Engineering and Mining Journal

INDEX TO VOLUME CVIII

July 1 to December 31, 1919

EXPLANATORY NOTE

Illustrated articles are denoted by an asterisk (*); book notices by a dagger (†). This index is made comprehensive but concise. Pains are taken to bring together matter belonging to the same subject, so that when a reader looks up an article, he will be cited to related data. Series of simple page numbers, following names of mines or companies, usually refer to news notes. With a major entry or series of entries, may be placed several minor ones, relating to the same subject in order that its history may be followed. If the author's name be known, it is the simplest means of reference. Productions are indexed under names of metals and countries or states. The mere juxtaposition of a mineral and geographical name usually signifies an output, but may cover other statistical or news matter. Not all news are indexed but a liberal selection of them is made.

This volume of *Engineering and Mining Journal* is complete in 33 numbers owing to the fact that certain numbers so designated on their individual contents pages have been combined. Following is a list of the pages included in the several numbers of the volume, by date:

July	Pages	1-40
" 12	"	41-82
" 19	"	83-124
" 26	"	127-168
Aug. 2	"	167-208
" 9	"	209-250
" 16	"	251-292
" 23	"	293-334
" 30	"	335-376
Sept. 6	"	377-418
" 13	"	419-460
" 20	"	461-502
" 27	"	503-544
Oct. 4	"	545-586
" 11	"	587-628
" 18	"	629-670
" 25	"	671-712
Nov. 1	"	713-754
" 8	"	755-796
" 15	"	797-838
" 22	"	839-880
Dec. 6	"	881-922
" 13	"	923-964
" 20	"	965-1006
" 27	"	1007-1048

Number 1

A Few Words About Ourselves

WITH the opening of its 108th volume the *Journal* appears in a new editorial garb. If there were nothing more than mere caprice or whim in determining the typographical style and make-up of a modern magazine, the matter would not be worth the reader's attention; but if, as happens in this case, the changes are the result of deliberate study of the *Journal's* editorial purpose and the best mechanical means of accomplishing it, they may be worth passing comment. For ourselves, we look upon the new garb as the outward and visible sign of an inner zeal in the welfare of the mining industry, and a determination to promote its interests in a very definite way. The extent to which we achieve this declared purpose will be measured by our readers' approval. Success can come only through service.

The first and most noticeable change to attract the reader's attention is the shift of the editorial pages from their former position to the front of the book. In homely phrase, this enables the editors to greet the reader at the front door of what they hope will prove for him each week a storehouse of appropriate knowledge and information; and if, in addition, he finds therein material that affords him pleasure and recreation, the result will be doubly gratifying.

In the typographical style and arrangement of the contents of the magazine, consideration has been given to those rules and dicta that have been developed from the concrete experience of the printing craft, and a definite effort has been made to produce a prospect pleasing to the eye. In this respect, thoughtful typography serves a purpose in reaching the reader's mind similar to that of bright silver and snowy linen in tempting the diner's appetite. In the interest of certainty regarding our market quotations, we have set these in larger type, so that there will be no confusion in the integers or fractions, particularly the latter, when occasionally an accident mars the type face and gives a poor imprint. The *Journal's* market quotations are prepared with too much care to permit poor printing to vitiate their usefulness or leave room for doubt as to their exact meaning.

Close personal contact with the mining industry is an essential part of the *Journal's* editorial policy, to be accomplished by frequent and regular visits into the field by members of the editorial staff. In this respect the importance of the Rocky Mountain and Pacific Coast region has been specially recognized by the establishment of a Western editorial office in San Francisco, in conjunction with other McGraw-Hill engineering publications. The *Journal* will be represented there by a Western Editor, who by travel, correspondence and participation in local affairs will be able to reflect adequately the activities of a great mining region; but what perhaps is of greater importance, he

will at the same time personalize the *Journal's* service and usefulness to those who are engaged in mining. Thus, not only will the West find expression in the *Journal*, but the latter, as the exponent of the industry, will function most effectively in Western mining affairs. We shall be pleased if members of the fraternity will accept our cordial invitation to make personal use of this San Francisco office. It is established for the convenience of our readers and others engaged in the mining industry, and may be used as their personal headquarters, for the receipt of mail, or for conference with the Western Editor when he can be of assistance.

But the *Journal* has a still larger field of usefulness in reflecting world-wide mining conditions. It has become a trite saying that the war created new relations in our industrial life, but it is none the less true. Certain it is that the war demonstrated as nothing else could the far-reaching importance of the mining industry, the apparent dependence of the world on the peculiar mineral resources of certain countries, and the necessity for every nation to know its neighbors' resources as well as to survey carefully its own. Accordingly, we in the United States face the necessity of extending our horizon and adjusting our concepts of the mining industry. Henceforth we must think internationally as well as nationally, and view the world as the field of action for American mining engineers. No longer will it suffice to be well posted on conditions in the United States alone. We must be prepared to seek opportunities elsewhere for the investment of American mining capital, and we must view domestic enterprises in the light of possible foreign competition. In the reflection of these new conditions the *Journal* will draw upon authentic and reliable sources of information.

The publication of a magazine is a co-operative enterprise in which the reader, the advertiser and the publisher share the benefits. Contributing mainly to the reader's interest, and through him to the advertiser's, is the editorial staff, on which all concerned rely for the production of a magazine of reliability and unquestioned integrity. In the case of an engineering magazine the character of the editorial staff becomes of primary importance on account of the technical nature of the subject, requiring special knowledge and sound judgment. Manifestly, the requisite qualifications cannot reside in an individual; hence the *Journal* is the joint product of a staff of trained and experienced engineers, working as a unit for a common purpose. In this respect we have similarity with a college faculty, composed of specialists and combining a variety of talents. This makes for breadth of view and sympathy, and catholicity of judgment that appeals to a wide circle of readers. Conversely, it avoids the pitfalls of prejudice and narrow-mindedness.

The *Journal* is naturally restricted as to the subjects to which it can devote its pages, but the staff will

endeavor to take a broad view of the economics and practice of mining, mining geology, and appropriate phases of ore-treatment, continuing to rely on the valued support of old contributors and inviting the co-operation of new ones.

The Signing of the Peace Terms

A FRIEND of ours related the following incident, which we will tell in his own words: "During the war I had been in the habit of buying my evening paper at a little news-stand close to my apartment. The owner of the news-stand was a gruff, morose old fellow, who shuffled up and gave me my paper with little regard for my greeting or for custom. He was evidently German born. Last Saturday evening, however, as I entered the place, I was greeted with a cheery hello and a smile which was evidently sincere. Puzzled, I walked away, opening my paper as I went. Suddenly I comprehended, as I read the bold headlines 'Peace Treaty Is Signed.'"

The incident of the old German may or may not be typical, but it at least indicates that among many the tension produced by the war has been broken and replaced by a happier frame of mind. June 28 marks the consummation of a progression of events occurring during the last five years and profoundly affecting individuals and nations. Whatever the terms of the peace treaty may be, and however they may affect the several nations signing it, the fact remains that in that treaty we have, as near as it is possible to attain by human efforts, a world constitution.

Our experience with our own constitution may well lead us to feel that the peace treaty will clarify and strengthen international relations. There will be doubts and misgivings, but the important fact remains that the treaty will become just what we make it. A broad spirit of acceptance and tolerance will make it a success. The world grows smaller, population increases, elbow-room becomes harder to get; more and more is it imperative to cultivate a spirit of amity, comradeship, and understanding among nations.

Americanization

AMERICANIZATION as we understand it has for its object the saving of 30,000 lives per annum in the United States, the saving of 100,000 injuries, and the saving of millions of dollars to our mines and industrial plants, but more than all these its object is to save the United States for our children and ourselves. Secretary Lane, in an address before the Washington Conference of Americanization Specialists, in May, said:

The right of revolution does not exist in America. We had a revolution 140 years ago which made it unnecessary to have any other revolution in this country, because it was fundamental. One of the many meanings of democracy is that it is a form of government in which the right of revolution has been lost by giving the Government wholly to the people. Revolution means revolt. Against whom are we to revolt in the United States excepting the people of the United States?

If we Americans do not like officials, programs, policies, measures, systems, we can try others, but in Europe the right of self-determination as to domestic concerns has been denied, and therefore the right of revolution has been preached.

No man can be a sound and sterling American who believes that force is necessary to effectuate the popular will. As we have taken from the duelist his pistol and compelled

him to seek redress in the law, so in the larger affairs of the nation we have said, "This is your country. Make it what you will; but you must not use force, for when you came here and became a citizen you gave over the right to resort to anything but public opinion and the methods of the law in the determination of national policies. If you are in a minority you must wait until you become a majority, and as a majority you must be content to prevail by processes which respect the rights of the minority."

Americanism does not mean that any one economic system is right, or that the United States is a perfected land; it does not mean that any one social philosophy must be accepted as the final expression of truth; but Americanism does mean that we have evolved for ourselves machinery by which revolution, as a method of changing our life, is outgrown and outlawed.

That the foreign-born citizens may grasp this idea, the start must be made with the English language. John H. Finlay aptly said in his remarks before the same conference:

To make here in America a permanent Pentecost that all the people of the land may understand one another, we must begin with a common language. I know that this is not the sufficient thing, but we must begin with words, for all the good and bad that gets done in the world is done through words.

The large mine or reduction works has a duty to itself and the community in bringing about a condition on its properties requiring that notices be printed in but one language, the English language. With the small mines the duty is no less imperative, but is more difficult of accomplishment. Here it means co-operation between the mine management and the local community.

Americanization will not be accomplished through closing our ports to immigrants over a period of four years or any other period, but much may be accomplished through teaching those already with us, and teaching the others as they come.

Worth-While Men

CAN-DO men are worth-while men. The urge of necessity develops self-reliance. Can-do and self-reliance are complements of each other. On the battle-fronts of Europe men were compelled to think fast and to act. They were compelled to do with what they had. The construction of a billet, a bridge, a road, the extrication of a motor truck from a shell hole, or the rescuing of the wounded under fire became imperative necessities. Our soldiers did all of these things. They also vanquished the enemy. And in doing these things they were under a great co-ordinated system, the American Army.

It is difficult to estimate the value of the Army experience to each individual. Each was the better for it. The returning soldier is a greater asset to the country than he formerly was as a citizen before he donned the uniform. The Army has been quick to realize that it is a great training school where men are made. How to take care of himself; how to work with others; how to obey orders; how to use his time to best advantage—these are a few of the fundamental lessons that the Army has instilled in the soldier.

That the new plane attained by the Army may be made permanent is the wish of all who have its interests at heart. At the recent meeting of the New York Section of the American Institute of Mining and Metallurgical Engineers, Major Stuart elucidated and explained the new purpose of the Army. He impressed those present with the economic importance of the Army

when considered as a training school for men. All who heard him were quick to catch the drift of his argument. There will be substantial agreement that the Army has contributed a large number of creditable and valuable men to our citizenry.

Increasing Iron-Ore Resources

THE heavy drain upon the domestic iron-ore resources caused by the enormous production of iron and steel naturally raises the question of the life of the deposits and the probability of maintaining the grade of the ores produced. Despite the productiveness of the Minnesota deposits, there is a limit. It is true that this limit is in the future, but that future may not be so far away. Both the grade of the ore and the proportion of bessemer ore have sensibly diminished. Were the present merchantable ores of Minnesota our only resource in that state, the prosperity of the iron-mining industry there might be seriously curtailed within several decades. Fortunately, however, there exists a large tonnage of low-grade taconite which contains upward of 30 per cent of iron in the form of magnetite. Until recently this ore was not merchantable, for obvious reasons.

At the recent meeting of the New York Section of the American Institute of Mining and Metallurgical Engineers, Horace V. Winchell, president of the Institute, related how, by well-known metallurgical methods, the low-grade taconite can be treated and a merchantable ore of bessemer grade and higher in iron content than the Mesabi ore obtained. This is a significant and important achievement. It was not obtained casually, but is the result of careful and persistent experimentation. Mr. Winchell paid special tribute to Walter G. Swart for his able work in conducting the investigation which has resulted so happily. The intelligent application of engineering principles to the solution of problems of this kind gives further emphasis to the value of the engineer to the community.

When actual exploitation of these deposits along the proposed lines will take place is problematical. In all likelihood this will be when plant and operating costs reach a level that will insure an adequate margin of profit to justify the large capital expenditure.

Nevertheless, great credit is due the men who have solved this vital problem.

Sealing Off Water in Oil Wells

THE wholesale development of oil-bearing formations has brought with it a number of peculiar engineering problems, among the more important of which is the necessity of preventing the contamination of the oil with water which leaks in from contiguous strata. Individually, the operations of a producer may be of importance to himself alone. He may lose the product of a well by excessive infiltration of water. This may be due to his own carelessness or ignorance. For this he pays his own price. Where, however, there are a number of producers operating in the same field, the operations of each company become of considerable importance to the others.

Carelessness or ignorance is never excusable, even when the guilty individual is the only sufferer, but if his neighbors also suffer, through no fault of their own,

there should be a strict accounting. The continuity of structural conditions in the large oil fields necessitates a considerable degree of co-ordination of the efforts of individual companies, particularly where there are important water-bearing formations in close proximity to the oil sands, either above or below. The infiltration of water caused by a single well may adversely affect the product from a number of wells. It is on this account that geologists and oil men combine to study the conditions in a given field, to the end that all of the recoverable oil from the field can be obtained, and the greatest length of life of the particular area assured.

Methods for coping with infiltrating water have been progressively developed. At present there are a number of effective processes for handling both top and bottom water. All involve the sealing off of the troublesome stratum by the use of either cement or mud-laden fluid in conjunction with the steel casing. Structural conditions and the nature of the water-bearing stratum determine largely the selection of the method and the details of its application. The degree of success attained depends upon the thoroughness of the knowledge of the underground conditions and the skill and experience of the operators who are engaged in conducting the sealing operations.

Knowledge of underground conditions cannot usually be obtained entirely from a single well, but should be derived from the detailed logs from a number of wells in the same field, as well as from the behavior of the producing wells. This implies that there should be some clearing house of information in each field from which data could be obtained to guide the individual operator and to warn him of the dangerous horizons. The necessity for this has been recognized, and in oil fields where water troubles are critical operators have co-operated with one another to minimize the difficulty.

In California a law providing for the protection of oil deposits in that state against water and other damages following improper development methods has been in operation for three years. A department of the California State Mining Bureau administers the law, and considerable progress has been made in establishing records and field procedure useful in controlling the situation. A report recently issued by the California State Mining Bureau contains descriptions of many interesting examples of the practice of sealing water-bearing formations, and should be useful to operators and engineers. On the whole, this state control has resulted in material benefit to the California oil industry. It emphasizes the important results that accrue from organized, intelligent direction.

In the current number we are publishing, on page 11, an article by Seth S. Langley, which gives in detail an insight into the practical details of this all-important problem.

Progress in Milling

IN THE Milling Number of the *Journal*, published on June 28, the last paragraph of the editorial, "Progress in Milling," is to be taken as referring solely to the Minerals Separation "means" of introducing air. The mining industry still has the possibility of the "bubble-column" process, commonly called the pneumatic-cell process, with an economical use of oil. The recent decision of the U. S. Supreme Court clearly indicates the intention of that court to hold the patentees strictly to the "means" disclosed in their patent, No. 835,120.

Some Prominent British Engineers

ALFRED JAMES

Distinguished metallurgist of international reputation, who has been particularly identified with the development of the cyanide process.

THOMAS KIRKE ROSE

Assayer of the British Mint. Author of "The Metallurgy of Gold," and a distinguished authority on that subject.

HUGH F. MARRIOTT

A mining engineer who has been prominent in the operation of gold-mining interests in the Transvaal.

F. W. HARBORD

A metallurgist closely associated with the British iron and steel industry, and of wide experience and high attainments in general consulting practice.

Developments in Lake Superior Milling

Copper Ore-Dressing and Leaching Practice—Two Types of Ore Necessitate Different Methods, Of Which the More Complicated Includes Stamping, Regrinding, Tabling, Leaching Of Sands by Ammonia Solutions and Flotation of Slimes

By C. H. BENEDICT

Metallurgist, Calumet & Hecla Mining Co., Calumet, Mich.

AS IS WELL KNOWN, two principal types of copper ore are mined in the Lake Superior region, both of which contain native copper, but which differ materially, not only in the physical character of the gangue but also in the physical character of the contained copper. The conglomeratic ore is a hard, close-grained rhyolite, characteristically composed of pebbles, and in which the copper forms the cementing material in the interstices between the pebbles. In the amygdaloidal ore, on the other hand, the copper occurs in more massive form than in the conglomerate and the rock is much softer.

of the nature of the ore and the general simplicity of the metallurgical treatment, it is not always economical to carry that recovery to its highest point, as the additional value is not warranted by the increased cost incurred. The richest ore now milled in the Lake Superior region comes from the Champion mine of the Copper Range Co., which throughout 1918 gave a recovery of 36.6 lb. copper per ton of ore milled, with a tailing loss of probably six to seven pounds per ton. The lowest-grade ore profitably milled in the district during the same year was from the Kearsarge lode of the Osceola Consolidated Mining Co., which yielded only

FIG. 1. AHMEEK STAMP MILL, HUBBELL, MICH.

Numerous amygdaloidal lodes are being worked, and each lode differs to some extent from all the others, both in physical characteristics and in rock constituents, and more particularly as regards the richness of the ore and the size and distribution of the copper particles. The only conglomerate ore mined at present is from the Calumet & Hecla mine, and, inasmuch as the lode is rich and the copper is in a fine state of subdivision, metallurgical development has been more pronounced in the treatment of this "rock" than in the case of any other "rock" in the district.

The question of the best metallurgical treatment of the amygdaloidal ore is most often a compromise between the possible metallurgical recovery and of the economics of that recovery. That is to say, though it is possible to get a high metallurgical recovery, because

12.62 lb. per ton, with a tailing loss of less than four pounds.

It is obvious that it is possible to carry the metallurgical treatment of ore further when one is treating material assaying 40 lb. copper per ton than would be possible with corresponding material assaying but 16 lb. copper per ton. If one is inclined to criticize the lack of fine grinding or some other relatively crude method prevailing in some mills, one must take into account the fact that the value of the fine copper may not be present in sufficient amount to warrant a better process. The amygdaloidal ore mined by the Isle Royale Mining Co., for example, contains a large percentage of heavy copper, so that it is possible to make a recovery of more than 80 per cent by stamping it in a steam stamp and screening it to a maximum size of $\frac{3}{16}$ in. without the

necessity of finer grinding of the $\frac{3}{16}$ -in. material. On the amygdaloidal ore of the Kearsarge lode, and also on that of the Pewabic lode, the metallurgical recovery is not nearly as good for the same degree of crushing. To get satisfactory results it is necessary to resort to regrading of the coarser tailings.

COPPER IS COARSER IN AMYGDALOIDAL LODES

In all of the amygdaloidal lodes the copper is in a coarser state of subdivision than in the Calumet conglomerate. Thus, to release the mineral values, it is necessary in the case of the Calumet conglomerate to grind to a finer size than for the amygdaloidal ore. The big problem for the metallurgist is not so much to devise a method of saving the copper when liberated as it is to decide to just what extent he is justified in going into the matter of saving. His judgment in this respect must be based on many factors, some of which are within his control and some of which are not. The equipment that would have been justified at 26c. copper would not be economical at 15c. copper,

efforts have been made in this direction, but until some one can devise a plan whereby the large masses of copper can be automatically removed from the heads at the same time, there will be no saving of labor in having the automatic feeder, because it is essential to have an attendant present at the feed shoot to remove the large masses of copper. If they get into the mortar they may cause serious damage, such as the breaking of the shoe, stamp stem or piston rod, and if they do not do this they will accumulate in the mortar to such an extent as to make necessary the removal of the grates and the shoveling out of the mortar contents. This refers to masses of copper eight or ten inches in size.

Provision has been made for the removal from the mortar of masses up to three or four inches in size by means of two devices patented in about 1900 independently by F. E. Woodbury, now deceased, and by Charles and Henry Krause. The devices are known as mortar discharges and have for their object the removal of coarse copper from the mortar, for which purpose they are most effective.

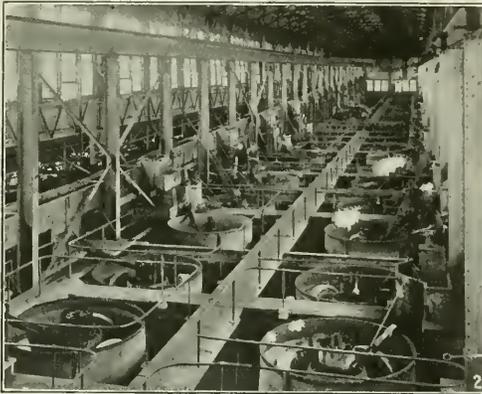

FIG. 2. OLD REGRINDING PLANT OF THE CALUMET & HECLA MINING CO.

FIG. 3. PRESENT REGRINDING PLANT OF THE CALUMET & HECLA MINING CO.

and, in the same way, an equipment that would be justified for a given price of copper for a given quality of ore might, in turn, not be justified in case the ore became two or three pounds leaner. That is the reason for a statement made earlier in this article that the complexity of treatment and the choice of the flow sheet are, to a great extent, a question of the value of the copper per unit of ore.

One feature that must be clearly understood in any review of the metallurgy of Lake Superior is the influence of the presence of coarse metallic copper, because of the fact that it is metallic and therefore not subject to subdivision at the will of the operator. As is well known, one may have masses of metallic copper underground of almost any size up to hundreds of tons' weight, but as the ore comes to the mill the largest masses of copper have been cut up and one must reckon with pieces that might be contained in rock of the maximum size of, say, 12 by 12 by 14 in. in dimensions. It is because of the possible presence of masses of copper of this size that the automatic feeding of stamps has not been practiced in the Lake Superior region.

It would be easy to devise a feeder for a stamp that would maintain the proper load in the mortar, and many

The Krause discharge is a plain hydraulic discharge opening into the mortar through the staves at a point about five inches below the level of the bottom of the mortar grate. The Woodbury device also operates through the staves, but at the level of the bottom of the mortar grate, and is in the nature of a jig with a pulsating current, as opposed to the constant hydraulic pressure used in the Krause discharge. These two devices are effective in removing from the mortar such copper as may be within their range, which is roughly from $\frac{1}{2}$ up to 4 in. in size, and any copper coarser than this should be removed by the stamp attendant, or "head feeder," as he is locally known. It is the presence of these large masses of copper that makes it impracticable to use a gyratory crusher or even coarse rolls for the preliminary crusher, and the steam stamp has been unique and unchallenged for this purpose.

It is not only on account of the size of the copper that the steam stamp is so efficient, but also, strange to say, because of the shape of the copper. This is really worth consideration, as those who operate mills in the Lake Superior region find a great deal of confusion of ideas on the part of the sulphide-ore operators in respect to the last-named feature.

Before the days of flotation the most common criticism heard of Lake Superior practice was the opinion that the steam stamp caused too much abrasion and consequent loss of copper. To anyone who has tried to abrade copper, and then at the same time attempted to crush amygdaloidal rock, the fact would quickly be forced home that the rock will slime while the copper still remains in its original form. Further than this, it is really necessary that the copper be somewhat "punished" before it is given jig or table treatment. A great part of the copper is in such shape that the surface is out of all proportion to the mass, and by the action of the stamp it is either hammered into a more compact body or is subdivided into a number of pieces each more compact than the original. This matter of the shape of the copper particles becomes much more important in the finer states of subdivision, where forces other than gravity have free play.

In the early days the inefficiency of the metallurgical process was recognized just as keenly as it is at present, but there was no form of fine grinder that was sufficiently cheap in operation to warrant its installation on these relatively low-grade ores; more particularly because, even with the release of the copper particles from the ore, their recovery was problematical.

USE OF ROLLS NOT SUCCESSFUL

The use of rolls for fine grinding was not a success and could not have been a success, because they simply cracked the particles of rock and released the copper in its original shape, which ordinarily is so pronged and irregular that it could not be saved on a vanner or on a Wilfley table. The same general effect occurs with the Huntington mill, the crushing action of which is similar to that of a roll. The effect of the shape of the copper was definitely recognized by the early operators, who attempted to use grinding devices that would put the flat copper particles into more of a pellet form. For this reason the old Herberle grinder found great favor in the Calumet & Hecla mills before the days of the Wilfley table, because its action was such that the copper was rolled up into a globular or pellet form which was easily saved by a jig.

At present a crushing device is being developed which it is confidently believed in some quarters will accomplish the same result. The device is known as the Lovett grinder. It is a horizontal disk grinder, one of the disks having an oscillating and the other a circular motion, so that the grains of rock are torn apart and the copper is rolled up into a more compact form than it originally had in the ore.

It was not, however, until the introduction of the Chilean mill, taken in conjunction with the Wilfley table, that it was possible in the Lake Superior region to obtain an economical recovery of copper from particles finer than $\frac{3}{16}$ in. The Chilean mill had not met with great favor in Western practice, because of its sliming proclivities, which made it, on the other hand, acceptable to native-copper metallurgy. The copper freed by the Chilean mill was in the shape of flat grains and was in excellent condition for a good recovery by the Wilfley table. Up to the time of the introduction of the pebble mill, the Chilean mill was the only type of fine grinder used generally in the Lake Superior region, and it found a place in the stamp mills, not only of the Calumet & Hecla Mining Co. but also of the Copper Range, the Mohawk, and the Lake Milling Co.

With the introduction of the Hardinge grinder, which

fortunately occurred at about the same time that cheap power became available, owing to the adaptation of the low-pressure turbine to the utilization of the exhaust steam from the stamps, fine grinding may be said to have secured an established place in the metallurgy of the Lake Superior district. Each important plant now has one or more mills in operation, and each operator has attempted to find the economical point to which this fine grinding can be carried on his particular ore under the varying conditions of the copper market.

In the Isle Royale plant, which has a capacity of about 2,000 tons of ore per 24 hours, one mill is in operation, regrinding middlings from the jigs and tables; and this seems to be about the proper practice for the ore, as it contains a large percentage of the copper in coarse particles. In most of the mills treating amygdaloidal ore, however, the practice is to have at least one pebble mill for each stamp unit of 700 tons' daily capacity. This might be termed standard practice for medium-grade amygdaloidal ores.

The Champion and the Baltic mills of the Copper Range Co. stamp the highest-grade amygdaloidal ores in the Lake Superior district, and in both there are a sufficient number of ball mills in use to regrind all jig tailings. The Quincy plant has two Hardinge ball mills in operation and is now installing five Marcy ball mills for the regrinding of its jig tailings.

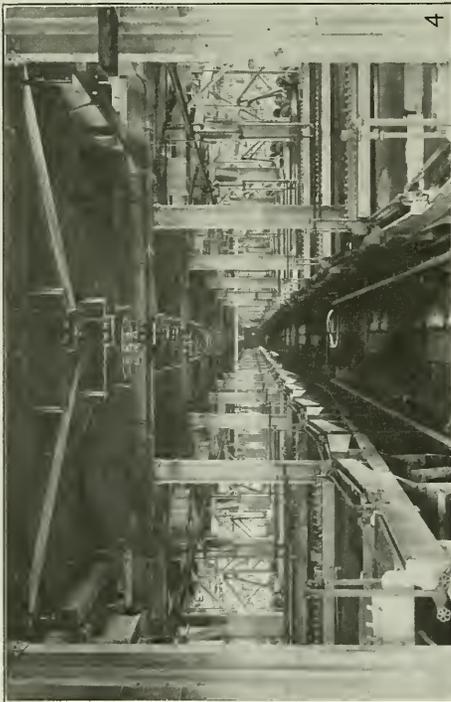

On the conglomerate ore of the Calumet & Hecla Mining Co. there are sufficient pebble mills in operation to regrind all jig and table tailings so that the product passes a 28-mesh screen and about 40 per cent passes 200 mesh. In all of the plants the product of the ball and pebble mills, with little preliminary classification, is treated on Wilfley tables, and a recovery of from 35 to 60 per cent of the copper is effected. The resultant tailings in all mills except those treating conglomerate ore is sufficiently low in copper to throw away. Only in the mills of the Calumet & Hecla does further metallurgical treatment follow the tables.

CALUMET & HECLA CONGLOMERATE ORE CONTAINS FINELY DIVIDED COPPER

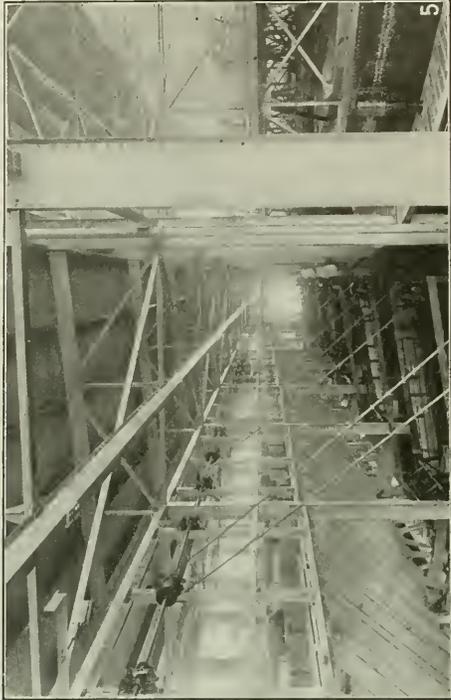

The conglomerate ore of the Calumet & Hecla Mining Co. is in a class by itself, because of the fact that, as stated earlier in this paper, the copper is in a fine state of subdivision and also because the ore is richer than any of the amygdaloidal ores except the product of the Champion and the Baltic. The pebble mill regrinding followed by table treatment still left copper amounting to seven or eight pounds per ton, and it was realized that the limits in mechanical separation had been reached.

Efforts had been directed for many years to find a leaching method that would recover the copper commercially, and finally, in 1912, a process was invented by the author¹ which solved the problem. The leaching plant has now been in operation three years, and has been an entire success. For 1918 there was recovered 8,035,156 lb. refined copper from the treatment of 1,005,015 tons of sand, at a cost, excluding smelting and selling, of 7.71c. per lb. This showed a copper recovery of about 75 per cent on the material treated by leaching, and brought the recovery on the original ore up to better than 90 per cent. The cost of the leaching operation is about 40c. per ton under normal conditions, which would necessitate a grade of ore assaying at least six pounds per ton before one could hope to make the

process commercially available, and, as most of the amygdaloidal ores of the district yield a tailing just under this, there does not seem to be much hope for the extension of the ammonia leaching process to such ores, although it is perfectly adaptable to them and will effect a good metallurgical recovery.

FLOTATION IN TREATMENT OF COPPER ORES

The latest development in the treatment of Lake Superior ores is the adoption of the flotation process. The leaching process has been worked out only for the treatment of the sands, and flotation is so efficient for the treatment of slimes that it is not conceivable that the leaching process could compete with it, even were the many mechanical problems worked out that would arise in an effort to adapt ammonia leaching to slimes. None of the amygdaloidal mines has installed the flota-

recovery of about 65 per cent on the material treated, so that the final mill recovery is fairly satisfactory.

It is on the conglomeratic ore of the Calumet & Hecla Mining Co. that the only flotation plant of any size is in operation. Up to the time of the introduction of flotation, slime practice had consisted of treatment of the pulp on round tables and of the concentrate produced by these on Wilfleys. This round-table Wilfley practice has now been discontinued, and the slimes, as they leave the Woodbury classifier following the stamp, are subjected to the action of a two-spigot hydraulic classifier, and the resultant spigot products are treated on Wilfley tables. The overflow of this classifier goes to a 25-ft. diameter three-tray Dorr thickener, and the product of this thickener is treated in flotation machines of the Minerals Separation type. For each conglomeratic-ore stamp unit of 350 tons' daily capacity there is one

FIG. 8. FLOTATION PLANT OF CALUMET & HECLA

tion process as part of the mill practice, although the Winona mill had made a beginning toward this end at the time it was closed down following the signing of the armistice.

Both the Copper Range and the Quincy are doing some experimenting with flotation, but neither company has even an experimental unit in operation. At the White Pine mill, where the ore is neither conglomeratic nor amygdaloidal, but consists of sandstone and slate, flotation is part of the regular practice, and all the tailings are subjected thereto. In this mill, the flotation is applied to the ore following the table treatment and as a final process. The ore consists of copper in a fine state of subdivision in sandstone, and in an almost microscopic state of subdivision in slate, so that the mill recovery, previous to the introduction of flotation, did not exceed 60 per cent. Flotation processes effect a

25-ft. thickener, and the thickened product from four thickeners, amounting to about 400 tons daily, is treated on a 24-in. Minerals Separation machine of 600 tons' nominal capacity. Of the sixteen cells of this M. S. machine, two are used for mixing only, and two for cleaning up the concentrates of the other twelve.

The concentrates go to a Dorr thickener, and from this to an Oliver filter, from which the material is scraped into the concentrate cars for treatment at the smeltery. The plant has been working for just about a year and indicates a recovery of about 65 per cent of the contained copper and at a cost of possibly 20c. per ton, including royalty. In addition to this plant of 2,000 tons' daily capacity on the Calumet & Hecla conglomerate, a second plant of like capacity is being built, which is to treat the slimes resulting from the regrinding operations, both of the current tailings and of the tail-

ings from the lake. This plant will consist of eight Dorr thickeners, 40 ft. in diameter, three-tray, and for the treatment of the thickened product will have four M. S. type machines of 600 tons' nominal capacity each. The plant should be in operation some time during the summer and will give a total flotation capacity of 4,000 tons. The capacity of the leaching plant is also 4,000 tons, so that the combined re-treatment plants will be able to handle the normal production of 5,000 tons daily of ore from the mine and 3,000 tons from the accumulated tailings.

With the successful working out of the leaching and flotation processes on native copper ores, the operator in the Lake Superior copper region has at his command all necessary means for good metallurgical recovery. Milling costs are low, and can be lowered by cheaper power resulting from a more general installation of low-pressure turbines, which have been found universally satisfactory. Grinding costs may be still further reduced by improvements in machines or methods. Neither jig nor table practice has been improved for some years, the re-treatment of the tailings from these machines making them of lesser importance than formerly. It is to the economics of the problem that the mill man must give greatest attention.

Report of Chile Copper Co.

Reserves, Production, Equipment, Improvements, New Construction—Twelve Shovels Are Now Operating—Leaching Recoveries High

THE third annual report of the Chile Copper Co., for the year ended Dec. 31, 1918, shows that 3,745,248 dry tons of ore was treated, averaging 1.64 per cent copper, the recovery from which averaged 82.17 per cent, or 51,068 tons of copper produced, compared with 2,905,156 tons treated in 1917, averaging 1.76 per cent, with recovery of 81.81 per cent, or 44,185 tons of copper produced. The positive and probable ore reserves as of Dec. 31, 1918, are estimated as follows: Oxidized ore, 336,510,349 tons, of 1.91 per cent copper; mixed ore, 151,000,000 tons, 2.98 per cent copper; sulphide ore, 210,000,000 tons, 1.84 per cent copper; total, 697,510,349 tons, 2.12 per cent copper.

In 1918, there was produced 102,136,658 lb. of copper, of which there was sold and delivered 84,695,299 lb., at an average price of 24.713c. per lb. of copper. The total cost of production was 17.885c. per lb. of copper sold, distributed as follows: Cost of production, including depreciation, selling, delivery, New York expenses, taxes, and less miscellaneous income, was 15.318c. per lb. Cost of plant and equipment installed in prior years and abandoned or superseded by other structures or machinery has been charged against the year's income, equivalent to additional cost of 0.049c. per lb. Depletion of mineral deposits has been charged against income at a cost of 2.518c. per lb.

OPERATIONS AT THE MINES

Ten hectares of ground situated along the northern border of the district were acquired for use as a dump site and railroad right of way. Only five prospect holes were drilled, with total footage of 642 ft. There was loaded, to be sent to the reduction plant, 3,401,627 metric tons of 1.71 per cent copper. A total of 557,800 cu.yd. of waste was removed from all benches, averaging 0.37 per cent copper. Underground development

was advanced 34,721 ft. Since the beginning of the underground blasting tunnel development a total of 70,950 ft. of tunnels has been driven, of which 23,739 has already been blasted.

During the year, 1,458 holes were drilled, with a total footage of 53,268 ft. Since operations began, 3,812 holes have been drilled, with a total footage of 145,398 ft. The ground broken was 4,140,318 cu.yd. No ore has been taken from the dumps. The tonnage remaining in the several piles is 207,267 tons, averaging 3.85 per cent copper.

Twelve shovels are in operation, two of which are standard 103-C Bucyrus electric machines. These electric shovels are giving excellent service, their operation being in every way more economical than steam shovels. One Baldwin, seven Porter and thirteen Panama locomotives are in service attending shovels. Two more 103-C electric shovels have been erected and will go into service when main hoisting motors are received. One 225-B electric shovel is under erection and will be put into service within ninety days (report dated Feb. 5). Two 1,050 ft. motor-driven compressors were installed.

In the secondary crushing plant, the operation of rolls was discontinued early in 1918. The third section went into service on Mar. 21, and on July 2 a complete installation of eighteen fine reduction Symons disks were in operation. The feature of the completed disk installation was the gradual cutting down of the oversize on .371-in. screen. During the first quarter this oversize was about 50 per cent, whereas for the last quarter it averaged 18.5 per cent.

In the leaching division, the important feature was the increased extraction. An average of 87.9 per cent was reached, as against 82.2 per cent for 1917, owing principally to the finer grinding of the ore. The maximum was reached during November, when an average of 91 per cent was obtained.

The new de-chloridizing plant should be in operation before the middle of 1919, with greatly improved equipment. The feature here was the development of a cylindrical copper drum for precipitating cement copper, in place of the trommel.

The following were among the important additions to the plant equipment completed during the year: Symons crusher house, first west extension; solution sump; foundry and oxygen generation plant. The following features are well under way and should be completed early in 1919: sewage system and disposal plant; machine shops; Toconce pipe line, and eleven-bay extension to electrolytic tank house. Progress in all construction work is still seriously retarded, owing to difficulties in obtaining material on account of embargoes on exporting from the United States, as well as shortage of shipping facilities.

The average rate of exchange between Chilean currency and United States currency was 3.37 for 1918, as against 3.90 in 1917. This low exchange had the effect of increasing the payroll for native labor by \$800,000 United States currency over what it would have been at the previous year's exchange.

The Record of Tax Receipts of the Ontario Government for the year ended Oct. 31, gives the total amount paid by mining companies as \$863,547. The principal items are: Hollinger Consolidated, \$70,473; International Nickel, \$600,000; Nipissing, \$64,927; Mond Nickel, \$45,769; Kerr Lake, \$34,460; McIntyre-Porcupine, \$3,937; Miller Lake-Obrien, \$8,781.

Sealing Water in California Oil Fields

Productivity of Oil Formations Is Sometimes Seriously Affected by Water Penetration—Improved Methods of Sealing Water-Bearing Formations Have Been Devised

By SETH S. LANGLEY

Mining Engineer, General Petroleum Corporation, Taft, Cal.

IN CALIFORNIA, all drilling operations are under the supervision of the California State Mining Bureau, which maintains an office in each of the principal fields. A definite procedure under supervision of the bureau is followed from the time of location of the well, while it is being drilled, and through its productive life to final abandonment. The purpose of this is to provide proper protection of the underground oil and gas resources. Each major operation is inspected, and either accepted or rejected, by a deputy inspector, and there has grown up a cordial cooperation between the bureau and the operators. The California State Mining Bureau should be congratulated for its personnel and for the results that have been obtained.

Before describing the various methods of sealing water, or water shut-off, as it is more generally designated, it is necessary to present some figures to show the necessity of successful water control in the California oil fields. I am indebted to the California State Mining Bureau for some of the statistics given in Table I.

TABLE I. TOTAL OIL AND WATER PRODUCED BY ALL WELLS DURING FISCAL YEAR, JULY 1, 1917, TO JULY 1, 1918

Field	Oil, Bbl.	Water, Bbl.	Water, per Cent.
Coyote Hills.....	11,743,952	894,534	7.1
Olinda.....	2,909,421	432,899	12.9
Brea Canyon.....	1,615,240	661,779	29.0
Puente.....	19,415	1,838	8.6
Whittier.....	1,102,453	1,013,680	48.0
Montebello.....	3,263,389	214,283	6.1
Salt Lake.....	1,134,797	764,975	40.2
Newhall.....	119,289	132,656	52.7
Total and average.....	21,907,956	4,116,644	15.8

TABLE II. AVERAGE DAILY PRODUCTION

A—Average Daily Production of Fields in Ventura County.

Field	Oil, Bbl.	Water, Bbl.	Water, Per Cent.
Piru.....	378.5	629.8	62.5
Simi.....	202.0	26.8	12.1

7	C	264,556	1,161	0.43
8	C	452,669

Zone A, the uppermost oil horizon, is about 100 ft. in thickness, and has a water zone 50 ft. above it. The top of Zone A is about 2,600 ft. from the surface. Zone B, the top of which is approximately 100 ft. below the bottom of Zone A, has a thickness of 200 ft. There is a water zone between Zone A and Zone B. The top of Zone C, which is 400 ft. thick, is 100 ft. below the bottom of Zone B. There is a water zone with two water sands between zones B and C. The total production to Feb. 1, 1918, of oil and water from the three zones is shown in Table IV.

TABLE IV. TOTAL PRODUCTION TO FEB. 1, 1918, IN SUNSET FIELD

No. of Wells	Zone	Oil, Bbl.	Water, Bbl.	Water, Per Cent.
25	A	1,433,173	496,417	20.5
9	B	1,226,856	224,002	11.3
26	C	2,175,530	211,995	38.0

Per cent water means the percentage of water in the fluid, fluid being the mixture of water and oil.

It would be expected that the failures to exclude water would be greatest at the greatest depth. This is found to be true, but Zone B has a greater percentage of success than Zone A, which lies above it. The explanation of this is that there is a more favorable structural condition between the water sand and Zone B than above zones A and C.

It is readily seen from the conditions outlined that one of the most serious problems in California operations is the control of underground water. The operators have been fortunate in that the men who have been called upon to solve these problems have been drawn from all the fields of the world. Broad experience and the breadth of vision to meet new conditions with new methods or adaptations of old methods have solved many trying situations, and the outlook for future progress is encouraging. The technology of all branches of the oil industry is advancing, and none more rapidly than that appertaining to underground operations.

Four types of water must be excluded: top, intermediate, bottom, and edge. Top water is water

originating above the first oil horizon. Intermediate water is water originating between oil sands. Bottom water is water originating below the lowest oil sand from which the well is producing. Edge water is water in an oil sand following the oil, and may appear in one oil horizon while other oil horizons are still productive. Should water appear in the second oil horizon while the first and third are productive, it would be an edge water in its own sand, but an intermediate with respect to the first and third.

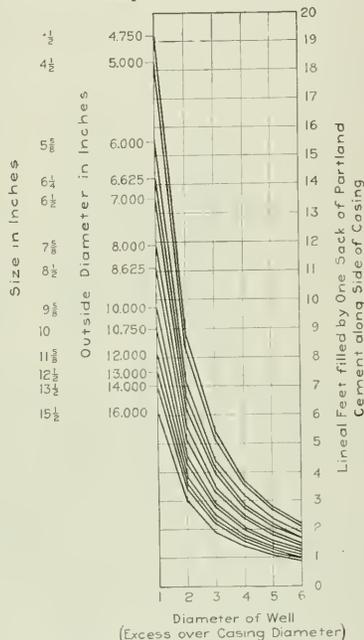

FIG. 1. GRAPH FOR THE DETERMINATION OF NEAT CEMENT FOR DIFFERENT CASINGS

The migration or movement of water from one formation to another is prevented by one or all of the following methods: formation shut-off, cementing, or the use of mud-laden fluid.

FORMATION SHUT-OFF

A formation shut-off is attempted when the casing is tightly driven into, or landed, in shale or clay, without the use of a packer or cement. The success of this method depends upon the selection of a shale or clay stratum as a landing for the casing. Shale or clay offers the greatest probability of being impervious to water. If possible, correlative data should be gathered to show the location and probable thickness of the best landing stratum. If this is not possible, the drilling should be closely followed and the casing landed too high rather than at such depth as to involve a chance of encountering a productive sand before having shut off the water. It is always possible to go back and ream the hole to size if a lower landing stratum is found.

When the place selected has been reached, the operation consists in drilling a smaller hole, 10 to 20 ft. in advance, and driving the casing into it. It is not good practice to raise the string of casing 20 ft. or

more and let it drop free, to sink by its momentum into the formation. This is too severe a shock for any casing. The driving should be done with driving clamps, and an experienced driller knows when to stop driving.

A plain or tapered casing shoe is used, the length depending on the thickness of the landing stratum. A tempered steel tapered shoe is best, as it will set more firmly and withstand corrosion longer. When the casing has been landed, the hole is deepened 5 to 10 ft. ahead of the casing shoe, and bailed for testing the effectiveness of the shut-off. Care should be taken not to bail below the collapsing point of the casing. It is best to allow a safety factor of two in determining the resistance of the casing to collapsing pressure. The water level is known from the level to which the water rose in the casing while drilling.

If the bailing test shows no water coming in, the Mining Bureau is notified to send an inspector to witness a second bailing test, which is made at least twelve hours after previous bailing. If the test is satisfactory, the shut-off is approved; if not, the operator and the Mining Bureau agree upon a plan of operation to remedy the failure. If the total depth of the hole is not too great to allow bailing to bottom, the most satisfactory test can be made by bailing dry. The collapsing strength of casings is shown in Table V.

TABLE V. COLLAPSING PRESSURES OF CASING

Size, In.	Weight per Ft., Lb.	Inside Diameter, In.	Collapsing Pressure per Square Inch, Lb.	Equivalent Water Column, Ft.	Water Column With Safety Factor of 2, Ft.
4½	16	4.082	4,710	10,850	5,425
4¾	12.85	4.506	2,900	6,680	3,340
4⅝	15	4.424	3,610	8,320	4,160
6¼	20	6.049	2,380	5,480	2,740
6⅜	24	5.921	3,220	7,420	3,710
6½	26	5.855	3,650	8,410	4,205
6¾	28	5.791	4,070	9,380	4,690
6⅞	28	8.017	1,670	3,850	1,925
7	32	7.921	2,150	4,950	2,475
7½	36	7.825	2,630	6,060	3,030
8	40	10.054	1,420	3,270	1,635
10	45	9.360	1,800	4,150	2,075
12½	40	12.438	500	1,150	575
12¾	45	12.360	750	1,730	865
15½	70	15.198	790	1,820	910

CEMENT SHUT-OFF

A cement shut-off is the operation of sealing between the formation and the casing shoe by the use of hydraulic cement. There are two methods of cementing, with many variations of each.

Dump-Bailer Method—The same operations are followed in the dump-bailer method of cementing as in the formation shut-off up to the time of cementing. The shale or clay landing stratum is chosen, and a small hole drilled ahead 10 to 20 ft. When ready to cement, the bottom of the hole is bailed clean of cuttings, and the casing is raised about 18 in. off the bottom of the full-sized hole. Enough cement must be used to fill the small hole and to flow up back of the casing 20 ft. or more. A sack of cement is figured as 1 cu.ft., and, when mixed with water to the consistency of gruel, will be increased to 1½ cu.ft. A graphic illustration of the amount of neat cement required to fill the space back of the different sizes of casings is shown in Fig. 1. The usual amount of cement in practice varies from 8 to 75 sacks, and the amount necessary can be determined only by the size of the casing, the condition of the hole, and the depth of the small hole.

The cement is dumped into a shallow rectangular tank in such quantities as to fill the bailer to be used. The bailer may be either cast iron or glass bottom, with a moving plug below, which breaks the bottom

when landing, or it may be a trip-valve bottom, to drop its load, rather than to pick up a load as the usual bailer does. The glass or cast-iron bottom bailer can be used only when cementing on a plug or bridge, or original bottom with no small hole drilled ahead. When ready to cement, the bailer is lowered into the casing with its top just below the top of the casing.

The tank for mixing cement is set close to the top of the casing, with the back end raised and a pipe leading over the casing to discharge into the bailer. The cement is mixed with water, no sand or rock being used, and when thoroughly mixed it is emptied into the bailer. The bailer is lowered to the bottom of the hole and its load dumped. If more than one bailer load is used, the procedure, as outlined above, is repeated until the entire charge is dumped. The casing is now lowered to the bottom and driven into the formation.

The depth driven will be governed by the good judgment and experience of the driller. Should it be desirable to force the cement along the outside of the casing above its natural level, the casing is raised 20 to 30 ft. off the bottom. It is then filled with water and a plug screwed on the top, and the casing then lowered to position. As the water cannot leave the casing at the top, the cement is forced ahead of the lowered casing and travels up the sides of the hole.

Should a condition be met where the water runs off into some formation, so that the casing cannot be filled, it becomes necessary to use a cement plug, unless the pressure method is substituted for the dump bailer. Several kinds of plugs are suitable for this purpose, and they work on the principle that, when lowered below the bottom of the casing, a portion of the plug expands so that, when the casing is lowered to the bottom, the expanded plug acts as a seal and prevents the cement from entering the casing. These plugs are of cast iron and are easily drilled out when the cement has set.

The hole is allowed to stand idle a week or more, the time generally depending upon whether or not the drilling crew can be kept at work elsewhere while the cement is allowed to set. When ready to test, a hole is drilled ahead of the shoe for 5 or 10 ft., and the same test is made as in the formation shut-off.

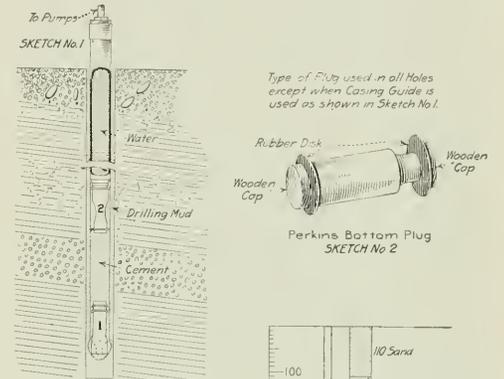

Cementing by Pressure—The pressure methods are known by the names of the inventors, or by the means of placing the cement, and are called the Perkins, the Huber and Wilson, and the Scott and tubing. The Perkins method is that used by the inventor after whom it is named. Equipment is maintained in the principal fields of California, with an operating crew for each unit. The charge is \$250, regardless of the depth of the shut-off or the quantity of cement used.

The equipment consists of two pumps for handling cement and two rectangular mixing tanks, which are built to nest one within the other. One pump will operate up to 300 lb. pressure and the other up to 1,000 lb. The pumps are mounted on a motor truck, behind the driver's seat, and the tanks carried behind the pumps. A small box, to act as a sump, is also furnished. The contractor furnishes two wooden plugs, the equipment described, and the labor of two men, the owner of the well furnishing everything else—cement, steam, water, and all additional labor.

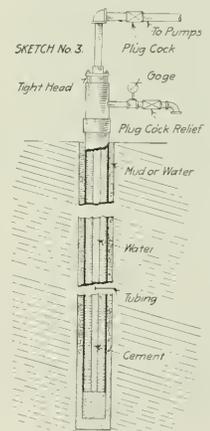

Upon arrival at the well, the steam line from the drilling boilers is connected to the pumps. A hole is dug and the sump box placed with its top level with

the ground. The suction lines of the pumps and the main water-supply line are run to the sump. After the mixing tanks are unloaded from the truck, they are set up to discharge into the sump. Two tanks, each of a capacity of about 500 gal., are filled with water, and are also connected to the sump. The discharge line of the pumps is connected to the casing head by a long swing joint. This is to allow movement of the casing while cementing, in order to keep it free in the hole.

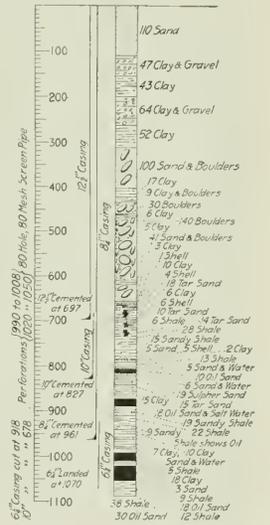

The drillers first secure circulation. By circulation is meant fluid pumped into the casing passes down

Cross Section showing Perkins Plugs, lower Plug at Bottom, upper Plug has begun to force Cement into Hole through Bottom Plug

inside the casing and returns up between the casing and the wall of the hole to the surface, or passes into some formation before reaching the surface. The casing is then lowered to bottom. A rise of pressure on the pumps will show that the landing is tight and the casing does not leak.

It is necessary now to describe the two plugs which are to be used. One plug precedes the cement down the casing and the other follows the cement; both are

made of redwood. No. 1 plug is put in the casing after circulation has been obtained, and the casing raised 18 in. off the bottom. This plug is 3 ft. long, and at its lower end is $\frac{1}{2}$ in. smaller in diameter than the casing in which it is to be used. This diameter is maintained up the plug 9 or 10 in., at which point it is reduced about 3 in. for the remainder of its length. At the upper end, the plug consists of two wooden disks, which unscrew by means of a wooden screw in their center, which is right-and-left threaded to retain it in the body of the plug. Between the lower wooden disk and the plug a rubber disk, just the diameter of the casing, is placed; the wooden disk is screwed on, and another rubber disk placed above it. The second wooden disk is then screwed on top of the second rubber disk. (See Sketch 1, Plug 1.) Thus the plug has two rubber disks firmly seated, which prevent the cement above them from passing down and the water below from coming up, and which, when the plug reaches bottom, will bend downward, allowing the cement to pass. In the large portion of the bottom of the plug, a hole is bored upward which meets two holes bored diagonally downward, from opposite sides, forming a Y. The upper parts of the Y, or inlets, of these holes enter the plug in the reduced portion, thus making a passage through the bottom of the plug for the cement to pass when the plug reaches the bottom.

The type of bottom plug just described is used when lowering the casing into a rotary hole with an egg-shaped casing guide, as shown in Sketch 1. The plug shown in Sketch 2 is the type of bottom plug used when lowering casing with a plain shoe into a standard hole.

After the plug is in the casing, the casing head is screwed in place and connected to the pumps. By this time the cement has been mixed and is now discharged into the sump as rapidly as the low-pressure pump will pick it up and force it into the casing. The volume of the mixed cement is known and also the lineal feet which it will occupy in the casing to be used. When all the cement has been pumped into the casing, the casing cap is removed and the second wooden plug put in on top of the cement. The casing cap is replaced and again connected to the pump.

A water meter is connected on the main supply line to record the amount of water consumed. As enough water must be pumped into the casing to replace its total contents, an accurate record of the water must be kept. The total volume of the casing less the volume of cement will show the amount of water required to land the first plug at the bottom, and the total volume of the casing will show the amount necessary to land both plugs at the bottom. The two tanks of water are kept full, to be used if the main supply line fails, and, in that case, the water used is computed from the size of the tanks.

The upper wooden plug is 36 in. long, with the lower end about 3 in. less in diameter than the casing. A rubber disk is placed on the lower end and acts as a guide. Above the disk, the plug is reduced in size to a point about 12 in. below the top. In the top is placed a rubber disk, with a wooden disk above it, and, on the top of that, a leather cup disk, such as is used on a deep well pump. This leather cup is placed so as to prevent any water above the plug mixing with the cement below it.

The water is now pumped into the casing as fast as the low-pressure pump will handle it. The meter is

watched, and when the lower plug should reach bottom a rise in pressure should be noted on the pump gage, as the pumps are now forcing the cement and mud up the wall and the weight of the column of water in the casing is not equal to that of the mud and cement outside of the casing. From this point on, the pressure will rise more rapidly, and when the second plug lands on the bottom plug, there should be a sudden rise to 300 or 400 lb. pressure. The rise in pressure is more conclusive evidence that the plugs have come together than the meter readings of water pumped. If the meter fails, as sometimes happens, the pressure gage will show when the plugs have come together. Although the low-pressure pump may finish the work, it is well to use the high-pressure pump and hold the pressure long enough to be sure that the upper plug has actually landed and not temporarily jammed before reaching the bottom. The casing is then lowered to the bottom, a valve in the pump line close to the casing head is closed to keep the pressure on the casing, and the pump line disconnected.

If it be necessary to use 100 sacks of cement, and a third of it is left in the casing, all of the benefit of the shut-off may be lost when drilling out the cement remaining in the pipe. The jar of drilling out 50 to 100 ft. of cement may crack the bond between the casing and the wall of the hole. The cement is given a week or more to set, and the same tests of shut-off are made as in the other methods.

The tubing method, as its name implies, is the use of tubing as a means of placing the cement. It is common practice to use 2- or 3-in. tubing, such as is used in pumping a producing well. It is necessary to provide a tight head in the casing, so that the cement will pass outside the casing. The basic principle of a tight head is that of a stuffing box. In some cases the stuffing-box collar screws into the box without packing, instead of in the usual manner. This method is most successful when working under high pressure.

The tubing method is not applicable if there is a possibility of the casing freezing while lowering tubing and cementing. The most successful operators stand the tubing in the derrick before beginning operations, thus lessening the time required and consequently reducing the chances of the casing becoming tight by caving.

The drillers get circulation before starting the tubing in the hole. The tight head is slipped on the last joint of tubing, and, when the tubing has been lowered to the position it will occupy during cementing, the head is tightened around the tubing. Clear water is pumped in the tubing with the casing on bottom until the gage shows about 50 lb. pressure, thus showing that casing can be landed tight on bottom and has no leaks.

Before cementing, it is necessary to calculate the quantity of water necessary to fill the tubing, and the water-supply tanks should have a capacity sufficient to furnish this amount. The cement is either mixed as in the Perkins method, or in a mechanical mixer, and pumped into the tubing. When all the cement is in, the pumps are connected to the water-supply tanks, and the calculated amount of water is pumped into the tubing. When this has been done, all cement should be back of the casing, except that occupying the space between the lower end of the tubing and the bottom of the hole. The casing is now landed on the bottom, and the operation completed, unless it is desired to

leave very little cement in the casing, in which event the tubing is raised or lowered to the required point, the tight head loosened, and clear water pumped into the casing. This is continued until all cement above the lower end of the tubing has been flushed back to the surface, as will be shown by the water coming out at the collar of the casing.

If it is not possible to seat the casing on the bottom, either because of the presence in the hole of side-tracked casing, lost tools, or collar-bound casing, in which case the cement will return inside the casing, it is necessary to use a cement retainer. The Baker cement retainer is a device well suited to meet this condition. It works upon the principle of a check valve, which can be firmly seated at or near the bottom of the casing after the casing is in the hole, and cement can be pumped down through this check valve, but cannot return.

The Scott method is really a process of mixing, rather than of placing the cement, and can be used with any cement method, but it is principally used by W. F. Scott, of Taft, Cal., the inventor, in placing cement by the tubing method. The mixing equipment consists of a steam-driven cement pump, a steam-driven cement mixer, a small suction tank, and a water tank. All but the suction tank are permanently mounted upon a wagon or motor truck.

The cement mixer consist of a 6½ ft. length of 12½-in. casing, lying horizontally, and acting as a mixing barrel, in which revolves a shaft with radial blades. Above the working barrel, and discharging into it, is the feed hopper. Water is piped into the working barrel at the feed end by two pipes tapped into the plug which forms the end of the working barrel. One of the water inlets is on each side of the stuffing box of the drive shaft.

Upon arrival at the well, the equipment is connected to the steam and water lines. A small platform with steps is moved beside the mixer, and all the cement sacks are untied, being placed within reach of the mix-

ing crew. As a ton (20 sacks) can be mixed in 2½ to 3 min. it is necessary that the cement be handled rapidly. The suction tank is placed on the ground below the discharge of the mixer, with the suction of the cement pump laid to it. The procedure from this point is similar to that described in the tubing method, the principal variation being that a relief valve is connected to the tight head. The purpose of this relief valve is to avoid the necessity of loosing the tight head when pumping clear water into the tubing, either before or after cementing.

The Huber and Wilson method can be used with any

cement shut-off. Its distinguishing feature is the addition of a secret solution which it is claimed produces quick setting of the cement.

Of more than 800 shut-off operations, 89 per cent were successful. The cementing shut-offs do not show as high a percentage of success, but it must be borne in mind that cementing is attempted at greater depths, with correspondingly greater hydrostatic pressures to overcome. This is well illustrated by the data in Table VI, which shows the depths at which the respective methods were used.

The relative success of these methods at different depths with cable and rotary tools is shown to be in favor of the formation shut-off in cable-drilled holes above 2,000 ft., whereas the formation shut-off is not common practice with rotary tools above 2,000 ft. This is shown by Table VII.

TABLE VII. RELATIVE SUCCESS OF FORMATION AND CEMENT SHUT-OFFS

f. represents formation shut-off; c represents cement shut-off.

off may be made after mudding under pressure, or dump-bailer cement shut-off or pressure cement shut-off after mudding under pressure.

The hole is drilled by rotary to a point below the first tar sand, which is usually at a depth between 600 to 750 ft., 650 ft. being the average. From the surface to 500 or 575 ft. the formation is alternating shale, clay, sand, and boulders. The first indication of approach to the first tar sand is a thin stratum of very hard formation, known locally as shell. This shell is seldom more than 5 ft. in thickness. Following this will be a stratum of clay or shale, seldom more

than 10 ft. thick, with another thin shell stratum immediately below. The tar sand is usually next below the second shell. There are exceptions to this. It may be said that there are exceptions to everything in this field. There may be several shell strata between the depths of 200 ft. and the first tar sand, but a tar sand should be watched for under the first shell passed below a depth of 500 ft. From the first tar sand and to the bottom of the lowest oil horizon the succeeding tar and oil sands are so lenticular that they cannot be correlated further than two or three locations, 800 to 1,200 ft. apart. It is sometimes impossible to correlate from one location to another. The first tar sand can usually be correlated accurately and is the "marker" for cementing the first water string, which is 12½-in. casing. The 12½-in. casing is usually cemented with 160 sacks by the Perkins method.

The rotary is then moved to another location and the cable tools are rigged up, and a week or ten days are allowed for the cement to set. When ready to test the shut-off, the hole is drilled ahead by cable tools, about 5 ft. below the shoe of the casing, and then bailed dry, to stand 12 hours. The usual test is made in the presence of a Mining Bureau inspector.

Because it is impossible to foretell whether or not lower water sands will be encountered between the bottom of the 12½-in. casing and productive oil horizons, a string of 10-in. casing is carried as a possible second water string, and if sands are encountered they are tested for water. These sands may be tar, dry, or oil sands, in the adjoining wells, yet prove water-bearing in the new hole, or they may be dry in the new hole, though wet, tar, or oil in the adjoining wells.

Should water be found while carrying the 10-in. casing, it is landed for a temporary shut-off in the first suitable shale or clay stratum below the water sands. This shut-off may be formation, or the dump-bailer method. The 8½-in. casing is then carried as a prospect string until it is known if the 10-in. casing should be carried lower for a permanent shut-off. When the 10-in. casing is cemented for a permanent shut-off, mud-laden fluid is pumped under pressure into all formations back of the 10-in. casing. If the 10-in. casing becomes a water string, it is between the depths of 780 and 825 ft. It sometimes happens that when drilling ahead to complete with the 8½-in. casing, it also must be cemented for a shut-off and the hole completed with 6½-in. casing, in spite of the fact that the average depth of the wells is between 1,000 and 1,100 ft. An example of this condition is shown in the accompanying graphic log. Attention is called to the fact that the two upper oil sands are shut off, as shown by the depth of cementing with 8½-in. casing. The 10-in. and 6½-in. casing are cut and pulled above the shoe of the next larger casing and adapters placed.

Portable Lamp Guard

The necessary repair work about mine hoist houses and boiler rooms can best be done in daylight and under such conditions as will permit of a full view of the part or parts that require attention. But this is not always possible, and it frequently happens that inaccessibility of parts allows little choice in the matter, and the work must be done in a cramped position and with little light. The latter condition prevails to a great extent in underground mine pump stations and repair shops, but, wherever electric connections are to be had, the

difficulty may be partly overcome by the use of a portable lamp properly provided with a guard. The uses about the mine for such a device are not confined to the above-mentioned instances, for the portable lamp will be found invaluable in shaft work, motor-locomotive repairs, and under many other conditions where it is possible to obtain the necessary current for illumination.

In drifting and crosscutting where electric current is available a flexible cable and tungsten lamp, protected by a lamp guard, are used for illumination.

A successful portable lamp guard, which is quickly attached and fulfills all the requirements of durability and safety, is made by the Flexible Steel Lacing Co., of Chicago. It consists of a split handle attached to an expanded-steel lamp guard. The halves of the guard, including the handle itself, open wide from the hinge at the bottom of the guard and can be instantly closed and locked around the socket at the end of any extension cord.

Fuller's Earth in 1918

U. S. Geological Survey

Fuller's earth, which is used principally in filtering petroleum, was in good demand in 1918, and, in consonance with the increase in production of petroleum, showed a large increase in output, notwithstanding the handicaps of shortage of labor and fuel, and unsatisfactory conditions of transportation. A report on fuller's earth in 1918, by Jefferson Middleton, shows that the output in 1918 was 83,968 short tons, valued at \$1,143,854, or \$13.62 per ton, at the mine. This was an increase of 11,401 tons in quantity and \$371,767 in value, compared with 1917, and was the largest output and the greatest value in the history of the industry. The output in 1918 was twelve times as great and the value twenty-eight times as great as in 1895, the first year in which fuller's earth was commercially produced in the United States. The average price per ton in 1918 was the highest on record and \$2.98 higher than in 1917.

Deposits of fuller's earth are found in many states, but the deposits in only seven states were worked in 1918. Named in the order of output these states were Florida, Texas, Georgia, California, Arkansas, Massachusetts, and Nevada. Of the output in 1918 about 99 per cent came from Florida, Georgia, Arkansas, and Texas. Nevada appeared for the first time as a producer of fuller's earth. A large deposit of earth in Ash Meadows, Nye County, known as "Death Valley Clay," has been used experimentally in refining petroleum and is said to be excellent for this purpose. Florida, which has been the leading state in the production of fuller's earth since the beginning of the industry, reported about four-fifths of the output and value in 1918.

Though the production of fuller's earth increased in 1918, the imports fell off, owing to shortage of bottoms and high ocean freight rates. The quantity imported was 12,607 short tons, valued at the port of shipment at \$165,535, or \$13.13 per ton, a decrease of 4,387 tons in quantity and of \$10,882 in value, compared with 1917.

The apparent consumption of fuller's earth—that is, the production plus the imports—was 96,575 tons in 1918, an increase of 7,014 tons, compared with 1917. The domestic production therefore constituted 87 per cent of the consumption in 1918.

Graphite Mining and Milling in Alabama

Adoption of Oil Flotation Is Responsible for Recent Progress Made in the Graphite Industry, And That Process Will Probably Supersede Other Methods of Concentration

By H. P. H. BRUMELL

Mining Engineer, Ashland, Ala., and Buckingham, Quebec, Canada

SINCE the appearance of an article¹ on graphite mining in Alabama, by Irving Herr, little has been published regarding conditions in this district, and, in consequence, it may not be as generally well known as its importance warrants. For the last two years there has been considerable local activity, the result being the establishment of what promises to be one of the country's important minor industries.

There are in Alabama large deposits of low-grade disseminated graphite ore that are easily mined. The graphite is of excellent quality and entirely of the crypto-crystalline variety, known in the trade as "flake graphite." Until recently the deposits were considered to be pre-Cambrian, but later investigations have demonstrated that they are of Carboniferous age, though the rocks are highly metamorphosed and consist entirely of quartz schists.

Dr. W. F. Prouty² describes³ the district as follows: "The rock in which the flake graphite beds occur is a mica schist, generally considered of pre-Cambrian age, for the most part highly metamorphosed and much intruded by both acid and basic igneous rocks, which are for the most part in long dikes, nearly parallel with the trend of the graphite orebodies, but in some cases cutting them at slight angles. Some of the pegmatite dikes have excellent commercial mica and kaolin. Bordering this mica schist on the west, for the entire length of the area, occurs a green-colored schist, originally a basic igneous rock and designated by the Alabama Geological Survey as the Hillabee schist. The graphite area is seldom more than three miles distant from this metamorphosed basic igneous mass and locally is in contact with it."

The ore which is now mined consists almost entirely of the weathered portion of the beds, the weathering usually extending down to the water level in the valleys between the hills on which, almost without exception, the deposits are found, the valley bottoms being usually filled with soil washed down with other detrital matter from the higher ground. This weathered ore is soft and in most instances breaks down on quarrying, like sand. The whole is easily milled, the quartz being friable. The gangue consists entirely of a friable quartz with a small quantity of "a white fibrous mineral, probably sillimanite" and occasionally mica, either biotite or muscovite, cyanite, and tourmaline.

FLOTATION METHODS SUCCESSFUL WITH ALABAMA ORES

Until within the last two years, practically all the mills were equipped with "skin-flotation" machines, known locally as the "Ashland washer," a device identical with the Brumell hydraulic separator, used long ago and abandoned at Buckingham, Quebec. One of the mills obtained concentration by means of the Huff

electrostatic machine and one adopted the use of a Minerals Separation oil-flotation machine.

Since 1917, and with the advent of the oil-flotation method of concentration, the industry in Alabama has made excellent progress, and this method seems to have solved the problem of cheap extraction. Many new mills have been erected, and a few of them have operated satisfactorily, the most successful being those wherein flotation methods were employed. The following is a list of the plants in the three counties of Clay, Coosa and Chilton, showing the method used at each:

ALABAMA GRAPHITE PLANTS AND METHOD OF CONCENTRATION.

Plant	Situation	Type of Concentration
Liberty Graphite Co.	Clay County	Callow
Lineville Graphite Co.	Clay County	Ashland
Carbon Mountain Graphite Co.	Clay County	Ashland
Peerless Graphite Co.	Clay County	Remodelling
Jennings Graphite Co.	Clay County	Ashland
Republic Graphite Co.	Clay County	Ashland
Crystalline Flake Graphite Co.	Clay County	Log washer
Clay County Graphite Co.	Clay County	Ashland
Monitor Graphite Co.	Clay County	Callow
Alabama Graphite Co.	Clay County	Ashland
Graphite Mills, Inc.	Clay County	Pneumatic tables
National Graphite Co.	Clay County	Ashland
Southern Graphite Co.	Clay County	Callow
Acme Graphite Co.	Clay County	Log washer
Ashland Graphite Co.	Clay County	Callow
Griesemer Graphite Co.	Clay County	Wet tables
May Brothers Graphite Co.	Clay County	Ashland
Alabama Graphite Co.	Clay County	Callow
Alabama Graphite Co., No. 2	Clay County	Log washer
Axton-Noe Graphite Co.	Clay County	Ashland
American Graphite Co.	Clay County	Minerals Separation
Guemeda Graphite Co.	Clay County	Ashland
Norway Graphite Co.	Clay County	Ashland
Eagle Graphite Co.	Clay County	Log washer
C. B. Allen Graphite Co.	Clay County	Callow
The Ceylon Co.	Clay County	Callow
Atlas Graphite Co.	Clay County	Callow
Superior Flake Graphite Co.	Clay County	Brown
Crucible Flake Graphite Co.	Clay County	Ashland and Minerals Separation.
Hood-Graves Graphite Co.	Clay County	Ashland
Graphite Company of America	Coosa County	Electrostatic
Goodwater Graphite Co.	Coosa County	Ashland
The Ceylon Co.	Coosa County	Minerals Separation
Parkdale Graphite Co.	Coosa County	Simplex
Diamond Graphite Co.	Coosa County	Simplex
Seminole Graphite Co.	Coosa County	Callow
Duro Flake Graphite Co.	Coosa County	Simplex
Flaketown Graphite Co.	Chilton County	Electrostatic

The superiority of the oil-flotation method of concentrating graphite over other methods employed has been demonstrated, and it is probable that all mills in the future will be equipped with one or other of the various types of machines on the market, or by flotation apparatus of home construction. The types so far used in Alabama comprise Minerals Separation, Callow, Simplex, Brown, and Janney, the latter only, up to the present, being used for purposes of re-cleaning. In those cases where the machine treatment is followed by the use of wet tables, either Wilfley or Deister, concentrates that assay from 80 to 88 per cent, with an extraction ranging from 83 to 90, are being produced. With all the types of machines the extraction is in inverse ratio to the size of the graphite particles in the pulp. Thus, the coarser the graphite, the poorer the extraction; and the greater the proportion of saving of the coarser material, the poorer the concentrates. There is opportunity here for expert mill practice, and the most successful operator will be the one who can best adjust the two conditions.

¹Eng. and Min. Journ., Apr. 21, 1917.

²Assistant State Geologist, University, Alabama.

³Birmingham Age-Herald, Jan. 28, 1917.

It is not the intention to criticize or compare the methods of mechanical or pneumatic agitation, but, in a general way, it may be positively stated that the machine which affords the greater time for the settling of the froth will give the highest percent concentrates, whether the froth be made by one or the other method. In the matter of the recovery of the coarse flake, the question of froth settling is a serious one, as any agitation sufficient to lift the heavier graphite will lift considerable gangue, and, if quick delivery is made, poor concentration will be the result.

PRIOR OILING OF PULP SECURES GOOD RESULTS IN BALL MILLING

In general practice, various crushers are used, both jaw and gyratory, and the crushed ore is, in some instances, further reduced by rolls before going to the ball mill, to which it is fed after oiling. The emulsification of the water before the ball-mill treatment tends to save the freed flake, as the revolving and churning action of the mill creates a froth, which carries the graphite through on the surface of the charge, leaving only the coarser particles of ore to be ground. It was feared that the use of ball mills would prove to be so destructive of the flake as to be inoperative, except for the making of fine flake and dust, neither of which is desired by the producer. But experience has proved that with prior oiling of the pulp, and with care in adjustment and operation, excellent results can be obtained.

The ball mills in use in the district comprise Marcy, Hardinge, Lehigh, and Marathon types. Various classifiers, including the Dorr, Atkins, Gemmill, and Deister, are in use. Heretofore little attention has been given to the operation of classification, and the machines were used entirely for the purpose of returning oversize to the ball mills. It is, however, thought that with proper adjustment a large proportion of barren material might be removed and full advantage taken of this important operation. With an ore in which the graphite separates easily, there is no reason why at least 50 per cent of the gangue should not be eliminated.

GRAPHITE TREATMENT FOLLOWING CONCENTRATION

After concentration is effected, the concentrates are dried and sent to the finishing plant, where the usual methods of refining or finishing are followed. At most of the mills some type of air classifier is used, either an aspirator or apparatus of home construction, and two of the mills use high-speed smooth flour-mill rolls, the action of which is to crack the coarser gangue particles, the consequent dust being removed by screens clothed with silk belting cloth. At one of the latter mills the concentrates were improved from 71.8 to 85.7 per cent and in the other from 51.0 to 82.0 per cent carbon.

After treatment, as above, the finished concentrate goes direct to the buhr mills, where it gets a final grinding and polishing and is then graded for the market, Alabama stocks being known as No. 1, No. 2, No. 1 dust, and No. 2 dust. It has not been found possible to obtain sufficient representative assays from which to make an average, but it may be stated, in a general way, that the average of No. 1 would be about 88.0 per cent carbon, and of No. 2 about 82.0, and both qualities of dust would range from 30.0 to 50.0 per cent pure graphite.

As an evidence of the freedom of Alabama graphite from deleterious substances, more especially iron, lime, and mica, the following complete analysis, a composite of several analyses, is presented, and for comparison an analysis of the Ceylon material. Both analyses are official, being taken from a report by George D. Dub, "Preparation of Crucible Graphite," U. S. Bureau of Mines, 1918:

COMPARATIVE ANALYSES, ALABAMA AND CEYLON GRAPHITES

	Alabama, Per Cent.	Ceylon, Per Cent.

BUREAU OF MINES EXPERIMENTS AND FUTURE OF ALABAMA GRAPHITE INDUSTRY

Considerable experimental work has been undertaken by the Bureau of Mines, with a view to ascertaining the relative value of Alabama crucible stock as compared with that of Ceylon, which has hitherto dominated the markets of the world. The investigations have proved the stocks for crucible making to be of a parity, and the fact that during the period of embargo on foreign graphite there was no dislocation of the crucible industry, which was forced to use both domestic clay and graphite, would further tend to prove this.

In conclusion it may be stated that Alabama has extensive beds of low-grade ore, easily mined and milled and possessing all the elements necessary to the success of the industry, such as available labor and shipping facilities, so that its permanent establishment and extension are solely matters of proper business organization and management. The industry is not, in the true sense, a mining one, but is rather a milling proposition, and, as such, will become standardized as are other industries.

Crushing Practice at Anaconda

At the concentrating mill of the Washoe Reduction Works of the Anaconda Copper Mining Co. the run-of-mine ore is roughly screened over a shaking screen with 2-in. round holes, the oversize going to a 12 by 24-in. Blake-type crusher set to 2 in. The crushed product is sent over a stationary grizzly with 2-in. openings, the oversize going to two 8 by 20-in. Blake-type crushers set to 1 in. The product of the 8 by 20-in. crushers joins the undersize of the shaking screens and is delivered to a series of trommels. The first trommel has 1-in. round holes, the oversize going to one set of 55 by 24-in. heavy-duty rolls set to about $\frac{3}{8}$ in., the crushed product being sent back to the trommel line. The undersize from the 1-in. trommels passes to the $\frac{3}{8}$ -in. trommels, the oversize being sent to one set of 55 by 24-in. heavy-duty rolls and back to the head of trommel line. These rolls are set to about 5 mm. All material crushed through $\frac{3}{8}$ -in. is further sized and jigged. The jig tailings are then partially dewatered and sent to $1\frac{1}{2}$ by 12 mm. trommels operating in closed circuit with two sets of 55 by 24-in. heavy-duty rolls, where the crushing process is completed to $1\frac{1}{2}$ mm.

