,932 bbl. Eight of the pipe-line companies reported.

The State of Texas has entered suit against the Texas Pacific Coal & Oil Co. for possession of 50.6 acres of land surrounded by producing wells situated in Eastland County. One-eighth royalty owned by the state is worth \$250,000. The state is also suing for \$500,000 damages for drainage of oil from under this land by the adjoining wells. Suit is based upon a question of mineral leases.

The bidding on one-half of the submerged oil leases to be sold at Goose Creek field by the State of Texas is finished. The highest price paid for any one tract was \$3,527, by the Texas Washington Oil Co., for tract No. 5, of five acres. Individuals and small companies did all the bidding; the big producing companies did not participate, which was contrary to expectations.

The Sinclair Consolidated Oil Corporation has acquired the Wrightman oil properties in the Bull Bayou fields. These were known as the Johnson, Polly, and Hollingsworth leases, and, in addition to previous holdings, give the Sinclair corporation a large percentage of the producing area of the field. It is proposed to build a 250-mile pipe line, with daily capacity of 20,000 bbl., from the Louisiana properties to the refinery on the Houston Ship Channel, near Houston, Tex.

The Rowe Oil Corporation, it is stated, is negotiating with E. F. Simms Oil Co. for the sale of its entire holdings to the latter company. The property consists of 1,200 acres in the Homer field, and a one-

half interest in the Shaw lease, now making 650 bbl. daily and with a gushing well capped awaiting pipeline facilities. The Rowe Oil Co. properties are owned jointly by the Western Oil Fields Corporation, of Denver, and W. H. Rowe, of Shreveport, La.

The White Oil Corporation has been recently incorporated under the laws of Delaware, with a capitalization of 1,000,000 shares, of no par value, of which 630,000 shares will be issued at once. Officers are: P. J. White, president, formerly senior partner of White & Sinclair; Thomas White, vice-president in charge of production, at present with the firm of White Bros.; Frank H. Bethel, vice-president in charge of finances, now first vice-president of the New York Telephone Co. Properties owned include 26,950 acres of oil and gas leases, two refineries, with daily capacity of 2,000 bbl. of gasoline, and 100,000 shares out of 160,000 shares of the Crown Oil & Refining Co. The latter company own leases on 87,500 acres of land, producing 5,000 bbl. daily of Gulf Coast crude oil; a 5,000-bbl. refinery on Houston ship channel, and a 1,000-bbl. refinery at Clarendon, Pa.

The board of directors of the Texas Company has recommended an increase in capitalization from \$85,000,000 to \$130,000,000; other recommendations made were that \$42,500,000 of the new stock be offered to the present stockholders at par; that \$2,500,000 of the new stock be sold to a trustee for allotment and sale at par to employees of the company; and that par value of the stock be reduced from \$100 to \$25 a share. The stockholders were asked to ratify these recommendations at a meeting held in Houston, Tex., Nov. 18, 1919.

The West Columbia field production for the fourth week in October averaged about 30,000 bbl. daily. The larger producing companies were the Gulf Production Co., 10,000 bbl.; Humble Oil & Refining Co., 10,000 bbl.; Texas Co., 7,000 bbl.; Crown Oil & Refining Co., 3,000 bbl.

The Freeport Sulphur Co. is making preparations to drill for oil on the McNeil tract, about ten miles west of Freeport near San Bernard River. The boarding house, bunk houses, and derricks are under construction.

The Texas Co. at West Columbia brought in No. 12 Hogg well recently, flowing over 5,000 bbl. a day.

The Sinclair Gulf Oil Co. has abandoned its No. 1 Norton well at Damon Mound at a depth reported to be over 4,200 ft.

The Humble Pipe Line Co. has nearly completed its new loading docks at Texas City. The tanker C. B. Ashe will take the first cargo of 90,000 bbl., on Nov. 1, destined for a New Jersey refinery. The oil to docks will be supplied from the company's tank farm at Webster, where fifteen tanks of 55,000-bbl. capacity each have been built.

The Terminal Oil Co. has had a temporary receiver appointed until after the court proceedings in which two notes of \$150,000 and \$75,000 are involved. The company owns properties at Humble field said to be worth \$300,000.

The Sinclair Consolidated Oil Corporation has begun operations at its new refinery, situated on the Houston Ship Channel. Expectations are that it will be operating at a daily capacity of 4,000 bbl. in the near future. Much Mexican crude oil, brought directly to the refinery in tank ships, will be refined.

The Walker Oil Co. has completed the first unit of its oil refinery at Morgans Point, where it owns twenty-five acres of ground. The Southern Pacific R. R. is installing switching facilities. The ultimate capacity of the refinery will be 5,000 bbl. daily.

The Hoffman Oil & Refining Co. is doubling the capacity of its oil refinery on Houston Ship Channel, making it 1,000 bbl. daily.

The Deep Water Oil Refineries Co. in Harris County has purchased twenty-seven acres at Harrisburg, on the Houston Ship Channel, at a reported price of \$1,500 per acre. The company will build loading, storage and trackage facilities here.

The Texas Co., in Jackson County, has leased a large acreage near La Ward from L. Ward, and has machinery on the ground to begin the drilling of oil test wells.

In Lampasas County, three new wells spudded in recently at Lampasas field. These are the White well, on Smith ranch; the Western Lampasas Oil Company's well, and the Waxa-Tex well of Waxahatchie Oil Co. Other wells being drilled are the Howell well, on the White ranch, 1,050 ft. deep; the Nelms-Marvin well, on McCrea ranch, 1,100 ft. deep; the Grooves well, 1,000 ft. deep; St. Mary's well, on Le Compté ranch, 900 ft. deep; and two wells of the New York Oil Syndicate, each about 1,300 ft. deep.

The Hull field production for the fourth week in October was about 3,800 bbl. daily. The major portion of production was made by the Gulf Production Co. and the Republican Production Co. The Empire Gas & Fuel Co. is doing deep drilling south of Dayton, where the No. 2 Jackson and No. 3 Welder wells are about 1,500 and 2,000 ft. deep, respectively.

Condition of the Petroleum Industry in Rumania.

Petroleum production in Rumania has reached about 80 per cent of its pre-war output, according to Lewis Van Norman, of the Bureau of Foreign and Domestic Commerce, who recently returned from an extended trip through that country. Some permanent damage was done to the petroleum deposits by the Germans, who, in their haste to secure maximum production, allowed the inundating of some of the deposits.

Dr. Van Norman found that during the term of German occupation, 1,500,000 metric tons of raw petroleum was taken from the Rumanian deposits by the Germans. During the period of occupation, the Germans did all in their power to provide for permanent German control of the Rumanian petroleum industry by a skillful organization of German enterprises, which already had more capital invested than did any other one of the foreign groups or the Rumanians themselves. After the armistice, however, the Rumanian government sequestered the

German plant and holdings, and it is now operating them as a state monopoly.

The extensive pipe lines, which were just being completed at the outbreak of the war, were not damaged seriously by the Germans, and soon can be placed in operation. The development of petroleum deposits in Persia, and the fact that petroleum must bear heavy taxation for many years to come, are certain to hamper the expansion of the oil industry in Rumania, Dr. Van Norman points out in his report.

Ownership of Petroleum Lands in Colombia

The supreme court of Colombia is likely to annul the recent decree of the president of that republic in which proprietorship of the subsoil, without exception, is assumed by the nation, according to a report received by the Department of Commerce. Publication of the decree has aroused a storm of protest from the land owners in all sections of the country, many of whom have contracts with American companies permitting petroleum exploration.

In a formal report to the department, the American Consul at Barranquilla reviews the legal question involved and shows why he believes it is scarcely possible for the Supreme Court to do other than annul it.

Much harm already has been done, both within and without the country, by the decree, the consul reports, as it has weakened confidence in the sanctity of property rights. The general sentiment in Colombia, he says, is that it is imperative for the Congress to legislate definitely on the question, so that confidence may be restored. He points out that though Colombia possesses much promise for the petroleum prospector, the successes thus far obtained are not sufficiently striking to attract capital if there is any question as to proprietorship of the subsoil.

Treatment Costs of Oil Shales

James Duce, oil inspector of Colorado, recently returned from St. Louis, Mo., where he was sent by Governor Shoup to report on the Wallace process for treating oil shales. Mr. Duce states that shale containing 1 bbl. of oil per ton of ore should be treated for \$1 a ton. The shale should not cost more than \$2.15 per ton, delivered to the retort. By this process 30 gal. of 56° Beaume oil was produced. Assuming a price of 15c. a gallon for this grade of oil, there is a profit of \$1.35 per ton, not including the byproducts obtained, such as lubricating oils and ammonium sulphate. He mentions that the technology of deriving lubricating and other byproducts from shale oil is as yet undeveloped, and that it is not justifiable to induce capital to invest in oil shales upon the assumption that these products are at present valuable. They have potential value, but the perfecting of their technology will be a slow process.

The Nipissing Mines Co., Ltd., of Cobalt, Ont., has an option on oil lands in Texas and has drilled to a depth of 1,500 ft., according to recent reports. It is planned to continue to a depth of 3,000 ft.

CORRESPONDENCE AND DISCUSSION

Letters From the Mining and Metallurgical
Industry Dealing With Pertinent
Subjects of Interest

The Domestic Production of Chrome Ore

The Washington correspondent of the Journal, in reporting Secretary Lane's conference on chromite, held last December, for the purpose of considering the chrome-ore situation, said that "All present recognized the objections that would be raised by Congress to a duty high enough to protect American producers of chrome ore." It was stated that such a duty would increase the cost of steel by 8 per cent over the pre-war price, and that this entire cost would be saddled upon the people of the United States, who, to avoid a possible loss of \$1,000,000 to the chrome producers of the country, would be called upon to pay \$17,000,000.

That this statement is inaccurate is apparent on a moment's thought. The total value of all the chrome ore used in the United States in any one year prior to the war was less than \$1,000,000. It is not the desire of the producer that the consumer should pay \$17,000,000, and if there is any likelihood of such being the case it might be a fit subject for Congressional investigation.

Because the distributor of chrome has been able to charge exorbitant prices for the mere reduction of the ferrochrome ore to the metallic state, it does not necessarily follow that a tariff will protect him in such a practice. A consideration of pre-war prices shows that the price paid for the chrome ore has little if any relationship to the prices charged for ferrochrome. It is likely that if Congress were to act, it would place such a duty upon the ore as would offset the increased cost of American production as compared to the cost of foreign ore. Such a policy would permit those manufacturers having a real preference for the foreign ore to continue to use it.

There seems to be an opinion that the chrome deposits of the United States could not supply our future market demands and that we should conserve our present supply by non-use and non-production. Although prior to the war such a contention might have been made without contradiction, our unprecedented development and production of chrome ore in the latter part of 1918 demonstrated to all who have taken the trouble to investigate the facts that, given a market for the ore which justifies the payment of a living wage to our American miners, they could and did meet the demands of our nation in the midst of war and at the same time piled up a reserve.

I do not mean to question the ability of our geologists to approximately estimate the tonnage of ore in any particular deposit when presented to them for

their examination; or their ability to compile data as to the possible future production of the United States of those minerals having a commercial value and for which we have for years past made diligent search, but I do not believe they should be called upon to report the maximum amount of chrome ore we can produce until they have themselves made a search for the mineral or until the prospectors and miners of our country have been given an opportunity to investigate and report their findings. Both before and after the war, high-grade chrome ore on the Pacific Coast sold for less than an equal weight of coal or coke. Our prospectors were trained not to investigate chrome deposits.

There is today four times as much undeveloped ore in sight in the United States as there was prior to our entry into the war, not to mention the supply of mined ore on hand not worth the price of transportation to market. The greater part of this ore was brought to light within six months after our Government announced a policy of restriction of imports and the introduction of legislation for mineral control. Neither of these were carried out as expected. While we were in the thick of our fight and the chrome miners hard at work developing chrome, and at the same time keeping the market supplied, foreign ore was brought into this country.

The other measure which appealed to the miners as an inducement to develop chrome was the "War-Minerals Bill." The Government, after the signing of the armistice, did not put this bill into effect and denied relief to the chrome miners on the grounds that under the requirements a shortage of the mineral to be protected must be declared to exist.

Protection should be given the American miner, that we may relieve the feeling he has today that our Government is being exploited in the interests of capitalists, and that he is powerless to obtain relief.

Prior to the war, the United States was entirely dependent upon the chrome deposits owned or controlled by England and France. In 1914 we imported 74,686 tons of crude ore and produced but 591 tons.

In 1915 at the time when we were endeavoring to maintain peaceful relations with Germany, and President Wilson was doing all in his power to urge neutrality in our thoughts and actions, England placed an embargo on chrome ore being supplied to the United States and forced us to guarantee not to ship or permit to be shipped any chrome ore, or chrome products to the then neutral powers. Although in this instance it was not difficult to square our acts with our conscience, are we to admit and permit other nations, when they get into wars among

themselves, to deny us the right to market our steel products because some of these products contain a small percentage of chromium? We should never permit ourselves to be placed in a predicament that will permit a European nation to say to whom we shall and shall not sell our products.

But far more vital than to whom we sell is the question of our own supply. That we might rightly consider the danger of depending upon a foreign supply of this material so essential for war purposes we should give thorough consideration to the location whence we are obtaining this supply.

All the largest deposits as well as the largest amount of chrome ore used by the world today comes from New Caledonia and the east coast of Africa. These countries, situated in the South Pacific Ocean, are, figuratively speaking, in the back yard of Japan. In the event of a war with this nation Japan would attempt to place an embargo upon this important war mineral leaving Rhodesia and New Caledonia for the United States; and unless we were strong enough to keep the Japanese fleet from these waters we would not be able to obtain the chrome ore necessary for munition purposes to successfully carry on the conflict.

The chrome producers desire that a tariff be placed upon the importation of chrome ore equal to the difference in the pre-war cost of producing and delivering foreign ore to our markets and the pre-war cost of producing and delivering domestic ore to the same market. A tariff of 50c. to 75c. a unit on the chromic oxide of a ton of chrome ore is equivalent to $3\frac{1}{2}$ c. and $5\frac{1}{2}$ c. per pound of chromium. The present quoted price of chromium as used by our steel interests in the form of ferrochrome varies from 30c. to 50c. per pound; consequently such a tariff should produce but a slight increase in the cost of chromium to the consumer, and, as the amount of chromium used for the production of chrome steel does not as a rule exceed 3 per cent, such a tariff as above suggested should temporarily increase the price of chrome steel by not more than 2 or 3 per cent.

The chrome producers ask for a tariff to protect an infant war and a peace industry. Have we a right to limit our efforts for the production and utilization of chromium? Today, the interests in control of the ferrochrome markets which supplies all our Government should come to the assistance of their metallurgists. If the market prices are a criterion of costs, there is abundant field for improvement in their metallurgical practice. Is there any reason why their costs should not be made public?

A domestic production of the raw ore would broaden the field of production and by the co-operation and competition of our American metallurgists not only lower the price of ferrochrome but lead to the development of hitherto unworkable deposits, and in the application of our increased knowledge, broaden the economic benefits derived from the ore.

W. P. Lass.

Berkeley, Cal., Sept. 9, 1919.

Minnesota State-Owned Mines

An article appears in the Journal of Sept. 6 which gives interesting information about Minnesota state-owned iron mines. Not the least of this is the table showing "state-owned mines now exhausted." These latter number eight, and they have made aggregate shipments amounting to 1,736,000 tons.

It may be assumed that these mines are not "exhausted" in the sense that all their now merchantable ore is gone, for some of them were operated during a period when less care was observed than now in the conservation of ore in the ground and when there was much waste. But the losses as a whole are not great, and one may estimate that these mines averaged a tonnage of less than 300,000 each. They were, therefore, very small mines, as iron ore mines go. Are the remaining thirty active mining properties of the state as small? By no means. Without particularizing, it may be stated that these thirty contain approximately 150,000,000 tons, or 5,000,000 tons each, of ore now merchantable. Some of them comprise two or three hundred thousand tons only, but such properties as Missabe Mountain, Hill Annex, or Scranton, each of which has more than twenty million tons in reserve, bring up the average.

Many of the state leases have run more than half their allotted fifty years, and must be mined at speed to exhaust the ore during the life of the lease. This is especially the case with Missabe Mountain. The law under which state mineral leases were granted has been rescinded so far as the taking out of leases is concerned, and when such law is once more operative it will be on a far different royalty than the 25c. a ton now paid for ore mined. Probably it will be under some sort of sliding scale, based on quality, or ease of mining, or both.

The article referred to says that the state "is the largest single fee owner of iron ore deposits in the United States." Great as are its holdings, I question this statement. On the Mesabi Range alone the Great Northern Iron Ore Properties holds in fee the following mines: Mahoning, mine and reserves; Utica, Stevenson, Harrison, Lamberton Annex, North and South Uno, Enterprise, Harold, Thorne, Wabigon, North Star; and a half interest in the fee of the following: Leetonia, East and West Stevenson, Sweeney, Ann, Patrick, North Harrison, Warren, Mace, Hill-Walker; and in addition there are several reserves not opened, some not yet leased to operators, and the entire tonnage of the above mines and of these reserves is doubtless somewhat more than that in the ownership of the state.

It is well known that the Tennessee Coal, Iron & Railway Co. owns in fee tonnages vastly greater than those of the State of Minnesota. My present recollection is that the holdings of the Woodward Iron Co. are at least as large as Minnesota's, though my memory may be at fault here; and the ores owned by Witherbee, Sherman & Co. rank above those of the state.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

War-Minerals Relief

Slightly more than \$8,000,000 of the War-Minerals Relief Appropriation was unexpended on Oct. 31. Awards had been made to the extent of \$343,195.67, representing 26 per cent of the amounts claimed. Expenses of the commission to that date aggregate \$129,521.17.

The Chestatee award has been revised and increased by \$3,000, bringing the total to \$223,529.17, or 24 per cent of the amount asked. Other awards to date, with the class of claim and the percentage of the amount asked, are as follows: National Pyrites Chemical Co. (pyrites), \$33,067.49, or 18 per cent of claim; C. T. Pinson (chrome), \$212, or 12½ per cent of claim; Maryland Chrome Co. (chrome), \$37,585.36, or 68 per cent of claim; Tynor, Pittard & Sloane (manganese), \$186.40, or 9 per cent of claim; Oscar Reinhold (manganese), \$1,456.25, or 58 per cent of claim; White Horse Mine (manganese), \$468.97, which is 2 per cent of claim; Butte & Plutus Co. (manganese), \$3,952.39, or 18 per cent of claim; Herbert W. Smith (manganese), \$16,908.78, or 81 per cent of claim; Schafer, Atherton & Co. (chrome), \$407.11, or 58 per cent of claim; L. B. Payne & Co. (chrome), \$7,862.24, or 35 per cent of claim; Arata & Palmer (chrome), \$302.20, or 11 per cent of claim; Playter Bros. (manganese), \$1,046.43, or 17 per cent of claim.

Legislation to Liberalize Act

In view of an opinion rendered by the Secretary of the Interior in connection with proposed legislation to liberalize the War-Minerals Relief Act, the Committee on Mines and Mining of the House of Representatives probably will take no immediate action on the bill. In a letter to the House committee, Secretary Lane expressed himself as follows:

"It occurs to me that the most satisfactory way to treat this matter would be to wait until the work of the commission has progressed to a point where we can have definite information as to the claims which were rejected and the amounts to be paid under the existing law. If the matter were to be thrown wide open, and all claims considered, including requests for losses incurred through published reports, the appropriation of \$8,500,000 would not cover the award, so that all must necessarily be scaled. On the other hand, if the commission be permitted to complete its work under the present law, it appears that a substantial amount will remain unused. By that time we shall have a knowledge of the situation which will enable Congress, perhaps, to establish a more liberal rule of award than that now existing, under which many of the claims now ruled out can receive attention. Up to

this time, the War-Minerals Relief Commission has held hearings in 461 cases and has passed upon 347 claims out of 1,206 filed. If all the claims in which no direct request was made must be examined as to facts and questions involved, it will prolong the work of the commission very much and consequently delay the determination in those cases where a direct request was made."

The Position of Chief Engineer

The War-Minerals Relief Commission still is without a chief engineer. The position has been offered to several well-known mining engineers, but each has been forced by other considerations to decline the offer. W. R. Crane, of the staff of the Bureau of Mines, is filling the place temporarily, but it is the desire of the Bureau to place the engineering responsibility in the hands of an engineer who is not already in the Government service.

General Mineral-Leasing Bill

By vote of 169 to 39 the House of Representatives on Oct. 30 passed the General Mineral-Leasing Bill after four days of debate. The measure already had been passed by the Senate. The measure has been passed by the House four times, and twice by the Senate. Leasing legislation has been under active consideration in Congress for seven years. At the last session of Congress, when the measure was passed by both houses, six months was consumed before the conferees could reach an agreement. It was then near the close of the session, and the conference report was defeated in the Senate by Senator La Follette's filibustering tactics.

The measure is of the utmost importance, as it affects in a general way 700,000,000 acres of public land, and involves directly 6,500,000 acres of possible oil land, 70,000,000 acres of coal land, 2,700,000 acres of phosphate land, and 3,500,000 acres of oil-shale land.

An important feature of the bill is the unlocking of the resources of lands that have been withdrawn in California and Wyoming. In California, 40,000 acres of oil land were withdrawn, and in Wyoming about 10,000 acres of land were withdrawn after a considerable number of claims had been taken up. This resulted in extensive litigation, and as a result \$25,000,000 has been impounded from the returns for the oil produced from these lands. The leasing bill will enable the Secretary of the Interior to settle these litigations and permit increased production of oil.

The bill was taken up under a special rule. The House committee had struck out all of the bill passed by the Senate and inserted a substitute.

Though many of the sections were unchanged, the action of the committee had the effect of simplifying the controversy over sections 40 and 41 of the Senate bill. Section 40 of the Senate bill, it was feared, would undo the dissolution proceedings against the Standard Oil Co. of New Jersey, and would have the effect of reassembling the dissolved units into single control. Section 41 provides that corporations engaged in producing or refining petroleum shall maintain the same price for their products where the stockholders of any such corporations own or control 25 per cent or more of the stock of any other such corporation. The opinion of the House committee was that the section is capable of great abuse and is loosely drawn. The two sections, it may be added, were attached to the bill in the Senate as a rider and were not considered by the Committee on Public Lands.

The bill as reported to the House provided that 10 per cent of the fund accruing from the leases is to be turned in to the Treasury of the United States to offset the expense of administering the act. The remaining 90 per cent is divided equally between the Reclamation Fund and the state in which the lands are leased. The 45 per cent for the states was intended to compensate them for their losses in tax values. This provision of the bill was changed on the floor of the House, however, so that 70 per cent of any moneys that may be paid on account of past production goes to the Reclamation Fund, 10 per cent to the Government, and 20 per cent to the state. Returns from future production are divided so that 60 per cent goes to the Reclamation Fund, 30 per cent to the state and 10 per cent to the Government. It is probable that these percentages will be changed in the conference. Many of the details of the changes made in the House are not presented in this article, owing to the certainty that additional changes will be made by the conferees.

The House left in the bill the provision of its committee that all helium gas is to be reserved for the Government. Representative Mondell dissented from this, saying, "We have become so hysterical about such matters that we are going to the extreme of over-protection. A certain amount of helium gas is necessary and important, but it is perfectly absurd to reserve the helium gas in all of the lands which would be affected by this bill."

Representative Sinnott, the chairman of the committee, pointed out, however, that experts had advised him it will be easy to separate helium from natural gas without in any way jeopardizing oil operations. The extraction of that gas is beneficial, it is claimed, as it results in a more inflammable natural gas.

Opening of Indian Lands

Location of mining claims on certain Indian reservations, and the leasing of those which may be found to contain deposits of metalliferous minerals, as provided in the last Indian appropriation act, was permissible after 12 o'clock noon on Nov. 1. The Secretary of the Interior has promulgated regula-

tions to govern the prospecting and leasing. The Indian lands which will be subject to exploration under this act are included in the following reservations:

Arizona—Moqui Indian Reservation, Salt River Reservation, San Carlos Reservation, Walapai Reservation, Colorado River Reservation, Fort Apache Reservation, Western Navajo Reservation.

Arizona and New Mexico—San Juan Reservation, Navajo Reservation.

California—Hoopa Valley Reservation, Tule River Reservation, Fort Yuma Reservation, Morongo Reservation, Idaho Reservation, Fort Hall Reservation, Nez Perce Reservation.

Montana—Rocky Boy Reservation, Tongue River Reservation.

Nevada—Pyramid Lake Reservation, Western Shoshone Reservation.

New Mexico—Mescalero Reservation, Pueblo Bonita Reservation.

Oregon—Warm Springs Reservation.

Washington—Yakima Reservation, Neah Bay Reservation.

In laying out the original Indian reservations, not much was left to the Indians in the way of mineral resources. Since that time various sections have been detached from the reservations in order that such promising mineral supplies as existed could be exploited. As a result, the mineral wealth of the reservations included under the present act is not great. All of the reservations named have been covered by geologists of the U. S. Geological Survey.

Some gold occurs in the Moqui Reservation, but, perhaps, not in economic quantities. The San Carlos Reservation is in a copper region, but it is doubted if important deposits exist on the reservation itself. Some occurrence of asbestos is reported on the Fort Apache Reservation. Gold-bearing veins of no particular promise are reported on the Fort Hall Reservation. The Pyramid Lake Reservation offers some inducement to prospectors for copper.

The law providing for the leasing of these mines does not apply to oil, coal, potash, or phosphates. Coal deposits occur on a number of reservations, and though they are not leasable, they would be available as sources of fuel for mining operations.

Copper-Mining Bill

Representative Carl Hayden, of Arizona, has introduced a bill (H. R. 10433) to provide for the disposal of public lands in Arizona, New Mexico, and Utah containing copper at depth. The legislation proposed by the Hayden bill is designed to meet and deal with a condition to which the existing Federal mining laws are not, from the practical standpoint, applicable.

Many of the important copper deposits in the states mentioned do not occur as regular veins or lodes, but in extensive low-grade bodies, often underlying a heavy overburden of wash, conglomerate, or other non-mineral-bearing formation. To discover such underlying deposits deep and expensive drilling or shaft sinking is necessary, requiring months, and even years, for its accomplishment. Under existing law a discovery in such a drill hole or shaft could serve to validate, and vest possessory title to, only one claim, 1,500 by 1,600 ft., or an area of only about twenty acres, which is absurdly insufficient to justify the great outlay involved.

In the past the mining communities have attempted to meet the conditions by locating claims and doing annual assessment work in the overburden. Such claims, in most instances unsupported by any semblance of discovery, have been recognized by the communities as property, and bought and sold as such.

In many instances meager surface showings, not connected with the underlying deposits, have been claimed as discoveries and even made the basis of patent proceedings. In the early days the Land Department did not critically examine into the matter of discovery unless the question was raised by protest or contest, and large numbers of such claims were patented. This was the case at Bisbee, Ariz., where the ore formation occurs at a depth of 1,000 ft. or more. In later years the department has established the practice of requiring a detailed showing as to the character and quality of discovery claimed, and has made, through the field service, an investigation on the ground. As a result, the department has been confronted with the question as to whether inconsequential mineral showings in the overburden could be accepted as sufficient to constitute discovery, as in the case of the Rough Rider and other claims which were finally patented because it was felt that the previous patenting of similar claims had established a rule of property.

But, generally speaking, lands of the character contemplated by the proposed legislation cannot now be patented under the existing mining laws unless discoveries are made by deep drilling or shaft sinking. On the other hand, large areas of such land were in the early days patented under the non-mineral laws, under the rule which then prevailed that land could not be classified as mineral in character, or patented as a mining claim, unless mineral had been actually disclosed. In recent years, however, the department has adopted the rule that, through geological deduction as to underlying deposits, land may be classified as known mineral in character, and now declines to patent such lands under the non-mineral laws.

There are thus large areas of land in the four states mentioned which the Land Department recognizes, or would recognize, as being mineral in character, but which remain undeveloped because title thereto cannot, as a practical proposition, be acquired under the present mining law.

To justify the great expense of exploration by drilling or sinking shafts to a great depth, as well as the great outlay in working shafts, machinery, and equipment for actual mining operations, it is necessary that a reasonably large acreage be acquired or controlled.

The proposed legislation is designed to encourage the exploration and development of such lands by giving to any one who will undertake deep exploration work the right to control and acquire an area of not to exceed 1,280 acres (which is about the minimum area now held by any of the large porphyry copper mining companies), upon conditions carefully designed to prevent abuse of the privilege.

Mining Costs and the Federal Trade Commission*

The Wages of Capital Should Be Included in Costs of Production as Well as the Amount Paid to Labor

A TRUE diagnosis of the financial condition of our industry involves bookkeeping that states the real economic symptoms. In mining, as in all other productive business, production costs should express all the facts, but I am convinced that we have not yet reached that stage in our accounting methods. The annual reports of our largest mining corporations and the studies by the Federal Trade Commission alike fail to tell the whole story in their statement of production costs, which are made to include the wages of labor but not the wages of capital employed. The Federal Trade Commission, in its definition of cost, specifically excludes interest on investment, but can we do that in the world of realities? Does not the cost of a pound of copper just as truly include its share of the interest due on the bonds and the dividend due on the capital stock actually paid in—that is, wages paid to capital—as it includes the wages paid to the mine worker or the man in the smelter? Of course, neither payroll should be padded. Do not regard the definition of profit as simply an academic question for college professors to discuss: It is more a matter of fundamental concern to the men who are trying to build up the industry.

In the first place, such terms as "net earnings," "profit," "net income," "surplus," or "balance to surplus account," which appear on your financial sheets, are too optimistic in tone when the operating costs do not include any charge on account of the investment. The inference is too easily drawn that this surplus is available for profit-sharing between labor and capital. For example, the Federal Trade Commission report on copper is quoted in newspaper headlines as showing "28 per cent profit in copper," yet in this report the wage to labor is set forth as the first and largest item among the elements of cost, this item alone averaging 5 1-3c. a pound in 1918, but cost of capital is not included. The report, however, shows that the eighty-five copper companies discussed would require an average of 3c. a pound to pay 10 per cent on their actual investment, yet this 3c. does not appear in the 16c. of average cost, but instead it forms a part of the 8c. of so-called "net profit," which the unwary may regard as the actual difference between price and cost.

In the second place, I fear lest accounting which does not count all the costs may lead us to fail to appreciate the results of American engineering. Our mining engineers, backed up by red-blooded capitalists, are constantly lowering labor costs by increasing the investment in improved mine equipment. This means replacing the hardest part of labor with machinery—working dollars instead of men—so that your cost-keeping conceals the true state of things.

*Extract from an address to be delivered by Dr. George Otis Smith, Director U. S. G. S., before the American Mining Congress, Nov. 18, 1919.

Rapid Determination of Silver in Cyanide Solutions

BY J. E. CLENNELL

The following method, which I devised for the rapid determination of silver in cyanide solutions, has been checked both against the fire assay (usual method of precipitation with zinc dust, lead acetate, and hydrochloric acid, with cupellation of the resulting lead sponge), and against Clevenger's method (filtration under vacuum through a bed of zinc dust, the solution being delivered slowly from a dispensing burette, finally dissolving the precipitate in nitric acid and titrating with thiocyanate). The results obtained were, in general, higher than those given by the fire assay, and identical with those of Clevenger's method.

Reagents required:

1. Lead acetate (saturated solution).
2. Zinc dust as commonly used in cyanide plants.
3. Sulphuric acid, 50 per cent by volume.
4. Nitric acid, 50 per cent by volume.
5. Indicator for the final titration, being a concentrated solution of ferric nitrate, ferric sulphate or ferric alum.

Standard solutions required:

1. Silver nitrate. This may be the regular solution used in titrating cyanide at the plant, or may be adjusted so that 1 c.c. equals a round number of ounces of silver per ton (or other desired unit) in the measured volume of solution used for the test. In the tests in which the method was checked, the solution contained 3.2617 gm. AgNO_3 per liter, so that 1 c.c. = 2.07 gm. Ag.

2. Potassium thiocyanate (sulphocyanide). This cannot be prepared by weighing an exact quantity of thiocyanate, but is easily adjusted to the required strength by blank titrations with the standard silver nitrate and diluted as required. In the experiments a solution was made, containing about 2.5 gm. KCNS per liter, and diluted to correspond with the standard silver nitrate.

Method (for poor solutions): Take 500 c.c. of the solution to be tested (if desired, 20 a.t. or 583 1/3 c.c. may be taken). Add 10 c.c. saturated lead acetate, 5 gm. zinc dust, and 25 c.c. sulphuric acid. Boil, settle, decant, and wash three times by decantation with hot water, without filtering. Dissolve the residue in 25 to 50 c.c. of nitric acid. Heat to boiling to expel red fumes. Cool. Dilute with about 100 c.c. of water. Titrate with standard thiocyanate and ferric indicator.

Remarks: For richer solutions 10 a.t. (291 2/3 c.c.), or even less, will suffice, the other reagents being reduced in proportion. The exact end point may sometimes be ascertained rather more accurately than by direct titration, if a slight excess of the KCNS be added and the excess cautiously removed by back titration with standard AgNO_3 till the trace of red color is no longer observed after agitation and

settling. Where the precipitate is bulky it is an advantage to allow it to settle and decant the bulk of the supernatant liquid into another vessel before making the black titration.

Advantages: This method has the advantage of not requiring any filtration whatever. On the other hand, a rather large volume of solution must be heated, whereas Clevenger's method avoids the necessity of artificial heat, at least in the preliminary or precipitating stage. Notwithstanding this, the new method proved the more rapid. In general, the sponge settles so rapidly that the process of washing by decantation occupies only a few minutes. Sulphuric acid is used instead of hydrochloric, to avoid the possible introduction of chlorides in the final solution, which would interfere with the thiocyanate titration.

Specifications for Reagents

Those who have experienced difficulties in operation attributable to impure chemical reagents are invited to write to W. D. Collins, Bureau of Chemistry, Washington, D. C., stating their experience, giving the use to which the reagents have been put, and suggesting, if possible, methods which would be satisfactory in determining the presence and amount of objectionable impurities. The American Chemical Society recently appointed a committee, of which Mr. Collins is secretary, to collect data regarding the quality of the reagents now on the market, and to draw up specifications. Insufficient knowledge on the part of the producer, both as to requirements and acceptable methods of testing, has been one source of the dissatisfaction heretofore experienced.

Indian Gold Production

The output of the Indian gold mines in September, 1919, amounted to 36,813 oz., the lowest monthly yield since May, 1902. The accompanying table, republished from "Financial Times," shows the monthly output in fine ounces since the beginning of 1915:

	1915	1916	1917	1918	1919
January	47,354	45,214	44,718	41,420	38,184
February	46,117	43,121	42,566	40,787	36,834
March	45,736	43,702	44,617	41,719	38,317
April	46,033	44,797	43,726	41,504	38,243
May	46,835	45,055	42,911	40,889	38,608
June	46,307	44,842	42,924	41,264	38,359
July	46,189	45,146	42,273	40,229	38,549
August	46,586	45,361	42,591	40,496	37,850
September	45,076	45,255	43,207	40,038	36,813
October	45,943	45,061	43,941	39,472	—
November	45,346	45,247	42,915	36,984	—
December	45,020	48,276	44,883	40,149	—
Totals	556,596	541,077	520,362	485,236	341,762

In September, 1919, the Mysore company made the largest production (12,502 fine oz.), followed by Goregum (7,373), Champion Reef (6,848) and Nundydroog (6,263 fine oz.).

New South Wales Gold Yield for September, 1919, was 3,000 oz., valued at £13,000, as compared with 8,000 oz. valued at £32,000, in September last year, according to a report in Financial Times. The production for the nine months of this year amounts to 40,000 oz., valued at £170,000, as compared with 63,000 oz., valued at £268,000, for the corresponding period last year.

BY THE WAY

Hands Across the Sea

A shortage of British technical experts, or some equally valid reason, has induced the S. Pearson Oil Co. to send five American geologists to Trinidad to explore and prospect some 200,000 acres of oil lands, according to the May issue of *Petroleum*. Development work is to cost about \$250,000 a year and it may be presumed that the money will be judiciously expended.

New Fuel for Stubborn Fires

A Red Cross man, in Rumania, discovered a new kind of fuel recently, when his wits were put to the test of making low-grade lignite burn under his soup kitchens.

Wood and coal have been very scarce in Rumania since the German and Austro-Hungarian invasion and the traveling soup kitchen men, "goulash cannon operators," are sometimes hard put to it, to keep the pot a-boiling. John H. Nolan of Alpena, Michigan, Red Cross worker near Buzeu, found some of the rivers thickly encrusted with oil scum. One day a brilliant idea came to him.

Mr. Nolan and some of his assistants skimmed the oil off twenty or thirty square yards of the surface of a stagnant pool near their food station and then dropped the lignite briquettes into the oil. After the briquettes had soaked for two hours they were taken out and set afire. The lignite burned with a cheerful roar and now all other goulash experts working for the Red Cross are following the same method.

Civil But No Engineer

The following is excerpted from a bona-fide report on a lead property recently submitted in all seriousness to the American Metal Co. by a "civil and mining engineer":

The vein is a well-developed rift, subtending between genuine wall rocks, in a northerly and southerly course, in strict conformity with the direction of the primitive formation of the country, which is always necessary to constitute a true and genuine vein. There is a gallery or tunnel following longitudinally and horizontally for 700 ft. upon this vein . . . and there is no reason why the tunnel may not be continued northerly upon the vein to the company's north line about 5,000 ft. These facts are supported by prospect shafts, showing up the well-defined primitive formation of the country, as well as an extraordinary large vein having an average width of nearly or quite 40 in. Twenty-four in. in width in our western mines constitute a fine-sized lode vein, while 1,500 ft. is the limit of its length by law in Colorado, and other states and territories.

The main shaft in this mine passes down through the tunnel mentioned and subtends to a depth of 225 ft. below said tunnel. At this point the gangue material of the vein appears to change, as should be expected at such a depth. Flint with a small fissure of talc appears. These with other blue-stained materials, give tolerably good indications of the vein running in silver. This flint is little else than silica, tempered with alumin and altogether gives the materials a slight appear-

ance of silver ore. Yet the whole may prove to be simply silicified flint, or dike, interjected at this point in the vein. . . .

It is accepted as true that metallic veins grow stronger as we go deeper. Then it follows that this 220-ft. level must have a heavier percentage of lead than the 83 ft. above it, which with numerous side fissures must average at least 24 in. in width of vein matter in sight. Growing schists caused many of those small side fissures which join the main vein further below. Calculated upon all the above facts which have been reasonably proved, this vein practically in sight must contain about 513,333 tons of ore.

After this ore has been taken out the mine will be increased in value beyond reasonable calculations that can be made at this stage of the work. No one has ever found the bottom of genuine lode vein. Generations will have passed away before it is exhausted. Gold lode veins are now being worked for profit that have only 15 to 20 in. width and not one of them will be abandoned so long as it produces \$12 to \$15 per ton, certainly not if it produces \$20.

Cinderella Manitoba

"Manitoba is the Cinderella of the Canadian sisterhood, so far as the Geological Survey is concerned," writes "C. A. B." in the "Manitoba Free Press." "The survey seems to have a fixed idea that British Columbia is the land of promise, and to that favored province go geologists in gangs, while we get but a stray one. Of course, B. C. is attractive; the climate is in most parts delightful, the scenery grand in the extreme; possibly science there finds its surroundings more conducive to the correct attitude of mind for the unraveling of complicated stratigraphical problems. No doubt, no doubt. Yet poor old Manitoba is trying to tell the world that as regards mineral wealth she can do her bit, and more than her bit, if given a chance, and we should be so thankful if the powers that be would send us a nice flock of experts next season. Please do!

"In Ontario the dominion and provincial authorities seem to take delight in duplicating one another's work. P. C. Hopkins examines Larder Lake for the Ontario Bureau of Mines; soon after, Dr. H. C. Cooke hastens there to read its riddles for the dominion survey. A. G. Barrows reports on the Matachewan area, for Toronto, and forthwith Ottawa sends Dr. Cooke to investigate what is in the same map sheet. To those that have much shall be given.

"As for B. C. she is the petted darling of the G. S., if not its first love, certainly its latest. Eight parties have been assigned to the province during the summer, and a ninth took over the Mayo country, Y. T. J. J. O'Neill has been in charge of the party studying Salmon Arm, Portland Canal; B. R. McKay has investigated the placers of Cariboo; L. Reinecke passed weeks estimating the value of the soda lake between Clinton and Quesnel; the Slocan attracted M. F. Bancroft; the wild west coast of Vancouver Island yielded a wealth of information to V. Dolmage; S. J. Schofield seems to have discovered a new mining property which the Review calls "Brittania," S. C. McCann accumulated material for a map of the Bridge River country; and, lastly, Charles Camsell, the O. C. of the brigade, paid particular attention to the Coquilla section."

PERSONALS

F. W. Bradley has returned to San Francisco from Alaska and Idaho.

John W. Mercer returned from Europe during the latter part of September.

C. A. Burdick was in Ashland, Clay County, Ala., during September and October on professional business.

Alan M. Bateman, professor of economic geology in Yale University, has returned from a professional trip to Alaska.

Frank Williams, president, and W. A. Chesterton, director, of the Victoria Gold Mining Co., have returned to Boston after visiting the mine in Michigan.

S. S. Sorensen, general manager of the Braden Copper Co. at Sewell, Chile, who was in New York the latter part of October, sailed for Chile on Nov. 3.

S. Skowronski was in charge of the Anaconda Copper Mining Co.'s exhibit at the Fifth National Exposition of Chemical Industries held in Chicago during September.

Colonel U. G. Lyons, of the Cowango Refining Co., Warren, Pa., was elected president of the National Petroleum Association at the annual convention held at Atlantic City, N. J.

Carl O. Lindberg, mining engineer, with offices in New York and Los Angeles, representing an English company, recently visited the Coeur d'Alene district, seeking zinc property.

Donald H. Fairchild, mining and metallurgical engineer, returned to Denver from a professional trip to San Francisco and to the Kingman, Ariz., district, where he examined properties.

Ernest N. Patty, mining engineer for the Washington State Geologic Survey, has completed a geologic reconnaissance along the route of the proposed Methow-Okanogan tunnel, Okanogan County, Wash.

F. L. Estep, of the firm of Perin & Marshall, consulting engineers, New York, sailed on Oct. 2 for England, on the "Mauretania." S. M. Marshall, of this firm, intended to leave England for India about Nov. 1.

Fred Searls, Jr., of San Francisco, is in Wallace, Idaho. Mr. Searls' services have been secured by the Hecla Mining company in connection with the impending apex litigation with the Marsh Mines Consolidated.

J. Gordon Hardy, formerly consulting engineer of the American Smelting and Refining Co., has resigned his position to return to Mexico, where he

was engaged in private work prior to the revolutionary troubles.

A. E. Ring, who had charge of the operations of the American Smelting and Refining Co. at Creede, Col., has been transferred to Leadville, where he is at present on the staff of the Yak, a subsidiary of the company.

Hugh A. Stewart, general manager of the Chiksan Mines, Chiksan, Korea, has returned to the United States because operations have been suspended at the property. Mr. Stewart will spend the winter in Denver.

Joseph Daniels has returned to the faculty of the University of Washington College of Mines as associate professor of mining and metallurgy. For the last year Mr. Daniels has been connected with the Sydney Junkins Engineering Co., Vancouver, B. C.

Harris & Ewing
A. G. WHITE

A. G. White, who has served for a number of years as the economist for the Bureau of Mines, has resigned to accept a professorship with the University of Pennsylvania. He will serve as an instructor in economics as applied to business.

Joseph P. Connolly, of Villa Beach, Cleveland, has been appointed professor of mineralogy in the South Dakota School of Mines. Professor Connolly has been lecturing on economic geology at the University of Missouri since his discharge from the Army in January.

Leon J. Pepperberg, Frank W. Reeves, and Carlton Meredith, geologists and engineers, announce the removal of their offices from Mineral Wells, Tex., to Great Southern Life Building, Dallas, Tex., and Mrs. Dan Waggoner Building, Fort Worth, Tex.

M. H. Merriss resigned from his position with the Raritan Copper

Works in September and is now with the Nicols Copper Co. E. J. David succeeds Mr. Merriss as head of electrolytic department, and M. H. Mosher has been placed in charge of the silver refinery.

J. Leonard Replogle, former Steel Director of the War Industries Board, was decorated with the Belgian Order of the Crown at the order of King Albert in recognition of his work during the war. The decoration was delivered by a Belgian Vice-Consul for Baron de Cartier, the Belgian Ambassador.

J. B. Tyrrell, of Toronto, Canada, arrived in Winnipeg on Oct. 30 from a professional trip in Manitoba, after being delayed for a week by the freezing over of several streams and lakes. The Aero Club of Winnipeg sent out an airplane piloted by Captain Thompson and carrying J. D. Perrin, an official of the Gold Pan Mines, Ltd., to bring Mr. Tyrrell back, but he arrived in Winnipeg on the same day the plane departed.

C. K. Brown, of Kingwood, West Virginia, and J. A. Graft have been named instructors in the mining extension bureau of West Virginia University. Mr. Brown will have headquarters at Wellsburg, Brook County, and Mr. Graft at Beckley, Raleigh County. A. C. Callen, head of the department of mining, superintended the opening of the extension office at Beckley, and R. Z. Virgin, assistant director, left for Wellsburg to superintend the opening at that place.

SOCIETIES

Inter-Professional Conference will be held in Detroit, Nov. 28 and 29. Representatives of the engineering, legal, educational and medical professions will be present. The organizing committee consists of Calvin W. Rice, secretary, American Society of Mechanical Engineers; Arthur D. Little, chemist, Cambridge, Mass.; E. J. Mehren, "Engineering News Record," New York, and Henry W. Hodge, bridge engineer, New York. The office of the committee is at 56 West Forty-fifth St., New York. The meeting will be held in Detroit at the Hotel Statler.

American Society of Mechanical Engineers will hold a joint meeting with the American Society of Heating and Ventilating Engineers on Dec. 11, at which the following paper will be presented: "Oil as a Fuel," by Henry Thomas, combustion engineer, Sun Co.,

and E. H. Peabody, vice-president, Babcock & Wilcox Co., and on Jan. 8 a paper, "Air Cleaning by the Cottrell Electrical Precipitation Process," by P. E. Landolt, Research Corporation, New York, will be presented.

National Research Council, division of industrial research, is arranging for the formation of a co-operative association to plan and support fundamental researches in alloys. It is believed that a co-ordinated effort under the general guidance of the council of specialists representing both the manufacturers and users of alloys can produce results of great importance. The success of the National Cannery Association and the Malleable Iron Manufacturers are examples in other industries. It is planned to create a special scientific staff composed of a director and assistant director of research and a group of scientific investigators and technical experts who shall give their whole time to the work. To finance the organization each member of the co-operative association will pay \$1,000 a year, and all contributing members, who may be either manufacturing or using individuals, firms or companies are to benefit alike by the results of the researches.

OBITUARY

W. D. Weaver, one of the charter members of the American Electrochemical Society, died at his home in Charlottesville, Va., on Nov. 2, 1919, aged 62. Mr. Weaver was among those who started "Electrochemical Industry" in 1902, being one of the five original stockholders. He was editor of the "Electrical World" for fifteen years, and exercised considerable influence upon the development of electrochemistry by the prominent place he gave to it in that journal.

INDUSTRIAL NEWS

Albert P. Hill Co., Inc., announces the removal of its offices from the Peoples Bank Building.

Federal Motor Co., Detroit, Mich., recently published an issue of "Traffic News" containing information relative to motor vehicles and costs of operation.

The Chicago Pneumatic Tool Co. has removed its Birmingham office from 801 Brown Marx Building to 1925 Fifth

Ave., North, where a service station with a stock of pneumatic tools, electric tools, air compressors, oil engines, rock drills, and repair parts will be maintained.

Horace G. Cooke announces the organization of Horace G. Cooke, Incorporated, to design and market for the National Marine Engine Works, Inc., a complete line of rotary compressors, gas exhausters, and pumps. Mr. Cooke also announces his withdrawal from the Connersville Blower Co., after twenty years as Eastern representative.

The Electric Furnace Co., Alliance, Ohio, has recently issued three pamphlets. The first, 7 B, describes the company's standard 105-kw. brass melting furnace; the second, 17 B, gives details of a special furnace for rolling mills, designed to allow pouring the metal directly into the molds; and the third, 13 B, is a discussion of various electric non-ferrous metal furnaces, which was delivered at the Boston meeting of the American Institute of Chemical Engineers.

TRADE CATALOGS

Davis Bournoville Co., Jersey City, N. J., has issued a circular describing a decarbonizing outfit for burning out carbon deposits in gas engine cylinders.

Magnetic Pulleys and Separators. Magnetic Manufacturing Co., Milwaukee, Wis. Bulletin P.; 6 x 10; 10 pp., illus. Describes high-duty ventilated magnetic pulleys for use in crushing plants and foundries.

Boiler Room Records. Yarnall Waring Co., Philadelphia, Pa. Catalog; 6 x 9, 22 pp., illus. Describes the Yarrow Lea meter for measuring feed water, which is a continuous self-recording instrument showing fluctuation in steam output as it occurs.

Modern Rock Crushing Plants. Allis-Chalmers Manufacturing Co., Milwaukee, Wis. Bulletin 1141; 8 x 10½, 44 pp., illus. Describes the machinery and appliances used in the equipment of a rock-crushing plant, including rock and ore breakers, screens, and elevators.

Drop Forgings. Page Storms Drop Forge Co., Chicopee, Mass. Catalog, 17th Edition; 5 x 8; 80 pp.; illus. Describes numerous types of wrenches and various processes and machines used in the manufacture of the material. Tables of prices and dimensions are also included. Crank handles, thumbscrews, bolts and similar special drop forgings are also described.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Alkali Metals—Process of Producing Alkali Metals From Their Chlorides. Horace Freeman, assignor to American Cyanamid Co. (1,319,148; Oct. 21, 1919.)

Aluminum Alloys—Method for Manufacturing. Arrigo Tedesco. (1,318,702; Oct. 14, 1919.)

Blast Furnaces—Apparatus for Charging Blast Furnaces. Tokuji Kawai. (1,319,005; Oct. 14, 1919.)

Cable Attachment. Charles J. Kienzle, assignor to Jeffrey Manufacturing Co. (1,315,969; Sept. 16, 1919.)

Concentrator Table. Albert E. Fish. (1,319,383; Oct. 21, 1919.)

Copper—Process of Extracting Copper from Ore. Robert Seaver Edwards. (1,319,858; Oct. 28, 1919.)

Crushers and Pulverizers—Feeder For. Paul S. Knittel, assignor to American Pulverizer Co. (1,318,389; Oct. 14, 1919.)

Drill—Power Drill. John M. Robertson. (1,315,422; Sept. 9, 1919.)

Drill—Rock Drill. William A. Smith, assignor to the Denver Rock Drill Manufacturing Co. (1,318,617; Oct. 14, 1919.)

Drill Bit—Mining-Drill Bit and Coupling. David J. Williams. (1,318,940; Oct. 14, 1919.)

Drilling—Rock-Drilling Apparatus. Sten Rudberg. (1,319,968; Oct. 28, 1919.)

Drilling Apparatus. William A. Smith, assignor to The Denver Rock Drill Manufacturing Co. (1,318,618; Oct. 14, 1919; 1,319,975; Oct. 28, 1919.)

Electric Furnace. Carlo Masera. (1,320,884; Nov. 4, 1919.)

Ferrosilicon—Process of Making Ferrosilicon and By-Products. Joseph E. Johnson Jr., deceased. (1,318,763; Oct. 14, 1919.)

Fuel—Distributor for Comminuted or Pulverulent Fuel. Daniel Goff. (1,318,375; Oct. 14, 1919.)

Fuel—Feeding Apparatus for Pulverized Coal. Charles Willis Kinter. (1,319,348; Oct. 21, 1919.)

Fuel—Feeding Device for Pulverulent Fuel. Karl Hjalmar Vilhelm von Porat. (1,319,193; Oct. 21, 1919.)

Fuel—Plant for Feeding Pulverized Coal to Furnaces. Joseph E. Kennedy. (1,320,367; Oct. 28, 1919.)

Furnaces—Shield or Auxiliary Wall for Furnaces. John O. Griggs. (1,320,386; Nov. 4, 1919.)

Iron Alloys—Process for Producing Iron Alloys. J. E. Johnson, Jr., deceased. (1,318,764; Oct. 14, 1919.)

THE MINING NEWS

New York, November 8, 1919

Utah Consolidated-Utah Apex Suit Opened

The apex suit brought by the Utah Consolidated Mining Co. against the Utah Apex Mining Co., both with properties at Bingham Canyon, Utah, opened in Salt Lake City, on Nov. 3, in the U. S. District Court, before Judge Tillman D. Johnson. Prominent geologists and engineers have been retained by both sides. Among these are Waldemar Lindgren, H. V. Winchell, James Furman Kemp, and Albert Burch. Both sides have been preparing the case for a number of months. A large amount of unproductive underground work has been done by both parties to the issue, to demonstrate the various points to be debated. Judge Curtis H. Lindley, of San Francisco, author of "Lindley on Mines," is asso-

ciated with former judge John A. Marshall and William E. Colby, of San Francisco, for the defense.

by the Railroad Administration. It is now expected that this essential work will be completed in the near future, when operation will begin.

The company expects to draw ore from Johnson, Patagonia, Helvetia, and other districts. It has an old slag dump of good fluxing material which it considers a valuable asset. The plant is shown in the accompanying photograph. The stack in the background was raised into its present position in a rather interesting manner, an account of which is given in the "Journal" of July 19 last, under the title of "Solving a Stack-Raising Problem."

International Ore Co. Reorganized in Liege, Belgium

The reorganization of the International Ore Co. was effected in Liege,

workmen, specialists in making zinc, arrived at Saltillo, Chi., in September, and operations have been fully resumed at the new smeltery. This will soon begin the work of producing zinc ingots.

For some time the company has been engaged in erecting two Belgian distilling furnaces of 300 retorts each, which will be fired with petroleum. It has also completed an eight-grate furnace to make zinc oxide direct from ore. The equipment also includes a 30-retort distilling furnace, said to be the first zinc-distilling furnace in Latin America.

Daniel Guggenheim Discusses Industrial Unrest

In a recent interview published in the "New York Times" Daniel Guggenheim made the following suggestions toward solving the problem of industrial unrest:

Congressional legislation chartering both employers' and employees' organizations involved in interstate business.

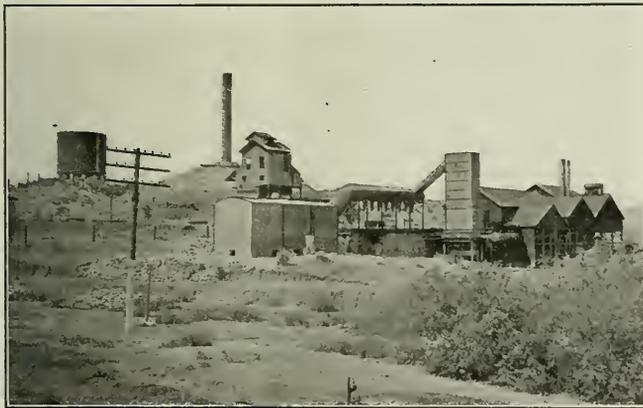

Passage of a law preventing strikes or lockouts without full investigation and report.

Laws making decent working conditions and hours of labor, which have been voluntarily put into effect by some employers, to be made compulsory.

The use of moral suasion to force arbitration; employers and employees to be compelled to respect their agreements, and the appointment of a commission to carry out this program.

"I suggest that Congress pass legislation along the following lines," said Mr. Guggenheim: "First, charter both the employer engaged in interstate business and organizations of employees involved in such business, and that at the same time those measures for decent working conditions and hours of labor which have been put into effect voluntarily by some employers be translated into laws and be made compulsory; that a law be passed against strikes or lockouts without full investigation and report; that all moral suasion be used in forcing arbitration in the case of industrial disputes, and that both the employer and employee be compelled to respect their agreements

"I believe the best way to carry out this program would be for Congress to appoint a commission with wide powers, this commission to consist of an equal number of representatives of employers

PLANT OF ARIZONA SMELTING & POWER CO., BENSON, ARIZ.

New Furnace at Benson, Ariz., Ready to Blow In

The Arizona Smelting & Power Co. was organized late in 1918 for the purpose of taking over an old smelting plant at Benson, Ariz., which included a never-used 250-ton copper blast furnace. Charles E. Goetz is president of the company and Martin Fishback, general manager. The plant has been thoroughly overhauled and is now practically ready to blow in. The company has experienced much delay in having its railroad spurs and switches approved

Belgium, on Aug. 12 last. The new company is known as the International Ore & Smelting Co., its address being Apartado 136, Saltillo, Coahuila, Mexico. It is announced at the same time by F. E. Salas, general manager, that the new company has arranged with the Compagnie Metallurgique Franco-Belge de Mortagne, S. A., and with the Societe Royale Austrienne des Mines to establish a steamship service between Tampico and Amberes. The latter companies have agreed to buy in Mexico with the technical supervision of the International Ore & Smelting Co. the zinc ores, carbonate and sulphide, that they need for their plants in France and Belgium. A group of engineers and

and employees, and that the employers' representatives be appointed by Congress upon recommendation made by such semi-official bodies as the United States Chamber of Commerce.

"This commission should have power to revoke licenses given to industrial concerns or to labor organizations, and provide for investigations before strikes or lockouts, and to bring pressure to bear to permit it to arbitrate differences. This commission should be non-political, and the members should be appointed to continue in office for life, subject to certain limitations, similar to those affecting the duties of our Supreme Court.

"They should have all necessary authority and should be strengthened in every way possible, and they should have ample funds to carry on their work of investigation, to employ experts and to make recommendations to Congress on industrial matters. The members of the commission should receive salaries sufficient to permit obtaining the highest possible grade of men, and everything should be done to build up its authority and influence.

"I believe it is of the utmost importance to provide for our taking, in some such way, a middle-of-the-road progressive policy in dealing with industrial problems so that we will be able to stabilize industry, encourage initiative and enterprise, and at the same time build up a self-respecting, healthy and happy class of employees, all of whom will feel that their rights are carefully safeguarded, and that the avenues of opportunity for betterment of their financial condition are not closed, but that every one has an opportunity of reaching a level commensurate with his own ability, and that at no time will any one who is willing to do an honest day's work be unable to earn a decent living for himself and family.

"My views in this regard cannot be better expressed than in the words of Premier Lloyd George of England in commenting on their recent railroad strike: 'The strike proved that this is a really democratic country where public opinion must prevail. . . Prussianism in the industrial and economic world must not prevail. . . The nation means to be strong, firm, and just, but always master.'"

Quincy Company, of Michigan, to Re-work Old Sands

The Quincy Mining Co., of Michigan, plans to spend \$500,000 on a plant for recovering copper from the old Pewabic and Quincy sands on the shores of Portage Lake. Work will begin in 1920, according to an announcement made by

the company to the business association of Hancock. This is a substantial endorsement of the operations which the Calumet & Hecla Mining Co. has conducted for a number of years at the Lake Linden plant. The original Quincy smeltery stood on the shore of Portage Lake. It is known that the Quincy company has refused to renew leases that were made to a number of business houses using the water front. It is also planned to regrind the sands at Mason.

The Birmingham Situation

The end of October found the Birmingham district no more affected by the steel strike than at its beginning. In fact, some companies report an increase in production in October compared with any of the summer months. Labor seems to be contented, and the attendance at union meetings has decreased rather than increased. No prediction is made, however, as to how long this condition will prevail. Practically all of the large iron mining companies in this district own their own coal mines and are dependent upon them for domestic coal for their camps as well as that used in their steam and power plants. The coal miners of the district are well organized, and although the men of some companies have voluntarily stated they would not strike, it is expected that, if the coal strike does take place on Nov. 1, as announced, the majority of the coal mines in the district will be closed down. As a result the various iron mines and furnaces will shut down as their reserve stocks of fuel and coke become exhausted. Some mines and some furnaces have good supplies of reserve coal and coke that will carry them through the strike, which it is believed cannot be of long duration.

Interest in the Premier Bought by Guggenheims

The Guggenheim interests have purchased a two-fifth interest in the Premier mine, in the Salmon River district of British Columbia. This is the property that was bonded by H. R. Plate and associates, of New York, who, after driving 1,600 ft. of shafts and tunnels, abandoned the option. The property was then bonded by R. K. Neill, of Spokane, and W. R. Wilson, manager of the Crow's Nest Pass Coal Co.; A. B. Trites, and W. Wood, of Fernie, B. C., who found ore in the second round of shots exploded. From that time they have had one continuous round of successes. It is estimated that over 1,000,000 tons of ore assaying on an average \$30 per ton in gold and silver has been proved above the bottom level, where

the vein is stronger and richer than at any other point developed.

The following are the officers of the new Premier company: R. W. N. Wood, Fernie, B. C., president; H. A. Gues, New York, vice-president; Minor Keith, New York, second vice-president; W. E. Norris, New York, secretary; and L. A. Chaplin, New York, treasurer. During the coming winter six specially designed tractors will be employed to draw the ore over the snow from the mine to tide-water.

Goldfield Development's Plans

The Goldfield Development Co. plans to put its 1,000-ton mill on an operating basis of 2,000 tons a day, according to A. I. d'Arcy, general manager. Work on mill repair and construction has already begun. The mill is 85 per cent complete at present for handling 650 tons; completion of the remaining 15 per cent requires thirty days. Approximately \$27,000 has already been spent on this work. The cost of increasing the capacity from 1,000 to 2,000 tons and changing to a simple cyaniding process is estimated at \$205,000, to secure which the company has been refinanced. It is proposed to increase the capitalization from 2,500,000 to 4,000,000 shares.

The company holds under a five-year lease all properties of the Goldfield Consolidated Mines Co., consisting of all mining properties in the district and the latter company's mill. It is planned to decrease operating costs by working the deposits on a large scale for low-grade ore. Careful sampling of the Combination and Red Top mines showed 1,500,000 to 2,000,000 tons of \$5.60 ore available down to the 380 level. A caving system will be used in place of square setting. The ore will be drawn off through raises to the 380 level and hauled by electric locomotives to a shaft 300 ft. east of the vein. Thus a reduction in operating costs of about \$2 per ton is anticipated. It is estimated that mining and milling will cost \$3.15 per ton as against \$5.17 spent in 1917 by Goldfield Consolidated.

President Names Delegates to American Mining Congress

Ten delegates at large to the American Mining Congress, to be held in St. Louis, Nov. 17 to 21, were appointed on Nov. 1 by President Wilson. Officials of the Congress announced that an industrial conference would be held in connection with the meeting in an effort to work out solutions of the labor problems confronting the country. The delegates named by the President were: Emmet D. Boyle, Governor of Nevada;

Albert E. Carlton, of Cripple Creek, Col.; Jerome J. Day, of Wallace, Idaho; Alva C. Dinkey and Daniel B. Wentz, of Philadelphia; Van H. Manning, Director of the U. S. Bureau of Mines, and George Otis Smith, Director of the U. S. Geological Survey; W. A. McCutcheon, of Pittsburgh; Francis S. Peabody, of Chicago, and F. B. Richards, of Cleveland.

Utah Basin, Utah, to Be Tapped by New Railroad

Work on the projected railroad into the Uintah Basin of Utah is planned to begin in the early spring. The basin is rich in various hydro-carbons, including elaterite, gilsonite, and ozocerite, having produced more of this material than any other part of the country. A large sum of money will be needed for the project, which is endorsed by Governor Bamberger and the Commercial Club of Salt Lake City. Salt Lake will furnish most of the money required; Utah County, and Uintah and Duchesne counties will also contribute.

Hopp-Ward Litigation Settled

Cable advice from England states that the Privy Council has given a verdict in favor of R. T. Ward, of California, in the case of Hopp vs. Ward, which involved the ownership of the Bullion mine, near Quesnel Forks, B. C. The property, consisting of 1,200 acres of placer land, was originally taken up by C. P. R. officials, who spent \$3,500,000 in development and equipment and recovered \$1,500,000 in gold, and then sold to the Guggenheims who formed the Cariboo Gold Mining Co. The company spent an additional \$500,000 and sold to Ward. Hopp, a local man, "jumped" the property in 1913 on a technicality, and the case has been before the Executive Council and the Supreme Court, both of which favored Hopp, and the Court of Appeals and the Privy Council, both of which also favored Hopp. The litigation has cost Ward \$15,000, only a small part of which he expects to recover from the Hopp interests, the Quesnel Forks Gold Mining Co.

Smoke-Nuisance Investigation

Data regarding the smoke nuisance recurring with the winter months in Salt Lake City are being collected with a view to its control. The work is being done by Osborn Monnett, of Chicago, in co-operation with the local station of the U. S. Bureau of Mines and the engineering department of the University of Utah. The territory to be covered has been divided into districts and facts gathered will be recorded on Ringleman charts, to afford

a basis for calculations as to tons of soot deposited per annum for each district. The investigation will be completed in May or June next, and a bulletin published giving the data collected, including suggestions regarding an effective smoke ordinance and the establishing of a smoke inspection department.

Utah Potash Company Extending Holdings in Tooele County

The Utah Salduro Co., which is understood to be a subsidiary of the Solvay Process Co., has applied for patent on 1,543 placer claims at and near Salduro, in Tooele County, 112 miles west of Salt Lake City. The area for which patent is sought embraces 30,657 acres. Since August, 1916, when the first ground was located, this company has been operating a plant for producing potassium and magnesium chlorides from brines of the great salt beds of western Utah. The brines are collected in trenches, evaporated in solar vats, and later refined.

The acreage of salt lands applied for is the largest for which patent has ever been applied in Utah. About 125 miles of trenches have been dug. In the last three years the company has produced over 11,000 tons of 80 per cent potassium chloride. The present capacity of the plant is given as fifteen tons daily of potassium chloride of the same grade.

Further Action in Case of Ross vs. Burrage

The motion filed by Louis Ross to amend his bill of equity against A. C. Burrage was heard in Boston, Oct. 27, by Justice Jenney, of the Supreme Court, with Thomas W. Proctor as master to hear additional evidence. Ross wishes to show that when Burrage induced him to sign the agreement of May 6, 1912, a modification of the agreement made in 1910, relative to the investigation of mining properties in Chile, Burrage had already parted with his rights and interest in the mine by assigning the same to Daniel Guggenheim. He alleges that the profits received by Burrage from Guggenheim amounted to \$25,000,000. He contends that he is entitled to be paid 5 per cent of the profits under original agreement, amounting to \$1,200,000. Ross was recently awarded \$100,000 in settlement of his claim against Burrage.

New Company Organized to Work Mexican Mines

The Sonora Mexican Silver Mines, Ltd., has been organized in London to acquire and work silver mines at Minas Nuevas, Sonora, Mexico, including a

thirty-stamp mill. The property is 330 miles south of Nogales, Ariz., and consists of about 125 acres of land held under the following titles: La Purisima Concepcion, Mina Zambona, Continuation Zambona, San Antonio, Fortuna, and Zambona No. 3. The capital of the new company is £85,000 in £1 shares.

Development at Hampton Plains, Western Australia

The original discovery of gold which was made during September last at Hampton Plains, twenty-two miles south of Kalgoorlie, in Western Australia, was made in Block 50, now known as the Celebration lease. This lease is under option to a syndicate consisting of the following: J. McDermott, general manager of the Ivanhoe mine, Kalgoorlie; R. Hamilton, general manager of the Great Boulder mine, Kalgoorlie; J. W. Sutherland, general manager of the Golden Horsehoe mine, Kalgoorlie; P. Fitzgerald, general manager of the Oroya Links mine, Kalgoorlie; and A. Francis, attorney for the Hampton Plains Co. The lease cost \$125,000 and is being vigorously prospected. A shaft has been sunk 100 ft. and a crosscut at 50 ft. showed the lode to be 25 ft. wide and worth \$38.40 per long ton. At the bottom of the shaft the ore is worth \$24 per ton. North of this find, there is a lease which stands under option to an Adelaide (South Australia) investor where good values have been discovered in a lode near the surface, but no further prospecting appears to have been done. Six miles south of the find on Block 50, several parties have found gold on Block 48, and Slavin & Eivers, who have called their lease the Lily of the Valley, have a large sulphide formation stated to assay 1 oz. per ton. Large numbers of leases have been pegged, and options are being freely taken, but further action is waiting the publication of fuller details of the values, in the Celebration lease.

At Broad Arrow, which is north of Kalgoorlie, some rich ore has been found at Borland and Rundd's Oversight mine, which is under option to D. L. Doolette, of Melbourne, Vic. The present owners have received \$77,750 from 450 tons, and from the Tara lease, which adjoins it on the north, \$100,000 has been won from 500 tons.

Bendigo Amalgamated Goldfields Production

The reported output of the Bendigo Amalgamated Goldfields for the four weeks ended Sept. 9 was 8,554 tons for a yield of 5,097 oz. The highest grade ore was from the Constellation mine, 1,295 tons averaging 144s.

PROGRESS OF MINING OPERATIONS

Important Events of Interest
Condensed and Classified
for Easy Reference

ALASKA

OPERATIONS IN VALLEY OF KUSKOKWIM RIVER

The first gold dredge on the Kuskokwim River has been installed on Candle Creek, and after delays incident to the erection of new machinery, has averaged about \$6,000 a day during July and August. The dredge is owned by the Kuskokwim Gold Mining & Dredging Co. of Aniak, Alaska, and was placed on the upper end of the creek to work down-stream.

W. Y. Fisher, of Aniak, and associates are prospecting a group of placer claims on Marvel Creek, a tributary of the Aniak River, with a view to installing dredging machinery if the results justify. The prospecting is being done with a gasoline drill. E. W. Parks, of Georgetown, Alaska, has a crew of men at work erecting a furnace on his group of cinnabar claims. These are situated fifteen miles up-stream from Georgetown. Two tunnels have been driven into the orebody just above the level of the Kuskokwim. Another crew under H. W. Reeth, of Bethel, Alaska, is at work installing a hydraulic outfit at Golden Gate Falls, on the Riglagolic River, a tributary of the Kuskokwim on the left limit. The plant will be in operation some time in 1920.

Last season a discovery of placer gold was made in the gravels of Watermouse Creek, in the Goodnews Bay district, near the mouth of the Kuskokwim. The gravels average about 4 ft. thick, and yield \$4 per sq. ft. A rich strike has been reported near the mouth of the South Fork of the Kuskokwim River, known locally as the Nixon Fork. The ground is being prospected with a power drill with a view of installing machinery later.

Prospecting is being vigorously prosecuted on the Holitna River, a tributary of the Kuskokwim, which comes in thirty miles above Georgetown, and is yielding encouraging results. The gravels are reported to average from 7 to 9 ft. deep, and will average 50c. per foot, 200 ft. wide and 7 miles long. A machine outfit was installed last season on the placer ground on Crooked Creek, but has not been used this season, but a gang of men has been employed to shovel-in. The ground averages \$30 a day to the man.

Prospecting and mining on the Kuskokwim is rendered difficult and ex-

pensive because of the lack of ocean transportation, and the bringing in of machinery and supplies is accomplished with great difficulty.

Juneau—Alaska Gold Mines Co. in October milled 206,200 tons of ore averaging 80.1c. per ton. Percentage of extraction was 81.88; tailings loss 16.1c. per ton.

ARIZONA

U. V. EXTENSION BUYS HAYNES GROUP

Jerome—The United Verde Extension Copper Co. has added eight patented claims to its group by the purchase of the property of the West United Verde Copper Co., better known as the Haynes group. The new property has a 1,200-ft. shaft, 2,500 ft. of

orebody. It is from 40 to 100 ft. wide and has been opened for 900 ft.

orebody. It is from 40 to 100 ft. wide and has been opened for 900 ft. The Jerome-Verde Copper Co. will have its annual meeting in Phoenix Nov. 10. For submission to the stockholders, H. P. Henderson, consulting engineer, has prepared a statement of progress for the last year. The production has been 4,709 tons, averaging 9.6 per cent copper and returning in cash \$108,359. Development work has aggregated 2,283 ft., and 3,106 ft. of diamond drilling has been done. It is believed that the Main Top orebody, which has been the main producing section, is in a shear zone that continues to the United Verde Extension

UNITED VERDE EXTENSION COPPER CO.'S PLANT, JEROME, ARIZ.
DOUGLAS RESIDENCE IN CENTER

development on the 700 level, and 300 ft. on the 1,200. George Kingdon, general manager, stated his opinion that "it is good ground, well worth developing, and its purchase was in line with the policy of the Extension company not to rest content with one mine."

Ore trains will be operating by Nov. 15 between the ore pockets of the United Verde Extension mine and the smeltery at Verde, through the 12,000-ft. tunnel, now nearing completion. The tunnel headings were completed last March, but much remained to be done in concreting sections and installing railroad and electric equipment. The railroad is now complete more than half way from the portal. Ore will be handled in 30-ton cars, hauled by electric locomotives. Operation of the tun-

nel will materially decrease costs. Only one furnace will be operated for the present, turning out about 3,500,000 lb. a month.

OCTOBER COPPER PRODUCTION

New Cornelia Copper Co., Ajo, produced 3,878,000 lb. of copper in October, compared with 3,898,000 in September.

Calumet & Arizona Mining Co., Bisbee, produced 4,244,000 lb. of copper in October, compared with 3,318,000 in September.

Old Dominion Copper Mining & Smelting Co., Globe, produced 2,365,000 lb. of copper in October, compared with 2,460,000 in September.

CALIFORNIA

THE MOTHER LODE—SAN JOSE
Grass Valley—Unwatering the vertical shaft of the Idaho-Maryland mine to a depth of 240 ft. has been

accomplished by compressed air. The method is so satisfactory that the management expects to clear 1,000 ft. of shaft without resorting to pumps. A temporary hoist has been erected over one shaft compartment, and the shaft is being repaired as rapidly as water is lowered. The hoisting plant is being assembled.

Amador City—The Keystone mill, which was shut down several weeks for repairs, is again closed down on account of an overflow of sand at the stone dam across Amador Creek. The dam is to be raised 20 ft. higher, which will give an added capacity to the impounding basin of 1,500,000 tons.

San Jose—Suit has been filed in San Jose by the California Industrial Accident Commission in the Superior Court, to close the Guadalupe quicksilver mine, on the ground that it was dangerous and a menace to the lives of the miners.

IDAHO

COEUR D'ALENE DISTRICT

Wallace—Practically all stock in the Albany company has been purchased by August Paulsen for \$15,000. John H. Nordquist and John Dunphy are the chief stockholders. The company owns eleven claims joining the Omaha group, of which Paulsen is owner and upon which he has done a large amount of development. The Albany will be developed from Omaha workings. The property has two veins, one of which shows lead near surface. Paulsen is one-fourth owner of the Hercules mine.

Adair—The Richmond Mining & Milling Co. has closed down. It has been employing thirty-five men during summer and has been shipping ore. Unsatisfactory treatment charges for the low-grade copper are given as reason for suspension. Failure to find the orebody on the 600 level and unsatisfactory showing on 500 level are believed to have had much to do with the closing down. J. E. Codd, of Spokane, is president.

Mullan—Local stockholders in the National mine, dissatisfied with the action of directors in closing down the property several weeks ago, are considering calling a meeting of stockholders to urge further prospecting. They believe that the main orebody has never been found. There is a large vein near the surface carrying galena and lead carbonate, but deep workings show nothing but low-grade copper. The company has \$50,000 in treasury, and the stockholders favor using some of it to prospect with the diamond drill.

MICHIGAN

THE COPPER DISTRICT

Calumet—The Seneca Mining Co.'s shaft is down 1,930 ft. having complet-

ed the curve and is two-thirds of the way to the third level station. The raise from the second level has held through furnishing a pocket. The lateral faces on the second level are the only openings in the Kearsage lode contributing to the stockpile. No ore has been shipped yet for a mill test.

Rockland—At the Michigan mine grading has been completed for 4,500 ft. of railway spur for the C. M. & St. P. Ry. Rails are hard to get and will not be laid for sixty days. Machine drills total twenty-two. The physical showing is maintained.

MINNESOTA VERMILION RANGE

Ely—The north section of the Chandler mine has resumed with full force, and the south section with about twenty men. Other mines in the district are still down, because of the local strike. Three leaders have been arrested for attempted violence.

MONTANA

Anaconda Copper Mining Co. produced 15,000,000 lb. of copper in October, compared with 12,780,000 lb. in September.

East Butte Copper Mining Co. produced 2,027,340 lb. of copper in October, compared with 2,093,780 lb. in September.

NEVADA

DIVIDE DISTRICT

Divide—On recommendation of George H. Garrey, consulting geologist, the shaft of the Tonopah Divide mine will be sunk from its present depth of 585 ft. to 800 ft, where he believes the water level and sulphide zone will be reached. At the Revert Divide property, John G. Huntington has recently had numerous assays made of ore from the lease owned by himself and partners, the majority of which show ore of shipping grade. A new vein of commercial ore has been opened up on the Belcher Extension. E. Roberts is the engineer in charge. At the Butte Divide, the ore is said to be improving as drifting on the veins proceeds on the 150 level. George Reading is manager.

ELY DISTRICT

Kimberly—The Consolidated Coppermines Co. has started to deepen the Alpha shaft from 1,440 ft. to 1,880 ft. It was expected to start this work last summer, but labor troubles, which affected most of the Nevada mining districts, made it inadvisable to undertake new work at that time. Diamond drilling from the 1,300 level is still going on and will be continued until definite information is obtained as to the depth at which sulphides occur. The present hole, which is the third one

drilled, passed through 48 ft. of oxidized ore that averaged 8.5 per cent copper, and for an additional distance of 90 ft. the copper contents averaged over 2 per cent. Ore production has been resumed and will be continued on a limited scale. Shipments from the Alpha mine are at the rate of about 100 tons per day. Considerable ore is also going forward from the Liberty pit, where the Nevada Consolidated Copper Co. is mining ore from Coppermines ground and concentrating it at the Steptoe works under the existing contract between the two companies. E. P. Matthewson, recently consulting metallurgist with the American Smelting & Refining Co., has been engaged as consulting engineer. Under his direction plans will be immediately prepared for the reduction works at Kimberly, which have been under consideration for some time.

DAYTON—AUSTIN—LORING—PIOCHE

Dayton—The Carson River Mills 200-ton cyanide plant, erected to treat an immense pile of tailings from Comstock ores, is operating successfully, according to A. H. Jones, in charge of the Salt Lake City office of Charles Butters & Co., Ltd. Mr. Jones was formerly mill superintendent of the Tonopah Belmont Development Co. The Gold Canyon Dredging Co., which is controlled and managed by Bulkeley Wells, will probably have to defer starting operations until Jan. 1, owing to delay in shipment of equipment resulting from labor troubles in San Francisco. The company has 1,000 acres of placer ground under lease. G. F. Hutton is in charge.

Austin—The Cahill Lode Mining Co., controlled by Jack Cahill, the original discoverer of Birch Creek, is getting ready for operation. The mineralized zone at Birch Creek is about 300 ft. wide, and good pannings are secured at various points across the entire width.

Loring—W. H. Shewan has opened up the cross fissure known as the Silver vein at 200 ft. in the tunnel on the Tennessee claim. This vein carries gold also. Assays will not be made till the whole vein is exposed. On the Banker's Dream property, the Jose Davis Co. has 40 tons of good ore on the dump. The shaft is down 50 ft., and the vein is four ft. wide at the bottom.

Pioche—Ore shipments from Pioche for the week ended Oct. 23 were: Prince Consolidated, 1,500 tons; Virginia Louise, 350; Black Metals, 300; Combined Metals, 50; Ida May, 50, Bristol, 50.

OKLAHOMA

JOPLIN-MIAMI DISTRICT

Petosi (Douthat)—Taken over by R. P. Sharpe, of Miami, who will operate

this plant, which has been idle several months. Was fair producer in 1918.

St. Regis M. & S. (Douthat)—Moving old mill from Joplin to new lease at Picher. Expect to finish by January 1, 1920. Tom Shelton superintendent.

Skelton L. & Z. (Douthat)—Recently took over Lucky Kid mine and mill and are sinking new shaft. Company now has eight mines equipped with concentrators. Frank Childress, Galena, Kan., manager.

Texas (Joplin)—Holman Bros., of Wetumtka, Okla., have started up Texas mine south of Hockerville, after overhauling and improving mill. W. L. Owen, Joplin, manager.

Underwriters (Joplin)—Have contributed six-inch two-stage American pump to Quapaw Drainage Co. for its fight against heavy water. Pump placed in Lucky Extension Co. shaft.

Cedar Bluff (Lincolnville)—Sinking shaft on tract adjoining Mission lease. Company composed of engineers from San Francisco.

Blue Bonnet (Miami)—Has started sinking new field shaft 500 ft. south of mill. Shaft expected to be completed to 250 level in forty days. W. H. Logan, manager.

Reliance (Neck City)—Lead and zinc mill being remodeled; to be completed November 15. J. E. Smith manager.

Big Chief (Picher)—Purchased by R. P. Sharpe and others, of Miami, Okla. Lies just north of Eagle Picher Lead Co.'s Netta property. Sharpe also owns Vantage and Petosi.

Cortez (Picher)—Oberman-Carson re-erecting on Commonwealth lease old True Blue mill from Quapaw; to be completed December 15. M. Lichliter superintendent.

Kitty (Picher)—Operating new shaft recently completed west of mill shaft.

Pittsburgh Miami (Picher)—Purchased by L. V. Rice, of Chicago, who will operate property. H. L. Jones, of Robert W. Hunt Co., superintendent. Plant idle several months.

St. Joe (Picher)—Sludge mill under construction.

Whitebird Addition (Picher)—Larsh-Benentendi lease purchased by E. R. McClelland, of Kansas City, and associates. Shaft in ore will develop property and build mill. Thelst Shelton, Carterville, Mo., manager.

Alamo Lead and Zinc (Quapaw)—Has closed down operations at Lucky Bob mine and will deepen shaft.

Aurora (Quapaw)—Have started Sunnyside mill after shutdown of several months.

Lone Star (Quapaw)—Taken over by A. G. Kelley, who is drilling out tract.

Waxahatchie (Quapaw)—Has begun operating old Wilson mine, southwest of town. Will sink to deeper level, now made possible through draining by Quapaw Drainage Co.

SOUTH DAKOTA

At the Homestake mine at Lead, S. D., the fire which broke out on Sept. 25 is still burning on the 700 level with continued efforts being made to extinguish it. The water used in flooding the workings has reached the 1,250 level, and it will be some time before it reaches the fire. Two deaths have resulted to date as a result of the fire. On Oct. 13, two men employed in removing forms from concrete bulkheads on the 700 level were overcome and died. The company announced on Oct. 16 that declarations of dividends would be suspended for the present.

UTAH

TINTIC DISTRICT

Eureka—The Tintic Standard Mining Co. is installing a large compressor. Two smaller compressors now in use are to be kept in reserve. New ore opened on the 1,350 level southeast of the shaft will afford a large stope. A station is being cut at the 1,450 level, the present bottom of the shaft, and drifting will be started to get under the ore.

The Chief Consolidated Mining Co. is employing about 450. The new three-compartment concrete-lined shaft is down 800 ft. and at 1,000 ft. will be connected with old workings. Ore is being mined throughout the property and from below water level. The pumping capacity has recently been doubled. Surface work and drilling are being done in the eastern section of the camp.

The new wagon road into east Tintic will be completed within a few weeks. It will especially benefit the Eureka Lilly, Eureka Bullion, Big Hill, East Tintic Coalition, and Tintic Standard properties. Later the road may be extended south of the Tintic Standard to reach the Apex Standard, Iron King, Zuma, Eureka Standard, and other properties.

WASHINGTON

Republic—Mines of this district continue shut down owing to the strike that began Oct. 9. The demands made by the workmen were for an increase in pay from \$4.50 and \$5.00 per day to \$5.50 and \$6.00—an increase of \$1—and also that two men be put on each Leyner drill instead of one.

CANADA

NORTHERN ONTARIO

Port Arthur—The Nicholls Chemical Co., of New York, is about to begin

construction of an ore dock on the Mission River, at Fort William, for the purpose of handling pyrites from the Northern Pyrites mine, at North Pines, Ont., and also from its pyrites property at Mokoman, about 30 miles west of Port Arthur. This dock will cost \$100,000 and be ready for operation on the opening of navigation in the spring of 1920. It will afford facilities for the shipment of local iron ore.

The syndicate that owns the Ozone Siding zinc property, situated about 70 miles east of Port Arthur, on the line of the Canadian Pacific Ry., is conducting negotiations for the sale of the property. The orebody has been traced for more than a mile. It consists of from 2 to 3 ft. of specular zinc blende, with from 10 to 12 ft. of lower grade ore. The owners are Messrs. Lawrence and Rochon, of Fort William, and Dr. R. J. Manion, of Fort William.

MEXICO

SONORA

El Tigre—Mining conditions at El Tigre are reported to be favorable. The earnings on this property during 1919 have exceeded those of any previous year, and, although no new veins have been discovered, ore has been found at greater depth than ever before. Net earnings for September were \$155,000. Political conditions in the vicinity of El Tigre are favorable, and labor is reasonably plentiful. The Lucky Tiger-Combination Gold Mining Co., operating in the district, also owns zinc property in Oklahoma that has been worked to advantage in spite of the low price of zinc during the last year.

NEW SOUTH WALES

Broken Hill—During the six months ended June 30, 1919, North Broken Hill Ltd., of Broken Hill, New South Wales, hoisted 55,072 tons of ore, as compared with 75,155 tons for the previous half year. The falling off was due to the strike which occurred in May, having been caused in the first place by inter-union disputes. All productive work ceased at the North mine on May 8. The low output, combined with the heavy expenditure during the period of suspension, forced working costs up to \$8.80 per ton, as against \$5.92 for the corresponding period of 1918. The milling plant treated 53,984 tons of crude ore. Working costs were as follows: Mining, \$5.95; development, 0.58; and milling, \$2.27; total, \$8.80 per ton. The company formerly sold its zinc tailings to the Amalgamated Zinc Co., but has completed its contract with the latter, and is now erecting a flotation plant capable of treating the whole output of tailings.

4								
5	20 $\frac{3}{4}$ @21	54@5 $\frac{1}{4}$	6.75@6.85	6.60	7.50@7.75			

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

Metal Markets

New York—Nov. 5, 1919

The markets were extremely dull this week. Copper was soft, while lead continued firm. Zinc experienced a further reaction and then a sharp rally.

Transatlantic freights are nominally unchanged. The longshoremen's strike is ended and vessels are being loaded again. The rate from San Francisco to Hongkong and Kobe declined to \$15.

Frederick Wallace, general manager of the Waelark Wire Co., died suddenly of double pneumonia Oct. 29. He was a prominent figure in the copper industry, not only as a buyer of copper and a manufacturer of it, but also as a seller, the disposition of the product of the United Verde Copper Co. passing through his hands. He was an extraordinarily hard worker, and without any doubt overworked himself.

Copper

The market was extremely dull, buyers being conspicuous by their absence in all quarters. The small amount of business that was done by producers was at the expense of prices. Wire drawers report continued good business, but apparently they are well supplied with copper for the moment.

Copper Sheets—32 $\frac{1}{2}$ c. per lb. Wire 24 $\frac{1}{2}$ c., weak. Domestic buying dull.

Tin

Business was pretty good, but in view of the approaching release of supplies from the docks, prices became a little easier. Singapore quoted c.i.f. London as follows: £287 $\frac{1}{2}$ on Oct. 30; £282 on Oct. 31; £272 $\frac{1}{2}$ on Nov. 3; and £278 $\frac{1}{2}$ on Nov. 4 and 5.

Lead

The market was quiet and firm. Independent producers appeared to have no difficulty in realizing a premium of 10 points over the price of the A. S. & R. Co.

Zinc

The reaction that was already in course at the end of our last week continued. There was a similar reaction in the London market. New York cabled to London asking explanation, and London cabled New York with similar inquiry. The whole thing was nothing but a bear raid. When the selling by weak hands was ended, the larger producers being in no wise frightened, a

sharp rally ensued, and today the market closed firmly at 6%*c.* Right through the week higher prices were asked for futures than for prompt metal. Business, both domestic and foreign, was light, but today considerable inquiry from galvanizers appeared in the market.

The demand for zinc from the brass makers has been relatively small for a long time, and many smelters have discontinued the production of the "brass special" grade of zinc, letting all the draws from the distilling furnace go together. If anybody wants to buy "brass special," he can easily get it at a premium over Prime Western corresponding merely with the extra cost of production, say 5*c.* to 10*c.* per 100 lb. The differential between Prime Western and high-grade zincs is not very easy to determine, for the former is sold generally on the basis of St. Louis, while the latter is sold on terms including delivery to the consumer. As a generalization, the present premium for high-grade, reduced to a common marketing point, may be generalized at $\frac{1}{4}$ *c.* to $\frac{1}{2}$ *c.* per lb.

Zinc Sheets—\$10.50 per 100 lb.

Silver—Owing to short London supplies, price has advanced in that market to 67*d.*, under date of Nov. 3. Supplies in New York are moderate, with the East as the destination. No London shipments the last week.

Mexican dollars at New York: Oct. 30, 97; Oct. 31, 92 $\frac{3}{4}$; Nov. 1, 92 $\frac{3}{4}$; Nov. 3, 94 $\frac{1}{2}$; Nov. 4, holiday; Nov. 5, 96 $\frac{1}{2}$.

Platinum—Stronger. We quote refined ingot at \$135.

Palladium—Unchanged at \$120.

Aluminum—33*c.* per lb.

Antimony—We quote spot at 8%*@* 8%*c.*, and futures at 8.90*@*9*c.*, duty paid.

Bismuth—Unchanged at \$2.96.

Cadmium—\$1.40*@*1.50.

Nickel—Ingot, 42*c.*; shot, 43*c.*; electrolytic, 45*c.*

Quicksilver—Quicksilver to arrive was quoted at \$80*@*85, while small lots of spot sold at \$90*@*100. San Francisco telegraphs \$82.50, firm.

Tungsten Ore—In general the situation is unchanged. Some high-grade Bolivian ore was reported sold at \$10 per unit, while Chinese ore was quoted at \$7.

Molybdenum Ore—Unchanged at 75*c.* per lb. of molybdenum sulphide, but this is merely a nominal quotation.

Manganese Ore—Quoted at about 50*c.* per unit.

Chrome Ore—Quoted nominally at about \$25 per ton, f.o.b. California.

Sulphur—Prices remained unchanged at \$18 per ton for domestic and \$20

per ton for export at mines, Freeport, Tex., and Sulphur Mine, La. Strike of dock workers in New York is interfering with domestic shipments. Numerous inquiries are being received for export business.

Pyrites—Spanish pyrites is quoted at 17 $\frac{1}{2}$ *c.* per unit for furnace-size ore, free from fines, c.i.f. New York or other Atlantic ports. Market unsettled.

Fluorspar—Quotations have been made at about \$25 a ton f.o.b. mines in Kentucky and Illinois for washed-gravel grade and \$16 per ton at mines at Tonouco, N. M., for lump grade. Analyses of these grades show about 85 per cent calcium fluoride and about 5 per cent silica.

Zinc and Lead Ore Markets

Joplin, Mo., Nov. 1.—Zinc blende per ton, high, \$48; basis, 60 per cent zinc, premium, \$48*@*46; Prime Western, \$45; fines and slimes, \$42.50*@*40; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$46.17; calamine, \$33.64; all zinc ores, \$45.75.

Lead, high, \$86.70; basis 80 per cent lead, \$85; average settling prices, all grades of lead, \$86 per ton.

Shipments the week: Blende, 7,816; calamine, 275; lead, 1,810 tons. Value, all ores the week, \$525,700.

The effort to cut prices to \$45 basis met with stubborn resistance from sellers, and at a late hour very little ore is sold, sellers still expecting buyers to meet last week's price level tonight. As buyers report light or no orders, the market appears closed.

The lead smeltery of the Ontario Smelting Co. is reported idle, ostensibly from lack of ore.

Platteville, Wis., Nov. 1.—Blende, basis 60 per cent zinc, base price of Prime Western grade lowered \$48*@*47, with still lower offerings at the week end. Exclusive buyers of premium grade blende not in the market. Lead ore, basis 80 per cent lead, \$80 per ton. Shipments, curtailed because of car shortage, are as follows: 2,170 tons blende, 186 tons galena, and 341 tons sulphur ore. For the year to date the totals are 84,453 tons blende, 5,524 tons galena, and 16,798 tons sulphur ore. During the week 2,751 tons blende was shipped to separating plants.

Pittsburgh—Nov. 4, 1919

Though the iron and steel strike, now in its seventh week, continues to lose ground, it is still receding more slowly than might have been expected, although more rapidly than in the earlier weeks. Good gains in operation have been made in the Mahoning Valley, where production, only recently resumed, is now about 20 per cent of normal, and about the same statement ap-

plies to Cleveland. The Chicago-Gary district situation has improved materially, and production there is perhaps 50 per cent of normal. The Wheeling district remains closed tight. In Western Pennsylvania some vestiges of the strike remain, chiefly in the upper Monongahela Valley region and at one point in the Allegheny Valley. Production of steel in the United States is now 60 to 65 per cent of the rate just before the strike, and is gaining approximately 3 per cent a week. Production of finished material has been at a slightly greater rate than production of steel, as stocks have been drawn upon.

In the last week interest in the iron and steel strike has been overshadowed by the coal strike, as a coal strike such as planned would in the course of from two to four weeks close nearly all the iron and steel plants from lack of fuel. Owing to the attitude of the United States Government and the state and local authorities, intimidation of workers in the non-union fields is forestalled, and the Connellsville region is running full, together with the non-union districts scattered in western Pennsylvania and in West Virginia. It is generally believed now that through the activity of the Government the union miners will soon return to work, without the steel industry having suffered severely from lack of coal. Shipments of coal to steel mills and byproduct ovens are shut off at the moment by the priority system. Collapse of the coal strike may hasten the end of the steel strike, but the latter has little organization, and those who produced it may be unable to call it off, even if willing; so the strike may have to die a natural death.

It is to be presumed that finished steel products are scarce, but there is little evidence of scarcity among manufacturing consumers, and it is possible that they were stocked before the strike to a greater extent than was generally known. Jobbers' stocks, on the other hand, show signs of growing ragged.

A little business is being done in prompt deliveries of steel, at premiums. Large producers, who make a practice of contracting with customers, continue to book business, though in reserved manner, and of course at Mar. 21 prices, as the Steel Corporation is strongly opposed to advances, and the Corporation now has a considerable following in that course.

Pig Iron—The local market has stiffened sharply, but is not clearly defined, for the reason that large advances are obtainable on prompt shipment of foundry and malleable iron, and for 1920 deliveries buyers are unwilling to take hold, and there is scarcely any demand

for basic or bessemer, either prompt or forward. Claims are made that small lots of prompt foundry have brought \$30 to \$33, furnace, whereas basic is not quotable above the old price of \$25.75, and the market could not stand such a spread, as furnaces would shift from basic to bessemer. For forward delivery we quote foundry up \$2 a ton, making the market as follows: Bessemer, \$27.95; basic, \$25.75; malleable, \$28.75; foundry, \$28.75; forge, \$27.75. At Valley furnaces, with \$1.40 freight to Pittsburgh.

Ferromanganese—One or two sales of English ferromanganese are reported at \$100, c.i.f., but with the iron and steel strike and the longshoremen's strike there is practically no activity, and \$100 is not an open quotation on English. Domestic producers still quote \$110, delivered. Spiegeleisen is \$33@35, furnace.

Steel—Sheet bars are in demand, with scarcely any offerings, and would probably bring \$45, Pittsburgh, for prompt. Billets are said to have sold in the East at \$5 above Mar. 21 prices, which are: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; rods, \$52.

Coke—Furnaces as a rule are out of the market, but occasionally a furnace will pay an exceptional price, and no furnace coke is offered at ordinary prices. Sales of Connellsville furnace coke occurred this morning at \$5.75. Foundry coke is in good demand, as coal is being shut off from some byproduct ovens making foundry grade. We quote Connellsville foundry coke at \$7@7.25 per net ton at ovens.

Metal Markets

New York—Nov. 12, 1919

Several of the important metals exhibited peculiar features this week. All of the markets were manifestly influenced by the severe break in the stock market, the advance in the rate for money, and the declared intention of the Federal Reserve Board to check speculation.

With the settlement of the longshoremen's strike in New York, transatlantic freights became easier, as was anticipated. To British ports \$12@12.50 could be obtained; to Havre, \$12.50; to Hamburg, \$12; and to Rotterdam, \$10. The rate from San Francisco to Hongkong and Kobe remained at \$15.

Stock of metals in the hands of the War Department, Oct. 30, 1919, were reported as follows: Brass, 70-30, 47, 326 tons; brass, 60-40, 15,281 tons; lead, miscellaneous scrap, 2,140 tons; zinc, 7,284 tons.

Silver and Sterling Exchange

Nov.	Sterling Exchange	Silver		Nov.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
6	415 ³ / ₄	123 ⁵ / ₈	66 ³ / ₄	10	413 ³ / ₈	127	65 ⁷ / ₈
7	415 ³ / ₄	123 ⁵ / ₈	66 ³ / ₄	11	412	126 ¹ / ₂	65 ⁷ / ₈
8	414	123 ⁵ / ₈	67	12	411	126 ¹ / ₂	67

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

Nov.	Copper		Tin		Lead		Zinc	
	Electrolytic	Spot	Spot	N. Y.	St. L.	St. L.	St. L.	
6	20 ³ / ₄ @21	54	6.75@6.85	6.60	7.75			
7	20 ³ / ₄ @21	54	6.75@6.85	6.60	7.75			
8	20 ³ / ₄ @21	53 ⁷ / ₈	6.75@6.85	6.60	7.75			
10	20 ³ / ₄ @20 ³ / ₄	53 ¹ / ₂	6.75@6.90	6.60@6.70	7.75@7.85			
11	20 ¹ / ₂ @20 ¹ / ₂	53 ¹ / ₄ @53 ³ / ₈	6.75@6.95	6.60@6.70	7.80@8.00			
12	20 ¹ / ₂ @20 ³ / ₄	53 ¹ / ₄ @53 ³ / ₈	6.75@6.95	6.65@6.75	7.80@8.05			

The above quotations are our appraisal of the average of the major markets based generally on sales made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cutbacks are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

Nov.	Copper			Tin		Lead		Zinc	
	Standard		Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Copper

All of the producers were seeking business this week and fishing for what they could get, without being too particular as to prices. There was very little comparing of notes. The result was a highly irregular market, and the circulation of rumors which had varying degrees of foundation. Everybody did a little business, but nobody did much, and the aggregate of all did not amount to much. Manufacturers, both wire-drawers and brass-makers, reported continuance of good business, but at the same time disclaimed much necessity for taking in more copper right away. A small amount of export business was done during the week.

Up to Monday prices held pretty firmly on an average basis of 20³/₄c., f.o.b. New York refineries, but during Monday copper became easily obtainable from large producers on the basis of 20³/₄c., and later that price could be shaded. The bulk of the business of the week seems to have been done at 20³/₄c. The banking position undoubtedly had an important effect on the market.

Copper Sheets—31¹/₂c. per lb. Wire 24¹/₂c., weak. Domestic buying dull.

Tin

The market became easier through the release of some of the large supply of metal that had previously been tied up on the docks. Throughout the week there was a good deal of irregularity. On one day electrolytic sold at 55c. and Straits at 54¹/₂c. at the same time. Later Straits declined to 53¹/₂c. Tin of 99 per cent grade declined from the beginning to the end.

Singapore quoted c.i.f. London, £279¹/₂ on Nov. 6 and £282 on Nov. 11 and 12. The cables were not received for the other days.

Lead

A fair amount of business was done, but it was limited by the supplies available. There were two conflicting factors in the market, one being producers who were willing to promote a further advance and the other, producers who desired to keep on the brakes. The latter would sell to none but consumers and accepted prices lower than they might otherwise have obtained. These conditions explain variations in prices.

The St. Louis market continued to be the truest index.

Some small export business to France was booked, and further inquiries from that quarter are pending. The price for bonded lead advanced to 6½c., New York.

Zinc

The market continued firm at 7.75c. until Monday, when there developed an urgent demand, which was apparently of speculative character and looked like the covering of contracts that had previously been sold for export. This resulted in curious conditions, the market being bid up sharply on zinc originating west of the Mississippi River, while producers east of the river who had determined to sell only to consumers offered zinc, St. Louis basis, at much lower prices than would be received by producers in Kansas and Oklahoma. Today business was reported done at 8.05c. for zinc west of the river, while consumers could buy it from works east of the river on the basis of 7.80c.

Of consumers' buying there was little during the week, but toward the close there were more inquiries, especially from galvanizers.

Zinc Sheets—\$10.50 per 100 lb. less 8 per cent on carload lots.

Silver—Operations have been on an advancing market. London has been seeking silver at higher prices, owing to the scarcity of supplies in that market. It must, however, be said that more free offerings of the metal in London would have the effect of lowering the price for China, as the Eastern banks base their figures on London quotations as well as on the exchange quotation from the Orient on London. Shipments to Europe from New York for the week ended Nov. 6 were very small—only \$2,000 oz.

Mexican dollars at New York: Nov. 6, 96½; Nov. 7, 96½; Nov. 8, 96½; Nov. 10, 99; Nov. 11, 98¾; Nov. 12, 99½.

Platinum—Refined ingot unchanged at \$135.

Palladium—Unchanged at \$120.

Aluminum—33c. per lb.

Antimony—The market was stronger, reflecting the effects of higher prices for silver, and also the increasing scarcity of metal in China. We quote spot at 9c., and futures at the same figure.

Bismuth—Unchanged at \$2.96.

Cadmium—\$1.40@1.50.

Nickel—Ingot, 42c.; shot, 43c., electrolytic, 45c.

Quicksilver—The market continued firm, with spot quoted at \$90@95, and metal to arrive at \$80@85. San Francisco telegraphed \$82.50, steady.

Tungsten Ore—No business was re-

ported. Chinese wolframite was quoted nominally at \$7, high-grade wolframite at \$10, and scheelite at \$15, f.o.b. mines.

Molybdenum Ore—No business reported.

Chromite Ore—Charles Hardy reports that a fair tonnage of New Caledonia ore was sold at 80c. per unit.

Pyrites—Spanish pyrites is quoted at 17½c. per unit for furnace-size ore, free from fines, c.i.f. New York, or other Atlantic ports. Market unsettled.

Zinc and Lead Ore Markets

Joplin, Mo., Nov. 8.—Zinc blende, per ton, high, \$48.40; basis 60 per cent zinc, premium, \$48.50; price Western, \$47.50; fines and slimes, \$45@42.50; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$45.81; calamine, \$33; all zinc ores, \$45.67.

Lead; high, \$87.10; basis 80 per cent lead, \$85@88; average settling price, all grades of lead, \$86.26 per ton.

Shipments the week: Blende, 7,718; calamine, 156; lead, 1,551 tons. Value all ores the week, \$493,410.

The \$88 basis price of lead came about by spirited competition between two buyers for a choice lot of ore.

Sellers holding firm for \$50 basis this week succeeded in advancing the market \$2.50 per ton to \$47.50, and sold freely on this market. Buying was largely increased over last week, and it is estimated 7,500 to 9,000 tons were purchased.

Platteville, Wis., Nov. 8.—Blende, basis 60 per cent zinc, \$50 per ton for Prime Western grade. Lead ore, basis 80 per cent lead, \$82 per ton. Shipments for week are 2,268 tons blende, 136 tons galena, and 313 tons sulphur ore. For the year to date the totals are 86,721 tons blende, 5,660 tons galena, and 17,111 tons sulphur ore. Shipped to separating plants during week, 2,696 tons blende.

Iron Trade Review

Pittsburgh—Nov. 11

The Steel Corporation's unfilled obligations increased by 188,030 tons during October, this being about 14 per cent of the month's capacity. Shipments just before the strike were at the rate of about 85 per cent of capacity, and shipments in October were about 60 per cent as great, or at about 51 per cent of capacity. Thus the October bookings were about 65 per cent of capacity. These bookings were confined almost entirely to contract tonnage with regular customers, many customers being allotted less tonnage than they desired. The Corporation being already sold far ahead, the bookings were necessarily for 1920, and practical proof is fur-

nished of the Corporation's now well-known intention to maintain March 21 prices without change, despite the scarcity of steel and the desire of many independent producers that there be advances. Many leading independents, if not all the large ones, will follow the Corporation's policy.

In this the eighth week of the iron and steel strike, production and shipments of steel are about 70 per cent of the pre-strike rate. Wherever the strike remains it is losing ground, except in the case of the Wheeling district, and at a more rapid rate than formerly. The strike as a strike will soon be over, but afterward production will be restricted by the disorganization of working forces, which will be repaired only slowly. There will be an extension of the eight-hour day, adding to the difficulty of building up full working forces. With the railroads about to enter the market to a greater or less extent, steel promises to be in scant supply for a long time, and this in itself is one reason for large interests being opposed to the relation between demand and offerings being allowed to dictate the market price.

Pig Iron—Foundry and malleable grades have been bringing fancy prices for early shipment, up to \$32 or \$33, Valley, and furnaces have been refraining from selling for extended delivery, whereby some of them evidently hope to develop an extended delivery market on the basis of the prompt market. Some makers of bessemer and basic are opposed to there being large advances from the March 21 schedule. Basic and bessemer have sold as substitutes for foundry and malleable at prices above what they would bring for their regular purposes, and conservative interests regard as the actual market the prices that have been obtained for these grades when sold for regular purposes, latest sales of this description being at \$27.25 for basic and \$28.50 for bessemer, Valley. We quote the market at \$28.50 for bessemer, \$27.25 for basic, and \$30@33 for malleable and foundry, f.o.b. Valley furnaces, freight to Pittsburgh being \$1.40.

Steel—Despite the great curtailment in production of billets and sheet bars, there is no heavy demand. Leading producers continue to regard the market at March 21 prices: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; rods, \$52. Some prompt lots of billets and sheet bars have been sold at premiums of \$3 to \$5.

Finished Steel—Basis prices for finished steel products continue to be at the March 21 schedule, but prompt lots of merchant bars have sold at \$3 premium, or 2.50c.

ROOFING MATERIALS—Prices per ton f.o.b. New York and Chicago:

	New York		Chicago	
	Current	One Year Ago	Current	One Year Ago
Tar felt (14 lb. per square of 100 sq. ft.)	\$60.50	\$61.50	\$61.00	\$61.50
Tar pitch (in 400-lb. bbl.)	21.00	18.00	22.00	19.00
Asphalt pitch (in barrele)	34.00	34.00	37.50	37.50
Asphalt felt	65.00	63.00	67.50	67.50

PREPARED ROOFINGS—Standard grade rubbered surface, complete with nails and cement, costs per square as follows in New York, St. Louis, Chicago and San Francisco:

	1-Ply		2-Ply		3-Ply	
	1 c. 1.					
No. 1 grade	\$1.50	\$1.75	\$1.90	\$2.15	\$2.30	\$2.55
No. 2 grade	1.55	1.60	1.70	1.95	2.05	2.30

Asbestos asphalt-saturated felt (14 lb. per square) costs \$1.50 per ton (State-surfaced roofing (red and green) in rolls of 109 sq. ft. costs \$2.25 per roll to carload lots and \$2.50 for smaller quantities. Shingles, red and green, slate finish, cost \$6.00 per square in carloads, \$6.25 in smaller quantities, in Philadelphia.

FOLLOW TILE

Table with columns for location (St. Paul, Los Angeles, New Orleans, Cincinnati, Birmingham, St. Louis) and prices for 4x12x12 and 8x12x12 tiles.

*P. o. b. factory, 4, 8 and 10 in.

LUMBER—Price per M in carload lots

Table showing lumber prices for 8-in. x 20 ft. and under, and 12x12-in. x 20 ft. and under, with columns for location and price.

1-lc. Rough, 10 in. x 16 ft. 2-lc. T. and G. 10in. x 16ft.

Table showing lumber prices for 2-lc. T. and G. 10in. x 16ft. with columns for location and price.

Notes—Charge for base is generally 15% each, 60¢ per bbl.

MAILS—The following quotations are per keg from warehouse:

Table showing mail prices for Will, St., Dallas, Chicago, and San Francisco.

PORTLAND CEMENT—These prices are for barrels in carload lots, without bags.

Table showing Portland cement prices for New York, Jersey City, Boston, Chicago, Pittsburgh, Cleveland, and Denver.

Notes—Charge for base is generally 15% each, 60¢ per bbl.

LIME—Warehouse prices

Table showing lime prices for Hydrated per Ton and Lump per 200-Lb. Barrel, with columns for location and price.

*300-lb. barrels. †Per 180-lb. barrel.

LINSEED OIL—These prices are per gallon:

Table showing linseed oil prices for New York, Cleveland, and Chicago, with columns for current and year ago prices.

RAW per barrel (5 bbl. lots) \$1.75 \$1.90 \$2.50 \$2.40 \$1.92 \$2.05

5-gal. cans—15.00 16.50 2.75 2.25 2.07 2.25

WHITE AND RED LEADS—500-lb. lots sell as follows in cents per pound:

Table showing lead prices for White and Red, with columns for current and year ago prices.

MINING AND MILLING SUPPLIES

Table showing mining and milling supplies prices for HOS-B, Underwriters, and 2 1/2-in. and larger, in 1200-ft. coils.

Table showing mining and milling supplies prices for First Grade, Second Grade, and Third Grade.

STEAM—50% Second Grade—40% Third Grade—45%

LEATHER BELTING—Present discounts from list in the following cities are as follows.

Table showing leather belting prices for New York, St. Louis, Chicago, Birmingham, Denver, and Cincinnati.

RAHWIDE LACING—50% off for out; \$0.82 per sq. ft. for side lacing.

MARLEA ROPS for rope smaller than 5/8-in. the price is 1/2 to 3/2¢ extra; while for quantities amounting to less than 600 ft. there is an extra charge of \$0.01.

Table showing Marlea Rops prices for Boston, New York, Cincinnati, Chicago, St. Paul, and San Francisco.

PACKING—Prices per pound:

Table showing packing prices for Rubber and duck for low-pressure steam, Asbestos for high-pressure steam, Flex, regular, Flex, waterproofed, Compressed asbestos sheet, Wire insertion asbestos sheet, Rubber sheet, size insertion, Rubber sheet, duck insertion, Asbestos packing, twisted or braided and graphited, for valve stems and stuffing boxes, Asbestos wick, 1/2-and 1 lb. balls.

REFRACTORIES—Following prices are f. o. b. works:

Table showing refractory prices for Chrome cement, Chrome cement, Clay brick, 1st quality fireclay 1030, Clay brick, 2nd quality, Magnesite, dead burned, Magnesite brick, Silica brick, Standard size fire brick, St. Louis-Fire Clay, Birmingham-Fire Clay, S&S; chrome, Chicago-Second quality, Denver-Silica.

RAILWAY TIES—For fair size orders, the following prices per tie hold:

Table showing railway tie prices for Chicago, San Francisco, San Francisco, Douglas Fir-Creosoted, Prices per tie at Missouri mills, Untreated A Grade White Oak.