War's Influence on the Zinc Industry*

The Meeting of the Zinc Institute at St. Louis an Occasion for Special Emphasis Upon the Development of New Uses for Zinc and Co-operation Between Miner and Smelter

BY POPE YEATMAN

Consulting Mining Engineer, New York

I FEEL greatly honored to be called to this, my native city, to speak to you of the zinc industry, for it was in zinc mining that I spent my happiest, early professional days. Our job is to look forward not backward; to make history in the zinc industry, not to live in the past, considering what "might have been." On the other hand, a study of what has been done, or might or should have been done, may be helpful in the consideration of the future.

Though we do not look on zinc as a "war baby," from a purely selfish and materialistic point of view, the war ended too soon for the zinc industry, not so much on account of the lessened demands for the metal for munitions, as in the line of building up new uses for zinc and therefore new requirements, and a better co-operation of the mining and smelting interests, with a breaking down of old-time antagonism and distrust.

This society of ours can and should be of great assistance in these directions, and it should be aided in every way possible by its members in the future. We need a continuance of the enthusiasm of the directors whom we now have, backed by the loyal support of our membership.

BEGINNINGS OF CO-OPERATION

As you know, just before the armistice was declared, a distinct evidence of co-operation of the miners and smelters was being displayed—of co-operation not against the Government, or in "restraint of trade," but helpfully to further the legitimate interests of the trade.

Quoting Edgar Palmer, president of the New Jersey Zinc Co., regarding an agreement to be entered into: "The proposed plan is designed to bring about closer co-operation between the zinc-ore producers and the zinc smelters. Such a stabilization of the zinc industry is a matter of national importance." The negotiations were, I believe, to have been handled by the Zinc Institute. The numerous conferences have produced a greater feeling of trust on the part of both miners and smelters, and the miners have learned more of the conditions under which the smelters have had to operate; so, as always happens with better knowledge, there is less apt to be misunderstanding between the two interests in the future.

NEED FOR PUBLICITY

We are more and more being drawn to the belief in the doctrine of publicity. A condition of secrecy causes distrust and dissatisfaction, whereas publicity produces a better understanding, and results in greater co-operation and pursuit of common interest. In the old days, it was the custom in metallurgical establishments to keep everything secret, to hold as an asset some process of which it was believed others knew

nothing, and to struggle along and grope about while seeking knowledge others had. This is now largely altered, and there is a fine exchange of ideas and methods, to the advantage of all. Secret processes do not remain so for long.

During the period of the European war, the zinc industry passed through many phases: from normal conditions, through a period of expansion or inflation, during which time there was an abnormal increase of production, by reason of more mines being operated, as well as a great increase in smelter capacity; thence, as a result of overproduction, back to prices which, though higher than in the pre-war period, were nevertheless not unreasonable when compared with the advances in costs; and now back to a condition of low demand, with higher costs than those prevailing prior to the war.

The inflated prices were by no means an unmixed blessing, for they caused an increased production beyond possible requirements, and the operation of properties which under normal conditions could not be worked at a profit, resulting in a depression of the trade which always follows periods of great and rapid expansion. The zinc-smelting capacity of this country, as well as of the world, is much in excess of normal demands.

ANTAGONISTIC FEELING BEFORE THE WAR

Previous to the war, the relations of the different branches of the zinc industry, one to another, were by no means ideal. There always had been a more or less antagonistic feeling between the smelter and the miner—not only antagonistic but distrustful. It was almost as bitter as the feeling in a long-drawn-out lawsuit, where each of the contending parties feels that he is in the right but cannot see anything good in the case of the other, and, being a partisan, energetically hates and despises his opponent.

Between the different smelters, owing to competition, there was also antagonism; in fact, the whole industry was noted for the lack of co-operation on the part of those engaged in it. Nor, as a whole, was the business a progressive one. There was no community of interest, the main aim of the interested parties being in their own particular business, regardless of the fact that anything done for the benefit of the many might also be of advantage to the few.

It was under these very unfavorable circumstances that the War Committee, appointed by the different branches of the industry to aid the Government, started in. However, immediately after our Government joined the Allies, things changed for the better. It was the object of the War Industries Board, with which your committees and individuals of the industry co-operated, to aid in every possible way the object in view of bringing out a production adequate for the war needs of the Government and, so far as possible, to supply

*An address at the American Zinc Institute Meeting at St. Louis, Mo., on Monday, June 9, 1919.

the commercial needs where to do so would not interfere with the conduct of the war.

It was also the object of the Government to interfere as little as possible with the conduct of the industry, and for this reason the Government officials opposed the fixing of maximum prices except in the case of two products which it seemed essential to stabilize. They endeavored to avoid runaway markets, as well as to prevent prices dropping so low as to cut off the steady and necessary production required, the effect of runaway prices being an excessive production, followed by closing down of properties due to inability to dispose of the product, and resulting later in too little production to supply the demands. Instead of a steady and stable production, this rising and falling of prices proves demoralizing, especially during a period of war.

The two products on which a maximum price was fixed were high-grade zinc and sheet and plate zinc. These maximum prices were fixed high enough to stimulate production by giving some assurance to the producers that the Government regarded these prices as fair under the circumstances, and in order to remove from their minds a possible fear of lower maximum prices being fixed in case the prices were left open.

The amount of high-grade zinc which could meet the Navy requirements was not equal to the demand, and it became necessary to increase the output by re-distilling spelter and by arranging for the use of high-grade metal not quite equal to Navy specifications, for the manufacture of grades of brass for which the very highest grades of spelter had previously been required; and in the case of rolled sheet and plate it was believed that the existent plants would not be able to turn out the quantity necessary, so that the expansion of rolling mills was necessary, and to bring this about a tempting price for the finished product would be required. It is believed that the plan worked out satisfactorily.

DURING WAR NORMAL USES WERE RESTRICTED

During the war, the normal uses of zinc were greatly upset and altered, with increased utilization in one line and almost complete lack of demand in another. For instance, the demand for high-grade spelter for shells was greater than ever known, though the use of spelter for galvanizing was not only diminished but practically wiped out. In the future, there will be little demand for brass for shells, for the business of war for many years to come will, we hope, be done away with. Unfortunately, during the war many substitutes were found to replace galvanized iron, the principal manufactured product for which spelter was previously used, and the use of these substitutes will undoubtedly be largely continued.

Spelter being plentiful, it was found necessary, in order to keep up the output, to find other uses for this metal, and in this direction the most promising field lay in substituting zinc for metals which were either very much more expensive, or in which there was a shortage. Among these may be mentioned the replacement by zinc of tin, aluminum, brass, and other alloys.

The Conservation Division of the War Industries Board, with the Zinc Section, evinced great interest in this direction, and a start was made in getting the manufacturers to substitute zinc for other materials in rather a large way. Some of your own companies also interested themselves in a practical manner, and this not selfishly, in keeping to themselves, but freely

giving of their information to the industry as a whole.

I said "unfortunately for the zinc industry, the war ended too soon," because I believe that through the agencies of the Government further uses for zinc were being inaugurated, and that after experience with this product the public would wish to continue its use. We know it is a hard thing to change precedents and to alter well-tryed and successful plans and introduce something else, unless there are some spectacular features connected with it—something that might help as an advertisement. In the case of many of the manufactured products in which, for instance, tin or other rather high-priced metals were used, zinc could be substituted. It was, however, with the practical certainty of reverting again to the original metals after the embargo on these had been raised. However, zinc could have been substituted for other metals in a great many products with the certainty also of a continuance of its use.

NEW USES FOR ZINC

There has been scarcely time in which to prove this plan to be good, and now persuasion will have to be employed in place of the so-called "force," which was really an appeal to patriotism. The list of articles in which zinc could be substituted for other metals is, to use a common expression, "as long as your arm." Many of these amount to but a few thousand pounds per year, though others aggregate thousands of tons.

It was the view of the Conservation Division of the War Industries Board that, to quote from one of their reports:

The possibilities of increasing the uses of zinc are very large, particularly in the case of rolled sheet. In this country the rolled zinc produced has never been more than 10 per cent of the production of spelter, though on the Continent of Europe many of the largest producers roll 50 per cent to 100 per cent of their output.

The largest tonnage uses of sheet zinc in Europe are for roofing, cornices, architectural ornaments, gutters, leaders and flashing, all of which are more durable when made of zinc than when made of galvanized iron or tin plate, as is usual here. In all of these cases painting is unnecessary, except where desirable for decoration. In the few cases where zinc roofs have been used in this country they have remained in good condition for forty or fifty years, though entirely unpainted.

Zinc, both cast and rolled, can be substituted for other metals in many cases. Possibly the increased use of castings is even more important.

Though the business is an old one, few of those engaged in it have known in a more than rudimentary way the real value of zinc, and few, if any, have taken any active interest toward increasing its use, devoting their time mainly to disposing of their own individual product to the best possible advantage, but doing practically nothing toward building up the business as a whole; growling because the market was limited, but leaving to others the increasing of the markets—but, practically speaking, there were no others.

THE EXAMPLE OF ALUMINUM

One of the best instances of building up trade for an industry which started on the smallest basis is that of aluminum. When aluminum was first manufactured, the cost was high and there were very few uses for the finished product. As it became possible to manufacture more cheaply and in greater quantity, it was found necessary to produce a market, and this was systematically done. This feature became just as im-

portant a part of the business as the production itself.

The largest producer of aluminum carried out a broad and comprehensive program of manufacturing finished products and introducing them to the public, in the way of cooking utensils, containers, instruments, sanitary appliances, sheet aluminum for automobile bodies, cast aluminum crank cases, aluminum wire for conductors, electrical appliances, and in other like applications, and also for alloys, the utilization of which had to be brought to the public's notice, such as employing aluminum in the manufacture of steel, and for paint and other utilitarian purposes.

In introducing the metal, the aluminum company was obliged to exercise the greatest care to see that its products were used under proper conditions, and on many occasions declined to sell to those who wished to employ the metal for purposes for which it might not be suited. The producers of nickel also went through a similar experience in order to make a market for their product, which started with a small demand. Certain uses of zinc have been taken for granted, and the miners and smelters have sought to supply only these particular uses; but that is really a small part of what is possible. The more one studies the proposition, the more one feels convinced of the possibility of increasing the needs for this metal. What has been done with aluminum and nickel can be done with zinc.

PROPOSED PROPAGANDA

We do not like to use the word "propaganda," because it has been associated with so much that was sneaking and underhand, but a campaign of "propaganda" in its best form should be inaugurated by the zinc industry. It will be necessary to educate consumers and possible users in the advantages of spelter over other metals for certain uses, and to let them know for what new uses the metal can be employed.

Get samples of different manufactured-zinc products to show the builders, architects, dealers, and general consumers. Explain by means of literature, and by "spielers" for zinc, sales engineers, and traveling men with samples, the advantages of the zinc articles, and remember that while this program may help certain manufacturers more directly than it may the majority of you, it will build up the industry generally and so help the individual, whether miner or smelter.

First have the matter studied scientifically by research, experiment, and demonstration; then advertise for all it is worth. You have a good thing—do something with it. Do not leave it to one or two companies to exploit, but work it up by the industry as a whole. To recover in volume the old uses for zinc, such as for galvanizing and for paint, should also be an object of great endeavor. The increasing of demands should not be the only aim, for there is great promise in improving metallurgical methods, as has been emphasized by W. R. Ingalls. Zinc smelting has been backward, more so than the metallurgical treatment of other metals, and it is believed, by those who are in a position to be judges, that there are great possibilities of improvement in this field.

UTILIZATION OF BYPRODUCTS

The utilization of byproducts should also be pushed, in order to cut down the cost of the main product—zinc. Of course, in many smelteries the sulphur from blende ores is utilized for the manufacture of sulphuric

acid. Attempts should also be made to utilize that much-abused metal cadmium, which can in part be substituted for a portion of the tin in certain alloys. High prices are not so much required as low costs of production, with an increased spread between price and cost; in other words, greater profit; for the lower the average price—other things being equal—the greater the chance for increased consumption, the larger the volume of zinc produced, and the greater the volume of profit.

Really the most important thing that materialized in the numerous meetings at Washington and elsewhere was the bringing together of old-time interests which previously had been battling, and the birth of a more friendly and helpful feeling. This was made possible by the fact that every one was stirred by a spirit of patriotism, which made him willing to sacrifice his individual material or business interests if necessary, just as his sons and brothers were willing to sacrifice their lives for the good of their country. It made him more unselfish and more willing to help his neighbor, and it brought into especially strong relief the virtues of each individual man.

We know that there may be individual business men who may not be thoroughly unselfish; that with many it has been "every man for himself and the devil take the hindmost," but from the moment our Government entered the war the men of the zinc industry have truly "played the game," and no criticism can be made of any display of selfishness, lack of patriotism, or unethical conduct.

Everyone has been willing to help; everyone has wanted to have the industry meet its requirements; and everyone has had a pride in the business as a whole, and has been anxious for it to do its part. Men who had never pulled together were keen to co-operate in the broadest possible way. The smelter and the miner walked hand in hand: They were like the lion and the lamb who "lay down together." I leave it to you, however, to decide which was the lion and which the lamb.

The miner began to think that the smelter official was a pretty good fellow after all, and the compliment was returned by the latter. I do not know how often I have heard the remark: "Why, I thought So and So was a pretty hard nut, but now I have seen him and talked with him, I find he is a pretty good chap after all."

It is believed and hoped that this meeting together of different interests, resulting in a better "acquaintanceship"—a word made famous at the last dinner of this organization—will have a lasting effect and will produce a condition that it would have taken years to have accomplished in such a thorough manner in normal peace times.

No Important Improvements in Flotation Practice have taken place during the last two years at Anaconda in the kind or method of use of flotation agents. At present, the launder system attached to the spitzkasten of each flotation machine is being rebuilt in such a manner that all middling froth and pulp are returned to a box directly in front of the first cell of the machine. The bottom of this box is below the bottom of the cell. This box is connected to the bottom of the first cell of the machine by a 6-in. suction pipe. The pumping action of the impeller in the cell serves to return all froth and middling to the first cell of the machine, making each machine a separate and distinct unit and doing away with middling return elevators and their necessary upkeep.

CORRESPONDENCE AND DISCUSSION

Letters From the Mining and Metallurgical
Industry Dealing With Pertinent
Subjects of Interest

The American Quicksilver Industry

The *Journal* published on May 17 an interesting letter from Murray Innes, of San Francisco, and another from Fletcher Hamilton, both relating to the necessity of fostering the mercury industry of the United States.

Mr. Innes' letter commends most highly the report of the U. S. Tariff Commission upon the mercury situation at home and abroad, but severely criticises the conclusions that F. L. Ransome has drawn from his investigations of the subject. Previous to reading Mr. Ransome's conclusions I had read the report of the Tariff Commission and such other data as have recently been published, and was regretfully forced to almost the same conclusion reached by Mr. Ransome. My conclusions were not published, for they too would have read like an "epitaph of the quicksilver industry in the United States."

As one indirectly interested in the mercury industry, and appreciating the status of those who have done their utmost to fulfill the requirements of the Government in an emergency, I preferred to believe that I was mistaken and that at an early date a more hopeful outlook for the mercury industry might develop. My personal feelings are fully expressed in the editorial of April 19 which Mr. Innes was good enough to quote, and, having those feelings, it is evident why one does not wish to believe that Mr. Ransome's conclusions are correct, irrefutable as they may appear to be.

If the mercury industry is to be saved in this country it will be through stronger arguments than those presented by Mr. Innes in the letter quoted, and it is with the hope of eliciting such stronger argument that this communication is submitted.

Is it possible to continue to produce in this country approximately its normal consumption of mercury without a protective tariff that will be an actual burden on the consumer? Is the statement correct that the average ore mined in the United States (during 1918) contained only five pounds of mercury per ton?

Mr. Ransome believes that the prospect of opening any new deposits of mercury are extremely small and that those deposits now capable of producing will yield less and less per ton as time passes. Is this correct, or do those who are familiar with production of mercury have reason to believe the contrary, and, if so, upon what is that belief based?

What hope can the producer of quicksilver give to the consumer that the protection asked for will not continually rise, that it may remain constant or diminish as the industry prospers? There is no doubt that the European supplies are controlled in London and that within certain limits one house controls the price. It must be noted in passing, however, that this condition has maintained for many years. This house could long ago have closed every mercury mine in the United States and then made prices to suit itself, or it could have done so, if I am correct in my understanding of

the European situation; but it has not taken such action. The reason may be that it does not possess physical control of the output, but more probably is because it does not consider such a policy good business. If this firm has not monopolized the business in the past, is there good reason to expect that it will do so in the future?

The quicksilver miners, numerically small, to be entirely successful in their contention for adequate protection must have some support, or at least but slight opposition from the consumers, numerically large. If the miner can convince the consumer that free trade means high prices at no distant date, we will have support from a most important section of the community, and the battle will be more than half won.

There are several interests to consider in this discussion. First, and perhaps the most important consideration, is that of the preparedness of the Nation, the League of Nations to the contrary notwithstanding. What should be the policy of the Government in order to avoid the possible consequences of all foreign supplies being suddenly cut off? Should the Government buy and store enough mercury in times of peace to carry it through two or three years of intensive military preparation? Should it try to conserve all present known deposits to meet such an emergency? Should the mercury industry be encouraged with the hope of developing additional supplies, even at the risk of using up all of which we now know? May we not reasonably expect that, with more detailed geological investigations, new deposits will be found?

The second consideration is that of the normal consumer, of whom there are thousands. What procedure will be to his best interest? Will it be best to take down all tariff bars, admit the metal freely, and cut off the home supply, or will it be better for the consumer to pay a high tax and be sure that there is a home supply to be depended upon?

Third, those who have invested capital for the production of the metal must be considered. They are not many, as compared with the consumers, but their work and expenditures have been in good faith, they have helped win our war, and should not now be left to shift for themselves. There can be but one answer to this question, but the form the aid should take is open to discussion. The experience that is gained in the handling of the war-minerals relief will at least acquaint the Government with full information about the cost of mining operations when undertaken on a relatively small scale.

And, fourth, there is the mining industry in general, and the policy to be adopted respecting war minerals in particular. Mercury is one of those metals, and the need for uniform policy respecting them is plainly apparent. Whatever that policy may be, it will effect the mining industry of the country to a marked degree.

New York, June 16, 1919.

F. F. SHARPLESS.

Trouble With Rock-Breaker Pitmans

Even if true, I think the troubles with rock-breaker pitmans described in the Mar. 29 issue of the *Journal*, are a little exaggerated so far as small and medium-sized plants are concerned. It is not advisable to have the pitman water cooled. To do so would require some kind of water jacket, and this would make the pitman more cumbersome. The jacket would be likely to crack and leak. Two lines of hose would be necessary, one to bring the cool water, the other to take the heated water away, and the hose would of necessity be long, in order to absorb all the stroke vibration, and leaks would surely occur. The change may be desirable where water is scarce, although overflow water can surely be used in some other place in the mill. If the rock breaker is situated, as in most cases, on the top of the mill, the pressure may not be sufficient, but a small rotary pump like that used on machine tools could be geared on the crusher shaft. From the engineering standpoint water cooling can be done easily enough, but few would use the water jacket, and many in a short time would discard it after having given it a trial.

In nearly all the swing-jaw types of crushers the pitman bearing extends the full length of the eccentric—the width of the jaw. This is ample bearing surface, but the babbitt must be of the right kind. I have used "Magnolia" with good success on 10 by 15-in. crushers running 16 to 20 hours daily. All the oil pockets are filled with hairy wool waste, packed tight enough so as to be always in contact with the shaft. Lost motion can no more be permitted in the pitman bearing than in a connecting rod, as it causes pounding, more friction, and, of course, more heat.

The toggle must point down toward the pitman, as, if placed slanting off from the pitman, the strain will be on the bearing caps, and this will cause the studs to break quickly. It will also cause undue heating of the bearings, caps, and shaft. The remedy is to raise the block carrying the toggle seat above the toggle seat of the pitman. It may be necessary to change the toggle to keep the jaws to breaking size. Never let the toggle ends and the toggle seats wear down too far. Both get so out of shape (rock and dust helping) that the tension of the spring must be increased to hold them home.

All dust and grit must be kept out of the lubricating oil and grease. A good way is to cover the bearings with a 5-gal. can or a cyanide can. The crusher depends to a large extent on the filtered oil already used on the engines. Castor machine oil has in many cases helped the running of crusher bearings. It is advisable not to fill the oil box of the pitman with waste alone. A little wool waste will do to absorb and hold oil; then, on the top of the waste, place a piece of felt the shape of the oil box, and hold tight by driving a strip of wood. This will act as an oil filter that can be relied upon. The oil grooves in the bearing must be of a shape that will permit oil circulation. One groove usually is not sufficient.

Reversing the motion on a hot-running pitman will help, but it makes but an insignificant change with most crushers, whereas to the bearing it may make a great change, particularly in connection with worn bearings, because one edge has usually worn so sharp that it scrapes nearly all the lubricant off the shaft. Running in the other direction, it faces the beveled edge of the

babbitt. Both sides of the bearing must be beveled to ease off and give the lubricant every chance to follow the shaft.

The crusher must be run at a reasonable speed. Over-speeding increases the capacity, but unless of exceptionally heavy construction, it soon breaks the foundation bolts or loosens up the framework. A bent, grooved, or worn shaft also invites trouble.

When an idle pulley is used on a rock-breaker shaft it must have a renewable bushing and an automatic grease cup of ample size. The diameter of the idle pulley must be $\frac{1}{2}$ to 1 in. smaller than the diameter of the driving pulley. The belt tension is lessened and the friction on the bearings greatly relieved when the belt is shifted on the loose pulley. It is of course highly desirable to avoid the loose pulley wherever possible.

Johnnie, Nev., Apr. 10, 1919.

C. LABBE.

A New Factor in Flotation Litigation

To anyone who has followed flotation litigation during recent years it must be rather a surprise to learn that there are some features of the process that have not been brought out in the course of the many hearings before the various courts. That some points still remain open for elucidation and discussion is evident, as the *Mining and Scientific Press* of Mar. 22 comments editorially concerning J. D. Wolf's patent.

Apparently this patent, No. 787,814, dated Apr. 18, 1905, the application for which is dated May 22, 1903, is likely to be of importance. As neither of the litigants made a particular point of it in the Hyde case, it seems to have received no consideration from the profession in general. In the action of Mineral Separation, Ltd., vs. Butte & Superior the patent apparently is accorded technical attention for the first time. The defendant's expert, Dr. Sadtler, after detailing the working of the apparatus as described by Wolf, concluded his testimony as follows:

"Now, I feel satisfied that we cannot practice this procedure of first practicing agitation with that form of apparatus without producing an aerated froth which holds the mineral, as stated, quite completely, and then, if we follow that by a flotation as described here in these claims, of the mineral-bearing oil, an air-bubble mixture over the top of the spitzkasten, that it is impossible to have anything else than the removal of the mineral-bearing froth."

I suppose it is unwise for one to make predictions or to commit himself as to what bearing certain patents or applications have upon the legal aspect of flotation. Apparently, however, this Wolf patent must be of some importance. It seems that an actual recovery by an oil froth can be made by carrying out the directions of the patent. Coupling this with the fact that Wolf's patent appears to antedate the patents under litigation, it is evident that flotation operators are confronted by a new source of what may be trouble or salvation.

It is unfortunate that this patent has been kept dark for so long, if the facts are as they seem to be. The more light we can get on this situation, the better it will be for every one having any interest in flotation metallurgy. There is an opportunity here for investigators to give attention to the Wolf patent and discuss it in the technical press, just as the other patents and processes have been discussed. H. A. MEGRAW.

New York, May 29, 1919.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Zinc Tariff Gets Hearing

Paul A. Ewart, representing the zinc-mining industry of the Joplin district, appeared before the Committee on Ways and Means in support of the bill providing a tariff of 2c. per lb. on the metallic contents of zinc ore. He stated, however, that all that the producers want is a tariff that will equal the difference between costs here and in Mexico. Though the principal competition is expected from Mexico, Mr. Ewart told the committee that he fears the dumping of German zinc.

Otto Ruhl, representing the Webb City Chamber of Commerce, the Joplin Chamber of Commerce, and the Webb City Mine Sanitary and Safety Association, engaged in the following colloquy during his appearance before the committee:

Mr. Kitchin: Is there any evidence that the zinc producers have, of a combination among the smelters to fix the price?

Mr. Ruhl: There has been such an accusation, but we have not the evidence on that particular question here.

Mr. Kitchin: The general opinion among you zinc producers is that they fix the price among themselves?

Mr. Ruhl: There is some sort of an opinion like that expressed among a certain element of our men.

Mr. Kitchin: What do you think about it?

Mr. Ruhl: I am open-minded, and I am willing to be convinced; but I do not think we have the evidence to do so yet.

Mr. Kitchin: You do not want to cast any reflections because they are your only purchasers and you do not want to embarrass yourself with your purchasers?

Mr. Ruhl: If we find there is such a combination we have legal relief, and I understand we will probably exercise that legal relief if we can do so.

The Chairman: You do not know now that there is any combination?

Mr. Ruhl: No, we do not know it.

Farmers Object to Potash Bill

Farmers and importers are vigorously opposing the proposals to establish a potash-licensing system, or to place a tariff on imported salts. Ben C. Marsh, secretary of the Farmers' National Council, told the Ways and Means Committee that the principle of the Fordney bill is vicious and that the farmers of the country want the bill killed. It is estimated that one-third of the agricultural products of the United States require potash, and that the yield next year will be 30 per cent less if potash is not available at a price the farmers will pay. The decrease in production will be increasingly greater as the reserve of potash in the soil is exhausted, it was stated. Representatives of the agricultural interests of the country were unanimous in their belief that there is no important reason why the United States should tax itself heavily to create a domestic potash industry.

It is inconceivable, one witness pointed out, that this country would be at war with France and Germany at the same time. H. A. Huston, secretary of the German Kali Works, an American corporation, a subsidiary

of the potash syndicate of Germany, said among other things:

The American producers are rather sharply divided into two classes. One of these cannot produce potash at a price that the consumer will ever consent to pay; the other class can produce at a price that can compete with any foreign source. One is beyond help, the other does not need it to make reasonable profits on honest capitalization.

A sound national policy would seem to require that those sources from which potash can be produced only at a high cost should be held in reserve as an insurance against another period of shortage, as are the oil-bearing shales. It is not a sound national policy to pay a premium to exhaust these resources and at the same time increase the cost of producing food and clothing.

Federal Aid for Mining Schools

Senator Smoot has introduced a bill providing for the application of part of the proceeds of the sales of public lands to the endowment of schools or departments of mines and mining in each state. The amount to be expended is to be \$25,000 per year in each state. The purposes for which the money is to be spent are given in the bill as follows:

Instructions, research, and experiment (including the employment of instructors and experts, the purchasing of apparatus, supplies, books, and the equipping of laboratories) in mining, mining machinery (with the application of electricity thereto), mining engineering, ore-treatment, metallurgy, assaying, and chemistry and geology, so far as these sciences relate to minerals and mining, with a view to teaching a practical and scientific knowledge of the best and safest methods of mining and carrying on the business of mining and of producing gold, silver, coal, and other minerals, oils, gas, and medicinal waters, and also the concentrating, smelting, refining, and other preparation of the same for marketing so far as the same may be necessary and appropriate to the mineral resources of the state or territory in which said school or department of instruction in mines and mining shall be located; and especially for the study and prevention of explosions, fires, and other dangers incident to the carrying on of mining and the mining industry, in order to secure the most intelligent conservation, use, and development of the mining and mineral resources of the country, to make the lives of miners more safe, property in mines more secure, and to promote the general welfare of miners and operators of mines.

Shippers Get Respite as to Bills of Lading

In the long-pending matter of bills of lading, the Interstate Commerce Commission, on June 26, extended by one month the date on which the printed forms of bills of lading now in use should be discontinued. The date is thus advanced from Aug. 8, as set in the order of Apr. 14, 1919, to Sept. 8, 1919. Otherwise the original order remains in full force. This action was taken because it was realized that shippers having printed stocks of such bills on hand would suffer some loss if forced to waste them unused; also the date originally set allowed insufficient time to have new bills printed.

N. Y. Section American Institute of Mining and Metallurgical Engineers

Meeting Addressed by Horace V. Winchell, Who Reviewed Conditions on the Mesabi Range and Recent Advances in Ore Concentration

THE regular meeting of New York Section of the American Institute of Mining and Metallurgical Engineers was held on June 26, 1919, at the Machinery Club, New York City. The usual dinner, followed by the program and entertainment, was attended by seventy-five members and guests. William Young Westervelt was chairman of the evening. Announcement was made of the meeting of the Institute in Chicago, Sept. 22 to 26, 1919, and members were urged to attend. An appeal was also made to the members of the Institute to make every effort to give employment to returning soldiers, not only from patriotic motives, but also for the reason that such men have acquired discipline and a high sense of duty and are usually worth more to employers than men without the Army training.

The president of the Institute, Horace V. Winchell, submitted a resolution expressive of the high esteem in which J. E. Johnson, Jr., who died recently, was held by the members of the Institute. The resolution was adopted unanimously. Mr. Winchell then addressed the meeting, and pointed out the momentous possibilities of peace, and the place that mining and metallurgical engineers would occupy during the impending industrial development. He commented particularly on the iron-ore resources of the Mesabi Range, the annual production of which is 40,400,000 long tons, and reviewed in detail the possibilities of a new mining and metallurgical enterprise which has been brought through the experimental stages to a commercial possibility by Walter G. Swart and Dwight E. Woodbridge.

These metallurgists have devised a method for the treatment of certain extensive deposits of taconite containing 25 to 35 per cent iron in the form of magnetite which promises to be of great commercial importance. The process is the outgrowth of tests conducted by W. G. Swart in an experimental mill built in Duluth in 1916. The ore is crushed to 1/2-in. size and passed to magnetic cobbing machines, which eliminate 50 per cent of the material, the remainder being delivered to a closed-circuit ball mill. A Davis magnetic log washer receives the ball-mill product and recovers a clean, fine concentrate, representing 30 to 40 per cent of the original ore. The ratio of concentration is approximately three to one. The concentrate is mixed with pulverized fuel, filtered, and sintered on Dwight-Lloyd sintering machines. The sinter is of bessemer grade, and contains 61.18 per cent iron, 0.025 per cent phosphorus, and 11.72 per cent silica.

Mr. Winchell called attention to the great production of the Mesabi Range, which now amounts to 500,000,000 tons of its best ore. He stated that fifteen years ago, about two-thirds of the ore mined was bessemer grade, and contained approximately 0.038 per cent phosphorus, whereas last year only about one-third of the tonnage was bessemer grade, and the phosphorus had risen to 0.045 per cent. At the current rate of production, the supply of commercial ore under present practices will be exhausted in about thirty years, and if the production should increase 10 per cent a year, the exhaustion of the Minnesota deposits might take place

in twenty years. The new methods described promised to make large deposits of lower-grade ore available, thereby greatly extending the life of the district, as well as the supply of useful material.

Major C. E. Stuart addressed the meeting on the subject of recruiting for the U. S. Army and pointed out the advantages of the Army as a training school for men who would subsequently go into industry. He called attention to the radical changes in Army life during the last few years, and the new recruiting slogan: "The Army is a builder of men." Major Stuart explained the effect of the educational advantages now offered by the Army, and the wholesale development of "can-do" men under the new system. He stated that the \$30 per month to the soldier is equivalent to \$125 per month in civil life, and that a young man earning \$125 or less per month would do better in the Army, because he would receive a liberal education, which he could not otherwise afford. Major Stuart convinced the members present of the value of the idea.

Major Arthur S. Dwight was greeted with genuine enthusiasm. In a direct and simple way he told the members of his war experiences, concluding his interesting narrative by the presentation of moving pictures of war-zone activities.

June Mining Dividends

Dividend payments by mining companies in June, 1919, show a big decrease from the amount for the same month last year, owing to continued additions to the list of those companies which have passed their dividends, and those which have decreased their payments. Companies which failed to pay the dividends which would have been due at this time were the following: International Nickel (common), Ahmeek,

U. S. Mining and Metallurgical Companies			
	Situation	Per Share	Total
Am. Sm. and Ref., com.	U. S.-Mex.	\$1.00	\$699,980

Utah Copper, c.	Utah	1.50	2,436,735
Canadian and South American Companies			
	Situation	Per Share	Total
Cerro de Pasco, c.	So. Am.	\$1.00	\$898,224
Hedley, g.	B. C.	.10	24,000
Hollinger, g.	Ont.	.05	246,000
Mexico Mines of El Oro, g.	Mex.	.96	174,960
Kerr Lake, s.	Ont.	.25	150,000
Min. Corpn. of Can., s.	Ont.	.12 1/2	200,000

Allouez, Isle Royale, and Osceola. Calumet & Arizona reduced its payment from \$1 to 50c. per share; Copper Range, from \$1 to 50c.; Federal Mining & Smelting, from \$1.75 to \$1; and St. Joseph Lead, from 35c. to 25c. per share.

Whereas, in June, 1918, 40 United States mining and metallurgical companies, making public returns, paid dividends amounting to \$24,662,838, only 24 companies are on the list for June of this year, their

payments having amounted to \$9,963,616, a decrease of more than 55 per cent.

Canadian, Mexican, and South American companies also show a decrease in their payments, the amount in June, 1919, being \$1,693,190, compared with \$2,653,442 in 1918.

By error, Hollinger Gold Mines was included in the dividend table of May payments, published in the *Journal* of June 7. The date of its payment was June, and it appears in the present list.

The only holding company to pay in June, 1919, was the Yukon Alaska Trust, which made its usual quarterly payment of \$1 per share.

The totals for the first six months are as follows, the figures for the corresponding period of last year being given in parentheses: United States mining and metallurgical companies, \$50,039,792 (\$89,763,010); holding companies, \$900,005 (\$1,066,866); Canadian, Mexican, Central and South American companies, \$8,060,281 (\$9,719,686).

Lake Superior Metal Mine Safety Conference at Duluth

Meeting of Representatives From Every Mining Range in the Upper Peninsula of Michigan and Wisconsin and Minnesota

THE Lake Superior Metal Mine Safety Conference was held at Duluth on June 19-20. Among the many papers, the following were presented: "Proper Safety Organization for Metal Mining Companies," by George Martinson; "Common Open-Pit Accidents and Their Prevention," by H. E. Mitchell; "Americanization of Mine Employees," by George H. Crosby; "The Safety Engineer and Accident Statistics," by A. H. Fay; "Open Stopes," delivered for M. E. Richards by J. J. Griffiths; "Underground Disaster Warnings," by B. O. Pickard; "Some of the Different Methods of Interesting Our Mine Employees in Accident Prevention," by B. D. Shove; "The Problem in the Work of Accident Prevention," by William Conibear; "Work of the Safety Division of the Bureau of Mines," by D. J. Parker, and an address on general safety problems by F. E. Morris.

The committees in charge were as follows: Program, George Martinson, William Conibear, and Stephen Quayle; meeting plans and hotel accommodations, A. A. Krogdahl and George Lohneis; reception and luncheon committee, A. A. Krogdahl, George Lohneis, B. D. Shove, and E. A. Sporley.

After the luncheon on June 20, C. E. Julihn spoke on "Neighborliness as an Industrial Factor."

A resolution was unanimously passed recommending that the U. S. Bureau of Mines should consider making these conferences annual affairs in the district, as it was felt that such conferences should be prompted by the Bureau of Mines rather than by an organization of safety engineers in the district.

The testimony taken by the Committee on Ways and Means of the House of Representatives on potash, magnesite, and tungsten will be of interest to a large proportion of those engaged in mining. A copy of any one of these hearings may be obtained gratis on application to Paul Wooton, 307 Union Trust Building, Washington, D. C., the *Journal's* special correspondent.

BY THE WAY

Emerald and Molybdenite

Molybdenite has a greenish streak at times, according to Dana. In this connection it is interesting to note that William J. Spain, of New York, who operates the Spain molybdenite mine at Dacre, Ontario, is also the local treasurer for Ireland's victory campaign fund. "The Irish have declared a republic," run the advertisement in New York street cars soliciting contributions for the fund. More evidence of the versatility of mining men.

Unpatented

"H. W. Hardinge has spent two weeks at his camp in Spencer, Me.," writes a friend. "Fishing was very good, and Mr. Hardinge caught one that was too large to be weighed on any scale in Maine. However, being of an inventive turn of mind, he hung the fish on a tree and weighed it on its own scales. Furthermore, the camp being eighteen miles from the nearest town and difficult to find, he hung the small fish on trees to act as guides, the scales showing the weigh."

Thus we see that one can be comical as well as conical.

Joking at a Funeral

War-mineral producers who suffered loss in their effort to aid the Government have our deep sympathy. To this is added our admiration in the case of the manganese operator in Tennessee, who jestingly announced his loss to the War-Minerals Relief Commission as follows:

The sudden death of the manganese market upon the signing of the armistice, having plunged the _____ Manganese Co. into deepest mourning to the extent of about four thousand dollars, Mr. Wilbur A. Nelson, State Geologist of Tennessee, directs that we take this matter up with you, as being the one best qualified to offer consolation in our bereavement. If you will kindly suggest how we may best shape our supplications for relief from our distress we will consider ourselves under many obligations to you.

To this H. E. Meyer, chief clerk of the commission, replied in like vein:

I am in receipt of your letter of Apr. 17 and am very sorry to learn that the _____ Manganese Co. has, by the unexpected death of the manganese market, been required to take on the garb of mourning. I very fully appreciate your need for sympathy in your great bereavement. Having learned in advance from Dr. Wilbur A. Nelson of your loss, I took it upon myself to forward to you under date of Apr. 18 the regulations and questionnaire prepared by the War-Minerals Relief Commission, with the suggestion that you prepare your claim for relief from your dire distress.

The regulations and questionnaire are very simple and I am sure you will have no difficulty in shaping your supplications for relief. I will say that the questionnaire must be sworn to before a notary public or clerk of a court of record. June 2 is the date for the placing of claims with the commission for final rest; so therefore get busy with your undertaker, and have your claim properly embalmed and shipped for burial. Having so disposed of your claim this at least should give you some relief, pending the commission's autopsy of your case.

If the commission, now conducting hearings in Western cities, finds other producers as amiable, its task will at least be pleasant.

PERSONALS

C. F. Kelley is going to Butte in connection with the labor situation there.

H. G. Officer sailed for Chile on June 21, where his address will be Casilla 83-D, Santiago.

J. W. Russell, of Woodstock College, Woodstock, Ontario, has resigned his position to become manager of the Oxford Cobalt silver mine.

August Heckscher, president of the New Jersey Zinc Co., has been elected a director of the Crucible Steel Co. of America.

T. O. McGrath, auditor, Shattuck-Arizona Copper Co., appeared before the War-Minerals Relief Commission, at its recent sitting in Tucson.

Arthur W. Jenks is in New York on his return from Nanttu, Burma, where he was smeltery manager for the Burma Corporation.

F. M. Van Tuyl, who has recently joined the staff of the Malm-Wolf Co. as consulting geologist, is examining oil properties in Wyoming, where he expects to be engaged until Aug. 1.

E. F. Simms, vice-president of the Sinclair Gulf Corporation, will be president of the Simms Petroleum Co., with extensive acreages in the Texas oil fields.

Fred Carroll has discontinued his duties as State Commissioner of Mines in Colorado, and resumed his former position as general manager of the Atlas Mining Co. near Ouray.

Horace F. Lunt has been appointed State Commissioner of Mines of Colorado, succeeding Fred Carroll. Mr. Lunt served during the war as a captain in the U. S. Army.

A. Tancig, mechanical superintendent of the mining operations of the Shenango Furnace Co., has returned from a business mission in Buffalo, N. Y.

Richard Hamilton has been re-elected president of the Western Australian Chamber of Mines. Mr. Hamilton has been president for twenty-two consecutive years.

James Flannigan, superintendent, Higgins mine, has returned to his home in Bisbee, after making a tour of examination of the oil fields of central Texas.

G. Chesterfield Evans, a member of the metallurgical staff of the Oriental Consolidated Mining Co., Unsan, Korea, has left Australia, where he has been spending his vacation, to return to Korea.

W. H. MacMahon, formerly safety inspector of the Northern Ore Mines District of the Republic Iron & Steel Co., has accepted a position as employment manager for the American Hoist & Derrick Co., of St. Paul, Minn.

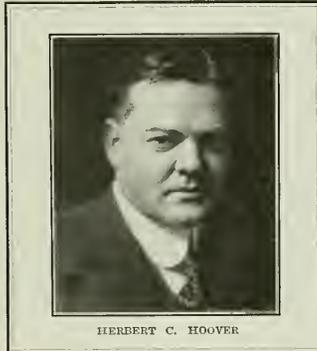

F. D. Adams, dean of the Faculty of Applied Science, McGill University,

Montreal, who went abroad last year as deputy director of educational services of the Canadian military forces, has returned to Montreal.

Richard Tarantous, who first served in the Engineers Corps on the border and later with the tank service in the battle in the Argonne, was recently discharged from the service. His address is 1,050 Clay Ave., New York.

H. S. Mulliken, for some years engaged in active metallurgical work in Mexico, with the A. S. & R. Co., and afterward with the Peñoles Mining Co., and Cia. de Minerales y Metales, will have his headquarters in the States after Sept. 1, continuing to act as consulting metallurgist for the last two named companies, in addition to other professional work.

Herbert C. Hoover, in addition to many other honors awarded him during his tenure of office as Food Director of the United States, and subsequently as Director General of Allied Relief, was included in the honor roll of Oxford University, receiving the degree of Doctor of Civil Law at the exer-

HERBERT C. HOOVER

cises held on June 25. Only one other American, General John J. Pershing, was so honored. Many of the war's greatest diplomatic, economic and military leaders also received the degree, the list including the Prince of Wales, Marshal Joffre, Marshal Haig, Admiral Beatty, Premier Orlando of Italy, and Premier Venizelos of Greece. Mr. Hoover has resigned as chairman of the Food Administration Grain Corporation, but remains as a director.

Arthur W. Burgren has been appointed superintendent of the Dolores Mines of the A. S. & R. Co., at Matehuala, San Luis Potosi, Mexico.

Rex R. Seeber, formerly manager of the Winona Copper mine, in Michigan, is now situated at Dalhousie, New Brunswick, where he is in charge of extensive lumber interests.

E. N. Patty, assistant to Milnor Roberts, dean of the college of mines, University of Washington, started on June 22 on a trip through various parts of the State of Washington.

J. Leonard Replogle, chairman of the board of the Wharton Steel Co., Whar-

ton, N. J., has been elected a director of the Sinclair Oil & Refining Corporation.

R. A. McGovern, general manager of the Caloric Co., a subsidiary of the Mexican Petroleum Co., has arrived in New York from Rio de Janeiro, Brazil. Mr. McGovern expects to leave on a tour of Europe about September.

Charles F. Willis, consulting supervisor, Department Industrial Relations, Phelps Dodge Corporation, has returned to his home in Warren, Ariz., after making a tour of the copper mining camps of the state.

G. W. Grey, superintendent of mines, for the Rio Tinto Co., Ltd., with headquarters at Rio Tinto, Huelva, Spain, is making a tour of the various mining camps in Arizona, including Bisbee, Ajo, Globe, Miami, Clifton, Morenci, and Jerome, studying modern mining methods employed in the various operations of the state.

Amasa Stone Mather, head of Pickands-Mather & Co., with a party of associates, made an inspection tour of the company's Mesabi Range holdings June 25-26. In the party were Henry Coulby and William H. McLoughlin, of Pickands-Mather & Co.; George Downs, of the Lackawanna Steel Co., and C. H. Munger, W. P. Chinn, and W. A. Rose, of Duluth, local officials of Pickands-Mather & Co.

OBITUARY

William G. Sharp, president of the United States Smelting, Refining and Mining Co., since its organization, in 1906, died suddenly on July 1, at his home in Wenham, Mass. He was born in Utah and was graduated from Rensselaer Polytechnic Institute in 1879.

William Thum, superintendent of the United States Metals Refining Co.'s East Chicago plant, died at his home in Hammond, Ind., on June 28. Mr. Thum was specially interested in the electro-metallurgical treatment of copper, nickel, silver, lead, bismuth, and zinc. A more extended notice of his career will be published in the *Journal* in the near future.

SOCIETIES

The Engineers' Club of Northern Minnesota on June 21 entertained 200 members of the American Society of Civil Engineers, adjourned from the regular annual convention at Minneapolis. The guests arrived on a special train and were taken through the Hull-Rust-Mahoning mines, at Hibbing, and later by automobile across the range from Hibbing to Eveleth.

American Mining Congress, Arizona Chapter, held the bi-monthly meeting of the directors on June 27 and 28, in San Francisco. The following at-

tended: Robert E. Tally, assistant manager, United Verde Copper Co., Jerome; B. Britton Gottsberger, ex-general manager, Miami Copper Co., Miami; W. B. Gohring, superintendent of mines, Calumet & Arizona Mining Co., Bisbee; George Kingdon, general manager, United Verde Extension Mining Co., Jerome; Norman Carmichael, general manager, Arizona Copper Co., Clifton; L. S. Cates, general manager, Ray Consolidated Copper Co., Ray; J. A. Burgess, general manager, United Eastern Mining Co., Oatman; J. Kruttschnitt, Jr., manager, A. S. & R. Co., Tucson; W. C. Browning, general manager, Magna Copper Co., Superior; W. G. McBride, general manager, Old Dominion Co., Globe; Captain Joseph P. Hodgson, manager, Morenci branch, Phelps Dodge Corporation, Morenci; G. H. Dowell, general manager, Copper Queen Branch, P. D. C., at Bisbee.

INDUSTRIAL NEWS

Walter A. Zelnicker Supply Co., of St. Louis, has added 2,000 sq.ft. to its present office space at 325 Locust St., St. Louis, Mo.

The Celite Products Co., New York, announces the appointment of Edward F. Davis as sales engineer in northern New Jersey on the application of Sil-o-Cel insulation and Filter-Cel for filtration.

Stephens - Adamson Manufacturing Co., Aurora Ill., has announced its new representation in the San Francisco district. The firm of Bannon, Bodinson, MacIntyre, Inc., 317 Market St., San Francisco, will have charge of the engineering sales work in this territory.

Cavein Rock Fluorspar Co., Evansville, Ind., filed articles of incorporation for the mining, treating and selling fluorspar for use in the tempering of steel, with a capital of \$60,000. Directors are William E. Barnes, William P. Walsh, and P. F. Persons.

H. D. Staley and G. A. Fisher, doing business under the name of Western Steel & Engineering Co., 35 Montgomery St., San Francisco, have been appointed California representatives for the United Filters Corporation. They are also representing "Beaver" brand drill steel and "Duroloid" grinding balls.

Leeds & Northrup Co., Philadelphia, Pa., has opened a pyrometer sales and service department at 1304 Monadnock Block, Chicago. A complete standardization equipment will be maintained, and certification of thermocouples and of pyrometer equipments will be furnished in terms of standards certified by the United States Bureau of Standards. Particular attention will be given to maintaining equipment after installation. The office will be in charge of Henry Brewer.

D. Tyne O'Day & Sons, Rio de Janeiro, Brazil, announces the opening of

offices at 149 Broadway, New York, to carry on a business in Brazilian products as follows: Manganese ore, ferromanganese, pyrolusite, zirconium, monozite, and similar materials. The company, having its own salesmen and buyers throughout Brazil, is prepared to market American manufactured products. The New York office is under the management of Herbert S. Davis.

Hendrie & Bolthoff Manufacturing and Supply Co., Denver, Col., have been recently appointed exclusive distributors in the Rocky Mountain region for the Shelby cold-drawn seamless steel tubing made by the National Tube Co. The wide range of uses for which it is peculiarly adapted includes heater, condenser and evaporator tubes, bushings, washers, axles, automobile parts, ball-bearing sleeves, boring bars and an extended list of manufactured articles. The June stock list of sizes on hand in Denver is available for distribution. This list also gives information on outside diameters, thickness of material, decimal equivalents, weight per foot and list price per foot.

TRADE CATALOGS

"Pedigreed Gears." R. D. Nuttall Co., Tractor Department, 2,133 Conway Building, Chicago. Catalog, 6 x 8 1/2; 16 pp.; illustrated. Descriptive of the Nuttall tractor gears, which are designed to meet the severe service required in tractor work. A discussion is included on gear troubles and inefficiency resulting in escape of power in transmission, as well as effect of uneven wear of bearings and vibration. It is claimed that with cut heat-treated gears and anti-friction bearings, the power loss is reduced to 3 per cent for each gear set, which amounts to 9 per cent for three sets, as compared to a loss of 10 per cent per set for rough-toothed gears.

Nordstrom Lubricated Plug Valve. The Merrill Co., formerly Merrill Metallurgical Co., San Francisco, Cal.; catalog, 6 1/2 x 10; 22 pp.; illustrated. Descriptive of the Nordstrom valve, particularly designed for the handling of cyanide solutions and slimes. It has been in use in mining camps of Mexico for over three years, particularly in Pachuca and El Oro. The basic principle is the combination in a plug valve of lubricant conduits and a lubricant chamber at the base of the plug so positioned that when pressure is applied to the lubrication screw this pressure operates to lift the plug from its seat and simultaneously to distribute lubricant over the bearing surfaces. It possesses a full 100 per cent opening in the plug.

Austin Roek Crushing Equipment. Austin Manufacturing Co., general offices, 910 South Michigan Ave., Chicago. Catalog 28; 9 x 12; 48 pp.; illustrated. Describes the company's gyra-

tory crusher, which has an automatic oiling system, rigid eccentric bearing, countershaft supported on each side of driving pinion, retains full eccentric bearing surface when head is raised, and is thoroughly protected from dust and grit. The portable crusher is also described. The Austin standard screens with dust jackets and the municipal revolving type; elevators of the pipe frame or municipal, belt and traction chain types; bins, of the portable telescope and stationary types, and dump cars are described. Detailed drawings of complete Austin crushing plants installed at various properties are also included, as well as a number of tables of engineering data.

NEW PATENTS

U. S. patent specifications may be obtained from the *Engineering and Mining Journal* at 25c each.

Drill Sharpener. Jesse Ditson, Littleton, Col., assignor to the J. George Leyner Engineering Works Co., Littleton, Col. (U. S. No. 1,304,459; May 20, 1919.)

Electrodes—Production of Electrodes. William Kingman Page, Chicago, Ill., assignor to Chile Exploration Co., New York, N. Y. (U. S. No. 1,302,959; May 6, 1919.)

Electrolysis, Process of. Herbert I. Allen, Portland, Me., assignor to Electrochemical Co., Portland, Me. (U. S. No. 1,303,226; May 13, 1919.)

Electrolytic Slimes, Treatment of. William C. Ferguson, Garden City, N. Y., assignor to Nichols Copper Co., New York, N. Y. (U. S. Nos. 1,305,787, 1,305,788; June 3, 1919.)

Filtering Apparatus. Michael H. Kuryla, San Francisco, Cal., assignor to Merrill Metallurgical Co., San Francisco, Cal. (U. S. No. 1,302,812; May 6, 1919.)

Furnaces—Construction of Roof of Openhearth and Reverberatory Furnaces. George Campbell Carson, San Francisco, Cal. (U. S. No. 1,302,307; Apr. 29, 1919.)

Hoisting—Safety Device for Mines. James A. Nolan, Bowerston, Ohio, assignor to the Mining Safety Device Co., Bowerston, Ohio. (U. S. No. 1,301,732; Apr. 22, 1919.)

Filtering—Process of Maintaining Filters in Filtering Condition. Michael H. Kuryla, San Francisco, Cal., assignor to Merrill Metallurgical Co., San Francisco, Cal. (U. S. No. 1,302,813; May 6, 1919.)

Drills—Cylinder and Guide Construction for Hammer Drills. Lewis C. Bayles and Fred M. Slater, Easton, Pa., assignors to Ingersoll-Rand Co., Jersey City, N. J. (U. S. No. 1,304,442; May 20, 1919.)

Flotation—Differential Flotation Concentration of Sulphide Ores and Raw Ore Products. Charles Cuthbert Freeman, Broken Hill, New South Wales, Australia. (U. S. No. 1,301,551; Apr. 22, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief
of Interest to Engineers
and Operators

SAN FRANCISCO, CAL.—June 26

Potash Production from the Mohave desert will have a decided impetus if all those who have received permits from the Government start operations. Ten permits have been issued for Searle's Lake, four for Mesquite Valley, and five for Layo County.

Strikers at Grass Valley Mines were joined on June 21 by the engineers and pump men, who walked out after the expiration of their 24-hour notice to the operators. C. A. Brockington, superintendent of the Allison Ranch mine, has made it known that his company will accede to the new schedule for the few men he employs, but only in the departments affected by the strike. The rest of the force are employed under the contract and tributary system. Deputy State Labor Commissioner John D. Blair arrived on June 21, with instructions to use every possible means to effect a settlement. A proposal by the operators to abolish the bonus system, establish a free market, and grant a percentage wage increase was rejected.

Consolidated Virginia Mining Co., on the Comstock lode, made a record shipment to the Mexican mill in the week ended June 14, amounting to 425 tons, valued at \$11,223. Ophir shipped 223 tons, valued at \$5,013. The average of the Consolidated Virginia ore was \$26.43 per ton; Ophir \$22.48. In the week ended June 21 the total ore shipped and crushed was 492 tons of a total value of \$13,336. Consolidated Virginia shipped 249 tons, averaging \$29.44 per ton, and Ophir 223 tons, averaging \$24.29. The mill was run 96 per cent of the time in the first week and 81 in the second week. Prospecting and exploration in Union, Mexican and Sierra Nevada are progressing favorably, and indications are good for development of commercial ore in sufficient amounts for shipment.

GOLD HILL, ORE.—June 27

War-Minerals Relief Committee will hold hearings at Medford, Ore., about Aug. 5 to receive further evidence supporting claims filed in the Oregon and northern California. Claims filed are to be for net losses. Operators must show that sufficient ore existed to yield profit had market been able to absorb ore.

Gold-Mining Activity has not been resumed in southwestern Oregon as readily as had been hoped for, owing to the continued scarcity and high cost of labor and supplies. Many mine owners who during the war had sold much old mill and mine equipment at great profit now find it impossible to obtain machinery at any price to replace the old. Little development work is in progress. Few copper and mercury deposits are being worked. Chrome and manganese mining is, of course, wholly suspended. The general revival of the lumber industry and building of the Federal Highway and other roads is held responsible for the shortage of mine labor.

The Oregon Bureau of Mines, which suspended all field work and publications during the war, has again resumed its activity, and with the liberal appropriation recently made by the Legislature purposes to extend its investigations. The auto truck engineering bureau of the bureau is operating in the Jacksonville district, west of Gold Hill. Equipment consists of an auto truck, upon which is mounted a complete sampling, crushing and assaying outfit, the power machinery of which is operated by the truck motor. This party, consisting of five men, is making detailed examination during this summer of partly developed mines in the region, most of which are now idle. The work of investigating oil and gas possibilities in eastern Oregon is being done jointly with the U. S. Geological Survey. The state bureau has secured a firm of consulting oil geologists to conduct investigations in western Oregon. Insufficient work has been done hitherto to obtain the necessary geologic information upon which to prospect for oil and gas.

ABERDEEN, WASH.—June 21

Two Carloads of Casing and one carload of machinery for Standard Oil Co.'s projected well near McClips, Wash., at the end of the branch line of the Northern Pacific, 30 miles north of Aberdeen, arrived at McClips the middle of June and are being transported to the site of the oil derrick over wagon roads, construction of which has just been completed. Offices and cook house are finished, as is the laying of mud sills for derrick and engine room, and indications point to an early start of actual drilling.

ROAD BUILDING BY STANDARD OIL CO., NEAR MCCLIPS, WASH., LAST STRETCH IN SEC. 8-20-12, JUNE 5, 1919.

Photo by Girard & Frank, Aberdeen, Wash.

Shell Oil Co.'s Geologists arrived at Aberdeen this week. This is taken in some quarters to indicate intention on the part of that corporation to enter the Grays Harbor oil exploration field, but no statements to that effect have been authoritatively made. No activities, in fact, of the number of companies, mostly newly organized, now in the field safely may be taken as affording sound indication of actual development intentions. Nothing has transpired clearly to prove that any exploration of oil prospects is planned other than that undertaken by the Standard Oil Co., upon some stage of whose work, in the opinion of most local observers, other concerns are waiting before starting development prospects themselves.

WALLACE, IDAHO—June 26

Managers of Coeur d'Alene Mines will make no concessions to the International Union of Mine, Mill, and Smelter Workers, successor to the Western Federation of Miners, nor will they do anything that could be construed as a recognition of the organization. This in substance is the answer given to Robert M. McWade, Conciliation Commissioner, representing the Department of Labor, who has been in Wallace for the last two weeks. Mr. McWade invited the managers to meet him in a body and discuss the situation, the result of the conference being as stated. He does not appear to regard the matter as finally settled, however, for in adjoining the conference, he stated that it was necessary for him to leave for a few weeks and that he desired to meet the managers again upon his return.

BUTTE, MONT.—June 26

Options providing for a 60-day examination of the property of the old Bluebird mining company, embracing 21 claims, toting together with adjoining property, are being sought in Butte, presumably by an outside company. The Bluebird has large bodies of silver-zinc-lead ore, and 20 years ago was a producer of silver ore. A large mill erected on the ground failed in its treatment of the ore in consequence of its high zinc content.

Initial Payment of \$110,000 for a tract of ground lying on the west side of the Butte district and known as the Bernard placer and the West Yellow Jacket claim, has just been made in a deal involving a total payment of \$330,000. This territory is more than a mile long and from 300 to 400 ft. in width, lying at right angles across the strike of the large fissure system of the Anaconda company, embracing the Syndicate vein on the north and the Stewart on the south, two of the largest producing figures in the district. Payment was made through Joseph C. Pyle, a prominent mining engineer and geologist, connected with the W. A. Clark interests.

Organization of Montana Mining Association, with headquarters at Helena, during the last week is the first step of Montana owners of mining property to act in concert in bringing the merit of their claims properly before Eastern capital; also to act together in the suppression of wildcat mining flotations. Former State Senator C. S. Murray of Broadwater County, was named chairman, with Lieutenant Governor W. W. McDowell vice-chairman, and L. S. Ropes temporary secretary-treasurer. Addresses were made at the organization session by Governor S. V. Stewart and Mr. McDowell. Twenty years ago the state boasted a mining association but it soon fell into the discard. The silver boom is responsible for its revival.

SALT LAKE CITY, UTAH—June 26

The Park City Strike is at an end and the men are going back to work under the conditions prevailing at the time of its beginning in May. Normally there are employed in this camp between 700 and 800 men, and production has been averaging 8,000 to 9,000 tons per month. It is estimated to be 300 to 450 men at work. The number for the Judge Mining & Smelting and Daly West is estimated at 75 to 100; for the Silver King Coalition at 85 to 90; for the Ontario Silver, at 40; for the Silver King Consolidated, at 20. Other properties opening up include the Three Kings, Nalldriver, Iowa Copper, and Park-Utah. It will probably take two to three weeks before work forces are all, as these have been scattered to some extent. However, the more permanent and more dependable men have remained, and others are coming from outside as they hear that the mines are opening up.

A Survey of Metal Production in Utah in 1918, according to advance figures by the U. S. Geological Survey, shows Salt Lake County to lead, with 13,744,115 short tons of ore, from which was produced 100,477 fine ounces gold, 3,022,638 fine ounces silver, 213,236,973 lb. copper, 88,681,872 lb. lead, and 11,169,540 lb. recoverable zinc, the total value of which was \$65,987,444. Juab County was first in production of silver, second in lead, and second in total value. The figures are: Juab, 1,115 short tons treated, 30,408 oz. gold, 894,806 oz. silver, 5,896,223 lb. copper, 25,823,853 lb. lead, 218,061 lb. recoverable zinc; total value of output \$8,953,104. Summit County, with Park City the center of activity, was third in silver and lead produced, and in value of output. Ore treated amounted to 116,797 tons, from which was produced: Gold, 3487 oz.; silver, 7,061,292 oz.; copper, 544,322 lb.; lead, 16,361,250 lb.; recoverable zinc, 103,849 lb. The total value of these metals was \$3,435,033. There were 19 producing companies.

Report of Treatment of Low-Grade Ore by volatilization, by the U. S. Bureau of Mines at the University of Utah.

for work done during May, shows new Cottrell treaters and large rotary kiln just installed to have worked satisfactorily. During the month three large trucks at the Park City district were treated; one a very complex silver-lead-zinc-iron sulphide ore, the content of lead and zinc averaging about 15%; the second type representing oxidized ores of lead practically free of zinc; and the third type partially oxidized lead ore containing a little zinc. Large tonnage of material is present on dumps in the district. It was found possible to extract practically all of the lead from each of the samples and the greater part of the zinc from the oxidized ores. The complex sulphide ore has not responded to the volatilization treatment as readily as the other ores and had to be pre-roasted to drive out the greater amount of sulphur before it was subjected to the chloridizing roast. As this is typical ore, representing large tonnages, considerable time is being given to the problem. It has been possible to drive off practically all of the lead, but the silver extraction up to the present has not been satisfactory.

Assessed Valuation.—The Utah Mines under the new state law is operating for the first time this year is in round numbers \$100,000,000, as compared with \$46,000,000 last year. Metalliferous mines are now taxed on a basis of three times the net proceeds and, in addition, according to their improvements—including milling plants, whether situated at the property in question or not, such as smelters and flour plants, of the Utah Copper, formerly separately taxed by the county—instead of at their net proceeds plus an occupation tax, as in the case of non-metalliferous mines, represented chiefly by coal mines, are taxed according to a cash valuation fixed by the state board of equalization. As will be seen, the new law is being applied by the mining industry in this state to have the law in regard to mine taxation read as "not to exceed" three times the net proceeds in this form. This form was approved by the State Senate and had the sanction of the Governor, but failed to pass the House. Mining companies opposing the "occupation" suit as unconstitutional had withdrawn suit instituted and paid the tax, with the understanding that the law would read at "not to exceed three times the net proceeds." The Governor's veto and the failure of the House to pass the law in this form, was released from any obligation by the mining interests.

DENVER, COL.—June 26

An Independent Co-operative Ore-Treatment Plant, to be erected in Denver, is favored by various metal-mine operators of Colorado. No actual plans have yet been made for the erection of such a plant, and it remains to be seen whether anything will come of the proposition. The opinion is expressed that the concern will be made up of small producers if anything comes of it.

The State Mines Development Association was organized some time ago in Denver, with the object of governing the operations of a company to be formed that would be active in the development of prospects to the point where they might be termed mines, thus eliminating the promoter and wild-catting. It was planned to organize a board of representative business and mining men in each of the ten mining districts. The association does not seem to have extended its activities to any of the mining districts in Colorado.

CLIFTON, ARIZ.—June 27

Shannon Copper Co.'s Holdings recently purchased by the Arizona Copper Co., Ltd., of Clifton, Ariz., include 17 claims once acquired from the latter company, a well-equipped road to the mines, a large smelter below Clifton, the smeltery, concentrator, offices, and considerable realty. The furnaces are to be scrapped and the railroad will be sold, although possibly maintained for future use. The Arizona company has been narrowing the scope of its operations for some time, and has closed down its workings at Metcalf and Coronado as well as its No. 4 concentrator at Clifton, which has handled the ores from the sections named. The Metcalf district is therefore idle, save for a little work by lessees.

BEROME, ARIZ.—June 27

Steam Shovel at Verde Mine, are working toward the upper "hot stopes" on benches that correspond to the 150 and 300 levels. These shovels are expected to cut down through the entire burnt zone of the mine, removing what has been a source of irritation that is a danger. The cost of extraction of this ore will be relatively small. Embraced within the operations will be the bench formerly occupied by the

United Verde smeltery, and the company's main office will have to be removed to a place prepared on the 300-level bench. The company's present operations consist mainly of exploration work on its deepest levels. A coal-crushing plant is also being installed preparatory to doing away with oil firing of reverberatories.

GLOBE, ARIZ.—June 26

Inspiration Consolidated Copper Co. is equal partner with Anaconda Copper Mining Co. in the purchase for about \$1,600,000, of 160 acres of producing oil land in the Bakersfield district of California. Title has been passed to an Arizona corporation formed for the purpose. The purchase was for the purpose of protecting the fuel supply of the two companies, which are closely associated. For months past Inspiration has been securing most of its power from the reverberatories at the International Smeltery, as Roosevelt hydro-electric works, with a low reservoir level, would not be relied upon. It appears that Inspiration had made need of this Roosevelt title, the default emphasized the need for maintenance of the company's own power plant for possible use in the full operation of the mines and of the 20,000-ton mill.

BISBEE, ARIZ.—June 27

The Southwestern Oil Co., recently formed to explore some of the oil districts of Texas is attracting considerable notice at this time among the mining fraternity of Arizona, principally because its incorporators and principal stockholders are prominent mining men in the state. It holds all of the stock of the company is held by mining men in various Arizona copper camps. The new manager is H. E. Barkwood, formerly of Bisbee, Ariz., who had charge of the Phelps Dodge churndrilling operations on Sacramento Hill. Two deep wells are to be started immediately by the company on its holdings, which lies several miles northwest of Ranger, Tex., in a district which has recently brought in a heavy producer known as the Perkins well.

TYRONE, N. M.—June 27

The Stopping of Copper Production at the Burro Mountain branch of the Phelps Dodge Corporation at Tyrone, N. M., as recently announced, and the turning of attention to development and repairs indicates the company's policy. Tyrone cannot produce copper at a profit at the present market, which is present cost of labor and supplies, it is officially stated; moreover, there is no incentive to produce copper now. The employment situation in Tyrone is little affected, as practically all miners who have been producing ore for the mill have been placed on development work, which will be pushed. Testing is being done in the big mill, which will probably result in remodeling.

AUSTIN, TEX.—June 28

Two Pipe Lines to carry oil from West Columbia and Ranger to coast will be completed soon. Pipe line of Humble Oil & Refining Co. from West Columbia to Webster tank-farm is nearly finished. Completion of the second line of the Texas Co., from Ranger to Fort Arthur, has been interfered with by weather.

The Texas Co. has recently increased its capitalization from \$69,275,000 to \$85,000,000 by an amendment to its charter filed in Austin on June 18. This increase was approved at a meeting of the board of directors held in Houston last December, and, it is stated by officials of the company, represents increase in the company's business.

The Railroad Commission has formed a temporary organization and adopted temporary rules and regulations for enforcing the oil and gas conservation law, which became effective June 18. Prior to its enforcement is the duty of the Railroad Commission. The law prohibits waste of natural gas, crude oil, or petroleum, defining the terms as follows: (a) "waste" in commercial quantities . . . except from gas pockets at high points in strata recognized as oil strata; (b) "drowning" with water waste as follows: (1) burning of waste; (d) waste-ful utilization of such gas; (e) burning flambeau lights; and (g) burning of gas for illuminating purposes between certain hours. In all, thirty-

seven rules are laid down pertaining to the conduct of companies engaged in the business of producing or drilling for the products named.

DULUTH, MINN.—June 27

The Railroad Management responsible for shipments of iron ore from Minnesota ranges continues to develop new means for hampering the shipper, the latest being a proposal to make the operator pay for and maintain special tracks leading into his mine and contracts of binding nature, which will perpetuate this system after the return of the railroads to private ownership have been submitted. Many operators have over the year the excessive charge of \$75 per car, which was put in effect by the Railroad Administration during the last shipping season, by doing the work with their own locomotives and crews, and it is rumored that the objections of the railroad unions to this system have been so strenuous as probably to necessitate a track-rental charge so prohibitive as to insure the return to the spotting charge system.

The Oliver Iron Mining Co. is making preparations for the building of a model village at Alice to replace the scattered houses and locations which will have to be moved when operations begin on the removal of the ore now underlying the north end of Hibbing. The village will consist of 40 acres in the village of Alice has been purchased, and work is now going forward on the plotting, grading, and other preliminaries necessary for building the houses, which it is announced will be started as soon as the ground is ready. A feature of the new location will be a fine electric trolley system, which, if the plans possible and which, it is claimed, will be the most complete in Minnesota. It will cover an entire block, be three stories high, and be used for hauling, drying, refrigerating machinery, ventilating machinery, anesthetizing, sterilizing and gynecological rooms, X-ray, and an obitric section covering the entire third floor.

ISHPEMING, MICH.—June 28

The Michigan State Tax Commission has increased the valuations of many of the mines in both the iron and the copper districts. The Calumet and Hecla Mining Co. is now on the assessment rolls for \$1,000,000 more than last year, and some of the largest iron producers have been advanced as much as \$3,000,000. The mines of the Gogebic Range are now assessed at about \$50,000,000, the largest increases having been made in the case of the Newport Mining Co., the Oliver Iron Mining Co., and the new pit properties near Wakefield. The mines on the Marquette Range were advanced, but some reductions were also made, so the increase is not as great as for some of the other ranges. It was many years ago that the tax commission reassessed all of the properties, claiming to place them on a cash-value basis, and it was not expected that any changes would take place this year. The policy of the state to tax all ore reserves has had the effect of slowing up development work, the companies not caring to open ore deposits before they are needed. The Cleveland-Cliffs Iron Co. is the only concern which is doing any great amount of diamond drilling in the Michigan field at present. The company is now carrying several drills on the Mesabi Range. Ten to twelve drills are being worked regularly by the company on the Marquette Range, but no information is being given as to what \$50,000,000 is known that the Cleveland-Cliffs desires to find another mine in the Ishpeming field, as three of the properties now operating there will be closed down in a matter of two or four years. Ore is not going forward any faster than it was a week ago, there being few shovels attacking the stockpiles. Some properties are now making development of the ore that is now coming to surface, and the outlook for next winter is far from being encouraging. There is certain to be shut down a number of the ore mines unless the movement of ore is much more brisk than it is now.

HOUGHTON, MICH.—June 28

The Situation in the Michigan Copper District is summarized as follows: Seven mines are producing copper as close to normal as their working forces will permit. They are: Quincy, Mohawk, Wolverine, and Champion of the Escanaba, Mountaintop, and Champion mines of the Copper Range company. Eight mines are producing at approximately half of normal. They are: Calumet, Hecla, Ishpeming, Wakefield, Central, Almeck, Osceola Consolidated, Superior, and Mass Consolidated. Fifteen active organizations have their properties closed down: Lake Copper, White Pine, La Salle, Franklin,

New Baltic, New Arcadian, Hancock Consolidated, Winona, White Pine, Cass Copper, Wyandt, South Lake, North Lake, Cherokee and Indiana. Five exploration properties are continuing their development with energy: Seneca, Mayflower-Old Colony, Naumkeag, and Michigan. With reference to the properties that have suspended, it should be noted that mines like the Hancock, Franklin, La Salle, and White Pine are keeping their pumps operating, and could be reopened and become factors in copper output, in a small way, on short notice. Michigan is included in the list of exploration properties. The mine is a regular producer, but has a most important future possibility in an exploratory sense.

More new ground was opened in lower levels of the mines of the copper district during June than in any month for two years. The most noteworthy fact in connection therewith is that the general physical condition is better than average. This applies most importantly to the lower levels of the older mines, which are equally productive to the newer mines or those working along new lines.

Mines included in the classification of high-normal output have not cut down the total number of men working with drills underground. They have, therefore, a larger number employed in sinking shafts and opening new laterals. This underground preparation for the future places them in position to increase output of copper rock to normal whenever the metal market warrants such action and without the necessity for doubling their underground working forces. Greatest interest centers in the developments at the Seneca and the Michigan properties. The Seneca showing in the Kearsarge amygdaloid is up to reasonable expectations. That was made as certain as anything in copper mining might be made, by reason of the developments in adjoining properties, Ahmeek and Mohawk, and then again by reason of the drill showings when underground tests were conducted.

BIRMINGHAM, ALA.—June 27

Inquiries for Pig Iron are steadily becoming more numerous, a few for 1920 delivery being noted. Most companies, however, are refusing to sell beyond the third quarter of 1919, looking for an advance in prices. Two or three are out of the market for deliveries in the third quarter at present prices, and, owing to the belief that higher prices are to come, no inquiries for 1920 delivery are being considered. The Birmingham district is again shipping iron north, and were it not for the extremely high ocean freight rates the district could secure a large export trade. The Tennessee Coal, Iron & Ry. Co. is preparing to blow in its Alice furnace in the city proper at once; likewise in the near future another furnace at Bessemer, Ala. The feeling in

the district is that a decided change for the better has set in.

The demand for steel wire products for future delivery has become so heavy that plants are preparing for long and steady operation. Dealers are said to be taking advantage of the prevailing low prices. The plant of the American Steel & Wire Co. at Fairfield, Ala., has been in steady operation for some time, and, with the exception of repairing to be done in some departments, no shutdown is looked for. The Gulf States Steel Co. will close its Gadsden plant for about three weeks during July in order to put it in the best of condition. This company also expects to start its blast furnace in July. Some repairs now being rushed to completion.

Unionization of mill and furnace workers as well as of those in ore and coal mines and byproduct plants is progressing rapidly, with the aid of experienced organizers. The latter declare the workers are eagerly accepting the propaganda of the American Federation of Labor. Mass meetings in the old Ironstone district. One is scheduled for the latter part of June at Ensley, Ala., where the big steel mill of the Tennessee Coal, Iron & Ry. Co. is situated. The local business officials intend to make any statement as to the attitude which would be taken by the companies in regard to the efforts to organize. A shortage of labor in the mining divisions along Red Mountain, first noticed in the middle of June, has increased somewhat during this the last week of June. Some labor is being transported from Bessemer to northern points, but this will not wholly account for the shortage.

VICTORIA, B. C.—June 27

Diamond Drilling is being used to a larger extent in British Columbia in mine development than heretofore. The provincial government is drilling on the Snow-storm group of copper claims in Highland Valley, near Merritt, B. C. The work was started last January, and five borings have been completed. The sixth is now down and the plan is to drill at least 10,000 ft. for the purpose of proving up the orebody. The surface showings indicate an extensive zone, with good values in copper.

The Granby Consolidated Mining, Smelting, and Power Co. closed its Phoenix mines and Grand Forks smelter on June 10. Trains on the Phoenix branch of the Great Northern Ry. made their last trip on June 13, and now the rails are being removed from the track. For some time the company has been concentrating its efforts at its northern property, at Anvox, and reducing them at Phoenix and Grand Forks, and it was the intention of the owners to

close the latter properties at the end of the year. The strike of the coal miners at Fernie, and consequent inability to get coke from there, hastened the closing by six months. The grade of ore at the Phoenix mines has averaged about only 1% of copper and about 60c. in gold and silver for some time. During the last 20 years, 12,814,862 tons of ore has been taken from the Phoenix mines and smelted at Grand Forks, producing 636,291 oz. gold, 4,330,345 oz. silver and 271,073,000 lb. of copper. All the miners and smelter men have been offered work at the Granby company's northern property. During the month of July, the company's Anvox mines produced 1,267,658 lb. of copper.

In the Portland Canal District, W. R. Tonkin and W. W. Warren, representing United States capital, and John Peterson, of Stewart, B. C., have bonded the North Star, the Van Guard, the Last Chance, and the second Thought mines at Alice Arm, Portland Canal district. The total consideration is \$550,000. W. Somerville has bonded the Homestake, Xelking, and the Muskies and the Taylor Mining Co., a subsidiary of the Taylor Engineering Co., which was incorporated recently to take over the Dolly Varden mine—has taken a working option in the Ruby mine, opposite the Dolly Varden, and has started to operate the properties. The Temiskaming Mining Co. of Cobalt, Ontario, is negotiating for the purchase of the Moose group.

TORONTO, ONTARIO—June 28

Conferences Between Striking Miners and mine managers of Kirkland Lake have been held without leading to any settlement. The majority of the mining company officials do not expect that any adjustment of the dispute can be effected for some time, and have made their plans for remaining inactive for an indefinite period. One effect of the strike has been to encourage the development of the outline districts, where a number of the strikers have found employment in doing assessment work on mining claims. Others have gone out as prospectors or obtained work on undeveloped prospects. The Porcupine miners this week presented a new wage scale to the operators calling for an increase of 50c. per day all round and asking for an answer by June 28. The minimum asked for is below that demanded by the Kirkland Lake and Cobalt miners, and the attitude of the men is generally conciliatory. They ask for a reasonable and just discussion of local labor problems, and a peaceful settlement. A factor that is expected soon to cause a subsidence of the strike fever is the large surplus of labor in the Sudbury district, owing to the curtailment of the nickel output, and the reduction of wages in the mining districts of the Western states, which it is anticipated will cause an influx of mine workers into northern Ontario.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ARIZONA

Cochise County

NIGHT HAWK LEASING (Bisbee)—Has purchased new hoisting machinery for property, which will be installed promptly, preparatory to extending shaft from 600 to 800 ft.

Gila County

MIAMI M. & M. (Miami)—Recently closed deal for purchase of milling plant formerly owned by Arizona Butte corporation.

Pima County

LITTLE AJO (Ajo)—Some copper mineralization disclosed by diamond-drill hole at depth of 1,150 ft.

MYERS GROUP (Ajo)—Property adjoining New Cornelia on southeast, may soon be diamond drilled. Investigation of ground by representatives of E. J. Longyear Co. for data in estimating drilling costs, has been made.

PAYMASTER MINE (Twin Buttes)—Preparations being made to open old property again and operate under name of Paymaster Silver & Lead Co.

Pinal County

SILVER BELT (Mayer)—Eight-inch vein cut at 275 ft., carrying 400 oz. silver, 40% lead, within 12 ft. of orebody carrying pay ore. Strike is on new ground.

HALF-MOON (Ray)—Property, 12 miles from Florence at Red Hill, being developed by Ray men, headed by Charles Goodman.

Yavapai County

GREEN MONSTER (Jerome)—Secretary and Power Co. resigned, succeeded by Perklin. Company developing Silver Tip claim.

COLORADO

Boulder County

BOULDER COUNTY TUNNEL (Cardinal)—Development resumed, and force engaged in clearing out tunnel preparatory to active operations. Tunnel is crosscut for 2600 ft. then drift for about 2500 ft. on Boulder County vein. Chicago capitalists interested in new work.

YELLOW PINE (Crisman)—Twenty sets of lessees at work under superintend-

ence of J. W. Pherson. Winze from 6th to 9th level being unwatered, and will probably drain water from property. Installation of larger compressor plant under consideration.

Clear Creek County

BLACK EAGLE (Idaho Springs)—Reopened, and force of six men engaged on development under management of Harry Short.

CROWN POINT (Idaho Springs)—Lessees have opened 30-in. vein of high-grade gold ore west of main shaft.

EDGAR NO. 2 (Idaho Springs)—Lessee Al. Freedman has opened 4 x 4 ft. vein of milling ore in east heading from Big Five tunnel level. Heading being advanced and raise being extended east of old ore-shoot for exploration purposes. Six-inch streak of high-grade smelting ore opened 60 ft. east of raise. Miami tunnel level being cleaned out and new track being laid preparatory to resuming development of ground above this level.

LORD BYRON (Idaho Springs)—Mine in Spring Gulch will be taken over by P.

O. Dwyer, of Davenport, Iowa. Planned to develop property to depth of about 900 ft. through Stanley Road adit level. Crosscut will be driven about 200 ft. to the Byron vein, and thence drift will be advanced on vein for distance of about 2000 ft. to point under Byron shaft. Raise will then be extended about 500 ft. to connect with bottom of shaft.

STANDARD (Idaho Springs)—Lessees have opened small streak of high-grade ore on 400 level of this Fall River property. Ore being shipped in sacks by express to Pueblo smeltery under valuation of \$10 per lb.

SAN JUAN COUNTY

GOLD BIRD (Silverton)—Development resumed under direction of W. N. Kloster, owner. High-grade gold and silver streak opened.

PARADISE (Silverton)—Crosscut now 200 ft. long and will be advanced 75 ft. to junction of several promising veins. J. W. Esley superintendent.

SILVER LAKE (Silverton)—Secured by John B. Giono and associates under lease from American Smelting & Refining Co. Development will be resumed soon.

SAN MIGUEL COUNTY

SHIPMENTS OF CONCENTRATES from Telluride during May were as follows: Smuggler Union, 80 cars; Tomboy, 52; total, 132. Twenty cars from Smuggler shipped to Durango, and remainder to Pueblo smelteries.

CALIFORNIA

Eldorado County

STILLWATER GOLD QUARTZ (Omo)—Two hundred feet driven on vein and 6 ft. of quartz exposed.

Fresno County

CHROME PRODUCERS OF FRESNO COUNTY have organized to aid Government in speedy adjustment of claims.

Inyo County

SLATE RANGE MINERALS (P. O. Bakersfield)—Erecting 50-ton mill, combining gravity concentration and flotation, to handle ore averaging \$15-\$20. Three years' supply blocked out. Eight-mile electric power line installed. Expect to be in operation about July 15. Ore chiefly lead carbonate, with oxides sulphates and sulphides. High grade shipped to U. S. smelter, Midvale, Utah Property in Slate Range Mountains, about eight miles northeast of Trona, Cal. Number employed 20-40. Production in 1918, 1,331,440 lb. lead, 1,783.85 oz. gold, 64,388.89 oz. silver, and 90,124 lb. copper. Gross receipts 1918 were \$142,821.87. Morris B. Parker, superintendent.

Nevada County

IDAH0 MARYLAND (Grass Valley)—Has purchased Eureka claim and is negotiating for purchase of Brunswick group.

Sierra County

EXAMINATION OF ALHAMBRA PROPERTIES in Jim Crow Canyon finished by H. S. Raymond and F. O. Richardson. Sovereign mine now being examined, these properties under option to Gold Exploration Co., of Salt Lake City; also the Comet, latter carrying vein of arsenical sulphides not amenable to ordinary mill processes.

TABLE ROCK MINING CO. has found body of gold-bearing pipe clay overlying gravel in 3,000-ft. tunnel at Howland Flat, near Sierra City. J. H. Hartley in charge.

GIBRALTAR (Downieville)—Two feet per day being made in tunnel by Kieffer brothers.

Siskiyou County

BLUE LEDGE (Hutton)—Shipping three cars weekly of 12 per cent copper ore to Tacoma smeltery, with several thousand tons good ore on dump. Will double shipment while roads are good. Thirty-five-mile haul to shipping point, costing \$11 per ton.

Tuolumne County

DREISAM (Tuolumne) Shaft being unwatered by Ripon Mining Co.

IDAH0

Shoshone County

NABOB (Bealer)—Mill of 150 tons' capacity nearing completion. Expected to be running in July. Large amount of lead-silver-zinc ore available. Controlled by Stewart Mining Co.

AJAX (Burke)—Development resumed after suspension of three months. Work transferred from Con Paul tunnel to Moonlight shaft. Down 200 ft. and drifting west toward common end line with Hercules. Considerable ore continues in drift.

Vein supposed to be identical with Hercules. Company controlled by capitalists of Lynn, Mass.

GOLD FLOTATION (Mullan)—Gold Flotation Development Co., which has lease and bond on old Singiser mine in Lehmi County, Idaho, announces mill will be installed within 30 days, and will include crushing plant, tables and flotation cells. Former company discontinued work in 1906, after doing large amount of development, and property is equipped with stamp mill and cyanide plant. Ledge said to be 50 ft. wide, with 3-ft. pay streak. Satisfactory tests made with flotation. Officers and directors: W. H. Havlin, Baltimore, Md., president; Harold Williams, of Mullan, vice-president; H. G. Loop, of Seattle, secretary-treasurer; John Brizel, of Wilmington, Del., and O. W. Lewis, of Wallace.

GIANT LEDGE (Murray)—Large lead-silver ore shoot on 200 and 400 levels. Property originally located and developed for gold.

BULLION (Wallace)—Operations suspended during war. Now has five men drifting into body of 4% copper ore disclosed in shaft above and by diamond drill.

LUCKY SWEDE (Wallace)—Work started in crosscut to promising copper ledge, which will be cut at 1,000-ft. depth. Should reach vein during summer.

NEW MILL UNDER CONSTRUCTION BY SLATE RANGE MINERALS CO., INYO COUNTY, CAL. CUT SHOWS FLOTATION MACHINE ON SKIDS

MICHIGAN

Copper District

CALUMET & HECLA (Calumet)—Copper production for May was as follows: Ahmeek, 1,117,984 lb.; Alouez, 190,000; C. & H., 3,596,900; Centennial, 92,732; Isle Royale, 790,209; Osceola, 812,497; Superior, 102,386; and White Pine, 94,111.

MICHIGAN COPPER (Rockland)—Copper output now running 25 lb. to ton, but May output showed 23 lb. to ton. 149,000 lb. being total refined output from 6,230 tons. Company plans to increase force on development work. No construction work now under way. Underground openings going forward on three lodes, the Butler, Ogima, and Evergreen. These all toward location of proposed shaft, east of present shaft.

Gogebic Range

NEWPORT (Ironwood)—Has built four more cottages for miners at North Park location. Employees may buy these or other houses from company, paying on installment plan. In last year homes for salaried men and miners have been built.

PAEST (Ironwood)—Haulage-power generating set consisting of tandem-generator Corliss engine and 400-kw. d.-c. generator

has been sold and removed from power house. Current for haulage now supplied by rotary circuit in pump house on 23rd level, which receives power from turbine generators in main power house. Company trying out Captain Hear's mucking machine in 8 by 15-ft. crosscut on 24th level of H shaft. Newport mine has two and ordered another of these machines. Is using them chiefly in ore. Machine driven by air motors, has a dipper, and swings in horizontal circle, but will operate in 8 by 8-ft. drift.

MONTREAL (Montreal, Wis.)—Exploration of property by diamond drills continuing. Most of holes are some distance north of foot wall in horizons where other mines have recently found ore. This property on Gogebic Range in Wisconsin.

Menominee Range

CARPENTER (Crystal Falls)—Four miners killed on June 20. Bodies recovered.

MINNESOTA

Mesabi Range

AJAX (Biwabik)—Operators announce discovery of vein of high-grade manganese ore 6 ft. wide.

HOBART (Gilbert)—Completion of new spur will permit resumption of shipments July 1. Hanna Ore Mining Co. operators.

ALEXANDRIA (Hibbing)—Big underground property, of Hanna Ore Mining Co. starts shipment of stockpile.

CYPRUS (Hibbing)—Property, opened by R. M. Sellwood in 1903, makes final shipment. Open-pit scrap, total shipments 1,800,000 tons.

WEBB (Hibbing)—Resumes operation of underground portion of mine with full crew day shift only. Shenango Furnace Co. operators.

DEAN (Kinney)—Tod-Stambaugh Co. completes churn-drilling campaign. Drilling equipment transferred to Dunwoody, at Chisholm, operated by same company. Dean increases shipments from 80 to 120 cars daily, with announcement of further probable increases.

PIL0T (Mountain Iron)—New open-pit property of Hanna Ore Mining Co. made initial shipment of concentrate. Drainage shaft completed at depth of 103 ft. Complete electrical equipment.

MONTANA

Jefferson County

LEGAL TENDER (Clancy)—Orders placed with hardware and mining machinery department of Anaconda Copper Mining Co. for electric hoist and compressor plant.

Silver Bow County

ANACONDA (Butte)—Shortage of water has compelled Washoe smeltery to shut off treatment of independent copper ores which require concentration. Sinking under way at Orphan Girl and Original shafts. Drifting in ore continues on 800 level of Emma mine. Good showing reported at Tropic. Treatment of zinc concentrates from Butte & Superior and Timber Butte Milling Co. resumed. Shaft of Gambinus, recently acquired, has been abandoned and head frame removed. Production continues slightly under 60% normal.

ANSELMO MINING (Butte)—Shipments resumed, smelter returns on first six cars showing net value up to \$3,000 per car. Succeeding cars running around \$1,500 net value chiefly in gold, silver, and zinc. Property now opened to 800 level through Trifle shaft, and drifting in progress.

BARNES-KING (Butte)—Options being taken on several claims in northern and northwestern part of district. Some preliminary prospecting being done on Little Annie and George properties.

CRYSTAL (Butte)—Drifting on 500 level of North Goldsmith ledge shows ore of medium grade continuing 5 ft. wide.

DAVIS-DAILY (Butte)—Steam shovel double former capacity at work removing Colorado mine dump. May returns from development ore show net of over \$28,000 despite added cost of removing dump. High-grade zone continues. Silver-zinc shipments from Hibbernia approximating carload daily. Sinking of Colorado shaft under way and will be started soon at Hibbernia.

ELM ORLU (Butte)—Two high-grade bodies of silver-zinc ore 15 ft. 2,000 level of Rainbow fissure, one 15 ft. wide, and other 20, lying on foot and hanging walls. Sinking in progress. Production of zinc ore being increased.

NORTH BUTTE (Butte)—Good ore disclosure reported on 600 level of Speculator. Development progressing, but ore production still curtailed to 25% normal. Sarsfield shaft crosscuts still in country rock.

NEVADA

Washoe County

STANDARD METALS (Reno)—Company operating Peavine mine, near Reno, installing new mill with K. & K. flotation machines, Wilfley tables, Calkow tanks. Expected to be in operation within 30 days. Ore chiefly silver, with some copper.

OREGON

Jackson County

RAINIER MERCURY CO. of Tacoma, Wash., operating Utah groups of 38 claimants north of Gold Hill during last two years, with monthly output of 65 flasks of mercury, has been reorganized. New corporation, known as War Eagle Mining Co., organized at Medford, Ore., with local men at head, is operating mines with present equipment, making developments, and purposes to erect large-capacity furnace for reducing lower-grade ore.

Josephine County

DAILY & CASEY (Selma)—Two prospectors have struck high-grade gold quartz on claims on Briggs Creek near Selma, Ore. The mine is a high-grade quartz also chrome producer, inaccessible until Government roads were built. Find in Illinois River district.

TEXAS

Brazoria County

WEST COLUMBIA FIELD production for week ended June 19 averaged 34,435 bbl. daily. Producers as follows: Humble Oil & Refining Co., 10,000 bbl.; Gulf Production, 8,300 bbl.; Texas, 8,300 bbl.; Crown Oil, 6,800 bbl.; Sun, 600 bbl.; Hanicker Oil, 35 bbl.

TEXAS CO. (Brazoria)—Good pump brought in at 2,300 ft. on Masterson & Altan ranch, 16 miles south of Brazoria. Will continue drilling.

Galveston County

HUMBLE OIL & REFINING (Texas City)—Will build 1,200-ft. dock for loading oil from north Texas fields for shipment to Atlantic seaboard refineries. Loading of channel-dredged will be 2 1/2 ft. deep, to accommodate largest tank steamers. Will be connected with company's 8-in. pipe line from oil fields.

Gonzales County

LARGE ACREAGE NEAR WALDER leased recently, and more ground being taken up; several thousand acres altogether now under lease. Test wells will be sunk soon.

Kleberg County

CONSIDERABLE DRILLING near Kingsville to be done soon. Texas-Kentucky Co. building derrick on land six miles southeast of Kingsville. International Petroleum Co. opened office at Kingsville. Kleberg County Oil & Gas Co., just organized, capital stock \$100,000, owns leases on 4,020 acres from six to twelve miles southeast of Kingsville. Some gas seepages found.

Lampasas County

HOWELL WELL NO. 1, on White ranch, shows oil at 1,030 ft. Nelms-Marvin well No. 2, southwest of Lampasas, now drilling in dark gray limestone at 775 ft.

Montgomery County

BLACK HAWK PETROLEUM CO. has Water No. 2 well down to 4,315 ft., and going deeper.

Orange County

DRILLING BY CHICAGO SYNDICATE will be started soon in Orange County. Large acreage leased. George A. Foreman local manager.

Wichita County

WICHITA FALLS DISTRICT production now about 100,000 bbl. per day, according to producers and pipe line officials. Total capacity of pipe lines in district less than 85,000 bbl. a day. Several lines building. Big companies building more tanks. Federal officials asked to assist in facilitating movement of tank cars to decrease storage.

UTAH

Box Elder County

VIPONT MINING (P. O. Oakley, Idaho)—Proposed to construct modern mill to treat low-grade silver ores, of which there is stated to be good tonnage. Property

worked intermittently since '60s, but only high-grade mined. Attempts at concentrating low-grade by old method unsuccessful. Main tunnel in 1,000 ft., giving depth of 200 ft. Reported force of 50 men working is adding rapidly to low-grade ore on dumps.

Juab County

TINTIC SHIPMENTS week ended June 21 amounted to 110 cars.

CHEF CONSOLIDATED (Eureka)—Three new pumps put in operation, making possible lift up to 1,250 gal. water per min.

COPPER LEAF (Eureka)—Shaft at this Tintic property down to 1,200 level, and 100 ft. more of sinking probably to be undertaken. Two shifts working in shaft, and drifting being done on 1,000 level.

EUREKA BULLION (Eureka)—Strike holding out. Raise from 800 level up about 10 ft. and showing 6 ft. of ore. Ore mined also from crosscut in main drift a short distance from raise. Conditions promising. Further sinking to be done, as large bodies are found at depth in this section.

LEHI-TINTIC (Eureka)—Assessment 2c. at this level to provide funds for new working shaft. Has power connections, and sinking will begin as soon as necessary equipment acquired.

TINTIC PAYMASTER (Eureka)—Consolidating interest of claims with Eureka King effected, stockholders in latter to receive two shares in new company for one of Eureka King. Understood not less than \$50,000 worth of development work promised under agreement.

DESERET MOUNTAIN (Tintic Junction)—Probable work will be resumed soon. Opened to depth of 300 ft. Difficulty in getting ore to railroad. Property in west Tintic district.

IMPERIAL LEAD (Tintic Junction)—Some development work being done. Made shipments last year.

Salt Lake County

MICHIGAN-UTAH (Alta)—Shipped six cars week ended June 21. Reported no miners still scarce, and that with sufficient force could market 300 or 400 tons weekly.

SELLS (Alta)—Spur 850 ft. long being built to connect with Little Cottonwood Transportation. Shipped 450 wet tons during week ended June 21. Increase shipments when spur is in operation.

SOUTH HECLA (Alta)—Shipped about 1,000 tons week ended June 21, over Little Cottonwood Transportation Co.'s road.

MONTANA-BINGHAM (Bingham)—Work resumed under old company account after four-months' shutdown; some leases shipped during this period. Several assessments levied, and last assessment of 2c. a share levied in February, 1919. 2,000,000 shares capitalization and 47,000 shares delinquent. This and reductions in salaries and overhead expenses placed company on better foundation. Mayflower drift being worked on level 2,400 ft. from surface on dip of vein and 1,600 ft. below Keystone tunnel of Fortuna.

WOODLAWN MINING (Salt Lake City)—Property at mouth of Cottonwoods has made trial shipments by truck. Stated to have enough ore blocked out for regular shipments.

Sanmiti County

NAILDRIWER (Park Citk)—Work resumed.

SILVER KING COALITION (Park City)—Work resumed under old conditions since calling of strike. A. J. Drey for some time with Cardiff and in early days superintendent of Coalition, is mine manager.

Tooele County

HONORINE MINE (Stockton)—Ore opened in Hercules vein on 600 level by lessees, who are preparing to ship.

Utah County

PACIFIC (American Fork)—High-grade silver ore reported opened in new ground.

WISCONSIN

Zinc-Lead District

KISTLER & STEPHENS (Platteville)—Results of recent drilling on Alderson tract four miles south of Platteville indicate reopening. Property dismantled and abandoned three years ago.

ZINC HILL (Platteville)—Company's "Little Dick" mill, at Cuba City, placed in operation in July. "Big Dick" will be opened upon completion of shaft now being sunk.

WILSON (Platteville)—Milling plant at Potosi completely destroyed by fire on June 6. Property idle for two years.

CANADA

British Columbia

(CONSOLIDATED) M. & S. COMPANY has purchased five groups of claims in Sibola county, 20 miles from Sibola Mountain and 100 miles southwest of Grand Trunk Pacific Railway.

ARTHUR E. HEBURN, of Vancouver, has taken bond on seven claims in Summit camp, Tulameen district. Claims are silver-lead and include Sutter No. 7, Nickel Plate, Huckleberry, Huckleberry Fraction, Sunlight, Sunbeam, and Jumbo.

SKEENA M. & M. has working bond on Victory and Coronado groups, Hudson Bay Mountain, northern British Columbia. Properties silver-lead-zinc. To install 50-ton concentrator and other operating equipment.

NUGGET GOLD (Victoria)—Development tunnel extended 350 ft. and advancing at rate of 200 ft. monthly. When sufficient ore is blocked out Mother Lode mill will be operated. E. C. Property on Sheep Creek, near Salmo, B. C.

Manitoba

SILVER DISCOVERY is reported near Mile 235 on Hudson Bay Ry. in The Pas district of northern Manitoba. Find made by Louis Coteau prospector, and samples exhibited at The Pas.

Ontario

COBALT PROVINCIAL planning to increase capacity of mill to 80 tons at cost of \$10,000.

BUFFALO (Cobalt)—Annual report for year ended Apr. 30 showed production of 625,000 oz., a decrease of 140,000 as compared with previous year. Net income for year, \$171,238, which brought surplus to \$636,139. Ore reserves estimated at \$288,700.

FOSTER (Cobalt)—New high-grade vein two inches wide discovered.

MOHAWK (Cobalt)—Work started. Property situated on west side of Mud Lake.

CASTLE (Gowganda)—Shaft down 380 ft., with results stated to be satisfactory.

KIRKLAND LAKE (Kirkland Lake)—Frank L. Crysler, president, states mine bins filled with 500 tons of ore and surface dump contains 8,000 tons, with stopes at 300 level also full and smaller quantities at lower stopes. A 15-ft. ore-face shows at 600 level, averaging \$5 per ton, and close by is parallel 3-ft. body carrying \$28 ore. Underground workings kept pumped out.

YOUNG-DUNCAN (Kirkland Lake)—Property east of Tough-Oakes shows possible extension of same vein system.

MATACHEWAN (Matachewan)—Shaft down 140 ft. and still in ore. Orebody dipping at 70 deg. and expected to leave shaft at depth of about 160 ft. Shaft will be continued to 200 ft. and crosscut started. Stated that assays show average gold content of good milling grade.

DOMESTIC EXTENSION (Porcupine)—Annual meeting showed \$51,841 cash on hand. Property under option to Dome, and president stated development of same vein. Large body of ore averaging \$5.22 already developed.

INSPIRATION (Porcupine)—Diamond drilling begun.

MEXICO

Baja California

COMPAGNIE DU BOLEO (Santa Rosalia)—Copper production for May was 1,322,720 lb.

Sonora

SANTA LUCIA (Nacoazar)—Syndicate headed by D. J. O'Rourke, of Potter, Jarrett & O'Rourke Construction Co., has perfected 60-day option upon Santa Lucia mine. Careful investigation of property now being made. Ore contains silver, copper and lead.

BELGIAN CONGO

UNION MINIERE DU HAUT KATANGA (Elisabethtown)—May production of copper was 2,094,370 lb. April, 4,295,970 lb.

BURMA

BAWDWIN MINES (Bawdwin)—Lead production for May, 1,976 tons gross, from 5,988 tons of lead-bearing material (including 1,000 tons of secondary refined lead production 1,587 tons; refined silver production approximately 180,371 oz.

THE MARKET REPORT

Daily and Weekly Metal and Mineral Prices,
Metal Market Conditions, Average
Monthly Prices, Stock Quotations

Silver and Sterling Exchange

June	Sterling Exchange	Silver		June-July	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
26	4.5800	1.09½	53½	30	4.5900	1.08½	53
27	4.5900	1.08½	53½	1	4.5800	1.07½	53
28	4.5938	1.08½	53½	2	4.5538	1.07½	53

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

June-July	Copper		Tin	Lead		Zinc
	Electrolytic	Spot		N. Y.	St. L.	
26	18.35	68	5.35@5.40	5.15	6.95@7.00	
27	18.50	68	5.35@5.40	5.15	6.95@7.00	
28	18.60	68	5.35@5.40	5.15	6.95@7.00	
30	18.70@18.85	68	5.35@5.40	5.15	7.00	
1	19.00@19.10	68	5.35@5.40	5.15	7.00	
2	19.10	68	5.35@5.40	5.15	7.00	

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for spelter are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

June-July	Copper			Tin		Lead		Zinc	
	Spot	3 M.	Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.
26	86½	88½	90	239½	235½	22½	22½	38½	38½
27	87½	88½	91	238	235½	22½	22½	38½	39
28
30	87	88½	91	238½	236	22½	22½	38½	39½
1	86½	88½	91	240	236½	22½	22½	39	39½
2	89	90	92	240	238½	22½	22½	39½	40

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb.

Metal Markets

NEW YORK—July 2, 1919

The main features this week were a further advance in copper, which crossed 19c. in its upward movement, and the resumption of free trading in tin on a fairly active scale.

Pacific freights remain unchanged at \$14 from San Francisco to Hongkong and Kobe. Transatlantic freights remain unchanged.

The price for three-months tin, at London, on June 25, was given incorrectly in the "Journal" of June 28. The correct price was £238.

Copper—The conditions we reported last week continued, i.e., the market remained wholly in the hands of the producers, who made the consummation of relatively small business the basis for advancing prices further, and immediately obtained what they asked. On Thursday the market was firmly es-

tablished at 18½c., delivered, and before the end of Friday no copper was to be had for less than 18½c., delivered.

On Saturday the market was firmly established at 18½c., delivered. During these days a pretty good business was done. A noteworthy feature was the buying by brass-makers. With Monday, producers advanced their prices to 19c., delivered, and on Tuesday a further advance to 19½c. was made. A rather fair business was done on Monday, but on Tuesday and Wednesday transactions were light.

The total of domestic business done during this week was only moderate, but the sentiment among the buyers is such that producers are able to advance prices and get them on relatively small business. No attention is paid to the statistical position, but a good deal is focussed on the labor situation.

The Japanese were again considerable buyers of copper this week, making pur-

chases through the Export Association. Nobody knows just what is at the bottom of the Japanese demand.

Copper Sheets—The base price of copper sheets is 28½c. per lb. Market strong. Copper wire is quoted at 22c. in carload lots, f.o.b. mill. Market strong.

Tin and Lead

Tin—Business amounting to several hundred tons was transacted during the week, mainly in the reselling of surplus material. Producers did not sell much. There was substantially no change in prices from those which prevailed at the close of the previous week. The market is still more or less in a daze and has not yet found itself, many consumers who are potential sellers apparently not yet having made up their minds what to do. At the close high-grade tin, including Straits, Banka, and American electrolytic, was quoted at 70c., and tin of 99 per cent grade was at 68c. July-August shipments from the Straits and July shipments from Banka were quoted at 50½c., c.i.f. Lamb & Flag, July shipment, 51½c. Lamb & Flag, 99 per cent grade, July shipment, 51½c.

Lead—A rather large business was transacted during the week, especially on Friday. Following that the market became rather dull. The prices were cut a little in order to effect business. There was gossip about bonded lead being sold at 4½c., which would give a price of 5c., or only a trifle more for domestic consumption. A small quantity was bought on that basis, but this was apparently lead smelted in this country from foreign ore, the supply of which is not large. Mexican producers were able to sell rather freely, at relatively good prices, to France and Japan, and so long as they have a fair foreign outlet they will not be disposed to think of entering their product for domestic consumption.

inc

Zinc—A rather large business was done during the week, much of which was apparently of speculative character. The market having touched 7c., some interests were evidently minded to realize, and sales were made as low as 6.95c. However, the market exhibited a good deal of resiliency, and quickly returned to a firm basis of 7c. The advance in spelter in London, which today touched \$40 for futures, is reflected here for spelter could theoretically be sold for shipment to England via Galveston, on terms netting 7@7.05c., f.o.b., works in Oklahoma. However, the

sharp fluctuations in sterling exchange make all calculations uncertain.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 32@33c. per lb. Market quiet.

Antimony—Unchanged at 8½@8½c. for spot. Scarcely any offerings of futures are made.

Bismuth—Metal of the highest purity for pharmaceutical use is quoted at \$3.20 per lb. for wholesale lots—500 lb. and over.

Cadmium—Quoted at \$1.50 per lb. in lots of 500 pounds. For lots under 200 pounds, \$1.75 per lb.

Nickel—Ingot, 40c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—Shortage in supplies here continues, but there was no further advance in price this week. Californian is quoted at \$95, and Mexican at \$92. San Francisco telegraphs \$92, firm.

Silver and Platinum

Silver—The London price has shown a downward tendency. Owing to the weakness of China exchange, there having been a decline both in Shanghai and Hongkong, the offerings on the London market have been larger. Shipments of gold to China may have occasioned the decrease in demand for silver in that quarter.

Mexican dollars at New York: June 26, 84½; June 27, 83½; June 28, 83½; June 30, 82½; July 1, 82½; July 2, 82½.

Platinum—In very strong demand, but as yet no further advance in price. We quote refined ingot at \$105@107½. A lot of crude platinum sold this week fetched \$105.50, which would indicate a price of \$107.50 for refined ingot. There were several bidders for this lot.

Philipp Bros., metal and ore dealers, of New York, inform us that Derby & Co., Ltd., of England, have consigned to them a parcel of platinum per the dirigible "R-34."

Zinc and Lead Ore Markets

Joplin, Mo., June 26—Zinc blende, per ton, high, \$47.50; basis 60 per cent zinc, premium, \$46; Prime Western, \$45; sludge and flotation, \$42.50@40; calamine, basis 40 per cent zinc, \$28@25. Average settling prices: Blende, \$42.71; calamine, \$26.36; all zinc ores, \$42.27.

Lead, high, \$63.30; basis 80 per cent lead, \$60; average settling price, all grades of lead, \$60.83 per ton.

Shipments the week: Blende, 8,467; calamine, 236; lead, 1,303 tons. Value, all ores the week, \$447,150.

Shipments six months: Blende, 271,161; calamine, 7,240; lead, 38,289 tons. Value, all ores six months, \$13,234,910.

Sellers are producing so lightly this week that no offer under \$45 basis would be accepted. Buyers finally met this demand, and a considerable tonnage was contracted on the higher price level. Owing to miners and teamsters leaving for the harvest, estimates are

offered of a reduction of 20 to 40 per cent in the production this week. Perhaps 25 per cent is a conservative estimate. Few mills are idle, but none are milling over 75 per cent of capacity.

Platteville, Wis., June 28—Blende, basis 60 per cent zinc, \$45 base for premium grade, and \$42.50 base for high-lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$60 base for top grade and \$59 base for second grade. Shipments reported for the week are 1,905 tons blende, 284 tons galena, and 396 tons sulphur ore. For the year to date the totals are 50,224 tons blende, 2,611 tons lead, and 7,144 tons sulphur ore. Shipments for the first six months of 1919 compared with the corresponding period of 1918 show decreases for all ores as follows: Blende, 16,210 tons; galena, 983 tons; sulphur ore, 19,457 tons. During the week 2,937 tons blende was shipped to separating plants.

Other Ores and Minerals

Chrome Ore—This ore is offered abroad, but high freight rates prevent the consummation of business. It is thought that Canada may become a larger producer of chrome ore.

Manganese Ore—Charles Hardy reports that the first shipment of Caucasian ore has been made, but American buyers being skeptical of it, the material was diverted to Liverpool, where it was due to arrive on or about July 3.

Molybdenum Ore—Unchanged at 75@85c. per lb., but this quotation is merely nominal, there being scarcely any inquiry for the ore.

Tungsten Ore—Considerable business was reported this week, Chinese ore selling at \$7.25@7.50. Shipments from China were sold at \$6.75. High-grade ore is still held at \$10 and upward, but no business was reported.

Nitrates—The market is quoted at \$3@3.25 for carload lots, with some spot supply reported available in this country. It is said there have been practically few or no transactions done with Chilean producers recently, importers in this country awaiting easier prices.

Pyrites—Spanish pyrites is quoted at 19c. per unit for furnace ore, c.i.f., New York or other Atlantic port. Market slow and unsettled.

Iron Trade Review

New York, July 2,

June pig-iron output, according to *The Iron Age*, shows definitely the turn in the industry. For the thirty days the total was 2,114,863 gross tons, or 70,495 tons a day, against 2,108,056 tons in May, or 68,002 tons a day. Seventeen furnaces blew in and twelve blew out last month, a gain of five, and estimated capacity active on July 1 was 71,700 tons a day for 200 furnaces, as compared with 68,600 tons a day for 195 furnaces on June 1.

The gain in output last month was the first check to a steady decline in the

daily average from the high point reached in September, 1918, at 113,942 tons. From 372 furnaces in blast Sept. 1, last year, the shrinkage was 177 in nine months to 195 on June 1.

Pittsburgh—July 1

The steel market has continued to gain steadily. The advent of the mid-summer period does not appear to have any effect whatever upon the activity, and the common opinion now is that the improvement will not be interrupted by the season or anything else. The prospective signing of the peace treaty doubtless had a favorable effect, but results from the actual signing are yet to be seen, and these will probably be observed during the next few weeks in favorable action by directors, executives, and general investors upon various construction projects that have been held in abeyance until the consummation of this important event.

Steel-mill operations, which dropped from 65 per cent to 54 per cent from April to May, as monthly averages, and probably to about 50 per cent at the middle of May, were approximately 65 per cent of capacity last week, and are showing further increasing tendency, though this week the holiday interferes somewhat. Many mills are operating at a general average of 75 per cent, and some are doing better than that, and many departments are running full. The general average is pulled down by the light operation of rail, plate and structural mills.

Even in conservative quarters the prediction is now ventured that the steel industry will be operating substantially at capacity next September, as a result of continuance of the improvement in steel demand that has been so constant for the last six or seven weeks. Such predictions, however, do not necessarily mean that the full ingot capacity will be engaged. The percentages named above are computed on ingot capacity, which is taken at 49,000,000 tons a year, against about 35,000,000 tons in 1914, showing a 40 per cent increase. There has not been a commensurate increase in finishing capacity for any important product except plates, and the majority of finishing departments could run full without using all the raw steel that could be made. Prior to the war, the supply of ingots would run short before all finishing departments attained full rates.

The general character of demand can be described in fewer words by mentioning the slack commodities than those that show full activity. The least demand is for rails, and plates, structural shapes, and butt-weld pipe follow in sequence. Even tin-plate demand has increased and is producing operations near to capacity. Delivery promises on lap-weld pipe, because of continued heavy demand for oil-country goods, are lengthening. Demand for shapes is steadily improving. Fabricated-steel lettings doubled from April to May, to 49 per cent of the shop capacity, and June is expected to show a marked additional improvement.

Predictions of prospective advances in steel prices, recently floating about promiscuously, are now much less common, probably through the Steel Corporation quietly allowing it to become known that it has definitely adopted the policy that there should be no steel price advances this year. It is understood the Steel Corporation has let it be known it would refuse to be stamped, even should the independents all advance prices, and with such warning the independents are unlikely to make any attempts.

Pig Iron—The market has become quiet, but at the same time it shows a stronger undertone, the active furnaces being well sold up for a few months by reason of the recent activity, and the idle furnaces are unlikely to consider blowing in until there is fresh evidence of demand. The Valley market is now firm at Mar. 21 prices, and concessions by other furnaces for Pittsburgh delivery have become uncommon. We quote Valley prices at \$27.95 for bessemer, \$25.75 for basic, \$26.75 for foundry, and \$25.75 for forge, with \$1.40 freight to Pittsburgh. W. P. Snyder & Co. report computation of average prices involved in sales by Valley furnaces during June at \$27.95 for bessemer and \$25.75 for basic, the averages being the same as for the two months preceding, and being the regularly recognized quotations. Valley foundry was quotable at \$26.75 throughout the month.

Steel—Billets, slabs, and rods continue quiet. Sheet bars are in active demand, chiefly because sheet and tin mills send specifications weekly to their regular sources of supply without price negotiation, the market being firm. We continue to quote: Billets, \$38.50; slabs, \$41; sheet bars, \$42; rods, \$52.

Ferromanganese—Domestic producers made sales of a few thousand tons of 80 per cent ferromanganese when they reduced prices to \$110, apparently fearing that English producers would cut their price of \$125, delivered, or \$121, c.i.f., and take prospective business. Some makers state they have returned to their former \$125 quotation, but desirable orders could probably be placed at the same price as recently. We quote domestic ferromanganese at \$110 @ \$125, delivered, and English at \$125, delivered, with spiegeleisen practically nominal at about \$30 @ \$33 for 18 per cent delivered.

Coke—Nearly all the contracting for second half has now been done, furnace coke going generally at 61 to 1, against basic pig iron at Valley furnaces, and foundry at \$5 @ \$5.50, depending on brand. As usual, spot coke is stiffer, on account of the impending holiday, furnace having brought \$4.25 even last Saturday. Next week the usual reaction will probably occur. Illustrating the situation, one producer of a favorite brand is today holding spot at \$4.25, but would sell over July at \$4. Prompt foundry may be quoted at \$4.50 @ \$5 as formerly, per net ton atovens.

THE MINING INDEX

Listing Special Articles of Interest
and Value to the Miner
and Metallurgist

This index is a convenient reference to the current literature of mining and metallurgy published in all of the important periodicals of the world. We will furnish a copy of any article (if in print) in the original language for the price quoted. Where no price is quoted the cost is unknown. Inasmuch as the papers must be ordered from the publishers, there will be some delay for the foreign papers. Remittance must be sent with order. Coupons are furnished at the following prices: 20c. each, six for \$1, 33 for \$5, and 100 for \$15. When remittances are made in even dollars, we will return the excess over an order in coupons, if so requested.

COPPER

100—ARIZONA—The Middlemarch Mine, Cochise County, Ariz. B. M. Snyder. (Min. and Oil Bull., Apr., 1919; 24 pp., illus.) 20c.

101—IRISH COPPER-ORE DEPOSITS. (Statist. Apr. 19, 1919; 14 pp.)

102—LEACHING—First Year of Leaching by the New Cornelia Copper Co. Henry A. Tobelman and James A. Potter; also discussion. (Bull. A. I. M. E., Feb. and Apr., 1919; 54 pp.; illus.) 40c.

103—NEVADA—Geology and Ore Deposits of the Yerington District, Nevada. Review by William H. Emmons of Prof. Paper 114, U. S. Geol. Survey. (Eng. and Min. Journ., June 21, 1919; 1 p.)

104—PERU—Estado Actual y Porvenir de la Industria Minera en los Departamentos del Sur. Carlos Basadre y G. (Bol. del Cuerpo de Ingenieros de Minas del Peru, No. 93, 1918; 64 pp., illus.)

105—POWER—Economy of Certain Arizona Steam-Electric Power Plants Using Oil Fuel. C. R. Weymouth. (Advance copy, A. S. M. E., June 16, 1919; 23 pp.) Refers to plants of Inspiration, New Cornelia, and Arizona Power companies.

106—QUEENSLAND—Resources of the Cloncurry Copper Field, North Queensland. S. Harris. (Reprinted from Chem. Eng. and Min. Rev., Nov. Dec., 1918, and Jan., 1919; 123 pp., illus.)

107—SOUTHWEST—Notes on Certain Ore Deposits of the Southwest. (Bull. A. I. M. E., Feb., 1919; 3 pp.) Discussion of paper by W. Tovic, previously indexed.

GOLD AND SILVER—GEOLOGY

108—ONTARIO—The Gold-Quartz Lodes of Porcupine, Ont. Ellsworth Y. Dougherty. (Min. and Sci. Press, Apr. 19, 1919; 4 pp., illus.) 20c.

109—WESTERN AUSTRALIA—The Geology of the Water Reserve Find at Linden, North-East Coolgardie Goldfield. C. S. Honman. (Geol. Surv. of W. Aust., Bull. 74, 1917; 23 pp.)

GOLD DREDGING, PLACER MINING, ETC.

110—BRITISH COLUMBIA—Placer Operations in Cariboo Area of British Columbia. B. R. MacKay. (Eng. and Min. Journ., June 14, 1919; 6 pp.) Abstract from Summary Report, 1918, Canadian Department Mines. 20c.

111—CHINA—Gold Washing on the Banks of the Yangtze. H. K. Richardson. (Eng. and Min. Journ., June 21, 1919; 12 pp., illus.) 20c.

GOLD AND SILVER CYANIDING

112—LIME as a Settling Agent. Paul T. Bruhl. (Eng. and Min. Journ., June 21, 1919; 13 pp.) 20c.

113—MANGANESE SILVER PROBLEM. The Harry J. Wolf. (Col. School of Mines Mag., Apr. and May, 1919; 104 pp.) Extracts from address before Teknik Club, Feb. 11, 1919. 40c.

114—PRECIPITATE—Device for Charging Precipitate. (Eng. and Min. Journ., June 14, 1919; 1 p., illus.) 20c.

GOLD AND SILVER

GENERAL

115—AUSTRALIA—A Brief Resumé of the Smelting Plant at the Sulphide Corporation Limited Works, Cockle Creek, N. S. W. Guy Courtney. (Proc. Austral. Inst. M. E., Sept. 30, 1918; 4 p.)

116—CHARGING AND SAMPLING—Short Description of the Method of Discharging and Sampling Ore Received, at the Sulphide Corporation Limited Works, Cockle Creek, N. S. W. Thomas Lawrie. (Proc. Austral. Inst. M. E., Sept. 30, 1918; 24 pp., illus.)

117—ELECTRIC FURNACE—Experimental Electric Furnace S. R. Mitchell. (Proc. Austral. Inst. M. E., Sept. 30, 1918; 5 pp., illus.) Describes furnace used satisfactorily for melting gold-bearing material.

118—NEVADA—The Divide District. Frank L. Sizer. (Min. and Sci. Press, May 10, 1919; 4 pp., illus.) 20c.

119—PRODUCTION—The Position of Gold. H. N. Lawrie. (Eng. and Min. Journ., June 7, 1919; 43 pp., illus.) Revised notes of an address before the Internat. Mining Convention, Mar. 18, 1919; illustrated by interesting charts. 20c.

120—UNITED STATES ASSAY OFFICE. The. (Eng. and Min. Journ., June 7, 1919; 1 p.) Notes on procedure at U. S. Assay Office at New York and data regarding Mint charges for melting, etc. 20c.

IRON AND STEEL METALLURGY

121—ANALYSIS—The Estimation of Phosphorus in the Presence of Tungsten. (G. Watson Gray and James Smith. (Advance copy, Iron and Steel Inst., May, 1919; 3 pp.)

122—BLAST FURNACES—Charging Raw Material into Blast Furnaces. J. A. Mohr. (Iron Age, May 29, 1919; 33 pp.) 20c.

123—CHROMIUM in Steel. G. L. Kelley and W. C. Wright. (Iron Age, June 5, 1919; 1 p.) 20c.

124—CORROSION—Metallic Coatings for Rust-Proofing Iron and Steel. Henry S. Rawdon, M. A. Grossman, A. N. Finn. (Chem. and Met. Eng., May 1, 15, and June 1, 1919; 15 pp.)

125—GRAY IRON—Improving the Quality of Gray Iron by the Electric Furnace. George K. Elliott. (Advance copy, Am. Electrochem. Soc., Apr. 5, 1919; 64 pp.)

126—HARDENING—Shimer Case-hardening Process. Joseph W. Richards. (Bull. A. I. M. E., Feb., 1919; 24 pp.) 40c.

127—HEAT TREATMENT—Fundamental Principles To Be Considered in the Heat Treatment of Steel. R. A. Hayward. (Chem. and Met. Eng., May 15, 1919; 4 pp.)

128—LIME—Deoxidation, and the Influence of Lime on Equilibrium in the Acid Open-Hearth Furnace. B. Yaneske. (Advance copy, Iron and Steel Inst., May, 1919; 16 pp.)

129—MANGANESE ALLOYS—Use of Manganese Alloys in Open-hearth Practice. (Bull. A. I. M. E., Apr. 1919; 7 pp.) Discussion of paper by S. L. Hoyt, previously indexed.

130—MODERN STEEL METALLURGY. (Calculation and Comparison of Processes.) Chas. H. F. Bagley. (Advance copy, Iron and Steel Inst., May, 1919; 483 pp.)

131—WELDING—Path of Rupture in Steel Fusion Welds. S. W. Miller; also discussion. (Bull. A. I. M. E., Feb. and Apr., 1919; 30 pp., illus.) 40c.

LEAD AND ZINC

132—ASSAY OFFICE—A Brief Description of the New Assay Office at the Sulphide Corporation Limited Works, Cockle Creek, N. S. W. E. Strangway-Jones. (Austral. Inst. M. E., Sept. 30, 1918; 1 p., illus.)

133—AUSTRALIA—Sulphide Corporation Limited Works, Cockle Creek, N. S. W. (Proc. Austral. Inst. M. E., Sept. 30, 1918; 2 pp., illus.) Brief notes, introductory to a series of articles on various parts of the works, which are separately indexed.

134—BELGIUM—The Zinc Industry of Belgium. (Min. Journ., May 17, 1919; 1 p.) 40c.

135—CHARGING AND SAMPLING—Short Description of the Method of Discharging and Sampling Ore Received, at the Sulphide Corporation Limited Works, Cockle Creek, N. S. W. Thomas Lawrie. (Proc. Austral. Inst. M. E., Sept. 30, 1918; 23 pp., illus.)

136—GALLIUM AND GERMANIUM. The Extraction of, from Zinc Oxide. H. C. Fogg and C. James. (Journ. Am. Chem. Soc., June, 1919; 24 pp.)

137—HUNTINGTON-HEBERLEIN PROCESS—Description of the Floating Sulphide Ore by the Huntington-Heberlein Process, at the Sulphide Corporation Limited Works, Cockle Creek, N. S. W. By W. J. Jackson. (Proc. Austral. Inst. M. E., Sept. 30, 1918; 4 pp., illus.)

138—REFINERY—Description of Lead Refinery at the Sulphide Corporation Limited Works, Cockle Creek, N. S. W. By R. E. Cowles. (Proc. Austral. Inst. M. E., Sept. 30, 1918; 62 pp., illus.)

139—STATISTICS—Spelter Statistics for 1918. W. R. Ingalls. (Eng. and Min. Journ., May 31, 1919; 44 pp.) Production; imports and exports; list of smelters; market review, etc. 20c.

140—ZINC OXIDE—The Manufacture of Zinc Oxide. (Chem. Eng. and Min. Rev., Apr. 5, 1919; 14 pp.) Description of plant installed by Broken Hill Associated Smelters Proprietary, Ltd. Port Pirie. 40c.

OTHER METALS

141—ALUMINUM—The Micrography of Aluminum and Its Alloys. D. Hamon. (Advance copy, Inst. of Metals, Mar. 26, 1919; 134 pp., illus.)

142—ANTIMONY in 1917. Edson S. Bastin. (Mineral Resources of the U. S., 1917—Part I; 11 pp.)

Number 2

Mexico and Proposed Propaganda

IN RECENT news reports it is said that attempts are to be made to purchase the support of American newspapers for spreading Mexican propaganda in connection with a defence of Mexican policy toward American oil operators issued by General Candido Aguilar, son-in-law of President Carranza. It is a poor governmental policy which will not stand on its own legs and which requires the crutches of "propaganda" to enable it to limp along. Why is it that the real merit of a policy is not its best support? If the policy is fair, and if there exists confidence that it will be carried out substantially as it is stated, no propaganda should be required. The fact that propaganda should be thought necessary under the circumstances in itself arouses suspicion that there are defects either in the policy or in the way in which it is to be effectuated.

American oil operators and mining men ask few things from Mexico. Security of life and property, protection of titles, and the assurance that company operations can go on without onerous and unfair restrictions are necessary to promote continuity of work and to make the enterprises sufficiently remunerative to attract outside capital. In respect to taxes, all that is demanded is a square deal.

Non-fulfillment of these important conditions cannot be covered up by propaganda, however expensive or extensive that may be. Fulfillment of them will make unnecessary such a detestable method of evading direct issues. We want friendly and cordial relations with Mexico. American mining men have done their part, and require of Mexico only that she stabilizes conditions in a broad and equitable spirit.

There are important natural resources in Mexico. Their development will provide work and opportunity for the Mexican population as well as increasing the prosperity of that country as a whole. Without the assistance of foreign capital and the leadership of experienced technical men a long time must supervene before Mexico can come into its own. There is a mutuality of interest here which is the part of governmental acumen to recognize. Without an equitable division of the proceeds of enterprise there is little incentive for foreign capital to enter any country. A state of continual disorder and brigandage is also equally vexatious and embarrassing to the government as well as to private enterprise.

Great courage has been shown by American mining men and oil operators in continuing operations in the face of danger and under trying experiences. How long are such conditions to continue? The answer to this question can be made in part by Mexico doing her share and, in part, by our own State Department insisting that Americans and American interests are accorded the treatment that foreigners should receive in any civilized country.

The Latest Transatlantic Flight

THE first dirigible to cross the Atlantic, the giant British R-34, arrived safely at Roosevelt Field, Long Island, Sunday, July 6, 1919, bearing a message from the King of England to the President of the United States. The craft was in the air 108 hours and 12 minutes, and covered a distance of 3,599 miles. It carried a crew of thirty officers and men. Major G. H. Scott, commander; Major Cook, navigator, and Lieutenant Harris, meteorological officer, gathered data relating to problems of aerial navigation, which further enrich the fund of knowledge already accumulated.

The distinguishing feature of this successful exploit is that the R-34 is the first lighter-than-air machine to cross the Atlantic. All previous attempts were with heavier-than-air types. The special advantages of each type, and which design will be adopted finally for commercial purposes, are for the future to determine. However, all recent attempts to cross the Atlantic in plane and dirigible add to the sum total of human knowledge of the art, and bring nearer the era of practicability of transoceanic flight.

This recent achievement of the engineer should prove a great boon to mankind, as it offers to all the world the advantages of an intimacy heretofore unknown. The British are to be congratulated on this latest historic achievement.

Re-employment at Calumet & Hecla

LAST May the Calumet & Hecla Mining Co. announced simultaneously an increased reduction of its operations and a changed form of curtailment. For some time previous to the announcement the men had been employed on three-fourths time at a reduction from war wages, but the plan was not sufficient to accomplish the necessary reduction of output and expense, so that a 50 per cent curtailment was ordered, and the men retained were allowed to work full time.

There was ample reason for the change. There was little or no market for copper, the active and profitable war demand for the metal lapsed with the signing of the armistice, and the accumulation of stocks, which were produced in many instances at costs higher than the selling price of that date, continued to grow. Up to that time, the companies had maintained their production, not because it was to their advantage to do so, but to aid constructively in the solving of a difficult labor situation.

There can be little doubt as to the magnanimity of this policy. Obviously, the greatest return for the company during that period could have been obtained by a drastic curtailment immediately following the declaration of the armistice. The plan followed, however, is indicative of the far-seeing vision of the Calumet & Hecla management, and it is such policies as these that

greatly aid in the stabilization of industry and the prevention of labor unrest.

The announcement made on July 7 by the Calumet & Hecla and subsidiary mines to the effect that all underground men are to be re-employed is indeed welcome news, not only in the local field but to the copper industry at large. The additional labor may produce no immediate effect in the amount of copper produced, and aside from the present possible anticipation of an immediate increase in the price and sales of the metal, there is now assurance that underground development work is to continue apace. Production during the war years proceeded at high speed, and in many cases little attempt was made toward the development of future supplies of copper. With the cessation of a pressing demand for the metal and the accumulation of stocks, the copper industry may be considered to be facing a breathing spell, and the news that this interim is to be used for the development of future resources is of significant interest.

Development in

Dressing Tin Ores

IT WOULD seem, in view of the long time during which tin ores have been successfully treated in Cornwall, that there could be little room for improvement either in appliances or in the method of using them. The exceeding fine state of subdivision of the cassiterite has made it obligatory upon the tin-mining industry to perfect methods for the separation of the cassiterite from the slimes. This has been the real problem, as the coarser particles of the mineral admit of ready and clean separation from the gangue.

Modern research does not accept prevailing practice unless experimental verification has shown justification for it. Undertaken in this spirit, there is much that can be done in determining the best procedure to be followed in any one case, and there are few instances where improvement cannot be made. In a series of papers presented before the Institution of Mining and Metallurgy, Professor S. J. Truscott has given the results of investigations made by him in collaboration with J. H. Goodchild, K. S. Low, and H. L. Burnie upon the treatment of slimes on Cornish frames. It is reasonable to assume that the limitations of this simple device had been determined long ago, but Mr. Truscott and his collaborators have shown that radical improvements are possible and that better results can be achieved.

The nature of the surface of the frame, its length and inclination, as well as washing, rate of feed, consistency and duration of feed, have been subjected to exhaustive investigation. The value of re-grinding not only the middling product but also the sand product, which has been allowed to go to waste, has been demonstrated. Tailing losses have been due not so much to excessive comminution as to the excessive state of subdivision of the cassiterite. If higher recoveries are to be made, the re-grinding of the sand has been shown to be essential.

The rapid enrichment of the slime by the use of the simple frame, improved as shown by the experiments, removes the danger of greater tailing losses on account of the finer grinding. Higher recoveries necessarily imply a corresponding increase in the proportion of liberated grains. In this respect the tin ores present a problem of greater difficulty than is met in other ores

where the mineral grains are of larger size and the fine grinding is of lesser degree. The results of the investigation as a whole are of importance to the tin industry, as well as marking an advance in improving some of the simpler methods of treating slime, and commendation is due Mr. Truscott and his collaborators for their thorough work.

The Situation In Butte

BUTTE is again afflicted with labor troubles. The desire to strike is apparently like an intermittent fever, which comes and goes with the changing condition of the patient. No longer ago than February mining was practically suspended in the district for a short time, following a wage reduction at the Great Falls and Anaconda smelters. Now again a strike is pending, some of the men having already gone out.

On Sunday last, the downtown pay office of the Anaconda company was dynamited, supposedly by a fanatic. Whatever the justice of their cause, violence will do the workmen little good. Nothing can be gained thereby that cannot be had by peaceful conference. Whether the deed of an individual or not, a criminal act will inevitably be charged against unions in general by the public. The organization in Butte will do well to help rid the district of such radicals.

A Brighter Future For Zinc

TO MAINTAIN an industry—for example, the zinc industry—the demand for the product must be maintained under price conditions that permit the producer to make a fair profit. Maintaining demand for a product means convincing the consumers that they need the product, and can use it to their advantage. If customary uses for the metal are insufficient to sustain the demand, new uses must be found, and consumers must be educated to appreciate the advantages of these new uses.

A campaign to educate consumers to new uses for zinc should be founded on scientific study, research, experiment, and demonstration, followed by advertising. This is one of the constructive ideas expressed by Pope Yeatman in his address before the American Zinc Institute of St. Louis on June 9, published on page 19 in the last issue of the *Journal*. Mr. Yeatman points out the development of the spirit of helpful co-operation among zinc producers and a better understanding between miners and smelters.

The conversion of a blind feeling of antagonism into a mutual desire to serve has never failed to produce good results. Perhaps here is a lesson for other ill-advised opposing interests in industry.

Colombia To Get \$25,000,000

THE Foreign Relations Committee has reported, or is about to report, a new treaty giving to Colombia \$25,000,000, but making no apology for the assistance given Panama 16 years ago. There is a strong probability that this treaty will be ratified and its terms carried out. The payment of this sum has been recommended by two Presidents of the United States, and probably it would have been made long ago had it not been for the strenuous opposition of Theodore Roose-

velt. Ex-President Roosevelt remembered well the reasons for the failure of Colombia to ratify an earlier treaty and felt strongly that the United States had not only acted legally but justly, and he naturally opposed what would appear to be a reflection on his administration.

The question of who was right or who was wrong will probably not be discussed at length on this occasion. Sentiment seems to be in favor of the payment being made, and we trust that the money will be accepted in as good a spirit as it is tendered. If the funds are used, as has been intended, for internal improvements, and if they will heal a wound that many Colombians have felt was unjustly inflicted, we need not regret the manner of closing the incident.

Perhaps a more intimate acquaintance between Colombia and the United States may develop from this settlement. There is reason for such acquaintance to grow. Colombia needs much that we can supply in the way of manufactured articles, and she has natural resources with which to pay for what we can send her. Her chocolate, beans, and coffee are of the finest quality, but what is of more interest to the miner is that her mineral resources are extensive and of considerable importance.

Looking back over the statistics of mineral production it will be seen that there was a time not so long ago when Colombia had more gold credited to her than had the United States. Her rivers and streams have produced a large quantity of platinum. Her silver production has been large, and she is now practically the only producer of emeralds in the world. On account of inadequate means of transportation, and lack of fuel development, the base metals of Colombia have attracted little attention.

For the immediate future gold, silver, and platinum mining offer more attractive opportunities than other metals, and we believe that Colombia will not go unanswered if she applies to the miners of the United States for assistance in the development of these precious metals.

From time to time in the past we have published descriptions of mining districts in Colombia, and our readers will find in the files of the *Journal* an immense amount of information respecting this fascinating country. Though we have published much, there are many attractive areas of which nothing or but little has been written, areas that are well worth the serious attention of the mining industry, and we believe, as the years go by, and our miners come to know Colombia better, that they will find it an extremely interesting and profitable country in which to operate.

Too Much Legislation

ON PAGE 49 in this issue our Denver correspondent discusses the Engineers' License Bill, recently passed by the Legislature of Colorado. This bill requires that all engineers practicing in the State of Colorado must take out a license before they can legally undertake any engineering work. As our correspondent points out, the conditions under which a mining or other engineer is employed are markedly different from those of the physician. Consulting mining engineers may be called by their clients to undertake examinations and investigations in any part of the United States or in foreign countries. In the course of a year a mining engineer might visit a dozen states

and several foreign countries. Can anyone imagine a more exasperating condition than for such an engineer to be compelled to take out a license in every state which he may enter in the course of his activities?

Most mining engineers engaged in consulting practice have their offices in large cities where they can be conveniently reached by their clients. If other states follow Colorado in the enactment of such legislation, an engineer with a large practice would be compelled to take out licenses in those states where his business centers. We hope that no other state will be so short-sighted as to emulate the example set by Colorado. The motive back of this law is clearly an attempt to monopolize local engineering practice, for the aggregate revenue to be derived from the operation of such a law will be pitifully small compared with the loss in prestige of the state enforcing it. Colorado mining interests require and should receive protection from unwise legislation of this kind.

The Geologist and Prospecting

THE location of mineral deposits at grass roots must grow more infrequent from year to year, especially in those areas that have become the home or hunting ground of intelligent men. Much virgin territory remains, and it will be many generations before the most distant has been prospected. But it is not upon these distant localities that our industries must depend. Manufacturing industries do not quickly follow to the source of raw supplies. Supplies must be brought to industrial centers, and the nearer those supplies are to the industrial centers already built the more valuable do they become. Naturally, supplies close at hand will be the first to be exhausted, and gradually the manufacturer draws from known sources farther and farther away, until the expense of transportation becomes so great as to threaten the industry. It is at this stage that the prospector loses his importance, and the economic geologist has an opportunity to exhibit his skill. With all visible ore exhausted, it is no longer a question of following stringers and indications to other veins or bodies of mineral, searching with small deposits as a guide to larger ones, but is a matter requiring an intimate knowledge of ore deposits and the formations in which they occur.

The surface of the earth, that portion of it which a prospector may examine with care, is a very limited portion of the whole. The surface of the earth as known to the geologist, or that portion respecting which he has considerable knowledge, may extend from daylight to several miles in depth, certainly far beyond human means of penetrating with shafts or boreholes.

It is in the study of these buried formations and the minerals that they contain that the geologist becomes especially useful to industry. The geologist is not infallible, he is not working with an exact science, or not with one whose factors are all known. The most that he can do is to guide, to reduce the amount of useless risk and increase the amount of profitable work.

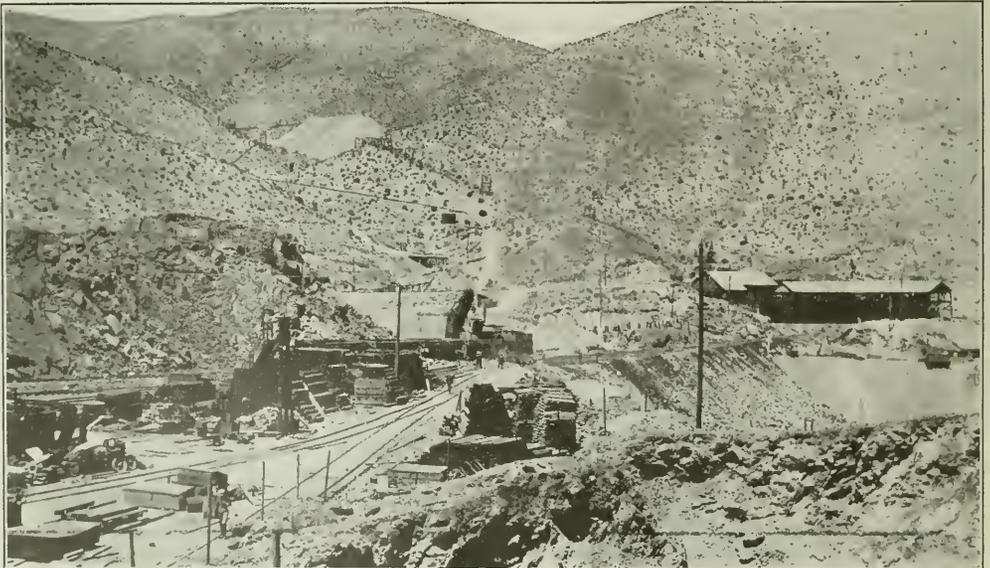

Not only in oil but in the mining of almost every mineral of economic importance geological knowledge may be used to advantage. Our mining schools of the future will probably spend as much time in teaching how to use geological knowledge as they spend in teaching pure science, and as we now have mining, metallurgical, and chemical engineers, our colleges will soon be graduating geological engineers.

Electric Blasting Equipment

Dependability and Conditions Under Which Electric Detonating Caps Can Best Be Used—
Methods of Testing—Advantages in the Use
Of the Ohm-Meter

BY L. D. ROWELL

Captain of Engineers, Washington, D. C.

THE experience of the Army in the recent European War brought out certain weaknesses and faults in the equipment used in electric blasting, and led to the development of apparatus which, it is hoped, will find a permanent place in the commercial field. It is not the purpose of this article to discuss the method of setting off blasts in general, but to present certain features of the problem as it affects general practice in the use of electricity for the detonation of explosives.

The standard electric caps manufactured in this country are thoroughly dependable if handled with intelligence, and, when one considers their construction, their uniformity is remarkable. The "bridge" of an electric cap is a piece of high-resistance alloy not over $\frac{1}{4}$ -in. long, and so fine that it can hardly be seen with the naked eye. The resistance of this bridge is about one ohm. It is soldered to the ends of the copper wires which are sealed into the cap and serve to connect it in the circuit. To fire the cap, the bridge must be heated by a current of electricity to the temperature necessary to start detonation of the fulminate, which is materially less than that required to fuse the wire of the bridge. A current of 0.4 amp. will fire some caps, and 0.5 amp. may be depended upon to fire any single cap. The time required to produce detonation, however, varies from 0.05 sec. to 0.2 sec., even with caps of the same resistance, and may vary considerably more. This fact is of the utmost importance in electric blasting, as will be shown later.

The variation in time required for detonation at low current strengths is not due to avoidable variations in manufacture. It is probably dependent on the amount of solder at the joints where the bridge wire is soldered to the leading-in wires, to the character of the joint, and to the closeness of contact between the bridge wire and the fulminate paste which surrounds it. There is no way of testing for variations of this kind, other than by exploding the cap, and the whole structure is so minute that no inspection could possibly detect it. It does not detract in the slightest from the dependability of the cap, provided the condition is clearly understood and proper precautions are taken to insure the necessary current in firing. Unless the caps have been injured by storage in too hot a temperature, failures may always be charged to a faulty circuit or too low current strengths when firing.

The effect of time variation at low currents is seen only when two or more caps are connected in series. If a current of one-half ampere be used, and two caps be connected in series, it is probable that one of the caps will fire and open the circuit before the other has reached the firing temperature, and if a circuit of 20 or 30 caps be connected up, a current of one-half ampere may fire only a few caps for this reason, even though the same current, if continued, would have fired all of them. The conclusion that the unexploded caps are faulty is entirely

wrong, and is based on a lack of knowledge of the true conditions.

The difficulty presented by this time variation can be overcome only by using a current so high that the slowest cap in the circuit will be raised to the firing temperature before the quickest cap explodes and opens the circuit. A time interval elapses between the raising of the bridge wire to the firing temperature and the explosion, probably due to the transfer of the necessary heat from the wire to the fulminate. While this is taking place in the "quickest" cap, the current must be high enough so that the bridge of the "slowest" cap reaches firing temperature. The explosion of the first cap, and consequent interruption of current, will then not interfere with the firing of the second, as the heat transfer, which takes place in a few hundredths of a second, can proceed after the current has been interrupted.

So far as I know, no accurate determination has ever been made of the magnitude of the current required to ignite a number of caps. Experiments by Captain Ralph W. Crocker, Chemical Warfare Service, at the Pittsburgh Laboratories of the Bureau of Mines, show an increase of 20 per cent in the current necessary to fire two caps in series, one of which was 10 per cent high in resistance and one 10 per cent low. An increase of 8 per cent in current over that for single caps was found necessary where two caps of the same resistance were connected in series.

From results secured in the testing of blasting machines, I believe one ampere may be accepted as a safe current to insure the detonation of all caps in series. As the heating varies as the square of the current, this represents four times the heating rate required for single caps. The bridge wire fuses before explosion of the cap at a current of about 2.5 amps., and this value forms the basis of the specifications adopted by the Corps of Engineers, U. S. Army, for electric exploders.

TESTING BLASTING MACHINES

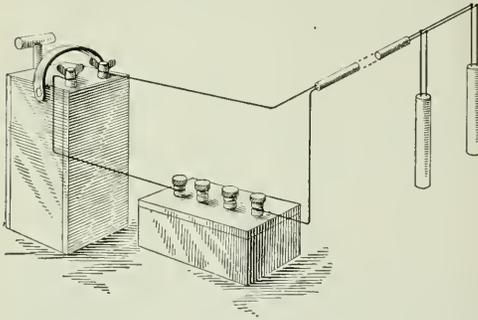

The considerations mentioned are of the utmost importance in the testing of electric blasting machines. It is customary to test the machines by the use of a rheostat (which takes the place of a stated number of caps in the circuit), with a single cap connected in series with it. Such a test, however, may give erroneous results, for the reasons already stated; that is, the current necessary to fire a series of caps is always higher than that which will always fire a single cap. To remedy this, and provide the necessary factor of safety, the resistance of the rheostat is made two or three times that of the caps which it replaces, but this may not give the desired results, as will be shown.

The type of blasting machine in most common use delivers an initial current which is determined by the windings of the machine, and is independent of the number of caps in the circuit. Now, if such a machine

is designed to deliver an initial current of one-half ampere or slightly higher, it will pass a splendid rheostat test, but it will not fire a series of caps with any degree of certainty. The effect of added resistance in the circuit is to produce a more rapid falling off of current, so that a machine designed to deliver an initial current of five amperes may fail on the same rheostat test, and still be a dependable machine, up to its rating, though the first machine is not dependable at any rating. Making the rheostat resistance double that of the caps in the contingency suggested has not provided the necessary factor of safety. It can also be shown that, with the five-ampere machine, doubling the resistance and using a single cap may not provide a true indication of the machine's capacity.

RHEOSTAT TEST

The best rheostat test is to connect two caps in parallel, as shown in the figure. If they both fire, the test shows that sufficient current is delivered to insure the firing of all the caps in a series circuit. The factor of safety in such a test conforms to actual working conditions, and though a difference in the resistance of the two caps may permit the explosion of both caps on less than one ampere, my experience warrants the belief that this is a reliable test for capacity. In making this test, be careful to place the caps so that one can-

METHOD OF TESTING BLASTING MACHINE

not detonate the other. The rheostat in this case should be equivalent to the actual resistance of the caps which it replaces in the circuit.

The average resistance of a Du Pont cap with 10-ft. leads is 1.3 ohms, and if 1.5 ohms per cap is used in the rheostat it allows for the resistance of the cap and connections, when properly made. Duplex firing wire has a resistance of one-half ohm per 100 ft., or 300 ft. is equivalent to one cap. Allowance for this should be made in calculating the number of caps in the circuit. Thus, 25 caps connected up through 1200 ft. of duplex firing wire would be equivalent to 29 caps. The Du Pont rheostats have a resistance of about 3.2 ohms per cap; when used as described above, with two caps in parallel, their rating may be increased in the ratio of 2 to 1. Thus a machine which fires two caps in parallel through the 25-cap step of a Du Pont rheostat would have a capacity of 50 caps.

The blasting machines in common use are frequently referred to as magnetos, or magneto exploders. This is a misnomer, and the term should not be used, inasmuch as it conveys a wrong impression as to the nature of the machine. These machines are electric generators

of the series type; that is, the field windings are in series with the cap circuit. When such a machine is operated with no connected circuit, severe insulation strains are produced, and in the larger capacities this becomes a vital defect. The shunt machines, however, in which the field windings are connected in parallel with the cap circuit, do not have this objectionable feature, and they may be designed for larger capacities than is practical in the series machine. The Du Pont No. 6 is an example of this type.

By the use of small, enclosed-frame machines, with impregnated windings, exploders having considerably greater capacities than those in present use have been built and tested. Machines having the size and weight of a 30-cap exploder have a capacity of 120 to 150 caps, and a machine having a capacity of 500 caps weighs not over 35 lb. and is entirely practical. These machines represent a development in advance of any of the earlier machines, and indicate the possibilities in this field.

Testing of the electric-cap circuit is usually of the crudest sort, consisting of a test for continuity made with a "circuit detector," which is some form of galvanometer, with a self-contained silver chloride cell. This type of cell is used because its potential is so low that it does not give enough current to explode the cap, and also because of its supposed permanency. This latter quality, however, is questionable, and there is nothing more undependable than a cheap circuit detector equipped with a silver chloride cell.

The best instrument of this type is a well made, pivoted galvanometer, with a graduated scale. With a good cell, and careful usage, such an instrument serves the purpose of tests for continuity of the circuit, and gives a rough indication of the number of caps. Instruments of the annunciator type, which merely show whether the circuit is open or closed, are not recommended.

For military operations, and for commercial work where it is important that there shall be no failures in the explosion, especially in cases where the cap circuit is connected up for some time before being detonated, it is highly desirable to make more thorough tests than those above indicated. For this work an extremely rugged, portable ohm-meter has been developed, by means of which the resistance of the circuit can be instantly measured, with an accuracy sufficient to detect the shorting-out of a single cap. With it, tests for opens, short-circuits and grounds can be made readily. As it uses an ordinary flash-light cell, which is easily renewable, it is not subject to the uncertainty of instruments using silver chloride cells. Protection against currents high enough to explode the caps is secured by a resistance combination, and the sensitiveness of the instrument is such that the actual current used is less than that of the ordinary circuit detector, being limited to 2 per cent of that required to explode the cap. With such an instrument, the condition of the cap circuit may be fully determined at any time, and the development of trouble at once detected.

Exports of Graphite from Madagascar during the first nine months of 1918 amounted to 15,914 metric tons, according to a recent consular report. The figure for the corresponding period of 1917 is not at hand, but, during the whole of that year, exports amounted to 27,838 metric tons.

Blast-Furnace Explosions

A Disastrous Accident Occurred When the Blowing Engine Was Shut Down, Probably Due To Leaky Jacket Permitting Contact of Water and Hot Coke, and Consequent Generation of Water Gas

By B. B. HOOD

Assistant to Superintendent, Chrome Plant, United States Metals Refining Co.

IN SHUTTING down a copper blast furnace precautions must be taken to avoid accidents. These precautions should, among other things, guard against the gas generated in the furnace getting back into confined spaces, where it might explode and cause damage. Several years ago at the Chrome, N. J., plant of the United States Metals Refining Co. a serious explosion took place, an account of which may be of value in helping someone to protect his plant against a similar calamity.

operations the valve at the end of the blast pipe was closed and the two valves on the branch pipes were open.

The blowing machinery consisted of a No. 9 Roots blower, directly connected to a reciprocating steam engine. An auxiliary motor-driven No. 6 Roots blower of much smaller capacity was also connected to the air pipe. The power house building is 52 by 126 ft. in size, of brick construction, and houses, besides the two blowers mentioned, a converter-blowing engine and two high-pressure air compressors. All of these engines

WRECK OF ENGINE ROOM CAUSED BY EXPLOSION OF GAS IN AIR-BLAST PIPE

The equipment consisted of two blast furnaces, 44 by 186 in. An air pipe, 32 in. in diameter and about 300 ft. long, connected the two furnaces with the blowing machinery. This air pipe, as it entered the smeltery building, branched to each furnace and was fitted at the end with a gate valve. The two branch pipes to the furnaces were each fitted with valves, one being a butterfly and the other a gate valve. Under normal

were furnished with steam from a boiler plant 150 ft. distant.

The blast-furnace blowing engine was to be shut down in order to repair the crosshead and connecting rod, which would take about ten minutes. The motor-driven blower was not running, nor was it started up. The smeltery was notified that it was desirable to shut this engine down, and the management put the furnaces in

first-class condition and reported back to the engine room force that everything was arranged for the short shutdown. The blower was then stopped. The furnaces still contained their usual charges, and precaution was taken to remove about one-third of the tuyere blocks on each furnace. The two valves on the branch air lines were not closed. This operation had been performed many times before, both with the branch line valves closed and with the valves open.

another piece went through a 12-in. brick wall. All of the window sashes and frames and door frames were completely wrecked. The roof of the building was made of tile, and large parts of it had to be replaced, as the tile seems to have been lifted up from the purlins and then dropped back into place again. Flying pieces of metal broke the main steam lines, and the building rapidly filled with steam. The men groped their way out, some of them hardly knowing how they arrived outside of the building. Aside from a few bruises and the general scare, the men were none the worse for their experience.

The engine driving the large Roots blower was thrown out of line to some extent, but otherwise not damaged. The valve mechanism of the converter-blowing engine was partly wrecked, but the two high-pressure air compressors escaped with little injury. The 32-in. air line had a "T" connection just outside of the engine room, one end of which was covered by a blank flange $\frac{1}{16}$ in. in thickness. This was blown off, striking a steel tank 4 ft. in diameter and 10 ft. high and knocking it over. One of the 3-in. bolts was hurled a distance of about 100 ft. through an erecting shop and through a window of a machine shop, barely missing a machinist's head, and burying itself in the opposite wall. The gate valve at the smeltery end of the 32-in. blast pipe consisted of a slide $\frac{1}{4}$ in. thick, and was not even bent. In fact, those in the smeltery hardly realized that an explosion had taken place.

As stated before, the practice of shutting down the blowing engine for a short period was not a new one, and why an explosion took place at this particular time is not absolutely certain, but the following is what probably happened:

One of the jackets of one of the furnaces leaked rather badly. The water, upon meeting the hot coke, undoubtedly generated water gas in sufficiently large quantities to force its way back into the blast pipe. This took place until the pipe was practically filled completely back to the engine room, and then, for some reason or other, it was ignited, causing the slight puff which had rattled the safety valves near the blowers. The mixture in the pipe, however, was too rich to explode, but a flame gradually burned its way back along the pipe until it neared the power-house end of the gas column, where undoubtedly air was mixed with the gas, forming an explosive compound. This was ignited, causing the explosion close to the boilers themselves. There was absolutely nothing in the power house to ignite the gases.

The smelting plant was in operation again in three weeks, during which time a No. 11 Roots blower weighing about 67 tons was taken from a similar plant near Salt Lake, Utah, shipped east by express and installed. No other blower of similar capacity could be obtained in less than two or three months' time. New air-pipe connections were made, the blower engine was relined, the foundations were enlarged to suit the larger blower, and the two blast furnaces were practically rebuilt, as they were in need of extensive repairs. The repairing of the damage done by this explosion might properly be listed among the historical quick repairs.

The total cost of the explosion is not represented entirely by the repair costs; the lost production which might have been made in that time must be considered.

To protect the plant against explosions of this nature in the future there have been installed upon the main blast pipe seven ventilating doors (Fig. 1). These are

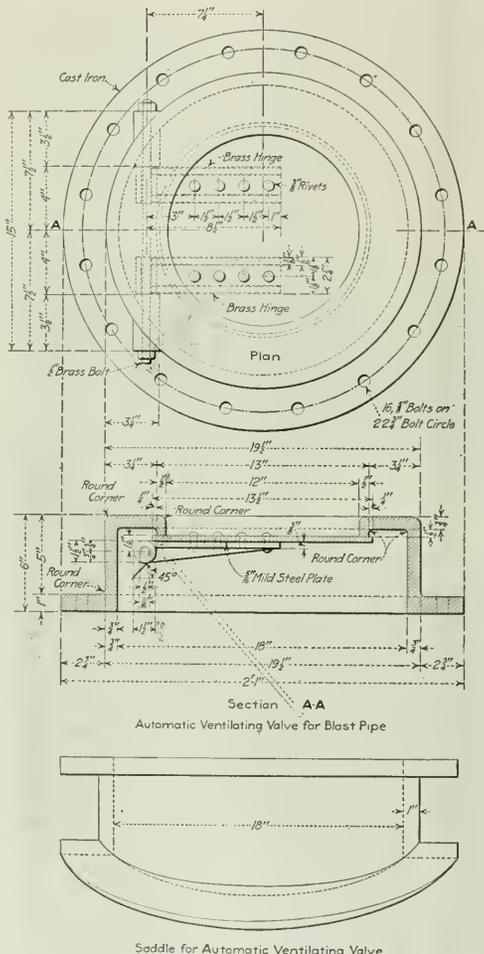

FIG. 1. DETAILS OF VENTILATING DOOR

Approximately four minutes after shutting the engine down a slight explosion took place, which rattled the safety valve mechanism in the power plant. About a minute after that a terrific explosion followed. There were five men in the building at the time of the explosion, and that no one was killed is a miracle. The two Roots blowers were completely wrecked, as indicated by the photograph, and pieces of them weighing from 200 to 300 lb. were scattered from one end of the building to the other. One piece went through the roof;

nothing more than check valves 12 in. in diameter, and are situated along the top of the blast pipe. They automatically open to the atmosphere when the pressure inside of the pipe is taken off. The air volume is such that they automatically close themselves when the blowing engine is started up. The purpose in installing these valves is to allow the gas, when produced, to find its way out to the atmosphere before collecting in large enough quantities to do damage. Care is also exercised to see that valves on the branch blast pipe lines at the furnaces are closed when the blast is taken off.

Engineers' License Bill

Act Passed by Colorado Legislature Providing for Licensing of Engineers Takes Majority Of Engineers by Surprise

DENVER CORRESPONDENCE

ENGINEERS who intend to engage in professional work in Colorado will be interested in the Engineers' License Bill. When Senate Bill 339, introduced by Senator Knaus and Mr. Finley, providing for a State Board of Engineer Examiners and the licensing of engineers in the State of Colorado, became a law, fully 90 per cent of the practicing engineers of the state were surprised. Most of them had never heard of the bill. A few who were in touch with activities in the Legislature knew that such a bill had been offered, but they regarded it as freak legislation and assumed that it would in all probability expire without receiving serious consideration. However, before the majority of the engineers who were to be affected by the measure had become familiar with it, the bill was passed.

Supporters of the bill claim that the licensing of engineers is a desirable reform measure to protect the public against incompetent advice, and at the same time to reduce competition among engineers. These supporters of the measure, representing a small percentage of the practicing engineers of the state, regard the licensing of engineers as similar to the licensing of physicians. This view indicates that they fail to appreciate that the services rendered by physicians and engineers are far from parallel in most respects.