Table showing railway tie prices for No. 1, No. 2, No. 3, No. 4, 7x3x8 white oak, 7x3x8 red oak.

FLOTATION OILS—Prices of oils for flotation, in cents per gal. in bbl.

Table showing flotation oil prices for Pure steam-distilled pine oil, Pure destructively distilled pine oil, Pine tar oil, Crude turpentine, Hardwood creosote, 0.96-0.99.

COTTON WASTE—The following prices are in cents per pound:

Table showing cotton waste prices for White, Colored mixed, 9.00 to 12.00, 8.50-12.00, 11.00, 9.50 to 12.00.

LAPPING CLUTCHES—Jobbers' price per 1000 is as follows:

Table showing lapping clutch prices for Cleveland, Chicago.

EXPLOSIVES—Price per pound of dynamite in small lots and price per 25 lb. keg for black powder:

Table showing explosive prices for Low Freezing, Gelatin, New York, Boston, Kansas City, New Orleans, Seattle, Chicago, St. Paul, St. Louis, Denver, Dallas.

CHEMICALS

SODIUM CYANIDE—New York price is 31c. per lb.; Denver, 37c.; Chicago, 31 1/2 c.; St. Louis, 31c

SODIUM SULPHIDE—New York price per pound is .05c. for concentrated, 3c. for crystals. Denver price is 7 1/2c. for crystals. Chicago, 5c. for concentrated, 3c. for crystals. Concentrated comes in 500-lb. drums, crystals in 440-lb. bbl.

ZINC DUST—For 350 mesh the New York price is 10c. per lb.; Chicago, 12c Denver, 22c. St. Louis, 15c.

ALUMINUM DUST—Chicago price is \$1.10 per lb.

WINERS' LAMP CARBIDE—Prices net f.o.b. cars at warehouse points.

Table showing Winers' Lamp Carbide prices for Union, Cameo, Union, 100-Lb. Drums, 100-Lb. Drums, 25-Lb. Per Ton, Per Ton.

The Armenian Mandate

"Then up spoke brave Horatius,
The Captain of the Gate:
To every man upon this earth
Death cometh soon or late;
And how can man die better
Than facing fearful odds
For the ashes of his fathers
And the temples of his gods?"

The Turkish Empire has long been known to contain considerable undeveloped mineral resources. Although it is one of the most ancient seats of civilization, modern mining and industry have not touched it. The Greek heroes smelted copper for their shields and helmets out of the small deposits which they found in the islands and near the bays round the Ægean Sea; and slaves worked gold-bearing gravels in Macedonia for Alexander the Great, to win metal for coinage which bears his effigy. In modern times Turkey has mined chiefly those mineral treasures which could be dug out without much skill and marketed without much preparation. Chromite produced around the Ægean Sea for long supplied the world and is still exported; and magnesite as well. Meerschau has been principally produced from Asia Minor. A few silver-lead mines have been worked.

Judging from all reports the most considerable mine in Turkey is at Argana, near Diarbekr, where high-grade copper ore has been mined for many decades, smelted in charcoal furnaces, and freighted by camel to Alexandretta, to furnish the usual copper cooking utensils of the empire. Copper mines of less importance are known near the Black Sea coast, in Turkish Asia Minor, and in Armenia. Many plans have been formulated by the miners of our Western civilization to develop these ore deposits on a modern scale, and American enterprise has tried to solve the problem, but has been unable to make way against Turkish caution and the blocking strategy of European influence at Constantinople.

The situation has been changed as the result of the war. The German plot of a Pan-Islamic crusade to include India and give victorious Germany control of Western and Southern Asia was answered by England with the campaign of General Allenby up through Syria and Palestine, which resulted in the spectacular fall of Jerusalem. The French landed, after the war, at Alexandretta, at the northern end

of Syria, and have established themselves thence in the Cilician rearland and beyond, well toward, if not up to the famous Argana mines. The Italians have seized the south and southwest coast of Asia Minor (Anatolia) as far northwest as Smyrna. North from the Italian holdings the Greeks have possessed themselves of the strip along the east coast of the Ægean Sea (Cydonia) northward to the region of the Dardanelles, and the Sea of Marmora, Constantinople, and the Bosphorus, which is held jointly by the Allied forces.

England recently made arrangements with Persia which establish a de facto British protectorate, guarding the great oil reserves of Persia and Mesopotamia, in the exploitation of which the British Government, itself, is the controlling partner. The French-held territory in Cilicia, to the west of the British-held territory, controls strategically the Argana copper deposits; and the Italian and Greek-held territories contain various deposits of chrome, magnesite, emery and other minerals.

Inland and to the north is the mountainous Anatolian plateau, peopled by Turks, and in the east inhabited by various semi-civilized Mohammedan hill tribes. In the northeast part of this territory lies Armenia, with part of the Black Sea coast, and Trebizond as the principal port. The Armenian territory is bordered on the south by regions populated by Turks and Kurds, on the west also by Turkish territory, on the east by the new-born and chaotic Mohammedan republic of Azerbaijan, and on the north by the similar republics of Daghestan and Georgia, both Mohammedan. In other words, a Christian population is entirely surrounded by Mohammedans of an especially turbulent character. The Armenians of this region are, themselves, largely hill dwellers, and by no means of universally peaceful proclivities, and within Armenia are many Mohammedan villages, inhabited by Turks or Kurds. Part of the Armenian territory is now held by the so-called Armenian republic, a new state as wild and undisciplined as the neighboring Mohammedan republics, and with the same bolshevist tendencies. North of this group of four little republics lies the Caucasus, and beyond is that part of Russia held by Denikine's Cossack republic.

England has, up to now, held Batoum, and has occupied the mountainous rearland between Batoum and the Caspian Sea with about twenty-five thousand scattered troops which covered, in the Caucasus section, the territory of the Georgian and Azerbaijan

republics. This territory she now finds it impossible to hold, and is withdrawing her troops, although it is not to be anticipated that she will definitely abandon the rich oil fields of Baku and the great manganese deposits of the region, unless through dire necessity. The principal manganese deposits are in the Georgian republic, formerly Russian territory; and lesser deposits in Armenia. In Armenia, also, is some copper, especially in the district of Zanghezur, where the principal deposits are reported to be British owned.

The territories now held by the various European powers to the south of Armenia and along the easily accessible portions of the Mediterranean coast will doubtless be retained indefinitely under a mandate by the nations now occupying them, if they are not formally annexed. The British newspapers speak of the Mesopotamian fields as theirs "by right of conquest," and both the French and English conceptions of the meaning of a mandate is that it is the equivalent of a strong protectorate. The Armenian territory is thus isolated, cut off from the Mediterranean and the Ægean by a Turkish no-man's land, which lies between it and the territory held by the European powers, and surrounded by a medley of swash-buckling Mohammedan races.

It has been seen that England finds the turbulent mountainous country of the Armenian republic and the wild republics between it and Russia impossible to hold, and she is very urgent that America take up her share of the white man's burden and assume the mandate over the Armenian territory. As may be surmised from the foregoing description, the region over which it is proposed that America accept the mandate offers another Balkan situation and is even more inaccessible and difficult. It must be held safely against the Turks, Circassians, Kurds and Georgians if the fair mineral and agricultural lands to the south, which have been seized by England, France, Italy, and Greece, are to be safeguarded. It is a true buffer state, moreover, between Russia on the north and British territory on the south. If England cannot police a portion of it with twenty-five thousand men, we may assume that it would require a considerable standing army of Americans. With America responsible for the holdings of this gateway between Russia and British-controlled Mesopotamia and Persia, she must become a party to every European difficulty, whether it involves England, France, Germany, Italy, Greece, Russia, Rumania, Bulgaria or Turkey.

The strategic desirability, as seen by the inveterate European diplomatists of having America hold this pass of Thermopolæ, is at once apparent. Moreover, let us consider England's great Mohammedan empire, now including India, Persia, Egypt, and Arabia. For England to be forever taking the part of Christian Armenia against the surrounding Mohammedan peoples would not make her control of this Mohammedan empire any easier; and the British Government would be the subject of constant attack from the church element at home. Should outrages against the Armenians take place under

British domination, in what an unpleasant light would the government be placed! Nothing of that sort, of course, could happen under an American regime.

The plea for protection of the Armenian people is one that should be heard; but why, of all the Christian powers, only the United States can protect Armenia, is not clear; nor why the forces of the greatest fighting nation of the world should be withdrawn, pending the dispatch thither of our own boys. The situation is clearly nothing less than the result of a diplomatic move made by France and England—England, who as a result of this war has extended her flag over German Africa, Persia, Palestine and Mesopotamia, and much besides.

That our missionaries should second the propaganda of these powers simply bespeaks the guilelessness of these good people. If American interests in mining or other industries are also behind this movement, they are not fully appraised of the delicacy of the situation. Economic reasons underlie most territorial problems, the solutions of which are advocated on sentimental grounds, as witness Alsace-Lorraine and Silesia. Our Allies have most excellent economic reasons for nominating Uncle Sam to the heroic position assumed by the Captain of the Gate, Horatius, when he undertook to keep the bridge to Rome against all comers; but no adequate reason, economic or diplomatic, appears why Uncle Sam should accept this distinction.

Armenia, both in a physical and diplomatic sense, is a trap, and the situation is not changed by the proposition to extend the American mandate over all that portion of Turkey (including Armenia) not already occupied by one of our Allies. With the United States the mandatory of this whole territory, we would be the responsible keepers (for the benefit of the European powers, and at our own expense) of the gateway between Western Europe and Asia and Africa, as well as guardian of the buffer state between Russian and British territory. Not only would we be involved in the mad complexities of the Caucasian situation as above described, but the interminable quarrels of the European Balkans would be ours as well. It would be our duty to settle the fights between Greek, Bulgarian, Serbian, Bosnian, Rumanian, Turk, Albanian, Ukrainian and Russian, on the one hand, and of all the tribes of Western Asia on the other.

The guardianship of Armenia and of Turkey belongs to the European powers at most liberal estimate, to the Allies jointly. Drawn into such an agreement, we should be a party to the quarrels of the world no less than the British, but without the corresponding territorial and commercial rewards. In such a position, moreover, our Monroe Doctrine would appear untenable. The Monroe Doctrine of the keeping away of European nations from the Western Hemisphere has always been associated with the principle of the United States keeping clear from European and Asiatic territorial entanglements; with the one gone it would be difficult to argue the other.

The Mining Congress at St. Louis

THE twenty-seventh annual meeting of the Mining Congress at St. Louis was noteworthy and successful. Efficient activity on the part of the management, and hospitality by the local authorities and residents, combined toward this result. Many addresses were delivered that were all worth traveling far to hear.

Primarily, the activities of the congress are devoted toward influencing legislation in Washington to protect the rights and further the interests of the mining industry. In its unreserved loyalty to the producing end of this industry, the congress might modify and adopt the inspiring sentiment attributed to Decatur: "Our country! May she always be right; but our country, right or wrong."

Broader questions and policies connected with the mining industry received especial consideration at this session, particularly the problem of radicalism, the relations of employer and employee, the railroad problem, taxation, and the coal strike. The League of Nations was tabooed as a purely political subject. And elevated and virile Americanism was conspicuous in the addresses and the spirit of the audiences. Radicalism in any form met no tolerance. There was manifested the fervor of 1776 and 1917. With the observer was left the comfortable feeling that here was a group of strong and representative men from all states and all walks of life who would stand as immovably in the way of the Russian-German tyranny called bolshevism as in 1917 they did against the Prussian tyranny of militarism, or as was done in 1776 against the bungling petty tyranny of the German-born king that sat on the throne of England.

Among many notable addresses was that of Governor Roberts of Tennessee, whose utterances were those of a strong, balanced, and just executive. He has cleaned bolshevism out of Tennessee, and calls on other states and municipalities to clean house similarly. The address of Charles A. Piez on the labor problem was fearless and sound, and deserves the wide publicity which we understand the congress will give it. He dissected dispassionately the attempted tyranny of labor unions; called for laws to compel the submission of grievances to a properly constituted tribunal, instead of striking; and offered the constructive suggestion that, as it was impracticable to force labor unions to incorporate against their will, a law should be passed to make any organization legally liable, whether organized or not, and so hold unions responsible for the immense losses they create in their present system of predatory economic warfare. We wonder if Congress can take its eye off the voter and re-election long enough to pass such patently equitable measures, or whether its members will continue their record of weak sisters in this regard, creating a favorite class so exempted from the law that it has not hesitated finally to defy the Government.

A most important function of the congress is that of the resolutions committee, composed of single representatives from each state represented at the

congress. To this committee are referred resolutions introduced before the congress. The committee may kill these resolutions or may pass them as they stand, or in modified form, and such resolutions as it indorses are usually afterward indorsed by the delegates as a whole when submitted to them in one of the final gatherings.

The congress is not an exclusive organization. It represents a fair cross-section of the American people or of the mining (producing) industry, which is much the same thing. Here one may meet the mining engineer, owner, operator, and promoter, of all degrees; the superintendent or mine captain, the journalist, the stockbroker, the college professor, and the Government official, and not a few of the husky or horny-handed variety whom we love best. The inveterate collector will even find specimens of the common "mining shark and the shining mark." It is this wide representation that gives color, interest, and strength to the organization, and makes it democratic. Under an impeccable leadership, with an enthusiastic and attractive staff, this organization is equipped to have great influence, especially in Congress, and to get results. The presence of many eminent mining engineers, as well as the heads of the Geological Survey and the Bureau of Mines, was a recognition of the useful and strong position which the congress occupies; and we bespeak for it still greater attention and support. We may not always agree with the conclusions of the congress, or the views of its staff; but we like it and them.

One of the things on which we differ is in regard to what we understand to be the congress' present attitude in respect to Federal blue-sky legislation, designed to prevent the operations of dishonest promoters and peddlers of stocks. This session of the Mining Congress failed to pass a resolution which had been submitted favoring such legislation. Of the twenty-two resolutions which were finally adopted, however, we believe that most will meet the approval of the whole mining industry; and the rest will crystallize live topics into subjects for debate.

The Man Hoover

AT THE recent dinner of the Rocky Mountain Club in New York, many distinguished men sat on the elevated platform which at once enabled them to view the other diners and the diners to observe them. It was well worth a man's time to study this living picture, as they sat, reflective and genuinely sorrowful, at the birthday anniversary of their great compatriot—Roosevelt. On faces seasoned by years could be read the frank and adventurous spirit of John Hays Hammond, the benign and solid manhood of Judge Alton B. Parker, the saddened philanthropy and optimism of Ambassador Jusserand, and many others. Two personalities stood out most plainly—the commanding and active mentality of Roosevelt's Secretary of State, Elihu B. Root, and the impassive presence of the mining engineer, Herbert Hoover.

"The first citizen of New York" lived in the past, his mind brooding, his eyes snapping, his features

mobile as he followed the course of the dinner proceedings, or, on his feet, with concentrated effort, sought to make his audience sense his own feelings regarding his beloved chief. On Hoover's face, quiet to stoicism, was graven the same shadows as those on the countenance of Jusserand—the sadness of men who have lived with and striven in behalf of a horribly wronged humanity, whose pain they could only slightly alleviate, and whose call has reduced their measure of their own personalities to the stature in which the Maker views them. It was with Hoover the spirit of the present and the future, brooding, thoughtful, and determined. Hoover's speech, read from notes, had the quality of a carefully reasoned mining report, and was delivered in the same conscientious and unrhetoical spirit.

A most trying time for those Americans who have performed a conspicuous public service is the applause, hand shaking, and seven-day glorification of them as heroes and supermen. Worthy and great men have foundered or been damaged on these rocks. It is our impression that Hoover has not experienced to any great degree the natural pleasure of standing in this warm though transitory sunshine, nor expanded in response.

A just appreciation of a man is difficult for his contemporaries. We have seen an autograph letter of Horace Greeley's, written during the Civil War, in which he lamented to a friend the weakness and inadequacy of Abraham Lincoln. Today no orator hesitates to group Lincoln with Washington. The tendency of the age is to complete the group as a trio, and various third members have been proposed. At the Roosevelt dinner the dead President was so rated, and none will deny the place in history of that simple and heroic figure, whose part in the Great War was limited "malgre lui," as he pathetically wrote to Jusserand. As to the active personalities of the war, history and posterity will decide; but no figure in America stands out to our imagination like that of the mining engineer Hoover, a man neither elected nor appointed to his mission, who rose above the sea of obstacles and opportunities by his own strength and natural buoyancy, who handled matters of business and state of world importance—and held his peace about the rest.

The rest of us, who are eternally busying ourselves about other people's shortcomings and duties, are wondering, among other things, "What will Hoover do?" The obvious and usual thing will be for him to accept the presidency of some great corporation, become a power in Big Business, a captain of industry, and so pass on. Our guess and belief is that he will not do this. Having given so much of his vital force to America and the world without the ordinary recompense, he must give the rest. Abilities such as his are not private property, but belong to the commonwealth.

There is much talk of Hoover as President, and there is no one we can think of that we would rather see in the Executive chair; but the position of this, in view of all the machinery of party and politics, seems very doubtful. In making his decision doubt-

less there will occur to our miner the example of Roosevelt himself, who, when he had once dedicated himself to public work, took up with energy whatever labor of that type came to him, whether it were small or large.

Power for Prospecting Plants

THOUGH the use of hand methods for drilling in the work of prospecting, as well as the hand windlass for hoisting, will continue indefinitely as convenient and simple, requiring the minimum of equipment, modern prospecting often makes use of power for these two important operations. Compressed air is invariably used in drilling where it is obtainable. It can also be used for hoisting, and for this operation air hoists of convenient size and adaptability are afforded by the machinery market. If electric power is available from hydro-electric lines, or from a central power plant, electricity is in most instances the most convenient power agent to use for driving the compressor. It is also used for hoisting, and is more economical than a compressed air driven hoist.

If it is necessary to generate power, there is considerable latitude of selection. Steam power for hoisting and air compression is simple and effective, and results in a compact plant. Fuel is the vital question. With cheap and easily procured fuel the steam plant is a good arrangement. In the absence of fuel or where fuel costs are high, the internal-combustion engine is the next possibility. The advantage of this form of primary power is the relatively small consumption of gasoline, distillate, or fuel oil per power unit generated. This important fact is vital in transportation and storage. Gasoline and distillate engines have been used for prospecting plants, both for hoist operation and for driving air compressors. It is doubtful whether they have been entirely satisfactory.

The semi-Diesel engine is less complicated and is successful to a high degree. We believe that it is deserving of greater attention from the mining field and that it is well worth the attention of engineers who have the selection of mechanical equipment for prospecting plants. In this issue we present a short descriptive article on a tandem type of semi-Diesel driven air compressor which indicates the progress made in manufacturing power machinery suitable for the small mine and prospect.

THE growth of the Journal calls for an expansion of its staff, which is already so adequate that it has been divided between New York and San Francisco without interfering with efficiency at either end. We should like applications for the position of an editor to take especial charge of our petroleum section and another to take special charge of the non-metallic mining section, which we purpose introducing as soon as present mechanical difficulties have been passed. Applications should be addressed to the New York office.

Ore Contracts—Part I.

The Terms Under Which Ore is Bought and Sold Should Be Clearly Expressed in Plain Language, So As to Avoid Subsequent Misunderstandings—
Provisions Should Be Legal and Friendly

BY C. A. GRABILL

THIS article is not intended to be a legal disquisition on the law of contracts. I am not a lawyer, and do not intend to discuss the matter from the legal standpoint. A great deal has been written about the subject, from the business standpoint, and there have even been several legislative investigations, notably one in Colorado a couple of years ago; but it seems to me that something may still be said that is both relevant and material to the subject.

The first question is: What is an ore contract? To my mind it should be a memorandum of friendly agreement setting forth as plainly as possible, and as simply, the terms under which one of the parties signing will buy and the other sell the ore which is the subject matter of the agreement, the terms being allowable under the statutes and legally stated in accordance therewith in such manner as to avoid subsequent dispute as far as may be. Unfortunately, these agreements are not always friendly, and sometimes one party tries to slip something over on the other; and they are not always clearly stated, and the unforeseen happens—hence the disagreements and lawsuits.

With reference to one of the latter, I was once told by an authority that no contract was ever written that did not contain loopholes big enough to drive a team of horses through. This is stating the matter in somewhat stronger fashion than I think it deserves; nevertheless, one of the most important points of any contract is the character and integrity of the signers. Still, it is also well to know the reason for, and the meaning of, the various clauses, and also of those clauses which for one reason or another have not been put in writing, for there invariably are such, the interpretation of which subsequently will depend on custom, argument, or the court.

The complaints usually made against ore contracts are that they are too complex. This applies not only to the long and complete contracts covering large amounts for a term of years, but also to the comparatively simple schedules issued by various companies for the purchase of ore in the open market without definite contract. The latter, however, contain such statements as "as usual," or "in accordance with the custom," or similar phrases, that really cover large parts of the more formal contracts, and are accepted by the sellers, usually without question though sometimes with more or less grumbling. I am not referring here to some of the lead schedules such as are reported by the Colorado Commission, which are not only complex but foolishly and indefensibly so.

In this article I shall attempt to point out most of the subjects to be covered in a fairly complete contract and typical schedule, with an explanation of the more important. The full contract form is much longer than many of those in general use. In fact, one company on the Pacific Coast does not make any contracts, but simply issues a schedule of prices subject to change on notice. On the other hand, another company endeavors to tie up all shippers by a definite formal contract as far as they have desirable ores, buying only the small and more or less undesirable lots on open prices.

All this brings up the second question: Why any contract at all? There are two very different classes of reasons: the first is concerned with matters of policy and the second merely with the setting forth of the terms in a way to avoid later disagreements or trouble.

One of the reasons of the first class may be that the buyer is willing to offer a rate so favorable to the seller that the former will make no immediate profit, expecting to recoup through the development of more or better ore in the seller's property. In this case his only protection is a long-term contract which will prevent the sale of the better ore to competitors when found. The same thing will apply if the buyer wishes to aid the development of a property by a loan. Another, and perhaps the most important of all, is that the buyer is assured of a steady supply of ore of more or less definite character on which he can base his operations, and from time to time he can take advantages of opportunities to contract other ores complementing the first and extending his operations under terms more favorable to himself, or to the shipper, as the case may warrant, than if buying in the open market from hand to mouth.

Smelting companies, and especially commission agents (who are gradually disappearing), are not charitable associations, and the buyer may wish to take advantage of the temporary condition of the market to make a contract for a term of years at better than the average price, or to take advantage of the temporary or immediate lack of competition to tie up the ore supplies so that competitors can not enter the field, or merely to grab everything in sight.

Conversely I have never seen any shippers that were willing to contribute to the welfare of the buyer any more than was absolutely necessary, and they frequently take advantage of similar conditions in their favor. Generally, however, the important factor in their case is the same as in the buyer's; that is, the possession of a constant market with

conditions as fixed as possible on which operations may be based.

The seller has nothing to limit his efforts to beat down the smelter tariffs, but the buyer—smelter, mill, or agency—is always faced by the goose-and-golden egg proposition; that is, the lower the amount paid for ore, the less tonnage available, or the greater the profits per ton, the less tons on which to profit. This is a very real limitation and constitutes a reason for the frequent aid extended to shippers in the way of advances, and also for many of the terms and complexities of the schedules, as will be seen later.

Now comes the question: Why the complexity? The authority previously quoted also said that the shorter and simpler a contract is, the better it is. Though not approving the complex schedules previously referred to, I do not agree with this statement, unless the shorter form covers the same points as the other, and even then I have my doubts. If it is true, a flat rate and simple statement of sale would be all that is required. The use of the Jackson Price in Chile was an attempt to do this, but the results are not satisfactory, and a great many things are done "in accordance with the custom" that subsequently cause dispute or trouble.

Anyone who has had the patience to read this article is probably a potential shipper. For the sake of argument let us assume that you are a buyer and that I wish to sell you some ore from Timbuctoo, or from an undeveloped mine. Do you wish to purchase it at a flat price? I think not! First we must ascertain how much valuable metal it contains, and how much of each metal, if more than one, and agree on a method of determining the price in these days of violent fluctuations, and a treatment charge to cover your expenses, and deductions for what you expect to lose, and all the rest of the things that make up the schedule. Omitting consideration of all these details, and assuming that the schedule is agreed upon, are we all right? Far from it. Where is the ore to be when the price is paid? Presumably at the buyer's plant, but not necessarily so. If so, and delivery is by railroad, who pays for the unloading? Supposing you are asked for an advance, to be protected by the ore in transit, and it is lost in transit. Who loses? Who loses if the advance is protected by a bill of sale and the shipper fails to take out insurance or send advice of shipment in time to permit it to be done? If the shipper pays for unloading, who pays for demurrage? Taxes? Who pays them, and what about new taxies levied during the period of liquidation or treatment of the ore?

There are about a thousand of these questions, most of which can be answered definitely by a well-written contract form. Of course, many of them are answered by the statutes covering the case, or by the common law, but many are not, and a well-written form will save much annoyance, not to say grief, later.

It may appear to the reader that there are too many of these questions to be answered, but it must

be remembered that most of them are important only if left unanswered. It makes little difference whether the shipper pays the freight or the buyer does it. The freight has to be paid, and if the buyer pays it he will simply put it in the treatment charge or as a deduction, probably with a little additional charge for his trouble.

In general, little argument need be wasted on the preliminaries, only noting them and their effect on the schedule, which is the main question at issue, and to which real study should be given, not only as a means of determining how much the seller is to receive for his ore but to see that it is so arranged as to encourage the production of that grade and class of ore which will result in the greatest profit to both parties. This is a most important part, frequently neglected. I refer to this again when discussing the schedule.

The comparatively minor importance of the preliminaries, except in a few special cases, accounts for the blank forms used by some companies, but they frequently omit important things, though rarely intentionally, and often from oversight. A contract form prepared by a buyer or association of buyers will not ordinarily give special attention to the protection of the seller's interests. But if the form is complete the seller has ample opportunity to study its effect on the main question before settling that.

In the British shipping industry the forms have crystallized into the well-known "charter parties," with their ancient phraseology, each clause of which has been clearly defined by court decisions for many years. In the United States the preliminary and final clauses usually follow a fixed form of words, for the same reason. In Spanish America the civil codes prescribe certain requirements for a contract and certain civil attributes that the contracting parties must possess. The former, such as the date, place, signers' names, and language, simply appear as part of the contract, but it is customary to set forth the latter in the opening paragraph. This is not always essential, but if not done, proof that both parties had the necessary qualifications becomes the first thing in any subsequent court procedure, and it is probably best to follow the customary form.

All these matters of form being cleared away, most of the points to be covered may be grouped under the following headings:

1. Date of contract and time element.
2. Source of the ore.
3. Character and classification of the ore.
4. Tonnage involved.
5. Place of delivery.
6. Shipping expenses and responsibilities.
7. Weights.
8. Sampling.
9. Moisture.
10. Assaying.
11. Comparison of assays and splitting limits.
12. Umpires.

13. Shipper's representative.
14. Schedule of payments and deductions.
15. Quotations.
16. Exchange.
17. Taxes.
18. Advances.
19. Liquidations and settlements.
20. Manner and place of payments.
21. Deleterious substances—see schedule.
22. No payments to be made for things not provided for.
23. Force majeure.
24. Penalties, special clauses, etc.

This forms a fairly good list, but several of the items, particularly 3, 6, and 14, are capable of considerable expansion, though most are simple and nearly all are capable of being covered by standard forms. Omitting consideration of No. 14 until the last, they will be taken up in order as follows:

1. Date of Contract

This clause should state the date of the beginning of the contract, and, if possible, the time of its duration or termination. If there is no definite period of duration, the method of termination should be given. Contracts are of two types: time contracts, for a definite period or until cancelled by one or the other of the contracting parties, and tonnage contracts, for the sale of a definite number of tons. In the case of tonnage contracts, time limits are often inserted. Frequently contracts are made for short or trial periods, with the option of extension, on due notice or before a certain date. Care should be taken that the time and manner of giving this notice is clearly stated, and similarly if cancellation is provided for. Mines are not like quarries, and if a miner contracts to deliver 100,000 tons of ore, and conditions change, it is just as well to be sure that the contract provides some method for its cancellation if he finds that he can produce only 1,000 tons per year; otherwise his grandchildren may have a whack at it.

2. Source of the Ore

It is customary to specify from what mine, or group, ore may be taken for sale under the contract. If this is not done, a contract may be offered to the owner of a mine producing ore of a kind particularly desired by the buyer, and the owner may subsequently acquire another property producing similar ore but lacking the characteristics which made the other desirable, or the owner may have been offered an extremely favorable rate in order to induce development of a new low-grade deposit, and later acquire an old high-grade shipper, expecting in perfect good faith to dispose of the ore under his favorable contract. Two ores of similar composition chemically may be of such different structure physically that they will yield entirely different results on treatment. It behooves both parties to the contract to understand clearly its limits as to the intended source of the ore.

3. Classification of the Ore

Similarly, the contract should specify whether the ores receivable under it are run-of-mine, coarse, or fine, screenings, concentrates, dump ore, or other product alone or mixed. This may seem at first sight unnecessary, but it is difficult to make a schedule cover everything. The shipper may be calculating his expenses, on the basis that he can screen his dump, obtain a product profitable under the terms of the contract, mix it with the mine ore, and profit by the reduced "overhead." The smelter refuses to receive the screenings, on the ground that they are not ore, and the shipper finds himself "stuck." Or the smelter may have offered a schedule with a 10 per cent free limit for zinc, on the understanding that the mine ore averaged 5 per cent Zn, varying from 2 to 10 per cent. The shipper finds that he can work the dump and obtain a high zinc product previously rejected. By mixing it with the mine ore he obtains a product within the terms of the contract but containing 10 per cent Zn, thus defeating the intent of the contract.

The contract should also specify what classes of ore are intended to be included in the agreement, that is, silver, gold, copper, lead, sulphide, oxide, or other, and define their limits. A recent failure to do this came to my attention. An ore buyer had offered a contract for the product of a certain mine known to produce copper ore, with little gold and silver. The treatment charge was made nominal, it being the intention to take the profits in the form of deductions from the price paid for copper. The miner, considering the low treatment, found that he could work a silver vein on the property previously unworkable, and proceeded to ship a carload of the ore under the contract. There were no copper deductions, and the ore could be treated only at a loss. If the two were mixed when did the copper ore cease to become copper ore? If it was copper ore at 2 per cent, was it at 1 per cent or at one-half of 1 per cent? Classes should be defined and limited, for the protection of both parties, or else the schedule should be arranged to cover the whole thing, which can be done but is not always convenient. In this case, if the limit is made 2 per cent, is there any reason why the shipper should not mix his 5 per cent ore with the silver ore until the combined product is about 2.1 per cent or go to a neighbor and buy a little copper ore if necessary? Not unless there is an understanding to the contrary, and understandings are poor things. It is better to write it into the contract.

In this case things could have been arranged in several ways. One would have been by making a nominal deduction from the copper price and increasing the treatment charge. The objection was twofold. To make the profit proportional to the money invested would have required a sliding treatment charge, which would have been more complicated and was particularly not desired. The expense of treating this ore was high, and the psychological effect of the high charge would have been to induce the seller to go to a competitor, even under equal conditions. Another method would have been to

leave the terms as they were and to provide for the payment of a correspondingly low portion of the silver, say 75 per cent, instead of the customary amount. Then, no matter in what proportion the silver ore might be mixed with the copper ore, the result would be the same. The objection is again partly real and partly psychological. The first is that occurrence of silver in the copper was quite possible and would have resulted in unjustifiable profits by the buyer and complaint by the shipper. The second was that the mining world has become so accustomed to expect a payment of 95 per cent or thereabouts that the payment of the lower percentage would have caused the shipper to think an attempt was being made to rob him, and he would have sought a competing buyer, even on more unfavorable terms, which were not evidently so.

4. Tonnage

The contract should state whether the total production of the mine is to be delivered, or only a limited tonnage, and if a limited tonnage, how much, and at what rate of delivery. Thus it may cover the whole output for five years, with a minimum and maximum per month, or a total of, say, one hundred thousand tons, but not to exceed three thousand tons per month, with the proviso that should the shipments be less than "x" tons per month for "y" consecutive months, the buyer may cancel, or a penalty may be attached. (N. B. There is a legal technicality to be watched.) In either case provision should be made to permit the shipper to dispose of his excess or low-grade tonnage in such manner as he may desire. Provision is frequently made to give the buyer first chance to buy it, terms being equal.

The limit is placed to prevent overwhelming of the small plants in times of high prices and also to prevent speculation in metal prices at the buyers' expense. Owing to the effect of high prices in increasing ore deliveries, falling off of shipments in times of low prices, and the inelasticity of smelting plants, reduction works frequently fail to receive as much for their metals as they pay. This is referred to again in connection with the deductions from the price of copper in discussing the schedule.

5. Delivery

It would seem that a simple statement that the ore should be delivered to the buyer's place of business would be sufficient. Sometimes the buyer shuts down a plant or has a surplus of ore, or for some other reason wishes to divert the ore to another plant and transfer his contract. For this reason the contract contains a clause to the effect that the buyer may demand delivery at some other point than that specified, on condition that any increased expense of shipment is for the buyer's account.

6. Freight

It would also seem as if the case of shipments from points near at hand would not require any statement other than that of the delivery place, but there is still the question as to who will pay unloading charges, demurrage at the buyer's plant for

which the buyer may or may not be responsible, routing and releasing to fixed valuations, insurance and penalties for violations of railroad regulations, and diversion to other delivery points, all of which may have considerable importance if advances are made before, or on advice of, shipment, or if the ore is bought at some intermediate place. And if the shipment is from some such place as Bolivia to New York, via Antofagasta, Chile, New York prices and weights to govern, and advances, consular invoices, customs dues, lighterage, port charges, exchange, interest, commissions, sacking and resacking, losses in transit, differences in weights, all in two languages, and two systems of weights and measures and three or four currencies enter into the question, then the bookkeeper is in for a busy afternoon.

7. Weights

The weights that govern are usually the buyer's receiving weights taken in the presence of the shipper's representative, but sometimes vice versa. If outside of the United States, it should be stated whether metric or other systems of weights are intended, and, particularly, the ton should be defined. I recall one contract that used four different kinds of tons. They were the metric ton, the ordinary short avoirdupois ton of 2,000 lb., the long ton of 2,240 lb., and a special arbitrary ton of 1,030 kilos. I think it a good plan to always spell the word "tonne" when referring to 1,000 kilos.

8. Sampling

The clause covering this usually reads "in accordance with the usual practice," or something similar, and it ought to be more definite. In the case of large shippers it is not practicable to hold the whole lot for resample in case of disagreement, and provision should be made for cutting a first sample by hand or machine which can be held for resample if desired. There must be enough sealed pulps (samples for final assay). The buyer requires one, the shipper one and sometimes two, and then there are the control, umpire, and one or two reserves in case of damage or loss to the others—six or eight in all. An intermediate sample is frequently cut, sacked, and sealed for reference or use in case of accident or error in the final sample. The presence of the buyer or his representative at all sampling operations is always provided for.

Excepting a few irresponsible ore buyers, it is fairly safe to assume that the buyer is going to try for an accurate sample, but in the case of smelters treating the ore in blast furnaces, there is a clashing of interests in the buyer's own domain. Good sampling requires fine crushing. Good blast-furnace operation requires coarse ore. It may therefore be seen that the smelter who treats the ore in blast furnaces will not crush the ore any more than is necessary, and, in order to keep down costs, may even be willing to take a chance on the self-correction in a number of errors. Now, the values in an ore are not usually the same in both coarse and fines, but may be greater in either one. In either case it is

necessary to watch that sample and reject carry their due proportion of both. There is no doubt that the sample taken from well-mixed fine ore will be better than that from coarse ore, no matter how taken.

Handbooks give the limits to which the different classes of ore should be crushed before cutting in each step of the process, but they are often neglected. They are based on the effect that one extra particle of maximum size will have on the sample if it should consist of the richest ore in the lot, and the tables can readily be calculated if not at hand. In the case of ore containing free gold, the figures are rather startling to the uninitiated.

9. Moisture

The moisture determination is, I believe, the most unsatisfactory detail of the whole business. In most contracts the clause referring to moisture merely says that there will be a minimum deduction of 1 per cent for moisture. This is supposed to cover the dusting loss in dry ores, and I believe it to be fair. In Chile operators used to have a custom of making no moisture determination at all. The sample was cut down, bucked, and assayed without more ado and supposed to represent the ore pile without further question. This was all very well around Antofagasta, where it rains once in ten years, or at Iquique, where it never rains at all, but when it comes to ores from Concepcion, where it rains all the time, the matter bore quite a different aspect, because the process of bucking the sample will partially dry it; in fact, the ore will not pass the screen until fairly well dried, and the sample then indicated more value in the ore than it actually contained.

But how is the moisture to be determined? It is the custom to take a small sample at the time of weighing the ore, weigh out from one to three pounds and dry them in a steam room until no further loss of weight takes place, usually from twenty-four to thirty-six hours. But in the case of a carload consisting of fine ore and boulders of from 10 to 400 pounds each, no one can tell me that the sample is accurate. Furthermore, in climates like Arizona there may be a thin layer of dry ore on the surface and a wet interior, or in the rainy season conditions may be reversed, and I have known of one enterprising shipper, who observing that the smelter people were in the habit of opening up the middle of the carload and excavating a short way towards the ends until a representative face was opened up, and then taking the moisture sample there, conceived the bright idea of turning the hose on the ore in the ends of the car while loading. I hate to tell what the moisture was on the sample taken from the next car after this appeared, but I believe the practice stopped.

It is not practicable to wait until the car is unloaded and crushed to take the sample, as it may dry out appreciably, and the same thing happens if a large sample is taken and put through a crusher. A small sample will dry on its way to the testing room if not placed in a non-absorbent and covered

container; otherwise, a tin pail. The moisture is usually in the fines to a greater extent than in the coarse material, and the tendency is always to take too great a portion of fines. But if the ore comes from a wet mine in a dry climate the fines may dry out in shipping and the interior of the large pieces remain wet. The best thing that can be done practically is to take a fairly large sample, breaking up a few of the larger lumps with a hammer and dry about ten pounds on steam plates or coils in a steam room with constant circulation of air. Steam-heated air baths, with constant circulation of heated air, held at a fixed temperature are better, though rather more expensive to install.

There is one kind of ore that should be watched for as it invariably causes disagreement. This is ore containing combined water such as the zeolites, gypsum, and like materials. They are not uncommon in the Southwest and may contain as much as 14 per cent of water and still be dry and dusty. These ores will sometimes reabsorb water after drying on the steam bath. In this case the samples for assay should be dried under the same conditions as the moisture sample and sealed in glass bottles, or else the sample packet should be marked "This sample is hygroscopic and should be dried at 105 deg. C. (or whatever temperature is used) before assaying." Otherwise there may be a substantial deduction from the weight of the ore without a corresponding increase in the assay. Even though the sample packet is properly dried, it may absorb moisture before reaching the shipper, or, in case of difference, before reaching the umpire, and if the umpire fails to dry it, or dries at the wrong temperature, injustice will be done. Roasted ore high in iron sometimes has the same property.

Some ores, such as those containing gypsum, will dehydrate to different extent, depending on the drying temperature. It is ordinarily assumed that it does not make any difference what temperature is used in drying a sample provided that it is below the ignition point, and that the moisture sample and assay sample are dried at the same temperature. However, if the treatment charge is based on the dry weight, or there is a sliding scale, it may have considerable influence in case of the zeolites previously mentioned.

10. Assaying

It is customary to specify that the silver shall be determined by scorification and the gold by crucible methods, the supposition being that these are the best methods, respectively. This is not always true, as some silver ores give higher results by scorification, and others by the crucible method, and the same holds with gold ores. Fulton says that the scorification method is not to be trusted for silver ores containing much zinc or tellurium.

The fire assay will reproduce its results very closely if repeated under the same conditions, but if "uncorrected," as is the custom, it is only a close approximation to the true result. Fortunately, the richer the ore the greater the accuracy in per cent,

and the variation is not large. This is again referred to in considering the silver deduction in the schedule.

Lead should be determined by wet methods, of course, and if the dry assay is used in the schedule as a base for prices, a statement should be inserted that it is to be determined by deducting from the wet assay from $\frac{3}{4}$ per cent to 2 per cent, as the case may be. There is only one use for the fire assay for lead under modern conditions, and that is to obscure something, but it still persists from force of habit.

Wet methods are not subject to the losses of fire methods; therefore I do not consider it wise to specify what particular wet method is to be used, and the chemist should be asked for accuracy of results, not methods. This increased need for accuracy has driven out the cyanide method for copper except for a few limited purposes.

The one important exception to the above statement is the determination of the "insoluble." It is in almost as bad a position as the moisture question. On some ores it gives results that are really of value, but in many cases it does not determine anything except the buyer's determination to pick up a few stray cents. It is supposed to give the silica plus alumina, but does not, and the result may be high or low. In cases of garnets or other complex silicates it will yield almost any results wanted, within a range of several per cent, depending on the kind and amount of acid added, the manner of adding it, the time of digestion, the number of times evaporated to dryness, and helps keep the umpire assayer in pocket money even in times of H. C. L. It is a cheap and simple assay to make, and that is all that recommends it to the shipper. It is likely to err on the high side, and that is no insuperable objection to the buyer. It brings in the business, and that recommends it to the umpire.

In some of the cases the shipper will weigh out a portion in the beaker, carefully avoiding the small ones, fill up the beaker with suitable acid, leave it on the stove over night, filter sometime next day, and report an insoluble that is satisfactory from his standpoint. (N. B. Silica is materially soluble in acids under certain conditions.) In the meantime the buyer picks a beaker, a small one, adds as little acid as his conscience will permit, evaporates to dryness, filters promptly, and the poorer guesser pays the umpire \$3 to tell them that they are both wrong. Barium sulphate is insoluble and does not have the properties of either silica or alumina, and silver ores frequently contain large amounts.

11. Comparison of Assays

The contract should give the time and manner of comparing assays, preferably by the simultaneous presentation of certificates of assay covering the shipment in question, buyer's assay to govern; but if the seller is not satisfied with the buyer's assay, then the sample is to be umpired, with the understanding that the result, either buyer's or seller's, whichever is closer to the umpire assay, shall govern, and the loser pay the bill. Let the shipper who thinks that it is not fair to let the buyer's assay

govern compare this method with the one he is now using and consider what would happen. The effect would be enhanced if there were a more substantial penalty attached than the bill for the umpire assay.

If splitting is authorized by the contract, there is more carelessness about the results, as each side feels that its figures are not final anyway. Of course the knowledge that any carelessness of magnitude by one party will be taken advantage of by the other, either to split or refer to umpire, has a wholesome effect, but still causes much umpiring. In the Colorado investigation one witness testified that he umpired everything. In such cases considerable trouble and expense would be avoided by referring the original sample directly to the umpire, but they are entirely unnecessary.

Occasionally splitting limits are provided in the contract. I do not believe in them at all. In about twenty years' experience I cannot see any particular improvement in the analytical work as actually carried out in ore buying, and I believe it to be due largely to the use of wide splitting limits. The ordinary limits are 1 unit (per cent of the ore) on silica, iron, lime, and sulphur; .5 unit of copper, and .5 oz. silver. The ordinary error of determination on silica, iron, lime, and sulphur is, or ought to be, within .3 per cent, and on copper from .03 on low-grade to .1 on high-grade ores. Owing to dust, impurities in the chemicals, material dissolved from the containers, and other causes there is a tendency for all results to be high. The assayer for the buyer knows this, and in trying to avoid it is likely to overdo the matter slightly. Similarly, the shipper's assayer is going to be sure that he gets all the metal in the ore. The result is a difference, not of .3 but .6. Knowing that there is a compulsory splitting limit, each one, in perfect good faith, will think that the other is trying to "slip one over." Unless stopped, the final result will be two spoiled assayers and inability to get results on a simple determination that will check within reasonable limits. Anything that permits such a state of affairs should not be allowed.

Imagine this condition: A contract with compulsory splitting limits as quoted, an unscrupulous but able shipper (I have seen them), a narrow margin of profit—say, \$1 per ton. What would you do if you were the buyer and your assayer returned absolutely correct results, and on comparison you found the shipper reporting .4 high on Cu, .8 low on insoluble and Zn, .8 high on lime and iron, and copper was worth 20c. per lb., lime and iron worth 10c. per unit, insoluble penalized at 15c. and Zn at 25c. per unit? And vice versa, suppose you are the shipper and the buyer is reporting low?

I repeat, compulsory fixed splitting limits should not be tolerated, unless they are made within the error of determination, say .1 for copper, .4 for silica, iron, and lime. Then if a substantial penalty were added for failure to come within the limits, or to have subsequent confirmation by the umpire, such a penalty would be of value.

If the buyer's assay governs, many shippers overlook the effect of the curve of probable error. In any group of assays there is always a slight variation above and below the true assay. Now, on comparison, if the buyer is high and the shipper is low (that is, if that particular assay in the buyer's group has been one of his high ones and it has been one of the seller's unlucky days), the shipper will accept the result and not umpire. If both are high or both low the shipper will also accept the results, but when the turn comes around for one of the buyer's low results to fall with a shipper's high one, the shipper will umpire. Now, the umpire will also have high and low results within the limits of error, and it is therefore to be seen that one-half of the buyer's lowest group are cut out and replaced by the umpire's or shipper's, at least half of which are higher. Thus there is a margin against the buyer.

12. Umpires

The contract should contain a list of umpires to be used in rotation, and provision made for striking out or adding more as desired. It is wise to watch the umpire work carefully and select suitable ones. They frequently receive a great deal of undeserved blame, but it is not all undeserved, and there is always the personal factor. I recall that a number of years ago we obtained excellent comparative results on copper from a well-known New York assayer, the results checking our own to within .1 per cent on 60 per cent material, and another New York firm returned results agreeing wonderfully well, but uniformly about .06 per cent higher. I consider both high class workmen, but my choice as an umpire would depend on whether I were buying or selling. On the other hand, neither one reported concordant results on gold and silver. At the same time we were able to obtain settlements on a gold ore that required close agreement between three assayers, one in Denver, one in San Francisco, and one in Arizona. But the Denver man fell down on the coppers. This was all quite natural. Denver did very little business in copper, and was a gold and silver center. New York did very little fine work, but its analytical standards are high. That holds true today. There are only a few assayers in the West to whom I would care to send work requiring great accuracy in arsenic, antimony, and bismuth, because there is little or no call for that class of work.

The assaying of ordinary gold and silver ores is fairly well standardized and presents few difficulties, but how about the few unusual ores that require special treatment? How far should the umpire go, or be instructed to go, in the effort to determine the actual contents? The cupellation loss on low-grade ores is greater in percentage than on high-grade. Should the umpire combine lead buttons by scorification for cupellation in order to reduce this loss, or not? The answers to many such questions are left unmade. When required they should appear in the contract. In their absence the umpire staggers along and does the best he can with occasional kicks from both parties.

At present anyone, honest and competent or otherwise, may open an assay office and solicit trade. The smelters offer lists of names of men known to be suitable for selection as umpire by the sellers, and will usually add new ones to be tried out if so requested. I believe that the suggestion that public assayers be examined and licensed by the state is an excellent one. Licensing on the basis of a simple fee and registration is of no value, but if done on the basis of a real examination or some form of civil service competition much good might result.

As a class the assayers rank high in integrity, but I have known of several fakers who have lived for many years on the fees of the gullible and who were a source of injury to the rest of the fraternity. Their usual claim is that they can obtain more gold or silver by their methods than can the regulars, and they cause considerable discontent among the inexperienced.

13. Shipper's Representative

Provision is always made for the presence of the shipper or his representative at the weighing and sampling. This is as much for the buyer's protection as the other's. Caesar said "Men are prone to believe that which they earnestly desire," and the miner still retains that characteristic. He usually believes that his ore contains more than it actually does, and if he or his representative is not present at the sampling, there is often a howl when the returns are in.

14. The Schedule will be considered later.

15. Quotations

The contract should specify what quotations are to be used and where they are to be obtained. They are, variously, those of the date of receipt, date of sampling, average of the week of receipt, or thirty or ninety days after receipt, the last to throw the speculative element on the shipper or to avoid loss to the buyer during the time required for treatment of the ore in periods of falling prices. The contract should also state what is to be done if the date falls on a holiday, or quotations are suspended for one cause or another. Copper quotations are usually for electrolytic copper, and for either wire bars or cathodes, the latter being the lower. If London prices are used, "Standard" is the base though "electrolytic" is quoted and formerly "Chile Bars" and "Best Selected" were used. "Standard" is not as high a grade as "electrolytic," and consequently is lower in price. It is always quoted in sterling per long ton. The most extensively used quotations are those of the Engineering and Mining Journal. Lead quotations are those of New York, though formerly London for soft Spanish lead were much used.

16. Exchange

Exchange applies only to contracts involving foreign countries, and the local conditions must be carefully considered. As with quotations, care should be used to specify the time and source, and also whether buyer's or seller's or average exchange

should be used. In Chile, for example, preparation must be made for three exchanges.

17. Taxes

The contract usually says "All taxes are for the account of the seller." Quite simple and clear! The last few years have taught several lessons in this line. Supposing that you are mining in Mexico, and you sell your ore on the basis of quotations ninety days after delivery, and you have delivered your ore, and the government then puts a 10 per cent production tax on the metal contents to be collected on export. Who gets stuck and how much? Quite so!

It is advisable for the shipper to allow the insertion of a very complete clause covering this point, because the smelting is usually on a comparatively narrow margin, and if not protected in that way the company will protect itself elsewhere in the contract, with a good broad margin to cover the risk involved. Agreements frequently specify "all taxes in force at the time of delivery of the ore or within ninety days thereafter," to allow time for treatment. During the war, in countries like Chile, import taxes in the countries to which the ore or its products were shipped for refining were included.

18. Advances

Most shippers, in common with every one else, are chronically short of funds, and want advances. The terms under which they may be obtained, if at all, and the method of liquidation, should be included. The smelter may advance on receipt of the ore, or on advice of shipment, and may require provisional bills of sale, insurance of the ore in transit, or some other method of protection.

19. Settlements

Liquidations and settlements may be made immediately on comparison of assays, on receipt of umpire returns, or monthly. The time and manner depend much on the method of bookkeeping by the two companies. Usually provisional liquidations are made at the time of comparison of assays, and final settlements on acceptance of the final assays by the shipper, or on receipt of the final quotations when these are of some deferred date.

20. Payments

Time, manner, and means of payment should be specified. The contract should state whether settlement for all shipments is to be made on the first of each month, or whether settlement of each lot is to be made separately; whether settlements are to be made by cash payment to the owners of the product shipped, or to the owner's representative; whether payment is to be made by check or by draft; on what city exchange is to be drawn; and, if settlement is to be made in foreign countries, in what currency payment is to be made.

21. Deleterious Substances

These are occasionally prohibited above certain limits. Chlorine is believed to cause substantial losses of silver and copper. In lead smelting, arsenic and antimony cause the production of speiss and poisonous fumes; in copper smelting they cause

poisonous fumes only. The time is approaching when they will be valuable elements, though there is now more than the market can absorb. They can be easily recovered by baghouses or Cottrell plants, but the cost is still equal to the returns in the limited market.

22. No Payment

Some companies insert in the contract a clause that no payment will be made for any substance for which payment is not specifically provided. Many ores contain minute amounts of cadmium, bismuth, nickel, and other substances, in amounts so small that the cost of determination would be more than their value. They are later recovered as byproducts, and the clause is simply intended to forestall argument.

23. Force Majeure

Both parties should be relieved of the burden of the contract in case of force majeure, acts of God or nature. But what is force majeure and how is it determined? War undoubtedly might constitute a case of it, and so might insurrection. Would riots, strikes, lockouts, or simply shortage of labor be so regarded? Would the closing of the mine, mill, or smelter constitute proof of it, or might such action simply be construed as an attempt to break the contract? Would increase of cost of essential materials, sufficient to cause a loss in operating, be force majeure? In case of a suspension of operations due to this cause, does the contract terminate, is it simply suspended, or is it extended for a term equal to that lost? The contract should as far as possible answer these questions, although the very phrase used, "acts of God," indicates the impossibility of foreseeing all of them.

24. Special

These cover provisions for the transfer of the contract, or any unusual condition. There is often an article providing for reference of all disputes to arbitrators instead of to court proceedings. What should be done about shipment of ore which contained less value than the charges against it? Should the shipper be expected to pay the difference or not? The answer, of course, depends on the local conditions.

All the above subjects might come up in connection with the ordinary ore contract, the simple agreement of purchase and sale. They may not be written, and many are simply accepted as a matter of course, or, as the Chileno puts it, "Por la razon o por la fuerza." It does seem complex, and we have not touched the real meat of the coconut, the schedule, but it is not as bad as it seems, and three or four typewritten pages will cover the whole thing so as to answer ninety or more per cent of all the questions that may arise. That is the reason for the forms in common use. They are not to "slip one over," but to avoid all possible disagreement and bad feeling, and only exceptionally contain a "nigger in the woodpile."

[To be continued]

American Mining Congress Meets at St. Louis

Problems of Mine Taxation, Gold Situation, and War Minerals Relief Considered in Special Conferences—Protective Tariff Session Draws Small Audience—
Exposition of Mines and Mining a Success

THE convention of the American Mining Congress that was held in St. Louis, Mo., on Nov. 17 to 21 can be recorded as a profitable experience by the delegate or visitor who was fortunate enough to be able to attend it—and actually did so. A most valuable feature of any convention is the opportunity it affords to meet others, in this case from all parts of the country, who are engaged in similar lines of work and are troubled with the same problems. This feature together with the fact that some of the most vexing questions of the day were scheduled for discussion at the St. Louis convention should have brought together a much larger number of men representative of the American mining industry than were actually seen at the various gatherings and sessions during the week.

The attendance, it may be said, was not bad, but it should have been better. The convention was well advertised. The official call sent forth by the Congress well in advance of the event was responded to by the appointment of delegates of all degree, many of whom were not much in evidence in St. Louis, at least in the neighborhood of the Planter's Hotel or the convention halls. St. Louis, its Chamber of Commerce announces, is at the cross roads of the country. This in itself is, perhaps, as much of an inducement to the new arrival to continue his journey on, as it is an inducement to remain. At any rate, some of the delegates evidently went absent without leave but enough appeared to make the convention a success.

It may here be remarked, without any attempt to flatter, that the importance of the American Mining Congress to the mining industry of the United States was well demonstrated at St. Louis. The Congress styles itself "the fighting organization of the mining industry." It is the vehicle through which this industry can reach the legislative bodies at Washington as a concrete and organized force. An organization such as this is needed. It is needed especially in view of the fact that in many states the mining industry is forced to bear an unjust burden of taxation to the advantage of other lines of industry. For example, it may be cited without further comment, that the mining industry in Utah is now confronted with the necessity of paying seven different kinds of state and Federal taxes.

In giving publicity, as it does, to new developments in mining legislation, both through its bulletins and through the Mining Congress Journal, and in acting as a medium of expression on legislative matters for the industry, the American Mining Congress performs a function carried out by no other body in the country. The St. Louis convention debated many topics of current importance and before

it adjourned expressed its opinions and recommendations in the form of resolutions, some of which are to be brought to the attention of the national Congress at Washington. The questions of mine taxation, of remedying the present situation of gold producers, of obtaining more liberal legislation for the relief of war mineral producers, as well as those of wiping out bolshevism and promoting better relations between capital and labor were among the subjects that received the attention of the convention.

Program Covers Wide Range of Subjects

It was physically impossible for a delegate to have attended all the sessions of the convention. The lengthy program and the limited time made it necessary to hold simultaneous sessions of which the delegate was free to take his choice. In all, there was the National Gold Conference, the War-Minerals Conference, the Tariff Conference, and a session on mine taxation. The program also included the National Conference of Schools of Mines, the first of its kind to be held in the country, the National Oil Shale Conference, two sessions on subjects relating to the coal industry and one on safety and welfare work, to say nothing of two informal dinners. And poured round all, like the ocean in Bryant's "Thanatopsis," was the National Exposition of Mines and Mining, at which about 150 exhibits were shown. To get into the main convention hall it was necessary to pass a great display of mining machinery and mineral products, so that no effort was required if one desired to visit the Exposition.

Bulkeley Wells Points Out Task of Congress

Preliminary conferences of the committee on standardization of mining equipment took place at the convention headquarters at the Planter's Hotel on Saturday and Sunday, but the Congress, and the Exposition as well, were not formally opened until Monday afternoon, Nov. 17. This occurred when, after speeches of welcome on behalf of various St. Louis organizations, Bulkeley Wells, of Denver, president of the American Mining Congress, made response in his opening address. Mr. Wells stated that the chief task of the Congress was to develop a plan for readjusting industrial relations that will be satisfactory to employer and employee.

"There are no sound objections to collective bargaining, provided the conditions surrounding it are sound," said Mr. Wells. "Indeed, it furnishes the only practical method of dealing with large numbers of men. But the parties to such a discussion of wages and conditions of employment must, actually and with duly conferred authority, represent at least a majority of those concerned, and must be firmly and equally bound in their final agreement.

"Labor organizations should be compelled by law to incorporate and thus become as legally and financially responsible for the observance of their contracts as are employers. The power of organized labor to do good and to do harm is amply proven, but the responsibility for harm and injustice done is too often evaded.

BULKELEY WELLS
President of American Mining Congress

"As proof of the sincerity of the words of its leaders, organized labor should emphatically deny the assertions that its purpose in demanding shorter hours of employment is to limit production. Most reasoning employers will no longer oppose an eight-hour day. Eight hours' work, with eight hours' recreation and eight hours for sleep, can hardly justify complaint on the part of labor. Fewer hours of employment will inevitably increase the cost of all production and develop indolence and extravagance on the part of labor. The one fundamental cure for the high cost of living is, naturally, increased production."

Following Mr. Wells came Van H. Manning, director of the U. S. Bureau of Mines, who as personal representative of the Secretary of the Interior, formally declared the Exposition open. Dr. Manning in his speech drew attention to some of the principal problems confronting the mining industry. He referred to the coal strike and, while avoiding mention of the merits of either side, said he felt it his duty to discuss a problem that has concerned both miners and operators in the past, namely the frequent periods in which the bituminous mines, especially in the spring and summer months, are not at work from causes not under the control of either the operator or the miner.

"In the five-year period, 1912 to 1916, the time worked in the bituminous mines ranged from 195 to 232 days of a possible 310 working days," said Dr. Manning. "In 1917 the mines worked 243 days,

and in 1918, under abnormal war conditions, 249 days. In round figures, the mines are idle for one-third to one-fourth of the time in ordinary years. The reason is well known to you that: bituminous mines are opened and manned on the basis of the maximum or winter output, which in large part arises because consumers reduce their purchase of coal in the spring and summer months.

"Although some bituminous coal does not stock well, yet there are ways and means by which this can be done, but it requires careful storage, and the storing and rehandling costs money. The trouble is that the consumer does not perceive the cost of this to himself. He thinks to himself, it is all right for Mr. Jones to buy his coal early and in this way help out the miners, but it is going to be inconvenient for me to tie up my money so far in advance, and so does not order coal early in the season. It must, therefore, be made worth while to the consumer from a money standpoint.

"Since Congress has prevented by law agreement among operators as to price, it becomes impossible for them to take care of this situation by agreeing to sell their coal for materially less in summer and making it up in winter. It has been suggested that this could be taken care of through the Government establishing summer and winter rates on coal, so fixed that there would be no loss of net revenue at the end of the year; or, still better, establishing a sliding scale that would produce an equalization of coal purchases and shipments through all the months of the year.

VAN H. MANNING
Director, Bureau of Mines

"The effect of this would be that the miners would have steady work and there would be readjustment by which fewer mines could furnish the total amount of coal needed. This would not necessarily mean the shutting down of mines, for coal production in 1918 was 113,000,000 tons, or 20 per cent greater than in 1913, and if new mines were

not opened for awhile productive capacity would quickly become adjusted to consumption. Fewer miners would be required, and we would have the advantageous condition in this country which prevailed in Europe before the war, where the miners worked practically every working day in the year, and the operators were able to count on a regular output.

"The coal industry of the country will be greatly benefited by a good export business. We have never had a large export coal business before because Great Britain, through its dominant position in shipping, had the lion's share of the business. But England has, temporarily at least, lost the larger part of its coal export business through the curtailment of production, resulting from reduction in the hours of labor of the mines. The United States coal export trade should be placed by its own great shipping facilities on a firm basis where it can compete on even or better terms because of our more easily and cheaply mined coal. It is probable that the Mediterranean and South American regions will look to the United States for their coal supplies.

"The Government has wisely put into the hands of the operators, through the Webb-Pomerene Act, an opportunity for handling export business through a corporation by means of which operators who export coal can dispose of their coal to the best advantage."

Committee on Resolutions Appointed

The opening session was followed by the appointment of the Committee on Resolutions. Each state delegation selected one of its number to serve on this committee. Thus, it was thought, the resolutions to be adopted would be more representative of the wishes of the convention and of the mining industry at large. The value of this method, however, depends largely on how representative the so-called state delegations are in the first place. If, by any chance, but one member was present from any particular state, as happened in the case of Alaska, that member became forthwith a member of the committee on resolutions. It may therefore happen, unless the state delegations are carefully selected, that men not qualified to serve may find themselves on this very important committee on resolutions.

The importance of this committee was increased by the fact that the convention worked under the rule that all resolutions introduced to it must be referred to the committee on resolutions without debate. This procedure saved much time that might otherwise have been lost in prolonged debate on the convention floor.

The evening session was enlivened by what turned out to be a joint discussion of the railroad problem. Alba B. Johnson, president of the Railway Business Association and formerly president of the Baldwin Locomotive Works, maintained that state and federal regulation was strangling the railroads, while Clifford Thorne, of Chicago and formerly a member of the Interstate Commerce Commission, stated that the railroads during the three-year period ending June 30, 1917, showed a greater net return upon

their investment than ever before in their history, except 1907.

Mr. Johnson advocated the passage of the Cummins bill or legislation embodying its general features with some modification. He urged the creation of a federal board of transportation to pass upon railroad security issues and to determine the amount of money the roads must have from rates and to make surveys of needed railroad facilities. He urged that Congress guarantee the roads adequate rates so as to re-establish their credit and attract new capital. He recommended the substitution of federal for state regulation of the carriers.

On the other hand, Thorne characterized the provisions of the Cummins and the Esch bills as revolutionary in character and calculated to result in injustice to the shippers. He attacked the accuracy of literature and statistics now being circulated on behalf of proposed railroad legislation and rate increases, and said that a sweeping increase in freight rates would be deplorable.

"Let us have no more changes in rates, rules or regulations causing disturbance in present conditions, rate relationships," said Thorne, "or causing increased charges on traffic as a whole or increased operating burdens on individual industries, without a full, open public hearing by a disinterested tribunal where both parties are heard and know what the other side is presenting. Let us abandon all revolutionary changes which would disturb existing commercial conditions."

Samuel O. Dunn, editor of "Railway Age," declared that unless the railroads get \$6,000,000,000 of new capital during the next three years, they will be unable to cope with the growth of traffic and that increased production would do little good.

Whatever be the merits of the foregoing arguments on the railroad problem, it was to be noted that Mr. Johnson's remarks went practically unapplauded, whereas Mr. Thorne was interrupted by frequent demonstrations.

Greater Production the Need of Today

George Otis Smith, director of the U. S. Geological Survey, in addressing the convention on the following day, made a plea for greater production. He described the work of American mining engineers, backed up by capital, in constantly lowering labor costs by increasing the investment in improved mine equipment. Said Mr. Smith: "The great strides in advancing our mining industry have come through large investments in plants, and we must in fairness include a living wage for capital as well as for labor when we figure the cost of winning this or that metal from the lowgrade ores, metal which a few years ago not all the labor in the world could have won for the use of mankind.

"As the railroad's largest customer," Mr. Smith continued, "the mining industry is largely concerned in the solution of the transportation problem now so prominently before the American public. It is plain that adequate service and low rates mean much to the health if not to the very life of our industry.

yet even as large buyers of transportation we should not seek preferential rates at the expense of the rest of the public, any more than as sellers of fuel and metal we should be willing to let the Railroad Administration procure its supplies from our mines

freight rates to be determined by facts of transportation cost, rather than by what we claim to be exigencies of our own business. Even a legislature can not impose rates, however they may seem calculated to serve public interest, that would deny to the rail-

and furnaces and mills at prices so related to bare cost that the public must make up the difference. You coal operators know too well how that style of shoe pinches to wish the same kind of narrow policy on the reorganized railroad system. We must allow

road the reasonable reward necessary for its financial and physical upkeep. The Supreme Court has ruled that a state law can not force a railroad to haul coal at a loss on the supposition that the profits in the wheat traffic will recoup the carrier. So it is

that in a spirit of fairness the mining industry ought to help in the adjustment of rates on a basis adequate to revive healthy conditions on our railroads.

"In its relation to the mining industry the Government needs to be fair, whether the relation is that of mineral landlord or of business investigator or of tax collector or of purchaser of fuel and metals. Disregard of established equities, ill-advised charges of bad faith, threats of commandeering, or offers of confiscatory terms are no longer warranted in these days when the Government's necessities are no greater than those of other consumers. Indeed, the principle laid down by President Wilson during the war that the Government rate should be the same as the rate to the public should have been followed by every one down the line, whatever his title or insignia of office. Now that we have had time to regain our poise, I think the public servant generally wishes to serve rather than to commandeer.

"In my opening words I suggested that welfare rather than wealth be the dominating note of our industry. But wealth may be defined as provision for future welfare, inasmuch as it is the surplus beyond present needs. To the present-day problem of industrial unrest, then, what is the answer, except to create a larger surplus? As I analyze the economic situation, surplus of production over consumption can come through decreased consumption or increased production or both, but it can not come through restricted production or increased consumption or both, and the shortened day of labor surely means both less produced and more consumed. Whether among individuals or among nations, the old-fashioned ideas of industry and thrift come nearer the natural law than the new proposition of a five-day week and a six-hour day. No protective tariff can safeguard the home market for industries based on a 30-hour week, nor can our industries expect to win or hold a place in foreign markets on any part-time program, unless there is some international agreement making for universal indolence, and even then we may discover that there can be no return to Garden of Eden conditions of consumption without productive industry. I believe the earliest precedent was a continuing injunction for a six-day week, and no lower court has since ordered any better rule of action or reversed that Divine injunction."

Delegates Dinner an Event

Two informal dinners for delegates marked the program of the convention. At the first, the present industrial situation was briefly discussed. The second, however, was an occasion to be remembered, informal as it was. A program of entertainment had been arranged that made one forget he had come for such a gross purpose as dining. The toastmaster was Robert E. Lee, of St. Louis, the very active vice-chairman of the Exposition Committee, who can be serious on occasion. As a raconteur, Mr. Lee is unexcelled. One of his stories was absolutely unprintable, being delivered in near-Chinese, a language not heard in the Far East.

Chief among the speakers was Governor Frederick D. Gardner of Missouri, Bulkeley Wells, and Rev. Charles W. Gordon. Dr. Gordon, who had spoken the day before on the Winnipeg strike, now addressed those present on the present industrial situation in Great Britain, whence he had just returned. A speech was also made by Fedor F. Foss, chairman of the Russian Mining Commission. The dinner was one to be remembered.

War Mineral Producers Confer

Since the signing of the Armistice, in fact, since the bottom fell out of the chrome market before the Armistice, much has been heard about relief for the producers of war minerals, oftentimes with bitter expressions from the producers. It was therefore expected that these same producers would be present in numbers at the sessions of the War Minerals Conference, or at least strongly represented. Such was not the case. At the most important session less than fifty people were present and when the opportunity was given for producers to air their views, Victor Rakowsky, of Joplin, Mo., was practically the only one to respond.

Mr. Rakowsky complained that the War Minerals Relief Commission had in some cases acted on questions involved on its own interpretation. He stated that all over the United States there was a feeling that the Relief Act was not being administered properly and that something was wrong. On the other hand, he stated that personally he felt that the Commission had done the best it could. Formation of a War Minerals Section of the American Mining Congress was proposed by Mr. Rakowsky in concluding.

Previous to this, James F. Callbreath, secretary of the American Mining Congress, had outlined the history of the campaign to increase the production of war minerals and had stated that Congress at Washington should further instruct the War Minerals Relief Commission to relieve the producers. Following Mr. Callbreath, Herbert W. Smith, chief of the war minerals division of the Mining Congress, said that the position of the organization with respect to claims for relief was well understood—that it stands for the rights of the claimants as a whole.

The chief speaker at this conference was ex-Senator Shafroth, of Colorado, a member of the Commission. Mr. Shafroth recounted the history of the passage of the present Relief Act through Congress. He recalled and emphasized the sentiment of the public, especially of the farmer, against it, and pointed out how this sentiment was reflected in the House. The limitations put on relief in the Act had been inserted deliberately, he said, for without them the Senate never could have obtained the consent of the House to the passage of any relief measure at all. Senator Shafroth further said that where the Commission had found it necessary to interpret the Act it had been as liberal as possible. It has also avoided technical features wherever possible. It has taken the position that where a man was sent out to stimulate production and this was interpreted as a request, the Commission should construe this as a

request though actually no request had been made. The Commission, said Senator Shafroth, had construed a request made by any agent of the U. S.

tungsten in sufficient quantities. The Commission has held that where a mine is not of commercial importance, if the Government has made a personal

Bureau of Mines as coming from the Director of the Bureau. Some cases, he said, had been decided on questions of commercial importance. Production was not sought from prospectors without property. The law prescribed, he continued, that no claim shall be allowed or paid unless expenditures were made for properties of chrome, manganese, pyrites or

request, it is estopped from later claiming that the property is not of commercial importance.

Following Mr. Shafroth, Philip N. Moore, past president of the A. I. M. E. and also a member of the Commission, supplemented his colleague's remarks by talking on "The Commission's Viewpoint." He defined a deposit of commercial importance as

one carrying ore of sufficient quantity and richness to permit of being worked at a profit for a reasonable period of the war at the time when operation was undertaken. This reasonable period, he said, was taken as being two years. In concluding, he said, "You came to tell your troubles, but we got to ours first. We are rejecting some righteous claims—can't help it. We are allowing some unrighteous claims."

Without doubt, any grievances held against the Commission by members present must have largely been dissipated by the frank statements of the Commissioners. At any rate, so few attended the next session of the War Minerals Conference on the following day that it was called off. This was to be regretted, as addresses by Dr. R. B. Moore and Dr. Dorsey A. Lyon had to be cancelled. Dr. Moore, chief chemist of the U. S. Bureau of Mines, had for his subject "The Development of Commercial Helium," and Dr. Lyon, who is chief metallurgist and supervisor of stations of the Bureau, had planned to talk on "Increased Production by the Use of By-products."

On Thursday afternoon, the Tariff Conference engaged the attention of the war mineral men. E. C. Voorheis, of the Atolia Mining Co., California, spoke on the need of a tariff on tungsten. Fletcher Hamilton, state mineralogist of California, outlined the American quicksilver situation. Dorsey A. Lyon read part of a paper on the "Utilization of American Graphite and American Clay in Ceramics." An attempt was made by a member from Alabama, who was interested in graphite, to get into the record the statement that Alabama graphite made better crucibles than the imported variety. Evidence of this, however, was lacking at the moment. The chief address of this session was made by E. P. Costigan, of the U. S. Tariff Commission, who talked on the work of the Commission. The meeting was poorly attended, the delegates thus evincing little interest in a protective tariff on war minerals.

On Tuesday afternoon, Nov. 18, the first meeting was held of the National Gold Conference at the Statler Hotel with H. W. Seaman, president of the Trojan Mining Co., of South Dakota, presiding. A short and interesting address was made by George M. Taylor, president and general manager of the Portland Gold Mining Co., of Cripple Creek, Col. Mr. Taylor pointed out the fact that the gold mining industry had declined and would shortly disappear with the continuance of the present conditions.

H. N. Lawrie, chief of the precious and rare metals division of the Mining Congress, then presented a paper illustrated by charts which were of great interest. These charts showed, among other things, that the gold produced in the United States was only to a very small extent derived as a by-product of other metals, and came almost entirely from gold mining proper and mainly from lode mining. The very rapid decline in the production of gold since 1915 was also shown. An interesting fact in this connection is that the use of gold in manufacture

has increased above normal as rapidly as gold production has decreased, so that in 1919 the consumption for this purpose (outside of coinage) exceeds the total production and there will be no gold left for coinage purposes.

A resolution following Mr. Lawrie's suggestions was finally drafted for presentation to the Committee on Resolutions, making the following recommendation:

That the Congress of the United States be and it is hereby earnestly petitioned to pass such speedy and remedial legislation as shall provide for a period of five years from and after the passing of such legislation, there shall be paid to every person producing gold from the mines within the United States and its possessions, under such terms and conditions as may properly be provided, a premium of \$10 per fine oz. of such gold so hereafter produced, such payments to be made out of funds to be provided by an excise of \$10 per oz. on the use, manufacture or sale of gold in the United States for other than coinage or monetary purposes and from other funds in the Treasury of the United States, not required for specific purposes, and,

It is further recommended that after five years from the passage of such legislation the premium and excise so to be provided shall be adjudged in accordance with the rise and fall in commodity prices as compared with the average for the five-year period herein referred to; this readjustment and excise to be made each year and until such time as the premium and excise can be abandoned on account of the restoration of a price level which will satisfactorily maintain the normal production of new gold in the United States to meet all industrial requirements of the arts and trades.

When this resolution later came before the Congress for acceptance, it was adopted after substituting the word "suggested" for "recommended" and making other minor changes in the wording. Objection to the resolution in its original form came from E. P. Mathewson and Edward Ludlow.

Taxation Session Marked by Interesting Addresses

The meeting of the Mines Taxation Section was held on Thursday, Nov. 20, at the Planter's Hotel, under the chairmanship of Dr. R. C. Allen, vice-president of the Lake Superior Iron Ore Association, was of especial interest and a number of papers were presented. The first paper was on "Mine Accounting in Relation to Federal Taxation," by Wade Kurtz, consulting accountant, Kansas City, Mo., and was followed by an address on "Income Taxes as Applied to Mines," by A. P. Ramstedt, comptroller of the Hercules Mining Co., of Wallace, Ida. A notable paper was presented by T. O. McGrath, auditor of the Shattuck-Arizona Copper Co., Bisbee, Ariz., on "Protection Against Unjust Taxation." Mr. McGrath called attention to the fact that in a modern mining enterprise it took several years and several hundred thousands of dollars before the mine could be put on a paying basis, yet the first year that profits were declared, all profits above 8 per cent were subject to heavy taxation. Mr. McGrath claimed that the preceding years, in which no return was obtained upon the capital invested, should be taken into consideration; in other words, that an 8 per cent return should be allowed out of the first profits on the invested capital during all the preceding years before

the taxable surplus should be arrived at. George E. Holmes, the author of "Holmes on Federal Taxation," of New York City, also read a paper on "Taxation of Income from Mining," and there were contributions to the discussion of the general subject by several other experts. All these papers will be submitted to the Income Tax Unit of the Natural Resources Division of the Bureau of Internal Revenue.

The annual meeting of the American Mining Congress was held at the Planter's Hotel on Nov. 20. The minutes of the preceding meeting were adopted as read by the secretary, James F. Callbreath. Mr. Callbreath outlined the work of the past year in vigorous fashion and recommended that a capable freight man be added to the official staff of the organization at Washington. The following officers were declared elected for the ensuing year: Bulkeley Wells, president; Harry L. Day, first vice president; Col. D. B. Wentz, second vice president; E. L. Doheny, third vice president; and James F. Callbreath, secretary. E. P. Mathewson and Walter Douglas were appointed members of an executive committee, including the president, which shall have power to act between directors' meetings. Four directors were elected for a term of three years as follows: R. C. Allen, Cleveland, Ohio; Col. D. B. Wentz, Philadelphia; T. T. Brewster, St. Louis; and John C. Howard, of Salt Lake City. The meeting then adjourned.

In all twenty resolutions were introduced to the convention, of which two were killed. The first introduced by Walter Douglas, president of the Phelps Dodge Corporation, was a protest against the inadequate policy of this Government in Mexico. It was worded as follows:

Be it resolved, that the American Mining Congress, assembled in annual convention at St. Louis, Mo., hereby protests to the Department of State of the United States against the continuance of policies by the American Government that make inadequate provision for the safety of American mining engineers, operatives and employees in the practice of their profession and in caring for the business interests entrusted to them, and be it further resolved that this Congress urges that the Government of the United States demand full and immediate reparation for losses and injuries suffered by American mining engineers, operators and employees in the lawful exercise of their duties in foreign countries and that the Government of the United States take such steps as will insure that the constitutional rights of American citizens shall protect them on our borders and throughout the world, and be it further resolved that a copy of these resolutions be forwarded to the President of the United States through the Vice President and Speaker of the House of Representatives.

This resolution was adopted in spite of the objection of the Mexican consul at St. Louis, who was a delegate to the convention. Another resolution was adopted aimed at Great Britain's present policy of excluding aliens from ownership or control of oil property within the borders of the British Empire and demanding that similar action be taken by this country in case the British stand were maintained.

Aid for gold producers was suggested in a resolution, the text of which has already been given. The

convention also voted in favor of a resolution recommending that destruction of gold and silver coinage be prohibited by law.

Antistrike railroad legislation was asked in a resolution which stated that the mining industry furnishes more tons of freight than all other industries combined. This resolution ran as follows:

First, in any railroad legislation ample provisions shall be made for such regulation of railroad rates as shall produce such rates of return upon capital invested in railroad securities as to make an investment in such securities sufficiently attractive to insure capital for railroad betterment and extension.

Second, that in any railway legislation provision be made to prevent strikes upon railroads until the matters which may be the subject of controversy shall have been submitted to investigation and arbitration by some tribunal on which the public is represented.

The convention put itself on record as opposed to "red" doctrine of any kind and in favor of enforcing existing laws against anarchy and of passing further laws. It further announced its belief in the right of labor to organize and in the right of the workman to work where he pleases. It was also proposed that the Mining Congress appoint a committee to make a survey of the industrial situation with the idea of determining what laws should be passed to bring about industrial peace.

War Minerals Committee Suggested

Appointment of a war minerals committee was recommended which should work with the president of the American Mining Congress in any effort to secure further relief for war mineral producers. Development of Alaska's mineral resources through further railroad construction and powersite work was also urged. Another resolution asked for legislation to authorize the mining of oil shale upon public lands.

Other resolutions were passed, one of them bearing on the existing situation in the coal industry and recommending that an attempt be made to adjust the price of coal according to the season, so as more nearly to equalize its production throughout the year.

Many Interesting Speeches at Other Sessions

There were various other sessions of general interest throughout the week. The Oil Shale Conference resulted in the organization of a permanent oil shale section of the Congress.

At the evening meeting of Tuesday, Nov. 18, George W. Simmons, vice president and general manager of the Simmons Hardware Co., of St. Louis, who has recently traveled in Russia on Red Cross work, gave a vivid first hand discussion on "The Russian Radical as I Found Him," describing the condition of Bolshevik Russia at the present time as criminal and anarchistic to the last degree. Allen Walker, manager of the foreign department of the Guaranty Trust Co. of New York, delivered an interesting and scholarly address on "What Is the Matter with America," referring to the present tendencies of labor to ask more pay for less work. Mr. Walker exclaimed: "I myself am a wage earner and

always have been that, yet I am not fool enough to accept a raise in wages for doing less work than formerly and of a punker kind."

An exceedingly interesting speaker at this session was Rev. Charles W. Gordon, of Winnipeg, Man., better known as the author "Ralph Connor." Dr. Gordon had for his topic "The Red Menace," and described the general strike that occurred at Winnipeg last spring and how it was broken by the citizens themselves with the aid of the Northwest Mounted Police.

On Friday morning a general session of the Congress in the convention hall was marked by two very notable addresses, that of John Leitch on "Industrial Democracy," and Charles Piez, president of the Link Belt Co., of Chicago, on "Labor and Its Responsibilities." Mr. Piez' address was especially noted for its firmness as regards the present labor situation. Mr. Piez pointed out that it was impossible to compel labor unions to incorporate so as to make them liable under the law for their acts and proposed the enactment of a law which would make unincorporated organizations legally responsible, a suggestion which is a very valuable one and which is especially recommended to consideration of the public and of the Congress in Washington. Mr. Piez' speech will be published and distributed.

A very patriotic, anti-radical spirit permeated the whole Congress and was evidenced in many of the speeches which were of a notable character. An address by Governor Roberts of Tennessee, describing how bolshevism was being combated in that state, was enthusiastically received by the convention, as were those of Dr. Gordon and Mr. Piez.

Efforts to Popularize Exposition Succeed

A session on safety and welfare was held on Wednesday, Nov. 19, under the direction of the U. S. Bureau of Mines, Morton F. Leopold presiding. Mr. Leopold took occasion to object to the nominal admission fee of 25c. charged for the Exposition of Mines and Mining. Apparently his protest was heeded and the doors thrown open to the public, for the small boy was very much in evidence during the last few days. Exhibitors who had been complaining of the poor attendance now had to watch their exhibits and "literature" more carefully. The addition of a band in the evening did much to popularize the Exposition. It is a debatable question whether a sparse attendance of interested persons is of more value to such an exposition than a large attendance of people who do not comprehend what they see.

At the welfare session referred to above a very interesting talk was given by C. W. Seiberling, vice president of the Goodyear Tire & Rubber Co. Mr. Seiberling discussed how his company had grown since its incorporation and attributed it to the admirable organization and teamwork of their employees in their recreation as well as in their work at Akron. An address entitled "Does 'Safety First' Mean Increased Dividends," was delivered by W. D. Ryan, Commissioner of Safety of the Bureau of Mines.

Mineral Statistics and the League of Nations

Reference has been made in the Engineering and Mining Journal (July 26, 1919, p. 152) to the importance of having better statistical information of international scope and the suggestion that an organization be formed within the League of Nations to collect and distribute such data.

The Economic and Finance Section of the League of Nations held a conference on the subject in August, 1919, and its report has now been published in London. The "Economist" of Nov. 1, 1919, gives the following brief summary of the more important conclusions, which, although not having the character of binding decisions, met general support:

A. That the institution of a Central Advisory Council on Statistics, to meet normally at the seat of the League, is desirable; this council being constituted partly of members of the separate statistical bodies referred to below, and partly of statisticians and other persons nominated by the League.

B. That, in principle, there should be a separation of the main classes of statistics, and that these should be entrusted to several different bodies or institutions working in conjunction with the League.

C. That these bodies should be, in the case of agricultural statistics, the International Institute of Agriculture at Rome; in the case of labor statistics, the International Labor Office; and, for the time being, in the case of demographic statistics, the Permanent Bureau of the International Institute, at the Hague.

D. That a committee be appointed to consider the definite distribution of statistical work between the various bodies connected with, or proposed to be connected with, the League of Nations, and to make suggestions for the establishment of other bodies than those already referred to.

E. That the appointment of such a committee, if thought advisable, should be undertaken by the Secretary-General of the League of Nations.

"The Armenian Mandate"

Your leading article in the current issue of the Journal on "The Armenian Mandate" is most timely and illuminating, and for that reason it seems worth while to point out an error, even though that error in no wise invalidates your main contention.

You say "The Armenian territory is bordered . . . on the north by the similar republics of Daghestan and Georgia, both Mohammedan." Georgia is not Mohammedan. Like Armenia, it is Christian, and its church is autonomous, or was so until about the year 1900, when the Russian government seized the ecclesiastical income and otherwise assumed more or less control over the Armenian Church. To be sure, there are on the fringes of the ancient kingdom districts inhabited by Georgians forcibly converted to Islam by the sword, and it was to escape further inroads by the Turk that the kingdom finally sought Russian protection a century ago.

New York, Nov. 11, 1919.

Laying a Pipe Line in Frozen Ground

Details of Method Used in British Columbia, Where Deep Snows and a 45 Per Cent Grade Were Encountered

BY WILLIAM W. ELMER,
Mining Engineer, Portland, Ore.

INSTALLING a 10-in. pipe line on a 45 per cent grade in the Selkirk Mountains of British Columbia in the middle of winter, with from two to seven feet of snow on the frozen ground, was not always a pleasant job. The illustrations give some idea of the conditions met; yet no especial discomfort was suffered except while connecting the steel pipe flanges in zero weather. The details of the work and the costs should prove interesting to those who may have similar work to do.

length of pipe (see Fig. 1), the other end being supported in a similar manner. All of the pipe was hauled along the right of way by this method except about 400 ft., which it was necessary to haul up a grade steeper than 45 per cent, by single block and tackle. The time required was $14\frac{1}{2}$ days for two teams and three to four men. The total cost of the distribution of the pipe along the right of way was \$309, or 15c. per lineal foot.

Because of the solid flange connection, the pipe could be bent but little to conform to the contour of the ground, and it was necessary to dig a trench, as deep as 10 ft. in some places, for a total length of 640 ft. The method followed was to excavate 35 ft. of trench, then to connect a length of pipe and cover it with soil excavated from the next section. Grade was determined by a carpenter's level

FIG. 1. HAULING 10-IN. PIPE UP 45 PER CENT GRADE.

FIG. 2. LOWERING PIPE INTO A TUNNEL.

FIG. 3. LAYING PIPE ON A TRESTLE.

The pipe line was part of a hydro-electric development, and carried water 2,088 ft. to the generating station, where a static head of 833 ft. was obtained. The first 960 ft. of pipe was laid at an angle of 23 degrees 45 minutes, or a grade of 44 per cent. The next 730 ft. was laid on a grade of 42.9 per cent, and the remainder, connecting with the penstock, on a 45.6 per cent grade.

The first 960 ft. was of spiral riveted pipe with forged steel A.S.N.E. standard flanges. Of this, 390 ft. was 9-in., 12-gage pipe, weighing 420 lb. per 30-ft. section. The next 300 ft. was 10-in., 12 gage, weighing 450 lb. per section, and the remainder was 10-in., 14 gage, weighing 330 lb. per 30-ft. length. Following this came 10 and 12 in. wire-wound, wood stave pipe, averaging 240 lb. per section.

The pipe was moved up the hill by two teams hitched to a 2-ft. sled, which carried one end of a

and a wooden triangle. When it was necessary to make the trench more than 7 ft. deep, occasional tunnels were dug to avoid shoveling snow and breaking through the frozen moss and soil. On account of the steepness of the grade, throwing the dirt out of these tunnels over the preceding length of pipe was easy. Fig 2 shows a length of pipe being lowered into one of these tunnels. The stove is made of a 100-lb. carbide can and was very successful for burning chips and trash. Before lowering the pipe, one end was connected with the chimney of the stove for about three minutes, which sufficed to melt adhering ice and snow which otherwise would have interfered with flange connections. The total excavation necessary was 361 cu. yd., which cost \$868, or \$2.40 a yard. In the summer time the work could have been done by contract at 96c. a yd. The material excavated was a cemented glacial wash with very few boulders larger than one-man size.

Approximately 1,100 ft. of trestle from 1 ft. to 16 ft. high was constructed, using 18,320 ft., b. m., of round timbers, cut and hewed, when required, on the ground. All posts were round timbers, with sills and caps hewed on two sides. The bents were set in 10-ft. centers and, on account of almost continuous snowfall, the pipe was laid as soon as two or three had been constructed. No timbers had to be carried over 80 ft. The cost of trestle construction was \$568, or \$3.64 per 1,000 ft. of timber, this including cutting and hewing of timbers and construction of bents. The cost of laying the entire line was \$298, or about 14c. per foot. Wages were \$5 a day and board, for all men except the foreman, who received \$6.

Details and Cost of a Mine Model

Materials Needed—Drafting and Construction—Line-Tracing and the Preparation and Application of Colors—Wiring and Lighting Arrangement

BY VOLNEY AVERILL,
Mining Engineer, Tonopah, Nev.

THE glass mine model recently constructed for the Tonopah Extension Mining Co. has received much favorable comment for its practical value, neat appearance, and low cost. The model is of the plan type, showing the geologic plans of twenty levels on sheets of glass placed one above the other at the proper vertical distances according to the scale of the drawing. It is viewed from the top through a glass cover. No attempt was made to show vertical sections by means of strips between the levels, because this makes the removal of glass for additions difficult, and detracts from, rather than adds to, the clearness of the completed model. The whole is in a practically dustproof case, so arranged that any sheet of glass can be removed in an instant for making additions. The illumination comes from below. The total cost of materials and labor was approximately \$400. A detailed description of the construction follows:

Frame and Case

The size of the glass used is 30 x 36 in. and the scale is 80 ft. to 1 in. The total height of the frame is 48 in. This allows a 3-in. base, 8 in. for lights, 2 in. for the top caps of the frame, and leaves room for showing a vertical depth of workings of 2,800 ft. on the scale used. The width is $36\frac{1}{8}$ in. inside the posts, leaving a play of 1-16 in. on each side of the glass. The length is 6 ft. 3 in. The reason for the great length is that after the ninth level is reached, each sheet of glass is moved forward $1\frac{1}{4}$ in., so as to follow approximately the dip of the veins. If desirable, two sheets of glass can be used to show one level.

The frame is constructed somewhat on the plan of a mine square-set, with four sets of posts, sills, and caps, all of 2 x 4 in. material. The frame of the base is of 2 x 4 in. pieces laid flat and covered with a floor of 1-in. boards. The frame is put together entirely with screws, and is arranged so that, by removing the four cross caps on top and a few of the main screws in the base, the remainder of the frame will

come apart in three large sections: first the base, consisting of the floor and the four cross-sills; second and third, the two sides, each consisting of four posts, a long sill and a long cap. This feature is for disassembling for transportation. The frame was completed as far as described and then painted with two priming coats and two coats of white paint.

The runners for the glass are of $\frac{1}{4}$ in., square, cold-rolled steel 2 in. shorter than the frame, to allow for the insertion of panels in the ends of the frame. They are drilled with $\frac{1}{8}$ -in. holes in such a way that the holes in alternate bars come opposite each other, those of the other set being about $\frac{1}{2}$ in. to one side—this is to allow for countersinking the nuts on the opposite side of the posts where levels are close together. The posts were first carefully marked at the proper intervals with the help of a long steel straight-edge, then the bars were each in turn clamped to the posts at the marks; holes were drilled through the posts through the holes already in the bars and countersunk on the opposite side of the posts, and the bars bolted in place. The small bolts for this purpose were made in the machine shop, the nuts were purchased, and washers from copper rivets were used. The carpenter would have preferred to use wood screws to hold the bars in place, but I do not think that this would give as rigid construction, or that they could have been put in place with as much accuracy. The holes in the posts containing the nuts and washers were covered with beveled strips. I have seen models in which the glass is supported in notches sawed in the posts, but this is very unsatisfactory, because the wood between notches splits out; also, the glass is more likely to be broken in handling.

After the twenty pairs of bars were in place, together with an extra pair for a glass over the lights, 8 in. above the floor, the sides and ends of the case were closed with wooden panels of 1-in. material, which had previously been painted like the frame. The side panels were placed tightly against the runner bars and serve to guide the glass. They are held in place by means of small moulding and round-head screws. The end panels are provided with brass knobs and small iron turn-buttons to make them readily removable. The latter were not put in place until the final coat of paint had been applied to the outside of the completed case. The top openings were provided with mouldings placed so that a pane of glass cut to fit would lie just flush with the top of the side and cross caps. The carpenter wanted to tongue and groove the side panels all round and glue them into the frame. This would have been a great mistake, because even the best seasoned lumber is subject to great shrinkage in this climate, and, if the edges of the panels had been held fast, they would, in the course of a few months, have split from top to bottom. The shrinkage is taken up at the edges in the present arrangement and is covered by the moulding.

The plans on the glass show the geology in detail, the veins, faults, and rock formations being in colors. The veins are shown in red, the faults in blue, and

the rock formations in various colors, purple, yellow, green, brown, and orange. On the lower sheets of glass the yellow and brown look a great deal alike, because of the superimposed color of the many thicknesses of glass. Small black crosses are placed on the yellow on all levels to overcome this difficulty. Conventional signs such as crosses, dots, circles, and like markings, could probably be used with as good results as colors to represent the different rocks. In either case the band of color or signs should be made as narrow as possible, so that the details on the lower levels will not be obscured.

The glass used is "double-strength" or "picture" glass, and is about $\frac{1}{8}$ in. thick. Plate glass is thicker and stronger, but it would absorb too much light and would not allow of the close spacing of levels. Ordinary window glass is so thin that, in large sheets such as are used, it is likely to break in the handling necessary to make additions to the model. The glass used is slightly curved, due to the fact that it is blown as a cylinder and allowed to flatten while hot. The convex side should be turned up so that the weight of the glass will tend to correct the curvature and make the sheet more nearly flat.

Before starting work on the glass it is washed perfectly clean and free from grease, allowing a coat of the cleansing preparation to dry and then rubbing it off. It is very important to have the glass free from all traces of grease. Then the glass is placed in the proper position over a map of the level and the lines and geology are traced through. The property lines are first traced through for each level with a heavy line, made by setting the pen for a finer line, drawing several fine lines close together, and then joining them. Each glass is allowed to dry again after the property lines have been placed on it. The posts are represented by small circles drawn with an ordinary swivel pen. This is difficult to manipulate on the glass at first, but care in holding it vertically overcomes the difficulty. Next the levels are outlined on each glass with an ordinary pen, and it is allowed to dry again. The faults are represented by blue pen lines, and the colors for the rocks put on with a brush, a period for drying being allowed after each color is applied.

The colors are all made up from oil tube paints mixed with Japan dryer. With this type of color, when dry, the maps may be washed if necessary. This is a distinct advantage over inks if the model ever becomes dusty or dirty. Another thing to consider in the use of inks is the fact that the hand is likely to rub off one part of the map while working on another, even after the ink is dry. Gold size may be used for mixing the colors, but it darkens the colors and does not dry as quickly as the Japan drier. The colors are mixed very thin, so that the shade is soft and they are nearly or quite transparent when applied to the glass. Some colors give better satisfaction in this respect than others, for example, the color magenta may be mixed so thin that it is transparent, and it will still give an excellent shade. The time for drying varies from about twelve hours for the black to half an hour for the

blue. The difference is probably due to the difference in the proportions of the tube color and the Japan drier used to give the desired results. A large proportion of the black must be used to give a satisfactory color, whereas a very small proportion of Prussian blue is necessary. No oil or turpentine is used. Turpentine may be used, but the drier gives better results when used alone. However, turpentine is very useful for cleaning off the pen, when difficulty is found in making the mixtures run off freely.

Lights and Costs

The wiring for the lights is carried under the floor to sockets of the sign-board type setting almost flush with the floor. Eight lights are used in the present model, some 100-watt nitrogen, and some 60-watt tungsten. The number of each may be varied to give the proper intensity of illumination. Eight inches above the floor is a sheet of glass covering the entire area of the floor. This glass is coated with a mixture of flake white and gold size. The light through the coated glass is soft and pleasing. Ground glass might give a still better effect, but the coated glass is cheaper and is satisfactory. Costs were approximately as follows: Designing and work on glass, \$200; carpenter and painter, \$60; steel bars, \$8; machine shop, \$13; electrician, \$6; lumber, \$8; glass, \$50.

I have no figures on paints and lights, but these would bring the total to a little over \$400. This has been considered low for the satisfactory results obtained.

Debris Dams on North Yuba River, California

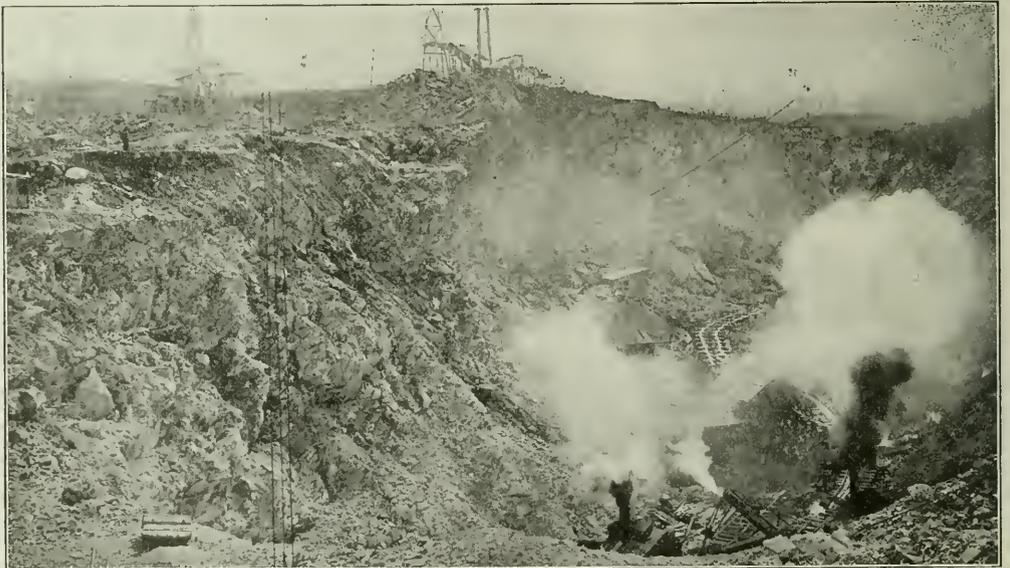

A concrete dam on the North Yuba River at Bullard's Bar, northwest of Nevada City, Cal., was completed early in October, having been constructed for the purpose of impounding debris from hydraulic mining operations. The dam, which is of the "constant-angle arch" type, was designed by L. R. Jorgensen, of San Francisco, and is 160 ft. long and 33 ft. high. It is a permanent structure, capable of permitting a 20-ft. flood stream to pass over its crest, and will prevent the debris bed which settles above it from being washed farther down the river. The storage capacity is computed to be 1,000,000 cu. yd. The cost of the structure was \$30,000, or an expense of 3c. per cu. yd. of gravel.

As a result of the construction of the dam already mentioned, a second dam, 5,900 ft. below the other and above the Colgate power house of the Pacific Gas & Electric Co., will be started soon. This second dam, which will be 170 ft. high and will have a storage capacity of 50,000,000 cu. yd. of gravel, will allow additional hydraulic mines on the North Yuba watershed to operate within the provisions imposed by the California Debris Commission. The construction cost is estimated to be about \$600,000. The power rights of this dam have been acquired by the Pacific Gas & Electric Co. At a later date it is possible that a third dam farther up the river, with the same storage capacity as the second, will be constructed.

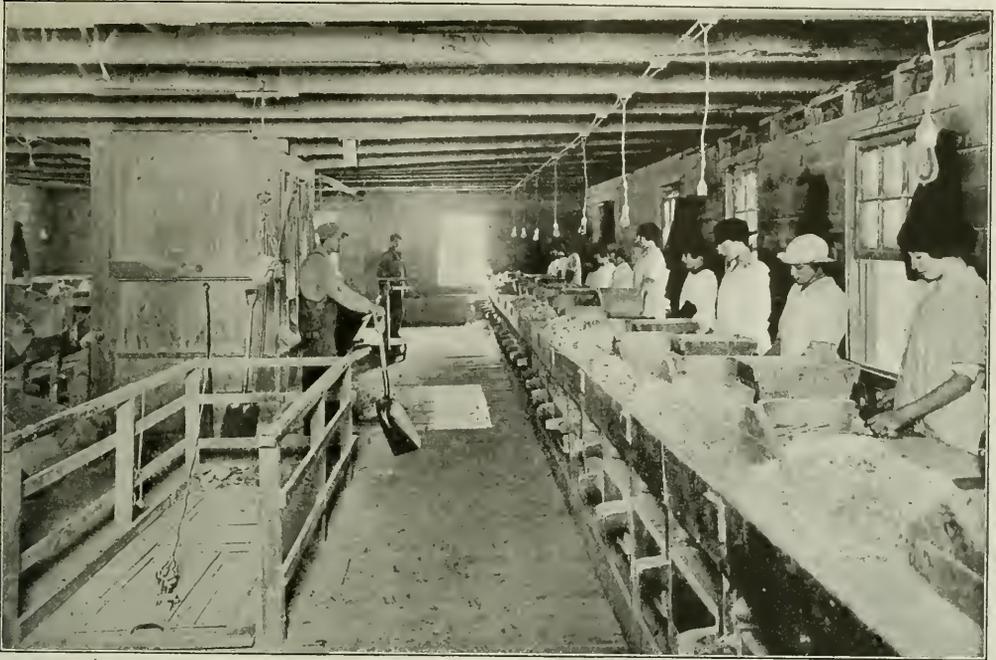

Asbestos Mining at Thetford Mines, Quebec

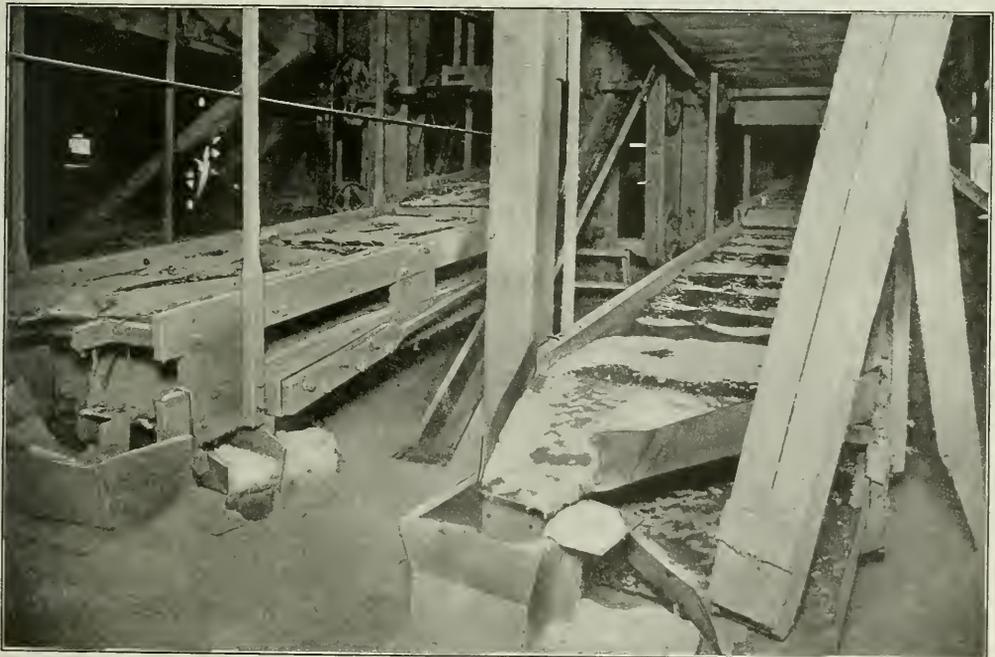

VIEW OF THE MINING PIT OR GLORY HOLE. THIS PIT IS ABOUT 300 FT. DEEP. SOME IDEA OF THE DEPTH CAN BE JUDGED BY THE SIZE OF THE MAN AT THE BOTTOM.

Franz Fohr

(A BIOGRAPHICAL SKETCH BY W. R. INGALLS)

ON JULY 27, 1919, there passed away a simple, unassuming gentleman, who through his life allowed his intense modesty to keep him in the background and during his later years effaced himself so thoroughly that few of his old acquaintances knew aught of him. Yet he was one of our accomplished metallurgists, who did good work in the practice of his profession, and lived an upright life, and it will be a pleasure to his old friends to have a record of him in the annals of the mining and metallurgical industry. Now that he is no longer with us, Franz Fohr cannot plead to be overlooked, and those who fondly remember him will be gratified by his receiving his due.

FRANZ FOHR

Franz Fohr was born on Sept. 7, 1838, in Mannheim, Germany. Of his ancestry, education, and early career we know scarcely anything. We do not even know just when he came to America, or what led him hither. The first record of his professional work in this country, found among his papers, shows that from July, 1870, to Jan. 1, 1872, he was superintendent of the Newark Smelting and Refining Works, then owned by Edward Balbach & Son. At that time the Balbach works at Newark, established in 1850, and the Selby works at San Francisco, established about 1866, were the only important silver-lead refineries in the United States. Mr. Fohr may have been associated with the Balbachs for some time before he became superintendent of their plant, or he may have come from Germany only a short time previously. At all events,

it is certain that he was at that time an experienced and accomplished metallurgist, for after leaving Newark and going to San Francisco he soon formed some kind of a connection with Thomas H. Selby & Co. Early in 1874 the Selby firm sent him to New York to procure information respecting the manufacture of white lead. His engagement in New York terminated on Jan. 31, 1875.

During 1875 Mr. Fohr spent some time at Silver Islet and in the Lake Superior copper region, but of his work there no record remains. In the latter part of 1875 or early in 1876 he associated himself as metallurgist with the Boston Silver Co., operating at Saint John's, Summit County, in which William L. Candler, of Boston, was the moving spirit. That company was developing its mine in 1875. At the end of that year it "had about 800 tons of ore on hand, about three-fourths of which is dressing ore, to be concentrated in its very systematic establishment and to be smelted into pig-lead." Evidently Mr. Fohr was engaged for the latter purpose. Henry A. Vezin, erudite and painstaking, was the mechanical engineer for the company. In the fall of 1876 Anton Eilers took his family for the first time so far west as Denver, and Mr. Fohr went with them. I do not think that Mr. Eilers had any connection with the Boston Silver Co., save possibly in a consulting capacity, but he visited Saint John's, and the enduring friendship among Eilers, Fohr, and Vezin, which terminated only with their deaths, dated from that time.

I ought to know more about the association at Saint John's for only a few years later I was under the tutelage of the distinguished and lamented Vezin, who never tired of relating the history of that famous if not very successful enterprise, and also I knew Mr. Fohr from 1886 onward, but memory is an evanescent thing. My recollection is that a lot of excellent engineering and metallurgical work was done there without there being any great foundation for it. At all events, Mr. Fohr remained with this company nearly three years and then went to take charge of the smelting operations of the Horn Silver Mining Co. at Frisco, Utah, which he conducted from Aug. 1, 1878, to Aug. 1, 1879. This was the time of the height of the boom at Leadville, and it was but natural that Mr. Fohr moved promptly to the greatest silver-lead mining and smelting district. He became part owner in the Malta Smelting Co., below California Gulch, and had charge of its plant. In 1881 he became superintendent of the Harrison Reduction Works of the St. Louis Smelting and Refining Co., and retained that position until his retirement from active work. I do not remember just when his retirement took place, but my recollection is that it was during the '90s. He then moved to New York and kept a little office here, in company with Faber du Faur, one of his early friends. Mr. Fohr went religiously to his office every day, spending a few hours there, reading and absorbing the

general information for which all his life he was so greedy.

On his seventy-fifth birthday, which he celebrated with the Eilers family at Sea Cliff, Mr. Fohr told them that in early life he had made up his mind to divide his years of life, twenty-five years to study, twenty-five to accumulating money, and twenty-five to enjoyment. He then remarked that, having passed seventy-five, he was free to do anything he liked. I do not think that he conformed exactly to that schedule, but he was methodical enough in his habits to develop such a plan and follow it generally.

Mr. Fohr was a tireless student, both in his professional work and outside of it. Indeed, with his calm philosophy he was able to dismiss the affairs of the works when he left them for the day. He had them so well organized that he felt no concern about them ever. I sat at the same table at mess with him for two years, perhaps, and do not recall his ever talking "shop." He preferred to talk about politics—in the broad sense—art, music, literature, and history.

His knowledge was profound, his memory wonderfully accurate, and woe to any one who challenged his statement of facts. So careful was he in discriminating between wheat and chaff, that we used to say laughingly that he would not accept anything as being truly news of the day until he had the authority of the London "Times," the weekly edition of which he read religiously.

In the latter portion of his life it had been his custom for many years to go to Sea Cliff every Sunday, spending the day alternately at the houses of Anton and Karl. It was at the latter's that he died, July 27. He had reached a ripe old age, and had outlived nearly all of his early associates of his own generation. Of that famous galaxy of metallurgists that created the art of silver-lead smelting in this country between 1870 and 1885 he was practically the last. The seniors of the present time do not hark back to the pioneering stage, but belong to the early part of the engineering stage which followed.

Mr. Fohr's modesty and his disinclination to form a wide circle of friends prevented him from attaining the fame that might easily have been his if he had cared for it. Rather, he chose to have only a few friends, but to them he was one of the closest and most loyal they ever had, and to their children he soon became and always remained "Uncle Fohr."

Oil-Well Activity in California.—Reports filed with the State Oil and Gas Supervisor of the California State Mining Bureau during the week ended Sept. 13, 1919, show seventeen new wells, making a total of 454 reported since the first of the year. Eighteen wells were reported ready for test of water shut-off and seventeen deepening or redrilling. Six abandonments were reported. For the week ended Sept. 20, 1919, there were twelve new wells, making a total of 466 reported since the first of the year. Twenty-five wells were reported ready for test of water shut-off, and thirteen deepening or redrilling. Five abandonments were reported.

Chino Copper Company

The thirty-second quarterly report of the Chino Copper Co., covering the third quarter of 1919, states that the gross production of copper contained in the concentrate from milling operations for the quarter was 10,427,395 lb., or an average monthly production of 3,475,798 lb. The total amount of ore treated for the three months was 425,350 tons, equivalent to an average of 4,623 tons per day. This daily average is 216 tons more than that milled for the second quarter of 1919. The average assay in copper of the ore treated for the third quarter was 1.9024 per cent, compared with 1.8327 per cent for the second quarter of 1919. The ore milled during the third quarter was less favorable to concentration than the ore treated during the second quarter, on account of its high carbonate and silicate content. The recovery per ton of ore milled for the third quarter was 24.515 lb. of copper, as compared with 26.28 lb. of copper for the second quarter of 1919. There were produced 28,094 dry tons of concentrate, averaging 18.553 per cent copper, compared with 26,830 dry tons of concentrate, averaging 19.645 per cent copper, for the second quarter.

The cost per lb. of net copper produced from milling operations for the third quarter, after allowing for smelter deductions and including depreciation, was 15.70c., compared with 14.16c. for the second quarter of 1919. The increase is due largely to wage advances which became effective near the beginning of the quarter. The cost figures shown do not include any charge for Federal income or excess-profits taxes, nor do these costs take into consideration miscellaneous income. Gold and silver to the amount of \$3,701.55 was paid for during the third quarter.

The financial results of the company's operations for the third quarter are as follows:

Net income from copper production (only).....	\$677,961.93
Miscellaneous income, including payments for precious metals....	24,422.66
Total	\$702,384.59
Distribution to stockholders.....	652,455.00
Surplus after distribution to stockholders.....	\$ 49,899.59

The above figures are based on a carrying price for copper of 22.478c. per lb. for the third quarter, calculated in the usual manner by inventorying unsold copper at 13½c. per lb. The figures for the second quarter of 1919 were based on a price for copper of 14.599c. per lb.

During the third quarter there was removed by steam shovels at the Santa Rita mine a total of 1,166,389 cu. yd. of material, equivalent to an average of 388,796 cu. yd. per month, compared with a total of 1,084,668 cu. yd. of material during the second quarter of 1919, or an average of 361,556 cu. yd. per month. Of the total material removed during the third quarter, 893,353 cu. yd. were stripping, the remainder being equivalent to 541,889 tons of ore of an average grade of 1.746 per cent copper, according to mine sampling and assaying. The difference between the tonnage mined and the tonnage milled during the third quarter is due to oxidized and partially oxidized ore which was sent to the mine stockpiles.