Whenever a man engages the services of a physician with whom he is unacquainted, it is because an emergency exists and human life may be endangered by delay. It is proper that the law should provide for such cases, as well as it can, by insisting that a practicing physician give evidence of certain ability. On the other hand, when a man desires engineering advice, no such emergency exists as in a case requiring the immediate services of a physician or surgeon. A client rarely engages an engineer with whom he is unacquainted, or who has not been satisfactorily introduced and recommended. Engineers are not selected hastily from the lists in business and telephone directories. Competent practicing engineers receive their appointments through the recommendation of satisfied clients; they fear no competition from incompetent or inexperienced members of the profession, nor is the public safety ever endangered through their work.

There are serious and well-founded objections to the bill from the point of view of all engineers who reside outside the state. Under the law, all consulting engineers, including those engaged in the investigation of

mining and metallurgical projects and those who may be directly or indirectly instrumental in bringing outside capital into the State of Colorado for its industrial development, may be subjected to the irritation and delay incident to making application for a license and passing an examination before they may proceed.

Regardless of the high personal qualifications which individual members of the Board of Engineer Examiners may have, such a board will be utterly incompetent to pass upon the ability of a certain engineer to render certain specific service to his client. As a rule, the client will have no interest whatever in the opinion of the examining board, because confidence in his engineer may have been firmly established by previous service or satisfactory recommendation. In instances of this character, which represent a large percentage of all those coming under the law, the examining board will serve no useful purpose, but the operation of the law will make Colorado unpopular with engineers and hamper development with red tape.

The law provides that the Examining Board shall admit to examination any candidate who pays a fee of \$10 and submits evidence, verified by oath and satisfactory to the board, that he is a citizen of the United States and is more than 25 years of age; that he is of good moral character; and that he has been actively engaged in the practice of engineering for at least six years, in the employ or under the supervision, direction, and tuition of one or more practicing engineers.

Each complete year as a student in an engineering school of recognized reputation, or employed in the military service of the United States or its Allies during the war, shall be credited as one year of practice. The candidate must show that, during two years of his period of six years of active practice, he has been in active, responsible charge of engineering work requiring the exercise of initiative, judgment, and independent decision. The Board of Examiners shall verify the statements of the applicant, so far as practicable, and shall mail to each licensed engineer and to each employer or reference given by the applicant a copy of the statement pertaining to his experience. In not less than 60 nor more than 120 days, the application for license shall be either approved or denied, and final action taken thereon.

The law provides the manner in which the examination of candidates shall be held. Upon the evidence of the official record that an applicant has successfully passed the examination, the Board of Examiners shall issue to him a license to practice engineering, upon the payment of an additional fee of \$5. This fee, added to the examination fee of \$10, makes the total cost of a license amount to \$15. This license may be renewed from year to year by paying an annual fee of \$5.

The following extract from the law is of interest: "Any person who, not being then lawfully authorized to practice engineering within this state, according to the provisions of this act, shall attempt to practice or shall so practice for hire, and any person who shall, in connection with his name, use any designation tending to imply that he is a licensed engineer, within the meaning of this act, and any person who shall violate any other provision of this act, shall be deemed guilty of a misdemeanor, and, upon conviction thereof, shall be punished by a fine of not more than \$500 or by imprisonment for not more than six months, or both.

Refining Flake Graphite for Crucible Use^{*}

The U. S. Bureau of Mines Investigates the Possibilities of Producing a Satisfactory Grade of Crucible Graphite From Alabama Flake Graphite—Intermountain Station Contributes Research Results

BY FREDERICK G. MOSES

FERGUSON¹ describes the requirements for crucible graphite as follows: "Graphite for the making of crucibles must be of great purity. Its content of graphite carbon should exceed 85 per cent and preferably should be as high as 90, and it must be practically free from mica, pyrite, and iron oxide. A small amount of quartz is not injurious. Graphite for making crucibles should also be coarse enough for the interlocking fragments to be bound by the clay with which it is mixed. It should contain a large percentage of flake about 1 m. in diameter and should all remain on a 100-mesh screen."

The concentrates produced in the Alabama district differ widely in their physical characteristics and graphitic content. Notwithstanding this fact, however, the physical properties of the different minerals composing the concentrates cannot, of course, vary greatly, and hence a scheme worked out for any one of the types can be applied, with only slight variations and adjustments, to the others. For this reason, and because of the numerous schemes tried in the limited time available for the investigations, it was impossible to do all of the work on all of them. It was decided, therefore, to select several of the most representative for investigation, and to determine the extent that the results obtained on the concentrates could be generalized and applied to all.

EXISTING REFINING METHODS

The present method of finishing the crude concentrate consists of, first, drying the concentrate from the previous process, grinding the dried material in a buhr mill, and "bolting" or screening the ground product to remove the impurities that have been crushed during the grinding operation. The theory of the process is that the graphite, being tougher, smoother, and thinner than the impurities that occur with it, will be rubbed and polished between the buhrstones, with a minimum reduction in size. The impurities, owing to their more brittle characteristics and more massive structure, will be ground between the stones to such an extent that they can be removed by screening over a suitable cloth.

It is readily understood that the theory of this process is simple, and in fact, within certain narrow limits and under favorable circumstances, the method will give good results. As a general rule, however, two difficulties are encountered that interfere with the commercial success of the operation. The first of these is the large proportion of the coarse and valuable flake that is often destroyed during the grinding. The second is lack of uniformity in the finished product. It is evident that the primary object of the present investigation is to determine the most efficient manner of ob-

taining the desired results and eliminating the troubles in the process mentioned above.

The first experiments were made to determine the possibility of separating the graphite and gangue material by differences in specific gravity and shape of the various particles. The apparatus first tried depends on the difference in specific gravity and the difference in shape of the various minerals to accomplish separation. This type of apparatus is already being used to a limited extent in Alabama, and is there known as an aspirator. The aspirator is fundamentally an air classifier. The name is appropriate, for the reason that the separation depends on the settling rate of the different minerals in a current of air.

The apparatus constructed for the experiments was closely similar to devices now used in the Alabama field. The material to be treated is fed from a hopper to a roller, from which it drops into the large end of a long, sloping, horizontally placed box. The roll feeder is arranged so as to feed the material in an even curtain across the whole opening. Leading from the small end of the box is a suction pipe equipped with a suction fan. The box is 13.5 in. wide by 12.5 in. high at the feed end, and 43.5 in. long. The suction pipe is 31 in. long and 4 in. in diameter.

Across the opening of the box and parallel to the ground line are four vanes or sand deflectors, placed at such an angle from the vertical that any material fed from the roller when the air current is not on will be deflected to the outside of the box.

The principle of operation of the aspirator is as follows: The graphite, being lighter in weight and of a flat shape, will, of course, be deflected further from the vertical by a horizontal current of air than the heavier and more massive sand particles. For this reason, the graphite will be carried further into the box than the heavier and more massive sand material, which will fall on the vanes and be thrown to the outside of the box.

The results obtained indicate that although some of the impurities can be removed with the aspirator, thereby materially raising the grade of the original material, the application of this type of machine will never be general.

It has been known for a long period that the coarse sand particles cause the greatest destruction of the large flake in the buhr mill. When the concentrates carry a large proportion of sand particles of such nature that the type of treatment described will raise the grade of the crude product to 70 per cent or better, there can be no question that the aspirator can be used to great advantage before treating the concentrates in the buhr mill. It is to be understood, however, that unless there is a comparatively large proportion of such impurities in the crude concentrate, the aspirator cannot be used to best advantage. The apparatus should certainly not be incorporated in a finishing mill except after thorough and comprehensive tests to determine

^{*}Abstracted from War-Minerals Investigation Series Bulletin 8, Bureau of Mines, Washington, D. C.

¹Ferguson, H. G., "Mineral Resources U. S., 1917," U. S. Geological Survey, 1918, p. 97.

the results that can be obtained by its use, and then only on the advice of a competent engineer conversant with the conditions that must be met by the installation.

TESTS WITH PNEUMATIC JIG

The pneumatic jig differs in construction from the aspirator, although the principles involved in the operation of each are similar. This equipment has been manufactured on a commercial scale for several years, and its use would be advantageous when feasible, as a more simple and standard layout could be arranged than where improvised equipment like that described was used. Both types would be simple to operate, the aspirator, however, being capable of more sensitive adjustment.

The jig used in the experimental graphite work was a small laboratory apparatus, built by the manufacturers of the standard machine, for laboratory experiments. It consists of a small metal box, the bottom of which is made of a screen 3.25 by 2.5 in. Air pressure of 2 to 4 oz., furnished by a pressure blower or compressor, is admitted to the bottom of the box under the screen through a small rapidly rotating valve. The rapid pulsation of the air, due to its passage through the valve, causes the material on the screen to remain in continuous agitation and suspension. Consequently, the coarse and heavy impurities collect at the bottom of the material on the screen, the lighter graphitic material being stratified above the sand. The jig is so arranged that the operation is continuous, the heavy sand impurities being constantly collected and discharged from one side, whereas the lighter graphite is separated above the sand and discharged from the top of the column and on the other side.

AIR JIG PRODUCES CLEAN TAILING

The field of application of the air jig is practically the same as that of the aspirator. The results indicate that the air jig can be made to produce a cleaner tailing than the aspirator, but that the aspirator will give a higher grade of finished product. This condition will not, however, interfere with the usefulness of the jig, provided the material removed from the crude concentrate by it is the coarse-sand particles that cause the high loss of coarse flake in the buhr mill. Inspection of the various products of the jig will indicate that it does remove the coarse-sand particles.

Many of the remarks regarding the use of the aspirator will apply also to the air jig. There is no question that under certain circumstances the jig can be made to do valuable work in the preparation of crude graphite for crucible making, but the character of the crude concentrates themselves, and the other factors that enter into the commercial finishing of concentrates, must be considered before the jig is recommended for use in preliminary treatment. If the jig is used, and used only to do that for which it is particularly adapted—the removal of coarse-sand impurities—its success can be assured.

Probably the most striking characteristics of graphite flakes are their toughness and the shape of the individual particles. In these two respects the flakes differ greatly from the impurities usually associated with the graphite in the crude concentrates. It was hoped, therefore, that these properties could, in some manner, be utilized in separating the graphite from the associated impurities. In considering the matter, it was decided

that although the coarse-sand impurities were much harder than the graphite flakes, they were, at the same time, so much more brittle than the carbon that the concentrate could be ground in some manner so as to materially reduce the size of these hard, brittle particles without causing a material reduction in the size of the graphite particles themselves. A careful survey of the different classes of grinding machinery indicated that this operation could be carried out with the greatest chance of success in a mill of the ball or pebble type.

The difference in the specific gravity of the two classes of substance was also a reason for believing that this method of selective grinding could be done. It was thought that, under correct conditions of dilution, the heavier, sandy material would tend to classify in the bottom of the charge among the grinding balls, where it would be ground more than the graphite, which, because of its lighter weight, would tend to segregate higher in the charge and out of the grinding zone. Such a separation corresponds closely to that in a hydraulic classifier. The results obtained from experiments proved that in most particulars the assumptions were fundamentally correct.

SEPARATION OF SAND AND CARBON

After a treatment such as suggested, which would produce a product with the sandy constituents ground to a finer size than the flake graphite present, two means of separating the sand and carbon would be available. One of the methods, as might be expected, would be a screening operation. In fact, it was found that after such grinding it was possible to raise the grade of the original material 25 per cent or more by simply passing the ground concentrate over a 100-mesh screen.

In summarizing the results obtained by the pebble-mill grinding, it may be said that the apparatus, when operated under the conditions that have been determined to be the most satisfactory, will raise the grade of the + 100-mesh material in a crude concentrate to such a degree that the following buhr-mill grinding can be carried on to give the maximum results possible with it. At the same time, the results indicate that the pebble mill cannot be used to produce a finished grade of product. In other words, the pebble-mill grinding should be used only as a step in the process, and that step only preparatory to treatment in the buhr mill.

The choice of method of removing the impurities that are ground in the pebble mill will depend on the character of the concentrates that are being treated and on other conditions that will be encountered in the commercial finishing plant. The results obtained in the experiments here described indicate clearly that the field of the pebble-mill grinding is wide and that the process can be made to produce favorable results even under the most adverse and difficult of operating conditions.

TESTS WITH ELECTROSTATIC SEPARATOR

The great difference between the electroconductivity of graphite and that of the principal impurities associated with it in the crude concentrates early suggested that a method of separation based on electroconductivity might be developed. Such a method has already been tried to a certain extent in the Alabama field, but the results in general have been unsatisfactory. This failure has been due to two difficulties. The first of these was

that most of the concentrates produced in the district contained a large amount of iron oxide, which, obviously, could not be removed with an electrostatic machine. Of course, crucible stock containing a large quantity of iron oxide could not be sold. The other reason for the failure of the process was principally that mechanical faults developed in the electrostatic separator when attempts were made to treat a product containing such large quantities of light, electroactive material.

However, in one section of the field producing concentrates high in mica but low in iron, the process worked well on a commercial scale, and is now being used. Such material is particularly adapted for electrostatic treatment; hence the process gives satisfactory results, although certain changes in the separator, as originally designed, were made to overcome inherent mechanical defects. This condition was only local, however, and electrostatic separation was never successfully used in the remainder of the district.

Improvements in the concentration mill made it possible to produce a concentrate carrying so much less iron that it was thought that the iron would no longer be a determining factor, and that, consequently, the electrostatic process should offer much more chance for success than previously. Thus, in order to use this method of separation, it seemed necessary only to construct a machine that would eliminate the mechanical difficulties previously encountered in the operation of this type of apparatus.

ELECTROSTATIC TESTS OFTEN UNSATISFACTORY

With this end in view, a series of experiments was made with a large machine of the type at present on the market, to determine definitely the reason for its previous failure. However, with this machine the separation was not satisfactory. The poles of the machine are so arranged that the graphite particles receive a certain charge and are thrown into the field of the pole carrying the opposite charge. When the graphite particles come under the influence of the charge of the latter pole, the charge first obtained is neutralized and the particles are thrown in the direction of the first pole. In this manner the material progresses through the apparatus in a zigzag path, first in one direction and then in the opposite, with the result that no separation of the graphite from the non-electroactive particles is obtained. The sand and other impurities, being unaffected by the charges acting on the graphite, fall directly through the machine. It can be seen, therefore, that the graphite will be separated from the impurities while passing the first pole; but on passing the oppositely charged pole will be thrown in the opposite direction and into the sand from which it has just been separated. Eventually the mixture is discharged practically unchanged from its original state.

The experiments demonstrated that to overcome the faults mentioned it would be necessary so to design a machine that when a graphite particle had received a charge of a certain sign, it would carry this charge unneutralized, and not be forced in the opposite direction and lose its tendency to separate. Many experiments were made with this end in view, and two types of apparatus were constructed. It was found possible to build a machine of such a nature that only one set of poles would tend to give a charge to the graphite, which would be repelled directly into the concentrate hopper and given no chance to be neutralized and thrown back

into the impurities from which it had been separated.

Fig. 1 shows the principal details of the separator as finally constructed, and indicates the manner of its operation. The material to be treated is placed in the hopper at the top of the apparatus and fed from it by a roller in the bottom. The graphite first strikes one of the inclined planes that carries a weak negative charge. While the graphite is on this plane it therefore receives also a weak negative charge. As the plane and the graphite both have the same charge, the graphite will be repelled and will jump from the negative vane into the field induced by the positive vanes. On coming into this opposite field, the graphite gives up its weak negative charge and receives, instead, a much stronger positive one, which, in turn, causes it to be repelled violently from the positive plate and through the openings shown between the electrodes. After having passed to the back of the plates, the graphite is free to fall directly into the concentrate hopper at the bottom of the separator.

The sand and mica, being much poorer conductors of electricity, receive such a weak charge from the negative plate on which they first fall that they are not repelled into the strong positive field, but simply slide from one negative plate to the next, and so on down through the machine, until finally discharged into the

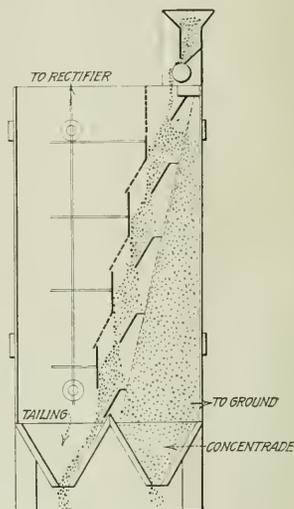

FIG. 1. ELECTROSTATIC GRAPHITE SEPARATOR

tailings hopper at the bottom of the apparatus and in front of the concentrates hopper.

SUMMARY OF RESULTS WITH ELECTROSTATIC SEPARATOR

The results obtained with the electrostatic separator prove conclusively that electrostatic separation can be successfully used in the finishing of graphite. They also indicate that the separators now on the market must be changed in certain respects to make it possible to obtain satisfactory results by their use. The results also seem to prove that the apparatus has a wider application than is possible with any of the other devices tested, with the possible exception of the buhr mill.

The electrostatic process seems also to be economical.

The cost of power is low and the loss of coarse and valuable flake is small. At the same time, it is to be expected that, although the device will invariably improve the grade of the concentrates treated, it will not yield a finished product containing 90 per cent carbon, which is considered necessary for crucible manufacture. However, the improvement in grade of the concentrates tested was so great as to indicate that electrostatic separation will, with few exceptions, produce a feed for the buhr mill that will be ideal for that apparatus to finish to the crucible requirements without a prohibitive loss of coarse flake. The removal of the coarse sand was almost complete.

The results already recorded show that, although the

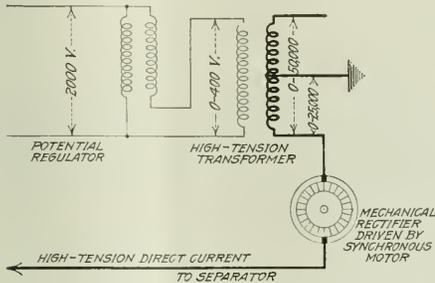

FIG. 2. WIRING DIAGRAM OF ELECTRICAL EQUIPMENT USED FOR ELECTROSTATIC GRAPHITE SEPARATOR

electrostatic separator will improve the grade of the concentrates, the degree of improvement will vary. Seemingly, the degree of variation depends on the physical condition of the concentrates themselves previous to treatment. In other words, the results to be obtained with this separator, as with those of any other type of equipment, will depend on the concentrates themselves, and consequently there can be no doubt that conditions will sometimes be met under which this type of treatment would not be as satisfactory as some other that might be developed for the removal of the coarse sand. However, the process has a more general application than is possessed by any of the other methods thus far described.

FLOTATION AS A FINISHING PROCESS

Flotation as a process of concentrating the graphite content of ores has been used for some time and with a fair degree of success. For this reason, and because graphite has a much greater tendency to float than the impurities that are usually found associated with it, the idea of re-floating the concentrate to remove the impurities before buhr-mill treatment was suggested.

There are two primary reasons for thinking that flotation could be used in this connection. The first is the law of concentration that the grade of the concentrates produced by a concentration process will vary directly with the richness of the feed being treated. As it is possible to produce a 45 per cent graphite concentrate from ore carrying only 3 per cent graphite, it is reasonable to believe that, under the proper conditions, it should be feasible to make a concentrate carrying, say, 70 per cent or more graphite from a feed carrying 40 per cent or more of graphite.

The results obtained make it evident that simple re-flotation, without a preliminary treatment, will mate-

rially raise the grade of the product, and give a high recovery of the carbon content of the feed. However, as would be expected, the results do not indicate that simple re-flotation would be satisfactory in commercial practice.

As regards re-flotation following treatment in buhr or pebble mills, the results are such as to justify its adoption in a commercial installation. Both the mechanical and the pneumatic types of flotation machines were used in the tests, and, as far as could be noted, neither machine could claim an advantage. Several oil mixtures were used. A mixture of 2 lb. of No. 17 oil and 0.75 lb. of No. 5 oil, both made by the General Naval Stores Co., was found satisfactory in every case.

THE BUHR MILL: ITS PLACE IN GRAPHITE FINISHING

During the comparatively long period that the buhr mill has been employed to finish graphite, methods of overcoming inherent difficulties in its use have become evident. One requirement is that the concentrate be of comparatively high grade before grinding in the buhr mill. With such material, no difficulty is encountered in consistently producing a crucible stock assaying 90 per cent graphite, provided the other conditions are correct. That the excessive destruction of coarse flake incident to buhr-mill grinding may be eliminated, it is necessary to remove only the coarse, gritty particles, or, at least, those coarse enough to require a large amount of grinding in the buhr mill. Stated simply, when the buhr mill is operated principally as a grinding machine on low-grade material, the grade of the product resulting cannot be depended upon, and an excessively large proportion of the flake will be ground to dust. When, on the other hand, the machine is operated only as a polishing or buffing machine, it will give satisfactory results.

The limitations of the mill were realized early in the progress of the work, and the experiments were conducted accordingly. Most of the products resulting from the various treatments contained less than the required 90 per cent of carbon, and, therefore, could be used by the crucible makers only after a treatment in the buhr mill, to bring them to the necessary grade.

GENERAL SUMMARY AND DISCUSSION OF RESULTS

As a result of the investigations made to determine the most satisfactory methods of refining crude graphite concentrates, several important facts were developed. Probably the most important of these is that each concentrate to be treated is a problem in itself, and, therefore, no complete plan of treatment applicable to all kinds of concentrate can be prescribed. Such a limitation is due to the differences between the characteristics of the crude graphite flakes and of their associated impurities. The most important characteristics that will effect the type of treatment scheme to be applied are the hardness, toughness, diameter, and thickness of the flakes and their contents of interfoliated impurities. The different physical properties affect the amount and intensity of the grinding necessary to remove the impurities without the destruction of too large a proportional amount of the large and more valuable flakes.

Another important factor in determining a satisfactory finishing process is the kind of impurities that must be removed. When these impurities exist free from the flakes of carbon, they can be removed, to a great degree, with a small loss of coarse carbon. When these impurities are soft and of small size, they can

be removed after a slight and non-destructive grinding operation, which will, in all probability, cause a comparatively small loss of valuable flake.

On the other hand, coarse, hard impurities are much more difficult to handle in a satisfactory manner. This type of material offers the greatest problem to the operator of the finishing mill. The results obtained in the experiments indicate that the efficiency of the finishing process will depend on the success obtained in the removal of this type of impurities at the earlier stages of the finishing operations.

The investigations have also brought out the fact that the buhr mill is a necessary apparatus in all processes for graphite finishing. It separates the flakes into their constituent laminations, and prepares them for the removal of the interbedded or interfoliated impurities.

The aspirator and the pneumatic jig were found to have an application under certain circumstances. It was seen, however, that such apparatus can be considered only for preliminary treatment previous to the regular finishing process, and should be used only for the removal of coarse, hard, free impurities that are sometimes encountered.

The experiments proved fairly conclusively that the use of either the electrostatic separator or the pebble mill, followed by flotation, will be applicable to all types of concentrates produced in the Alabama fields. The material produced by either of these types of apparatus can be ground in the buhr mill with satisfactory results.

The different processes of finishing graphite may be classified under two general heads—wet and dry. The decision as to which of the two should be used is dependent on the characteristics of the concentrates themselves. It is important that neither be adopted except after the necessary experiments and on the advice of an engineer thoroughly conversant with the problems to be encountered in the treatment of the particular concentrate, and with the economic conditions that will exist in the operating plant.

It can be said that, with rare exceptions, a satisfactory crucible stock can be produced from all of the concentrates that are at present made from the Alabama ores, and that the recovery of +100-mesh flake at the majority of finishing plants now operating can probably be improved. It should be possible to keep the recovery of material coarser than 100 mesh at 70 per cent of the total carbon in the original concentrates, and in many cases this can be increased to 80 per cent or more. These figures are sufficiently high to make profitable a loss.

The results obtained in finishing the graphite concentrates are dependent largely on the character of the crude flake contained in the ores. Moreover, mills that are producing a potential crucible stock in their concentrating plants can also produce a satisfactory crucible stock at a profit from a finishing plant that is correctly designed and intelligently operated. The operator who is unfortunate in having to mine small, low-grade flake requiring a large amount of intensive grinding and associated with a large quantity of coarse siliceous or micaceous impurities will have difficulty in producing the required grade of crucible stock at a profit. In common with all mining ventures, successful operation depends more on the character of the raw material occurring in the ground than on the treatment given the ore after it has been mined.

Chemical Industries Exposition

Companies Which Will Exhibit—Meetings of the American Institute of Mining and Metallurgical Engineers, American Electrochemical Society and Other Organizations

AS PREVIOUSLY announced in the *Journal* the national exposition of the chemical industries will be held during the week of Sept. 22 in Chicago, during which time a number of societies will also hold meetings. The American Institute of Mining and Metallurgical Engineers will occupy the first part of the week. The American Electrochemical Society will hold its meeting on Sept. 25, 26, and 27. The following companies are among those which will have exhibits at the annual exposition:

Abbe, Paul O.	Hercules Powder Co.
Alnsworth, Wm. & Sons	Harold China & Pottery Co.
Allen Electrolytic Cell Corporation	Huff Electrostatic Separator Co.
American Chemical Society	Industrial Electric Furnace Co.
American Chemical & Manufacturing Co.	<i>Journal of Industrial & Engineering Chemistry</i>
American Cyanamid Co.	Lead Lined Iron Pipe Co.
American Electrochemical Society	Little, Arthur D. Inc.
Anaconda Copper Mining Co.	MacBeth Evans Glass Co.
Armstrong Cork Co.	Magnetic Manufacturing Co.
Austin Co.	McGraw Hill Co. Inc.
Bailey Meter Co.	Merck & Co.
Barrett Co., The	Metals Disintegrating Co.
Bausch & Lomb Optical Co.	Mineral Point Zinc Co.
Brown Portable Conveying Machinery Co.	Nash Engineering Co.
Canadian Electrode Co.	New Jersey Zinc Co.
Carborundum Co., The	Norton Co.
Celite Products Co.	Olivet Continuous Filter Co.
Central Scientific Co.	Ontario Bureau of Mines
Carnotte Reduction Co.	Permutit Co.
<i>Chemical & Metallurgical Engineering</i>	Pennsylvania Salt Manufacturing Co.
Chemical Catalogue Co. Inc.	Raymond Bros. Impact Pulv. Co.
Cleveland-Cliffs Iron Co.	Research Corporation
Coors Chemical Porcelain Co.	Rössler & Hasslachner Chem.
Corning Glass Works	Rossendale-Reddaway Belting & Hose Co.
Crane Co.	Schutte & Koerting Co.
De Laval Separator Co.	Sperry Co., D. B.
Deans Fire Clay Co.	Sturtevant Mill Co.
Dings Magnetic Separator Co.	Sullivan Machinery Co.
Dow Chemical Co.	Taylor Instrument Companies
Duriron Castings Co.	Texas Gulf Sulphur Co.
Eimer & Amend	United Filters Corporation
Electric Furnace Co.	United Lead Co.
Electrolytic Engineering Corporation	United Lined Tube & Valve Co.
Foote Mineral Co.	U. S. Cast Iron Pipe & Foundry Co.
Fuller Lehigh Co.	U. S. Bureau of Mines

Hardinge Conical Mill Co.	

Prices of Milling Supplies in New York

The following table shows the fluctuation in prices of milling supplies during the last two years from July, 1917, to June, 1919.

Supplies	1917-1919 PRICES OF MILLING SUPPLIES IN NEW YORK				
	July, 1917	Dec., 1917	July, 1918	Dec., 1918	June, 1919
Leather belting, heavy, discount, %	35	35	35	25
Rubber air hose, 1-in., first grade per ft.	\$0.55	\$0.60	\$0.60	\$0.60	\$0.50
Cotton waste, white, per lb.	.13	.11	.11	.11	.11
Packing, rubber and duck for low-pressure steam, per lb.	.15	.13	.13	.13	.13
Packing, asbestos for high-pressure steam, per lb.77	.99	.99	.95
Packing, rubber and duck for piston packing, per lb.88	1.10	1.10	1.00
Pure steam-distilled pine oil, per gal., in bbl.	.501	.501	.56	.65	.70
Pure destructively distilled pine oil, per gal., in bbl.	.40	.40	.49	.65	.63
Pine tar oil, per gal., in bbl.	.26	.28	.35	.38	.45
Crude turpentine, per gal., in bbl.	.37	.37	.40	.45	.61
Hardwood creosote, f.o.b. Cadillac, Mich., per gal., in bbl.	.191	.191	.23	.23	.23
Sodium cyanide, per lb.	.30	.37	.39	.30	.30
Zinc dust, 350 mesh, per lb.	.16	.18	.16	.16	.10

PHOTOGRAPHS FROM THE FIELD

DISASTROUS FIRE AT PROPERTY OF SUNNYSIDE MINING AND MILLING COMPANY, EUREKA, COLORADO. The fire, which occurred on Apr. 21, originated in the third story of one of the bunk houses. The following buildings were completely destroyed: Boarding house, two bunk houses, moving-picture hall, commissary, and compressor plant. The following buildings were saved: Tramway terminal, crushing plant, machine shop, blacksmith shop, and transformer plant. There was no damage to the tramway which connects with the 600-ton mill three and one-half miles distant.

Sinking and Concreting Mine Shaft 936 Feet Deep*

Lining and Walls of Four-Compartment Shaft No. 5 of Miami Copper Company Concreted Simultaneously With Excavation Operations—Blasting Impossible Below 200-Foot Depth

BY RICHARD L. RUSSELL
Superintendent, The Foundation Company, Miami, Ariz.

SEVERAL novel details in underground construction were developed and applied in the sinking and concreting of shaft No. 5 of the Miami Copper Co., at Miami, Ariz. This shaft has four compartments and is 936 ft. deep, and the concrete lining was carried on at the same time as, and without interference with, the sinking, 700 ft. of the shaft lining having been placed and two large stations having been excavated and concreted by the time the shaft had reached its final depth. The section, shown in Fig. 1, is 13 ft. by 16 ft. 4 in. clear and required an excavated section 15 by 19 ft.

The entire shaft lies in what is locally known as Gila conglomerate, a formation which is typical hardpan rather than a true conglomerate. Although the material is very hard, no blasting was done after water was encountered at a depth of about 200 ft., it being found practically impossible to remove the powder fumes from the fissures in the water-laden hardpan. Light jackhammers with "bull points" from 2 to 3 ft. long were used to break the ground. This method, besides permitting the walls to be trimmed neatly, with far less overbreak than would result from blasting, permitted a progress of 100 ft. per month.

The shaft was sunk on the side and near the top of a small, steep hill, the top of which was graded down by the contractor to the elevation of the collar of the shaft. The plant layout is shown in Fig. 2. The shaft being near the present operating plant of the Miami Copper Co., the air, water, and electricity were delivered by that company at the collar of the shaft.

The contractor began erecting the headframe and other working structures Dec. 11, 1917, and hand excavated for the top 25 ft. of shaft without blasting, to avoid disturbing the ground adjacent to the collar. As the hoist could not be delivered until the end of January, 1918, the contractor obtained, late in December, permission to drift in from a tunnel of the Miami Copper Co. which passed within 20 ft. of the southerly corner of the shaft at a depth of 118 ft. This permitted the tramping of muck by hand a distance of about 300 ft. through the tunnel to a dump in the gulch at the tunnel entrance.

After the line of the shaft was reached, a raise was driven for the purpose of meeting the excavation from the surface. This raise was 2½ by 6 ft., of which 2½ by 2 ft. was a manway with ladders and the remaining space was occupied by a cribbed chute. At the tunnel level the drift was widened and the full shaft section excavated to make a working chamber large enough to accommodate a switch, which permitted the sidetracking of an empty car while another car was being loaded. The full section of the shaft was then broken down through this chute by the use of 40 per cent dynamite.

The drift was started Dec. 26, 1917, and completed Jan. 1, 1918; the raise was started Jan. 2, 1918, and

completed at 6 a.m. Jan. 8, 1919—a rate of 5 ft. per eight-hour shift. The full section of shaft was excavated to the level of the tunnel Feb. 20, 1919, and 60 ft. of shaft had been concreted in the same period, as follows:

As soon as the excavation had reached a depth of 35 ft., the forms for the 25-ft. collar were started on 12 by 12-in. bearing timbers placed in 18-in. hitches cut in the hardpan walls. No back forms were used, and the whole 25 ft. was poured continuously. As no water was encountered, no timbering was necessary.

While the collar was being concreted, the excavation had progressed to a depth of 55 ft. Hitches were again cut in the walls, and the three 12 by 12-in. bearing timbers were lowered into them. On these bearing timbers was placed a timber frame, the exact size of the con-

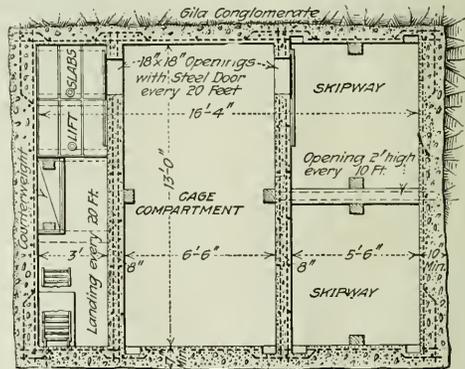

FIG. 1. CROSS-SECTION OF SHAFT, SHOWING CONCRETE LINING

creted section, which served both as a bottom form and a sill on which the form panels could be set. The vertical reinforcing rods were then hooked to the verticals which had been left projecting from the bottom of the previous concrete, and the horizontal reinforcing was wired to the verticals. A 5-ft. section of forms was then placed, and concrete was poured, this process continuing until the concrete was carried up to the bottom of the collar section. It was found that the ground would safely permit the opening up of a depth of fully 25 ft. of shaft without lateral support, and the concrete was carried down in 20-ft. sections by the above process for the first 200 ft. of the shaft.

As soon as the raise from the tunnel level was finished and the breaking-down process was well under way, a small air hoist was installed at the tunnel level, and the two skip compartments were sunk and timbered as a pilot shaft, the muck being hoisted to the tunnel level and also tramped through the tunnel. Thus excavation was being carried on simultaneously at two levels

*From *Engineering News-Record*, June 26, 1919.

without interference, while waiting for the double hoist to be delivered.

By the time the whole shaft had been excavated down to the tunnel level a two-compartment pilot shaft 100 ft. deep was ready, one compartment serving as a chute through which to draw off the muck from breaking down the full section of the shaft and the other a hoisting compartment to the tunnel level through which the muck was still trammed.

Water was encountered at this depth (218 ft. below the surface) and while the full shaft section was being excavated to this depth the double-drum hoist was delivered and installed and a special crosshead was devised to comply with the requirements of the Arizona mining laws and at the same time permit the bucket to be dumped into the receiving bin in the headframe without excessively increasing the height of the latter.

As it was neither possible nor desirable to keep the bucket guides extended nearer the bottom than 15 to 30 ft. while sinking was in progress, this crosshead had to be such that it could be stopped at any desired point in the shaft as well as at the headframe and allow the bucket or skip to continue on, for filling or changing at the bottom or dumping when reaching the headframe.

It was found that the water caused the hardpan to slough very treacherously soon after a wall was exposed. Full timbering was therefore carried on with the excavation from the 250-ft. depth; 8 by 8-in. plates, posts and dividers and 2-in. lagging were used. Corner joints were framed as shown in Fig. 4 to secure an increased bearing surface. As the shaft was concreted, all timber and lagging were removed and re-used, some timbers being used as many as four times. This not only resulted in a large material saving but also saved a high framing expense, as carpenters were paid \$7.25 per shift at that time.

The section concreted in one operation was increased to 100 ft.; that is, the 12 by 12-in. bearing timbers were lowered 100 ft. and set in hitches and the 100-ft. section was concreted upward in 5-ft. courses.

The water was bailed into buckets and hoisted, five buckets per hour, or 600 gal., which, together with the water shoveled and hoisted with the muck, was sufficient to keep the bottom free. A timber bulkhead 6 in. thick was kept not over 50 ft. above the men working in the bottom over all of the shaft except the two skip compartments. While the reinforcing and forms were being set in one of the skip compartments all the

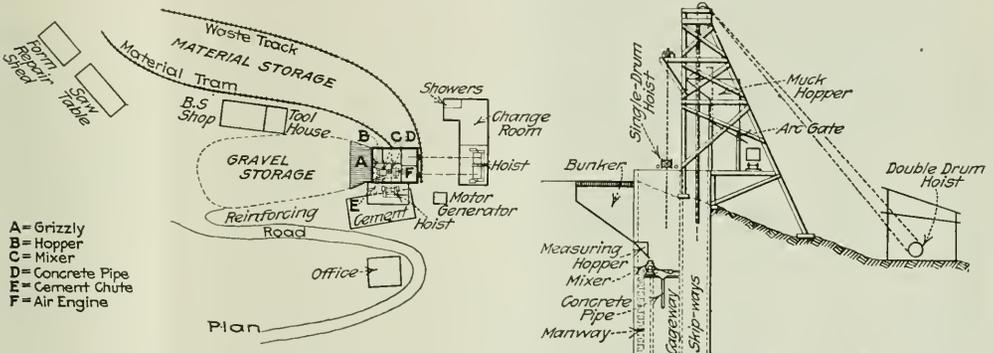

FIG. 2. PLAN AND SECTION OF CONSTRUCTION-PLANT LAYOUT FOR SINKING AND CONCRETING MINE SHAFT

This was accomplished by the arrangement shown in Fig. 3.

A lug D was securely clamped to the cable about 6 ft. above the shackle loop. This lug engaged the dogs B and thus attached the crosshead securely to the cable. When the crosshead reached the top of the headframe, the top lander pulled the lever E and slid the frame A over against the guides and gave the lowering signal. The bumper C then hit the frame A, the dogs B released the lug D, and the crosshead was left resting on the frame A while the bucket was dumped, after which the latter was raised high enough to take the crosshead off the frame A. The frame was then slid back and the bucket with the crosshead attached was ready for lowering. At the bottom of the shaft, or at any other point where free use of the bucket was desired, stop blocks E were bolted to the guides and performed the same function as the frame A at the headframe. This crosshead gave perfect satisfaction.

From the 218-ft. depth to the bottom the full section of shaft was excavated by the use of bull points; three men using jackhammers, working them into the material, loosened all that four muckers could load into the buckets.

hoisting from the bottom was done in the other compartments, and after the forms were set one of the skip compartments was bulkheaded at the level of the top of the forms, as were the cage and manway compartments, one skipway only being left open for hoisting.

Upon the completion by the contractor of the contract for lining with concrete the old shaft No. 3 of the Miami Copper Co., a mile distant from the new shaft No. 5, about Apr. 1, 1918, the single-drum hoist from shaft No. 3 was installed at shaft No. 5, as shown in Fig. 2, working from extension timbers from the same headframe and operating in the cage compartment.

This hoist handled all reinforcing, forms, concrete pipes, and timbers to the form and concrete gangs, and as there was always a bulkhead in this compartment over the men in the bottom, the danger of working at two different levels was greatly lessened. This hoist was also used in pulling and resetting the rather heavy wooden forms in all compartments. It proved nearly as fast as a derrick and obviated the use of the slow and expensive block-and-tackle method.

Separate bunkers for sand and gravel were excavated immediately adjacent to the collar of the shaft at the

manway end, and the sand and rock from the crushing plant, which was installed in the creek bed, were dumped through grizzlies into these hoppers. Through openings left in the shaft collar, with arc gates, the sand and stone passed into measuring hoppers inside the manway and cage compartments. These hoppers were of the proper dimension for a one-bag batch, and from them the material was chuted to a batch mixer in the shaft

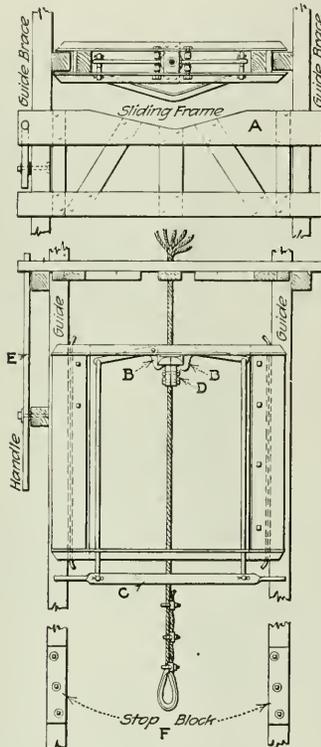

FIG. 3. CROSSHEAD AND SAFETY DEVICES

cageway compartment 20 ft. below the surface. The cement was slid in bags down a chute from the door of the cement shed through an opening in the south side of the cageway compartment directly to the mixing plant.

The mixer, of 8-cu.ft. capacity, was belt-driven from a small air hoist set at the same level. This plant occupied the southerly half of the cage compartment and manway compartment, the wall between the two being omitted temporarily for its accommodation, the whole plant occupying an area only 7 ft. by 9½ ft., as clearance for buckets, and material handled by the small hoist in the cage compartment had to be maintained at all times.

The 1 : 2 : 4 mixture of concrete was dumped from the mixer through a 6-in. iron pipe with screwed couplings and with the fall broken at junction boxes every 300 ft. and at the swiveled chute which carried the concrete to the forms around the shaft. This pipe was supported by timber clamps resting on 6 by 8-in. timbers carried in recesses left in the concrete when poured,

and on the shaft timbers where the concrete had not yet been placed.

In the manway compartment the permanent iron ladders were put in position as the concrete lining was placed. In advance of that, the permanent ladders were placed on temporary wooden landings. Concrete-lined stations were constructed at 235, 490, 576, 643, 729, 770, 835, and 920 ft. below the surface. The 490- and 576-, also the 770- and 835-ft. stations were the top and bottom of future ore pockets. The ore pocket between the 643- and 729-ft. stations is now being constructed.

To facilitate the construction of these pockets, 4 by 4-ft. cribbed chutes were excavated before the shaft was concreted just outside of the concrete walls of the northwestern skipway, with a gate and a chute leading into the skipway at the bottom of each pocketway. When the ore pockets are constructed the muck will be shoveled into these chutes and drawn off at the bottom, and the cribbing removed as the excavation proceeds, thus effecting a considerable economy in the cost of excavation.

For the hoisting in the cageway compartment, cable guides were installed, carried on reels on the head-frame and unreeled as the shaft was deepened, and even at the full depth of 936 ft. these did not oscillate enough to cause difficulty.

To avoid trouble with the permanent guides from the use of expansion bolt fastenings, and to obviate the irregular spacing of bolt holes in the guides if anchor bolts were set in the concrete as it was poured, a novel guide fastener was designed. It was built in the concrete as poured, but still allowed drilling of the bolt holes by templet after the shaft was completed and permitted a leeway for any reasonable irregularity in location while pouring. These fasteners are shown in Fig. 5.

A chart was kept showing the progress made each day by each shift on each part of the work. A large-scale elevation of the whole shaft, stations, tunnels and ore pockets was made, and a certain portion was allotted to excavation, timbering, form work, reinforcing, concreting, and other construction processes. To each shift boss was assigned a certain color, and the portion of the chart representing the position and the amount

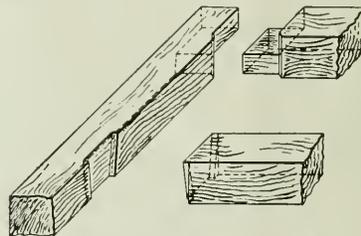

FIG. 4. DETAIL OF TIMBER FRAMING

of work done was colored for the shift doing the work. The date was then written through the color. Quantities for this purpose were determined both by actual measurement and by the foreman's reports. For instance, the number of buckets of muck hoisted was a close check on the advance in sinking for that shift. The foremen were never formally notified that this chart was being kept, but within two days from the time it was instituted they all seemed familiar with it and watched it closely.

The chart not only furnished information as to progress at all times and gave a comparison of the work accomplished by each shift, but it also served as a record which showed at a glance which shift boss had excavated any part of the work. If faulty workmanship had been discovered it would have been simple to trace it.

Probably the greatest value of the chart, however, lay in the competition it aroused among the shift bosses, who realized that their work was being closely followed and that they were getting due credit.

In spite of the fact that the hardpan through which the shaft was driven is so firm that all former shaft

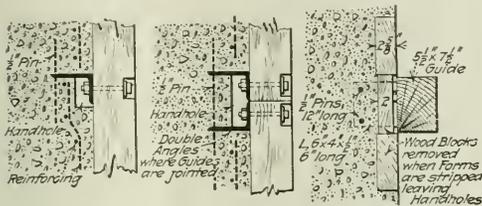

FIG. 5. DETAIL OF NOVEL GUIDE FASTENING

sinking in the district had been done by blasting, it sloughed badly upon exposure to the air, and this without warning. Ground which had been sounded and found solid but a few minutes before would suddenly fall, with no warning, so that the sinking combined the difficulties of both hard-rock work and soft, treacherous ground. In spite of this fact, there have been no serious accidents to either construction or the employees during the entire work, which means that though every precaution has been taken to safeguard the men and the work, good luck has also favored the job.

The Foundation Co., of New York City, did this work by contract, under the supervision of its Pacific Coast department, with Bayly Hipkins, vice-president and Pacific Coast manager, and A. S. Lilley, assistant manager; and under the direct charge of the writer as superintendent, James H. LeFeaver as assistant superintendent and John Sheehy as night superintendent.

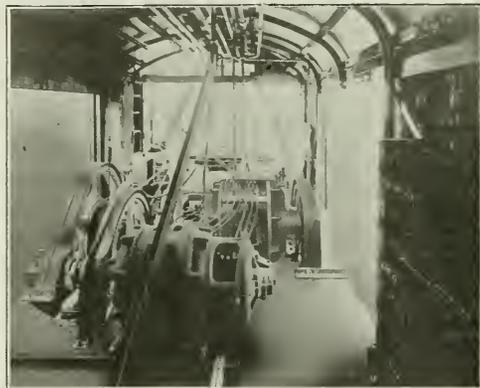

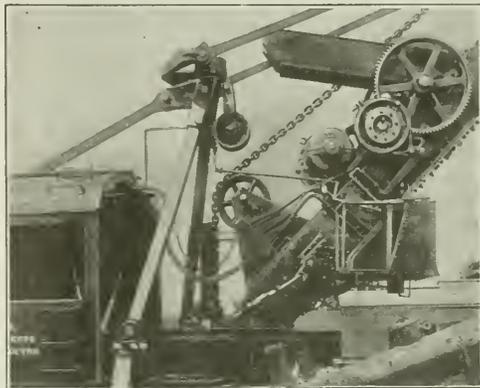

Copper Range Co.

The Copper Range Co., reporting operations during 1918 at the Baltic, Trimountain, and Champion mines, states that 792,151 tons of rock was stamped and 26,623,940 lb. of refined copper produced, and that these figures represent 33.61 lb. of copper per ton of ore stamped. The total cost per lb. of copper produced was 14.46c., and the average price received was 24.76c. Total expenses amounted to \$3,849,216.38. Net earnings were \$2,895,615.28 and dividends \$2,336,394. It should be noted that the above figures include only one-half of the Champion's operations, the property being owned jointly with the St. Mary's Mineral Land Co.

At the Baltic mine, No. 3 shaft was sunk 178 ft., and 11,901 ft. of drifting was done, together with 164 ft. of sub-drifting, 965 ft. of crosscutting and 663 ft. of raising. At the Champion mine, No. 2 shaft was sunk 95 ft. and 3146 ft. of drifting was done, together with 35 ft. of crosscutting, 202 ft. of sub-drifting and 1022 of raising. At the Trimountain mine, No. 2 shaft was sunk 159 ft. and No. 4 shaft, 154 ft. Drifting at the mine totaled 4913 ft.; sub-drifting, 1362 ft.; crosscutting, 289 ft. and raising, 841 feet.

• Motor-Driven Shovels and Draglines

In stripping overburden or performing work of a similar nature where the use of steam shovels or draglines is desirable, it will often be found that the utilization of electrically driven equipment is an economy, especially where the electric power is available and can be secured at reasonable rates. Some of the advantages obtained by the use of the electrically driven shovel and dragline are that fewer operators are required; fuel is not an essential; no water supply or boiler is needed, and no smoke, no sparks and no objectionable

MECHANISM ON ELECTRICALLY DRIVEN SHOVEL
Top—Motor installation on shovel boom. Bottom—Driving mechanism in interior of shovel.

noises are present, and more material can be handled if the proper arrangements are made for car supply.

A complete line of electrically operated shovel and dragline equipment which meets the severe service encountered in such work, and embraces simplicity in design, has been placed on the market by the Westinghouse company. In general, the situation of the shovels makes alternating-current equipment preferable, although both alternating and direct-current equipment can be furnished. The accompanying cuts show motor installations on a shovel boom and the driving mechanism in the interior of a shovel, where motors are used to operate the hoisting drum and to swing the boom.

Petroleum in April and March

Production and Consumption of Domestic Crude Petroleum—Stocks on Hand—Imports and Exports—
Total Consumption of Domestic and Imported

A COMPARATIVE summary of the quantity of crude petroleum produced and marketed, imported, consumed and exported in April and March, 1919, and in April, 1918, prepared by C. C. Osbon, under the supervision of E. Russell Lloyd, of the U. S. Geological Survey, is given herewith. The statements with regard to fields east of the Rocky Mountains are based upon reports filed by about two hundred pipe-line, marketing, and refining companies, only such refineries being included as receive crude oil by private pipe lines or tank cars directly from the wells. Statistics relating to California and to imports and exports were compiled from secondary sources. This statement indicates the general trend of conditions in the crude-petroleum industry of this country.

The quantity of crude petroleum run from wells and producers' field storage tanks and delivered to pipe lines, marketing companies, refineries, and other consumers in the United States in April, 1919, amounted to approximately 29,310,000 bbl., a decrease of 1,102,000 bbl., or nearly 4 per cent, compared with March, 1919, but an increase of 461,000 bbl., or nearly 1½ per cent, compared with April, 1918. The average daily rate in April, 1919, was 977,000 bbl., a quantity less by 4,032 bbl. (a little over 0.4 per cent) than the average daily rate in the preceding month, but greater by 15,367 bbl., or about 1½ per cent, than the average daily rate in the corresponding month of 1918.

Approximately 98 per cent of the oil included in the following table was actually brought to the surface in the United States in the months specified, the remaining 2 per cent consisting of runs or tank-car shipments from field storage. Data concerning the quantity of oil run into field storage are not available.

TABLE I. PRODUCTION OF DOMESTIC CRUDE PETROLEUM
(Barrels of 42 Gal. Each)

Field	April, 1919	March, 1919	April, 1918
Appalachian.....	2,542,000	2,453,000	2,178,000
Lima-Indiana.....	293,000	282,000	294,000
Illinois.....	1,008,000	1,166,000	1,145,000
Mid-Continent.....	14,048,000	14,629,000	14,182,000
Gulf Coast.....	1,843,000	1,890,000	1,745,000
Rocky Mountain.....	1,259,000	1,166,000	955,000
California.....	8,317,000	8,824,000	8,350,000
Totals.....	29,310,000	30,412,000	28,849,000

PETROLEUM CONSUMPTION

It is estimated that 27,726,000 bbl. of domestic crude petroleum was delivered in April, 1919, to refineries and other consumers of crude oil and used for the manufacture of petroleum products and for fuel, or exported. This quantity is less by 486,000 bbl., or nearly 2 per cent, than the quantity so delivered or consumed in March, 1919, and by 2,441,000 bbl., or about 8 per cent, than the consumption in April, 1918. However, the average daily rate of consumption was 924,200 bbl., an increase of 14,135 bbl., or about 1½ per cent, compared with the daily rate in March, 1919, but a decrease of 81,367 bbl., or about 8 per cent, compared with the rate in April, 1918.

The following table, computed from marketed production and stocks, includes approximately 99 per cent of the total quantity of domestic crude oil consumed or exported in the months referred to, the remainder

representing oil used by producers in drilling and pumping.

TABLE II. CONSUMPTION OF DOMESTIC CRUDE PETROLEUM
(Barrels of 42 Gal. Each)

Field	April, 1919	March, 1919	April, 1918
Appalachian.....	2,359,000	2,359,000	2,204,000
Lima-Indiana.....	124,000	251,000	289,000
Illinois.....	797,000	580,000	1,368,000
Mid-Continent.....	13,664,000	13,553,000	14,352,000
Gulf Coast.....	1,272,000	1,251,000	2,215,000
Rocky Mountain.....	1,305,000	1,209,000	842,000
California.....	8,260,000	9,009,000	8,897,000
Totals.....	27,726,000	28,212,000	30,167,000

STOCKS OF PETROLEUM

The surface reserve of domestic crude petroleum held on April 30, 1919, by pipe lines and marketing companies and by refineries that receive it directly from the wells, was approximately 132,694,000 bbl., a gratifying increase of 1,584,000 bbl., or a little more than 1 per cent, compared with the quantity on hand March 31, 1919, but a decrease of 12,104,000 bbl., or about 8 per cent, compared with the quantity in storage on April 30, 1918.

From about 95 to 98 per cent of the domestic crude oil above ground in the United States in the months specified is included in the following table, the remainder representing unmarketed oil run by producers to private tanks and held as field storage.

TABLE III. STOCKS OF DOMESTIC CRUDE PETROLEUM AT
END OF MONTH
(Barrels of 42 Gal. Each)

Field	Increase or Decrease		April, 1918	Increase or Decrease April, 1919 Apr., 1918
	April, 1919	March, 1919		
Appalachian.....	4,246,000	4,063,000	+ 183,000	3,966,000 + 280,000
Lima-Indiana.....	1,429,000	1,260,000	+ 169,000	1,594,000 — 165,000
Illinois (a).....	3,823,000	3,612,000	+ 211,000	3,066,000 + 757,000
Mid-Continent.....	79,567,000	79,183,000	+ 384,000	96,334,000 — 16,767,000
Gulf Coast.....	10,131,000	9,505,000	+ 626,000	11,445,000 + 1,314,000
Rocky Mountain.....	955,000	1,001,000	— 46,000	754,000 + 201,000
California (b).....	32,543,000	32,486,000	+ 57,000	30,395,000 + 2,148,000
Totals.....	132,694,000	131,110,000	+ 1,584,000	144,798,000 — 12,104,000

(a) Includes some Lima-Indiana oil stored in Illinois. (b) Includes stocks of residuum and unfinished refinery products.

Statistics for the California field in 1918 were compiled from figures published by the Standard Oil Co. (California), the Independent Oil Producers' Agency, and the Pacific Coast Petroleum War Service Committee, but for 1919 the figures are those of the Standard Oil Company only.

PETROLEUM IMPORTS AND EXPORTS.

The United States leads the other countries of the world in the production of crude petroleum, but the quantity obtained from domestic sources is inadequate to meet the demand, and a large volume is imported, chiefly from Mexico. Although the export trade of the petroleum industry in the United States consists chiefly of refined products, a substantial volume of crude oil is being exported for the manufacture of petroleum products in Canada, Cuba, and other foreign countries.

The following table was compiled from the records of the Bureau of Foreign and Domestic Commerce:

TABLE IV. IMPORTS AND EXPORTS OF CRUDE PETROLEUM
(Barrels of 42 Gal. Each)

Imports	April, 1919	March, 1919	April, 1918
Mexico.....	3,970,195	3,492,800	2,846,037
Other countries.....	14,000	981	205
Totals.....	3,984,195	3,493,781	2,846,242
Exports			
Canada.....	275,000	178,228	377,233
Cuba.....	1,429	39,384	5,912
Mexico.....	241	628	681
Other countries.....	1,240	144	875
Totals.....	277,919	218,394	384,701
Excess of imports over exports.....	3,706,276	3,275,387	2,461,541

Data are not available to show the quantity of Mexican crude oil held in storage in the United States. If, however, the consumption of Mexican oil keeps pace with importation, the following table indicates the total quantity of petroleum exported and delivered to refineries and other consumers in this country:

TABLE V. TOTAL CONSUMPTION OF DOMESTIC AND IMPORTED CRUDE PETROLEUM (Barrels of 42 Gal. Each)

Kind	April, 1919		March, 1919		April, 1918	
	Total	Daily Average	Total	Daily Average	Total	Daily Average
Domestic	27,726,000	924,200	28,212,000	910,065	30,167,000	1,005,567
Imported	3,984,195	132,807	3,493,781	112,702	2,846,242	94,875
Totals	31,710,195	1,057,007	31,705,781	1,022,767	33,013,242	1,100,441

The foregoing data are subject to revision in subsequent statistical reports of the U. S. Geological Survey relating to crude petroleum.

North Star Mines Co.

The 1918 Report Shows Diminishing Operating Profits Due to Increased Costs—Champion Mine Produces Small Profit

THE North Star Mines Co. has had a long and successful record, but, like most gold-mining companies, it experienced marked operating disadvantages during the period of the war, on account of conditions beyond its control. The following information is taken from the company's last annual report and is presented in more detail than is customary, to illustrate the difficult conditions under which the company operated:

During 1918 the gross production of the North Star mine was \$775,688.18; the expenses for current operation amounted to \$716,778.14, and for development to \$9225.70, or a total outlay for operation and development of \$726,003.84, leaving an operating profit of \$49,684.34. The gross production of the Champion mines was \$271,108.40, and the expenses for current operation amounted to \$235,363.18 and for development to \$27,759.64, or a total outlay for operation and development of \$263,124.82, leaving an operating profit of \$7983.58. The total production of the company's mines was therefore \$1,046,796.58, with total operating and development expenses of \$989,128.66, leaving an operating profit of \$57,667.92. Interest and dividends on invested funds amounted to \$36,331.43, increasing the total net earnings of the year, before deduction of allowance for depletion and depreciation, to the sum of \$93,999.35. The amount allowed for depletion and depreciation, on the same basis as in previous years, was \$315,734.83, resulting in a deficit on the year's operations of \$221,735.48. Of the dividends declared during the year, amounting to \$100,000, the sum of \$50,000 was derived from undistributed earnings of the year 1913, and, the surplus of previous years being exhausted, \$50,000 was paid as a distribution of capital assets.

The conditions under which the business of gold mining was conducted during 1918 were so unfavorable and abnormal that the outcome affords no criterion of the results obtainable with ordinary factors of operation. The scarcity and inefficiency of labor and the high cost of materials used, combined with a lower yield per ton crushed, resulted in a situation at the North Star mines during the latter part of the year under which the cost of producing an ounce of gold exceeded the standard price at which it could be sold. Since the beginning of 1919 conditions have improved. The supply of labor is now fairly adequate; there is a declining tendency in the cost of certain supplies; and, although the process toward lower prices generally is likely to be a slow one, a gradual return to more normal conditions may be looked for.

The year's output from the North Star mine came chiefly from stopes on the 3400, 4000, 4400, 4700 and 5000 levels. A

total of 130,445 tons of rock was delivered to the sorting plant, of which 30,895 tons was discarded as waste, leaving 99,550 tons of ore crushed, with an average yield of \$7.79 per ton crushed, at an average cost of \$7.20 per ton for operating and \$0.09 per ton for development expenses, making an aggregate cost of \$7.29 per ton crushed (\$5.59 per ton mined), and leaving a realized profit of 50c. per ton crushed.

The yield per ton crushed in 1918 was \$3.64 less than in 1917. This decrease was partly due to unfavorable operating conditions, the scarcity of labor making it necessary to mine the ore most readily available, without proper sorting, in order to keep the mill supplied, and partly to the fact that the North Star vein, so far as developed below the 4000 level, seems to be of poorer and less uniform quality than in the upper levels. The total cost per ton of operation and development in 1918 was \$7.29, as compared with \$7.19 in 1917. The average outlay per ton for development during the five preceding years was 65c. If an equivalent amount had been spent for development in 1918, the total cost per ton of operation and development would have been \$7.85, as compared with \$7.19 in 1917, \$5.43 in 1914, and \$5.20 in 1913.

MAJOR PROPORTION OF YIELD WON BY AMALGAMATION

Of the total production of the year, 82.03% was obtained in the mill by amalgamation; and 17.97% was recovered by cyanidation. It is estimated that the valuable material lost in the tailings amounted to about 33c. per ton crushed.

The development work done in 1918, restricted as above stated, amounted to 701 ft. of drifts, with results of no particular significance as to the opening of additional resources.

During the year, \$27,681.21 was expended on improvement account, almost entirely in the erection of a plant for disposal of the tailings from the cyanide treatment, as required by the United States Debris Commission.

A reestimate has been made of the ore reserves, with a reduction of about 100,000 in the number of tons counted as positively developed. The ore supply now available is estimated as sufficient to keep the mill supplied for two or three years. The prospects for developing additional resources, both on and above the 4000 level, and at the bottom of the mine, on the 6300 level, are favorable.

The Champion mines were operated throughout the year, with a production, as above stated, of \$271,108.40, the yield of 41,300 tons crushed, or \$6.56 per ton, resulting in a small profit over all expenses of operation and development. Nearly all of the ore came from 2400 to 2700 levels of the Providence mine.

Development work at the Champion mines amounted to 2109 ft. (drifts 1579 ft., raises 43 ft., and winzes 487 ft.). With the exception of the Providence 2700 orebody, the development work revealed practically nothing of value, and the outlook for the future is not encouraging. As long, however, as the production is sufficient to cover expenses, some further prospecting is justified.

The result of the Champion venture has been extremely disappointing. From 1911 to the end of 1918 a total of 228,810 tons has been milled, with an average yield per ton of \$5.44, and the cost of operation and development per ton has been \$8.04. The production obtained has been only about six tons of ore per foot of development; an exceedingly low ratio when compared with 20 to 25 tons per foot at the North Star.

Flotation Agents at Anaconda are delivered to flotation sections of the copper concentrator by means of a constant-speed disk-type feeder, with detachable cups, operating in a feeder tank or rectangular cross section. The amount of agent used is determined by measuring the volume removed from the feeder tank over a period of from one to four hours, depending upon the rapidity of flow from the tank. The specific gravity of the agent being known, the number of pounds of agent used is easily determined by use of curves or tables. The adjustment of agent to flow of pulp through the flotation section is made by varying the number and size of the cups attached to the disk.

Calumet & Hecla Mining Co.

During the year ended Dec. 31, 1918, the Calumet & Hecla Mining Co. produced 67,968,357 lb. of copper. The production costs and earnings statement, as given in the annual report, is tabulated as follows:

PRODUCTION COSTS OF CALUMET & HECLA MINING CO. FOR YEAR ENDED DEC. 31, 1918

	Pounds	Per Lb.	
Mining and mine taxes	58,722,969@	15 01c.	\$8,816,924 28
Reclamation	9,245,388@	7 20c.	665,600 39

Dividends paid	\$5,500,000 00		
Reserve (estimated) for 1918	600,000 00		6,100,000 00
Federal taxes			
Balance			\$1,150,803 93

Tons of rock treated aggregated 2,876,392, at a mine cost (excluding construction) of \$3.07 per ton. The rock yielded 58,722,969 lb. refined copper, or 20.42 lb. per ton of ore mined. Of this production 1,547,603 tons came from the Conglomerate lode, at a mine cost of \$4.09 per ton, and yielded 43,329,816 lb. copper, or 28 lb. per ton, and 1,328,789 lb. came from the Osceola lode, at a mine cost of \$1.88 per ton, and yielded 15,393,153 lb. copper, or 11.58 lb. per ton.

Mine development on the Conglomerate lode included 33 ft. of shaft sinking, 7,149 ft. of drifting, and 3,659 ft. of crosscuts and foot-wall raises. On the Osceola lode, 10,192 ft. of drifting was performed.

Operation of the regrinding plants is illustrated by the following figures of tonnage treated and results obtained:

TONNAGE AND TREATMENT DATA

	From Mine	From Old Sands
Tons treated	530,657	715,007
Assay headings, per cent. copper	0 599	0 868
Assay tailings, per cent. copper	0 414	0 568
Pounds refined copper	2,243,022	4,776,302
Pounds refined copper per ton treated	4 23	6 68
Cost per pound, excluding smelting and selling, cents	6 75	4 33

The leaching plant operated satisfactorily throughout the year, with the following results:

Tons treated	1,005,015
Assay headings, per cent. copper	0 555
Assay tailings, per cent. copper	0 126
Pounds refined copper	8,035,156
Pounds refined copper per ton treated	8 00
Cost per pound copper, excluding smelting and selling, cents	7 71

The results of operations of the reclamation plant for the year are as follows:

	Year, 1918	Since Starting
Tons tailings treated	715,007	2,173,009
Assay headings, per cent. copper	0 868	0 928
Assay tailings, per cent. copper	0 244	0 364
Pounds refined copper	9,245,388	25,316,296
Pounds refined copper per ton treated	12 93	11 65
Cost per pound copper, excluding smelting and selling, cents	7 20	5 99

Dividends paid by the company to the end of the year 1918 (including No. 186), amount to \$150,750,000. Divi-

dends received from subsidiary companies to the end of the period reviewed were as follows: Ahmeek, \$5,533,640; Allouez, \$1,127,500; Centennial, \$166,000; Isie Royale, \$411,734.50; Osceola, \$3,629,002; and Superior, \$100,200; total, \$10,968,076.50.

An Adjustable Motor Anchorage

An adjustable motor anchorage which is used for the purpose of conforming motors to their bedplates is illustrated herewith. It is suitable for use on motors of 50 hp. or over and recently has been placed on the market by the Adjustable Anchorage Co., of Detroit, Mich. The device is simple, reliable and positive, and its application to motors equipped with magnetic clutches is of particular advantage, although it is useful

ADJUSTABLE ANCHORAGE FOR MOTORS

on motor driving belts. Heretofore motors have not infrequently been doweled in place. Any change in the situation of a motor so positioned is difficult, slow, and often entails injury or destruction to the concrete foundation. By means of this new device slight changes in the position of the motor may be readily and quickly effected, the only tool necessary being a suitable wrench.

Injury to Blasting Employees

BY A. L. H. STREET

Attorney at law, 820 Security Building, Minneapolis, Minn.

In an action to recover damages for death of a mine laborer in the Joplin district, due to an explosion of dynamite used by him in breaking boulders, it is held by the Missouri Supreme Court that a mine operator may be regarded as having been guilty of actionable negligence in permitting an inexperienced man to use dynamite under such circumstances, without proper instruction, not only as to the dangers involved in the work, but also as to how he should do his work to avoid such danger. (*Batesel vs. American Zinc, Lead & Smelting Co.*, 207 *Southwestern Reporter*, 742.)

It is also decided that whether an employee is to be regarded as having been guilty of contributory negligence or as having assumed the risk of injury in such a case depends upon whether the peril encountered by him was so obvious that a reasonably prudent man would not, under the same circumstances, have undertaken the work, considering the injured man's experience or lack of it in such work.

Technical Training*

Special Knowledge Required by the Young Man Who Hopes Successfully To Meet the New Problems Which Have Grown Out of Recent Changes in Commercial and Industrial Activities

BY M. L. REQUA

TO THOSE young men who contemplate a career in the petroleum industry—or, for that matter, in mining of any sort or in the diversity of industries that have to do with engineering in all its multiplicity of forms—thorough technical education is today of greater value than at any time in the past. Tomorrow it will be still more valuable, and its value will increase as the years pass.

The reason is simple, if we will but stop to consider and analyze the events of the last century. A hundred years ago our mineral wealth was practically untouched; the great West was an unknown wilderness; the revolutionizing inventions based upon steam and electricity were undreamed of. We were in large part a pastoral and mercantile people, untrained in the sciences which now form so vital a factor in our daily life. The great fabricating plants of all kinds that now dot the landscape from Maine to California were then unthought of; the family spinning-wheel supplied the wants now cared for by the factory crammed with intricate machinery. The home-made tallow dip afforded the light now supplied by electricity, gas, and petroleum; and the horse transported from place to place the freight we now move by railroad and motor. The infinite and complex activities founded upon power have necessitated special knowledge, and that knowledge is now in large part being supplied by our colleges and universities through engineering courses.

Science, after all, is but the record of experiments, successful and unsuccessful, which have been coordinated, catalogued, and filed away for future reference. It is the index, the record, of the activities of the practical man whose pioneer efforts in the field, the factory, and the laboratory are made available as a guide to posterity. And because of the complexity of modern engineering in all its branches, its constantly widening scope and growing literature, it is becoming more and more important that the young man upon the threshold of his career shall be familiar with past failures and successes; to the end that he shall not waste his time in attempting experiments long ago undertaken by others, the records of which are available for the asking.

None of us, I am sure, would think of submitting himself to untrained hands if in need of a surgeon, nor would he knowingly commit his cause to one untrained in the law. The case of the youth about to enter the oil industry is to a great degree parallel—no one would think of giving him the job of drilling the well, producing the oil and transporting, refining and marketing it, unless he had first undergone a preliminary course of education, had served his apprenticeship. This apprenticeship may be served entirely in the field, but if it is served first in the classroom and thereafter in the field the result will, of course, be more satisfactory. And, given two boys equally endowed, the one possessing the technical education should not only far more quickly

complete his practical apprenticeship, but he would in after years be more completely the master of his chosen subject.

And, again, the reason is not far to seek: he has mastered not only the theory but the practice of his business; he knows not only what to do, but—and what is perhaps equally important—why he does it. I know, of course, that there are great men who have risen to premier rank in their several professions without a college degree, but I think it may safely be said of them that they would have the sooner arrived, and would have saved themselves endless and laborious effort, if they had in the first place completed a technical course of training. The information slowly gathered in fragments here and there over the long years of practical apprenticeship could be far better mastered in four years of intensive training in college, where it is acquired in an orderly, co-ordinated, and complete way.

We must not fall into the error of believing that a college degree is a certificate of ability. Far from it. The world is well supplied with men possessing sheepskins whose services would be dear at any price. Without the requisite foundation of character, all the diplomas on earth will fail to make their possessor a man of value. Common sense, that greatest of all fundamentals, is often notable by its absence among highly educated theorists.

We are basing our discussion broadly upon the question as to whether or not a technical education is desirable for a young man about to embark in the oil business. In production, certainly, some geology as well as civil and mechanical engineering is of value. In transportation, mechanical engineering is almost a necessity: and in the refinery a course in chemistry is a prerequisite for any man who hopes to master the refining of petroleum in all of its branches and stand among the leaders of modern refining practices. I believe, too, that a salesman who knows something of the chemistry of oils, and who has served apprenticeship in a refinery, will, other things being equal, lead the way rather than follow the lead of others.

All industrial activities should be constantly progressing. Inertia is fatal. And he who would lead or be near the head of the procession must of necessity have technical education as the foundation of his activities. He may not acquire it in college; it may come through the slow process of years of practical experience, but it is none the less necessary; and if four years will serve to acquire the fundamental knowledge that it would otherwise have taken fifteen or twenty years to gather, is it not the part of wisdom to adopt the former course?

There are many young men who have already started out in their work without having had the opportunity to secure the necessary technical foundation. I believe that those who can would do well to spend a year or more at some technical school, and with that groundwork build the balance of the structure by home study.

*Reprinted from Sinclair's Magazine, June, 1919.

It does not follow that, simply because work has been commenced before the college course has been undertaken, the time has gone by. I know several men who have abandoned work for the classroom and who have afterward returned to their business career far better equipped for the struggle.

The future has still in store many great discoveries in perhaps all lines of engineering endeavor. Certainly the end of invention has not yet been reached; there is much yet in store for the student who would venture upon pioneer expeditions into the realm of science. Learned mathematicians of the past demonstrated conclusively that the flying machine was an impossibility; and yet today we do fly. Petroleum may yet be made into edible fats; the heavy-gravity oils may be metamorphosed into 80 per cent gasoline; the impossible, so-called, may in years to come be found to be, after all, absurdly simple.

It is a wonderfully brave man—or an ass—who confidently outlines the limits of possible future advancement in the realms of science. I think that about all we can say with assurance is that the future holds possibilities as yet unfathomed.

TECHNICAL TRAINING NOW ESSENTIAL

Within the life of two generations conditions have been revolutionized. It was not particularly necessary for our grandfathers to be technically trained. Power, as supplied by steam, petroleum and hydro-electricity, was virtually unknown; and the myriad inventions that today depend upon power were unredeemed of. Our children have other days to face, wherein the activities of the time will rest largely upon technical skill. He who would be a part of those activities must know some phase of them, and know it well. A mere smattering of knowledge no longer suffices.

The man who is sought after today is the man who knows his subject thoroughly and who brings to the task not alone adequate training but common sense, honesty, and integrity, loyalty, and untiring energy. For such as these, opportunity beckons with insistent gesture. That it rewards only those who hold college degrees would be, of course, an absurd statement; but, all things being equal, the man with the technical training has an advantage that will be found difficult to overcome by those not so fortunate.

Edward A. Caswell Dead

Dean of Lead Industry, and for Years the Country's
Leading Lead Statistician, Expires Suddenly
At West Chester, Pa.

EDWARD ALEXIS CASWELL died suddenly on June 25 at West Chester, Pa. In his death the metal industry lost one of its best-known and most-respected figures. For nearly half a century he had been prominently identified with the lead business of the United States, as a broker and statistician, and for many years there was no one better known in those capacities.

Mr. Caswell was graduated from Yale in 1866, and immediately afterward went to Europe, where he remained for six years, studying, traveling, and seeking restoration to health. During a part of that time he was correspondent to newspapers in this country. Returning to the United States in 1873, he engaged in business as a metal broker in New York, and continued in

that business up to the time of his death. In December, 1912, owing to his advanced years, Mr. Caswell incorporated the business under the name of Caswell & Starke, Inc., and during recent years he had not been very active at the firm's office.

Mr. Caswell was born in New York in 1844. His father was Nathan Caswell, a descendant of Peregrine White, and his mother was Mary Lincoln (Bowman) Caswell. He was married to Emma Fairbanks in Geneva, Switzerland, in 1872. His wife died in New York City in 1883, leaving two children, a son and a daughter.

From Mr. Caswell's early participation in metal-industry affairs up to about the beginning of this century he was one of the recognized pig-lead statisticians in the United States. In earlier years he was, in fact, the only one; and the possession of any statistical working knowledge about the industry was due to him. In the course of time, however, as statistical work was taken up by others, Mr. Caswell gradually dropped it as being no longer a necessary effort on his part.

Mr. Caswell was a member of the Century Association and the Yale Club. In addition to his business, he wrote occasional musical and art criticisms for the New York daily papers. He was one of the charter members of the New York Metal Exchange.

Mr. Caswell was highly esteemed by all who came in contact with him, and the number of his staunch friends is legion. The men who were most closely associated with him in business unite in saying that he never did anything dishonorable, nor did he ever seek an unfair advantage. He was a true and loyal friend of all. With his passing away, the lead business of the United States may be truly said to have lost its dean.

Expiration of Flotation Patents

According to the *Boston News Bureau* of June 23, 1919, the following statement recently appeared in print on behalf of the Butte & Superior company in its legal controversy with Minerals Separation, Ltd:

"The Butte & Superior Mining Co. states it is prepared to continue the use of permissible quantities of oil until the expiration of the (Minerals Separation) patent in November, 1923, (after which time the use of the process with any quantity of oil will be free and open to the public), or to adopt one of the more economical methods now coming into use."

The article continues to the effect that counsel of Minerals Separation was asked for a statement concerning the patent expiration referred to, and the following reply was received:

"The fact is that the patent which was adjudicated by the Supreme Court in the Hyde case and in the Butte & Superior case ends its seventeen-year term on Nov. 6, 1923, and the public will then be free to the use of the invention disclosed and claimed in that patent. There are, however, many other flotation patents owned by the Minerals Separation North American Corporation which have considerably longer periods to run, such, for example, as the basic patent covering the use of soluble frothing agents, which expires in June, 1927; the aromatic-hydroxy-compounds patent, which expires in 1931 (both of which patents have been declared valid by the Circuit Court of Appeals of the Third Circuit), and the essential-oils patent (which necessarily includes pine oil), which expires in 1930."

Recent Metallurgical Progress*

Flotation Has Revolutionized Concentration—Zinc Metallurgy Has Advanced, Though But Little, in Smelting—In Copper, Reverberatory Practice and Ammonia Leaching Are Chiefly To Be Noted

BY HUGH K. PICARD

President of the Institution of Mining and Metallurgy

IN REGARD to metallurgical advance during the last few years, it will probably be conceded that the practice of flotation has brought about greater progress in metallurgy than any other single invention. At the inception of the froth flotation process in 1905, oils, such as oleic acid (then deemed to be insoluble), were used. As careful analysis showed the mineral so frothed to be intimately associated with the insoluble oil employed, the impression was gained that this had uniformly coated the particles which had been floated, and that the air-bubbles had become attached to such oiled particles. As the amount of oils used was relatively minute, say two pounds to the ton of ore, though the aggregate surface of the particles oiled is enormous, calculation showed it to be questionable whether an oil could be distributed *qua* "oil" in such extreme tenuity and still retain its original physical properties.

PROCESS BECOMES KNOWN AS FROTH FLOTATION

With the discovery, about four years later, that other and wholly soluble frothing agents were found equally as and sometimes even more efficacious, the conception that oil was primarily essential to frothing was necessarily modified, and the process became more widely known as that of froth flotation. With later discoveries as to the partial solubility of essential oils, of the beneficial effect of certain insoluble oils in "stabilizing" the froths and of sub-aëration procedure, the elimination of any need for pulp-heating, or in many cases for acidification, together with the use of alkaline circuits, and like expedients, modern flotation has made remarkable advances.

Broadly speaking, the essential conditions for effective flotation appear to be that the material to be floated must be capable of flocculation, whereas that not to be floated must be brought as nearly as possible to the reverse state. This is achieved by the addition to the ore pulp of reagents which by absorption or adsorption at the surfaces of the various particles increase such differentiation. Acids, alkalis, and certain alkaline salts act in the direction of wetting the gangue by water more profoundly, producing a deflocculation effect and the adsorption or absorption of a minute amount of an immiscible oil at the mineral surface renders this still less capable of being wetted by water, and thus stabilizes a mineral-coated bubble in water.

The water-soluble portion of an oil, or a water-soluble substance such as cresol or amyl alcohol, reduces the tension of water, and thus permits the latter to form an extended froth surface for occupation by the less water-wetted floatable mineral. Certain oils may thus play a dual part in flotation. Variations in ore constitution—both physical and chemical, in the nature of the water, in choice or limitation in reagent, and in local conditions generally—are so wide that each one

will present a flotation problem of its own, requiring individual study. Where the factors are so varied flotation must in large degree remain an art, as well as a growing science. This condition, however, governs applied science generally, and metallurgical processes form no exception to the rule.