Small Compressors Driven by Oil Engines Becoming Popular in the West

BY GEORGE J. YOUNG

A single-stage air compressor driven by an oil engine of the semi-Diesel, valveless, two-cycle type, in tandem with the air cylinder, has become popular in several mines in Nevada, even where electric power is available. Four machines of this type are in use in the Tonopah district, three of them at the Midway mine and one at the Gypsy Queen. The initial installation at the former superseded a steam-driven compressor, and the oil-driven unit was so satisfactory that two more were installed at another shaft.

One of these compressors, supplying air for four jackhammers, consumes 35 to 40 gal. of oil per eight-hour shift, which, at 8 to 9c. per gal., amounts to from \$2.80 to \$3.60. The repairs on a machine which has been in use for four or five years have been moderate, the principal ones being reboring of the combustion cylinder and replacing the Diesel piston. Adjustment of the cooling water and lubricating oil for both cylinders is the principal operating detail which requires attention. After heating the ignition apparatus with a blow torch, the machine is easily started with compressed air from a small auxiliary gasoline-driven compressor.

An idea of the construction and cost of the machines may be obtained from the accompanying table, made up from data given in a manufacturer's catalog.

Piston Displacement, Cu. Ft.	SEMI-DIESEL			TANDEM-TYPE AIR			COMPRESSORS		
	Devel-oped HP.	Piston Displacement, Lb.	Approx. Cu. Ft. Displ.	Sq. Ft. Floor Space	Fuel Oil Hr., Gal.	Lubricat. Oil For Cyl. Per Hr.	Water Supply		
133	19.5	41	\$15	0.30	2.8	1	1.2		
192	27	46	14	0.25	3.3	3/4-1	to		
309	47	43	13	0.25	4.5	3/4-1	1.5		
370	57	50	15	0.27	5.2	1-1/4	gal.		
507	77	66	18	0.25	7.0	1 1/4-1 1/2	per hp.		(a)

(a) For both compressor and Diesel cylinders.

One engineer states that, from his experience, the repair cost is excessive and that a good mechanic must be available. Others report that the repairs are not prohibitive and that if proper attention is given, and adjustments are intelligently made, the unit will operate satisfactorily. Operators are, however, somewhat difficult to secure, and a man who understands the gasoline engine is not always satisfactory. A substantial foundation is almost a necessity to prevent excessive vibration.

Machines of this type are suitable for the initial development of prospects, but in larger operations their economical use is open to question. No other power would be required on a small property if a hoist operated by compressed air were installed. When a compressor supplies air for both hoisting and drilling, an extra large receiver is, of course, desirable.

Ray Consolidated Copper Co.

The thirty-third quarterly report of the Ray Consolidated Copper Co., covering third quarter of 1919, states that the gross production of copper contained in concentrates for this quarter is 11,534,747 lb., or

an average monthly production of 3,844,916 lb. In addition to the copper derived from concentrating ores, a total of 136,222 lb. of copper was contained in ores sent direct to the smeltery. This, combined with the copper contained in concentrates, brings the total gross production from both sources for the quarter up to 11,670,969 lb., as compared with 11,667,701 lb. for the previous quarter. During the quarter there was milled 392,800 dry tons, averaging 1.828 per cent copper. This tonnage corresponds to a daily average of 4,270 tons, as compared with 4,302 tons for the previous quarter.

The mill extraction for the quarter was 80.33 per cent of the total copper contained in the concentrating ores, as compared with 79.06 per cent for the previous quarter. The underground development for the quarter was 2,606 ft., making the total development to date 694,671 ft. The milling cost for the quarter was \$1.33 per ton, as compared with \$1.23 for the previous quarter, both exclusive of income and excess-profits taxes. The average mining cost of ore milled for the quarter was \$1.83 per ton, of which 6.46c. was the cost of coarse crushing, leaving the net mining cost \$1.76 per ton, as compared with \$1.58 for the previous quarter, both exclusive of income and excess-profits taxes. The average cost per lb. of all net copper produced for the quarter was 15.53c. This figure does not take into account credits for the value of gold and silver, or for miscellaneous income, and compares with a cost of 14.64c. for the previous quarter.

The costs detailed include a charge of 15c. per ton of ore treated for the retirement of mine-development expense, but are exclusive of estimate of Federal income and excess-profits taxes. The higher cost per lb. of copper produced is due to a wage increase of 75c. per shift for all classes of employees, which was put into effect July 16, 1919. Miscellaneous income for the quarter, including net receipts from gold and silver produced, amounted to 1.999c. per lb. The financial results of operation for the quarter are as follows:

Net operating profit.....	\$706,070.59
Miscellaneous income.....	226,076.44
Total	\$932,147.03
Disbursements to stockholders.....	788,559.50
Net surplus for quarter	\$143,587.53

The average carrying price for the quarter was 21.77c., as compared with 14.80c. for the previous quarter. The output for the quarter was approximately 50 per cent of normal, and is practically identical with the production of the second quarter. The upkeep of mine and mill has been properly attended to, and both plants stand ready to operate at full production on short notice.

Carmen Nol Gusher was brought in by the Standard Oil Co. in the Elks Hills district, section 36, about ten miles northeast of Taft, Cal., on Oct. 7. The oil goes 30 to 40 ft. above the derrick, flowing from ten thousand to fifteen thousand barrels daily. The company has been drilling for six months, using a 6-in. drill casing and 10-in. mouth casing. The crown was not disturbed by the blow-off. The gusher lies one mile east of the gasser brought in last June. The oil is of high gravity.

Southern Pacific Loses California Oil Lands

U. S. Supreme Court Reverses Finding of the Circuit Court and Orders 6,000 Acres Returned to the Government

THE U. S. Supreme Court in Washington handed down a decision on Nov. 17 cancelling the patents for 6,000 acres of California oil lands, valued at \$10,000, which were alleged to have been obtained through fraud by the Southern Pacific Co. The decision reverses the decree of the Federal Court, which dismissed proceedings instituted by the Government to have the land, which is situated within naval oil reserve No. 1, returned to the Government. The contention of the Government was that the company, at the time the patents were issued, in 1904, under a railroad land grant which reserved mineral lands, was aware of the fact that the lands were valuable for oil, although alleged false affidavits to the contrary were filed. The Federal District Court, in ruling on the suit, held that though there had been no actual discovery of oil on the lands, the surrounding conditions indicated that it was valuable for oil, which in turn was reversed by the Circuit Court of Appeals, which body is now finally reversed by the Supreme Court.

In rendering the opinion, Justice Van Devanter said the officials of the railroad company were not acting in good faith, and were "attempting to obtain the patent by representing that the lands were not mineral when they believed the fact was otherwise." Continuing, the Justice said: "After considering all the evidence, we think it is adequately shown that the lands were known to be valuable for oil when the patent was sought and obtained, and by this we mean that the known conditions at that time were such as reasonably to engender the belief that the lands contained oil of such quality and in such quantity as would render its extraction profitable and justify expenditures to that end."

The company introduced evidence to the effect that a general land office agent examined the lands and reported them as non-mineral. The court said that this report was made in another connection, and was not considered by the Government in approving the company's selection. The decision states: "It did not relieve the company from showing that the lands selected were not mineral, nor did the company understand that it had any such effect. Besides, if the report could be considered here it would be without any real evidential value, for it appears from testimony given by the agent at the hearing that he was not a geologist or familiar with oil mining, and

that his examination of the lands was at best only superficial."

The area involved amounts to about 6,000 acres, situated in the Elk Hills region of Kern County, near the town of McKittrick. The lands are declared to be part of a grant made by the Government to predecessors in interest of the Southern Pacific Co. in 1866, in return for the promised development of the region. The patents to the lands were not perfected until Dec. 12, 1904. The suit for the return of the lands to the Government was started in 1910, when it was determined that the lands were partly mineral, on the basis that the original grant covered non-mineral lands only. Government geologists came to the conclusion that the lands were in the Taft Presidential withdrawal order of 1912, and they were thereby added to the naval reserve. It is maintained by experts for the company that the lands have little present or potential mineral value, and the oil content has only been proved within the last year. The Government experts oppose this opinion and hold that the lands have a high potential value.

Oil Fields of England, Limited

First British Company Licensed by the Government to Bore for Oil in England. To Develop 5,000 Acres in Nottingham

THE first or statutory general meeting of the members of Oil Fields of England, Ltd., held on Oct. 30 and reported in the "Financial Times," London, contained an interesting review of the present status of the development work being done in England. The chairman, William Ivey, said that this company was the first British company formed in Great Britain to bore for oil in Great Britain itself. There have been plenty of oil companies, and millions of dollars have been raised in Great Britain for the development of oil fields, but up to the present all of that money had been subscribed for development work abroad. In this instance, the money had been subscribed with the definite object of proving whether oil existed in commercial quantities on the Kelham estate in Nottinghamshire. This company holds the first British license granted by the British government for that purpose. Lord Cowdray and his staff, who have already been drilling for oil in several counties, do not represent a British company, but have been acting as an advisory staff to assist the government in proving whether oil existed in commercial quantities.

In regard to the prospects of the company, the chairman stated that the company's future was speculative, but only in regard to the amount of oil

that would be found. The existence of oil has been proved on the Kelham estate. In regard to obtaining oil in commercial quantities, nothing more is known at the present than was not apparent three months ago. The capital of the company amounts to \$250,000, and the area about 5,000 acres. The chairman also stated that it is intended to proceed without delay in drilling down to the oil strata. Therefore, some of the material necessary had been ordered in America, owing to the fact that delivery of the entire equipment could not be obtained in Great Britain.

Anglo-American Oil Company to Build Refinery in England

According to advices received from London and printed in the "Boston News Bureau," the Anglo-American Oil Co. is to build a refinery in England. If this step is to be taken, it is because present British laws exempt from certain taxation gasoline made in England. The construction of a refinery at Swansea by the Anglo-Persian Oil Co., 65 per cent of which is said to be owned by the British government, the capacity of which, when completed, is estimated will be 30,000 bbl. of crude oil a day, has resulted in forcing other oil companies to refine oil in England.

The Anglo-Persian development was followed by E. L. Doheny, who organized the British-Mexican Oil Co., in conjunction with the prominent British industrial and shipping interests. The British-Mexican Co. is to build a refinery on the Manchester Ship Canal in conjunction with its activity in distributing oil products throughout Great Britain and Continental Europe. It has been reported that a considerable amount of stock of the Anglo-American company has been purchased for English account. English industries realize that control of oil means control of shipping, and, therefore, appreciate the great extent to which oil companies will be in a position to share in the marine fuel-oil business.

Petroleum Possibilities in British India

According to an article in "Indian Engineering," and reprinted in the "Board of Trade Journal," London, Oct. 16, 1919, a theory is being discussed in British India that oil beds exist continuously along a belt stretching from Burma in the east to Rumania in the west. Should the fact be eventually established, a discovery of the highest importance will have been made, for the belt will lie wholly on the Indian side of the Himalayas.

At present, however, only uncertain indications have been found, the latest of which have been discovered by Mr. Middlemiss, who is now superintendent of the Mineral Surveys of Kashmir. He has not so far actually found oil in Jammu Province, but has located geological conditions pointing to the existence of a natural reservoir of a type giving good promise of a store of oil, being in all respects similar to oil-yielding structures in the neighboring Rawal Pindi Plateau. In the latter region oil had long been known to be present, but efforts to obtain it in quantity were unsuccessful till the Khaur oil field near Pindigheb was at last located.

Discussing the general question of the occurrence of oil beds along the sub-Himalayas, Mr. Middlemiss says: "The whole of the belt of stratified rocks in Jammu embraces a section of the sub-Himalayan rocks of Tertiary age from Eocene upward, which are identical in composition, age, and lithological characters with those of the petroliferous series in the neighboring Rawal Pindi district. They are also identical in age with, but differ in some particulars lithologically from, the petroliferous series in Assam and in Burma, and also in the newly-discovered fields in Persia. In fact, they form with these known petroleum-bearing areas what is really one continuous but intricately winding belt of deposits belonging to one comprehensive geological epoch, that stretches from Persia on the one hand to the extreme south of Burma on the other. It is also equally true that in general characteristics and in age these rocks exposed in Jammu agree with those of a great proportion of the more distant successful oil fields of the world, notably with those of California, Peru, Russia, Rumania, Galacia, and Sumatra."

Notes From the Texas and Louisiana Oil Fields

Taxes paid by oil companies for last quarter will be over \$500,000 on gross receipts. Some of the largest taxpayers are: Texas Co., \$81,866 on sales of \$5,457,747; Gulf Production Co., of Houston, \$74,876 on sales of \$4,991,755; Magnolia Co., of Dallas, \$60,542 on \$4,036,170; Humble Oil & Refining Co., of Houston, \$45,569 on \$3,037,920; Texas Pacific Oil & Coal Co., of Ferber, \$33,106 on \$2,270,083; Prairie Oil & Gas Co., of Dallas, \$21,292 on \$1,419,518.

The oil and gas department of the Railroad Commission is endeavoring to standardize its records, in order to make few changes necessary, and make it easier for pipe-line companies to conform to the requirements. In carrying out this plan the following ruling has been drafted, to go into effect on Dec. 6: "All maps or sketches of any kind of any tract or tracts of land filed with the oil and gas department of the Railroad Commission must be drawn on a scale of 500 ft. to 1 in., unless the area involved is less than two acres, when the scale must be 50 ft. to 1 in."

The Prime Oil & Refining Co., of Dallas, was recently incorporated with a capital stock of \$500,000. The incorporators are: C. E. Lang, Wichita Falls; Mills Bennett, Houston; and Howard Paschal, Asbury Park, N. J. The Texas Oil Corporation, of Dallas, was incorporated with a capital stock of \$150,000. The incorporators are: J. J. Simmons, C. C. Quillan, W. S. Blair, and H. E. Halaby, all of Dallas.

The Yount Lee Oil Co., of Sourlake, Tex., has filed suit against Land Commissioner, J. T. Robinson, to test the constitutionality of the Texas Oil and Gas Permit Law and to attack the validity of a permit recently granted to W. M. Fleres and M. K. Fletcher, of Beaumont, on oil land in Liberty County. This

is the first of several suits. The land in controversy is valued at \$3,000,000.

The Homer field, in Claiborne Parish, La., is showing great activity. Among the largest wells are the Swan No. 3, of the Rowe Oil Corporation, which flowed unchecked at the rate of 15,000 bbl. daily from 2,100 ft., when first drilled in; and the Oaks Farm well, of the Standard Oil Co., which gaged 12,000 bbl. per day when first brought in.

An injunction, asked for by Isadore Leon against A. S. Moss, N. E. Burke, and J. E. Pitts, trustees for the unincorporated joint-stock association called the M. & P. Burk Oil Co., has been granted by Judge Ewing Boyd, of the 55th District Court, Houston, Tex. The plaintiff claims the agreement was entered into by the terms of which the defendants were to deliver to him 700 shares of stock of this company for \$478,333, but which they now refuse to do. The plaintiff further claims that the stock is now worth \$750,000, and is suing for the stock or the difference in value, about \$270,000. The stock is held in the City National Bank, of Wichita Falls, and the court has granted a temporary injunction restraining the defendants from transferring the stock to others, and the bank from making delivery to the defendants.

In Brazoria County, Tex., the West Columbia field production for the first week in November was about 20,000 bbl. daily. The larger producing companies were: Humble Oil & Refining Co., 7,500 bbl.; Texas Co., 6,000 bbl.; Crown Oil & Refining Co., 3,500 bbl.; Gulf Production Co., 3,000 bbl. New wells being tested are Texas Co.'s Hogg Nos. 18 and 28; Gulf Production Co.'s Hogg No. 1; Sun Co.'s No. 2 Robinson.

The Sinclair Consolidated Co.'s No. 9 Jackson well, on Damon Mound, was recently completed and is now producing 150 bbl. daily. The Humble Oil & Refining Co., at Stratton Ridge, is drilling at 2,500 ft. depth. Other work in this district is being done by the Texas Co., Freeport Sulphur Co., and Castell Oil Co. The Freeport company is sidetracking a well at 1,100 ft. In Coleman County, Tex., the Texas Best Oil & Refining Co. will build a refinery at Santa Anna, with a capacity to be 2,000 bbl. daily.

Harris and Jackson Counties

A new refinery on the Houston Ship Canal will be constructed immediately after Jan. 1 by the Maryland Refining Co., of Ponca, Okla. A tract of 1,830 acres on the channel, eight siles south of Houston, has been secured at a price stated to be \$525,000. The site has exceptional transportation advantages, both by rail and water, and is 30 ft. above tide water.

The case of Adolph Golman vs. Invincible Oil Co. and twenty-eight others was to be heard on Nov. 10, in the 18th District Court, before Judge J. D. Harvey. The suit is over 160 acres in the Landslide tract of the Humble oil field, from which oil previously taken out is said to be worth \$45,000,000. Golman claims the title on the ground that he received a land grant from the state. The defendants claim this grant was cancelled and that they bought the land from the late George H. Hermann.

Drilling in the vicinity of Edna, in Jackson County, is now under way. The Texas Co. is drilling in the La Ward section; the Vanderbilt Petroleum Co. is rigged up and ready to drill on Coop farm, twelve miles south of Edna, and the Coastline Oil Co. is now down over 500 ft. in a well on W. A. Calhoun tract, two miles south of Edna.

Developments in Other Fields

The Gulf Refining Co., in Jefferson County, announced through the local manager that oil shipments from here during October totaled 2,305,163 bbl. by water; of this 803,028 bbl. was foreign, and the rest coastwise. This breaks all previous records. In Nelms-Marvin well on the McCrea ranch is 1,100 ft. deep; the Waxa-Tex Co. is 600 ft. deep; the Groves well cased to 1,000 ft., is making a good showing of both oil and gas; St. Mary well, on Le Compte ranch, is now 900 ft. deep; the New York Syndicate has gas indications in two wells, and work at the Key well will be resumed.

In Liberty County the Texas Co. had a gas blow-out while drilling Palmer well No. 2 on Nov. 5. The gas coming in contact with the firebox of a boiler on the nearby Palmer No. 2 well of the Humble Co., was ignited, and a severe explosion resulted. One man was fatally burned, twenty other men barely escaped, and the derricks and rigs at both wells were damaged.

The Houston Oil Co. is testing No. 1 well at 1,980 ft. Other tests in the vicinity are temporarily suspended on account of high water.

In Mills County, Tex., new wells contracted for in the vicinity of Goldthwaithe are: Simms Oil Co., of Houston, two wells on school land northwest of Mullin, to be not less than 3,300 ft. if oil is not discovered sooner; L. H. Armstrong, of Huntsville, Ala., 4,000-ft. well on Armstrong survey west of Mullin, the work to begin by Dec. 15; the Mill Oil Co. well on the Cryer tract. In Wichita County, Tex., Waggoner City was destroyed by fire on the morning of Nov. 9. This place was also known as "New Town," and is in the heart of the northwest extension of the Burkburnett field. The fire originated by nighting striking a battery of steel storage tanks, and a river of fire flowed through the town, igniting everything with which it came in contact. It is stated that fifty steel tanks and 200 derricks were destroyed, and it is estimated that 1,000 people are homeless. The total damage will amount well over \$1,000,000. One life is known to have been lost.

The Western Oil Corporation, of Wichita Falls, has given the oil and gas division of the Railroad Commission notice of its acceptance of the act of 1919 regulating pipe lines, and agrees to become a common carrier. The company operates a pipe line between the northwest extension of the Burkburnett field and Burkburnett station.

During October, 157 wells were completed in the Burkburnett field. This is a considerable reduction in number compared to September and August. The wells are now making a smaller average production than those first drilled.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Tariff Legislation

A subcommittee of the Senate Committee on Finance, composed of Senators Watson, of Indiana; Thomas, of Colorado; and McCumber, of North Dakota, has listened to testimony regarding the need for tariff legislation on tungsten from Representative Timberlake, of Colorado; Roy C. McKena, of Latrobe, Pa.; and Frank N. Franklin, of Denver. The hearing was held largely to accommodate the witnesses, who wished to submit testimony before returning to their homes. It continues to be the view of the majority of the Senate Finance Committee that tariff legislation should be general and not piecemeal. That view has prevented the advancement of the various tariff measures which were passed earlier in the extra session by the House.

Atmospheric Nitrogen

The formation of the United States Fixed-Nitrogen Corporation, to produce and develop the products of atmospheric nitrogen, is proposed in a bill, drafted in the War Department, and introduced in their respective houses by the chairmen of the committees on Military Affairs. The organization of the corporation is to be undertaken, the bill provides, by a committee of five persons appointed by the Secretary of War. Once formed, the corporation is to be conducted under the supervision and control of the board of directors, which is to consist of not less than three nor more than eleven members, and is to work along lines usually followed by directors of private corporations. The members are to be appointed by the Secretary of War and are to hold office at his pleasure.

The corporation is to take over nitrate-fixation plants No. 1 and 2, situated, respectively, at Sheffield and Muscle Shoals, Ala., and in addition, the fixed-nitrogen research laboratory at Washington, the Waco limestone quarry, the electric-power unit at the Warrior River Station of the Alabama Power Co., and any other plants or equipment owned by the Government which will be helpful to the general project.

The corporation is charged with the completion and operation of the hydro-electric power plant now being constructed at Muscle Shoals. It is also to acquire United States or foreign patents and processes. It is to be allowed to export its products only when there is a surplus in addition to that purchased by the Government or by private interests within the United States.

There is to be common and preferred stock. The common stock is to be without par value, and is to be delivered by the corporation to the Government. The corporation also is empowered to issue preferred

stock when necessary and sell it in any amount not to exceed \$12,500,000. The bill has been referred to the committees on Agriculture.

Suspension of Assessment Work

With only two votes against it, Representative Garland's resolution providing for the suspension of assessment work on all mining claims for the year 1919 was passed by the House. It was then promptly considered and passed in the Senate. On becoming a law it will supersede the House resolution, which limited the suspension to those holding five claims or fewer. The language providing that those holding more than five claims must do assessment work is ambiguous and likely to lead to litigation. That fact, together with the prevailing high prices, the difficulty of procuring labor, and the lateness of the season, is the principal reason given for changing the existing statute. The bill as reported includes Alaska within its provision.

The Secretary of the Interior in his recommendation to the committee urged that the new resolution be given favorable consideration, as he believes that the five-claim proviso in the existing law is likely to be productive of controversy and confusion, in view of the fact that fractional interests in mining claims are held by many citizens. He thinks it will be almost impossible to interpret and apply the limitations.

Mine Inspectors Wanted by the Government

The U. S. Civil Service Commission announces an open competitive examination for mine inspector to fill a vacancy in the Indian Service, Seneca Agency, Okla., at \$2,000 a year, and vacancies in positions requiring similar qualifications, at entrance salaries ranging from \$2,000 to 3,500 a year. Competitors will not be required to report for examination at any place, but will be rated on the following subjects: Education and preliminary experience, 30; responsible experience and fitness, 70.

The duties of the position consist of the inspection of mines, mills, smelting works, oil, ore, and quarry operations, with respect to their safe and proper development. Applicants should at once apply for Form 1312, stating the title of the examination desired, to the Civil Service Commission, Washington, D. C. Applications must be filed prior to the hour of closing business on Dec. 30, 1919.

Physicists Needed by the Government

The U. S. Civil Service Commission announces an open competitive examination for associate physicist qualified in physical metallurgy, for men only, at salaries ranging from \$2,000 to 2,800 a year; and

assistant physicist qualified in physical metallurgy, for both men and women, at salaries ranging from \$1,400 to \$1,800 a year, to fill vacancies in the Bureau of Standards, Department of Commerce, for duty in Washington, D. C., or elsewhere, and in positions requiring similar qualifications in other branches of the service.

Competitors will not be required to report for examination at any place, but will be rated on the following subjects, which have the relative weights indicated: Education in general physics, chemistry, and mathematics, 40; special education and experience in physical metallurgy, 60. On account of the needs of the service, applications will be received until further notice. Applicants should at once apply for form 1312, stating title of examination desired, to the U. S. Civil Service Commission, Washington, D. C.

Select Committee on Expenditures in the War Department

Representative Graham, of Illinois, as the chairman of the Select Committee on Expenditures in the War Department, expects to sum up his conclusions of the extended hearings conducted by his committee in an address before the House in the near future. In asking the House to vote favorably on the resolution requesting the Secretary of War to make a review of certain settlements for war materials, Mr. Graham makes the following reference to the purchase of surplus copper by the United Metals Selling Co.: "Immense profits were made by the producers of copper by virtue of a combination of the low-price copper producers, which combination was aided and encouraged by the Government, although in violation of the law of the land."

Mr. Graham's committee recommends "that if it be found that sums of money are due the Government on account of such settlements being fraudulent, or not according to the tenor of the law, proceedings be instituted by the Secretary of War to recover the sums of money due the Government."

General Leasing Bill

Failure of the conferees on the mineral leasing bill to reach an agreement during the extra session of Congress is not indicative of any unusual delay of this measure in conference. The conferees met only for two short sessions. It was evident that the matter could not be disposed of during the short time before adjournment, and it was agreed not to take up the bill in detail until the beginning of the regular session.

The President, on Nov. 13, signed the bill suspending all assessment work on mining claims for the year 1919. The measure is now a law, and those holding five or more claims are released from the assessment work requirements as the holders of a smaller number of claims have been released by an earlier act. To obtain the benefit of this suspension, claimants must file a notice of their desire in the office where the location or certificate is recorded on or before Dec. 31, 1919.

Testing of Mine and Track Scales

Work by the Bureau of Standards in connection with mine and track scales has been continued in different sections of the country, and six men are now employed in this field. The mine scale trucks have operated in the states of Tennessee, West Virginia, and Kentucky, and track-scale testing equipments have covered the states of Kentucky, Michigan, Minnesota, North Dakota, Montana, and Washington.

A member of the Bureau's staff recently attended a meeting with representatives of the American Railroad Association and the scale department of the Pennsylvania R. R., in order to discuss the subject of track specifications. As a result of this conference, it has been proposed to add to the committee of the American Railroad Association a representative of the Bureau of Standards. It is hoped that when this committee is organized, it will form a means whereby progress in the securing of accurate weights on railroads will be expedited and all railroads will be induced to adopt types of scales and weighing rules which will result in first-class weights.

President Calls New Industrial Congress

According to an announcement on Nov. 20, the President has issued invitations to a new conference of former Federal and state officials, business men, and economists, to meet in Washington, on Dec. 1. Guided by the experience of the last conference, the President has thought it advisable that in the new body there should be no recognition of distinctive groups, but, instead, action in the interest of the people as a whole.

The personnel of the new conference, which does not include any of the men who served in the previous conference, is as follows: W. B. Wilson, Secretary of Labor; Thomas W. Gregory and George W. Wickersham, former United States Attorney-Generals; Herbert Hoover; Oscar Straus, former Secretary of Commerce; Henry M. Robinson, of Pasadena, Cal.; Frank W. Taussig, former chairman of the Tariff Commission; Samuel W. McCall, Martin H. Glynn, and Henry C. Stuart, former governors of Massachusetts, New York, and Virginia, respectively; W. O. Thompson, of Ohio State University; Richard Hooker, of Springfield, Mass.; George T. Slade, of St. Paul; Julius Rosenwald, of Chicago; Owen D. Young, of New York City; H. J. Waters, of Manhattan, Kan., and Stanley King, of Boston.

Prospecting for Potash

Despite the rather gloomy future of the domestic potash industry, a considerable number of prospecting permits are being issued, the total of such permits now exceeding 200. Most of the permits issued cover areas in southern California, Nevada, and Utah, but some are being issued in New Mexico, Colorado, and Arizona. As two years are allowed for prospecting, no one has yet applied for a patent.

All of the lake bed proper at Searles Lake, Cal., is covered by leases. Ten leases have been issued covering that area, only three of which are being

operated. Information reaching the General Land Office, which is in charge of potash leasing, is to the effect that active work is in progress on the plant being erected on the leucite deposit in Sweetwater County, Wyo. A number of operations are in progress on the Salt Lake desert. Applications have been made for patent on several claims in that region which were taken up prior to the potash-leasing law.

Several holders of leases have been granted an extension of one year in which to begin operations, but the Secretary of the Interior has announced that no extension beyond one year will be granted.

Exports of Mining Machinery

The exports of mining machinery from the United States during September, 1919, according to the Bureau of Foreign and Domestic Commerce, were as follows:

Countries	Oil Well	All Other
Belgium.....		\$ 7,564
France.....		152,766
Netherlands.....		1,766
Rumania.....	\$ 31,622	4,520
Sweden.....		6,100
England.....		142,621
Canada.....	7,045	54,463
Costa Rica.....		326
Guatemala.....	1,054	
Honduras.....		1,676
Nicaragua.....		8,501
Panama.....		1,514
Mexico.....	41,780	145,769
Barbados.....		771
Trinidad and Tobago.....		34
Cuba.....		3
Dominican Republic.....		515
Argentina.....	11,441	
Bolivia.....		1,925
Brazil.....	10,658	
Chile.....		45,319
Colombia.....		8,197
Ecuador.....	3,740	
Dutch Guiana.....		4,517
Peru.....	923	30,590
Uruguay.....		169
Venezuela.....		1,765

British West Africa.....	1,057	250
British South Africa.....		46,676
Portuguese Africa.....		198
Egypt.....	121	
Totals.....	\$151,300	\$723,008

High Prices for Silver

For the first time in nearly fifty years silver went under the 16 to 1 ratio to gold on Nov. 10, when bullion sold in the New York market at \$1,305 per oz., according to the Guaranty Trust Co., of New York. This was the highest price since 1872, when silver brought \$1,325 per oz. Though this price for bullion would yield a profit to those melting down silver dollars, the silver in which is worth \$1 when the price of bullion silver is at \$1.2929, it is doubtful whether such melting will take place to any great extent unless the present high prices for bullion are maintained for a considerable period.

The rise in the price of silver is attributed to the heavy demand for the metal by England, Canada, India, Hongkong, and China. Stocks, in China especially, were reduced by the embargo on exports which was maintained from the summer of 1918 until last May. Since the lifting of this embargo China has been taking more silver than all other countries

combined. In August, China took \$10,911,987 in silver, and since then her agents have been in the market for even larger quantities.

Foreign Trade in Metals and Ores

Imports and exports of the more important metals and ores, are reported by the Department of Commerce, for September, 1919, and the figures for September, 1918, as finally revised, as as follows:

	IMPORTS FOR SEPTEMBER (In pounds unless otherwise stated)	
	Sept. 1918	Sept. 1919
Antimony ore, contents.....	Nil	28
Antimony matte, regulus or metal.....	6,201,579	393,070
Copper:		
Ore, contents.....	4,253,028	3,712,966
Concentrates, contents.....	4,936,050	2,789,346
Matte, regulus, etc., contents.....	1,639,732	6,445,780
Imported from (in part):		
Canada.....	2,168,703	2,194,122
Mexico.....	4,892,799	9,399,950
Cuba.....	2,736,544	87,392
Chile.....	768,970	891,200
Peru.....	35,744	55,893
Unrefined black, blister, etc.....	37,570,650	22,686,470
Refined in ingots, plates, etc.....	1,472,454	869,157
Old, etc., for remanufacture.....	103,516	199,324
Composition metal, copper chief value.....	16,548	1,896
Lead:		
Ore contents.....	5,202,110	1,414,137
Bullion, contents.....	17,905,345	21,476,353
Imported from (in part):		
Canada.....	5,475,372	1,531,828
Mexico.....	17,622,551	21,359,162
Pigs, bars and old.....	13,163	2,622,636
Pyrites, long tons.....	50,651	28,658
Imported from (in part):		
Spain, long tons.....	4,349	20,583
Canada, long tons.....	43,623	8,061
Tin ore, long tons.....	683	4,036
Tin bars, blocks, pigs, etc.....	10,928,098	11,087,403
Imported from (in part):		
United Kingdom.....	627,262	5,412,168
Straits Settlements.....	5,482,436	4,730,489
Dutch East Indies.....	2,949,120	743,324
Hongkong.....	1,016,299	10,822
Zinc:		
Ore, contents.....	4,030,201	1,910,486
Imported from (in part):		
Canada.....	538,800	424,258
Mexico.....	3,481,401	1,486,228
Blocks, or pigs, and old.....	7,762	34,477
Manganese ore, long tons.....	72,635	19,901
Imported from (in part):		
Cuba.....	12,664	275
British India.....	2,775	500
Brazil.....	50,414	16,786
Tungsten ore, long tons.....	1,164	818

	EXPORTS OF COPPER, LEAD AND ZINC (In pounds)	
	Sept. 1918	Sept. 1919
Copper:		
Ore, contents.....	132,242	3,000
Concentrates, contents.....	42,716	52,460
Unrefined, black, blister, etc.....	Nil	811
Refined, in ingots, bars, etc.....	73,302,985	62,341,191
Exported to (in part):		
France.....	8,938,231	8,317,911
Italy.....	15,561,737	13,051,699
United Kingdom.....	45,973,753	2,814,973
Canada.....	2,663,470	2,581,539
Composition metal, copper chief value.....	3,548	10,928
Old and scrap.....	Nil	201
Pipes and tubes.....	327,325	641,448
Plates and sheets.....	1,166,832	307,742
Wire, except insulated.....	665,332	2,523,049
Lead:		
Pigs, bars, etc., produced from domestic ore.....	8,062,118	1,976,815
Produced from foreign ore.....	9,389,476	7,416,828
Exported to (in part):		
United Kingdom.....	11,061,754	224,000
Canada.....	3,010,633	149,701
Brazil.....	358,400	112,000
Japan.....	2,351,316	7,375,295
Zinc:		
Dross.....	2,366,669	110,613
Zinc produced from domestic ore.....	10,511,200	19,034,689
Zinc produced from foreign ore.....	3,794,068	1,456,337
Exported to (in part):		
France.....	3,287,303	160,137
Italy.....	1,908,298	None
United Kingdom.....	5,661,518	5,320,504
Canada.....	338,167	68,149
Mexico.....	502	400
Japan.....	3,009,924	14,794,410
In sheets, strips, etc.....	1,895,099	3,432,428

The New Oil Field at Colony, Creek County, Wyo., was first entered by the Roxana Oil Co. and several of the larger oil companies have since secured leases. The field is twenty-five miles west of Belle Fourche, in Butte County, where a standard oil rig had arrived recently on its way to the new oil field. Drilling was expected to begin about the first part of November.

BY THE WAY

Tungsten and Tombstone

Two years ago it was reported that tombstones were being used for location monuments in the district near Sodaville, Nev., where a "rich ledge of tungsten ore" was discovered. One miner located the village cemetery, and, as there were no rocks near, he used some of the best looking tombstones to mark the boundaries of his claim. Others followed suit, and soon it was difficult to recognize one claim from another. There are those today who will say that there is something fittingly symbolical about a tombstone as far as tungsten is concerned.

Leadville Reformed

Leadville in boom days was the gambler's paradise. But there the day of the gilded den has passed. By a court order this fall much elaborate paraphernalia seized in several establishments was destroyed. Roulette wheels and other devices were the food for a spectacular bonfire. One roulette wheel, valued at \$2,500, is said to have been one of the finest "wheels" in the West. It was a "crooked" wheel, with a "squeeze" that could be controlled by the operative or from another room than that in which the "play" was being conducted. More fortunes were won and lost in Leadville than in any other Colorado camp.

The Curfew Law in Chemistry

The American Chemical Society in announcing its regular meeting for December makes the statement that the usual informal dinner will be held before the meeting at the clubhouse in New York. It then goes on to say that "house rules of the Chemists' Club make no provision for the entertainment of ladies in the club proper after 4 p. m. We are forced, therefore, to exclude our lady members from this dinner invitation."—Why, we ask, on behalf of our friends among the fair sex, is the line drawn at 4 p. m.? Has not even a chemist noticed that the lady fair is even fairer after this time than before? But perhaps the lonely worker of the laboratory is more susceptible to the lure of the ladies than most people by reason of the very seclusion in which he generally hides himself. Self-defense is one of the first laws of nature, and here, perhaps, may be found an explanation of the odd rule in effect at the Chemists' Club.

Whither Are We Drifting?

An editorial writer in September "Industrial Management" seizes upon "The Parable of the Laborers," Matthew XX, and applies his interpretation to present-day problems with a right good will and, also, with most lofty spirit. The parable tells us that, when pay day came, each laborer received a penny—even those engaged at the eleventh hour; the said hour of the calling of "Time" indicating that the

basic eight-hour-day had not, in St. Matthew's era, been made an article of faith. Our contemporary argues that the parable must be interpreted as sanctioning and confirming the justice of the demand for a living wage, irrespective of the hours worked! This is good news indeed—for some! Does the one-hour day—Saturday half-holiday—impend? We are further told by the journal quoted: "The bond of so-called natural, economic, and judicial laws is crumbling, and, whether we will or not, labor will come into its own." We should say so! If the interpretation be prophetic, labor will soon come into everybody's own. We imagine organized labor will be compelled blushing to admit, "This is 2 mutch."

Another Children's Crusade

Under the heading "School Children Demand the Metric System," the World Trade Club of San Francisco has issued another bulletin advocating the use of the metric system. The appeal contained is worded as follows:

The World Trade Club is daily receiving evidence as to the growing strength of public opinion thruout Britannia in favor of metric standardization. Just the other day word came from one of their co-workers in England of an interesting episode that took place during one of his lecture tours.

At Kingsbridge he spoke before a gathering of enthusiastic schoolboys from the local grammar school, telling them of what adoption of the metric units of measurement would mean to the school children of the world,—how easy metrics are to learn, how simple to apply—in short, that it would lessen the necessary time spent on arithmetic by three years.

At the close of his talk, the boys unanimously adopted a resolution urging other schoolboys to go on strike with them against the British weights and measures, and demanding that only metrics be taught in the schools. These English youngsters realized the increase in efficiency, and the immense saving of time and labor obtainable through the meter-liter-gram.

In a previous bulletin the club chronicled the fact that Henry Ford had taken up arms in behalf of the metric system. That may be accepted in all seriousness. Mr. Ford has enough money to do many things, and is doing them sometimes. However, when the World Trade Club holds up the action of children as a pattern for adults to follow, for this is what the bulletin referred to really means, it must expect to have its utterances taken as a joke. This criticism is not to be considered as for or against the metric system—much is to be said for both sides of the controversy. If this were not so, there would not be any controversy. But unless the World Trade Club can do better than this, it had better fire its press agent or else be listed among the amusements of the day.

Exit the Ball Mill

The following interesting communication from E. W. Lawler has been crowded out of our "Correspondence and Discussion" section, but we are publishing it here in order to get it before our readers at the earliest moment. We have been hoping for a solution of the ball-mill controversy for some time, but had not before thought it would be settled by

the total elimination of such mills from the flow sheet, as will follow the general introduction of the following process, the devilish ingenuity of which is at once apparent.

Manufacturers of pottery and china, it is said, require that large chunks of enamel be broken up into small pieces without the admixture of iron, which would interfere with the color. In order to do this, the enamel, in molten condition, is poured into water, a process known as "water-cracking," and somewhat similar to the method of granulating slag.

The idea has now, it seems, been applied to ore reduction and successfully used at one of the largest gold mines on the Hawaiian Islands. Melting the ore was found to be expensive, so the ore is merely heated to redness and the requisite temperature drop obtained by plunging the hot ore into cracked ice instead of water. The flow sheet is something as follows: The ore, crushed to about 1 or 2-in. size by any economical or other means, is delivered on a conveying belt made of "ass-best-toes." (These belts are made from the front toes of the best burros in the pack train. Whenever a burro dies, his feet are saved; in this way, cheap material for repairs is always available.) An ass-best-toes belt is necessary on account of the extreme heat through which the belt must pass. The ore is conveyed between two electrodes and the current passing through it heats the rock to the proper temperature. The latter, of course, depends upon the fineness of reduction desired.

Immediately after passing through the electrodes, the ore is mixed with cracked ice, which is furnished by a refrigerating machine of a new type, based on the principle of hail. This refrigerating machine, instead of making ice in blocks which would necessitate the use of ice crackers and the consumption of power, simply pumps the brine through pipes, and the rain (this process is only adapted to rainy countries) coming through the chilled pipes turns into hail, or ice. This makes a cheap method of obtaining cracked ice.

The addition of the ice to the red-hot ore causes the latter to crack up to any fineness necessary. This has only been tried on free-milling gold ore, and as the reports indicate that the metal is not at all broken up, the separation of the ore from the metal is easy.

The finely decrepitated rock is sucked away by means of a current of air caused by the sudden cooling of the atmosphere in the vicinity of the refrigerator pipes. This air is so guided by means of proper deflecting vanes as to cause the gangue to be deposited in one place, while the metal, or gold, being heavier, remains on the traveling belt and is carried to a bullion safe at the end, equipped with a trap door.

In dry countries, where rain is not available, it is proposed to deflect some of the air so that it will carry the steam arising from mixing the cracked ice with the hot ore, over the refrigerating pipes to again be turned into cracked ice. Such a regenerative process would, of course, save water.

NEW PUBLICATIONS

Documentos Relacionados con la Legislación Petrolera Mexicana. Paper, 8 x 10; pp. 700. Secretaria de Industria, Comercio y Trabajo, Mexico City, Mexico, 1919.

A List of Books on Foreign Countries. Compiled by Miss M. L. Prevost for the U. S. Shipping Board. Paper, 6 x 9; pp. 25. Government Printing Office, Washington, D. C., 1918.

Iron-Depositing Bacteria and Their Geologic Relations. By Edmund Cecil Harder. Paper, 9 x 11; pp. 89, illus. Professional Paper 113, U. S. Geological Survey, Washington, D. C., 1919.

Techno-Chemical Receipt Book. By William T. Brannt and William H. Wahl. New Enlarged Edition. Cloth, 5 x 7½; pp. 516, illus. Henry Carey Baird & Co., Inc., New York, 1919.

Clays and Shales of Minnesota. By Frank F. Grout, with contributions by E. K. Soper. Paper, 6 x 9; pp. 259, illus. Bull. 678, U. S. Geological Survey, Washington, D. C., 1919.

Deposits of Manganese Ore in New Mexico. By Edward L. Jones, Jr. Paper, 6 x 9; 24 pp., one map. Bulletin 710-B, U. S. Geological Survey. Contributions to economic geology, 1919, Part 1, pp. 37 to 60.

The history and geologic relations of manganese deposits in the state. The orebodies are small and costs of mining and transportation high so that it is doubtful if profitable extraction can be made, at least at pre-war prices. Descriptions of deposits and operations, including exploration, development, and production, in Dona Ana, Grant, Sierra, and Socorro counties are given.

Manganese Deposits of the West Foot of the Blue Ridge, Virginia. By G. W. Stose, H. D. Miser, F. J. Katz, and D. F. Hewett. Paper, 7 x 10; pp. 166, illus. Bulletin 17, Virginia Geological Survey, Charlottesville, Va.

The report covers in a complete manner the work which has been done jointly by the Virginia Geological Survey and the U. S. Geological Survey in this section, and is an excellent example of the scope that should be included in studies and investigations of other mineral-bearing districts. The information is well arranged, and the bulletin constitutes a most valuable work on the subject of manganese deposits.

Mineral Resources of Georgia and Caucasia, with a Chapter on the Manganese Industry of Georgia. By D. Gham-bashidze. Cloth, 5½ x 8½; pp. 182, illus. George Allen & Unwin, Ltd., London; The MacMillan Co., New York, 1919.

Of no little interest to the reader is the introduction to this book in which the author presents a number of pertinent facts regarding the country of which he writes and concerning which many of us know but little. The neglect of Russia to develop the natural resources and her prevention of outside capital from entering this field have served to retard the development of the mineral potentialities of Georgia. Already well recognized as one of the three great manganese producers of the world, the district is rich in other minerals which await development. With some exceptions mining has not been carried on by extensive operations, but this has been due, in great measure, to unsettled conditions. Under the present government and a well directed mining board, the possibilities of financial return from mining in Georgia hold considerable promise to investors of foreign capital.

PERSONALS

Walter M. Stephen is now residing at 15 Central Ave., Staten Island, New York City.

Donald G. Campbell, of Seattle, is in Alaska for the winter, investigating properties north of Nome.

A. J. Wyly has left Leborg, Tandai, and is now at Leborg Donok, Mocara Aman, Sumatra, Dutch East Indies.

S. M. Levy, manager of the Calaveras Copper Co., Copperopolis, Cal., spent a few days in New York recently.

Edel Moldenke has returned to Wat-chung, N. J., after spending two years in Burma with the Burma Mines, Ltd., as mining engineer.

John Ogden has closed his laboratory in Philadelphia and is associated with the United Reduction & Metal Co., Denver, Col., as chief chemist.

P. G. Beckett has been appointed general manager of Phelps Dodge Corporation, with headquarters at Douglas, Ariz., effective Jan. 1, 1920.

Theodore W. Richards, professor of chemistry at Harvard University, has been elected president of the American Academy of Arts and Sciences.

A. J. Crowley, superintendent of Nevada Sulphur Co., has returned to the mines near Winnemucca, after spending several weeks in San Francisco.

G. M. Colvocoresses, general manager of the Consolidated Arizona Smelting Co., Humboldt, Ariz., is in New York City for two or three weeks.

Scott H. Sherman, manager for a number of years of the Gila Copper Sulphide Co., at Christmas, Ariz., has resigned. He will reside in Phoenix, Ariz.

L. D. Adams has returned to San Francisco after spending several months visiting various properties in eastern Canada in which he is interested.

W. J. Elmendorf, of Campbell, Wells & Elmendorf, Seattle, is now at Sandon, B. C., in operating charge of the Mercury, Charleston and Gault silver-lead mines.

Albert H. Low, senior member of Von Schulz & Low, assayers and chemists, of Denver, was appointed professor of chemistry at the Colorado School of Mines on Oct. 1.

William Crosley, who went to Burma in May, 1917, to engage in the production of tungsten, is making preparations to return, and expects to be in London in December.

A. T. Thomson, assistant to the President, Phelps Dodge Corporation,

who has had his headquarters in Douglas, Ariz., will return to the New York office on Jan. 1, 1920.

F. A. Goodale, of Colfax, Cal., has gone to Australia to make an extensive examination of a placer property containing gold and sapphires. He will be gone about four months.

Fletcher Hamilton, W. J. Loring and L. D. Gordon, of California, attended the St. Louis meeting of the American Mining Congress to advocate a protective tariff on quicksilver.

N. O. Lawton, formerly mine superintendent of the Miami Copper Co., has been carrying on some successful diamond drilling at Pilley's Island, Newfoundland, for the Blast Furnace Products Co., of New York.

George R. Fawcett, mining engineer of the Arizona State Bureau of Mines, is lecturing throughout Arizona on "Practical Mineralogy for the Prospector," to aid in the discovery and development of valuable mineral deposits.

H. W. Kitson, formerly on the staff of the Engineering and Mining Journal, has gone to Tampico, Mex., to examine oil lands, and will be absent about a month. Mr. Kitson recently established headquarters at 1209 Mills Bldg., El Paso, Tex.

Lindsay Duncan, formerly chief mechanical engineer of the Nevada Consolidated Copper Co., and Curtis Lindley, Jr., mining and construction engineer, have formed a partnership under the name of Duncan & Lindley. Their address is Room 649, Mills Bldg., San Francisco.

W. G. Miller, provincial geologist of Ontario, has returned to Toronto from a six months' stay in Europe, where he was engaged in completing the organization work of the Imperial Mineral Resource Bureau. While abroad Doctor Miller visited the battlefields of France and Belgium.

J. Parke Channing was the guest at a recent banquet in Miami, Ariz., of the Globe-Miami Chapter of the American Association of Engineers. In his address Mr. Channing dwelt upon the conservation of water and the work of the National Engineering Council, of which he is a member.

T. H. O'Brien has been appointed manager of the Industrial and Public Relations Department of Phelps Dodge Corporation, and consulting engineer of the Stag Canyon Branch, with headquarters at Douglas, Ariz. Mr. O'Brien has been manager of the Stag Canyon Branch, but resigned that position and will be succeeded by W. D. Brennan.

Charles Eugene Schneider, the French steelmaster, and head of the Creusot Iron Works, who has been touring this country, has received the honorary de-

gree of Doctor of Science from Western Reserve University, the honorary degree of Doctor of Engineering from Stevens Institute of Technology, and the honorary degree of Doctor of Science from the University of Pittsburgh. In Pittsburgh M. Schneider was extended the freedom of the city and was presented with its flag. On Nov. 23 M. Schneider addressed a mass meeting of Alsatians, Lorrainers and Czecho-Slovaks in New York and was presented with a gold medal, on which was inscribed "Noble Son of Lorraine," from the Association of Alsatians and Lorrainers.

OBITUARY

Henry Laurence Gantt, an industrial engineer of national reputation, died on Nov. 23 at his home in Montclair, N. J. Mr. Gantt studied at Johns Hopkins University and Stevens Institute of Technology. In association with the late Frederick W. Taylor, he helped to install modern methods of manufacture at the plant of the Midvale Steel Co. and at other large industrial establishments. Mr. Gantt was the author of "Work, Wages and Profits," "Industrial Leadership" and "Organizing War Work," as well as a number of articles in technical journals.

SOCIETIES

Institution of Petroleum Technologists held its first meeting of the session on Oct. 31, with the president, Sir Frederick W. Black, in the chair. A paper on "Some Laboratory Tests on Mineral Oils" was read by Arnold Philip.

American Institute of Chemical Engineers will hold its twelfth annual meeting at the Hotel De Sota, Savannah, Ga., Dec. 3-6, 1919. The meeting will be devoted largely to Southern chemical industries, and a number of inspection trips have been arranged. Among the papers to be presented is one by J. G. Bailey on "Acid Electric Furnace Ferrotungsten."

American Welding Society—Realizing the necessity of publishing its proceedings regularly, the "Journal of the American Welding Society" has been started by the American Welding Society, and its first issue, dated October, 1919, has been published. The size adopted is 8½x11 in., and printing and illustrations are excellent. The first issue contains 64 pages, including the

cover, of which 36 are advertising. The address of the American Welding Society is 33 W. 39 St., New York City.

American Electrochemical Society—Arrangements are being made for the spring meeting to be held in Boston, Apr. 8, 9, and 10, 1920. On Apr. 9, there will be joint meeting with the American Institute of Electrical Engineers, and it is proposed to have two symposiums on that date, on "Electrically Produced Alloys" and on "Power for Electrochemical Purposes." On Apr. 8, there will be a symposium on "Colloids."

The New York Section recently elected the following new officers: W. S. Landis, chairman; W. A. Cowan, vice-chairman; H. B. Coho, secretary-treasurer.

American Association of Engineers announces that effective with the January number its official publication, "The Monad," will be published under the name of "Professional Engineer." At the same time the size of the publication will be increased to 9x12 in. The magazine will remain a monthly.

The American Association of Engineers has recently organized chapters or clubs in the following cities: Globe-Miami, Arizona; Terre Haute, Indiana; Phoenix, Arizona; San Antonio, Texas; Tulsa, Oklahoma; Joliet, Illinois; Butte, Montana; Davenport, Iowa; Rock Island, Illinois; Moline, Illinois; Morgantown, West Virginia; Pocatello, Idaho; El Reno, Oklahoma; Arkansas City, Arkansas; Akron, Ohio; Springfield, Illinois; New Orleans, Louisiana; Newell, South Dakota; also at University of Minnesota, University of Arizona, University of Michigan.

INDUSTRIAL NEWS

James A. Lannon, formerly general superintendent of the Atlas Mining & Milling Co., Ouray, Col., has associated himself with the Denver Engineering Works Co., the Aldrich Pump Co., and the Victor M. Braschi Machinery Co., of Mexico City, as their representative, and will have headquarters in Mexico City with the Braschi Machinery Co.

Wisconsin Bridge & Iron Co., North Milwaukee, Wis., announce that E. P. Rankin, Jr., will represent them in the Southwest, with headquarters at El Paso, Tex. Mr. Rankin's address will be P. O. Box 692, El Paso.

Russell W. Stovel, who recently returned from France, where, as Lieutenant-Colonel of Engineers, he served as Chief of the Terminal Facilities Division of the Army Transport Service, has been appointed a consulting engi-

neer of Westinghouse, Church, Kerr & Co., Inc., and, as a member of that organization, will devote his entire time to the company's electrical and mechanical work.

Goodyear Tire & Rubber Co., of Akron, Ohio, has created the position of sales manager, and appointed L. C. Rockhill to that position.

Lincoln Electric Co., of Cleveland, Ohio, announces that Paul M. Lincoln, for many years commercial engineer of The Westinghouse Co., has resigned from that organization, effective Nov. 1, to enter the consulting engineering field, and in that capacity will have active charge of motor application engineering for the Lincoln Electric Co.

Black & Decker Manufacturing Co. has opened an additional office on the Pacific Coast, at 201 Maynard Bldg., Seattle, Wash., in charge of A. E. Nordwall, who will have charge of the distribution of Black & Decker products in the state of Washington, working under the direction of the main Pacific Coast office, 918 Hearst Bldg., San Francisco, Cal.

TRADE CATALOGS

Centrifugal Pumps. The Goulds Manufacturing Co., Seneca Falls, N. Y. Bulletin No. 122, entitled "Centrifugal Pump Sales Service Data"; 8x10; 36 pp.; illus. Contains data on the theory, design, testing, and similar information on centrifugal pumps, including curves and formulae.

Heat Insulations. The Franklin Manufacturing Co., Franklin, Pa. Catalog F. C. 7-19; 8¼x11¼; 77 pp., illustrated. Describes the insulating products of the company (magnesia and asbestos) and gives the usual sales data and suggestions for the proper type of insulation for certain purposes.

Centrifugal Pumps and Pumping Units. Allis-Chalmers Manufacturing Co., Milwaukee, Wis. Bulletin; 8x10½; 52 pp.; illus. Describes various types of centrifugal pumps and their particular uses with different kinds of drives. Data in tabular form giving relations between H.P., R.P.M. efficiencies, and capacities, as well as efficiency curves, are included.

Steam, Water and Air Specialties. The McAlear Manufacturing Co., Chicago. Catalog No. 25, describing modern steam, water, and air specialties for high- and low-pressure heating and power plants, and devices for plumbing installations. Catalog entitled "25 Years of Know How," covering vacuum, vapor, and air-line heating specialties, is ready for distribution.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Iron and Steel—Metallurgical Process. Joel Lund. (1,320,483; Nov. 4, 1919.)

Iron-Ore Treatment—Process of Extracting Iron From Its Ore. Charles Colcock Jones. (1,319,589; Oct. 21, 1919.)

Iron Oxides—Method of Separating the Oxides of Iron and Other Metals Occurring in Compound Ores. James Claude Adell. (1,318,431; Oct. 14, 1919.)

Lamp—Miner's Hand-Lamp. John Lawrence Conway. (1,319,758; Oct. 28, 1919.)

Manganese—Process of Preparing Highly Oxidized Manganese Compounds. James C. Adell. (1,318,432; Oct. 14, 1919.)

Molybdenum Bronze. Seiko Shigetani. (1,319,537; Oct. 21, 1919.)

Oil Wells—Packer For. Shelton T. Cameron and Edward R. Inman. (1,318,352; Oct. 14, 1919.)

Open-Hearth Furnace. John O. Griggs. (1,320,387; Nov. 4, 1919.)

Ore-Treating Kila. William Winkelman. (1,319,939; Oct. 28, 1919.)

Potash—Extraction and Recovery of Potassium or Potassium Salts From Potassium-Bearing Materials. Edgar Arthur Ashcroft. (1,320,193; Oct. 28, 1919.)

Potash—Process of Extracting Potassium Salts. Robert S. Edwards. (1,320,211; Oct. 28, 1919.)

Refractory Materials and Method of Making the Same. Bernard Enright. (1,319,056; Oct. 21, 1919.)

Separating or Concentrating Ores—Apparatus For. David Cole. (1,319,208; Oct. 21, 1919.)

Separation—Apparatus for Separating Minerals. Erastus B. Bennett. (1,320,526; Nov. 4, 1919.)

Separation—Machine for Separating Minerals From Ore-Bearing Materials. Richard P. Park. (1,319,790; Oct. 28, 1919.)

Separator—Mineral Separator. Charles W. Eccleston. (1,319,646; Oct. 21, 1919.)

Slags—Process of Treating Slags. Ulysses A. Garred. (1,319,061; Oct. 21, 1919.)

Steel—Apparatus for the Production of Steel Directly From Pig Iron. Alfred Nielsen. (1,318,906; Oct. 14, 1919.)

Tuyeres—Process and Apparatus for Molding Tuyeres and the Like. Benjamin F. Caffey. (1,321,008; Nov. 4, 1919.)

THE MINING NEWS

New York, November 22 and 29, 1919

Iron Formation Cut at Escanaba, Michigan

An iron formation has been cut at a depth of 550 ft. on lands being drilled by E. J. Longyear Co. five miles from Escanaba, Mich. No ore has ever been found in this vicinity, and even at present only an iron formation has been discovered. The work is being done by the Escanaba Iron Range Exploration Co., which was organized by Escanaba people to prospect the lands that are under option. The fact that the

The Pas, Manitoba, on the Hudson Bay Ry. to Mile 43 on the railway. From this point to the vicinity of the new gold find it is about forty-five miles northwest, the trail going over numerous lakes, with portages between. An engineer from the Department of Public Works of Manitoba is in The Pas at the time this is being written, and it is expected that he will proceed to Mile 43 on Nov. 19 and make reconnaissance of the country for a winter sleigh road from the railroad to Copper Lake. Much interest will be taken in the de-

there is no evidence that the dike contains sufficient pitchblende to permit of its being worked for that mineral. The uranium is distributed sparingly, and from the material already broken one would have difficulty in picking out more than an ounce in an hour. The deposit has been reported on by C. W. Knight, of the Ontario Bureau of Mines.

The Utah Apex Suit

Testimony Taken on Both Sides—Many Prominent Geologists on Both Sides as Witnesses

In the suit now in progress between the Utah Apex and Utah Consolidated mining companies before Judge Tillman A. Johnson in the U. S. District Court in Salt Lake City, the witnesses for the latter company were heard first. Utah Consolidated is seeking to prove that the extralateral rights in dispute center in the Highland Boy limestone as the highest point of mineralization in the two properties and not in the fissuring. Its witnesses gave much testimony in regard to geological conditions and ore deposition. Mine models were brought in as evidence, as well as a large number of maps. Among the witnesses first heard were R. N. Hunt, geologist for the company; Professor J. F. Kemp, Reno H. Sales, geologist for the Anaconda Copper Mining Co.; Professor C. K. Leith, and A. S. Wintner, mine superintendent at the Utah Consolidated property.

Prof. Kemp gave a general description of the geology of the camp of Bingham, correlating the Highland Boy limestone with the Jordan limestone, and the Commercial limestone with the Yampa. He said that the limestone beds were the lodes and what the miners prospected in search of ore. In the Utah Consolidated on the 1,300 level a 2,000-ft. drift had been driven under the claims of the Utah Apex, in which a large orebody was opened up. The apex of this body, R. N. Hunt stated, is in the Utah Consolidated grounds. Reno H. Sales, following Professor Kemp, described the mineralizing solutions in coming in as traveling principally along the limestone beds and principally along the Highland Boy lode, declaring that the fissuring had little effect on the mineralization. Professor Leith's testimony followed similar lines.

The Utah Consolidated company finished presenting its side early in the morning session of the court on Nov. 14. Judge John A. Marshall followed,

PIT ON GOLD PROSPECT, COPPER LAKE, NORTHERN MANITOBA

formation is present in that vicinity bears out geological reports made some years ago regarding the extension of the Menominee Range formation to Little Bay de Noc, Lake Michigan. The formation lies under 500 to 600 ft. of sandstone and limestone, not far from Lake Michigan. One well known mining man of the district stated that it would be a difficult task to get ore out from under Paleozoic rocks, his contention being that Lake Michigan is too close by and that water would cause much trouble.

Development Work at Copper Lake, Manitoba

J. P. Gordon, owner of the new gold discovery at Copper Lake, in northern Manitoba, has gone to the property to begin development work, on which it is understood \$50,000 will be spent. This property will be remembered as the one which attracted so much attention a few months ago. The district is reached in winter by going north of

development of this property, because of the spectacular surface showing of free gold in the quartz and vein matter. There are much larger gold-bearing orebodies in close proximity to this high-grade vein, but their gold content has not been determined. The future of this camp will depend on the results of further underground development, although much may yet be learned from surface trenching and sampling.

Radium Found in Ontario

Much interest has been aroused by the discovery of pitchblende in the township of Butt, east of Georgian Bay, Ontario, and as a consequence a number of mining claims have been staked. The pitchblende occurs in a coarse pegmatite dike, which was being mined for mica. The width of the dike has not been exposed, but it has been proved by an open cut for a length of 40 feet. The uranium mineral is found associated with red feldspar and occurs in grains about the size of a pea. So far

opening the case for the Utah Apex with an outline of the argument to be followed, and making an introductory statement that all of the orebodies in dispute were in the Utah Apex property, and that they belonged to the Utah Apex company unless it could be proved beyond question that they were on veins that apexed in other properties. He stated that the Utah Apex company was in reality the plaintiff, and that it would be shown that the Utah Consolidated had gone into Utah Apex ground and extracted a large tonnage of ore, an accounting for which the Utah Apex would ask. Bodies opened through the 1,300 level drift, mentioned frequently in the testimony, are claimed by the Utah Consolidated as apexing in its ground in the Highland Boy limestone, which this company holds to be the lode.

Judge Marshall stated that it would be shown that there was a difference of opinion as to what the Highland Boy vein constituted, and that the 1,300 level drift was not run to develop the Highland Boy limestone, but for the purpose of developing the Leadville orebody, and that it was in reality a straight level run through the barren limestone of the Highland Boy, as the result of an examination of Utah Apex underground workings which Utah Consolidated officials were permitted to make a few years ago. He also stated that the lead ore would be shown to be closely associated with the 1,312 level fault.

Witnesses for the Utah Apex company already examined (Nov. 19) have been Frank Anderson, of Salt Lake City, and Ellsworth Daggett, who was manager of the Winnemucca mine at Bingham, Utah, in 1878, also of Salt Lake. Albert Burch, consulting engineer, who has operated extensively in Utah and in the Coeur d'Alene district, and elsewhere, was completing his testimony at the time of writing. The testimony in general was directed with the object of proving that the ore was directly connected with the fissuring and made as much in the quartzite as in the limestone.

New Apex Litigation Probable in Coeur d'Alenes

Marsh Mines Consolidated Claims Apex of East Vein of Hecla Mine

A real sensation was created recently by the announcement that the Marsh Mines Consolidated would lay claim to the apex of the east vein of the Hecla mine, at Wallace, Idaho, involving the ownership of lead-silver ore bodies valued at millions of dollars. At the date of writing (Nov. 10), no legal proceedings have been started, but formal notice has been served on the Hecla min-

ing company by the Marsh company that it will claim the apex, as stated above, and therefore, all the ore that may be in the vein thereunder or that may have been removed therefrom. The vein in controversy is about 600 ft. north and east of the original Hecla vein. It is known that a large body of lead-silver ore has been developed in this vein from No. 3 tunnel level to the 900-ft. shaft level; also that a raise has been made on the vein to the surface presumably establishing the apex in the Hecla ground, the distance from the 900 level to the surface being about 2,200 ft.

The apex claimed by the Marsh company is an extension of the old Tiger-Poorman vein and is on the Russell claim, which has a common south side-line with the Consolidated Extension claim, owned by the Hecla company. The Russell claim, as well as the O'Neil and Mono Fraction, is part of the Tiger-Poorman group, owned by the Federal Mining & Smelting Co., and is held by the Marsh company under a ten-year lease, which will expire on July 20, 1926. The leased ground lies between the Hecla and the Marsh ground property.

It appears from the lease on record that the Federal company was preparing to bring suit against the Marsh to recover the value of large quantities of ore alleged to have been removed by the Marsh through underground workings into the Tiger-Poorman ground, and in consideration of the agreements entered into in the lease, the Federal company waived its right of action to recover for the ore alleged to have been extracted. Under the terms of the lease the Marsh company agreed to spend \$40,000, at the rate of not less than \$2,500 per month, in the development of the Russell, O'Neil, and Mono Fraction claims, the work to be done under the supervision and direction of the Federal company, the lease expressly stating that "It is the intention of this agreement to leave the conduct of the work to the party of the second part (Marsh), but the judgment of the party of the first part (Federal) shall be conclusive as to the place or places where the work shall be done, and the character of the work to be done." The Marsh company agreed to pay the Federal a fixed royalty on ore shipped during the life of the lease. It may be assumed that in planning the work it was the apex of this Hecla vein that was being sought, albeit it is described as the extension of the Tiger-Poorman vein.

It is evident that the Federal company is more deeply interested in the final decision than the Marsh, for as

apex litigation goes it would be a physical impossibility for the Marsh, in the event it should win, to make much headway in mining the ore during the life of its lease, and unless there is an agreement outside of the lease that would give the Marsh a right to the ore extracted by the Hecla, and for which it would be required to account, it would seem that the Federal company would be the sole beneficiary. In the absence of anything but the most general information, the prevailing opinion is that the Hecla is secure in its apex rights. The company is capably and carefully managed, and it hardly seems likely that its rights would have been neglected in this respect. But in any event, the outlook is that another long apex battle is being staged in which will be matched the most brilliant mining lawyers, geologists, and mining engineers.

Ecuador Has New Mining Law

The Congress of Ecuador recently passed a law declaring that unless the exploitation of mines in that country was begun within two years from the promulgation of the law, the rights of the holder of the patents would cease until a new law would be enacted, according to a cable dispatch received by the Department of Commerce. The law further provides, according to the report, that unless the patents are paid for within a time specified by the mineral code, the acquired right would, ipso facto, be void. The charge for the annual patent fee is to be not more than 10 per cent of the gross production and not less than 45.

Industrial Dispute Compromised at Tonopah and Divide

The labor troubles which have been bothering the Tonopah and Divide districts for several months are believed to be definitely settled. The newly organized miners' and craftsmen's unions which called off the original strike recently made demands for an increase of \$1 a day in wages. After a number of conferences with the operators, a compromise was agreed upon, of which the following are the principal features:

The operators agree to establish a commissary within sixty days and to sell the necessities of life at cost to their employees, plus operating expenses, and the employees are to have equal representation on the advisory board. Coal shall be sold and delivered to all employees at cost. Operators will grant a bonus to all employees of 50c per shift, retroactive to the time the individual employee returned to work, provided such employee is still on the payroll. At the end of sixty days a Federal mediator will be

called in and if he finds the commissary functioning fully, he will so declare and the bonus will be withdrawn. Should he not find it so, he will return each thirty days thereafter until he does find it functioning fully, the bonus in the meantime to be continued. Board shall be given to single men at \$37.50 per month where boarding houses are now or hereafter operated by companies. Goods from the store to be sold to private boarding house keepers who furnish board to employees at \$37.50 per month.

The agreement, which was signed by both parties, is effective to Aug. 15, 1920.

Ontario's New Minister of Mines

The new Ontario government, which is a combination of farmer and labor members, has appointed a Minister of Mines in the person of Harry Mills, of

Fort William. Heretofore lands, forests, and mines have been under one department, but will now be under two departments, with the mines having a minister of their own. Mr. Mills is a labor representative and has been a locomotive engineer on the Canadian Pacific Ry., and, having once worked in a coal mine in Wales in his early youth, probably possesses the qualifications necessary for a successful minister for the Department of Mines. The industry is said to view the appointment with interest and some trepidation. In interviews credited to Mr. Mills it was intimated that his department would be expected to provide the revenue for the new scheme of mothers' pensions which the labor members propose to have enacted. The new members of the cabinet, however, impress one as being sincere and honest, and there is no doubt that Mr. Mills will familiarize himself with conditions before attempting to impose higher taxes.

Mesabi Ores Shipped to St. Louis by Water From St. Paul

A new outlet for Minnesota ores was opened on Oct. 21 when two large steel barges were loaded at St. Paul for shipment to the Mississippi Valley Iron Works at St. Louis. The barges are 300 ft. long and 48 ft. wide and are the forerunners of others if the traffic proves successful. Capacity is 1,500 tons, and with the current of the river a small tug can handle a large fleet of them. It is planned to institute a return traffic in coal. The original shipment was loaded by the simple but slow expedient of spotting the cars on a river bridge and tripping the hoppers into the barges below one at a time. An entire day was required for the loading of less than 3,000 tons, and better dock facilities will have to follow. The ore came from the Mahoning mine at Hibbing.

PROGRESS OF MINING OPERATIONS

Important Events of Interest
Condensed and Classified
for Easy Reference

ALABAMA. BIRMINGHAM DISTRICT

The coal situation in the Birmingham district is becoming acute. The miners are not returning to work as promptly as was hoped, and the non-union mines, though turning out record productions, are not able to supply the whole demand. A number of plants are said to be on the point of closing, owing to coal shortage, and those fortunate enough to have a large reserve stock are diminishing the same rapidly. This is particularly noticed at some of the ore mines. All the ore-mine and furnace operators are also interested in coal production, and the two interests are so combined that what affects one seriously affects the other.

One of the new batteries of the by-product coke plant of the Tennessee Coal, Iron & Ry. Co. at Fairfield, Ala., has been completed. The battery will be put in operation about the first of next year. A large crane is to be erected to make possible the storing of large quantities of coke.

ARIZONA.

BISBEE DISTRICT—SILVER BELL—MIAMI

Bisbee—The Copper Queen expects to use its new steel power line about Dec. 1. A substation has been established near the Warren concentrator site, from which lower voltage lines will run to the mill and the Calumet & Cochise shaft, where pumps will be elec-

trically operated. The builders hope to have the new 4,000-ton flotation and concentrating mill ready for operation by July 1, 1920—another Phelps Dodge property, operated by the Night Hawk Leasing Co., is working a large body of 10 per cent copper ore. James McKenna is the company's representative. —At Dos Cabezas the Basin mine has been shipping gold concentrates from its twenty-stamp mill. The property is operated by Gold Prince M. & M. Co., A. J. Welty in charge, and is considering erecting a 200-ton mill.—The Middlemarch mine, at Pearce, has repaired the mill machinery damaged by former employees, and its flotation mill is in operation again.

Silver Bell—El Tiro Mining Co. is installing a 250-kw. generator for the electric operation of pumps, blowers, haulage, and lighting systems. The company is shipping a carload of ore daily and reports large profits.

Miami—The Miami Mining & Milling Co.'s new mill at Doak station is complete. A 200-ton Blake crusher sends the ore to a Lane 50-ton mill, and thence it is delivered to plates and Wilfley tables. Tailings later will be treated by flotation, when the appropriate process is determined. A second mill section, with a battery of ten 1,000-lb. stamps, is already on the ground. The mill is at the portal of the 560-ft. tunnel that has cut four veins which are to feed the mill until the main vein

is cut at 1,000 ft. Additional drill and compressor equipment is being installed. Ore said to sample \$18 gold, with some lead.—The International Smelting Co. is operating two reverberatories, with its third under repair for an early resumption.

CALIFORNIA SHASTA DISTRICT

Ingot—The Afterthought Copper Company completed installing of a reverberatory furnace during October. The furnace is now treating 135 tons of siliceous copper ore from the mines daily. A concentrate fairly high in copper, from the old Horwood plant, is being smelted with the copper ores, resulting in matte containing 18 to 20 per cent copper. The 300-ton oil flotation plant is ready to run, and will probably start up Nov. 15. A selective concentration of the copper and zinc will be made. The copper concentrate will be smelted in the reverberatory furnace; the zinc concentrate will be stored for future treatment. The company expects to install an electrolytic zinc plant in the near future.

Iron Mountain—The Hornet Mine is now making an average daily production of 400 tons of pyritic ore. The ore is marketed for its sulphur content to the General Chemical Co., and to the Standard Oil Co. Some of the ore is also used in the manufacture of fertilizer at the acid plant of the Mountain Copper Co., at Martinez.

TUOLUMNE—NEVADA—ALAMEDA
COUNTIES

Stent—The ground around the Jumper mine has settled about six feet over an area approximating that of a city block. The engine and boiler works are situated in this sink. As a result of the condition of the ground, a new shaft may be necessary. It is understood that good paying ore is still in the mine.—The App mine has been unwatered by a raise from the lower workings of the Dutch mine. A large force of miners is engaged in timbering up the old App mine and in other repairs necessary by the long continued drowning of the workings.

Grass Valley—The Idaho-Maryland group, which recently suffered from flooding, has been unwatered to a depth of about 500 ft. by means of the air lift process. The shaft was found in poor condition below the 400 level, and much new timbering was necessary. Therefore no effort is being made further to lower the water until the first 500 ft. of the shaft has been repaired.

Livermore—The Western Magnesite Development Co. and other companies shipped the record quantity of 1,408 tons of magnesite from the Red Mountain district during October, 1919. Thirteen auto trucks were used.

Tule River Reservation—The lands of the Tule River Indian Reservation were thrown open to public entry on Nov. 1, 1919, under the act of June 30, 1919 (Public No. 3), authorizing location of mining claims on unallotted Indian lands. Since Nov. 1, fifteen mining claims have been located in the Cow Mountain section.

Porterville—The American Magnesite Co. has just been purchased by C. W. Hill, of Los Angeles and San Diego. A rotary kiln will be put in operation immediately on custom ore. Several sets of lessees are now operating on the property.

COLORADO.

Ouray—A. G. de Golyer, of Denver and Ouray, has taken over the Kentucky Giant at Ironton under the name of the Silver Hills Mines Co. He is erecting a large and convenient bunkhouse and putting in a compressor and complete mining plant, to ship ore this winter. He has announced that the Vernon Mining Co., nearby, will resume next spring, driving a long crosscut to develop at lower levels.—The American Smelting & Refining Co. has relinquished its option on the Revenue Tunnel group. A. E. Reynolds, of Denver, owner, is preparing to resume work on his own account. It is understood that development of the mine was not carried far enough and was not discouraging.—The Summit Copper Co. has taken over the Amazon group at Red Mountain, adding to its already

considerable holdings and large ore reserve. Mill erection this fall was abandoned, but probably will be accomplished next spring.

Leadville—Work has been resumed at the A. V. mine, which was a heavy shipper of high-grade manganese ores during the war. It had been idle since July, and the owners are entering upon an extensive prospecting campaign in hope of finding high-grade silver-manganese ores. Work is being done by M. L. Buchanan. No new contracts have been obtained for the straight manganese ores.—John Cortellini and associates, of Leadville, have taken over several of the old properties in Adelaide Park. They are developing several old silver-lead properties that have been idle for a good many years. This portion of the Leadville district has been little prospected, and results are awaited with interest.—Lessees on the Crescentia property in California Gulch have opened up a good sized body of high-grade zinc ore on the 600 level. In the same vicinity, on the Shamus O'Brien and the Seneca, lessees are also mining zinc ore and prospecting the formations known to have been productive of high-grade silver ore in the old days.

Georgetown—Isabell, Plant & Co., of Toronto and Montreal, representing Canadian and British interests, have taken over silver-lead property known as the Sunburst Group. This property has been operated for the last three years by the Longeley Syndicate. A 3,200-ft. tunnel was driven, and the mine completely equipped by this company. A 100-ton aerial tramway 7,000 ft. long was also built, as well as a complete camp for accommodating forty men. The Longeley company expended \$150,000 on this work.

MICHIGAN.

COPPER DISTRICT

Calumet—The Seneca Mining Co. is ready to ship copper ore to the Baltic mill, but is prohibited from doing so until the U. S. Railroad Administration determines what rate shall be charged for this important matter of hauling a few cars over a railroad that has been in business for thirty years. There is no precedent, the Seneca being a new mine and never having produced copper ore previously. The shaft is approaching the third level, which will be cut soon. Laterals on the second level are now opening 300 ft. of Kearsarge lode rock. A boiler has been installed and other surface equipment is being accumulated for unwatering the Gratiot property, recently purchased from the Calumet & Hecla.

Hancock—All parts for the Quincy Mining Co.'s new hoisting plant for No. 2 shaft are now on the ground, and erection is under way. The company

has a large stock of unsmelted ore on hand.—The Hancock Consolidated has ten drills at work, eight in drifts on the vein east of the shaft and two on crosscuts to the vein. All work is being concentrated in opening ground that will be rich enough to permit profitable operations on a scale of more than 500 tons daily.

MEMONINEE RANGE

Iron River—Water is causing much trouble at the Rogers property. No ore is being mined. Pumps are handling 4,500 gal. per min., but with practically no lowering of the water level in the overburden. A concrete shaft was put down, but this did not end the trouble. A new program of drainage has been decided upon. The water is to be drained from the sand in specially constructed drifts in the rock, close up to the sand. Drifts will practically encircle the orebody and form a big drainage tunnel. At intervals raises will be driven and from these laterals will be run so as to increase the drainage area. The laterals will be close to the sand, but within the rock to guard against sand runs. From the back of the laterals, holes will be drilled into the sand to drain it. Water will follow the laterals to the raise, then to the drainage tunnel and back through the tunnel to a new sump. Electric pumps will send the water to surface. A year will be required to complete this program.

MISSOURI.

SOUTHEASTERN LEAD DISTRICT

Iron Mountain—The old Iron Mountain property, eighty miles south of St. Louis, Mo., which covers an old Spanish grant five miles square, has recently been sold to parties connected with the Mid-Co. Iron Company for \$750,000. This property was purchased last spring by John Elledge, who continued a shaft that had been started on an old drill hole that was very promising and which was recently bottomed by Mr. Elledge in a fine body of high-grade specular hematite, that is associated with more or less mixed ore and porphyry. Mr. Elledge also reopened some of the old surface workings, with encouraging results. It now looks as though this property will have a new lease of life and produce a fair tonnage of high-grade ore, although it will be necessary to erect a concentrating mill. There are now three blast furnaces that will furnish a local market, and a 500-ton furnace is now being built at Granite City, Ill., which will greatly increase the local demand for iron ore.—The old Pilot Knob iron property, five miles south of Iron Mountain, is also being reopened and is making moderate shipments of low-grade phosphorus ore from a deposit that lies northeast of the old exhausted mine.

Annapolis—The Annapolis Lead Co. has begun work on a three-quarter mile railroad spur from the Missouri Pacific main line below Annapolis, and is preparing to sink a shaft to open up the body of disseminated lead ore found by diamond drilling. To date seventy-nine holes have been drilled. As soon as sinking is under way installation of a 500-ton mill will be started. D. G. Cook is president and A. J. Meier operating manager.

Flat River—The miners of the Federal Lead Co. at Flat River, recently went on a strike, but after two-weeks' lockout, they returned to work at the old rate of wages. The No. 12 shaft at Elvins, on the former property of the old Central Lead Co., is now producing 3,000 tons a day, which is being treated in the No. 3 mill.

Herculeum—The Herculeum Smelter of the St. Joseph Lead Co. is again operating, now on the open-shop plan, after locking out the union since last spring. The company's No. 16 shaft at Elvans, which is close to their No. 4 mill, is nearly completed and is expected soon to handle the output of the old mine at the River Mines and thus do away with delivering the ore from same by surface railroad. The Leadwood mine is still closed down, where the union has quite a stronghold, but is being kept unwatered. A slight advance has recently been made through the lead belt, which nearly restores the high rate that prevailed during the war.

The recently developed iron mine in Franklin County is partially supplying the local market with a high-grade hematite and some of the output is being shipped to Kentucky and Tennessee furnaces.

MONTANA

Butte—The Tuolumne Copper Co. has struck an orebody on the 1,000 level, the crosscut being in it on Nov. 17 for 24 ft., with the drills still in ore that runs high in silver and over 2 per cent in copper.—In October the North Butte company produced 2,019,421 lb. of copper, 81,940 oz. of silver, and 122 oz. of gold.

NEVADA

DIVIDE DISTRICT—ARROWHEAD

Divide—The new east-west vein recently found on Belcher Extension has been recently sampled by Andrew Walz in widths from 3 in. to 48 in., and 24 assays run, the results giving values in gold and silver of from \$3.20 to \$134.40 per ton. The vein was traced for 800 ft. on Belcher Extension ground and 300 ft. on the Belcher. Mr. Walz has recommended sinking a prospect shaft on vein near the Thompson Divide, where there is an unusually good showing.—The new shaft of the Tonopah Dividend Co. is down 50 ft. on what is

thought to be the extension of the Caldwell vein of Divide Extension. A hoist is being installed.—Crosscutting by the Divide Extension Co. for the hanging-wall vein has been started from the 200-ft. point at the Caldwell shaft.—At a depth of 365 ft. the diamond drill which is prospecting the Hecla Divide encountered gold quartz of good grade.

Arrowhead—As a result of improved showing in the property of the Arrowhead Mines Co. there is much activity at this new camp which is seventy-six miles east of Tonopah and only a short distance from the road to Ely. On the 145-ft. level of the main property the showing is good, much high-grade ore being in sight. A townsite has been laid out and Leonard & Chapin, owners of the Ely "Record," are talking of starting a paper.

of a receiver. It is reported that plans are under way to reorganize this company, as there is considerable ore in sight in this property that will yield a good profit under the present price of silver. A large number of claims are held in the Dry Creek country southeast of Mogollon, and prospectors occasionally send in good assays, but no extensive work is going on there at present. The gold occurs as a telluride in these prospects.

SOUTH DAKOTA

BLACK HILLS DISTRICT

Lead—Flooding of the Homestake mine continues, and the water is approaching the 900 level. It will probably be necessary to flood to the 500 level. Diamond drilling and development of other ground away from the main workings is being continued.—At

HOMESTAKE MINING CO.'S HYDRO-ELECTRIC PLANT NO. 1. WATER TAKEN FROM SPEARFISH CREEK, ABOVE SPEARFISH, S. D.

NEW MEXICO

Mogollon—There is not as much activity in the Mogollon district as might be expected with silver selling at its present price. The Mogollon Mines Co. is, however, operating at full capacity. It is reported that more ore was put through the mill last month than in any other one month in the history of the company. The profits were exceeded in only one month prior to last month. Besides ore from its own ground, this company is extracting ore from the Confidence ground to the east. This ore is coming from the extension of the company's 500 and 700-ft. levels east into the Confidence ground. About 150 tons per day being put through the mill. Extractions run over 90 per cent. The Socorro Mines Co. is in the hands

Galena, the New Silver Queen company has resumed work and is producing a good grade of lead-silver ore for shipment to the smelter.—At Maitland, the two-compartment shaft being sunk on the Echo property has reached the 200-ft. point, where a station will be cut and laterals driven. Sinking will be continued to 500 ft.

TEXAS

Freeport—All four units of the Freeport Sulphur Co.'s two steaming plants are operating steadily. Sulphur shipments by rail are being made regularly, but shipments by ocean freighters have been temporarily delayed by silting of the channel at the mouth of the Brazos River. Shipments will be resumed in a short time, when dredging is finished.

CANADA

BRITISH COLUMBIA

Alice Arm—A. J. T. Taylor, head of the Taylor Mining Co., that is operating the Dolly Varden mine at Alice Arm, together with two others interested in the company, has returned from a visit of inspection to the company's property. The season's work at the Dolly Varden mine, it is stated, has been satisfactory and shipments will probably be maintained throughout the winter. It is expected that the rate of output during October will be continued. At present a thousand-foot tunnel is being driven below the lowest workings. This should tap orebodies 250 ft. below the present tunnels. The statement is made that the Dolly Varden mine shipped 112,000 oz. of silver during September, and 150,000 oz. in October. The run of shipping ore is returning from 50 to 70 oz., although some sacked toward the end of the season is expected to run several hundred ounces.

The North Star group, adjacent to the Dolly Varden, has arranged to ship some sacked ore this year. The Tiger group and the Muskette, across the river, have developed some good showings, and will continue with development work through the winter, expecting to ship in the spring.

The Dolly Varden officials state that the railroad between tidewater and their mine has experienced no operating trouble so far this year, and the weather alone will determine the length of its winter operations. Up to the time of their departure there had been no snow at the mine.

MEXICO

GUANAJUATO DISTRICT

Guanajuato—The Pinguico Mines Co. has secured a lease and bond on the Esperanza group of claims at Santa Ana. This group consists of 197 acres on the Mother vein, about 2.5 miles northwest of the city of Guanajuato. Two shafts are at present being unwatered for the purpose of examination. Considerable work was done in the past on these properties, and it is expected that enough ore will be found to keep the San Prospero mill of the company operating for several years. The company is also examining the San Gregorio mine, twenty miles south of Guanajuato. In the event of satisfactory results it is proposed to move the Pinguico mill from Pinguico to the property.

La Luz—There is a project on foot to renew operations on a large scale at the Asuncion Company's properties in the La Luz district near the city of Guanajuato. The properties comprise 1,716 acres and consist of a number of mines opened up on two distinct vein systems. There are twenty shafts, and it is proposed to equip the mines so

that 1,000 tons per day can be milled. Some of these mines have been large producers in the past and are among the most celebrated of the Guanajuato district.—The Peregrina mill of the Peregrina Mining & Milling Co. continues dropping sixty stamps, and is undertaking a vigorous prospecting campaign in the neighborhood of the Peregrina mine, having acquired for that purpose leases and bonds on a number of properties.—The fifteen-stamp mill of the United Mines Co. at the Melladito group of mines has been completed and is now in operation. This mill is constructed so as to increase capacity at a future date.

NORTHERN SONORA

El Progreso—Although retarded somewhat during the last few weeks by the Yaqui Indian scare, which has gripped northern Sonora, operations at the property of El Progreso silver mining company have proceeded steadily and the mill recently completed is handling about 100 tons of ore daily by cyaniding and wet concentration. The company's offices recently removed from Nogales to Douglas, Ariz., and arrangements have been made to handle shipments of bullion and concentrates by truck from the mine 100 miles south of Nacoziari, near Batuc. At Nacoziari shipment is made by rail to the border at Douglas. The concentrates are to be shipped to the smeltery at El Paso and the cyanide precipitates to Perth Amboy, N. J., for refining. The principal values in the ore are in silver and gold, and the mine is known among mining men of Sonora as a former shipper of high-grade silver-gold ores.

The known ore resources of the property occur in five fissure veins traversing its holdings from end to end, paralleling one another. The mine is worked through two shafts, an old one now about 200 ft. in depth, with drifts on the first and second levels, which have opened up continuous oreshoots, the limits of which are unknown. However, about 50,000 tons of ore has been developed in the two drifts. A new double compartment, being sunk now, is below the 100-ft. level, being completely timbered to that point. It is equipped with a large hoist, headframe, and cage capable of carrying the working 500 ft. or more. It is the intention of the management to sink to the 500-ft. level, crosscutting at every 100 ft. to the various veins of the property, then drifting on the vein. Ore from the various dumps is hoisted by an incline track to the crusher level, but the collar of the new shaft is on a level with the crusher floor of the mill. Ores hoisted from the new shaft will be trammed by hand into the mill. The mill has been built on a steep hillside, all machinery being placed on concrete

foundations. The Progresso company has available an abundance of good Mexican labor, with plenty of wood and water in the vicinity. A Macfarlane is manager, and is assisted by five American department heads.

Mina Mexico—E. P. Ryan, manager of the Cusi Mining Co. and kindred interests in Chihuahua, is now at the Mina Mexico, forty miles east of El Progreso, making plans for re-opening the property. For more than four years, owing to revolutionary troubles, it has been idle. Mr. Ryan was unable to make a detailed statement of plans before completing his inspection, as no one connected with the management had visited Mina Mexico for between four and five years. Various rumors of theft of equipment and high-grading by natives have reached the outside world, but nothing definite was known. When the property was abandoned, about the time of Pancho Villa's raid from Chihuahua into Sonora, in 1915, there was a small smelter and a mill on the property, but whether these remained intact was not known. Mr. Ryan was of the opinion that it would be necessary to overhaul all equipment and probably to install a flotation mill.

Accompanying Mr. Ryan on the trip were C. B. Clyne, consulting engineer; J. J. McCleary, master mechanic, and J. S. Dickerson, chief electrician of the Cusi company, each of whom was to investigate the Mina Mexico from a technical standpoint. The natural route for shipping and receiving supplies at Mina Mexico always has been via Toniche, but the branch railroad of the Southern Pacific de Mexico from there to Torin having been destroyed by the Yaquis during the last three years, it will be necessary to ship hereafter via Batuc, where there is available the trucking road from El Progreso to Nacoziari, from where shipment can be made to the border by the Nacoziari railroad. Mr. Ryan's intention was to choose a route for a trucking road from the Mina Mexico to Batuc, should it exist, otherwise to use pack trains to that point and make arrangements for the freighting of the ore northward.

The opening of the Mina Mexico recalls the dramatic struggle to keep it open, approximately five years ago. Despite revolutionary and Indian troubles, which prevented freight from getting into that section for weeks and sometimes months at a time, every resource was strained to operate. When coke for the smelter ran short the then management of the property went so far as to have charcoal burned for use in the furnaces. It was not until the actual menace of Villa's anti-American followers hung over them that the Americans quit and came out.

Metal Markets

New York, Nov. 19, 1919.

Copper was weak in what was distinctly a buyers' market. Zinc, after an exhibition of strength in the early part of the week, experienced a relapse. Lead was strong, but was slightly easier.

Transatlantic freights were unchanged. Transpacific freights also were unchanged.

The British government's stocks of metals on Nov. 1, with the corresponding figures for Oct. 1 stated in parenthesis, were: Copper, 41,422,050 lb. (51,036,160); lead, 72,112 short tons (82,387); zinc, 29,444 short tons (32,831); aluminum, 20,950,720 lb. (22,408,960); nickel, 4,704,000 lb. (4,403,840); antimony, 3,584 short tons (3,696).

United States copper production in September, 1919, amounted to 108,703,075 lb., as compared with 107,994,040 lb. in August, 1919, and 157,992,487 lb. in August, 1918. Imports of copper ore and concentrates, and blister, during September, 1919, amounted to 35,634,562 lb.

Copper

At the close of our last market week it was clear that if any producer had an opportunity to dispose of a block of copper at 20c he would not let it go by. Before the end of the last calendar week business was actually done in million-pound lots at 20c, delivered. Some business was done at the same price on the following Monday, but before the end of Tuesday small producers accepted 19½c; and on Wednesday large producers were sellers at 19½c, delivered, which price was equivalent to 19¾c at refinery. The volume of business, as reported to us, was larger than in the previous week. Some of it was apparently of speculative character. There was a good deal of irregularity in asking prices, for each seller was playing his own hand and the consumer who requested offers was likely to get them over a wide range. It was absolutely a buyer's market. The business that was done for export was very small.

Continuance of good business is reported by domestic wire-drawers and brass-makers, but, nevertheless, they evince no inclination to contract for copper.

Copper Sheets—31½¢ per lb. Wire 23½ f.o.b. factory, weak. Domestic buying dull.

Tin

The market seemed easier and somewhat irregular. Singapore quoted c.i.f., London, £282 on Nov. 13; £283½ on Nov. 14; £284 on Nov. 17; and £286 on Nov. 19. In this market Straits tin ranged from 53½ to 55c during the week.

Lead

A fair amount of business was done, with certain large producers still sellers at 6¾c, New York, though other producers got as high as 6.85c. There was a renewal of offers of small lots of lead from second hands which could be obtained around 6¾c. St. Louis market was steady at 6.70@6.75c, with business done at and between those figures.

Zinc

During the earlier part of the week a rather large volume of business was done at 7.90@8c, which included some buying for export to England and France and some buying by strong speculative interests. Domestic consumers were conspicuous by their absence. Rather free selling was encountered at this level, and upon the failure of the foreign demand to develop any further, speculative support was withdrawn and the market receded to about 7.80c.

The cargo of Australian zinc ore, to be followed by a second one, that will presently arrive in this country is no new development in trade, but is simply the delayed complication of one of the contracts of four years ago.

Zinc Sheets—\$11.00 per 100 lb. since Nov. 14, less 8 per cent on carload lots.

Silver has continued to advance in London on short supplies, until it is now quoted at the highest rate on record, 70½d. This rise in London price has been affected here, however, by the falling rates for sterling exchange, which close at \$4.04, the lowest point reached. The strength of the silver market, however, still continues to depend on the China demand, which continues unabated and at a premium over the London price.

The general stock of money in the United States on Nov. 1, 1919, totaled \$7,721,561,106. Of this, \$2,872,525,066 was in gold coin and bullion, \$308,145,759 in standard silver dollars and \$245,127,765 in subsidiary silver. The money in circulation on Nov. 1, 1919, was \$5,816,925,779, or \$54.63 per capita.

Mexican dollars at New York: Nov. 13, 99½; Nov. 14, 98½; Nov. 15, 97%; Nov. 17, 99½; Nov. 18, 100%; Nov. 19, 101½.

Platinum—Refined ingot was unchanged at \$135 and strong at that.

Palladium—Unchanged at \$120.

Aluminum—33c per lb.

Antimony—This market was strong and steady at 9¼c for spot, at which price a rather good volume of business was done. Futures were quoted at 9@9¼c, duty paid.

Bismuth—Unchanged at \$2.96.

Cadmium—\$1.40@1.50.

Nickel—Ingot, 42c; shot, 43c; electrolytic, 45c.

Quicksilver—This market was a little easier. Business in prompt metal was done at \$90 and metal to arrive was sold for \$80. San Francisco telegraphed \$82.50, steady.

Tungsten Ore—Only a small amount of business was done. Chinese wolframite, at \$8.75@10, and Western scheelite, at \$15.

Molybdenum Ore—Quoted nominally at 75c per lb., but no business reported.

Manganese Ore—Quoted nominally at 50c per unit, c.i.f., Atlantic ports.

Pyrites—Spanish pyrites is quoted at 17c per unit for furnace-size ore, free from fines, c.i.f., New York, or other Atlantic ports. Markets slow and unsettled.

Fluorspar—Lump ore containing 85 per cent CaF₂ and not over 5 per cent SiO₂ is quoted at \$16, f.o.b. mines at Tonoucu, N. M. Freight to Chicago \$7.50; to New York \$15.00. Prices quoted f.o.b. Kentucky and Illinois mines are \$25 for washed gravel grade.

Zinc and Lead Ore Markets

Platteville, Wis., Nov. 15.—Blende, basis 60 per cent zinc, \$50 per ton for Prime Western grade. Lead ore, basis 50 per cent lead, \$82 per ton. Shipments reported for the week are 1,992 tons blende, 226 tons galena, and 360 tons sulphur ore. For the year to date the totals are 88,713 tons blende, 5,886 tons galena, and 17,471 tons sulphur ore. Shipped during week to separating plants, 2,335 tons blende.

Joplin, Mo., Nov. 15.—Zinc blende, per ton, high \$49.20; basis 60 per cent zinc, premium, \$48.50; Prime Western, \$47.50; fines and slimes, \$45@42.50; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$46.07; calamine, \$34; all zinc ores, \$45.83.

Lead, high, \$86.37; basis 80 per cent lead, \$88@85; average settling prices, all grades of lead, \$86.37 per ton.

Shipments the week: Blende, 9,945; calamine, 191; lead, 1,134 tons. Value, all ores the week, \$562,550.

The midweek metal market gave hopes of higher prices, and sellers were nearly certain the Prime Western price would be \$50, but later metal declines left the week-end market unchanged.

Iron Trade Review

Pittsburgh—Nov. 18.

Though the striking coal miners have not returned to work, the steel mills have not thus far suffered from lack of coal, as their stocks have in the main proved ample, particularly as many of the mills have been operating under a sub-normal consumption, on account of the iron and steel strike. In exceptional cases the Railroad Administration, acting for the Fuel Administration, has released coal, as there was a large amount held, and there is now a fairly large production from non-union mines. The Connellsville region, for instance, is producing more than ever. About 3,000 cars are loaded with coal in railroad yards in the Youngstown district.

The iron and steel strike, now in its ninth week, is waning rapidly. Most of the mills in the Mahoning Valley are working fairly well. In the Wheeling district, a tour of the operating mills conducted by the Wheeling Chamber of Commerce for shopkeepers and representatives of the workmen has had beneficial results, by showing that other mills actually are operating. The Chicago and Gary mills are rapidly approaching normal operation.

The American Sheet & Tin Plate Co., as of Nov. 15, has opened its books for sheet and tin-plate contracts, for the first quarter of 1920 in the case of jobbers and for the first half in the case of manufacturing consumers, prices being precisely those of the Mar. 21 schedule. As previously noted, the Steel Corporation has been strongly opposed to price advances, and its October bookings of nearly a million tons, practically all for 1920 delivery, showed that it was carrying its principles out in actual practice. Many of the independents have strongly favored advancing prices.

Pig Iron—Though certain conservative interests making bessemer and basic iron were strongly in favor of holding prices at \$27.25, Valley, and bessemer at \$28.50, the market has got away from them, sales being made at \$30, Valley, for 2,500 tons of basic iron, December to March delivery, and at \$31.50, Valley, for about 2,000 tons of bessemer, approximately the same delivery, the iron in each case being for steel making, so that the business was distinguished from sales recently made of these grades as substitutes for foundry or malleable. Foundry iron has continued to advance, with sales at \$34, Valley, though \$33 might possibly be done. We quote the market advanced to the following: Bessemer, \$31.50; basic, \$30; malleable, \$31@32; foundry, \$33@34; forge, \$31.50 f.o.b.

Valley furnaces, freight to Pittsburgh being \$1.40. These prices average nearly \$5 a ton above the Mar. 21 schedule.

Ferromanganese — The market has been quiet, with occasional sales of prompt domestic at \$105@110, delivered, English being sometimes available at \$95@100, Baltimore.

Steel—The Steel Corporation has covered regular customers some distance ahead at Mar. 21 prices, \$38.50 for billets and \$42 for sheet bars, but there is much unsatisfied demand, and the only open market offerings are at \$3 to \$4 a ton premium.

Coke—Coke operators expect to secure much higher prices on foundry and furnace coke on contracts for the first half of 1920 than they are receiving on contracts for the present half year, partly on account of scarcity and partly on account of increased costs due to the prospective wage advance, hinging on the settlement for the union coal mines, now under negotiation at Washington. One operator sold foundry coke for first half at \$7, plus whatever increased cost may come from wage advances, and then withdrew. Some furnace coke is understood to be offered at \$5.50, but most operators talk \$6 or higher. The prompt market is about \$6 for furnace at \$7@7.50 for foundry, per net ton at ovens.

Metal Market

New York, Nov. 26, 1919.

Further crumbling away in the price for copper, and a distinctly easier tone in the market for lead, were the distinguishing features of this week. Zinc experienced another sudden and sharp rally. Tin, after being erratic, advanced sharply, reflecting what appears to be the institution of a bull movement in London.

Transatlantic freight rates were unchanged. Transpacific rates declined, \$12 being quoted from San Francisco to Hongkong and Kobe.

Copper

By the afternoon of Nov. 20 copper was available from nearly all quarters at 19c, and during the remainder of the week the bulk of the domestic business was done between 18½ and 19c. The market was more or less uncertain, some producers being suspected of selling on private terms and endeavoring to conceal their tracks, which gave rise to various rumors and gossip coming back into the market via buyers. At the close the situation seemed to be about like this: Consumers were willing to pay around 18½c., f.o.b. refinery, for delivery during the first quarter of 1920. Business had been accepted at 18%, refinery, by producers for prompt delivery. Japanese buyers

24	97¼	98¾	109	292¼	294	36¾	36¾	48	48½
25	95½	97	109	295¼	296¾	36¾	36¾	48	48½

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

were reported as showing some interest in copper and willing to pay 18¼c. A lot of 200,000 lb. was sold on the Metal Exchange at 18¼c.

Small business was done through the week by the Export Association at slightly higher prices than prevailed in the domestic market. In the latter the buying was mainly by wire-drawers, but there was some by brass-makers. The brass-makers are reported to be feeling sore over the way in which the copper market has been allowed to go, and speak about signs of recession in their own business.

Tin

This market was erratic, reflecting what appears to be the institution of a bull speculation in London, the basis for which is supposed to be the theory that there will be shortage in the supplies from the Straits. It will be noted, however, that the Eastern market did not advance in anything like the same proportion as London.

Singapore quoted, c.i.f., London, £287 on Nov. 20; £288½ on Nov. 21 and 24; and £289 on Nov. 25. Quotation for Nov. 26 not received. In London, spot tin was £283 on Nov. 20; £284¾ on Nov. 21; £288¾ on Nov. 24; £290½ on Nov. 25; and £295¼ on Nov. 26. Sales

on these days were 450, 500, 1,100, 900, and 650 tons respectively.

In the New York market prices rose in sympathy with London, that for Straits tin ruling about ½c per lb. above that for 99% brands. The advance in prices inspired the liquidation of some old bull accounts, but there was not induced any significant buying by consumers.

Lead

Reports were conflicting, some producers reporting important inquiry and the consummation of a good deal of business, while others reported just the reverse. Assembling all reports, however, it appears that a pretty fair tonnage was placed, but, on the whole, at slightly lower prices than in the previous week. The situation in lead has in fact become distinctly easier, which is ascribable to increasing production. This has been reflected emphatically in the St. Louis market, where some small producers have been shading prices, while today a large producer offered lead below 6.60c.

A rather fair export business was done with France, England, Sweden and South America.

Zinc

During the early part of the week the reaction went further under the influence of some large speculative

offerings, but on Nov. 24 began one of the sharp recoveries that have been characteristic of this market recently. The last recovery followed upon considerable buying for export, together with some fair orders by domestic consumers. The houses that are buying for export continue to give preference to zinc available for delivery west of the river. This, together with position as to time of delivery, creates differentials in prices. At the close the market is quoted firmly on the average basis of 8c., St. Louis.

Antimony—This market was strong, with considerable business done. We quote spot at 9@9½c. and the same for futures.

Aluminum—Unchanged at 33c. per lb.

Palladium—Unchanged at \$120.

Platinum—Refined ingot \$135@\$140.

Quicksilver—Business in prompt metal was done at \$85@\$88, and metal to arrive was quoted at \$80@\$85. San Francisco telegraphed \$80 steady.

Tungsten Ore—Only a small amount of business was done. Lower grades of tungsten ore were quoted at \$6.50@ \$7. Bolivian and South American ore at \$10@\$12 and Western scheelite, at \$15.

Molybdenum Ore—Quoted nominally at 75c per lb., but no business reported.

Manganese Ore—Quoted nominally at 50@55c. per unit, c.i.f., Atlantic ports. There is a little more inquiry.

Copper Sheets—30c per lb. Wire 23c f.o.b. factory, weak. Domestic buying dull.

Zinc Sheets—\$11.00 per 100 lb. since Nov. 14, less 8 per cent on carload lots.

Bismuth—Unchanged at \$2.96.

Cadmium—\$1.40@\$1.45.

Nickel—Ingot, 42c; shot, 43c; electrolytic, 45c.

Silver—During the last week silver has advanced rapidly in London from the price on Nov. 20 of 71¼ to 76d. on Nov. 25. This figure is the highest price silver has attained in this spectacular advance. The London quotations have gone up chiefly from the fact that the amounts for sale in London have been limited and not equal to the demand. Then, in turn, the London price has stimulated Shanghai quotations. As a result of this combination, the official price in New York has moved up rapidly. The sharp advance in New York on Nov. 20, when the price here was materially influenced by the Oriental exchanges, also reflects the focusing of the Asiatic demand on New York and San Francisco, rather than on London; and it followed naturally after the restrictions put on the export of silver from London, as well as the curtailment of supplies from Mexico, owing to the attitude of the Mexican government. The future out-

look of silver from this point is uncertain, as influences at work may create a reaction from current figures.

Mexican dollars at New York: Nov. 20, 102½; Nov. 21, 103½; Nov. 22, 103¾; Nov. 24, 104¾; Nov. 25, 105½; Nov. 26, 100¾.

Pyrites—Spanish pyrites is quoted at 17c per unit for furnace-size ore, free from fines, c.i.f., New York, or other Atlantic ports. Markets slow and unsettled.

Sulphur—Prices remain unchanged at \$20 for export delivery and \$18 for domestic delivery; per ton f.o.b. mines at Freeport, Tex., and Sulphur Mine, La. Shortage of labor and coal continues to prevent Sicilian mines from providing for European demand, and prevailing rates remain high on shipments from the United States.

Nitrate—Spot supplies are quoted at \$2.97½ per cwt. for carload lots.

Fluorspar—Lump ore containing 85 per cent CaF₂ and not over 5 per cent SiO₂ is quoted at \$16, f.o.b. mines at Tonuco, N. M. Freight to Chicago, \$7.50; to New York, \$15. Prices quoted f.o.b. Kentucky and Illinois mines are about \$25 for washed gravel grade.

Graphite—Ceylon grades are quoted: Lump, 15@16c.; chip, 11@12c.; dust, 8@9c. The recent increase has been owing to the increase of premium on rupee exchange and higher freight rates.

Feldspar is quoted from \$13.50 to \$17 per ton, according to quality. Labor difficulties are hindering producers in increasing production.

Zinc and Lead Ore Markets

Joplin, Mo., Nov. 22.—Zinc blende, per ton, high, \$49.80; basis 60 per cent zinc, premium, \$46; Prime Western, \$45; fines and slimes, \$42.50@\$40; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$46.44; calamine, \$32.45; all zinc ores, \$46.45.

Lead, high, \$88.30; basis 80 per cent lead, \$85@\$88; average settling price, all grades of lead, \$87.23 per ton.

Shipments the week: Blende, 12,097; calamine, 80; lead, 1,130 tons. Value, all ores the week, \$664,160.

Producers generally are now convinced there will be no stability to the ore market until international credits are established on a basis that will permit a free purchase of metals abroad. Representatives of Belgium smelters, who visited this district in the summer, expected to have an exchange basis permitting them to export ore from this district before the end of the year. Production continues strong, but some mines are down from lack of coal.

Platteville, Wis., Nov. 22—Blende, basis 60 per cent zinc, \$50.50 base for Prime Western grade; lead ore, basis

80 per cent lead, \$85 per ton. Shipments reported for the week are 1,912 tons blende, 291 tons galena, and 175 tons sulphur ore. For the year to date the totals are: 90,625 tons blende, 6,177 tons galena, and 17,646 tons sulphur ore. During the week 2,759 tons blende was shipped to separating plants.

Iron Trade Review

Pittsburgh, Nov. 25.

The iron and steel strike has been crumbling fast in the last fortnight and is now nearly over. The coal strike continues, but the steel mills have not been hampered in operation, as they had considerable coal stocks, coal taken by the Fuel Administration just before the strike is being released in cases of necessity, and there is a fair volume of production from non-union mines.

The serious item for the steel industry now is not the strike, but the after-effects of the strike, with working forces disorganized and the necessity of training many new men, or old men in new jobs. Some mills made a rule against taking back strikers of certain nationalities or degrees of illiteracy. A long period is faced, perhaps six months, of production being much below capacity on account of the labor situation. As to the general labor shortage, the majority of manufacturers hold it will affect the iron and steel industry also, but a few claim that the wages paid are sufficient to attract enough men from the outside to man all the equipment that is to be operated, the training necessary being the chief restrictive influence.

Pig Iron—It is difficult to buy at prices quoted by conservative producers as the market, but the situation has not been thoroughly tested, as the call is chiefly for the early deliveries, and few if any producers would sell for late deliveries in any event. On this basis we quote: Bessemer, \$31.50; basic, \$30; malleable, \$32@\$33; foundry, \$33@\$34; forge, \$31.50, f.o.b. Valley furnaces, \$1.40 freight to Pittsburgh.

Ferromanganese—The market is stronger, and domestic producers may be able now to get their asking price of long standing, \$110 delivered. Recently there were sales of 500 tons, 200 tons, and two lots of about 100 tons of English, to local consumers, at \$100, Baltimore, but there are no regular offerings now at any price. Spiegeleisen is quotable still at \$34@\$35, furnace, but some makers are asking up to \$45.

Steel—Premiums seem to be the rule for small lots of prompt, but leading producers are adhering to Mar. 21 prices with old customers.

Number 21

A Question of Policy

What shall be the policy of the Engineering and Mining Journal with relation to vital problems which affect the mineral industries? That is a question which we have to think over and decide at the start, and we don't mind thinking aloud—it may help. First, it seems clear that the Journal covers and represents the whole field of the mineral industries—not only that of the miner, but the smelter, the dealer, and the consumer. The ties between all are so close that no one of these nowadays can transact his business intelligently without understanding the whole cycle; and an increasing number of organizations combine two or more of these functions.

There are no strings on the Journal or its editorial staff. It is neither subsidized nor financed by mining or smelting interests or by those of the consumer; but it is plain that the welfare of all is vital. Substantially, then, the mineral industry of the United States is its field. But the American mineral industry is not confined to American territory. It reaches into Mexico and South America; and in a lesser degree into Europe, Asia, and Africa. We believe in the protection by our Government of the rights of American industry abroad, and in the theory of commercial *aure* or *penumbra* around the nation, which, although diffused in varying degree, still retain the rights and duties of nationality. Beyond all this is the international situation with which we are each day more closely bound, as members of a shadowy, waxing and waning, but ever more clearly defined, world brotherhood. We have many readers in Australia and Japan, for example, who look to us for a clear and fair presentation of facts concerning the mineral industries elsewhere.

Thus far, all plain sailing. Let us suppose, however, that a flourishing abrasive (garnet and corundum) mining industry could be developed in the South, by subsidy or protection, but that the change would be disadvantageous to abrasive consumers, would cause a lessened consumption, and the adoption of substitutes of inferior quality by manufacturers at an equal or greater cost to the final consumer. What then? Let us suppose, similarly, that any section of the country has its new baby of a mining industry, which it desires to have fed by the country at large, at the expense of the diet of the rest of the family. Shall we fight the battles of the kid because his last name is Mineral, and we belong to that clan?

Our representative government, our legislative bodies—whether municipal, state, or national—operate more or less fully and frankly, on the basis

of sectionalism: each Alderman gets what he can for his ward, each Assemblyman for his corner of the state, each Congressman for his district, and each Senator for his state; and the outcome of such competition, when tested by voting, forms a fair sort of representative government, though an expensive and turbulent one. Similarly, trade journals may reflect and advocate as a matter of course the interests of the trade they represent, with no pretense of sympathy or understanding for the impinging trades.

When it comes to the mineral industry, we find associations of producers sometimes sharply in conflict with associations of consumers; or we find the interests of the producers of one mineral opposed to those of the producers of another, where the two are competitive for a market or for use. Such special-interest organizations are necessary and useful. Even organizations of national scope, if they frankly represent, let us say, the producing phase alone of the mineral industry, or the consumers or the importers' interests alone, regardless of the rest of the mineral industry, or of the country at large, are justified and worthy, so long as their field and attitude are clear to themselves and others.

In ascending the scale of responsibility, however, a stage is reached where partisanship and favoritism should be discarded in favor of a calmly judicial friendship to all. Such a stage, it seems to us, is occupied by the executive branch of our government, in all its forms; and in this group are included the bureaus representing the mining industry, the Bureau of Mines and the Geological Survey. What should be the policy of these bureaus? Should they support doctrines and measures which would benefit ten miners and injure a thousand farmers, and so conflict irremediably with the Agricultural Department, which, in its turn, would have the motto "We represent the farmer; the miner be damned"? We think not, as all are arms of the Chief Executive, who ideally is what the Indians call him, the Great Father in Washington; and so these mining bureaus will act as experts to further the prosperity of the mining and mineral industries, will be on watch as special "friends at court" to interpret, represent, and help them; but will do so in all fairness as regards other men.

In these vexing problems, there is no rule that works except the national one of the greatest good to the greatest number; and from this national point of view in the last analysis, a Federal bureau will not deviate. Where the interests of the mining and mineral industries, or any portion of them, conflict

with the average best interests of the whole country—East, West, North, and South—a branch of the Federal Executive will recommend to the rest of the Federal Government the solution which means the welfare of the majority.

Finally, to return to our own problem, what about the mining press—what about the Engineering and Mining Journal? The common-sense reply, it seems to us, depends on whether we represent a trade or a national publication. If the former, by all means boost—don't knock. It is also the easiest way. But the actual scope of the Journal, above partially sketched, is not only national but international. It seeks to cover (how inadequately we recognize with humility) all phases of an industry which in its entirety is not sectional, but is part of the very fibre of the nation's being and of the business and welfare of every citizen.

Iron and steel, copper, oil, lead, and zinc—these represent the foundations of prosperity of every state and group, and of the states united. We cannot see that it is possible consistently to assume partisanship for any part against the whole. Even in the most trying possible case, where a certain policy may appear to be for the benefit of the American mining industry as a whole, but opposed to the best interest of the country at large, we find no safe ground except in the rule of the greatest good to the greatest number. To favor groups or minorities at the expense of the rest of the country is to be unfair even to them; for whatever benefits the country at large is bound to react favorably on all groups, and be most to the advantage of every citizen.

The Conservation of Metals

SOME years ago, Gifford Pinchot, backed by Theodore Roosevelt, then President, launched a vigorous campaign in opposition to the popular impression that the resources of the United States were inexhaustible and indestructible. A trained forester, he focused his preaching on the reckless destruction of American forests (the heritage of centuries and the common dower of America—past, present, and future), for the enrichment of a few swift grabbers. He showed that unscientific and opportunistic forestry meant the destruction of the forests, irreparable washing away of the soils that had accumulated for thousands of years, and the trifling with local climatic conditions. The result of his campaign was the establishment of the Forestry Service, the withdrawal of Government forest reserves, and much other work that was good, even though it has not been far-reaching enough.

At the time of this forestry campaign, some attention was called to the advisability of conservation measures regarding our other natural resources, such as our minerals; but this phase was passed over lightly. Yet a forest of some useful varieties, like eucalyptus or white pine may grow from infancy to marketable age in a generation; but an ore-body, once removed, is never renewed. Every pound of metal extracted from the earth leaves mankind in practical perpetuity that much the poorer.

The full consciousness of two things has only recently begun to dawn upon us—first, as to how immensely important to our modern civilization and to the strength and power of nations it is to have mineral wealth within our boundaries; and, second (through the more mature understanding of the geology of ore deposits) what are the relative and probable limits of metallic supplies in this country and in the world. Many nations are now enacting legislative measures to secure to themselves the maximum benefit from such mineral wealth as they have and enable them to "stake" all they can elsewhere in the earth before the world is all "located," to use the parlance of the prospector, to whose role the nations are turning.

Conservation measures of many countries, such as England, France, Spain, Mexico, and others, include a discrimination against aliens in favor of nationals, in order to prevent the benefits of their political control being superseded by a more powerful commercial control, and their mineral resources extracted to increase the wealth and power of foreign nations.

There is the stress of approaching necessity behind this movement. Already the competition for metals and metal-bearing districts has become keen among the great industrial nations; and, granted that our modern civilization is not quenched for all time by a bolshevist upheaval, we see clearly directly ahead of us an industrial era far more active than anything of which the world has ever dreamed. New peoples and new countries will demand the devices of modern mechanism, as a result of their own emulation and the missionary salesmanship zeal of the nations which are leaders in industry. Science and skill can cultivate renewed and even larger crops of many of the staple raw materials, such as textiles and foodstuffs; and even, to a degree, lumber; but progress of time and industry means a swiftly increasing shortage of mineral wealth. This would have visited the world long ago had any such intensively exploiting period ever before occurred in its history; and now that it has come, we must consider the results.

Doubtless most of us think that a serious shortage of metals is a matter too remote to affect us practically. It is true that the maximum effects will doubtless be considerably postponed. If, however, we look a thousand years ahead with the present rate of progress, we must picture a strange world, where many substitutes and devices have taken the place of the metals now prodigally used. Should the present rate of extraction be kept up, practically all our easily accessible and our higher-grade mineral wealth will have been used up long before this period, and mankind will either have had to give up the attempt, and have reverted to a simpler civilization, or will be extracting, at great cost, the elements from the rocks themselves.

Some metals, however, will be exhausted before others. Iron and coal will last a few centuries, and are abundant at present; other materials have a relatively long time to run; but in some things the

shortage is already upon us, and will increase swiftly. This is true, for example, of the precious metals gold, silver, and platinum, of various steel-hardening minerals, like tungsten, chromium, and vanadium; of radium and of tin. These metals are going the way of the auk, the aurochs, and the buffalo. It is estimated that the petroleum of the United States will be exhausted in ten to thirty years.

The war has brought home to the world the necessity of a wise nationalism: that the great states and races should hold themselves as separate units of the world league; otherwise the fusion of all would result in a mongrel mixture in which the benefits of evolution and the patient breeding of superior types would be lost. Therefore the great nations are casting about for measures to preserve their natural advantages, and increase them by adroit measures.

The "squeeze" of diminishing resources has not yet come to the United States as it has to the European nations, and therefore we have no national consciousness of one impending. We have for the moment the advantage of wealth, which we are squandering but which is still unsquandered, and we therefore estimate ourselves as a people with special gifts. It is the popular conception that we have only to develop our mineral industries like tungsten and chrome by protection, for these industries to be established on a policy of ever-increasing prosperity, and warnings of the geologist to the contrary are looked upon as "old wives' tales." Consider, however, the chrome industry of Maryland, which, in the earlier part of the nineteenth century, was the chief source of the world's supply: it is no longer producing. Already the gold deposits of Alaska are largely exhausted after twenty years of modern exploitation. Some metal deposits, like tin, we do not possess in commercial quantities at all; others, like tungsten and chrome, we have in so small a quantity that they would be exhausted in a few years of extraction, under the forced draft of prices artificially heightened by protection; others, like copper, we have been abundantly provided with, but we have already reached or passed the zenith of our meteoric exploitation. In other words, the sapping of our national strength by prodigal consumption of our irreplaceable limited stocks of metal is not a matter of a thousand years hence, but of the present generation, and still more intensely of the next. We are passing to our sons to bear the debts the United States has incurred in this war. Is it fair for us to squander their patrimony and not leave them as well provided as possible with the means wherewith to pay? Is it generous for a few of us to howl for sudden wealth through feverishly robbing the earth of the fruits of all time; and to have the wealth made possible by forcing an abnormal market on the rest of the people through special legislation? Certainly it is not for the best interests of the country. We may not expect the Republic to last forever, but we have inherited the results of our forefathers' work, and our duty, at the least

estimate, is to hand on the Republic unplundered and unscathed to our sons. When our own stores are gone, we shall have more difficulty than now in getting them elsewhere, for other nations are waking earlier than we to these fundamental facts; and the principle of export duties and other discriminatory legislation in order to further conservation and to give the national possessors of wealth economic advantage, is coming to be more commonly employed. For the immediate present, let us conserve the stores of our own "cache" prudently, and eke out by buying where we can most cheaply. We shall not always have the opportunity.

The Downtrodden Capitalist

A capitalist, says our good friend the dictionary, in effect, is one who has accumulated goods, which he uses to promote the production of more goods, rather than for his immediate enjoyment. Most of us are capitalists—all but the unfortunate and the unfit. The owner of a prospect, a mine, a share of mining stock, or a Liberty Bond, a farm, a taxi, a fishing sloop, or a sawmill, is a capitalist. A country is strong and steady in proportion to its amount of capitalism. In France, we are informed, nearly every one is a capitalist. In the United States, there are fewer capitalists, perhaps, than in France, because more, even of the prosperous, live from hand to mouth. The man with an automobile and a mortgaged home is not, perhaps, a capitalist, but the plumber who holds the mortgage is one. Let every one who does not belong to the capitalistic class start a savings-bank account, and become a capitalist.

Is the above far-fetched or humorous? Not in the least. The working capital of the country is mainly held by the population at large, who have invested their savings in Liberty Bonds, railroads, public utilities, mortgages, and savings banks. And having invested his savings in railroads or public utilities or other ordinary forms of investment all necessary for the country's progress—having loaned his accumulated overtime labor and self-denying thrift to the public in response to its urgent solicitations and demands,—the individual with the formidable designation of "capitalist" becomes the most helpless lamb imaginable. He has no rights nor friends. When not only his income from capital but the capital itself is wiped out by the great forces of the day, he seldom has courage even to expostulate. He is outside the law. He is the prey of the wage-earner on the one hand and the organizer on the other. The former, spending as he works, has prior claim on all available moneys so long as there are any; and the latter has many devices to assure of not being overlooked in the division. If worst comes to worst, he reorganizes the enterprise in question, and there is enough left for the wage-earner and himself; but the capitalist finds himself thrown out into the street. Possibly he deserves no better, for he is not greatly gifted with sense; he is usually a strong partisan of the wage-earner (whom he calls the "laborer") and hostile to the organizer (whom he calls the "capitalist"). He loves what he conceives to be

the under dog, as a result of the atmosphere of fanciful economic folk-lore in which we live; and when he is sandbagged and robbed by both the maiden and the dragon, he is so ashamed to think that he had secreted a private fund that he will not go to the police with the story, but starts another surreptitious hoard out of his \$36 or \$72 per week.

The organizer is a most useful citizen. He is a great producer, who deserves a far higher share in the division of the profits than the rest of us. Our problem for the future is to decide how much he shall have, and that he does not take too much. The virile organizer has sometimes spells of berserk madness; he reverts temporarily to his viking ancestors and cannot help trying to pirate the whole. Our other problem is to see that the wage-earner (honest laborer) does not take it all, for he is not gifted with imagination and would gladly take it all, and more—he needs it.

Know then, honest miner, mining engineer, or holder of mining stock, that the quaint division into capital and labor, if it ever applied accurately anywhere, does not do so here and now. The average and the ideal American is both capitalist and laborer; he works, and produces, and he has, by overtime work or the expenditure of excess energy, saved something to make his old age dignified. About one in ten, perhaps, of such average Americans is also an organizer to a greater or less degree. The organizer, again, may or may not be a capitalist; but if he is not one, he hopes so to become. They are all indispensable professions; and a proper division of the rewards will not ignore the rights of any—least of all the members of the unorganized capitalistic class who can now only compensate their losses by the fact that they are also laborers. If they are past labor—and there are many of them—then may God console the aged or broken-down capitalist and wage-earner or his widow, for the law does not provide against his robbery by the other two active parties.

Gasoline Locomotives Underground

IN THE November Bulletin of the American Institute of Mining and Metallurgical Engineers, F. J. De Wilde contributed an interesting discussion of the paper on "The Wisconsin Zinc District," by W. F. Boericke and T. H. Garnett. From this discussion we quote the following paragraph:

"Haulage—It seems to me that the gasoline and storage-battery locomotives have been slighted by the authors and favoritism shown to the mule. The authors state that haulage costs when using mules are from 25c. to 35c. per ton-mile. This is excessively high when compared to mechanical haulage, where the cost is seldom above 24c. per ton-mile with a limited tonnage. Where large tonnages are hauled, the average is about 16c. per ton-mile. When first used, the cost has been as low as 8c. per ton-mile. These figures include the cost of maintenance, repairs, oil, gasoline, and depreciation. The exhaust from gasoline locomotives vitiates the air consider-

ably and it always takes some time for the men to become accustomed to the fumes. The mines must be kept well ventilated for good results."

The methods of underground haulage, the burden of the paragraph quoted, are given as, mule, gasoline locomotive, and storage-battery locomotive. Concerning the mule and storage-battery locomotive there need be little discussion, as both methods are safe insofar as underground conditions are concerned, and the selection of either is dependent upon comparative costs of installation and operation in specific cases. The writer's statement of the vitiation of the air by the exhaust from the gasoline engine, and that it always takes some time for the men to become accustomed to the fumes, should make mining engineers sit up and raise the question whether men can ever become accustomed to the "fumes." The poisonous constituent of the "fumes" is carbon monoxide. Viewed from a physiological standpoint it is a matter of doubt whether the human system can accustom itself to the continual presence of even a small percentage of this noxious gas in the air of a mine. In justice to Mr. De Wilde, it should be noted that he states that the mine must be kept well ventilated to secure "good results."

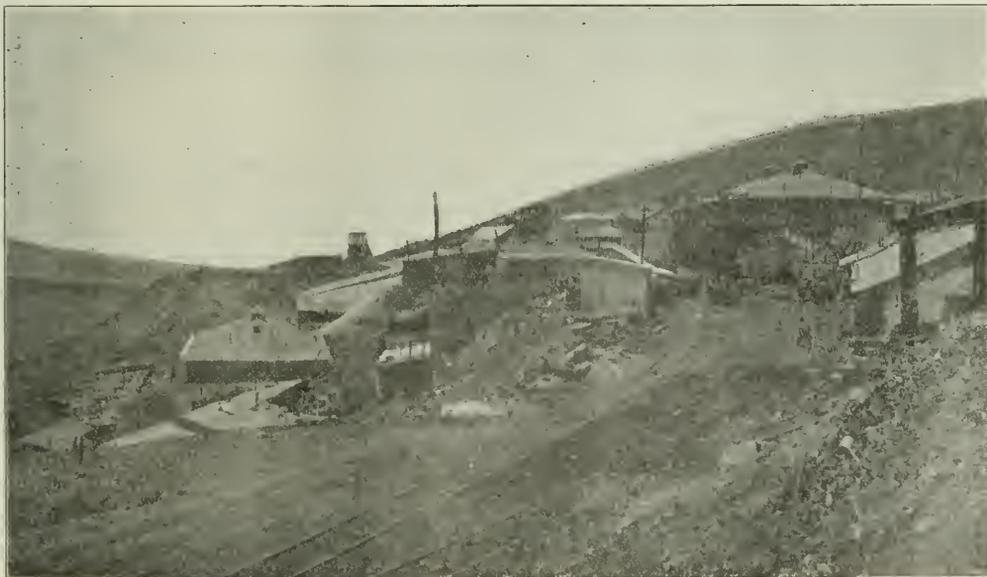

The use of the gasoline locomotive underground at all is objected to by many well-qualified engineers. The Bureau of Mines advocates the elimination of internal-combustion locomotives from underground workings. A similar position is taken by some states in their safety regulations. The prevailing use of the internal-combustion engines for many purposes raises the question as to whether this position is not a reflection on the ability of engineers to overcome a difficulty which imposes such restrictions upon the use of gasoline locomotives underground. We do not know of any recent work done upon the gasoline locomotive with the objective of rendering the exhaust gases innocuous; but we believe that experimental investigation should be pushed, and the question of the practicability of the gasoline locomotive underground determined on more substantial grounds than at present exist. Whether the difficulty lies in the carburetor, or in a change in compression, or in the proper selection of lubricants, are points which should be cleared up. There are few absorbents of carbon monoxide, and probably none is practical. It appears to us that the design of the engine, the perfection of a suitable carburetor, and the standardization of the operating details of the engine are the significant features that might lead to the development of an engine unit that could be satisfactorily used underground. Until this is done there will be the temptation to use the existing gasoline locomotive underground, and though its use may be restricted to those parts of a mine where there is good ventilation, occasions may arise where portions of the mine might become charged with dangerous amounts of monoxide in quantities greater than even "men accustomed to the fumes" can safely inhale. It seems to us that the investigating already done by the Bureau of Mines might well be extended and pushed to early completion.

LA GRANDE MINE, COLLAHUASI, CHILE

Panel System of Stopping at the Herman Mine

Underground Conditions Made Advisable the Adoption of a Method of Mining Which Assured Economic and Safe Removal of Ore—Stopes Worked by a System of Raises Within Oreshoot, Followed by Panel Stopping

BY S. H. BROCKUNIER

Mining Engineer, Lowell, Mass.

THE Herman gold mine, in Placer County, Cal., presents unusual features, and, in the mining of the vein, offers difficult conditions. This article describes the vein and the manner in which an unprofitable method of stoping was changed a few years ago into a profitable one.

The Herman vein consists of quartz, lying wholly within schist walls. This schist is blocky and has many cross fractures. On the hanging wall there is a layer of soft black slate, making the upper part heavy and subject to many falls without warning. This is especially true if a large surface is exposed to the air for any length of time.

to four inches in diameter and sometimes twelve inches long. Some of them were clear quartz and some stained from the iron in the vein, producing different shades of amber and brown. Contrary to the usual rule, the gold content increased in or near these watercourses, so that often the mill would be stamping rock crystal and recovering gold. Surrounding the courses the vein was usually shattered; the quartz could be dug out by hand and resembled dirty rock salt. The greatest gold value was found in these places, and depth may prove that the pockets result from a mechanical sorting and concentration of the gold from the vein above.

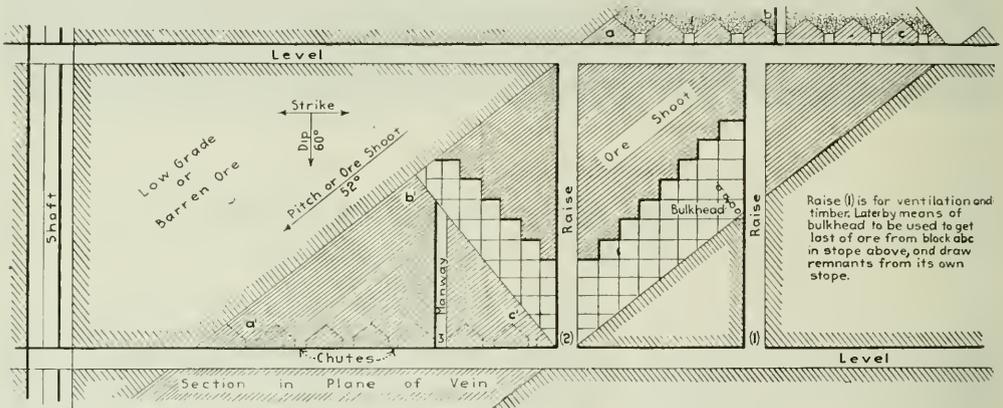

FIG. 1. FIRST SYSTEM USED AT HERMAN MINE. OVERHAND STOPING USING SQUARE SETS

The quartz vein is from four to thirty feet thick. The gold is confined almost entirely to shoots, which are generally in the thickest part of the vein. Usually the value decreases without any change in the thickness, although there is a physical change, which the trained eye can detect, as the quartz becomes denser and more glassy as the value decreases. There are many high-grade spots in the shoot, but as a whole the ore is a low-grade, and all the methods of mining and milling were consequently governed by that circumstance.

The quartz in the principal oreshoot was unusually abrasive to tools and mill, but was brittle and easily broken. It contained numerous water courses, some of which occurred at a depth of 1,000 ft. below the outcrop and formed caverns or holes six or eight feet in diameter. These caverns were lined with beautiful quartz crystals from a fraction of an inch

The quartz, where shattered, was usually ten or twelve feet thick, and much of it could be picked down. When dynamite was used, the charges were made light to avoid caving of the heavy hanging wall, which had caused so much trouble that the previous practice had been to open the shoot by raises from the level below and then extract the ore by overhand stoping, timbering closely with heavy square set timbers. (See Fig. 1.)

This method worked satisfactory in that the hanging wall was supported during the progress of the work but the practice was dangerous and entirely too slow and expensive, considering the grade of ore obtained, and at least one of the raises was in waste all of the time, and therefore was an additional expense, with no return.

After considerable experimenting it was found that the hanging wall in these stopes would stand

well, without timber, up to twenty feet of open space, providing that a little quartz was left on the hanging and the opening was given an arched roof. The method of mining was therefore changed, and the stopes were worked by a system of raises within the oreshoot, followed by stoping in panels across the shoot (see Fig. 2), using only an occasional stull to catch up a loose piece of ground, or as a support for the drillers where the dip was steep. If the work was too slow there were occasional falls of large blocks, and these had to be worked out, and were used to fill the lower stopes.

One hundred and fifty feet between levels proved to be the proper distance for synchronized work of the miners in a shoot 200 ft. long and from eight to twelve feet thick. Two drillers were started in raises No. 1 and No. 2, and one driller worked in

The temporary manway into No. 2 was necessary in the beginning to permit entrance to stopes after blasting when chutes No. 1 and 2 were filled with ore. When the driller in No. 3 made connection with the upper level he came back to the lower level and made the openings for chutes on each side of his own raise, as shown at a, b, c. These chutes were used in stoping the block of ore a-b-c by the usual method, leaving pillars to support the hanging.

After the stopes were fully opened, the pillars on both sides of the panel stopes were sliced down and finally cut through, leaving the small pillars shown by reverse cross-hatching. These pillars were drilled at this time and were shot down as the ore was drawn in the stope. The pillars in the level above were also drawn at this time, allowing the caved waste and mat from the stope above to rest

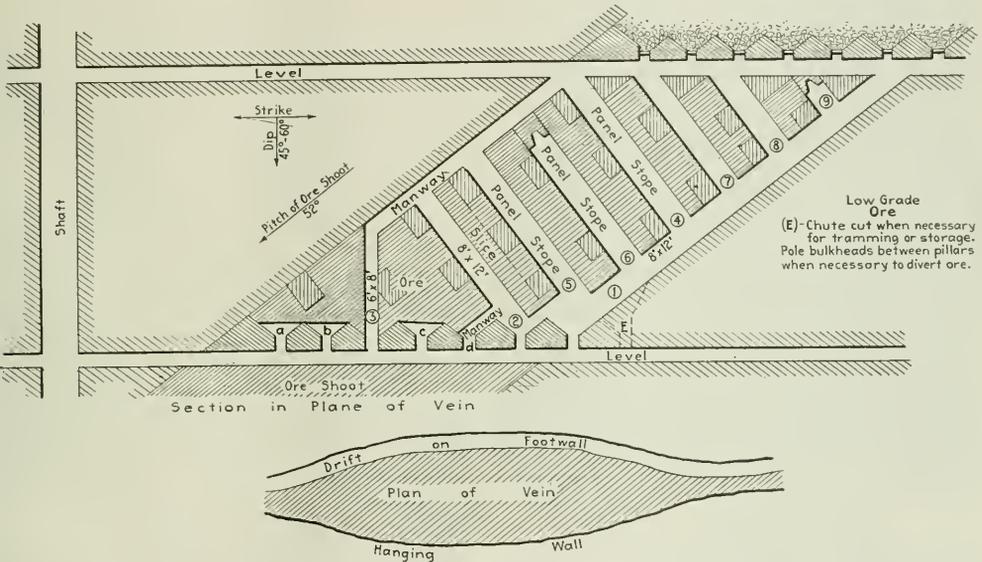

FIG. 2. PANEL SYSTEM LATER USED AT THE HERMAN MINE

raise No. 3, all on the foot-wall side of the vein. Raises No. 1 and 2 were 8 x 12 ft. and raise No. 3 was 6 x 8 ft., hence the footage to be made in each was the same, and No. 2 and No. 3 intersected at the same time that No. 1 reached No. 4. The driller in No. 3 then turned with the oreshoot and continued to the upper level. His raise was used for a manway and for ventilation, and was necessary to this manner of working. The drillers from No. 2 then moved to No. 4 and drove that raise, while the drillers in No. 1 continued to the level above. The drillers from raises No. 1 and No. 4 were then changed into the panel stopes 5 and 6, and two other drillers put in 7. When half way up the drillers sometimes broke through the pillars on either side in order to get air and timbers more readily, and to permit leaving broken ore in the stopes below.

on the top pillars and follow them down when they were drawn last. Of course, if the level was to be retained for haulage or access, it was necessary to leave these pillars until later or to replace them by timbers. The thickness of the pillars depended upon the nature of the ground, although they were kept as narrow as was consistent with safety.

The disadvantages of the method were that it threw the bulk of the ore into two or three chutes, thus making it more difficult to get speedy tramming, but this was also true of the old method; and there was little opportunity for storage of ore, as the stopes were worked practically open, the only storage being in the lower part. The method would, therefore, be inapplicable excepting in cases where ore was to be removed quickly. Shrinkage stoping had not worked well on large areas, as the hanging crushed down and pinched the broken ore.

The advantages of this method were as follows: Speed in opening the stope, which was vital in order to prevent large areas from being exposed to the slacking influences of the air; little timber used; no ladder ways excepting in the bottom of No. 3 raise; practically no mucking in stopes, unless the vein became very flat; the miners at all times working under a cover, and several men were always working in proximity and could help each other in case of trouble, although having their own places of working out of sight of each other. All of the development was in profitable ore the entire time, doing away with handling of waste, and all raises, excepting No. 3, were large enough and pulled enough ore to be classed as stopes.

The miner in raise No. 3 pulled 15 to 20 tons per shift, the miners in Nos. 1, 2, and succeeding numbers, pulled 40 to 50 tons per shift per raise, and the pockets in No. 1 and No. 2 chutes had therefore to be made large enough to accommodate that amount of ore and yet allow access through the temporary manway d, while No. 1 and No. 2 were being driven.

Of course the presence of unusual quartz made it possible to secure such tonnages in the raises, and speed was further facilitated by driving the raises without timbering, excepting for an occasional stull. In harder and more compact quartz the method would not have worked—that is, it would not have been economical—but in that case the probabilities are that the hanging wall also would have been better and the practice described would not have been necessary.

The method was developed to meet difficulties in a special case, and was used on only one oreshoot; the other oreshoot, where the vein was four feet thick, worked by the ordinary shrinkage method. The plan of operation outlined lessened the cost of stoping, and no miners were injured after its adoption.

Lowering Cable in a Shaft

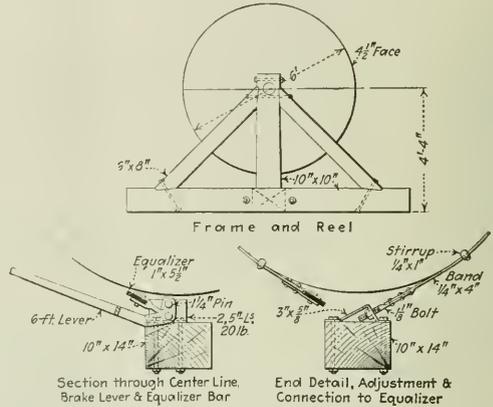

BY H. F. MILLS

At the Loretto mine, Loretto, Mich., a No. 0 B. & S. 3-conductor, 5,000-v., armored cable weighing 7,800 lb. was recently lowered in an 800-ft. vertical shaft by means of a hand brake, using the original reel.

It is common practice to lower the reel to the desired depth and then pull the cable up by means of the hoisting rope, but that method could not be used in this instance, as the reel was too large to pass through the shaft. Another method which is sometimes used—that of lashing the cable and the hoisting rope together at intervals and lowering by the mine hoist—was discarded on account of the difficulty of lashing to the $\frac{1}{2}$ -in. x 4-in. flat hoisting rope, and because of the danger of the ropes spreading and straddling a pipe tee, or other projection, as the ladderway is small and much of the space is filled with pipes and cables.

A substantial wooden frame was built to accommodate the reel. Two brake bands, as shown in the

accompanying sketch, were mounted, one on each side of the reel, the bands being provided with a number of U-shaped clips to prevent their slipping off the reel. One end of each band was provided with a screw tension adjustment, the other ends being connected to the opposite ends of an equalizer bar. This bar was, at its center, connected to the forked end of the brake lever by a short arm. This arrangement relieved the reel of most of the twist which would result from the use of one band.

DETAILS OF APPARATUS USED TO LOWER CABLE IN SHAFT

The frame and reel were set over the ladderway, and the cable was lowered to the 800-ft. level. Two men on a hoisting cage kept abreast of the end and guided it when necessary. It was then secured by a heavy timber clamp below the 500-ft. level, and again lowered, the bight in the cable being pulled in the shaft station where a tap was to be made. The remainder of the cable was then secured at 150-ft. intervals by timber clamps. One man handled the brake easily, and the cable was lowered and in place in four hours.

Petroleum in Switzerland

Interesting information as to the oil-bearing properties of the Swiss soil is contained in a work entitled "Investigations on the Petroliferous Molasse in Switzerland," by Arnold Heim and Adolf Hartmann, which has just been published, says the "Financial Times," London, Oct. 31, 1919. In the introduction the authors make the following statement, which indicates that there may be great possibilities of development if the requisite enterprise can be found in Switzerland for developing this new line of mineral production: "In general it is little known that rich oil-bearing shale is common in Switzerland, particularly in the Canton of Geneva, where hundreds of thousands of tons of lubricating oils of the best quality are lying in the ground, besides benzine and burning petroleum. If we can solve the problem of developing these resources in a rational manner our country will in future be fully provided for in the matter of the raw products of the petroleum industry."

Ore Contracts—Part II.*

An Ideal Ore Schedule Should Provide Equitable Payment for the Desirable Contents of All Ores and a Distribution of Profit Calculated to Cause Maximum Economical Development

BY C. A. GRABILL

THE schedule is simply a statement of the method of ascertaining the payment to be made for the desirable substance in the ore and the deduction for the undesirable ones, with the charges for treatment. An ideal schedule may be defined as one that is applicable to all ores, that will provide payment for all the desirable contents proportional to the value to the buyer of the respective amounts recoverable or usable, and for deductions for the undesirable contents proportional to the harm caused, and for a treatment charge in accordance with the work to be done and the expenses incurred in reduction, refining, and delivery, but with the quantities so adjusted as to yield the minimum profit to the buyer on ores of low grade or high cost of production in periods of low prices, and the maximum on high-grade or cheaply mined ores in times of high prices, the actual profit to the buyer in each case to be such as to cause the greatest development of the seller's property economically possible, and therefore the maximum possible profit to buyer and seller combined.

Of course, it is not possible to evolve such a contract, but with the simple omission of the last three words and the word "therefore" the above long sentence represents the aim of most ore contracts.

The substances usually covered are gold, silver, copper, lead, iron, lime, silica (insoluble), zinc, arsenic, bismuth, antimony, and sulphur, to which is added a treatment charge. They will be considered in this order.

Gold

The value of pure gold at the mint (mintage value), is a fraction of a cent more than \$20.67 per oz. Troy (England, £4 4s. 11.45d. per fine oz. Troy). This is equivalent to about 66.5c. per gram in metric measure. This is not necessarily the available value. In Mexico, for example, there are extraction or other taxes that may amount to 10 per cent of the value, and there is or was until recently a provision which was practically an embargo on export of gold. The result was that the effective value of the fine gold to the owner was governed largely by the rate of exchange between Mexico City and some foreign point, mainly New York City. This applied not only to foreigners doing business in the country but to the natives who had to purchase large amounts of their supplies from foreign sources.

Ore contracts usually specify that if there is more than .05 oz. per ton of gold in the ore all will be paid for at \$20 per oz. This is sometimes made \$19 or \$19.50, but \$20 is the usual amount. The smelting company must pay for refining and de-

livery and mint charges, so it is obvious that it is not going to make much from low-grade ores on this item. It also has to assume a positive loss in the slag. In spite of this slag-loss, books on smelting state that the recovery of gold is usually 100 per cent or more, and it is commonly accepted that this is due to small amounts in ores too low grade to pay for determination or consideration. The truth is that the average smelter has a pretty fair idea as to the source of the gold in his shipments and the 100 per cent recovery. The protective factor is the cupellation loss. In buttons of large size this is very small, amounting to only a fraction of 1 per cent, but most smelting charges contain comparatively small amounts, and the cupellation loss increases (stated in per cent, not absolute units) quite rapidly as the size of the button decreases. I have not the exact figures at hand, but as I recall them the loss is of the order of 10 per cent on a copper ore containing \$1 per ton in gold. At any rate, the smelter gains on this item are not of great importance, because as soon as the amount on the charge becomes appreciable its slag losses increase and the protective cupellation losses decrease. The presence of gold may therefore be considered to have no effect on the balance of the schedule.

At \$20 per oz., .05 oz. Au is \$1. On small shipments the cost of assaying by both parties and a possible umpire will not leave much of the \$1 to worry about. If there is, say, \$0.50 Au in the ore, it is usually considered in making the other terms. In large shipments the limit is often lowered.

Silver

New York prices for silver are based on the fine ounce, Troy, but London prices are quoted in pence per Troy ounce of standard silver, 925 fine. Formerly the London price was the governing price, but since the war the New York price is the base, the London price varying from the other in accordance with the cost of delivery and the exchange.

The schedules usually provide for the payment of 95 per cent at the New York price if the ore contains 1 oz. or more per ton. Sometimes the figure is as low as 90 per cent and rarely as high as 100 per cent, but in the large majority of cases it is 95 per cent. All treatises on smelting place the silver loss at about 5 per cent and as due to two causes, namely, silver in the slag and silver volatilized in the fume.

In a modern plant there is a baghouse or Cottrell plant, and in such cases the volatilization losses may be assumed at zero. There is a dusting loss on all ores which, though undetermined and perhaps amounting to fairly large figures in the aggregate,

*Part I was published in the "Engineering and Mining Journal" of November 22 and 29, 1919.

is quite small on the percentage basis, a small fraction of 1 per cent in a good plant, I should say, and is partly covered by the 1 per cent minimum moisture clause. As a matter of fact, the 1 per cent minimum is usually exceeded except in dry climates like Arizona, and even there most ores have some moisture.

The slag remains, then, as the only important source of loss. The only questions consequently are: does 5 per cent represent the general condition, that is, is it too high or too low; and is the percentage basis correct or should there be a fixed deduction of, say, 1 oz. per ton and 100 per cent of the remainder paid?

C. H. Fulton (Bureau of Mines, Technical Paper 83) as quoted in the report of the Colorado Commission estimates the silver losses in copper smelting at from .5 to 10 per cent, and in lead smelting from a loss of 1.5 per cent to a gain of 1.75 per cent. Although stated in this form, he really means that in lead smelting the recovery is from 98.5 to 101.75 per cent of the assay value of the ores treated, or such is my interpretation of the statement, and in copper smelting it is from 90 to 99.5 per cent.

There is little accurate published data. The big custom smelters do not care to publish theirs, for obvious reasons, and the private plants, where silver is usually a comparatively small part of the values, rarely keep records that are sufficiently accurate. I am inclined to think that 5 per cent is an underestimate of the loss and 95 per cent an underestimate of the recovery. The discrepancy is due to the difference between the actual silver contents of the ore and the assay, as commonly reported, caused by cupellation and kindred losses in assaying.

The general opinion is that these are small, perhaps 1 per cent. This belief is due largely to the fact that experiments in this line have been made mostly in connection with bullion work or on high-grade ores, on which the loss is low. Fulton states, in his work on assaying that the silver recovered in a "corrected" assay is from 98 to 100 per cent of the amount present, but it is not common to make corrected assays in mine, mill, or smelter work. By "corrected" assay he means the determination of the silver absorbed by the cupel or scorifier slag and its addition to the regular result. Sharwood states (Bulletin of the A. I. M. E., Vol. LII, page 129) that the percentage loss in cupellation is inversely as the cube root of the weight of the button, and for silver is 1 per cent for a 1,000 mg. button and 10 per cent for a 1 mg. button. In the scorification assay it is customary to take a charge of from .2 to .3 A.T. On a .25 A.T. charge a 1 mg. button would mean an ore with 4 oz. Ag per ton. Fulton gives a series of tables showing that the additional loss in assay slag is from .14 to 3.0 per cent and that the cupellation loss in the ordinary assay is materially increased by the presence of Fe, Sb, Sn, As, Se, Te, and Zn, and gives a table showing that the addition of 1 gm. of Te to the cupel caused a loss of 65 per cent, approximately.

The Colorado report gives the average of all ores smelted in that state for four years as 18.5 oz. Ag

per ton. That would mean on a crucible charge with a .5 A.T. charge a button weighing 9.25 mg.

Sharwood's figures would indicate a 4.75 per cent cupellation loss, to which should be added an increased amount for loss in the assay slag and increase due to impurities or perhaps 6 per cent as the total assay loss. In other words the smelter has 6 per cent unreported silver in the ores which will readily explain Fulton's figures of 98.5 to 101.75 per cent recovery, in spite of the known silver in the slag.

If Sharwood's figures are correct (and there is no reason to doubt them), a plant operating with 4 oz. per ton will have about 12 per cent unreported silver, and if it reports a 5 per cent loss the real loss is around 17 per cent.

Of course a difference of 15 per cent on a 1 oz. charge means only 16c. per ton, even at present prices, and on small lots would not pay for the extra cost of determining it. This also accounts, in a measure, for the failure to pay for small amounts of silver, say when it is less than 1 oz. If known that the average will be around .5 oz. per ton, compensation may be made in a slight decrease in the treatment charge, with better monetary result to both parties.

All of which brings up the question as to what the actual loss in the slag is, and what the laws are that governs it. Discussion of it would lead too far, but there is one point that is interesting. The silver in the slag is always some function of the silver in the collector, though in lead smelting the presence of more than one collector complicates matters. In copper smelting, within the ordinary limits the relationship may be represented by a straight line. In cases where this condition is not obscured by some other factor it is interesting to note that the percentage loss of silver has nothing to do with the amount on the charge. This may be demonstrated as follows:

For convenience let the relationship be represented by the factor K, and assume that the collector is copper matte, then

$$\text{Oz. Ag in charge} \times K$$

$$\text{Oz. Ag in the slag} = \frac{\text{Oz. Ag in charge} \times K}{\text{Wt. of Cu matte produced}}$$

Dividing both terms by the number of ounces of silver on the charge, and noting that the left-hand term is then the silver loss expressed decimally, and multiplying both terms by 100, so that the figure will read in per cent, we have:

$$\text{Silver loss in per cent} = \frac{100 K}{\text{Wt. of Cu matte produced}}$$

The whole matter is complicated, and many other factors appear that may interfere with the application of this rule, but where it does express the condition it means that the percentage loss is dependent on the amount of collector available, other things being equal and is independent of the amount of silver on the charge.

The 95 per cent payment clause originated in Colorado, and it is interesting to note that in that state

the smelting companies have to import lead ores at some expense, and consequently all companies try to operate on a minimum of collector that is more or less the same, and the conditions tend to be the same. O. R. Whitaker, in his report of the Colorado Commission, assumes a constant loss of 1 oz. per ton of ore, and calculates the percentage loss against this for the different grades of ore, but I do not believe he was justified in so doing.

It is obvious also that a dry ore containing no collector might displace some of the collector already on the charge, and thus be at a disadvantage in comparison with one carrying copper or lead, in sufficient amount. The subject is too big for discussion here.

Lead

Copper smelters do not pay for the lead in ore received by them, because it is not normally recovered by them, and, when it is, by the aid of a baghouse Cottrell plant or otherwise, the cost of recovery is about the value of the product. Part of the lead on the charge of the copper blast furnace goes in the slag, part in the matte, and about half into the fume, and that in the matte goes to the converters, from which it emerges as fume. The time is approaching when this fume will be treated to recover the lead, arsenic, antimony, and bismuth at a profit, but they are not yet considered as assets.

Wet methods only should be used for the determination of lead. The dry assay is easy, but usually low, though not always so, because arsenic, antimony, bismuth, and zinc may raise the weight of the button above the percentage as determined by wet assay. When the dry assay is used in the schedule it should be made by running a wet assay and deducting an agreed upon figure, from $\frac{3}{4}$ to 2.0 units as the case may be, calling the results the dry lead.

Small amounts are not paid for even at lead plants, or are paid for at a very reduced rate, but the reason is not the same as with silver and gold. Lead furnaces require at least 8 per cent on the charge for satisfactory work. If the ore contains less than this, the difference must be made up by the addition of richer ores, sometimes, notably in Colorado, obtained at considerable expense. Furthermore, the lead loss is largely a fixed amount, independent of the amount on the charge (unlike silver, where it is the percentage loss that is independent of the quantity) and consequently the percentage loss increases as the assay decreases. Ores without lead are penalized by a higher treatment charge in lead practice. When they are siliceous and low in lead, they may be sent to the copper furnaces if such are available and the lead lost rather than incur the extra expense of furnishing the extra lead for them.

Originally there were large losses of lead in the fume by volatilization, but the introduction of baghouse and Cottrell is eliminating this and the lead in the slag will soon be the only serious loss. Mr. Whitaker gives the loss in Colorado practice at about 30 lb. per ton of ore; this probably is intended to include losses by volatilization in plants not equipped

with baghouses. In another place he says that with low-grade ores 10 per cent goes into the slag, and Fulton, as quoted in the report, states the total loss as from 5 to 20 per cent.

**Smelter Investigation Committee
State of Colorado**

The schedule is as follows:

Gold: \$19.50 per oz. if 5/100 oz. or over per ton.

Silver: 95 per cent of New York quotation, date of assay.

Lead: Prices based upon \$4.00.

Wet assay, 1.50 units off wet assay for dry assay.

Copper: Deduct one unit from wet determination for dry assay, and pay for dry copper on casting quotation for copper; defined as the electrolytic cathode quotation, as given by the "Engineering and Mining Journal" for the week preceding date of assay, less 3-10th of a cent per lb., with the following deduction:

Six cents per lb. from above quotation.

Zinc: Limit 10 per cent; 50c. penalty for all excess per unit.

"Neutral Schedule" to be used when it figures better for shipper.

SILVER QUOTATION

The New York quotation for bar silver, as furnished by Handy & Harman, or their successors in business (or, in case said firm and its successors should go out of existence, by the firm of J. W. Seligman & Co.) to the Western Union Telegraph Co. on date of assay.

LEAD QUOTATION

The prices paid per unit for lead in all ores and concentrates are based upon a quotation of \$4.00 per hundred lb., 1c. up or down for each change of 5c. in this quotation.

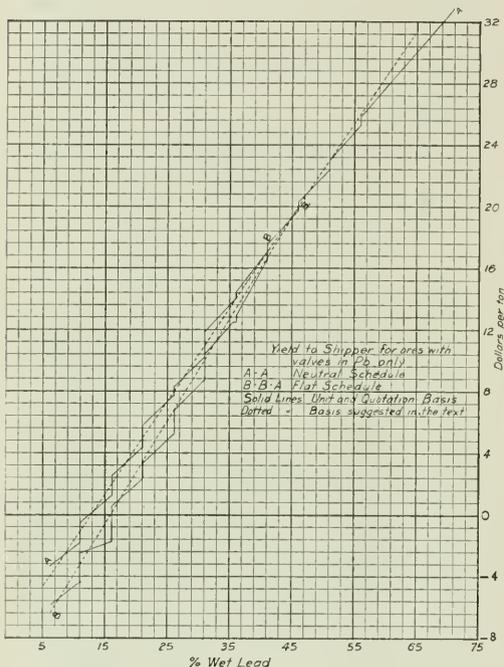

The quotation used as a basis of settlement shall be 90 per cent of the sales price in New York of the American S. & R. Co. of common, desilverized, domestic lead, in lots of fifty tons or over, for delivery within thirty days, on date of assay; provided said sales price does not exceed \$4.00 per hundred lb. When it does exceed \$4.00 per hundred lb., the quotation used as a basis of settlement shall be \$3.60 per hundred lb., plus $\frac{3}{4}$ the excess of said sales price above \$4.00 per hundred lb.

I have given here as a typical example of a lead schedule of the "unit-and-quotation" type, one taken from the report of the Colorado Commission. For obvious reasons I have omitted the name of the company which issued it, but it was published in 1917, and whether it is in force now or not is immaterial. With it was published a similar schedule for dry and copper ores, and a clause covering concentrates was included.

There is nothing to note about the payment for gold and silver, and the only thing about the penalty for zinc is that 50c. per unit is $2\frac{1}{2}$ c. per lb., and the shipper can afford quite a little expense in sorting or other treatment to avoid it.

The payment for copper is low, because, as previously noted, the losses and expenses are high for copper in lead work. The quotation for casting copper is .3 below cathodes, which, in turn, are about .1 below wirebars and ingots, so that the deduction is really 6.4c. per lb. from electrolytic wirebars.

At first sight the lead prices seem to be complicated. Putting them in tabular form has a tendency to confuse, so I have plotted the returns to the shipper by both tables on the basis of 4c. lead, using lead values alone and deducting treatment

charges before plotting. The result is shown by the solid lines in the figure. Where the line passes below the zero line it means, of course, that the indicated quantity must be deducted from the other values in the ore.

Personally, I do not care for schedules in tabular form, because they result in these step curves and there is always considerable jockeying and squabbling around the change points such as occur in this every 5 per cent. At 30 per cent Pb it may be noted that a difference of .1 per cent Pb makes a difference to the shipper of \$1.60 per ton although at the price assumed it is only worth 6c.

If any one finds difficulty in using the tables on which to base shipping estimates, a general statement can be calculated without difficulty that will give the same effective result. I have plotted one, and it is shown on the diagram in dotted lines and gives results that vary less from the tabulated values than they differ in themselves. It will cover ores from 5 per cent to 60 per cent Pb, and with prices from 3c. to 9c., a range sufficiently broad.

The basis of this curve may be expressed as follows:

Lead: Deduct $1\frac{1}{2}$ units from the wet assay and pay for the remainder at $\frac{3}{4}$ of the New York price. Treatment charge: \$7.00 per ton for neutral ores, 10c. up or down, but the total of such increase for excess silica not to be more than 6c. for each unit paid for less than 45 per cent Pb (dry). No excess silica will be charged on ores with more than 45 per cent Pb (dry). This covers both tables.

When stated in this manner it is to be noted that there is a deduction of $1\frac{1}{2}$ units for losses (Mr. Whitaker's 30-lb.), a deduction from the New York price, which with lead from 3c. to 9c. will vary from $\frac{3}{4}$ c. to $2\frac{1}{4}$ c. per lb., the larger amount in the time of highest price, and presumed to cover refining and delivery. There is also a smelting charge of \$7.00 per ton. Somewhere in these amounts is also hidden the profit which the smelting and refining companies expect to make. The expression 10c. up or down is intended to mean that there will be an additional charge of 10c. for each unit (20 lb.), more of silica than iron plus lime per ton of ore, and that if the iron and lime exceed silica there will be a corresponding credit.

Copper

The dry assay of copper is obsolete, though it is sometimes referred to in ore contracts as a kind of explanation for certain deductions; but it really has nothing to do with the case. Of course, the old theory was that the difference between the dry and wet assays represented the smelter losses. It may have, approximately, in the days of Welsh reverberatories, but it does not now and has not since the time water jackets were invented.

Copper is not volatile, and does not appear to any extent in the fume. The only exception is in the case of copper chloride, which it is generally believed is completely volatile. It is rare in North America, and good dust chambers should collect all that escapes from the furnace top.

For many reasons it is usually desirable in custom work to produce about a 35 per cent matte. The result is that in blast-furnace work slags usually contain from .2 to .45 per cent Cu and in reverberatory work from .3 to .5 per cent averaging say .35 per cent. Copper is sometimes used as a collector, and sometimes that property is of secondary consideration. In the first case the amount on the charge will be as low as possible, but in the second case will vary from one extreme to the other. The slag will vary from 60 to 85 per cent of the charge, so that if the average copper in the slag is .35 per cent, the loss may be considered to be .25 per cent or, say, 5 lb. per ton. This will tend to be a constant figure, irrespective of the amount on the charge, and may be considered as a proper deduction. In cases of high iron and low silica slags it will be considerably increased, particularly in reverberatory work. If the copper is being used as a collector, barren ore and fluxes may be added to the slag and will absorb their proportion of copper. Each ore should be charged with the copper necessary to saturate its slag-forming components, as should the fluxes. The total of these

may raise the copper loss from what might have been a reasonable amount to a very large part of the total, both as regards absolute units and as percentage.

From which it follows that the deduction for losses need not be the same on ores containing the same amount of copper. As an example, assume the case of a plant operating with an excess of siliceous ore. One ore is offered that is self-fluxing, that is, it contains the requisite proportion of bases and acids and sulphur to produce the type of slag made at the plant. It will have the average loss at the plant. Another ore is offered consisting, as an extreme case, of copper carbonate and quartz. It will require the addition of lime, iron, and sulphur, and will produce about twice the weight of slag that the former will; therefore the deduction for loss should be double.

Take another case: Assume a plant with ores requiring no flux and producing an ideal slag high in lime and containing little copper. The ore offered in this case, say, is an iron gossan with 5 per cent Cu, no sulphur and 50 per cent Fe. It is true that no additional fluxes would be required, but the effect would be to lower the percentage of silica and increase that of the iron, and thus increase the copper lost in the slag. Roughly, one may say it would have double the normal loss. The same ore delivered to a plant buying barren iron flux would be entitled to credit for the full copper contents, with no deduction for loss at all.

I have before me the open schedule of a Western smelting company, which I recommend for simplicity. After providing for the gold and silver, it specifies that the company will pay for the copper, less a deduction of 1.3 units at the New York price of electrolytic cathodes less 3c. per lb., as quoted by the "E. & M. J." Under present conditions and with present prices the deduction from the New York price is figured about as follows: Selling and delivery commissions are about $\frac{1}{8}$ c. per lb. each. The last figures that I have seen for refining were $1\frac{1}{4}$ c. per lb. Shipping converter bars from somewhere in the West to Baltimore or New York may be taken at $\frac{3}{4}$ c., converting at from $\frac{1}{4}$ to $\frac{3}{4}$ c., depending on the condition of the market, as regards ore for the converters, and interest and insurance. Only rough figures can be given, as they are changing rapidly, but it will be seen that 3c. can be accounted for. As regards the 1.3 deduction for losses: The smeltery in question is operating under severe metallurgical conditions and has a much higher loss than most companies are required to meet. It also aims to take some of its profits in a deduction here rather than in the treatment charge.

Some smelters are now making a fixed deduction from the price when copper is low and an additional deduction in the form of a percentage of the increase when the price rises above a certain fixed figure. The idea behind this is supposed to be that when conditions are bad the smelter will make as little profit as possible, thus carrying the miner through the hard times, and when prices rise will

recoup himself by correspondingly increased profits. It may be so, but the miner is inclined to regard it as an example of "all the traffic will bear" tariffs. If honestly carried out this arrangement is susceptible of great good to the small companies, but it is also capable of great abuse. Another idea behind it is that the smelter has just as much right to profit by high prices as has the miner. Still another is that the smelting companies are unable to sell their product so as to get the full advantage of the high prices. First, the high prices bring increased production of ore, and it takes from 90 to 120 days to get the product on the market, by which time the peak price has passed. The marketing company could, of course, try to protect itself on the purchase of each lot by selling a corresponding amount for future delivery, but the price for futures at peak times is usually below the peak. A high price is indicative of a sold-out condition of the market and is generally coexistent with a prior selling for future delivery at a price below the peak.

That this is not a fanciful statement may be seen by reference to the table in the Copper Handbook, 1918, page 211, at which the price actually received by many producers is given as 1.5 cents below the average of the quotations for 1916. This year, on account of the large stocks accumulated last winter at the time of low prices, many companies should show large quotational gains. The absolute suspension of quotations for a long time had a demoralizing effect on both shipper and buyer, and the question of what quotation to apply on their resumption was by no means an easy one, and it speaks well for the business as a whole that there was so little friction.

Copper in lead ores is in a better situation than lead in copper ores. It is recovered largely, but the refining and delivery charges are heavy, and so are the losses, as a rule. It is collected as a matte and turned over to a copper smeltery for further treatment, usually with the loss of the accompanying lead.

Silica, Iron, and Lime

These three must be considered together. For many years the payments and deductions for these elements were in most cases based on the theory of type slags, and the development of the industry has consequently been greatly influenced thereby. Just the same, many have been convinced for many years that there "ain't no such animal," and the development of the reverberatory and the production of flotation concentrates are introducing factors that are resulting in an entirely different view of the matter.

The theory of type slags was based on the hypothesis that there are a few limited combinations of silica iron and lime in simple ratios which give much cleaner and more satisfactory slags than any others, even though they may approximate the favored ones closely in composition. It is now known that slags are mutual solutions of various silicates containing dissolved oxides, sulphides, and other materials, all in more or less dissociated state, and that

their properties vary without abrupt changes. According to the original theory, iron and lime had to be provided for the silica in definite proportions, whereas it is now known that these limits are purely economical. Thus it is possible to smelt with a slag containing as much as 60 per cent SiO_2 , or as little as 10 per cent, or any point in between, the only limiting factor being the expense bill. A slag may have no lime or it may have 50 per cent and the iron may be from some unknown lower limit to 75 per cent FeO or more, and the correct amount is determined by a balance of the economical forces. Operators do not smelt with a 60 per cent slag—not because it cannot be done, but because it does not pay. The furnace will not run under ordinary conditions of operating, it is true, and the smelter cannot afford to produce the conditions under which it will run.

Now, the bearing of this on the subject under consideration is that the majority of ore schedules are based on the assumption not that it costs \$x to smelt a ton of ore, but that it costs \$y to smelt a ton of silica, and that iron and lime, being necessary for that purpose, are of value. This is a perfectly legitimate assumption in those cases where barren iron and lime must be added to keep the cost of smelting it at the economical point, but with the coming of flotation concentrates containing iron, and the production of slags containing 36 per cent of silica or less, there may be, and often is, more reason for assuming that it costs \$x to smelt a ton of iron and that silica and lime are the fluxes, and it is sometimes assumed that a ton of ore is a ton of ore as far as costs are concerned, irrespective of its contents.

Now it is important to the shipper which one of these views is held by the smelter. From the standpoint of a smelter having all three to draw upon, silica and lime are really of more value than the iron (within limits). In copper smelting for smooth furnace running it is best to have at least 15 per cent FeO in the slag, but from that point up each additional unit has a fouling action on the slag, this being true whether it is substituted for lime or silica, or, what is the same thing in quality if not in amount, added to the other two. Increasing silica or lime decreases the metal loss in the slag. These statements hold true within the present smelting limits, but unfortunately the curves showing the effect of varying amounts of the different substances are not always simple ones. I am, of course, referring to the assay value of the slag and not to the loss in pounds, which is more complicated.

As concerns the schedule, matters of policy may enter largely. A company may be smelting a heavy sulphide ore and obtain sufficient silica at a good treatment charge to produce a 30 per cent silica slag. The addition of more silica would produce a better and cleaner slag, but conditions might easily be such that the offer of a bonus for free silica would produce only a very small additional tonnage and cause the loss of the substantial profit on the original supply.

When a penalty for silica is exacted it is usually based on the insoluble, it being assumed that this will also cover most of the alumina. The silica and

alumina determinations are difficult and expensive, and the insoluble is simple and cheap, and therefore will always be used on small lots. The silica and alumina together are generally more than the insoluble, and in such cases the deduction for the insoluble is justifiable, but calcium fluoride, barium sulphate, garnet, and some other minerals are insoluble.

Large amounts of alumina are unquestionably bad and cause all kinds of trouble, but I consider small amounts, say, up to 2 or $2\frac{1}{2}$ per cent, as beneficial rather than otherwise. In fact, I consider small amounts of almost all slag-forming bases as beneficial and attribute the property to the effect of Raoult's Law that the addition of small amounts of dissociated substances in solution lowers the freezing point. This effect is soon overcome by their other properties if increased amounts are added.

Manganese is supposed to act as iron, and is frequently included for payment at the same price. It is said to have a bad effect on silver losses, but I have had no personal experience with large amounts.

Contracts sometimes read that available lime will be paid for. This is intended to exclude calcium fluoride, but the ordinary method of determination will also exclude lime silicates and garnets. The theory is that calcium as fluoride is of no value as a flux. This may be true in lead smelting, but in iron work a good price is paid for it to make a liquid slag. It seems to have this property in copper smelting, and I believe that it has a cleansing action on the slag.

Magnesia is supposed to be a substitute for lime, but it is almost never paid for. I have used it with satisfactory results as a substitute for part of the lime, and one of the fastest running slags that I have ever seen contained more than 10 per cent of this element. It apparently emphasizes the bad properties of zinc when the two occur together, and the fact may be easily explained from a chemical standpoint. The same is said to hold true of barium, but the explanation is not so obvious. In the one case coming under my observation it seemed to be true, but the bad qualities of zinc are so great that it is likely to warp one's judgment as to the effect of small amounts of other elements accompanying it.

Barium occurs as sulphate, and then there is an argument as to whether it is "insoluble" or not, which chemically it is, and penalizable or not, which, in the absence of zinc, I do not think it ought to be. Slags containing large amounts were run in British Columbia several years ago, and from my own limited experience it would seem as though it could be calculated as lime per cent for per cent, but I am not convinced.

Zinc is rightly penalized. There is usually a small amount allowed free. This is also in accordance with conditions. A small amount on the charge does not seem to do any harm; perhaps otherwise. Then its evil effects begin to manifest themselves and become serious when 6 per cent is reached. The free limit is generally higher because some ores carry none and

will help take care of the more zincy ones. It is to be hoped that some method of benefiting by the presence of this element will be discovered, and a means found for avoiding the present enormous waste.

In lead smelting sulphur is a nuisance and requires preliminary treatment of the ore at considerable expense; hence the charge against it. Under the present system of sintering fines a small amount is needed, but there is usually more than required, and a penalty is essential to keep down the supply.

In copper smelting it is absolutely necessary, though in a few contracts I have noticed the rather amusing statement that it will not be charged for. Of course there are some plants which have an excess that must be disposed of, and a penalty is allowable. On the other hand, in a great many camps it should draw a premium. Unfortunately it is extremely difficult to settle upon an equitable basis. The first few units are essential, the next few quite valuable; then they decrease in value until they finally become a source of expense. Furthermore, at the same plant, sulphur in one ore may be more valuable than that in another, depending on the nature of the constituents. The result is that it is usually disregarded in the schedule and provided for by variations in the treatment charge, depending on the probable character of the ore expected under the contract. In many camps such as exist in the Southwest I think that this is a mistake and that some form of payment and penalty depending on the ratio between the sulphur and the copper or some other element, would be desirable. Shippers are prone to look on penalties as an unmixed evil, but there is another side to the shield, even from their point of view. A properly designed penalty will permit of a cheaper total treatment charge and prevent the shipment of material that will be a source of loss to both parties.

Comes now the shipper and sets forth "Arsenic is selling for 5c. per lb. in New York, and not only am I not being paid for it, but I have to pay a penalty because of its presence in my ore." The amount of arsenic lost in the smelter fume is estimated at four times the total amount consumed in the United States. Who wants to buy it? The present price is due to a combination of the high cost of recovery and a temporary scarcity due to war demands. With the installation of fume-recovery plants, methods of separation for the arsenic, antimony, and bismuth will be developed and ores containing appreciable quantities will profit accordingly, but there will be considerable likelihood of a decreased price due to overproduction.

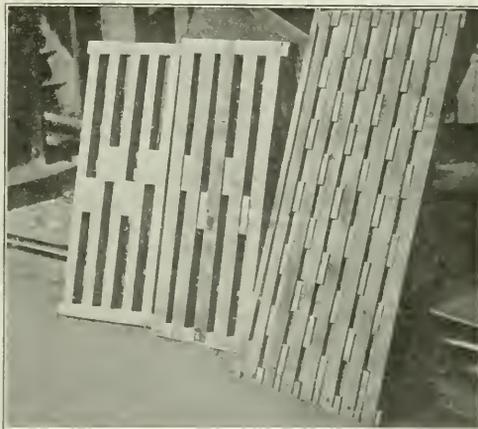

Treatment charges are of all kinds, flat, sliding scales varying with the value, with the metal contents (lead or copper), with the silica, and many other variations. One of the best, though complicated, was based on the cost of prime materials used in the treatment. This is much what is done in the "Jackson Price" in Chile. There is usually a minimum charge, to be applied on small lots to cover the cost of sampling and assaying. It is not commonly

appreciated that the assays made on an ordinary lot at the time of purchase would cost, if made by an umpire according to his regular price, from \$20 to \$50 per lot. There is usually an additional charge in the case of fines, to cover the cost of briquetting or sintering. It is based on material less than $\frac{1}{4}$ inch in size.

With the addition of a few special clauses, such as one providing for the transfer of the contract or for reference to arbitrators in case of dispute, this covers the general ore contract. It sounds fearsome, but with a few exceptions is really quite simple, though it will never be like a contract for 1,000 bushels of No. 2 white corn.

Gold-Saving Riffles on a Dredge

The gold-saving riffles used upon the dredges of the Yuba Consolidated Goldfields Co. have been standardized, like most other parts of the dredge. They are made in sections, five riffle bars to a section. The five bars are held by two end pieces and are separated by wooden blocks between each pair, staggered as shown in the photo. The bottom of the section is flush so that it will bear evenly on the sluice.

GOLD-SAVING RIFFLES ON A YUBA DREDGE

The upper face of each riffle is protected by a $1\frac{1}{4}$ -in. iron strap, $\frac{1}{8}$ -in. thick, held in place by wood screws, the flat heads of which are countersunk. This strap is set at a slight upward angle, the highest edge downstream, the upper surface of the wooden bar being cut at an angle corresponding to the upward tilt of the strap. The side bars have slots cut in them for the reception of the straps.

At intervals in the sluices a mercury, or trap riffle, is placed. In this, the spaces between the riffles are fitted with short wooden bars which do not quite reach the surface of the strap, these wooden pieces dividing each trough into a number of smaller troughs, as shown in the left of the photo. Each pocket is filled with mercury after the section has been placed in the sluice.

The Mackenzie River Basin

Possibilities of the Vast Territory Which Is Being Opened in Northwestern Canada—
Geological Features of the Area and Most Favorable Regions in Which to
Prospect for Minerals and Oil

BY PHILLIPS THOMPSON

TO THE prospector and the mining man the Mackenzie River basin affords a vast field of unknown but great possibilities. Not only is the greater part of the territory quite unexplored, but more than one-third of it is still unexplored, and even its geographical features are unknown.

With the opening of this region for settlement, increased attention is being given to its economic resources, concerning which the amount of available information is very limited. With the view of presenting, in a concise form, such data regarding the geological features and mineral occurrences of the country as are procurable, the Canadian Geological Survey has issued a volume compiled from numerous sources by Charles Camsell and Wyatt Malcolm, including information acquired by Mr. Camsell in personal exploration.

Vast Unexplored Territory of the Region

The basin of Mackenzie River occupies about 682,000 square miles in the northwestern part of the continent comprising the northern parts of British Columbia, Alberta, and Saskatchewan, the western part of the Northwest territories, and parts of the southeastern and northeastern Yukon. Lakes cover a large part of the area, and though many large bodies of water are still unexplored and unmapped, it is estimated that the water area cannot be less than 40,000 square miles. Its longer axis, about 1,350 miles, conforms in direction to the trend of the main physiographic features, and strikes north-westward. In width, it ranges from 100 miles at the mouth of the river to 900 miles near the center of the basin. It includes within these boundaries three physiographic provinces, each of which runs almost the whole length of the basin and has characteristics which sharply distinguish it from the others.

On the western border, and extending throughout the whole length of the area, is a lofty mountainous district known as the Cordilleran region. It forms a belt varying in width from 20 to 200 miles, extending from the foothills which border the central lowlands to a height of land separating the Mackenzie waters from those which drain westward to the Pacific. The great physiographic province known as the Laurentian plateau, which covers such a great part of northwestern and northern Canada, extends for some distance into the basin of the Mackenzie River, occupying a strip along its eastern edge from 80 to 280 miles wide and stretching over a length of 800 miles from the height of land at the south to the northern shores of Great Bear Lake. The western border of this province is a fairly well-defined line marked by the contact between the Pre-Cambrian crystalline or metamorphic rocks.

The physical features of this province are typical of the whole Laurentian plateau generally. It has, as a rule, little or no soil or loose material covering its bedrock, the region having been subjected to intense glacial erosion. The physiographic province termed the Great Central plain occupies the central portion of the basin, including all the region between the Laurentian plateau on the east and the Cordilleran region on the west. It has a length of about 1,300 miles and its width ranges from a maximum of 420 miles to about 200 miles.

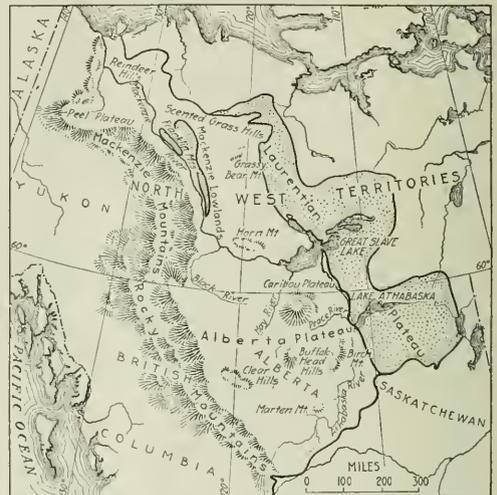

DIAGRAM OF THE MAIN FEATURES OF THE MACKENZIE RIVER BASIN

The distribution of the Pre-Cambrian rocks coincides with the physiographic province known as the Laurentian plateau. On the east these rocks extend over to the Hudson Bay, far beyond the boundaries of the region, but on the west they pass under a cover of later stratified rocks. The contact with these younger rocks runs from Methye portage to the west end of Athabaska Lake, thence down the valley of Slave River to Great Slave Lake, and from the north arm of that lake north-northwesterly to McTavish Bay, on Great Bear Lake. North of Great Bear Lake the contact has not been defined. The Pre-Cambrian rocks of the region have not been subdivided in such great detail as in the Lake Superior region or Northern Ontario, and only three different subdivisions have been recognized and mapped.

The oldest of the three groups consists of highly metamorphosed schists, slates, limestones, quartzites,

and volcanic rocks, occurring in isolated areas as erosion remnants. This group includes formations that have been uncertainly correlated with the Keewatin, Huronian, or Grenville of other regions. These rocks have been intruded by granites or gneisses of probably more than one age. Overlying these two groups is a series of younger rocks, not greatly disturbed, consisting of sandstones, conglomerates, shales, limestones, and some associated volcanic rocks that have been referred to as Keweenaw or Animikie. The rocks which have been more or less doubtfully correlated with the Keewatin or Huronian, consisting mainly of schists, slates, limestones, and quartzites, occur here and there throughout the Pre-Cambrian, in areas usually small but sometimes many square miles in extent. They occur in isolated bands which are merely remnants of formerly more widespread series, and have been so reduced in area by intrusions of granite and by deep erosion that they now form apparently the smallest portion of the Pre-Cambrian.

Though these lands are really not of great extent, they are much the most important economically of all the divisions of the Pre-Cambrian, and although no commercial mineral deposits have been found in this division within the limits of the Mackenzie basin, the rocks of which they consist have been proved in other parts of Canada and the United States to contain valuable deposits of gold, silver, and iron ores. The rocks are frequently traversed by quartz veins, which, in a band on Yellowknife River, are known to carry free gold. It is advisable, therefore, for the prospector working in the Pre-Cambrian of this region to pay particular attention to these rocks, as they are more likely than any other formation to contain ore deposits.

Gold Placers Not Likely to Be Found

Gold has not been discovered in any important quantity in the Mackenzie basin east of the Rocky Mountains, and the extent of country known to be favorable for prospecting for it limited. Gold has been found in small quantities on Peace River above the mouth of Battle River, on the Loon and the McLeod rivers, and in some other localities, but the glaciation to which the Pre-Cambrian area was subjected renders the occurrence of important placers highly improbable.

Coal is one of the most important resources of the Mackenzie basin, and occurs in the Cretaceous formations of the southern part of the basin and in the Tertiary formations of the northern parts. Mining operations are being conducted on important seams in the Cretaceous rocks along the Grand Trunk Pacific Ry. The report contains descriptions of the principal less-known deposits found in the north, including those on Smoky River, and in the Peace River district.

An immense body of bituminous sands, so-called tar sands, is exposed on Athabaska River, extending from Boiler rapid, about 200 miles below Athabaska, to a point many miles below McMurray. Outcrops occur, also, in the banks of the rivers and many small streams tributary to the Athabaska be-

tween these points. Although the area represented by actual outcrops has not been determined, it is probably not less than 750 square miles. The estimated thickness of the bituminous beds and the overburden, and the conclusions to be drawn are based wholly on surface indications. In 1915, experiments were conducted on the commercial utilization of the bituminous sands in street construction in the city of Edmonton, the result indicating that they could be successfully used for this purpose. The conclusion reached from a comparative study of cost data, as compared with imported asphalts, was that the application of the bituminous sands in a crude state to pavement purposes will be restricted within comparatively narrow limits in western Canada, and that extensive development of the McMurray deposits will probably depend on the evolution of a commercial extraction process, whereby the bitumen can be marketed in a fairly pure form.

Attention has for some time been directed to the possibilities of discovering petroleum and natural gas in localities where numerous striking indications of their occurrence have long been known. Boring operations have been conducted along Athabaska and Peace rivers, where strong flows of gas were struck in two or three wells, and petroleum-bearing strata on Peace River have been penetrated. Oil and gas indications are found in the sediments of Cretaceous and Devonian age, both of which are of wide distribution. From the point of view of the prospector for oil or gas, the McMurray sandstone is, so far as present knowledge goes, the most important formation of Cretaceous age in the Mackenzie basin. It comprises the great body of bituminous sands exposed on the Athabaska River, and is the formation from which issue the strong flows of natural gas struck in the wells sunk by the Dominion government and by the Pelican Oil and Gas Co. in the vicinity of Pelican River.

No important deposits of copper, silver, or iron are known to exist, though argentiferous galena containing 38.86 oz. of silver to the ton of pure galena is stated to have been found at a point in the vicinity of Great Slave Lake east of Resolution. No nickel deposits of economic value have been discovered, but nickeliferous sulphides occur at the east end of Lake Athabaska, where a number of claims have been staked. Gypsum is exposed at many points, the deposits most likely to prove commercially valuable occurring on Peace River and in the escarpment to the west of Slave River. Considerable interest has been manifested in the possible occurrence of potash in commercial quantities, but analyses of samples taken from brine springs and waters from strata pierced in boring operations have proved disappointing. There are numerous brine springs, from some of which salt is obtained for local consumption.

Considerable Water Power Available

Water power will be an important factor in the development of the region, because of the scarcity of coal. As in the Laurentian plateau regions elsewhere, the rivers of the eastern part of the basin

contain a number of falls at which power could be developed, including Black River, at the east end of Athabaska Lake, and Taltson, Lockhart, and Yellowknife rivers, flowing into Great Slave Lake. Water power could also be developed on Peace River at the chutes, on Slave River near Fort Smith, and on a number of rivers which fall over the face of the Devonian escarpment south of Great Slave Lake.

Sorting Ore in Raises

BY A. C. BIGLEY

At one of the important mines in Butte, Mont., ore sorting chutes are used in all raises. As a rule the sorting is done on the fourth or fifth floor above the sill. Fig. 1 shows a raise having two chutes and a manway in between. If chute A is drawn first, the chute directly below it is used for ore and the one alongside it below, B, receives the waste. Under the lips of chutes A and B grizzlies with bars 4 or 5 in. apart are used. Some of the bars of the waste grizzly must be removed to admit the large pieces of waste.

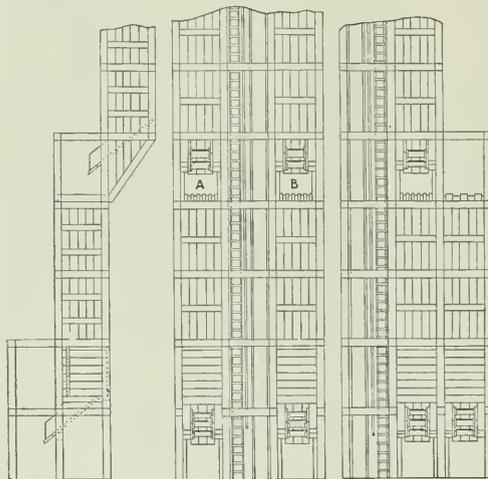

Fig 1
Fig 2
ORE SORTING CHUTES FOR RAISES

In drawing chute A the broken ore and waste from the blast is allowed to run on to the grizzly beneath the lip until it begins to heap up. Most of it, having been broken fine, passes readily between the bars. The larger pieces of ore must be broken with a sledge so that they will pass through. Such waste as will not pass is picked out and thrown down the waste chute under B. After chute A is empty, or enough ore has been drawn, chute B is drawn in similar fashion, the chute under the lip of A now becoming the waste chute.

Fig 2 shows a raise having one chute and a manway, with an extra chute for waste carried up as far as the sorting floor. This extra chute is directly alongside the main chute, to facilitate handling the large pieces of waste.

Foreign Trade in Metals and Ores

Imports and exports of the more important metals and ores, as reported by the Department of Commerce for October, 1919, and the figures for October, 1918, as finally revised, are as follows:

IMPORTS, OCTOBER, 1918, AND 1919 (In pounds unless otherwise stated)		
	Oct. 1918	Oct. 1919
Metals and ores:		
Antimony, contents	30,271	14,054
Antimony matte, regulus or metal	3,025,609	2,420,025
Copper:		
Ore, contents	2,908,758	4,004,003
Matte and regulus	3,156,878	3,256,640
Concentrates, contents	4,046,730	3,208,468
Imported from (in part):		
Canada	917,162	3,051,262
Mexico	5,745,218	6,493,722
Cuba	1,959,063	221,760
Chile	713,349	30,223
Peru	1,655	166,865
Venezuela	353,736	Nil
Unrefined, black, blister, etc.	33,884,114	17,392,398
Refined, in bars, plates, etc.	2,080,763	Nil
Old, etc., for manufacture	43,863	182,001
Composition metal, copper chief value	Nil	224,109
Lead:		
Ore, contents	2,247,673	3,036,568
Bullion, contents	11,252,412	8,285,550
Imported from (in part):		
Canada	1,654,000	885,614
Mexico	11,846,085	8,706,834
Pigs, bars and old	9,812	1,721,764
Pyrites, long tons	35,051	67,155
Imported from (in part):		
Spain, long tons	Nil	42,707
Canada, long tons	35,051	19,548
Tin ore, long tons	30	366
Tin bars, blocks, pigs, etc.	9,885,984	16,210,512
Imported from (in part):		
Straits Settlements	6,448,003	11,611,756
Dutch East Indies	792,041	742
United Kingdom	1,355,405	3,226,310
Australia	592,055	510,760
Hongkong	544,330	Nil
Zinc:		
Ore, contents	4,104,712	2,998,115
Imported from:		
Canada	190,000	220,993
Mexico	3,914,712	2,777,122
Blocks or pigs, and old	Nil	469
Manganese ore, long tons	48,917	15,363
Imported from (in part):		
Cuba, long tons	6,176,171	32
Brazil, long tons	37,885	8,620
British India, long tons	Nil	2,300
Tungsten ore, long tons	959	592
EXPORTS OF COPPER, LEAD AND ZINC (In pounds)		
	Oct. 1918	Oct. 1919
Aluminum:		
Ingot, metals and alloys	1,253,000	389,000
Plates and sheets	133,254	47,099
Copper:		
Ore, contents	364,000	3,000
Concentrates, contents	15,400	46,457
Unrefined, black, blister	110,066	Nil

A hearing in the matter of the steel-price basing point was held before the Federal Trade Commission on December 2. The commission received a large number of statements from important interests on each side of the question.

Exploration in Southeastern Asia

Prospecting of Virgin Territory Difficult Owing to Jungle and Infrequent Outcrops—Natives a Source of Information, but Many Dialects Make Interpreters Necessary—Government Co-Operation Must First Be Secured

BY MICHAEL H. LOVEMAN
Mining Geologist, 32 Broadway, New York

THE facts to which attention is directed in the paper here presented should be of interest at the present time, when renewed activity is being manifested in the mineral exploration of little-known regions. They are based on experience gained in Burma, but are in a general way applicable to the greater part of southeastern Asia.

An absolute essential to exploration work of any magnitude in the Far East is the assent and, in fact, co-operation of the government of the country in which it is carried out. An attempt to search for mineral deposits without the previous consent of the government would involve certain failure of the expedition.

Exploration work in an unexplored country is of two types: (1) Virgin prospecting, by which is meant the examination of a section of country concerning which nothing regarding definite occurrences is known. This type of work implies the examining of outcrops and of stream float and thorough cross-examining of the natives of the country. (2) The investigation of reported occurrences where the approximate situation and kind of ore are already known and the presumed existence of which is the reason for the expedition. This second type is not discussed in this article, as it is analogous to examinations of prospects anywhere, and differs only in the fact that the information is generally vague and may eventually prove to have no basis in fact.

The physical difficulties met in the tropics, such as transportation, distance from supplies, and rainy seasons, merely call for a general knowledge of the country, and a sensibly equipped expedition will have no troubles of any magnitude.

Few Outcrops Make Prospecting Difficult

Virgin prospecting through practically all the region under discussion has to combat the serious obstacle of heavy jungle and a thick covering of soil, with a consequent great paucity of outcrops. The trails in all countries of heavy rainfall such as southeastern Asia follow the ridges wherever possible, and descend into the valleys only for short stretches. Contradictions to this occur only when the valley bottoms are fairly wide and flat, in which cases the valley floors are covered with fluvial deposits and are generally cultivated. The search for outcrops would thus entail the cutting of paths through the jungle and would take a prohibitive amount of time in relation to any possible results.

It is obvious that, even with any help derived from technical knowledge, it is impossible to go over any definite section of ground in a few days as thoroughly as has been done by the inhabitants of the district in the course of their daily work over a prolonged stretch of years. The hill tribes of south-

eastern Asia are all hunters and fishermen, and during the course of their daily wanderings have explored practically all accessible points in the neighborhood of their homes. The constant moving of the settlements themselves implies the acquisition of knowledge concerning a wide range of territory.

It is, of course, true that the almost absolute ignorance of the natives concerning the various ores, combined with their lack of interest, may be the cause of their overlooking mineral deposits. However, the appearance and weight of the commoner metallic minerals, such as pyrite, chalcopyrite, hematite, sphalerite, and cassiterite, unusually attract the attention of anyone, even if he is not looking for them. That their presence has been noted by the natives is evidenced by the fact that mineral specimens have been observed in the houses of villages near deposits. The rapidity of erosion of exposed outcrops is so great that the sulphides almost invariably outcrop on the surface, thus doing away with the oxidized ores which are recognized with greater difficulty. This is not always true of the copper minerals, but among these the appearance of the oxidized ores is more striking than that of the sulphides.

An examination of an area by means of working along its lines of drainage is extremely unsatisfactory, as the distance that sulphide float of any appreciable size is carried from its source is generally measured by yards rather than by miles, and this implies the working of streams practically up to their sources. To do this carefully entails a prohibitive amount of time, two miles of stream bed having been found to take a full day's work. The question of float in streams really falls into the category of things as to which better results can be obtained by questioning the natives rather than by actual search. Float other than in stream beds is practically non-existent.

Questioning Natives Produces Best Results

It follows naturally from the above that the most productive method of prospecting is by means of inquiries among the natives. This method is of necessity a leisurely one, as information must generally be secured by indirect methods, entailing time and patience. The payment of small sums of money for information is, of course, necessary. The amount asked depends largely on the eagerness shown by the questioner, but it is, even in the cases of the larger demands, a small sum, and can generally be made partly dependent on whether the information turns out to be of any value.

The ignorance of the natives about the various minerals entails a great amount of useless work in reported occurrences. Reported gold or copper is

generally found to be pyrite; silver, muscovite; coal, a dark carbonaceous band; iron, any red-colored rock. The obvious remedy for this is to insist on seeing actual specimens from the reported localities before visiting them. This is generally satisfactory as far as determining the kind of ore is concerned, but is useless as to grade. The invariable careful selection of specimens is carried to such an extreme that the least mineralization is made to produce high-grade samples. It is sometimes possible by carefully interviewing the bringer of specimens to ascertain in a way the nature of the deposit, but the information derived in this manner is always so vague and unsatisfactory that it is of no help in coming to a decision as to whether to visit the spot or not.

Ancient Workings Help, but Are Hard to Find

In all the sections contiguous to the southern border of China, and, to a lesser degree, in those more distant, the presence of ancient workings is a prominent aid to prospecting. This is not so much owing to the help which they afford in actual examination of the deposits, as because of the fact that their existence is generally known over a wide stretch of country. Information as to the existence of such workings has been secured from points forty to fifty miles distant. In fact, villagers at a distance from a deposit are generally more free with their information than those close to it; the latter often being afraid of interference with their normal life.

Ancient workings are generally hidden in dense jungle, the old dumps apparently favoring the growth of heavy vegetation, especially of undergrowth. In one case, at least, an hour or more had been spent by three or four men in finding a single tunnel, when the final result revealed six old workings within a radius of a hundred yards.

As far as their being an aid to examination is concerned, the ancient workings generally prove disappointing. The majority are either caved, generally at the mouth of the tunnel, or filled with water. Most of them are inclines sloping at 20 to 45 degrees. A moderate amount of work will often make them accessible, but it is generally necessary to do fresh underground work to secure reliable information.

Inability to speak the language of the natives is naturally a drawback, but practically an unavoidable one. The mountainous regions of southeastern Asia, especially the areas bordering on China, are not inhabited by a single homogenous race of people, but by a large number of races; each speaking a distinct dialect. If the territory covered by an exploring party be large, it is inevitable that the members of the party will have dealings with numerous races, thus making necessary the use of a number of little-known languages. It is practically impossible for the members of a temporary expedition to acquire a knowledge of these tongues. Recourse must, of necessity, be had to native interpreters. In many instances it will be necessary to translate the conversation through two stages, namely, from the language of the hill tribe to the general language of the country, and then into English. Naturally such a process is unsatisfactory, but is less of a

drawback than would appear at first glance. As mentioned previously, the knowledge secured by questioning natives is vague and unsatisfactory. The main object of the questioning is therefore simply to secure two items of information: (1) Whether any valuable minerals have been observed in the neighborhood; (2) how to get to them, the latter meaning simply the securing of a guide. This limited amount of information can generally be satisfactorily secured through interpreters. As an aid to obtaining an answer to the first question, exhibiting of type specimens of the different minerals has proved of help. Owing to a human trait, a native is more apt to impart information to one of his own kind than to one of an entirely different race, even if the latter has a knowledge of the local tongue. This fact is an argument in favor of using an interpreter, even if he is not actually necessary.

It will be understood from the observations set down that virgin prospecting by itself in the section discussed involves a rather slow trip through the country, and that the main chance of finding mineral deposits is through information secured from the inhabitants. The possibility of finding valuable mineral deposits in this fashion is so uncertain that it rarely attracts capital.

Geologists Leaving Government Employ

Seventeen per cent of the scientific force of the U. S. Geological Survey resigned during the last fiscal year, it is shown by the annual report of its director, Dr. George Otis Smith. The cause, Dr. Smith points out, is inadequacy of compensation. Separations in the clerical force were much larger than in the scientific force, for the same reason.

"The relation between Government salaries and outside salaries of geologists," says Dr. Smith, "has been determined definitely in a compilation of the records of twenty-nine geologists who left Government service after receiving an average salary of \$2,271. The average initial salary of these men in private employ was \$5,121, and after two years of service this compensation averaged \$7,804. Eight of these geologists received \$10,000 or more. The disparity is even greater if consideration is given to the large financial returns from investments made by the private geologists in connection with their professional work, a privilege properly denied by statute to the official geologist.

"That the value of these men as specialists and consulting geologists is far greater to the country at large than to private corporations is undeniable. Furthermore, it is important to note that most of these geologists had resisted to the limit of endurance, with a magnificent spirit based on their love of scientific research, and their desire to contribute to the sum of geologic knowledge. Unless adequate measures are taken to ameliorate the situation, the geologic staff is destined to suffer far greater deterioration of morale and depletion in its ablest, most responsible, most experienced, and most valuable members."

Extinguishing a Burning Gas Well

Exploding of Nitroglycerine, in Conjunction With the Use of Steam, Water and Slime, Proved Successful—Details of the Process

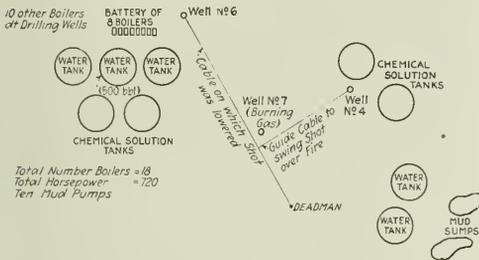

BY SETH S. LANGLEY
Mining Engineer, Taft, Cal.

ON JUNE 6, well No. 7, of the Standard Oil Co., California, on Sec. 36, Township 30 N., R. 23 E., M. D. B. & M., was being bailed to bring it in as an oil well, when gas broke in and caught fire. The 6-in. casing had been cemented at 1,800 ft., and the total depth of the well was 2,141 ft. This cement job must have failed, as the gas sands in the other wells are at a correlative depth above 1,800 ft. As well No. 4 had broken in as a gas well, the casing on No. 7

best that had been accomplished was to lower the flame to a point about 40 ft. above the collar of the well.

The last and successful attempt was most ingenious. A cable was strung from a nearby rig to a deadman beyond and in line with the fire. To this a second cable was attached from another rig, the two cables forming a right-angle at the fire. The second cable was to serve as a guide to swing the first directly over the well. With the steam, water, mud, and chemicals turned on, and the fire lowered to about 40 ft., a charge of 150 lb. of nitroglycerine was guided down the first cable directly above the flame. The shot was detonated by a battery and the fire was out on Aug. 5, 1919. The figure is a general sketch of the arrangement finally used.

[The means employed to extinguish the fire at well No. 4 were described in the Journal of July 12, 1919, on page 73.—Editor.]

GENERAL ARRANGEMENT OF TANKS, BOILERS AND WELLS

was provided with a gate and relief valve to meet such a contingency. When the drillers heard the gas coming they were able to close the gate and open the relief valve, but the pressure was too great and tore off the fittings. The fire did not start at once, but broke out about an hour later. It was apparent that this was a much bigger gasser than No. 4, but the steam from sixteen boilers had been all that was necessary in that case, and eighteen were at once made ready.

After clearing away the remains of the drilling equipment, an attempt was made to smother the fire with steam. Several attempts resulted in failure. The gas had been bringing sand and shale with it to such an extent that the two upper joints of the casing were worn away and the hole enlarged around the collar of the well. This allowed the flame to reach down below the surface and increased the difficulty of smothering. After the steam had proved of no avail, water and slime were added with no better success. The next attempt included all of these with fifteen tons of a solution of carbon tetrachloride and as much sulphuric acid and bicarbonate of soda. The fire refused to smother. The

Status of English Oil Development

According to the American Chamber of Commerce in London, the oil discovery at Derbyshire, England, which caused so much excitement some few months ago, has amounted to practically nothing. The Hardstoft boring, at which the strike was made, is still the only one to have come in, and even there the flow is small. The bore hole is now down 2,800 ft. and has passed through two colliery workings, but the yield of oil was only about 2,000 gal. per day. A powerful pump, introduced in the hope of increasing the flow, has now broken down, and the oil is penned up in the bore hole, escape having been cut off by means of a safety valve. It is hoped, however, that the subterranean supply is good, because the flow up to the present has been continuous.

The other borings, at Ironfield, Reinshaw, Ridge-way, Brimington Common, and Heath, have not struck oil at all. It is reported that drilling on these sites has been suspended, owing to the non-arrival of the steel tubes necessary to keep out the water and to prevent oil from escaping in any subterranean crevice which the drill may have passed through.

No Japanese Oil Concessions in Mexico

Persistent rumors that Japanese are acquiring petroleum lands along the Gulf Coast of Mexico were denied emphatically by the Secretary of Industry and Commerce of Mexico, according to official information reaching Washington. Not a single concession of such a nature, up to the present time, has been granted to Japanese subjects, it is stated.

Irish and Scottish Oil Shale*

Geological and Mineralogical Character of Deposits, and Estimation of Reserves—Yields of Oil and Sulphate of Ammonia

THE earliest recorded production of oil shales was in 1873, when the output amounted to 542,643 tons, and there was a steady increase until the year 1913, when the highest production, amounting to 3,280,143 tons, with a value of £822,394, was reached, all of which, with the exception of 240 tons from Flintshire, came from Scotland.

Oil shale has been obtained during varying periods from many English counties, but the Scotch deposits in the counties of Edinburgh and Linlithgow have at all times been the most important.

Some clay rocks split readily into fine leaflets or laminae parallel to their bedding, and this structure is accentuated by films of other materials, such as sand or vegetable debris. Laminated clays of this nature are generally known as shales. They are found in many formations, but are most common in the carboniferous. Some of them contain much organic debris, and when distilled yield paraffin oil, wax compounds of ammonia, and other products. In these oil shales are clear, globular, yellow bodies which seem to be resinous, and a suggestion has been made that the admixture of large quantities of decomposed fresh-water algae among the original mud explains the origin of paraffin. Many shales contain great numbers of nodules of clay and ironstones, and others are rich in pyrites which on oxidation produce sulphuric acid; this attacks the aluminous silicate of the clay and forms alum shales. The lias shales of Whitby contain blocks of semi-mineralized wood or jet.

Geological Character of Deposits

The oil-shale measures of Scotland form part of the calciferous sandstone series which embrace two subdivisions. The upper, known as the shale group, is over 3,000 ft. in thickness and contains in its higher parts, beds of coal usually of inferior quality and further down about six main seams of oil shale interstratified with beds of sandstone, shale, fireclay, marl, and estuarine limestones. Oil shale is found both in the coal measures and in the carboniferous limestone series of Scotland, and has been wrought in various localities together with seams of coal and ironstone. At present practically none of these shales is considered workable, exclusive attention being paid to the valuable seams occurring in the calciferous sandstone series. In thickness these seams vary greatly. At certain localities they disappear, passing into ordinary carbonaceous blaes, and at others swell to 6 or perhaps 15 ft. in thickness.

There is undoubtedly a considerable resemblance between the Scottish shale measures and those found in the Ballycastle mineral field in the North of Ireland. The field is in the lower carboniferous series, and the calciferous sandstone series being composed of massive sandstones, shales, thin beds of limestone, ironstones, and coal seams. A good section of the

lower carboniferous series can be found on the cliffs forming the coastline between Ballycastle and Fair Head, showing the outcrop of the different seams.

Possibility of Future Developments

As pointed out, the shale seams in the Scotch carboniferous series have hitherto been but little availed of for exploitation, but it would be premature to depreciate the value of Irish measures on that account. It is stated on good authority that the 8-ft. seam of limestone which outcrops in part of the Irish field at Colliery Bay is recognizable as the Burdiestone limestone, a well-known horizon on the Scottish field. As the outcrop of this 8-ft. bed is at sea level, it is anticipated that there should be a considerable thickness of productive strata below this horizon. At Pumpherton in Scotland there is up to 1,000 ft. of productive strata below the Burdiestone limestone. At Colliery Bay the outcrops are first met about half a mile to the east of the town of Ballycastle, continuing for a distance of four miles to Fair Head. The cliffs gradually rise in height from 150 ft. near Ballycastle to 636 ft. at Fair Head. The seams of shale outcropping on the cliffs are eight in number, varying in thickness from 3 to 17 ft., making a total thickness of 90 ft. of shale, of which about 25 ft. is true oil shale.

As numerous mines have already been driven into the face of the cliffs to work the coal and ironstone, it might be possible to restore them with but little expense to work the seams. The total area of this district is 9,230 acres, and the shale reserves have been estimated at 189,000,000 tons. This computation allows for 25 per cent for losses incurred in connection with faults, intrusions, and loss in working, and takes into account only 5,600 acres, as the remainder would be required to be proved by boreholes. A drawback in connection with the Ballycastle field is the presence of many faults and disturbances which follow a more or less north-and-south course, splitting up the field into numerous divisions. Practically the whole of the region is capped with sheet basalt and, unfortunately, in one section zones of this material are noted through the stratified rocks.

The Irish field is not, however, peculiar in the possession of these disadvantages. Broadly speaking, the effect produced on oil shales by the intrusion of igneous rocks depends on the proximity, the temperature, and mass of the intruded matter, and the amount of water with its cooling power in the sediments which are invaded. Specimens of Broxburn shale taken some distance apart from localities beneath the dolomite sill—a coarse variety of basalt—near Newbygan gave some interesting results. Two samples yielded 23 gal. each, which was comparatively low, but the other two gave 31 gal. each, the explanation probably being that the igneous rocks were further off.

Again, in another part of the Scotch field, near Drumshoreland, the existence of a basalt dike about a mile or two long has had the effect of rendering useless the shales for about a distance of 70 ft. on either side. A process of distillation of the shales has been evidently carried on here by the molten

*From "The Statist," London, Oct. 11, 1910.

material. The basaltic cap is not of general occurrence in the Irish field. Around Ballyvoy it is absent, the strata are covered with a considerable thickness of drift, and consequently better inducements for working might be afforded here. It is stated that shafts sunk in the locality have cut through at 120 ft. a seam of shale 15 ft. in thickness; and, directly over the coal seam, a seam of shale 60 ft. in thickness was encountered.

A distinct similarity has been traced between the cannel coal once mined in Ballyvoy and the highly-bituminous Boghead coal or Torbanehill mineral, returning 120 to 130 gal. of crude oil per ton, and worked out in Scotland in 1862. The main difference between shale and cannel coal consists in the percentage of ash, rich shales approximating to the coal in their composition. This is well illustrated by the New South Wales kerosene shale, which contains only 8 per cent of ash, and a splinter of which will burn like cannel coal.

As regards the oil yields from Scottish shale, the figures vary for the richer kinds from between 30 and 40 gal. per ton, but the higher yield is usually obtained at the expense of the solid paraffin and of the quantity of heavy oils. Contrasted with this the Irish yield is comparatively low, but in this connection much would depend on the extent to which investigation was restricted to outcrops. It is also worthy of notice that the inferior shales in Scotland, producing about 18 gal. of oil per ton, give a proportionately larger amount of sulphate of ammonia.

The Ballycastle field is not unfavorably circumstanced for development. The town of that name is connected with the standard Irish gage railway by a narrow gage line seventeen miles long, the latter, however, being capable of considerable improvement. As the area is situated on the coastline, the sea would provide an alternative method for disposing of mineral products were harbor accommodation sufficient. The coal reserves are estimated at 83,000,000 tons, and it is unnecessary to emphasize the advantages of the centre as a coaling station and its favorable position for business connections with the industrial area in Ireland, the South of Scotland, and the North of England.

The oil shales of Scotland yield by destructive distillation at a bright-red heat, crude oil and ammonia, and this oil furnishes on fractional distillation a series of products resembling those obtained from its rival, petroleum. It yields from 3 to 6 per cent of gasoline and naphtha, about 30 per cent of burning oils (for use in lamps), about 9 per cent of gas oil, 20 per cent of various lubricating oils, and about 10 per cent of paraffin.

Of course petroleum products are more easily and cheaply won than those from shale. The crude oil of the former is obtained without the expense of mining and retorting. A bore is simply put down and tubed and the oil flows like a fountain or is brought to the surface by a pump. In this state it is much easier to refine than that produced by the violent method of the shale retort which yields unsaturated hydrocarbons and a little sulphur.

Crude petroleum in its first distillation separates a considerable proportion of burning oils which require only one treatment each with oil of vitriol and soda to render them fit for the market. Scottish burning oil, on the other hand, demands three or four distillations. A gigantic bench of 60 retorts with 250 tons of shale put through every day gives a very thin stream of crude oil and ammonia water. Nevertheless, there are consolations in the presence of ammonia and in the issue of more homogeneous products as a result of repeated distillation.

California Oil Production and Developments for October

The production of oil in California fields during October, according to information given out by the Standard Oil Co. of California, amounted to 277,589 bbl. per day, a decrease of 3,205 bbl. daily as compared with September. October shipments were 306,060 bbl. per day; a decrease of 1,592 bbl. per day as compared with September. Stocks were decreased 882,601 bbl. during the month. Forty-nine new wells were completed during the month, with initial daily production of 5,960 bbl.

SUMMARY OF DEVELOPMENTS AND PRODUCTION FOR ALL CALIFORNIA OIL FIELDS FOR OCTOBER

FIELD	New Rigs	WELLS			Producing	Production Per Day
		Drilling	Completed During Month	Abandoned During Month		
Kern River	5	22	16	...	2,035	20,040
McKittrick	...	9	...	1	347	7,317
Midway-Sunset	10	74	6	...	2,339	87,800

Summerland	142	147
Watsonville	5	77
Totals	46	345	49	5	9,064	277,589
Total crude oil stocks, October 31, 1919.....					32,017,037	bbl.
Total shipments from fields, October, 1919.....					9,487,858	"

CRUDE OIL PRICES AT THE WELL

San Francisco, Nov. 14, 1919
 Effective June 10, 1919, Standard Oil Co. offers the following prices for crude oil at the well.

San Joaquin Valley Fields	Per Bbl.
Kern River, Midway-Sunset, McKittrick, Lost Hills-Belridge, Coalinga.	\$1.23
14° to and including 17.9° gravity.....	1.24
18° to and including 18.9° gravity.....	1.25
19° to and including 19.9° gravity.....	1.25
and for each increase in gravity of one (1) full degree above 19.0° gravity, up to and inclusive of 35.9° gravity, two (2) cents per bbl. additional.	
37° to and including 37.9° gravity.....	1.62
and for each increase in gravity of one (1) full degree above 37.0° gravity, three (3) cents per bbl. additional.	
Whittier-Fullerton and Santa Maria Fields	
16° to and including 17.9° gravity.....	\$1.23
18° to and including 18.9° gravity.....	1.24
19° to and including 19.9° gravity.....	1.25
and for each increase in gravity of one (1) full degree above 19.0° gravity, up to and inclusive of 35.9° gravity, two (2) cents per bbl. additional.	
37° to and including 37.9° gravity.....	1.62
and for each increase in gravity of one (1) full degree above 37.0° gravity, three (3) cents per bbl. additional.	

California Petroleum Development Activity is indicated by reports filed with the California State Mining Bureau, Department of Petroleum and Gas, during the week ended Oct. 4, 1919, which show sixteen new wells ready to drill, making a total of 501 since the first of the year. Other operations reported are 26 tests of water shut-off; 14 deepening or re-drilling jobs; and 6 abandonments.

Natural Gas and Natural Gas Gasoline in the United States

Great Increase in Value of Natural Gas Used—The Recovery of Gasoline From Natural Gas Has Become a Large Industry

MORE than 2,100 cities and towns in the United States are supplied with natural gas, which is furnished to domestic consumers at rates that should arouse the envy of those consumers of artificial gas who have to pay about a dollar a thousand cubic feet. The average price per thousand cubic feet charged to domestic consumers of natural gas in the United States in 1917 was about 30c. The average price charged to manufacturers was less than 12c.

Most of the towns and cities supplied with natural gas are in New York, Pennsylvania, Ohio, West Virginia, Kansas, Oklahoma, and California. In Ohio, 872,000 domestic consumers were supplied in 1917, in Pennsylvania 480,000, in California 239,000, in Kansas 188,000, in New York 164,000, in West Virginia 129,000, and in Oklahoma 95,000. The industrial consumers, by whom the gas is used for manufactures or for generating power, use twice as much gas as the domestic consumers.

During the present century the value of the natural gas used in the United States has risen annually without break from \$27,000,000 to \$142,000,000 and is still rising.

A report on "Natural Gas and Natural Gas Gasoline in 1917" by John D. Northrop, just published by the U. S. Geological Survey, gives statistics of the production and consumption of natural gas and sketches the condition of the industry in twenty-five states. It gives also statistics concerning gasoline made from natural gas in that year.

Gasoline From Natural Gas

The recovery of gasoline from natural gas has now become a large industry, which contributes materially to the supply of motor fuels. Experiments in the conversion of natural gas to gasoline were made as early as 1903, but experiment did not give way

to commercial production until about 1910. The growth of the industry since that year has been remarkable. In 1911 there were in operation 176 plants, which produced about 7,400,000 gal. of raw gasoline from natural gas. In 1917, only six years later, there were 886 plants, which produced nearly 218,000,000 gal.

Prior to 1916 most of the gasoline recovered from natural gas was derived from casing-head gas obtained from oil wells, by methods involving compression and condensation, but from year to year an increasingly large proportion of the annual output of natural gas gasoline has been recovered by the absorption process, which has now been applied not only to "wet" gas from oil wells but also to so-called "dry" gas, which occurs independent of oil and constitutes the main supply of natural gas. Dry gas cannot be profitably converted into gasoline by compression.

New Petroleum Legislation in Rumania

A communication from the British commercial secretary at Bucharest printed in the "Board of Trade Journal," London, Oct. 16, 1919, reports that a new law of Sept. 12 provides that all those properties in Rumania upon which no work has as yet been done shall be subjected in their future working to laws which are to be passed later. This is considered in many quarters as a preparatory measure to enable the Rumanian government to become an interested party in their exploitation. This point, however, should not be considered serious, because only those properties upon which no exploitation work has yet been done are brought into control, and these—or the majority—have been held presumably for speculative reasons.

Art. 1 acts, on the other hand, rather in favor of companies having established rights over properties, as their present rights remain valid and cannot be attacked or limited during the period of application of the new law, although it prevents further exploitation on other lands, or transmission of existing rights, and is thus an infringement on the "right" of free sale or mortgage of holdings.

ITEMS FROM TEXAS AND LOUISIANA OIL FIELDS

WHITE AND HUMBLE COMPANIES PLAN TO ADD TO TEXAS PLANTS

The White Oil Corporation of Delaware has decided to build a 15,000-bbl. light oil refinery on the Texas Gulf coast, to be connected to the mid-continent oil-fields by an 8-in. pipe line, 400 miles long. P. J. White, president; Thomas White, vice-president; and Louis E. Stoddard and George E. Colvin, directors, have recently visited Houston and a decision as to the site of the refinery is expected shortly. The

pipe necessary has been purchased from the National Tube Co., and the construction will be in the hands of the J. G. White Co., and Stone and Webster. To handle its increasing capacity in the Homer, La., field, the White Oil Corporation will install twenty 50,000-bbl. steel tanks there.

The business of the Humble Oil and Refining Co. has expanded to such an extent that the capital stock will be increased from \$8,200,000 to \$25,000,000. The company owns leases on extensive areas in Texas, Oklahoma and Louisiana, with lesser holdings in Wyo-

ming. Eighty-one wells, 60 of them producers, were drilled in the past year in west and northwest Texas, and 154 are now being drilled. In the Gulf coast district, 19 wells were drilled, 12 being producers, and 20 wells are now being put down. The company has 3,000,000 bbl. of oil in storage, which is a little more than three months' production. The 8-in. main trunk pipe line from Stevens County to Texas City, Galveston County, with a daily capacity of 20,000 bbl., is expected to be finished by Jan. 1, 1920. The 8-in. line from the West Columbia field to the Webster

tank farm, 50 miles long, with a daily capacity of 14,000 bbl., was put into operation last July. A 10,000 bbl. refinery at Baytown, near Goose Creek, will be in operation, it is hoped, in June, 1920. Provision will be made for increasing the capacity later, as has been done at the San Antonio refinery, which is now handling 2,000 bbl. daily of crude supplied by rail from Burkburnett. Two casinghead gasoline plants at Iowa Park, Tex., and Healdton, Okla., are making 2,500 bbl. of gasoline daily, and a third plant, with a capacity of 1,500 bbl., is being built near Burkburnett at a cost of about \$100,000. A skimming plant is under construction at Comyn, Comanche County, for treating Ranger and Desdemona crude oils before sending them to storage. A dock at Texas City, sufficiently large to load two tank steamers at a time, has been built. The extensive development in all of these fields has necessitated an extensive building campaign to house employees, especially at Cisco. A new six-story office building will be erected, fronting on Polk St., Houston, to cost \$1,000,000.

OIL BOOM AFFECTS OTHER INDUSTRIES

Industries other than oil are soon called into being in districts where petroleum is found. A new telephone corporation, capitalized at \$1,000,000, has been organized by Eastland, Tex., men to serve the Central-West-Texas oil region. The company has been financed, and long distance service with Dallas and Fort Worth will be installed.

The Lucey Mfg. Co., of Houston, will expend about \$1,000,000 on a steel plant and a new factory for the manufacture of oil well equipment and supplies; and 800 to 1,000 men will be employed. The new plant will be so arranged that the capacity can be greatly enlarged in a short time, and it will, it is expected, eventually be the largest of the company's works. The old plant will be temporarily doubled in size to fill present demands.

PIPE-LINE OWNERS FEAR BEING MULCTED

The proposal of the Texas Railroad Commission that pipe lines cannot be laid without securing the written permission of the owners of the land over which the lines pass, is being opposed by the oil companies. The latter claim that gathering lines are laid in a rush to meet emergencies and that there is no time to obtain permission. Furthermore they argue that such a ruling would lay them open to the rapacity of some land owners on whose property, lines have already been laid without protest.

CLAIBORNE FIELD LACKS PIPE LINES

New Gushers Overtax Capacity—Much Property Changing Hands

Wonderful progress is being shown in the oil developments of northern Louisiana. Several large gushers have been brought in recently in the Homer field. One of the recent completions in Claiborne Parish is Gilliland & Foster's No. 6 Oaks, which is flowing over 5,000 bbl. daily through a 4-in. pipe line, 4 miles long, to Homer. This well was drilled as an offset to Standard Oil Co.'s No. 1 Oaks, the first big well completed in the deep sand. These operators are drilling several other wells. The Louisiana Oil & Refining Co., in the Claiborne field, completed its No. 4 Jackson well recently, and this is producing satisfactorily. No. 9 well of the Fortuna Oil and Gas Co. in the Bull Bayou district, is now making 1,000 bbl. daily from 2,750 ft., a greater depth than former producing wells had reached.

The Claiborne field is held back on account of insufficient pipe line capacity. The Sinclair Consolidated Oil Co. has completed survey of its pipe line from Cisco, on the Houston ship channel, Harris County, Texas, to Mansfield, La., and the Homer field. The line will be 226 miles long and will have three pumping stations. The Simms Oil Co. will also build a 6-in. pipe line, 20 miles long to its projected tank farm at Sibley.

Considerable property is changing hands in northern Louisiana. Recently the Simms Oil Co., of Houston, Tex., bought the holdings of the Rowe Oil Co., in the Homer field for a price reported to be \$9,000,000. The property has several producing wells and is making 15,000 bbl. daily. The Simms Oil Co. has also purchased a one-third interest in the 3-in. pipe line of the Claiborne Pipe Line & Refining Co. from the Homer field to the loading racks on the railroad at Homer. H. T. Stati and associates, of Houston, Tex., connected with the Simms Oil Co., have purchased the property of the Frost Oil Co., with four producing wells, for the reported price of \$1,500,000.

LEGAL HAPPENINGS AT AUSTIN, TEXAS

Several oil companies have recently been chartered at Austin, the largest being the Duquesne Oil Corporation of Wilmington, Del., with a capital stock of \$5,000,000, and headquarters at Eastland. The West Texas Oil Co., of Wilmington, Del., has a capital stock of \$1,000,000. The United States Oil Co., also of Wilmington, has a capital of \$2,000,000, and the Belle City Oil Co., with workings in Cement County, Oklahoma, is capitalized at \$500,000.

The suit between A. Goldman and the Invincible Oil Co., in which 160 acres in the Landslide tract of the Humble field, and the oil removed from it, were involved, has been settled in favor of the defendants. The plaintiff, as shown by the evidence, did not have a grant from the state for the land.—The Burk-Senator oil land dispute was discussed at a joint meeting of representatives of Texas and Oklahoma at Fort Worth beginning Nov. 20. The governors and attorney-generals of both states were present. It was agreed that for the present the district judge having jurisdiction over the boundary lines shall act as receiver, operate the wells, sell the oil, and hold the receipts until such time as the U. S. Supreme Court shall finally decide which state owns the land. In a later statement, Attorney-General C. M. Cureton, of Texas, said he would go to Washington and resist all efforts by Oklahoma to obtain control of the Burk-Senator oil property through the Supreme Court. The suit by the state to retain option on the Bassett Blakely lands at Blue Ridge has been postponed until the next term of the district court in January, 1920. No steps, however, will be taken to prevent drilling on this land in an attempt to find oil.

PERSONAL ITEMS

Grover Hartt, formerly a member of the faculty of the University of Texas, and later an attorney in Ranger, has been appointed president of the American Oil & Refining Association, of Ranger.

E. F. Simms, president of the Simms Petroleum Co.; Oscar L. Gubelman, of Knauth, Nachod & Kuhne, and Thomas Streeter, vice-president of the American International Corporation, were recent visitors in Claiborne Parish, La.

A. C. Veatch has been appointed by the Sinclair Consolidated Oil Corporation to search for oil in promising districts. Mr. Veatch was formerly connected with the Lord Cowdray interests in England and was the discoverer of the petroleum deposits in that country.

James P. Nash has been named by the oil division of the Texas Railroad Commission as one of the supervisors for Eastland and Stephens Counties. Mr. Nash was formerly connected with the state highway department and with the University of Texas Bureau of Economics.

Olaf J. Perkins has severed his connection with the Arizona State Bureau of Mines to enter the employment of the Pearson syndicate. Mr. Perkins has gathered the greater portion of the data for the geographic base map of Arizona now being compiled, and has also had charge of mapping and investigational work in several sections of the state.

BY THE WAY

A Mining Song

There is lots of gold in the ore of life
 When men extract it all;
 In the stream of woe, or the fire of strife
 It does us good to fall.
 While the poison lies of a misplaced trust,
 Should teach us to be true,
 As although our bodies may turn to dust,
 The golden soul is you.
 And the gold remains when the slag sloughs off,
 To the real, true metal our caps we doff.

—L. M. Weston.

Wanted a Metallurgist with Wheels

To have a bonanza on your hands and yet be able to interest no one in it is most tantalizing. But when this state of affairs is owing to the lack of a metallurgist with sufficient ability to detect the value in the ore, it is also most surprising and the profession should take notice. To this end we publish below a letter received from G. A. E. Martin, druggist and physician of Adona, Ark. Will some metallurgist whose wheels are running as they should, kindly lend a hand to Mr. Martin and thereby aid the mining industry at the same time?

The Adona Irido Mining Co.'s wealth consists only of the immense deposits of the metals iridosmine, ruthenium, palladium, gold, silver, copper and vanadate of iron, heterogeneously mixed in gangues of sandstone, shale, coal and blue-clay, and this known only to the writer, notwithstanding the fact that many of the best-informed metallurgists have had samples of these different gangues to test for these metals. I know they only gave them a specular examination. Surely if they had put any of the many samples they have been presented with to test they would have found at least one or two of these many metals in it, for I have failed in no one of the many thousand that I have examined, and me only an amateur—learned all I know without a teacher.

I am enclosing you a small sample, though large enough to produce an acid-test sample. I ask that you kindly look out for a metallurgist that hasn't got his wheels of locomotion so deep in the ruts of classical metallurgy that he cannot get out of the adamantine walls of the idea that everything that is has long since been known to the scientists; and that because these metals have never before been found in these gangues it is impossible for them to contain them—and he will find the metals as I say.