I understand that contributions to the more scientific aspects of flotation may be expected soon, which will, no doubt, go far to elucidate the fundamental principles on which the process is based.

Since the outbreak of war, flotation methods have been widely, indeed almost universally, adopted. During this period, the greatly extended use of this process in the United States is the most notable feature, and it is hardly too much to say that concentration practice has been revolutionized. In addition to the increased recoveries of mineral due to the ability to deal effectively with slimes, its adoption has led to a general simplification of concentration procedure, with a corresponding reduction of working costs.

In modern installations, such as that of the Inspiration Consolidated Copper Co., Miami, Ariz., where the plant was specially designed for flotation, the current practice is to limit the units to the smallest number possible. At this mill, the ore, first crushed by disk crushers, is passed to tube mills, working in closed circuits. The pulp is then immediately sent to flotation units, with the consequent elimination of all intermediary steps in the concentration. The re-treatment of any middling products and the enrichment of the primary concentrates are also effected by flotation, resulting in a simple flow sheet.

Froth flotation has developed the use of settlers and vacuum filters, which are now indispensable units in concentration plants adopting this process. The settlers are in some instances employed for the re-utilization of plant water and in others for the thickening of concentrates prior to vacuum filtration. Their usual size is from 30 to 50 ft. in diameter, but in some instances settlers of over 200 ft. in diameter are in use. The shallow "tray" settler is also employed where the physical character of the ore permits. The trays consist of units 3 to 4 ft. in depth superimposed on a common shaft to economize space and secure increased capacity.

Similar progress has marked the evolution of the flotation units themselves. In the M. S. type, for example, the driving gears have in some instances run continuously for over three years. These units are self-regulating, the supply of reagents being automatic, so that in practice it is not uncommon to find one man per shift operating units dealing with between 3,000 and 4,000 tons of ore per twenty-four hours.

Everywhere the tendency is toward the elimination of hand labor. Thus, besides ores, the concentrates and tailings are handled by settlers and belt conveyors, and the grouping of all units is designed with the object

*Excerpted from the presidential address delivered at the annual general meeting of the Institution of Mining and Metallurgy, in London, May 8, 1919.

of reducing to a minimum labor, space, and construction cost. The result has been a reduction in treatment cost which, in many instances, has rendered obsolete the best of the older gravity-concentration systems.

FIGURES SHOW ADVANTAGES OF FLOTATION

Comparative figures as to the advantages of flotation may be of interest. The total tonnage of ore treated by water concentration at the Anaconda plant from February, 1902, to December, 1915, was approximately 36,000,000 tons, carrying 1,250,000 tons of copper, of which the actual recovery was approximately 900,000 tons. In 1916 flotation was installed, from the results of which it is estimated that had it been used during the earlier period 175,000 additional tons of copper would have been saved, capable of realizing, less cost of treatment, a further profit of nearly £8,000,000. In 1913, when water or gravity concentration had attained perhaps its high-water mark of efficiency, the five largest porphyry copper mines in the United States produced approximately 162,000 tons of copper, but discarded 83,000 tons in tailings, the average recovery of copper at these mines being about 66 per cent. Had flotation been employed, it is now demonstrable that their increased recovery for that year alone would have exceeded £3,500,000.

In its turn, however, flotation has introduced new smelting problems, mainly due to the fineness of the material to be handled. The International smeltery, at Miami, which now represents the latest copper-smelting practice in America, has been specially designed to deal with this type of concentrate. Hand labor here has also been practically superseded by mechanical appliances; specially designed cars handle the concentrates and facilitate their loading and unloading, prior to their passage to the roasting plant. The roasters are fired either by oil or coal dust, the latter having now proved the more economical. The Cottrell process here becomes a necessary adjunct, preventing dust losses with practical completeness. Again, progress in one department of metallurgy has imposed conditions which have led to improvement in another; thus, the cost of smelting the fine concentrates, originally so difficult to handle, is now reduced to between 5s. and 6s. per ton of charge.

Though the theoretical principles underlying flotation are still unsolved, progress in this direction is being made, and it is one of the most remarkable features of this process that its use has been so greatly extended, although its full scientific basis is yet unestablished. Callow, whose contribution to the technics of the art deserves special mention, calculates that with four different oils, three oil percentages, two pulp densities, and two changes of temperature, the possible commutations are no less than 59,284. This gives some idea of the difficulty experienced in arriving at the effect of any given change of conditions, but in spite of this over 400 flotation plants have been installed in the North American Continent alone.

LITTLE IMPROVEMENT IN ZINC SMELTING

Passing to the metallurgy of zinc, there has not been marked improvement of first importance in smelting during recent years, though general advance in matters of detail may be recorded. The problem of the mechanical roasting of the ores cannot yet be considered as completely solved, especially for the more refractory

types, such as Broken Hill concentrates, which form so large a proportion of the world's supply of raw material. Though improvement has been effected in this direction, as exemplified by the Ridge and Spiret furnaces, it is significant that in the latest zinc works to be erected in this country the management has adopted the hand-rabbléd Delplace furnace as being the type best suited to its requirements. These works, situated at Avonmouth, are being constructed by the National Smelting Co., and are designed for an ultimate output of 50,000 tons of zinc per annum. When completed, with extensions of other existing works, they should go far toward establishing the industry in this country on a much sounder basis than existed before the war.

No effort is being spared to make the Avonmouth works thoroughly efficient and up to date. The general lay-out is well designed, and provision is made for future extensions. The pottery has a capacity of 45,000 retorts, and is arranged for convenient handling in and out. Two hydraulic pot presses are to be installed (one of which is already erected), which will supply the retorts for the sixteen retort furnaces now planned. These are of modern gas-fired type, the retorts being arranged in four rows, back to back. The air is preheated in regenerative chambers under the furnaces. These chambers are protected from injury due to slag from broken pots by the interposition of a layer of chrome-iron ore between the regenerators and the retort chamber. Five gas producers are provided for each pair of furnaces, two being in regular use for each furnace, the fifth being a spare one which can be turned on to either furnace, as may be required.

Though Delplace furnaces are being installed for roasting, the management is erecting one of special design, upon the results of which future additions will depend. The former are of large type, having six muffled hearths with eighteen sections, and should be capable of dealing with twenty tons of raw concentrates per day. Special care has been taken in the design to insure easy renewals of the hearths as required.

The acid plant, of platinum "contact" type, was originally built by the government, and has been used for the manufacture of sulphuric acid from Sicilian sulphur. With the necessary additions for cleaning the roaster gases from arsenic and other objectionable material, this plant will be available to deal with the sulphur dioxide evolved from the twenty roasting furnaces that it is purposed to install.

In view of the present high cost of both labor and material, and of the improved extraction now called for, much attention has lately been given to the question of treating retort residues for their metallic contents, both as to zinc still contained, and other metals such as lead and silver, if present. It has been proposed to blow such residues on Wetherill grates, but this yields a mixed product of zinc oxide and lead sulphate and affords only a partial elimination of the silver. Other objections are the inferior quality of the product (due to a certain amount of fine grit being carried over with the fumes), and if silver be present the blown fume acquires a pinkish tint, rendering it unsuitable for paint purposes. Further, the silver, both in the fume and the ultimate residues, is lost.

In the absence of silver, a market exists for the zinc oxide-lead sulphate product, if free from grit and carrying about 20 per cent of lead. Such a mixture makes a paint of covering power superior to pure zinc-white,

besides being cheaper. For ores of a less complex character, "blowing" the residues offers fair possibilities, and it has even been proposed to modify the usual distilling practice in the direction of recovering only the more easily distilled part of the zinc, calling for the employment of a smaller amount of reducing coal and leaving a richer zinc residue for blowing. Such a procedure would increase the capacity of the distilling furnace and result in longer life of retorts, as it would not be necessary to submit them to the high final temperature required to drive off the last units of zinc.

ELECTROLYTIC ZINC PROCESS WILL BE ESTABLISHED

Wet processes for zinc extraction, with the subsequent recovery of the metal by electrolysis, have now become firmly established. Ashcroft's pioneer work in this direction will be remembered. The conditions necessary for success, notably roasting at a low temperature to avoid the formation of insoluble ferrite, and the subsequent perfect purification of the solution, are now well understood, the latter condition being demanded by the necessity for keeping the deposited zinc in a passive state to prevent re-solution. As a necessary consequence, electrolytic zinc will always be highly pure compared even with the redistilled zinc producible from retorted metal.

Much discussion has taken place as to the possibility of the electrolytic process displacing the older method; but it seems probable that for some years both processes will survive, and that local conditions with regard to the nature of ore, power cost and facilities, and other factors of production will determine which method shall be adopted for any particular case. It may be said for the electrolytic process that it certainly permits the utilization of low-grade and complex zinc ores which cannot be made available to the retort process. As an example, the Consolidated Mining and Smelting Co. is treating ores by this method at Trail, which assay as low as 20 per cent zinc and carry 14 per cent lead. Further, combination dry-and-wet processes are likely to develop in which the zinc oxide (and lead if present) are concentrated as a "fume" for subsequent treatment by solution of the zinc, followed by electrolysis. Such methods have the advantage of yielding a zinc solution which requires the minimum of purification, at the same time leaving other metallic contents in a form recoverable by smelting.

At Anaconda, Laist has proceeded in a reverse direction, by first extracting roasted flotation concentrates with acid, electrolyzing the purified solution, and treating the residues by volatilization in a reverberatory furnace, the contained zinc being recovered as oxide. According to recently published information, Laist no longer recovers the zinc by volatilization, confining this operation to the saving of the lead, the zinc passing into the slag. How far this is due to more perfect original extraction of the zinc in solution in the previous operation is not stated.

AMERICAN METALLURGISTS CHIEF CONTRIBUTORS

These developments are due in large degree to the work of American metallurgists, who have at their disposal large supplies of ores of varying character, which offer scope and opportunity for special methods of treatment. But in this country, also, zinc has been regularly produced by electrolysis from ores, though on a smaller scale. Given, however, equal opportunity, we

may certainly claim to possess the necessary technical knowledge to compete with foreign producers.

The war brought about a large demand not only for the highly pure electrolytic zinc of 99.95 per cent grade, but also for metal of 99.9 per cent purity, obtainable by the redistillation of ordinary brands, and even of hard spelter, which contains from 90 to 92 per cent zinc, the remainder being mainly iron. The preferred method in this country was devised by Fricker, who distills the metal in vertical-closed crucibles provided with connecting pipes leading into a brick condensing chamber common to a number of pots, generally eight. The lead and other impurities are prevented from passing over with the zinc vapor by covering the surface of the molten metal with a floating filter of crushed coke or similar porous material. By this process large quantities of refined metal have been produced for cartridge brass and other purposes.

How far the demand for high-grade zinc will persist for ordinary commercial uses is uncertain. For most alloys containing a substantial percentage of zinc, as also for galvanizing, ordinary brands of spelter are sufficiently pure. Hence, consumers are not likely to pay the higher price demanded for "purity" metal.¹ The latter will therefore have to compete with G.O.B., and producers may perhaps be forced to accept a price only greater in proportion to the higher unitage of the purer product.

Before leaving the subject of zinc metallurgy, reference may be made to the manufacture of zinc oxide in this country. Before the war practically the whole of our requirements were met from Continental and American sources. Indeed, our secondary products were, in some cases, bought by German firms, exported to the Continent for treatment, and the zinc oxide product again sold to us. War conditions have since brought about the establishment of a home zinc-oxide industry; and, as in other cases, we now produce this material of a quality equal in all respects to that hitherto imported. Works capable of producing fifty tons or more per week are running regularly, and, given reasonable protection against unfair competition, there seems to be no reason why all of our requirements should not hereafter be met from home sources.

The oxide is manufactured by distillation of hard spelter and scrap, with subsequent burning of the volatilized metal to oxide, which is collected in a baghouse plant in the usual way. Technical details as to pipe, arrangements, fan capacities, and other operating factors have been worked out, and the conditions necessary for the production of the highest quality product have been established. No doubt there will still be competition from American oxide, produced directly from ore, owing to the lower cost of the raw material employed. This oxide, though of inferior color, is suitable for many purposes, such as rubber filling; moreover, it possesses the advantage of high density. Oxide production from ores and residues, though not yet established in this country, is being investigated, and there is reason to expect that this may eventually prove successful.

In South Wales zinc dust ("zinc blue") has recently been manufactured direct from metallic scrap, and a product obtained which is far superior to that derived as a byproduct from the retort process. The latter

¹The galvanizer would prefer pure zinc if obtainable at a reasonable price, as a more durable product results from its use.

usually contains about 85 per cent of active zinc, whereas the former carries not less than 95 per cent. The demand for high-grade zinc dust in the dyeing industry is large, and owing to its superior reducing value it should have a good outlet in gold precipitation.

The prepared fume is screened in a flour miller's bolting machine. Owing to its granular character, no difficulty is experienced in screening. The product, though excessively fine, is uniform in size of particle and free from dust; under the microscope each grain is seen as a brilliant metallic sphere. A word may be said as to the perfection of the bolting machine for screening fine powders. This has been developed to meet the stringent requirements of the corn-milling industry, and, if better known, would no doubt find application in screening dry crushed ore.

A wider general knowledge of the practice of industries other than our own would, I believe, lead to the discovery of many appliances which could be adapted to our special needs. For example, the filter press was well known to the potter before its value was recognized in ore treatment. He has from our point of view the worst possible type of clayey material to filter, and, in addition, contamination by iron rust must be avoided. Hence he adopts a press with wooden frames. We could perhaps reciprocate by introducing to him the vacuum filter and pulp thickeners.

COPPER METALLURGY HAS PROGRESSED

For developments in the metallurgy of copper we naturally look to the United States. Thanks to the publicity given to progress in the States, and to excellent technical publications, we have been made familiar with recent advances, and it thus becomes unnecessary to refer to them in detail. Among such, reverberatory practice (due to the ever-increasing amount of flotation concentrates to be smelted) may be mentioned. In this connection the increased throat area, with correspondingly larger burners for oil or coal-dust firing, resulting in largely increased output per furnace, should be noted. The El Paso 130-ft. furnaces, burning oil, have reached a daily capacity of over 960 tons, with a consumption of 0.61 bbl. of oil per ton. Leaching of oxidized copper ores by ammonia, so often suggested, has come within the domain of practical metallurgy. For example, it is reported that the Calumet & Hecla Mining Co., in a plant treating 2,000 tons of tailings per day, is recovering copper at a total cost of 6.25c. per lb., with a loss of only 1 lb. of ammonia per ton of ore. Further developments have also taken place in acid-leaching plants, in connection with which A. W. Halin's process deserves mention. He passes the acid solution through a number of ore charges until the solution becomes neutral. It is then delivered to a tank containing fresh ore, whereby the ferric iron is precipitated, whence, after acidification, the solution passes to the electrolyzing plant for precipitating the copper. The treatment of ore in heaps by leaching, following Rio Tinto practice, is also being extended in America.

The metallurgy of gold, in so far as it relates to the recovery of the metal from its ores, shows general improvement, but nothing of first-rate importance except perhaps Crow's method of precipitating cyanide solution under reduced pressure. He shows that the air dissolved in the solution has, owing to the different coefficients of absorption, a composition of 35 per cent of oxygen and 65 per cent of nitrogen, and consequently

is a more active oxidizing agent than air of normal composition. He points out that in weak cyanide solutions, consequently with a minimum of hydrogen being generated, the oxidizing action of the dissolved oxygen largely neutralizes the reducing action and may even overcome it. In normal practice this is met by adding lump cyanide at the head of the precipitation box, with consequent increased consumption of both cyanide and zinc. By the adoption of the vacuum process this practice is unnecessary and extraction may be effected with weaker solutions, resulting in savings in all departments, including the production of a purer bullion. The Portland Gold Mining Co. reports a saving of \$30,000 a year in zinc and cyanide in a plant treating 2,000 tons of ore per day. It is interesting to note that G. T. Hansen claims similar advantages by heating the solutions to 170 deg. F. before precipitation.

FLOTATION OF GOLD ORES HAS RESTRICTED FIELD

Concentration of gold ores by flotation is making progress, but the field for this process is somewhat restricted, owing to the general high efficiency of the older methods. At Cobalt, flotation has replaced gravity concentration, though at the Nipissing mines this process has been rejected, not on account of its inefficiency, but because of the difficulties in subsequent treatment of the concentrates. On complex gold-silver concentrates involving further treatment, the advantages of flotation compared with ordinary concentration followed by cyanide are not so manifest. The value of flotation as a means of increasing the world's output of gold lies, rather, in improved recovery of base metals, such as copper, with which gold is so commonly associated.

In the metallurgy of lead, also, recent advances seem to be in detail rather than in fundamental improvements. In the stress of recent years there has been small opportunity of developing new processes in industries that are well established on recognized lines, such efforts being rather devoted to specialties called for by the art. Mention, however, may be made of progress in hydro-metallurgy, as applied to oxidized lead ores. This has been limited to brine treatment, with or without the addition of sulphuric acid to carbonate and sulphate ores. This process has been tested in America, as well as in North Wales, where a small plant was working until the difficulties of obtaining supplies caused a temporary cessation of operations. In this case the material to be treated consisted of an extensive dump of blende and lead sulphate slimes.

Vanner concentration yields a mixed product of no value until further separated. This is effected by agitating the concentrates with hot saturated brine at 70 deg. C., whereby the lead sulphate is completely dissolved, with, of course, the equivalent formation of sodium sulphate. The presence of this salt in growing proportions interferes with the solubility of the lead sulphate, and it must therefore be removed by the addition of the equivalent amount of calcium chloride. The lead solution is filtered from the blende-calcium sulphate residues, and precipitated with slaked lime, re-forming a portion of calcium chloride. About 50 per cent of the chloride is regenerated, the rest of the chlorine being precipitated with the lead as oxy-chloride. The blende-calcium sulphate residues are then re-treated on a vanner, which effects perfect separation of the easily removed flocculent sulphate, leaving a

salable blende concentrate. The chief objection to the process lies in the chloride present in the lead precipitate, involving volatilization loss in smelting, but this may be overcome by precipitating the lead by electrolysis, using soluble iron anodes. This process is limited in its usefulness by the relatively small quantity of material available and by its inapplicability to silver or gold contents. It may, however, develop in the direction of the treatment of low-grade sulphide ores, after a sulphating or chloridizing roast at a temperature low enough to prevent the volatilization of the lead chloride.

In the province of general metallurgy the increasing use of the Cottrell process deserves special mention. As an example of painstaking research in developing a practical process from a long-known but unused scientific fact, it has few equals. We have to go back to 1870 to the work of Dr. Tyndall for the first disclosure of the phenomenon on which the process is based. This was further examined by Frankland, Lord Rayleigh, and Oliver Lodge; but for the useful application of the principles involved we had to wait for Dr. Cottrell. He first applied the method to depositing sulphuric acid mist produced in the contact process, and it is still being used for this purpose. It is satisfactory to report that the merits of the invention have been recognized in this country, the first plant to be erected here in 1917 being at one of the government acid plants. It is also in use here for the precipitation of fumes from metallurgical works, following established practice in America; and its further extension in this country seems certain. The advantages of the process are far-reaching. Not only are valuable products recovered, but agriculture in the neighborhood of the operations is saved from serious damage. We are glad to congratulate Dr. Cottrell on receiving the Perkin Medal as a recognition of his valuable services to industry.

Labor Troubles at Butte

Shorter Workday and Wage Increases Sought by All Crafts at Mines—Anaconda Pay Office Dynamited
— C. F. Kelley in Butte—Local Merchants Called Profiteers

BUTTE CORRESPONDENCE

LABOR controversies are occupying the center of the stage in the Butte district. All crafts engaged at the mines either have made demands, or will do so soon, asking for a shorter workday and material wage increases, which demands at this time, it is expected, will be rejected by the operators, in view of the high mining costs and market conditions.

C. F. Kelley, president of the Anaconda Copper Mining Co., arrived in Butte tonight (July 7) to take personal charge of the labor situation, and conferences with local mine officials will be held on July 8 to set dates for meeting with representatives of unions. Mooney sympathizers and the I. W. W., by a system of personal picketing, up today had succeeded in inducing about 35 per cent of the working force of miners in the district to stop work, although many of these have quit in line with the program to enforce demands for higher wages and a shorter workday. The miners themselves as yet have presented no formal demands, despite the fact that all other crafts have done so.

The downtown pay office of the Anaconda company, which is remote from the mines, was dynamited Sunday. This is regarded as the work of a fanatic. Little damage was done.

The metal crafts, comprising all classes of mechanics employed at the mines, demand \$8 per day for journeymen and \$7 for helpers, with a 5½-day week, with overtime at double pay for Saturdays and Sundays. These crafts now are receiving \$6 for journeymen and \$5.75 for helpers. Carpenters ask for similar increases. Smelter men's demands are based on what is purported to be a Government report showing that the cost of living has doubled since 1914, and a wage increase which would measure correspondingly is asked. This would not necessarily mean doubling the present pay of smelter workers, as their wages have been increased materially since 1914. The smelter men's organization embraces most of the crafts employed at the reduction works. Demands of the miners had not been received up to the time this is written.

The unions also had asked the companies to take steps to lower living costs by establishing company stores operated at cost. The complaint is widespread against alleged profiteering of Butte merchants, and the unions declare that it is impossible to live in Butte under the present expenses, even under what the new scale demanded would give them.

One factor in favor of the operators is that the greatest number of miners are on what is known as a contract basis. That is, they are paid for what they do, and their remuneration is running from \$6 to \$12 daily. These men are not in favor of striking, particularly as they either are married or have dependents. The I. W. W. and radicals long ago were weeded out of the properties to a great extent, with the single men giving way to the married or those with dependents, thus leaving the more conservative of the miners.

There is apparently a disposition on the part of the unions to wait and see what the Anaconda company is disposed to do before deciding upon radical action, as word has gone forth that the company is not opposed to suspending mining operations altogether for a period, in view of the huge copper surplus.

Despite unofficial word that the operators were not inclined to grant wage increases, a feeling of optimism is dominant, and the sentiment obtains that wage increases will be had, particularly as the copper market is showing signs of recuperation to an extent which will show a profit under present conditions.

A Department of Public Works

New Bill Introduced in Both Houses To Reorganize Interior Department—Will Bring All Engineering Activities of Government Into One Department

FAR-REACHING changes in the executive machinery of the Federal Government are proposed in bills introduced in each house of Congress on June 25. The Federal Department of the Interior will become the Department of Public Works, if the legislation proposed is enacted. The main idea is to assemble all engineering activities of the Government in one department.

Such bureaus of the Interior Department as are non-engineering in character are, under the terms of the

bill, to be placed under the jurisdiction of appropriate departments, and engineering bureaus from other departments are to be included in the Department of Public Works. The bill proposes that the Patent Office be removed from the Interior Department and placed under the Department of Commerce. The Bureau of Pensions is assigned to the Department of the Treasury. The Bureau of Education and the Bureau of Indian Affairs are transferred to the Department of Labor, with the proviso that the engineering and construction work and the land and mineral surveys now performed under the direction of the Bureau of Indian Affairs are to be prosecuted under the Department of Public Works.

On the other hand, the Department of Public Works is slated to absorb the Supervising Architect's Office of the Treasury Department, the Construction Division, River and Harbor Improvements, Mississippi River Commission, and California Debris Commission of the War Department, the Bureau of Standards and the Coast and Geodetic Survey of the Department of Commerce, the Bureau of Public Roads, and the Forest Service of the Department of Agriculture.

The bill provides that the Secretary of Public Works "shall by training and experience be qualified to administer the affairs of the department and to evaluate the technical principles and operations involved in the work thereof." The measure accepts from the foregoing provision the Cabinet officer who is at the head of the department at the time of the passage of the bill.

Four assistant secretaries, each to be paid \$7,500 per annum, are provided and their duties outlined. One assistant secretary is to have administrative jurisdiction over all matters of engineering design and construction. Another is to have charge of architectural design and construction. The third is to have jurisdiction over all scientific work and surveys, and the fourth is to be in immediate charge of all land and legal matters. The assistant secretaries are charged with the duty of co-ordinating all activities of the department.

An important feature of the bill is the proviso that engineer officers of the U. S. Army detailed on non-military work are to be assigned by the Secretary of War to like duties under the new department, for not over two years. This enables the Secretary of Public Works to make gradual transfer of improvements and instrumentalities to civil administration without detriment to public interest. Members of the Corps of Engineers may, under the direction of Secretary of Public Works, be detailed by the Secretary of War to temporary duty in the new department for such instruction, training, and experience as desired.

The bill was introduced in the upper house by Senator Wesley L. Jones, of Washington, and in the lower by Representative Frank C. Reavis, of Nebraska.

June Pig-Iron Production

Pig-iron production during June was 2,114,863 gross tons, or an average of 70,495 tons per day, as compared with 2,108,056 tons in May, a thirty-one-day month, according to *Iron Age*. Ferroalloy production amounted to 14,254 gross tons, of which about 70 per cent was ferromanganese. The estimated capacity of the 200 furnaces active July 1 is 71,700 gross tons a day, as compared with 195 furnaces, rated at 68,600 tons, active June 1.

Cornerstone Laid for Assay Office In New York

Carter Glass and W. G. McAdoo Have Chief Parts in
Ceremony at Site of New Building
In Wall Street

THE cornerstone of the new eight-story building that is to house the United States Assay Office in New York was laid on July 1 with fitting celebration. The ceremony, taking place at noon in the heart of the financial district, was witnessed by many thousands who filled the adjoining streets.

Vernon M. Bovie, superintendent of the Assay Office, was in charge of the ceremonies, and after a brief opening address resigned his position as chairman to Mr. McAdoo, who in a short speech introduced the Secretary of the Treasury. Mr. Glass, speaking briefly, confined his remarks chiefly to the position which the United States occupies in the world and set forth the steps by which it has been brought to its present high place.

Following the addresses, Mr. Glass and Mr. McAdoo participated in the actual work of laying the cornerstone, and with a silver trowel designed and cast in the local Assay Office spread at the base of the huge marble block the mortar which will hold it in place.

Calumet & Hecla Increases Forces

HOUGHTON CORRESPONDENCE

The Calumet & Hecla and subsidiary companies announced on July 7 that all underground workmen would be re-employed. This means that 3,000 men will return to work in the mines. Copper output will not be increased beyond 50 per cent of normal, but the amount of underground development work will be augmented. This event presages the turn in the copper-metal situation as viewed by the leading Michigan copper producers.

West Virginia Well Down 7,579 Feet

WASHINGTON CORRESPONDENCE

Evidence sustaining the temperature hypothesis of a cooling globe has been obtained by the U. S. Geological Survey in the large number of thermometer readings made during the sinking of a well near Valley Falls, W. Va., to a depth of 7,579 ft. The temperature near the surface was 52 deg., whereas at a depth of 7,500 ft it was approximately 170 deg. A slight reduction in the steepness of the gradient is noticed below 6,500 ft.

The well was designed for a test of the Clinton sand on the prominent geological arch, which is deeply cut by a river at the point where the well was put down. It was remarkable for the fact that it was dry and no casing was used below 2,000 ft. Caving started near the bottom of the well, however, and the drillers were forced to give up their attempt to reach a depth of 8,000 ft. The log of the well is being studied by the State Geologist of West Virginia.

The well was bored by the same company which put down a Goff well near Clarksburg, in northern West Virginia. That well, at the time of its drilling, about nine months ago, was the deepest well in the world. The record prior to that time had been held by a boring at Czuchow, in Silesia, which was 7,349 ft. deep.

Embedded in the stone was a copper box containing the customary documents, coins and other mementos. An inscription on the block read: "William G. McAdoo, Secretary of the Treasury; Raymond T. Baker, Director of the Mint; York & Sawyer, architects; James A. Wetmore, supervising architect; MCMXXVIII."

The new Assay Office, when completed, will contain the largest vaults of their kind. They will be able, it is estimated, to hold \$20,000,000,000 in gold. There is at present in the local Assay Office more than \$900,000,000 in gold and more than \$100,000,000 in silver. Five of the building's eight stories will be below the level of the street and three of them above.

Chronology of Mining, June, 1919

June 2—Period set for filing claims with War-Minerals Relief Commission closed, 1,287 claims having been filed.—U. S. Supreme Court decision handed down in Minerals Separation, Ltd., vs. Butte & Superior.—Pan-American Commercial Conference opened at Washington.

June 5—Powder explosion in Baltimore tunnel of Delaware & Hudson Coal Co. killed 83 and injured 50.

June 9—Arizona Employers' Liability Law held constitutional by U. S. Supreme Court in case against Arizona Copper Co.—American Zinc Institute opened first annual convention at St. Louis, Mo.

June 13—Strike of underground employees declared at mines in Grass Valley district, California.—War Trade Board announced scientific books and periodicals printed in Germany may be imported.

June 16—War Trade Board announced licenses will be issued for tin imports.

June 18—American Institute of Chemical Engineers opened semi-annual meeting in Boston.

June 19—Lake Superior Metal Mine Safety Conference opened in Duluth.

June 24—Strike at Park City, Utah, ended.

June 25—Bill introduced in both houses to create a Department of Public Works.

June 26—Interstate Commerce Commission permitted shippers to use old bills of lading until Sept. 8, 1919.

June 27—Arizona Chapter American Mining Congress opened bi-monthly meeting in San Francisco.

June 28—Strike of miners at Grass Valley, Cal., ended.—War Department offered platinum surplus for sale.

June 30—Transference announced of War Trade Board's personnel, powers, duties, and records to Department of State.

BY THE WAY

Junk

The connection between the secondary metals industry and criminal courts is not immediately apparent. However, according to an investigation made for the Juvenile Protective Association of Chicago, much of the delinquency of minors (not miners) in that city is to be attributed to the lure of the junk dealer. Statisticians will no doubt find it an interesting addition to the data already accumulated to estimate what portion of the secondary metals annually saved is "recovered" with the

aid of the Fagins of the junk business. The householder who is blithesomely packing up for a month at the seaside should include the investigating committee's bulletin in his summer reading. When he returns he will then be prepared to answer the query, "Where are the lead pipes of yesteryear?"

Objection Sustained

"Ere, partner, gos' long naow an' 'ave tha doctor take a geek at thee afor' thee gaws down in the bal," said Cap'n Dick. "Better that thee's 'ol an' soun' than to 'ave some o' these 'ere physical difficulties 'amperin' tly work. These 'ere days, m'son, ut don't do. Back 'long ve, in tha days o' 'ammer an' drill, Jan Penglase, 'e an' Dick Trevarrow wuz double-jackin' to Dolcoath mine. Many years befor' Jan 'ad los' 'is lef' h'eye, but few nawed about un, an' them as did figger'd as 'ow 'e 'ad a 'andsom glass one. Any'ow Dick never nawed till one day 'e wuz 'oldin drill an' Jan wuz strikin'. So 'appened w'en Jan lef' tha 'ouse in a 'urry that mornin' 'e came away leavin' this 'ere glass h'eye be'ind. They wuz takin' five, an' Dick looks h'up an' sees this 'ere h'empty socket. 'So 'elp me, Jan,' says Dick, 'Wot's tha matter with tha h'eye?' 'Oh, dam-me,' says Jan. 'I lef' un 'ome; she's one o' these 'ere glass chaps. Never figger'd for to do that.' 'Veli, gos' along with thee, Jan Trembath, I'm through,' said Dick; 'W'y, dam-me, man 'as 'ard nuff time strikin' with two h'eyes, let alone 'avin' one o' they glass beggars.' So thee can see, m'son, some men is powerful particular as to 'oo they works with an' these days a chap mus' be physically perfect."

The Chromatic Rainbow Process

Tourists and perhaps metallurgists passing through Salt Lake City will find it worth while to visit the plant of the General Reduction & Chemical Co. there. The public has been invited, in fact, by the company to witness demonstrations in the new science of converting crude ore into finished paint. Its advertisement runs thus:

The crude ore is crushed and by the application of various chemicals is reduced to pure pigments, such as prussian blue, white, chrome, red and arsenate of lead, and every desired shading or color. In fact, there are no colors we cannot produce. Besides this, we not only recover and set aside valuable byproducts, such as silver, zinc, iron and sulphur, or any other metal the ore may contain, but we save all chemicals, and use them over and over again.

Mine owners are urged to bring in samples and have them treated free of charge.

"It seems unfortunate that a company producing paints like these did not advertise in colors," says George D. Van Arsdale. "Of course, it is a little difficult to understand from the advertisement where the colors are to come from, as it is stated that all metals are recovered as byproducts and all chemicals used over and over again. This is no doubt a mere matter of detail, and probably the pure pigments are only intermediate stages in the production of the final products.

"As a name for this interesting process there is so little choice between chromatic and rainbow that it would seem best to call it the chromatic rainbow process. With the suggestion of the pot of gold which we all know is at the foot of every rainbow, investment in the method should be much increased."

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

War Department Selling Platinum

The War Department is offering its present surplus of platinum for sale at a minimum of \$105 per oz., and iridium at a minimum of \$200 per oz., prices and orders subject to cancellation without notice. The sales will be made from the New York Assay Office and will be handled by the committee on sale of materials, New York District Ordnance Office, 1107 Broadway, New York. The minimum offer which will be considered by the committee will be for a quantity of 10 oz., and the maximum amount that will be disposed of to a single purchaser will be 1,000 oz., unless the Director of Sales deems it advisable to grant special permission for a sale of larger quantities.

The platinum will be delivered in the form of grains or sponge, and, as the New York Assay Office has limited facilities to prepare the product for delivery by either mail or express, the deliveries will be made wherever possible to the purchaser in person, cash being required in advance.

West Indian Surveys Division Formed

Arrangements have been made whereby the U. S. Geological Survey will direct certain extensive topographical surveys in several of the West Indian countries. It is probable that this will be followed by a similar arrangement for geological studies. The work will be done by members of the Survey staff, but the money for their salaries and for the other expenses incurred will be furnished by the governments for which the work is being performed. The arrangement offers to Survey staff members an opportunity for interesting and useful foreign service.

To handle this work the division of West Indian Surveys has been created, with Lieutenant Colonel Glenn S. Smith as the topographic engineer in charge. Though the members of the Survey's staff assigned to the West Indian division are technically furloughed without pay, they will continue to make their usual reports to the chief geographer and collect technical data for the use of the Survey.

Congress has appropriated \$1,461,353.50 for the use of the Geological Survey during the present fiscal year. The total of the funds placed at the disposal of the Bureau of Mines is \$1,201,897. Of the Survey's appropriation, \$110,000 is to be used in gathering mineral statistics. This is an increase of 10 per cent over the amount available for the fiscal year just ended. The Bureau of Mines appropriation for investigating health conditions in mines and for a study of waste in mining is \$125,000. The item in the bill which provides for three new mining experiment stations was eliminated, as was the section providing for Federal explosives regulations.

The Geological Survey will have \$425,000 available for its topographic surveys. Of that amount \$100,000 is to come from the War Department's appropriation, it is understood.

Engineering Training and Economics

After extensive discussion occupying two days, representatives of engineering schools and societies, at a meeting in Washington presided over by the Commissioner of Education, Dr. Glenn L. Swiggett, adopted resolutions recommending that economic phases of engineering subjects should be emphasized, wherever possible, in engineering instruction. This may be done, it was stated, by emphasizing the problems of values and costs in the regular technical work and by introducing or extending courses in general economics, cost accounting, business organization, and business law into the engineering curricula. These courses should be designed particularly to meet the needs of the engineering student.

It was also recommended that the engineering phases of economic subjects should be emphasized wherever possible in commercial instruction, and all institutions with departments in engineering and economics or commerce were urged to consider some plan to develop a course in preparation for careers wherein practical training in modern languages, in the essentials of engineering and business theory and practice have been found helpful and necessary.

Tin Import Ruling Changed

The War Trade Board section of the Department of State will issue licenses permitting the importation, on or after Sept. 1, 1919, of pig tin and all metal alloys containing tin, including oxides, from points other than points of origin and without reference to the date of shipment.

On June 30 the transference was announced of the War Trade Board's personnel, duties, powers, and records to the Department of State, as of July 1.

A Becker Fellowship

An effort is being made to establish a fellowship in memory of Dr. G. F. Becker. Edward B. Mathews, chairman of the division of geology and geography of the National Research Council, has been active in promoting the movement. It is expected that John Hays Hammond will serve as chairman of a committee which will "confer with others similarly interested and report specific recommendations."

Czecho-Slovak Mission Here

A Czecho-Slovak technical mission is in the United States to study development of mineral resources and water-power. The commission also will make studies of flood control and irrigation. The membership of the commission is as follows: Joseph Spaek, member of No. 1 Assembly; Stanislav Spaek, of Ministry of Public Works; Charles Anger, of Ministry of Public Works; Vaclav Masek, of Ministry of Agriculture; Frank Binovec, member of No. 1 Assembly; and Lieutenant Frank Mick, of the Ministry of Foreign Relations.

Extinguishing a Burning Gas Well

CALIFORNIA CORRESPONDENCE

On the evening of June 2, 1919, well No. 4 of the Standard Oil Co. of California, in Elk Hills, Sec. 36, T. 30 S., R. 23 W., M. D. B. & M., came in as a heavy gusher, and caught fire. The 10-in. casing had been cemented at 2,520 ft., and the well was being bailed to test the water shut-off. Gas broke in, shooting the bailer up into the derrick. The drillers were able to close the head valve and reach a point of safety. The pressure became so great that the valve was torn from the casing. Undoubtedly the friction of tearing the

VIEW OF A BURNING GAS WELL

the junk pile by several men. Other men followed with streams of water, playing it on the screen, on the ground, and on the men. The men were equipped with heavy woolen clothing and asbestos shoes. A drag cable was carried up behind the screen, and, working in short periods, the men were able to remove all the hot metal.

While this was going on, a battery of five boilers had been set up, about two hundred yards away from the well. These boilers, together with ten drilling boilers at other wells, supplied the steam. From different directions, three steam lines were laid as near to the well as possible without protection. Sections of pipe were made up long enough to reach the remaining distance to the well. Under the protection of the fire screen, these sections were carried to the collar of the well, and connection was made to the lines leading from the boilers. Steam was turned into these lines simultaneously. The first two attempts to smother the well were failures, because of insufficient steam. After slight changes were made in the method of applying the steam, the third attempt was successful.

The following day the ground had cooled sufficiently to permit an examination of the casing, which was found to be intact at the bottom of the first joint. A control valve has been put on the well. The gas flowed freely through a 4-in. opening under a pressure of 210 lb. per sq.in. The accompanying photograph shows the burning well before the attempt was made to extinguish it.

Explosives in Trans-Mississippi States in 1918

A total of 9,866,534 kegs of black blasting powder, 206,516,077 lb. high explosives, and 46,045,233 lb. permissible explosives was manufactured in the United States in 1918, and the following quantities were used in states west of the Mississippi, according to a recent bulletin of the U. S. Bureau of Mines:

New Outrage in Mexico Probed by State Department

The State Department at Washington has inquired of the Carranza government concerning the measures it is taking to protect foreigners from the attacks of bandits as well as of soldiers of the existing regime. This action has been hastened by recent reports that an American citizen, John W. Correll, was murdered on June 16 at Colonia, twenty-seven miles north of Tampico, while attempting to protect his wife. Complaints of other outrages have also been received since repeated assurances were given by various officials of the present Mexican government that the lives and property of foreigners would be safeguarded in Mexico.

casing caused the gas to ignite. No one was injured. The capacity of the well was estimated at 30,000,000 cu.ft. per day.

The company decided to smother the well with steam. The accompanying photograph indicates that considerable junk, such as rotary drilling outfit, drill stem, crown blocks, and piping, was close to the well. Naturally, all this metal was red hot and, unless removed before smothering the well, would ignite the gas again. A fire screen of corrugated iron, about 8 ft. high and 25 ft. long, was constructed and carried to the edge of

PERSONALS

E. E. Carpenter, recently in San Francisco, will return soon to Tonopah.

Harry J. Wolf recently made an examination of mining property near Salisbury, North Carolina.

Robert E. Tally, assistant manager, United Verde Copper Co., is spending a short vacation in California.

A. C. Bedford has returned from France and England, where he went in the interests of the Y. M. C. A.

Theodore J. Hoover has been appointed to take charge of the mining department of Stanford University.

Henry Oliver, president of the Oliver Iron & Steel Co., will be a director of the recently incorporated Simms Petroleum Co.

A. G. McGregor, of the firm of Rip-path & McGregor, is making plans for the erection of a \$25,000 residence in Warren, Ariz.

Kirby Thomas has returned to New York from Colorado, where he has been engaged in making examinations in the San Juan district.

J. Volney Lewis will spend several weeks on professional work in the Las Animas district of New Mexico. His address will be Hillsboro.

H. E. Minor, formerly geologist for the Gulf Production Co., is now on the staff of the Sinclair Gulf Oil Co., with headquarters in Houston.

J. E. Curry, secretary, Arizona Chapter, American Mining Congress, of Bisbee, is spending a month on the California coast with his family.

Hoval A. Smith has returned from a ten-day trip into the Moctezuma mining district of Sonora, Mexico, where he is interested in silver properties.

Sidney L. Shonts, mining engineer of Wallace, Idaho, is engaged in investigating claims of chrome producers in eastern Oregon for the Government.

Lorin Kemp is spending several months in the United States, after which he will return to South America. He is on the staff of the Chile Exploration Co.

Scott Turner has recently been appointed consulting engineer to the Mining Corporation of Canada, Ltd., 1511-20 Bank of Hamilton building, Toronto, Ontario.

E. W. Wagy, petroleum engineer of the Bureau of Mines, stationed in San Francisco, is in Illinois studying production methods in use by oil operators in that district.

George T. Smith, president of the Joseph Dixon Crucible Co., together with the directors, lately made the annual inspection of the properties of the American Graphite Co.

Captain J. C. Ray, a California mining engineer, late of the 544th U. S. Engineers, has been appointed manager of the Bellevue Mining Co.'s properties in the Rice Lake district, Manitoba.

H. Kenyon Burch, consulting engineer, Phelps Dodge Corporation, has returned to his headquarters in Bisbee, Ariz., after a visit of inspection to the company's plant at Nacozari, Sonora.

C. E. Julihn, superintendent of the Lake Superior station of the U. S. Bureau of Mines, and his assistant, G. E. Ingersoll, are on the Mesabi Range, working in the interests of the Bureau.

D. E. A. Charlton, Managing Editor of the *Journal*, has returned to New York after a month's trip through the Minnesota and Michigan iron and copper districts.

George J. Young, Assistant Editor-in-Chief of the *Journal* since January, 1918, has left for San Francisco, to assume the position of Western Editor of the *Journal*, with headquarters at the Rialto Building.

GEORGE J. YOUNG

Fred Crabtree, consulting metallurgist with the Bureau of Mines, is in charge of the recently organized cooperative department of mining engineering of the Carnegie Institute of Technology.

B. C. Yates, superintendent of the Homestake Co., at Lead, S. D., is spending his vacation visiting points of interest in Colorado. He is accompanied by his family, and is making the trip by automobile.

Captain E. R. Graham has returned from service in France and has taken up his residence in Lead, S. D. Previous to his entering the army Mr. Graham was superintendent of the Mogul Mining Co.

W. Fleet Robertson, provincial mineralogist of British Columbia, has been appointed acting deputy minister of mines of that province, during the absence of R. T. Tolmie, who has been granted sick leave.

Richard Bollas, of the engineering staff, Copper Queen mine, Bisbee, has resigned, to take over the management of the Smith-Cananea Mining Co., whose property is situated in Cananea, Sonora. It will be worked for silver.

J. Wallace Bostick is now chief geologist of the National Oil Co., of Philadelphia, and has recently made two locations for this company in Duval County, southwest Texas. Mr. Bostick was assistant geologist in the oil division of the Southern Pacific Ry.

J. A. O. Preus, State Auditor, and F. A. Wildes, State Mine Inspector, of Minnesota, have returned from Cleveland, Ohio, where they were in conference with officials of the Fort Henry Mining Co., operators of the Woodbridge mine, situated at Buhl, Minn.

Charles T. Willis, head of the industrial relations department, Phelps Dodge Corporation, has returned to his home in Warren, Ariz., after an extended visit to the company's copper camps at Tyrone, N. M., and Morenci, Ariz., and its coal camp at Dawson, N. M.

Joseph Hyde Pratt, State Geologist of North Carolina, has secured his discharge from the Army and has returned to his former duties. As Colonel of the 105th Engineers, a combatant regiment which served for eleven months with the British in Flanders, Dr. Pratt did distinguished service.

John W. Mercer, who has been the American Red Cross commissioner for Switzerland, expects to return to New York by the end of the summer, as his work is then expected to be completed. All mail should be sent to his New York address, 15 Broad St., from which it will be forwarded if there is still time.

John F. Shaforth, former Senator from Colorado, presided at the session of the War-Minerals Relief Commission at the University of Arizona, June 21 and 23. H. E. Meyer, of Washington, secretary, former president of the A. I. M. E., and Paul S. Black, council for the Bureau of Mines, were also present. The commission heard the war claims of a number of southern Arizona mining men.

OBITUARY

Elwyn Waller, for many years professor of analytical chemistry at the Columbia School of Mines, died at Morristown, N. J., recently. He was seventy-three years old, and was graduated from Harvard, becoming assistant instructor at Columbia in 1871 and professor in 1885, continuing there until 1893. Professor Waller was mineralogist at the Santo Domingo Exposition in 1871. He was a member of many engineering societies.

Charles K. Lipman, who since 1905 had been prominently identified with the Guggenheim interests, died on July 2 at his home, No. 205 West 89th St.,

New York. He was vice-president of the following concerns: Chile Copper Co., Braden Copper Co., Yukon Gold Co., and the Yukon-Alaska Trust Co., and was a director in many allied and subsidiary concerns. Mr. Lipman was born in California fifty-two years ago, and all of his business career had been in mining projects. He came to this city thirteen years ago. Mr. Lipman leaves his wife and one brother, Frederick L. Lipman, who is vice-president of the Wells Fargo-Denver Bank, of San Francisco.

SOCIETIES

The Chemical Foundation, Inc., has published a 60 p. report describing its aims and purposes and the reasons for its organization, as told by A. Mitchell Palmer, U. S. Attorney General and former Alien Property Custodian in his report to Congress, and by Francis P. Garvan, Alien Property Custodian, in a recent public address.

American Society for Testing Materials had the opening session of the 22d annual meeting on June 25 at Atlantic City, N. J. The election of the following officers has been announced: President, J. A. Capp; vice-president, C. B. Young; executive committee, Ernest Ashton, H. F. Moore, C. R. W. Ryes, and Admiral D. W. Taylor, U. S. N. The membership now is 2,500. Revisions have been proposed in four tentative standards, including those for openhearth steel girders, high T-rails, and engine-bolt iron. Five tentative standards, including that for malleable castings, have been recommended for adoption. Recommendations for the use of the Saybolt viscosimeter were adopted. The committee on preservative coatings reported results of tests had not been sufficiently conclusive to warrant recommending any particular method of preparing iron and steel for painting.

INDUSTRIAL NEWS

Gauld Supply Co., Incorporated, has taken over the business of the Gauld Co., Portland, Ore. The directors of the new company are William P. F. Ayer, president; Thomas Nickerson, vice-president; G. A. Ricker, treasurer; Theodore W. Little and Carl T. Keller, all of whom are prominently connected with the Walworth Manufacturing Co.

Eastern Foundry & Machine Co., Inc., announces the placing in operation of its new plant at Ambler, Pa. This company furnishes bronze castings, bushings, cord bars, bearings, or specification work. General sales offices, 706 Liberty Building, Philadelphia. B. J. Morrison, general sales manager. R. W. Dale, assistant general sales manager.

Electric Hoist Manufacturers' Association held the regular monthly meeting on June 27 at 9 East 40th St., New York. A pamphlet prepared by the engineering committee is available by applying to the secretary, W. C. Briggs, 30 Church St., New York. A new pamphlet on track, supports, current conductors, and other subjects will be issued soon.

War Department, office of ordnance district chief, Equitable Building, St. Louis, Mo., offers for sale a quantity of black iron pipe, second hand, random lengths. Also quantities of new galvanized iron pipe and fittings and caulking lead. Complete description and conditions of sale are furnished by the St. Louis Salvage Board, Committee on Sale of Materials, Lieutenant Cleve A. McMullen, Ordnance Department, U. S. A., secretary.

Hamilton & Hansell, Inc., New York City, announces the selling of the following electric furnaces: One 1,000-lb. Rennerfelt furnace, 400 k.v.a., to the Steel Alloys Co. of America, to be erected at its plant in Bayway, Elizabeth, for the reduction of tungstic acid to metallic tungsten. One 1,000-lb. Rennerfelt furnace, 200 k.v.a., to the British-American Nickel Co., Ottawa, Canada, to be erected at its Deschene plant in Quebec, for melting nickel.

Federal Trade Commission formally charges the Non-Derrick Drilling Machine Co., Inc., Pittsburgh, ostensibly organized for the manufacture of an apparatus for the drilling of oil, gas, and water wells, with false and misleading advertising and misrepresentations to the public in the interstate sale of stock. The company was incorporated in June, 1917, the complaint sets forth, and has not yet engaged in actual manufacture. The concern is cited to make answer before the commission in Washington on Aug. 11.

TRADE CATALOGS

Fume Recovery. Dust Collecting. Pneumatic Conveying. The Dust Recovering and Conveying Co., Cleveland, Ohio. Illustrated pamphlet describing the operation of handling gases from driers and arsenic dust with Perfecto filters, automatic cutouts, and condensers.

"Bulldog" Jaw Crushers. Traylor Engineering & Manufacturing Co. Bulletin JX-1; 6½ x 9½; 26 pp.; illustrated. Descriptive of the Traylor "Bulldog" jaw crusher, designed to have a stronger and more reliable main frame than could be made with either cast steel or cast semi-steel, because of the difficulties in making a perfect steel casting of the complicated sections necessary and having them properly annealed. Other parts, viz., pittman, toggles, and oiling system, are included.

Lilly Gravity Electric Hoist Controller. Duro Metal Products Company,

361 East Ohio St., Chicago. Catalog B1, 7½ x 10½; 8 pp., illustrated. Descriptive of the Lilly controller, the principles of which are based on the laws of gravitation and electricity and designed to control and regulate the operation of steam, air, and electric hoists. It is claimed to possess instantaneous action, positive results, to sound an alarm when excess speed is attempted, and will stop the hoist if the engineer fails to respond. The operation is briefly: The force of gravity is prevented from actuating the controller by an electro-magnet acting through a series of levers so that only a small current is necessary to hold it in balance. When an emergency arises, and current is broken by the controller, the levers are instantly taken from the engineer. It is stated that closed-circuit system insures against possibility of failure by a broken or loose wire.

NEW PATENTS

U. S. patent specifications may be obtained from the *Engineering and Mining Journal* at 25c each.

Fuel—Fluid-Pressure Apparatus for Burning Powdered Fuel. Patrick A. Leonard, Michael F. Maloney, and Ernest Fandrich, Schenectady, N. Y. (U. S. No. 1,305,726; June 3, 1919.)

Gasoline—Recovery of Gasoline from Natural Gas, etc. Edmund S. Merriam, Marietta, Ohio. (U. S. No. 1,304,587; May 27, 1919.)

Lead—Extraction of Lead (Electric Smelting). Edward Salomon Berglund, Trollhättan, Sweden, assignor to Sven Huldt, Stockholm, Sweden. (U. S. No. 1,306,942; June 17, 1919.)

Lead—Process for the Electrolytic Deposition of Lead. Dell F. Harbaugh, Chicago, Ill. (U. S. No. 1,306,479; June 10, 1919.)

Magnesite—Manufacture of Bricks and Furnace Linings from Dead-Burned Magnesite. Samuel Gerard McAnally, Hull, Quebec, Canada. (U. S. No. 1,305,475; June 3, 1919.)

Molybdenum—Extraction of Molybdenum. Tormod Reinert Förland, Hauge, Norway. (U. S. No. 1,305,350; June 3, 1919.)

Pyrolusite—Method of Treating Pyrolusite. Carl Valdemar Jorgensen, Copenhagen, Denmark. (U. S. No. 1,303,911; May 20, 1919.)

Separator—Hydraulic Separator for Crushed Ores. Henry R. Wahl, Chicago, Ill. (U. S. No. 1,306,361; June 10, 1919.)

Separator—Magnetic Ore Separator. Lewis G. Rowand, Brooklyn, N. Y., assignor to the New Jersey Zinc Co., New York, N. Y. (U. S. Nos. 1,303,396; 1,303,397, and 1,303,398; May 13, 1919.)

Separator—Ore-Separating Machine. Joseph William Miller, Miami, Okla. (U. S. No. 1,306,270; June 10, 1919.)

Sintering—Treating Fine Ores. Daniel Shields McAfee, New York, N. Y., assignor to the Dorr Co. (U. S. No. 1,305,817; June 3, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief of Interest to Engineers and Operators

SAN FRANCISCO, CAL.—July 3

New Oil Wells started during the first half of the year 1919 totaled 367, as compared with 406 and 577 for the same period in 1918 and 1917. The number for last week was 16, which is considerably above the average so far. Nine were in Kern County, three in Ventura and three in Los Angeles neighborhood. There were 18 wells ready for test of shutoff, 20 being deepened or redrilled, and four abandoned. A notable development during the week was the striking of oil in the Myers well of the Union Oil Co., about four miles east of the Coyote Hills field, and three miles south of the Whittier field.

The Government Oil Land Suit against L. E. McMurry, charged with illegal and fraudulent entry of 160 acres in Kern County, has been decided in favor of the defendant by Judge Robert S. Bean, of the Portland, Ore., sitting in the U. S. District Court at Los Angeles. McMurry located the land in 1909 and secured eight individuals and companies to file mineral claims on it. The locators, after securing a contract for development. The contract was transferred by J. M. McLeod, the contractor, to his attorney, who re-transferred it to McMurry. The Government charged that McMurry sold portions of the land for large sums and contended that the land and the proceeds of the sales were secured by fraud. The court held that in making the location and subsequent contracts in relation thereto, the fair consensus of opinion from the evidence was that McMurry was acting for and in behalf of his principals, with no intention at that time of fraudulently acquiring the land or proceeds therefrom for himself.

GRASS VALLEY, CAL.—July 3

Marysville Nevada Water Co. has selected a site a mile and a half below Eullard's Bar, on the north fork of the Yuba River, and twenty miles west of Grass Valley, as proposed for a restraining dam. This is intended for hydraulic tailings to come from renewed operations at a number of old camps in Sierra and Nevada counties. A nominal charge for the work will be made. The overflow is to be used for power generation.

The Strike at Grass Valley, after continuing for fifteen days, ended suddenly on the evening of June 28, when the Mine Workers' Protective League voted almost unanimously to accept the operators' revised proposal. The new wage scale calls for a 10 per cent advance over the old rate, wherever emplaced, and with the provision that the extra amount will be paid in a lump sum to each man on the payroll at the end of a certain length of time. Provisions are also made for the men to leave the employ of the company, when necessary, without loss of pay, and half pay will be allowed for time lost during the strike. All mines and North Star mines operating with greatly reduced forces. The lower levels of these mines have flooded, but the men were able to work higher up. The Pennsylvania drains into the Empire. Milling cannot be resumed for some time. The Western Federation of Miners had no voice in the strike, although it has a chapter at Grass Valley. No violence was reported. About 1,000 men are enrolled in the Mine Workers' Protective League.

SALEM, ORE.—July 3

A Board to License Oregon Engineers has been appointed by Governor McClell of Oregon, in conformity with the act passed by the last Legislature requiring the licensing of all professional engineers. Under the new law all engineers will be required to register. The board consists of two civil engineers, two mechanical engineers, two hydraulic engineers, and one electrical engineer.

WALLACE, IDAHO—July 3

The Question of a Strike in the mines of the Coeur d'Alene district, has been deferred until after July 15. It was decided at meetings of the local branches of the International Union of Mine, Mill and Smelt-

er Workers, when the question was submitted to a vote of the membership. Union leaders state that the request of the conciliation commissioner, Robert M. McWade, to postpone the strike, is all that prevented it carrying by a large majority.

Consolidated Interstate-Cullahan Mining Co. is preparing to resume operations early in August, after a suspension of about four months. A few weeks ago the management stated that when zinc reached 7c, per lb., the company could earn a fair profit, even with the prevailing high cost of mining, and that if the market seemed stabilized around that figure, the company would feel justified in resuming production on a normal basis. Though the chief product of the mine is zinc, the company also produces considerable lead. The mill recovery of lead has never been satisfactory, and for months before the shutdown the manager, C. W. Newton, had been conducting experiments with the view to reducing the lead losses in flotation. As a result, in the last month of operation the lead produced was almost double what it had been formerly, the character of the ore being the same. When the mine closed down plans were at once prepared to add a lead flotation section to the mill which is nearing completion and is expected to double the company's lead production. New classifiers and a ball mill are also being added to the mill equipment. Another change is being made in handling the crude ore. Heretofore ore coming from the mine was conveyed direct to the mill by tramway, where it passes over sorting belts to permit removal of waste rock and shipping ore. A sorting plant is now being built at the mine, where the waste will be removed before the ore reaches the tramway, and another shaft is being provided to bring the mill, where the first-class ore will be removed for shipment crude.

BISBEE, ARIZ.—July 3

Hoval A. Smith, well known as a mining engineer in the Southwest, recently returned from a ten-day trip into the Moctezuma mining district of Sonora, Mexico. Mr. Smith stated that confidence was in a decline over northern Mexico, and that although there were many problems to be worked out, and some time will be needed to bring things back to normal so far as the mining industry is concerned, there today are not as serious as some believe. The resources of Sonora are great. Mr. Smith said, and the transportation problems are not, as a general thing, serious handicaps, and with silver at \$1.07, there is no question that the country will be developed rapidly in the near future. Mr. Smith was formerly chief engineer for the Calumet & Arizona Mining Co., and was one of the promoters of the Warren company and Warren ranch at Bisbee, as well as of the Globe Consolidated Mining Co., of Globe.

SALT LAKE CITY, UTAH—July 3

Working Forces at Park City Mines are being increased gradually to normal conditions. The state-owned mine at Park City has not yet been resumed at the Judge electrolytic zinc plant, owing to an accumulation of spelter. The state-owned zinc plant was producing a high grade of spelter, and the problems of operation had been satisfactorily solved. It is expected that the plant will resume operation as soon as the weather improves, when it will be a greater demand for spelter.

Changes in the Workmen's Compensation Law, made at the last session of the Utah Legislature, whereby, among other things, the rate of compensation has been increased, because of the strike, has been given as the cause of increased insurance rates charged by stock companies operating in the state. A lower rate is charged by the state insurance fund, but this in some quarters is considered inadequate. To meet state competition the companies will adopt merit-rating and experience-rating plans intended to give an employer credit for installing safety devices and otherwise providing working conditions that will reduce the liability to accident to a minimum. Ex-

perience rating will apply only to companies having an annual premium of \$500 or more. A company with a good showing as to accidents for twenty-one months just ended will be given allowance in the next year's premium. It is said the merit and experience ratings may bring premiums in individual cases down to almost the same as, or possibly a lower rate than, that charged by the state fund. The advance made was fixed in New York at a meeting of companies affiliated with the National Workmen's Compensation Bureau, and all companies operating in Utah except one will be bound by the rate fixed. The new rate is 26.5 per cent on \$100 in excess of the old rate. Compensation is now at the rate of 60 per cent of the average weekly wage, instead of 55 per cent, as formerly; and the maximum weekly payment in most instances is \$16 instead of \$12. The minimum in all cases is \$7 per week. The maximum aggregate payment in all is \$5,000, except in case of total disability. For total disability the compensation is 60 per cent for 45 weeks, and 45 per cent until death, with a maximum of \$16 per week and a minimum of \$7 per week. Additional compensation up to a maximum of \$500 is allowed for hospital and nursing expense, and up to \$150 for funeral expense.

DENVER, COL.—July 4

The Industrial Commission of Colorado announces that advances in rates necessitated by amendments to the law adopted by the last Legislature will not effect mining insurance now in force under the State Fund, or insurance renewable in July, and that renewals to Dec. 31, as well as new insurance, will be written in the fund at the present rate, until July 31, after which the rate will probably be advanced 15 per cent. The new law provides for an increase in the weekly benefit from \$8 to \$10, cuts down the waiting period from fourteen to ten days, increases the death payment from \$2,500 to \$3,000, and provides \$200 for hospital fees, instead of \$100. The State Fund will declare a dividend on mining risks of 15 per cent of premiums paid for the first half of 1919.

In Molybdenum Production Colorado ranks first, according to a fifteenth biennial report of the State Bureau of Mines, covering 1917 and 1918, which was compiled by Fred Carroll, until recently the State Commissioner of Mines. The equivalent of 665 tons of concentrates averaging 90 per cent molybdenum sulphide, valued at \$1,436,400, is the estimated production of the state for 1918. The world production in 1915 was slightly under 250 tons. Colorado's output is derived from the properties of the Climax Molybdenum Co., at Climax, in Summit County, and of the Primus Chemical Co., at Camp Urad, in Clear Creek County. It is estimated that molybdenum can be produced at these mines for 50¢ per lb. The State Construction was started on these properties in 1917 and milling by flotation in 1918. The mines of the state also produced in 1918 a total of 1,071,763 lbs. of copper (7,204,352 in 1917); 6,423,919 lb. of copper (8,122,004 lb. in 1917); 64,282,841 lb. of lead (67,990,012 lb. in 1917); and 88,411,745 lb. of zinc (120,315,750 lb. in 1917). It is further according to the report, there are five smelters operating in Colorado, with a daily furnace capacity of 4,000 tons of which more than 1,000 tons are utilized, although a large tonnage of ore is imported from other states.

GLENROCK, WYO.—July 3

The Midwest Refining Co., at Casper, Wyo., has expended over \$2,000,000 in the last year in new construction and additions to its refinery, and now has a daily capacity of 55,000 bbl. The company has started work on erection of a refinery at Laramie, Wyo. The Riverton Wyoming refinery, at Riverton, has started operations, and most of the oil will be taken from the Dallas field. In the Lauce field, the Buck Creek company brought in well No. 1. The oil sand was tapped at 3,650 ft. in

the same field the Lusk Royalty company has five wells drilling, but as yet these have not given sufficient depth to prove the presence of oil. The Ohio company is drilling for the Lance Creek Royalty and has reached a depth of 3,600 ft. Oil was encountered at 2,200 ft. It was decided to go deeper or a larger production. At present 230 wells are being drilled in the different oil fields of Wyoming. The 1919 season of oil production in Wyoming passed the Carbon Black bill, which prohibits the manufacture of carbon black from natural gas in Wyoming within ten miles of an oil well. The measure takes effect Oct. 1, 1919, and is protested by producers of this material.

EDGEMONT, S. D.—July 3

In the Mule Creek Oil Field, west of Edgmont, in Wyoming, the Ohio Oil Co. has brought in its second well. Though it has a capacity of only 100 bbl. it is encouraging, in that it marks the boundary of this oil area and greatly extends the productive area. This new well is four miles from the pioneer well on the Norbeck and Nicholson lease and opens a large track for oil drilling. North of the Mule Creek area, Norbeck and Nicholson are drilling on a structure known as the Cottonwood Dome.

HOUSTON, TEX.—July 2

Invincible Oil Corporation, of New York, incorporated under the laws of Virginia, with capitals of \$1,000,000, has secured contract from Invincible Oil Co. for all its holdings. Consideration involved is said to be \$5,000,000. Through a merger with the Gladstone Oil Refining Co. of Oklahoma, and the Louisiana Oil & Refining Co., of Shreveport, the Invincible corporation has acquired 83,643 acres of land, held by fee and leases, in the Ranger and Blue Ridge fields in Oklahoma, and in the Walters and Cement fields in Oklahoma, with estimated production now of 3,500 bbl. to 5,000 bbl. daily. Other holdings are in Stephens field in the Fumble district and in Alabama. The corporation has one refinery of 300 bbl. capacity in operation, together with 70 miles of gathering lines, and 200,000 bbl. storage capacity; also 160 steel tank cars for transportation to dewater export station, at New Orleans, where storage capacity of 100,000 bbl. is provided. Estimated production of 3,000 bbl. capacity nearing completion at Fort Worth.

MOUNTAIN HOME, ARK.—July 3

Mining Operations in the north Arkansas zinc and lead field are nearly at a standstill. Less work is being done than at any time during the last five years, and at the same time there is no new ore developed. Most of this is zinc carbonate averaging 40 per cent zinc, which is bringing from \$22 to \$28 on the present market, which is the operators' average. A large amount of development and prospecting is in progress.

DULUTH, MINN.—July 3

The Minnesota State Supreme Court has upheld the finding of the district court at Erskine, whereby Patrick Hammel established his claim to half interest in the mining lands held by the estate of the late Thomas Feigh. The lands involved include two operating properties on the Cuyuna Range, the Hillcrest and the Feigh, and the Hammel share of royalties at the time suit was begun amounted to \$135,700, to which must now be added the 1917 and 1918 earnings of the properties. It was held by Hammel that under an arrangement between himself and Feigh he was to do the detail work of locating the properties while Feigh retained the ownership and that the properties were placed in Feigh's name to protect his investment. The agreement was that all profits should be divided half and half, and that the property had developed in a new trial in which H. B. Blackwood, of Duluth, who controlled the lands involved at the time Hammel and Feigh were negotiating for them, now claims one-half of Hammel's interest under an agreement he claims to have had with Hammel.

HOUGHTON, MICH.—July 5

Calumet & Hecla's loss by fire of the Hancock & Pewabic engine houses, with the hoisting plants contained, did not interfere with production. The plant served four shafts on the conglomerate, namely Nos. 7, 8 and 10, the last two being a double shaft, all in the South Hecla branch of the main Calumet & Hecla mine. Within twelve hours after the fire, one of the shafts was connected with an auxiliary hoist, and within twenty-four hours all shafts were producing rock and hoisting at normal rate. These four shafts, which are included in the program for greater development, with depth that is planned for the Calumet & Hecla conglomerate lode, are among the deep mining shafts of the Lake Superior

district. No. 7 is below the 81st level. No. 8 was permanently discontinued at the 63d level, and Nos. 9 and 10 were 142 ft. below the 82d level, a depth of 8,132.7 ft., on Jan. 1.

Because of the excessive cost of maintaining Nos. 6 and 7 Hecla and Nos. 9 and 10 South Hecla, it was determined some months ago to discontinue sinking at these points. To reach the ground lower down in this end of the mine, a haulage level (at the elevation of the 80th level) connecting this territory with the Red Jacket shaft, is being driven in the amygdaloid lode 150 ft. under the conglomerate. This haulage level, when completed, will be 7,800 ft. long, 3,700 ft. having been driven already. Shafts will be sunk from the haulage level, from which the conglomerate will be mined. Power tramming will be used to get this product over to the Red Jacket shaft, where it will be sent to surface.

SNOW TUNNEL BETWEEN SANDON AND CODY, B. C., ON ROAD TO NOBLE FIVE MINE DURING LAST SEASON

BIRMINGHAM, ALA.—July 3

At the Woodward Iron Co.'s plants there is considerable construction and repair work in progress, notably at the company's No. 1 mine, on Red Mountain. The company has two furnaces in operation out of three at Woodward, Ala.; the third now being repaired. It is expected this furnace will be blown in soon. Sinking has begun at the company's Songo mines. Electrically operated elevators and other time-saving devices are to be used here to eliminate expensive haulage.

All classes of industry in the district seem to have speeded up. Coke production is being increased to meet orders now being received. With iron up 10 per cent and production increasing, several large companies are out of the market at present prices for third-quarter delivery. Cast-iron pipe shops, machine shops, and foundries with plenty of orders on hand or expected are gradually working back to normal operating schedule. The Republic Iron & Steel Co., the Sloss-Sheffield Steel & Iron Co., and the Alabama Co. are expected to blow in a furnace in the next few weeks. On the whole, July opened with the brightest promise of a good month of production and sales in the iron and steel industry this district has experienced for some time.

No statement as yet has been received from the various companies as to their attitude toward the movement to unionize the steel and iron workers in the district. The organizers are credited with the statement that no strike is in prospect, but only the right to organize and do collective bargaining with employers is sought.

Suit has been brought by Wiley Nunn against the Woodward Iron Co. for \$3,000 for injuries to a minor son formerly employed in the company's mines. Suit has been brought by Will Gray against the Tennessee Coal, Iron & R.R. Co. to collect \$3,000 damages, for injuries received in the company's employ.

BOSTON, MASS.—July 7

Shannon Copper Co. states officially that an agreement has been entered into with the Arizona Copper Co., of Phoenix, Ariz., to sell the latter the Clifton and Metcalf, Ariz., properties of the Shannon company for approximately \$600,000. It is possible that operations at the Shannon and Veager may be resumed, but the directors have not definitely decided upon any policy for the future.

VICTORIA, B. C.—July 3

The Free CODY Mine, which has recently been formed at Prince Rupert, B. C. It has announced its purpose to be "the employment of a permanent secretary in premises containing the operations of the company together with information about them and other mining literature. It has petitioned the provincial government to establish an assay office at Prince Rupert, one-half the cost of assays made to be paid by the individual and the other half by the government. Weston Coyney, Prince Rupert, is secretary. Membership in the Free League costs \$5 a year.

The Noble Five Mine, situated between Sandon and Cody, in the Sloacan mining division, British Columbia, is installing a 100-ton concentrator that, it is expected, will be ready for operation this autumn. The company now has a considerable force engaged in the development of the mine. A photograph on this page was taken early this year by Paul Lincoln, manager of the Noble Five, on the Old Cody Road running between Prince Rupert and Codan and the snowshed shown took place, some of the company's employees were busy repairing the road. They had little notice of their danger, and sent them to the local level. The slide was one of the greatest in the history of the district, and, as the view indicates, it was necessary to tunnel to open to the mine late in spring.

The Committee Investigating Smelting Rates charged by the Consolidated Mining and Smelting Co. for treating custom ores at Trail has gone a report into the information it received in length of twenty-two pages. Its conclusions have been summarized as follows: "A new smelting rates schedule which, applied to average ores received at Trail smeltery during the seven months ending April 30 last, is being prepared. It will effect an average saving to shippers of \$3 per ton. Most of this benefit will accrue to producers of silver-lead-zinc ores, who were hit hardest by Schedule B. Miners of oxidized ores, or low-silver, low-zinc ores will benefit very slightly, if at all.

"Prior to the introduction of Schedule B and for some time afterward, the lead-smelting operations of the company were conducted at a loss. Though other causes of this loss existed, it was attributable chiefly to the nature of the general ore supply, the increased prices of metals, particularly that of silver, and the use of large shipments of ores and mill products high in zinc content, which, if sold at previously prevailing metal prices, would have been far less profitable.

"The schedule was devised as a fair means of securing improvement of quality in the general ore supply through elimination of some of the zinc, or placing the burden of cost arising from its presence in undue amount in the furnace charge, upon those who fail to help bring about the desired end. The result of operation under the schedule, during recent months, is manifested by marked improvement in the general ore supply, and in the substantial increasing recovery of silver and lead, and by decreased cost. No undue margin from increased treatment rates has been derived by the smelter, and in the opinion of the committee 'the end has justified the means.'

"Finally, the general improvement of conditions warrants the committee's expectation of the important concessions in favor of the shippers, upon whom, nevertheless, there still rests the duty of helping themselves. The committee recommends the appointment of a permanent committee on smelter rates."

TORONTO, ONT.—July 5

Many Districts of Northern Ontario have been devastated by extensive bush fires, which at one time threatened to cause much loss in the mining camps. Some of the recent heavy rains the danger has been averted with comparatively small loss. The Boston Creek district and Ironouls Falls suffered the most damage. The plants of the Patricia mine and the Cotton property at Boston Creek are reported to have been destroyed, and the Miller Independent though the mine camps were escaped. At the Porcupine camp, the West Dome and Davidson mines were in great danger and were saved only after a protracted fight with the flames. The plants in the mine neighborhood the Hollinger and other properties were saved by a timely fall of rain.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ARIZONA

Cochise County

PHILIPS DODGE (Bisbee)—Copper production for June from all branches 8,415,335 lb. (May 8,355,900), U. S. properties producing 6,253,335, Mexican 1,735,000, and custom ore 427,000.

Maricopa County

LEFD ROYER (Phoenix)—Company plans to build own power line to connect with line of Arizona Light & Power Co., being built from Fossil Creek plant to Phoenix.

Pinal County

SOUTH RAY COPPER (Kelvin)—Unwatering completed to 500 level. Old timbering needs repairs before sampling can be completed. Crosscutting into walls shows copper orebodies not located by former owners. No. 2 shaft will be unwatered in July. W. E. Duvoil in charge.

RAY BROKEN HILLS (Ray)—Tunnel will be driven another 200 ft. Flow of water now approximately 100 gal. per min.

POLAND COPPER (Ray)—Lateral development on 2^d level being continued, and shaft will be sunk additional 200 ft. About fifteen men now employed.

U. S. VANADITE (Kelvin)—More men working in lower tunnel, from which crosscuts are being driven north and south. Drifting on diabase-limestone contact in lower tunnel shows 5 ft. of well-mineralized vein.

Santa Cruz County

BLUE NOSE (Cogozales)—John Hoy, of Harshaw, has sold Blue Nose group to Lyman syndicate, of Jerome. Property formerly big producer of high-grade silver ore, but has been idle since 1881. New owners have installed compressor and hoist and begun sinking new shaft.

SHARDSHELL (Harshaw)—Twenty-five men now at work on property. New shaft being sunk at rate of 5 ft. a shift.

ARKANSAS

Marion County

LONNIE BOY (Rush)—Will start erection of small concentrator soon. Five thousand tons zinc ore developed.

MATTIE MAY (Rush)—Work on new mill be resumed at once.

MOONEY-HAIZER (Rush)—Mooney and Haizer, owners of ten-acre tract adjoining Philadelphia mine, are developing two zinc orebodies on tract.

CALIFORNIA

Amador County

ARGONAUT (Jackson)—Mill now running to capacity and work progressing on same scale as before fire.

Calaveras County

KEYSTONE (Railroad Flat)—Operations will be resumed under management of Joe King. Shaft now being unwatered.

SHEEPFRANCH (Sheepfranch)—Preliminary work by Golden Gate Exploration Co. practically complete, and expectations are that mill will be started early in July.

El Dorado County

MANZANITA (Kelsey)—Recently bought by E. V. Fessler. Has been sold to Morovitch-Dryden-Morganson Co., of Seattle.

Nevada County

H. H. NOBLE mineral rights within limits of Nevada City were bid in by David Wildin.

Placer County

MAMMOTH SPRING (Dutch Flat)—Work resumed after usual winter shut-down. Compressor installed to speed work.

GEORGIA HILL DEEP GRAVEL (Yankee Jim)—After consolidating small holdings Crofters has started development by running 1,000-ft. tunnel.

Shasta County

UNITED STATES (Kennett)—Only development work being carried on at Mammoth mine. Company's operations in Mexico continued without interruption in first half of 1919, according to official re-

port. Average tonnage produced and milled about 68,000 per month for first half year. Expected to increase to 80,000 tons in July. Company's coal mines operating full time, with reduced forces.

Sierra County

MARIPOSA (Alleghany)—Electric hoist installed in main tunnel. Ready to begin sinking 500-ft. shaft.

Siskiyou County

LANKY BOB (Salmon River District)—Purchased by J. Tenny, of Seattle, who is arranging to install compressor and drills.

Tuolumne County

ANGELS DEEP (Angels)—On completion of headframe, sinking and crosscutting will be resumed.

SONORA (Sonora)—Property bonded to Blake and Solinsky, of San Francisco. Work to start within thirty days.

COLORADO

Boulder County

VICTORIA MINES (Boulder)—W. S. Garland, of Brockton, Mass., president, and directors plan to increase force and purchase more machinery for development campaign. Mine showing large bodies of high-grade silver ore. Last carlot shipped weighed 27,658 lb., settled for at 102 oz. per ton.

Ouray County

VERNON MINING (Ironton)—Entire plant in Gray Copper Gulch, near Ironton, destroyed by fire on July 26. No insurance. Will be rebuilt. Manager, A. G. de Golyer, Ironton. President, W. L. Fleming, 50 Broad St., New York. Plant shut down recently, with two watchmen in charge. Probable cause of fire spontaneous combustion. Plant included 150-ton concentrator with Marcy mill and flotation equipment, hunk house, hoisting house, shaft and compressor house. Plans for work this year may be carried out through driving new crosscut lower down gulch.

San Juan County

SUNNYSIDE M. & M. (Eureka)—To begin rebuilding hunk house, compressor house and other necessary buildings, preparatory to resuming active work. Will erect steel frame buildings. Will deepen Washington shaft to connect with Terry tunnel at Midway and erect buildings at Midway.

Summit County

SILVER DISCOVERY made by Charles Godfrey and partners on exposed bedrock of Meeka placer east of Breckenridge. Ground leased from owner, M. G. Evans, Denver.

TONOPAH PLACERS (Breckenridge)—Operating three dredges full time, one each in Blue River, upper Swan Valley, and in French Gulch.

WASHINGTON (Breckenridge)—Placer in Illinois Gulch first to start washing gravel this season in Breckenridge district. Under lease to James T. Burney, J. H. Bills in charge.

Teller County

CRESSON (Cripple Creek)—Dechene and Kearns have reached objective in shaft on Maggie, striking flat three-foot vein at 40-ft. Breeding ore bins.

FREE COINAGE CONSOLIDATED (Cripple Creek)—Wilson vein cut by diamond drill at depth of 550 ft. from Pinto mine workings adjoining Wilson on west. Bennett and Gunn, lessees. Now crosscutting to vein from 800 level of Lee shaft, of Isabella Mines Co. adjoining Wilson on north.