I should admit that I sent a sample each of the shale and sandstone gangues to John Ogden, then of Philadelphia but now of Denver, who did examine the shale-gangue and found platinum, gold, and silver; the sand-stone gangue was the richer of the two, but its values were mostly iridosmine.

To get the sample from the gangue, first crush the gangue in a clean agate mortar to a fine powder; then lift it out of the gangue substance by carefully stirring a smooth well-magnetized penknife blade in the gangue, jarring the microscopical, flat, metallic granules that adhere to it on to a smooth oiled paper; then jar it from the paper into a dry clean test tube and it is ready for the nitromuriatic acid. And it generally needs to be fortified with sulphuric acid.

I have written to the "Patent News" for advice about my discovery being of sufficient merit for a patent, but have not yet heard from them. Will you kindly give me such advice.

What Was the Sentence Pronounced?

The State Corporation Department of California has issued a bulletin announcing that "Diamondfield Jack" Davis, who was arrested some time ago in San Francisco charged with violating the provisions of the Corporate Securities Act, has been found guilty by Judge Oppenheim in San Francisco. Davis was accused of having made frequent and successive sales in California of shares of stock of the Silver Reef Divide Mining Co., a Nevada corporation, which had been issued to him in Nevada, without having first obtained from the Commissioner of Corporations of California a certificate authorizing him to do so. The bulletin states further:

Judge Oppenheim, in pronouncing judgment upon Davis, declared that he was convinced of Davis' guilt and intended to see that the provisions of the Corporate Securities Act were enforced, and, if he was found at any future time violating any of the provisions of the act in connection with the sale of corporation stock, he (Judge Oppenheim) would see that Davis would be severely dealt with.

Commissioner of Corporations E. C. Bellows, in commenting upon the outcome of the charges against Davis, declared that it is his purpose to take every means provided by law to put a stop in California to the operations of such dealers as "Diamondfield Jack" Davis.

California is fortunate in having a Blue Sky law and an official who will enforce it. Experience has shown, however, that only the imposition of severe penalties will make the fractious obey.

Dan McGann Declares Himself

BY EDGAR A. GUEST

Said Dan McGann to a foreign man who worked at the self-same bench,

"Let me tell you this," and, for emphasis, he flourished a Stilson wrench.

"Don't talk to me of the bourgeoisie, don't open your mouth to speak

Of your socialists or your anarchists, don't mention the bolsheveek,

For I've had enough of their foreign stuff, I'm sick as a man can be

Of the speech of hate, and I'm tellin' you straight that this is the land for me!

"If you want to brag, just take that flag an' boast of its field o' blue,

An' praise the dead an' the blood they shed for the peace o' the likes o' you.

I'll hear no more," and he waved once more, his wrench in a forceful way,

"O, the cunning creed o' some Russian breed. I stand for the U. S. A.!

I'm done with your fads, and your wild-eyed lads, don't flourish your rag o' red

Where I can see, or at night there'll be tall candles around your bed.

"So tip your hat to a flag like that! Thank God for its stripes and stars!

Thank God you're here where the roads are clear, away from your kings and czars.

I can't just say what I feel today, for I'm not a talkin' man, But first an' last, I am standin' fast for all that's American. So don't you speak of the bolsheveek, it's sick of that stuff

I am,
 One God, one flag is the creed I brag! I'm boosting for Uncle Sam."
 —Ax-i-dent Ax.

PERSONALS

W. H. Goodchild has left England for South Africa.

William Cullen has left England for South Africa, where he will remain for six months.

Harley C. Hooper has left Burma for Australia, where he expects to remain until March, 1920.

E. F. Yates, formerly of the Miami Copper Co., has been appointed city engineer of Globe, Ariz.

C. W. Purington has returned to England from Eastern Siberia and the Federated Malay States.

T. R. Jones, for many years manager of the Buffalo mine, Cobalt, has returned to the United States.

H. M. Gallagher has been appointed general auditor of the Phelps Dodge Corporation, with headquarters in Douglas.

Walter Lyman Brown has returned to London from Holland and is in charge of the operations instituted by Mr. Hoover for relief in eastern Europe.

Horace F. Lunt, State Commissioner of Mines of Colorado, with Bulkeley Wells, visited the mines of the Radium Co. of Colorado early in November.

E. W. Martin, A. T. Roos, Burt Rogers, and W. H. Seaman, all of Deadwood, S. D., attended the meeting of the American Mining Congress at St. Louis.

J. G. Lawn has left England on his return to South Africa to take up the position of managing director to the Johannesburg Consolidated Investment Co., Ltd.

R. M. Thompson, of New York, has entered the Matachewan mining field of Northern Ontario and taken an option on four claims adjoining the Matachewan mine.

Ralph S. Rainsford, formerly with J. G. White & Co., has become vice-president of W. B. Richards & Co., accountants and engineers, of 71 Broadway, New York.

A. J. Robin has severed his connection with the Mazapil Copper Co. and has accepted a position in Aguascalientes, Mexico, with the American Smelting & Refining Co.

Sergio Bagnara is consulting engineer and general manager of the Marine & Commerce Pocahontas Corporation, one of the large operators of the Pocahontas field in West Virginia.

Thomas H. Tulloch has resigned as general superintendent of the Chestnut Pyrites & Chemical Corporation to accept a position with the American Venture & Mines Corporation, Thomson, Ga.

C. F. Mason, after completing the installation of powdered-coal equipment at the Hayden, Ariz., smelter, is visiting the various smelting centers of Arizona before returning to his home in Canton, Ohio.

B. O. Pickard, engineer in charge of the Bureau of Mines station at the Michigan College of Mines, left for Hibbing, Minn., on Nov. 15, to attend a conference of the safety men of Pickands, Mather & Co.

Jesse Butler has been appointed superintendent of the Michigan mine in Ontonagon County, Mich., succeeding the late Samuel Brady. Mr. Butler, who is a graduate of the Michigan College of Mines, worked under Mr. Brady for two years and has intimate knowledge of the property.

J. A. BATTLE, JR.

J. A. Battle, Jr. is now in private practice. As stated in the "Journal" of Oct. 25, Mr. Battle resigned recently as acting chief engineer in the investigation of claims filed with the War Minerals Relief Commission.

William Boyce Thompson, of New York, has been in Phoenix, Ariz., visiting his brother, J. E. Thompson. Colonel Thompson, accompanied by Charles Ayers, president, and W. C. Browning, manager of the Magma Copper Co., will visit the holdings of that company, in which he is heavily interested.

Horace V. Winchell and Bradley Stoughton, president and secretary, respectively, of the American Institute of Mining and Metallurgical Engineers, are on a trip through the Western States, during which they will visit all of the local sections of the Institute. They will be absent about two months.

Robert R. Boyd has accepted appointment as assistant superintendent of mines at Bisbee, Ariz., for the Cop-

per Queen branch of the Phelps Dodge Corporation. Mr. Boyd has resided for fifteen years in the Globe section, where he was connected with the Warrior, Old Dominion, and Arizona Commercial companies.

OBITUARY

J. W. Moffett, former manager of the Beaver and Temiskaming mines, Cobalt, and a pioneer of the Cobalt camp, died recently from tuberculosis at Hailybury, Ont., after a long illness. He was about forty-five years old and a native of Missouri. In his younger days he was engaged in mining in the Joplin district, and came to Canada about fourteen years ago. He designed and built the Beaver and other mills, and afterward became superintendent of the Beaver and Temiskaming mines. Mr. Moffett leaves a widow and one child.

Benjamin Hollinger, a noted prospector and mining man of Northern Ontario, and the discoverer of the Hollinger mine of Porcupine, died suddenly from heart failure at his home in Pembroke, Ont., on Nov. 26. He was thirty-four years old. He was born at Chalk River, Ont., and engaged in prospecting when quite young. His labors yielded little result for some years, until the discovery of the Hollinger, his share of which was estimated at \$250,000. The Hollinger Reserve was another of his fortunate discoveries, and he was interested in a number of other properties. Mr. Hollinger was apparently in good health up to the time of his death, and had just returned from a deer-hunting expedition. He is survived by a widow and three children.

SOCIETIES

Idaho Society of Engineers has voted to affiliate with the American Association of Engineers under the title of the Idaho Society of Engineers Chapter of the American Association of Engineers.

Canadian Mining Institute held its annual general meeting at the Hotel Vancouver, Vancouver, B. C., Nov. 26-28, 1919. A number of interesting and practical papers were on the program. An account of the proceedings will be published later.

American Institute of Mining Engineers.—The Puget Sound Section held its annual meeting at the Faculty Club Building, University of Washington,

on Nov. 12. Following the usual dinner, the secretary's report was presented and officers were elected. The Montana Section held a meeting at the Montana Hotel, Butte, on Nov. 8, 97 members being present. Addresses were made by Frederick Laist, H. J. Maguire, James K. Murphy, and E. B. Young.

Rice Lake Mine Operators' Association.—At a meeting of mining men interested in the Rice Lake gold field of Manitoba, held in Winnipeg, Nov. 21, preliminary steps were taken toward forming an organization under the above title, with the object of improving transportation conditions and otherwise promoting mining interests. A committee consisting of J. W. Harris, F. O. Fowler, Col. A. C. Gray, Joseph Myers and Gordon McTavish was appointed to draft a constitution and by-laws.

INDUSTRIAL NEWS

Pittsburgh Testing Laboratory announces the death of William Frazier Carpenter, second vice-president, on Oct. 10.

International Exposition of Mining Industry will be opened to visitors on Dec. 1, but it will not be complete, as many exhibitors have not yet been able to arrange their exhibits. It is expected that everything will be in condition for the formal opening on Jan. 1, 1920.

Parsons-Moorhead Machinery Co., Hostetter Bldg., 237 Fourth Ave., Pittsburgh, has been organized to do a general machinery business. William L. Moorhead, of this company, was formerly vice-president of the Duquesne Electric & Manufacturing Co. Mr. Parsons has been doing a general machinery business for several years.

Redwood Manufacturing Co. was awarded a contract by the Butte Water Co., in October, 1919, for twenty-four miles of 26 and 24-in. Remco continuous stave pipe for additional water supply, this line to run from the pumping plant on the Big Hole River to a connection with the city water system. In 1892 the Redwood Manufacturing Co. installed a line of pipe 46,000 ft. in length and 24 in. in diameter, and in 1899 it installed 64,700 ft. of 24-in. and 32,000 ft. of 26-in. pipe, also for the Butte water supply. The lines installed in 1892 and 1899 were thoroughly examined in October, 1919, and found to be free from deterioration, the redwood showing no decay and being in its original condition. The pipe lines have operated continuously since they were installed, notwithstanding the fact

that they are situated in a climate where the temperature goes 50 deg. below zero at times. Mr. Eugene Carroll has been general-manager of the Butte Water Co. since 1892, when the first line was installed. The fact that he gave the last contract to the Redwood Manufacturers Co. may be taken as evidence that the Remco pipe gave satisfactory service.

TRADE CATALOGS

D F C Melting Furnaces. Bulletin No. 450. Denver Fire Clay Co., Denver, Col. 7 x 10 in.; 20 pp., illustrated.

Imperial Incandescent Headlights for Electric Traction and Mining Service. Ohio Brass Co., Mansfield, Ohio. Catalog No. 205. 6 x 9; 96 pp., illustrated.

Black & Decker Electric Air Compressors, Portable Electric Drills and Electric Valve Grinders. Black & Decker Mfg. Co., Baltimore, Md. 8½ x 11; 31 pp., illustrated.

Concrete Pipe. American Concrete Pipe Association, 210 S. La Salle St., Chicago, Ill.; 8½ x 11; 12 pp.; illustrated. Booklet aiming to show the broad field for concrete pipe and adaptability for its many uses.

Concrete Tanks for Industrial Purposes. Portland Cement Association, 111 W. Washington, St., Chicago, Ill.; 6x9; 35 pp.; illustrated. Gives examples of concrete tanks used in different industries for storing various liquids, covering water, mineral oils, salt brine, chemical solutions, etc. In the mining industry concrete tanks are used as depositing tanks in electrolytic refining, for storing sulphuric acid and for slime-settling.

Bacharach Instrument Co., of Pittsburgh, Pa., has recently issued two new pamphlets as follows. Pamphlet P, on "Pitot Tubes and Orifices for Measuring the Flow of Gas in Connection With Hydro Flow Meters," and Catalog F, describing a new pressure-volume indicator for the control of air delivery to cupolas, suitable for either permanent installations or testing purposes.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Alloys—Manufacture of Metal Alloys. William Lawrence Turner and Harold Alexandre Blackwell. (1,321,684; Nov. 11, 1919.)

Cement—Process and Apparatus for Cooling Cement-Kiln Gases and the Re-

covery of Dust Therefrom. Levi Stevens. (1,315,254; Sept. 9, 1919.)

Conveyor-Belt Drive. Charles Piez, assignor to Link-Belt Co. (1,319,109; Oct. 21, 1919.)

Crushing—Pulverizing-Mill Roller and Supporting Structure for Same. Robert A. Lachmann, assignor to Raymond Brothers Impact Pulverizer Co. (1,321,379; Nov. 11, 1919.)

Drills—Mounting for Hammer-Drills. William A. Smith, assignor to Ingersoll-Rand Co. (1,321,565; Nov. 11, 1919.)

Electric Furnace for Heating, Annealing and Melting Metallic Material. Mario Fossati, assignor to Societa Anonima Stabilimenti Biak. (1,322,416; Nov. 18, 1919.)

Fuel—Method and Apparatus for Feeding Pulverized Fuel. Cloise H. Baldwin. (1,320,963; Nov. 4, 1919.)

Grizzly for Ore Separation. William Ross. (1,321,716; Nov. 11, 1919.)

Mining and Quarrying Machine. Cyrus S. Oldroyd. (1,321,840; Nov. 18, 1919.)

Nitrogen—Process for the Fixation of Nitrogen. Frank L. Slocum. (1,318,929; Oct. 14, 1919.)

Oil-Well Screen. Clarence N. Scott, assignor, by mesne assignments, to The Texas Co. (1,475,6; Nov. 18, 1919.)

Ore Concentrator. William F. Walda, assignor to Deister Concentrator Co. (1,321,577; Nov. 11, 1919.)

Roasting—Rotary Furnace for Roasting Blende, Pyrites, or Other Minerals. Henry Charles Bingham, assignor to Huntington, Heberlein & Co., Ltd. (1,322,223; Nov. 18, 1919.)

Separation—Ore-Separating Apparatus. Lewis H. Falley. (1,322,487; Nov. 18, 1919.)

Sulphuric Acid—Apparatus for the Fractional Distillation of Sulphuric Acid and Other Liquids. Henry Jander. (1,321,210; Nov. 11, 1919.)

Thorium—Recovery of Thorium. Magnus A. Goltz. (1,322,185; Nov. 18, 1919.)

Tungsten—Means and Method of Compressing Powdered Tungsten, Tantalum, and the Like into Crucible Form. Carl A. Pfanstiehl. (1,321,125; Nov. 11, 1919.)

Zinc—Recovery of Zinc by Electrolysis. Royale Hillman Stevens, assignor to Electrolytic Zinc Co. of Australasia, Proprietary Ltd. (1,322,071; Nov. 18, 1919.)

Zinc Oxide—Manufacture of Zinc Oxide. Frank G. Breyer, James A. Singmaster and Albert E. Hall, assignors to New Jersey Zinc Co., New York, N. Y. (1,322,088 to 1,322,091, inclusive; Nov. 18, 1919.)

Zinc Oxide. Manufacture of Zinc Oxide. James A. Singmaster, Frank G. Breyer and Earl H. Bunce, assignors to New Jersey Zinc Co. (1,322,142; Nov. 18, 1919.)

THE MINING NEWS

New York, December 6, 1919

Important Uranium Deposit in Wyoming

Fifty-Ton Plant to Treat Uranophane Ore

About a half mile north of Lusk, Converse County, Wyoming, a small town on the Chicago & Northwestern Railway, about twenty miles from the Nebraska border, is a small conical-shaped hill. This hill is about a quarter of a mile in circumference at its base and about 350 ft. high. The hill is known as "Silver Cliff Hill," and for years it was known to contain small amounts of copper and silver, but of too low grade to be commercial.

In the spring of 1918, Ross Lambert, a farmer, of Casper, Wyo., purchased some land near Lusk. Mr. Lambert desired to have this small hill excluded from the tract that he purchased, but the owner insisted that he must buy the tract intact, and thus Mr. Lambert was forced to pay for this seemingly worthless hill.

In looking over the small dumps of a silver mine that was abandoned about thirty years ago, Mr. Lambert's curiosity was aroused by the variety of colors of the rock. He sent ten samples to W. L. Piers, an assayer of Denver, Col., and requested Mr. Piers to make complete analyses on all the samples; he wanted to know what could cause this variation in color. Nine of the samples were found to contain small amounts of uranium and small amounts of copper and silver, and the rest consisted of silica. The tenth sample, however, ran more than 20 per cent U_3O_8 . Thus was the deposit discovered. Later the property was acquired by the Lorimer Minerals Co., and several carloads of ore containing about 3 per cent U_3O_8 were shipped.

The uranium occurs intimately mixed with well-rounded grains of quartz, forming a quartzite bed lying between mica schist and granite. The ore is conspicuous for its wide variations in color and occurrence. The most typical is an olive-green color, occurring as a cementing material between the grains of quartz. In places, the color is masked by the oxides of copper and iron, and it is difficult to tell which is high-grade uranium and which is not. A variety containing much iron oxide has a rich chocolate-brown color, and in some instances it contains as much as 15 per cent U_3O_8 . Then again other shades that are characteristic of ura-

nium minerals contain only a trace. In places the ore is found having a variety of colors, but the uranium content may be fairly uniform. Dr. F. B. Laney and Dr. E. D. Larson, of the U. S. Geological Survey, who made a study of the optical properties of the mineral, are of the opinion that it is identical with uranophane, a hydrated calcium silicate containing some barium and lead, to which the formula $CaO (UO_2) \cdot (SiO_2) \cdot 6 H_2O$ has usually been assigned.

The chemical evidence of Dr. S. C. Lind and C. W. Davis (Op. cit.) does not substantiate the above optical investigations, but this may be due to the fact that it was impossible to obtain absolutely pure specimens, owing to the masked occurrence of the mineral. Dr. Laney's micro-photographs indicate that small amounts of uraninite U_3O_8 are present, which were introduced subsequent to the deposition of the sandstone and replaced the cementing materials, chiefly iron and copper oxide, to a less extent than the sand grains themselves. It also appears that the uranophane is an oxidation product of uraninite. If this is the case, this is the first occurrence known of a free higher oxide, and it has been suggested that the mineral be called "Lambertite," in honor of its discoverer. However, further chemical and optical investigations will be necessary to substantiate this evidence.

The Lorimer Minerals Co. has just completed a 50-ton wet gravity concentration plant to concentrate the low-grade material.

The Wasapika Promotion

The promoters of the Wasapika property at West Shining Tree, northern Ontario, have now decided to form a new company which will take over the Wasapika and some adjoining properties, paying for them in stock. There will be 6,000,000 shares, having a par of \$1 in the new company, so there should be enough to go around and suit everybody. Wasapika, with a capitalization of \$1,000,000, has been selling above par. The property has been developed to a limited extent only, and not enough work has been done to indicate a sufficient tonnage of a grade of ore which will permit of profitable operation under present conditions of power and transportation.

¹"A New Deposit of Uranium Ore," by Dr. S. C. Lind and C. W. Davis, "Science," May 9, 1919, page 441.

National Mining Corporation Formed in London

Leading British Mining Houses Unite to Secure Dominant Position in World Industry

A company known as the National Mining Corporation, Ltd., has been organized in London, with an authorized share capital of £3,000,000, divided into 3,000,000 shares of £1 each. An issue of 2,500,000 shares of £1 each at par was advertised on Nov. 3 last, of which 2,000,000 shares had already been applied for by the directors and their associates. These directors, who include many well-known men, are as follows: Herbert Guedalla, chairman, managing director of the Imperial Foreign Corporation, Ltd.; John Alexander Agnew, director of Burma Corporation, Ltd.; Frederick William Baker, chairman of the Mexican Corporation, Ltd.; Stanley Christopherson, director of the New Consolidated Goldfields, Ltd.; Edward Mackay Edgar, partner of Spurling & Company, merchant bankers; Alexander Stanley Elmore, managing director of the Chemical & Metallurgical Corporation, Ltd.; Francis Algernon Gouvet, chairman of Lake View & Oroya Exploration, Ltd.; Berthold Kitzinger, director of the National Bank of South Africa, Ltd.; Walter McDermott, chairman, Consolidated Mines Selection Co., Ltd.; Henry Strakosch, managing director of Union Corporation, Ltd.; and Henry Steel, chairman of the United Steel Companies, Ltd.

The reasons for the formation of the National Mining Corporation are advertised by the company as follows:

"The principle of financial co-operation among the leading mining houses in this country has hitherto not been sufficiently considered as a material factor in the maintenance of the important position which British capital and enterprise have attained throughout the world. As a result, this country has to some extent lost the commanding position which it once held in the mining and metallurgical industries, the control of which has been secured by foreign capital, particularly in the United States and Germany, where the industry is vested in powerful corporations with great financial resources, supported by their banking institutions, and commanding the services of technical experts of the highest ability.

"The main reason that has brought about such loss of control is the fact

that, with one or two exceptions, the financial resources of any one mining house or group in this country have not been sufficient to undertake the provision of the capital necessary for large mineral industrial enterprises. As the advantages of financial co-operation have now been accepted, a number of the leading mining houses in the City of London have united in the formation of this company with a view to securing a dominant position in the industry.

"The major portion of the £2,000,000 capital privately subscribed (and forming part of the present issue of £2,500,000) has been applied for by and will be allotted to the co-operating mining houses, each of which will be represented by a director on the board.

"In addition to the advantages of financial co-operation, the company through its directorate will secure the benefit of the accumulated experience, financial, technical and local, of the gentlemen who have agreed to serve as directors, and through them of the mining houses which they represent."

More Michigan Copper Companies Insure Employees

The Mohawk, Wolverine, and Michigan mines, employing 2,000 men in all, have announced that life insurance policies have been given to all men on their forces. Two months ago the Calumet & Hecla company and subsidiaries, with a payroll totaling 11,000 men, determined upon this plan of insuring their men without cost to the latter. The Stanton properties make the second important group in the Michigan district to adopt the scheme. All employees are given policies dated Dec. 1, for sums ranging from \$1,000 to \$1,500, depending upon the length of time they have been with the company, this without cost to the men and without medical examination.

British Columbia's Gold Problem

With the depreciation in the purchasing power of gold, the system of taxation of gold mines of British Columbia has become obsolete and unfair, in the judgment of some members of the British Columbia Chamber of Mines. If the gold-mining industry is to be maintained, they hold, the fundamental principle in fixing taxes must be the ability of the properties assessed to pay. Owing to the fact that, since taxes were last adjusted, mining costs had practically doubled, a joint committee, representing the B. C. Chamber of Mines, the Canadian Mining Institute, and the mine owners, has been appointed to investigate the matter and submit a report with a view to making whatever representations are thought advisable to the provincial government.

Interest Awakening in Phosphate District of Idaho

BY R. N. BELL

The increasing demand for rock phosphate by agricultural interests, and advanced land values, have induced a sudden active interest in the phosphate field of southeastern Idaho, and several big deals are pending concerning the few privately owned properties that are not within the tracts withdrawn by the Government. At Paris, in Bear Lake County, the Western Phosphate Mining & Manufacturing Co. is shipping 2,000 tons of crude rock per month. It is building a three-mile railway spur to the mine and erecting a 250-ton mill for preparing the rock for market. A new double-track development tunnel is being driven, with two headings, at the rate of 600 ft. per month, the work being done by a prominent railway tunnel contractor. The deposit is a uniform vein of gray rock phosphate 7 ft. thick, with a 45 deg. dip, and is developed by adits. Its guaranteed shipments are 70 per cent tri-calcium phosphate, with not over 1 per cent iron and alumina.

The Waterloo mine, three miles from Montpelier, also in Bear Lake County, is likewise undertaking active operations, and for several months has been shipping a car a day of 70 per cent rock. Its resources are extensively developed through short crosscut tunnels and drifts. Other enterprises are on foot involving railway spur construction to deposits that have been shown to contain a huge tonnage in this county and adjoining counties. It looks as if an important new mining industry were being inaugurated in this great western phosphate field.

New Railway Sought From Elk Lake to Gowganda

The Ontario government has been asked to grant a charter for the construction of a light railway, such as was used in France, from Elk Lake to Gowganda. The present terminus of the Elk Lake branch of the Temiskaming & Northern Ontario Ry. is at Elk Lake, and the new road will make the connection to Gowganda. It is planned to use gasoline locomotives, which it is expected would be more economical. If this road should be built it would mean a great deal to this interesting camp. At the present time the only large producer is the Miller Lake O'Brien, but recent developments on the Castle property, which is being taken over by the Trethewey, point to another shipper in the near future. There are a number of other interesting and promising properties in the district, but development has been retarded by the excessive cost due to poor transportation.

The Magma Company Buys Three R Mine

The long-expected sale of the Three R mine to the Magma Copper Co. has at last been consummated, though the purchase price has not been announced. To work the property the Patagonia-Superior Copper Co. has been formed, of which W. C. Browning, general manager of the Magma company, will be general manager while retaining charge of the Magma interests at Superior. An offer of \$20,000 has been made for the surface machinery, of which the ownership is now in litigation. The entire acreage is to be explored by diamond drilling. The mine has long been owned by R. R. Richardson, of Patagonia, Ariz. Prior to 1914 it was under bond to N. L. Amster, of Boston, who gave it up after making heavy shipments of ore. Later it was bonded by H. C. and H. M. Harrison, of San Antonio, Tex., for \$500,000. They organized the Three R Mining & Milling Co. and built a 200-ton concentrator, which appears to have had only a small degree of success. For failure to meet payments, the property reverted to Richardson, and a receiver was appointed for such property as might belong to the defaulting corporation. The property is situated nine miles from Patagonia, in the Patagonia Mountains, and consists of 55 claims, or about 1,000 acres.

A. S. & R. Must Continue to Smelt Ore From Christmas Mine

The case of the Gila Copper Sulphide Co. against the American Smelting & Refining Co. was recently decided in favor of the former. Former president William H. Taft, acting as special master in the case, decided that the smelting company must keep the ten-year contract that it made three years ago to smelt 250 tons a day of the Gila company's ore. The mining company, which is operating the Christmas property in Gila County, Arizona, is said to have been saved from bankruptcy by the decision.

The company has been in the hands of a receiver since April, 1918, by reason of owing \$690,000 to a trust company of New Haven, Conn., most of which has been paid off with funds derived from ore shipments delivered to the Hayden smeltery of the American Smelting & Refining Co., which is nine miles by rail from Christmas. Shipments have averaged about 3 per cent copper, and have netted the mining company about \$30,000 a month. The smelting company claimed to have the right to break the contract, and maintained that recently it had been losing money on it.

PROGRESS OF MINING OPERATIONS

ARIZONA

Johnson—The Mines & Development Corporation of Arizona, formerly known as the Copper Chief, has struck two new veins of high-grade copper ore, one in the No. 1 shaft, the other in the No. 2 shaft, both places carrying native copper and glance. Shipments have been curtailed also by the Arizona United Mining Co., not to exceed 100 tons per day, in order to push the large amount of development work contemplated. It is understood that the machinery for the Keystone Mining Co.'s new concentrator is being purchased and will be shipped in the very near future.

ARKANSAS. ZINC DISTRICT

Yellville—More activity is apparent in the northern Arkansas zinc field than for two years past. Eastern chemical

is making a good production of jack.—J. B. Dyerle has leased the Boo-Gra-Loo company's mine and mill and is operating steadily.—J. H. Haddox, of Oklahoma City, president of the Magnolia Lead & Zinc Co., has put a force at work in the Tar Kiln mine.

The Katie mine, at Rush, is being developed by D. J. McCargar. Drifting on the 46-ft. level opened a small head of carbonate ore, and the ground looks promising.—The Michigan mine at Conville is to start development.

CALIFORNIA

Grass Valley—The Central Consolidated Mines will probably re-equip its old mill in about six months' time, re-designing it for amalgamation and flotation. The work of designing will be placed in the hands of Hamilton, Beauchamp & Woodworth, consulting metallurgical engineers, of San Francisco.

Mining & Tunnel Co. has been especially successful. It was organized less than a year ago by local capital. Sixty thousand dollars was subscribed, and all of this amount has already been redeemed, and a 25 per cent dividend declared.

Cripple Creek—Stockholders of the Elkton company are considering the formation of a leasing company similar to that recently organized by the Isabella Mines Co. If suitable leases can be obtained the company plans an extensive prospecting campaign.

Durango—The company operating the Southern Boy has opened up a high-grade shoot of gold ore 4 ft. wide and 90 ft. long. The vein is in a monzonite porphyry intrusion in the Dolores formation.

Leadville—A. A. Garret, promoter of the Prospect Mountain Tunnel Co. has announced that the company has opened offices in the Bank-Annex building, Leadville, and that he is making necessary arrangements preparatory to commencing operations early next spring. This company will undertake the development of the Canterbury Hill district, two miles northeast of Leadville.

Empire—The Primrose Exploration Co. has a crew of men at work at Urad constructing a 200-ton aerial tramway. Development work is being carried on at the upper mine and considerable ore is being blocked out.

Boulder—Fluorspar is being gradually resumed and the outlook for the fluorspar mines is more favorable than any period since the signing of the armistice. Then the market price slumped so as to make it impossible for the mines to operate. But recently Hibbs & Co., of Boulder, obtained substantial contracts for the delivery of high-grade concentrates to Eastern markets, so that the fluorspar mines and milling plants are now gradually resuming operations on a vigorous scale. Crude ore is hauled from various mines such as the Emmet, the Alice, the Argo and Humboldt, by auto truck to either the Lehman mill or the Colorado Pitchblende mill. By ordinary table concentration a 92 per cent fluorspar concentrate is obtained; 500 tons of these concentrates are being produced monthly.

IDAHO

Leadore and Gilmore Districts
BY R. N. BELL

Leadore—Recent development has disclosed one of the most promising lead-silver deposits that has been discovered in the state for years on the

VILLAGE OF ZINC, ARK., ON SUGAR ORCHARD CREEK, IN NORTH ARKANSAS ZINC DISTRICT

companies are bidding for the carbonate ores and are taking everything that is being offered at prices several dollars higher than the Joplin quotations for this ore. The specifications required are that the ore must carry approximately 40 per cent metallic zinc, and not over 2 per cent sulphur, 0.25 per cent lead and 2 per cent lime. Practically all the carbonate and silicate ores produced in the entire field come within this requirement, and it is thought now that a new market for the ores produced will be developed with the chemical companies.

ZINC DISTRICT

At Zinc, the Salina company has started a new concentrating plant and

COLORADO

Aspen—Great activity is taking place in this one-time bonanza silver camp. Local people are organizing companies and are taking over options on properties that have been idle since the panic of 1893. A mill operating on the Little Annie property is treating custom ores from adjoining properties. Most of the ore, however, is coming from old dumps. The Highland Mary group, 1,500 ft. south of the Oakland, where discovery of rich silver ore was recently made, is again about to enter the ranks of the producers. The Smuggler mine is to be unwatered and shipments resumed as the owners of the company have settled their differences. The Newman

Kimmel group adjoining the Sunset mine. The Sunset has been mined in a desultory fashion for several years and is credited with probably 150 car-load shipments of ore, one-third of which was 50 per cent lead and 50 oz. silver, the balance being varying grades of concentrates and second class ore.

The newly discovered deposit is on a contact between lake bed gravel and blue carboniferous lime with a 30 deg. dip in favor of crosscut tunnel work and lies near the edge of a broad valley at the foot of the main range of the Rocky Mountains. This limestone zone is 50 ft. thick and is paralleled by a belt of quartz porphyry or silicious igneous rock 2,000 ft. thick. The Kimmel development showed that the contact between the limestone and the porphyry was mineralized, the mineralization penetrating the porphyry. Considerable crosscutting has been done.

The silver-gold contents show appreciable increase, the ore remaining completely oxidized. Rather serious water trouble encountered is believed to be caused by seepage from a drain tunnel that crosses the shaft workings and not due to ground water. These two properties have made a gross production of several million dollars at considerable profit. The entire output has been sent to Salt Lake City as crude ore. The present yield is about 2,000 tons per month, carrying 30 per cent lead and 15 oz. silver with 50c. to \$1 gold per ton.

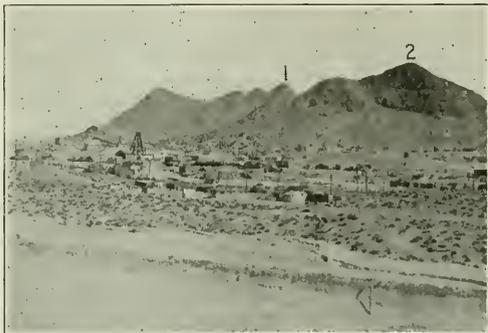

MICHIGAN COPPER DISTRICT

The No. 8 shaft (Pontiac) of the Quincy Mining Co. is making the best showing in the history of the property. The openings in working ground at present total 4,580 ft. Sinking is in progress from the 71st level to the 72d.

three-shift system abandoned. Two shifts now employed on straight mining.—The Oliver Iron Mining Co. will open up its underground property to handle the shallow deposit on the forty south of the Tener prospect.

Biwabik—The American Bridge Co. recently received the contract for erecting a 250-ton steel coal trestle at the Biwabik property. The foundation is being laid.

Cuyuna—The main shaft of the Croft mine has been deepened 114 ft. A station is now being cut for development of a new main haulage level. At the Cuyuna-Duluth at Ironton, shipments discontinued and underground force laid off until further notice. The Northland is also down and it is not yet decided whether or not the property will be kept pumped during the winter. The latter was originally developed because of the demand for manganese.

1. Mt. Butler 2. Mt. Broucher 3. Tonopah of Nevada 4. Montana Tonopah 5. North Star 6. Mt. Oddie 7. Silver Top Shaft 8. Desert Queen Shaft

Some of the faces show 10 to 15 per cent lead ore, but it is believed the whole mass will be low grade, probably as low as 2 per cent on the average. The ore carries about an ounce of silver to the unit of lead. The porphyry is fractured and could probably be readily caved. The deposit may possibly yield a large tonnage of low-grade lead-silver ore that may warrant large milling equipment when more fully developed. The contact is traceable along the foot of the mountain for eight miles with occasional shallow development and a succession of bunches of good ore at intervals.

Gilmore—The Latest Out mine in the Gilmore district is working at the 600 level one of the best orebodies that it has ever had. The Pittsburgh-Idaho mine has recently extended its 700 level development, resulting in the disclosure of five distinct orebodies. Interesting fissures and faults that were barren in the upper levels, here show good ore.

Sixteen levels are active from the 54th down. The tonnage of mass and barrel and ordinary ore will total 350,000 for 1919. All work in this shaft is confined to the east branch. Openings to the north at a distance of 2,000 ft. are in poor ground, which makes the outlook gloomy for Pontiac shaft No. 9. The lode continues to flatten with depth.

MINNESOTA MESABI AND CUYUNA RANGES

Chisholm—The open pit portion of the Shenango Furnace Co. made its last steam-shovel shipment at the close of the present season. About 4,000,000 tons estimated in reserve will be mined by milling and scrambling for which equipment will be placed during winter. With the cessation of open pit operations, the underground portion, which has been closed during most of the season, resumed operations with 20 gangs on double shift.—At the Billings property the main part of the development work has been completed and the

NEVADA

Tonopah—The Tonopah Mining Co. has resumed shipment of ore which is now being treated in the Belmont mill. The West End Consolidated company recently announced a dividend of 5c. per share, payable Dec. 31. The California-Tonopah company has announced that final payment has been made to the defunct State Bank & Trust Co. by Stall brothers and associates for the California mine which adjoins the Jim Butler property in Tonopah.

Round Mountain—Plans of the Gibraltar Silver Mines for development of the Gibraltar property, which lies across Smoky Valley from Round Mountain, north of Tonopah, are being carried out under the direction of William J. Loring, president and general manager. The vein or mineralized zone is 87 ft. wide on the surface and from the high average of assays secured Mr. Loring believes it is one of the most promising prospects he has seen.—An

average of 40 tons of good grade ore is being treated in the Sunnyside mill at Round Mountain, and the Fairview mill is treating an average of 30 tons daily.

Midas—Two new orebodies, which were found during the last few months, are being developed in the Elko Prince mine in the Gold Circle district. The first was found on the 600 level, 1,200 ft. north of the main oreshoot which is 600 ft. in length. The new find has been developed for several hundred feet, the drift on the hanging-wall showing five feet of \$25 ore, with no footwall in sight. The second new find was made on the 750 level, where from 8 to 14 in. of ore is said to run 300 oz. in silver, in addition to the gold. An unusual feature is the remarkable straightness of the vein and the smoothness of the hanging-wall.

Virginia City—The addition to the cyanide equipment of the Mexican mill has been housed in and the new filter has arrived and will soon be installed.

OKLAHOMA

ZINC-LEAD STRICTION

Miami—Short line railroads serving the zinc mining district have been notified that they may have an unlimited amount of empty coal cars for ore shipments now. The coal strike has released the cars. Mining operators are preparing to take immediate advantage of the offer. The ore bins have been full since late summer. The car shortage has been acute since Sept. 1.

OREGON

SUMPTER-GRANITE DISTRICT

The old E. & E. Mine has been leased by John Arthur, and thirty men are employed overhauling the mill and on underground repairs. New machinery will soon be installed. This mine is on the same vein with the Columbia, Taber Fraction, Golconda, North and South Pole.—The Ibx is working another large vein developed to some extent by tunnels. The company recently purchased the mill of the Ball Mountain mine, and will begin operating it in the spring. The Ibx is about seven miles from Sumpter and the Sumpter Valley R. R.—In the Cable Cove district the Imperial mine, about twelve miles from Sumpter, has been shipping good ore steadily for the last few years, but it is difficult to get the ore to the railroad, as the roads are too poor to permit of auto-trucking.—The Powder River bridge, three miles below Sumpter, is operating steadily on good pay gravel.—The Sumpter Dredging Company has just purchased a dredge, which will start operations in the early spring, on some of the best ground in this section. All outside work has been done, and dredging will begin as soon as the Eastern Oregon Power Co. can furnish the power.

The Bonanza mine, about nine miles from Sumpter, is driving a new cross-cut tunnel 500 ft. deeper than any other tunnel, thereby avoiding the present long tramway haul. The work will be completed this winter.—In the Greenhorn and Granite district, the Ben Harrison property has been shipping for over a year, and is now installing machinery to treat the ore on the ground, saving long hauls.—The Independence is milling ore developed last winter, and blocking out fresh ore.—The Buffalo mine, which has shipped ore steadily, has just opened up a 6-ft. vein of shipping ore. This mine is substituting machine drills for hand drilling. Its progress will be more rapid hereafter, but at present all chutes are full of ore, because snowfall has stopped auto-truck hauling.—A new property, the Continental, has just opened up a 3-ft. vein of high-grade ore, which the company is treating in its small mill. Development will be continued through the winter. A larger mill may be built in the spring.

The old La Bellevue mine is putting in a ball mill and a concentrating and cyaniding plant. The frame of the large mill is already in place. Some of the old workings are being retimbered. The ore carries a good percentage of silver.—The Monumental has considerable silver ore blocked out, and expects to start up in the spring.

SOUTH DAKOTA

BLACK HILLS DISTRICT

Lead—In the Homestake mine the water is now above the 700 level, and flooding of the 500 level is expected to be complete early in December. Unwatering will then be started immediately, and mining work should be resumed on the upper levels about the middle of the month. J. W. Dyer, engineer in charge of U. S. Bureau of Mines rescue car No. 5, which has been stationed at Lead during the Homestake fire, has been called to Mullan, Idaho, where a cave-in has entombed several men. Car No. 5 will remain in the Black Hills until the Homestake fire has been extinguished.

UTAH

TINTIC DISTRICT

Tintic shipments for the week ending Nov. 15 amounted to 140 cars, as compared with 118 cars the week preceding, several of the largest shippers almost doubling their output. Chief Consolidated shipped 38 cars; Dragon Consolidated, 19; Grand Central, 10; Iron Blossom, 17; Tintic Standard, 18; Centennial-Eureka, 9; Eagle and Blue Bell, 6; Colorado, 4; Swansea, 3; Mammoth, 3; Ridge and Valley, 2; Bullion Beck, 1; Victoria, 1; Eureka Hill, 1; Laclede, 1; and Sunbeam, 1.

Eureka—Suit has been filed by Tintic Standard against the Chief Consoli-

dated to determine the ownership of White Wing No. 5 claim, the plaintiff alleging defendants to have included a part of this claim in the survey for a patent of Cedar No. 10. North Tintic Mining Co. is also suing the Chief Consolidated in regard to the Miller claim.—The Lehi Tintic Mining Co. is driving a 1,000-ft. tunnel to cut at depth three fissures that are mineral bearing in its upper workings. The bunkhouse has been completed.—At the Eureka Bullion mine a winze is being sunk from the 800 level to cut at depth the intersection of two fissures, and is now down 60 feet.—The Pinion Queen continues to sink its shaft.—The Apex Standard property, south and east of Tintic Standard, reports mineralization increasing 250 ft. out from shaft in the drift on the 900 level.—Ore is being mined at four places in the Tintic Standard. The recent find on the 1,350 level, a short distance southeast of older workings, is opening up satisfactorily. The management hopes to increase shipments to four cars daily.—The Colorado and Iron Blossom mines of the Knight interests are shipping under the leasing system. The October earnings of the latter property are stated to have exceeded \$10,000. Considerable development is being done at both properties, but particularly at the Iron Blossom, where much deep work is in progress. Knights are also developing the eastern end of the district. From that section the Tintic Drain Tunnel will be extended to unwater the older part of the Tintic district. A shaft is being sunk in ground owned by the Tintic Drain Tunnel Co. not far from the tunnel portal, and is already down 150 ft. The same interests are also sinking a shaft at the Big Hill property in East Tintic.

WASHINGTON

Seattle—With a cargo of lumber, machinery and supplies, including a boiler weighing 44,000 lb., the steamship Norwood, under charter to the Alaska Sulphur Co., sailed from Seattle Nov. 6, for Akun Island, Western Alaska, where the company is developing valuable sulphur deposits and erecting a plant where the sulphur will be refined and shipped to Seattle. The steamship also carried 18 employees who will be engaged on construction of the plant and the completion of a two-mile aerial tram. T. H. Landswick, secretary of the company, states that the plant will have a capacity of 100 tons and by April of next year they expect to be supplying sulphur to Seattle and principally the paper mills of the Northwest. He states that the company has 400 acres of land on Akun Island and a large tonnage of sulphur already developed. He further states

that about \$250,000 are being spent on the plant and aerial tramway. Another shipment of machinery for the smelter will be sent north during February.

WISCONSIN ZINC-LEAD DISTRICT

Platteville—The Mineral Point Zinc Co. (Galena, Ill.) has opened a new shaft at Mifflin, Wis., on the Coker Range, and has resumed milling at the Coker mill No. 2.—Kistler & Stephens, Platteville, have started a new shaft on the Goke land, a half mile east of the Blockhouse mine.—At Shullsberg, the Little Giant mine, with its mill equipment, has been overhauled by T. A. Hansen and others, and mining operations are underway.

CANADA BRITISH COLUMBIA

Barkerville—The Mining Corporation of Canada has undertaken the work of proving up the gold-quartz claims situated on Proserpine Mountain about four miles north of Barkerville, B. C. A promising discovery was made on this property about a year ago. It is said that the present work, which is being done under the direction of Robert H. Bryce, of Toronto, is expected to demonstrate by spring whether the mineralization continues at depth. A crew of more than fifty men is now at work. Cabins for 100 men have been built, as well as offices and other necessary buildings. A contract for driving two 200-ft. tunnels has been let to John Bell, and I. E. Moore has a contract for two others. Two diamond drills are being shipped to the property and will be at work before long. Work done thus far on the property is said to have shown an average gold content of \$17 per ton. Many claims have been staked in the Barkerville section as a result of this company's activity.

Nelson—The ore of the California mine, which is near Nelson, is to be treated at the old Athabaska 10-stamp mill. A ball mill will be added to the equipment of the latter for primary grinding. The product after classification will be passed over Senn amalgamating tables and finally be treated by flotation. The capacity of the mill is small, about 25 or 30 tons, but may be increased. A recovery of 90 per cent is anticipated.

Kamloops—The difficulty of obtaining labor is hampering the completion of a number of British Columbia enterprises which are expected to benefit the mining industry. One of these is the branch line of the Canadian National Rys. between Kamloops and Kelowna by way of Grande Prairie and Vernon. Another is the branch railroad from the Kettle Valley Ry. to Copper Mountain, where the Canada Copper Corporation is opening up extensive de-

posits of low-grade ore on a large scale. A third is the construction by the Kootenay Power & Light Co. of its power line from Bonnington Falls, where the power is developed, to Princeton, where it is to be used by the Canada Copper Co. in its new mill. The new Kamloops-Kelowna branch road will afford transportation facilities necessary to the development of the gypsum deposits at Grande Prairie, which are owned by the Manitoba Gypsum Co. and said to be of great extent.

Trail—The practice of wet magnetic concentration has been successful in the test mills of the Consolidated Mining & Smelting Co. of Canada, at Trail. Success was first attained in the laboratory, then in the 150-ton test mill, which was later increased to 250-tons daily capacity. It is expected that equally good results will be obtained in the 600-ton temporary mill about to start operations. The practice may also be used as part of the treatment to be employed in a much larger concentrator to be constructed in the course of a year or two years.

Anox—The Granby Consolidated Mining, Smelting & Power Co. blew in its fourth furnace here on Nov. 15, thus bringing the entire plant into operation for the first time since last spring. Restriction of operations had been caused by shortage of coke.

NOVA SCOTIA

Sydney—An option on a zinc-copper-lead property at Stirling, N. S., was recently acquired by Captain P. J. Webb, manager of the Sydney Investments Limited, at Sydney, from James Nolan of Glacé Bay, who is owner of the leases. It is claimed that over \$40,000 has been spent in developing this property.

ONTARIO

Sudbury—The new smeltery of the British-American Nickel Co. at Nickelton, Ont., will be blown in about Dec. 1, it is expected. Two blast furnaces and two 13x30-ft. Pierce-Smith converters have been installed. This plant is the third to enter the nickel-copper field of the Sudbury district, the other two being the Mond Nickel Co. and the International Nickel Co. The head office of the British-American Co. is at Ottawa. W. A. Carlyle is general manager. The Mond company has one furnace in blast. The International Nickel Co. has increased its production to 3,000 tons of bessemer matte per month.

MEXICO NORTHERN SONORA

Nacozari—A shortage of skilled miners and surface labor in this district has hampered operation of the various properties to a considerable extent. However, this camp is not alone in experiencing a labor shortage, which has been evident also in Cananea and

other parts of Sonora. It is ascribed to the heavy drain of laborers secured by agents of farmers in the southwestern part of the United States to harvest their crops. Several thousand crossed the international boundary to work in the Salt River Valley picking cotton. These men and their families have only begun to return to their native land. Many others have gone as far east as Kansas to perform common labor for the railroads and other industrial enterprises. The statement was recently made that Nacozari could use between 300 and 400 men. Small properties in the outlying districts also are hampered by lack of pack animals, and fully 1,000 burros and mules could be used in the vicinity of Nacozari alone.

AUSTRALIA

Bendigo—The Bendigo Amalgamated Co. was formed several years ago to revive gold mining on the famous Bendigo field. The aim of the promoters was by centralizing the management to enable money that would otherwise be spent in administration and surface operations to be expended in underground developments. According to the report for the year ended July 1, the tonnage treated was 112,977 for a yield of 41,022, as against 146,769 for a yield of 41,130 oz. for the preceding period.

The financial position of the company is summed up in the following statement: Dec. 31, 1917, loss for 7 months, £38,459; June 30, 1918, loss for 6 months, £20,382; Dec. 31, 1919, loss for 6 months, £10,718; June 30, 1919, profit for 6 months, £2,934. One factor that has helped the company recently has been the premium obtained by the Gold Producers' Association on gold exported from Australia. The company's share amounted to £5,902.

Up to the present the company has not been fortunate in making any rich "strikes" such as have always been a feature of the Bendigo field, but should such good fortune be met with it would materially improve the position. Exceptionally good returns, however, have been obtained recently, particularly in the workings north from the Constellation shaft, where, within the last twelve months, gold to the value of about £40,000 has been recovered. The last week's milling of 314 tons from this reef gave a return of 604 oz. The aggregate output from the company's mines for a two-weeks period recently aggregated 417 tons for a yield of 2,140 oz. This is the best return obtained since the formation of the company and the only occasion on which it was exceeded was on Dec. 18, 1917, when the inclusion of 994 oz. of gold from the plates brought the fortnight's return to 2,196 oz.

THE MARKET REPORT

2	17 ³ / ₄ @18	52 ³ / ₄	52 ³ / ₄ @52 ³ / ₄	6.75	6.50	8.15@8.20	...	
3	17 ³ / ₄ @18	52 ³ / ₄	52 ³ / ₄ @52 ³ / ₄	6.75	6.50	8.15@8.20	...	

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

Nov. and Dec.	Copper			Tin		Lead		Zinc

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—Dec. 3, 1919

The features of the metal markets this week were further weakness in copper and a more decided easing in lead. On the other hand, zinc became much stronger, on the transaction of large business.

Efforts are being made to advance transatlantic freight rates, by agreement, to the scale of the U. S. Shipping Board, but it is uncertain whether such an arrangement can be effected, or maintained if it be effected.

Transpacific freight rates from San Francisco to Hongkong and Kobe remain unchanged at \$12.

The price for silver during the last week was erratic, reflecting speculative influences. However, high prices for

this metal may be expected to continue for a long time. Asia has been draining the world of gold and silver, and will continue to do so as long as the black and yellow races work harder and sell the white men more than they buy in return.

On Dec. 2, gold in London went to 106s., a premium of 19s.

Copper

At the beginning of the week some small sales were made at 18³/₈c., but before the end of the day copper was offered at 18c., delivered, although such offerings were not broadcast and did not immediately become generally known. As late as Saturday some small sales for export to Europe were booked as high as 18¹/₄c., f.a.s., by sellers outside of the Export Association. On

Dec. 1 copper was so freely offered at 18c., delivered, equivalent to 17³/₈c., cash New York, that the market could no longer be considered any higher than that. On the basis of 18c., delivered, which price prevailed in all quarters since Monday, the market showed some resistance, and in spite of rumors to the contrary, there were no authentic reports of any sales at lower figures. All producers were emphatic in their refusal to sell anybody but consumers, there being a determined effort to keep copper out of speculative hands.

The sales of copper in November attained a surprisingly large figure. Sales during the last week amounted to considerably more than in the previous week. Sales of the week were mainly with wire-drawers, but the Export Association did a rather fair business, divided among numerous foreign countries, at prices decidedly better than what prevailed in this market. However, there was no general inquiry from domestic consumers, and nothing much is to be expected until there is a general belief that the present decline in the market has ended.

Copper Sheets—28¹/₂c. per lb. Wire, 22c. f.o.b. factory, weak. Domestic buying dull.

Tin

This market was erratic, owing to the fluctuations in the exchange rate and uncertainty about the deliveries from steamships arriving in this port. There was not much buying by domestic consumers and not much interest in the metal on their part.

Singapore quoted c.i.f., London, £288 on Nov. 27; £291¹/₂ on Nov. 28; £299 on Dec. 1, and £302¹/₂ on Dec. 2.

Though tin of 99 per cent grade declined in this market, Straits tin remained rather firm.

Lead

The easing tendency in the market continued, and by Nov. 29 there were sellers at 6.75c. New York other than the A. S. & R. Co. The St. Louis market was steady at about 6.60c. On Dec. 1 a round lot was bought in St. Louis at 6.50c. and on Dec. 2 and 3 other round lots at the same figure. On Dec. 2 a large lot was booked in the New York market at 6.75c. At the close the market was squarely on the basis of 6.75c., New York, and 6.50c., St. Louis, with numerous of the large producers sellers at those figures.

During the week a rather large business in the domestic market was transacted, corrodors being heavy buyers. A large business was done in Mexican lead for export to Europe—England, France, and Germany being buyers. Europe has been buying more or less lead in this market for some time, taking especially Mexican lead for shipment from Tampico. This follows upon unexpected shortage of supplies in Europe, where consumption, especially in Great Britain, is good. The strikes in Australia resulted in a large loss of lead production, and the labor troubles in Spain have diminished supplies from that quarter. The cost of production in Spain is high. These influences indicate that Europe may have to get lead from here.

Zinc

Right from the beginning of the week there was powerful buying by speculative parties who accumulated large quantities, paying 8c. St. Louis, for any delivery, either prompt or first quarter. A domestic galvanizer who bought 500 tons on the same day paid 8c. for it. On Nov. 29 speculative interests bought at 8.05c. St. Louis, outbidding European buyers who offered to pay 8c., this being reckoned as the equivalent of £48 c.i.f., London. On Monday business was done in the morning at 8.05c. and later at 8.10c., a large lot of prompt zinc being booked for export at the latter figure. On Tuesday a large business for export was done at 8½c. More inquiry from galvanizers also developed on this day. At the close producers were asking 8.20c. With Wednesday, however, there was some relaxation in the demand and a development of some relatively low offerings, probably from sources that desired to realize. Transactions of the week were large, probably 6,000 or 7,000 tons having been sold for export, and, including speculative purchases, the total was doubtless upward of 10,000 tons.

Zinc Sheets—\$11.00 per 100 lb. since Nov. 14, less 8 per cent on carload lots. Slightly higher prices for export.

Silver—The New York silver price broke violently on Nov. 27 on the announcement that the U. S. Treasury was paying out silver dollars in San Francisco in exchange for gold, dollar for dollar, and that silver dollars were being exported in large quantities to China, thereby enabling buyers for export to obtain silver coin on the basis of \$1.29 plus per fine ounce. Naturally, buyers for export declined to continue paying a large premium over the price at which they could obtain silver by shipping silver coin, and the New York price declined to \$1.29. The Treasury Department has under advisement whether it will continue to pay out silver dollars in exchange for gold, and

whether it will require the melting of coin before export. Notwithstanding the lack of definite official action, the demand for export continues, and buyers are paying a premium over the silver-dollar equivalent.

Mexican dollars at New York: Nov. 27, holiday; Nov. 28, 99%; Nov. 29, 99%; Dec. 1, 99½; Dec. 2, 100%; Dec. 3, 101.

The Mexican government issues an official silver price on the last day of each month as a basis on which the export taxes on silver bullion for the month following are figured. This price is theoretically the average New York official quotation, taken from the 26th of one month to the 25th, inclusive, of the following month. For example, the Mexican government's official price for the month of November is calculated as the average of New York official quotation, beginning with Sept. 26 and ending with Oct. 25. The Mexican official price, as above stated, is used in calculating the value of silver put in the mint for export, and this same valuation is also used as a basis for express charges to the border.

The Mexican official prices for this year have been as follows:

Mex. per kg. fine Ag.	
January	P-65.16
February	65.16
March	65.16
April	64.84
May	64.94
June	63.14
July	71.24
August	72.06
September	70.96
October	71.80

The above prices are in Mexican gold and are transferred into U. S. Currency on the basis of 2:1.

Palladium—Advanced to \$125.

Platinum—Early in the week rather large quantities were sold at \$135, but about Dec. 1 the market experienced a sharp advance and closed at \$145, \$150 for refined ingot. The strike among the jewelry manufacturers relaxed demand for a while, but with the end of this labor trouble coming in sight, jewelers became more active buyers. Supplies are scarce. Whereas 100 oz. formerly used to be considered an ordinary wholesale lot of platinum, producers now do business in 20-oz. lots.

Aluminum—33c. per lb.

Antimony—There was considerable activity, with the market unchanged at 9@9½c. for spot, and the same for futures.

Bismuth—Unchanged at \$2.96.

Cadmium—\$1.40 per lb.

Nickel—Ingot, 42c.; shot, 43c.; electrolytic, 45c.

Quicksilver—This metal was firm at \$95, a sharp advance from the previous

week. The price in London advanced to £21½ today. San Francisco telegraphed \$87.50, strong.

Monthly Average Prices for November

Lead, New York	6.808c
Lead, St. Louis	6.649c
Lead, London	£34.731
Zinc, New York	8.177c
Zinc, St. Louis	7.827c
Zinc, London	£46.588
Silver, New York	127.924c
Silver, London	70.065d
Copper, electrolytic, N. Y.	19.758c
Copper, standard, London	£98.894
Tin, New York	53.307c
Tin, London	£283.556
Bessemer pig iron, Pittsburgh	\$31.60
Basic pig iron, Pittsburgh	\$31.56
No. 2 foundry, Pittsburgh	\$32.16

Tungsten Ore — Chinese wolframite was quoted at \$7 per unit, Bolivian at \$10. Business in scheelite was actually done at \$10.

Molybdenum Ore—Quoted nominally at 75c.

Chrome Ore—Arrivals from South Africa are reported.

Zinc, Lead and Ore Markets

Joplin, Mo., Nov. 29—Zinc blende, per ton, high, \$49.40; basis 60 per cent zinc, premium, \$48.50; Prime Western, \$47.50; fines and slimes, \$45@42.50; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$49.19; calamine, \$33.45; all zinc ores, \$45.15.

Lead, high, \$89; basis 80 per cent lead, \$88@85; average settling prices, all grades of lead, \$87.09 per ton.

Shipments the week: Blende, 7,542; calamine, 29; lead, 1,038 tons. Value, all ores the week, \$432,250.

Shipments eleven months: Blende, 437,348; calamine, 11,597; lead, 66,610 tons. Value, all ores, eleven months, \$23,150,870.

With few cars provided for this week's loading, and prospects not encouraging for a larger number next week, and in the face of the threatened strike of railroad men, the market advanced \$2.50 per ton this week, on the strength of a slight improvement in metal. Nearly all buyers were holding back on \$45 offerings, until two or three came in with offerings of \$47.50.

Platteville, Wis., Nov. 29—Blende, basis 60 per cent zinc, \$51.50 base for premium grade and \$50.50 base for Prime Western grade. Lead ore, basis 80 per cent lead, \$85 per ton. Shipments reported for the week are 2,528 tons blende, 85 tons galena, and 85 tons sulphur ore. For the year to date the totals are 93,153 tons blende, 6,262 tons galena, and 17,731 tons sulphur ore. During the week 2,667 tons blende was shipped to separating plants.

New York and San Francisco, December 13 and 20, 1919

Number 22

The Silver Problem

THE New York press reports that silver coins are getting scarce on Broadway. Theatre box offices receive too many bills and too few dimes; banks are paying out silver which never reappears, and are having a hard time in keeping their commercial depositors supplied. According to the "Tribune," a theatre auditor reported that "We have in our safe, as a precaution, \$17,500 in halves, quarters, and dimes. If that coin were to be melted, it would net a profit of \$1,400. This \$17,500 will vanish into the hands of theatre goers, and it will never come back. Even on a light day we give out \$2,000 in silver. At night, when we close, we bank nothing but bills—never a piece of silver."

"I am convinced," said the paying teller of a Broadway bank, "that silver coin is being melted up here in New York, and sold as bullion for the profit there is in it. I don't believe the big jewelers or silversmiths are doing it, but well-defined rumors credit the small dealer in metals with this sort of thing."

The report of this situation follows closely the discovery of a similar state of affairs in Paris, where this condition has reached a more advanced stage, partly on account of the relatively larger issue of paper money and also on account of the exporting of coins to be melted into bullion.

Silver is now quoted in New York at \$1.33 per ounce, the highest point yet reached; and at this figure the silver coin is worth considerably more as metal than its exchange value as currency.

No law, as we understand, exists against the melting of coin. A resolution introduced at the meeting of the American Mining Congress at St. Louis in November proposes a law to that effect. We are not in favor of it: first, because it could not be enforced; second, because it would not prevent the exporting of silver coins; and, third, because we doubt the logic and fairness of it.

In our bizarre system of finance silver has occupied a peculiar position between gold and paper: with no fixed real value, the United States silver dollar has been a strange monstrosity. In a system based on the gold standard, the silver currency was put out and circulated without even the promise to pay its face value in the legal standard, gold, which is the basal theory of the paper currency. Uncle Sam took fifty cents' worth of silver, and stamped it "One Dollar," and sent it out so to pass, and to be the equivalent in purchase value of one-twentieth

of an ounce of gold; a very dishonest trick, had it been done by folk of humble station and authority. The bright idea behind this legerdemain was that if you issued currency having real metallic value, you could make a few passes before people's eyes and get them to see that it was twice as heavy as it really was; but if you stamped something that had no value at all, you must in some cases promise to pay in gold, and in other cases let it be known that there was a "gold reserve" back of all paper, in some intangible way. Yet this gold reserve cannot be drawn upon by the silver currency; and some of the paper dollars are promises to pay silver dollars, which are worth, when issued, fifty cents.

As we write, we find in our pockets, by diligent search, two one-dollar bills. One is not a dollar at all, in any sense. It is a "legal tender" for one dollar. But the United States, which paid it out for a dollar, will not redeem it as a dollar (gold) or as a near dollar (silver), and, indeed, will not receive it in payment of duties. The other is good for one silver dollar when we choose to claim it. When issued, it was a clever thing in national finance to issue a demand note for a silver dollar which was only a half a dollar; but now that the silver dollar is worth more than a dollar (a thing utterly unforeseen) it will be a good time for us to cash in, and show, for a change, a little business acumen ourselves.

In short, silver in the United States is, and has been since Bryan's "Crime of 1873," a commodity like copper and lead. It has not been used as a standard commodity for exchange purposes, like gold. Its price has not been fixed, but has fluctuated with the natural law of supply and demand. In the form of Mexican dollars (pesos) it has honestly so circulated, and has been exported to India and China for the purpose of being used as a medium of exchange, on a sound valuation basis. If the holder of a silver "dollar" that he innocently accepted for a real dollar, but which cost Uncle Sam only fifty cents, has the chance of a lifetime to get his dollar—a real dollar—one-twentieth of an ounce of gold—out of his coin, or if he thinks he can beat the game in this way, is it fair to prevent him? Must he be ruled out of the game when the luck runs his way? As a matter of fact, though, (editorially speaking) we shall not keep Uncle Sam to his word in this respect, since it is dulce et decorum pro patria mori. Yet it will eventually be done, whatever may be considered to be the ethics of the thing; and by the

natural law of supply and demand, which any commodity whose price is not fixed follows, it is certainly being done right now. It constitutes a real danger to the business and credit of a nation short of gold, if it becomes short of its other metallic currency. It is wonderful how the chink of small coin in the pocket keeps us under the impression that all our transactions are in real dollars. The passing of the silver dime would undermine confidence more than the passing of the gold eagle has done.

Congress should take steps immediately. A law against the melting down of silver coin would be ineffective; if effective it would precipitate a more serious custom—the exportation of silver coin, to be melted abroad. An embargo on silver exports would be necessary to prevent this; but that would be an unwelcome check upon our silver-mining industry, and would tend to establish different silver prices here and abroad, without preventing the domestic conversion into bullion. There is only one remedy, it appears to us—to fix the price of silver. This is not so much a novel and fearsome thing to do as it used to seem; for we have become inured to the price fixing as a consequence of war emergencies.

At present two great commodities are pegged—gold and wheat; gold at \$20.67 per ounce, and wheat at \$2.25 a bushel. We are not therefore on a gold standard but on a dual standard—not gold and silver, but gold and wheat; and as our gold is not actively traded in as a real commodity exchange, while wheat is, it is wheat that is the true standard which determines, rather than gold, the relative value of things. So long as wheat is pegged at \$2.25, or over 100 per cent above the pre-war value, the cost of other commodities and the cost of labor and of living must remain at least double what it previously was.

Price fixing is a mischievous thing, a powerful force too dangerous to play with. There is only one thing that can safely be pegged, and that is the standard exchange commodity, which cannot be otherwise than fixed. This commodity will not likely be wheat permanently, as this is not durable or convenient; but it had better be wheat than a fictitious commodity, and a false theory of symbolism under which we are now working; and in this case gold should be unpegged. This, of course, is all impracticable; the precious metal standard of exchange is fixed and time-tried. In the wealthier countries it is essentially gold; in the poorer, like India and China, essentially silver. All attempts to introduce gold currency with India as a substitute for silver have failed—coin and notes alike are on the silver basis.

The necessity of both metals for a world standard is demonstrated, especially in this time of need of a real standard commodity of exchange—of real metallic money, or honest and solvent notes redeemable in full in real money, as specified. A double standard is not advocated; it must be a single amalgamated standard—the gold-silver standard, with the ratio of one to the other to be fixed and unchangeable.

An estimate by engineers and geologists of the available gold and silver resources of the world, of the average cost of extraction of gold and silver, respectively, and of the average relative market value over a period of many years, would constitute a sound basis for fixing a ratio. This done, no fixed price of any commodity should be attempted. Wheat should be unpegged as soon as possible, and the demoralizing expedient never repeated in the case of anything.

The League of Nations

SINCE many of our metal markets are stagnant and our mines idle, due to the lack of foreign demand for raw materials, which must postpone the program of reconstruction until the Treaty settlement by the United States and the arrangement of credits, it will not be foreign to our field to consider the main cause of delay in the Treaty signature.

No more important matter exists today, for all Americans, whether concerned in the mining and metal industries or otherwise, than the League of Nations; and its decision will have a far-reaching effect, usually not fully comprehended. Its importance transcends all politics; the Treaty is the most important document which Americans have had to consider since the drafting of the Constitution. It is necessary, therefore, that it should be closely viewed from all angles. That any one individual, however placed, should undertake to assume that his approval is sufficient, is an incredible insolence that ignores the first principles of democracy.

An alliance between Great Britain, France, and the United States is, in our opinion, desirable and necessary. This alliance should be stronger than the usual arrangement, and should be not only military but commercial; and other nations should be admitted if properly prepared for such responsibilities. To admit immature countries, not yet advanced to the standard of these three, would be to create serious difficulties.

Is the project of the League inserted in the Peace Treaty a workable plan? The debate and analysis of the Senate show that in parts it has been loosely drawn; that certain articles involve the transfer of important elements of the control and independence of the United States to the League organization, and that certain others are obscure but may be so interpreted; in other words, that in some important respects the United States would be under the control of Europe.

One of the provisions in question is the much-debated Article X, which binds members of the League to preserve against external aggression the territory of all members, and leaves to the Council the devising of means for carrying out this obligation. The reservation approved by the Senate in regard to this article is intended to preserve or make clear the autonomy of the United States as against the above: surely a necessary precaution. It provides that the Army and the Navy of the United States shall not be used for the above purpose except by authority

of Congress. Similarly, Article I provides that any member of the League may withdraw from the League "provided that all its international obligations and all its obligations under this Covenant shall have been fulfilled at the time of its withdrawal." This may apparently be interpreted as meaning that the League must sanction the withdrawal and release the member so desirous; and that it might on various grounds withhold or delay its consent and by military or economic pressure prevent the member from withdrawing. The reservation approved by the Senate concerning this article provides that the United States shall be the sole judge as to whether all its obligations have been fulfilled, and lodges the power of withdrawal in the Congress of the United States. This is a precaution necessary to maintenance of the autonomy and independence of the country, and no reasonable objection should be raised by any American to this interpretation.

The reservation on Article XXII, concerning mandates, is to the effect that mandates must be accepted by Congress. In the original article the responsibility of accepting a mandate is not fixed: it might conceivably mean that it could be accepted by the President, and the reservation of the Senate, as in the case of Article X, is drawn for the purpose of preventing such usurpation of the powers of Congress by the President. Unless the President really desires to deprive Congress of these powers, and to put them in the hands of the Chief Executive, there is no possible reason for his objection to the reservation on Article XXII.

Article IV of the Treaty provides that the Council of the League should consist of representatives of the United States, of the British Empire, France, Italy, and Japan, and representatives of four other members of the League. Article I provides that "Any fully self-governing state, dominion, or colony . . . may become a member of the League," and this provision was inserted with special reference to Canada, South Africa, Australia, and New Zealand; so that on the Council as at present specified the British Empire would have five votes out of nine; and as it is provided that in the Assembly also each member of the League shall have one vote, the British Empire's votes would here also be five against one for each of all other nations. In reply to this the reservation approved by the Senate declines to pledge the acquiescence of the United States in any "election, decision, or finding of the Council or Assembly in which any member or its self-governing dominions, colonies, or part of empire in the aggregate have had more than one vote."

Though it is provided in the Treaty that in the case of disputes between two members of the League the disputing nations have no vote in the adjustment, yet, as arranged, in the case of a dispute between the United States and England, votes would be admitted from Canada, Australia, New Zealand, and South Africa; and the Senate reservation in regard to this expressly declines to have the United States so bound. It seems to us that there can be no two ways of fair thinking about this, and surely

only one attitude for the United States to take—namely, that taken by the Senate. The dominions and colonies of the British Empire are self-governing, but they are not independent. The British Empire should have no more votes than the United States and its possessions. Our forty-eight states are self-governing, and some are much more populous than some of the British dominions or colonies involved. Should not the United States stand out for forty-eight members of the League?

It is not our purpose to analyze further the parts of the League provisions on which there is a difference of opinion between the President and the Senate; but we have indicated enough to show why, in our opinion, some of these reservations are absolutely imperative, and that the Senate will never withdraw them. Better than such ineptitude, to let the League, which we have so long desired, but which has been so crudely drawn by our American representatives, be definitely abandoned. England, as the price for her approval of the League, has safeguarded herself by providing for her domination of it by plural voting. France secures the guaranty of her territorial integrity, including Alsace-Lorraine. Both would benefit financially, through loans from America.

What will America have from it? Nothing, except that, if wisely advanced, it should operate greatly in the interests of the common good and the welfare of the world; and the Senate is anxious to do this, provided the independence of the United States, and its equal footing with any other nation, is not attacked, and the powers of Congress not usurped by the President. From this position the Senate will not recede.

Copper Boom Postponed

THE plight of the copper producers is becoming serious just about the time when a boom was expected. During the war, the supply of this metal among the Central Powers became so low that many manufactured articles had to be melted up for their copper content. German housewives were asked to give up their kitchen kettles to the cause. As Germany and Austria between them consumed before the war close to 350,000 tons of copper a year, almost one-third of the world's production, copper producers and investors looked to a large market at the conclusion of peace, both to replenish the depleted supplies and for current needs.

Germany needs the copper—of that there is no doubt—but of course has nothing with which to pay for it. In fact, practically all of our foreign consumers are temporarily bankrupt, resulting in such high exchange rates that they cannot afford to buy copper or any other commodity in greater amounts than is absolutely necessary for current needs. Meanwhile, the price of copper has dropped to the neighborhood of 19c., which is only about 25 per cent more than the pre-war price, although the cost of production, especially under the conditions of reduced output now obtaining, has increased considerably more.

The zinc and lead producers are both somewhat better off than the copper men, and of course the silver producers are in a bed of thornless roses.

During 1916, in view of the continued good business expected for some years, there was a disposition in some quarters to criticize the policy of the copper companies of not sharing with the stockholders a more liberal portion of the large profits then being made. The wisdom of the policy decided on is now apparent, for with no money in the treasury many of the high-cost producers would now be obliged to close down their plants, always an expensive thing to do in the long run. The present general operation of the companies on a basis of 40 to 50 per cent of normal output cannot be continued indefinitely, however, and unless conditions improve soon, the high-cost producers will be forced to succumb. This would be a calamity, for the world right now needs all the copper that can be produced.

The remedy, of course, is an early settlement of European affairs, so that the nations which need our copper will get back to work and produce commodities which we can use, in exchange. A temporary extension of credit will be necessary so that they may buy the raw materials on which to work. The signing of the peace treaty will be an important step to these ends, and, with the ending of the war more than a year in the background, further procrastination on the part of the politicians in Washington should not be tolerated.

Compensation of Engineers

AT A RECENT meeting of civil, electrical, and mining engineers, under the auspices of the American Society of Civil Engineers, Arthur S. Tuttle, Francis Lee Stuart, John S. Conwell, and several others discussed the compensation of engineers. The usual statistics were presented to show that the cost of living had more than doubled during the last fifteen years, and that salaries of engineers had not increased in proportion, but had risen only about 10 per cent. It was pointed out that these conditions had the effect of cheapening the profession because they lowered the standard of living, thereby making engineering less attractive to progressive young men. The natural result is a larger proportion of incompetent engineers in the lower ranks of the profession, with consequent increased cost of engineering work.

Furthermore, the struggle of the lower salaried engineer against the high cost of living develops a tendency toward trade unionism, especially when the engineer observes that the law of supply and demand, which is supposed to regulate his compensation, accomplishes nothing, whereas the simpler law of "demand," as applied by the unions of common labor, gets everything. However, any tendency toward unionism among engineers, for the purpose of enforcing unreasonable demands for higher pay, has gained little ground, thanks to the fact that the true engineer has ideals that lead him to think much about doing his work well, and little about his compensation. Compared with those in other occupa-

tions, engineers in general have fared well so far as compensation is concerned, if statistics of income-tax returns mean anything. According to available figures, those classified as stockbrokers have the largest incomes, engineers, including mining engineers, come fifth on the list, teachers are twenty-first, and farmers are twenty-second and last. The engineering profession seems to be holding its own.

The Engineering Council's General Committee appears to have made one strange discovery, namely, that the higher-grade engineers, or those receiving \$5,000 or more per annum, suffered proportionately greater injustice under present industrial conditions than the men who receive about \$2,000 or less per annum. It is as difficult to see how the committee develops this idea as it would be to demonstrate that the actual necessities of life are less costly for the \$2,000 man than for the \$5,000 man. Surely, it is clear that when the lower-salaried man is just meeting his expenses, the higher-salaried man could be saving money. If it is true that the higher-paid engineers need encouragement to keep them in their profession, is it not reasonable to consider what kind of encouragement is required to hold the younger and lower-priced engineers in line? Is it not a fact that the on-coming army of young engineers represents the raw material from which the big men of the profession are made? If this be true, then it behooves the men at the top to consider unselfishly what is good for the men at the bottom; otherwise, how will the higher positions be filled when their present occupants have passed on?

Aluminum vs. Aluminium

THE use of the term "aluminium" in "Mineral Industry" brings to mind the difference between the English and American pronunciation and spelling of this word. Time was when "Mineral Industry" spelled it in the familiar way, but since Dr. Richards has been covering the subject for that excellent publication, the English spelling has been used in his articles, and evidently the present editor, G. A. Roush, is also a convert to that form.

The old Roman word for bodies with an astringent taste was "alumen." Not until 1722, when F. Hoffmann announced the fact, was it known that the base of alum was an individual substance. About 1820 it was decided to call this substance "alumina." In 1809 Sir Humphry Davy succeeded in producing an iron aluminum alloy, and, in anticipation of the actual birth of the new metal, called it "aluminum," but was later persuaded to change the spelling to the present American form, "aluminum." A few years later, English chemists decided on "aluminium," to conform with sodium, potassium, and many other elements, and so it has remained to this day. This spelling has, however, not received recognition in America, except by a few chemists who have decided views on the subject. Aluminum is certainly a simpler pronunciation, and as it is analogous to platinum, molybdenum, glucinum, tantalum, and lanthanum, we fail to see how the American spelling should be very much of a crime.

Precipitate Smelting at Tonopah

General Method of Treatment Much the Same at Each of the Four Plants Now Operating—Kinds of Furnaces Used and Details of the Process Employed at the Belmont and West End Works.

BY GEORGE J. YOUNG

THE method of treating cyanide precipitate at Tonopah, Nev., has been thoroughly standardized. Of the four mills now operating, the Belmont, West End, Extension, and MacNamara, the first three mills use Monarch double-chamber melting furnaces and the fourth mill employs a cylindrical tilting furnace of the crucible type. In all of the mills, clean-ups are made twice a month. At the Belmont, zinc-dust precipitation and Merrill presses are used; at the others, zinc-thread precipitation.

At the Belmont mill, the presses are discharged into sheet-steel false-bottom steam-heated pans, which are wheeled under the presses. The precipitate is dried in the pans and is weighed, mixed with

At the West End mill about 150 oz. of bullion is melted per gallon of fuel oil.

During the melting, which requires from three to three and three-quarter hours, the position of the furnace is changed several times by rotation upon its trunnions, for the purpose of rinsing down the sides of the melting chamber and for removing any portion of precipitate clinging to the walls of the furnace above the molten charge. When melted, most of the slag is poured into conical pots which are handled on buggies, shown in Fig. 2. The bullion is then poured into moulds, holding 2,000 oz., which are placed on a low truck and run under the furnace, as shown in Fig. 3. In pouring the bullion, crusts

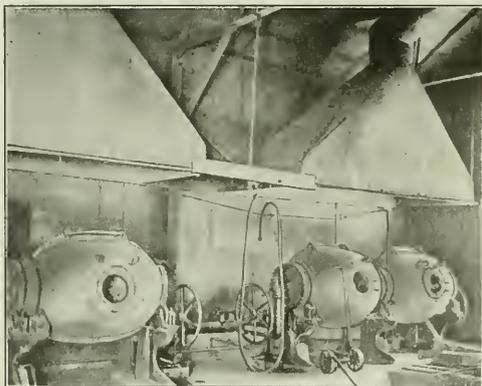

FIG. 1. MELTING FURNACES AND HOODS AT THE TONOPAH-BELMONT MINE

fluxes, and then briquetted. Four per cent of soda and 2 per cent of borax are used for fluxing. In some instances a little sand is used, but in most cases, sufficient sand is present to give a siliceous slag.

The furnace is lined with carborundum, which is first mixed with water glass and then rammed into place. An air hammer is used for tamping. To facilitate relining, the furnace, which is egg-shaped, is made in two symmetrical parts, bolted together. A crude-oil burner, using high-pressure air, is used for atomizing the oil and for supplying air for combustion. The furnace gases discharge into steel hoods (see Fig. 1), which are connected with a sufficient length of stack to remove all of the poisonous fumes and gaseous products. Fifteen trays, containing thirty briquettes to the tray, constitute the charge, which weighs from 700 to 900 lb. The lining of the furnace lasts from twenty to twenty-four melts.

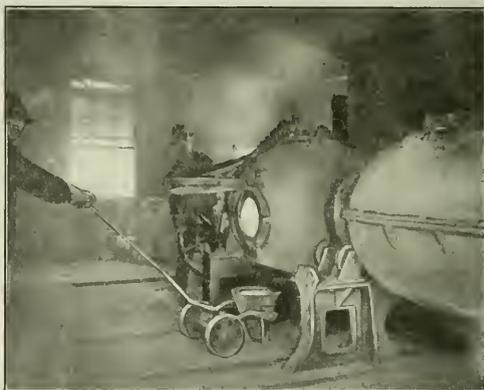

FIG. 2. SLAG POURING AT THE WEST END MILL

or portions of the lining which float in the remaining slag, on top of the bullion, as well as the slag itself, are kept back by a hoe-shaped implement.

After pouring, the slag layer is stripped from the bars while still viscous, the moulds are dumped and the bars lifted with tongs and placed in the cooling tank. The slag, after quenching, is passed through a small crusher and charged into a barrel-type ball-mill, where it is ground fine. The mill discharges onto a small table where the crushed slag is concentrated. The concentrates are added to the furnace charge, and the ground slag is sacked for shipment to the smelter.

At the West End mill, the fluxing charge consists of 3 per cent borax and 5 per cent soda. One man briquetts from two to two and a half tons of precipitate in an eight-hour shift. At both the Belmont and the West End mills two men are required to handle the melting. The bars, when cleaned and hammered free from slag, are numbered, marked,

and sampled. For sampling, a blacksmith's drill-press and 3/16-in. drill are used. Three holes, each about one and one-half inches deep, are drilled, two holes on diagonally opposite corners in the top of the bar and one hole in the center of the bottom.

The slag is crushed in a small stamp battery, concentrated on a small table, and the concentrates, together with all shots, pills, and bullion scraps, are

FIG. 3. CHARGING BRIQUETTES INTO FURNACE AT WEST END MILL

remelted. The crushed end-slag is allowed to accumulate until there is a sufficient quantity for a shipment to the smeltery.

The equipment of all of the "refineries" is much the same. Flat-bottomed, steam-heated rectangular open pans are used for drying the precipitate. Mixing of flux and precipitate is done by hand, although

FIG. 4. POURING BULLION AT THE WEST END MILL

a small inclosed mechanical mixer of a simple type could be used. The mass is briquetted, but a press is not absolutely necessary, as at the Extension mill the mixture is placed in paper bags and charged in this way into the furnace. For quenching bullion bars a small sheet steel tank, 2½ to 3 ft. square and ½ to 2 ft. deep, provided with water inlet and outlet,

answers the purpose for mills of from 100 to 400 tons' capacity.

Slag quenching is best done in a concrete sump, flush with the floor and not more than 2 ft. deep and 6 x 4 ft. in size. Overflow and drain connections are essential. For slag crushing, a 4 x 6-in. crusher and a small stamp battery, a clean-up barrel, or a small ball-mill for fine grinding can be used. A sump like the one just described is suitable for receiving the discharge from the fine-grinder, and a similar one can be used for the discharge from the small Wilfley table. Small platform scales of 1,000 to 2,000 lb. capacity, bullion scales, tongs, bullion, and slag moulds are necessities. A steel-frame, corrugated

FIG. 5. HOME-MADE BRIQUETTING PRESS AT WEST END MILL

iron building, with a well-constructed cement floor and of a size sufficient to give ample room for the workmen, completes the equipment.

Nevada Consolidated Copper Co.

The report of the Nevada Consolidated Copper Co. for the third quarter of the fiscal and calendar year, 1919, states that the production of copper for the three months was 9,336,753 lb., as compared with 11,149,362 lb. for the quarter ending June 30, 1919. During the present quarter 454,255 dry tons of ore, of an average grade of 1.54 per cent copper from the shovel pits and the Ruth mine, was treated, as compared with 558,525 dry tons, averaging 1.42 per cent copper, for the previous quarter. Of the tonnage milled during the quarter, 73 per cent was supplied from the pit and 27 per cent from the underground workings of the Ruth mine. In addition to the treatment of company ores as stated, 14,500 dry tons of custom ore was milled and the concentrates product of same was smelted at the Steptoe plant during the quarter.

The cost of production for the quarter, including charge for depreciation of plant and equipment, and the usual overhead or fixed and general expenses, but without credit for gold and silver recovered and miscellaneous earnings, was 21.68c. per lb. of copper.

The value of gold and silver recovered and the miscellaneous income earned for the third quarter amounted to 1.42c. per lb. of copper. The cost of production per lb. of copper for the first quarter of the current year was 16.85c., and for the second quarter 18.07c., all calculated on the same basis. The unusually high costs for this quarter are due largely to the fact that operations at mine, mill, and smelter, were entirely suspended during the greater part of August, because of a strike by certain classes of employees, which threw the burden of the extraordinary costs which usually attend a shutdown, plus the ordinary fixed and general expenses for the month, upon a materially reduced tonnage. Costs were further increased by an advance in wages which became effective in July.

Because of the loss of the August month's copper, the average monthly production for these three months was only 3,112,251 lb., as compared with an average of 3,716,454 lb. per month for the preceding quarter. If industrial and market conditions warrant, this shortage can be made up before the close of the final quarter, and the average monthly output for the year maintained on the basis of 50 per cent capacity of production, in accordance with the policy of production curtailment made necessary by post-war conditions.

The financial results of operations for the quarter are shown to include as operating costs the regular monthly charges made to cover depreciation of plant and equipment, and are set out in the statement following:

Operation profit or loss.....	\$331,153.83
Earnings from investments and miscellaneous.....	133,296.18
Net gain	\$464,449.01
Distribution to stockholders.....	749,796.38
Net deficit	\$285,347.37

The operating earnings for the quarter are based upon a carrying price of 25.23c. per lb. of copper produced, which is considerably in excess of the price of 15.12c. per lb. used in calculating the operating income for the previous quarter. This increase in carrying price is due to the fact that sales exceeded production, the result of decreased output and increased sales. All unsold copper is carried as usual at 13.5c. per lb.

The walkout of employees, which occurred late in July, tied up the entire property for practically a month, operations being in part resumed near the end of August. All departments of the mines and reduction works are now in operation at regular rate of production and output of copper on the curtailed basis which has been in effect since the beginning of this year.

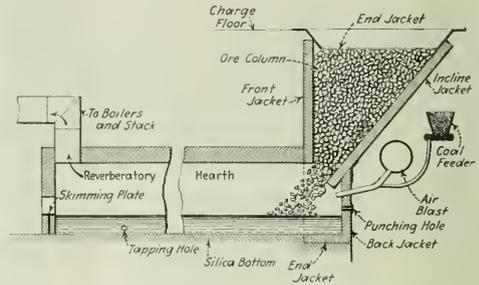

Concerning an Omission

Through inadvertence attributable to unavoidable difficulties of publication, the name of the writer of the article "E. & M. J. Quotations Recognized by Court," on page 683 of the Oct. 25 issue of the "Journal," was omitted. The author was Wellington Gustin, of Chicago, an attorney and writer of legal matters.

A New Furnace Using Pulverized Coal or Oil

Referring to the interesting article in the "Journal" of Aug. 16, describing experiments with the coal-dust firing of blast furnaces at the Copper Cliff and Tennessee smelteries, I wish to call attention to an entirely new type of furnace, which I believe would eliminate many of the difficulties encountered in the experiments described, and which has at the same time points of superiority over any other style of furnace now in use.

The advantages of the furnace illustrated in the accompanying drawing include: (1) No uptake is necessary on the feed floor, as the gases and dust are drawn downward through the ore column. (2) All the tuyeres point in one direction, through the base of the falling charge into the molten bath and also in the direction of the draft travel, so that most of

NEW FURNACE FOR BURNING POWDERED COAL.

the heat is utilized in smelting the charge and not so much heat wasted on the water jackets as is the case in ordinary blast furnaces. (3) As the charge slides down the inclined back jacket gradually, and only as the base of the charge is fused away by the direct flame from the tuyeres, no coke would be needed to carry or sustain the burden, and there would be very little heat in the charge above this local fusion zone at the tuyeres. Consequently, no accretions would build up on the furnace jackets. (4) Flue dust and fine ore could be dropped through side drop holes in the roof of the furnace in the usual way.

W. M. Barker.

McGill, Nev., Aug. 26, 1919.

[In the scheme which Mr. Barker suggests, it is doubtful if there would be enough voids in the bank of ore which would pile up in front of the burners, to allow the burning coal to pass through. Continuous punching would probably be necessary, which would be an extremely uncomfortable job, and even then the passages for the flame would hardly be sufficiently large. The opening at the bottom of the jacketed charging compartment would, of course, have to be great enough to prevent the ore from hanging up in the bin. If the ore were not allowed to pile up to the roof of the reverberatory, but were charged intermittently, we would merely be going back to the old practice.—Editor.]

Cottrell Electrical Precipitation Process in Japan*

Initial Installation Made at the Ashio Smeltery of the Furukawa Co. Has Been Followed by Several Others—Valuable Dust Recovered and Fume Nuisance to a Large Extent Obviated

BY DR. RITARO HIROTA AND KYOSHI SHIGA

THE history of the Cottrell electrical precipitation process in Japan begins with the purchasing of the Cottrell patent rights in 1916 by the representative of seven well-known mine owners in Japan, T. Wada, from the International Precipitation Co., of Los Angeles, Cal., of which Walter A. Schmidt is president.

An experimental precipitator consisting of sixteen pipes, 12 in. in diameter and 16 ft. long, with a capacity of 3,000 cu. ft. per min. at 4 ft. per sec., was erected in the compound of the Ashio smeltery by the Metallurgical Research Institute (Kinzoku Kogyo Kenkyusho), Tokyo, of which Mr. Wada is the president. This experimental treater, with the electrical

city in the vicinity of the plant, because of the dust nuisance. If this nuisance had not been abated by Dec. 25, 1917, the Asano Co. would have been obliged to move this plant to some other locality. Confronted with this difficulty, and learning of the successful results obtained at the Riverside Portland Cement Co., the Asano Co. decided to install the Cottrell process at the plant. As the time limit was strict they immediately proceeded to build the treaters, F. B. Church and K. I. Marshall being sent from Los Angeles to look after the design, erection, and operation. Their strenuous efforts benefited not only the Asano Cement Co., but also the community in general, as the Cottrell plant, starting a

MAIN TREATER OF ASHIO SMELTERY WITH CURRENT ON

MAIN TREATER OF ASHIO SMELTERY, ELECTRICAL CURRENT OFF

equipment, was erected according to the design and suggestions of the International Precipitation Co., in October, 1916. The tests were conducted by the engineers of the Metallurgical Research Institute, who were assisted by F. B. Church and K. I. Marshall, engineers of the International Precipitation Co. The test treater proved satisfactory, treating the mixed gases coming from the roasting pots, blast furnaces and converters of the copper smeltery, and precipitating the dust, containing oxides of arsenic, zinc and lead, and a small amount of copper.

Among the mines and smelteries, the Ashio copper smeltery of the Furukawa Mining Co. was the first to apply the results of these important tests. The pipes and electrical equipment were at once ordered from American manufacturers and foundations were begun.

The Asano Portland Cement Co., of Tokyo, was having considerable trouble with the residents of the

few days before the specified time, caught more than 95 per cent of the dust causing the nuisance. Thus, the long-pending problem was solved satisfactorily to all concerned. It was one of the striking examples in Japan where engineering science has contributed to the welfare of the nation and the advancement of industry.

To perfect designs of Cottrell installations for prospective customers and to study the actual operation of installations in the United States, the Metallurgical Research Institute sent its engineer, Kiyoshi Shiga, to the offices of the International Precipitation Co., of Los Angeles, where he studied the design and operation of precipitators. In May, 1917, after completing his study, Mr. Shiga was joined by Dr. Rituro Hirota, the manager of the Electrical Precipitation department of the Metallurgical Research Institute, and both visited the principal smelteries and factories in the United States, in which the process had been installed, such as the plants in Miami, Garfield, Tooele, Anaconda, Riverside, Hagerstown, the Duquesne Reduction Works,

*Excerpt from a pamphlet published by Kinzoku Kogyo Kenkyusho, No. 1 Yayasue-cho Ichome, Kojimachi-ku, Tokyo, Japan.

the Pennsylvania Smelting Co., the Portland Gas Works, and the Merrimac Chemical Co.

In the meantime, orders were placed with the Westinghouse Electric and Manufacturing Co., Pittsburgh, Pa., the General Electric Co., Schenectady, N. Y., and the Kelman Electric Co., of Los Angeles, Cal., for electrical equipment, such as extra-high-tension transformers, motor generators, and rectifiers. Orders were also placed with the Western Pipe & Steel Co., San Francisco, and the Robertson Bros. Co., Chicago, for pipe electrodes, for treater installations at the smelteries belonging to the Mitsui and Mitsubishi companies.

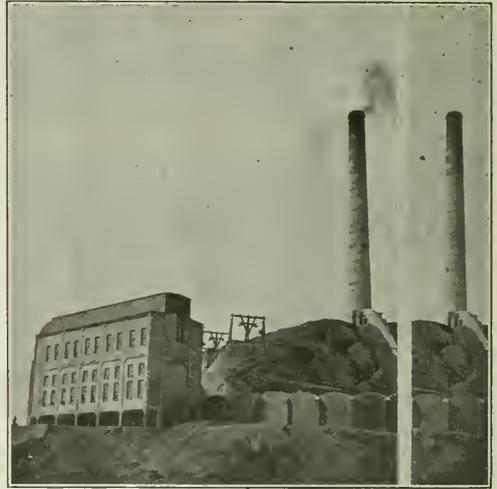

Since the return of Dr. Hirota and Mr. Shiga to Japan in the autumn of 1917, several plants have been equipped with Cottrell installations, and these plants are now working satisfactorily, eliminating the smoke and dust nuisance, and collecting many tons of valuable dust, which was hitherto going to waste. The Metallurgical Research Institute did not lose the opportunity of making the Cottrell process widely known, and has exhibited a model installation at the expositions in Tokyo and Osaka. Lectures have been delivered by Dr. Hirota at the meetings of the Mining Engineers, Mechanical Engineers, and Railway Association, and by Mr. Shiga at the Chemical Industrial Association and the Smoke Abatement Association of Osaka City.

Thus the Cottrell process, although only a few years old in this country, has made rapid progress. Eight treaters, having a total of 1,984 pipes, have been built and are now operating. However, on account of war conditions, there has been considerable difficulty in procuring the equipment. Engineers and metallurgists in Japan are eagerly investigating the work being done, and several plant managers now intend to install precipitators for collecting sulphuric-acid fumes coming from acid-boiling kettles, and acid-concentrating furnaces; cleaning iron blast-furnace gases used for firing boilers and hot stoves; and for collecting sulphuric acid liberated from alunite calcination furnaces. Designs and specifications have already been submitted for the Imperial Mint, Shikama Alum Factory, Kanto Sanso Alkali Works, Hokkaido Iron & Steel Works, and the Fujita Mining Co. The Imperial Mint has recently decided to install a plant for collecting sulphuric-acid fumes from acid-boiling kettles. The following are brief descriptions of the electrical precipitators installed in Japanese smelteries and refineries up to the present time:

Ashio Smeltery, Furukawa Mining Co.

Two treaters were installed in 1918. One, which is called the "main treater," was intended to treat the mixed gases from four McDougall roasters, two blast furnaces, and four converters of the copper smeltery; the other, called the "reverberatory treater," was intended to treat the gases from a reverberatory furnace after their having passed through waste-heat boilers. Each treater is furnished with an independent power plant. Six electrical units are being used for the main treater, one unit being spare; and two are used for the reverbera-

tory treater. Each electrical unit consists of the following General Electric Co.'s equipment: One 10-k.v.a. 50-cycle, single-phase, 200- to 100,000-volt transformer; one 10-k.v.a. 200-volt, 50-cycle, single-phase alternator, driven by a 15-hp., 50-cycle, 500-volt, three-phase induction motor; and a disc-type rectifier, manufactured by the Kelman Electric Co., directly coupled to the motor-generator shaft. Besides these machines, exciter sets for the excitation of the field of the alternators are furnished, two for the main treater and two for the reverberatory treater. The charging voltage is adjusted by regulating the intensity of the field current of the alternators. By this means, it is possible to produce practically any desired voltage from zero up to 100,-

THE NAOSHIMA TREATER, SHOWING APPEARANCE OF SMOKE WITH CURRENT OFF, COMPARED WITH THE CONDITIONS WHEN THE COTTRELL PROCESS IS IN OPERATION

000 on the secondary terminals of the transformer. The average power consumed by the precipitator is about 30 kw.

The main treater consists of ten sections, each containing 64 riveted pipes, arranged in a square (or a total of 640 pipes), and the reverberatory treater consists of three similar sections (or a total of 192 pipes). These pipes, 12 in. inside diameter and 16 ft. long, of No. 16 sheet steel, were manufactured by the Western Pipe & Steel Co. The gases are drawn through the main treater by two induced draft fans, and are discharged directly from the fan casings. Those from the reverberatory furnace are drawn through the reverberatory treater by the natural draft of the stack. As the reverberatory furnace is not operating continuously at present, the Ashio smeltery uses eleven pot roasters, four blast furnaces, and four converters, the gases from which are mixed and treated entirely by the main treater. Thus the gas volume now handled by the main treater seems somewhat in excess of 150,000 cu. ft.

per min. as designed. The amount of dust collected varies from 13,000 to 22,000 lb. per twenty-four hours.

The efficiency of precipitation seems to depend upon the nature of the furnace charge and the moisture and temperature of the gases treated. The recovery runs as high as 98 per cent, and sometimes it drops to about 70 per cent. When the conditions are such that the charging voltage can be raised above 80,000 volts with a comparatively small increase of the current, precipitation is very satisfactory. Actual experience at the smeltery has shown that when the smoke has a white appearance, precipitation is satisfactory, but when the smoke coming from the treater outlet has a yellowish appearance, the efficiency of precipitation is not so high and the current increases greatly, even if the operator tries to raise the charging voltage. The smeltery engineers are now investigating this phenomenon, and no doubt will soon be able to get entirely satisfactory precipitation, regardless of the different smoke conditions encountered.

Several years ago a large dust chamber was installed, using the Roesing wire system. The gases passed from this chamber to four large stacks, in which they were diluted by the forced admission of fresh air, before being discharged into the atmosphere. The main treater was installed at the side of this dust chamber, so the gases pass through the dust chamber, before going through the treater. The numerous suspended wires in the dust chamber were removed, so that only the heavier dust, which is of more value because of its higher percentage of metals, would be caught in the chamber; and all the lighter dust, which cannot be efficiently collected by gravity settling, would be caught in the Cottrell treater. An analysis of one of the samples of the dust settled in the Ashio main treater is as follows:

Per Cent		Per Cent	
Cu	1.37	As	31.83
Fe	2.99	Al ₂ O ₃	1.45
S	19.72	Pb	0.84
SiO ₂	3.92	Zn	5.57
CaO	1.19	Moisture	6.40

Thus the electrical precipitator collects not only the poisonous dust, such as arsenious oxide, but also the fine particles which were hitherto escaping into the atmosphere and which perhaps were acting as the nuclei for the concentration of the noxious gases, such as SO₂, preventing their free diffusion. Such poisonous dust and concentrated noxious gases cause damage to vegetable growth.

As the analysis shows, the precipitated dust contains rather large quantities of the oxides of arsenic. These oxides are extracted by subliming the dust in a small reverberatory furnace, and the cinder resulting, rich in copper, is sent back to the pot roasters after being briquetted.

Kamioka Smeltery, Mitsui Mining Co.

This treater operated by this company consists of three sections, each containing sixty-four riveted pipes arranged in a square (or a total of 192 pipes). It was started in May, 1918. The pipes, 12½ in. inside diameter by 16 ft. long, made of No. 14 gage

sheet steel, were manufactured by the Western Pipe & Steel Co.

The gases passing through the treater come from the following furnaces: Three lead blast furnaces, two liquation furnaces, five softening furnaces, and all the lead-refining furnaces and kettles. At first it was intended to install a treater having four sections of the same size as those specified above, and three electrical units. In fact, three 15-k.v.a., 200- to 100,000 volt transformers and three motor-generator sets were ordered from the Westinghouse Electric & Manufacturing Co. On account of the delay in shipment of this electrical equipment, due to labor troubles and difficulties of transportation caused by the Great War, the size of the treater was reduced and temporary electrical machines were substituted until those from the Westinghouse company could be obtained.

The Kamioka smeltery is situated in the heart of the sericulture district, and the residents in the vicinity made strenuous objections, demanding heavy indemnities, as they claimed that the smeltery smoke damaged the mulberry leaves and killed the silk worms. Therefore, every effort was made to complete and start the Cottrell plant at an early date. The temporary electrical machines supplied by the Metallurgical Research Institute consisted of high-tension transformers, the voltage of which was regulated by an induction regulator and "K-1" type rectifiers driven by synchronous motors. The precipitator worked continuously without trouble, and from 2,200 to 3,300 lb. of dust per twenty-four hours was collected, even though temporary electrical equipment was being used. Recently the Westinghouse equipment arrived and has now been installed. Analysis of the treater precipitate is as follows:

Per Cent		Per Cent	
SO ₂	0.63	As	19.65
Zn	1.68	Pb	37.25
Ag, oz. per ton	1.5	Cu	Trace
Au	Trace	Bi	0.16

The treater charging voltage is about 70,000, and the power consumption is approximately 6 kw. Not only has the Cottrell process settled the smoke nuisance problem, but it has also been the means of saving dust which is valuable to the smelter because of its high metallic content. This installation, although not large in size, may be taken as the most striking example in Japan of the benefits which may be derived both by the public and the smelters.

Naoshima Smeltery, Mitsubishi Mining Co.

The erection of this smeltery was permitted by the government on condition that the gases would be cleaned by the Cottrell process. The operation of the treaters was therefore begun when the smelter was blown in in March of this year (1919). The treater consists of five units, each containing sixty-four lock-seam pipes arranged in a square (or a total of 320 pipes). These pipes, manufactured by the Robertson Bros. Co., of Chicago, are 12½ in. inside diameter by 16 ft. long and are of No. 14 gage sheet steel. The treater was designed for a capacity of 80,000 cu. ft. per min., assuming a velocity

through the pipes of 5 ft. per sec. The fumes from the lead furnaces, and from the McDougall roasters and converters of the copper smeltery, are mixed and then treated by the precipitator. Natural draft is furnished by a stack 150 ft. high and 10 ft. inside diameter. The electrical equipment consists of three Westinghouse units, the same as those described above for the Kamioka smeltery. As the delivery of these machines was delayed, the plant was started using temporary machines, as at Kamioka.

The smeltery being only recently started, the furnaces are not yet running at their full capacity, and the gas volume handled runs from 40,000 to 45,000 cu. ft. per min. The efficiency of precipitation is so high that the stack is practically smokeless, and the people scarcely realize that such a large smeltery, producing hundreds of tons of copper and lead every month, is in that locality. The dust collected every twenty-four hours amounts to about 3,300 lb., and its analysis is as follows:

	Per Cent		Per Cent
Au	Trace	Cu	2.30
Ag, oz. per ton	2.9	Pb	22.54
Sb	3.14	Fe	11.20
Zn	3.29	S	12.00
Loss on heating	25.68	As	13.43

After much study and discussion, sixty-four pipes, arranged in a square, as designed for the Naoshima

by an exhaust fan and are discharged from the old stack into the atmosphere. Two sets of electrical equipment, one unit being spare, and each consisting of a 15-k.v.a., 200 to 100,000 volt, 60-cycle, single-phase transformer, and a motor-generator set, were ordered from the Westinghouse Electric & Manufacturing Co. In January of 1919, this treater was started, using a temporary electrical equipment.

At the first trial, the treater showed good efficiency. This efficiency lasted only two days, and then the operation became so unsatisfactory that the diminution of smoke was scarcely perceptible even when the treater was charged with a high potential. After experimenting in various ways, it was decided to humidify the gases, a practice which was found necessary for satisfactory precipitation in several American plants. A dozen orchard spray nozzles of 1/16-in. diameter, arranged in the dust chamber, using water at 120 lb. per sq. in., injected a fine spray into the gases before they entered the treater. Precipitation was conspicuously improved and the efficiency raised to about 95 per cent. Now, the operator can raise the charging voltage to 80,000 volts while the current is only approximately 30 amperes. When, in order to examine the effect upon precipitation, the water sprays are turned off, the charging potential drops and the current increases so that the efficiency becomes as low as 50 per cent. This experiment shows that smeltery smoke, difficult to precipitate on account of its non-conductive properties, may be treated easily by being humidified. The amount of dust precipitated per twenty-four hours is about 1,350 lb., and its analysis is as follows:

	Per Cent		Per Cent
Zn	6.80	Ag, oz. per ton	0.2
CaO	0.30	Pb	7.80
MgO	Trace	Cu	0.50
SiO ₂	1.05	Bi	2.48

		Al ₂ O ₃	0.20

Nikko Electrolytic Copper Refinery—Furukawa Mining Co.

The gases from two cupellation and two reduction furnaces are treated to recover silver-bearing lead dust. The treater consists of one section of thirty-two pipes, arranged in a rectangle 8 x 4 ft. These pipes, manufactured by the Western Pipe & Steel Co., are 12½ in. inside diameter by 16 ft. long, and are of No. 14 gage steel plate. The treater was designed to handle a gas volume of 8,200 cu. ft. per min. The actual volume is about 6,500 cu. ft. at a temperature of from 100 degrees to 200 degrees C., and is drawn through the treater by an exhaust fan. The electrical equipment consists of a 10-k.v.a. 50-cycle, 200- to 100,000-volt transformer, manufactured by the American Transformer Co., and a rectifier of the rotary-arm type, 30-in. in diameter, supplied by the Research Corporation of New York. The rectifier is driven by a 1½-hp. 220-volt, three-phase, Westinghouse synchronous motor. The transformer has taps on the low-tension windings which will give voltages of 50,000, 62,500, 75,000, 87,500 and 100,000 on the secondary. These taps, together with a rheostat of a few ohms' resistance in the transformer primary

THE IKUNO SMELTERY, SHOWING TREATER AT THE RIGHT OF STACK. PHOTOS TAKEN BEFORE SPRAYS WERE USED.

treater, were chosen as the standard treater unit by the Metallurgical Research Institute. For small plants, thirty-two pipes, arranged in a rectangle of 8 x 4 ft., or half the size of the standard unit, are used. This plan was adopted to facilitate the design and erection of plants, the object being to benefit by the standardization of parts.

Ikuno Smeltery, Mitsubishi Mining Co.

The treater at the Ikuno smeltery handles the gases from two blast furnaces smelting copper ores. It consists of two sections, each having sixty-four lock-seam pipes, arranged in a square (or a total of 128 pipes). These pipes are 12½ in. inside diameter and 16 ft. in length, and are of No. 14 gage sheet steel. The gases, after passing through an old dust chamber, are drawn through the treater

circuit, are sufficient to produce any desired voltage. The treater was started in May of this year (1919). The analysis of the precipitation dust is as follows:

Pb	Per Cent	Au	Per Cent
Se	54.90	Nil	165.0
	14.23	Ag, oz. per ton	0.23

The amount of the precipitate is about 100 lb. per twenty-four hours. The power consumption is comparatively high, being from 2.5 to 5 kw.

One more Cottrell treater was to have been built, but delay in delivery of the building materials and electrical machinery has compelled its erection to be temporarily suspended. This treater, of 256 pipes, was to have been installed at the Miike lead smeltery of the Mitsui Mining Co. When times become more settled the smeltery will undoubtedly be finished and the Cottrell treaters used.

Chronology of Mining, October, 1919

Oct. 1.—National Safety Council opened its annual congress at Cleveland, Ohio.

Oct. 3.—American Foundrymen's Association annual meeting at Philadelphia ended.—Governor Boyle of Nevada announced end of strike of miners at Tonopah and Divide.

Oct. 6.—National Industrial Conference called to order at Washington by William B. Wilson, Secretary of Labor.—Mine taxation conference held in Washington, the mine taxation committee of the A. I. M. E. and representatives of the income tax unit of the Bureau of Internal Revenue participating.

Oct. 7.—Shareholders of New Baltic and New Arcadian copper companies, of northern Michigan, approved plan to merge companies.—Decision in case of Arctic Iron Co. vs. Cleveland Cliffs Iron Co. and Mr. Mather handed down by U. S. Circuit Court of Appeals in favor of defendant, the Cleveland Cliffs company.—House passed magnesite tariff bill.—General anti-dumping bill introduced by Senator Smoot, pending passage of new protective tariff legislation.—Strike of metal crafts in Butte, Mont., ended after two months' duration, the strikers losing.—Miners in Republic district of Washington demanded \$1 wage increase resulting in closing down of mines.

Oct. 8.—Strike of miners and millmen in Coeur d'Alene district, Idaho, called off by International Union of Mine, Mill & Smelter Workers.

Oct. 9.—House voted to repeal Canadian Reciprocity Act.

Oct. 19.—Mine Rescue and First Aid Association of Globe-Miami district, Ariz., opened "Safety-First Week" program.

Oct. 21.—Completion of Montana Southern Ry. from Divide, Mont. to Elkhorn, Mont., announced.

Oct. 24.—American Iron & Steel Institute opened its sixteenth general meeting at Hotel Commodore, New York.

Oct. 30.—General leasing bill passed by House.—Old Pandora mill of Smuggler Union Mining Co., at Telluride, Col., burned down.

Monthly Copper Production in 1919

The table which appears herewith is compiled from reports received from the respective companies (except in the cases noted as estimated), together with the reports of the U. S. Department of Commerce as to imported material, and in the main represents the crude-copper content of blister copper, in pounds.

MONTHLY CRUDE COPPER PRODUCTION, 1919

	August	September	October	November
Alaska Shipments (c)	1,333,009	6,208,840	4,210,274	6,067,735

Mexico:				
Boleo	1,597,040	1,477,280	1,708,560	
Cananea	4,200,000	4,200,000	4,000,000	3,900,000
Phelps Dodge Mexican Properties	3,422,000	2,827,000	3,053,000	2,331,000
Other foreign:				
Cerro de Pasco	5,726,000	5,266,000	5,652,000	4,752,000
Chile	8,594,210	7,044,000	6,800,000	
Katanga	5,026,488	4,340,064	4,916,258	
Bactus & Johnston	2,118,000	2,280,000	1,360,000	1,712,000

(a) Only electrolytic cathodes are entered. New Cornelia also produces some copper from ores sent to Calumet & Arizona smelter. (b) Estimated. (c) Official figures of the U. S. Department of Commerce; includes Kennecott production from its Alaska mines.

Production of the United States by months since the beginning of the year and the corresponding figures for 1918 were as follows:

	1918	1919
January	165,431,598	135,733,511
February	160,011,364	111,649,512
March	185,325,168	102,040,460
April	163,207,096	98,808,898
May	181,070,350	92,652,875
June	166,723,599	95,856,370
July	159,329,031	100,369,241
August	165,550,799	107,094,040
September	157,992,487	108,703,075
October	153,398,775	115,143,143

The grand total includes, under "Imports in ore and blister copper," the production of such companies as Granby, Cananea, Braden, Cerro de Pasco, and Chile. As a matter of record, however, the individual figures are given after the total. We also report the copper output of the Boleo and Katanga companies, which does not come to the United States.

The Marlborough Oil Development Co. has been chartered by the State of South Carolina for the purpose of developing the oil prospects on the plantation of Cliff N. Jackson, near Five Points, S. C. The capital stock of the company is \$125,000.

Accident Prevention Akin to Good Sportsmanship

The American Smelting & Refining Co. Proves Its Theory That Co-operation of Employees May be Secured in a Spirit of True American Sport, Fair Play and Good Fellowship

BY J. F. BELFORD

Secretary of Labor, Safety, and Welfare Department, American Smelting & Refining Co.

IT MAY not be amiss to say that in the smelting and refining of the precious metals may be found a wider variety of the hazards of accident to its workers than in any other of the great industries, for its operations include important features of such industries as well as activities peculiarly relating to itself. Accident hazards that are found in commerce, transportation, mining, manufacturing, building, the iron and steel, and chemical industries also contribute to the dangers that are met in the smelting and refining of ores, and risks incident to two or more of these diversified industries may be found in a single smelting or refining operation. The industry, therefore, ranks well up on the scale of those enterprises, occupation in which is classified as hazardous.

The steady decline in the accident rates of the American Smelting & Refining Co. since the establishment of plant safety organizations, and more especially during the past year, has gone far to take that company off the list of those industries whose employment is still regarded as hazardous. So pronounced has been the reduction of accidents throughout the plants of the organization that it should be of more than passing interest to know of the work that has been done in accident prevention, and the methods which have been pursued toward its accomplishment.