IDAHO

Shoshone County

RICHMOND (Adair, Mont.)—Winze from lower tunnel down 200 ft. and crosscut being run to vein, which should soon be reached. Ore oxidized copper above, but crosscut is finding stringers of sulphide ore.

SHERMAN (Burke)—Final payment made for property formerly known as Union, total amount being \$150,000. Union owned chiefly by estates of late John A. Finch and A. B. Campbell. Sherman Lead

Company, purchasers, controlled by Days. Deep tunnel being run expected to develop large lead-silver orebody. Ore found in two tunnels above. In addition to exploring Sherman this lower tunnel is expected to be permanent outlet for Tamarack & Custer adjoining, also controlled by Days.

CARBONATE HILL (Mullan)—Crosscut from shaft at 400 level finding some ore, but main vein thought not yet reached. Expect to prospect ground with diamond drill. Good showing of lead and zinc ore above.

NATIONAL (Mullan)—Company shipped sixteen carloads of concentrates in June, averaging 15 per cent copper and 40 oz. silver. This is one car more than May shipments, making record month. Important development work being done on 600 and 800 levels, above working tunnel, which is expected to show ore of better grade.

KANSAS

Aprilia District

EARLY BIRD (Baxter Springs)—Installing additional No. 4, 5 and 7 roller elevator pulleys, belting, shafting. Plant at Treece, Kan. Cleve Bird, superintendent.

UNION METAL MINES (Waco, Mo.)—Erecting new mill. Will need equipment. P. B. Butler, general manager.

MICHIGAN

Copper District

SENECA (Calumet)—Actual drifting on lode began July 1. Shaft below 1,800 ft. Additional surveys of possible mill sites made on Lake Superior shore on area held under option.

QUINCY (Hancock)—New hoist for No. 2 plant beginning to arrive. Drum will be 30 x 30 ft. Capacity for depth will be greater than for any other one-rope hoist, easily carrying for continuous hoist of 14,000 ft. Present plant hauling from 8,200 ft.

ISLE ROYALE (Houghton)—Production limited to three shafts, Nos. 4, 5 and 7. June tonnage about 42,000. Five drill parties working in newer openings. North of No. 7 shaft, drifts over to No. 6 are holed through to seventh level. To south all drifts from surface down to sixth level have been driven for 1,200 ft. and then stopped, as that is point midway to location of proposed No. 8 shaft.

Gogebic Range

ASHLAND (Ironwood)—Mining operations ceased some time ago, all available ore having been removed, but exploratory work is being carried on with small force on lower levels.

NEWPORT (Ironwood)—Diamond drill operating on surface north of Woodbury shaft and east of old north vein workings. As at other properties considerable attention being paid to horizon 500 ft. to 800 ft. north of foot wall. Wrecking of "D" engine house about completed. Boiler house abandoned last year because ground was sinking and now several other buildings are affected. Entire surface plant is south of foot wall, where no settlement of ground would be expected.

Menominee Range

AT CRYSTAL FALLS McKinney Steel Co. shipping from Odgers and Dunn mines. All ore in stock at Odgers to be loaded. M. A. Hanna Co. shipping from Carpenter and Monongahela properties.

CARPENTER (Crystal Falls)—Four men reported killed in last issue were caught by a cave-in. Accident occurred just above bottom level, and over 1,000 tons of rock had to be removed before bodies could be recovered.

MUNRO (Iron Mountain)—Operation started for season. Open-pit property. Hoose Construction Co. has contract to do loading in pit.

PEWABIC (Iron Mountain)—Discontinuing of entire surface plant about completed. Steel headframe sent to Iron River; and now several other equipment sent to other ranges. For many years mine was steady producer of low-phosphorus ores.

IRON RIVER DISTRICT shipments increasing. Most mines operating. Tully inactive, but will ship.

SPLES (Iron River)—Mine closed down. Most ore in stock to be shipped.

MINUOE (Norway)—Shipping of ore begun. Mine now operated as open pit. Mining done by Hoose & Person Construction Co. under contract.

MINNESOTA
Mesabi Range

DRAPER (Calumet)—New open-pit property of John A. Savage Co. has made initial shipment to modern washing plant, recently completed.

ACNEW (Hibbing)—Wisconsin Steel Co. property has reopened and taken on 100 men. One of deepest pits on range and has produced 2,000,000 tons by steam shovel. Present depth necessitates milling and scrambling with cable hoist.

RUSSELL (Keewatin)—New prospect of Pickands Mather Co. adjoining Bennett mine of same company being drilled by E. J. Longyear Co.

LA RUE (Nashwauk)—Carlson Exploration Co. operating two drills on preliminary exploration of open-pit orebody for M. A. Hanna & Co.

Vermilion Range

MCDONALD (Winton)—New property operated by Chippewa Iron Co. developed to stage where it will probably ship 50,000 tons this season. Shaft bottomed at depth of 345 ft. and levels partly developed at 100, 200 and 309 ft. Royalty 60c. per ton for first five years thereafter 62½c. Minimum tonnage 20,000 for first year and increasing 10,000 per year until 60,000 tons per year becomes permanent minimum. President, E. J. former operators. Will use stamps, amalgamation, tube mills, calow tanks, Janney classifiers, and James concentrators. Present company is reorganization. Property in litigation for ten years. Title perfected in 1917. During 1918 this mine produced \$52,000 worth of tungsten ore.

MISSOURI
Joplin District

ALLEGHENY WESTERN (Waco)—Moving old Adams mill from Tuckahoe to Waco. Will need steam engine, boilers, rock drills, and tables. W. S. Marquis, general superintendent.

ORANGE (Webb City)—Enlarging all departments of plant. Will need crushers, rolls, hoist, compressor. H. H. Wallower, superintendent.

MONTANA
Park County

JARDINE GOLD (Jardine)—Operating 23 patented claims six miles from Gardiner, Mont. Has started Huntington test mill in ore after having been shut down during winter. Remodeling forty-stamp mill built in 1902 by former operators. Will use stamps, amalgamation, tube mills, calow tanks, Janney classifiers, and James concentrators. Present company is reorganization. Property in litigation for ten years. Title perfected in 1917. During 1918 this mine produced \$52,000 worth of tungsten ore.

Extensive development work done, including 21 deep test tunnels with large amount of raises and drifts, showing an extensive commercial vein system. Property has excellent hydro-electric plant, compressor, machine shop and other equipment.

Silver Bow County

ANACONDA (Butte)—Mining operations at 55 per cent capacity; development at about 75 per cent. Scarcity of water near Anaconda, Mont. has resulted in compelling curtailment of concentration of custom ores at Washoe mill. Production for June 1919, 150,000 lb. of copper, as compared with 135,000,000 in May and 137,500,000 in April.

BUTTE-BULLWACKER (Butte)—Mining and development will be resumed when it is assured labor troubles will not interrupt. Property being cleaned up.

BUTTE COPPER & ZINC (Butte)—Showing of high-grade silver-lead ore continues east of 1,000 level. Production being increased.

BUTTE-DULUTH (Butte)—Property being placed in condition for resumption of operations. Good ore showing disclosed in winze.

BUTTE & PLUTUS (Butte)—Sinking continues at Plutus shaft. Two feet of ore on 100 level of Mapleton claim.

BUTTE & RAMSDALL (Butte)—Cross-cutting and drifting on 200 level on fissures released from Davis-Daly. Ore showing strong, particularly in the Lizzie vein. Expected to resume shipments as soon as East Blue plant can be put in operation.

BUTTE & SUPERIOR (Butte)—Ore showing east on lower levels continues good, with large tonnage indicated. Production being increased in consequence of rising price of zinc and resumption of treatment of zinc concentrates by Anaconda company.

DAVIS-DALY (Butte)—Sinking of Colorado shaft from 2,500 to 2,700 level already progressed quarter way. Average of all smeltery shipments during May was 10.1 per cent copper and 8 oz. silver. Operating less than 50 per cent capacity. Net earnings for June approximately \$45,000.

EAST BUTTE (Butte)—Operations being maintained at 75 per cent of capacity, 30 per cent of Pittsmeat smeltery output being contributed by Davis-Daly ores.

NORTH BUTTE (Butte)—Production being slightly increased from 25 per cent of normal development program pushed at capacity. Ambitious exploration campaign mapped out. Promising ore development reported on 600 level of Speculator.

TULUMANE (Butte)—Station cutting on 1,000 level nearly completed. Estimated output will be reached with 700 ft. of cross-cut. Shaft now more than 50 ft. below the 1,000 level and will be sunk to 1,200.

NEVADA
Emerald Valley

COIKNFORTH MINE, in Bellehelen district, taken over by Pacific States M. & M. Co., which is capitalized at \$1,500,000, par value of stock \$1. President, T. T. Cornforth; vice-president and general manager, Warren A. Haggott; secretary-treasurer, Ben Gill. Other two directors Charles S. Sprague and J. E. Vainwright. Home office in Goldfield, with Charles S. Sprague resident agent. Executive committee comprises Cornforth, Haggott and Sprague.

GOLDFIELD DEVELOPMENT (Goldfield)—Planned to start stamps about July 1, when repairs and alterations are expected to be complete. Will start on Red Top ore.

NEW YORK
Jefferson County

BASIC PRODUCTS CORPORATION (Natural Bridge)—Preparing plans for inclined railway, ore hoist, and housing to be constructed at Natural Bridge, at estimated cost \$12,000 to \$15,000. New York office, 233 Broadway.

TEXAS
Brazoria County

GULF PRODUCTION (West Columbia)—Eyers No. 2 well came in June 25. Well is 2,800 ft. deep.

Eastland County

GUGGENHEIM INTERESTS have purchased holdings of Gates Oil Co. of Ardmore, Okla. Land consists of W. T. Barker lease, six miles northwest of Ranger, of 67 acres; 40 acres of Hilly tract and 223 acres of Hawkins tract, near Desdemona, all in Eastland County, and 2,200 acres in Oklahoma. Barker lease, midway between Perkins gusher and Danley well of Prairie Co. Well on tract now 3,320 ft. deep.

Grimes County

BIG BEND OIL & GAS (Navasota)—Entire property change hands. Development will drill soon. New officers: C. C. Camp, president; E. F. Blackshear, secretary; Ward Templeman, treasurer; B. F. Reeves, manager.

Liberty County

BIG FOUR OIL (Hull)—No. 4 Hannerick well came in June 26, flowing from 1,550 ft. but soon sand-ed, and has not been brought in again.

Orange County

SHIPBUILDERS' OIL & GAS (Orange)—Build a new rig over Rio Bravo well, a producer brought in six years ago, intending to rewash it in effort to make it flow again.

ORANGE OIL (Orange)—Has won race against time, after delay in starting to drill, thereby saving lease and \$1,000 forfeit.

Victoria County

GOLDEN EAGLE (Victoria)—Drilling on Golden Eagle No. 1 well, near Victoria, started June 22.

Wodd County

WIXON OIL & GAS (Eryau)—Organized locally; capitalization, \$75,000. Rig ordered, and drilling will be done about fifteen miles northeast of Bryan on Navasota River. Officers: J. E. Gator, president; S. E. Hallan, vice-president and general manager.

UTAH
Beaver County

UTAH SULPHUR (Morrissey)—Plant, consisting of two retorts, turning out 40-50 tons of sulphur daily, to be enlarged by addition of three new retorts, each three times as large as those now in use, making possible treatment of 1,050 tons of ore daily.

Utah County

TINTIC SHIPMENTS first half 1919 amounted to 8,830 cars, including four cars of bullion, as compared with 4,416 cars first half of 1918 and 5,363 cars the first half of 1917. Thirty shippers thus far compared with 40 last year. Tonnage around 181,000 tons, valued at \$5,700,000. Shipments, 489 cars, as compared with 686 cars in June last year. Shipments held down by labor shortage early in year and later by low price of metals and high costs.

CENTENNIAL-ELI BEKA (Eureka)—Damage to shaft timbers occurring when steel was being hoisted caused short close-down for repairs.

CENTRAL STANDARD (Eureka)—Equipment being shipped in readiness for starting work. Shaft to be sunk.

PAYMASTER (Eureka)—Contract let for sinking shaft from 200 level to depth of 150 ft.

TINTIC DRAIN TUNNEL (Eureka)—In 3,000 ft. in formation requiring no timbering. Will connect with Iron Blossom, and starting from there, probably unwater large mining area.

TINTIC MILLING (Silver City)—Car of bullion amounted to 32 tons shipped, expected to bring about \$90,000. Runs high in silver.

UNCLE SAM (Silver City)—To be opened at end of year on 1,800 level of Colorado Consolidated, showing in readily back tunnel. Will give depth of several thousand feet below old workings productive, in part.

Summit County

PARK CITY SHIPMENTS first half of 1919 amounted to 237,368 tons, valued at \$2,500,000, according to camp estimates and weekly shipments. This is compared with 57,000 tons first half of 1918. Production for June, 1918, was 1,750 tons, that for June, 1919, was 165 tons, owing to strike, only ore shipped coming from Naldriver.

SILVER KING CONSOLIDATED (Park City)—Work resumed on Spiro tunnel, now in 10,000 ft. and being driven to develop Thayne Canyon section and connect with California-Costock ground. Expected also to start work in old workings on opposite side of hill, where producing ground is open to 1,800 level.

Salt Lake County

SILVER SHIELD (Bingham)—Old workings retimbered and shaft in condition for work.

CARDIFF (Salt Lake City)—Shipped 350 to 450 tons week ended June 28. Ore silver-lead of good grade. Fifty-five men working. Drifting started on 800 level with view to opening new Kennecott.

CANADA
British Columbia

GRANBY CONSOLIDATED (Vancouver, B. C.)—Production for May was 1,848,800 lb. copper; 41,532 oz. silver; and 2,307 oz. gold. For April, 1,333,523 lb. copper; 29,826 oz. silver; and 1,955 oz. gold. For March, 667,142 lb. copper; 17,723 oz. silver; and 1,283 oz. gold.

Ontario

TEMISKAMING (Cobalt)—Oreshoot 2 in. vein carrying high-grade encountered at 575-ft. depth.

ALLIED GOLD MINES (Boston Creek)—Extension of Miller Independence vein cut by diamond drilling.

GREENE-KIRKLAND (Kirkland Lake)—Exploration program planned. Small mine plant will be installed.

KIRKLAND COMBINE (Kirkland Lake)—Work started on group of claims adjoining Sylvanias. Andrew Grierson, manager.

LAKE SHORE (Kirkland Lake)—Production during May for May was \$42,136, from the treatment of 1,750 tons of ore, being an average recovery of \$24.05 per ton.

ONTARIO-KIRKLAND (Kirkland Lake)—Officially stated by mill with capacity of 100 tons daily will be installed.

ASSOCIATED GOLDFIELDS (Larder Lake)—One thousand feet of diamond drilling done on Dr. Reddick property. Two diamond drills at work on Kerr-Addison group adjoining.

LUCKY CROSS (Swastika)—Taken over by New York interests and renamed Mari-gold.

HERRICK (West Shining Tree)—Contract let for 5,000 ft. of diamond drilling. Vein about 25 ft. wide traced for nearly 1,000 ft. Shaft down 50 ft.

THE MARKET REPORT

Daily and Weekly Metal and Mineral Prices,
Metal Market Conditions, Average
Monthly Prices, Stock Quotations

Silver and Sterling Exchange

July	Sterling Exchange	Silver		July	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
3	4 5200	1.07½	53½	7	4.4900	1.07½	53½
4	4 5200	1.07½	53½	8	4.4800	1.07	53½
5	4 5000	1.07½	53½	9	4.4763	1.06	53½

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

July	Copper		Tin	Lead		Zinc
	Electrolytic	Spot	Spot	N. Y.	St. L.	St. L.
3	19.10@19.30	68	5.30@5.40	5.15@5.17½	7.00@7.05	
4	
5	
7	19.60@19.85	68	5.35@5.40	5.17½@5.20	7.10@7.12½	
8	19.85	68	5.40	5.17½@5.20	7½	
9	19.85	68	5.40	5.17½@5.20	7½	

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c per lb.

Quotations for spelter are for ordinary Prime Western brands. We quote New York price at 35c per 100 lb above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

July	Copper			Tin		Lead		Zinc	
	Spot	3 M.	Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.
3	91½	92½	92	241	238½	22½	22½	39½	40
4	91½	92½	95	243½	241½	22½	22½	38½	40
5
7	94	95	96	248½	245½	22½	22½	40	40½

9	97½	98½	100	250	248	23½	23½	41½	42½

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb.

Metal Markets

New York—July 9, 1919

There was great activity in copper during the week, but zinc and lead, while both strong, were only moderately active.

Saturday, following July 4th, was kept generally as a holiday. Although some of the offices were open, substantially no business was transacted.

Transatlantic freight rates remained unchanged, but there is an easier tendency. Rate from San Francisco to Hongkong and Kobe continues at \$14.

The sharp decline in sterling exchange puts some recent export sales in quite a different light.

Copper

Copper—A large business was done on Thursday at advancing prices, which led producers to make a further raise when the market reopened on Monday,

on which day they began at 19½c. delivered, and ended with 20c. delivered. On Tuesday very large business was done at 20c. delivered, corresponding to 19.85c. net cash, New York. Business was done at the same price on Wednesday, and it was clear that speculative interests would be willing to pay even more if producers were disposed to sell to them. The demand from consumers on this day was much lighter than on the previous day.

The aggregate sales per week amounted to a fairly large total. Wire-drawers were the principal buyers, but there were some important transactions with brass-makers, especially on Tuesday. The demand for cakes was relatively light. A fair amount of export business was done, this including sales to England and also to Japan, which was still a buyer.

The recent Japanese buying, which has been regarded as mysterious, is

believed to have a substantial foundation. Japan has bought copper and lead not only in this market, but also in Australia, and has been inquiring in London. Speaking generally, the Orient is the most prosperous part of the world at the present time, and manufacturing costs in Japan are considered to give that country a great advantage over both Europe and America. Moreover, the Japanese activity in the metal markets has been based partly on munition requirements.

The labor situation in Butte is uncertain. Exorbitant demands on the companies have been made, which cannot be granted. Negotiations have been going on without any settlement being reached. Some of the men have failed to go to work, leaving the companies short-handed. Whatever be the outcome, the uneasiness will have a considerable effect upon production.

The sales of copper by American producers in June were very large, though not quite so large as in May. The Government copper has been practically liquidated, although under the terms of the agreement it was contemplated that fifteen months might be required to accomplish it.

Copper Sheets—The base price of copper sheets is 29c. per lb. Market fair, and improving. Copper wire is quoted at 23@23½c. in carload lots, f.o.b. mill. Market strong.

Tin

Tin—The market remained unchanged at 70c. for high-grade tin and 68c. for 99 per cent grade, the situation being practically in the hands of the two smelters, inasmuch as consumers possessing surplus stocks have evinced no anxiety to resell. The business by brokers has been mainly in tin for shipment. Straits for July shipment and English for July shipment were sold at 52c. and 51½c. respectively, in the early part of the week. In the latter part, sales were made at ½c. higher.

Lead

Lead—Some of the principal producers are in a very strong position, but others have not yet sold as much as they would like to, and their offerings hold the market back. This naturally produces a situation where special brands may command a premium, which is distinctly the case with chemical hard lead. In the Ohio valley and at other points in the Middle West lead fetches prices above either the New York or St. Louis parity. Lead manufacturers report continuance of good business, especially in white lead. In

its statistical position lead is no doubt stronger than either copper or zinc, but the market lags, nevertheless.

Zinc

Zinc—After the halt last week, the advance was resumed, but there did not seem to be any great enthusiasm about it. There was again some buying for export, but the situation in respect to sterling exchange makes it uncertain what sellers are going to realize on such business.

There was some fair business done in high-grade zinc at moderate premiums over the price for common zinc.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 35c. per lb. Market quiet.

Antimony—The market was strong at unchanged prices, viz., 83¢@81¢. for spot.

Bismuth—Metal of the highest purity for pharmaceutical use is quoted at \$3.10 per lb. for wholesale lots—500 lb. and over.

Cadmium—Quoted at \$1.50 per lb. in lots of 500 pounds. For lots under 200 pounds, \$1.75 per lb.

Nickel—Ingot, 40c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—New York price advanced to \$107, at which figure the market closed strong. San Francisco telegraphed \$95, firm.

Silver and Platinum

Silver—After advancing to 533d., declined in London under American sales at 53rd. Exchange on London continues to be dropping, with the future uncertain.

Mexican dollars at New York: July 3, 82½; July 4, holiday; July 5, 82½; July 7, 82½; July 8, 82½; July 9, 81½.

Platinum—In strong demand. We quote ingot at \$105@107.50.

Palladium—Rather easier. We quote \$118@120.

Zinc and Lead Ore Markets

Joplin, Mo., July 5—Zinc blende, per ton, high, \$48; basis 60 per cent zinc, premium, \$46; Prime Western, \$45; sludge and flotation, \$42.50@40; calamine, basis 40 per cent zinc, \$28@25. Average settling prices: Blende, \$43.04; calamine, \$26.32; all zinc ores, \$42.10.

Lead, high, \$62.90; basis 80 per cent lead, \$60; average settling price, all grades of lead, \$60.76 per ton.

Shipments the week: Blende, 7,240; calamine, 499; lead, 1,342 tons. Value, all ores the week, \$451,390.

Report is that not a movement is being made today by any of the mines in the district, so many miners declaring their intentions of not returning to work until Monday, at the close of work the evening of July 3, that no other course was open to producers, many of whom would have resumed today. Pumping operations save the situation

from an appearance of abandonment. With the prohibition enforcement coming the first of the week, and the observance of two days' holiday at the end, the production in output will probably approach 50 per cent.

Platteville, Wis., July 5—Blende, basis 60 per cent zinc, \$47 base for premium grade and \$44.50 base for high-lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$60 per ton. Shipments reported for the week are 1,947 tons blende, 233 tons galena, and 232 tons sulphur ore. For the year to date the totals are 52,171 tons blende, 2,844 tons galena, and 7,376 tons sulphur ore. During the week 3,396 tons blende was shipped to separating plants.

Other Ores

Chromite Ore—High-grade ore is reported offered at 50c. per unit f.o.b. California.

Molybdenum Ore—Quoted nominally at 75¢@85c.

Tungsten Ore—Chinese ore was sold at \$6.75@87 per unit. A lot of high-grade scheelite for export was sold at \$10. There is rather more inquiry for this tungsten ore.

Other Minerals

Pyrites—Spanish pyrites is quoted at 18c. per unit for furnace ore, c.i.f., New York or other Atlantic port, and 18½c. at Gulf ports. Market slow and unsettled; hand-to-mouth buying.

Nitrate—Price is quoted at \$3.10 to \$3.25, carload lots, for immediate shipment in this country. Little change developed during the week, although considerable business was reported done after the removal of Government control of price, owing to drop in quotations. Practically all supplies are now being obtained from Government allotments to importers, only a small quantity reported being brought in from South America.

Iron Trade Review

New York—July 9

June sales of pig iron in the case of some furnaces equaled the total for several preceding months, and now in a limited way there is pig iron buying for delivery in 1920, including some malleable in the Central West, says *The Iron Age*. But many foundries have yet to cover for the fourth quarter of this year. Enough furnaces are going in to make the market uneven in their efforts to get backlog orders. Some cuts are heard of each week, but are generally reported as lapses which did not break the market.

Some Southern furnaces that were weak sellers are asking \$1 a ton more, the recent heavy bookings of their Northern competitors having turned some inquiry southward. Eastern Pennsylvania still reports concessions on foundry iron, and standard low-phosphorus iron is available at \$35. Less than the full price was asked on a round lot of basic wanted by a large northern Ohio steel foundry.

A British inquiry for 20,000 tons of basic iron gives a fair prospect of business. Sweden and Holland and other countries, which see little early chance of getting pig iron from Germany, are now inquiring here.

Pittsburgh—July 8

The improvement in the iron and steel market is so steady that it is quite uneventful, with no clouds on the business horizon. In no particular quarter is there any burst of buying enthusiasm, but orders for steel products are flowing in more and more freely, and mills are enabled to operate at higher rates from week to week, the present rate of steel-ingot production being nearly if not quite 70 per cent of capacity. Steel-ingot capacity increased by 40 per cent from 1914 to the present time, and steel-finishing capacity, except in plates, increased much less. The result is that some finishing departments are able to operate at close to capacity, even though the ingot-production rate is not over about 70 per cent.

By far the busiest branch of the finished-steel trade is the lap-weld departments of the pipe mills, which are running at capacity, some of them being booked up for practically the remainder of the year, almost entirely by reason of the heavy demand for oil-country goods. This phase of activity is reflected in the plate market, which is extremely dull, except for the demand for plates for oil tanks. The automobile trade continues to be a heavy buyer of all the steel products it uses, orders for sheets and cold-drawn steel being especially conspicuous. Dwelling-house construction is increasing throughout the country, and particularly in the Pittsburgh district, where trades disputes, except that with the painters, are settled, and contractors are in position to bid on the large volume of work that has been waiting. In bridge and fabricated steel work generally there is not much activity, although conditions in this respect are improving.

Steel prices are much firmer and price cutting is exceptional. It still occurs in plates, and though not absent from the sheet trade it is no longer conspicuous. In pipe and wire products there is not the semblance of shading, and there is little if any in bars.

Some of the independent pipe and wire mills seem to wish to advance prices, but they know that the Steel Corporation is opposed, and it is doubtful whether any advances will be attempted. It is asserted that the mill position in these lines is such that advances could easily be held, but the effect in the future would be problematical.

Tin-plate production has increased rather sharply, the industry now operating at near to capacity, but this burst in activity is attributed chiefly to demands of the fruit and vegetable crops in California, which prove much larger than anticipated, and all the tin plate for California must be got out by the

So Go Back to Your Meat And Enjoy it.

IN A RECENT issue of the *New York Tribune* there appeared an advertisement from which we take the following extract:

"The war is over; and all restrictions on meat are off. Now you may eat all you want with a free conscience—beef, lamb, veal—three times a day if you wish. You have done splendidly; you have helped win the war by denying yourself meat, as you have in dozens of other ways. But you needn't hold off any more; it's over 'over there' forever. Most of the boys are back at work; Army meat demands are no longer a strain. England and other European countries do not have to depend solely upon us any more. Ever since the beginning of the war, the American livestock raiser has been raising so much more livestock that there is plenty to go 'round. So, go back to your meat and enjoy it."

There is a naïveté about this that compels an irresistible chuckle. It is signed by a number of livestock associations. Evidently they expected the public to take the whole matter quite seriously and immediately to place heavy orders for tender, juicy cuts, thick tenderloins, and roasts like those of the good old days. Can't you imagine the cattleman standing, hat in hand, and waffing the good people to the butcher shops? What a fine belief he has in all humanity!

Bolshevism will never take a hold on this country while we have such confiding and honest people as our cattlemen. Evidently there is an overplus of meat, and instead of letting the law of supply and demand take its course, our friends ignore it and trust to a stampede to follow on their sweeping permission to eat more beef and lamb. Perhaps they have associated so long with lambs that they have a strong belief in the lamb-like qualities of the great American public.

The copper producers may well take lessons from this. They cut their prices sharply when copper became a drug upon the market and just as quickly they curtailed production. Why did they not issue a manifesto to the public along similar lines? Live and learn is the order of the day.

A Mexican Policy Essential

THOUGH no official announcements have come from Washington respecting any new policy as to our relations with Mexico, an atmosphere of expectancy hangs over the Capital. Rumors are rife to the effect that the President has had several conferences with the State Department respecting this subject since his return to Washington. His personal calls on Mr. Daniels and Mr. Baker have been interpreted as having to do with Mexican affairs.

It is suggested that President Wilson will address Congress regarding Mexico somewhat on the lines of the

McKinley message which led to intervention in Cuba. We scarcely anticipate that the Executive will take precisely this view, as conditions in Mexico do not closely parallel those that caused intervention in Cuba. Moreover, it will be recalled that during President McKinley's administration the voice of the jingo statesmen was heard above that of the saner, wiser advocates of intervention.

Appeals to the President and the State Department have for several years been strong and insistent, but they have not been tinged with any coloring of jingoism. Our citizens have asked for intervention of some kind because their brothers, though obeying the laws of the land, have been maltreated or murdered. Property has been confiscated through decrees or some form of taxation, and millions of dollars' worth has been rendered valueless because its owners have been forced to abandon it.

Bad as this story of governmental mismanagement and obliquity has been, it is not all—it is not the worst. Our citizens have made their personal wrongs and sufferings known to us from time to time, but the wrongs to thousands of Mexican citizens have been rather overlooked on this side of the line.

The small group controlling Mexican affairs for the last few years has been the cause of death and suffering among its own people to a far greater extent than among foreigners. Thousands of natives have felt the incompetency or dishonesty of the present government for every score of foreigners that have felt it. The money that foreigners have lost, and about which we hear much, is not to be compared with the internal losses in property and life. It is these poor people who call feebly but insistently for our help. Theirs is not a jingo call. They call for no war in their country, no revolution against any government. They ask only for succor in their rags.

Two months ago the writer sat in a dirt-floored house of two rooms with an octogenarian of the Diaz type. He was a man of affluence and influence during the Diaz regime and was well known to two of our own presidents. There was no complaint that thousands of head of cattle had been driven from his ranch, or wantonly slaughtered for their hides—no complaint that he had been driven from his home and was now living on a precarious charity; but tears came to his eyes as he told of the little children who were dying from starvation at the old hacienda, their fathers dead or forced to join some band of robbers as the only visible means of existence.

It was announced on July 11 at the Methodist Centenary Exposition in Columbus, by Dr. R. N. Bridge, that \$8,000,000 would be made available for the benefit of Latin America and Mexico and that the first call on this fund was for saving the lives of 1,500,000 orphans in Mexico. This is an admirable charity and one that should be supported, but of more importance

is the eradication of the cause that produced these orphans and will produce thousands more if our statesmen can find no way of improving the conditions south of the Rio Grande.

We want no war with Mexico. Our boys have seen all the war that they care to see; but most emphatically we do need peace and order in our neighbor's country. The work ahead of our Government is the work of statesmen, not of warriors. Unfortunately, negotiations cannot be taken up with statesmen. They must be initiated with politicians and bandits, and because of this fact our statesmen may require—probably will require—the moral and physical support of the military arm of our Government.

With the United States temporarily controlling the civil government of Mexico, its courts, customs, schools and national industries, and with order guaranteed, there would be a marvelously rapid return to prosperity. Mexico is capable of a prosperity that would amply and quickly pay all of its obligations. If the real patriots of Mexico are given an opportunity to assist themselves, this work will be done without the application of outside force, and, as with Cuba, our physical support will not be required for long.

England and France are anxiously looking forward to the day when the United States shall say that order must be restored. Some of the constituents of every American Congressman are asking it. Silently, but no less earnestly, millions of Mexicans are praying for it. May our statesmen soon see the way to do that which it is their duty to do, and to do it in a manner that will produce the least possible bad feeling.

Friction there will be, but it will be with the incompetent, the dishonest, the oppressors of their fellow men; and we trust that this friction may be so intense as to see the hands of the rapers of their country so deeply that they will never again touch political intrigues.

Serious Condition of the Gold-Mining Industry of South Africa

THE unfortunate situation in which many American gold mines have been placed through the fortunes of war has been a matter of serious consideration by the owners of mining properties, and the gravity of this condition has not been relieved by the report of the commission appointed to investigate the situation and suggest remedies.

Practically no relief was suggested, and the American gold miner is left to work out his own salvation. Perhaps even more serious is the condition in South Africa, where nearly all of the ore is of low grade and where the margin of profit was narrow even before the war. The output of the South African mines in 1918 was \$176,000,000, compared with the total world's production of approximately \$377,300,000. A material reduction in the Transvaal output means a curtailment in the world's production, and if some remedial steps are not taken soon the output for 1919 will be seriously curtailed. The *New York Times* of July 5 quotes F. S. Malan, Acting Prime Minister, as reporting that on the Central Rand six mines out of sixteen were worked at a loss for three months ended February, 1919. Mr. Malan states:

"These six employ 2,271 Europeans, and the short-
age amounted to \$140,000, while the expenditure in wages and stores amounted to \$12,387,940 for the last year. Out of thirteen mines in the Near East Rand,

five had losses in the three months amounting to \$145,000. They employ 2,518 Europeans, and last year they expended \$13,953,520. Of nine mines on the West Rand, five worked at a loss which aggregated \$153,700. The profit of the other four was \$172,775, leaving a credit balance of \$6,175, which, of course, is insufficient to meet capital expenditure, interest on debentures, taxation, and other charges. The unprofitable five employ 1,156 Europeans, and they expended in wages and stores last year \$6,976,810.

"The grand totals show that forty-six mines on the Witwatersrand employ 22,035 Europeans. Thirty mines made profits aggregating \$8,173,775; sixteen showed deficits amounting to \$438,540 during three months, and the total expenditure on stores last year was over \$125,000,000. Of course the figure of working profit is not all distributable, as out of it has to come interest on debentures, loans, capital expenditure, government taxation, and to a certain extent miners' phthisis contributions. The eight richest mines, which are on the Far East Rand, show a working profit for the three months of \$5,905,240."

Sir Evelyn Waller, President of the Transvaal Chamber of Mines, in a letter to the Acting Prime Minister, complains of the failure of the government to take action to avert the impending crisis, despite repeated urgings and warnings. Even a request to recruit an experimental number of native laborers from north of latitude 22 degrees south—that is, in tropical Africa—with a view to offsetting in a measure the great shortage of labor resulting from the war, has not been acted upon, and Sir Evelyn says:

"The position foreshadowed by the chamber so many times is now at hand. So far as we can see, nothing can now prevent a number of important mines, employing a large number of Europeans and upon whose operations the prosperity of a considerable section of the Witwatersrand depends, from ceasing operations in the next few months."

Mr. Malan continues: "The menace of the grave problem which the unemployment and distress that this shutting down would involve moved the government in replying, through the Secretary of Mines and Industries, to urge, should the closing down become unavoidable, that this be done with the maximum possible interval between the dates selected for this action by the different mines. The government also considers that the appointment of a small commission to report on the reasons and necessity for the closing down of each mine before the date of cessation of operations would have a valuable effect and would tend to keep public opinion informed as to the causes which are operating in connection with the industry. Such a commission should, in the opinion of the government, be composed of a government representative and one or more representatives of the chamber and of the workers."

Hurley a Loss to the Mining Industry

WHEN E. N. Hurley quit the position as head of the Shipping Board, the mining industry of the western hemisphere lost one of its best friends. Such energy in construction work has seldom been exhibited as Mr. Hurley has shown in the building of an American merchant fleet. With many vessels built and the war over, he promptly concluded that the ships could be usefully employed in plying between North and South America, and it was expected that the same energy

would be exhibited in establishing trade routes, to such advantage to Latin America and ourselves that European ship-owners could not break in. South America has mines, and we need her minerals. North America builds the best mining machinery that is manufactured, and we need an energetic agent to bring about an exchange of these commodities.

Let us hope that Mr. Hurley's successor has the same energy and vision, and that ample opportunity will be offered the South and Central American producer to send his ore and metals to this country, and to receive from us the goods and machinery that he requires.

Protecting American Rights In Mexico

EARLY in the present year there was formed in New York a national association with the object of securing through the United States Government that protection in Mexico to which all American citizens and their property are entitled. The method of procedure which the executive committee of this association adopted cannot be criticised. Though it is quite natural that regret is expressed because little has been done toward bringing order out of chaos, the efforts of the organization are being directed toward securing authentic information respecting Mexican conditions and in placing this information before our Government officials and the public.

Most Americans have but scant appreciation of Mexico and present conditions in that republic. So little do they know, that there is no evidence of interest in or a desire to acquire more information. A general impression prevails that Americans who have gone to Mexico are adventurers and ne'er-do-wells who have left their native land to cast their lots in a country of precarious opportunities, and that, having done so, they have stepped beyond the pale of American protection. It is with the idea of educating the American public to the fact that this is not the case that the association mentioned has started its campaign of publicity; but beyond this, and of even greater importance, is its publication of the conditions under which the Mexican people are living today.

We have recognized as a duly-elected government a president and his supporters who have wrecked the industries of the country, increased taxation, reduced the number of schools, and continue to pile up the obligations of the country under a dictatorship of incapacity, if not dishonesty.

The first bulletin of the association was issued on July 1, and we cannot read it without feeling the keenest sympathy for those who are patiently waiting for better things, or dying of starvation, crushed under the heel of the latest liberator.

Our Bill Was Thirty Billions

LAST week Secretary Glass made public the latest calculation of our share of the war's expenses—a little over thirty billions of dollars. This is a staggering amount when thought of in dollars alone; yet it is not so colossal when we remember that nearly 30 per cent has already been met by taxes. Or shall we say that it is a colossal sum, and that our resources for meeting the obligation are colossal also?

As large as these figures are, they pale into insignif-

icance when compared with the costs that have been laid upon our Allies. Their burdens have been not only in money but in property and lives that cannot be brought back. The resources of our friends will probably enable them to pay their bills in the course of time, but it will be generations before the destruction of life and property will cease to be felt.

We can congratulate ourselves that our bill was only 300,000 casualties and thirty billions of dollars, a third of which sum was loaned to our Allies. And when it comes time to collect interest on this loan, and time to pay back the principal, let us remember that the money was spent for us every bit as much as for ourselves; that Frenchmen, British, Italians, and Belgians were dying for us while using the ammunition that our money bought. They were fighting our battles; they were saving our lives and our Republic.

The suggestion has been made that the United States cancel its European loans made on account of the war. The suggestion is not fantastic, and it would not be altogether bad business. We owe a moral obligation to our Allies, an obligation that we will recognize less and less as the years pass by. We cannot cancel this obligation with money, but we can alleviate the sufferings of those who have borne the brunt of the strife if we do not exact the last pound of flesh.

The Never-Ending Circle

THE British government has again raised the price of coal to the consumer, this time only six shillings per ton. The increase is to meet the higher cost of wages and the reduction in working hours. This is perhaps one of the most severe blows that labor has given itself for some time. It is surely a boomerang that will be felt most seriously by those employed in the manufacturing and export industries.

Great Britain has little water power. Her industries have been built upon her coal mines, and unless every manufacturing and shipping nation experiences a like increase in the cost of fuel, England places a handicap upon her business that no adjustment at home can meet. But if every nation should do the same, it would be equivalent to marking up the price of every product that labor consumes, and labor would gain nothing but the illusory pleasure of having more money pass through its hands in a given time.

Some day, some time—it may be far away, but it will come—labor will learn that in normal times there is only one way of raising the standard of living, but one way of increasing the pleasures of life, and that is by harder work, more efficient labor; by increased production per unit of labor.

Australia Seizes Coal

ENGLAND is not alone in her troubles with the coal miners and the production of coal. The Prime Minister of Australia has taken over the output of that commonwealth. It is the intention of the government to fix wages and the conditions of labor, as well as the price of coal. If this results in lowering production and increasing the price of fuel, as has been the case in England, the government will find that it has "fixed" some industries depending upon cheap fuel to an extent that will enable them to do without fuel or labor. It is to be hoped that the Prime Minister and the miners will both see the light before it is too late.

New Cornelia Copper Company

GENERAL VIEW NO. 2 HILL, SHOWING FIRST CUT, NEW CORNELIA COPPER COMPANY

Silver Volatilization in Smelting*

It Is Necessary To Distinguish Between Volatilization and Dusting—Mechanical Loss Due to Ebullition Has Nothing To Do With the Vapor Pressure Or True Volatilization

By **FREDERIC P. DEWEY**
Assayer, Bureau of the Mint, Washington, D. C.

MUCH has been written about the Parkes process for desilverizing base bullion with zinc. It is invariably stated that little silver goes over with the zinc in distilling the crusts, or that there is practically no loss of silver in this operation. Diligent search and inquiry failed, however, to disclose more than a single actual determination of silver in the distilled zinc, in one of Raymond's¹ reports. This gives a portion of 0.00012%, or 0.035 oz. per ton, a small proportion.

Johnston² presents a most interesting and valuable review regarding vapor pressure and volatility of high-boiling-point metals, containing much information and many useful references. He gives the boiling point of zinc as 920° and the vapor pressure of silver as 10⁻³ mm. at this temperature; the boiling point of lead as 1640° and the vapor pressure as 1 mm. at 960°, and the boiling point of silver as 2090°.

Groves and Turner³ heated gram samples of an alloy of silver and zinc containing 50.46% silver in a vacuum, with the results shown in Table I. In the last test of the

TABLE I. RESULTS OF HEATING SILVER AND ZINC ALLOYS IN A VACUUM

Temperature, Degrees	Time, Min.	Weight, Gram.	Residue Silver, Per Cent	Zinc, Per Cent
500	45	0.7382	65.86	34.14
500	120	0.7350	68.46	31.54
600	120	0.6052	83.28	16.72
700	120	0.5104	98.68	1.32
1000	30	0.4924	99.33	0.67

series, 99.33% of the zinc volatilized and should have shown 3.13% silver, 912.75 oz. per ton. They also heated a gram of silver-lead alloy, containing 49.60% silver, in a vacuum for two hours at 1000°, and obtained a volatilization of 99.4% of the lead and 8.31% of the silver. The sublimate should have shown 7.61% silver, or 2226 oz. per ton.

Friedrich⁴ distilled zincs containing 0.01 to 1% silver at 1165° to 1392° for varying periods of time, the tests being accompanied by checks of pure silver. The actual losses varied from 2.5 to 8.2% of the silver. The net losses, which he regarded as largely mechanical, were from 0.4 to 5.8%. Five checks weighing from 2.5 to 260.45 mg. lost from 2 to 3.4% on heating at 1165° for 30 minutes.

Blakemore⁵ gives the following assays of blue powder obtained in distilling crusts carrying 1000 to 2000 oz. silver and several hundred ounces gold per ton—so-called "gold crusts": Silver, 1.18, 6.89, and 20.12 oz.; 2.18, 7.32, and 20.78 oz., and 5.47, 15.32, and 332.21 oz. per ton. He suggests that the high result was caused by bullion getting into the condenser, but Sulman⁶ states that melted zinc in the presence of oxygen gives "solid par-

ticles" "capable of carrying off finely divided gold," so that the highest result may have been caused by a leaky retort. Excepting the case of the high silver, the gold varied from a trace in three cases up to 2.74 oz. per ton, with 20.78 oz. silver. With the wealth of data in this paper, it is curious that no assays of the distilled zinc are given.

At Lautenthal⁷, in the oxidation of the zinc by steam, the flue dust showed—ZnO, 69.6%; PbO, 28.2%; Ag, 8.8 oz. per ton. In an experimental distillation of cyanide precipitate, Clevenger⁸ found 7.2 oz. silver and 0.8 oz. gold per ton. Rose⁹ reviews the loss of gold and silver in the volatilization of zinc and adds some tests. H. H. Alexander, superintendent Maurer plant, A. S. & R. Co., kindly supplied seven miscellaneous samples of Parkes zinc, which yielded me the results given in Table II.

TABLE II. ASSAY OF MISCELLANEOUS SAMPLES OF PARKES ZINC

No.	Silver, Oz. per Ton	Gold, Oz. per Ton
1	28 0	0 14
2	33 0	0 17
3	41 0	0 20
4	75 5	0 41
5	77 0	0 29
6	325 0	1 25
7	604 5	2 91

The results shown in Table II are entirely contrary to the book statements. They also indicate wide diversity of conditions in the distilling. It has been suggested that the high results might be due to the use of old retorts for condensers, but only iron condensers were used. Mr. Alexander has reported three inventory assays, which show similar results as follows:

No.	Silver, Oz. per Ton	Gold, Oz. per Ton
1	69	0.26
2	158	1.56
3	325	1.33

Mr. Alexander also sent me two sets of four samples taken during the course of two distillations, which gave the results shown in Table III. E. B. Braden, general

TABLE III. ASSAY OF DISTILLATION SAMPLES OF ZINC

No.	First Set		Second Set	
	Silver, Oz. per Ton	Gold, Oz. per Ton	Silver, Oz. per Ton	Gold, Oz. per Ton
1	22.5	0.12	13.0	0.05
2	10.6	0.03	6.1	0.05+
3	2.5	tr	2.1	tr
4	3.0	0.02-	1.5	tr

manager of the Selby plant of the American Smelters' Security Co., kindly supplied a set of three time samples which showed:

No.	Silver, Oz. per Ton	Gold, Oz. per Ton
1	4.8	0.13
2	1.9	0.07
3	1.5	0.01

These time sets show that it is possible to distill the zinc out of the crusts so that it carries only slight amounts of silver, but the miscellaneous samples show that proper care is not always exercised and much silver

⁵Trans. Aust. Inst. M. E., 1898: p. 221.

⁶Trans. Inst. M. E., Vol. XIV, 1904-05: p. 431. See also Sulman and Peed, Jr., Soc. Chem. Ind., Vol. XVI, 1897: pp. 966-7.

may be carried along with the zinc. This is undoubtedly mechanical and has no connection with volatilization. It is caused by excessive ebullition of the zinc in the retort, due to allowing the temperature to rise too high.

In all, I have made eighteen assays of Parkes zinc, and Mr. Alexander has furnished three giving the following silver results, the gold figures being too small to count:

Time Samples,		Miscellaneous		Miscellaneous	
Oz. per Ton	Samples,	Oz. per Ton	Samples,	Oz. per Ton	Samples,
1.3	4.3	28	138		
1.5	6.1	33	325		
1.9	10.6	41	325		
2.1	13.0	69	604.5		
2.5	22.5	75.5	...		
3.0	...	77	...		

Friedrich¹⁹ reviewed and investigated methods of determining silver in zinc and gave determinations on thirty-one samples of a wide variety of zincs. Two did not show surely detectable silver, two showed 0.00002% silver on 1-kg. samples, seventeen showed less than 0.001%, six showed 0.001 to 0.002% and four showed from 0.00221 to 0.00648%. The most satisfactory way I have found for determining the silver in zinc is to dissolve the zinc in sulphuric acid, filter, scorchify the residue and cupel. Many tests on the filtrate failed to show silver on nearly neutralizing the acid and adding a limited amount of sulphureted hydrogen water. Under these conditions some sulphide of zinc will be separated as a perfectly white precipitate, which may be tinged yellow when cadmium is present.

The Alexander crusts run fairly uniformly from 4800 to 5500 oz. doré per ton. The Selby crusts are approximately 5000 oz. per ton, about 50 fine in gold.

I have also determined the lead in the time samples and have figured the parts of lead per part of silver going over with the zinc and have given the results in Table IV.

TABLE IV. PARTS OF LEAD PER UNIT OF SILVER IN ZINC SAMPLES

No.	Alexander				Selby	
	First Set		Second Set		Lead Parts per One	
	Per Cent.	Part Silver	Per Cent.	Part Silver	Per Cent.	Part Silver
1	0.89	11.6	0.96	21.6	0.88	53.5
2	0.88	24.3	0.75	51.2	0.90	138.0
3	0.88	102.8	0.95	130.3	1.24	278.0
4	1.51	147.0	1.30	253.9

These results show most emphatically that lead does not promote volatilization of the silver. On the contrary, they demonstrate that the lead protects the silver from the drag of the volatilizing zinc. In distilling zinc out of Parkes crust there appears a complex result, the details of which should be sharply defined. There is, first of all, the straight volatilization of the metals due to vapor pressure. There is the drag of the volatilizing zinc upon the other metals. There is the purely mechanical loss due to excessive ebullition of the charge, and this has nothing to do with the vapor pressure or true volatilization. The drag of the volatilizing zinc must decrease as its proportion decreases and the proportion of silver increases, but this might be overbalanced by the greater vapor pressure arising from an undue increase of temperature. Also, the increase in the proportion of lead in the bath must oppose the drag of the volatilizing zinc. Thus it happens that in the early stages of a properly conducted distillation the zinc carries more silver than at the end.

At various times during the lead determinations the

solutions showed the color of iron and No. 3 of the first time set from Mr. Alexander showed 0.4%. In his second set only qualitative tests were made. Iron appeared in every sample, but in widely varying amounts. In the Selby set I found: No. 1, iron 0.55%; No. 2, iron 1.10%; No. 3, iron 0.70%.

The conditions in distilling zinc from ores are markedly different from the crust conditions, particularly in that there is no bath of lead to hold the silver back and there may be dusting. K. Stock, general manager, Earlesville Zinc Co., has kindly supplied a set of samples made in a test to "produce spelter of the new Government regulations for A-grade out of crude spelter produced from Butte and Callahan ores." The ores were supposed to carry about 20 oz. silver per ton and to require about 2½ tons to produce a ton of spelter. In samples representing the first, second, and third draw spelter from straight Butte ore I found the following:

No.	Silver, Oz. per Ton	Lead, Per Cent.	Parts per One Silver
1	0.164	1.0	1778
2	0.583	1.3	750.5
3	1.178	2.25	557

Though there is an increase in both silver and lead in these samples, the amounts of silver shown are small, and the increases are not proportional. The increase may have been owing to increase in temperature during the distilling. In any event, these figures show that the carrying capacity of the lead for silver must have been low.

Starting with zinc as low in silver as these results indicate, it could not be expected that the redistilled metal would yield definite results. From 101½ gm. of R-1, I obtained 0.21 mg. of silver; from 70½ gm. of R-2, the silver bead was not visible to the naked eye; from 75½ gm. of R-6 the bead was just about visible. I did not test any of the other R's for silver. The lead results were: R-1—lead, 0.25%; R-2—lead, 0.08%; R-3—lead, 0.07%; R-4—lead, 0.10%; R-5—lead, 0.07%; R-6—lead, 0.07%. The first sample showed the most lead, and by qualitative tests it showed the most cadmium, as would be expected. I am much indebted to W. R. Ingalls for assistance during the course of this investigation.

Many of the statements of volatilization losses in smelting include the loss by dusting. The necessity of distinguishing between true volatilization and dusting is well shown by a month's record of the commercial cupels at the Balbach S. & R. works (equipped with a Cottrell condenser), as kindly given me by Mr. Dieffenbach. The dust collected showed only 40% of lead, proving that it contained much mechanical dust. This was due to the fact that over 70 tons of rich slimes were treated on the lead bath. The dust collected showed 0.64% of the silver charged and 0.072% of the gold. With so much mechanical dusting of rich stuff, the amount of silver and gold actually volatilized must have been extremely small.

Eilers²⁰ exhaustive paper on the baghouse in lead smelting furnishes some pertinent illustrations. The Murray, Utah, plant smelts the ordinary run of silver-lead ores of the West. The charge runs low in both lead (10-12%) and silver. In smelting 254,794 tons, there was collected 0.44%, or 1124 tons of fume, showing only 0.0149 oz. gold and 2.62 oz. silver per ton, or 0.097% gold and 0.085% silver charged. Though it carried only 28.42% lead, or 3160 parts to 1 part silver,

¹⁹Zeit. f. Angew. Chem., Vol. XVII, 1904: p. 1636-44.

²⁰Trans. A. I. M. E., Vol. XLIV, 1913: p. 708-35.

it also carried 36.6% arsenic, or 48.3% arsenious oxide. It showed only 2.9% silica, and may be considered as essentially volatilized material. In 4.5 years' run the fume carried 0.049% of the gold charged and 0.063% of the silver. It showed 4401 parts of lead to 1 part of silver.

The blast furnaces at Omaha, Neb., treat various plant products, with some ore. The charge is high in lead, often 40%, and rather low in precious metals. In one year, 74,112 tons yielded 580 tons of fume, carrying 1615 oz. silver, or 2.78 oz. per ton. It showed 230 tons lead, or 4154 parts to 1 part silver.

A complete illustration of volatilization in smelting operations under oxidizing conditions is afforded by the record of the converter baghouse at Omaha. These converters bessemerize leady copper matte, about 90 oz. silver per ton, with various byproducts and ores, to blister copper. The fumes pass through about 1200 ft. of flues to a fan and thence to the bags. Six samples were taken from this flue, generally at 200-ft. intervals, and one sample was taken from the baghouse. The analyses show that, certainly after the first 400 ft., the fume consisted essentially of volatilized material in the form of sulphates and oxides. If both the lead and the combined SO_2 are calculated to lead sulphate, the interesting comparison in Table V is obtained. At first there were other sulphates besides lead, but at the end there was an excess of lead oxide.

TABLE V. DISTRIBUTION OF LEAD SULPHATE IN FLUE

Lead		SO_2		Sulphate of Lead		Lead		SO_2	
Feet	Per Cent.	Equivalent, Per Cent.	Feet	Equivalent, Per Cent.	Feet	Equivalent, Per Cent.	Equivalent, Per Cent.	Feet	Per Cent.
200	81.96	95.18	800	94.55	85.60				
400	87.82	87.60	1100	92.21	88.36				
600	93.97	86.43	1200	94.26	78.02				
			Bags	96.60	81.92				

That the volatilizing lead exerted little or no drag upon the associated silver is manifest from the following table showing the parts of lead per one part of silver:

Distance, Feet	Parts Lead	Distance, Feet	Parts Lead
200	3889	800	9421
400	5833	1100	8750
600	7892	1200	11739
		Bags	6875

During one year 1551 tons of fume carried 5559.44 oz. silver, or 3.58 oz. per ton. It also carried 1325.387 tons lead, or 85.45%, which would be 6953 parts per 1 part silver. It is essentially an oxide fume, practically free from sulphates.

Fulton¹² gives an analysis of fume showing 40.57% oxide of zinc and 6.7 oz. silver per ton and one with 34.34% arsenious oxide and 5.07 oz. silver per ton. Roesing¹³ bessemerized base bullion with 12.4 oz. silver per ton, bringing it up to 196.3 oz. per ton. The fume showed 75% lead and 2.5 oz. silver per ton. The litharge was over 1200° and very fluid. It showed 1.05 oz. silver per ton.

These results confirm my Parkes process figures regarding the slight effect of volatilizing zinc and lead in promoting the co-volatilization of silver. As far as they go, they also indicate that even arsenic has little effect. The effect of arsenic is, however, largely dependent upon the temperature of the operation. I have roasted many charges of rich arsenide ores from Cobalt, Canada, at a very low temperature for the purpose of converting as much as possible of the arsenic into metallic arsenates.

With about 40% arsenic and several hundred ounces silver per ton, a little more than half the arsenic remains in the roast. From the furnace to just beyond the fan five samples of the arsenious oxide showed 3.62, 6.18, 6.89, 6.9, and 7.4 oz. silver per ton. Further along, at and in the bag, the arsenious oxide was very white and uncontaminated with dust. Three samples showed 1.69, 2.00, and 2.04 oz. silver per ton. A ton of arsenious oxide represents approximately 6.5 tons of ore.

Wright¹⁴ obtained a base silver, about 800 fine, containing much arsenic, from these ores. On bessemerizing and refining this bullion the impure arsenious oxide produced showed about 800 oz. silver per ton.

Hand Sorting in Idaho

According to a report on mining districts of Idaho recently issued by the Bureau of Mines, hand sorting is practiced to a more or less extent at many of the mines and mills. Where hand sorting is employed and the mill is some distance from the mine, the sorting is usually done at the mine, although at a few places the ore is sorted at the mine and also at the mill. At some of the mills, when the ore is rather coarsely disseminated, both mineral and waste rock are sorted. The quantity of shipping ore thus sorted out, which is known as "crude ore" or "high grade," varies from a few per cent to as high as 60 per cent of the total tonnage of concentrates shipped.

The usual method of procedure in hand sorting is as follows: The oversize passes from the grizzly onto a wide conveyor belt, where the ore is washed with a spray of water, so that the sorters can distinguish the mineral from the waste rock more readily. Men stationed on each side of the conveyor belt sort from the washed material either the mineral or the waste rock and drop it into shoots leading to the respective bins.

A paper on hand sorting of mill feed was presented by R. S. Handy, mill superintendent of the Bunker Hill & Sullivan Co., Kellogg, Idaho, at the meeting of the Columbia Section of the American Institute of Mining and Metallurgical Engineers, held at Kellogg, on Nov. 17, 1917. This paper was most interesting and instructive, as was the discussion that followed. Mr. Handy claimed that hand sorting of the mill feed is not necessary, and that it is cheaper, in fact, to treat the mill feed direct, without previous hand sorting. There seems to be no question that Mr. Handy, who has made careful study of the treatment of the Bunker Hill ore, is correct in assuming that for this particular ore and under the conditions in the mill it is best to treat the mill feed direct without hand sorting. Whether, under different conditions, hand sorting is essential or not should be determined for each individual ore.

Screen Sizing at Anaconda is done entirely in the coarse-crushing and concentrating division of the copper concentrator at the Washoe Reduction Works, primarily to secure a product of the required size, with a minimum amount of slime and with as much as possible of the valuable mineral liberated for recovery by gravity concentration. At the zinc concentrator no gravity concentration methods are in use. The screening, however, is conducted as at the copper plant, producing a 1½ to 2 mm. feed for the ball mills. The screens used are revolving trommels 3 by 6 ft. with 1 in., ¾ in. and 4 mm. round holes and 1½ by 12 mm. slotted holes. All screens are steel. No screens finer than 1½ by 12 mm. are used.

Placer Mining in Oregon

Hydraulic Elevators Which Have a Lift of 89 Feet Will Be Replaced by a Water Classifier That Requires Driving a 700-Foot Tunnel—Operating Costs Will Be Reduced

By A. E. KELLOGG
Gold Hill, Oregon

THE original "old channel," or bed of the ancient river, the dream of which has caused many a weary Oregon prospector to renew the search, has recently been uncovered at the Esterly mine, situated in the Waldo district, in the southwest part of Josephine County. A pit 25 ft. below the level of the former workings has been piped, and operations have opened up a bed of gravel that shows a different character from the clay banks which have proved so profitable during the last fifty years of active operation of the mine. The extent of the new deposit has not yet been determined, as no exploration has been done at this

The Esterly property, combining the old Logan, Simmons and Cameron placers, has been a profitable producer for more than fifty years. It now consists of 4200 acres, practically all of which is payable ground. The water rights attached to the property consist of a flow of 14,000 miners' inches, water being supplied by a system of ditches that total twenty-five miles in length. The property was purchased for \$140,000 in 1916, from James Logan, who successfully operated it for many years, by the Waldo Corporation, of Seattle, Wash., George M. Esterly is manager and superintendent. According to mint shipments, the annual output of the

Showing pit, hydraulic giant in operation, elevators, and tailing flumes

particular place, although many prospect shafts were sunk during a preliminary investigation. No clean-up has yet been made on which it is possible to base an estimate of the gold contained in the ground, but sufficient panning has been done to demonstrate the presence of much coarse gold. Heretofore the gold secured from the ground covering this deposit has been fine, and flour gold was found to be evenly distributed through the clay banks, which range from 15 to 35 ft. in depth. These deposits, according to Kay,¹ have averaged about 12½ c. in gold per cu. yd., and contain some platinum.

mine for the last three years has averaged \$45,000 in gold dust and \$10,000 in platinum.

HYDRAULIC ELEVATORS TO BE REPLACED BY WATER CLASSIFIERS

A hydraulic elevator system has been erected to provide sufficient grade for the disposal of tailings, which are lifted by two elevators a distance of 73 ft. A recent erection of a third elevator has increased the lift to 89 ft. above the pit opened up on the new deposit. All standard placer gold-saving devices are in use, although owing to the flour-fineness of the gold, a considerable amount is lost in the tailing. Mr. Esterly is

¹"Oregon Bureau of Mines 1916 Handbook," p. 143.

planning the construction this season of a "water classifier," his own invention, which he is confident will recover 90% of the mineral values. He also purposes to do away with the elevator system by building a race to the Illinois River. This plan will require a 700-ft. tunnel through serpentine, which will cost between \$40,000 and \$50,000. The new system of operating, when completed will release for actual mining a volume of water several times that which is now being used to mine a daily output of 1000 cu.yd. at a cost of about 6c. per yard, and will reduce the cost of mining to ½c. per yard. The lighting equipment for night operation consists of a battery of nine 2000-c.p. searchlights and many 1000-c.p. tower lights.

The Waldo district is about twenty-five miles long in an east and west direction and fifteen miles wide. It is a region of rugged mountains, except on the western border, where the Illinois River valley is rather flat. The valley, an excellent agricultural land, varies in elevation from 1400 ft. to 1700 ft., and the mountains are from 4000 ft. to 6000 ft. in height. The area is heavily timbered, especially at the higher elevations, and forms a part of the Siskiyou National Forest Reserve. The nearest shipping point is Grants Pass, about forty miles distant, although a fourteen-mile branch railway now extends toward the district from Grants Pass.

GEOLOGY OF THE WALDO DISTRICT

The rocks of the district are chiefly sedimentary, including argillites, quartzites, and limestone, and dark-colored sub-siliceous igneous rocks, including andesite, serpentine, auganite, and pyroxenite. Smaller areas of other rocks are known, such as Cretaceous gravels and sands. The oldest rocks are the Paleozoic argillites and limestones, which occupy much of the mountainous part, not only that drained westward to the Illinois River, but also that drained eastward to the Applegate River. In general, these rocks strike northeast and dip steeply eastward. They are interbedded with andesite greenstone in many places, and are overturned so that the oldest beds of the series are on the eastern border lying above the younger beds to the westward. The entire Paleozoic series lies above the still younger Galice formation of the Jurassic period near Waldo and Kirby.

According to Diller,² the overlying position of the Paleozoic rocks is due to faulting in this locality. Andesite and basic igneous rocks largely altered to serpentine are associated with the argillites of the Galice formation. Near Waldo there is still a small area of Cretaceous gravels and conglomerate, which has served as a source of placer gold. This lies unconformably above the Jurassic argillites. The latter are steeply inclined to the east, whereas the Cretaceous gravels are nearly flat. On the basis of fossils, these have been referred to the Horsetown formation of the Lower Cretaceous or Comanchean. It is probably that these gravels were formerly much more widespread in this region than they are at present.

The youngest rocks in the Waldo district are the alluvial gravels, which are still being formed by existing streams. In the mountainous part of the district they are confined to narrow strips along the water-courses, but in the Illinois River valley, near the Estero mine, they are more extensive.

The mineral resources of the district include copper,

gold, silver, chromium, platinum, manganese, and Eme-stone. Gold and silver deposits occur both as placer and metalliferous quartz veins. The placer deposits have been worked successfully for more than sixty years and are still far from exhausted. During the war considerable copper and chrome were shipped from the district.

Packing Goods for Shipment To South America

Insufficient and insecure packing of goods which are shipped to South America by American manufacturers has been the subject of frequent criticism. Shipments of machinery are often too lightly packed, the shipping cases or crates are smashed in transit, and considerable damage is inevitable. All machinery consigned to South American countries should be heavily boxed. Small pieces should not be tied to larger pieces in the same crate, but should be securely boxed and shipped separately. All shippers should assume that their packing cases and crates will receive rough usage in transit in South American countries, and such cases should be designed accordingly. An American consular agent in South America, in writing to the Guaranty Trust Co. of New York, calls particular attention to this fault of American shippers.

Vulcan Steel Products Co. Awarded Huge Contract Abroad

A contract involving a quarter billion dollars for rebuilding the devastated area in the Nancy district of France has been signed by the Vulcan Steel Products Co., of New York. Associated with the Vulcan company in the enterprise are two large contracting concerns, the McClintic-Marshall Construction Co. and MacArthur Brothers Co. Negotiations have been in progress ever since the signing of the armistice between Rodney D. Chipp, general manager of the Vulcan company, and the Committee of Nancy. The \$250,000,000 figure appears in the contract, but it is estimated that before the work is completed half a billion dollars will have been spent. The contract was signed some time ago, but actual work has awaited the peace treaty. One of the largest stockholders, who is also a director, in the Vulcan Steel Products Co. is T. Coleman du Pont.

Manganese Ore in India

At a recent meeting of manganese-mining companies, according to the *Journal of the Society of Chemical Industry*, of May 15, 1919, the position of manganese ore in India was described by Sir Thomas Birkett. During the last year the mining industry experienced all the disadvantages arising out of war conditions, and consequently production was considerably restricted. New ore formations have been found at the principal mines, but the cost of working has risen considerably, owing to increased wages.

India has now to be prepared for a serious contingency. The Caucasus mines will again reopen, and there are other mines in Egypt and Africa which threaten formidable competition. Egyptian and African deposits are more favorably situated than those in India for putting manganese ore on the European market, and unless the government helps the industry by various concessions in regard to transport, it has a gloomy future.

²"Oregon Bureau of Mines 1916 Handbook," p. 291.

Ancient Tin Mining in South Africa*

Mines Are in Waterberg District, About Forty Miles West of the Pretoria-Pietersburg Railway
—The Ore, Cassiterite, Occurs in Well-Defined Lodes
In Quartzite and Sandstone

WHERE in the course of their prospecting the ancients came upon rich ore, they followed it down until beaten by water or the rock became too hard to treat. Where ore occurred in pockets, flats, or pipes it was followed and taken out with a cleanness which is truly astonishing. Generally speaking, the ancients mined so thoroughly, and left so little behind them, that in one instance the occurrence of ore left in place is very interesting. The old miners must have been disturbed and left suddenly—either a raid occurred or the entrance may have fallen in—otherwise they would not have abandoned such a large number of stone hammers, nor would they have left the working unfilled and a face of good ore for their modern successors, who have taken from the deposit approximately seventy tons of ore containing 7 per cent metallic tin.

ANCIENT METHODS OF BREAKING GROUND

The ore was broken or chipped away with hammer and gad. The gads were of steel, roughly rectangular in section $1\frac{1}{2}$ by $\frac{3}{4}$ in. and 12 in. to 18 in. over all, made in one continuous taper from the head to a fine point. The metal was of extremely fine quality, being a mild steel of exceptional purity, equal in quality to the best Swedish iron. The following is an analysis: Silicon, 0.17; sulphur, 0.01; phosphorus, trace; manganese, nil; combined carbon, 0.35 per cent.

The hammers employed by the primitive miners were of stone and roughly spherical in shape, in diameter from 3 to 5 in., and weighing between 3 and 6 lb. They are the hard unweathered round lumps which remain as a result of the spheroidal weathering of diabase. The majority of the hammers probably came from the farm Overwacht [in South Africa] where a diabase dike outcrops. A few of the hammers are of hard felsite, of which many small dikes traverse the area under discussion. The hammers appear to have been held in the hand, and no handle was used. Many hammers have had a deep concentric groove cut round a mid-circumference, due to the constant tapping on the head of the gad. That fairly effective work could be done with a stone hammer was shown by a hammer boy at Rooiberg, who collared and drilled, with a set of modern steel drills and a handleless stone hammer, a hole 36 in. deep in ground in which over the same drilling period, but using a 4-lb. hammer, he could put in a 54-in. hole.

Where the ground was too hard to break with hammer and gad, the method of fire-setting was employed, a process which was used as recently as forty years ago in Norway. On the "H" lode at Rooiberg a pile of wood ready for fire-setting was found in the face of a flat, elongated, old working. The wood was about 4 ft. long and 4 in. to 5 in. in diameter, stacked near the face in a roughly conical pile. It had been such a length of time in the air-tight working that when touched it crumbled to an impalpable powder. In addition to the small hammers, occasionally very large hammers or mullers were

discovered. These were used either to break up large lumps, the result of fire-setting, or to grind to a powder the broken ore before transport to the surface. One such stone was quite smooth, roughly oval in shape, and measured 9 in. in diameter at a mid-section, 14 in. across its longest axis and weighed 70 lb. It was found lying in one of several artificial dish-shaped depressions which covered the floor of a horizontal pocket, where grinding had evidently been done underground.

Most of the ancient workings were filled in before being abandoned. This is also a Rhodesian experience, and the reason for doing so is hard to conceive, but probably it was a superstitious or religious one. The other explanation advanced by some, that the filling-up was to hide the existence of a mine, seems to the writer out of court in an area like Rooiberg, where the small mines were as thick as diggers' claims on the river diggings: more particularly as no working was filled up until (except in a few cases) it had been scraped bare of all payable ore. Particularly at Leeuwpoot have the workings been most carefully filled in with a mixture of rubble, broken waste and surface soil. The remarkable feature at Leeuwpoot is that the ancients have left no other records of any kind. Not a gad nor a hammer has been found in any working, nor are there any traces at surface of smelting operations. The principal old workings there are over the so-called "H. G." section.

None of the old workings at Leeuwpoot is deeper than 40 ft., and they have been broken into at several points from the modern chambers below. There is no apparent reason why the ancients should have stopped at that depth. The tin is found here in a very wide kaolinized body, which is quite soft. Nor could water have been the cause of abandonment, for the present mine, 300 ft. deep, can be kept dry with a skip only. There is every evidence that the ancients must have mined a considerable tonnage, apart from the fact that the Leeuwpoot company has extracted 80,000 tons of ore between the ancients' lowest limit and the modern 100-ft. level.

MANNER OF STOPING AND TIMBERING

As a variant of the total fill-in method was one used on the Empire lode at Rooiberg. Here the lower section of a stope was found open. About half way up the stope, which was narrow, stull pieces 18 in. to 24 in. long were wedged between foot and hanging wall, and these were lagged over with rough bush timber and the stope was filled in on top of the lagging with the usual mixture of rubble, broken waste, and sand.

Another well-known mining practice was followed at Weynek. Here the tin occurs in soft clayey interbedded lodes dipping 10 deg. west, and varying in thickness from a few inches up to 4 ft. The majority of the stopes do not go down more than 50 ft., but the principal one followed the lode to a depth of 120 ft. on the dip. The stope had been started as an open cast with a width of about 20 ft. along the strike. It then bellied out below to a maximum width of 50 ft. on the strike, coming

*Excerpt from an article by Max Bauman in the *Journal of the Chemical, Metallurgical, and Mining Society of South Africa*, February, 1919.

down at the bottom to 15 ft. The average width of the stope was 30 in., but at places this narrowed down to 10 in. (actually measured). At that flat dip and narrow width no full-sized man could work, and the actual ore breaking must have been done by small boys or by an undersized race like the Bushmen. This stope is of particular interest from the fact that a number of pillars were left in it, not, as might have been supposed, to support the hanging, but simply because the mineral sought was not present in the ore. In addition to following the ore down from the surface by small shafts or open casts, there is an instance at Weynek of a working having been entered by an adit at right angles to the strike of the lode.

The longest continuous ancient working is that on the South End lode at Rooiberg. Here the ancients stripped the outcrop from the surface to a depth varying from 15 to 27 ft. over a length of 620 ft. on the strike. The average width on the top of the cleaned-out workings was 20 ft., which narrowed down considerably at the bottom. Modern work below that of the ancients has shown the existence of a narrow but rich lode. Of sampled development, 450 ft. gave an average of 11.4 per cent metallic tin over 7 in. Over a stoping width of 30 in., and at the present price of tin (£220), this is equivalent to over 80s. per ton mined. The probability is that the ore at surface was much richer, and, judging by the width of the workings, the deposit was also considerably wider. Much of the stoped-out lode had been filled in as usual. There was evidence of the filling having been done in two distinct periods. At one spot, where the working was being bottomed and the filling had been cut through from top to bottom, it was observed that there was a layer, several feet in thickness, of sharp broken waste and rubble at the bottom. This was covered by a layer of surface sand about 2 ft. thick; above this was another layer of waste and rubble, and covering this to normal ground level was a top layer of surface sand. The intermediate sand layer was not uniform throughout, but was made up of a succession of laminae of light and dark-colored sand, each lamina probably representing the washings over one rainy season, and the number of laminae indicating a considerable number of years occupied by the washing-in process.

The working clearly showed an early period of mining, then a long interval of abandonment, followed by a second period of mining, and final abandonment. From the appearance of some of the relics found here, some of the work must have been of comparatively recent date. On a ledge, and hidden away after the manner of the modern native, was found a gad, a stone hammer, a knobkerrie, and an adze with a handle. The adze was 12 in. long, with a 5-in. cutting edge set at right angles to the plane of the handle. It ended in a tapered shank which fitted into a tapered hole in the handle—a method of fastening which today is still being used for native axes.

LIGHTING

The question of underground illumination has an important bearing on the subject of the age of these workings. The working in one case is open to daylight, and the afternoon sun shines right into the toe of the stope. It was therefore probably worked throughout without artificial illumination. In the case of the narrow and low pockets in another stope, however, it was

impossible for the old miners to have done the careful and clean work which they did without some kind of artificial light.

Dr. Theal points out that the Bantu have no lamps, and R. N. Hall infers from this that the ancient miners of Rhodesia could not have been Bantu. But, on the other hand, no remains of anything resembling a lamp has been found locally. It is possible that the darker workings were mined in earlier times by a people who were acquainted with an artificial light, and that intricate workings were worked in more recent times. One working is extensive, and, unlike most other workings, was never filled in by the old miners. As it lies in the bed of a storm water course, it became filled up with clean water-borne sand, probably in the space of a few years. It was holed into by chance at its deepest point, 55 ft. below the surface, by a modern drive. The working was cleaned out in the hope of finding ore left in place, but with disappointing results. At the bottom a tree was found 6 in. in diameter at base and about 14 ft. long, with the branches hacked off about a foot from the stem, and which had evidently been used as a primitive ladder. The wood is said to be what is locally called *Olievenhout*, and was in a good state of preservation. Further, about 50 ft. down, an earthenware pot was found, which was still soot-encrusted. It is almost spherical in shape, 7 in. in diameter and 5 in. deep, of fairly coarse texture and resembles in all respects a modern Basuto cooking pot.

The broken ore was probably carried to the surface in baskets or grass bags, the material of which is so perishable that no remains have been found. It is possible, too, as a good many earthenware pots have been discovered, that these were also used for transport. The largest pot discovered was almost spherical in shape, 16 in. diameter and 14 in. deep, and holding about seven gallons. Mention has already been made of the discovery of a crude ladder, and in an old working on the Empire lode, at Rooiberg, a number of steps or footholds can be seen which have been cut out from top to bottom of the soft foot wall of the working, dipping at 75 deg.

METALLURGICAL

Some of the ore was probably ground to powder underground, though the greater quantity was reduced to that state at surface, as is proved by the large number of mullers and grinding stones found everywhere. In the course of trenching, broken ore has frequently been found a few feet below the surface, evidently having been dropped while it was being transported. As these odd pieces have almost invariably been of extreme richness, one is forced to the conclusion that the ancients worked only ore of high tin content.

The ore, after being reduced to powder, was washed either in flat dishes of earthenware, closely woven baskets or perhaps by some method of calabashing, as in Nigeria. The spruit running through the Rooiberg property was probably the principal scene of these washing operations, but in one case they appear to have used an old working as a slime pit. This was an ancient open-cast on the Empire lode, at Rooiberg, roughly rectangular in shape, 45 ft. long by 20 ft. wide at top, narrowing down to 4 ft. at a depth of 15 ft. The material in this pit was unmistakably slime tailing, being much finer than the surrounding reddish surface sand and was arranged in alternating light and dark layers which dipped at 15 deg. The slime assayed 1.2

per cent metallic tin, and about 200 tons was excavated and treated in the modern mill.

All the ore mined by the ancients came from near the surface, and would contain little or no sulphide. By panning, the lighter tourmaline, gangue, carbonates of copper, and oxides of iron would be easily removed, leaving a concentrate of perhaps 70 per cent metallic tin. The concentrate was probably not calcined, for an ingot of bronze found contained 2 per cent of arsenic, and several tin ingots discovered were very impure.

SMELTING

The principal center of smelting appears to have been an outlier to the Elandsberg Range, known as Smelters Kop. The kop is a steep, fairly flat-topped hill about 1½ miles from the Rooiberg mine. The edge of the plateau on top is guarded by the usual rough Basuto stone schanzes, such as may be found anywhere in the Transvaal. Scattered over the top are many small slag heaps—some of the slag containing considerable sized beads of tin—and innumerable broken pieces of coarse earthenware. These are the remains of crucibles and tuyères used by the ancients.

It is much to be deplored that in the early days of modern mining here, the value of Smelters Kop as a record of the past was not recognized and that no attempt was made properly to investigate the smelting site. A decade of picnicking has done much to obliterate any evidence which could have been scientifically recorded. It is impossible therefore to reconstruct the ancient smelting furnaces, which were probably blast furnaces similar to the primitive kind formerly used in the Straits by Chinese. The blast may have been produced after the Bantu manner, with two skin sacks, or after the Chinese manner, with a hollowed-out tree, with piston and long piston rod.

Apart from Smelters Kop, numerous smelting sites, with their remains of slag and broken nozzles, are to be found on Olivebosch, Haartebeestfontein, Weynek, and Blaauwbank. On the latter farm a most interesting ancient furnace bottom was discovered. It was a circular ring of hard-baked clay, about 2 ft. in diameter and 1½ in. higher than the ground around it. In the sand on the outside of it was found an unformed lump or ingot of bronze, evidently the result of an overflow of molten metal through a crack in the bottom of the furnace. The composition of the ingot was as follows, the figures being approximate only: Cu, 80 per cent; Fe and Al, 5; Ni, 3; Sn, 7; As, 2; gangue, 3 per cent.

The presence of arsenic may be due to non-calcination of the tin concentrate used; but the nickel content is rather remarkable. It is interesting to note that this farm Blaauwbank, where the ingot was found, is one of the few places in South Africa where nickel is known to occur. On the western boundary of Haartebeestfontein small heaps of slag have recently been discovered containing 30 to 35 per cent of oxide of tungsten and 2½ per cent of metallic tin.

HISTORICAL

Who were the ancient miners, and when did they work here? The presence of underground timber in a good state of preservation, the comparatively small size of trees growing in some of the large workings, and the finds of crude earthenware pots and implements pointing to a race resembling and no further advanced

than present-day Basutos, all tend to show that some of the workings are of recent date. Confirmation of this could be deduced from the following:

In 1723 Jan v. d. Capelle, an official of the Dutch East India Co. at Delagoa Bay, reported to the Governor and Council of the Policy at the Cape: "At the end of the year just passed natives have been at La Goa from the countries 'Paraotte' and 'Machicosje,' who not only brought copper but also tin for purposes of barter. The copper was of very fine color. The tin was of medium good color, but somewhat brittle and light, as may be seen from two samples of staves (bars or ingots). One of these is much harder than the other, as would happen if remelted. They state that the tin was found on the banks of a river in the country 'Machicosje,' is gathered in baskets, cleaned of sand, and then smelted to bars for the purpose of barter. All the inland dwellers use this tin (also such as they buy from us), which they alloy with copper for the purpose of making necklets and bracelets. That is, no doubt, the reason why their ornaments have such a high polish and are more pliable than those of the company."

Nine years later this same van de Capelle reported to the Cape that he had purchased 56 bars of tin from natives at Delagoa. Now, Rooiberg is only 260 miles due west of Delagoa Bay, and it is a fair inference to assume that these bars came from Rooiberg or its neighborhood. Dr. Moffat mentions that as late as 1826 he came across a Mohurutsi coppersmith near the Molopo who could smelt bronze, and with a draw plate drew his own copper or bronze wires for making bracelets. All this would point to the modern date of the workings under discussion by people of Bantu stock, either Basuto or Bapedi.

FORMER PRODUCTION

A careful estimate—though only an approximation, of course—shows that 18,000 tons of ore was taken from the Rooiberg area alone. The small lots of broken ore occasionally found indicate that the old workers smelted only ore high in tin content. Their tailings contained over 1 per cent metallic tin, and their average recovery was probably not less than 5 per cent metallic tin. Thus, 18,000 tons at 5 per cent metallic tin would give a recovery of 900 tons, or, say in round figures, 1,000 tons of metal. Judging by analogy, it is fair to assume that from Weynek, Leeuwpoot, and contiguous territory a further 1,000 tons was recovered, or an output of 2,000 tons from this whole area. The greater part of this would be turned into bronze. Assuming that the average alloy had the tin content of the locally found bronze, 7 per cent metallic tin, the 2,000 tons of tin expressed as bronze would amount to, roughly, 30,000 tons. What became of this 60,000,000 lb. of bronze? The Bantu in the 1,000 years since they crossed the Zambesi could not have used up that quantity for bracelets and necklets only.

It is, therefore, necessary to conclude that the mining, though some of it is recent, extended over a much longer period than 1,000 years, and that a large portion of the bronze was not absorbed by South Africa, but was exported. There must therefore have been some remote period when these mines were opened up and the product was smelted and utilized by an ancient civilized race of traders. In fact the available evidence correlates the ancient tin miners with the ancient gold miners of Rhodesia.

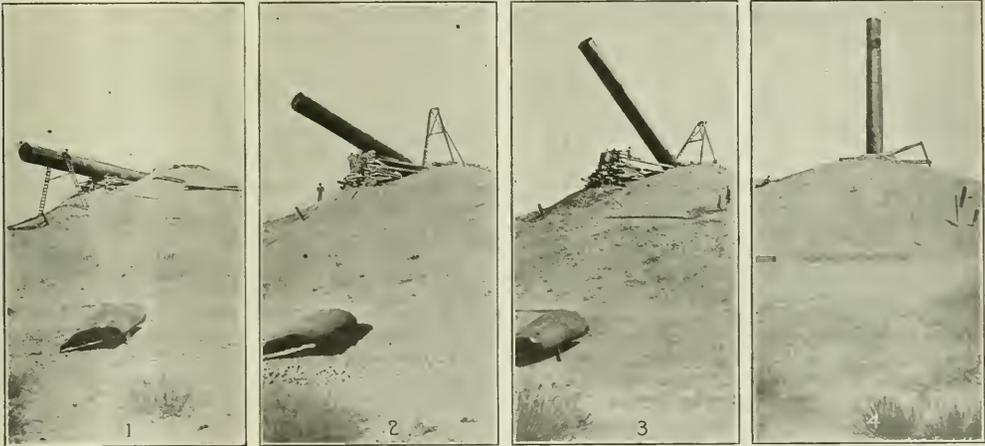

Solving a Stack-Raising Problem

Thrown Fifty Feet From Its Foundation by a Windstorm, a Smeltery Stack Was Re-erected And Established in Final Position at Considerably Less Than Estimated Cost

BY MARTIN FISHBACK
Mining Engineer, Benson, Arizona

IN REMODELING a copper-smelting plant at Benson, Ariz., one of the problems to be solved was the replacing of a stack 6 ft. in diameter, 75 ft. long, made of 1-in. steel plates, originally put up in sections and placed on top of a small hill, where a shaft 30 ft. deep connected with a 200-ft. tunnel leading from the dust chamber. The stack was originally placed on top of a concrete foundation, but not anchored or supported except by guy wires. A short time before the present owners took over the plant, the stack, which, like all other smelting equipment on the property, was new and had never been used, was torn from its moorings during a heavy windstorm, and thrown down the hill about 50 ft. from its foundation. The extreme top-end of the stack, which, of course, hit the ground the hardest, was flattened out. By sacrificing a section of this part

lb. Two of these were "snaked" to the top of the hill, and one was placed on each side of the old concrete foundation, 14 ft. apart and parallel to the direction in which the stack had to be moved. The other two timbers of similar dimensions were placed about 30 ft. down the hill, opposite to the side on which the stack was lying, and were to serve as the "dead man," or pulling point. The timbers were placed as shown on the side elevation in the accompanying cut, the ends toward the direction of pull being notched into the hillside about 1 ft., and the pulling point established 10 ft. from this end. This left 22 ft. as "cantilever weight" of both the two timbers, which was several times more than sufficient to sustain the weight of the stack to be lifted. No further tying down was required.

STAGES IN THE RE-ERECTION OF A SMELTERY STACK

of the stack, the remainder of the flattened portion was forced back into shape by jackscrews, and then held there by placing two "sprags" of 3-in. steel pipe, 6 ft. long. The jacks were then removed. That completed the repair work on the stack itself.

The next step was to carry the stack up the hill and place it where it belonged. Its weight was approximately 14,000 lb. The power-plant at the smeltery was undergoing repair and overhauling, and it was necessary to replace the stack entirely by hand. To "snake" it up the hill 50 ft., on an incline of 30°, and then up-end it and put it back into place did not appear to be an easy job with the equipment available. The method finally worked out and adopted, however, proved efficacious and economical, and will be described for the benefit of those who may have to solve a similar problem.

There were at hand four heavy timbers, each 12 x 20 in. x 32 ft. long, each timber weighing about 2000

The two timbers placed on top of the hill were tied together and braced on the side next the "dead man," to prevent side slipping and spreading. The front or side next the stack had to be left open for the path of the stack when raised. A two-legged derrick, or bipod, made of 8 x 8 in. Oregon pine, 22 ft. long, as shown, was securely reinforced with heavy iron straps, and hinged or pivoted on the two heavy timbers; this was accomplished by bolting heavy 1-in. iron on the bottom ends of the bipod, and chiseling out a groove 8 in. deep and 1½ ft. long in the timbers, allowing free movements of the hinges. A 2-in. hole was bored horizontally through the timbers, intersecting the groove, and drilled into the old concrete foundation to a distance of about 8 in. The bipod was then raised with the iron loops in their position in the grooves, and a 2-in. iron bolt or pin driven through the timbers and iron loops, and into the concrete. The bipod was thus se-

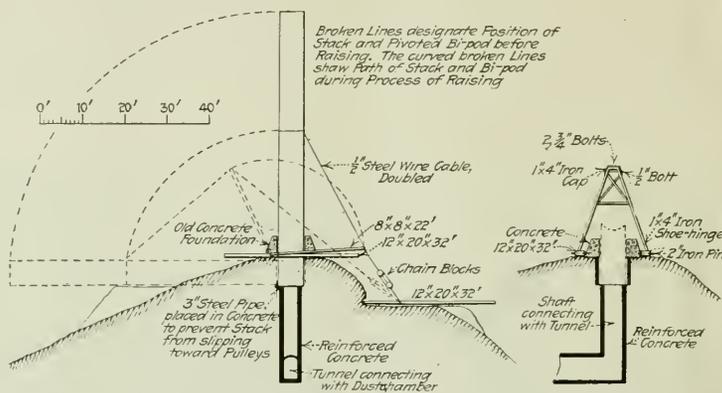

curely hinged and had free play. Driving the iron pins into the old concrete prevented any movement of the large timbers, and the hoisting apparatus was ready.

While the gear was being assembled an open cut was excavated between the timbers on the side facing the stack, in order to place the base of the stack 10 ft. below the top of the old foundation, in its former position. This necessitated blasting out enough of the old concrete on that side to allow the stack to pass through and within the old concrete walls. A solid foundation for the new position of the stack had already been provided by a system of square sets constructed of reinforced concrete from the bottom of the shaft to the new foundation of the stack. The stack was then rolled around on the hillside by the cant-hook method (with chains and 3-in. steel pipes) until it was in direct line with the open cut and for a straight pull to its new position. A skidway was then provided

and attached to another set of chain-blocks; and by this system each of the two chain blocks worked independently, and permitted the shortening of the cable for a new pull when the limit of each chain-block had been reached about every 10 ft. of pull. The total distance of pull was approximately 40 ft., which necessitated a shortening of the cables four times before the stack was in position.

The maximum load to be lifted was, of course, at the beginning. For the first 10 ft. of pull the chain blocks were assisted by jackscrews and supported by following up with cribbing, as shown in the halftone. From there on the stack was raised exclusively with the chain-blocks, as described.

When placed in its final position, a collar of reinforced concrete, from its new base to the top of the old foundation, was poured around the stack. No guy wires are required. The stack is firmly planted, and

DETAILS OF EQUIPMENT FOR RAISING STACK

by laying some $\frac{3}{8}$ -in. steel sheets in position. A $\frac{1}{2}$ -in. steel cable was looped around the end of the stack nearer the foundation. The stack was pulled up the hill over the steel sheets by a three-ton chain-block, and eased into the open cut, with the end of the stack within two inches of the proper position for up-ending.

To prevent the stack from slipping ahead during the raising process, a 3-in. steel pipe, 4 ft. long, was placed in the concrete immediately in front of the rim of the stack, allowing a few inches to extend above the rim. The other end of the stack was then raised up with jackscrews and supported with blocks and timbers, placing the stack in a horizontal position. While in this position about 40 ft. of the top end of the stack was painted.

A $\frac{1}{2}$ -in. steel cable was then looped around the stack three times, 30 ft. from the top end, and held in position and kept from slipping by lugs bolted to the stack. The two cable ends were then looped around the top of the bipod and securely fixed with cable clamps. The angle of the bipod inclining over the stack at this stage was 65° , or, in other words, this was the angle intercepted between it and the stack. The distance, or length, of the fixed cable between the stack and bipod was 32 ft. From the bipod the two cable ends were then carried down to chain blocks hooked to the "dead man." One cable was double-looped around the chain-blocks hook and returned up toward the top of the bipod, where it was connected with the twin cable with cable clamps. The other cable end was arranged in a similar manner

it is reasonable to assume that nothing less powerful than dynamite will ever bring it down again.

The estimated cost of raising was \$500. When the job was completed, the total labor cost was \$315.59, and material used amounted to \$54, including concrete support and all. Hence the actual expense came well within the estimated cost of solving the problem.

Workmen's Compensation

Employers Should Study the Law of the States in Which They Operate and Legal Decisions and Departmental Rulings

By CHESLA C. SHERLOCK

NO EMPLOYER, engaged in a specialized avocation, can have more than a hazy conception of the workmen's compensation acts until he comes to study them in connection with his own trade or industry. It is then only that he can have some measure of comprehension as to just how these acts affect his business. This does not mean that employers are generally uncertain as to the law, but it does mean that the average statute is so worded as to be obscure to everyone until the courts have interpreted the details in the light of actual cases arising within the various trades and callings.

Mining is certainly a specialized industry, and it is an extra-hazardous one. It is so unusual, as far as risk is concerned, that many of the states have enacted laws specifically applying to the mining business. For instance, the Alaska Compensation Act operates upon the mining industry entirely. One employer raised the point that, as this act applied to only one industry, it was class legislation and therefore unconstitutional. The Federal court (Johston vs. Kennecott Copper Co., 248 Fed. 407, p. 413) said that the classification of subjects for regulation by law was a function of the legislative branch of the Government; and that, though class legislation is generally prohibited, if the application is limited, and it affects all alike that are within its sphere, it is not within the prohibition. The compensation act of Alaska, although applied to the mining industry alone, affected everyone engaged in mining, even though remotely, and it was not unconstitutional upon this ground. The act was to include "mining operations," which was sufficiently broad to include everyone in the industry, in the opinion of the court.

In determining the interpretation of an ambiguous statute which is capable of two or more constructions, the Utah court (Ind. Com. vs. Daly Min. Co., 172 Pac. 301, p. 306) held that the court must take into consideration the object the Legislature had in enacting the law. If it be possible to give the act a construction which would render it largely ineffective and useless, and, likewise, possible to give it another construction which will make it effective and of benefit, the court must follow the latter construction, so far as it is possible in accordance with the principles of law and statutory construction. The basis of the payment of compensation is often a serious question for employers to determine, especially when they are engaged in mining operations. Compensation acts usually provide that the workman shall be compensated in accordance with the average weekly wage he has earned for the year preceding the date of injury.

In those not infrequent instances in which the workman changes his employment several times within the year, or changes his grade within the same employment, employers are naturally anxious to know just what his measure of compensation is. This is a difficult question, especially if the earnings of the employee have been irregular and hard to ascertain. In Kansas, however, it was held (Bundy vs. Petroleum Products Co., 172 Pac. 1020, p. 1021) that the employee is entitled to compensation based upon his earnings or those of other persons in the same grade of service, although the injury had been received when he was employed in a different grade at less wages, to which he had been assigned for a short time by reason of lack of work for the period in the employment for which he had been hired. This decision declares that the mere work at which the man happens to be engaged at the precise time of his injury does not absolutely fix or limit his amount of recovery, although it will have that effect in the majority of cases, for most men are injured at the work for which they were regularly employed. It means that substantial justice must be done in each case; and if the man has been worth more and has earned more than the immediate work which caused his injury, he is entitled to the compensation legally attaching to the higher rate of wage.

Generally, there is an attempt to do away with the technical and the arbitrary in compensation practice, so

as to make it as simple and free from legal technicalities as possible. There are provisions in every statute as to the time within which the workman must file his claim for compensation. Employers are seldom allowed to profit by these time limits, however, the courts and commissions usually being disposed to listen to the workmen, even if their applications have been made at a time subsequent to that specified in the statute. But in a Michigan case (Basse vs. Banner Coal Co., 167 Northwestern 954, p. 955) it was shown that the Michigan laws required the claimant to file his claim within six months after the date of the injury. In this suit the workman had failed to make either an oral or a written claim until after the statutory time had elapsed. Then a written claim was presented, but it was not entertained, the court saying that it could not be heard, because the rights under the act had expired, so far as this injury was concerned.

The question of dependency also raises many uncertainties in the mind of the employer when it comes time to make settlement. This is especially true of the case where a son or daughter has contributed to the support of the parents. The question that most frequently puzzles the courts and employers is whether the reasonable value of the board which the child consumed should be deducted from the amount of the contribution which has been made to the parents each week. If this is allowable under the law, the deduction will make a material difference in the amount to be paid the dependents. In a Michigan case (Engberd vs. Victoria Copper Min. Co., 167 Northwestern 840, p. 841) the court held that in instances in which a son had been living with his parents and contributing to their support, the reasonable value of his board should be deducted from the amount of the contributions made. This, however, is not the rule in all states, lively controversies frequently being waged over this point.

The compensation acts, as is generally known, secure the payment of compensation to workmen who have been incapacitated from earning their regular living by means of an accident arising out of and in the course of the employment. The employer's liability extends to the work the employee is hired to do and no further. In a case where a workman was injured while in his employer's hospital, it was held that he was not entitled to compensation, because he had not received his injury arising "out of and in the course of the employment."

These are, it is true, apparently trivial points, but they are those about which there is the greatest misunderstanding. Ninety per cent of the litigation involving the compensation acts, particularly in their application to mining operations, arises through the demand for their adjudication.

At all times employers engaged in mining operations, as well as others, must remember that the true criterion of their liability is the compensation act under which they are working. It explicitly defines the limits of their liability, and with the aid of the courts upon uncertain and complex sections of the law it should not be difficult to ascertain what the law really is upon any given point. These decisions should serve to clear the most obscure sections of compensation acts.

Manganese Exports From Brazil in 1918 amounted to 393,388 metric tons, according to a recent consular report. For the first time in five years shipments of this ore from Brazil showed a decrease.

Gold Mining and Milling in Colombia

OXEN CARRYING ORE FROM OTHER PROSPECTS TO STAMP MILL AT EL RECREO MINE

Gold mining, in the district of Ibagué, declined during 1918, on account of the extremely high prices for supplies and the difficulty of obtaining them, even at those prices. Blasting gelatin was \$70 per box of 50 lb., carbide could not be obtained at any price, and the mines had to return to the use of tallow candles, made locally. The mines, especially gravel mines operated with small capital, experienced considerable trouble for some months in disposing of their product, on account of the low dollar exchange, but this condition improved, and at the close of the year the Medellín mint was able to coin all the gold produced. The El Recreo mine operated one wooden stamp mill throughout the year, and the profits were used for development work. The holdings of this property were extended in 1918 and now comprise 84 vein claims. (A Colombian claim is 600 m. by 240 m.) Two promising finds have been made in this ground, and are being developed. At one of these about 300 tons of ore, removed in the course of development work and crushed in the wooden stamp mill, yielded an average of 15 g. of gold per ton, on the plates alone. The second new discovery occurs in a chloritic schist, in a narrower but high-grade vein. Other operations in the Ibagué district during 1918 were as follows: La Golondrina mine employed a few men on development work, although its four wooden stamp mills were idle; La Norcasia mine, a new producer, started a wooden stamp mill and cyanide plant during the latter part of the year, and La Veta mine, abandoned by its former owners, was prospected by Emery Koch, an American miner.

INTERIOR OF WOODEN STAMP MILL, EL RECREO MINE, IBAGUÉ DISTRICT, COLOMBIA

New Uses for Zinc*

Zinc Institute Is Told That Publicity Is Necessary To Inform Public of the Desirable Qualities and Varied Industrial Applications of the Metal—Suggestions For Promoting Use of Zinc

BY GEORGE S. HARNEY

American Zinc Products Co., Greencastle, Ind.

FIRST and foremost, gentlemen of the Institute, I think we ought to begin our campaign of publicity right here at home. I think we ought to so change our phraseology and nomenclature that the word "zinc" should be omnipresent in our discussions. "Jack" and "spelter" are good names, perhaps, but they do not convey to the world that they are zinc. "Galvanizing," besides being a misnomer, is certainly not the correct term for coating a substance with zinc. "Zincking" a substance—zinc-coated sheets, nails, wire and similar material—would be an expression that would convey to the ear of the public the fact that zinc was used to preserve that metal or substance, and from this the public would learn that zinc was the principal factor in the operation. Similar reasoning should apply to "sherardizing" and other processes in which zinc and the preserving qualities of zinc are necessary to give the other metals life and standing in the commercial world. I suggest these changes for the reason that not one person in ten of this great public that we want to win to the uses and benefits of zinc knows that the words "jack," "spelter," "galvanizing," and "sherardizing" have any relation to zinc and its preserving properties. And if the public did know these things our battle would be half won.

Second, zinc needs a press agent. I do not refer to the grandiloquent and verbose personage who writes the fanciful stories of the prima donna's diamonds, nor the lurid pictures of the circus, its daring performers and rare animals, but the artist that would write the interesting stories of the usefulness of this strange metal and of the benefits it confers on mankind. Such articles I am sure would go "big" in our trade papers and publications, and, in view of the fact that the newspapers are searching everywhere for readable and instructive paragraphs that will interest humanity, they would no doubt willingly print them.

INFLUENCE OF TRADE PAPERS

Our trade papers have been very kind, in times past. They, too, are deeply interested in our success. If short and readable stories concerning the diverse and industrially valuable applications of zinc are furnished them, they will give such articles their initial push on their voyage over the world and on their mission of instruction. But these stories must use the word "zinc." The daily paper wants general items of interest, and not trade names. It wants short stories of human interest.

Stories about zinc may be semi-scientific in their nature. The world is ready to hear again the story of the Swiss clock that is run by the expansion of zinc. It will willingly read of the non-conducting properties of zinc as it relates to heat and cold. Why, even the

story of how in years past zinc has been abused in having to work under so many noms-de-plume and noms-de-guerre is a good one and will not only be read, but it will correct an old-time error and aid the work we seek to do.

Such publicity should come from this Institute. I recall the concentrated publicity that has been engendered by manufacturers and producers of other products, and they were not so favorably situated. Take cement. One cent per barrel from the manufacturer, contributed to a central bureau, gave his product the publicity he sought. The railroad was told how to construct a water tank, and the farmer was instructed in making a pig trough of cement. Within the year, school children could talk in cement terms and knew of its uses. Team work won for cement. Team work will win for zinc!

I realize that we have in this Institute two divisions or sections that are not directly interested; but both are bound together in mutual interests in the production of the parent raw material. The producers of zinc pig desire to promote its wide consumption and distribution, and the users of the base metal seek to accomplish the same object.

PUBLICITY SHOULD ORIGINATE WITH THE AMERICAN ZINC INSTITUTE

We can well afford to waive any thought of direct results, if the whole trade is benefited by our team work. This Institute, I think, should father and promote the project of general publicity for our metal. It will cost little, but the general benefits in the education of the public as to what zinc will do, and what damage and deterioration it will prevent, will be enormous. We will all reap a benefit far beyond our personal contributions.

Thus far I have spoken only of publicity. From personal knowledge I know that "advertising" is not always "publicity." Like the grains of the "sower who went forth to sow," some advertising falls on "stony ground." But, to carry the simile further, the kind that falls on fertile soil will put you on "velvet" for life. If the "copy" is well prepared and the right media are selected, no one factor in your business will "bring home more bacon" than advertising. It is the red blood of business and the trade stream in the seas of commerce. No matter how humble or how pretentious, it speaks a vital story. The signboard at the crossroads, and the full-page ad in the big national daily, both have a clientele, and in both mediums the public will be informed of the merits of your wares.

Getting down to brass tacks (which are made in part of everlasting zinc), I would recommend that every producer of pig zinc adopt a trade name for his product, and in so far as his budget will allow him to do so he should herald that trade name to the world as being *zinc* and fit for use where zinc should be used.

* Excerpt from an address made at the St. Louis meeting of the American Zinc Institute.

In this work, our way has been blazed for several years past by the New Jersey Zinc Co., which has persistently and consistently insisted, through the trade journals and other media, that "Horsehead" and "Bertha" are the pure and proper metals for all human requirements to which zinc can be put. I am frank to tell you now that one of my purposes in coming here was to compliment our New Jersey friends on this pioneer work, as I feel that it has benefited all. Just how much benefit has been reaped by the company itself I hope will be told by those who represent the company at this meeting.

In referring to our New Jersey friends by name, I do not mean to convey the impression that they are the only users of printer's ink, but I believe you will agree with me that they have ventured further out into the general field than any of the rest of us, and that they have persistently stuck to their trade names. If they have been benefited, so will you be benefited. If their work has carried to the public something of the uses and benefits of zinc, this publicity, multiplied by the number of similar producers, will give an idea of the total. Personally, I feel that the results will be enormous, and if consistently carried on for a period of three to five years the public will be fully informed as to the usefulness of our product.

Now, as to those of us who deal more with the finished product, the field for publicity presents even a better opportunity. In the coming years zinc is to have a more extensive use. Those who fabricate the pig zinc or rolled sheets into a finished product must tell the world of its utility and usefulness, if they are to succeed. Be it a sheet for a roofing, or a slab for casting, the word "zinc" should follow on to the consumer.

USES OF ZINC TO BE EMPHASIZED

Hereafter, the world will get its vegetable products, such as teas, tobaccos, and like commodities, in zinc containers. It must be told that it is a zinc container, and that zinc is the very metal that will properly preserve the content. Nay, more: the man who offers the spurious substitute must be publicly denounced, and, if possible, prosecuted for his counterfeiting. We must no longer keep our light under the bushel. It is zinc that preserves steel and iron, and wood and fabrics. We must proclaim this fact wherever possible. Every advertisement must boldly proclaim that the product is zinc, and science will verify that zinc is the best metal for such use.

Because I have rambled somewhat in handling the subject assigned, may I offer a summary:

First. Zinc should at all times be referred to as zinc; this to correct past errors and aid the public in learning that zinc is the world's everlasting metal.

Second. This Institute should take up the matter of a press agent or publicity bureau, from which will come the true stories of the wonderful properties of the world's most useful metal.

Third. The producers of pig zinc should, if possible, give a trade name to their product and give as wide publicity as is possible to its merits.

Fourth. Those of us who market a finished product from zinc must say that it is of zinc, and refer to the metal's property of preserving the content as placed therein. The best part of the zinc producer's advertising story is that his product is made of zinc, and he should so inform the world.

Industrial Relations Commission Reports on Canadian Situation

High Cost of Living Chief Cause of Unrest—Whitley, Colorado and Leitch Plans Compared—Joint Industrial Councils Recommended for Canada

TORONTO CORRESPONDENCE

THE Canadian Commission on Industrial Relations, appointed to consider and present recommendations for securing improvement in the relations between employers and employees, has presented a comprehensive majority report from the chairman, Judge Mathers, and four other members. The commission finds that the high cost of living is one of the chief causes of labor unrest, and reports that there is everywhere a great reluctance to risk unemployed capital in new enterprises or the expansion of existing ones, owing to prevailing conditions. It approves of the ground taken in the peace treaty that "labor should not be regarded merely as a commodity or an article of commerce." The report recommends legislation providing for an eight-hour workday and a weekly rest of at least twenty-four hours; a minimum wage law, especially for women, girls and unskilled labor; state insurance for those unable to work; proportional representation from grouped constituencies, and restoration of freedom of speech and of the press. The commission approves of the principle of collective bargaining, which in its opinion does not necessarily imply the "closed shop."

The report outlines and makes suggestions as to various types of joint industrial councils, including the Whitley plan as in operation in about forty large British industries; the Colorado plan, which is in force in many American and some Canadian plants, and the Leitch plan, which is based on the American constitution. The essential feature of all these systems is that the human factor in industry is to be regarded as of first importance. The commission believes that in Canada a beginning should be made with joint plant councils, and more extensive organizations of district and national councils evolved therefrom as necessity arises. Every council must be the result of the unfettered choice of both employees and employers, and any attempt to enforce a definite plan upon either would be foredoomed to failure. Some machinery, however, should be established to take the initiative and bring the parties together. It is therefore recommended that a bureau should be established under the Minister of Labor to compile available information and statistics, and maintain officers, who would act between employer and worker.

The minority report, signed by Senator Smeaton White and Frank Pauze, finds that unemployment is largely due to the unequal distribution of labor. It expresses a doubt whether the Whitley plan would be suitable to Canadian conditions and considers that the Colorado plan, or a system similar to that under experiment by the Imperial Oil Co., would be more workable. The minority commissioners did not find any real poverty that was not properly taken care of by local institutions, and considered that a system of old-age pensions or unemployment insurance might seriously affect the ambition of the worker. They suggest the encouragement of joint industrial councils where such are established and that employers and employed be urged to institute forms of co-operative insurance, or other provision for pensions to old employees who are sick or invalidated.

Mining Convention at Nelson, B. C.

Meeting of 200 Delegates Representing Various Sections of the Northwest—Formation of a British Columbia Branch of the Canadian Mining Institute—Interesting Addresses On Current Problems in the Canadian Mining Industry

ABOUT 200 delegates assembled on June 20, 1919, at Nelson, B. C., to organize a branch of the Canadian Mining Institute, in the interest of the mining men of the British Columbia interior. The convention was opened by S. S. Fowler, manager of the Blue Bells mines, near Riondel, B. C., who was selected as temporary chairman. Mr. Fowler explained the importance of the proposed organization in bringing about association and cooperation of mine operators, and for the purpose of establishing a means of acquainting government officials with the needs of the industry. Suggestions regarding the usefulness of the new branch were made by E. T. Hodge, professor of geology at the University of British Columbia; Ernest Levy, James Anderson, and Randolph R. Bruce.

Spokane, and of the debt of gratitude which that city owed to the mines of the Boundary district and the Kootenays. Mr. Armstrong delivered a message of goodwill from Philip N. Moore, former president of the A. I. M. E.

During the afternoon the American Institute of Mining and Metallurgical Engineers and the Canadian Mining Institute held a joint meeting, S. S. Fowler presiding. Three interesting papers were presented: "Mining Methods at the Granby Mines, Phoenix," by C. M. Campbell; "Nodulizing Copper Concentrate," by Oscar Lachmund, and "Tunneling Reminiscences," by Major Angus W. Davis.

The convention reassembled on June 21, Nicol Thompson, chairman of the Bureau of Mines, Board of Trade,

BIRD'S-EYE VIEW OF THE CITY OF NELSON, B. C.

Following formal organization of the branch, the delegates elected S. S. Fowler chairman, and W. G. Wilson secretary, to serve during the ensuing year. James Anderson, of Kaslo; Randolph R. Bruce, of Windermere; A. G. Langley, of Ravelstoke; F. S. Peters, of Rossland, and S. G. Blaylock, of Trail, were elected members of the executive committee. A reception was held in honor of the delegates, and addresses of welcome were delivered by Mayor J. A. McDonald, and the Hon. John Keen, Speaker of the British Columbia Legislature. L. K. Armstrong, secretary of the American Institute of Mining and Metallurgical Engineers, spoke of the importance of the mining industry to the city of

Vancouver, presiding. Charles Camsell, of the Dominion Geological Survey, delivered an address on the geological features of the gold deposits of British Columbia. Mr. Camsell commented on the decrease in the gold production of the province, and pointed out the probable reasons therefor. He stated that the decrease in output was so alarming at one time that a commission was formed in England to discuss the problem of extending aid to the industry. In commenting on the gold production of Western Canada, Mr. Camsell said:

"It is not safe to argue that because each mile of Cordilleran chain to the south of the dominion has produced so much in mineral wealth, an equal amount per

mile will be found in the Canadian portion; but the difference is as yet so great, and so much of our country remains to be prospected, that we can well afford to feel that our production in gold, as well as in other metals, must increase until the difference per mile is greatly reduced. This and other conditions lead one to believe that as soon as industrial unrest is settled

and stated that practically all the gold deposits of British Columbia belonged to the second or younger period of mineralization, and that the whole production of gold is from these deposits. He said, further, that "All formations are believed to be closely related to the great intrusions of plutonic rocks that took place in the Jurassic period, and were formed at the time of intru-

DELEGATES TO THE CONVENTION GROUPED OUTSIDE CONVENTION HALL

we will have reached the downward limit of gold production in this province, and any change will be for the better. The same cannot be said of the outlook for gold production in the United States, but it is being urged there as a patriotic duty to produce gold, in spite of difficulties and discouragements, in order to maintain

or shortly afterward. Some of them appear as contact metamorphic deposits formed on the border of the igneous bodies, but most of them occur as veins both in the igneous bodies and in the intruded rocks in a zone surrounding the igneous bodies. No workable gold deposits have been developed in British Columbia whose

LOOKING UP THE KOOTENAY LAKE, FROM NELSON, B. C.

their reserve and their credit, which is based on that reserve. The same duty devolves on Canadians, and I would earnestly urge prospectors to devote more time and effort to the discovery and development of gold deposits."

Mr. Camsell referred to the geological occurrence of primary gold deposits in the North American continent,

origin may be attributed to the early Tertiary period, such as are found in Colorado, Montana, Utah and Idaho, or to the late Tertiary, as the bonanza deposits of Nevada, and portions of the adjoining states, and in Mexico. From 65 to 75 per cent of the gold produced in the Province of British Columbia is obtained from the smelting of copper ores, but in describing or dis-

curring gold deposits in this paper I purpose considering only those deposits in which gold is the principal metal obtained. Placers need not be considered, as they are secondary, and derived from erosion from the primary deposits."

Mr. Camsell discussed the chief districts from which a production of lode gold has been made, including Atlin, Princess Royal Island, Bridge River, Hedley, Rossland, Nelson, Ymir, and Sheep Creek. Unfortunately, the interesting details of these districts cannot be published at this time, because of the limitations of available space.

REVIEW OF THE MINING INDUSTRY

The Hon. William Sloan, Minister of Mines, reviewed the mining industry of the province, and in the course of his remarks he said in part:

"The aim of the provincial government is to establish the best of relationship between capital and labor. Only by so doing can the best results be obtained in the development of our natural resources, and this refers especially to the great mining industry in which we are so much interested. When in New York recently, I had many inquiries as to the situation in this province, and the prospects for profitable investment, and am therefore certain that as soon as the industrial unrest to which I have referred, and of which we all are so painfully aware, subsides, we shall be able to take up the work, confident that the sinews of war will be available in ample volume. It is a matter of comment outside the province that the mining laws of British Columbia are fair and just, and of such a character as to encourage the capitalist to find in the development of its minerals as safe a field for investment as is to be found anywhere. In the matter of taxation I may say that the policy of the government is to base its assessment to a constantly greater degree on net incomes alone. At present, unfortunately, there are not enough net incomes to make this possible and to pay the bills.

ORE-TESTING PLANT ASSURED

"While in Ottawa I conferred with the Hon. Mr. Burrell, Minister of Mines, on the matter of the establishment of an ore-testing plant in British Columbia. There has been an agitation for one here for many years. Mr. Burrell informed me that it was the government's intention to begin work on such a plant, the required finances having been provided by the dominion Parliament. I know of the difficulties experienced in this section because of the lack of facilities for the determination of what class of mill should be provided for the treatment of various kinds of ore, and there is no doubt that an ore-testing plant is a necessity in this district.

"It is interesting, in touching on the complexity of some of our ores and the consequent difficulty experienced in effecting full recovery of their values, to recall a statement made in Nelson a few weeks ago by J. J. Warren, general manager of the Canadian Consolidated Mining & Smelting Co., in the presence of Mr. Beatty, the president of the Canadian Pacific Ry. He stated that Mr. Blaylock, of the company's metallurgical staff, and his assistants had discovered a process by which silver, lead, and zinc can be recovered from the Sullivan mine ore. He is reported to have said also that the problem of the treatment of the low-grade gold-copper ores of the Rossland mines had been solved, and that within a short time the Rossland mines of the com-

pany would be turning out between 2,000 and 5,000 tons of ore daily.

"I sincerely trust that I have correctly interpreted the purport of these statements. The first should mean much to the operators of properties, of which there are not a few, with ore similar generally to that of the Sullivan mine. The second should result in the bringing to the historic mining camp of Rossland that prosperity which it has enjoyed for so many years and which we all are interested in seeing continued.

"With respect to the iron and steel industry, which is a matter to which I, as Minister of Mines, have been devoting much attention, I may say that we have on the coast and elsewhere large deposits of magnetite ores. These are of exceptional purity. We have been handicapped by the lack of hematite. As to what has been done, most of you are familiar with the Bounty Act, passed by the provincial government, granting a bonus of \$3 a ton on pig iron produced in the province from local ores. This so far has not given the results hoped for, and was followed by an investigation of the possibility of the development of our iron ores by electric smelting. Alfred Stansfield was commissioned to come to the province and make a report thereon. His report indicates that our magnetites can be so treated, but that the cost of power stands in the way of making the enterprise a commercial success. Recently an electric smeltery expert came to the government and stated that he had an improved method by which it would be possible to treat our ores more economically. As the government is much interested in this possibility, a small grant was made in order that this method might be demonstrated, and the results of the experiments will be known at an early date."

ADDRESSES AND RESOLUTIONS

Among the many other interesting addresses made at the convention were: "Revival of Local Treatment as Regards Flotation," by Francis A. Thomson, dean of the College of Mines, Moscow, Idaho; "The Iron and Steel Industry in British Columbia," by E. T. Hodge, professor of geology, University of British Columbia, which was followed by a discussion by Mr. Armstrong, of Spokane; "Platinum and Other Minerals Found in the Ultra-Basic Rocks," by William Thomlinson, of New Denver; "Mining and the Distribution of Minerals in the Kootenays," by A. G. Langley, district engineer for mineral survey district No. 5, and "Mineralization of Northern Manitoba," by R. C. Wallace, The Pas, Manitoba, the last paper being read by Mr. Armstrong. Mr. Fowler, as chairman of the committee appointed to investigate the justice or injustice of the charges levied by the Consolidated Mining & Smelting Co. on custom ore, gave a summary of the findings of the committee, which was to the effect that the charges had been justified.

The convention closed with the discussion and passage of a number of resolutions. The first was to the effect that returned soldiers be provided with an opportunity to prospect for minerals, the dominion government being asked to provide \$200,000 to permit 200 returned men to be sent into the field. The second resolution requested the provincial government to arrange for the purchase of powder in large quantities for use in each mineral district, to be sold at a minimum charge. The third resolution called upon the government to appoint more district mining engineers.

DETAILS OF PRACTICAL MINING

Suggestions From Practice for the
Superintendent, Foreman,
and Miner

A Home-Made Slip-Joint

BY GEORGE S. STURGES

Manager, Jacket-Crown Point-Belcher Co., 1026 Mills Bldg.,
San Francisco, Cal.

Some years ago the Jacket-Crown Point-Belcher Mines Co. lost its incline sinking pumps when a fire started in the incline above the pumps, which were two-stage electrically driven centrifugals, and caused the water level to rise rapidly until it was approximately 200 ft. vertically above the point where it stood at the time of the fire.

After some time the management decided to recover the lost levels, which had been under water for about 25 years before the above pumping plant had been installed. It was impossible to duplicate the pumps without heavy expense and long delay, but I secured three two-stage centrifugals, one of which was used as an extra, and rigged up a long truck to fit the track in the incline. One of these pumps was placed at the lower end of the truck, and at the other end a 75-hp. motor was secured and belted to the pump. The truck was

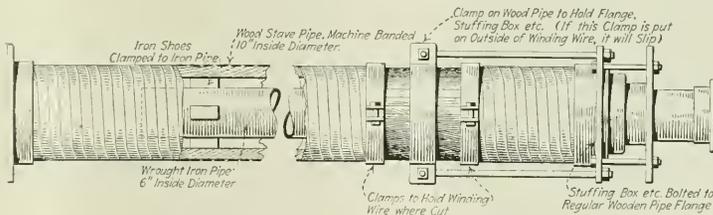

Laying Out Short-Radius Curves

BY JOHN FABER HANST

Mining engineer, 261½ Cross St., Pittsburgh, Pa.

A method for laying out short-radius curves underground, and one that is particularly useful in driving drifts on a curve, is as follows. It has the advantage of being so simple that the miners themselves can apply it, its utilization requiring no calculation, and the results are sufficiently accurate for all ordinary work:

A curve templet of a required radius is laid out on a level floor, or on level ground, by the engineer, using a steel tape of sufficient length. To do this, a center point is marked, and, with the tape lengthened to the exact radius, an arc is struck off on a piece of 1-in. plank of any convenient length, 10 ft. being about right. The same is done with another plank half the length of the first. Similar cross-pieces are marked at each end of the curve planks, taking care to nail them exactly at 90° to the curve. This is easily done, provided the curve planks are held firmly in position when the

PIPE SLIP-JOINT USED IN RECOVERING SUBMERGED LEVELS

lowered on the incline by means of an electric winch, installed for use on the regular pumps, and was connected to a 10-in. machine-banded stave pipe by means of the home-made slip-joint shown in the accompanying sketch. The incline was fairly dry, and, although not entirely desirable for permanent service, the belted pump and motor, together with another similar unit placed on the first unwatered station, recovered the two lost levels and the big pumps, which were eventually placed in operation again. The motors were, of course, rewound, but otherwise the pumps were not damaged.

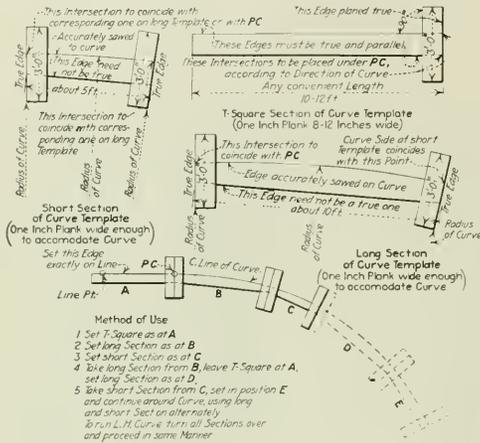

The discharge line from the pumps was made of machine-banded stave pipe and of different strength, to withstand increased pressure as the pumps were lowered. The particular piece from which the slip-joint was made was of that pipe used for the highest pressure, that it might be serviceable throughout the entire drop of the temporary pump. Approximately 1,150,000 gal. of water was pumped through the slip-joint every 24 hours. Such equipment as was available was utilized, but the joint construction would have been simplified had wrought-iron pipe been used instead of the wooden pipe, as explained in the article.

arc is struck off and that the end points are marked. The edge of the tape itself will serve to strike off the correct line on which to nail the cross-pieces. The templet being constructed, proceed as follows:

At the *point of curve (P.C.)* of the curve set a plug or place a nail in the cap. On tangent, and in a direction opposite to the curve, set another line point at such a distance that it will fall within the length of the T-square section of the templet. Place the T-square with one edge on line, using plumb bobs suspended from the line plugs, and with the outside intersection of the straight-edge and the head exactly at the *P.C.* Holding this firmly, bring one curve templet so that the head coincides with the T-square head, and with the curved edge running in the proper direction. To reverse the direction of curve, simply turn the templet over, thus using the same templet for right or left curves. Now hold the curve templet and bring the shorter templet to position, carrying one ahead of the other as far as necessary. In this manner, with one setting of line plugs by the engineer, the miners can check up their drift after each blast, or as often as desired. The short and long sections enable the true line to be carried

right into the breast at all times without difficulty.

Of course, when the P.T. is approached, it will be necessary for the engineer to run a survey around the curve and spot the exact P.T., giving lines for the tangent at the same time. Most of this work, however, can be done in the office, especially if the survey points are figured on a co-ordinate system. This, by the way, is the only logical and systematic way of surveying a mine, and with a good accurate map on a scale of 50 ft.

METHOD OF LAYING OUT SHORT-RADIUS CURVES

to the inch it is possible to determine the position of a point with great accuracy.

For the benefit of those to whom this method of laying out a curve is new, sketches of the templet and the manner of application are appended. The method is in general use in many of the mines of the Lake Superior iron ranges, and, so far as I know, was developed by the engineers of the Cleveland-Cliffs Iron Company.

Uses for Empty Carbide Cans*

By E. P. HUMPHREY

Several uses can be made of the 100-lb. tin carbide containers, instead of throwing them away. They have a small refund value, but when the freight is paid it amounts to practically nothing. One use is to place them in the machine shop so that the machinists can put their turnings and borings into them, one for each kind; and then, when a car of scrap is to be loaded, the filled cans are placed in this car. The blacksmith also should have some of these containers for his scrap ends. The practice is not only a great labor saver for the mine or shop operator, but also for the receiver of the car, as it greatly facilitates unloading.

These cans may also find place in the shop as receivers for dirty cotton waste and wiping cloths. Some reclaim the cotton waste, and the oil residue is used on gearing. A few cans of this oily waste are handy in the winter time for thawing pipes. A locomotive fire may be easily started with it, saving good waste and oil which the engineer is likely to use in order to secure a quick, sure fire.

Another use lies in substituting the cans for bags in

carrying feed to mules in the mines. They can be easily cleaned and dried, and with the screw top are moisture and rat proof. This feature is especially useful in the small mine, where there may be only one mule that is cared for by the driver. The tendency when bags are used, as in ordinary practice, is for the feed to get wet and be left out for the rats.

Motor Generator for Mine

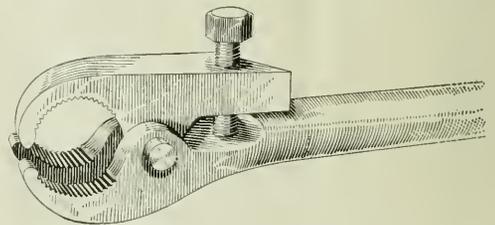

There are periods when the electrical load of a mine is light, and then, in an instant, the demand for power may jump to several times the average. Such conditions occur with the starting or stopping of hoists and locomotives, and demand an extra high peak-load performance of the generating apparatus. This is especially true as regards synchronous motor-generator sets, because the generators are denied the relief afforded by the fall in speed of an engine-driven set, being run at constant speed.

A new synchronous motor-generator set, which embodies the continuous power-factor correction common to such sets with very high overload and peak capacity, has recently been put on the market by the Westinghouse Electric and Manufacturing Co. It consists of a Type-G 3-phase, 60-cycle, synchronous motor, driving a Type-SK 150-275-volt compound generator. The machine has three bearings, the pedestals and field frames being mounted on a common bedplet. The full-load rating is based on continuous capacity with 35° C. rise on the generator, 45° C. on motor armature, and 50° C. rise on motor field, with 80% power factor. After a two hours' run at 50% overload, the generator temperature rise will not exceed 55° C., and the motor 55° C. On test, commutation was satisfactory at 250% load. The compound field is adjusted to give 10% increase in voltage from no load to full load.

A Sure-Grip Wrench*

By CHARLES H. WILLEY

A wrench which may be made of a convenient size and will be found invaluable for the purpose of gripping any round stock, pipe, studs, or similar material is shown in the accompanying cut. The device is in-

WRENCH FOR ROUND STOCK

vented to answer the need of a positive grip wrench for removing stubborn pipes and studs. The pin is slipped out when putting the wrench on or removing it from the work. By screwing down the small threaded bolt, the jaws of the wrench exert a firm grip on the pipe or stud.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Our Mineral Wealth

Pooling of information at the Peace Conference regarding the mineral deposits of all countries has served to emphasize the great mineral wealth of the United States. Dr. J. B. Umphey, the geologist in charge of foreign mineral deposits for the U. S. Geological Survey, who was in Paris as a special mineral adviser, points out that in the past the course of conquest and the seat of empire have been determined by mineral deposits. These, he believes, will now determine industrial supremacy. In 1913, the latest normal year, the United States held first place in the production of thirteen of the thirty most important mineral commodities. It held second place in the production of four, while it contributed 5 per cent of four other minerals.

The United States, during 1913, on which year Dr. Umphey bases his figures, produced 39 per cent of the world's coal; 36 per cent of the iron; 56 per cent of the copper; 37 per cent of the zinc; 30 per cent of the silver; 17 per cent of the tungsten; 38 per cent of the molybdenum; 65 per cent of the petroleum; 95 per cent of the natural gas; 16 per cent of the arsenic; 43 per cent of the phosphates, and 20 per cent of the salt.

In the same year, the Transvaal produced 41 per cent of the world's gold; Russia, 99 per cent of the platinum; Peru, 76 per cent of the vanadium; Russia, 55 per cent of the manganese; Rhodesia, 35 per cent of the chromic iron; Canada, 85 per cent of the nickel; China, 53 per cent of the arsenic; India, 59 per cent of the mica; Spain, 54 per cent of the pyrites; Italy, 43 per cent of the sulphur; Germany, 99 per cent of the potash; Chile, 99 per cent of the nitrates; France, 58 per cent of the bauxite; Austria, 39 per cent of the graphite; Malay States, 40 per cent of the tin; Spain, 31 per cent of the mercury, and Austria, 74 per cent of the magnesite.

Virginia Emery Equal to Turkish

Emery deposits developed in Virginia during the war are yielding a product in every way equal to Turkish emery, according to F. J. Katz, of the U. S. Geological Survey. This opinion was expressed after tests had been made at the Bureau of Standards. Mr. Katz doubts, however, if it will be possible for the Virginia production to continue, as the freight rate from the southern part of the state to the emery-crushing mills in New York, Massachusetts, and Pennsylvania is such as to make it impossible to compete with the Turkish product, which reaches this country largely as ballast for light, bulky cargoes. As the operation in Virginia is small, there is no expectation that a tariff can be secured, and it is anticipated that work will have to stop as soon as imports from Turkey are resumed. The fact, however, is established that the country is independent of foreign supply if conditions warrant the development of the Virginia deposits on a large scale.

War-Minerals Relief Act Interpreted

By Attorney General

Material reduction in the number of claims which will be allowed under the War-Minerals Relief Act will result from an opinion by the Attorney General in interpreting Section 5 of the act. The opinion was rendered to the Secretary of the Interior as follows:

I acknowledge receipt of your letter of June 25, 1919, asking my advice as to the proper construction of the words "request or demand" as used in Section 5 of that Act of Mar. 2, 1919 (40 Stat. 1272). The part of this section containing these words is as follows:

"That the Secretary of the Interior be, and he hereby is, authorized to adjust, liquidate, and pay such net losses as have been suffered by any person, firm, or corporation, by reason of producing or preparing to produce, either manganese, chrome, pyrites, or tungsten in compliance with the request or demand of the Department of the Interior, the War Industries Board, the War Trade Board, the Shipping Board, or the Emergency Fleet Corporation."

The words "request" and "demand" are both synonyms of the word "ask." A demand might perhaps be said to be a "peremptory request." The claims recognized by this section are those of persons who have suffered loss by "producing or preparing to produce either manganese, chrome, pyrites, or tungsten in compliance with the request or demand of the Department of the Interior, the War Industries Board, the War Trade Board, the Shipping Board, or the Emergency Fleet Corporation." That is, one of the five governmental agencies must have asked (either by request or demand) the claimant to produce or to prepare to produce one of the four named minerals. The statute specifies the five agencies authorized to make request or demand for the production of minerals, specifies the minerals, and specifies that the production, or preparation for production, must have been "in compliance with the request or demand" of one of the five agencies.

The language used could hardly be more clear or allow less room for construction. No claim based upon a general appeal or solicitation is authorized by it, but to come under the statute the claimant must have been asked specifically by either the Department of the Interior, the War Industries Board, the War Trade Board, the Shipping Board, or the Emergency Fleet Corporation to produce or prepare to produce one or more of the four named minerals.

In your inquiry you state:

"Many claims have been filed which appear to be based upon an asserted reliance upon appeals to the general public for the production of these minerals alleged to have appeared in the newspapers, etc."

As I have stated above, the statute does not authorize the recognition of a claim based upon a general solicitation or appeal. This is apparent from the provision itself. It is also apparent from the history of the enactment (which it is unnecessary to detail here) that it was intentionally framed so as to exclude such claims as are referred to by you.

The Federal Reserve Board announces the removal of all restrictions from the export of bullion, coin, and currency. Applications and licenses are no longer required. An exception to the ruling is that part of Russia under Bolshevik control.

William Thum, Noted Metallurgist, Dead

Inventor Prominent in the Introduction and Development of the Electrolytic Refining Process in the United States Expires at Hammond, Ind.

WILLIAM THUM, metallurgist and inventor of prominence, and a pioneer in the art of electrolytic refining in the United States, died on June 28, 1919, at his home, at Hammond, Ind. Mr. Thum was born in Germany in 1863, in the parish house of his grandfather who was a clergyman in the small town of Bleichenbach, Oberhessen. After spending about seven years of his early boyhood days on the coast of Wales, where his father, F. A. Thum, a distinguished mining engineer of the Clausthal School of Mines, was in charge of a zinc plant, he attended preparatory schools in Germany until 1879, when he, with his parents, came to the United States.

WILLIAM THUM

In 1883 Mr. Thum became assistant superintendent of the Balbach Smelting & Refining Co., at Newark, N. J., and there, in association with his father, he began the development of the first electrolytic refinery in the United States, laying the foundation of an industry which has assumed gigantic proportions in this country. At the time of Mr. Thum's connection with the Balbach Smelting & Refining Co., that company was using the Parkes process for lead refining.

In 1904 Mr. Thum served as superintendent of the De Lamar Copper Refining Co., at Chrome, N. J., and in 1906 he became superintendent of the electrolytic lead refinery of the United States Metals Refining Co., at East Chicago, Ind. This was the first plant of its kind in the United States. A refinery was in operation at Trail, B. C., and another at Newcastle-on-Tyne, but these plants recovered no byproducts except gold and silver.

At East Chicago, Mr. Thum developed a process which recovered bismuth, tellurium, and antimony as

byproducts in the electrolytic refining of lead. Later he took out a number of patents, among which are: A patent for a process for the electroplating of metals, especially lead; one for the separation of bismuth from copper, which covered a particular feature of the complete process; a patent for an apparatus for use in the Pattersonizing process, and one for an improved method of construction for a round-bottom tank. Another patent was for a horizontal cell for parting doré bullion which is today in use in a number of plants, and which was an improvement on his father's earlier design.

However, Mr. Thum's most important general contribution to the metallurgical art was a method which made practicable the basic process of Anson G. Betts, which had been previously patented in the United States.

William Thum was one of the most versatile of men, in addition to his distinguished professional attainments. He painted in oils and watercolors and was dextrous with the pencil in caricature. He spoke French as fluently as English and German, and read Latin with great facility, from which he would frequently quote. Mr. Thum was interested in botany and possessed an extensive knowledge of bird and animal life. Being an ardent hunter in former years, he made many trips to Maine for moose and in recent years he indulged in duck shooting.

Mr. Thum was well known for his charity, sympathy, and general human qualities. During the war, he was active in the many Liberty Loan campaigns, and took a prominent personal part in the proceedings of the specific patriotic societies of the East Chicago-Hammond district in Indiana.

The Waihi Gold Mining Co., Ltd., In 1918

During the year 1918, according to the last report, the Waihi Gold Mining Co., Ltd., treated 188,998 short tons, dry weight. The ore was mined from seventeen different reefs, which contributed to the total production in amounts ranging from 84 to 59,138 tons. The gold and silver sold realized £387,065. Interest (including £3,109 income tax deducted therefrom) amounted to £23,282, and £4,491 was received from a neighboring mine for ore inadvertently mined in previous years, making a total of £414,838. The expenditure in New Zealand and London, including development work at the mine, amounted to £215,564, leaving a balance of £199,274. The above sum, added to the balance of £62,435 brought forward from the preceding accounts, totals £261,709. After all appropriations, including dividends amounting to £99,181, the balance remaining to the credit of revenue account at Dec. 31 was £52,953.

The ore reserve shows a decrease of 116,846 tons, of which 96,955 tons is from the general account and 19,891 tons is from the suspense account. The total reserve on Dec. 31, 1918, was 602,789 tons in suspense account and 556,761 tons in general account.

The development and dead-work footage amounted to 7,366.5 ft. in 1918, of which 3,975.5 ft. was in connection with the extraction of suspense ore. No shaft sinking was done during the year. The mill ran 298.6 days. The average number of stamps running was 120,412. The ore crushed amounted to 188,998 tons, representing a daily average stamp duty of 5.255 tons, being a decrease, compared with the previous year, of 0.091

tons per stamp day. The average number of tube mills running was 6.89.

The average assay of the ore treated was 0.375 oz. gold and 2.764 oz. silver, a total value per ton of £1 16s. 10.25d. The average assay of the residue was 0.026 oz. gold and 0.456 oz. silver. The average extraction was 93.1 per cent of the gold and 83.5 per cent of the silver, or 91.7 per cent of the total gold and silver in the ore treated. The proportion of the ore treated as sand was 21.77 per cent, as slime 76.81 per cent, and as concentrate 1.42 per cent. All concentrate produced, amounting to 2,676 tons, was treated in the concentrate-treatment plant.

George S. Rice Discusses Trip To Foreign Fields

Reclamation of French Mines Delayed—England Considering Discontinuance of Coal Exports—Germans Mining Coal for France Under Military Control

WASHINGTON CORRESPONDENCE

THE French are showing engineering ability second to none in the rehabilitation of their coal mines, according to George S. Rice, chief mining engineer of the U. S. Bureau of Mines, who just has returned from a personal survey of the coal situation in France, Belgium, Germany, and England. The reclaiming of the French mines, however, is being delayed by the French governmental policy, which Mr. Rice does not undertake to criticize. The policy to which he refers is that of opposing the purchase of foreign mining machinery, owing to the overwhelming balance of trade against France.

In Great Britain, Mr. Rice found that the financial interests are frankly calculating the effects of a total discontinuance of coal exports from England proper. Apparently, England needs all the coal she can produce. It is evident that present restrictions on local consumption of coal cannot be continued indefinitely. Mr. Rice found powerful influences at work tending toward the nationalization of coal mines. He gained the impression, however, that the opinion of the majority of the people is that the time is not ripe for the nationalization of the coal industry. That sentiment, however, may not have crystallized to the point where it may be effective in preventing such a step.

Mr. Rice went to Europe several months ago at the head of a Bureau of Mines commission. He now is engaged in writing a report on the great deficiency in the fuel supply of Europe. He also will reduce to a report other observations and conclusions that he reached as a result of his trip. In a running story of his survey, Mr. Rice says:

"On our arrival in Paris, thanks to Professor Probert, our itinerary was practically arranged. Through the kindness of Secretary Baker, a military automobile was placed at our disposal. This greatly facilitated our movements in a territory where ordinary means of transportation are largely disrupted. We visited first the Lorraine iron mines. Then we went to the French steel plants which had been destroyed by the Germans. We visited the mining areas of Luxemburg and those in the vicinity of Metz, after which we went through the Sarre coal fields, where we saw the German miners working under French military control, helping to sup-

ply, in part, the loss of production in the Pas de Calais field. We then returned to Paris via Verdun, where we had the honor of spending the night in the citadel as the guest of the commandant. We had an opportunity to go over the whole battle area on which occurred the most intense conflict in the whole history of clashing arms.

"On return to Paris, Dr. Cottrell left us to visit the air-fixation plants in Germany. Professor Probert and I went to the Pas de Calais coal field. In addition to examining the mines which had been wilfully destroyed, we made interesting observations at the principal French mines which escaped that fate. These mines continued in operation during long periods when they were under shellfire. Professor Probert then returned to the United States. I was requested to take part in an advisory capacity on coal matters in an Allied conference with German representatives at Cologne. The object of the conference was to obtain information as to what Germany had to offer in exchange for foodstuffs. As France and Italy each was in great need of coal and coke, it was hoped that Germany might have a surplus of these fuels. It proved that Germany had no coal and coke from the Westphalian field to offer, other than that already going to the occupied territory on the west bank of the Rhine. Strikes and labor difficulties, ascribed partially to food shortage, had cut down the output. It was at this conference that the Germans complained that the French had made no accounting to them of the coal taken from the Sarre Valley. Major General Gailard, who presided, merely smiled and did not call attention to the fact that they also had received no bill for the damage done French coal mines. The bearing of the Germans on that occasion was not that of those who recognize military defeat.

"While waiting for the conference to convene, I had time to visit the mines on the west bank of the Rhine in the Westphalian field and the remarkable brown coal field near Cologne. On the return from Cologne I visited the mining region of Belgium from one end to the other—from Liège to Mons—and thence continued over the line into the devastated region as far as Lens.

"I was detained in Paris by some matters pertaining to the Economic Commission's work, but as soon as I could get away I went to the south of France to visit the St. Etienne, Marseilles, and Alais coal fields. I was interested particularly in the latter, where there are great outbursts of nearly pure carbonic-acid gas which appears to be held under a very high compression in the coal.

"I then went to England, where I visited the typical iron mines in the Cleveland and Cumberland district; the oil-shale workings in Scotland and various typical collieries."

American Institute of Mining and Metallurgical Engineers

From a technical point of view, the Chicago meeting of the Institute, to be held Sept. 22 to 26, inclusive, promises to be one of the most interesting in its history. The wealth of material in the line of technical papers for discussion is greater than has been offered for any previous meeting. More than 150 papers have been submitted to the committee, which is finding it no small task to arrange a program with a minimum of conflicts among papers on allied subjects.

One of the excursions to be made by the Institute as a body during this meeting is to the La Salle district. A special train leaving Chicago early Thursday morning will take the members and guests to La Salle, Ill., where automobiles will convey the different parties to the coal mines, cement works, and zinc smelteries. For the ladies, and for others of the party not particularly interested in these industrial operations, the La Salle hosts plan an automobile trip to Starved Rock.

South African Gravity Stamp Practice*

The Use of Large-Mesh Stamp-Battery Screens, Together With an Increase in Tonnage, Raises the Question of a Substitute

FEW novel ideas have come into practice in Witwatersrand metallurgy during the last decade. Sixteen years ago H. S. Denny (who was at the time second in command to his brother in the technical administration of the affairs of the General Mining and Finance Corporation) read his noteworthy paper on "Main Reef Milling and Cyaniding Practice," and proposed certain reforms which had previously been adopted in other parts of the world, notably western Australia. Mr. Denny's valuable contribution to the technical literature of the gold fields was quickly followed by the adoption of some of the innovations suggested.

The New Goch and Glen Deep erected tube mills, fine grinding soon became general practice at most of the large and modern mills of the Rand, the mill screening employed became coarser and coarser, and the duty of stamps, which in 1903 seldom exceeded five tons in the 24 hours, rose to proportions which demonstrated that the functions of the gravity stamp battery had in some degree been changed. The new metallurgy grew apace, and, before long, tube mills were installed from one end of the Reef to the other. Fine grinding became part and parcel of Main Reef practice, and slime, which was the bugbear of the metallurgist in the earlier days of the fields, quickly lost its terrors.

Then followed a period in which the practical ramifications of the new metallurgy were extended to the adoption of filter presses and agitators, and as knowledge of these devices became extended and practice improved, the tendency to create more and more slime advanced in keeping with the growing tendency to make the apertures in the mill screening coarser and to throw more and more duty upon the tube mills. Today no less than 80% of the gold recovered by a leading mine is obtained from the slime product.

The evolution of the new metallurgy can easily be traced from the early part of 1903, when there was not a single tube mill at work along the Reef, up to the present day, when every mine from South Randfontein to Springs employs one or more of these machines for secondary pulverization of the ore, and between 300 and 400 tube mills are in daily operation. The development of the new metallurgy has been even and unchecked, and for the last year or two it has seemed as if a stage of general practical perfection had been reached. Details are constantly being experimented with or improved on, but the general impression has been that an established technical status of high capacity has been

attained, as well as reasonable cost and low residues, which does not offer or suggest much scope for the adoption of any important or epoch-making ideas.

Bearing all this in mind, it is at least interesting to learn that there is a suggestion that in the equipments of the future the gravity stamp may disappear altogether. In support of this view it is pointed out that screening as coarse as a 1/2-in. mesh is being employed in at least one of the newer mills, and it is contended that ore can be reduced to this size by means of a system of stage crushing in rock breakers, and by the employment of a form of crusher combining both the gyratory principle of the Gates type with the percussive action of the Blake-Marsden. I understand that the Sturtevant crusher is considered to comply with the necessary requirements, and there is one school of thought which claims that by the employment of these methods the stamp battery, with its heavy capital charges, becomes unnecessary.

The employment of coarse mill screening has resulted in the duty of a stamp being increased to a figure unheard of 12 or 15 years ago. On the Further East Rand there are three or four reduction plants in which the amount of ore crushed is over 20 tons per diem. In January, for instance, the duty per stamp at the Government Areas was nearly 25 tons in the 24 hours, and at the Modder Deep it was 23.8 and at the Van Ryn Deep 22.4 tons. Latterly the Chamber of Mines has discontinued the inclusion of a column exhibiting stamp duties in the monthly analysis of output. This publication now, however, gives more detailed information in regard to stamps and tube mills erected and at work and running time in respect of both forms of ore crushers, and the following table of stamp duties on the newer Far East Rand mines, compiled from the chamber's January returns, should be instructive in connection with the subject of the present achievements and functions of gravity stamps in the more modern plants of the Rand:

STAMP DUTIES AT MINES OF THE FAR EAST RAND

	Erected		At Work		Days Milling		Tons Crushed	Stamp Duty per 24 Hours
	Stamps	Tube Mills	Stamps	Tube Mills	Stamps	Tube Mills		
Brakpan.....	140	12	110	10	23.0	26.94	42,000	16.6
Government Areas.....	200	25	180	22	23.77	24.83	106,500	24.8
Modder B.....	104	8	104	8	27.01	28.66	58,000	20.5
Modder Deep.....	70	8	70	8	26.66	26.88	44,400	23.8
New Modder.....	236	15	236	15	22.44	21.86	76,000	14.3
Springs Mines.....	80	8	80	8	18.87	20.14	33,350	22.1
Van Ryn Deep.....	90	9	90	9	21.2	25.07	42,000	22.4

These figures demonstrate that the tube mill now performs a considerably greater proportion of the work in the reduction plant than formerly, and the contention under consideration is that large savings on capital account can be effected in new plants by eliminating stamp batteries altogether and feeding the product of the final crusher direct into the tubes. The idea is not a novel one. Many attempts have been made in other parts of the world to supplant the gravity stamp by utilizing rolls, grinding pans, and other devices.

In most instances the cost of maintenance has been the chief factor detrimental to the substitution of other devices for the California stamp, and the claim that the employment of crushers or combined gyratory and percussive action can prove satisfactory rivals to the present system of crushers and stamps will have to be proved before it finds many adherents.

*Reprinted from the *S. A. Mining and Engineering Journal*, Mar. 15, 1919.

Monthly Copper Production for 1919

The table which appears herewith is compiled from reports received from the respective companies (except in the cases noted as estimated), together with the reports of the U. S. Department of Commerce as to imported material, and in the main represents the crude-copper content of blister copper, in pounds.

	MONTHLY CRUDE-COPPER PRODUCTION, 1919			
	March	April	May	June
Alaska shipments (a)	1,471,398	2,153,691	1,134,272	2,374,843
Arizona:				
Arizona Copper	2,800,000	2,400,000	2,400,000	2,400,000
Calumet & Arizona	4,602,000	3,822,000	4,308,000	4,872,000
Cons. Ariz. Smelting	720,000	770,000	690,000
Inspiration	6,700,000	6,900,000	6,200,000	6,300,000
Magma	1,000,212	674,943	730,548

New Mexico:				
Chino	3,770,000	3,498,747	3,583,396	3,615,458
Utah:				
Utah Copper	8,366,000	9,420,000	9,125,000	9,528,000
Eastern smelters (b)	1,400,000	1,400,000	1,400,000	1,400,000
Total reported	87,040,460	85,428,998	83,072,975
Others, estimated	15,000,000	13,380,000	9,580,000
Total United States	102,040,460	98,808,998	92,652,975
Imports: Ore and concentrates, etc.	10,146,979	9,773,655	7,946,560
Imports in blister, etc	49,564,356	22,781,489	15,997,164
Grand total	161,751,975	131,364,142	116,596,699
British Columbia:				
Granby Cons.	667,142	1,333,523	1,848,802
Mexico:				
Boleo	2,039,520	1,433,040	1,322,720	1,256,640
Cananea	3,200,000	3,000,000	3,000,000	3,000,000
Phelps Dodge, Mexican properties	1,900,000	1,702,000	1,552,000	1,735,000
Other foreign:				
Cerro de Pasco	4,838,000	4,780,000	4,034,000	4,026,000
Chile	4,368,000	5,024,000	5,066,000
Katanga	3,262,800	4,298,970	2,094,370
Baekus & Johnston	2,144,825

(a) Only electrolytic cathodes are entered. New Cornelia also produces some copper from ores sent to Calumet & Arizona smeltery. (b) Estimated. (c) Official figures of the U. S. Department of Commerce; includes Kennecott production from its Alaska mines.

Production of the United States by months since the beginning of the year and the corresponding figures for 1918 were as follows:

	1918	1919
January	165,431,568	135,733,511
February	160,011,364	111,649,512
March	185,525,168	102,040,460
April	163,207,090	98,808,998
May	181,070,350	92,652,975

The grand total includes, under "Imports in ore and blister copper," the production of such companies as Granby, Cananea, Braden, Cerro de Pasco, and Chile. As a matter of record, however, the individual figures are given after the total. We also report the copper output of the Boleo and Katanga companies, which does not come to the United States.

Cupro-Nickel Stock for Sale

The War Department, through the Director of Sales, has recently been making inquiries designed to develop a market, other than that afforded by the United States Mint, for approximately seventy-five carloads of cupro-nickel, the material from which the five-cent piece is coined. This material was acquired by the department for making metal jackets that incase the .30 calibre

bullets, and other small-arms ammunition. The alloy obtained for military purposes has a slightly higher copper content than that used for coinage. It consists of 85 per cent copper and 15 per cent nickel. Cupro-nickel is stronger than brass, and maintains through long usage a natural nickel finish.

New Suits Brought for Deportation At Bisbee

Cases Rushed Through Just Before Two-Year Statutory Time Limit Expires—Plaintiffs Ask Over \$5,000,000 Damages—Some Arrests on Criminal Charges

AS AN OUTGROWTH of the Bisbee deportation which took place July 12, 1917, civil suits to the total of 272 were filed on July 10, at Tombstone, Ariz., the county seat of Cochise County. Damages amounting to over \$5,000,000 are sought, on the ground of alleged assault, bruising, beating, and wounding by plaintiffs; 166 of the cases ask for \$20,000 damages each, one-half of which is claimed for actual damages and the remainder for punitive damages; 75 of the cases ask for \$25,000 each, and 31 ask for \$10,000 each.

The plaintiffs in the majority of the cases are men who it is alleged were deported, or their families or relatives. The defendants for the most part are the same, the following list covering the principal ones: El Pasc & Southwestern Railroad Co.; Phelps Dodge Corporation; Copper Queen Consolidated Mining Co.; Calumet & Arizona Mining Co.; Shattuck-Arizona Copper Co.; Walter Douglas, president of the Phelps Dodge Corporation; M. J. Cunningham, vice-president of the Bank of Bisbee; Harry C. Wheeler, former sheriff of Cochise County; Charles W. Allen, James R. Henderson, Ben Frankenburg, Mose Newman, all prominent merchants of Bisbee; Grant H. Dowell, manager of the Copper Queen company, of the Phelps Dodge Corporation; Arthur Notman, superintendent of the Copper Queen company; L. C. Shattuck, manager of the Shattuck-Arizona Copper Co.; J. P. Hodgson, manager of the Morenci branch of the Phelps Dodge Corporation; H. H. Stout, smeltery superintendent, Douglas Reduction Works; W. H. Brophy, former manager of the Phelps Dodge Mercantile Co.; Gerald Sherman, consulting engineer, Phelps Dodge Corporation; Charles F. McDonald, cashier, Citizens' Bank & Trust Co., Bisbee; also several other prominent citizens of Bisbee.

In addition to the above civil suits, over fifty arrests of prominent Bisbee men have been made on criminal charges preferred by some of the men deported, in each case the bond being fixed at \$2,000. Assistant County Attorney Roark authorized the statement that owing to the crowded condition of the Superior Court docket, together with the fact that it will take considerable time in the justice court to dispose of the cases now in progress, the state would probably await the final outcome of the present cases before filing the next list. The criminal cases will be given a preliminary hearing in the court of Justice W. C. Jacks, of Douglas, who stated his intention of trying one case a day and keeping the calendar moving as rapidly as possible, the first case to be heard on July 11.

It is understood that all of the above cases were rushed through and filed prior to July 12, 1919, thus coming within the two-year limit prescribed by the statute of limitation.

BY THE WAY

The Engineer in Civic Life

Among the engineers who have risen to distinction in civic life is Mayor Walton, of Oklahoma City, who is a consulting civil engineer. When recently a vigorous chapter of the American Association of Engineers was organized at Oklahoma City, the Mayor honored the association's national secretary, C. E. Drayer, of Chicago, by conferring a policeman's commission upon him. The club that no doubt goes with the commission can be used to remind "Monads," of the Oklahoma chapter at least, of their duties as citizens, whenever the occasion arises.

Educational Advantages

"Speakin' o' this 'ere simplified spellin' an' pronunciation, m'son," said Cap'n Dick, "reminds me o' the time w'en Jan Tregillis made h'up 'is min' to get educated. Jan, 'e'd never putten much stock on learnin', an' w'ile 'e naved all bout minin' an' such 'e figgered as 'ow 'e h'ought to h'improve long lines o' readin' an' writin'. So 'e starts h'out gawin' to night school. Cordin' to 'im, 'e wuz doin' fine, an' mighty proudd wuz 'e of 'is 'eadway. One day 'e got 'old of Billy Penglase, an' sez 'e to 'im, 'Ere, Billy, this 'ere readin' is simple nuff. Naow 'ere's sumthin' in this paper that's plain as can be, an' yet I'll bet there be them chaps 'o can't make un h'out no 'ow. C-A-T. Now I naws that spells cat, an' E spells 'e, 'e cat. An' 'ere's G-O-R-Y, gory. W'y that's simple nuff; that there word spells bloody tomcat."

D. E. A. C.

Froth

The proposed San Bernardo mill, in San Miguel County, Col., is to be a 100-ton flotation plant, with ball mills for grinders and oil as an ore dressing, according to a local paper. A slip of the tongue, perhaps, in speaking thus of the oil used in flotation. But flotation, after all, must be a puzzling thing to the layman, and laxities of speech may be pardoned. Mother Shipman really foretold the art when she prophesied that "iron would on water float." There is a bare chance that the old lady knew more about it than she let on, and if the Minerals Separation people will hunt up the records they may be able to acquire what few remaining rights they do not already possess—with the aid of the courts, of course.

But to get back to our puzzled layman, who has always considered oil the great soother for troubled waters. How confused must he be on finding oil used in flotation with the opposite result! Here too, the law of gravitation is suspended and Sir Isaac Newton seems a faker. And about it all is a fascination that attracts layman, metallurgist, and lawyer alike.

Astrology in the Oil Fields

"Doing business by mail assures you Uncle Sam's protection," advertises the Astro Oil Association, of Fort Worth, Tex. Sometimes it also brings the Post Office inspectors down upon you, the association would do well to note. At any rate, oil geologists must get

together, unionize, or do something to keep astrologers from breaking into the game and grabbing all the profits. "The ancient wise men were astrologers," runs the association's advertisement; "kings followed their counsel and successful men do so today. Professor Richard S. Bacon, famous astrologer, fully demonstrated to us his ability to locate oil pools. Our geologist has found a structure, surrounded by proven fields, and Professor Bacon says it contains oil in paying quantity. They may both be wrong, but we are betting our money they are right." The public is invited to subscribe at only \$1 per share.

A Silverless Islet

Silver Islet is all right except for the silver, in the opinion of Horace V. Winchell, who takes exception to a "romantic and highly colored article" about this property on the shore of Lake Superior, which was recently published in the *Minneapolis Journal*. The impression conveyed, according to Mr. Winchell, is "one calculated to induce optimistic individuals to spend money fruitlessly in further exploration of this property." In a letter to the *Minneapolis paper*, Mr. Winchell describes the property briefly as follows:

The Silver Islet mine was discovered by John Morgan, one of the party of surveyors who were working under the direction of Thomas Macfarlane, a well-known geologist who had been engaged by the Montreal Mining Co. to survey and prospect that company's Lake Superior properties in 1868.

The country rock at Silver Islet and upon the adjacent mainland consists of a series of dark slates and other sedimentary rocks of Animikie series. These slates are cut by sills and dikes of basalt, a massive eruptive rock which rests in steep bluffs and escarpments around the shores and islands of Thunder Bay. The rich silver ore was found only in the basalt and in the black slate immediately adjacent thereto. It occurs in a fissure vein from 8 to 10 ft. in average thickness with occasional enlargements to 20 or 30 ft. This vein extends downward to the underlying quartzites and probably into the still deeper-lying granite. In these formations the vein is distinctly impoverished and does not carry enough value to pay for working.

I do not conceive it to be the province or duty of the newspapers to protect the careless individual from unwise speculative ventures, but, on the other hand, I question the policy which leads them occasionally to publish statements which are not only erroneous, but which may easily aid the unscrupulous promoter in parting the sucker from his wealth. The business of mining is attended with sufficient hazard, even when carried on with good judgment and understanding of all the facts which may be known, and it should not be cumbered with the additional encouragement and romance aroused in the mind of the inexperienced reader by such inaccurate statements as those above referred to.

It is the opinion of those best qualified to judge, and in possession of all the facts with reference to Silver Islet, that *the silver is not there*; that the property has been thoroughly prospected and mined, and that further attempts to operate this property have little chance of success. The mine was not extraordinary in its ore nor in the production. The dividends paid from it were probably not large, and many other properties in the United States and Canada have exceeded many times its value and production.

The article in question appeared in the Sunday magazine section of the paper named, on June 22.

Advices to Washington are that blast furnaces are being blown in in the Liège district, Belgium. Among those started are the furnaces of the Cockerill Company, at Seraing.

NEW PUBLICATIONS

International Mining Law. By Theo. F. Van Wagenen. Cloth, 5 x 7½; pp. 342. McGraw-Hill Book Co., New York, 1918.

This work on the mining laws of the world contains a mass of interesting and important information, and the reader may get an excellent idea of their characteristics and varying features. The name is a misnomer. There is no code of "International Mining Law," strictly speaking, each country having its own individual laws. The work might better have been entitled "Mining Laws: a Comparative and Historical Treatment." The author gathered this material with the idea of informing himself as to the need of revision of the Federal mining law in force in the Western part of the United States. As a result of his research, which is presented in this work, he came to the conclusion that "its fundamental principles are sound." As a whole this work is excellent, and the conclusions are justified in the main. There are some details, however, to which exception might be taken. For example, the author states that no serious effort has been made to change the American mining law for nearly fifty years. As a matter of fact, one of the most determined efforts radically to change this system was made in 1879 and 1880, when the Public Land Commission, composed of J. A. Williamson, Clarence King, A. T. Britton, Thomas Donaldson, and J. W. Powell, authorized by Congress for the purpose of reporting on all of the public land laws, made its report, which was published in 1880, and most emphatically recommended that the mining laws be radically amended.

The author also states that we have a more complete record of the ancient Spanish mining laws than has been preserved in any other part of the world. He probably had in mind the most excellent commentaries on the mining laws of Spain by Gamboa, but with the exception of this work and one or two others the literature accompanying the ancient Spanish mining law is comparatively limited. On the other hand, the ancient mining laws of the original Germanic states are embodied in a literature that is unequalled in extent and detail of treatment by any other ancient system in the world.