Marked Reduction in Accidents Achieved

For the year 1914, at which time plant safety organizations had just begun to take a decisive hold of the problems confronting them, the average disabling accident rate per 1,000 employees per annum (based upon 3,000 working hours per man per year) for all plants was 233. At that time, too, available statistics show that quarry accidents ran as high as 187 per 1,000; that in ore dressing establishments the rate was 113; in auxiliary works (machine shops, carpenter shops, and like places), 170; in metal mines, 195; in smelting and refining establishments generally, 204; in the iron and steel industry, 160; in industrial railways, 145; and that 35 per cent of the accidents occurred during the first six months of employment.

For the first eight months of 1919 (on a yearly basis) the accident rate of the American Smelting & Refining Co. was 89 per 1,000, a reduction under its 1914 performance of over 61 per cent. During this latter period eleven of the nineteen smelting and refining plants scored a no-accident record for a month at least. Twenty-seven such records were made during that time. One plant, with an average of 285 employees, covering a period of 194 consecutive days without having a single disabling accident;

another, with an average of 500 employees, going four months consecutively without a disabling accident; and still another, with an employment average for the period of 847 men, went four months—three of them consecutively—without a disabling accident, its accident rate during the entire eight months—placed on a yearly basis—being only 27 per 1,000 employees per annum.

In 1914 the accident rate for fatal injuries was 1.25 per 1,000; for permanent injuries (not necessarily totally disabling), 4.32; and for the first eight months of 1919, based on the yearly basis, the fatal accident rate is .906, and the permanent injury rate is 1.81. The reduction in the accident rate under that of the preceding year, beginning with 1915, has been as follows: 1915 under 1914, 7 per cent; 1916, 9 per cent; 1917, 24 per cent; 1918, 28 per cent; first eight months 1919, 16 per cent.

How the Record was Accomplished

In the face of such a showing, indicating a steady and persistent decline in accidents in an industry that has been and still may be regarded as hazardous, the reasons why such an accomplishment has been made possible, and the conditions under which it has been effected, become important. With operations partaking, as has been said, of many of the important functions of other industries, a double responsibility rests upon management and employee, in such circumstances, to recognize all the risks incident to the general and the particular employment, to safeguard against each danger, wherever possible, and to exercise such watchfulness and care as should nullify all the hazards present.

If the responsibility were to be recognized and assumed, the company felt that it must be the pioneer in first setting its house in order. It began by doing all that was humanly possible to eliminate all dangers that were present in structure, in mechanical operations and appliances, in manual implements, and in environment. Side by side with the safeguarding of the plant the company carried on its educational campaign for safety and safe methods among the staff and the rank and file. Foremen's, workmen's, and general safety committees were formed and carried on with all the enthusiasm that could be injected into them. Safety inspectors were appointed, efficient methods encouraged, and a closer scrutiny was given to employment selection and the placing of employees in activities where they were the best fitted to serve.

During the last five years the company has expended in safeguards and their replacements over \$155,000, and its expenditures for the same period on account of safety has been over \$406,000. As a

part of the campaign for safety close attention was paid at the same time to welfare and service needs of the employees, and in this work it has expended over \$386,000 in the last five years. At the larger plants of the company, in addition to the regular medical staff, are visiting nurses, who aid the wives of the employees in the care of their children, give instruction in sanitation and hygiene, and are helpful in many ways. The expenditure for welfare and service covers the building and maintenance of pure water-supply systems, plant bath houses, lunch rooms, coffee stands, modern sanitary toilets, employees' clubhouses, children's playgrounds, baseball grounds, and the costs of moving-picture shows, musical entertainments, and other forms of amusement and education.

Value of Welfare and Service Work

Though the welfare and service work should not be technically considered as a part of nor be confused with the accident-prevention activities of the company, such work has had, in reality, a marked effect in creating a better understanding by the employee of the advantages of favorable hygienic and sanitary conditions in a plant as a spur to cleanliness, better health, a closer co-operation, and consequently more personal care in operations and fewer accidents.

Having given a visible expression of its desire to do all that was mechanically and physically possible to promote safety by safeguards, by the elimination of dangerous places, so far as could be done, and continuing to provide every facility for care and cleanliness and also having placed the safety educational features upon a basis where they could reach each employee, it was believed that the full co-operation of the employee was bound to follow and that the results looked for in accident prevention could be achieved. The record, as given, is proof of the co-operation between management and employees.

Details of Safety Measures Adopted

A glimpse at a few of the features of the methods in reaching the employees and securing their valuable assistance in helping them to help themselves along the path of safety should have an interest to employer and employee alike. The company proceeded on the theory that accident prevention was true sportsmanship; that sportsmanship was an American institution, innate in the native and quickly absorbed by the alien after he could get a view of and settle down to the American form of civilization; and, that the best elements of sportsmanship were found in our national game—baseball. If the men could be reached in the spirit of baseball they would play the game with every ounce of energy in them.

Baseball is the game that you can't job, that you can't throw, that you can't cheat in—and get away with it. Your hits must be clean, your base running honest, and you must beat the ball if you want to win. It calls for the highest type of team-work, energy, understanding, and a strong heart. It gives opportunity for the highest skill in finesse and of

individual play, double play, and mass performance, and though one man, by brilliant workmanship, may save his team or put over a shut-out, he doesn't win for himself alone, but for all concerned—himself, his team mates, his manager, his club, his league, his town or city.

In tossing out the ball for the first performance it is well to remember that bad ball can be played on a poor field, but good ball can't. A clean plant is like a baseball field. A player must have a clear way to make good running and good fielding. The grounds dry, the sacks whitewashed, the runways swept, the outfield mowed, the gong sounded, and the game begun, you have your eye on play and players.

The player must be awake—on the job every minute; keep his eye on the ball and the play, know the moves of the game, be at the right spot at the right instant, cover his particular station, and not be dead on his feet. He must know how to handle the implements of his calling and see to it that they are in good condition. He can't line out a home run with a split bat and a half-ripped ball. He must be a good judge of distance and of the other fellow; be quick to think in an emergency, and to think right. A muffed ball often brings in a home run for the opposing team. The player that can't hold on to the ball when it comes into his hands soon finds a place on the bench.

Cases of "Dropsy"

Seventy-five per cent of smelter accidents are hand-labor accidents. A large proportion of these are "dropsy" cases, where the employee lets something slip from his hands and drop on his feet. Get him in the habit of concentrating on his work and he can effect a self-cure of "dropsy." You've then developed a player who doesn't "muff the ball"; you've added to your "working team" an employee who isn't putting anything in the "error" column through bad play; you're reducing accidents.

The careless player, if he can remain in the game until the ivory is in plain sight, can throw away a world series, spike the bag holders, disrupt a club, and a riot call can't keep him out of the hands of the mob. He's a poor sport, who neither thinks of or for himself or for any one else; he's a piker, a welcher, a dangerous liability, a menace to his fellows, and a disgrace to the game. But there is hope and good material in the clumsy, willing fellow, for, with his heart in the game all he needs is training, encouragement, and practice to bring him around.

Manager, team captain, water boy, clubhouse rubber, mascot, are all part of a team's aggregation, and have their important functions in the game, but the club's standing, the batting, pitching, fielding performances, errors, assists, games won and lost, are the accomplishments or failures of the players themselves. Given an understanding of the game, a realization of the individual and collective part of it, a knowledge of the necessity of being in the pink of condition and staying fit, each player will strive to his utmost to play the game for all there is in it, and play it fair.

It was believed that, having organized and put on a sound running basis the workmen's safety committees—of which each employee must at some time become an active working member—if the employees themselves could conduct these meetings in their own way, but with the backing and encouragement of the management, they, the workmen, would show their true sportsmanship, would eliminate the slackers and boneheads, educate the butter-fingered, clumsy recruit, and play the safety game in championship form.

Pursuing the simile further, the safety inspector occupies the relative position of a team business manager, who looks over the field and makes report of its condition. If he finds a bit of bad ground it is reported and fixed. He inspects the paraphernalia and sees that the working tools are in good condition and fit for the players. If they are not, they go into the discard or to the repair shop. He consults with and advises the foreman—the field captain—in all matters concerning the rules, good practice, and bad play. He may suggest taking a man out of the game or placing him in another position where he can make a safe play. At all "team meetings" he is on hand, coming in close contact with the men and giving counsel or inviting suggestions.

Foreman Is the Captain of the Team

The foreman is field captain of his "department team," and he is looked to and expected to win with a no-accident "shut-out." He is held to strict responsibility and account for all accidents that happen to his men. He must assume the burden of proof that it is through no oversight of his, either in instruction (coaching) or play that an accident occurs; through no failure of commission or omission on his part that some bonehead stunt sends one of his men back to the bench. He is required to instruct each man under him in the safety rules and practices and to see that he observes them. The blame for an accident is lifted from the foreman only when it is shown that there has been no negligence on his part and that the accident was wholly beyond his power to prevent. He is encouraged by the management to give every aid and assistance in his power to each man in acquainting him with and helping him to master all the details and intricacies of his game; to arouse a comradeship that will develop teamwork and friendly co-operation to the highest degree, and to invite suggestions from his men as to safer and better methods.

Finally, one must come to those who at one time or another were themselves real participants in the field; who have perhaps covered every sack and station, and who are now the real backbone of the game—for without the Fan the game languishes and grows stale. Who, but the Fan, can put the real "pep" into the play; who sees the move before it is executed; who can cheer or "tie the can"; who can encourage with his enthusiasm or take the heart out of the sport?

Fortunate for the safety game of the American Smelting & Refining Co. its managers and superintendents are "nth" degree Safety Fans, and many

of them premier coaches who are there with the advice that brings in the run; and through their encouragement, active personal interest and concern in all matters relating to accident prevention have built up a confidence and real enthusiasm among the men that has made the record possible.

Battles are won off as well as on the field, and there is a strategy of sport as well as of war, and it is at the clubhouse (foremen's, workmen's and general safety committee meetings) that past performances are analyzed, new plays considered, and campaigns laid out.

Impressing the Value of "Safety First"

And so it is that at the respective safety meetings, where men can get together, become better acquainted, and frankly and freely discuss the matters before them, where every accident that has happened since the last meeting is thoroughly dissected and analyzed, and every unsafe place or practice noted is gone over, and where every suggestion for betterment is considered, the employees learn that carelessness is bad sportsmanship.

Every workman is encouraged to enter into the discussions at these meetings, to make such criticisms as he may desire, and to offer any suggestions that he may have, and these are fully considered and acted upon by the management.

Recognition and reward are given for good work in accident prevention, and the employees themselves are now the first to criticize and condemn the careless acts of their fellows. In addition to the stimulation given to the safety movement by the personal active interest of the managements; by the various safety committees; by the individual work of foremen and employees, and through safety publications and bulletins, there is issued each month and posted on the various plant bulletin boards a target, with the center as a no-accident bull's eye, showing the relative position of each plant with reference to a perfect score. The employees everywhere are thus shown how their work in accident prevention compares with that at the other plants. A pennant is given each year to the plant having the lowest accident rate for the preceding year. For three years the Omaha plant has successively won the pennant, but with such a spirited rivalry and a continued closer approach of the contenders that it will probably take the "official returns" to determine the 1919 winner.

The unmistakable fact in it all is that the employees generally no longer regard accidents as mere hazards of employment or as the common happenings of a day's work, but things that can be avoided if each one grasps a proper appreciation of himself, his surroundings and his fellows; that carelessness is poor sportsmanship, for it lacks that appreciation: that it is

". . . the close co-operation that
Makes them win the day.
It ain't the individual, nor the
Army as a whole,
But the everlastin' teamwork
Of every bloomin' soul."

Henry Clay Frick

Noted Financier Was One of the Most Prominent Figures in the Development of the American Steel Industry—Secured Control of Coal Land and Developed Coke Production Early Associate of Carnegie

IN THE death of Henry Clay Frick, on Dec. 2, at the age of seventy, America has lost another man who figured largely in the development of the country's steel industry. Although not as well known to the public in recent years as Carnegie, Mr. Frick took an equally active part in the industrial life of the country. He was averse to publicity, and had not it been for events connected with the Homestead strike in 1892, he might have remained almost unknown to most of the men in his organization. He was a giant of big business, and played the game

this fuel in its relation to the manufacture of steel. His business sagacity led him to secure control of as much coal land and as many coke ovens as possible, and in this he was assisted materially by the panic of 1873, which threw many valuable holdings on the market. At that time coke could be bought at 90c. per ton. Later it advanced to \$5, and, with the corresponding increase in the value of the wherewithal for making it, Frick became a millionaire before he was thirty years old.

Mr. Frick soon became associated with Andrew Carnegie, as the steel and coke business had become necessary complements. He exchanged a part of his interest for shares in Carnegie Brothers, of Pittsburgh, and had been made chairman of the board of managers when the labor troubles occurred in 1892. Frick insisted that the owner of a property could do with it as he pleased, and he resisted all efforts of the labor element to change working conditions. The result was one of the bloodiest labor disputes in American history. The strikers seized and fortified the Homestead works and had an armed battle with 300 detectives brought by Frick to restore order. Ten men were killed. Eight thousand National Guard troops were then called out, and in a few weeks order was restored. It was at this time that Alexander Berkman, the anarchist, who, with Emma Goldman, was recently deported from the country, attacked Frick in his office and came very near taking his life. For this crime Berkman served almost fourteen years in jail.

HENRY CLAY FRICK

on an equal footing with men like Carnegie, Morgan, and Schwab.

Starting life a poor farmer boy, the story of his rapid accumulation of wealth is one of those romances of American business with which the magazine-reading public has become familiar. He was born Dec. 19, 1849, and until he was sixteen divided his time between school, his father's farm, and the Overholt distillery, owned by his grandfather, where he kept the books. He attended Otterbein University for one year, leaving to go into the coke business.

Frick's home was in the center of the coke-producing district, and he realized the importance of

Business rivalry between Carnegie and Frick later developed into a bitter estrangement, which was never healed. Frick's animosity also extended to Schwab, and he was successful in ousting him from the presidency of the U. S. Steel Corporation through power obtained by the purchase of steel stock during the hard times of 1903. In the last ten years Frick had acted largely in an advisory capacity to the numerous big corporations in whose directorate he was represented.

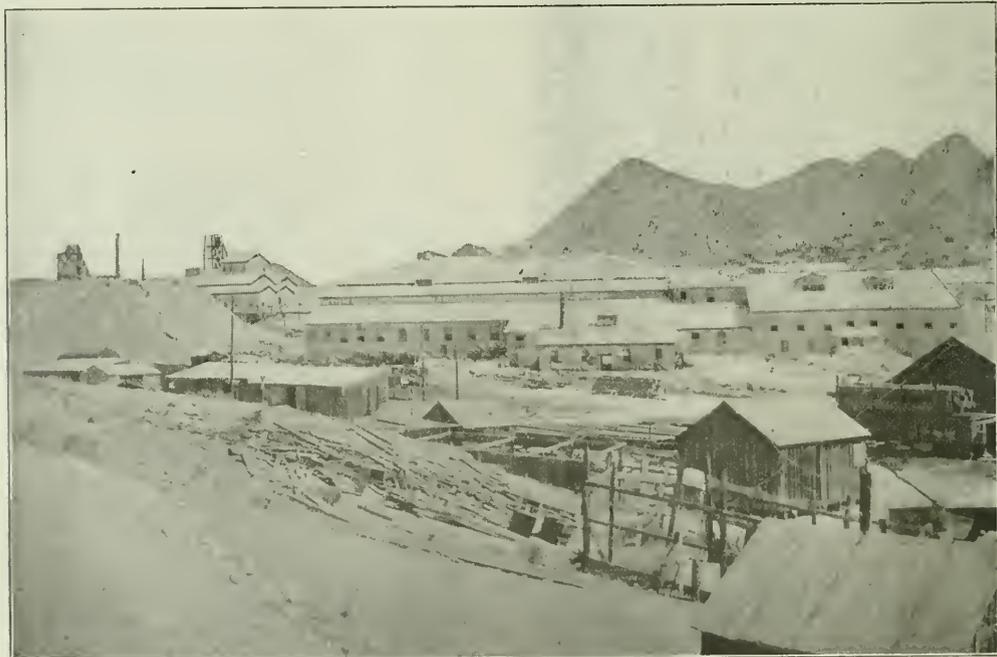

One of the principal reasons for Frick's financial success was his ability to keep his affairs in such a condition that he was able to take advantage of, rather than be harmed by, trade panics and depressions.

During his life Frick accumulated incomparably the finest private art collection in the world. This has been placed in a palatial building at Fifth Ave., at Seventieth St., New York City, and it is planned to make it a public gallery. Much of his money was devoted to private philanthropy which never became known to the public.

To Develop B. C. Oil Lands

New Company Formed to Consolidate Individual Claims
in Southeast Kootenay Will Lease Part
of Holdings for Prospecting

FROM Eastern Canada comes the report that an organization calling itself the Amalgamated Oil Co., Ltd., after obtaining satisfactory reports from government and other geologists, has acquired considerable holdings in southeast Kootenay, to the end that the ground may be thoroughly prospected for oil. The company claims to have acquired a lease of 30,000 acres in the vicinity of Sage Creek, giving it the right of acquiring complete possession through crown grants at a cost of from \$10 to \$20 an acre. A tract of 4,886 acres has been leased to the Crow's Nest Oil Co., of Spokane, and associates on a royalty basis, with option to purchase at \$500 an acre. This company is drilling and is now down 1,800 ft. in one well.

Negotiations are in progress with one of the strongest U. S. companies toward leasing half of the remainder of the Amalgamated's property on a royalty basis, also with an option to purchase at \$500 an acre. Both of these leases include an obligation of the lessee to do certain development work. The company at present does not intend to operate, but will await the results of the development work being done on the property by the lessees.

"The business of looking for oil," according to the prospectus, "is always a speculation. There is nothing new in this statement, and the public knows it as well as the directors. The directors, however, believe that they have obtained the best advice available, and feel confident that their programme will result in what they consider one of the best prospects in Canada receiving a thorough testing.

"The indications of oil and gas at depth have been reported as most satisfactory, and analyses show that oil to be of extremely high grade and its value much higher than the average. Should oil be found in commercial quantities not only the shareholders but the whole country will benefit."

Inquiry in Victoria shows that the consolidation, under the control of one organization, of leases to land in southeast Kootenay held by individuals and by companies is in process. These leases in many instances were issued years ago, and prospecting for oil in some cases was undertaken. Not a few are in arrears in payment of government fees, action against the owners having been held up by the terms of the Relief Act which was brought into force for the duration of the war. With the war over, steps

will no doubt be taken to secure delinquent payments, and it is probable that the lessees, in assigning their properties to the new company, will pay up their arrears to the government. The Canadian people would welcome the thorough prospecting of these lands for oil or for any other natural resource which would be an asset to the country. The district has been mentioned by several authorities as a possible oil producer.

Petroleum in the Pacific*

Exploitation of Promising Petroleum Lands in Papua
by the Australian Government—Native Labor
Inefficient and Much Preliminary
Sanitation Necessary

RICH mineral deposits of various kinds, such as nickel, copper, chrome, and phosphate rock, have been exploited in the Pacific Islands, and the discovery of petroleum was long anticipated. Today it is known that there are parts of Papua (British New Guinea) and the late German colony in New Guinea exceedingly rich in petroleum deposits. These are believed to be a continuation of the proved deposits of the same belt which runs through Java, Sumatra, Timor, Borneo, Celebes, Ceram, and Dutch New Guinea. This belief is supported by the fact, testified to by experts, that the oil obtained so far in Papua is of the same type as the oil taken from the above-named islands.

Though private enterprise is desirous of thoroughly exploiting the deposits of Papua and German New Guinea, and is perfectly satisfied that the deposits are valuable and extensive, the federal government of Australia is exploiting the Papuan fields and prospects, and it is expected to undertake prospecting for deposits in what was German New Guinea. During the last five years the war has hampered both prospecting and work in the proved fields. The federal government has spent to date over £100,000 in pioneering work. Private enterprise has offered, and is ready to expend, ten times as much and place on the fields the labor and all the accessories for the production of the oil.

At the present time the British Empire is short of commercial oil. The opening up of oil fields such as those of the Pacific islands will bring far-reaching benefits to the whole of the empire. It has been proved by scientific exploration that the oil-bearing areas are extensive; experiment has shown that the oil is of a high grade, and it needs only the push and determination of British enterprise and adequate

*Commerce Reports, Nov. 10, 1919.

capital to develop petroleum industries in Papua and German New Guinea that will make the British Empire independent of supply elsewhere. Rumor has it that the Admiralty has long been aware of the vast possibilities of the Papuan oil fields, and that in sympathy with the Australian government these fields were held in reserve for some great commercial movement of the future; but in the meantime, should naval oil supplies run short from present sources of supply, the Papuan fields can be worked and opened up at a moment's notice. This, of course, may be mere island gossip.

Surveys of the oil fields of Papua and German New Guinea by British, American, and German scientists have definitely proved the value of the oil of these territories. Yet in both Papua and German New Guinea there are difficulties in the way of the present development on a large scale of this or any other industry. The question of native labor is a very serious one. Not that there is an actual shortage of this labor, for labor is plentiful, but it will not work. Then, when compared with the labor available in the oil fields of some other parts of the world, the native labor of the Pacific Islands can not be considered cheap. Wages vary from 10s. to £2 (\$2.43 to \$9.73) per month for laborers and overseers, or "boss" boys, but in addition to wages (and this is where the greater cost comes in), native labor has to be fed and housed in a most extravagant and wasteful manner. There is also the cost of recruiting from native villages, and this entails much expenditure in shipping and highly-paid and experienced management.

There are no railways in Papua and German New Guinea, and the construction of roads is slow and costly. These disadvantages would at present encumber private enterprise unless it was allowed full freedom of action and was liberally provided with capital. The introduction of suitable coolie labor, say, from Java or India, would solve the labor difficulty.

A Large Variety of Byproducts Obtainable

The oils obtained from the territories vary considerably in composition, and a large variety of byproducts can be distilled therefrom. Benzine, kerosene, lubricating oil, oil fuel, and paraffin wax are some of the products taken from the oils of Sumatra and Borneo, and it is reckoned that Papuan and German New Guinea oils have the same qualities, as they appear to belong to the same oil belt.

Malaria, a tropical fever common, but not dangerous, in Papua and the whole of German New Guinea, has checked wide prospecting for oil, but it is a noteworthy fact that once the clearing of jungle along the lines of oil wells begins this distressing fever departs. This is a factor of great importance in assuring the successful establishment of an industry in these territories. For the last five years, or even longer perhaps, white men have been engaged in boring for oil in the Vaiala River district of Papua, and malaria was a troublesome item in the prospecting and pioneering days. As soon as oil was

tapped and came to the surface the changed conditions led to the rapid destruction of the poisonous mosquito, and there were fewer cases of malaria.

Motor Oils

The Present Production and Qualities of Gasoline—Gravity Test Not of Importance—Oil Shale Products and Alcohol Promising Substitutes

THE use of vehicles propelled by internal-combustion engines is rapidly increasing, and the production of the raw material (crude petroleum) from which the most important type of motor fuel (gasoline) is obtained shows signs of reaching a maximum in the near future. Resources of crude petroleum are obviously limited, and the Bureau of Mines believes it desirable that conservation and efficiency in the production and utilization of gasoline be promoted.

Before attempting to arouse interest in any movement toward conservation of fuel, it is desirable that the facts concerning the present gasoline situation be understood. A paper has, therefore, been prepared which discusses the production, marketing, and use of gasoline, the physical and chemical properties of products now in the market, and present tendencies in the development of gasoline substitutes.

Three general methods for the production of gasoline are in use:

1. The "straight refinery" process, involving distillation of crude petroleum, with subsequent chemical treatment and redistillation of the volatile fractions.

2. The "casinghead" gasoline process, involving the extraction (by compression or absorption) of liquid constituents from certain types of natural gas.

3. The cracking process, involving the decomposition of heavy petroleum distillates under heat and pressure with the formation of gasoline.

The three types of gasoline differ somewhat in physical or chemical properties, but are all entirely satisfactory as motor fuel if properly produced.

The production of gasoline has increased from approximately thirteen million barrels for the year 1909 to over eighty-five million barrels for 1918, a gain of about 560 per cent. The production of crude oil in the United States has, during the same period, increased only about 95 per cent, though the number of cars and trucks in service has increased about 1,700 per cent. This means that, although the petroleum refiner has increased his efficiency more than has the producer, he has not kept pace with the manufacturer of automotive vehicles. The possibility of a motor-fuel shortage in the reasonably near future, unless other sources of supply are developed, is indicated by these figures.

Certain seasonal variations in the production, consumption and storage of gasoline may be noted. Production decreases slightly in the winter months and is at a maximum in the summer.

*Abstract of an address delivered before the Franklin Institute, Philadelphia, Pa., Dec. 11, by E. W. Dean, Petroleum Chemist of the Bureau of Mines.

Mapping of Oil Wells

Control of Water by Subsurface Correlations—Illustrations of Properly Made Charts From Drillers' Reports to Indicate Underground Conditions—Knowledge of Position of Oil and Water Sands Vital for Economical Work

BY S. S. LANGLEY

ACCURATE mapping of subsurface structure and mechanical conditions is as necessary in oil operations as in metal mining. The metal miner would not think of operating without accurate underground surveys, yet many large oil operators have no records to show the condition of their oil reserves, although these reserves are their only means of remaining in business. Of course, it is not possible to see the underground workings in oil operations, as it is in metal mining, but accurate maps can be drawn if detailed records are demanded and obtained from the drilling crews.

Fig. 1 is a field map of 160 acres of producing oil land, the surface of which is so completely covered with wash that no exposures of structure are visible to indicate the dip or strike of the oil-bearing strata. The wells average 1,000 ft. in depth, with a daily production of thirty barrels of twelve to fifteen gravity asphalt-base oil.

The tar and oil sands are so lenticular that accurate correlation of the structure, as shown by drilling, is the only means of solving the problems of water control intelligently. Mapping of the underground structure has shown this field to lie on the gently dipping southwest flank of a fold the strike of which is approximately north forty-five degrees west. The exchange of information between the various companies operating in this field has shown that the

water when tested, because the attempt to cement the 10-in. casing at 780 ft. was a failure, and the water shown at "A" has its source in the tar sand "B." The proof of this is that at correlative depths in Wells Nos. 1, 3, and 4, this oil sand does not carry water.

If no records were available, it would be reasonable to suppose that the sand at "A" in No. 2 was the same as the tar sand which shows water in Wells

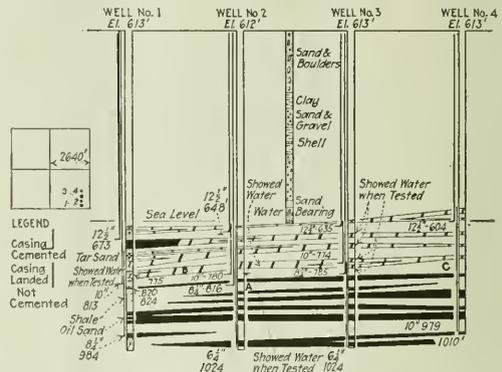

FIG. 2. CROSS-SECTION THROUGH WELLS NOS. 1, 2, 3 AND 4

Nos. 1 and 3, and, accepting that belief, to make no attempt to re-cement the 10-in. casing between the tar and oil sands. With the correct condition graphically shown, it becomes evident that if a shut-off is not made above "A," the water will enter the oil sand in No. 2 at "A," and, migrating from No. 2, its damage will be limited only by the amount and hydrostatic head of the water carried by the tar sand "B."

It is evident that Well No. 4 ultimately will require re-drilling and a second string of casing cemented in the shale break at "C" between the lowest tar and the highest oil sand. This is inevitable, as the edge-water originating in the tar sands, as shown in Nos. 1, 2, and 3, will rise along the fold and appear in this and all the upper wells, which, by correlation, are known to penetrate these tar sands.

Notwithstanding that the field operations have been closely followed by mapping, full advantage has not been taken of available knowledge. Fig. 2 shows that the two lowest tar sands in Well No. 3 are branches of the same sand, and as the upper carried water, the lower must also be water bearing. Had this fact been recognized, the 10-in. casing would have been cemented at 785 instead of at 774, with the

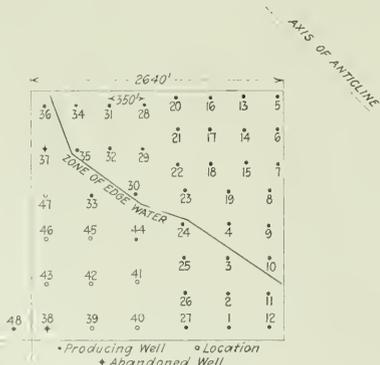

FIG. 1. FIELD MAP OF 160 ACRES OF OIL LAND

fold is an anticline whose axis is about five hundred feet northeast of Well No. 5.

Fig. 2 is a cross-section through Wells Nos. 1, 2, 3, and 4. A comparison of the depths at which the casing of the wells has been cemented shows that all but No. 4 have water-bearing tar sands lying between the highest oil stratum and the highest tar sand. The oil sand at "A" in Well No. 2 showed

8 1/4-in. casing landed as the oil string, thus saving one string of casing.

It will be noticed that the 12 1/2-in. casing is cemented in the first shale or clay stratum below the first or second tar sand. This is due to the fact that the wells were drilled by rotary to the point of cementing the 12 1/2-in. casing before enough wells had been completed by cable tools to show that the point of shut-off for this casing should have been the shale break between the lowest tar and the highest oil sand.

Fig. 3 is a cross-section parallel to the axis of the fold, and shows water-bearing sands in Wells Nos. 12 and 25 correlative with the wet sands of Well No.

any other effort to control the water in other wells will be nullified.

Fig. 4 shows the extension of the edge-water down the flank of the fold to Well No. 38, and, also, the height to which it has risen, corroborating the condition indicated in Fig. 2. The water-bearing sands in No. 38 at 762 and 785 ft. are correlative with those in No. 24 and 725 and 742 ft. In Well No. 24, these sands have been shut off from the lower oil sands, but have not been shut off in No. 38 from the sands at 875 and 920 ft. If the sands at 875 and 920 ft. were dry in No. 38, they would be a channel for the migration of water to the oil sands of No. 24 unless thoroughly slimed. As these sands themselves carry water, it is evident that there should be a water string cemented in No. 24 below the sands at 842 to 860 and 872 ft., but above the sand at 900 ft. Referred to Well No. 19, these conditions show that when this well is re-drilled for shut-off of edge-water, the second water string should be cemented in the shale logged at 840 to 860 ft. If this is done,

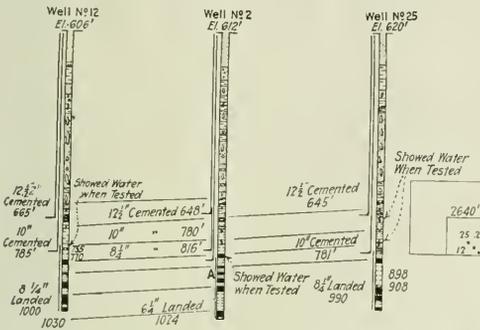

FIG. 3. CROSS-SECTION PARALLEL TO THE AXIS OF THE FOLD

2. As the correlative sands of Well No. 4 (see Fig. 2) are dry, the indications are that wells in the same relative position on the fold as No. 4 will also be dry, and, conversely, that wells situated similarly to Nos. 1, 2, 3, 12, and 25 will encounter edge-water. If

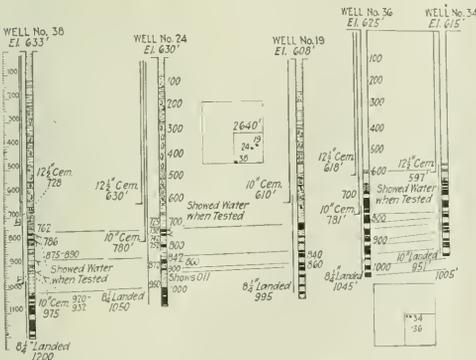

FIG. 4. WELLS NOS. 38, 24, AND 19, SHOWING EXTENSION OF EDGE-WATER TO WELL NO. 38. WELLS NOS. 36 AND 34. THE FORMER IN THE ZONE OF EDGE-WATER.

this proves true, then all of the wells yet to be drilled (Fig. 1) will be in the zone of edge-water.

Fig. 3 further illustrates the necessity of a shut-off in Well No. 2, between the lowest tar and the highest oil sand. If this condition is not corrected,

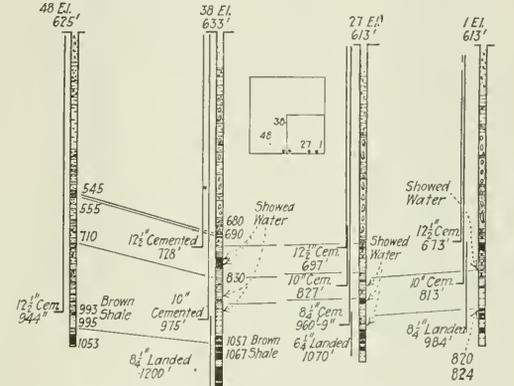

FIG. 5. CORRELATIONS OBSERVED IN DRILLING WELL NO. 48

and all formations are slimed, the lower productive sands will be protected in this and adjoining wells.

Fig. 4 shows Well No. 36 to be in the zone of edge-water, and No. 34 is east of this zone. Examination of the remaining well logs shows the line of demarcation to be as it is drawn on the field map (Fig. 1).

With the extent of the edge-water known, it is at once evident that Wells Nos. 10, 4, 30, 35, and 34 will soon show water. When these wells produce water, the source will be known, and the second water string cemented at the correct depth without a long and expensive series of bridges and tests on the sands of each well. The first clay or shale stratum below the lowest correlative wet sands of Well No. 38 will be the marker to determine the depth of cementing.

A study of the facts revealed by the cross-section leads to the belief that the wells within the zone of edge-water are on the northeast flank of the syncline. The appearance of sands that are water-bearing without traces of tar or oil substances this belief.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Increased Appropriations Asked for Survey and Bureau of Mines

Appropriations totaling \$1,655,880 have been asked by the Secretary of the Interior for the U. S. Bureau of Mines during the coming fiscal year. The principal items making up that total are as follows: For investigation as to the causes of mine explosions, as to methods of mining especially in relation to safety of miners, as to appliances best adapted to prevent accidents, as to the use of explosives and electricity, and for other technologic research, \$454,010 (an increase of \$31,800 over the appropriation for the current fiscal year). For investigation of mineral fuels and unfinished mineral products belonging to or for the use of the United States, \$175,000 is asked, this being an increase of \$25,000.

The sum of \$250,000 is sought for investigations concerning mining, preparation, treatment, and utilization of ores and other mineral substances with the object of improving health conditions and increasing safety and efficiency, and also with the view to developing domestic sources of supply and substitutes for ores and mineral products particularly required for military or naval purposes or needed for economic independence of essential industries, and which have been largely imported heretofore. The sum requested represents an increase of \$150,000.

One hundred and fifty thousand dollars (an increase of \$25,000) is asked for investigations concerning the mining, preparation, treatment, and utilization of petroleum and natural gas. For expenses in connection with maintaining and operating existing mining experiment stations and for establishing the four remaining stations authorized by law, \$250,000, an increase of \$100,000, is desired; for operating mine rescue cars, \$180,250, an increase of \$25,583; for the purchase of an additional mine rescue car, \$40,000; for inspection of mines in Alaska, \$7,000; and for the purchase or lease of land for headquarters of mine rescue cars, and for the site of an experimental mine and a plant for studying explosives, \$19,000.

The total of appropriations asked for the U. S. Geological Survey is \$2,592,920. The principal items included in that amount are as follows: For geologic surveys in various portions of the United States, \$500,000 (an increase of \$152,926.50 over the appropriation for the current fiscal year); for continuing the investigation of the mineral resources of Alaska, \$100,000 (an increase of \$25,000); for preparation of the report of the mineral resources of the United States, including special inquiries as to statistics of production, distribution, and con-

sumption of the essential minerals, \$200,000 (an increase of \$90,000); for chemical and physical research relating to the geology of the United States, including research with a view to determining the geological conditions favorable to the presence of deposits of potash salts, \$60,000 (an increase of \$20,000); for gaging streams and determining the water supply of the United States, \$200,000 (an increase of \$25,000); for examination and classification of lands, \$400,000 (an increase of \$225,000); for engraving and printing geologic maps, \$140,000 (an increase of \$22,000); for a survey of power production and distribution in the United States, including the study of methods for the further utilization of water power, \$250,000.

Bureau of Standards to Widen Scope of Research Work

An increased amount of metallurgical research is planned by the U. S. Bureau of Standards for the next fiscal year. Congress has been asked to appropriate \$75,000 for an expansion of the work, which was carried on during the current fiscal year for \$25,000. The research is to include alloy steel, foundry practice, standards for metals and sands; casting, rolling, forging, and the properties of aluminum alloys; prevention of corrosion of metals and alloys; development of metal substitutes as for platinum; behavior of bearing metals; preparation of metal specifications; investigation of new metallurgical processes, and study of methods of conservation in metallurgical manufacture and products.

The work is to be conducted under the immediate supervision of two consulting metallurgists at \$3,600, one associate physicist at \$2,700, two associate physicists at \$2,500, one associate physicist at \$2,400, one associate physicist at \$2,200, an associate chemist at \$2,500, two assistant physicists at \$1,800, two assistant physicists at \$1,600, and an assistant chemist at \$1,400, four laboratory assistants at \$1,200, a machinist at \$1,600, and two machinists at \$1,200, in addition to the necessary clerks and laborers.

More Silver Dollars to Be Used in Settling Foreign Balances

Announcement was made on Dec. 6 that, under arrangement made between the Treasury and the Federal Reserve Board, standard silver dollars that are free in the Treasury will until further notice be delivered against other forms of money to the Division of Foreign Exchange of the Federal Reserve Board, which will, through the Federal Reserve Bank of New York, co-operating with the branches of

American banks in the Orient, employ such dollars in regulating American exchanges with silver standard countries. This arrangement does not, it is stated, affect the redemption of outstanding silver certificates in standard silver dollars.

Approximately 60,000,000 silver dollars, against which silver certificates were issued and cancelled, can be exported under the new policy formulated by Treasury officials in connection with members of the Federal Reserve Board. The International Banking Corporation, the Park-Union Foreign Banking Corporation, and the Asia Banking Corporation, the three American institutions with branches in the Far East, will attend to the actual shipment of the coins.

The main demand for silver comes from China, which has a large balance of trade in its favor. The Chinese tael has been quoted as high as \$1.74, against a parity of \$1.45 and a low of 60c. a few years ago. The silver placed in China would be used to purchase dollar exchange. It would mark the settlement of international balances with silver and might temporarily lessen the demand on the part of the Orient for gold from the United States, of which \$67,000,000 was shipped in November.

Secretary Lane Makes Recommendations as to Oil Situation

In pointing out the necessity for the United States to develop petroleum supplies in other countries, the Secretary of the Interior, in his annual report, declared that American enterprise would find the oil supplies that the country needs if the Government does the following things:

1. Assures American capital that if it goes into a foreign country and secures the right to drill for oil on a legal and fair basis (all of which must be shown to the State Department) that it will be protected against confiscation or discrimination. This should be a known published policy.
2. Requires every American corporation producing oil in a foreign country to take out a Federal charter for such enterprise under which whatever oil it produces should be subject to a preferential right on the part of this Government to take all of its supply or a percentage thereof at any time on payment of the market price.
3. Sells, no oil to a vessel carrying a charter from any foreign government either at an American port or at any American bunker when that government does not sell oil at a non-discriminatory price to American vessels at its bunkers or ports.

War Minerals Relief

For the past several weeks the field force of the War Minerals Relief Commission has been working intensively on examinations. No time is being taken to write reports. Examinations will be continued as rapidly as possible, as long as the weather will permit, after which the mining engineers will return to Washington and write up all of the reports for which they have gathered data. This policy has brought forth some objections from claimants who are anxious that a report on their claims be written up immediately after the examination, in the hope that this will expedite the consideration of their

case. It was felt by the Commission, however, that benefit to a greater number could be obtained by making maximum number of examinations during the remainder of the field season.

Trade With Belgium Heavy

Commercial interests in the United States have lost no time in renewing trade relations with Belgium as is shown by the reports of the Bureau of Foreign and Domestic Commerce for the first nine months of 1919. During that period exports to Belgium have totalled \$283,417,698, or, \$37 per capita for the Belgian population.

Exports of refined copper in ingots and bars to Belgium during the first nine months of 1919 totaled 4,845,877 lb., valued at \$908,340. Exports of zinc, produced from domestic ore, to Belgium during that period amounted to 5,838,623 lb., valued at \$416,322.

Resigned from Geological Survey

Several names have recently been added to the list of resignations from the scientific staff of the U. S. Geological Survey. Members who have resigned to accept private employment are as follows: A. G. Maddren, C. C. Osbon, Miss Martinneau Knight, and W. A. Ingalls. It is thought that Miss Knight is the first woman to accept employment for geologic field service.

Copper Wire Surplus

Disposal of the remainder of the Government's surplus of copper wire and telephone cable was discussed at a recent meeting of those interested, with the Director of Sales. The surplus consists of 854,923 lb. of copper wire of various sizes and 1,710,000 ft. of telephone cable.

California Metal and Mineral Producers Association

On Oct. 22, 1919, a California Chapter of the American Mining Congress, to be known as California Metal and Mineral Producers' Association, was organized in San Francisco by a consolidation of the California Metal Producers' Association and the State Chapter of the Mining Congress, instituted in January, 1919. The following board of directors and officers were elected: George W. Starr, president; E. C. Hutchinson, first vice-president; L. D. Gordon, second vice-president; P. C. Knapp, third vice-president; Albert Burch; J. A. Fulton; W. J. Loring; O. J. Egleston; William G. Devereux; Robert I. Kerr, secretary-treasurer; C. H. Fry, engineer; Curtis H. Lindley, attorney.

Such reorganization will tend to broaden the scope of the association by admitting to membership producers of non-metallic minerals, including oil, and individuals directly and indirectly interested in the operation of metal mines, and its growing influence in state affairs will be increased. Additional benefits will be derived from membership in a national body.

All active and corporate members of the American Mining Congress residing in California were, by

resolution adopted at the meeting, duly elected members of the California Metal and Mineral Producers' Association and active members of the American Mining Congress were requested to indicate whether or not they desired to consummate such membership by the payment of annual dues in advance amounting to \$5.

Export Duties on Silver in Mexico

A cable dispatch from the United States Vice Consul at Mexico City states that according to a presidential decree of Nov. 25, in effect from Dec. 1, the duties payable upon the exportation of silver from Mexico have been modified. The new rates vary according to the daily New York quotations on silver and are as follows: When quotation is less than \$1 per oz., the tax is to be 7 per cent ad valorem; when the price is from \$1 to \$1.10, the tax is 8 per cent; from \$1.10 to \$1.20 the rate is 9 per cent; from \$1.20 to \$1.30, 10 per cent; from \$1.30 to \$1.40, 11 per cent; and if the quotation is above \$1.40 duty is to be collected at the rate of 12 per cent.

The government reserves the right to buy what silver it needs at the market price plus 1 per cent, but deducting taxes and shipping expenses.

November Mining Dividends

Dividends disbursed in November, 1919, by eleven United States mining and metallurgical companies making public reports, amounted to \$5,166,671, as compared with \$9,301,339 paid by eighteen companies in November, 1918. Reports from Canadian and Mexican companies indicate payment of only \$200,000, as compared with \$1,785,514 in November, 1918.

The White Knob Copper & Development Co., a holding company, paid its usual quarterly dividend on its preferred stock of 5c. per share (\$10,000).

MINING DIVIDENDS

United States Mining and Metallurgical Companies	Situation	Per Share	Total
Am. Zinc, Lead & Sm. pfd.	U. S.	\$1.50	\$ 120,810
Anaconda, C., S., & Z.	Mont.	1.00	2,331,250
Ariz. Copper, pfd.	Ariz.	.01	53,840
Caledonia, ls.	Ida.	.01	26,050
Chief Cons., ls.	Utah	.06½	57,475
Golden Cycle, g.	Cal.	.03	45,000
Intergnat. Nickel, pfd.	U. S.-Can.	1.50	133,689
Miami, c.	Ariz.	.50	373,557
Mohawk, c.	Mich.	1.00	100,000
New Jersey Zinc	U. S.	4.00	1,400,000
United Verde Ex., g.	Ariz.	.50	525,000
Canadian and Mexican Companies	Situation	Per Share	Total
Amparo, g.s.	Mex.	\$0.05	\$100,000
Coniacaas, g.s.	Ont.	.12½	100,000

The totals for the first eleven months are as follows, the 1918 figures being given in parentheses: United States mining and metallurgical companies, \$82,536,134 (\$144,351,954); holding companies, \$1,151,578 (\$1,728,438); Canadian, Mexican, Central and South American companies, \$14,073,152 (\$15,402,875).

Miami vs. Minerals Separation Again

The second suit brought by Minerals Separation Co. in this country resulted in a decision against the Miami Copper Co., for patent infringement, the latter company at that time employing what the court construed as violent agitation of the oil and

ore pulp in Pachuca tanks. Determination of the amount of damages payable to the patent exploiting company has been in progress for some time. Meanwhile, the Miami Copper Co. has changed its flow sheet, in order, if possible, to come without the scope of the M. S. patents. The Minerals Separation Co., has, however, challenged this and has recently applied to have a restraining order issued to prevent further infringement. The application is now being argued in Boston, and a decision is expected before the new year.

Gold Lode Mining in Alaska

Twenty-five gold-lode mines were operated in Alaska in 1918, according to the U. S. Geological Survey. There was also a production from seven prospects—abandoned mines or small mines that were not in regular operation. The value of the lode-gold output decreased from \$4,581,453 in 1917 to \$3,473,317 in 1918, owing partly to the disaster at the Treadwell mine in April, 1917, and partly to curtailment of operations, especially in the Juneau district, because of shortage of labor. Southeastern Alaska, especially the Juneau district, is still the only center of large quartz-mining operations in the Territory. Next in importance is the Willow Creek lode district.

The production in the Fairbanks district decreased materially, as the lode-mine owners of Fairbanks are still awaiting the cheapening of operating costs, especially of fuel, which is expected on the completion of the government railroad. In 1918 the average value of the gold and silver contents for all siliceous ores mined was \$1.70 a ton; the average for 1917 was \$1.37 a ton. These averages reflect the dominance in the total lode production of the large tonnage produced from the low-grade ores of the Juneau district.

New Steel Works in China

The Ho Hsin Smelting Works, capitalized at approximately \$550,000, has begun operations at Pootung and aims to become one of the leading steel works in China, according to the Guaranty Trust Co., of New York. Its daily output at the time of the latest available report was ten tons of pig iron. When the plant is completed, the output will be forty tons daily.

Under the direction of Japanese chemists, certain chemical products, such as caustic soda, creosin, stearin and soaps, have been manufactured in Kwantung during the war. The raw materials were brought from Manchuria. A committee of chemical investigation reports that there is in Manchuria a great abundance of raw materials suitable for use in the chemical industry, awaiting only active participation of capital to yield large returns.

The Canton Automatic Mine Door

Some misunderstanding appears to have arisen from a recent article in the "Journal," in which the statement was made that "the Canton automatic mine door has been installed in many mines and has

given satisfaction when used against low pressure." These doors, of the type now made, can be used to advantage even when the pressure registers 4 in. of water and where two men would be required to open a common door. Of approximately 4,000 of these doors installed, about 100 of them work under pressures of from 2 in. to $4\frac{1}{2}$ in.

N. Y. Section A. I. M. E. Discusses Mine Valuation

Well-Attended December Meeting Devoted to Consideration of Taxation Problems, Depletion, Accounting, and the Difficulty of Administering the Law

THE regular monthly meeting of the New York Section of the American Institute of Mining and Metallurgical Engineers was held at the Machinery Club, New York City, Dec. 3, 1919. E. P. Mathewson presided. The subject for discussion was the "Valuation and Taxation of Mines." J. R. Finlay delivered an address on "Mine Valuation for Purposes of Taxation," wherein he pointed out some of the difficulties of administering the laws covering mine taxation, and recommended that for taxation purposes a mining company's capital investment be computed on the basis of earnings, and that equitable annual adjustment be made to cover depletion.

R. C. Allen explained some of the problems arising in connection with the proper administration of the law, and advocated that the taxpayer be given the benefit of the doubt in every controversy over what is equitable valuation, both in granting a low valuation for purposes of taxation on capital investment and allowing high valuation as a basis for taxation on income. B. B. Gottsberger described the development of mine taxation methods during the past few years in the state of Arizona.

Paul Armitage discussed the provisions of the law dealing with depletion, and suggested that it would be more equitable to compute tax by means of a formula which should regard the total profits and redemption of capital investment as a continuous flow of income, rather than as an annuity to be adjusted each year. Fleming discussed the tax problem from the standpoint of the large mine operator. Henry Fernald outlined accounting problems involved in mine taxation, and Ralph Arnold gave assurance that the attitude of the Internal Revenue Bureau in connection with mine taxation was to establish a fair valuation as of March 1, 1913, so that the law could be equitably administered. Eighty-seven members attended the meeting, a larger number than usual. A detailed report of the discussions will be presented in the "Journal" later.

Management and Training of Men

In an address delivered at the Eighth Annual Safety Congress of the National Safety Council, W. W. Gidley, safety inspector, Phelps Dodge Corporation, said:

"No factor in the industrial world today presents to the employer a problem of such extreme complex-

ity as the training and managing of men. It has been proven repeatedly, that wholesale discharging by those in authority, in order to procure the right man for the place, is a dismal failure. It is therefore expedient that a system be developed whereby this weakness may be properly analyzed and a correct solution applied.

"The time has arrived when men who supervise labor must know the meaning of morale and how it is developed. The heads of various departments in any industry must be interested in safety, efficiency, and democracy, and understand how these features may be linked with proper discipline."

Education of the Mining Engineer

New York, Dec. 19.—The Mining and Metallurgical Society of America held its regular meeting on Dec. 18 at Columbia University Club. J. A. Church, Jr. presided and introduced Robert Peele, who delivered the address of the evening on the subject, "Education of the Mining Engineer, discussing service and the progress in the development of a mining engineer's education as given by leading mining schools, and outlining the new graduate course in mining engineering at Columbia University, which consists of a three-year post graduate course of study following a three-year college course or its equivalent. Professor Peele pointed out that the new plan had not had a fair trial, due to interruptions on account of the war, but that those who favored it believed it would give the technical man a broader mental equipment and result in making better engineers. He emphasized the advantages of thorough training in use of English language and fundamental scientific principles, together with practice in certain immediately useful subjects like assaying and surveying that would enable the young engineer to earn a living while getting practical experience.

Professor Peele called attention to the excessive number of mining schools, stating that there were in the United States forty-three schools giving courses in mining engineering, of which thirty-six were departments of universities, and seven were separate schools where mining engineering was taught as a specialty, like the Colorado School of Mines and the Michigan College of Mines. He expressed the belief that there were about ten first-class mining schools in the United States, and that in these schools would be found at least 1,500 of the 2,500 students in mining and metallurgy.

An analysis of the membership lists of the engineering societies indicated that there were about 12,500 mining and metallurgical engineers in the country, of whom many were not technical graduates. It is estimated that the supply of first-class mining and metallurgical engineers could be maintained by about 350 technical graduates per year, and that six or eight strong mining schools would be ample to maintain this supply. He contended that there were too many mining schools and

that the recent tendency toward expansion in mining education was unwarranted and would have the effect of lowering the quality of the product.

An interesting discussion followed in which W. R. Ingalls, J. A. Church, Jr., W. Y. Westervelt, A. H. Rogers, J. P. Metzger, J. V. Lewis and others participated. Thirty-five members were present.

Zinc Mining and Metallurgy Pictured in the Movies

New York, Dec. 18.—A private showing of the first of two educational films depicting the zinc industry was given before a few members of the American Zinc Institute in New York on Dec. 17. The picture shows views of the mines in both the Southwestern Missouri and New Jersey districts and the exact locations of the deposit are indicated by maps. The miners are shown at work and the method of hoisting the ore in cans is pictured. Then come the tramping of the ore, dumping into bins, transporting it on conveyor belts on which it is hand-picked, dumping it into a gyratory crusher, table concentration, and flotation. Roasting furnaces are next shown, and the zinc retorting furnaces, the latter appearing to particularly good advantage. The end of the picture shows the casting of the metal into ingots. Another film is in course of preparation, exhibiting the manufacture and uses of finished forms of the metal. The photography is well done and the picture should be interesting to most of those who will see it, whether they know anything about the mining industry or not.

The films are being produced by the Ford Motor Company as part of their educational series, and will be released through Goldwyn.

French Technical Journals

I read in your issue of Sept. 27, on page 541, a list of French technical journals. I think it may be of interest to your readers to know what are the American equivalents of these journals. Being an attentive reader of the technical papers of both countries, I have amplified your list as published, in the hope that the following information will be of interest:

"La Revue de Metallurgie" is a scientific journal and is widely devoted to metallography and pure science, together with some brief descriptions of the principal French and foreign plants of recent construction. It is something like the "Transactions of the American Electrochemical Society" and of like publications of other similar societies.

"La Technique Moderne" and "Le Genie Civil" are far more widely read. They are like the English publication, "Engineering," and are of a special interest to those who desire to keep informed as to what is thought and done in the French technical world. They give, also, good extracts from the general technical press. The other journals which you list are rather trade papers, and not so interesting for engineers.

But I have forgotten one of the best French journals, "La Revue generale d'Electricite," 12 place

de La Borde, Paris (VIII), which your readers should know. One year's subscription costs 50 fr.

For readers of the "Engineering and Mining Journal" who are interested in geology:

"Publications du Service des Topographies Souterraine," by Ministere des Travans Publics, Paris.

"Bulletin des Services de la carte Geologique de France," by Ministere des Travans Publics, Paris. Both of the last-named publications are sold by La Librairie Beranger, 15, rue des Saints-Peres, Paris, (VI).

"Travaux du Laboratoire de Geologie de la Faculte des Science de Grenoble." Sold by Allier Freres, 26, Cours. Saint-Andre, Grenoble.

For railways: "La Revue generale des Chemins de fer," by Dunod et Tinat, 47 Quai des Grands-Augustins, Paris (VI); 28 fr.

For motor cars: "La Vie Automobile," by Dunod et Pinat also; 30 fr.

I was about to forget a small but good journal, "Journal de la Houille Blanche," 85 Rue Saint-Lazare, Paris (IX). This publication is something like "Power"—not so beautifully printed but very well made and full of information. The subscription is 16 fr. a year.

I was always glad to meet American engineers in France during the last two years, and I feel obliged to show them the best means of remaining in touch with us.

P. Bourdon,

Chief Engineer of the Livet Works of the 87 Keller et Laleux.

Livet, Oct. 12, 1919.

Fencing Off the Switchboard

Switchboards so placed that persons are likely to back into them while their attention is otherwise directed should be provided with a guard. The illustration shows a switchboard so protected on one of

SWITCHBOARD PROTECTION ON A YUBA DREDGE

the dredges of the Yuba Consolidated Goldfields Co., at Hammonton, Cal. The end is hinged and may be swung open. The front is made in two sections which slide past each other.

BY THE WAY

Honest Men and Geologists

The Secretary of the Interior, the genial and brilliant Franklin K. Lane, remarks in his annual report (p. 14), in speaking of the reserves of petroleum: "Geologists have estimated and estimated, and they do not differ widely, for few give more than thirty years of life to the petroleum sands of this country if the present yield is insisted upon. And yet, there is so much of mystery in the hiding of this strange subterranean liquid that honest men will not say but that it will become a permanent factor in the world of light, heat, and power." We commend this passage to the study of George Otis Smith, Dave White, et al. The classification of mankind into liars, damned liars, and mining experts is a familiar one, but the classification into honest men and geologists is something for which we are indebted to Mr. Lane's acumen.

Fractional Distillation

A recent occurrence in the state of Nevada reminds one of Daniel Webster's speech on Alexander Hamilton in which he said: "He smote the rock of the national resources, and abundant streams of revenue gushed forth." Nevada is an arid state, as every one knows. Fluids of various kinds are transported over the state, but the presumption is that an "oil tank" always carries oil. That such is not always the case was recently proved by an incident that was reported in a San Francisco newspaper. An oil tank was given an especially vicious bump while on a sidetrack at Elko, no doubt by an engineer dissatisfied with the existing wage scale. A bung, or was it a valve, was disturbed and instead of oil forth came claret flowing out on to the thirsty desert. Hereafter a trainload of tanks will be viewed with greater interest by the casual observer.

Efficiency Excelsior

Before the war it used to be asked "Why is an efficiency engineer like a Welsh rabbit?—the answer being that a Welsh rabbit is neither Welsh nor rabbit but mainly cheese. But the efficiency engineer has come into his own—the fruits of his labor are everywhere apparent. How efficient we were before the war and how well we accomplish things today! Not only does Mr. Bursleson show a profit, a burlesque show as it were, not only does the laborer ride in state who formerly walked, but even the very crooks are doing their "jobs" better than they did before. The high-powered automobile is now frequently employed to facilitate the get-away. The crook, moreover, is surely reducing his overhead by stealing in six figures instead of a mere four or five. Jobs, too, are attempted now that would have been passed as hopeless before. A recent report from Arizona shows that high-grading has moved up a notch or two. When Rudolfo Vasquez, of Los Angeles, lately visited his Gold Hill mine, four miles north of Nogales, Ariz.,

he found that his large gasoline hoist and gallows frame had disappeared, the collar of the 385-ft. shaft having been wrecked in tearing away the frame. Below, it was found that the thieves had first looted a particularly rich stope and left never a clue behind them. It is too late for regrets, but if Mr. Vasquez had been a closer student of some phases of modern efficiency engineering he might at least have trained the cage dogs to watch the premises. In that day when the millennium shall come, let us hope that every thief will have his own gallows frame and, if possible, swing from it.

Mining in the Orient

In the narrative of a "Journey Through Asia Minor, Armenia and Koordistan," by John Macdonald Kinneir, published in 1818, there is on page 434 a curious note. "In the side of a great mountain called Abdul Azaz, thirty hours south by east of Merdin, is a deep cavern where, on a certain day in the year, they make offerings to the devil by throwing jewels or pieces of gold and silver into the abyss, which is said to be so deep that no line ever reached the bottom, and supposed to lead into the infernal regions." It is a simple matter to identify Abdul Azaz as the site of the original mine of the Nineveh Keseph Charutz Corporation. The custom of throwing valuables into the hole doubtless resulted from the practice of paying annual assessments on the stock of the corporation. Some wag must have remarked "there's another month's salary gone to H——"; and gossip did the rest.

Jack, the Rescuer

Stewart and Hyder, sister mining camps, situated on the water front at the head of Portland Canal, the former on the Canadian side in British Columbia and the latter a few miles to the north and in Alaska, form the gateways to the Salmon River district. They are described by our correspondent as being typical old-time frontier mining towns. Prospectors and miners from the interior coming to spend a holiday reach Hyder first and not infrequently return to the hills to earn the wherewithal for more indulgence without getting as far as Stewart. Hyder's buildings are built on piles. There is one main street, which runs in conformity with the sinuosities of the shore. An amusing phase of the life of the town is the activity of a character known as "Jack, the Rescuer." A sharp twist in the main street, at a point where the sidewalk is without a protecting railing and where, below, is the cozy mud of the tide flats, makes a veritable trap for the unwary. Absent minded or temporarily befogged pedestrians are frequently precipitated from the walk into the cold water and mud. This happening so often that "Jack, the Rescuer" earns a comfortable living by pulling them out, mud from head to foot and cussing most blasphemously, at a fee of \$2.50 per rescue. Everybody knows the danger and yet, it would appear, Jack's business never grows slack. His rope was just as much in demand at last reports as it was at the beginning of Hyder's recently resuscitated and now hectic life.

PERSONALS

E. P. Mathewson has opened offices as consulting metallurgist at 42 Broadway, New York.

Fred B. Ely has accepted a position in geological department of the Pierson Oil Co., with headquarters at Shreveport, La.

Charles M. McNeill, president of Utah and Chino Copper companies, has been elected a director of American Vanadium Co.

A. F. Keene, of the Gold Fields American Development Co., Ltd., has just returned to New York from a trip to the Neihart Mining district of Montana.

J. B. Tyrrell, of Toronto, will sail for England on the Lapland on Dec. 13. His address during his stay in England will be 208 Salisbury House, London, E. C.

Marvin J. Udy, of Kokomo, Ind., will take charge of the cobalt mines of the Haynes Stellite Co. on Blackbird Creek, Idaho, succeeding J. W. Caples who died three months ago.

Alexander Mackay, president of the Dundee-Arizona Copper Co., with his son, Capt. F. B. Mackay, both of Dundee, Scotland, has made inspection of the property of the company at Jerome, Ariz.

James G. Parmelee, recently research metallurgist with the School of Mines in co-operation with the U. S. Bureau of Mines, at Moscow, Idaho, is now connected with the Hardinge Conical Mill Co., Salt Lake City, Utah.

Cornelius Kelley, president, and John D. Ryan, chairman of the board of directors of the Anaconda Copper Mining Co., accompanied by Frederick Laist and William Wraith have been making a general inspection of copper mines in the southwest.

R. N. Ferguson, deputy supervisor, Department of Oil and Gas, California State Mining Bureau, has resigned to take a position with the Polish Government in connection with the development and conservation of the petroleum deposits of that country. Thomas D. Kirwain has been appointed as his successor.

Frank Hess and R. M. Overbeck, geologists who have long been members of the staff of the U. S. Geological Survey, have sailed for South America, where they will look over various ore deposits in Bolivia, Chile and other South American countries, for private interests. They expect to be engaged for six months or more on this work.

Frank M. Smith, for seventeen years connected with the American Smelting

& Refining Co., as superintendent of the East Helena plant, has taken a position with the Bunker Hill & Sullivan Co. He will be in charge of an office in Spokane for the purchase of lead, silver and gold custom ores, which the smelter is prepared to treat.

Thomas Varley, superintendent of the metallurgical research station maintained by the U. S. Bureau of Mines in co-operation with the Utah School of Mines at Salt Lake City, and C. A. Wright, superintendent of a similar station in connection with the Idaho School of Mines at Moscow, recently visited Wallace, Idaho, to confer with Coeur d'Alene mine operators regarding the results of experimental tests in differential flotation for the separation of lead-zinc ores.

Harris and Ewing
W. R. CRANE

W. R. Crane has been appointed chief engineer for the War Minerals Relief Commission, to succeed J. E. Spurr. For ten years prior to the outbreak of the war Mr. Crane was dean of the School of Mines at the State College of Pennsylvania. He received his education as a mining engineer at Columbia University, and later was a member of the faculty of that institution. He was in charge of the mining department of the University of Kansas for several years. He entered Government service at the beginning of the war and since that time has been engaged largely in field work pertaining to war minerals.

L. D. Knight, who has managed the business of the Ingersoll-Rand Co. in the Michigan district for the past three years has been promoted to the management of the Butte office. He is succeeded in the Houghton office by E. L. Hawes, who is transferred from the Mesaba Range.

OBITUARY

William Hugh Freeland, who developed the first commercially successful pyritic copper-smelting practice, died at San Francisco on Nov. 22. A more extended notice will appear later.

Albert E. Gregory died at San Francisco on Nov. 11. Mr. Gregory was born in England in 1879, and received his early education there. He spent two years at the Colorado School of Mines. From 1897 to 1901, Mr. Gregory was connected with the Exploration Co., Ltd., at London; he was accountant for the Montana Mining Co., Ltd., Marysville, Mont., from 1901 to 1906, and later was connected with the Tomboy Gold Mines Co. as assayer, sampler and on examination work; and with the Smuggler-Union Mining Co. as assayer and mining engineer. In 1916-17 he was superintendent of the Beebe mines for Bulkeley Wells.

At the time of his death, Mr. Gregory had been in the employ of the Metals Exploration Co., and had only recently returned from New Zealand where he had been employed on exploration work. He is survived by a widow and one child.

SOCIETIES

American Chemical Society—The California Section held a joint meeting with the local engineering societies on Nov. 25. The subject of the evening was a symposium on the application of chemistry to engineering. The speakers were: Prof. C. G. Hyde, University of California; S. Barfoed, C. F. Braun, of San Francisco; Prof. J. M. Hyde and Prof. R. E. Swain, of Stanford University.

American Society of Mechanical Engineers held its fortieth annual meeting in New York, Dec. 2-5. On the opening night M. E. Cooley delivered the presidential address, and welcomed the president-elect Fred J. Miller. Honorary membership was conferred on two distinguished French engineers, Charles de Freminville, consulting engineer of the Creusot works, and Auguste C. E. Rateau, chairman of the Board of Directors of Rateau, Battu & Smoot Co., France. On succeeding days there were interesting sessions, "The Industrial Situation in Relation to Present Conditions," being among the subjects discussed.

THE MINING NEWS

New York, December 13 and 20, 1919

Anaconda's Mines and Smelters Close Down

Union Pacific Railroad Seizes Coal Consigned to Mining Company—
Twelve Thousand Men Out of Work

Coal shortage caused the Anaconda Copper Mining Co. to shut down all its mines and smelters on Dec. 2. Twelve thousand men are idle in consequence. The Butte & Superior and Davis Daly

Homestake Fire Submerged

The fire which started on Sept. 25 in the Homestake Mine at Lead, S. D., when miners blasted down a timbered raise on the 800 level, has finally been extinguished by flooding the property. The water is now between the 500 and 600 levels and preparations are being made to unwater the workings. Water was run in from the surface through

Mining in Mexico

Activities in Various Sections of Republic—Silver Operations Stimulated

In the state of Nuevo Leon there has been little increase in the activity owing to the rise in the price of silver. Most of the mines produce lead ores with low silver content. In the Villadama district, the Cia. de Minerales y Metales, S. A., is working the Minas Viejas and the Soledad mines, producing from each group about 100 and 500 tons respectively. The ores are leady iron carbonates. In the Vallecillo district, it has been rumored that H. E. Harrison, of Patagonia, Ariz., was about to take over the lead-zinc mines formerly operated by James Morlan, for account of the Vallecillo Mining & Milling Co. There are several other operators in this district, who ship small tonnages of galena to the Monterrey smelters. From the Montañas mine in the Alamo district Francisco Ancira is producing several carloads of zinc ore and lead ore per month.

In the Cerralvo district, Nuevo Leon, the Cerralvo Mining Co. is developing its properties under the direction of J. T. Perry. The Cinco Amigos Co. has recently shipped several carloads of ores to the Monterrey smelters. Harry Harrison and associates, of San Antonio, Tex., are developing the San Antonio mine. Maiz Brothers, of Monterrey, report that operations at their La Blanca mine have been seriously interfered with by the heavy rains which have fallen during the last month. The Cia. de Minerales y Metales, S. A., are operating El Refugio, El Oso and El Porvenir mines, shipping about 1,000 tons per month of lead ores, to the Monterrey and San Luis Potosi smelters. The Benavides smelter and the Carboneras concentrator of this company have been closed during the entire year. Due to bad roads and the planting season, there have been few freighters for the transportation of the ores of this district to the railroad.

In the Monterrey district the Mexican Lead Co. has suspended production at its Diente mines and is carrying on development work. J. S. Carnahan is manager. This property was recently examined by engineers of the American Smelting & Refining Co. The Santo Domingo property, owned and operated by Larralde Brothers, is shipping occasional carloads. Other operations in

OPEN CUT OF HOMESTAKE MINE, LEAD, S. D., SHOWING STREAMS OF WATER BEING PUMPED INTO WORKINGS TO FLOOD BURNING STOPES

companies were operating at the time this is written. The East Butte Copper Mining Co. has ten days' supply of coal on hand. The shortage has been immediately caused through seizure by the Union Pacific Ry. of coal consigned to the Anaconda company.

the open cut, all mills being shut down to make available a maximum supply of water. In all probability stamps will be dropping again before the first of the year. Further details regarding this fire have been given in previous issues.

this district, are those of J. J. Murphy, at the San Antonio mine; Dr. P. H. Foster, at the Santa Juliana mine; D. Verastegui, at the Malinche mine. Shipments from all these go to the Monterrey smelters.

In the City of Monterrey, the American Smelting & Refining Co. is operating its smelter on a reduced scale. The Cia. de Minerale y Metales, S. A., is operating the No. 2 smelter and refinery of the Cia. Minera, Fundidora y Afinadora "Monterrey," S. A. A large part of the production of the Monterrey smelters is being shipped to New York and Perth Amboy, by water, via Tampico. The Monterrey steel plant is also operating. It is rumored that it is filling a large rail order for the Mexican Government. In the Linares district the Las Flores and Dulcinea companies have been operating on a small scale shipping about one car per month of high-grade lead ores to the Monterrey smelter.

San Luis Potosi

In San Luis Potosi engineers are in the San Pedro district examining the San Pedro mines of the Cia. Metalurgica Mexicana for the American Smelting & Refining Co. The former company operates the San Luis Potosi smelter and has been running steadily for the last year.

Coahuila

In Coahuila the Cia. Minera Paloma y Cabrillas, S. A., has been operating its property continuously during the present year, shipping about 3,000 tons per month to the No. 2 smelter, in Monterrey. The Cia. Minera Las Higuera, S. A., has been developing its Las Higuera mine and reports finding a parallel fracture to the one which has produced its large orebodies. Prospecting along this fracture is in progress. The Cia. Minera La Mariposa, S. A., and the Cia. Minera La Fortuna, S. A., are exploring their properties in this district, but so far only low-grade bodies have been encountered.

Durango

In Durango in the San Juan de Guadalupe district grading has been started for the railroad which will be built from Symon station to the mines of the Sierra Ramirez district. This will be about twenty kilometers long and will make available nearly 1,000,000 tons of dump material, containing from 6 to 10 oz. of silver and 45 per cent lime. This ore is desirable for its lime contents at the various smelters of the republic. Present shippers are Luis Audiffred, Francisco Gorraez, M. Z. Betancourt and F. Manuel. Owing to scarcity of freighters, this railroad is welcomed by the shippers and a considerable increase in shipments is expected.

Zacatecas

In the state of Zacatecas in the Fresnillo district, the Mexican Corporation, Ltd., has taken over the mines and mill of the Fresnillo Mining Co. and active preparations are being made to increase the capacity of the mill to 2,000 tons per day. It is stated that the entire mountain on this property will assay 200 grams silver per metric ton and that the ore will be quarried, loaded into railroad cars by steam shovels and taken to the mill. The railroad is being changed to broad gage and an ample power plant will be erected. In the Sombrete district the Sombrete Mining Co. has been shipping dump material from its Tocayos mine to the Mapimi smelter.

Mexico

In the state of Mexico in the Zacualpan district, the Cia. Minera Chontalpan y Anexas, S. A., is again at work after a labor strike, which lasted nearly

New Project to Supply Water to Mining Towns on Rand

Vaal River Barrage Near Vereeniging to Furnish 20,000,000 Gal. Daily

BY M. EDWARD

One of the largest engineering schemes ever undertaken in South Africa is now being carried out to supply Johannesburg and the mining towns on the Rand's seventy-mile strip of gold-bearing reef with water. By this project 20,000,000 gal. will be supplied daily by pumping through a forty-mile pipe line.

It was decided that the present system of supplying the Witwatersrand with water, was inadequate, and a scheme for damming the waters of the Vaal River about forty miles away, was sanctioned by the government, with the result that the work was begun about a year ago. The Vaal River barrage is twenty-four miles down stream from Vereeniging, a spot famous for the

GENERAL VIEW OF VAAL RIVER BARRAGE, SOUTH AFRICA. FROM ORANGE STATE BANK TAKEN LAST AUGUST. PIERS IN FOREGROUND 6 FT. HIGH ALL PIERS 12 FT. HIGH OR HIGHER ON OCT. 3, 1919

a month. This company operates a concentrator and cyanide mill, shipping its product to Toluca by pack mules.

Sonora

The Canario Copper Co., operating near Nacoziari, whose stock is largely held in New York and the East, decided to increase its capital from \$2,000,000 to \$20,000,000, at a recent meeting held in New York. This was done by increasing the par value of shares from \$1 to \$10. James P. Harvey, president and general manager, who attended the meeting, counselled against entering the producing field at the present time, preferring to continue development until sufficient tonnage had been developed to warrant installation of a large concentrator. The company was reincorporated under the laws of Delaware.

signing of peace at the cessation of the Anglo-Boer war. Great progress has been made, and a glance at the huge works gives one an impression that a second miniature Panama Canal is in course of construction.

The initial plant to be installed at a total cost of \$8,750,000, of which the barrage itself will cost \$1,425,000, will supply 10,000,000 gal. daily. The barrage is over a quarter mile long. There are 37 piers, 38 ft. apart, each 55 ft. long, 8 ft. broad and 34 ft. 6 in. high. On top of the piers is the superstructure to carry the gate-lifting machinery. From the top of this structure to the bed of the river, is nearly 75 ft. The steel gates to be worked by machinery on the superstructure, weigh 28 tons each. The work employs altogether 600 men (550 black and 50

white), and is being carried out under the direction of W. Ingham, chief engineer of the Rand Water Board, with J. C. Hawkins, as resident engineer. On the back of the piers the Water Board is building for the Public Works Department, a much-needed bridge across the Vaal.

The barrage is expected to be completed early in 1921, and will back up the Vaal to form a huge lake nearly 40 miles long, which will contain 13,633,000,000 gal. of water. Besides supplying water to the towns, the dam will irrigate many square miles of country.

WINTER FLOW OF VAAL RIVER, SOUTH AFRICA, CONFINED BETWEEN SAND BAG WALLS

Arizona & Swansea R. R. Told to Resume Freight Traffic

When the Arizona & Swansea R. R. management was interrogated by the Arizona Corporation Commission concerning failure of the company to furnish service to the Swansea Lease, there was offered the novel defense that the road's only locomotive is in a Phoenix foundry for repairs for which the company had no money to pay. It was suggested that, as the Lease already had advanced funds for repair of the twenty-six-mile road, it should also furnish the \$3,000 necessary to get the locomotive back on the line. The Commission failed to see the point and ordered immediate resumption of freight traffic. The railroad, in northern Yuma County, was built by George Mitchell, who was at the head of the original Clara-Swansea mines incorporation, later bankrupt. The road is not in debt and is valued at \$500,000. The Lease, now said to be valuable through development of new orebodies, is held by the Clark interests of Jerome and J. Ross Clark, of Los Angeles, with seven years yet to run.

Utah Apex Suit Continues First Part of Trial Almost Ended— Testimony Concerns Highland Boy Limestone

The Utah Apex Mining Co. on Nov. 25 finished the presentation of its witnesses in the first part of the suit with the Utah Consolidated Mining Co. over apex rights, which has been in progress for about two weeks in the United States district court in Salt Lake City. Attorneys for the Utah Consolidated have declared that the rebuttal evidence will be short so that the end of the first

solidated officials to the Utah Apex workings. Mr. Channing was cross examined by Judge Marshall as to the 1,300-ft. level drift in the Highland Boy limestone through which a large orebody, known as the Leadville body, was opened in Utah Apex ground, and claimed by the Utah Consolidated as occurring in the Highland Boy limestone. This drift, the Utah Apex holds, was run through barren limestone as the result of an examination by Utah Consolidated officials to reach the Leadville orebody in the Utah Apex, while it is the contention of the Utah Consolidated that the drift was run to develop the Highland Boy limestone, and was carried according to theories held by its management as to the opening up of the orebodies.

Martin J. Heller Sues De Lamar Estate

Asks \$150,000 for Services as Engineer and Confidential Agent

Martin J. Heller, a mining engineer, filed a suit in the N. Y. Supreme Court Dec. 1, against the estate of Captain Joseph R. De Lamar for \$150,000 for services as engineer and confidential agent in negotiating for mining properties. Mr. Heller said he made a contract with Captain De Lamar under which he was to receive 5 per cent for any properties introduced by him to Captain De Lamar and, if sold, 5 per cent of the proceeds. Mr. Heller bought the Blue Stone group of mines in his name and, it is alleged, Captain De Lamar sent him a letter reiterating the terms of their agreement. Captain De Lamar sold the mines to the Blue Stone Mining & Smelting Co., receiving 100,000 shares and \$800,000 in notes of the corporation. It is alleged that the Dominion Reduction Co., Ltd., of Cobalt, Ontario, bought 90,000 shares for \$1,240,800. Mr. Heller says he never received his commission on this deal.

The Bluestone mine and claims included in the group adjoin the Mason Valley mine at Yerington, Nev., the Bluestone being the oldest property in the district. The mine has been opened to a depth of 540 ft. The ore is mainly chalcopryite and has been proved to 750 ft. by drilling. The ore is treated by the magnetic concentration process.

Manchester, Tex., to Have Sulphuric-Acid Plant

The Texas Chemical Co. has let a contract to Horton & Horton, contractors, for the construction of a sulphuric-acid plant at Manchester, Tex., on the Houston ship canal, to cost \$500,000. This plant will have a capacity of 100 tons daily, and will be in operation by April or May, 1920. Work has already begun. The company's offices are in the Scanlan Building, Houston. S. Peiser is manager.

part of the trial, the Leadville case, concerning the Highland Boy limestone, appears not far off. At the time of the last writing, Albert Burch was on the stand for the Utah Apex. He was followed during the latter part of last week and the first part of the present week by Orrin Peterson, geologist for the Utah Apex; Frank M. Wishman, for some time superintendent of the Bingham New Haven Co., now a part of the Utah Metal & Tunnel; Andrew C. Lawson, of the University of California; Waldemar Lindgren, formerly with the U. S. Geological Survey, and at present professor of geology at Massachusetts Institute of Technology; V. S. Rood, manager of the Utah Apex mine, and Edward Jennings, formerly assistant engineer. Roscoe H. Channing of the Utah Consolidated was recalled for cross examination at the end of the session.

The testimony in general, following the outline of Judge Marshall, was given with a view to proving the fissures to be connected with the ore and mineralization. Mr. Rood was questioned in regard to a visit of Utah Con-

R & S Molybdenite Property to Have Flotation Plant

Deposit Near Questa, N. M., Has Sufficient Ore in Sight—Formerly Considered Lead and Sulphur

The owners of the R & S molybdenite property, situated in the Red River mining district, about eight miles northeast of Questa, Taos County, N. M., have succeeded in getting long-time contracts for their concentrates and plan to erect a 200-ton flotation plant at the mine. This will eliminate the excessive cost of hauling the crude ore from the mine to the present mill,

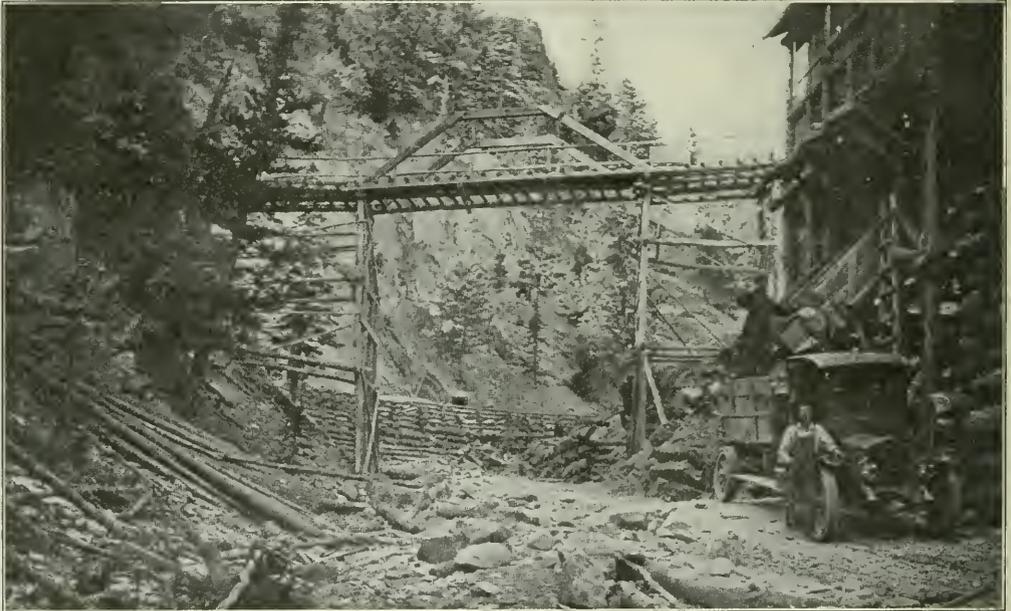

smelter was built, but because of its inaccessibility the enterprise failed.

Deposit Long Deceived Prospectors

The R & S molybdenite deposit has long been known to prospectors, being very conspicuous because of the extent and prominence of its yellow-stained outcrop of molybdenite. The old-timers supposed that this was sulphur. They made numerous attempts to mine the "lead ore," for which the molybdenite was mistaken. Since the "lead" contained neither gold nor silver it was considered worthless. It was not until the fall of 1918 that the true nature

of the water power available to generate about 1,000 hp., and a suitable hydro-electric site is within a mile of the mine. Climatic conditions are ideal for operation throughout the year, except for a few months during the winter. During these months little difficulty will be experienced if proper preparations are made.

At Red River, pre-Cambrian granites, schists and gneisses are found overlaid by Tertiary andesite and monzonite porphyries and breccias. A few miles below Red River, the river has cut through these volcanics and exposed the under-

LOADING CRUDE MOLYBDENITE ORE INTO MOTOR TRUCKS AT ORE BINS OF R & S MOLYBDENITE PROPERTY NEAR QUESTA, N. M.

a distance of five miles. It also plans to install a hydro-electric plant to furnish power for both mine and mill. At the present time seventy-five men are employed.

The R & S mine is named after its principal owners, M. B. Rapp and C. W. Savery, of Denver, Col. Questa, a small Mexican adobe village of about 350 inhabitants, is twenty miles east of the nearest railroad point, Jarosa, on the San Luis Southern R. R. The mine is five miles below (west) of the old mining camp of Red River. Mining has been carried on in a small way in this district for the last forty years. Gold and silver were the chief metals sought, although attempts were made to mine copper at the town of Red River, where a promising prospect occurs. A small

and value of the deposit was recognized by M. B. Rapp. Mr. Rapp succeeded in interesting C. W. Savery in the property, and together they spent over \$45,000 in developing the deposit and equipping an old cyanide mill, belonging to the Trinidad Mining & Milling Co., with flotation machinery. This mill, which they rented, is situated five miles up the river from the mine, and one mile below the town of Red River.

The mine is at an altitude of about 8,500 ft. above sea level and is situated in one of the spurs of the Sangre de Cristo Range, in the Carson National Forest Reserve. The summits of the mountains rise to a height of 1,500 to 2,000 ft. above the valley of the Red River. Timber is plentiful for fuel and mining purposes. There is also suf-

ficient water power available to generate about 1,000 hp., and a suitable hydro-electric site is found upon the basal complex. This has been extensively intruded by monzonite porphyry laccoliths and dikes, and completely metamorphosed. Subsequent to the contact metamorphism the rocks were subjected to regional metamorphism, and as a result both the sedimentaries and igneous rocks have been extensively fractured and altered. It is in these fractures that the molybdenite occurs, as the amorphous variety. Judging from the manner in which the limestone and monzonite porphyry have been altered, one is led to believe that the mineral-bearing solutions which contained the molybdenite, assisted in the metamorphism. The fractured zone is about 1,200 ft. wide and 3,000 ft.

long and approximately 100 distinct molybdenite veins are exposed.

Topography Facilitates Development

The deposit, because of the rugged topography, is adapted to development by tunnels. The accompanying photograph shows the two lower tunnels and also several open cuts. The top of the cliff is 400 ft. above the tunnel level, and the top of the hill is 200 ft. higher, thus making a total of 600 ft. In one tunnel there are two stopes adjoining one another which have 6,000 tons of $1\frac{1}{2}$ to 2 per cent ore developed, and another stope has 8,000 tons of ore of similar grade developed. The vein can be traced for 1,000 ft. on the surface. The average

hauled five miles to the mill. Here it is crushed in a jaw crusher and then fed into a ball-mill, which is in closed circuit with a classifier. After the material is ground to about 80 mesh it is fed direct to a Ruth flotation machine. The mill has a capacity of 40 to 50 tons a day. The concentrates have averaged from 85 to 90 per cent MoS_2 with a recovery of 85 to 90 per cent. The concentrates are dried and shipped in 100-lb. sacks.

Sulphur at Damon Mound, Tex.

Damon Mound, Brazoria County, Tex., while producing considerable oil, has a secondary importance in the sulphur discovered there. No information has been made public as to the quantity,

transactions, mainly at Bisbee and Miami, in all affecting about \$1,000,000. The firm, before dissolution, owned and so'd the Junction, Union and Rough Rider groups at Bisbee, and at Miami developed the Live Oak property and sold it to the Inspiration. The partnership also owned the valuable Warren ranch, irrigated from the pumped waters of the Bisbee district. The Rough Rider property was held in Smith's name and the Live Oak in Hoveland's.

New Project May Lower Cost of Timber in Southwest

It is possible that the great cost of mine timber in the Southwest is to be lowered to a degree by plans made for utilizing the pine forests of the western

TRINIDAD MINING AND MILLING CO.'S MILL, FIVE MILES FROM R & S MINE. TEMPORARILY RENTED BY THE LATTER FOR CONCENTRATING ITS MOLYBDENITE ORES BY FLOTATION

width of the vein as broken is about 4 ft. The ore as broken will average $1\frac{1}{2}$ per cent MoS_2 . In mining it is easily hand-sorted so as to maintain a grade of 3 per cent for shipment to the mill. Huge slabs of almost pure amorphous molybdenite are frequently found.

In addition to the ore already developed, there are approximately 100 veins out-cropping on the surface which as yet have not been developed. Many of them, judging from their surface indications, give promise of being as productive as is vein No. 1 upon which practically all the development work has been done.

The ore is loaded into a 5-ton White motor truck at the mine ore-bins and

but it is believed to be quite large. The property is largely owned by the Simms Co. Sulphur deposits in Texas known to exist in greater or less quantity, but not producing, are located at Damon Mound, Hoskins Mound and Stratton Ridge, all in Brazoria County. Deposits being worked are at Freeport, Brazoria County, by Freeport Sulphur Co., and at Gulf, Matagorda County, by Texas Gulf Sulphur Co.

Smith-Hoveland Dispute Being Heard at Tucson

At Tucson a long-drawn-out case is being heard before Special Master Jones involving the rights of Hoyal A. Smith and Henry B. Hoveland in certain mines and in the profits of certain mining

Sierra Madres, sixty miles southeast of Douglas, Ariz. Major Thompson Short, of Lexington, Ky., is now in the Sierras with a party of engineers, timber cruisers and attorneys, considering the question of working a timber tract of 87,000 acres on which he has an option. The mill is to be at Douglas and one question to be solved is whether it may be feasible to depend on motor truck transportation for the logs, thus saving cost of railroad construction. This tract is the same once held by Frank M. Murphy and W. C. Greene, but the latter finally concluded to operate on the eastern Sierra slope, where railroad transportation to El Paso could be secured.

Report on New Replogle Steel Co.

In a letter to stockholders of the Replogle Steel Co., which was recently formed to take over the property of the Wharton Steel Co., including the old Wharton iron mines at Wharton, N. J., the chairman of the new company, J. Leonard Replogle, includes a report on the property made by James Gayley, a former vice-president of the U. S. Steel Corporation. Mr. Gayley's letter, addressed to William H. Brevoort, president of Replogle Steel Co., says in part:

"I believe the Wharton property is fully assured of ore reserves amounting to 100,000,000 tons of high-grade ore and that these reserves will be materially increased as the orebodies are developed at greater depth.

"I have recommended modernizing of the two large blast furnaces, which should produce with good furnace management 30,000 tons of pig iron per month at a cost, under present conditions, of \$24.05 a ton. This cost is based on present market value of a 60 per cent ore, and coke at \$8.50 a ton, and should yield net profit of \$1,000,000 per annum on prices of pig iron prevailing in recent months.

"I consider the estimated profit of \$1,800,000 per annum for an output of 450,000 tons a year from the Replogle mill on a basis of present ore prices as very conservative. The market value today of a 60 per cent ore at Wharton, compared with Lake Superior ores in the Eastern market, is \$7.80 a ton. Your estimated profit was \$4 a ton. This would leave \$3.80 for producing the ore, which is excessive for that tonnage.

"I have recommended further development of the Dickerson and adjacent mines with view of doubling your production, as well as furnishing a variety of ores to produce different grades of pig iron and to insure the premium on your high-grade bessemer product which you are now shipping.

"In conclusion, I have reported that I consider you have at Wharton the backbone of a big steel industry already assured and that no improvements should be made that do not fit in as a component part to large and further extensions."

The total assets of the Replogle Steel Co. are given as \$12,121,289, which do not include any valuation of the 100,000,000 tons of ore reserves, nor any estimate of the 5,000 acres of mineral lands owned by Wharton Steel. The company's liabilities are not listed.

Canadian-American Resources, Ltd.

A new Company, the Canadian-American Resources, Ltd., has been incorporated under the laws of Ontario

with an authorized capital of \$50,000,000 for the development of natural resources, more particularly those of mines and oil deposits, in both Canada and the United States. It is the intention to acquire properties of value and operate them, some properties in the United States being already in view. The following are the officers: President, Alexander Alexander, New York; vice-president, L. E. Denyes, Toronto; secretary, Dr. R. Gordon Bogart, Kingston, Ont.; treasurer, George B. Leighton, New York; directors, Col. Jacob Ruppert, New York; George B. Gifford, New York; and S. W. Jenckes, St. Catharines, Ont.

Lake Superior Shipping Season Practically Ended

The 1920 shipping season from the Lake Superior iron ore district is about at an end, there being few boats remaining at the head of the lakes to be loaded. Loading has been carried on under difficulties during the last few weeks, as the weather has been quite cold and the ore has been freezing in the cars. Steam had to be used in large quantities in the yards near the docks to loosen the ore in the cars, entailing a heavy expense to shippers. The only ore that will go forward during the winter months will be to charcoal furnaces in Michigan and Wisconsin, there being a number of these furnaces in operation at the present time. It is believed that there is plenty of ore at eastern furnaces and in stock at lower lake ports to keep the furnaces in Pennsylvania and Ohio operating at capacity until next summer. The Indiana and Illinois furnaces also have their requirements. The total movement of iron ore from the district for 1919 is about 47,000,000 tons, or 13,000,000 tons less than in 1918. The predictions are that 1920 will be an active one in the ore business and the operators are looking forward to another 60,000,000-ton year.

Nothing has been heard regarding prices for 1920, and it is not believed that the ore scale for next year will be made until about Feb. 1. The operators contend that they should receive a higher price for their product, and it is likely that the 1920 prices will show an increase over the rates now in force. Costs have advanced considerably since the prevailing prices were made, and the outlook for lower costs is far from being encouraging. The prices now in effect range from \$5.55 a ton for Mesabi non-Bessemer to \$6.45 a ton for old range Bessemer, and the seller must produce the ore, transport it to the docks, down the lakes and unload it at the lower lake ports. Everything taken into consideration, the iron ore operator is not being in-

compensated for his investment, risk and hard work. The pit mines have an advantage over the underground mines, and the price must be such that those with the higher costs can show a profit at the close of the season.

Utah Metal Mines Unaffected by Coal Strike

The order of Fuel Administrator Garfield and Walker D. Hines, director-general of railroads, putting Utah coal mines on a war basis, cut off the supply of coal to all mines and smelters in Utah. R. C. Gemmill, general manager of the Utah Copper Co., has stated that he has coal enough to last from sixty to ninety days. The United States Smelting Co. has coal enough to last about thirty days. The American Smelting & Refining Co.'s local officials are quoted as stating that they do not know the exact amount of fuel they have on hand, but do not anticipate any immediate shortage. General Manager Gemmill of the Utah Co. said that if the American Smelting & Refining Co., which smelts its product, is forced to close down, the Utah Copper Co. will continue turning out concentrates and store them up.

Mining in Papua

Block 10 Misima Gold Mines Adds to Reserves—New Plant Under Erection

Development work at the Block 10 Misima Gold Mines, Papua, is stated to have considerably added to the reserves, previously stated at 130,000 tons, averaging 32s. 3d. per ton. Below the collar of the shaft they have over 34,000 tons valued at 56s. per ton. The assay plant shows an increase in value as depth is reached—probably due to leaching action—and it is anticipated the enrichment will continue to greater depth. It is officially added that indications point to the orebody having a length of not less than 220 ft. at the No. 1 level, with ore still in the face. During the June half year the mill treated 5,580 tons of ore, averaging 26s. 1d. per ton; and the sands and slimes were subsequently treated for bullion worth £5,716, equal to 20s. 6d. per ton. Costs for the term for mining development and ore treatment averaged 37s. 9d. per ton. Practically 45 per cent of the ore milled came from development work, and did not represent the average value of the reserves. There was a net loss of £4,300 on operations for the term. Owing to scarcity of shipping and labor troubles considerable delays occurred in sending forward new plant. However, one 20-head battery, with accessories, together with complete equipment for the tram line, has been delivered at Misima, while the balance of the equipment should be shipped at an early date.

PROGRESS OF MINING OPERATIONS

COPPER PRODUCTION OF "PORPHYRIES"

	Oct.	Sept.	Oct., 1918
Utah Copper	9,625,700	8,220,692	19,000,000
Chino Copper.....	3,287,905	3,538,704	7,063,000
Ray Consolidated..	3,900,000	3,850,000	7,490,000
Nevada Consol- dated	4,200,000	4,250,000	6,700,000

ALASKA

The shipments of domestic copper ore, matte, etc., from Alaska to the United States in October, were, according to the Department of Commerce, 6,523 gross tons, containing 4,210,274 lb. of copper valued at \$926,642.

Fairbanks—Increased activity at the mines in the Fairbanks section of Alaska in the spring is assured by the practical completion of the railroad between Fairbanks and the Nenana coal fields. The mines in the Fairbanks district have struggled against high fuel prices for several years. This has been caused by the depletion of the scant timber supplies of that region. The completion of the railroad will make available a rather low grade fuel but one which can be used to advantage.

ARIZONA

HELPS DODGE OFFICES TO BE CONSOLIDATED—CALUMET & ARIZONA MAY BUY SHANNON'S COPPER BELLE PROPERTY—SILVER KING SHAFT PAST 500 FT.

Douglas—For administrative convenience, there is to be consolidation in Douglas of most of the offices of the Phelps Dodge Corporation in Arizona. A floor of a new office building has been secured in which to house the legal and mining departments, headed, respectively, by Ellinwood & Ross, and Gerald Sherman, who will take with them twenty-seven employees. President Walter Douglas has been on an inspection trip to the various southwestern properties of the company, accompanied by a number of administrative heads. Only development work is being done at Morenci and Tyrone. At the former point it has been decided to build an entirely new mill, probably at a new location. At Tyrone the concentrator is being remodeled and enlarged.

Gleeson—It is reported that the Calumet & Arizona interests, of Warren, Ariz., are negotiating for the Copper Belle property of the Shannon Copper Co., \$450,000 being given as the price under consideration. The Copper Belle for several years past furnished the best of the ore that was handled by the Shannon smelter at Clifton and its ore reserves are said to be large and of fairly high grade. It had been proposed to work it in conjunction with the Shannon's Yeager Canyon property, but the latter has very different mining

conditions and is handicapped by lack of railroad transportation. It is considered obvious that the C. & A. could handle the Gleeson mines very much more economically than the Shannon, in view of ownership of a nearby smelter.

Inspiration—An experimental refinery and leaching plant has been placed in operation by the Inspiration Copper Co. for testing out methods of treating the large quantity of low-grade mixed ores on the property. Inspiration has about 40,000,000 tons of this mixture of carbonate and oxide ores. To handle a large tonnage and to get best results would probably necessitate the construction of a plant to cost several millions of dollars. New Cornelia, controlled by Calumet & Arizona Mining Co., has adopted this method of handling its ores and for some time past has been refining copper on the ground rather than shipping it to other points for custom treatment.

Superior—The new shaft of the Silver King of Arizona Mining Co., ground for which was broken in May, this year, was down 493 ft. on Dec. 1, having made 23 ft. in the week then ended. Sinking is proceeding at the same rate, the shaft being at 515 ft. as this is written. Lot No. 7, including 30 tons of concentrates, has just arrived at the El Paso smelter and is expected to net \$40,000. The lead and copper contained pay the freight and treatment charges. A crosscut was driven at the 415-ft. level connecting the new and old shafts, and another will be driven at the 600-ft. level. The mill ore at the 400-ft. level shows upwards of 17 oz. of silver to the ton, and shipping ore now being taken from the same levels shows upwards of 200 oz. of silver per ton, of which 365 tons were taken out in 1918, netting the company \$46,983.14. Ore extraction from this body was temporarily discontinued in 1918, due to the water level having been reached, but the added facilities provided by the new shaft now makes this orebody available. The returns from the 25-ton test mill since March, 1919, were \$58,392.99 at then prevailing silver prices, in addition to which a shipment of approximately \$40,000 of concentrates was made Nov. 24. A 250-ton mill is to be installed and additions made thereto as rapidly as the development work warrants. The shaft, when completed to the 1,000-ft. level, will have a capacity of upwards of 500 tons daily.

Kingman—The new mill of the Hackberry mine has been closed down, because of insufficient stoping ground.

Shipments of high-grade silver ores will continue. Workings will be extended on the 800 level to a point 400 ft. from the present shaft, where a raise will be started for a new working shaft. Work will be pushed on securing larger stoping ground.—The Berkeley property in Cedar Valley has been taken under option by T. N. Stanton, of Tucson, and Charles L. Jones, of Bisbee, from Mrs. Elinor Dennis and J. J. Jerome, of Kingman. This mine is known to have a main ledge with 9 ft. of commercial ore, with a high-grade streak. The old shaft will be reopened and pumps installed.—The Kingman Consolidated Co. is driving the Arizona Butte tunnel at a rate of 5 ft. a day in granite along the footwall of the Prince George vein. Modern equipment is installed at the tunnel mouth, including Diesel engine, compressor, etc., and electric transportation equipment is to be added soon. A new mill is to be built at the tunnel portal, and a smaller mill will be set up on the Banner group with jigs to handle low-grade base ores.

Chloride—At the Mollie Gibson mine a new engine house is completed, hoist and compressor are being installed.—Mine work is suspended at the Dardennes mine while a new shaft-head equipment is being erected.—A new hoisting engine and gallows frame are also being installed at the Emerson mine.—The Chloride Queen now has a working drift driven about 425 ft.—The Tennessee-Schuylkill Mining Co. is planning to install a large mill on the strength of lead-silver ore reserves said to approximate 100,000 tons. Heretofore necessary milling has been done at Needles reduction plant.

Prescott—The Centipede group in the extreme southeastern part of Yavapai County has been sold by Daniel J. Cawley to an El Paso company represented by Lewiston Hayward. Cawley worked this mine alone for 18 years. In the same section Henry Tilden has sold the Cavalry gold-copper group to a Miami company.—Another sale is that of the South Dome mine near Walker, to the Big Dome Silver Mining Co. for \$15,000.—The Big Bug mine at Mayer is being fitted with a new hoist, compressors and pumps; similar equipment is also being installed at the Mildred mine near Crown King. The latter mine is operated by Rosenberg & Co., of Los Angeles, who are building a wagon road and expect to deepen the shaft to 500 ft.—A flotation mill to handle silver ore is to be installed at the Monte Cristo mine near Prescott, by W. D. Worthington.

CALIFORNIA

CALAVERAS COMPANY'S FURNACE RUNNING EIGHT HOURS DAILY—GRUSS COMPANY HAS BEGUN WORK AT GENESEE

Copperopolis—The Calaveras Copper Co. is now mining a little over 300 tons of 2 per cent copper ore per day, two shifts being employed. This production is about 60 per cent of normal. The ore is milled and smelted to 40 per cent matte at the reduction works about a half mile from the mine. The matte is shipped to Tacoma for converting. Features of the treatment are: (1) The sintering of flotation concentrates in a Dwight & Lloyd machine, reducing the sulphur from 15 to 0.5 per cent and making a product suitable for blast furnace smelting; (2) the operation of the blast furnace, which is of the ordinary rectangular water-jacketed type, during only one shift a day. The balance of the time, the charge is banked with coke and flue dust. While, of course, the operation is not as economical as continuous running, satisfactory results are being obtained.

Engelmine—Feather River Copper Co. is rushing work on camp construction at Engelmine in order to be prepared for uninterrupted work during the winter. A large electric-driven compressor is being installed and a power line is in course of construction from the Great Western Power Co.'s line, to the property.

Victorville—Talmage Bros. are driving a cross-cut tunnel on the Al Watts group; a compressor and machine drills have already been installed.—The Gold Mountain mine has 30 stamps running on ore from Glory Hole, crushing one ton per stamp.

Angels Camp—Angels Camp Deep Mining Co. has just finished installing a 100-hp. double-drum hoist, a large jaw crusher and two air compressors. Work is being rushed on construction of the stamp mill which is expected to be in operation soon.

Forrest Hills—The Baltimore Deep Gravel mine has taken over the Forrest Hill electric power plant on the middle fork of the American River, and all the machinery at the mine will hereafter be operated by electricity.—At Colfax the Rising Sun Mining Co. has installed an electric-driven pump of 400-gal. capacity to unwater the mine. Power is obtained by a branch from the Pacific Gas & Electric Co.'s power line.

Greenville—The Droege mine has opened up, and will operate a full force of men during the winter. Tunnel No. 4 is being cleaned out and ground broken for a new mill at mouth of this tunnel.—The Gruss Mining Co. has started development work at Genesee and will carry it on throughout the winter. It is planned to drive a tunnel

from the 400-ft. station of the main shaft, a distance of 1,000 to 1,500 ft. The shaft will be sunk to the 6,000-ft. point where a new level will be opened up. The present stamp mill is being remodeled to treat sulphide ore by flotation, and will start up next spring.

Porterville—The American Magnesite Co., has been taken over by C. W. Hill, who will operate a calcining plant on custom ore.—The Blue Mountain gold mine at White River is being opened up by a new company of which J. M. Howard is president.

Placerville—In the Shan Tzy gold quartz mine or Shaw mine, four miles west and two south of Placerville, two new shafts are being sunk on the quartz vein and are now down 50 and 60 ft., respectively. The vein is "pockety" and some rich bunches of gold quartz are found occasionally.—The Pacific Deep Gravel mine, seventeen miles east of Placerville, has met very hard rock in the new crosscut being driven south from American River. The new tunnel is now in about 120 ft. and after another 100 ft. a raise to the surface will be made for a ventilating shaft. The total length of the tunnel will be about 1,000 ft. and several other raises will be cut.—The Sunshine Deep Gravel gold mine, including 60 acres owned by the Sunshine Mining & Development Co. of Sacramento, is situated at head of Steeley Creek, nineteen miles east and six miles south of Placerville. It is reported that a crew will be busy all winter getting out gravel for the spring clean up.

Nashville District—The Noonday gold quartz mine, on the Mother Lode at the north fork of the Cosumnes River, twelve miles south and two miles west of Placerville, has been taken over by the El Dorado Lime & Minerals Co. The manager, Rey La Fountain, has installed a boiler and hoisting engine, and is deepening the main shaft. Present developments include a 90-ft. crosscut and two shafts on the 7-ft. vein to depths of 50 and 60 ft. respectively.

COLORADO

The Golden Eagle property in the Argo tunnel at Idaho Springs has been bonded to Eastern interests. Much work has been done in retimbering, catching up caved ground and driving raises and skipways. A large tonnage is expected from the tunnel and upper levels. Al Weinberger is the general manager and T. D. McGuire superintendent.

MONTANA

NORTH BUTTE'S OCTOBER PRODUCTION INCREASED—DAVIS DALY MAKES IMPORTANT STRIKE—ACTIVITY NEAR IRON MOUNTAIN

Butte—North Butte has opened a width of 25 ft. of 6 per cent copper ore in drifting on the 3200 level of the Edith May vein. This company's cop-

per and silver production for October shows a 30 per cent increase over that for September. The Davis-Daly Copper Co. has opened a new vein near its 2,700 station showing a width of 5 ft., all high-grade ore carrying more than 6 per cent copper and about 7 oz. silver. The vein is well defined, and the discovery appears important from the standpoint of indicating a material increase in production and ore reserves. This fissure will be driven for on the 2,500 and other levels above. About two months of crosscutting will be necessary before workings on the 2,700 level will reach No. 2 vein, which is the principal fissure on the level above. Between this vein and the station it is expected that three other veins will be picked up first.

Iron Mountain—The Golden Sunset Mining Co., owning several quartz lode claims on Cedar Creek, fifteen miles from Iron Mountain, Mont., made a good showing last season. A mill for recovering gold has been erected, part of the machinery installed and the rest is on the ground to be installed early in the spring. The American Minerals Mining Co., of New York, has taken over the old-time placer claims known as the Venness and Eclipse, on Trout Creek, which have long been under development by A. P. Johnston, an old-timer in the district. Frank R. Gump, manager, has been putting this ground in shape and testing it since June 24. It is said the company will work it vigorously in the spring. The same company has purchased 60 acres of placer ground at the mouth of Windfall Creek, adjoining the Eclipse. Another company has been working further up Trout Creek, on Cement Creek, and it is said it will push work in the spring. Near these properties and lying between them and the Golden Sunset is the property of the Gold Hill Mining Co., which had a mill in operation last season. This property has a number of lode claims.

NEVADA

STRIKE OF SILVER-LEAD ORE NEAR MINA—BULKLEY WELLS TAKES OPTION ON MATJUBA MINES AT DMLAY—WEST END MINING CO. AT TONOPAH DECLARES DIVIDEND

Mina—A recent strike of silver-lead ore in the Marietta district, about twenty miles from Mina, is reported by the Mina Commercial Club to have caused some excitement at Mina. Jack Anderson and his partner, owners of the C & A group of five claims, brought in for shipment to Selby's ten sacks of ore valued at \$3,000. This ore came from a hole less than 6 ft. deep, and the vein has been traced for some distance from the strike. Samples have been taken at various points along the vein, the best of which assayed 6,000 oz. of silver and 33 per cent lead. The width of the vein is undetermined. The

deposit is said to be on a lime and shale contact.—British Columbia capital is associated with Mark Bradshaw in developing a new find in the Lafayette district, near Candelaria. J. L. Giroux, formerly associated with Senator Clark, is opening up an adjoining property.—The Olympic Mines company's 100-ton cyanide mill which was burned on night of Nov. 21 is a total loss. Mill cost \$75,000 in 1916. It was constructed of timber, with corrugated steel sheeting.

Yerington—The Nevada Coal & Oil Co. is mining coal in Coal Valley, thirty miles south of Yerington. The nearest railroad point is seventeen miles away and trucks will be used to reach it.

Dayton—Work on the big dredge being built for the Gold Canyon Dredging Co. and which will operate placer ground above Dayton is held up by the strike in the steel works at San Francisco where the hull is under construction.

Ludwig—Henry I. Moore, assistant manager of the Nevada Douglas Consolidated Copper Co., has issued a letter to stockholders of the company proposing a plan for re-financing the company and the erection of a flotation plant to treat the sulphide ores.

Imlay—Bulkeley Wells has secured option for control of the stock of the Majuba Silver, Tin & Copper Mines Co., and has added \$25,000 to the treasury fund for further development. Several thousand tons running over 12 per cent copper have been shipped and 500 tons showing 20 lb. of tin to the ton have been developed on one portion of property which comprises 1,580 acres. Jack Welch is manager.

Unionville—The Arizona Silver Mines Co. has declared a dividend of 3c. per share payable Dec. 15 to stockholders of record Dec. 1.

Tonopah—The MacNamara mill is again working to full capacity on ore from its own dumps and from the Divide mines.—The West End Consolidated Mining Co. declared a dividend of 5c. per share on Nov. 24.

Virginia City—The Comstock North-end Mines for the week ending Nov. 15, crushed a total of 573 tons of ore with a total value of \$9,209 at the Mexican mill. Of the ore crushed Consolidated Virginia produced 300 tons with an average assay value of \$11.77 per ton, and Ophir 273 tons with an average assay value of \$20.80 per ton. Work on the cyanide department is proceeding rapidly.

UTAH

UTAH COPPER CO.'S REPORT—LITTLE COTTONWOOD TRANSPORTATION CO. ORDERED TO RESUME

Bingham Canyon—Utah Copper Co. reports the total gross production for the third quarter of 1919 was 25,269,679 lb., 24,774,761 lb. of this from concen-

trates and 494,918 lb. from precipitates from the leaching plant, as compared with 28,046,978 lb. total gross production for the second quarter, when 27,523,978 was produced from concentrates. The Arthur mill treated 1,397,400 dry tons, of average grade 1.16 per cent copper and with 76.20 per cent recovery as compared with 1,242,500 dry tons of average grade 1.35 per cent copper and recovery 81.8 per cent in the quarter preceding. Average cost per lb. (excluding federal taxes, and without credit for gold, silver, and miscellaneous income, but including plant deterioration and all fixed and general charges) was 14.885c. as compared with 11.59c. The higher cost was due to wage increase of July 16, 1919, and lessened copper production. The earnings, computed at 22.225c. per lb. of copper as compared with 14.74c. in the quarter preceding, show an increase, in spite of the decrease in amount of copper produced owing to the lower copper content of ore. Capping removed totaled 549,166 cu. yd., more steam shovel work having been done than in second quarter, when 333,048 cu. yd. was stripped. A daily average of 9,949 tons of commercial freight sent over the Bingham & Garfield R. R. as compared with 8,734 tons in the quarter preceding, shows an increase due to heavier shipments from the Utah Copper mine.—The Silver Shield mine has good ore showing, and an assessment has been levied to further development.—The Little Cottonwood Transportation Co. of Alta, has been ordered by the Public Utilities Commission to resume operations on petition by the South Hecla Mining Co.

Park City—Shipments during the week ended Nov. 22 amounted to 3,537,480 lb. ore and concentrates.—The Three Kings mine made a shipment of 50 tons from the winze being sunk for the limestone-quartzite contact. This property embraces 156 acres adjoining the Silver King Coalition. Large tonnages in this district are secured from the limestone bedding just above the contact.—The Naildriver has installed a new compressor; and is shipping ore.

Tintie—Shipments during the week ended Nov. 22 increased to 160 cars as compared to 140 cars weeks preceding. The Chief Consolidated increased from 38 to 41 cars and the Tintie Standard, which has shortened its haul to the railroad from six and a half miles to one mile, shipped 28 cars as compared with 18 in the week preceding. In general the district is reflecting the higher price of silver.—At Eureka the Tintie Zenith, near the Apex Standard, is to be developed through the sale of treasury stock.—The Yankee mine, between the May Day and the Uncle

Sam, has a new superintendent in William Carter.—At the May Day, a drift from the Yankee shaft on the 1,800 level, is showing mineralization.

The Tintie Drain Tunnel is in 4,000 ft., and good progress is being made.—The older workings of the Sioux Consolidated at Silver City, are being operated by lessees.—At the Iron King the upper levels are to provide shipments of fluxing ore as soon as the Goshen Valley R. R. is completed to the property. Drifting is being done in two directions from the bottom (1,565 ft.) of the shaft; also drifting on the 1,000 level.—At the Bullion Beck mine work has begun on the dump from ore milled many years ago, and a profit is expected with the present price of silver.—Zuma mine shows 10 ft. of quartz carrying 2 to 3 ft. of high-grade silver-lead ore opened near the center of the property in 300-ft. winze from the 500 level.

Lion Hill—The old Lion Hill stockholders have been notified that the time for exchanging to Ophir Metals stock, expires Dec. 31. Stockholders on payment of 20c. per share are to receive share for share in new company, par value of stock being \$2.—The new road being built from Ophir on to Lion Hill is practically finished.

WASHINGTON

BLAST FURNACE WRECKED AT TACOMA SMELTER—WESTERN COPPER CO. AT INDEX TO START UP

Tacoma—One of the copper blast-furnaces at the Tacoma smelter of the American Smelting & Refining Co. was wrecked recently by a series of explosions. Fortunately no employee was injured. The property damage was estimated at several thousand dollars. It is stated that the breaking down of the furnace bottom, releasing the molten charge into a water drain, created the steam which caused the explosions.

Valley—Copper Blossom group has been acquired by Evan Morgan, of Loon Lake, formerly the operator of the Loon Lake Copper property. The claims are situated six miles east of Valley. Active development work will be undertaken.—At Danville new development work is under way on the Chetterboy Mining Co.'s property, formerly known as the Lucille Dreyfus mine. Two shifts are at work driving a crosscut to explore the orebody 500 ft. below the upper levels, and they expect to complete this drift in about 60 days. J. E. Leonard is manager.

Index—The Western Copper Mining Co. is situated five miles west of Index, Snohomish County, Wash., and one-quarter mile from the Great Northern R. R. The ore deposit is low-grade, lenses of chalcocopyrite occupying a shear zone in granodiorite. The property was formerly known as the Bunker Hill Mining & Smelting Co. Underground

development consists of about 2,700 ft. of tunnel work, a few short raises, etc. Surface equipment includes a 100-ton concentrator badly out of date, and a 75-ton copper reverberatory furnace. The property has been idle for a number of years, but plans are now being formed in the East for the resumption of work.

CANADA
BRITISH COLUMBIA

Kimberley—Preparatory to increasing output, the Consolidated M. & S. Co. has let contracts for driving tunnels and raises and for breaking ore at the Sullivan mine. The mine is shipping again. Shipping operations have been resumed at the North Star mine.

Trail—Shipments of ore received at the Trail smelter of the Consolidated

and its capacity will be increased. The mill has been closed temporarily on account of frozen water pipe.

Lillooet—The Mining Corporation of Canada has purchased the Pioneer mine at Cadwallader Creek, near the Pacific Great Eastern Ry. This mine has been developed during the last three years by a Vancouver syndicate, and last year produced about 2,250 oz. of gold, the crushing being done in a Chilean-type mill. The purchase price was \$100,000.

Surf Inlet—The Belmont Surf Inlet Mines, Ltd., is reported to be improving working conditions at its camp. A model town is being built, homes and public buildings all being equipped with electric light, steam heat and running water. There is a modern club hotel,

ties to resume underground work. Exploration will be carried on in the expectation of finding new orebodies.—Twenty-five acres of the Chambers-Ferland property, adjoining the La Rose, have been bought by the Northern Customs Concentrators, Ltd.—The Penn-Canadian property which has been closed since the strike is being dewatered—The Nipissing Mining Co. is negotiating for a large silver-lead property in the United States.

Kirkland Lake—During October 345 tons of ore was treated by the Lake Shores Mines with a production of \$5,565. The mine has been dewatered down to the 200 level.—A plant is being installed at the Chaput-Hughes property, preparatory to sinking a shaft.

Boston Creek—On the Boston McCrea property No. 1 diamond drill hole has cut four veins, two of which are gold-bearing. No. 2 hole is down 150 ft. and has passed through 10 ft. of vein matter.—The central shaft of the Miller Independence is now down 350 ft. A station will be cut at 400 ft. and cross-cutting done to tap the orebody developed to 200 ft. in an inclined shaft.

Larder Lake—The Associated Gold Fields is installing an electric hoist on the Harris-Maxwell property, the 400 level of which is now being opened up.

COLOMBIA

MINING QUIET IN IBAGUE DISTRICT

San Mignel—The year has been quiet in the district of Ibagué. La Norcasia worked the wooden stamp mill almost continuously. El Recreo kept one mill working and is transferring another one to a recently discovered promising outcrop. La Dorada seems to have found another ore lens, very near the former one which was worked from 1908 to 1912. Costs are still low in the district, running about \$4 per ton. Between \$8 and \$12, free gold, is saved on the plates, leaving a fair margin of profit.

The Department of Tolima contracted the construction of a railroad between Ambalema, the terminus of the Dorada Ry., and Picalaña, a point on the Tolima Ry., about six miles east of Ibagué. This connecting link is to be finished in three years. But no big mines, it is said, will be created without the influx of foreign capital. Nobody considers mines outside of the Departments of Antioquia and Caldas.

BURMA

The Burma Corporation, Ltd., produced in October from the mines at Baldwin 4,112,640 lb. of lead from 4,886 tons of lead-bearing material, including secondaries. The output of refined lead was 3,136,000 lb. The production of refined silver was approximately 149,560 oz.

PIONEER MINE, LILLOOET, B. C., LOOKING ACROSS CADWALLADER CREEK FROM CAMP. PROPERTY HAS JUST BEEN SOLD TO MINING CORPORATION OF CANADA

Mining & Smelting Co. of Canada during the week ending Nov. 21 are given in the following table.

Mine	Location	Gr. Tons
Alamo Mill	Alamo	30
Bluebell	Riondel	8
Chetterboy	Janville, Wn.	38
Eastmont	Enterprise	34
Emma	Johns	454
Florence	Princess Creek	153
Iron Mask	Kamloops	48
Jo Jo	Three Forks	10
Josie	Jossland	318
Kaslo Concentrator	Kaslo	77
Mandy	Lo Pas	156
North Star	Kimberley	198
Noonday	Sandon	8
Oriana	Joan City	48
Paradise	Athalmer	41
Rossland Properties	Jossland	1876
Rambler	Cariboo	62
Sullivan (Zinc)	Kimberley	259
St. Eugene (Zinc)	Noyle	487
Silversmith	Sandon	95
Standard	Silverton	199
Van Roi	Silverton	41
Whitewater	Ketalack	40
Total		4648

Omineca—A tunnel is being driven to cut the orebody of the Silver Standard mine at the 500 level. Considerable equipment is being added to the plant,

as well as churches, post office and school. The output of the mine is shipped to the Tacoma smelter. Surf Inlet is one of the most prosperous and wealthy mining camps of the north.

ONTARIO

Cobalt—The Mining Corporation of Canada, which has taken over control of the Buffalo Mines, Ltd., will treat the ore in its Cobalt reduction plant. Connection has been made between the two properties. It is also planned to treat the sands pumped from Cobalt Lake by the Mining Corporation at the regrading and flotation section of the Buffalo mill, which in the meantime will be closed. The company is said to have taken an option on property containing radium ores recently discovered in the township of Butt.—The Peterson Lake Silver Cobalt Mining Co. is dewatering the workings of the Seneca-Superior and Gould proper-

THE MARKET REPORT

Daily and Weekly Metal and Mineral Prices,
Metal Market Conditions, Average
Monthly Prices, Stock Quotations

Silver and Sterling Exchange

Dec.	Sterling Exchange	Silver		Dec.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
4	391½	131½	75	8	385½	132½	75¼
5	386½	131	74	9	384	131	75
6	386	132	74	10	379½	130½	75¼

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Metal Markets

New York, Dec. 10, 1919

The metal markets were spectacular this week, with sharp advances in copper, lead and zinc, and the transaction of large business in each metal.

The expected arrangement for an advance in transatlantic freight rates did not materialize. The rate of the U. S. Shipping Board to British ports is \$14, but contracts with outsiders can be made at \$12, and perchance at \$10. Transpacific rates from San Francisco to Hongkong and Kobe advanced sharply to \$18.

Copper

The decline that had been in progress for many weeks continued into this week. During Thursday and Friday no inconsiderable quantity of copper was sold at 17½c., delivered, equivalent to 17¼c., cash, New York, and possibly not quite so much as that. The low prices attracted buyers, and immediately a large business began, in which all of the big producers participated. In fact, practically all of the business was done by them, most of the small producers having apparently previously sold themselves out. On each day business was done at a range of prices, not only as between producers but also as between times on business done by the same producer. The buying was in sufficient volume to effect advancing prices, and one producer would raise his price before others had satisfied themselves at the old price. In the early part of the week, about ¾c. less was accepted for spot than for first-quarter contracts, but at the close both deliveries were more nearly on the same terms. The bulk of the business of the week was for January-February contracts. Some December business was done, and a few contracts running into March were taken. The character of the buying was quite irregular. Certain producers did by far the major part of their business with brass-makers, while the business of others was confined to wire-drawers. Rollers were not large buyers, but late in the week they came more into evidence.

The Export Association did a fairly large business, which was widely scattered. Japan bought some and Germany took several lots, which added up to a fair total.

Total business of the week, domestic and foreign, attained a large figure.

Daily Prices of Metals in New York

Dec.	Copper		Tio	Lead		Zinc
	Electrolytic	Spot		N. Y.	St. L.	
4	17½@17½	52½@52¾	6.75@6.80	6.50@6.55	8.15@8.20	
5	17½@17½	52½@52¾	6.80@6.90	6.60@6.65	8.20@8.25	
6	17¾@18	52¾@52¾	6.90	6.65@6.70	8.20@8.25	
8	17¾@18½	53½	6.90	6.75	8.20@8.30	
9	18½@18½	53½	6.90	6.75@6.80	8.30@8.35	
10	18½@18½	53½	6.90	6.75@6.80	8.35@8.40	

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

Dec.	Copper			Tin		Lead		Zinc	
	St. n lard		Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.
	Spot	3 M.							
4	99½	100¾	108	296¾	298¼	39½	39¾	51	51½

Copper Sheets—28½c. per lb. Wire 21¾c. f.o.b. factory, quiet. Market stronger.

Tin

The business in this market was mainly speculative. Only a few consumers were buyers. Western manufacturers who use tin are beginning to be affected by the coal shortage.

Singapore quoted, c.i.f., London, £303½ on Dec. 4; £301 on Dec. 8; £305 on Dec. 9; and £304½ on Dec. 10. In this market Straits tin sold at 53½c. at the beginning of the week and at 54½c. at the close.

Lead

The large buying of last week led one important producer to raise its prices on Dec. 4. It found no difficulty in obtaining the advance. On the following day the A. S. & R. Co. raised its prices to 6.90c., New York, and 6.65c., St. Louis. In view of the situation previously existing in this market, this sharp advance was unexpected. However, it followed the advance in the British market, and the imminent prospect that Great Britain would bid for domestic lead. During the remainder of the week, fairly large sales were made at the higher prices. A large business in bonded lead was done with Great Britain, France, and Germany, the latter country being a significant buyer. At the close, bonded lead was quoted at 6¾c., New York.

Zinc

Early in the week there was large speculative buying at 8.20@8.25c. A galvanizer bought a large lot, but in general, domestic consumers were conspicuous by their absence. Export sales were made right through the week, the volume increasing in the latter half. However, the total for the week was probably less than in the previous week. Nevertheless, the demand was sufficient to advance prices sharply, and in view of the fact that sales had been negotiated in London at prices above our parity, it is to be expected that our market will advance further. An interesting feature of the week was relatively low offers of zinc in the New York market, the supplies originating from consumers who desired to resell. Inasmuch as the export business is being done through Galveston and New Orleans, the New York market fell below the St. Louis parity.

Zinc Sheets—\$11.00 per 100 lb. since Nov. 14, less 8 per cent on carload lots. Slightly higher prices for export.

Silver—The feature in the silver market the last week was the announcement made by the Federal Reserve Bank that, under agreements between the Treasury and the Federal Reserve Board, standard silver dollars which are

free in the Treasury would be delivered until further notice against other forms of money to the Division of Foreign Exchange of the Federal Reserve, which will, through the local Reserve Bank, co-operating with the branches of American banks in the Orient, employ such dollars in regulating our exchanges with silver-standard countries. The American banks whose branches in the Orient are to be used in this operation are the International Banking Corporation, the Asia Banking Corporation, and the Park Union Foreign Banking Corporation. The Treasury, according to latest available figures, has between 60 and 70 million dollars of free silver with which to supply these banks. The banks will purchase this silver in current funds, and export it to the Orient. The object of this operation is apparently to stabilize the silver market, and prevent a rise in silver which might make it profitable to melt silver dollars and subsidiary coinage. The melting value of standard silver dollars is approximately 130c., whereas the melting value of subsidiary coinage is approximately 140c. for silver per oz. The knowledge that this large supply of silver is available for export is expected to result in holding the price down. It is possible that the United States Treasury will insist in the melting down of dollars before export. It is probable that if the demand from China continues, which seems likely, refined bullion will still continue to command around 130c. to 132c. per oz. The silver market in London continues steady around 75 to 75¼d., but the continued fall in sterling exchange makes the equivalent of the London shipping price below 130c. per oz., with the result that no shipments are being made to London. The China demand still continues unabated, but owing to the abnormal conditions this year, it is impossible to predict what effect the Chinese New Year, which occurs in February, will have on the China demand. As a rule, demand from China is suspended until after settlement occurring on the Chinese New Year, but this year may prove an exception to the rule.

Mexican dollars at New York: Dec. 4, 101½; Dec. 5, 100¾; Dec. 6, 101½; Dec. 8, 100¾; Dec. 9, 100¾; Dec. 10, 100¾.

Platinum—In strong demand and scarce. We quote refined ingot at \$150.

Palladium—We quote \$125@130.

Aluminum—33c. per lb.

Bismuth—Unchanged at \$2.96.

Cadmium—\$1.40 per lb.

Nickel—Ingot, 42c.; shot, 43c.; electrolytic, 45c.

Antimony—The market was firm at 9½@9¾c. for spot, and there is be-

lieved to be an upward tendency. We quote futures at 9½@9¾c.

Quicksilver—Quiet and steady at \$100. London £24.

Tungsten Ore—Market very dull. Chinese wolframite continued to be quoted at \$7 per unit, foreign scheelite at \$10, and Western scheelite at \$15.

Molybdenum Ore—Quoted nominally at 75c. per lb.

Pyrites—Spanish pyrites is quoted at 17c. per unit for furnace-size ore, free from fines, c.i.f., New York or other Atlantic ports. Markets slow and unsettled.

Sulphur—Prices remain unchanged at \$20 for export delivery and \$18 for domestic delivery, per ton, f.o.b. mines at Freeport, Tex., and Sulphur Mine, La.

Brimstone situation in Sicily characterized by much unrest among miners, and prolonged strikes. Sicilian sulphur production for 1919 estimated at less than 175,000 tons. At present no Yellow Superior grade for sale. Brown, or best thirds quality, is quoted at \$51.50 per ton of 1,030 kilos, in bulk, f.o.b. Sicilian shipping points. The output to the end of September was 149,000 tons, against 142,000 tons last year. Exports to end of September were 119,000 tons, against 194,000 tons the previous year. The stocks were 136,000 tons against 113,000 tons in September a year ago. The normal pre-war production was 350,000 tons or more.

Graphite—Ceylon grades are quoted: Lump, 15@16c.; chip, 11@12c.; dust, 8@9c. The recent increase has been owing to the increase of premium on rupee exchange and higher freight rates.

Feldspar is quoted from \$13.50 to \$17 per ton, according to quality.

Fluorspar—Lump ore containing 85 per cent CaF₂ and not over 5 per cent SiO₂ is quoted at \$16, f.o.b. mines at Tonuco, N. M. Freight to Chicago, \$7.50; to New York, \$15. Prices quoted f.o.b. Kentucky and Illinois mines are about \$25 for washed gravel grade.

Nitrate—Spot supplies are quoted at \$3@\$3.02 per cwt. for carload lots. Contracts for delivery during first six months of 1920 are stipulating \$3.05@3.07½. Shortage and good demand.

Zinc and Lead Ore Markets

Joplin, Mo., Dec. 6—Zinc blends, per ton, high, \$39.60; basis 60 per cent zinc, premium, \$48.50; Prime Western, \$47.50; fines and slimes, \$45@42.50; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$47.43; calamine, \$32.68; all zinc ores, \$47.12.

Lead, high, \$88.75; basis 80 per cent lead, \$88@85; average settling price, all grades of lead, \$86.96 per ton.

Shipments the week: Blende, 8,131; calamine, 175; lead, 1,356 tons. Value, all ores the week, \$510,130.

A little lead sold at \$88 basis this week, the price declining to \$85. Heger Bros.' Illinois zinc smelter is reported idle on account of the coal strike, but, contrary to rumor, all others are reported in operation. Electric service has been withdrawn from day operation of all mines until fuel relief is assured, the electric company installing oil burners under boilers in substitution of coal, releasing a large coal tonnage for distribution.

Platteville, Wis., Dec. 5.—No zinc or lead ore quotations; mines closed down by shortage of coal for electric drive power. Shipments reported for the week are 2,360 tons blende, 39 tons galena, and 30 tons sulphur ore. For the year to date the totals are 95,513 tons blende, 6,301 tons galena, and 17,761 tons sulphur ore. During the week 2,422 tons blende was shipped to separating plants.

Iron and Steel Review

Pittsburgh—Dec. 9

The coal strike is the chief item of interest in the iron and steel trade at the moment, but at this writing strong hopes are entertained that the strike will soon be settled. In that event the recovery from its effects will probably be rapid, as there are stocks of coal that will be released. It appears that since the coal strike started, on Nov. 1, the steel mills have been running chiefly on the stocks they had accumulated, but in a week or two weeks more these stocks would in most cases be exhausted. In the last week there have been a few closings, through stocks having become depleted. To date, steel production has been affected little, though tin-plate production has been curtailed 20 per cent or more, and sheet production more than half as much. Per ton of output, these branches of the steel-finishing trade use particularly large quantities of coal.

The iron and steel interests are limited to their own stocks of coal, and are not receiving any shipments, barring possibly, an occasional exception. Even shipments from their own mines, such as those in the Connellsville region, are likely to be seized.

Production of beehive coke is being curtailed by 25 per cent or more, through supplies of coke cars being limited, cars for coal loading being furnished instead, and in ample supply. By an order issued yesterday the old Government prices on coke have been restored.

Except for the Wheeling district, the iron and steel strike is over, as regards there being any large number of men intentionally out of employment.

Silver and Sterling Exchange

Dec.	Sterling Exchange	Silver		Dec.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
11	370	130½	76¼	15	372	133	78¾
12	369	131¼	78¼	16	374	133½	79½
13	367	131½	78½	17	382¾	133¾	78

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

Dec.	Copper		Tin		Lead		Zinc	
	Electrolytic	Spot	Spot	N. Y.	St. L.	St. L.	St. L.	
11	183¾	52½	6.90@7	6.75 @6.80	8.25@8.30			
12	183¾	52½	7.15	6.85	8.20@8.30			
13	183¾	51½@52	7.15	6.85	8.20@8.25			
15	183¾	52@52½	7.17½	6.85 @6.90	8.15@8.25			
16	183¾	52½	7.20	6.87½@6.90	8.20@8.25			
17	183¾	53¼	7.20@7.25	6.87½@6.90	8.20@8.25			

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values for the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

Dec.	Copper				Tin		Lead		Zinc		
	Standard		Electrolytic	Spot	3 M	Spot	3 M	Spot	3 M	Spot	3 M
	Spot	3 M									
11	101¾	103¾	111	306½	308	40½	40¾	53¾	54¾

13											
15	102¾	104¾	114	315	316½	39¾	39¾	52¾	53¾		
16	103½	104¾	114	313½	315	39¾	39½	52	52¾		
17	104¾	106¼	115	315	316½	39¾	39¾	51¾	52¾		

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—Dec. 17, 1919

The chief event of this week was the sharp advance in the price for lead. Copper was steady, but the bloom of the recent advance was gone. Zinc, which closed strong last week, with every prospect of immediately crossing 8½c., surprised everybody by a relapse. Gold sold in London on Dec. 12 at 111s. 6d. per fine oz., the highest price on record. The price on Dec. 11 was 109s. 7d.

Transatlantic freights unchanged. Trans-Pacific rates from San Francisco to Hongkong and Kobe declined to \$12.

Copper

A fair business was done, but very much less in volume than in the previous week. The bulk of the business was on the basis of 18¾c., cash, New York. During the last day or two the market exhibited a slightly easier tone. The Export Association did a business of moderate proportions.

Copper Sheets—28½c. per lb. Wire 22c. f.o.b. factory, quiet. Market stronger.

Tin

This market was erratic, conforming to the ups and downs in sterling exchange. A small business with do-

mestic consumers was done right along.

Singapore quoted £308½, c.i.f., London, on Dec. 11 and 12; £312 on Dec. 15 and 16; and £314 on Dec. 17.

Lead

The producers apparently abandoned all efforts to hold the market in restraint, and it bounded up immediately. The A. S. & R. Co. advanced its price on Dec. 12 to 7c., but on that day it was impossible for large consumers to get lead in tonnage at less than 7.15c. Higher prices were asked, but 7.15c. could be done. On Dec. 16 large business was done at 7.20c. The St. Louis market advanced to 6¾@6.90c., and the New York market moved substantially in conformity with St. Louis. Bonded lead was quoted at 6¾@6½c., New York. Lead production is increasing in Idaho, Utah, and Mexico, and this will eventually afford relief to the present acute situation. However, two smelting works in other districts are temporarily idle.

Zinc

Last week the market closed very strong, with every prospect that the price would immediately advance across 8½c., but with the beginning of this week free offerings developed, which appeared to be mainly the efforts of

speculators to realize, and the price receded in consequence thereof. Some business for export was negotiated, but the volume was less than in the previous week.

The United Zinc Smelting Corporation, owning plants at Moundsville and Clarksburg, Va., has passed under the control of Charles M. Schwab, who intends to enlarge and improve the plants.

According to the "Ironmonger," the total quantity of zinc exported from Germany to England by the German zinc syndicate since the resumption of business relations was 60,000 tons. This exportation is causing great dissatisfaction among German zinc consumers, who cannot get supplies.

Zinc Sheets—\$11.50 per 100 lb. less 8 per cent on carload lots. Slightly higher prices for export.

Silver—Although arrangements have been made by one government with the American-Asiatic banks to release silver dollars against legal-tender payments, the effect so far has not been sufficient to lower the price of bar silver for the Eastern market, as quotations would indicate.

Mexican dollars at New York: Dec. 11, 100%; Dec. 12, 100%; Dec. 13, 100%; Dec. 15, 101½; Dec. 16, 101½; Dec. 17, 101½.

Platinum—Very scarce and in great demand. We quote \$150@155.

Palladium—Scarce. We quote \$130@135.

Iridium—Quoted nominally at \$300.

Antimony—A fairly good business was reported. The market was firm at 9½@9¾c. for spot. Transactions in futures were reported at 9½@9¾c.

Bismuth—\$2.65 per lb. for 500 lb. lots. Price ranges from \$2.60@2.80 per lb. depending on quantity purchased.

Cadmium—\$1.40@1.50 per lb.

Nickel—Ingot, 42c.; shot, 43c.; electrolytic, 45c.

Quicksilver—Quiet and steady at \$100. San Francisco telegraphs \$95, steady.

Tungsten Ore—Scarcely any business was done. Chinese wolframite was quoted nominally at \$7, foreign scheelite, \$10. Domestic scheelite at \$15.

Molybdenum Ore—Quoted nominally at 75c. per lb.

Chrome Ore—Business reported at 65c. per unit.

Zinc and Lead Ore Markets

Joplin, Mo., Dec. 13—Zinc blende, per ton, high \$53.20, basis 60 per cent zinc, premium, \$51; Prime Western, \$50; fines and slimes, \$47.50@45; calamine, basis 40 per cent zinc, \$35@32.50. Average settling prices: Blende, \$47.93; calamine, \$36; all zinc ores, \$47.82.

Lead, high, \$91.85; basis 80 per cent lead, \$88@85; average settling price, \$86.82 per ton.

Shipments the week: Blende, 9,431; calamine, 86; lead, 1,659 tons. Value, all ores the week, \$599,160.

For two weeks buyers have started the market on Monday, and sellers have thought it meant advances at the weekend, but the market has each week held to the price established on Monday, with the slightest inclination to weakening. A large tonnage was disposed of on the \$50 basis offerings of the week, and an increased tonnage was for sale today, when it was finally decided there would be no higher price level.

Lead, which weakened \$5 last week, came back to \$88 basis today.

Platteville, Wis., Dec. 13—Blende, basis 60 per cent zinc, \$54.50 base for premium grade; no sales of Prime Western grade reported. Lead ore, basis 80 per cent lead, \$85 to \$86 per ton. Shipments reported for the week are 1,592 tons blende, 323 tons galena, and no sulphur ore. For the year to date the totals are 97,105 tons blende, 6,624 tons galena, and 17,761 tons sulphur ore. During the week 1,476 tons blende was shipped to separating plants. The mines closed by the coal shortage have resumed work.

Iron and Steel Review Pittsburgh, Dec. 16

Recovery of the steel industry from the effects of the coal strike has been rapid, as was expected. No large proportion of the capacity was closed, and nearly all mills and departments that were idle last week are already operating. Large quantities of coal were held by the Railroad Administration, and such coal has been released freely; and the new production will begin reaching the mills in volume late this week. Restoration of a supply of coal, whether by accident or otherwise, is accompanied by resumption of mills in the Wheeling district that were closed by the iron and steel strike of Sept. 22, that having been of late the only important district in which the strike remained.

At many mills operations are not on a satisfactory basis, but all operating difficulties are expected to end with this month, and January should show a large production all along the line. Full efficiency cannot be attained at once, and capacity outputs cannot be expected before March at the earliest. Just before the strike, however, the steel industry was not producing at more than 85 per cent of capacity at the outside.

There continues to be an eager demand for steel products, both for quick and for moderately extended deliveries, and many buyers are willing to pay premiums above the Mar. 21 prices, to which the Steel Corporation and some of the large independents are strictly

adhering. In pig iron there are continued advances due to the bidding of consumers.

In conservative quarters suspicions are now growing that the alarm of buyers and the disposition of many sellers to demand advanced prices have gone too far, and that the market will soon present a much less buoyant appearance. Attention is directed to the fact that though pig-iron producing capacity is now about 45,000,000 tons a year, production in the year just ending is only a trifle over 30,000,000 tons, and most of the difference has been due to lack of orders, only about 2,500,000 tons of curtailment being due to the iron and steel strike; and the coal strike accounting for only about one-tenth as much. With the large increase in production that is in prospect, it is possible that supplies will equal demand within a few months, whereas buyers have been acting as if the shortage of the last few weeks would continue indefinitely.

Pig Iron—Sales of basic at \$35, Valley, seem to establish the market at that level, \$2 above the price of a week ago. Bessemer has gone in good-sized tonnages at \$36, Valley, representing \$1 advance. Foundry brings \$38 for early delivery, though \$35 or \$36 might be done on second quarter. Few furnaces have banked on account of coke shortage, and difficulties in this respect will be ended in a few days.

Finished Steel—The increase of 655,000 tons in the Steel Corporation's unfilled obligations in November indicates that sales of nearly 1,500,000 tons were made, as shipments were nearly 800,000 tons, and no sales were made at above Mar. 21 prices. More independents than formerly are asking premiums above the Mar. 21 list, and the advances are paid rather freely for any early deliveries. A few weeks ago plates could be had at 2.50c., the regular price being 2.65c. This week some large tonnages have gone at 2.75c., or \$2 premium, and premiums of \$3 and more are the rule on bars. Tin plate is uniform at \$7 except for export.

Ferromanganese—There have been fair-sized sales of domestic 80 per cent ferromanganese at \$120 delivered, and there is a fair running demand now. Spiegeleisen is stronger at \$38@40, furnace, for 18 to 22 per cent.

Ferrosilicon—Electrolytic ferrosilicon has advanced by the lower sellers becoming filled, and we quote 50 per cent at \$90 and 75 per cent at \$140@150, delivered Pittsburgh and Valley points. Bessemer ferrosilicon is held at \$59.50 for 10 per cent, \$62.80 for 11 per cent and \$66.10 for 12 per cent, f.o.b. Jackson, Ohio.

New York and San Francisco, December 27, 1919

Number 23

The Mayflower and the Buford

On Dec. 21, 1620, the exploring party from the Mayflower (180 tons) landed at Plymouth. On this ship were Bradford, Brewster, Standish, Winslow, Carver, and others, in all, 102 men, women and children. They were all English; they came of the race that had steadily won greater and greater freedom for centuries and since then their freedom has progressed.

On Dec. 22, 1919, the Buford (5,000 tons) sailed from New York with 249 alien anarchists. On this ship the leaders were Goldman, Berkman, Lipkin, Bianky, and Bernstein. Nearly all were Russians; they came of a race that has never achieved representative government.

"I represent the devil," Emma Goldman said once. "I am the apostle upholding the glorious freedom, the apostle standing out against law and order and decency and morality. I am for the devil, who leads the way to the absolute yielding up to all the emotions here and now."

The Russians had plenty of American money; they fought against being exiled from the protection of the Government that they plotted to overthrow.

They have left behind 60,000 reds and 472 disloyal foreign-language newspapers.

SEND OVER THE REST!

It is a great Christmas gift to America.

We congratulate the Administration and the Attorney General in particular.

The Mexican Problem

THE Mexican problem concerns the mining industry more closely than any other group. There was, we believe, previous to the downfall of Diaz, at least, more American capital invested in Mexico than that invested by all other foreign countries combined; and of this capital the larger part was invested in mining and smelting enterprises. American-owned mines and plants of all degrees of importance were scattered all over the country. In the great oil regions around Tampico, also, American capital was being lavishly invested, along with that of England.

The mining engineer found Mexico an attractive field. In those pre-bellum days it seemed that the majority of engineers had been in Mexico at one period or another and the number of engineers who had found their main livelihood in that country was very large. Although the mines of Mexico had been worked in part by the Spaniards since before the landing of the Pilgrims in New England, they had

not been intensively exploited, and still yielded large returns. Silver, copper, and lead were the chief products, although many others occurred; in silver, Mexico took the lead among the nations of the earth.

It is a difficult thing to understand the heart and problems of a nation, as foreign comments on America will serve to show us. The popular characterization is invariably a slanderous and false one. The crafty and dollar-worshipping Yankee, the stolid and insensitive Briton, the decadent and immoral Frenchman, the effeminate Turk, are all imaginary characterizations. So it is with the Mexicans. We hear the Mexican characterized as dirty, lazy, and treacherous. It is true that the great bulk of this people, to whom American popular sympathy should go out, are desperately poor, and, in consequence, dirty, especially in the arid plateau country. They are not lazy, but are patient and industrious workers and craftsmen; and they cannot honestly be classified broadly as treacherous. The border Mexican

who has mixed with the border American, and who has perhaps a strain of the northern Indian, is possibly the least attractive of his race, and the reputation of the Mexican has suffered in consequence.

Although Mexico adjoins us directly across the Rio Grande, it is more strange and foreign than any country of Europe which the tourist is accustomed to visit. Should happier days come, we would recommend Americans to travel more extensively in this quaint land, with its beautiful old churches, its picturesque towns, its quiet and soft-spoken dwellers, with their life and habits of a by-gone age, reaching back to the simplicity of Egyptian or Biblical times; and its varied and usually wonderful climate.

The fifteen to twenty million inhabitants of Mexico are what Carranza in his messages proudly terms Indo-Americans. They are Americans of primitive stock—not Latin-Americans as we obtusely like to classify them. They are the descendants of that populous aboriginal people whom the pirate crew of Cortez found—industrious, civilized, with a civilization strangely like that of the East—Persia, Arabia, Egypt, five thousand years ago; agriculturists, weavers of cloth, makers of pottery, builders of temples, skilled in hieroglyphic writing, and with a religion again recalling the East, before Judaism and the later Christianity and Mohammedanism. The Spanish domination left its imprint on these people, but did not alter their main characteristics nor their national consciousness.

The average Mexican is perhaps 10 per cent Spanish (or perhaps some other European blood) and 90 per cent aboriginal; and many Mexicans are pure blooded, and in many sections they speak only their aboriginal tongue. The educated Mexican is, as a rule, proud of his race and his ancient civilization and often resentful of the Spanish strain. The great national hero is Cuauhtemoc, the valiant chief who made a vain historic last stand against Cortez, and their other heroes are those who have emancipated them from foreign domination or from political domination of the Church.

Diaz was an "Indian" from Oaxaca; and many other prominent men have been pure-blooded natives, like their hero Juarez. Spaniards are yet unpopular and much disliked in Mexico; and Americans find it politic not to retain in Mexico the Castilian lisp which they have learned in college. Other Europeans and Americans, however, have until recent years at least been good-naturedly received, all more or less on a par with one another, and have been accepted for what they are worth. In parts of the country, some inexplicable animosity seems to have smoldered against the Chinese, as in the early days of our own West. The American negro, however, is well received.

The exploitation of this patient people has not ceased since the days of Cortez. The division of wealth—lands and mines—in large parcels among the chieftains of a winning cause is one that was carried down to the days of Diaz. It is precisely the feudal system of middle Europe. Diaz was no ex-

ception. He divided the country largely into great estates, which he gave to his followers, who dispossessed by fraud or force any previous small holders they found, so that the rest of the population became dependent upon these feudal barons. The system of many haciendas or great ranches was to involve the laborer (peon) in debt, but to advance him shelter and food against its payment. In that way he worked his life long in virtual slavery (peonage) for the bare materials to sustain life. Progress under such a system was, of course, as difficult as in Russia or any other country that retained the feudal system.

Diaz was a progressive and a just despot. He welcomed foreign or domestic capital and enterprise; and under his regime railroads were built, power plants and public buildings constructed, and Mexico became stable and prosperous. This prosperity, however, benefited mainly the few, whether domestic or foreign; the life and opportunity of the mass of the population were not greatly improved. Between these two classes, the upper and the lower, however, grew up a middle class of schooled Mexicans—store keepers, clerks, and the like—who, with a few idealists of the upper classes and a few leading spirits of the lower classes, looked forward to more uniform opportunity for all. This hoped-for revolution was usually planned as bloodless, and was staged to come when Diaz died, for they would suffer Diaz as a despot more willingly than any other; but when Diaz got so old that he lost his grip and fairness, the upheaval took place, under the leadership of Madero, an idealist of the upper or ruling classes.

Francisco Madero will, in future, always be counted as a martyred patriot; an idealist in the extreme, a teetotaler, and a vegetarian, he was, in a still more accentuated form, the Kerensky of the revolution, who failed to exercise a sufficiently stern rigor to suppress the foes of the government which he won. After his assassination there succeeded the bloody Huerta, a drunkard and a despot, without the virtues which made Diaz great. That so many Americans, knowing the crimes and character of Huerta, should have clamored for our Government to support him showed threateningly our own losses in true Americanism, in democracy, and in idealism. Only such a type, these Americans argued, could keep Mexicans peaceable.

Let us be fair and frank and say that the Mexicans endured patiently and philosophically for years conditions that Europeans could not endure for a year, nor Americans for five minutes. Let us be fair and say that many Mexican mining towns were more orderly and peaceful than many of our own mining and lumber camps in pre-prohibition days, and that alcohol was mainly responsible for vice and disturbances of the law and order in both cases. One thing America and Mexico alike should love President Wilson for—that he refused to recognize Huerta, and so precipitated his downfall.

Huerta's crime, in the assassination of Madero, was immediately denounced by many Mexican chieftains—especially in the north—and most immedi-

ately and fearlessly by Carranza, the Governor of Coahuila, who became the leader of the element which ultimately accomplished the overthrow of Huerta and the placing of Carranza in power in Mexico City.

Since the overthrow of Diaz, however, the whole country has never been brought under a single strong government; hence we find large though shifting areas controlled by independent feudal chieftains, who support their armed followers by levy and banditry. Most conspicuous among these is Villa, a bandit chief without education or promise, whose operations in the north have caused the United States much annoyance. When cornered his favorite game has been a foray across the border, with the idea of forcing American intervention and giving him a chance to assume the role of patriot rather than bandit.

The pseudo-patriotic, chauvinistic, or anti-American pose is, indeed, the common reliance of all parties for popularity. This explains why Carranza, recognized by the United States as the most respectable possibility, and given the support which enabled him to win, has shown himself so tactless, thankless, and disagreeable toward the hand that helped him. Just as it is the popular delusion in the United States that the Mexican is hopeless, so the Mexican believes that the United States intends to annex Mexico and can be held back only by fear. Hence the bluff and braggadocio. This theory of the imperialistic designs of the United States has some foundation in our early difficulties with Mexico, which resulted in the annexation of California and the Southwest and in the conquest of Texas by the Texas Americans. The theory was seized upon long before the Great War as a fertile field for German propaganda, and it is almost entirely to this propaganda that we may look for the present fear of the Mexicans and the belligerent and provocative attitude of Carranza. The result was that in the Great War the Carranza government was not with the United States and the Allies, but was as actively pro-German as it dared to be. German-Mexican schemes for the invasion of the United States failed to materialize only on account of sheer helpless impotency on the part of the intriguing parties.

Carranza is still under German influence. He is hostile and morbid as to the United States simply because of this German-bred delusion. Mexico is still unquiet and unsafe. Neither the foreigner nor the native can prosecute the mining business, or any other, undisturbed; and many of the laws passed are aimed at the standing of American property and interests in Mexico. It is much the same attitude which, on the part of the Boer Republic toward the foreigner, led to the Boer War. Like his predecessor Madero, Carranza finds it difficult to carry out the promised sweeping reforms, and this gives the bandit chiefs, like Villa, the chance to claim the role of deliverer.

What should be the attitude of the United States? When the Diaz government broke down, and anarchy

swept a country so full of Americans and American interests and acquired rights, our Government should at once have stepped in and helped the country to an early adjustment and the needed reforms and democratic government so far as the people can respond.

Can Mexico realize her ideal of democracy—the dream of so many Mexican patriots? Not soon, without help from a more experienced and stable country, we strongly believe. It is true, as the Mexicans point out, that we have our own troubles and defects; but our duty and custom is to attack these and remedy them with a direct and strong hand; and as a matter of fact one of our troubles and defects is our disorganized, antagonistic, and pro-German neighbor to the south of the Rio Grande.

Our Government did not take a hand in Mexico at the psychological moment. With strange provincialism and a complete reversal of the earlier policies of the nation, it disowned its citizens and their rights abroad and treated them as under suspicion. Since then the policy of the Government has been shifting and weak and not calculated to win the respect of the Mexicans.

It is a disagreeable problem for the United States—one among many which she should face. It is high time that the United States should straighten things out in Mexico or forever renounce such a purpose. With its Monroe Doctrine, which excites the suspicion of those whom it seeks to protect, intervention by the United States would be interpreted as a pretext for conquest and would antagonize those South American countries which speak the same Spanish or the similar Portuguese language. The fact is that we do not want Mexico. We have already acute trouble in our melting pot, and we can stand no more foreign mixtures. We should not admit the Mexicans if they so begged. They must work out their own salvation as a separate republic, but we should help them, whether they realize or not the necessity and our intentions.

We suggest that the United States propose to England and France a joint mediation and organization of Mexico; Mexico to be left autonomous and absolutely independent as she can show herself able to be self-governed—not on the old feudal and despotic plan, but with the free and equal opportunity for which her patriots have so long striven and still strive. This is the only attitude that even the firmest-minded American should take.

Are there those who imagine that American intervention would insure a return of the conditions of the Diaz regime? Such a thought is as vain as it is ungenerous. That stage is past, and Mexico must progress with our help. Domination by the United States is out of the question. We could not assimilate the Mexicans as citizens, and we are glad to say that they will never willingly become a subject race. The role of the English in India or Egypt is not one that we can play. Ours is rather that of the Americans in Cuba and the Philippines, acting altruistically as liberators and educators.

Prospecting Beneath Overburden or Caprock

IT has always been a difficult thing invariably to comply with the law that makes it necessary to discover ore before a claim may be staked. Under the usual conditions, this is proper and easy, but the exceptions are very numerous and important. Many classes of geologic conditions occur which mean the plunging of the orebodies beneath a covering of barren rock or gravel. One of the familiar examples exists in all the arid states, where the great sea of wash or gravel surrounds the naked hills on which the ore may be found to outcrop, and covers the possible extension of these orebodies or similar ones with an ever-thickening blanket. Another case, found also in many Western states, is where ore-bearing formations have been covered by subsequent rocks, usually later volcanic, and so effectively buried. Such is the situation, for example, at Tonopah, Nev. Again, the ore may be restricted for geological reasons to a certain horizon or horizons, as at Leadville, in Colorado, and may dip beneath the characteristically barren formations, inviting prospecting work to follow, at the same time that the increasing cost of engaging in a gamble tends to deter the attempts.

It is well known that the custom has necessarily grown up of twisting the regulations to fit the facts. Lands suspected of covering the buried extensions of orebodies have been taken up as mineral claims by the aid of "discoveries," made as plausible as possible by the locators, but, nevertheless, as a basis for the real motive of location, often purely fictitious. No fraud can be alleged in such cases, however; the practice and the necessity of it were thoroughly understood, and all were on the equal footing of having done their best to comply with the only law under which mineral lands could be taken up. Unfortunately, the question of expense often delays indefinitely the proving up of claims so taken up, although few are held except with the intention of so developing. If not, they are generally allowed to lapse. With the more exact classification of public lands by the Government, it finds itself unable, however, longer to approve of a mining claim located without any discovery of ore, although doubtless located in the belief and hope that mineral might be found underlying a barren overburden.

It is unquestionable that the heyday of new discoveries and developments in the metal mines is past in this country. Most of the easily accessible ore deposits which crop at the surface as rich ore have been located and worked, or are being worked. Much ore remains undiscovered, but it is largely because it is buried by overburden or barren overlying formations; and the problem of the future is to make it worth while to prospect in depth, increasing the risk of an always extremely hazardous class of enterprise. Primarily, this is a Government problem, and it involves devising measures of encouraging private capital to enter this field more actively than in the past, for it is only by private enterprise that this can be approached. An obvious inducement would be to give the prospector, whom we might call

on this scale the explorer, permission to dig or drill to prove whether or not land is mineral-bearing, and, if so, to grant him, as the result of a real mineral discovery, a larger holding than the twenty acres provided in the ordinary mineral claim, and this both on account of the expense of exploring and the expense of exploiting, which would necessitate operations on a large scale to be successful. It goes without saying that extralateral rights and the operation of the apex law should be withheld from such grants.

The above has been written in consideration of a bill which was introduced by Congressman Hayden, of Arizona, on Nov. 7, 1919, (H. R. 10433) and of which mention has already been made in the "Journal."¹ Mr. Hayden's bill, as it now stands, though it covers and provides for the problem above outlined, specifies only copper-bearing lands in Arizona, New Mexico, Nevada, and Utah. From any point of view, of course, it must be made to apply to other metals besides copper, and to other states; but with these and perhaps other modifications, it seems a common-sense plan for encouraging further necessary developments of our varied mineral lands on a simple, equitable, and legal basis.

The Price of Steel

THE price of steel in the United States is determined by the price at Pittsburgh, plus the rail freight charge from that city to the point where the steel is sold. The buyer in Duluth, Minn., for example, with the ore mined only sixty miles away and smelted at his door, is required to pay approximately the same price for the same steel as the consumer in Eastport, Me. This tends, of course, to make Pittsburgh the center of the fabricated-steel industry, as the raw material must be cheaper there than anywhere else in the country. The practice has naturally aroused the ire of users who have plants at a distance from the Pennsylvania city, and they have requested the Federal Trade Commission to assume jurisdiction and declare the system in violation of the Clayton Anti-trust law and the Federal Trade Commission law, as constituting illegal price discrimination and an unfair method of competition in interstate commerce. The commission has been sounding the producing and consuming interests of the country for expressions of opinion, and, of the seventy-nine companies approached, forty-three have opposed the abolition of the system and thirty-six have favored it. Knowing whether the company was a producer or a consumer, and the location of its plant, it would not be difficult for one to tell what answer would be given.

Some of the arguments of those favoring a change in the system are as follows: The arbitrary added charge of a fictitious freight rate from Pittsburgh is uneconomic, and gives to the producers excessive profits for which no commensurate service is rendered. Chicago consumers declare that one-fifth of all steel produced in the United States comes from a district within forty miles of that city, and

¹December 8 and 15, 1919, p. 783.

is, moreover, produced more cheaply than at Pittsburgh. They resent paying for Pittsburgh costs plus the charge for a five-hundred mile freight haul which never takes place. They charge that the Pittsburgh basing system is a tool for illegal price control. Consumers in Duluth feel the same as those in Chicago, only they have the added sting of being charged the rail freight rate from Pittsburgh, when, if the steel were ever shipped at all, it would be shipped by water at a cheaper rate.

Southern manufacturers and shipbuilders say they cannot compete with Northern and Eastern manufacturers, because of the high price they must pay for steel, although steel is produced in quantities at Birmingham, Ala., and at lower cost than at Pittsburgh. The entire manufacturing development of the South, is, they claim, being arrested. They make the point that there is no price competition in the steel industry, as all mills adopt the Pittsburgh price, plus freight.

So far, it seems to be a case of unalloyed wickedness; but let us look on the other side of the fence. Pittsburgh produces about 70 per cent of all the steel in the country. No other one district, it is argued, produces enough to meet its own demands, and the deficiency must be made up with Pittsburgh steel. Mills at other points could not be expected to take a lower price than that which they can get,—and with the overbalanced demand they can get up to the Pittsburgh price, because that is economically where they begin to meet the competitors' supply.

The result of selling f.o.b. the producing mill would, it is claimed, result in restricting the sales of each mill to the district immediately surrounding it, and thus competition would be reduced. Also, the change would merely take some of the profits away from the producers and give it to the fabricators, the consuming public paying the same as before. One of the largest Pittsburgh mills complains that many of the mills in that district would have to be torn down and rebuilt in other parts of the country, resulting in a great expense not only to the mill owners but to the proprietors of many other industries which depend on the mills for their market. In many parts of the country the Pittsburgh mills would not be able to compete at all.

Judge Gary has ventured the opinion that if the Federal Trade Commission decides to assume jurisdiction and endeavors to change the present system the result would probably develop "the greatest lawsuit in the history of the country." Considering the extent and power of the interests involved, the Judge is probably right. To us, the present system seems wrong, and yet we are not prepared to advise changing it, in view of the extensive and costly readjustment which would follow.

Vacations

DISSATISFIED workers are beginning to take "vacations," instead of going on strike. Is this an acknowledgment that strikes are becoming unpopular, or is it a notice served on the aristocracy

that the customary "two weeks with" is not the sole prerogative of the bourgeoisie? The vacationists have usually found two months more enjoyable than two weeks, and have finally come back with the idea of doing less work instead of more, just as regular vacationists often return tired. Truly, the only time a man really needs a vacation is when he has just returned from one.

"Many Shall Run To and Fro, And Knowledge Shall Be Increased"

VISITORS to the plant are of two principal kinds. In one class are those who know nothing about the process or the industry and merely want to look around out of curiosity. To guide such people about is ordinarily more or less of a bore, which we usually try to pass on to some one else. After being shown through the electrically-driven compressor plant, they are likely to ask to see the boilers which furnish the steam for the engines they have just inspected. Such visitors usually come in parties, so the guide picks out the most interesting member, and thereafter shows a friendly interest in what the home-folks think about prohibition or the latest fox-trot step, as the case may be.

But the technical man, the mill superintendent from Arizona or the metallurgist from British Columbia, receives a different welcome. Such a visitor can probably help us more than we can help him. We are glad to give him a part of our time. Much of the metallurgical development in this country in the last few years has been due to the freedom with which information is given to properly accredited visitors and to the technical press. We forge ahead by co-operation. If we keep off by ourselves, the band marches away, and we get out of step.

Unfortunately, some plant officials have yet to see the wisdom of this course. They believe they have a monopoly of a certain process. All plant data, whether bearing on the forbidden subject or not, are withheld, and visitors are de trop. They do not realize that if one really wanted to find out what was going on, there would be no great difficulty in so doing. They are always glad to see what is going on elsewhere; they are careful to subscribe to all the technical journals. Their attitude is that of the graduate whom the writer once interviewed in an attempt to secure a contribution to a university fund. "No," he said emphatically, "When I went to college I paid the tuition asked, and the account is settled."

But the type of person who hoards information, as well as the food hoarder, is becoming more and more unpopular. America is possibly more open in this way than other countries are. Recently an Englishman came across the Atlantic to investigate the application of pulverized coal, and on his return published in a British government report the following: "The writer confesses that he never realized that in any country would it be possible for a stranger to receive so frank a welcome as was given him during his brief stay of four months in the United States of America."

The Kelly Silver Mine, at Randsburg, California

Rich Silver Oreshoot Outcropping on Surface in Well-Known Mining Camp Making Important Production—Property Yet to be Developed—Many Lessees

Working Adjacent Ground

BY JAY A. CARPENTER
Mining Engineer

Written exclusively for *The Journal*

A MINE that paid \$96,000 in dividends from the sage-brush roots, that to 50-ft. depth had no dump, everything mined being shipped to the smelters and yielding \$96,000 in dividends to the owners, is a discovery of interest to the mining industry. This unusual development occurs in a district noted for its gold production from 1895 to 1915 and for its output of tungsten from 1915 to 1918, and now probably destined to become known for its silver production.

The Kelly silver mine is situated one and one-half miles east and south of Randsburg, Cal. Though Randsburg is in Kern County, and the principal owners of the mine are from Bakersfield, the county

tension line from the Sierras to Los Angeles. An eighth of a mile away the water company that supplies Randsburg had laid its pipeline leading from the pumps at Squaw Springs. Kern County had brought its paved roads around Randsburg to within a half mile of this spot. Two miles away by road is Randsburg, with abundant labor to work a mine and stores at which to supply materials. Though the region is a mountainous sage-brush covered country of 3,700 ft. elevation, less than 200 miles away by quick train service or good auto road are the orange groves and Los Angeles, the promised land of the successful Southern California prospectors.

At this spot, about the first of April of the present

LEFT, JOHN NOSSER. DISCOVERER OF KELLY MINE. RIGHT, LOOKING NORTH TOWARDS THE KELLY MINE

seat, the mine itself is just over the line in San Bernardino County. A branch line of the Sante Fe railroad runs past the mine to its terminal at Johannesburg, which is only a mile to the northwest. The station of Searles, on the Southern Pacific R. R., from which a branch goes to the potash fields at Trona, is only twelve miles away and connected by a good auto road. Not only is the rich Kelly mine fortunate as to its location near railroads, but its proximity to other advantages makes it like unto the mine upon which the prospector builds his fairy castles of sudden wealth, and like the mine that the engineer travels incessantly to find, but seldom sees.

Just a quarter of a mile below where, since the days of '49, the rich horn-silver ore of the Kelly mine has been tramped over but lay unnoticed, the Santa Fe road put in a siding years ago; and a half-mile away the Sierras Power Co. strung its high-

way, two prospectors, Hamp Williams and John Nosser, sat down to rest on their way back to Randsburg, little thinking how soon they or their backers, J. W. Kelly and Miss Edith Coons, would reap the rewards of two years' patient search for a mine. A chance piece of rock broken off by one of them led to a discussion as to whether it contained antimony or silver. Two samples of the croppings were mailed to Mr. Kelly at Bakersfield. The returns showed \$60 in gold and 436 oz. silver in one and \$30 in gold and 326 oz. silver per ton in the second. As the cropping proved to be on the end of an old claim worked years before because of a gold vein on it, but on which exemption of labor had been filed during the war years, Mr. Kelly obtained an option to buy the claim, known as the Juanita, for \$5,000, and Williams and Nosser located all the open ground available, giving them over a dozen claims. To make

the first shipments Williams and Nosser each sold a half of his quarter interest to compensate for his share of the expense. Alfred Harold, editor of the "Bakersfield Californian," was one of the fortunate purchasers of an eighth interest for \$1,000.

Phenomenal Preliminary Shipments

The first two cars shipped from the surface netted over \$40 per ton. By August 19, twenty-eight cars had been shipped from a hole 18 by 20 ft. by 50 ft. deep. As yet it was a mine without a dump. The 1,180 tons shipped contained 405 oz. of gold and 174,722 oz. of silver. Estimating gold at \$20 and silver at \$1.10 per oz., the gross value of the ore was over \$200,000, of which over one-half was clear gain to the owners. Two small cars had returned \$600 per ton net, one 50-ton car had brought a \$21,000 check, and the average value per ton shipped had been over \$168. The daily assay sheet for July 30 is remarkable in that the eight samples taken that day did not vary widely and averaged \$1,528 per sample.

While this remarkable record was being made, Hamp Williams and John Nosser again sold one-half

also, small, rich stringers. The immense glory hole of this mine is one of the sights of the district, and its production of millions bespeaks its importance in the history of California gold mines. Today a small mine crew is working under the direction of Mrs. Rose L. Barcham, one of the original owners, and seeking to get under another favorable surface showing in the large acreage held by the company.

About three miles away from the Yellow Aster, in the unaltered granite, are the tungsten mines of Atolia, noted for their pure scheelite ores. During the high price of tungsten from 1914 to 1919, Randsburg was filled to overflowing with prospectors, miners, and speculators. The old-time miners of Randsburg saw the "heavy spar" that had troubled them in their stamp batteries and on their plates for years make quick fortunes for those who first realized the value of the mineral. With this example still before them, 1919 found Randsburg without a custom assay office, and the miners depending on the gold pan for prospecting and assaying. Anyone traveling from Randsburg to Atolia could not fail

LOOKING SOUTHWEST TOWARD THE KELLY MINE

of their remaining interest in the mine to Bakersfield people, but this time for \$50,000 each. Mr. Kelly sold three-eighths of his interest for \$100,000 and Miss Coons one-quarter of her interest for \$66,000. Thus in the space of six months the two prospectors, the ex-sheriff and the ex-assessor of Kern County have amassed comfortable fortunes.

The mine is locally known as the Kelly mine. The first name chosen was the Rand Divide, as the mine is in the Rand district on the dividing line between Kern and San Bernardino counties. However, as another company of the same name was operating in the Divide district in Nevada, the incorporated name was changed to the California Rand Mines Co.

Description of the District

The country rock surrounding Randsburg is principally granite or a granite schist. The Yellow Aster mine, discovered in 1895, operated first a 30-stamp mill, then a 100-stamp mill for over twenty years in the treatment of the ore from a wide zone of enrichment in the granite schists that constituted a low-grade, amalgamable gold ore, but contained,

to observe on the left-hand side of the road a prominent quartz reef which lay unprospected except for gold. It was on this reef that Williams and Nosser made their discovery of rich silver ore, at a low point on the reef which had been a trail and road for years.

Character of the Deposit

The quartz reef is on the foot-wall side of a rhyolite dike, about 200 ft. wide, which outcrops through the granite schist on a $N. 19$ degrees E. course for nearly a mile. Dikes of white, fine-grained rhyolite are rather common in the district, but the others do not show as great width or as great silicification as does the one that led to the discovery of the Kelly mine. The cockscomb reef that shows up so plainly in the accompanying photograph is nearly all quartz. It is of a red color, due to iron oxides, but the clean quartz is very dense, hard and blue in color with considerable fine pyrites. This quartz is in sharp contrast to the great amount of white quartz found as float or in innumerable veins cutting through the granite schist in all directions. The white quartz

veins are as a rule barren, but many of them have been worked for free gold.

The country around Randsburg and Johannesburg is dotted with headframes and small custom mills. The vein mined on the Juanita claim was of the free-gold variety. It strikes N.55 degrees W., and its projected point of intersection with the N.40 degrees E. quartz reef is just where the Kelly mine opened up its orebody.

Kelly Mine Thought to be on Juanita Vein

Many of the miners and engineers who have looked over the ground believe that the Kelly orebody is on the Juanita vein, and have taken leases or purchased claims along the strike of this vein. Other miners and engineers are as confident that it is on the reef vein, and as quartz containing a few ounces of silver has been found along the reef in a couple of places, these men have taken leases all along the reef both to the north and south of the ore body. Both sets of lessees have the unspoken fear that the main orebody may be a local enrichment at the intersection of the two veins; however, twenty-five sets of lessees are all sinking to depths of from 50 to 100 ft. and then crosscutting, each with the great hope that quick wealth lies just ahead.

Description of Kelly Orebody

The Kelly orebody by Oct. 1 had been opened to a depth of 100 ft. As the shaft was sunk in shipping ore it more nearly resembles a glory hole, being about 20 ft. wide and 30 ft. long at the surface; 20 ft. wide and 50 ft. long at the 50-ft. level, and 16 ft. wide by 22 ft. at the 100-ft. point. The length referred to above is along the N.10 degree E. line of the bucket skids, and coincides with the approximate strike of the reef. The most noticeable feature on going down the shaft is that the ore lies in nearly flat layers. The layers are very distinct and are horizontal north and south, but dip from 5 to 20 degrees to the east. They vary from hard blue quartz to oxidized soft quartz, all carrying silver, but the richest are the softer layers which are spotted through with horn silver.

This appearance of the ore, lying so flat, led many to believe at the start that the ore was a shallow surface deposit, or more of a blanket vein. However, the bucket skids to the 50-ft. level rest on a well-defined slip striking N. 30 degree E., and dipping 78 degrees to the east, both dip and strike being the same as the main reef. Short crosscuts to the west of this slip, on the ends of the 50-ft. level, go out of ore.

A careful scrutiny of the sides of the shaft shows vertical stringers of quartz cutting in a continuous line through the flat layers. The stringers are parallel and have the same strike and dip as the foot-wall slip. A crosscut to the east from the north end of the 50-ft. level station shows one of these stringers 30 ft. away from the foot wall. It has a width of nearly two feet, assays high in silver, and could be called a vein by itself. Beyond this point the crosscut shows decreasing mineral values to its present face. At the bottom of the shaft there is one of the vertical stringers nearly 3 ft. wide. It is

hard blue quartz which in places carries high values in silver sulphides, and right at the 100-ft. point an oxidized flat layer carries an exceptionally high gold and silver content.

Mineralized Solutions Ascended Along Fissuring

From the above observations it is reasonable to form the hypothesis that the mineralizing solutions ascended along fissuring within and parallel to the dike, and that these solutions also spread out horizontally along the horizontal fracturing of the rhyolite. If this hypothesis be tenable, then there is an excellent possibility of finding commercial ore at depth and along the strike of the reef.

The orebody now exposed seems to have no connection with the Juanita vein. The Juanita vein has a

HEADFRAME AT KELLY MINE

N.55 degrees W. strike and a flat dip of 35 degrees to the northeast. If the ore in the Kelly were on the junction of the two veins, the oreshoot should have a flat rake of 35 degrees from the horizontal toward the north. There is no evidence of such a rake to the north, and neither the hanging wall nor foot wall side of the shaft shows indication of any cross vein or fracturing. However, the nearness of this orebody to the projected intersection of the two veins might have had considerable to do with its exceptional richness.

The composition of the ore above the 50-ft. level is best given by a smelter analysis of the control sample of the nineteenth car shipped. The analysis is as follows: Gold, trace; silver, 0.97; arsenic, 0.22; antimony, 0.07; silica, 76.0; iron, 3.2; magnesia,

1.34; manganese, 0.21; alumina, 6.30; sodium and potassium oxides, 6.82 per cent. There was no trace of lead, copper, platinum, palladium, bismuth, zinc, cadmium, selenium, tellurium, barium, calcium, sulphur, or tungsten. The analysis shows that the deposit is a remarkably clean siliceous silver ore, except for a very small content of arsenic and antimony. Below the 50-ft. point in the shaft, the ore is changing rapidly to a sulphide, especially in the hard blue quartz ore, which shows solid chunks of antimony and silver sulphides as large as a man's fist.

The stibnite is often without the needle crystal form, and is not then easily distinguished from the silver sulphides. A sample of this may run as low as a few ounces of silver or up to a thousand ounces. The silver is probably in the form of argentite, proustite, pyrargirite, and stephanite. One sample containing black sulphides assayed 312 oz. gold and 3,368 oz. silver per ton. Other samples have a much higher gold ratio.

At present the higher-grade material from the shaft is sorted for shipment and the remainder is put on a mill dump. Up to Oct. 1, fifty cars had been shipped, thus giving ample funds, after a payment of the \$96,000 dividend mentioned before, to use for the development of the milling ore on the property. Outside of the shaft there was on the same date not over 50. ft. of development work in crosscutting, but no drifting. There is, therefore, a possibility for a large quantity of shipping ore, above and below the 50-ft. level, on the strike of the quartz feeders.

Leasing in the District

The liberal leases which the company has granted to within 400 ft. of the shaft have already resulted in considerable work near the surface. However, most of the leases are equipped with windlasses and have only from two to four men working. A half-dozen are installing small hoists, while the first lease to the north is making good progress crosscutting with machines on the 100-ft. level. Very little prospecting or development work is going on in the neighborhood to find or develop other parallel dikes. The town of Randsburg is quiet, and at present there is more of a spirit of pessimism than optimism.

This condition is a strange contrast to the seething excitement which would prevail if this strike had been made in the State of Nevada, 135 miles due east. The difference lies partly in the fact that mining in California, especially in San Bernardino County and Kern County, is eclipsed by the oil and agricultural interests, whereas in Nevada mining is the paramount industry. Another reason is the marked difference in the law governing mining incorporations. In California the blue-sky law, in order to protect investors, is so strict concerning the promoters' share of the capital stock, and as to the selling price of the treasury stock, that the promoters have no strong personal inducement to develop prospects of merit. On the contrary, in Nevada the promoter is given so much leeway that

prospects of no merit are developing in order to make a living for the promoter, while the investor suffers. Whatever may be the handicaps, the accidental finding of the rich Kelly mine will result eventually in a careful prospecting and development of the surrounding country, with the possibility that the district may become the principal silver-producing camp in California.

Differential Flotation of Zinc-Lead Sulphides Improved by Metallizing the Blende

C. C. Freeman, of Broken Hill, has been experimenting on the differential flotation of lead and zinc sulphides, the results of his work being embodied in U. S. Patent No. 1,301,551 dated Apr. 22, 1919. Dilute carbonate of soda solution used as a frothing agent was found to give indifferent results, but a great improvement was noted when the zinc sulphide particles had been superficially coated with certain other metals, as copper. The metallizing of the zinc sulphides is the result of electrolytic or other action when copper or one of its salts, or a metal electronegative to copper, is in contact with the flotation pulp. When the flotation is effected in apparatus constructed wholly of iron, or of other metal not electronegative to copper, or of wood, and if no copper or other metal electronegative to copper be present, e.g. either free or combined mercury or silver, a definitely preferential action for the flotation of lead sulphide is displayed. Metallizing of the blende takes place more readily at high temperature than at low.

Mr. Freeman secures differential flotation of the lead sulphide by first carrying on the operation in an iron or wooden machine, employing as a frothing agent a solution containing about 3 per cent of sodium carbonate. Most of the lead sulphide is raised, and this concentrate may be cleaned in a machine of similar type. Most of the blende and pyrite remains behind with the gangue. This is then refloatated, using a machine made of copper, or after the addition of copper salts; a small amount of an essential oil or other frothing agent is also added.

The results of several tests are given in the patent paper. A calcitic ore, for example, containing 15 per cent of lead and 9.7 per cent of zinc, was floated in an iron machine, giving a concentrate assaying 63.2 per cent lead and 8.6 per cent zinc. A refloatation of this product under the same conditions gave a product containing 73 per cent lead and 6.2 per cent zinc. The same pulp, treated in a copper machine, made concentrate containing 39.2 per cent lead and 27.8 per cent zinc. The presence of the copper in the machine is thus shown to destroy the differential effect. The results of several other tests are also given. Oil, the inventor says, is unnecessary in the first treatment, as it helps to float the blende along with the galena, thus fouling the lead concentrate. The process is claimed to be of particular commercial value when the zinc predominates in the ore or mixed concentrate and when removal of pyrite is necessary.

Notes on the Final Report of the South African Miners' Phthisis-Prevention Committee

Value of the Various Methods of Testing Samples of Air—Effects of Different Types of Drills on Dust Production and Diffusion—High Temperatures and Humidity

BY E. M. WESTON

Written exclusively for *The Journal*

THE Miners' Phthisis committee of South Africa has been in existence since 1912 and has spent directly £8,619. It is dissolved for the present, as it was felt that sufficient work had been done to point out the right lines of progress in the future. There has been considerable difference of opinion regarding methods of dust determination and the relative merits of the konimeter and sugar-tube processes. In dealing with this subject, the committee remarked that "as a 260-mesh screen is the finest that can be made, and as it will allow a particle of 40 microns (micron = 1/2500 in.) to pass, a single particle of this size weighs the same as 37,000 average-sized particles found in the siliceous lung."

The survival of the ordinary gravimetric method is due chiefly to the fact that in mine-air samples the percentage of really fine or injurious dust, under about ten microns by weight, is not extremely variable, being 33 per cent minimum in collaring and about 94 per cent in blasting maximum; but usually about 70 per cent. Ordinary samples may then be assumed to carry 70 per cent "injurious dust," i.e., a return of 7 mg. per cu.m. represents 4.6 mg. of injurious dust per cu.m., an amount corresponding to 400 to 600 dust particles per c.c. of air.

New Methods of Dust Determination

The committee deals with new methods for estimating dust, including the "bottle method," the photo-konimeter, and Kotze's konimeter, with full drawings and a detailed discussion on the correct adjustment, employment, and method of counting by means of microscope and micrometer.

Returning to the question of the relation between weight and number of dust particles, the committee states that "a gravimetric return of 2 mg. per c.m. may mean the presence of 400 particles of injurious dust per c.c., or as many as 100 million per cu.m." The dustiest street air never contains more than 100 particles per c.c., and normal wet rock drilling averages 200 to 300 per c.c. In the case of "collaring" of holes, dumping into ore bins, and other work where coarse dust is produced, gravimetric results exaggerate the danger.

The committee therefore abandoned the tentative standard once suggested of 5 mg. (gravimetric) per cu.m., as in cases this might be as high as 7 or lower than 2. The report states, "Our investigations have proved that in either case it is practicable to reduce the amount of dust below the limits given." The majority report then says:

"A standard based on the number of particles can at this stage be based only on what is readily at-

tainable in practice. Our results have shown that to reduce the dust, as determined by the Kotze konimeter, breathed by persons, below 300 particles is not difficult in any operation. Anything above this is classed as unsatisfactory. Between 200 and 300 may be considered as fair, between 200 and 100 as good.

"The gentlemen who have signed the report object to this clause on other grounds. In my judgement they are more intimately acquainted with the actual conditions pertaining underground, and have given due weight to the fact, far too much ignored generally, that the manipulation of dust-producing processes is in direct charge of ignorant natives, usually without direct skilled supervision, and that they are not greatly concerned about the amount of dust produced, but rather to finishing their tasks and earning their wages. These gentlemen write, 'inter alia':

"In our opinion, there has not been sufficient detailed work done by this committee with the konimeter for the purpose of ascertaining its reliability and accuracy as an instrument for determining the dust contents of mine air. . . . It is impossible to distinguish between siliceous and less injurious particles . . . and until more information is available as to the variations caused by the personal factor in counting the particles under the microscope, we consider that the fixing of any precise standard of the number of particles for this purpose of indicating good or bad dust conditions in a mine is premature. In February, 1917, the Transvaal Chamber of Mines Dust Inspectors first began the use of the konimeter. . . . The results secured, however, have shown such surprisingly great variations, discordances, and discrepancies that the value of estimates of dust by the konimeter is still imperfectly understood. . . . We quote a few mines that have been sampled by the two methods . . . and cannot understand, in the face of their results, how anyone can describe the standard of 300 particles per c.c. as being 'readily attainable in practice'."

The following are the results (average from seven mines):

Mine	Each Method No. of Samples	Sugar-Tube Dust mg. per cu.m., Average	Konimeter Counts, Average
1	7	1.5	510
2	6	1.1	460
3	7	1.0	310
4	5	1.8	450
5	7	2.4	470
6	8	1.6	420
7	8	1.1	540

"In view of the data, and reasons given above, we contend that the standard of 300 particles is not

readily attainable in practice and would suggest . . . that the general use of the konimeter as the only indicator of dust conditions in a mine is premature."

Mr. Muir, in his paper on the konimeter, and reply in the proceedings of the Chemical, Metallurgical and Mining Society of South Africa, has published a lot of valuable data on this subject. The truth seems to be that the two methods of estimating dust are complimentary to one another. It is necessary to estimate the danger to workers near the source of the dust, where it is most concentrated in the air. In such places the distribution of the dust is not uniform, and the very small sample taken by the konimeter leaves a large margin for error. It is invaluable in showing the character of the dust and interpreting gravimetric results obtained in such places. When dust distribution is even and the quantity (gravimetrically) small, it gives more useful results than the sugar-tube method.

Effects of Dust Inhalation

The report gives a most interesting comparison between the number of particles inhaled and the number actually found in the lungs: "A recent estimation of the dust in the lungs of a person who had died of phthisis shows that they contain about 13 gm. of siliceous dust. If a man at work breathes one cubic foot of air per minute containing 300 particles per c.c., assuming them all to be siliceous, and if he works 300 days of eight hours each in a year, it would take him sixteen years to inhale the 13 gm. mentioned. As the lungs are normally capable of dealing with some of the dust entering them, and as all the dust in the air does not reach the lungs, it is obvious that the period is much longer than sixteen years."

The committee sums up by stating that "for investigation work and for checking purposes it is felt that both methods of dust determination should be utilized, particular attention (if desired) being devoted to the amount of injurious dust present and chemical and microscopic methods being pressed into service; but that for routine work the konimeter is the handier."

The quantity of dust in the air rapidly decreases in distance from the point of production. In the face of a drive showing 19 mg. per cu.m. the amount 40 ft. back was 10 mg. This is due largely to settlement of heavier particles and to diffusion.

"The second important factor controlling the amount of dust . . . is the presence of fog or moisture in the supersaturated state showing itself as fog or mist. . . The fine globules of water appear to lay the dust very rapidly. . . The effect of this precipitation of moisture is clearly shown in the amounts of dust that come to the surface at fan drifts and through upcast shafts. Although heavy blasting may have been going on for an hour before, samples taken at the top of upcast shafts have only shown an average of 12 to 26 particles per c.c. . . When air from blasting has to pass through areas where precipitation of its moisture

takes place, it does not appear that any appreciable quantity of dust travels half a mile."

Importance of Clarifying Water Used in Drills

The committee lays stress on clarifying all water used in rock drilling machines which are liable to produce a spray, as otherwise dust may be introduced into the lungs. Ordinary lake or river water contains 200,000 to 1,000,000 particles per c.c., and it was found mine water used for drilling varied from 700,000 to 500,000,000 particles per c.c. Large settling surfaces or filter beds of clinker and ash are recommended.

The control of crusher-house dust is practicable by the use of adequate fans and spraying apparatus. In the underground crusher station at the New Modderfontein Gold Mining Co. the dust is removed by fans and passes through a brick chamber filled with leafy branches of gum trees sprayed with water. The escaping air contains only 120 particles per c.c. The committee is satisfied that great improvements have been made in dust prevention underground, and considers that the dust inhaled today is only one-tenth of that previously breathed.

For avoiding dust formed by blasting in stopes which may contain 62,000 particles per c.c., single-shift blasting and the use of fan ventilation is considered adequate, provided the men, after blasting, are not exposed to the dust-laden air before being hoisted. In development ends, immediately after blasting a cut, the dust may be as high as 86,000 particles per c.c., whereas the dust in the smoke coming back from a development end after passing two "apex" water blasts was found to be 290 particles per c.c.

Dust in Drilling

Regarding dust caused by drilling: In collaring holes, the committee notes that the important matter is to provide a volume of water from a hose when using non-water-feed machines.

Jack Hammer, Drills, Wet Type—These produce 100 to 150 particles per c.c. when drilling and more when collaring. **Dry Type**—If the water supply is not well maintained, these are very dangerous dust producers.

Leyner Drill Type—When running as it ought, this type of machine gives low dust results, rarely exceeding 200 particles per c.c., and generally considerably lower. The machine has a number of comparatively delicate internal parts, of which the arrangements and function are not readily understood, with the result that these are frequently out of order". . . The miner continues to use it when only a trickle of water is being fed through the pumper. The heavy fog produced by leaking air and water may, if the water is dirty, contain dangerous quantities of dust. "The character of the dust produced by the Leyner drill is, for some reason not yet adequately explained, of an unusually fine character," the report says. One mg. dust per cu. m. gravimetric may represent 250 particles per c.c. "The Leyner type drill cannot therefore be regarded as quite satisfactory."

It is necessary that supervision be strict, and the committee recommends that to use a machine with its water feed out of order be made illegal.

Swifts Water Feed Attachment for piston drills gives satisfactory results, showing an average of 120 particles per c.c. drilling upper holes.

Hand Drilling.—The dust is coarse and the number of particles generally low. Results of 2.5 to 3.6 mg. per cu.m. represent 41 to 120 particles per c.c. "Walkers'" blow pipe is described and illustrated as a useful tool for blowing out old sockets and wetting the sides of drives. The committee seems unaware that I invented the device and published a drawing of it in "Rock Drills" years ago.

Sampling.—Tests carried out at three mines showed results rarely exceeding 200 particles per c.c. in the air while samplers were cutting grooves.

In another mine the figures varied from 450 to 800 particles, of which 75 to 80 per cent was under 5 microns. The report states that as sampling is an essential operation in mining, and the accuracy and reliability of the results preclude the use of water or other dust-preventing devices, mine samplers would do well to wear a good type of respirator such as Weston's or Toombs." This matter will be referred to later.

Chemical Nature of Rand Bunket.—It has been calculated that an average sample would contain

	Per Cent		Per Cent
		Total silica (82% free).....	86.8
Ferrous oxide	0.6	Alumina	5.0
Titanium dioxide	0.5	Pyrite Fe S ₂	4.0
Oxides, Ca, Zn, Ni, Co, Ch, U ..	0.4	Magnesia	1.3
Combined water in silicates.....	0.6	Potash K ₂ O	0.8

Water Blast.—The apex water blast, a description of which has already been published in this journal, is described and recommended. Robertson & Moss' water blast is a tank device for supplying a limited quantity of spray to a winze and preventing flooding.

The committee refers also to respirators, and is now prepared, largely owing to my efforts and protests, to modify its former attitude regarding them. This will be dealt with more fully in another article dealing with my patent respirator.

Ventilation.—The committee carried out tests on the amount of air entering and leaving all the mines of Witwatersrand. "The result of the tests showed that, taken as a whole, the ventilation of the mines could be considered good; but in some mines it was unsatisfactory. The committee notes that at the City Deep Gold Mining Co. mine an upcast shaft 18 ft. in diameter and 2,271 ft. deep was sunk and equipped with a fan capable of exhausting 450,000 cu. ft. per min., at a cost of £60,000. At the Crown Mines a circular shaft 18 ft. in diameter and 3,089 ft. deep has been sunk for ventilation, and a fan of 250,000 cu. ft. per min. capacity installed at a cost of £61,000.

Delivering Air to Workings

Wooden bratticing used in vertical shaft sinking is now made air tight by the use of the cement gun. Generally the committee lays stress on the need of the application of the well-known principles governing coal-mine ventilation to Rand mining conditions,

the chief points being the proper splitting of the ventilation current, and that every endeavor should be made to deliver the air in an unsaturated condition to the lowest workings. The splits should be designed to deliver unsaturated air to each individual district. The report states: The use of water for wetting down all rock surfaces . . . for the purpose of dust laying has rendered the underground temperature atmosphere practically saturated. This condition is almost universal." In a saturated atmosphere at 85 degrees F. it is difficult to do strenuous physical work. The direct effect of these conditions, namely saturated air and high temperature, on the incidence of miners' phthisis is unknown; but there seems to be a relation between the death rate and temperature, as the following statistical statement for the years 1915-1916 shows the figures referring to native laborers:

Range of Temp., F., Degrees	No. of Mines	Total Death Rate	Pneumonia Death Rate	No. of Natives Underground
60-68	2	13.1	5.1	3,129
69-70	14	15.7	6.9	25,370
72-74	20	16.4	7.6	79,296
75-77	9	17.9	6.5	21,958
78-80	8	20.5	8.5	29,872

"Several mines have now reached the depth at which the natural rock temperature is 85 degrees or more, and it is essential . . . either to reduce the temperature of the air and leave it saturated or to allow it to remain high; by decreasing its humidity, the movement of the air in some degree ameliorates the conditions. Fortunately the surface air of the Transvaal has normally a very low degree of humidity and its evaporative and therefore heat-absorbing powers are great."

The following table shows the comparative statement of awards made to Europeans under the Miners Phthisis Act, 1916, 1917 and 1918:

	—Year Ending July 31—		
	1916	1917	1918
Primary silicosis	564	225	201
Secondary silicosis	222	37	150
Tuberculosis without silicosis		62	39
Tuberculosis and primary silicosis		60	49
Tuberculosis and secondary silicosis		134	80
Totals	786	518	619

* + — Tuberculosis.

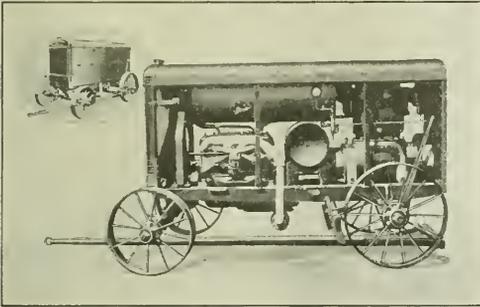

The report of the Miners' Phthisis Board and the Medical Bureau for year ending July 31 gives some additional figures. This board dealt with 3,267 applications for compensation during the year, leaving 522 outstanding, and at the end of the year there were 3,126 beneficiaries, drawing monthly allowances. The companies paid £120,000 to the compensation fund and the companies and employees paid £328,338 to the insurance fund, of which employees paid £109,446. The periodical examinations (every six months for all working underground) disclosed the presence of 700 miners with silicosis out of a total of 15,066. The prevalence rate was therefore 4.64 per 100,000, or 4.6 per cent compared with 5.04 per 100,000, or 5.0 per cent for 1917. This shows a definite decline. The number of cases of silicosis recognized as having originated during the year was 153. There are over 1,000 miners on the Rand who have worked ten years and are still free from silicosis. South African-born miners are apt to contract the disease at an earlier date than overseas-born men. These figures show that phthisis

is by no means stamped out on the Rand, and that there is a real need for additional protection from dust inhalation, such as would be afforded by a good respirator.

The committee suggests further additions and amendments to the mining regulations, and concludes with a generally hopeful survey of the position in the light of progress already made. Whether such optimism is justified in view of the continuous stream of applicants for compensation is a matter of opinion. There is no doubt that material progress has been made, but there is also no doubt that under average working conditions the miners (some classes more particularly) are during certain times and in certain places still exposed to the effects of breathing air containing dust particles in dangerous quantities, and until local protection can be given partially or wholly, phthisis will not be eradicated.

A New Portable Compressor

A novel portable air compressor, illustrated in the accompanying cut, is being introduced by the Ingersoll-Rand Co. Steel construction is used throughout, but the machine is not unduly heavy, the larger size, of 210 cu. ft. capacity, weighing 6,000 lb., and the smaller unit, designed to compress 118 cu. ft. per min., having a weight of about 4,000 lb. The compressor consists of duplex vertical cylinders driven by a four-cylinder, four-cycle, tractor type gasoline

210 CU. FT. IMPERIAL PORTABLE COMPRESSOR

motor. The mechanism may be entrusted to anyone familiar with the ordinary gasoline engine.

The mounting of the machines is a feature, particularly the swiveled front axle, which moves freely in both horizontal and vertical planes. This, with the rigidly attached rear axle, gives three-point suspension, and permits the outfit to pass over inequalities of the ground without racking effect or misalignment of the power plant.

The compressor should prove valuable to those who wish to use power drills for developing prospects rather than to do the work by hand.

Indian Mica.—There was a large increase in the output of mica in British India in 1918, according to the "Ironmonger," the amount being 51,572 cwt., as compared with 35,896 cwt. in 1917. This increase was almost entirely confined to the Bihar and Orissa fields, although the Madras field showed a slight advance.

The Still Engine

New Type Uses Steam on One Side of Piston and Oil or Gas on Other—Heat of Combustion Generates Necessary Steam

BY F. H. MASON
Victoria, British Columbia

CONSIDERABLE interest is being exhibited in England over the introduction of a new type of internal-combustion steam engine, in which the heat caused by the combustion within the cylinder is utilized to generate steam that is used on the side of the piston opposite to that on which the combustion takes place. The engines, several of which are in operation, were designed by W. J. Still, who has been assisted by the physicist, C. Vernon Boys.

Mr. Still has conceived the idea of employing a strong jacket, and surrounding the combustion end of the cylinder of the gas or oil engine with water at 350 deg. F. and under 120 lb. pressure. He has designed a special form of cylinder and piston. The latter is shaped like a handleless cup with straight, thick sides, that are half the length of the cylinder, the piston-rod being attached to the inside of the cup. The cylinder cover is shaped to fit the inside of the cup-like piston. Therefore this end of the cylinder, where the steam is employed, has a much smaller capacity than the other end, in which the combustion takes place. The steam end of the cylinder is surrounded by a steam-jacket, from which the steam enters through a port, which is opened and closed by a slide-valve operated by an eccentric.

The combustion end of the cylinder is surrounded by a water-jacket, which is connected at the lower end with the products of combustion cooler, which, in turn, is connected with the bottom of a small boiler. The upper end of the water-jacket is connected with the upper part of the boiler, the pipe entering just below the level of the water-line. The products-of-combustion cooler is really a small multi-tubular boiler, the gases passing through the tubes and then into a space occupied by a coiled pipe which supplies feed-water to the system through the products-of-combustion cooler. The gases enter the cooler at a temperature of 900 deg. F., and leave it at 150 deg.

To operate the engine, steam is raised in the boiler by auxiliary heat, which is then shut off, the waste heat from internal combustion maintaining the steam pressure. During compression, the incoming charge gains heat, causing more perfect combustion and greater expansion, and, as the walls of the cylinder are at an even temperature throughout the full length of the stroke, there is less friction. At the end of the stroke, steam enters the other end of the cylinder, the piston being pre-heated by the combustion stroke.

In trials, it was found that the steam added 29 per cent to the b.hp. efficiency of the shaft when the steam was not condensed and 40 per cent when it was condensed by a separately driven air pump.

Geology of the Michigan Copper District

Chance Mainly Responsible for the Discovery of Great Properties—Royale's Pig Find of Float Copper—Calumet & Hecla Projecting Extensive Geological Explorations

BY HOMER GUCK

FOR twenty years the theory commonly accepted in the Michigan copper country was based on the belief that no new copper deposits could be uncovered in this district, or in the United States for that matter; that geological experts and mineralogists had investigated and discredited every possible opportunity for discovering new copper; and that any new deposits that might be opened must necessarily come from South America, Africa, Siberia, or some territory which the geologists had not as yet dragged with their net.

With due respect to the work of the scientific and practical geologists (and their efforts have uncovered untold millions), the fact remains that the copper formations from which the greatest profits have been taken were found by pure luck. The further fact remains that this Michigan copper country, the oldest and the most profitable of all copper deposits in the United States, has today a greater opening for the economic geologist than any district in the world.

Luck Found Calumet

The Calumet conglomerate lode, which has paid dividends during its productivity amounting to \$145,000,000, and better than \$500,000,000 in wages, salaries, and operation of maintenance, was found by absolute luck. The story of the discovery of this famous lode by old man Royale's pig was a good story as far as it went, but a careful investigation conducted by George Agassiz, son of the late Alexander Agassiz, president of the company for many years, proved that the discovery of the conglomerate was without geological instigation at all.

In the early days of copper mining on the Keweenaw peninsula most of the effort was directed to locating float copper. That could easily be turned into real money. And Royale's pig did snoot up some float copper in the back yard of the old boarding house, at about the site where one of the active shaft houses now continues to hoist copper rock. Royale ran a half-way house to take care of the overland traffic between Houghton and Eagle River, two towns that had come into prominence through the discovery of mass copper and the opening of numerous mines.

The operators began to take out mass copper, and Mr. Agassiz's research seems to prove conclusively that it was copper that had been cached at this particular point, evidently by some pre-historic race. When the last of the mass copper had been removed from the pit where the Indians had evidently hidden it generations ago, it was found to rest upon a solid rock formation. That formation was later developed into the Calumet conglomerate lode. And the Calumet conglomerate lode was the richest continuous

formation of copper rock deposit found up to that time.

Shaft after shaft was opened on this formation. The original Alexander Agassiz had to make a plan to extract the copper, and there were other problems, but the richest copper mine in the world was found by plain luck.

Record of Development

How about the other mines that have opened in the Calumet field? Reasoning that if the Calumet & Hecla mine had a rich vein it ought to extend to the property adjoining, the Osceola was opened on the south. After mining a little corner of the conglomerate lode it ran out of copper in short order, until the Osceola lode, an amygdaloidal formation, having no direct connection with the Calumet conglomerate, was found. On the north the Schoolcraft, Centennial, and the Allouez spent millions opening the Calumet conglomerate and found it without merit. But in their efforts to find copper in the conglomerate they uncovered other lodes, the Kearsarge amygdaloid being the richest and most profitable. Mines like the Mohawk, Ahmeek, both Kearsarges, all were opened simply on the practical theory that there must be merit in a continuance of the lode that had made the Wolverine mine famous, and the Wolverine was a success only after it gave up trying to make the Calumet conglomerate pay and opened the Kearsarge.

Extent of Calumet Conglomerate

Now, this Calumet conglomerate has been identified at many points outside of the Calumet & Hecla property. Away down in Keweenaw County, at the old Clark mine, thirty-four miles from Calumet, the conglomerate is opened. It has everything excepting the copper. At the Delaware mine the conglomerate showed merit, some copper, but not enough to warrant operations under existing circumstances. Contrary to general opinion, the Mandan property opened the Mendota lode and found it promising in the upper levels, but later it petered out.

The same formation is identified, but without commercially profitable deposits of copper, at practically all of the operating mines in the district. At the same time there is a stretch of many acres, thousands in fact, now under the management of the Calumet & Hecla, where this conglomerate lode has never been subjected to anything but a most cursory examination. Diamond drill exploration of property, though it has been meritorious to a certain extent, is by no means satisfactory. Geologically there is a certainty that further investigation is worth while.

Owning or controlling 20,000 acres of mineral land, the Calumet & Hecla corporation has decided to make a most thorough geological exploration. This work

was decided upon two years ago, and L. C. Graton, economic geologist, was engaged to have charge of the operations. His services were desired by the United States Government for important war service, and he did not undertake the work as soon as anticipated. The first party of exploratory geologists is now here and at work. They will do considerable preliminary work before Mr. Graton assumes personal charge of the field operations.

Geologists differ as to the theory of deposition of the minerals from which the millions of copper have been taken. The commonly accepted one is that the copper was deposited in the rocks from the sea above, by precipitation. The mineralization is found between sandstone and appears in traps, amygdaloid and conglomerate, only occasionally in the traps. These, being basic rocks and unusually hard, ordinarily did not permit the intrusion of metal.

The possibilities of finding another mine of values in the Calumet conglomerate may be remote, but the extensive geological work which the Calumet & Hecla is now planning in this district will have a considerable and an important bearing on all future exploration operations, and will be quite as important to the entire district as to Calumet & Hecla interests.

Schneider Medal Presented

Mining and Metallurgical Society of America Honors
Head of Creusot Works for His Services]
in Ferro-Metallurgy
BY EDWARD H. ROBE

WITH the presentation of a gold medal to Mr. and Mrs. Hoover for their valuable work in translating Agricola, The Mining and Metallurgical Society of America initiated, in 1914, an annual custom of giving a testimonial to engineers who have made material contributions to the development of the mining and allied industries. In 1915 the medal was awarded to Robert H. Richards for his work in the realm of ore dressing; in 1916 to James F. Kemp, for distinguished achievement in the science of economic geology; in 1917 to E. P. Mathewson for his part in the advancement of non-ferrous metallurgy, and last year to Pope Yeatman for eminence as an administrator of mines. To Charles Eugene Schneider, the leading figure of the French iron and steel industry, and director of the famous Creusot Works, goes the 1919 medal for his achievements in ferro-metallurgy.

The Hoover presentation was made at the Biltmore in New York City, and on Nov. 24, 1919, the gilded banquet hall of that hotel was again the scene of the annual ceremony. About 250 were seated at the tables when the ever-present flashlight was exploded. The officials of the national societies of civil, mechanical, and electrical engineers joined with the mining and metallurgical engineers in the testimonial to Dr. Schneider, and the head table, which was placed along one side of the room, scintillated with prominent men. Many distinguished Frenchmen, members of the French Economic Mission, were

present, and snatches of the French language gave an international tinge to the conversation.

H. H. Knox, president of the Society, acted as toastmaster. Bradley Stoughton gave a short talk in his customary felicitous manner, and was followed by Dr. Henry M. Howe, who read an address in which the ingrained criminal nature of the Teuton beast was properly appraised. Then came Charles M. Schwab, who made his audience forget all need of artificial stimulation. It is a pleasure to listen to Mr. Schwab. Among his jocular references he mentioned a cartoon in "Life" depicting the sadness of the Kaiser in his realization that men with two such good names as Schwab and Schneider had

Courtesy Iron Trade Review
CHARLES EUGENE SCHNEIDER

caused him so much trouble. The name Schneider, is evidently, however, not pronounced like that of Rip Van Winkle's dog, but Mr. Schwab admitted his linguistic inability in this respect. Brigadier-General McCloskey was then introduced, (promoted from Colonel McCloskey on the souvenir program) and gave an entertaining talk on how some of the products of the Schneider works were employed in crushing Germany.

The medal was then presented in the conventional manner, after which Dr. Schneider made a fitting speech of acceptance. The present medalist is the first foreigner to be thus honored, if we may class as a foreigner one who can speak perfect English and without whose aid America's effective entry into the Great War would have been postponed many months. Dr. Schneider has just that accent which makes English, when spoken by a Frenchman, so alluring. Co-operation was his main theme. International co-operation was declared to be as important in peace as in war, for insuring the welfare of nations, and it is for the promotion of this idea that the French Economic Mission, of which Dr. Schneider is chairman, is visiting America.

Flotation at Picher, Okla.

Machines Operated Intermittently at Small Mine—Copper Sulphate Used to Obtain High Recovery of Lead-Zinc Sulphides

BY VAL LOTH

FLOTATION has proved its adaptability in the concentration of the lead-zinc sulphide ores of the district around Picher, Okla., as it has in many other parts of the world. The ore, or dirt, as it is called locally, is cherty, and much of the mineral is finely disseminated. Fairly coarse ore is jigged, the next finer product is tabled, and the very finest, preferably passing 80 or 100 mesh for the best results, is treated in a flotation machine of the mechanically-agitated type. Most of the mines are small, and for this reason continuous operation of a flotation plant is not always possible. The finely ground ore may, when necessary, be allowed to accumulate in a Dorr thickener, and the flotation machine run for several hours until the tank is emptied. The rakes of the thickener, of course, are stopped while it is filling, and should not be put in motion until everything is ready to start the flotation plant. The outlet of the tank can then be opened as soon as the mechanism is started.

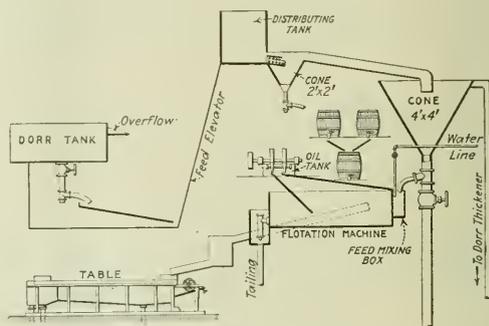

I have indicated in the accompanying sketch the flow sheet at one mill with which I am familiar. The faucet under the thickener is opened from one-third to full, depending on the moisture content of the tank product. The pulp is then elevated to a distributing box, from which it must pass through a box with 1-in. perforations to catch trash. The pulp from the distributing box is discharged into a 2 ft. cone, the outlet of which is kept slightly open. Material too coarse for flotation separates here and is sent to slime tables in the "sludge mill." The overflow from this cone passes to a 4-ft. cone, which discharges through a faucet to the mixing box of the flotation machine. Pulp in excess of that required by the flotation unit is returned to the Dorr thickener by the overflow from the cone. When the flotation machine is closed down the cone is drained through a 3-in. stopcock. Clear water may be admitted to the mixing box in order to dilute the pulp if too thick. The proper degree of dilution is obtained by regulating the supply of either the clear water or the pulp from the cone. Thick grayish froth usually indicates too thick a pulp; thin froth resembling soapsuds indicates that the pulp is too thin. When the dilution is right, fairly large golden bubbles will prevail at the intake end of the machine, shading down to fine whitish gray bubbles at the other end. The proper amount of pulp may be determined by looking at the 3-in. pipe overflow at the tailing end of the machine.

Wood creosote in connection with copper sulphate solution gives the best results on local ores, with the R. S. B. and K. & K. machines used. Each is dropped into the mixing box, though most of the creosote used is added to the spray water employed to break down the froth. This, in time, returns to the Dorr

thickener, so that it is not lost. Wood creosote by itself works well, but it has a tendency to bring up a lot of gangue, unless copper sulphate is added in large quantities. The latter chemical seems almost essential to secure good results on these ores. A dilute solution, 1 to 2 lb. to a barrel of water, is preferable to a saturated solution, as the flow is easier to regulate. The solution is made up alternately in two barrels.

In cold weather, steam is used in the mixing box. It is led through a 1/2- or 3/4-in. pipe, which passes inside the 1 1/4-in. pipe carrying the oil. This keeps the oil very thin, even in cold weather. The outlet of the steam pipe is about 3 in. below the pulp level in the mixing box.

The flotation concentrate is carried by a launder to a table, where the zinc and lead sulphides are separated, and any floated gangue is removed. Table middling is taken off over a length of from 2 to 3 ft., and is run back to the feed elevator leading to the distributing box. The tailing is returned to the Dorr

FLOTATION MILL FLOW SHEET

tank, carrying with it most of the oil used in breaking down the froth, which oil seems to be of distinct benefit at this point in two ways. The free sulphide particles suitable for flotation are oiled and sink to the bottom, where they are later drawn off ready to be floated. The finest slimes, possibly colloidal, which make trouble in the flotation machine, are floated off with the assistance of this oil, making the Dorr overflow cloudy. A cloudy overflow which gets rid of this troublesome exceedingly fine material is of great advantage, and it pays to circulate around through the thickener as much as possible the tailing from the table on which the froth is treated. Coal tar creosote is about the best oil to use for removing this colloidal matter, although I have found a mixture of two parts Du Pont wood oil and one part No. 2 wood creosote to be very good and to produce a high-grade concentrate.

The pulp should be kept as near to normal conditions as possible, and, when with proper regulation of the reagents, attention to the character of the froth and the amount of mineral in the tailing, and care to see that a cloudy overflow is maintained in the thickener, excellent results may be secured.

Production Statistics — Progress
in Important Fields

Drilling in British Columbia Meets Fair Success

Oil prospecting has been rousing considerable interest throughout the southern coast section of the British Columbia mainland during the last few months. A number of companies are engaged in drilling, and in one instance some success is reported. The Boundary Bay Oil Co., which is operating near Boundary Bay, has been drilling since last August and is down about 750 ft. At 686 ft. a flow estimated at between six and eight barrels a day was struck, and it now is reported that oil is flowing at about twenty-five barrels a day. This latter is through a test hole of 2½-in. diameter, projected beyond the 16-in. hole, and it is expected that oil will be tapped in commercial quantities when the 16-in. pipe is through to the present depth of the test hole. The Empire Oil Company is drilling in the vicinity of Langley, B. C., and is down about 1,100 ft. A slight showing of oil is said to have been encountered. The Pitt Meadow Oil Co. has run a 6-in. test hole about 2,000 ft., and the Spartan Oil Co., in the Burnaby district, close to Vancouver, is down about 2,000 ft. with a test hole, and is reported to be planning the starting of a commercial-sized hole.

California Oil Statistics for November

Crude oil stocks in the California oilfields for the month of November showed a decrease of 898,145 bbl., a daily average of 29,938 bbl. compared with the shortage in October of 30,288 bbl. daily, according to statistics issued by the Independent Oil Producers' Agency at Los Angeles, California. The November decrease wipes out the slight surplus hitherto shown and becomes a shortage for the eleven months of 1919 of 853,461 bbl., which is 2,555 bbl. per day.

Production in November totaled 8,197,784 bbl., or 273,259 bbl. daily, compared with 278,594 bbl. per day produced in October, indicating a decrease in November of 5,335 bbl. daily. November shipments amounted to 9,095,929 bbl., or 303,197 bbl. daily, compared with October shipments of 308,832 bbl. daily, a decrease in shipments for November of 5,635 bbl. daily.

There were 54 well completions in November with an estimated initial daily yield of 7,050 bbl. as compared with 42 completions in October with an estimated daily production of 5,775 bbl., an increase in November of 12 wells and 1,275 bbl. daily production. During November 60 rigs were put up, which is 6 less than the number built in October, which totaled 66. Producing wells for November

totaled 8,972 compared with 8,910 producing in October, an increase of 62. The production per well per day in November was 30 bbl. Drilling wells the end of November totaled 345 compared with 346 strings the end of October, a decrease of 1 string. Fourteen wells were abandoned in November compared with 27 in October, a decrease of 13.

Oil Prospects in Northern Alberta

Several large oil companies are arranging to enter the Athabasca and Great Slave Lake oilfields of northern Alberta next spring. Preliminary investigations by prospectors and geologists have induced the belief that a rich oil reservoir awaits development. The Standard Oil Co. is reported to be preparing to send two outfits into the large areas it has leased on Great Slave Lake to make a thorough exploration of them. The Anglo-Canadian Co., a consolidation of British interests, has had survey parties at work in northern Alberta for four years, has leaseholds covering 240,000 acres and has made contracts for development work covering five years. A. R. Coyne and W. R. Martin, of Medicine Hat, and several others interested are now on their way to London for consultation with the British directors of the company. The Shell Oil Co., also controlled by British capital, which some time ago unsuccessfully endeavored to obtain exclusive rights in a large tract in the Athabasca district, is again looking for leases of oil-bearing land. A number of smaller companies have been prospecting in the Far North, and a period of great activity is expected in the spring.

Oil Refining in Mexico

The President of Mexico, according to the October Bulletin of the Pan American Union, has done everything possible to establish in that country the greatest possible number of petroleum refineries, as he maintains that such plants are the most important part of the petroleum industry. At present there are only four operating refineries in Mexico, but work will soon begin in those which are now being erected by the Texas Company of Mexico and the Atlantic Refining Company. The total capacity of those refineries so far established amounts to 90,000 bbl. per day, and 22 per cent of the total of the exported petroleum is represented by the refined article.

California Oil-Well Activity.—For the week ended Nov. 1, 1919, according to the Department of Oil and Gas of the California State Mining Bureau, there were 19 new oil wells started, bringing the yearly total to 567, as compared with 619 in 1918, at the same date. Tests for water shut-offs numbered 22, deepening or redrilling jobs amounted to 10, and 5 wells were abandoned.

ITEMS FROM TEXAS AND LOUISIANA OIL FIELDS

Homer Proving Wonderful Oil Field

Several 20,000-Bbl. Wells Brought In—Other Fields Also Add Considerably to Louisiana Production

The Homer Oil Field, in Claiborne Parish, on the northern edge of Louisiana, is proving to be one of the most important oil discoveries in the United States. Already several wells have been brought in, each producing more than 20,000 bbl. a day. The chief producing company in this field to date is the Standard Oil Co. of Louisiana, a subsidiary of the Standard Oil Co. of New Jersey. This company has recently completed a refinery at Baton Rouge, where all of its production from this field will be handled. The development at the Homer field has been so phenomenal and successful that oil men are already leaving the great producing fields of North Texas for the Homer field.

In addition to the Homer, the development of the Bull Bayou, Caddo, Gusher Bend, and Pine Island fields will greatly increase Louisiana's oil production. A new company to operate in Louisiana is the Eagle Petroleum Co., of Houston, Tex., which will drill in Claiborne and De Soto parishes.

Austin Correspondence New Pipe-Line Rules of Railroad Commission—Burk-Senator Dispute—Recent Charters—General Land Office Receipts

The new pipe-line rules issued by the oil division of the Texas Railroad Commission do not contain the clause requiring the obtaining of permission from the owner before laying lines over private land. This affords considerable satisfaction to the pipe-line companies. The permission of the commission, however, must be obtained; is good for only one year, and may be revoked at any time if it is shown that there is wastage of oil. Rule 37 prohibits the drilling of an oil well within 300 ft. of any other drilling or completed oil well on the same or other tract of ground, and also prohibits the drilling of a well within 150 ft. of a property line. The commission has authority to suspend this rule upon the proper showing of any company desiring to drill.

In the Burk-Senator oil land dispute, between Oklahoma and Texas, the latter state won what is considered to be the first point in the argument before the U. S. Supreme Court, when, on Nov. 30, the U. S. Attorney General's office refused to support Oklahoma's claim before that court. Frank K. Ne-

beker, Assistant Attorney General, will make a personal investigation of the boundary line. The land involved comprises 64,000 acres of the richest oil-producing area, and is now controlled by a receiver.

Oil Corporations Chartered recently are: Belle City Oil Co., of Cement, Okla.; capital stock, \$500,000; Texas headquarters, St. Jo, Montague County; James Wiley, agent. United American Oil & Gas Co., of Dover, Del.; capital stock, \$200,000; Texas headquarters, Wichita Falls; E. F. Johns, agent. National Petroleum & Refining Co., of Delaware; home office at Fort Worth, Tex.; capital stock, \$10,000,000; C. S. Woods, Fort Worth, agent. Allouette Oil Co., of Boston, Mass.; capital stock, \$2,300,000; Texas headquarters, Austin; I. D. White, agent. Perfection Oil Co., of Dallas, Tex.; capital stock, \$25,000; incorporators, C. D. Cain, Ewing Howell, and S. S. Hopkins. Dunlap-Delaney Oil Co., of Beaumont, Tex.; capital stock, \$75,000; incorporators, W. B. Dunlap, Ward Delaney, of Beaumont, and Kirck Hillyer, of Fort Bend, Tex. The Boger Oil Co., of Phoenix, Ariz.; capital stock, \$4,000,000; Texas headquarters, Dallas; C. D. Mims, Austin, Tex., agent.

The General Land Office receipts for the month of November were \$600,000. This money represents the principal and interest on land purchased, and payments for oil leases on state lands. This is the largest amount ever collected in one month by this office.

West Columbia Most Active Field in Brazoria Co., Tex.

The chief activity in Brazoria Co. is at West Columbia, where the production for the last week in November was about 19,000 bbl. daily. The larger producing companies are the Humble Oil & Refining Co., Texas Co., Crown Oil & Refining Co., and the Sun Oil Co. The important wells recently completed in this field are the Texas company's No. 21 Hogg, which produced only salt water at a depth of over 3,300 ft., and the Sun company's No. 3 Robinson, which came in making 7,000 bbl. per day, but which rapidly decreased to 4,000 bbl., with considerable water.

The Damon Mound Oil Co. will resume operations at Damon Mound in the near future.

The Gulf Pipe Line Co., of Houston, recently purchased considerable acreage in the old town of Quintana, below Freeport, Brazoria County, at the mouth of the Brazos River, where it will build an oil-loading dock for ocean-going tank steamers.

Goose Creek Field, Texas, Producing 15,000 Bbl. Daily

The Goose Creek field, in Harris County, is producing 15,000 bbl. per day. The larger companies are the Republic, the Gulf Production Co., and the E. F. Simms Oil Co.; the Gulf Co. producing over one-third of the total. No. 7 Jones-Stateland well, of the Humble Oil & Refining Co., is pumping 250 bbl. The No. 3 Hogg Island is bailing, and the No. 6 Gillette is arranging to pump; both belong to the Crown Oil & Refining Co.

In the Humble field, Harris County, a new well of importance is that of the Texas Co. on Hermann ground, flowing 800 bbl. daily from 3,300 ft. For some time only small pumpers have been obtained in this field, and this well may prompt new operations.

In the Sheldon district, Harris County, northeast of Houston, several wells are being drilled, the deepest being over 3,000 ft., but so far without results.

Three Companies Now Drilling in Markham Field, Texas

In Matagorda County three companies are drilling in the Markham field. The Texas Co. is down over 2,000 ft. in its No. 6 Hudson well, and indications are good. The Clem Oil Co. has cut off salt water at about 1,480 ft. in the Meyers well and will make a test. Dr. Griffith's Northern Irrigation well No. 6 was 1,650 ft. deep, at last reports. The only work elsewhere in the county is the Triumph well, on Hawkins ranch, which is ready to start drilling, and the Allen Oil Co., east of Gulf, recovering casing from its abandoned dry well, No. 1 Baer. Recently a wind storm blew over for the second time the derrick at this well. The Texas Gulf Sulphur Co., has filed an amendment to its charter, increasing its capitalization from \$5,000,000 to \$7,600,000.

The Cueba Oil & Gas Co. has contracted to have its first well drilled. The company owns a lease on 200 acres in Clay County, seven miles southeast of Petrolia.

7,000 Bbl. Daily From Hull Field

The Hull field, in Liberty County, is producing about 7,000 bbl. daily, with the Republic Production Co. and Gulf Production Co. making the most oil. A well recently brought in by the Sun Co. is said to be making a good production by flowing. Another development of interest here was the blowing out of the Empire Gas & Fuel Co.'s No. 1 Barngrover well, when considerable gas escaped. The Gulf Production Co. will at once drill an offset to this well.

Political and Commercial Geology Series

The Petroleum Resources of the World—Part I.

Oil, Most Often Found in Tertiary Rocks, Is Widely Distributed Throughout the World—United States Now Furnishes 66 Per Cent of the Total Consumption of All Countries

BY JOHN D. NORTHPROP
Former Geologist of the U. S. Geological Survey
Revised and abridged for "The Journal"

COMMERCIAL accumulations of petroleum are everywhere restricted to strata of sedimentary origin. In the United States, petroleum is produced commercially from strata of all periods, from Cambrian to Quaternary, the most prolific sources being in strata of the Carboniferous and Tertiary systems. The principal sources of petroleum production in each of the other oil-producing countries of the world are indicated in the following table.

GEOLOGICAL OCCURRENCE OF PETROLEUM

Country	System
North America	
Canada	Silurian and Devonian
Mexico	Cretaceous and basal Tertiary
Alaska	Tertiary (?)
West Indies	
Trinidad	Tertiary
Cuba	Cretaceous and pre-Cretaceous
South America	
Colombia	Cretaceous and Tertiary
Venezuela	Cretaceous and Tertiary
Peru	Tertiary
Argentina	Jurassic, Cretaceous and Tertiary
Europe	
Russia	Tertiary
Rumania	Tertiary
Galicia	Tertiary
Italy	Tertiary
Germany	Tertiary and pre-Tertiary
Asia	
India	Tertiary
Turkestan	Tertiary
Persia	Tertiary
Africa	
Algeria	Tertiary
Egypt	Tertiary
Oceania	
Japan	Tertiary
Dutch East Indies	Tertiary
New Zealand	Cretaceous and Tertiary

From the foregoing alignment the conclusion might appear justified that a direct relation exists between the distribution of Tertiary rocks and the world's petroleum supply, were it not for the fact that in the United States, where two-thirds of the world's current supply of this mineral is produced, and where the quest for petroleum has, under scientific direction, included the entire range of the stratigraphic column, petroleum is found in considerable quantities in the rocks of each geologic system younger than the Cambrian.

The fact that seeps and other surface indications of petroleum are generally more pronounced in the relatively younger Mesozoic strata than in the older Paleozoic formations, and the further fact that geologic exploration for oil and gas in countries other than the United States has been restricted in the main to areas containing the most pronounced indi-

cations of petroleum, tend on the one hand to account for the predominance of the Tertiary system in the foregoing table and on the other hand to indicate the fallacy of attempts to estimate the world's reserves of petroleum on stratigraphic evidence alone.

Estimates of National Petroleum Resources Hazardous

Despite the broad geologic range of petroleum, its occurrence in specific members, formations, groups, series, or systems is by no means universal, being restricted rather to specific localities in which are fulfilled certain variable relations, as yet little understood, involving (1) the constitution, sequence, and content of organic matter of the sediments; (2) the nature and degree of metamorphism they have undergone; (3) their structure; and (4) their degree of saturation with salt water. Because of the fact that the most detailed geologic work is insufficient to provide a basis for the appropriate evaluation of the numerous factors involved, and because only a relatively small percentage of the areas of sedimentary rocks in the world have been examined geologically in any appreciable detail, any estimate of the future supply of petroleum in the world is peculiarly hazardous.

Geographical Distribution Wide

The geographical distribution of petroleum is as wide relatively as its geologic range. The oil fields of present commercial significance are situated, in the order of their importance as contributors to the world's production of petroleum in 1917, in the United States, Russia, Galicia, Mexico, Dutch East Indies, India, Persia, Japan and Formosa, Rumania, Peru, Trinidad, Argentina, Egypt, Germany, Canada, Venezuela, and Italy. Small quantities of petroleum have also been reported from Guatemala, Honduras, Costa Rica, Panama, Haiti, Porto Rico, Bolivia, Chile, Spain, Arabia, China, Australia, Papua, Philippine Islands, Nigeria, Belgian Congo, Gold Coast, Madagascar, and elsewhere.

In the opinion of the author the most conspicuous developments affecting the sources of the world's supply of petroleum in the next decade will take place in the countries that border the Caribbean Sea and the Gulf of Mexico. Within the last four years the annual production of petroleum in Mexico has increased from 21,000,000 bbl. to 56,000,000 bbl., and the potentialities of future production in that country have been demonstrated to be almost beyond comprehension. Its product, originally considered valuable only as a source of fuel oil, is now yielding, by modern refining methods, increasingly important

*The basis of this article by Mr. Northrop was issued in mimeographed form for government use only, as one of the Political and Commercial Control series prepared under the direction of J. E. Spurr, and after the armistice the remaining copies were released to the general public. In this article of Mr. Northrop's the Editor has incorporated certain later notes and additions; as, for example, information furnished by E. Russell Floyd, of the U. S. Geological Survey; A. G. White, and W. E. Perdue, of the Bureau of Mines, and others.—J. E. S.

percentages of illuminating oils and gasoline. The only obstacles to enormously increased production are unsettled political conditions and inadequate facilities for marine transportation. These obstacles will doubtless be overcome within the next few years, and barring unforeseen contingencies, Mexico will probably rank second among the oil-producing countries of the world in 1919, if not in 1918.