The author, in commenting on the pioneers who rushed to California upon the discovery of gold, also states that they "consisted mainly of American working men of *limited education* but unlimited virility and well endowed with common sense and a fundamental idea of justice." As a matter of fact, they were "educated, intelligent, civilized, and elevated men of the best classes of society" (*California Herald*, N. Y., Jan. 16, 1849). Speaking of one of the early mining conventions in which the miners made their own laws, an historian says:

"The number of talented men in this Convention was noted, although it was not unusual for such bodies in the early Fifties to be composed of men who might have sat in legislative halls with credit to themselves and all concerned"—"History of Amador County," pp. 145-146, 1881.

The author is not of the opinion that the extralateral right as developed in Germany was productive of much litigation. As a matter of fact, the extralateral right was abolished as to claims thereafter located in the various states composing Germany, beginning in the early part of the nineteenth century until 1865, when this change became universal, and the reason given for this change was that the character of the right gave rise to excessive litigation. The Germanic extralateral right, however, was much more complex and difficult of ascertainment than the corresponding right in the American mining law, and though excessive litigation has been given as a reason for the proposed repeal of the extralateral features of the American mining law, the true objection is, more properly, expensive litigation. The number of extralateral cases arising in the United States is comparatively limited when we consider

the magnitude of the industry involved, and the proportion that extralateral cases bear to cases arising under other phases of the mining law is a small percentage, being only 2 or 3 per cent of the total mining litigation.

The author is not in favor of the abolition of the apex and extralateral rights doctrine, but would modify it so that the extralateral right would attach only to the vein or deposit first discovered, limiting the rights to secondary veins by vertical boundary lines. It is difficult to see where in this change would improve the present situation, and it would certainly add materially to the amount of litigation.

In conclusion, the author feels that the American Federal mining law compares favorably with other mining-law systems of the world, and he is correct in his statement that, before attempting to repeal or modify our law as it now exists, those who advocate the change should become familiar with these other systems of mining law and their underlying principles. A woeful ignorance of results that would ensue if the law were amended as is generally suggested has been betrayed by many of those who have taken the lead in advocating a radical change in the mining law of this country.

Many well-meaning critics have recommended the outright abolition of the extralateral right and discovery features of American mining law. Those who advocate this without radically changing all our public land laws at the same time have no conception of the manner in which these laws dovetail and what a profound effect any change on the one side is going to make if those on the other side are not correspondingly profoundly modified. To wipe out the extralateral and discovery features from our law is to eliminate the major part of our mining law that exists today and to leave the field open for agricultural claimants and blackmailers, who could at once take advantage of this radical change, for it would leave the miner at their mercy.

The great difficulty with our whole system of mining law is that its framers were not prophetic enough to recognize that the only mining law which will bear the test of time is based upon a complete separation of title to mineral deposits from the title to the surface, wherever this is possible. Practically all of the mining law systems of the world have incorporated this fundamental conception. It then becomes easy to deal with agricultural and surface claimants who have no title to the underlying minerals, and who can possess only superficial deposits that cannot be dissociated from the actual surface. The extralateral feature of our mining law is practically the only attempt that has been made in our law to bring about this severance, if we except recent acts of Congress providing for the severance of the surface from underlying deposits of coal, oil, potash, and other metals and minerals. Whether it is too late at this day so profoundly to alter our mining law is a practical question that will take a Solomon to answer.

Mr. Van Wagenen's book has added materially to the information now available upon the general subject, and should be read by everyone interested in the proposed revision of our mining laws. It is also a convenient work of reference for those who have occasion to consult foreign mining laws.

WILLIAM E. COLBY.

Electric Generation and Distribution in Canada. By Leo G. Denis. Paper, 6¾ x 9¾; pp. 296, illus. Commission of Conservation, Ottawa, Canada, 1918.

Bibliography of Petroleum and Allied Substances in 1916. By E. H. Burroughs. Paper, 5¾ x 9; pp. 159. Bull. 165, U. S. Bureau of Mines, Washington, D. C.

Eighteenth Biennial Report of the Bureau of Labor Statistics of the State of California, 1917-1918. Paper, 5¾ x 9; pp. 470. John P. McLaughlin, Commissioner, 948 Market St., San Francisco, Cal.

Estado Actual y Porvenir de la Industria Minera en los Departamentos del Sur. By Carlos Basadre y G. Paper, 6¼ x 9½; pp. 64, illus. "Boletín No. 93," Cuerpo de Ingenieros de Minas del Peru, Lima, Peru, 1918.

- The Evaporation and Concentration of Waters Associated With Petroleum and Natural Gas. By R. Van A. Mills and Roger C. Wells. Paper, 6 x 9; pp. 104, illus. Bull. 693, U. S. Geological Survey, Washington, D. C.
- Fifteenth Biennial Report Issued by the Bureau of Mines of the State of Colorado for the Years 1917-1918. By Fred Carroll, Commissioner. Paper, 6 x 9; pp. 206, illus. Bureau of Mines of the State of Colorado, Denver, Col.
- Industrial Health and Efficiency. Final report of the British Health of Munition Workers' Committee. Paper, 6 x 9; pp. 374, illus. Bulletin, U. S. Bureau of Labor Statistics No. 249, U. S. Department of Labor, Washington, D. C.
- Mémoire Traitement Thermique des Obus (Application de la Méthode Taylor). By Léon Guillet. Introduction and notes by Henry Le Chatelier. Paper, 8½ x 10½; pp. 154, illus. Publication de La Revue de Metallurgie, Paris, France, January, 1916.
- Third Annual Report of the State Oil and Gas Supervisor of California, for Fiscal Year 1917-1918. By R. P. McLaughlin, State Oil and Gas Supervisor. Paper, 6 x 9; pp. 602, illus. Bull. 84, California State Mining Bureau, San Francisco, Cal.
- The Limestone Deposits of New South Wales. By J. E. Carne and L. J. Jones. Issued by direction of the Honorable J. C. L. Fitzpatrick, Minister of Mines. Card-board, 5½ x 9½; pp. 411, illus. "Mineral Resources No. 25," Geological Survey of New South Wales, Sydney, Australia, 1919.
- Trautwine—The Civil Engineer's Pocket-book. Twentieth edition, revised and enlarged. By John C. Trautwine. Leather, 4 x 6½; pp. 1,528. Trautwine Co., Philadelphia, Pa., 1919.
- This long-established standard handbook needs no review, as most engineers are familiar with its good features and its limitations.
- Manual of the Chemical Analysis of Rocks. Third Edition, Revised and Enlarged. By Henry S. Washington. Cloth, 5½ x 9; pp. 271. John Wiley & Sons, New York, 1919.
- A selection of methods for the chemical analysis of silicate rocks, especially those of igneous origin. The book is intended for the use of chemists and petrologists.
- Guía Industrial de Bilbao de 1918. Cloth, 7½ x 10½; pp. 124, illus. Sociedad General Española de Publicidad, Bilbao, Spain.
- A directory of concerns and individuals doing business in Bilbao. It includes lists of mining and metallurgical companies, manufacturers of hoisting ropes, carbide and explosives, and other materials, which will be of interest to the mining industry.
- The Energy Resources of the United States: A Field for Reconstruction. By Chester G. Gilbert and Joseph E. Pogue. Paper, 6 x 9; pp. 165, illus. Bull. 102, Vol. 1, U. S. National Museum, Washington, D. C.
- This bulletin deals largely with petroleum as an energy resource. For those interested in a broad treatment of the subject in its relation to the public interest there is much material of value in this publication.
- The Decline and Ultimate Production of Oil Wells, with Notes on the Valuation of Oil Properties. By Carl H. Beal. 6 x 9; pp. 215, illus. Bull. 177, U. S. Bureau of Mines, Washington, D. C.
- A useful bulletin which gives much needed information about the methods for estimating the future and ultimate production of oil properties and the application of these methods to oil-land valuation. Part 2 deals with the decline and ultimate production of different oil fields of the United States.
- Annual Statistical Report of the American Iron and Steel Institute for 1917. Cloth, 6 x 9½; pp. 96. American Iron and Steel Institute, 61 Broadway, New York, 1919.
- An excellent statistical summary of the production of pig iron, steel ingots and castings, rolled iron and steel, tin plates, galvanized sheets, pipes, tubes, and similar forms, iron ore, coal, and coke. It is stated that the compilation of these statistics was delayed owing to special work undertaken at the request of the War Industries Board and the War Trade Board.
- Iron and Steel, a Pocket Encyclopedia, Including Allied Industries and Sciences. By Hugh P. Tiemann, with an introduction by Henry Marion Howe. Leather, 4 x 6½; pp. 514. McGraw-Hill Book Co., New York, 1919.
- In the introduction to this little book Henry M. Howe says: "I commend the book without reserve to the whole family of steel metallurgists, be they millmen, metallo-graphists, teachers or students." The book is a combination of a dictionary, a cyclopedia and a handbook and is useful as a quick reference on iron and steel.
- Mineral Statistics. Paper, 5 x 8; pp. 31. Copies will be sent on request by *Engineering and Mining Journal*, 10th Ave. at 36th St., New York City.
- This pamphlet is a reprint of the principal statistical tables from the Annual Review Number of the *Engineering and Mining Journal* and a few from later issues. They have been reproduced in this form for ready reference, but, in some cases, the record has been completed, which could not be done at the date of original publication, and in other instances the figures have been corrected in the light of later information.
- The U. S. Geological Survey: Its History, Activities, and Organization. Institute for Government Research, Service Monographs of the U. S. Government, No. 1. Cloth, 5½ x 8½; pp. 163, illus. D. Appleton & Co., New York, 1918.
- The first of a series of monographs giving the history, development of service, functions, organization, plant, laws and regulations governing, appropriations, expenditures and other data of important governmental divisions. This particular volume gives in condensed form, suitable for convenient reference, full information about the U. S. Geological Survey.
- The Design of Walls, Bins and Grain Elevators. By Milo S. Ketchum. Third Edition, Revised and Enlarged. Cloth, 6 x 8½; pp. 556, illus. McGraw-Hill Book Co., New York, 1919.
- A well-known book which has already reached its third edition. This issue contains new material on economic design of reinforced-concrete retaining walls; formulas for wedge-shaped reinforced-concrete beams; formulas for calculating the unit pressures on bin walls; the report on the design of retaining walls, adopted by the American Railway Engineering Association in March, 1917, as well as other minor additions.
- Report of a Joint Committee Appointed from the Bureau of Mines and the United States Geological Survey by the Secretary of the Interior To Study the Gold Situation. 5½ x 9; pp. 84, illus. Bull. 144, U. S. Bureau of Mines, Washington, D. C.
- The findings of a committee appointed in July, 1918, by Secretary Lane to investigate the gold-mining situation in the United States. The committee consisted of Hennen Jennings, chairman; J. H. Mackenzie and Charles Janin, of the Bureau of Mines, and H. D. McCaskey and F. L. Ransome, of the U. S. Geological Survey. The bulletin will be useful to students of economics and to mining engineers.
- The Weight Per Unit of Brake Horsepower of a three-cylinder vertical Diesel oil engine, as given in a catalog for several sizes, is shown in the following table:
- | Net Brake, Hp. | Weight Range Lb. per Brake, Hp. | Net Brake, Hp. | Weight Range Lb. per Brake, Hp. |
|----------------|---------------------------------|----------------|---------------------------------|
| 150 | 446 to 533 | 400 | 390 to 525 |
| 200 | 420 to 510 | 500 | 405 to 464 |
| 300 | 400 to 530 | 600 | 386 to 500 |
- The weights are approximate only, and the larger weight includes a heavier flywheel than the smaller.

PERSONALS

AMOR F. KEENE, of the Gold Fields American Development Co., Ltd., who was formerly associated with H. C. Hoover's and other London mining and exploration companies, has been elected a director of Johnson, Matthey & Co., Inc., recently formed to take over the business in the United States of Johnson, Matthey & Co., Ltd., of London, England, dealers in platinum and precious metals, assayers and refiners for the Bank of England, bullion merchants, metallurgists, analysts, and manufacturing chemists. Mr. Keene has also been elected a director of the South American Gold and Platinum Co. and of the American Trona Corporation.

F. F. Sharpless has moved his office from 17 Madison Ave. to 115 Broadway, New York.

John E. Penberthy, mining engineer, of Gleeson, Ariz., has returned home from a trip of examinations.

W. E. Bennet returned to New York during June after several months' trip to the properties of the Chile Exploration Co.

Thomas O. McGrath, auditor, Shattuck-Arizona Copper Co., is with his family for a month's vacation at Southern California coast points.

W. W. Thayer, secretary of California State Mining Bureau, has again taken up his duties after a three months' absence due to influenza-pneumonia.

W. V. De Camp has recently left New York to accept a position as field engineer for the Western Metallurgical Co., with headquarters at Humboldt, Ariz.

W. E. Cockfield, of the Canadian Geological Survey, and party are making an examination of the country along the Ogilvie Range, in Yukon Territory.

Lieutenant Frank G. Berton, of the Canadian Engineers, who previous to his enlistment was gold recorder at Dawson, Yukon Territory, has returned from overseas.

Harry J. Wolf has resigned as professor of mining in the Colorado School of Mines and has accepted a position on the editorial staff of the *Engineering and Mining Journal*.

Major Charles S. Haley, 521st Engineers, is expected to return from France about Aug. 1 and plans immediately to reopen offices as consulting mining engineer.

C. Carleton Semple has returned to Lima from an examination of silver-lead and coal properties near Parquin, and is now examining copper properties near Huancaya, Peru.

Fletcher Hamilton, California State Mineralogist, has returned to San Francisco from Sacramento, where he had been sitting on the Board of Equalization and Readjustment of Oil Correction and Review.

Edward H. Robie, formerly assistant metallurgist with the International Nickel Co., of Canada, Ltd., at Copper Cliff, Ontario, has accepted a position on the editorial staff of the *Engineering and Mining Journal*.

A. M. McQueen, of Toronto, vice-president of the Imperial Oil Co., is in Edmonton, Alberta, in connection with the extensive program of exploration now being carried on by the company in Northern Alberta.

James J. Warren, of Toronto, who has been managing director of the Consolidated Mining & Smelting Co. of Canada since 1915, has been elected president, succeeding the late W. D. Matthews. He will continue to act as managing director.

Ralph Arnold, having completed his Government service, announces the resumption of his practice as consulting

Captain Hallet R. Robbins, Military Intelligence Division, U. S. A., formerly metallurgical engineer for the Granby Consolidated Mining, Smelting & Power Co., Ltd., has been recalled from Peking, China, where he was on duty as assistant to the American Military Attaché, for discharge from the military service.

Harold A. Linke has just returned from the coast, where he was engaged with the U. S. Housing Corporation of the Department of Labor on construction of "Vallejo Project 581," a town for civilian employees of Mare Island Navy Yard. Mr. Linke has resumed his professional practice, with office at 416 Boston Building, Salt Lake City, Utah.

G. L. Schmutz has reopened his office in Douglas, Ariz., and will conduct a general engineering business under the firm name of Schmutz & Rugen. Mr. Schmutz was efficiency engineer of the Pilares Mine of the Phelps Dodge Corporation, near Naco, Sonora, Mexico. O. N. Rugen is now serving as first lieutenant in the 301st Engineers in Germany, and expects to return soon.

Charles W. Badgley, has recently been appointed superintendent of the El Paso Smelting Works, succeeding **James Heggie**, who accepted the position of superintendent of the Verde Extension Copper Co., of Jerome, Ariz. **Paul Stein**, formerly of El Paso, but more recently of Hayden, Ariz., has been made assistant to Mr. Badgley. Mr. Stein until lately was assistant superintendent of the Hayden smelter.

Howard I. Young, for several years manager of mines for the American Zinc, Lead & Smelting Co., for the Joplin-Miami district, has been transferred to the company's properties at Mascot, Tenn., succeeding **J. N. Houser**, who has been promoted to a position with the company at New York. Mr. Young will move from his home at Carthage, Mo., to Mascot, but will retain the management of the Joplin district operations.

AMOR F. KEENE

petroleum geologist and engineer, with offices at Union Oil Building, Los Angeles, Cal., and 120 Broadway, New York. Cable, Ralfarfoil.

Lewis A. Parsons has resigned his position as engineer of mines with the International Nickel Co., Copper Cliff, Ontario, to accept the associate editorship of the *Mining and Scientific Press*, San Francisco. **Allan F. Brock** succeeds Mr. Parsons at Copper Cliff.

Roy E. Collom, petroleum technologist, resigned from the staff of the *California Oil and Gas Supervisor*, July 1. Mr. Collom immediately entered upon similar duties with the U. S. Bureau of Mines, his present headquarters being at the Customs House, San Francisco.

Captain W. H. Wright has received an honorable discharge from the Army and will resume his former connections with the Malm-Wolf Company. Captain Wright will be engaged in the examination of mining properties in Alaska during the next two or three months.

OBITUARY

Samuel T. Wellman, of Cleveland, Ohio, prominent in the iron industry on the Great Lakes, died suddenly of heart disease at Stratton, Me., on July 11.

Oskar Simmersbach died in Berlin, Germany, on Dec. 14, 1918, at the age of forty-seven years. He entered the Technische Hochschule at Aachen in 1891 and later went to the Mining Academy at Berlin, where he was engaged in the study of iron and steel metallurgy. He followed blast-furnace work at the Mathilden Hütte in Harzburg and the Ponnernmarch Hütte, in Upper Silesia, after the completion of his education. Mr. Simmersbach became professor of metallurgy in 1909 in the Technische Hochschule at Breslau.

During his later years Professor Simmersbach was the author of many articles on iron and steel metallurgy published in *Stahl und Eisen*. His book "Foundation of Coke Chemistry" was published in 1895 and translated into French and English.

MINING SCHOOLS

Carnegie Institute of Technology announces the organization of a co-operative department of mining engineering. A four-year course is open to boys with a high-school education, and a two-year course, planned for the man in the mines, is open to those who have had a common-school education and two years of experience in or about mines, or in their management. The latter course will include the fundamental and elementary subjects and practical application in field work.

INDUSTRIAL NEWS

Portable Machinery Co., Inc., Pas-saic, N. J., has issued a circular stating that the patents of the company for the manufacture of a scoop conveyor have been infringed by a competitor.

The American Brass Co. has issued a loose leaf folder on schedules for base prices and extras for seamless tubes manufactured of brass; commercial, Tobin and phosphor bronze, and copper. Also a folder on brass, bronze, and nickel-silver sheets, wire-rods, and brazed tubes.

National Bank of Commerce, New York, has issued a statement on the "Trend of Brazil Trade," showing the increase of United States exports to that country, from \$51,000,000 in 1913 to \$89,000,000 in 1918. British shipments decreased from \$80,000,000 in 1913 to \$50,000,000 in 1918.

Edison Storage Battery Co. announces the removal of its district office in Pittsburgh, Pa., to Room 431 Union Arcade Building. The change has been made necessary by the tremendous increase in the volume of business handled through this office. The new location provides better facilities and has larger office space.

The Midwest Engine Co., Indianapolis, Ind., announces the appointment of B. H. Downing as eastern sales manager, with offices at 111 Broadway, New York, where he will have direct supervision over all sales in the Eastern and Atlantic Coast states on Diesel and oil engines, steam turbines, and centrifugal and reciprocating pumps.

War Department, office of ordnance district chief, offers for sale a quantity of building brick, now in storage at the Manchester plant, Laclede Gas Light Co., St. Louis, Mo. The following are

the approximate lots: Hard red facing brick, 160,000 and 130,000; salmon-colored soft, 92,000. Quotations are requested on material f.o.b. Manchester plant.

A. J. Meier & Co., industrial engineers, Boatmen's Bank Building, St. Louis, Mo., issues a summary of the reports and data on the manufacture of lithopone, which includes the process and properties of the Collinsville Zinc Corporation. A discussion of the mining properties situated near Moselle, Mo., with estimation of available ore suitable for lithopone manufacture, is appended.

The Cutler-Hammer Mfg. Co., of Milwaukee, recently opened an office in Detroit, situated at 905 Kresge Building, to expedite the handling of orders and to give the company's customers in and about Detroit better engineering service. This office is a branch of the Chicago office. H. S. Kinsley, who is in charge at Detroit, has with him C. W. Greenman and M. Dugliss, both of whom were recently mustered out of service.

Chicago Pneumatic Tool Company announces the appointment of L. C. Sprague, formerly district manager of sales at New York, as manager of Western railroad sales, with headquarters at Fisher Building, Chicago, and H. G. Barbee as manager of Eastern railroad sales with headquarters at 52 Vanderbilt Ave., New York City. Nelson B. Gatch, formerly at Chicago, has been appointed district manager of sales at New York, succeeding Mr. Sprague. Announcement of Mr. Gatch's successor at Chicago will be made later.

Mark R. Lamb, who has recently returned from a four months' commercial trip through Europe, has just completed the purchase of a controlling interest in the New York Steel Exchange, Inc., with which will be combined his own export business. Mr. Lamb's foreign connections were largely in South America, until his recent opening of a branch office in Paris. This office will be in the Eclair Building as soon as that new office structure (the only one in Paris) is ready for occupancy. Mr. Lamb has taken the management of the enlarged company.

TRADE CATALOGS

Carbo-Hydrogen Apparatus. The Carbo-Hydrogen Co. of America, Benedum Trees Building, Pittsburgh, Pa. Catalog; 61 x 9; 27 pp.; illustrated. Describes the use of carbo-hydrogen apparatus for cutting steel and wrought iron.

Stationary and Portable Air Compressor Equipments. Allis-Chalmers Manufacturing Co. Bulletin 1,105; 8 x 10½; 8 pp.; illustrated. Descriptive of electrically driven air compressors built in two capacities—100 cu.ft. and 150 cu.ft. piston displacement.

Jeffrey Standard Apron Conveyors. Jeffrey Manufacturing Co., Columbus, Ohio. Catalog 258; 8½ x 11; 74 pp.; illustrated. A general discussion is given in the first pages on the subject of handling material mechanically with standardized units. Twenty-one pages of tabled specifications are included on standard steel and wood apron conveyors, which should prove generally valuable to engineers. The many excellent illustrations showing adaptations of these machines to a wide range of materials and conditions convey considerable information.

NEW PATENTS

U. S. patent specifications may be obtained from the *Engineering and Mining Journal* at 25c each.

Aluminum and Uranium Alloy. Louis Fenn Vogt, Washington, Pa., assignor to Standard Chemical Co., Washington, Pa. (U. S. No. 1,304,224; May 20, 1919.)

Briquetting Apparatus and Process. Fred Allen Jordan, Sellwood, Ontario, Canada, assignor to Moose Mountain, Ltd., Sellwood, Ontario, Canada. (U. S. Nos. 1,304,185 and 1,304,186; May 20, 1919.)

Cable Splice. Newton K. Bowman, Canton, Ohio, assignor to the American Mine Door Co. (U. S. No. 1,304,534; May 27, 1919.)

Concentrates—Process of Treating Concentrates. Walter G. Swart, Duluth, Minn., and Bethune G. Klugh, Aniston, Ala. (U. S. No. 1,303,411; May 13, 1919.)

Converter—Automatic Tuyere Cleaner for Metallurgical Converters. Charles J. Arch, Douglas, Ariz. (U. S. No. 1,303,755; May 13, 1919.)

Drill-Steel-Pinning Device. Jesse Dittson, Littleton, Col., assignor to the J. Geo. Leyner Engineering Works Co., Littleton, Col. (U. S. No. 1,306,106; June 10, 1919.)

Electric Furnace. Ivan Rennerfelt, Djursholm, Sweden. (U. S. No. 1,305,167; May 27, 1919.)

Flotation of Minerals. Clement Linwood Perkins, Pittsburgh, Pa., assignor to Metals Recovery Co., New York, N. Y. (U. S. No. 1,302,966; May 6, 1919.)

Thorium—Recovery of Thorium. Lonnie W. Ryan, Chicago, Ill., assignor to Lindsay Light Co., Chicago, Ill. (U. S. No. 1,307,153; June 17, 1919.)

Thorium—Treatment of Thorium Fluoride. Lonnie W. Ryan, Chicago, Ill., assignor to Lindsay Light Company, Chicago, Ill. (U. S. No. 1,307,152; June 17, 1919.)

Zinc—Method of Handling Anodes in Electrolytic Baths. Heber M. Stuart, Baltimore, Md., assignor to Electrolytic Zinc Co., Inc., New York, N. Y. (U. S. No. 1,299,519; Apr. 8, 1919.)

Smoke—Metallurgical Smoke Filter. William H. Bates, Jr., Boston, Mass. (U. S. No. 1,302,281; Apr. 29, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief
of Interest to Engineers
and Operators

SAN FRANCISCO, CAL.—July 10

The War-Minerals Relief Commission reached San Francisco July 5. Hearings for chrome, manganese, tungsten, and pyrite producers are being held daily in the Post Office Building. At present 83 claims for reimbursement are listed, but this number will probably be considerably increased, and the commission expects to remain here for at least three weeks.

The Big Hill Mining Co., a California corporation, is preparing for extensive development of three of the important properties in the Cove mining district, in Southern California. The active operation to follow development and installation of modern machinery will lead to a revival of productive mining in the district, which is among the oldest deep mining districts in California. The properties optioned by the Big Hill company are the Lady Belle, Bull Run, and Jeff Davis, all of which were producers more than thirty years ago, and one of which, the Jeff Davis, as far back as the middle 60's. The production of the district in the thirty years of active life up to 1893 totaled several million dollars from a depth not greater than 400 ft.

The Cove district is in Kern County, forty-two miles by wagon road north of Caliente, at an average elevation of 3,000 ft. The formation is granite and slate, the granite predominating. Nine ledges or

tricts spread to other parts of the state, the prospect of a large increase in gold production in the south as well as in the north is thought to be favorable.

Directors of Twenty-One Mining Co. have been vindicated by the final decision of the Superior Court of California. Judge Thomas F. Graham signed the judgment in their favor, reversing a former finding in favor of the plaintiff, Flinn. At the first hearing the latter testified he had paid \$25,000 for an option on property, purchase price to be \$250,000, and charged that F. M. Phelps had salted the samples, upon the discovery of which he demanded his money back. Judge Graham ruled that Flinn was entitled to recover. The defendants were granted permission to work the mine by the Federal District Court and uncovered a vein from which \$200,000 in gold was taken. Upon this showing was based the second decision. The \$25,000 paid for the option remains with the defendants. The defendant has a right, it is stated, to complete the purchase, but without title to the \$200,000 already removed.

SPOKANE, WASH.—July 11

Idaho Mine Owners' Association has joined the recently organized Silver Producers' Association. Ravenel Macbeth, secretary of the Idaho association, said in Spokane recently that it was his belief that the new organization will be able to keep the con-

of them going to Butte. All other operators in the district have followed the lead of those at Mullan.

BOISE, IDAHO—July 10

The Gold Hill & Iowa Mine, at Quartzburg, Idaho, forty miles northeast of Boise, controlled by the Boston & Idaho Dredging Co. interests, is working 100 men. Recent development has demonstrated the virtue of careful geologic study of the deposits, which has resulted in finding virgin orebodies of better grade than formerly. The milling capacity has been increased from 50 to 100 tons per day. A cyanide plant is now being installed to treat the concentrates by a process worked out by F. C. Brown, a local cyanide engineer. A good recovery is expected on \$50 to \$100 concentrates, about five tons of which is being produced per day. At present this is being shipped to the Salt Lake smelters at a high freight and treatment charge. This is the oldest gold-lode mine in Idaho, and has been successfully operated for the last fifty-four years, with a total output of between three and four million dollars and a maximum depth of 550 ft.

The I. X. L. group of copper claims, in Washington County, taken over last autumn by local wool growers, has since been under development and now has an 800-ft. crosscut tunnel penetrating a flat-dipping zone of quartz monzonite with primary chalcocite, the sulphides com-

COVE MINING DISTRICT, KERN COUNTY, CALIFORNIA, LOOKING NORTH WEST FROM RED HILL. 1, CONTENT; 2, PEARSON'S GULCH; 3, SUMNER GULCH; 4, LADY BELLE; 5, SHART; 6, LODGE; 7, RED HILL

lodes can be traced by bold croppings. The main lode is the Sumner, having a general width of 150 ft., and produces large tonnage of milling ore. The Bull Run, Jeff Davis, and Lady Belle veins have a length of 300 to 800 ft. and are 12 to 20 ft. wide, carrying high-grade ore from \$35 to \$100 per ton. These mines are situated about one-half mile north of Kernville, which is about forty miles in direct line northeast of Bakersfield. The district is well supplied with water from Kern River. The Southern California-Edison Co. diverts water from this stream at Kernville for generation of electricity. The Big Hill Mining Co. has water rights capable of providing ample hydro-electric power for mining and milling. The present equipment consists of hoists, Cameron pumps, an assay office, and other surface buildings, which will be supplemented by additional modern equipment as development and operation may demand. The district has been comparatively quiet for several years, but the owners of the various mines are only awaiting the final undertaking of a corporation provided with the means to mine on a commercially profitable scale. There is no question as to orebodies. It is merely a matter of adopting modern methods in mining and ore treatment. There has been a recent revival of gold mining all through the state in the last few months. Unless the strikes for increased pay of miners in the Nevada County dis-

trict of the price of silver in New York instead of in London. He said, "The prevailing belief that the price of silver will remain up has resulted in a great impetus to silver mining, and there is a revival in the early-day silver camps of southern Idaho, with many inquiries for properties."

Prospectors are expected to take advantage of the new Indian appropriation act and get on to the Indian reservations of Washington, especially the Colville and Spokane reservations, where there are known gold, silver, copper, tungsten, and other mineral resources.

WALLACE, IDAHO—July 10

The Five-Day Strike as a protest against the trial and conviction of Mooney did not materialize in the Coeur d'Alene district except at Mullan, where a number of I. W. W.'s were employed at the Morning, Hunter, and National mines. The strike was limited to members of that organization, which is chiefly made up of Finns, with a few professional agitators. The total number who went out was probably not more than 200, and a notice signed jointly by the operating companies was promptly posted to the effect that all employees who failed to report for work on July 7 would receive their time. The managers have gone further and announced that no member of the I. W. W. will be employed. As a result of this, most has been an exodus of the I. W. W., most

ing practically to the surface with no important zone of oxidation. The last 400 ft. of the zone passed through by this company's crew, as reported by conservative samplers, gives an average value of 12 per cent copper, with 50c. gold and silver per ton. The prevailing sulphide is soft high-grade chalcocite, with chalcocite facings. As the zone is penetrated the mineral formerly segregated on cleavage lines becomes more disseminated in the grain of the rock and mixed with magnetite and marcasite. The conditions suggested magmatic diffusion, and segregation of primary copper sulphide, and at the present stage of the development indicate a new type of porphyry copper deposit of some magnitude, there being two distinct zones of mineralization on the property, 500 and 800 ft. wide, respectively, and a mile long.

SALT LAKE CITY, UTAH—July 11

Mineral Locations totaling 2,373 were made in Utah in 1918, according to the report of the Surveyor General for the state. Since the first of the year there have been 482 applications for mineral survey. Utah's Production of Primary Copper in 1918 was 230,564,908 lb., compared with 227,840,447 lb. in 1917, making it fourth in the list of copper-producing states, as it was in 1917. Preliminary figures to this effect have just been issued by the U. S. Geological Survey.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ARIZONA

Cochise County

CALUMET & ARIZONA (Bisbee)—Production of copper in June was 4,872,000 lb., of which 4,142,000 was available for company.

DRAGON MOUNTAIN (Johnson)—To build concentrator.

KEYSTONE COPPER (Johnson)—Planning 100-ton flotation mill. Property developed to 635 ft. depth. Ore mainly sulphide, with some oxide on sixth level. H. W. Miller president and manager.

Gila County

SUPERIOR & BOSTON (Globe)—Assessment of \$1 per share, payable Aug. 8, stock of record, July 19. Property examined by C. W. Eotstford, who recommends diamond drilling from lower levels in search of Old Dominion vein in schists where commercial primary ore is hoped for. Crosscutting to south on 300 level to cut veins in that section, and drifting east on 1200 level to locate intersection of Old Dominion and Great Eastern veins beyond Quo Vadis fault line, started on 300 level bulkheaded off by Old Dominion helmet men.

INSPIRATION (Inspiration)—Copper production in June, 6,300,000 lb.; May, 6,200,000; June, 1918, 10,300,000 lb.

Greenlee County

ARIZONA COPPER (Clifton)—Copper production for June was 2,400,000 lb.

Mojave County

UNITED EASTERN (Oatman)—Main shaft below 1,500 ft., to be sunk to 1,600, reaching greatest depth of district. Ore-body crosscut on 1,400, with same values as on 665 level.

Maricopa County

RED ROVER (Phoenix)—Electric equipment installed and large concentrator planned to handle copper and silver ores developed on three levels. Development to be extended from 500 to 1,000 level. Property, 8½ miles northeast of Phoenix, owned mainly by F. A. Gillespie, of Tulsa, Okla., with B. A. Gillespie manager.

Pima County

NEW CORNELIA (Ajo)—All machinery on hand for new test of flotation mill to be in operation at early date. Ore in leaching beds now given additional washing, five in all, with material increase in copper saving. Two large towers added for reduction of ferric iron by sulphurous acid gas, doubling capacity in this respect. Plans being made for washing of tailings dumps of 3,000,000 tons, with expectation of precipitating 1,000,000 lb. of copper. Production of copper in June was 3,440,000 lb., of which 2,708,000 lb. was shipped; 2,500,000 smelting ore, and 482,000 cement copper.

Pinal County

RAY CONSOLIDATED (Ray)—Copper production in June was 3,890,000 lb.; May, 3,975,000.

SILVER KING OF ARIZONA (Superior)—New three-compartment shaft being sunk at rate of about 3 ft. per day. Will go to 1,000 ft. and at 600 level will crosscut to orebody to prospect ground below 400 level, which has been under water for many years. Mill, 25-ton capacity making high-grade concentrate from 40-oz. silver ore coming from old shaft. Flotation giving 95 per cent recovery. New head-frame shown in accompanying cut.

Yavapai County

GRAND ISLAND (Jerome)—Diamond drilling resumed. First drill working from main shaft on 500 level. Hole expected to cut vein outcropping on company's Arizona Girl claim. Will drill two other holes on same level north of main shaft toward adjoining Shea property.

Yuma County

SWANSEA CONSOLIDATED (Swansea)—Thirty miners working on development. Flotation mill of 250 tons' capacity installed.

CALIFORNIA

Calaveras County

MORGAN MINE (Carson Hill)—Rich ore going to mill from 200, 300, 500, and 675 levels. Monthly average approximates \$60,000. Being operated by Carson Hill Gold Mining Co., which is also developing group of claims on south side of Carson Hill.

Inyo County

BELMONT (Keeler)—Owned by W. L. Hunter, has been leased to syndicate headed by General Strong, late Commandant at Camp Kearny, and General Breckenridge, who are now equipping property for extensive working.

Kern County

SILVER DISCOVERY near Randsburg reported to show excellent mineral values. Two carloads shipped to Selby smeltery, first averaging \$45 per ton. Property near railroad and paved highway.

Nevada County

WILLIAMSON BROS. and C. Cole, of Washington, Cal., hauling 40 per cent chrome ore to Nevada City for shipment east. Grade said to yield owners fair profit.

NEW HEAD FRAME AT SILVER KING OF ARIZONA PROPERTY, SUPERIOR, ARIZ.

P. BOKAY developing Bokay Bonanza and Monte Carlo claims. G. G. Gates, of Oakland, Cal., examining Excelsior and Bokay holdings.

IDAHO-MARYLAND (Grass Valley)—Machinery being overhauled preparatory to unwatering and exploring lower levels. Will work south Idaho adjoining.

SULTANA (Grass Valley)—Not to be closed on account of partial flooding during recent strike. Water being lowered rapidly.

UNION HILL (Grass Valley)—Will be closed and plant dismantled. Mine damaged by flooding. Future operations will be through new shaft. Property part of Idaho-Maryland group.

MOUNTAINEER MINES CON. (Nevada City)—Ray C. Rossen, commissioner appointed by Superior Court of Nevada County, authorizes sale on Aug. 12 of all holdings of company to satisfy judgment for over \$151,000 obtained by Peter Bender, of Santa Clara County, on July 2. Property west of Nevada City and includes about 30 lots and patented quartz claims.

MURCHIE (Nevada City)—Clear title obtained by R. E. Steele, owner, when bid in for delinquent taxes.

Idaho County

ENGELS COPPER (Engels)—Examination recently completed by engineers for D. C. Jackling.

Shasta County

UNITED STATES (Kennett)—Mammoth smeltery produced no copper in June, owing to mine and smeltery being closed during month. Plant still down.

Sierra County

TABLE ROCK (Sierra City)—Has broken into gravel at end of 3,000-ft. tunnel. Gold coarse and heavy. Runs \$85 per five feet of drift.

COLORADO

Boulder County

SMUGGLER M. & M. (Jamestown)—Another carload of gold ore shipped, coming from oreshoot on new vein parallel to Struggler vein. Driving crosscut from 200 level west to cut new vein showing on surface.

Gilpin County

GREGORY BULL stamp mill in Central City leased for three years to Fuller MacCulloch, operating Becky Sharp and other properties in Russell district.

CORNUPEDIA (Apex)—Extensive development and milling program awaits report of George E. Collins, of Denver.

SACO DE ORO (Apex)—Air compressor, drill sharpener, and other equipment recently shipped to property.

Montrose County

RADIUM ORE SAMPLING (Montrose)—O. Barlow, Willmarth, manager, paid \$1 per lb. for 75 lb. high-grade carnotite ore in Telluride recently.

Sau Mignel County

TELLURIDE ORE SHIPMENTS for June totaled 109 cars. Tomboy shipped 60 cars to Durango; Smuggler, 25 cars to Durango and 20 to Pueblo; John G. Wagner, 2 cars of concentrates from the Cimarron; and Liberty Bell, 2 cars of concentrates.

VALLEY VIEW LEASING & MINING (Ames)—Company which took over San Bernardo mine last year plans to equip 100-ton flotation plant at once, to be designed by Walter L. Reid, mill superintendent of Smuggler Union company. Mill will be erected on Matterhorn side of railway at Yellow Mountain. Small force engaged for year retimbering and widening tunnels, tracks and chutes. Considerable good ore blocked out. Will ship ore recently cut in tunnel on 4th level to Durango smeltery. Company also owns property on Yellow Mountain adjoining Silver Bell and Caribou mines, on which several veins of milling ore have been cut. Will start new tunnel on San Bernardo 200 ft. below lowest workings to cut vein in good ore. Otto Beselack, of Ames, Col., president and manager.

Summit County

BEMROSE-BOSTWICK (Breckenridge)—Placer in Hoosier Gulch operated under lease with good results. Pay gravel over-lein with black muck that must be worked off before giants can work effectively.

CARBONATE (Breckenridge)—Several carloads of sorted lead carbonate ore ready for shipment. Property under lease and option to Samuel Klous and others, of Boston.

POWDER RIVER GOLD (Breckenridge)—Handling 4,000 cuyd. daily of Blue River's placer deposit on B. & L. placer. Deposit 48-55 ft. deep. Gold becoming coarser upstream.

Teller County

REVA GOLD (Cripple Creek)—Company, operating Rose Nicol mine, has cut five-foot orebody on main Rose Nicol vein on 8th level, connected with 1,000 level of No. 2 shaft of Portland Gold Mining Co.

STRATTON ESTATE (Cripple Creek)—F. M. Kurie, operating through Star of Bethlehem shaft, is mining good ore from blocks leased on Shurtloff, one carload bringing settlement of \$61 per ton.

IDAHO

Shoshone County

MARSH (Burke)—Statement just issued shows tangible assets \$18,153. Company has few men employed doing surface exploratory work, which will be followed by development from main tunnel. Shaft abandoned for present, and no further work to be done in it until orebody has been opened above.

SHERMAN (Burke)—Final payment of bond on old Union group made this week. Total amount of bond \$150,000. Originally held by Sherman Development Co. Control sold to Days, one of the terms being payment of balance due under bond. New company organized called Sherman Lead Ore developed in two tunnels, and another tunnel being driven 600 ft. deeper. Considerable ore encountered, but main shoot not yet reached. Ore, lead-silver and zinc.

BUNKER HILL & SULLIVAN (Kellos)—Only one furnace at smeltery running last few months, but announced that second will soon start. Plant has four furnaces.

SUNSHINE (Wallace)—Absorption of Sunset Banner group of claims by Sunshine Mining Co. completed this week, when stockholders of Sunset company received stock for original holdings on basis of one share of Sunshine for four shares of Sunset Banner. Properties adjoin on Beaver Creek. Sunshine will soon start crosscut to explore ground at depth.

KANSAS

Joplin-Miami District

EMPIRE DEVELOPMENT (Miami, Okla.)—Completing jig plant at mine near Hockerville. Crusher and rolls to be operated by electricity.

MICHIGAN

Copper District

CALUMET & HECLA (Calumet)—Copper production in June was 5,439,761 lb. Anheuser produced 700,000 lb.; Allouez, 138,340; C. & H., 3,221,220; Centennial, 87,900; Isle Royale, 655,400; La Salle, nil; Osceola, 603,550; and Superior, 33,100. Calumet & Hecla and Allouez production announced wage increase of 15% on July 15.

VICTORIA (Victoria)—Stamped 6,425 tons in June, recovering 137,077 lb. copper, including mass. Pounds ingot per ton of rock estimated at 14.4. Has not shipped any copper to smeltery since February.

Gorebie Range

DAVIS (Ironwood)—Repairs to shaft, which was burned out four months ago, completed down to 16th level, below which little damage was done. Fire stopped all pumping, and water has risen about 500 ft. in shaft. After this fire removed new and larger pumps with hoist being kept on 24th level to handle large flow of water which may be encountered as development work approaches Newport mine. Electric-driven pumps will probably be used.

NEWPORT (Ironwood)—Explanation of recent general increase of this and Anvil mine by outside experts may be found in statement coming from Milwaukee office that Newport Mining Co. has joined new combine which will manufacture tubes and other steel products. No changes in local management expected.

PABST (Ironwood)—Development at new vertical shaft will be suspended for week or more, owing to burning out of bucket-hoist motor. Water being kept down by bailer rigger on cage. Crosscut 8 x 15 ft. in granite on 24th level of this shaft, driven 145 ft. in June, by three shifts of men, and in month better progress being made, with shoveling machine and seven men per shift.

PURITAN (Puritan)—Mine shut down for week while repairs are made to wooden headframe.

MINNESOTA

Cuyuna Range

THOMPSON (Crosby)—Mine not shipping and practically all ore removed. Originally operated as underground mine, then stripped and milling used. Photograph shows typical formation of Cuyuna Range orebodies.

MISSOURI

COLLINSVILLE ZINC CORP. (St. Louis)—Formed to convert part of smelting capacity of Collinsville smeltery at Caneville, Ill., to make lithopone. Has issued \$500,000 of bonds and 10,000 shares of stock of no par value.

MONTANA

Beaverhead County

BOSTON & MONTANA DEVELOPMENT (Wise River)—Ground softening in upper Idaho crosscut being driven toward fissure. Big Hoie bridge of Montana Southern Ry. subsidiary, now being constructed near Wise River, to which point steel has been laid. Railway will afford outlet for company's Elkhorn ores. Estimated will reach mines within sixty days.

SHEEP CREEK (Wise River)—Three feet of ore opened at grass roots, and two carloads ready for shipment with completion of Montana Southern. Ore reported high in silver, ranging from \$5,000 to \$7,000 car lot. Several shallow shafts on property.

Cascade County

CASCADE SILVER (Neihart)—Narrow orebody reported uncovered below the 500 level. Vice-president H. L. Maury files answer to suit of Paul A. Gow, director, denying illegality of directors' meeting, at which Maury, who was present, was voted 130,000 shares for "services rendered" to distribute as he saw fit. Value of stock around \$300,000. Mr. Gow contends completion was unreasonable for whatever service could have been rendered, and asks court to order stock restored to treasury.

THOMPSON CUT, CROSBY, MINN., ON CUYUNA RANGE

Jefferson County

LEGAL TENDER (Clancy)—Power line under construction. Two more carloads of ore almost ready for shipment. Ore fissures narrow, but good grade.

LIVERPOOL (Clancy)—Old shaft being retimbered and power line constructed.

ANGELICA (Wickes)—Shipping lead-silver ore regularly to East Helena plant of American Smelting & Refining Co. Ore showing on lower levels continues good.

Lincoln County

LUKENS HAZEL (Libby)—Will build 200-ton concentrator and power plant. Surveying for two-mile pipe line from Granite Creek to proposed mill site. Will haul concentrates by auto truck nine miles to Libby. Contract let for timbers. Telephone line being built from Libby to mine.

Mineral County

TARBOX (Saltsee)—Directors have decided to install 150-ton concentrator, to represent expenditure of \$75,000. Orebody of good grade opened 15 ft. wide.

Powell County

CHAMPION (Deer Lodge)—Tunnel being driven to open property at depth. Mine is old-time producer.

EMERY (Deer Lodge)—Preparing to build electric power line to mill and to rework old waste dump.

MONARCH (Elliston)—Will start tunnel soon. Sawmill construction also completed. Air compressors installed.

Silver Bow County

ANACONDA (Butte)—Operations for July will show considerably less than 55 per cent of normal, as measured by metal output. Mooney protest demonstration serving to call large number of miners from work. Labor controversy over wages affecting working forces.

BUTTE & SUPERIOR (Butte)—Tonnage increased at Black Rock mill. Ore showing good in development work easterly in Four Johns' claim.

DAVIS-DALY (Butte)—Miners who left work to join Mooney strike have returned, and sinking of Colorado shaft resumed. Planning to resume capacity operations. Now working at less than 50 per cent of normal.

EAST BUTTE (Butte)—Pittsmont smeltery will soon resume at capacity. Company giving considerable attention to development of all ground in Wyoming fields.

NEVADA

Lyon County

MASON VALLEY MINES (Thompson)—Diamond drilling and other prospecting below main tunnel level has recently demonstrated large tonnage of good ore in new workings.

NORTHERN LIGHT COPPER (Yerington)—Bond and lease taken by Mason Valley Mines Co. Shipping ore from development work. Deepest shaft down 250 ft., last 80 ft. in sulphides. Orebody 10 ft. wide at bottom. Trucking expense almost prohibitive.

Nye County

BELCHER DIVIDE (Divide)—E. J. Roberts has uncovered new ledge crossing both Belcher and Belcher Extension, apparently about 50 ft. wide, assaying \$3 to \$29 per ton, a few samples running higher.

BROUGHER DIVIDE (Divide)—New vein cut on 505 level, 3 ft. wide. Drift on 177 level advanced 550 ft. Expect to reach junction of Divide Extension and Tonopah Divide vein within 100 ft.

DIVIDE EXTENSION (Divide)—Drifts on 45 level of Caldwell shaft still in high grade recently opened. Roy Hardy, consulting engineer, states ore in both hanging-wall and foot-wall drifts averaging \$75 per ton. Shaft down 80 ft. and vein will be crosscut again when it reaches 100 ft. Crosscut on 425 level of old shaft that is being driven to pick up vein opened in Caldwell shaft has advanced 25 ft. Andrew Walz, consulting engineer for Sherwood Aldrich, recently examined property.

TONOPAH DIVIDE (Divide)—Main vein opened in 530 level crosscut at expected distance of 125 ft. from shaft. Crosscut driven into vein 8 ft. without reaching foot wall, and drifting begun on hanging wall. No assay figures given, but management stating vein is in good commercial ore. Chief value in gold on fifth level, it is unofficially stated. Southeast drift on second level extended to get over "big bulge," where vein on third level attains 80-ft. width. Drift now out 325 ft., last 50 ft. averaging \$150 per ton, according to management.

White Pine County

NEVADA CONSOLIDATED (McGill)—Copper production in June was 3,715,482 lb.; May, 3,700,000.

NEW MEXICO

Grant County

D. L. HILL, of Lordsburg, has purchased from Klein and Reynolds old silver property in Gold Hill district, twelve miles north. Work will be started soon.

CO-OPERATIVE (Lordsburg)—Mill foundation complete. E. Walters, superintendent; A. Tabor, mill boss.

HOMESTEAKE (Lordsburg)—Taken over by E. M. Luckey from J. Arnett, and under examination by G. C. Pidgeon for John Gleason and James Parks. Ore carries gold, silver, copper and lead.

LUCKY STRIKE (Lordsburg)—Small ground cleaning out old silver property. T. Lister, owner.

OCTO (Lordsburg)—Main shaft down 225 ft. Labor reported scarce. Working 25 men. E. K. Davis, superintendent.

RUTH (Lordsburg)—Under lease by W. T. Scarborough, who has car silver-lead ore ready to ship to El Paso smeltery.

CHINO COPPER (Santa Rita)—Copper production in June was 3,615,458 lb.; May, 3,583,396.

OKLAHOMA

Joplin-Miami District

WEST VIRGINIA (Miami)—Planning construction of new mill on lease two miles east of Quapaw, Okla. Now sinking second shaft.

U. S. ZINC SMELTING (Picher)—Again in charge of Manhattan mine after turning it over to John A. Skinner, of Webb City, a year ago. Mine producing more heavily of late.

VANTAGE (Picher)—H. P. Sharpe and associates have bought interest of J. H. Denny. Sharpe became manager, succeeding O. A. Sneed, one of original owners, who sold out about six months ago.

FIG V. (Quapaw)—Controlling interest bought by Fred W. Mackey, of Vinita, Okla. Changing from steam to gas power. Fred Parish, superintendent.

SOUTH DAKOTA

Custer County

AMERICAN MICA PRODUCTS (Custer)—Property near Oreville being worked and mica shipped to Custer, where it is trimmed and sorted for market.

NATIONAL MICA (Custer)—Mica mine near Oreville has resumed operation. Product shipped to Hot Springs, where it is being prepared for market.

Pennington County

NATIONAL TIN (Hill City)—Machinery for concentrator arrived and being installed. Cowboy shaft being enlarged to one of three compartments, after which it will be sunk to 500 ft. Mohawk undergoing thorough development.

GERARD (Keystone)—Ore of good grade cut by tunnel to depth of 400 ft. Option on property given to New York interest, which will thoroughly develop ground.

St. Lawrence County

HOMESTAKE (Lead)—Report for year ended Dec. 31, 1918, shows surplus, after deduction of charges and taxes, of \$305,417, equal to \$1.21 a share earned on \$25,116,000 quantity, against surplus of \$1,195,383, or \$4.75 a share, in previous year.

TEXAS

Coryell County

LARGE ACREAGE LEASED near Coprus Cove, west of Temple, by New York men, and drilling will be started at once. Stated fourteen carloads of machinery and track work on ground.

Rockwall County

SPUDDING IN for deep well on Blake Mouldin Ranch, near Ozona, will be done at once. Ryan Petroleum Co., of New York, has built derrick on Roy Henderson Ranch. Equipment ordered from Oklahoma sufficient to sink this well to 4,000 ft. if necessary. E. B. Kirk, superintendent in charge. Drilling will be done on upper ranch of Robert Massie and on ranch of County Judge Charles E. Davidson, by Eddy, Licklow & Thomas, of Stephenville, Tex., and Tulsa, Okla. This firm has made third location on ranch of John Carson, in Pecos County, and materials expected on ground early in July.

Jefferson County

GULF PRODUCTION (Beaumont)—McFadden No. 2 well, at Spindle Top extension, said to flow in fifteen days' drilling. No. 1 McFadden well furnishes enough gas for fuel in drilling this well.

TEXAS CO. (Beaumont)—Will be drilling soon on Fee No. 1 and No. 2 wells.

Liberty County

BIG FOUR (Hull)—Came in as gusher and now making good production on pump. Well only 1,500 ft. deep, or 1,000 ft. less than near-by wells; oil 33 gravity, that from deeper wells being 22. Exhausted gas under pressure will cease flowing, but no signs of sanding up indicated.

Orange County

WILD-CAT WELL being drilled on Fletcher farm, twelve miles north of Beaumont. Gas seepage known here for years.

UTAH

Jaab County

BIG HILL (Eureka)—Property, recently taken under development by Knight interests, to be opened by shaft to depth of 1,000 ft. Old shaft on property 200 ft. deep, to be enlarged and retimbered, when further sinking will be started.

CHIEF CONSOLIDATED (Eureka)—Surface work on unpatented claims in eastern and northern Tintic, arranged for under contract, practically completed.

COPPER LEAF (Eureka)—Shaft down 1,200 ft. Second fan installed to improve air.

EUREKA METALLURGICAL (Eureka)—Small experimental operation, for some time to be electrified. Results of work reported satisfactory, and company stated to have funds for operation on larger scale.

LEHI TINTIC (Eureka)—Development of ore recently opened to be continued. Shaft to be sunk to 500 ft. and prospecting done, as indications point to more ore at depth.

TINTIC EASTERN (Eureka)—Company proposed to operate group of nineteen claims adjoining Tintic Standard and Apex Standard. Officers: J. E. Myers, president; Andrew L. Hurley, vice-president; J. H. McChrystal, G. W. Morgan and G. A. Udall.

TINTIC STANDARD (Eureka)—Six-day shutdown over July 4 used in completing change to new equipment and to making repairs in main shaft. No. 2 shaft down 1,000 ft., and after cutting of station will be sunk to 500 level. Railroad to property expected to be completed by Sept. 1. **ZUMA (Eureka)**—Ore opened on 500 level followed by winze almost to 800 level, where drifting has been started to cut ore, which has apparently dipped away from winze.

SHOWERS (Silver City)—Hoisting plant and all buildings destroyed by fire. Loss estimated at \$12,000. Owned by Walker Bros., Salt Lake City. Worked under lease.

Salt Lake County

UNITED STATES (Bingham Canyon)—Fire that broke out in mine on June 27 continuing, and owing to presence of gas, unable to be under control for several days. About 350 men out of employment until fire abates (July 8).

HOWELL (Salt Lake City)—Operations resumed.

UTAH COPPER (Salt Lake City)—Copper production for June was 3,528,000 lb.; May, 9,125,000.

Summit County

PARK CITY getting back to normal conditions after strike and shipments again being made. During week ended July 5, there were shipped 1,586,060 lb. of ore Silver, Validity, Silver King, Coalition, Judge Mining & Smelting, and Daly West. Good miners still scarce in this camp.

Utah County

SOUTH PARK (American Fork)—Contract let for raising and sinking on fissure bore cuts expected 150 ft. above tunnel and Cardiff limestone below it. Ore expected to be found making off from fissure into beddings.

WASHINGTON

Ferry County

VIRGINIA (Danco)—Directors visit property and decide to resume operations in August.

Stevens County

NORTHWEST MAGNESITE (Chewelah)—Has resumed operations with one kiln, and fills order several hundred tons to go to Eastern concern which needs product to tide over until shipments can be received from Australia.

UNITED COPPER (Chewelah)—Oscar Lachmund made general manager. Conrad Wolfe, former manager, retains presidency and will develop property he owns in Nevada.

LOON LAKE COPPER (Loon Lake)—Company says George T. Crane for \$131,250 and George Turner for \$21,250, alleging that while in control Crane secured treasury stock worth 70c at 11½c a share, and Turner secured 40,000 shares of stock worth \$35,000 for \$3,750.

NORTHPORT S. & R. (Northport)—Has begun shut for \$100,000 against Lone Pine Surprise Co., at Republic, Wash., for value Northport company's property at Republic; also similar suit against Insurgent Gold Mining Co. for same amount.

WISCONSIN

Zinc-Lead District

FRONTIER MINING (Galena)—Company one of most successful independent operators in Wisconsin field. Is operating operating and Middle mines, at Benton, and kin lease. Drilling in progress on Jeffries and John Gray leases, at Hazel Green.

MINERAL POINT ZINC (Galena)—Mines of company now in operation are Penn Bend and Hoskins, at New Diggins. Coker No. 1 at Livingston, and Black Jack, at Galena. In addition company continues cleaning out old mine shafts without milling, to oxide plant at Mineral Point. Additional orebodies blocked out by drill at Coker and Hoskins properties.

VINEGAR HILL ZINC (Platteville)—Operating is Jefferson, Graham, and North Unity mines, and reopening Tewdale mine, at Livingston. Is sinking new shaft and drilling on Copeland lease, at Shullsburg.

WISCONSIN ZINC (Platteville)—Operating Champion, C. A. T., and Longton mines, all at New Diggins, and drilling. Footy lease, west of abandoned Winshell, where results of drilling so far obtained indicate proximity of another orebody.

CANADA

British Columbia

CORK PROVINCE (Kaslo)—Operating mill one shift.

GIBSON (Kaslo)—Supreme Court decision at Vancouver, B. C. gives controlling interest to J. M. Wolbert and Louis Chassy, both of Spokane, instead of D. K. May, also of Spokane.

SILVER BEAR (Kaslo)—R. F. Green and Clive Fringle buy \$10,000 and take \$100,000 option on property near Kaslo, formerly owned by Frank Helme, of Nelson. New owners will develop it along with Silver Bell group.

SILVER BELL (Kaslo)—Owners have acquired adjoining Silver Bear group, and will consolidate.

NELSON M. & D. (Nelson)—W. W. Shaffner, manager, reports company will develop Whittewater and Comstock groups on Cascade Creek district. One crew driving tunnel to reach orebody.

PREMIER (Portland Canal District)—Building assay office and accommodations for large force. Portable sawmill at work and road being repaired for heavy hauling.

OHIO (Retailik)—Dr. F. C. Descent and other Spokane men have taken bond on Ohio mine, near Kaslo, for \$10,000, and expect to equip property.

BLUE BELL (Riondel)—Unwatering in progress. Low-grade lead carbonate ore shipped last year was important part of Ainsworth division's production. Shipments discontinued on signing of armistice.

SILVERSMITH (Sandon)—J. B. White, president, reports 3-ft. orebody cut in drift on 8th level. In drifting for this tunnel passed through orebody 100 ft. long and 4-16 in. wide, in which clean ore contained 136 oz. of silver per ton and 70 per cent lead. Mine production in June about 300 tons of concentrates.

Ontario

KENNEDY-BOSTON (Boston Creek)—Vein 14 in. wide partly stripped and some ore extracted.

MILLER INDEPENDENCE (Boston Creek)—Men who went out on strike have returned under practically old conditions.

PATRICIA SYNDICATE (Boston Creek)—Destruction of mill by fire has caused loss estimated at \$75,000; insured for about \$30,000.

QUEEN OF SHEBA (West Shining Tree)—Most camp buildings destroyed by forest fires.

BAILEY (Cobalt)—Justice Sutherland has upheld Master-in-Ordinary in refusal to allow sale of property to A. J. Young, of Northern Customs Concentrators, Ltd., with which it was proposed to amalgamate Bailey.

CROWN RESERVE (Cobalt)—Will develop claims located in Larder Lake district.

DOME (Porcupine)—Stated that company will issue monthly reports.

McINTYRE (Porcupine)—Cutting station at 1,200 level of shaft, and will continue shaft to 1,375 ft., which will be main haulage level and will be equipped with electric locomotives.

VIFOND (Porcupine)—Directors have decided to keep property closed down until labor difficulties are finally settled.

MEXICO

Sonora

GRENE CANANEA (La Cananea)—Production in June was 3,000,000 lb. copper, 147,730 oz. silver and 600 oz. gold. Production of copper unchanged from April and May.

KORFA

ORIENTAL CONSOLIDATED (Usan)—June clean-up, \$84,830; May, \$90,530. Completion of dam expected by May 10. Heavy rainfall between May 4 and May 10 increased flow into mines so that Chorro hydro-electric plant could not furnish enough power for pumps. Taracol mill therefore shut down to drive Taracol auxiliary electric plant by mill steam engine. Tonnage thus reduced. Four weeks' time also lost on Suribong power project owing to rains. Completion of dam expected by July 20. Taracol and Tabowie mills will be closed part of rainy season, owing to need of power for pumping. Labor and political situation unchanged.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for spelter are for ordinary Prime Western brands. We quote New York price at 35c. per 100lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240lb.

Metal Markets

New York—July 16, 1919

This was a week of furious activity in the major non-ferrous metals, with the exception of tin. Copper, lead, and zinc all experienced noteworthy advances in price, especially copper.

The rise in copper has been favorably received in Great Britain, where it has afforded an opportunity for some reduction in the government's stock of copper, but the statistics of July 1 showed that the latter still amounted to about 100,000,000 pounds.

With the present sentiment, both here and in England and France, large unsold stocks of the metals have ceased to be a factor of immediate importance. Whether this is a case of familiarity breeding contempt, or the reflection of the prevalent opinion that present metal values are relatively low, may be left to individual opinion.

The stocks of metals in the hands of the British Ministry of Munitions July 1, with the corresponding figures for June 1 in parentheses, were as follows: Copper, 99,227,520 lb. (107,502,080); lead, 271,342,400 (268,591,680); zinc, 88,289,600 (86,078,720); aluminum, 23,874,080 (24,458,560); nickel, 5,492,480 (7,956,480); antimony, 9,784,320 (10,080,000).

The further decline in sterling exchange, which this week fell to the lowest point heretofore recorded, is necessarily reflected in the London quotations for commodities. It has a disastrous effect upon contracts entered into previously that are now being executed. For the first time since the beginning of the war there were transactions in German exchange this week, the quotation of the mark being about 8c.

Freights to Hongkong and Kobe from San Francisco are unchanged at \$14 per ton. In transatlantic freights

the rate from New York to British ports is 0.9c. per lb.; to French ports quotations are irregular, but appear to be higher.

Copper

At the close of our last week copper stood at 20c. per lb., delivered, or 19.85c., f.o.b. New York. Some sellers thought that the advance was ended, and on the following day sold liberally at unchanged prices, but buyers simply took the bit in their teeth and ran away with the market. On Thursday and each succeeding day there was an enormous demand, which was in no-wise checked by the sharp advances in price that were made from day to day by the producers. The characteristics of a sellers' market, which have now obtained for about three months, were more in evidence than ever, and producers could easily refuse to sell to undesirable customers. Thus there was a general refusal among the principal offices to sell for speculative accounts.

Japan was again a large buyer, both through the Export Association and outside of it, and the Japanese demand was largely responsible for the advances in the market. Among domestic consumers wire-drawers continued to be the principal buyers, but there was substantial business with brass-makers. The aggregate business was large and exceeded the total of the previous week.

The London quotations of £115 for futures and £106 for spot correspond with 22 $\frac{1}{2}$ c. and 20.70c., respectively, c.i.f., with exchange at 4.39.

Germany made at least one direct inquiry for copper this week, and there were other inquiries which were assumed to be indirectly for German account.

The labor situation at Butte remains substantially unchanged. It has become a play between the I. W. W. and the American Federation of Labor, i. e., between the radical and conservative parties. In the meanwhile a great unrest continues.

There was riot this week at Rome, N. Y., where the strike is still in effect. At Hastings-on-the-Hudson some of the men have returned to work.

Copper Sheets—The base price of copper sheets is 31 $\frac{1}{2}$ c. per lb. Demand strong. Copper wire is quoted at 25 $\frac{1}{2}$ c. in carload lots, f.o.b. mill. Market strong. Heavy buying during last two months. Most mills reported loaded with orders up to Oct. 1.

Tin

The market is mainly in the hands of the American smelters, but brokers are able to do some business in resale lots

and in futures. However, the largest consumers of tin are finding that their business is becoming very good, and, consequently, they are not disposed to sell such surplus stocks as they may have. High-grade tin—electrolytic, Lamb & Flag and Straits—was quoted at 70c. right through the week. Straits tin for July shipment declined as low as 51c., but rallied and today was quoted at 52c.

Lead

There was a tremendous speculative demand for this metal, which combined with very substantial demand from consumers, enabled those producers who still had stocks to relieve themselves materially, and, indeed, enabled them to realize advances over the price of the A. S. & R. Co. Consequently, the A. S. & R. Co. was led to advance its price to 550c. on July 14, but the demand continuing strong, higher prices were realized by outside sellers. Lead for future delivery commands a premium over prompt. Chemical lead continues in strong demand and commands a premium.

Among domestic consumers, corrodors were the principal buyers this week.

British advices report that the consumption of lead in Great Britain is increasing. The corrodors are unable to keep up with the demand. However, the sheet and pipe trades are lagging. This is simply a repetition of the experience of America.

Zinc

Very large business was done during the week at steadily advancing prices. Some producers who had been holding their stocks of spelter for a long time became free sellers on the advance, but their offerings were readily absorbed. Galvanizers were important buyers. There were large purchases for speculative account. High-grade zinc is quoted at 81@82c.

Belgian zinc smelters are steadily getting into working order.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. Market quiet.

Antimony—Reports respecting this market were rather conflicting, but, on the whole, we characterize it as having been a little stronger, and quote spot at 81@82c. The Chinese producers have been selling large quantities of antimony to Denmark and Norway, the final destination of which is supposed to be Germany.

Bismuth—Metal of the highest purity for pharmaceutical use is quoted at \$3.10 per lb. for wholesale lots—500 lb. and over. No change.

Cadmium—Quoted at \$1.50 per lb. in lots of 500 pounds. For lots under 200 pounds, \$1.75 per lb. No change.

Nickel—Ingot, 40c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—The rise to \$107, at which the market closed last week, was

only maintained a few days, after which the price declined to \$103, and the market became rather quiet.

Silver and Platinum

Silver—The feature of the last week has been the weakness in the sterling exchange market. Offerings have been so much in excess of the demand that the demand rate has dropped from \$4.49 on July 10 to \$4.34 on July 16. This fall in exchange has seriously affected the price of silver and more than offset the advance of 3/4d. per ounce in London bid price. Silver has ruled around \$1.06 3/4 for London shipment, but China banks have paid a premium over London price and bought considerable amounts.

Mexican dollars at New York: July 10, 81 1/2; July 11, 82; July 12, 81 1/2; July 14, 82 1/2; July 15, 82; July 16, 80 1/2.

Platinum—In very strong demand. We quote \$105@110 for refined ingot.

Palladium—Quiet at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., July 12—Zinc blende, per ton, high, \$52.75; basis 60 per cent zinc, premium, \$50; Prime Western, \$47.50@50; sludge and flotation, \$47.50@45; calamine, basis 40 per cent zinc, \$30@25. Average settling prices, blende, \$44.07; calamine, \$30.29; all grades of zinc, \$43.71.

Lead, high, \$66.55; basis 80 per cent lead, \$63@60; average settling price, all grades of lead, \$63.49 per ton.

Shipments the week: Blende, 6,371; calamine, 171; lead, 1,036 tons. Value, all ores the week, \$351,690.

While most buyers were finessing along Friday morning waiting for sellers to accept a \$45 basis, one buyer picked up 1,500 tons on \$47.50 basis. Then the price went to \$50 basis. Buyers of ore for sheet-zinc factories noted the trend early and made their purchases on \$50 basis. Except for the 1,500-ton lot, blende prices generally advanced \$5 per ton. The production this week is 40 per cent below the average of the first six months.

Platteville, Wis., July 12—Blende, basis 60 per cent zinc, \$50 base for premium grade and \$47.50 for high lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$60 per ton. Shipments reported for the week are 1,586 tons blende, 195 tons galena, and 197 tons sulphur ore. For the year to date the totals are 53,757 tons blende, 3,039 tons galena, and 7,573 tons sulphur ore. During the week 2,842 tons blende was shipped to separating plants. The upward trend in the zinc-ore market has already caused the reopening of several mines, and others will follow.

Other Ores

Chromite Ore—Business was reported at \$25 per ton, f.o.b. California point, for ore running 40 per cent and better.

Manganese Ore—South American ore is offered at 65c. per unit, Baltimore. Buyers are not disposed above 55c.

Molybdenum Ore—Quoted nominally at 75@80c. per lb.

Tungsten Ore—Some business in Chinese and Japanese ore was reported at \$7@87.50. Some sales of scheelite were reported at \$10.

Other Minerals

Graphite—The situation is practically unchanged, with the exception that marine freight rates from Ceylon to New York have advanced about £1 per ton for August shipment over the July rate. Another slight advance will be recorded for September and October shipments. Only very small quantities are being imported, as there is little demand in the market. Prices remain practically stationary, the following being quoted for Ceylon trade: Lump, 13 1/2c@14c.; chip, 10 1/2@11c.; dust, about 7 1/2@8c. All prices are c.i.f. New York, ex ship. The market for domestic grade is dull.

Nitrate—Conditions are reported unchanged. The Government continues to liquidate its stocks, and the end of the Government accumulation is said to be in sight. Imported material is being delivered in small quantities, but a revival of regular shipments is expected. Prices are generally quoted at \$3.25 per cwt., carload lots, for immediate shipment, but one large firm has named \$2.95.

Pyrites—Spanish pyrites is quoted at 18c. per unit for furnace ore, c.i.f., New York or other Atlantic port, and 18 1/2c. at Gulf ports. Market slow and unsettled; hand-to-mouth buying. Price will decrease with ocean freights.

Iron Trade Review Pittsburgh—July 15

The American Iron and Steel Institute reports that steel-ingot production in June, by thirty companies which in 1918 made 84.03 per cent of the total output, amounted to 2,219,219 gross tons. From this the annual rate in June by the entire industry may be computed at 32,850,000 tons a year, or 67 per cent of capacity, taking the latter at 49,000,000 tons a year. The 67 per cent for June compares with the following for preceding months: January, 87; February, 85; March, 77; April, 65; May, 54. Production probably dropped to about 50 per cent at the middle of May, and, as production was increasing during June, the rate at the close of the month was probably about 70 per cent, showing a remarkable recovery, from 50 to 70 per cent in a month and a half. Production has not increased materially since the first of July. The increase in production previously recorded reflects the increase in the buying of steel products which began about the second week of May.

Contracting for steel products is now on a fairly large scale, the buying up to the latter part of May having been simply by placing actual shipping orders. Contracts made generally run to the end of the year. It is claimed some automobile makers have contracts for bars and perhaps other products to

July 1, 1920. The sheet mills have refused to contract for automobile sheets beyond this year, proposing that contracts for the first half of next year be at a \$5 advance, to which the automobile makers demur. The fact that contracting has been in vogue since about the first of June is reflected by the Steel Corporation's statement of unfilled obligations, which showed an increase of 610,545 tons during June, against a decrease of 518,375 tons in May and decreases averaging 640,000 tons a month in the six months December to May inclusive.

The finished-steel market may be a trifle quieter in a few lines, but in sheets, tin plate, and pipe, at any rate, the bookings thus far this month are well in excess of the average rate in June. Pipe bookings are running about double the capacity and sheets bookings from 50 to 75 per cent in excess of capacity. Tin-plate demand has had a great spurt in the last few weeks, due largely to additional demand for the California fruit and vegetable packs. All tin plate for California use must leave mills by about Aug. 10. There is increased demand for tin plate for the salmon pack; also better export demand, exports in May having been 14,000 tons.

There is a fair movement in the pig-iron market, though tonnages are not as large as in June. Price irregularities have practically disappeared, these having been due largely to furnaces in other districts endeavoring to sell in the local market. The Valley furnaces are all firm and are comfortably sold up.

There is a heavy demand for sheet bars, but little tonnage passes through the open market, mills simply ordering their supplies from regular sources, as these sources prove adequate and there is no chance of securing price concessions. The Steel Corporation is experiencing some difficulty in supplying its sheet and tin-plate subsidiary with sheet bars, and is putting its Columbus works in operation to improve the supply. Billets and slabs are in light demand. We quote: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; rods, \$52.

Quoting prices on 80 per cent ferro-manganese have now settled down to \$115, furnace, for domestic, and \$115, c.i.f., for English, with prospects that inquiry would develop special prices. Spiegeleisen presents no regular market, being quotable nominally at about \$30@\$33 for 18 per cent, delivered.

The market for Connellsville furnace coke for spot or prompt shipment has reverted to \$4, where it stood before the market was forced up to \$4.25 by buying intended to provide against shortages due to Independence Day and other celebrations. So many ovens have been blown in lately that a surplus may develop. Foundry coke easily retains its recent advance. We quote: Spot furnace, \$4; spot foundry, \$4.75@\$5.25; contract foundry, second half, \$5@\$5.50, per net ton at ovens.

Table with 4 columns: City, Current, 1 Year Ago. Rows include 100-lb. keg, 25- and 50-lb. kegs, 12-lb. keg, 5-lb. cans, 1-lb. cans.

MINING AND MILLING SUPPLIES

Table with 4 columns: Hose, Underwriters' 2 1/2-in., 1-in. per ft., First grade, Second grade, Third grade.

LEATHER BELTING—Present discounts from list in the following cities are as follows:

Table with 4 columns: City, Medium Grade, Heavy Grade.

WHITE LACING—30% off for cut; 62c. per sq. ft. for side 1/4 in.

Table with 4 columns: City, Manila Rope.

PACKING—Prices per pound:

Table with 2 columns: Item, Price per pound. Rows include Rubber and duck for low-pressure steam, Asbestos for high-pressure steam, Duck and rubber for piston packing, Flax, regular, Flax, w. proofing, Compressed asbestos sheet, Wire insulation asbestos sheet, Rubber sheet, Rubber sheet, wire insertion, Rubber sheet, duck insertion, Rubber sheet, cloth insertion, Asbestos packing, twisted or braided and graphited, for valve stems and stuffing boxes, Asbestos wick, 1/2- and 1-lb. balls.

REFRACTORIES—Following prices are f. o. b. works, Pittsburgh:

Table with 2 columns: Item, Price. Rows include Chrome brick, Clay brick, 1st quality fireclay, Clay brick, 2nd quality, Magnesite, dead burned, Magnesite brick, 9 x 4 1/2 x 2 1/2, Silica brick, Standard size fire brick, 9 x 4 1/2 x 2 1/2, St. Louis—Fire Clay, \$35 to \$50, Birmingham—Fire clay, \$40-\$45; silica, \$40-\$50; magnesite, \$90; chrome, \$120, Chicago—Second quality, \$25 per ton.

RAILWAY TIES—For fair size orders, the following prices per tie hold:

Table with 4 columns: City, Material, 7 1/2 in. x 9 in., 6 in. x 8 in., by 8 Ft. 6 in., by 8 Ft. 6 in.

Table with 4 columns: No., Price per tie at Missouri mills, St. Louis prices about 25c. higher.

FLOTATION OILS—Prices of oils for flotation, in cents per gallon, in barrels

Table with 4 columns: City, New York, In Bbl., Carloads, Denver. Rows include Pure steam-distilled pine oil, Pure destructively distilled pine oil, Pine tar oil, sp. gr. 1.02-1.035, Crude turpentine, sp. gr. 0.96-0.99, F. o. b. Cadillac, Mich.

COTTON WASTE—The following prices are in cents per pound:

Table with 4 columns: City, Current, One Year Ago, Cleveland, Chicago. Rows include White, Colored mixed.

WING CLOTHS—Jobbers' price per 1000 is as follows:

Table with 4 columns: City, Current, One Year Ago, Cleveland, Chicago.

EXPLOSIVES—Price per pound of dynamite in small lots and price per 25 lb. keg for black powder:

Table with 4 columns: City, Low Freezing, Gelatin, Black Powder. Rows include New York, Boston, Cincinnati, Kansas City, New Orleans, Seattle, St. Paul, St. Louis, Denver, Dallas.

CHEMICALS

SODIUM CYANIDE—New York price is 31c. per lb.; Denver, 42c.; Chicago, 31c.; St. Louis, 31c.

SODIUM SULPHIDE—In New York the price per pound is 4 1/2c. for concentrated, 2c. for crystals. The St. Louis price is 6c. for 2 1/2c. for crystals. The Denver price is 32c. The Chicago price is 6c. for concentrated, 3 1/2c. for crystals. Concentrated comes in 500-lb. drums, the crystals in 440-lb. bbl.

ZINC DUST—For 350 mesh the New York price is 10c. per lb.; Chicago, 13c., Denver, 13c. St. Louis, 11c., less than car lots 12c.

ALUMINUM DUST—Chicago price is 1.30 per lb.

MINERS' LAMP CARBIDE—Prices net f. o. b. cars at warehouse points.

Table with 4 columns: City, Union 100-Lb. Drums Per Ton, Cameo 100-Lb. Drums Per Ton, 25-Lb. Drum Per Drum. Rows include East of the Mississippi, North of Chattanooga, Southeastern portion U. S. A., Texas (except El Paso), El Paso, Texas, Denver, Colo., West Coast.

Number 4

The Mexican Situation

DURING the week ended July 23 there were no new or startling developments in Mexico, nor was there any change in the situation within that country; but a very decided interest has developed in the United States the last few days as to what is happening on the other side of the Rio Grande. Suddenly, for some unexplained reason, the daily press has opened its columns and is making known to the American people something of the troubles of that unhappy land. Many of the regrettable acts of violence to which attention is now being called can scarcely be attributed to the Mexican government; they may rather be attributed to the lack of a government, or the inability of the government to give adequate police protection. This fact should be emphasized, and the impression that the government really approves of the murder of foreigners should so far as possible be corrected.

Sudden and violent outbreaks on the part of the daily press are likely to do one of two things: there will develop in the minds of the people the idea that Mexico must at once be overrun by an American army, a development of the jingo spirit, or the action of the press will be similar to the removal of the cork from the soda-water bottle—a sudden effervescence and all is over. It is to be hoped that neither of these things will happen in the present instance, but, rather, that as the result of this publicity Congress will inform itself fully in respect to Mexico, learn positively of her troubles and their causes, and then take such steps as may be necessary to remove those causes.

The House Rules Committee began its inquiry on July 21, calling Ambassador Fletcher for information. Though Mr. Fletcher may be well posted, and able to give the President and the State Department private and valuable advice, he cannot appear with the same freedom at a public hearing. It is quite conceivable that should he have told all of the truth he would have henceforth been *persona non grata* in Mexico City. On the other hand, by leaving unsaid what he knows or believes to be true, such a witness could create in the minds of his hearers the impression that things in Mexico were not half so bad as painted.

As this investigation proceeds, others in a less delicate position than Mr. Fletcher may be able to throw more light on the problem. That the House proposes to get at the bottom of the situation is indicated by the