Resources of Colombia and Venezuela

Judged by the results of exploratory work already done in Venezuela and Colombia, both of those countries are destined to become appreciable contributors to the world's supply of petroleum within the next decade. Within recent months Colombia has furnished sufficient evidence of its ability to supply high-grade petroleum from wells of large individual capacity to warrant the large interests holding concessions there in exerting every effort to overcome the adverse natural conditions that have so long barred the way to exploitation of Colombia's petroleum resources. Enough drilling has already been done in Venezuela to demonstrate that the resources of heavy-gravity asphalt-base petroleum in that country are large, and the recent installation of a modern petroleum refinery for the treatment of these oils on the island of Curacao, off the Venezuelan coast, has provided the market necessary to active field development.

In Trinidad the production of petroleum, which is at a rate in excess of 1,500,000 bbl. a year, has doubled in the last four years, and with the increased facilities for ocean transport of petroleum that will be available at the end of the war in Europe, its further increase is assured.

Cuba is not expected to become an important producer of petroleum, and present knowledge concerning the petroleum resources of the Central American countries is not such as to warrant the belief that oil fields of material consequence will be developed in any of them.

United States Production Now a Maximum

Petroleum production in the United States is expected to reach its maximum this year and to decline steadily hereafter, though this country is expected to remain the leading oil-producing country of the world for the greater part, if not all, of the coming decade. With regard to the oil-producing countries of North and South America not already mentioned, no significant changes in their present status are now anticipated.

The petroleum resources of Russia (including Asiatic Russia) are believed sufficient to assure for that country its position as the leading producer of petroleum in the Eastern Hemisphere far beyond the next decade. Its production in the last four years has been obtained under great difficulties, and as a consequence has been no measure either of its present productive capacity or its potentialities. Concerning the future of Russia as a source of petroleum, Arnold¹ says: "Such large areas, both in European and Asiatic Russia, yield such unmistak-

able evidence of the presence of oil in large quantities that it is to this country, among those of Europe and Asia, to which the future must look for a supply."

Endowed as Russia is with petroleum reserves, both proved and prospective, of great magnitude, the ultimate position of Russia as the leading oil-producer of the world seems reasonably assured. Its immediate future is too intimately involved in the chaos of political Russia to warrant forecast.

Rumanian Fields Declining

The oil fields both of Rumania and Galicia are believed to have passed their maximum yield, and the possibilities of opening new fields of consequence in those countries are not considered sufficiently great to justify a forecast of anything but a moderate decline in production in future years. No material change in the status of the negligible oil fields of Italy or of Germany is anticipated at any time in the future.

With regard to the situation in Asia, it is believed that the next decade will witness a steady increase

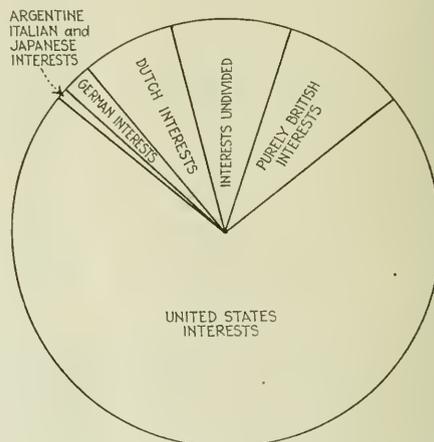

FIG. 1. POLITICAL CONTROL OF THE WORLD'S PRODUCTION OF PETROLEUM IN 1917

in petroleum production in India, and the probable development of one or more important oil fields in Persia and possibly in Asia Minor, Turkestan, and China. In Oceania, the same period will doubtless record material increase in the production of petroleum in Japan and Formosa and in the Dutch East Indies, together with the possible opening of new fields in Papua. Africa will probably receive considerable attention from oil operators in the next ten years, but on the basis of available evidence the results obtained in that period will hardly be of sufficient consequence to affect the world situation respecting petroleum.

The political control of the world's production of petroleum in 1917 is shown by the following table, and Fig. 1 shows the proportion of the world's production of petroleum contributed annually by each

¹Arnold, Ralph, "The World's Oil Supply." Report Am. Min. Cong., 19th Annl. Session, pp. 485-486, 1917.

of the principal producing countries in each of the last ten years.

POLITICAL CONTROL OF THE WORLD'S PRODUCTION OF PETROLEUM IN 1917

Source of Production	Quantity of Production (Barrels)	Percentage of Total	Country Exercising Political Control
United States	335,815,601	66.17	United States
Russia	69,000,000	13.62	Russia
Mexico	55,292,770	10.81	Mexico
Dutch East Indies	12,928,955	2.55	Holland
India	8,078,843	1.59	Great Britain
Persia	6,856,063	1.36	Persia
Galicia	5,965,447	1.18	Poland (?)
Japan and Formosa	2,898,654	.57	Japan
Rumania	2,681,870	.55	Rumania
Peru	2,533,417	.50	Peru
Trinidad	1,599,455	.32	Great Britain
Argentina	1,144,737	.23	Argentina
Egypt	1,008,750	.20	Great Britain
Germany	995,764	.20	Germany
Canada	205,332	.04	Great Britain
Venezuela	127,743	.03	Venezuela
Italy	50,334	.01	Italy
Cuba	19,167		Cuba
Total.	506,702,902	100.00	

Aside from the control exercised by Great Britain by virtue of its protectorate relation over the petroleum resources of Egypt, political control of the petroleum resources of the various countries is mainly by virtue of state sovereignty. This political control is strong in proportion to the strength of the government in the country exercising such control. The recent developments whereby the British government becomes the majority stockholder of a corporation controlling the oil resources of Persia, practically transfers political as well as commercial control of Persian petroleum from Persia to England.

Mexico's recently attempted firm political control of her vast petroleum resources depends for its success upon her diplomatic ability in dealing with the stronger governments of England and the United States, whose nationals have acquired commercial control which is threatened by Mexico's new and decided nationalistic policy.

California Oil-Well Records

State Mining Bureau Requires Complete Reports of All Drilling, and Advises Operators Concerning the Best Methods to Employ
BY SETH S. LANGLEY

SUPERVISION of field operations in the oil and gas industry by the State of California is the outgrowth of co-operative action by the large operators. Following the boom days of the Midway-Sunset field, it became apparent that, as the gas pressure was lowered by waste, water was entering the sands, and the future promised little encouragement. With the hope that the evils of gas waste and water encroachment might be controlled, the large operators formed the Kern County Protective Association in 1913. The members contributed to the employment of inspectors, or water commissioners, whose business was to supervise the field operations and, as the association's members controlled the pipe lines, it was possible to make non-members and sometimes antagonistic members abide by the judgment of the association. Similar organizations in other fields were formed about the same time, and in August, 1915, the State Mining Bureau took over the entire work.

The power given the bureau by the state legislature is broader in scope than the operators thought necessary, and even today some complaints are heard, but the work is honestly and skillfully done, with no political interference.

The Scope and Procedure of the Supervision

The notice of intention to drill is made out on a printed form (No. 105), and gives the location and description of the strings of casing which it is proposed to use. A reply is received, either approving or amending the proposal. All notices and reports are addressed to the Deputy State Oil and Gas Supervisor in charge of the district where the well is located. Should the well be in wildcat territory, the bureau will request a copy of the weekly progress reports. If the Well is to be drilled in productive territory, and the bureau has not the necessary data by which to check the proposed depths of shut-off, this information will be requested from the operator and his neighbors.

When the first string of casing has been cemented for water shut-off, notice of the fact is sent to the supervisor on another form (No. 106).¹ The operator allows the cement to stand several days and then makes a test. If this test is satisfactory, the Mining Bureau is requested to send an inspector to witness a second test. If this test is also satisfactory, the deputy later mails a statement of approval.

Should the test be a failure, it is usual for the operator and bureau to confer and decide upon a remedy. This remedy is incorporated in a supplementary proposal to the bureau on Form 123, and the approval is mailed to the operator, although the work may be, and probably is, finished before the correspondence is completed. Should it be found necessary to abandon the well for any reason, notice is given on Form 108, stating the present condition of the well and the proposed work. This is acknowledged and notification of the time of location and settling of the cement plugs, if such are used, is requested so that this work can be witnessed and approved.

Whatever the results of the drilling may be, a dry hole, producer, or mechanical trouble, the Mining Bureau is supplied with a complete log, as is given on Form 100, and also, a complete record of all work done since the last notice of test of water shut-off, or supplementary notice. This is done on Form 103; on Form 102, the history of the abandonment is furnished.

The foregoing procedure is a fair example of the close supervision exercised by the Mining Bureau. It may seem to the operator in other fields that there is an unnecessary amount of red tape attached to the California field operations. To the operator in a boom field, these restrictions would seem intolerable, but the monthly production reports of the next ten years depend upon a mechanically good well, and are of greater importance to the stockholders than the flush production of today or next month.

¹Copies of these forms may be secured from the California State Mining Bureau, Sacramento, Cal.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

War Minerals Summarized

A summary of the work of the War-Minerals Relief Commission has been made to Congress in conformity with the provision of its organic act. The following tabulation summarizes the work and the expenditures of the Commission up to Nov. 29:

WORK AND EXPENDITURES OF WAR-MINERALS RELIEF COMMISSION UP TO NOV. 29.	
Total number of claims originally filed.....	1,203
Number recommended for action to Nov. 29, 1919.....	472
Number of claims remaining to be considered.....	731
Total amount of all claims.....	\$16,655,481.94
Amount of the 472 claims already considered.....	\$3,245,486.95
Amount of claims remaining to be considered.....	\$13,309,994.99
Total number of claims recommended for disallowance.....	442
Amount claimed in those disallowed.....	\$1,946,374.23
Total number of claims recommended for partial allowance.....	30
Amount claimed in those partially allowed.....	\$1,399,112.72
Amount recommended to be allowed.....	\$418,502.79
RECAPITULATION	
Amount of appropriation.....	\$8,500,000.00
Amount of awards recommended.....	\$418,502.79
Administrative expenses to Nov. 29, 1919.....	\$147,431.25
Balance.....	\$7,934,066.96

The relatively large proportion of disallowances up to the time of the report should not be taken as an index for the future, it is pointed out, for the following reasons:

First. The commission naturally eliminated initially, as far as possible, claims which on their face admitted no request or demand.

Second. Some of the largest and most complex claims, requiring establishment of principles, demanded an excessive amount of time and study.

Third. The examinations by engineers and auditors of most of the claims on which some award must be made are not yet complete.

Although the commission does not attempt to foretell that the average allowance on claims will continue to be 30 per cent of the amount asked, the unqualified statement is made that the appropriation of \$8,500,000 will be ample for the adjustment of all of the valid claims.

Pittsburgh as Basing Point for Steel

The general conviction that there will be no abolition of the long-established practice of using Pittsburgh as a steel price basing point has been strengthened as a result of the arguments which have been presented in a hearing before the Federal Trade Commission. John S. Miller presented the arguments for the Western Association of Rolled Steel Consumers and the other complaining interests. His argument was based on the allegation that the single price basing point is a violation of the Clayton Act.

Steel fabricators in the Chicago district, he declared, are debarred from competing eastward because they must pay \$5.40 a ton fictitious freight rate on fictitious transportation from Pittsburgh on steel produced in the Chicago district. On the other hand, Eastern fabricators now place most of their products in the Chicago market on an even competi-

tive basis with the Chicago fabricators. For that reason, he pointed out, the Chicago fabricators lose the natural benefits of nearness to market.

R. V. Lindabury, general counsel for the United States Steel Corporation, defended the Pittsburgh base. As Chicago producers can supply only one-half of the Chicago demand, he asserted, Pittsburgh, which supplies the other half; necessarily dominates the price. Frank H. Scott, of the Steel & Tube Co. of America, said that the 6,000,000 tons of steel produced in the Chicago district cannot supply the demand of that district. L. A. Manchester, of the Youngstown Sheet & Tube Co., described the Pittsburgh base as a unit of measuring prices, just as there are standards of weights and measures.

Horace Pomeroy Appointed to War-Minerals Relief Commission

Horace Pomeroy, of Palo Alto, Cal., has been designated by the Secretary of the Interior as a member of the War-Minerals Relief Commission to fill the vacancy caused by the death of Dr. M. D. Foster. Mr. Pomeroy is a mining engineer with a long practical experience. He was born in Mercer, Pa., but obtained his early education in public schools in Oregon. He was graduated from Leland Stanford University in 1897 and then returned to Oregon to assist his father, also a mining engineer. Soon after obtaining his engineer's degree, Mr. Pomeroy was engaged in contract work in Oregon mines. In 1902 he was appointed engineer at the King of Arizona mine, at Kofa, Ariz., becoming general superintendent in 1903, in which position he continued until 1908, when he resigned to become general manager of the Banco de Oro property at Magdalena, Sonora, Mexico. After two and a half years in Mexico, Mr. Pomeroy returned to the United States to follow general consulting work. In addition to such work, he has also been general manager of the Mammoth Development Co., Ariz., for the last two and a half years.

Government Sells Brass

Practically all of the supply of surplus brass of a non-commercial size held by the Ordnance Department was sold Dec. 10 to the Van Dyke Smelting & Refining Co., of New York. The sale, which comprises 5,000,000 lb. of brass in the form of 60-40 rods, in sizes of 1¼ in. and larger, was negotiated on the basis of \$13.11 per 100 lb., f.o.b. cars in the present location. Most of the material is in the Boston district. On the basis of the value of the metal content of the material sold, the price of \$13.11 per 100 lb., according to Government officials in charge of the sale, represented a satisfactory return to the Ordnance Department. The price paid the Government for the material was \$721,050.

Northwest Magnesite Manager Testifies at Tariff Hearing

The principal witness appearing before the subcommittee of the Senate Committee on Finance during the hearing of arguments for a tariff on magnesite was Roy N. Bishop, general manager of the Northwest Magnesite Co., of Chewelah, Wash. Mr. Bishop thought that the House Committee had fixed its rates on magnesite without accurate knowledge as to costs of producing magnesite in Austria. He supplied more accurate information in that connection by filing with the committee a cable dispatch from the American Consul General at Vienna setting forth that the cost of magnesite laid down at Trieste is \$12.30 per ton. Of that amount labor represents \$2.39 per ton. He pointed out in addition to the lower production costs there is also the important matter of the rate of exchange. Mr. Bishop explained how the fall in exchange operates as a bounty on Austrian production. During the course of his remarks, he made the following statement:

Because we put three-quarters of a million dollars into a plant and develop magnesite, so badly needed by the country during the war, we were charged in the hearings before the Ways and Means Committee with being a monopoly. A complete refutation of that is that we only own one-eighth of the raw material in the United States. We never have produced more than 35 per cent of the magnesite produced in the United States, and as soon as a tariff is placed on magnesite those who own the other seven-eighths of the raw material will become very active competitors.

We have been producing from five kilns and can produce about 9,000 tons a month. We have increased our plant since the war by adding one kiln. We got an average price of \$29 a ton at the plant. The cost of production is a little over \$21 a ton.

We sold magnesite during the war at that same price, but those to whom we sold it, the refractories people, who in turn sold it to the steel companies, sold it with an addition of about \$10 a ton on our price, so that for practically endorsing the bill of lading, they made a greater profit out of the magnesite than we did. The agreement with the refractories companies has expired. Since the hearings before the Ways and Means Committee, I have sold magnesite up to \$30 a ton, depending upon the quantity the buyer takes, and have specified that if these buyers sell it for over \$32.50 a ton, that I would cease selling to them and quote magnesite direct to the trade. Although I do not care to go into the retail business, I did that to protect the steel companies.

In a reference to the War-Minerals Relief Act, Mr. Bishop said: "If we had waited until the government realized the necessity for magnesite, and perhaps called us slackers, we then would have come within the provisions of the relief measure and have been remunerated for our losses. But we did not come in under that because we anticipated the shortage of the material and went ahead before the government urged us to do so."

Would Continue Explosives Control

Extension until June 30, 1920, of the war-time law regulating the manufacture and sale of explosives was recommended to the Senate Dec. 23 by President Wilson. The President transmitted a letter

from Secretary Lane saying he thought this advisable because of "the present conditions of economic unrest."

Anti-Dumping Bill Passes House Ways and Means Committee

Though the Fordney anti-dumping bill is a composite of several proposed measures, and had the approval of several Government agencies concerned, the chances are that the measure will be changed considerably by the Senate. The plan of the House bill is outlined substantially in Section 9 of its bill, which reads as follows:

That whenever merchandise, whether dutiable or free, is exported to the United States of the class or kind provided for in this act, and the sales price is less than the foreign home value, or in the absence of such value is less than the value to countries other than the United States, or in the absence of such value is less than the cost of production, there shall be levied and collected, in addition to the duties on imported merchandise prescribed by law, a special duty in an amount equal to the difference between the sales price and the foreign home value or the value to countries other than the United States or the cost of production, as the case may be.

To the above section was added the following amendment suggested by the Democratic floor leader and approved by the majority members of the committee: "This section shall not apply to any article imported, the like of which is not produced in substantial quantities in the United States, the same to be ascertained, determined, and promulgated by the Secretary of the Treasury.

The bill had the approval of all members of the Ways and Means Committee, and the bill was passed without a rollcall. It is believed that the bill, when it emerges from the Senate, will embody in it certain requisites desired by the Tariff Commission which will make its enforcement easier. This is one of the great difficulties of such legislation, it being a hard matter to obtain proof of dumping.

New Regulations Cover Borax Content of Potash and Other Fertilizer

Drastic regulations were put into effect by the Department of Agriculture on Dec. 9 with regard to the borax content of fertilizer. It is expected that these regulations will have a decided effect on the domestic potash industry, particularly from the fact that the matter of tariff rates for imported potash is now under consideration by Congress. The Department states officially that apparently most of the potash salts available for fertilizer use in the spring of 1920 contain more or less borax. It also has been discovered that nitrate of soda as imported contains some borax.

Fertilizer containing more than one-tenth of 1 per cent of borax cannot be used safely, the department finds, when the seeds or plants come into virtual contact with the fertilizer. In cases where the fertilizer is broadcasted, and thoroughly mixed with the soil, as much as 10 lb. per acre of borax may be applied without menace to plant life.

Fertilizer manufacturers and others handling their product must indicate plainly on the container the amount of borax content when it exceeds 2 lb. per ton.

Tariff on Chrome Ores

Representative Kahn, of California, has introduced a bill to levy a protective tariff duty on imports of chrome ores and their products. The proposed duty is itemized as follows:

First, on crude chrome ores and chromium ores and concentrates thereof, the sum of 60c. per unit of Cr_2O_3 content therein contained, a unit being defined as being 1 per cent of Cr_2O_3 contained in a net ton of 2,000 lb.

Second, upon ferrochrome, and other metallic alloys containing chrome, 11½c. for each pound of metallic chromium contained therein.

Third, upon refractory brick and material used for refractory purposes containing chrome, the sum of 65c. per unit of Cr_2O_3 ; a unit being defined as being 1 per cent Cr_2O_3 contained in a net ton of 2,000 lb.

Fourth, upon chemical compounds and articles manufactured therefrom containing chrome or chromite, 90c. per unit of chromium content; a unit being defined as being 1 per cent of chromium contained in a net ton of 2,000 lb.

War Department to Sell Acid

Sulphuric acid to the extent of 43,880,000 lb. has been declared surplus by the War Department. Proposals for its purchase were received by the Director of Sales up to Dec. 23. In addition to the sulphuric acid, other acids have been declared surplus as follows: Nitric acid, 829,000 lb.; mixed acid, 17,138,000 lb.; oleum, 6,153,000 lb., and acetic acid, 65,000 pounds.

Oldest Survey Member Dies

J. D. McChesney, one of the oldest members of the U. S. Geological Survey, died in Washington recently. With the death of Mr. McChesney, only one of the original thirty-nine members of the Survey remains in active service. That one is John H. Renshaw, the geographer at the head of the inspection division of the topographic branch.

Colorado Section, A. I. M. E.

The regular meeting of the Colorado Section of the American Institute of Mining and Metallurgical Engineers, held at the Colorado School of Mines, in Golden, on Dec. 11, was one of the most successful meetings ever held by the chapter. Forty-five members from Denver and vicinity and eighty-five junior members and guests attended. An excellent dinner was served, after which short talks were given by active and junior members. George J. Bancroft reviewed an interesting paper on the Great Granite Batholith of Central Idaho. The junior associate members of the Colorado School of Mines spoke of the relationship between the school and the Institute. The following facts were brought forth: There are seventy-five junior members in the school and forty-five applications are ready to be handed Mr. Stoughton. The total enrollment of the school is 425, an excess of fifty over any previous attendance.

The cosmopolitan nature of the school was shown, and talks were made by students of several nationalities. In the student body there are South Americans, Mexicans, Filipinos, Chinese, Hawaiians, English, Canadians, Javanese, Germans, Japanese, and Armenians.

By the end of the school year it is expected that there will be 250 junior members of the institute in the school.

The chief speaker of the evening, Bradley Stoughton, because of delayed trains was unable to be present. As one of the chief purposes of the meeting was to enable students in the Colorado School of Mines, junior members of the institute, to meet Mr. Stoughton, his absence was deeply regretted, and the announcement that he would speak to the entire student body of the school on the following morning was greeted with cheers.

Much credit is due Professor J. C. Roberts for his untiring efforts in behalf of the institute, and in making this meeting an unqualified success.

San Francisco Section of A. I. M. E.

SAN FRANCISCO CORRESPONDENCE

TWO wise men from the East galvanized the San Francisco section of the American Institute of Mining and Metallurgical Engineers into activity and a meeting following a dinner was held on the evening of Dec. 22 at the Engineers' Club. Horace V. Winchell, president of the institute, and Bradley Stoughton, secretary, did the trick. They were introduced by the chairman, Frederick W. Bradley, to the members of the institute and guests from other technical societies to the number of eighty or more.

Mr. Winchell brought greetings from the founder of engineering societies to the local sections and expressed their kind wishes to and keen interest in the activities of the local sections. In brief, Mr. Winchell's remarks were as follows:

"I feel it a privilege to be in a state which is known so widely for its products, climate and men and which has a long and honored history of mines. You have opportunities here not only for tired workers but for untired workers. I congratulate you on the fact that one of your greatest men and engineers, Herbert Hoover, will be the next president of the American Institute of Mining and Metallurgical Engineers.

"We as engineers have devoted ourselves too closely to engineering and in so doing it is perhaps true that the engineer has surrounded himself with an atmosphere somewhat circumscribed. I want to bring more prominently to you the need for co-operation. Engineers as a whole have not co-operated in solving problems of general interest to the community. There is the present need of co-operating with the local engineering societies and of co-operation between different sections of each state. There is a change to be noted in the sentiment towards such co-operation. Engineers of all classes have common interests in broad questions affecting communities as a whole. We need co-operation together

with constructive ideas and constructive ideas are best developed by the friction of discussion arising in local meetings.

"Important public questions are already before us and engineers are doing their share in solving our present difficulties. As a specific instance, take the national income tax. The mining industry is called upon to pay an immense income tax. Every mining company has prepared a report and 35,000 of these reports have been presented in which every single company wants special treatment from the federal officials. The Treasury Department, confronted by this task, has requested the American Institute of Mining and Metallurgical Engineers to appoint a committee to confer with the Treasury department. A committee was appointed and twenty-five engineers dropped their work, paid their own expenses and journeyed to Washington. With their assistants and legal advisers, over fifty met in a two-day conference at Washington and arranged to meet later at Atlantic City. I was told by a representative of the Treasury Department that they were impressed by the fine response of these men who went to Washington. It seems to me that in this we are rendering a practical service.

"In the relations of capital and labor there is a field for the engineer. Many of our labor troubles are due to ignorance. Opportunities are overlooked daily for discussing difficulties that arise between workers and management. Where can the engineer use his knowledge to better advantage than in the education of the workers and operators to a better understanding? In Americanization there is another line of endeavor for engineers. Foreigners are revolutionists by birth and do not know the differences that exist in this country as compared with their own. There is need of more education along lines of Americanization.

"In the effort to persuade Congress to take an interest in governmental economy and the Department of Public Works, the engineer is undertaking a work of great public importance.

"If we are successful in our efforts to co-operate, the outcome will have an equally beneficial effect upon the engineer himself. The need for this co-operation is vital. We are too modest. We are not public speakers. We are workers. We don't want to express our opinions or volunteer our views. We wait until they are asked. What better right has the engineer than to assume leadership and bring his ideas out for the benefit of the public as a whole?

"There is something for us to do and do all the time. The engineer is in a favorable position to adjust the differences between capital and labor. We are in contact with both. We neglect our duty if we do not explain, bring together and smooth over difficulties. Thus may we lead in designing, constructing and building a bridge over the turbulent currents and whirlpools of human selfishness to industrial and country-wide peace and prosperity, so may we aid in the erection of the structure of an ideal democracy wherein are encouraged the development

of the individual and in which are realized the age-long aspirations of the multitude."

Secretary Stoughton discussed the get-together activity of engineers in all parts of the country. He said that every effort is being made on the part of the institute to support local sections. He briefly reviewed the co-operative effort of engineers at Denver, Spokane, St. Louis, Chicago, Pittsburgh, Washington, Birmingham, Atlanta and Philadelphia and in Minnesota. The get-together movement may be characterized as being nation-wide. There is a feeling, he said, that we must have some organized patriotism to overcome organized anarchy.

In commenting on licensing laws for engineers, Mr. Stoughton said that this subject was being discussed in different states and that there were a number of such laws already in force but most of them were bad laws. The Engineering Council has had the subject under discussion and has promised a good law. The mining engineers object to any license law at all. The importance of this subject was made clear to the members present.

The engineering societies are co-operating much more actively than ever before with governmental departments and the National Research Council. To correct a misunderstanding concerning the employment department of the institute, Mr. Stoughton explained that at present the four founder societies have co-operated in the establishment of a central employment organization under the direction of a board of directors consisting of the secretaries of the respective societies. The service is to be extended to every engineer whether a member of a society or not. The cost of the employment service amounted to \$14,000 in 1919 and \$12,000 had been appropriated for this work in 1920.

Mr. Stoughton next briefly discussed the American Association of Engineers and the relation existing between that organization and the four founder societies. He made it clear that there would be co-ordinated co-operation between the organizations but that there could be no division in the existing work of the founder societies.

Both addresses were exceedingly well received and at the conclusion of Mr. Stoughton's remarks, C. E. Grunsky, A. C. Lawson, T. A. Rickard, D. M. Riordan and F. W. Bradley expressed in short addresses the appreciation and concurrence in opinion of the members present with the speakers' views.

Trade With Germany

In a recent issue of Commerce Reports it was stated that on Dec. 1 the Minister of Economics of Germany issued a proclamation designating certain articles the exportation of which without special permit is punishable by imprisonment. Among these articles are the following: Iron ores, manganese ores, ferro-manganese, and ferrosilicates; iron, pig iron, steel, iron blocks, old iron, iron and steel scrap, and foundry products; anthracite and bituminous coal, briquets, and coke; lime, plaster, and cement; soda, potash, alkaloids, sulphate of sodium.

BY THE WAY

The Golden Rule

A pair of surveyor's boots, a Stetson hat and a corduroy suit do not make a mining engineer any more than a desk and two inkwells make an executive. The aforesaid articles of raiment together with much technical knowledge plus common sense and experience do often enter into the make-up of the successful engineer, but for all that, the clothing is but an incident. A knowledge of dynamite and a proper respect for its powers are among those things that even the undergraduate of a mining school is supposed to possess. The bohunk in charge of a muck stick generally knows something about dynamite, but frequently is lacking in respect for it, sometimes to his own undoing. Here is where the undergraduate supposedly differs from the bohunk. But the recent escapade of students of the Colorado School of Mines, as a result of which serious damage was done to the buildings of the University of Denver and loss of life might have easily occurred, leads one to suspect that the Golden boys are paying more attention to their clothing than they are to their studies. Doubtless the members of the faculty of this excellent school have of late years been often reminded of the story about the old professor who posted the notice that he "would lecture to his classes at 2 p. m." A facetious student erased the first letter of "classes," but the professor, chancing to note the change, went the wit one better by erasing the "l" as well, so that the bulletin read, "Professor A. will lecture to his asses at 2 p. m." Golden will do well to note that the war is over and high explosives are no longer in fashion.

Oil and Water

In the West Columbia oil field in Brazoria County, Tex., considerable trouble is encountered, due to some of the wells producing from 20 to 50 per cent of water along with the oil. Not far away in a water well drilled to a depth of 800 ft., the water has been found to be contaminated with oil, and as the well is sunk deeper more oil is encountered. We do not know whether this is considered hard luck or not. Many strange things pass as potable fluids nowadays, and oily water may not be such a bad drink provided enough oil can be separated to buy a suitable chaser. We are reminded of Bret Harte's poem "Dow's Flat," wherein is told the story of a hard-luck prospector who also dug a water well and found a gold mine. The last lines as we remember them were:

"It was water the durn cuss was seeking,
And his luck made him certain to miss it."

The old rule that oil and water won't mix may also have to be modified. Another popular misconception is that water will not run up hill. Engineers have proved that it will, but it costs money to make it do so.

A Leeching System

"Nature faking again," one exclaims, as he reads the advertisement of a mining company in Cheyenne, Wyo., in which it is stated that "Nature has built on our property a natural leeching system." The company, it is stated, is incorporated under the blue sky laws of Wyoming. But whatever confidence this fact creates, if any, is immediately destroyed by the legend in half-inch letters "We Simply Can't Lose, Invest With Us." The prospective purchaser is urged to write or wire his order because "Silver and copper are higher now than ever before. Our assays show value at \$119 per ton. Only five miles to railroad with a down hill haul." The descent to Avernus is easy. But it is the geological aspect of this bonanza that is most appealing. "The soft formation that forms the main substance of the claims," runs the ad, "will make it the fastest developed proposition of its kind in the West. Nature has built on our property a natural leeching system. For the past hundreds of years the surface water from rains and snows has been carrying down these veins the values they contained, and deposited them at a "cross fault" which crosses the main veins at the foot of the hill. Think of the concentrated values with only 300 ft. depth to go! Thus, as in many another case, we are impressed with the truth of the Scriptures declaring that all things work together for good to them that love righteousness.

Dies Irae

With December 17 safely passed and doomsday yet to come, we are all in position to scoff at the false prophecy of the self-styled meteorologist of San Francisco who saw in the planets a sign of coming disaster for the earth. It would have been unfortunate, indeed, to have had this happen with the holidays so near and the Journal's Annual Review Number in course of preparation. So much of interest would have thus been missed, so much labor wasted. And what a blow to geologists, who in a twinkling would have seen their strata, anticlines, faults and all, disappear in the final cataclysm! All of us would have been thrown out of work, at least, far more so than any combination of strikes could effect, but we opine that the geologist would suffer most of all. The world of ideas and ideals might still exist, but that of hard rocks, hot or cold, would have ceased to be. But it is more interesting to speculate as to the viewpoint of some of those who in anxiety awaited the last trump. It is reported, for instance, that several mines in the Miami zinc and lead field of Oklahoma closed down on December 17 because the miners refused to go underground with the prospect of the world crumbling to pieces while they were at work. One would imagine that for the miner, and especially for the smelterman, the hereafter would have the fewest terrors of all, as far as physical fear is concerned. Perhaps it was only healthy curiosity to see a great spectacle that made these men remain on surface. But, whatever the reason, another day of production was lost.

THE MINING NEWS

New York, December 27, 1919

Homestake Mills Start Three Hundred Stamps Out of 1020 in Commission—Mine Fire Extinguished

Two mills of 300 stamps of the Homestake Mining Co., Lead, S. D., were placed in commission on Dec. 9, following the recent mine fire which was declared extinguished on Dec. 1. Other stamps will start dropping as the unwatering of the flooded workings progresses. Ore is being hoisted from the upper levels of the mine which was flooded to the 500 level. Unwatering will probably be delayed, however, unless a supply of coal can be obtained. Mine rescue car No. 5 of the U. S. Bu-

reau of Mines it was a camp of some prominence. The Endowment, Black Hawk and other lesser known mines have a reputed production of some millions. The ore came from high-grade silver-lead deposits occurring usually in narrow streaks. The deepest of the old workings is said to be not over 500 ft.

There has been some work going on periodically ever since the old days, but since the Divide boom and the return of high-price silver the activity has been much greater, with the probability that the camp will be quite lively during the coming year.—J. L. Giroux, a local mine operator, is credited

with having acquired pitchblende property in Butt Township, Ont., preparatory to active exploration. The Elliott Syndicate, of Chicago, owners of the discovery claim, are pushing exploration work and assays of the ore obtained by them are stated to show 600 milligrams of radium per ton of pitchblende and 70 per cent of uranium oxide. It has not yet been ascertained how much pitchblende can be extracted from each ton of rock, as the mineral occurs in small particles scattered through the pegmatite. Owing to the weight of the pitchblende, which is about four times as great as that of the rock containing it, concentration is a comparatively easy process.

CYANIDE PLANT OF TROJAN MINING CO. AT TROJAN, S. D. NEXT TO THE HOMESTAKE PLANT. THIS IS THE LARGEST IN THE BLACK HILLS

reau of Mines has proceeded to Rapid City, S. D., where instruction will be given to the students of the State School of Mines in mine-rescue and first-aid work.

Control of Chrome, N. J., Plant Changes

It was announced on Dec. 15 that the U. S. Smelting Co.'s Chrome, N. J., plant has passed to the control of L. Vogelestein & Co. Further details will be published in subsequent issues of the "Journal."

Silver Mining Again Active at Marietta, Nevada

Marietta is in the Excelsior Mountains, about twelve miles northeast of Belleville, which is about the same distance northeast of Candelaria. About forty years ago during the days of

with the purchase of the old townsite with all the houses and buildings thereon, as well as some 400 or 500 acres of mineral ground in the vicinity. His plans have not been announced.—C. E. Noble and associates recently took over the Skinner property, which the latter has been working for some years and making occasional shipments.—D. B. Shepard, who is said to be associated with parties connected with the Crocker National Bank of San Francisco, is operating one of the mines and is said to be taking out some good ore. Miller brothers are working steadily and are also said to be taking out good ore.

Activity in Butt Township, Ont., Following Pitchblende Strike

The Mining Corporation of Canada is erecting buildings on its recently ac-

Utah-Apex Suit Continues

Testimony in the Utah Consolidated-Utah Apex controversy as affecting the first part of the suit regarding the Highland Boy limestone has been completed by both litigants, and the second part of the suit regarding the Yampa limestone is in progress. The point at issue is much the same as in the former case, involving the questions as to whether the limestone—in the present instance the Yampa limestone, apexing in the Utah Consolidated—is the lode, or as to whether the orebodies in the limestone are connected with the fissures, which apex in the Utah Apex. Perry G. Harrison, and Reno H. Sales, of the Anaconda Copper Co., have been on the stand recently testifying for the Utah Consolidated.

Federal M. & S. Co. Files Action Against Hecla Company

Hecla To Answer Only in Court—
Declares its Regular Dividend

Formal action has been filed by the Federal Mining & Smelting Co. against the Hecla Mining Co, Wallace, Idaho, in which the Federal company claims the apex of the east Hecla vein in the Russell claim and therefore all the ore in and heretofore extracted from the said vein on its dip under the surface of various claims owned by the Hecla between vertical planes representing the end lines of the Russell claim extended. Quoting the complaint the Federal company alleges "that the said defendant in extending the said workings from the Hecla mine into the Russell mine and into the veins therein, and in extracting and removing the ores therefrom, has done so wilfully and knowingly, secretly and wrongfully, and by such acts has carried away ore, the property of the plaintiff, exceeding in value the sum of \$6,000,000." The plaintiff asks judgment affirming its title to the Russell claim and to the Russell vein as described in the complaint; that the defendant and its employees be restrained from entering upon the Russell vein during the pendency of this suit and removing therefrom any ore, earth or rock; that a final decree be entered perpetually enjoining and restraining the defendant from entering upon the Russell claim or into or upon the Russell vein and removing therefrom any ore or substance whatever; and that the defendant be required to account for all ore heretofore extracted, and that the plaintiff have judgment for the full value of the same, together with interest and costs.

The action was filed in the U. S. District Court for the district of Idaho, northern division, at Coeur d'Alene, Idaho. John A. Marshall, of Salt Lake City, and A. H. Featherstone, of Wallace, Idaho, appear as attorneys for the Federal. John P. Gray, of Coeur d'Alene, Idaho, has been retained by the Hecla company.

In a letter to stockholders, dated Nov. 29, the Hecla company states: "Our answer to their (the Federal company's) complaint will be made only in court at the proper time. We may state, however, that the ore involved is only what is known as our East orebody and cannot affect the main orebody nor the Ore-or-No-Go, and that all ore mined by us has been taken from within our own lines. There is a great deal of misinformation being published on this subject—exaggerating the amounts involved and the probable effect on dividends. You are hereby notified that a dividend of 15c. per share will be paid from this office on Dec. 28, 1919, to

stockholders of record at the close of business on Dec. 1, 1919."

In the 1916 annual report of James F. McCarthy, manager for the Hecla company, it is stated: "This ore (of the East orebody) is remote from natural ventilation and not much can be done in the way of production until ventilation is provided. It requires a raise of approximately 1,400 ft. to reach the surface. One thousand feet of this raise is now completed and we should reach daylight in April. We have undercut this ore on the 900 level, which is 2,300 ft. below the surface, and have drifted upon it 150 ft. So far as one can judge from the small development, the ore is narrower than it was above and contains somewhat lower value in silver."

It is not likely that the case will come to trial until next summer or fall, as much time will be required by both companies in preparation, particularly the Federal, which must make a showing to connect its alleged apex with the Hecla workings.

Utah Employer Responsible for Workman's Insurance

A recent decision of the Utah Industrial Commission puts the workman's insurance, as required by the Workmen's Compensation Act, at the risk of the employing company taking out the insurance. Insolvency on the part of the insurance company does not relieve the employer of responsibility under the Compensation Act. The case in point was that of the American Fuel Co., which has been held responsible for compensation under the law, although the Guardian Casualty & Guarantee Co. is in the hands of a receiver and is unable to make a payment.

New Wage Scale Agreed Upon by Rochester Nevada Silver Co.

The Rochester Nevada Silver Mines Co. has entered into a new wage agreement with its employees which is to be effective until May 1, 1920. The present scale is \$5 for ordinary miners and \$5.50 for machine men, but under the new agreement the company will grant a bonus based on the average price of silver for each month as shown by the "Engineering and Mining Journal," subject to the following conditions:

(a) When the average price of silver for any month has been \$1.20 or less per oz., no bonus shall be paid and the regular wage scale will apply.

(b) When the average price for any month has been not less than \$1.21, and not more than \$1.25 per oz., a bonus of 25c. per shift will be paid.

(c) When the average price for any month has been not less than \$1.25 per oz., an additional bonus of 25c. per shift, or a total of 50c. per shift, will be paid.

Butte & Superior Accounting Filed

Company Maintains Sum Involved Is Not Properly Recoverable by Plaintiff

The Butte & Superior Mining Co. in accordance with the order of the federal court has filed with the United States District Court, in Butte, its accounting of the ores mined and milled during the time it has been adjudged to have been guilty of an infringement of the oil flotation process of the Minerals Separation Co. In this is shown valuation of \$451,096.96, which it is stated, includes total profits, gains and advantages. It also includes, the statement says, all ores mined and milled by the Butte & Superior Co. from the property of the Clark Realty Co., operating the Black Rock mine.

The statement says that the defendant is not to be regarded as admitting that the amounts are properly and legally recoverable by the plaintiff under the decree in the suit. It is stated that the defendant will prove that a large share of the apparent gains, profits and advantages are legally attributable to the work of the defendant's officers, employees and others in the development of the process and in the application of the same to such ores as the defendant has mined. There is also a statement to the effect that the account covers all ores mined and milled by the defendant without waiving any rights which defendant may have with respect to the subrogation of the ores or otherwise.

It is also stated that the defendant has not used a fraction of 1 per cent of oil on the ore in its flotation operations since June 4, 1919. During the period between June 5 and Sept. 30, 1919, the defendant, the statement says, has always used more than 1 per cent of oil. It is added that the books of the defendant show that the metallurgical results obtained by defendant by the use of more than 1 per cent of oil are at least as good as those obtainable by the use of fractions of 1 per cent of oil. It is claimed by the defendant that the apparent advantage to the defendant of its infringing acts is the difference in cost and that this difference will give the apparent profits, gains and advantages of the defendant from infringing acts. It is admitted that the cost of grinding is greater in the free process than in the infringing process, but defendant claims that the cost of heating in the free process is less than in the infringing process.

There is a table attached to the accounting statement which places the total cost of infringing operations from 1911 to 1919 at \$647,763. Additional costs which would have been incurred if the free process had been used are

set at \$545,736.08. Claiming that the cost of heating is less in the free process than in the infringing process, the defendant subtracts a heating credit of \$94,639.12 from the additional costs of the free process, so making the net difference in cost \$451,096.96.

The account is brought to infringing dates when Butte & Superior used less than 1 per cent of oil and has nothing to do with present operations, the Butte & Superior claiming that it is now and has been for a long time using more than 1 per cent oil.

Copies of the accounting have been given to the Minerals Separation Co.'s representatives and in due time an answer is expected. When the preliminary matters have been settled between the two concerns the accounting will come up in the federal court in Butte for final adjudication.

Seeks to Revive Hydraulic Mining in California

California Debris Commission Asks Increased Appropriation

An increase in appropriation has been asked by the California Debris Commission so that hydraulic mining may be resumed to a greater extent without injury to navigable streams. It is believed that a plan can be worked out for co-operative dam sites for the restraint of debris which would allow more hydraulic mines and an increase in the operations of quartz mines in the district without permitting tailings to find their way into navigable streams. It is also necessary to do additional work so that gold-dredging operations may be guided more intelligently.

The commission has received the following applications to mine by the hydraulic method: From B. S. Taylor, Old Channel mine near Gravel Range in Sections 33 and 34, Tp. 23 N., R. 7 E., and Section 3, Tp. 22 N., R. 7 E., M. D. B. & M., Plumas County. Tailings are to be impounded in Scotchman's Creek, one mile below the mine, and draining into the Middle Fork of the Feather River. From H. L. Berkey, New Council Hill mine, two miles south of Scales, Sierra County, who will impound tailings in the worked-out Council Hill mining pit, and draining into Canyon Creek. From Marysville & Nevada Power & Water Co.; the Grizzley Hill hydraulic mine, near Brandy City, Yuba County, Cal., to impound tailings in the North Fork of the Yuba River about one and a half miles below Bullard's Bar, draining into Cherokee Creek, and thence into North Fork of the Yuba River. It is to be hoped that these applications will be favorably acted on, and that the enterprises themselves will be successful ones, thereby helping to revive hydraulic mining in California.

Schwab Gets Control of United Zinc Smelting Corp.

Charles M. Schwab, chairman of the board of directors of the Bethlehem Steel Corporation, has acquired control of the United Zinc Smelting Corp., and plans are under way for the immediate development of the plant and its facilities. Further than this nothing has been given out regarding the transaction. Mr. Schwab has been elected a director of the company, B. Lissberger has been elected president, Otto Proelss, vice-president and general manager, and H. W. Lohman, treasurer.

The United Zinc Smelting Corp. was organized under the laws of New York in May, 1916, and owns 98 per cent of the common stock of the Kinefinck Zinc Co., as well as all of the capital stock of the Pearlman Co., Inc., which in turn owns the Clarksburg Zinc Co. Five zinc mines are owned through subsidiary concerns which produce a high grade of zinc concentrates, and the smelting corporation operates two large smelters and refineries, one at Clarksburg and the other at Moundsville, W. Va.

The capital stock of the corporation is 600,000 shares of capital stock without nominal or par value, a part of which was offered for public subscription at \$12.50 a share in 1916, and there is a bonded debt of approximately \$350,000 in 8 per cent serial bonds.

Coal Shortage Affects Operations in Birmingham District

Half the coal of the furnace companies of the Birmingham district, now going to the coke ovens, is to be diverted to commercial and domestic uses, it was announced during the first week of December. This will probably cut down coke supplies to such an extent as to cause the banking of fires at several of the furnaces in this district.

The demand for pig iron is very strong, in fact exceeds the output of furnaces of the Birmingham district and some companies have been forced to withdraw from the market, while others have sold through the first quarter of 1920. Very little business is being accepted as yet for the second quarter delivery.

Several furnaces were banked at the beginning of the coal miners' strike as a conservation measure, a long period of idleness it was believed being ahead of some of the coal mines. Since the beginning of the strike the Alabama company has blown in a furnace at Gadsden, Alabama. Just how long this furnace will be able to run is not known for at the time it went back into operation coal production in spite of the strike was nearly normal but since has dropped to an alarmingly low figure.

Minerals Separation, Ltd., Increases Capitalization Business Expansion and Proposed New Plants Given as Reason—John Ballot Resigns

The capitalization of Minerals Separation, Ltd., has been increased to £500,000 by the creation of 450,000 shares of £1 each. Of these 50,000 shares are to be offered to shareholders at a premium of £1 per share pro rata to their holdings. This action was taken at a special meeting held recently in London, under the chairmanship of Francis L. Gibbs.

As reasons for the increase in capitalization Mr. Gibbs gave the recent world-wide expansion of the corporation's business, as well as the fact that the company has acquired options on two large mineral deposits, on one of which it has already begun extensive drilling operations. This, Mr. Gibbs stated, is a copper deposit in Spain. The second is a large silver proposition containing a large body of rich silver ore available for immediate treatment by flotation. It was also stated that the company must spend large sums in the near future in erecting plants to prove on a commercial scale the value of certain other deposits acquired.

The policy of Minerals Separation, Ltd., according to Mr. Gibbs, is to acquire raw material on a large scale for treatment by the company's processes. The company, however, does not intend to relax its efforts to deal with other business on a royalty basis. On the contrary, it is expected that this part of the company's business will greatly increase.

Mr. Gibbs also announced that the company had recently made two important discoveries, both of which had been protected by patents. He refrained from divulging the nature of these discoveries but said that they cover a field not hitherto dreamed of as forming a part of the company's accustomed operations.

The resignation of John Ballot as chairman of Minerals Separation, Ltd., was accepted at this meeting. Mr. Ballot has resigned, it was stated, in order that he may devote his entire time to his duties as chairman of Minerals Separation North American Corporation.

Boston & Montana Development Co. Prepares to Erect Mill

Grading for the construction of the 500-ton flotation mill at the Elkhorn mines of the Boston & Montana Development Co., will undoubtedly be completed soon when the pouring of concrete will commence. This mill will have a base measurement of 430 x 156 ft. Seventy-five men are at work and it is proposed to increase this number

as soon as possible. The company is cutting its own lumber for the plant, the first carload of which is on the ground and it is estimated that it will be able to get all of its timber from nearby forests along the right-of-way of its recently constructed Montana Southern Ry. It will be necessary to ship in from the outside only about 25,000 cu. ft. of lumber.

Coal Supply Ample at Iron Mines on Michigan Ranges

Output of Hydro-Electric Plants Reduced by Water Shortage

The Marquette and Menominee Range mines, in Michigan, are well supplied with coal for the winter months, and there is some speculation regarding whether or not the fuel administration will ask to have some of the fuel transferred elsewhere. Agents went over the coal piles at mines on the Marquette Range and made estimates of the amounts in stock and then secured figures as to the requirements of the companies. The operators get in their coal during the period of navigation on the lakes, usually stocking enough at the mines to last until navigation opens in the spring.

Since the installation of hydro-electric plants on the two ranges the coal requirements have been greatly reduced and practically all machinery at some mines is electrically driven. The Cleveland-Cliffs Iron Co., the largest operator on either range, has five hydro-electric plants, all of which are in operation, but it is impossible to generate the normal amount of current at this time because of the scarcity of water. The long dry spell of the past summer caused heavy demands to be made on the reserve supply of water and only the normal flow of the streams is now available for the turbines. The coal shortage will have no effect on the mines of the two ranges unless the authorities decide to move some of the stocks on hand to other localities.

Canadian Cyanide Tested at Haileybury School

Tests of the low-grade cyanide manufactured in Canada, which have been made at the laboratory of the Haileybury Mining School, Haileybury, Ont., are stated to have been satisfactory so far as its use for the treatment of silver ore is concerned. During recent months a considerable tonnage of this cyanide has been used in the Cobalt mills, replacing to some extent the imported high-grade article. Another test shortly will be made to ascertain whether it can be successfully used for the treatment of the gold ores of Porcupine and other gold camps. The American Cyanide Co. of Niagara Falls, Ont., has improved the grade of its product.

Plans of Bully Hill Co., of California, To Be Announced

The publication in local and San Francisco papers of the intention of Bully Hill Mines, Inc., to erect a \$600,000 zinc smelter at its mines in Shasta County, Cal., is premature. This company has expended over \$500,000 in mine development during 1918-19 and has succeeded in developing a large reserve of zinc ore as well as copper ores in both the Rising Star and Bully Hill mines. During 1918, 30,000 tons of 6 per cent copper ore was shipped to the Tacoma smelter. The company's plans for the local treatment of its ores will be announced in the future. R. E. Beale is general manager and Walter Arnstein, of San Francisco, is president.

Cave In at Hunter Mine, Mullan, Idaho, Imprisons Two

Entombed in a stope of the Hunter mine, near Mullan, for two weeks and finally rescued without serious injury, is the unique experience of P. P. Grant and Emil Sayko, two miners employed by the Gold Hunter Mining & Smelting Co. Hearing the noise of a cave in, the two men took refuge in a crosscut just in time to save themselves from being caught. When the crush subsided they found that they were imprisoned. A raise was started by the company through filled ground to reach them, and on the second day the workmen noticed that the sound of their hammers was being answered from above. The ground is difficult to hold, and on the third day it got away from them, a slide closing up the raise and catching two more of the workmen, who were rescued with only slight injury about eighteen hours later. In the meantime a diamond drill hole was started through solid rock from a tunnel above, in the hope of establishing communication so that food and water could be sent to the imprisoned men.

The men had their lunch buckets with them and a little water, but had been without food for five days and without water for four. Food, a quantity of silk for warmth and an electric light bulb were all sent down the drill hole, also newspapers containing accounts of the occurrence. With the men made as comfortable as it was possible to make them through the small drill hole, the rescuers started to sink a shaft through the solid rock, but this soon had to be abandoned because the blasts jarred the rock dangerously. A 90-ft. raise in solid rock was then started, because although this would take longer, it would not endanger the men. The raise broke through on Saturday morning, Nov. 29, and at 3 p. m. Grant and Sayko were removed from the mine, having been entombed exactly two weeks and four hours.

Mexico Raises Export Tax on Silver Without Warning New Rate Levied on Sliding Scale Based on New York Market—May Deter Capital from Entering

A federal decree increasing silver taxes by about 50 per cent, has been received at Aqua Prieta, Sonora, from Mexico City. The tax is assessed on all silver content, whether in the form of bullion, concentrates, precipitates or ore, and is based upon a sliding scale, increasing or decreasing according to the market price of the metal. With silver at \$1 per troy ounce, the tax rate will be 7 per cent; from \$1 to \$1.10, 8 per cent; \$1.10 to \$1.20, 9 per cent; \$1.20 to \$1.30, 10 per cent; \$1.30 to \$1.40, 11 per cent; \$1.40 and over, 12 per cent. The tax is to be collected in accordance with New York metal quotation on the day the silver is presented to the customs house for export, plus the cost of sight exchange in New York. The government has reserved the right to buy any silver presented at Mexico City at New York market, plus 1 per cent, less all duties, taxes and usual export charges. This decree has had a bad effect in so far as new interests entering the Mexican field were concerned, because it puts a sudden increase of 50 per cent on silver export duties without warning to the operators. In the opinion of mining men in this district it will not decrease the scale of operations in Sonora, but may prevent new interests entering the field at present.

Edna May Mine in Westonia Field Worked Out

Property in Western Australia Exhausts Payable Reserves in Seven Years

Mining operations at the Edna May gold mines at Westonia, Western Australia, ceased on Oct. 19, the payable ore reserves having been worked out. The Edna May pumps, which drained the Edna May Central mine also, will be kept going on the latter company's behalf, the whole of the pumping equipment being under offer to the Central company. The Edna May's career lasted only about seven years, but the results were very successful, for dividends totaled £325,660 on a paid up capital of £21,425 (in 42,850 issued shares of 10s. each) or £7-12-0 per share. The highest price reached by the shares was £9-18-0 in 1915. So far none of the other mines has met with the high-grade ore which the Edna May Co. was fortunate enough to strike and therefore the prospects of the field cannot be said to be very encouraging. It would have been advantageous for the field (although not for the promoters) if the three principal properties had been controlled by one company as nature intended.

PROGRESS OF MINING OPERATIONS

ALASKA

The Kennecott Copper Co. produced 9,789,320 lb. (including output of Braden Copper Co.) in November, and 9,928,000 in October.

ARIZONA

GENERAL CONDITIONS IN STATE—COPPER QUEEN AND C & A REDUCE OUTPUT—PORPHYRY CONSOLIDATED TO DRILL FOR EXTENSION OF INSPIRATION OREBODY

Phoenix—Arizona mining operators generally are looking toward a gradual shrinkage of the state's copper production till the present overstock has been disposed of. None of the larger copper companies of the Southwest are running anywhere near capacity. The Phelps Dodge Copper Queen is on a two-thirds basis, its Nacoziari branch on

consciousness. The unions, in a meeting of their state federation, lately censured their officers for alleged sympathy with I. W. W. aims. In the meantime, while the copper situation is adjusting itself, there is likely to be much more activity in Arizona silver, lead and zinc mines than ever known before. The principal gold producers are showing no special enthusiasm over their own situation.

Globe—Frank P. Knight, president of the Iron Cap Copper Co. has advised stockholders that they need not fear the apex suit of the Arizona Commercial Mining Co., in that no surface showing can be established by the claimant. He hints also that his company can

shut down, cutting the smeltery down to about 50 per cent of its capacity. Copper Queen is exploring old ground in the Czar section, finding ore in the vicinity of some of its pioneer workings.

Bisbee—Calumet & Arizona produced 6,320,000 lb. copper in November, of which 4,466,000 was available for the company. New Cornelia's November output was 4,236 lb. Shattuck Arizona produced in November 238,969 lb. copper, 697,783 lb. lead, 2,182 oz. of silver and 29.84 oz. gold.

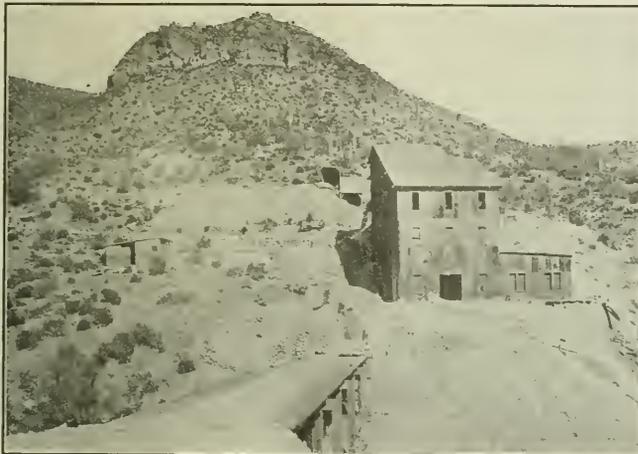

Miami—The management of the Porphyry Consolidated Copper Co. believes that the Inspiration orebody is to be developed at much greater depth on its property, and has decided to bore to at least 1,200 ft. A churn-drill hole will be sunk from the bottom of the old Barney No. 2 300-ft. shaft, and a second from the surface. Diamond drilling will be done from the 650 level, to determine the extent of an orebody already cut.—Inspiration produced 7,000,000 lb. copper in November, the same as in October.

Tucson—A. L. Pellegrin, owner of the Arizona-Mirage mine, is building roads to reach his properties in the Tucson Mountains, five miles from the city.—At the Stratton mine a geological survey is being made by J. Carter Anderson, of Colorado. A tunnel is to be driven 1,400 ft. to strike the main vein.

Mammoth—Magma Chief Co.'s operations at the Sombrero Butte mine after nearly a year are reported very encouraging. Drifting is to be started on 300 level.—The mill of U. S. Vanadium Development Co., of Kelvin, is to resume work, with an improved process for handling oxides. Ben S. Wilson is in charge.—The Armour Copper mine, fifteen miles northeast of Florence, reports bismuth ore discovery in 18-in. vein.

Patagonia—The Patagonia-Superior Mines & Development Co. has made a power contract with a Nogales electric company. The projected exploration will include much drilling, to define known orebodies.—The Bluenose mine is reported showing ore of good grade in silver and lead on the 160 level. The owner, James M. Layman, of Jerome, is directing the exploration and is considering building a concentrator.

Crown King—The Nelson Mining Co. has exposed 12 ft. of gold ore at the end of its tunnel, now 3,800 ft. long. This ore will be milled by the Bradshaw Reduction Co. or in a new concentrator. A 6-ft. vein of free-milling ore was also cut in the same tunnel.—From

MILL OF U. S. VANADIUM DEVELOPMENT CO., KELVIN, ARIZ., WHICH IS ABOUT TO RESUME OPERATIONS

one-half and the Morenci and Tyrone camps are closed. Similar disinclination toward production is shown at Clifton, Ray, Miami, Ajo and Jerome. Almost every company is adding to or improving its plant, with an eye especially to the installation of improved and cheaper processes. Managers are disinclined to shut down or even to turn off any considerable number of their workmen, fearing disorganization when the men again are needed and when they may have turned to other branches of industry now almost equally well paid. So development work is being planned everywhere. Moreover, not for years has the industrial situation in Arizona been as quiet as now, possibly owing to changed political conditions, in which the state no longer sustains the doctrine of class

institute a similar action against its neighbor. Iron Cap now is making a monthly profit of about \$22,000.—In the mine of the Superior & Boston Copper Co. the footwall vein at 400 ft., is producing ore sampling 15 per cent copper and 99 oz. silver. In the vein is 4 ft. of glance that assays better than 24 per cent copper and 90 oz. silver.—Old Dominion smelter produced 2,261,400 lb. copper in November and 2,365,000 lb. in October.

Douglas—General, though gradual, reduction of output has been announced by both the Copper Queen and the Calumet & Arizona mining companies. One of the former's blast furnaces at the Douglas plant has been drawn and the bullion output will be lessened by 1,500,000 lb. a month. At least one of the Calumet & Arizona reverberatories is to be

the Silver Belt property, near Prescott, Superintendent Ben Rybow is shipping high-grade silver ore to El Paso. He is mining an 18-in. vein of high-grade silver ore on the 400 level, and a recent cave opened a new 4-ft. orebody of almost as high-grade.—The Bullard mine near Wenden in southwestern Yavapai County, is being operated by Abbott & Bryant, who are sinking two shafts and shipping ore to the Hayden smelter. They are planning a mill.

Jerome—Alexander Mackay, president of the Dundee-Arizona Copper Co., together with his son Capt. F. B. Mackay, both of Dundee, Scotland, have made an inspection of the property of the company at Jerome, Ariz. It was determined to resume sinking early in December and to build leaching works for handling a great surface blanket of carbonates in the event the Consolidated Arizona Smelting Co., at Humboldt, will not take Dundee shipments for its new process works.

CALIFORNIA

KENNEDY HAS 60 STAMPS DROPPING—OLD EUREKA TO DEEPEN SHAFT—JUNIPER MINE ERECTING MILL

Amador City—The Keystone Mining Co. has ceased milling because the tailings storage basin is filled and the dam must be raised to prevent sands washing over. Some prospecting is being done in the mine and the shaft is being kept in repair.

Jackson—The Kennedy Mining & Milling Co. now has 60 stamps dropping on rock from the rich orebodies developed on the lowest levels. Recently 5 or 10 stamps only were at work for a short period.

Sutter Creek—The old Eureka company recently let a contract to sink the shaft an additional 550 ft., in the hope of striking better ore. The price to be paid is \$29 per ft., contractors furnishing their own explosives.—For the week ending Nov. 22, the Central Eureka Mining Co. reports the 3,510 drift as in 282 ft., with 7 ft. of good ore next to the foot-wall. The 3,700 north drift is in 144 ft. with 6 ft. of good ore in the face. The 3,700 south drift is 246 ft. south from station crosscut. The north raise is through and connected with the winze. The south raise will soon hole through to the 3,600 drift. On the 3,700 level, 360 lin. ft. of ore shoots have been developed, of which 200 ft. is south, and 160 ft. north from the crosscut station. The northern limit of the latter ore shoot has not yet been reached. The Central Eureka Mining Co. declared a regular 3c. and an extra 2c. dividend payable Jan. 12, 1920. The company is also placing a 4c. per share reserve fund aside at each dividend declared.

The Juniper mine at Hayden Hill has the equipment for a 10-stamp mill now

on the ground and has completed preliminary work for the installment of the mill.—The Bishop Creek mine at Bishop is installing a new ball mill of 150 to 170 tons capacity, and should have the mill ready by Jan. 1. It is expected to continue operations throughout the winter.—Electric power to operate the Kate Hardy mine, at Forrest, was turned on Nov. 22. A new double air compressor has been installed.

Masonic—Several shipments of high-grade ore, sorted from a vein that is 20 ft. wide in places, have been made from the Kibble-Cook lease on Cheming claim at Masonic. Shaft is down 87 ft. and oreshoot comes to surface.

Angels Camp—Machinery is being installed at the Angels Deep for 20-stamp mill. Operations expected to start in sixty days.

Bishop—The Wilshire Bishop Creek Mining Co. expects to have its entire plant in operation the early part of January.

Grass Valley—The Grass Valley Bounding Mining Co., which took over the Woodville, Gambler, Cabin Flat, Upper Scadden Flat, and part of Peabody mining properties, is reported to have struck a subsidiary vein in the incline shaft on the Woodville vein. The ore contains free gold.

Washington—Transfer of the El Capitan, New England, and Morning Star quartz locations has been made from A. A. McGee, of Emigrant Gap, to C. T. Worthley, of Nevada City.

Spring Garden—The Walker Mining Co. is building a nine-mile tram to connect its copper mine in Grizzly Valley with the Western Pacific at Spring Garden. The tram will carry copper concentrates for shipment to the smelters. A rich ledge, measuring 7 ft. in width, and carrying a large percentage of copper, was reported intersected by a crosscut in the mine.

Wintrop—The Bully Hill Mines Co. has cut its force from 70 to 25 men. This action was taken as development work will be discontinued for the present, enough zinc and copper ore having been blocked out to keep the contemplated reduction plant in ore for fifteen years.

COLORADO

GREATER ACTIVITY IN RED MOUNTAIN DISTRICT—PLATINUM FOUND IN OGDEN PROPERTY AT WARD

Ouray—The high price of silver is stimulating increased activity in the once famous Red Mountain mining district, which is credited with a gross output of over \$25,000,000. Many old-time operators who were familiar with some of the old mines from 1880, when they were opened, until 1893, when they were closed, are returning to the district to work some of the small ore

shoots that they left.—R. M. White, of Leadville, backed by D. E. Golyar & Co., has taken over the Kentucky Giant. He will fully equip it and commence deeper development.—The Genesee-Vanderbilt mill which was operated in connection with the Yankee Girl mine, was closed down recently, because of the change in character of the ore in the lower levels. The management has decided to erect a new combination concentration, flotation and cyanide mill next spring.

Idaho Springs—W. O. Reynolds and associates of Denver have acquired the Refugee group, consisting of two lode claims and a placer claim, situated southwest from the Shafter. An active development campaign is planned under the direction of Lt. A. P. Arundel. The property will be worked through the Big Five tunnel.—Nineteen assays were made from various parts of the Ogden property at Ward, and the ore was found to average 4 oz. of platinum. No other details are at present obtainable.

Colorado Springs—The Golden Cycle mill, which was closed down recently owing to a shortage of coal, has resumed operations and will continue to treat ores from the Cripple Creek and Boulder mining districts.—In the Alma-Sacramento mining district in Summit County several of the old silver-gold properties which have been idle for many years are again being operated. Many old properties are under development, and by spring a steady production should be made.

IDAHO

FURTHER DEVELOPMENT TO BE DONE AT NATIONAL MINE—POSSIBLE PLACER GROUND OPTIONED AT ELK CITY

Mullan—The directors of the National mine, conforming to the urgent request of the stockholders, are preparing to do certain development work that promises to disclose a new and important orebody. The mine was shut down and practically abandoned a few months ago, the copper ore being too low-grade to yield a profit. It has long been contended by many familiar with the property that the main orebody had never been reached, and as the company has over \$50,000 in the treasury, the stockholders insisted that some of this money be spent in an effort to find it.—Work was suspended three months ago at Carbonate Hill mine through lack of funds, after developing a fine shoot of lead-silver ore 6 ft. wide and 100 ft. long on the 400 level. The mine was unwatered and examined recently by an engineer and it is expected that his report will result in financial arrangements to resume development before spring.

Bellevue—Hand-sorted ore from the Edris mine is running 100 oz. silver and

60 per cent lead. Ore is found on both sides of a dike. The mine was formerly known as the Hawk. J. F. Pasold, Spokane, is the owner.—The Federal Mining & Smelting Co. has its 5,000-ft. tunnel nearly completed to connect Independence and North Star mines and give easy delivery of Independence ore to the North Star mill.—Utah Bellevue Mines Co. has its main tunnel in 470 ft., following the direction of the vein. The ore occurs in the contact between granite and porphyry; 2 ft. solid galena on the foot-wall and 2 to 4 ft. of zinc. Silver ore is being stocked at the mine.

Elk City District—Thousands of acres of ground are being taken under option along the Elk and American Creeks by unknown parties. Tests on a large scale are said to be contemplated to determine the value of the holdings for placer dredging. This will make the fourth time this ground has been worked. It is said \$18,000,000 was taken from this district by the men who went there in 1860 and the following years. Later it was worked by Chinamen, and about 10 years ago a small part of the field was worked by a small dredge.

MICHIGAN

SURFACE SINKING AT AHMEEK ENDANGERING PLANT—SENECA'S SHIPMENTS STILL HELD UP

Calumet—The Osceola Consolidated Mining Co. produced 59,000 tons of ore in November. Most of this came from North Kearsarge branch, and runs 16 lb. copper per ton. The output is showing no increase and now averages 900,000 lb. monthly.—Possible danger at the Ahmeek mine arises from surface sinking of land between No. 1 and No. 2 shaft, due to working out of Kearsarge lode mineral content. Conditions may require the removal of part of the plant of the corporation. The ore output for November was 69,000 tons compared with 68,000 tons in October. The yield maintained is better than 24 lb.—At the Allouez mine of the Calumet & Hecla company production of ore in November was 18,000 tons. The Centennial produced 7,000 tons, and the Superior and the La Salle got out simply the small production that necessarily extracted in the course of development.—The Seneca Mining Co. is not yet shipping ore as arrangements with the Government for railway accommodations have not been completed.

Houghton—At the Isle Royale Copper Co.'s mine production of ore dropped from 68,000 tons to 65,000 in November, but the yield is getting better all the time.—The Mass Consolidated Mining Co., Mass, Mich., produced 14,000 tons of ore in November which is normal. There was considerable production of mass and barrel stuff.

Iron District

ODGERS MINE RESUMES OPERATIONS—CLEVELAND-CLIFFS' NEW SHAFT HOUSES ALMOST COMPLETE

Menominee Range—The Odgers Mining Co. at Crystal Falls, has ordered resumption of operations; this being the third property in the Crystal Falls district to re-open recently.

Marquette Range—The Cleveland-Cliffs Iron Co. has shipped almost all the iron ore they had in stock. The Mackinaw-Gardner is now producing at a good rate; but the Stephenson mine is still idle on account of recent flooding. Unwatering is in progress, and in 1920 this mine will again be a producer.—The new concrete shaft houses of the Cliffs shaft at Ishpeming, are about complete. They stand 98.9 ft. high, weigh 1,700 tons each, and were cast around the old wooden head-frames without causing a moment's delay in hoisting. They are well reinforced with steel bar, and regarded as cheaper than steel shaft houses in the long run, as the upkeep cost will be very small. They are considered the finest shaft houses in the Lake Superior region.—At the Republic and at the Cliffs shaft mines considerable ore will be carried over the winter owing to the light demand for crushed hard ore.

Gogebic Range—The Newport Mining Co. will install an electric-driven pump on the 26th level of the Bonnie shaft at Ironwood. The pump will have a capacity of 600 gal. per min., and a head of over 2,300 ft. A lander at the Woodbury shaft was killed by falling into the shaft while changing the rope from cage to skip.—The Republic Iron & Steel Co. has bought an interest in the lease of the Townsite property and will continue to operate it. The fee is owned by the Longyear people. The property was formerly known as the Norrie mine, and was the most famous mine on the range.—At the Fabst mine the sinking of the "H" shaft has been resumed with a full crew. The shaft will be sunk 210 ft. from its present depth of 1,850 ft., and two stations cut, at depths of 1,865 ft. and 1,970 ft. When this work is completed the new surface equipment should be ready and the work of developing the 1,760 level in the orebody will begin.—Jones & Loughlin, Wakefield, have done considerable exploratory work with diamond drills east and north of the Morgan mine during the past summer. Results were more encouraging than the drilling on the Morgan which was done a few years ago.

MINNESOTA

LEONIDAS CONCRETING MAIN SHAFT—INLAND STEEL SURRENDERS THOMPSON LEASE

Mesabi Range—The Leonidas Mining Co. is concreting its main 10 x 18-ft.

shaft to a depth of 438 ft. on steel frames. The men are working three shifts and expect to finish the job before navigation opens in 1920.—The Susquehanna Carlson Exploration Co. is operating two drills to determine the rock limits on the south side of the pit for the Rogers-Brown Iron Co.

Cuyuna Range—The Inland Steel Co. has surrendered the lease to the Thompson property at Crosby, which since 1912 has shipped 900,000 tons. The lease reverts to the Maple Leaf Mining Co.—The location of the corner of the Rowe and the Sagamore mines and the Riverton Townsite, which has been in litigation has been fixed by court decision.

MONTANA

COAL SITUATION PREVENTS GREAT FALLS ZINC PLANT FROM RESUMING AS PLANNED—TUOLUMNE MAY ISSUE BONDS

Butte—The Great Falls zinc plant of the Anaconda Copper Mining Co., which shut down in mid-summer on account of the shortage of power, was to have started the second week in November, but did not on account of the coal strike. The zinc plant requires the entire output of one power house to secure best results and therefore could not tap other than its regular source when power became limited on account of water shortage. The coal strike affected it only because coal is required to haul concentrates and for auxiliary operations in Butte. On Dec. 3 all departments at Great Falls were down except the rod and wire mill. The temperature was 30 deg. below zero, causing much suffering. Anaconda produced 14,120,000 lb. of copper in November and 15,000,000 in October.

Butte & Superior in November produced 11,500 lb. of zinc in concentrates and 200,000 oz. of silver as compared with 11,000,000 lb. of zinc and 210,000 oz. of silver in October. The tonnage mined during November was 40,000 as compared with approximately the same tonnage the previous month. Ten thousand tons of concentrates were milled. Crude ore averaged more than 15 per cent zinc and about 6.5 oz. of silver.

The Pittsmtont smelter production of the East Butte Copper Co. for November was 1,902,580 lb. of copper and 56,834 oz. of silver as compared with 2,027,340 lb. of copper and 71,317 oz. of silver in October.

A special meeting of the stockholders of the Tuolumne Copper Mining Co. has been called for Dec. 30, 1919, at Phoenix, Ariz., for the purpose of authorizing a \$500,000 bond issue to provide funds for an aggressive development program. Details of the issue are to be worked out after the stockholders have ordered it. It is said, however, that the plan calls for 6 per cent bonds

of a convertible character, with the conversion figure at \$2 for the stock.

Crosscutting is under way on the 1,200 level of Tuolumne's Main Range mine and it is expected to reach the Spread Delight vein within 10 days. A Cameron centrifugal pump of 500 gal. capacity is being installed on the 1,200 level and when this is in commission sinking to the 2,000 level will begin. This pump is the first of its kind in the Butte district. Tuolumne will cross-cut all its fissures on the 2,000 level, including a number of "northwest" veins. The vein system of the Main Range mine particularly is pronounced, the Spread Delight fissure showing a width of more than 200 ft. on the 1,000 level. The Rory O'More vein, opened on the 700 level, shows a width of 30 ft., averaging 6 oz. of silver, of which 10 ft. runs up to 16 oz. The Rory O'More ledge has not been opened below the 700-level.

NEVADA

Elko—A large body of ore running 4 per cent copper, besides gold and silver values, has been opened up at the camp of Contact, in the extreme north-eastern portion of Nevada. Twenty-two men are engaged in developing.—The Bull's Head Mining Co.'s 50-ton smelter at the mine in the Spruce Mountain district near Tobar was completed and an initial run made the last week in November. The smelter is said to work satisfactorily, but severe weather in that section has forced a shutdown until spring.

Virginia City—Consolidated Virginia Mining Co. while drifting on the 2,150 level, which has been following ore going from \$18 to \$41 per ton, has opened ore assaying \$300 per ton, according to an official report. An old bonanza shoot in this mine extended from the 1,167 to the 1,800 levels, and was 300 ft. wide.

Battle Mountain—With considerable good-grade ore in sight, the Quicksilver Mines Co. will make regular shipments from its mine south of Battle Mountain. The last shipment was of 13 flasks.

Arrowhead—The shaft of the Arrowhead Extension mine is being sunk by contract and good progress is being made. The sulphide zone is expected to appear at 75 ft. and the vein seems to dip toward the shaft.—The old Gila silver mine, about three miles south of the Arrowhead, is now under option. It is hoped to inaugurate a large development campaign there. Its extension on the north is said to be under option to Tonopah and Ely parties. Reports state that many other properties in its vicinity are also involved in various deals.—From the Arrowhead Annex mine come reports of two good ledges

discovered.—The Arrowhead Bonanza Mining Co., E. J. Ramsay, secretary, is endeavoring to obtain \$50,000 from a San Francisco syndicate, to be used in development.—The Arrowhead Consolidated Mining Co., J. Henry Goodman president, has completed such arrangements and has purchased a large mechanical outfit. The shaft is to be enlarged as soon as the latter is installed. The shaft is now in the sulphide zone, though only 70 ft. deep, and has encouraging silver showings.—The Arrowhead Signal, between the Arrowhead and the Arrowhead Extension, is doing considerable development; and the Arrowhead Syndicate is reported to

the hill. They should be met within the next 200 ft. of drifting. Alterations and additions also have been made in the 15-stamp mill.

Manhattan—White Caps has shut down its mill and it is announced that ore will be shipped to a plant near Chicago where the treatment will save the arsenic. Auto trucks will be used to haul the ore to Tonopah.

Tonopah—The West End Consolidated Mining Co. has reached normal conditions at both mine and mill. Tonopah Extension has put on a full crew at its mill, and is also busy installing foundations for a compressor, erecting accommodations for men, and with

JIM BUTLER SHAFT, TONOPAH, NEV.

have let a contract for sinking their shaft to the 100 level. Many buildings, timber and supplies are being taken to Arrowhead from Tonopah, Ely and Goldfield, and the camp has made application for a post office. Some people expect the population to reach 2,000 by next spring.

Pioneer—The Reorganized Pioneer Mines Co. which owns 11 claims, 9 patented, and valuable water rights, is developing the Pioneer mine and has installed a large driving engine. The main working shaft is to be sunk to the 800 level where crosscuts will be driven to the orebodies. About \$500,000 worth of ore has already been produced by this mine from above the 300 level.—A close neighbor is the Consolidated Mayflower Mines Co. which is carrying on thorough development work, particularly on the 2d, 3d, 4th, and 5th levels. A drift northward on the 3d level is now out 1,000 ft. and is to develop orebodies higher up on

other preparations for general resumption of development work.—At the Tonopah Belmont Development Co. property the electric haulage system has been completed and adjusted to running conditions. This company is milling the ore mined by the Tonopah Mining Co. which has been working various stopes in the Silver Top, Mizpah and Sandgrass sections; most of the ore comes from the caved stope on the 500 level in the Mizpah shaft. The West End Mining Co. has continued its development work in the Ohio section of the mine and also in No. 2 shaft of the older section. Production has been from the Ohio section as in the past, and tonnages have increased steadily since work was resumed on Oct. 4. The Ohio shaft 802 crosscut is progressing, the face now is in West End rhyolite. Three other crosscuts are also going satisfactorily. One drift on the 832 level is showing good ore, and two new drifts, in low-grade ore

at present, have been started on the same level. Six stopes are working and in fair-grade ore. A raise in Mizpah trachyte is making limited headway, as is the drift started on the 536 level last week. In the older sections the regular stopes are being worked in ore of the previous average grade.—The Tonopah Mining Co. has bought the Silver Rule mine in the Kingston Mountains at Goodsprings from John Chamberlain.—Frank Stall and Jos. H. Hutchinson have been shipping about two carloads per week from the works of the New California Tonopah Mining Co. The ore is of the best grade among Tonopah ores. North Star mine is extending its workings on the 900, 950 and 1,050 levels. The MacNamara mine is also developing steadily, and its mill is fully occupied with the ores supplied, together with custom work from Tonopah Divide, Divide Extension, Hasbrouck, etc.

Mina—The Candelaria mines are installing two compressor plants and plans are being prepared for a 500-ton mill to treat the oxidized ores, of which it is estimated there are 500,000 tons on dumps or in sight in mines. International Nickel interests own control and Chas. D. Kaeding is general manager.

Imlay—A much better grade of ore has been opened up in the tin zone of the Majuba Hill Silver, Tin & Copper Mines Co., twenty miles west of Imlay. Management will not give out assays until extent of high-grade shoot has been better determined.

Winncucca—According to Manager Geo. B. Williams, Nevada Harmony Mines Co. has secured ample funds for 3-drill compressor and pumping plant, which will be installed at once. A heavy flow of water was encountered in the workings three months ago.

A hoist and compressor plant have been installed on Amalgamator property at camp of Dun Glen.

Wonder—Unless an unlooked-for find is made, the mill of the Nevada Wonder will probably cease operations this month. The mine has been worked thirteen years, has paid \$1,549,000 in dividends, and the company now has over \$400,000 in assets above all liabilities.

Tuscarora—It has been announced that the Holden M. & M. Co. will build a 250-ton mill at Tuscarora to replace a smaller one recently burnt. Work will start in spring. David J. Cook, manager, is reported as saying that the burnt mill was deliberately set on fire.

Midas—The drifts on 300 level of Missing Link claim of Big Chief Cons. Co. in the Gold Circle district are in even richer ore than was recently encountered on the 200 level.

SOUTH DAKOTA

TROJAN SINKING ON NEW GROUND—TUNNELING FOR IRON HILLS WORKINGS HALF COMPLETE

Trojan—Normal production is being continued in the Trojan company's plant in the Bald Mountain district. Sinking of a shaft has been started on newly acquired ground west of the present operations.

Carbonate District—The tunnel that is being driven to tap the old Iron Hills workings by eastern interests under the direction of W. S. Elder, of Deadwood, is in over 700 ft., a trifle over half the distance to be driven. The severe weather conditions have somewhat interfered with the delivery of supplies and retarded the work.

CANADA

Ontario

MINING CORP. OF CANADA PASSES DIVIDEND—HOLLINGER SHOWING WELL—PEERLESS AT BOSTON CREEK HAS UNIQUE ORE

Cobalt—The directors of the Mining Corporation of Canada, Cobalt, have decided to pass the regular quarterly dividend, but intimate that dividend payments will be resumed next year. The action taken was on account of the loss of revenue due to the strike and because of the purchase of the Foster lease and also a 70 per cent interest in the Buffalo mine. The La Rose is meeting with success in its development of the University property which it recently re-opened. Last week a new high-grade vein, one-inch wide, was encountered and the prospects are that this property will provide a considerable tonnage. The Princess mine, operated by the same company, is also showing up well. The Northern Customs Concentrators which recently purchased 24 acres of Chambers Ferland ground is putting up a head frame and installing machinery and will develop underground. The Trethewey has encountered a good vein of high-grade ore on the Gowganda property which it recently purchased. During the year ended Oct. 31 the Coniagas produced 900,000 oz. notwithstanding almost two months shutdown on account of the strike.

Boston Creek—The Peerless Co. in Boston Creek is installing a boiler and compressor plant. The ore is unique in this country being a bismuth sulphide carrying high gold values, in quartz. Pieces of the solid mineral run as high as \$3,000 to \$4,000 to the ton.—An important gold discovery is stated to have been made on the Manley Reilly claims in Skead township.

Porcupine—The Hollinger Consolidated Gold Mines continues to show good results and the dividend will no doubt be increased before long. The declaration of a 25c. dividend on Dome has helped to restore confidence in this venture. The development of the Dome

Extension is such that there seems little reason to doubt it will be taken over in March when the option expires.

Sudbury—Starting with the first of December the International Nickel Co. has increased its output to 3,500 tons of matte a month which is nearly up to its pre-war production. It is expected that before long it will be up to 4,000 tons. While the large copper companies are decreasing production the nickel companies are increasing and the demand is almost entirely for domestic consumption. The British-America Nickel Co. will start production this month and will begin at the rate of about 750 tons of matte a month.

Mine Center—The Foley mine, situated six miles south of the Canadian National Ry., at Mine Centre, Ont., has been sold to the Swedish-Canadian Gold Mining Corporation. About 1,000 ft. of sinking, and 2,000 ft. of drifting has been done on the property, which has developed a large ore reserve, averaging \$14 per ton. There is a 20-stamp mill on the property. A cyaniding plant will be installed, that is expected to effect a recovery of 95 per cent, as against 55 per cent under the old operations. Construction work on a 1,600-ft. aerial tramway will be commenced on Jan. 15, 1920.—The Mikado mine, situated at Shoal Lake, Lake of the Woods, has been sold to a Chicago syndicate, headed by Robert Wachman.

MEXICO

Northern Sonora

LA MINA MEXICO TO BE REOPENED—PREPARING TO ERECT MILL AT SAN JULIAN—BUENA VISTA'S CUPELING FURNACE COMPLETED

Agua Prieta—The ore exports through this port for the month of November showed a heavy decrease from the previous month. This was due chiefly to the heavy rains of the last ten days of the month which turned roads leading to Nacoziari into a quagmire. A flood on Nov. 24 swept through Nacoziari Canyon washing out several miles of road; a number of freight outfits in the canyon had a narrow escape from death. The Yaqui Indian trouble in the south end of the district early in the month also caused shipments to cease almost entirely, freighters fearing to take the road. The reduction in copper shipments, general throughout the southwest and Sonora, also was a strong factor. A total of 197 carloads of ore, of 9,648 tons, valued at \$1,655,000, was exported here. The shippers were: Nacoziari (including all the properties in this district, but chiefly the Mctezuma Copper Co.), 177 cars, 8,910 tons; El Tigre, 15 cars, 549 tons; Estrella, 3 cars, 126 tons; Las Chispas, 1 car, 36 tons; Monte Cristo and Norte Potosi, 1 car of 27 tons.

La Mina Mexico—La Mina Mexico, owned by the Potter Palmer estate of Chicago, will be re-opened in the near future, according to announcement made by the management, following inspection. The property has been closed for four years as a result of revolutionary troubles. Underground the mine was found in surprisingly good condition considering the period of idleness. Comparatively little work will be needed to put it in shape for production. The surface plant also was in good condition. Both above and underground a force of mechanics are working getting the mine and machinery plant ready for operation. E. P. Ryan, manager, and C. D. Cline, consulting engineer, made inspection and then returned to El Paso. It is intended to secure at once a 50-ton flotation mill, machinery for which will arrive at the border at

the past, though some of its packers have been killed from time to time. The product formerly was sent by way of Tonichi, but the revolutionary troubles and Yaqui warfare which destroyed the greater part of the Tonichi branch of the Southern Pacific de Mexico R. R. between Tonichi and Torin, caused pack trains to be employed to bring ore to Nacozeni for shipment to the United States.

Progreso — The Progreso Silver Mines Co. has been operating on its usual scale and has accumulated a considerable tonnage of concentrates and precipitates which will be shipped as soon as roads are repaired sufficiently to allow the use of the company's fleet of motor trucks between the mine and Nacozeni.

Buena Vista—The cupeling furnace on which work has been concentrated

of the property, who went to Nogales, Ariz., for that purpose.

Caborca—A placer gold discovery on the shores of the Gulf of California, a few miles from Caborca, Sonora, has caused a rush of considerable proportions to the field. While numerous rumors have been received relative to the richness of the placers, little authentic information has been obtainable. However, the excitement is high and many Mexicans and foreigners are going in to stake claims.

Cananea—Greene Cananea produced 3,900,000 lb. copper in November and 4,000,000 in October. Silver produced in November was 164,300 oz. and gold 800 oz.

PERU

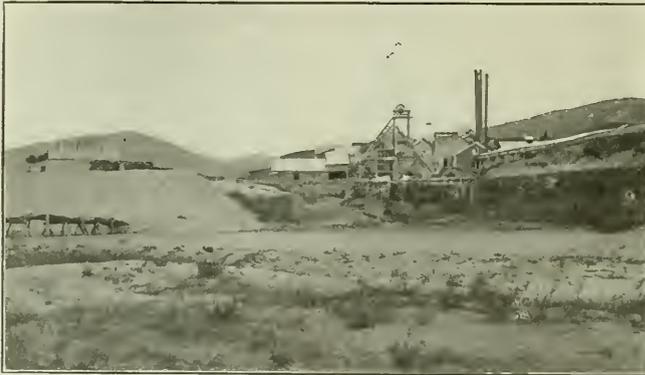

The Cerro de Pasco Copper Corp. produced 4,752,000 lb. of copper in November and 5,652,000 in October.

CHOSEN (KOREA)

The Oriental Consolidated Mining Co., Unsan, Korea, had the first unit in its Suribong power house ready for operation on Oct. 28. On Oct. 31 the load was brought up to nearly full capacity by making the unit drive the Tabowie and Taracol mills, Taracol shops and Taracol cyanide plant. This load has been carried continuously ever since without the slightest trouble. The unit is working smoothly, the load being approximately 640 hp. The second unit is being made ready. The Chorrie hydro-electric plant is now driving the hoist and pump motors in the mines, except the surface hoists at Taracol and Tabowie, which are steam driven at present.

The cholera situation is improving in Manchuria and the northern and central parts of Korea. The newspapers report that the number of deaths shows no decrease in southern Korea as yet. Statistics compiled by the police authorities show that at the end of October more than 12,000 cases of cholera had been observed in Korea this year with more than 8,000 deaths. There is little or no danger of the cholera invading the Unsan district as cold weather has set in.

The cost of native foodstuffs continues excessive; the company will probably have to buy millet and rice to sell to workmen at cost or below cost. Labor is scarce and inefficient. Many industrial undertakings are now under way in Korea, absorbing much labor. Chinese labor continues hard to obtain, because the Mexican dollar is worth between Yen 1.80 and Yen 2 and when the Chinaman converts the savings from his yen wages into Mexican dollars, he gets so little that he is better off working at home in China. The November clean-up was \$112,900 against \$100,000 in October.

MAIBONG MINE, ORIENTAL CONSOLIDATED MINING CO., KOREA

Douglas, Ariz., about Jan. 1. Assembling of pack and wagon trains has been started to haul this south. The inspection proved that part of the machinery in the old mill could be used in conjunction with the flotation process. The smelter probably will not be operated at present. Road building between the mine and the Progreso road near Suaqui will be started at once. It has not been announced whether the ore would be packed up to Nacozeni for shipment by rail or motor haulage would be adopted from Suaqui.

San Julian—The San Julian property in the Sahuaripa district is operating under the management of George Fast, assisted by his son, Frank, and M. E. Blome. It is a high-grade molybdenum property. The work of installing a 30-ton concentrator will be started at once. The first pack train carrying disassembled parts of the mill, left Moctezuma recently. Although in the heart of the so-called Yaqui Indian district this property has not been molested in

for several weeks now is complete, and the first run on silver-lead matte is reported to be under way, preparatory to making a test shipment to the refineries in the United States. The Buena Vista is fortunate in having within its holdings all the necessary elements for a perfect flux. By shipping matte the management counts upon eliminating much of the high cost hitherto attaching to getting its product to the market. The property is owned and managed by Wendler & Barney.

San Nicolas—Additional thickeners and one additional flotation machine have been purchased by the San Nicolas mine, which is operated by Douglas, Ariz., interests. When installed these will increase the mill capacity to approximately 100 tons daily. At present about 60 tons is the daily run. The machinery is expected to reach the border at Douglas in December and be on the ground early in January. The purchase of the machinery was arranged by H. W. Kaanta, mill superintendent

PERSONALS

Herbert Hoover is in California.

R. B. Whiteside is in the Louisiana-Texas oil district where he has interests.

G. M. Colvocoresses is in New York, having recently returned from a trip to Canada.

A. W. Allen, who has been in Chile, expects to be in New York the middle of January.

D. C. Jackling and R. C. Gemmell are inspecting the properties of the Utah Copper Co.

Horace W. Winchell and Bradley Stoughton left San Francisco for Los Angeles on Dec. 26.

S. M. Summerhays, general manager of the Bluestone Mining & Smelting Co., was in Reno on Dec. 18.

Colonel Ralph Stokes has returned from North Russia and will resume his mining work early next year.

Capt. John M. Goldsworthy of the East Norrie mine is recovering from a very serious spinal operation.

Jasper T. Robertson, mining engineer of San Francisco, recently examined the Simon mine for New York clients.

H. M. Alley, recently mill superintendent of the Nevada Wonder mill, at Wonder, Nev., is in San Francisco.

Andrew W. Newberry has opened an office at 66 Broadway, New York, for the examination of mining properties.

B. C. Yates, superintendent of the Homestake mine, has been in Chicago on business connected with his company.

R. C. Gemmell, general manager of the Utah Copper Co., has returned from a trip to Duluth in the interests of the Mesaba Syndicate.

Charles M. Schwab has been elected a director and member of the executive committee of the United Zinc Smelting Corporation.

George H. Carnahan, chairman of the Penyon Syndicate, has recently returned from an inspection of the syndicate's properties in Chile.

Ellsworth Bennett, who is in charge of the Tonopah School of Mines, recently made a geological examination of the La Toska mine, near Oreana.

Frank E. Lathe, formerly with the Anaconda and Chile Copper companies, is chief chemist of the British-America Nickel Corporation at Sudbury, Ontario.

A. P. Anderson, consulting mining engineer of the U. S. Smelting, Refining & Mining Co., is in San Francisco, having recently arrived from Pachuca, Mexico.

Eugene P. McCrorken has resigned from the editorial staff of the "Engineering and Mining Journal" to become managing editor of "Compressed Air."

Joseph T. Singewald, Jr., professor of economic geology at Johns Hopkins University, has been granted leave of absence to do geologic work in north-western Peru.

E. J. W. Donahue, representing the Gloria Mining Co., Cuyuna Range, has returned from Washington where he attended the sessions of the War Minerals Relief Commission.

W. G. Mather, president, and W. P. Belden, chief counsel, of the Cleveland-Cliffs Iron Co., of Cleveland, Ohio, have been inspecting the company's holdings on the Marquette Range.

Harris and Ewing

C. E. LESHER

C. E. Leshler has resigned as chief of the Division of Mineral Fuels of the U. S. Geological Survey, to take charge of the new statistical division of the National Coal Association. Mr. Leshler joined the Geological Survey nine years ago. He will be succeeded by F. G. Tryon.

Albert Burch, former manager of the Goldfield Cons., was in Reno on Dec. 15 on his way to the Simon mine, for which the firm of Burch, Hershey & White are consulting engineers.

T. M. Owen has returned from Australia after an absence of seven months. He has been appointed assistant general manager for the Federal Mining & Smelting Co., Wallace, Idaho.

Colby Dodge, of Los Angeles, has returned to Nevada after a trip to his home city. Mr. Dodge is doing some work on a promising property eight miles from Rochester in the East Range.

J. B. Tyrrell, mining engineer and geologist of Toronto, was in New York Dec. 12, on his way to England. Mr.

Tyrrell has for many years been one of the most active field geologists of Canada.

W. H. Taylor, of the E. J. Longyear Co., who was stationed for some time at Brainerd, Minn., has left for Southern Louisiana where he will have charge of the sinking of a 600-ft. shaft at a salt mine.

W. S. Miller, chairman of the board of directors of the Standard Oil Co. (California), will retire from active business on Jan. 1, 1920, after thirty years of service with the Standard Oil Co. of California.

W. H. Lawrence, mining engineer of New York, recently returned to Reno, Nev., from the Yale mining district in British Columbia where he made arrangements for the resumption of work on the Empress group.

Frank M. Manson, manager of the Western Ore Purchasing Co. and director in the Candelaria, Rochester and other mining companies, has returned to his home in Reno after a six-weeks' business trip to the East.

E. J. David is in charge of the electrolytic refineries and silver department of the Raritan Copper Works, succeeding M. H. Merriss. Mr. David also takes Mr. Merriss' place as a member of the General Safety Committee.

Charles W. Plumb, who has been assistant superintendent of the Mammoth mine for several years, will be transferred on Jan. 1, by the U. S. Smelting, Mining & Refining Co., to Utah, where he will be superintendent of a mine belonging to the company.

Carl B. Anderson, formerly with the Illinois Geological Survey and the Gulf Oil Corporation, has joined the staff of Rogers, Mayer & Ball, of New York and Boston, who announce that their facilities for the examination and appraisal of oil properties will be extended.

OBITUARY

J. M. Francis, for years manager of the Tom Reed mines and mill at Oatman, Ariz., died recently in a Los Angeles hospital. Interment was at Kingman, Ariz.

F. A. Wilde, who died recently in Oshkosh, Wis., aged 76, had been a pioneer silver miner at Ouray, Col. In 1890 he became identified with the Nordberg Manufacturing Co. of Milwaukee. A year later he moved to Kingman, Ariz., to install the plant of the Desert Power & Water Co., which now supplies electric energy to the larger

camps of the Mohave County. He became the principal stockholder of the enterprise and had been its president since its inauguration.

L. G. Bonesteel, superintendent of the western Mesabi interests of the Interstate Mining Co., died at Coleraine, Minn., on Dec. 5, following a hurried operation for appendicitis. He was thirty years old and engaged for several years in mining work in South Dakota before coming to the Mesabi.

Louis Valentine Pirsson, professor of physical geology in the Sheffield Scientific School since 1897, died at his home in New Haven, Conn., Dec. 8, aged fifty-nine years, while on a year's leave of absence owing to ill health. For more than twenty years Professor Pirsson was associate editor of the "American Journal of Science." He was the author of many scientific memoirs, textbooks, and papers on geological and mineralogical subjects, and was connected with the U. S. Geological Survey for a number of years.

G. S. Rogers, of the U. S. Geological Survey, died Nov. 18, in Colombia, South America. Mr. Rogers, who had been with the Geological Survey since 1911 in the capacity of oil and gas geologist, was on leave of absence from the Survey at the time of his death, making a survey of oils in Colombia. He met his death at the mouth of the Malotto River, when a canoe, in which he was attempting to cross the river was overturned. Mr. Rogers recently completed bulletins on "The Occurrence of Helium in the Crust of the Earth," and "Helium Resources of the United States," which are now in course of publication.

SOCIETIES

American Electrochemical Society, New York Section, held a meeting in New York on Dec. 12. The subject of discussion was "Labor and Industrial Conditions Abroad and Their Influence on the United States."

Iron and Steel Institute—Dr. J. E. Stead has consented to be nominated for the presidency to succeed Eugene Schneider, whose term will expire in May, 1920. Dr. Stead joined the Iron and Steel Institute in 1873, became a member of the Council in 1895, and was elected vice-president in 1910. It is proposed to hold the autumn meeting of the Institute next year in France, where it would probably have taken place in 1915 had not the war intervened. This will be the first foreign meeting since the notable gathering business in Jenkins valves abroad,

ing at Brussels in 1913, and, in fact, the first conference held out of London since that year.

American Mining Congress—In general the old officers of the Arizona Chapter were re-elected at the annual meeting at Phoenix. Norman Carmichael is governor, and the vice-governors are G. M. Colvocoresses, F. W. MacLennan and John C. Greenway. To the directorate, which has fourteen members, were added the names of W. S. Boyd, succeeding L. S. Cates, who has removed to Utah, and F. W. MacLennan, to succeed B. Britton Gottsberger.

INDUSTRIAL NEWS

Roger Woodbridge has been appointed Lake Superior representative of the Chicago Pneumatic Tool Co.

Fairbanks, Morse & Co. will start the erection of a modern foundry next year. This will be situated at Beloit, Wis., will be 900 ft. long, 550 ft. wide, and will contain 495,000 sq. ft. of floor space. The ultimate capacity will be 350 to 400 tons of gray iron daily.

Marchant Calculating Machine Co. plant at Emeryville, Oakland, Cal., which was partially destroyed by fire, caused by a defective heating system, on Nov. 29, is already being rebuilt and in sixty days' time will again be operating. The most important tools, dies and jigs were saved, enabling the company to start production at once.

Gasoline Engines. The U. S. Director of Sales is offering for sale 121 fifty-horsepower, and 192 thirty-five-horsepower gasoline engines with clutches, located at the Army Reserve Depot, Columbus, Ohio, the price being \$700 each for the fifty-horsepower, and \$640 each for the thirty-five horsepower. A special 15 per cent reduction in the fixed prices will be made to purchasers of ten or more of these engines.

Specifications and further information relative to the sale of these engines may be obtained from the Surplus Property Division, Munitions Building, Washington, D. C.

Jenkins Bros. announce that they will in the near future increase their manufacturing facilities by owning and operating a plant at Bridgeport, Conn. This plant will be devoted entirely to the manufacture of the Jenkins valve. The manufacture of the Jenkins discs, sheet packings, pump valves and other mechanical rubber goods will be continued at Elizabeth, N. J.

To take care of the rapidly increasing Canadian branch, Jenkins Bros.,

Ltd., of Montreal, have recently completed alterations and additions to their brass valve department, and now have in course of construction a new 192 x 80-ft. iron valve foundry. The Canadian branch supplies Jenkins valves throughout Canada and foreign countries, while the Bridgeport plant will make valves for use in the United States and insular possessions.

Chicago Pneumatic Tool Co. reports orders booked during the month of October in excess of any previous month since the armistice. The same is true of its English and German subsidiaries.

While the German subsidiary was seized by German government and has been run under "compulsory administration" since the United States participation in the war, compulsory administration has now been abolished and management is being transferred back to the Chicago Pneumatic Tool Co. through the courts of commerce, according to cable reports just received from the company's representative. Reports show the German company well managed during the war and is now operating on a satisfactory basis. Arrangements have been made to materially increase production.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Alloy—Electric-Resistance Element and Alloy Therefor. Frank L. Driver, Jr., assignor to Driver-Harris Co. (1,321,294; Nov. 11, 1919.)

Alloy of Magnesium, Silicon and Manganese. Frederick M. Becket, assignor to Electro Metallurgical Co. (1,322,158; Nov. 18, 1919.)

Casting—Art of Casting Molten Metal. Arthur R. Earnshaw. (1,323,583; Dec. 2, 1919.)

Concentrator—Centrifugal Concentrator. Charles Schifferle. (1,322,139; Nov. 18, 1919.)

Crusher—Oliver J. Williams, assignor to Williams Patent Crusher & Pulverizer Co. (1,322,211; Nov. 18, 1919.)

Crushing—Reducing Mill. Harold M. Plaisted, assignor to Williams Patent Crusher & Pulverizer Co. (1,322,339; Nov. 18, 1919.)

Flotation of Minerals. Clement L. Perkins, assignor to Metals Recovery Co. (1,322,816; Nov. 25, 1919.)

Fuel—Fuel-Feeder for Pulverized Fuel. Joseph F. Townsend. (1,321,262; Nov. 11, 1919.)

Nitrogen Fixation, Furnace for. Azariah Foster Crowell, Jr., assignor to Nitrogen Products Co. (1,321,892; Nov. 18, 1919.)

THE MARKET REPORT

Daily and Weekly Metal and Mineral Prices,
Metal Market Conditions, Average
Monthly Prices, Stock Quotations

Silver and Sterling Exchange

Dec.	Sterling Exchange	Silver		Dec.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
18	379 ³ / ₄	134	78 ³ / ₄	22	381	133 ¹ / ₂	77 ³ / ₄
19	371	133	78 ¹ / ₂	23	382	133 ¹ / ₂	77 ¹ / ₄
20	379	133 ¹ / ₂	77 ³ / ₄	24	383	133	77 ¹ / ₄

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

Dec.	Copper		Lead		Zinc
	Electrolytic	in Spot	N. Y.	St. L.	St. L.
18	18 ³ / ₄	53 ³ / ₄	7 22 ¹ / ₂ @7.27 ¹ / ₂	6.90@7	8 20@8.25
19	18 ³ / ₄	53 ³ / ₄	7 25 @7.35	6.95@7	8 20@8.25
20	18.40	53 ³ / ₄ @54	7 32 ¹ / ₂ @7.37 ¹ / ₂	6.95@7.05	8 25@8 ³ / ₄
22	18.45	54 ³ / ₄	7 32 ¹ / ₂ @7.37 ¹ / ₂	7.05@7.10	8 ³ / ₄ @8 ¹ / ₂
23	18.50	54 ³ / ₄	7 37 ¹ / ₂ @7.42 ¹ / ₂	7.10@7.15	8.45@8.50
24	18.55	54 ³ / ₄	7 45 @7.55	7.15@7.20	8 45@8.55

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

Dec.	Copper			Tin		Lead		Zinc	
	Spot	3 M.	Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pence sterling per ton of 2,240 lb.

METAL MARKETS

New York, Dec. 24, 1919

A further sharp advance in lead, a smart recovery in zinc, and a firming tendency in the copper market were the features of this week.

Transatlantic freights were unchanged, but exhibited a slightly easier tone. Transpacific freights continued unchanged at \$12 from San Francisco to Hongkong and Kobe.

Gold sold in London at 108s. 9d. on Dec. 17; at 107s. 7d. on Dec. 18, and at 110s. 6d. on Dec. 19.

Copper

A pretty good domestic business was done, wire-drawers, brass makers and rollers all being buyers, but especially the first-mentioned. We quote the market on averages, for there was a range

of prices at all times, not only among different offices but also in the same office. The major part of the business of the week was done at 18¹/₂c., delivered, but during the second half of the week 18³/₄c. became more general, although copper was still obtainable at 18¹/₂c. at the close. Copper was sold for export at 19c.

The Export Association did a moderate business, selling some copper to Germany and a considerable quantity to Japan.

Copper Sheets—28¹/₂c. per lb. Wire 21¹/₂c., f.o.b. factory, and 22c. f.a.s. N. Y.; quiet. Market stronger.

Tin

There was rather active business at advancing prices. However, buying was largely of speculative character.

Spot Straits in this market was quoted at 55¹/₂@55³/₄c. at the beginning of the week and at 57c. at the close.

Singapore quoted c.i.f., London, £317 on Dec. 18; £321 on the 19th; £322 on the 22d; £331 on the 23d; and £330 on the 24th.

Lead

The A. S. & R. Co. advanced its price to 7.15c. on Dec. 18, but the open market was already above that figure, large business having been done at 7.25c. During the following days the market advanced almost without interruption, and quotations represent transactions in blocks of 250 to 500 tons. Supplies of lead have now become very scarce, the situation is acute, and the prospects are that the market will go higher.

A large business was done in Mexican lead for export, Germany, Great Britain, and Belgium being buyers.

Zinc

Following the reaction of the previous week on renewed buying for export, zinc available for delivery west of the Mississippi River being especially in demand and commanding higher prices than those for which consumers could buy east of the river.

Zinc Sheets—\$11.50 per 100 lb. less 8 per cent on carload lots. Slightly higher prices for export.

Silver and Platinum

Silver—Market continues quiet. Efforts are, however, being made to deliver as much silver as possible for shipment from San Francisco in December for China, to arrive at destination before the Chinese New Year, which is in the latter part of February.

The general stock of money in the United States on Dec. 1 totalled \$7,783,144,476; of this \$2,833,221,135 was gold coin and bullion, \$308,145,759 in standard silver dollars, and \$246,540,741 in subsidiary silver. The money in circulation on Dec. 1 was \$5,929,874,791, or \$55.65 per capita.

Mexican dollars at New York: Dec. 18, 101¹/₂; Dec. 19, 101¹/₂; Dec. 20, 101¹/₂; Dec. 22, 101¹/₂; Dec. 23, 101¹/₂; Dec. 24, 101¹/₂.

Platinum—Refined ingot, \$150@155.

Palladium—Scarce at \$130@135.

Aluminum—33c. per lb.

Antimony—Spot was quoted at 9¹/₂@9³/₄c., fair business being done. Futures

were quoted at 9½c. Chinese houses report shutting down of works in China on account of political disturbances.

Bismuth—\$2.65 per lb. for 500 lb. lots. Price ranges from \$2.60@2.80 per lb., depending on quantity purchased.

Cadmium—\$1.40 per lb.

Nickel—Ingot, 42c.; shot, 43c.; electrolytic, 45c.

Quicksilver—Quotation remained steady at \$100 until this morning, when it dropped to \$85. It is reported that arrangements have been made between the Italian government and the Rothschilds, of London, whereby the latter will have control of the output of the formerly Austrian quicksilver mines. San Francisco telegraphs \$90, steady, this telegram being dated Dec. 22.

Other Ores

Tungsten Ore—A little more pressure on the part of sellers was exhibited. Chinese wolframite was quoted at \$6.75, Bolivian, at \$9, and domestic scheelite, at \$15.

Molybdenum Ore—Quoted nominally at 75c. per unit. Nothing doing.

Chromite Ore—In considerable demand. Quoted at 65@85c. per unit.

Other Minerals

Graphite—Ceylon grades are quoted: Lump, 15@16c.; chip, 11@12c.; dust, 8@9c. The recent increase has been owing to the increase of premium on rupee exchange and higher freight rates.

Feldspar is quoted from \$13.50 to \$17 per ton, according to quality. Labor difficulties are hindering producers in increasing production.

Fluorspar—Lump ore containing 85 per cent CaF₂ and not over 5 per cent SiO₂ is quoted at \$16 f.o.b. mines at Tonico, N. M. Freight to Chicago, \$7.50; to New York, \$15. Prices quoted f.o.b. Kentucky and Illinois mines are about \$25 for washed gravel grade.

Nitrate—Spot supplies are quoted at \$3@3.02 per cwt. for carload lots. Contracts for delivery during first six months of 1920 are stipulating \$3.05@3.07½. Shortage and good demand.

Pyrites—Spanish pyrites is quoted at 17c. per unit for furnace-size ore, free from fines, c.i.f. New York or other Atlantic ports. Markets slow and unsettled.

Sulphur—Prices remain unchanged at \$20 for export delivery and \$18 for domestic delivery, per ton f.o.b. mines at Freeport, Tex., and Sulphur Mine, La.

Zinc and Lead Ore Market

Joplin, Mo., Dec. 20—Zinc blende, per ton, high, \$53.50; basis 60 per cent zinc, premium, \$51; Prime Western, \$50; slimes and fines, \$47.50@45; calamine, basis 40 per cent zinc, \$35. Average settling prices: Blende, \$49; calamine, \$36; all zinc ores, \$48.90.

Lead, high, \$92.75; basis 80 per cent lead, \$90. Average settling price, all grades of lead \$88.70 per ton.

Shipments the week: Blende, 9,238; calamine, 68; lead, 1,791 tons. Value, all ores the week, \$614,260.

Following heavy buying last week, few buyers were bidding for ore this week, offering unchanged prices when sellers proffered any ore. For thirty-five years demand has usually dropped at the year-end. Not always a decline in price, but a decidedly short demand is the rule. Since coal cars have been called upon for coal shipments, little over half the demand for cars for ore is supplied.

Platteville, Wis., Dec. 20—No open market sales of premium or Prime Western grades of blende are reported. Lead ore, basis 80 per cent lead, \$86 per ton. Snowdrifts impeded shipments at several points, the tonnage reported for the week being 1,794 tons blende, 115 tons galena, and 30 tons sulphur ore. For the year to date the totals are: 98,899 tons blende and carbonate, 6,739 tons galena, and 17,791 tons sulphur ore. During the week, 2323 tons blende was shipped to separating plants.

Iron Trade Review

Pittsburgh, Dec. 23, 1919

The steel industry is now operating at a shade heavier rate than just before the coal shortage began to close plants and departments, as there has been resumption at most of the plants in the Wheeling district, which had persisted in the strike when nearly everywhere else the great body of the strikers had returned to work. The two pipe mills at Wheeling are now operating at a moderate rate, together with the Mingo steel works, and the Bellaire works would be running were it not for lack of coke, caused by car shortage in the Connellsville region.

At the majority of steel works and in many finishing mills outputs are unsatisfactory, there being three causes, shortage of men, low morale of the workers, and unfamiliarity with the work, there being some entirely new men, and many have shifted in employment. Conditions are likely to grow better steadily.

The steel market has been quieter in the last week than for several weeks. In part this is no doubt a reflection of the usual holiday dullness, but in addition there is the factor that the mills have sold almost as much material as they intend to sell. Some, and the Steel Corporation subsidiaries in particular, have obligated themselves for nearly all the material they can produce to the middle of 1920. Others, including many of the smaller independents, have

sold little, and do not intend to sell for a while yet, feeling that when they are carrying over nearly three months' work from their 1919 obligations there is no occasion to obligate themselves for the second quarter.

There has been much paying of premiums by consumers who have no regular mill connection or desire material in addition to what they will receive on regular contracts. There is room for suspicion that some consumers are more alarmed than they really need to be as to prospective supplies, having too readily assumed that the steel mills have lost forever the art of operating at capacity, as they used to do before the war when the condition of order books permitted. In no calendar year between 1906 and 1916 did the steel mills operate at capacity throughout, the deficiency when it existed being due entirely to lack of orders.

Pig Iron—The market has been quiet in steel-making grades and much less active in foundry grades. Sales of foundry iron, however, have lately been made for second quarter delivery alone at \$38, Valley, a price formerly well established only for early and first quarter delivery. Whether the pig iron market will resume its activity and advancing tendency after the holidays is really a question, though sellers do not admit having doubts on the subject. All the merchant furnaces in western Pennsylvania are now either operative or scheduled to blow in as soon as coke is available, with the exception of Rebecca, at Kittanning, about which no announcement has been made. Coke is still scarce, and several furnaces are banked or operating at reduced rate. The market is as follows: Bessemer, \$36; basic, \$35; foundry, \$38, f.o.b. Valley furnaces.

Steel—Though the Steel Corporation and a few independents are covering their regular customers at March 21 prices as well as they can, many sales are being made at premiums, even for delivery through first quarter if not second quarter, and thus the market stands at approximately the following ranges: Billets, \$38.50@45; small billets, \$42@48; sheet bars \$42@55; slabs, \$41@45; rods, \$52@66.

Ferromanganese—There have been some fair-sized sales of domestic ferromanganese at the regular quotation of \$120, delivered, and some English is reported to have sold at \$110, c.i.f., with \$120 now quoted. Spiegeleisen is stronger at \$40@42, furnace.

Ferrosilicon—The market is relatively quiet at the moment, with the following quotation ruling: Electrolytic, 50 per cent, \$90 and 75 per cent, \$140@150, delivered Pittsburgh.

Current Prices—Materials and Supplies

IRON AND STEEL

SHEETS—Quotations are in cents per pound in various cities from warehouse also the base quotations from mill:
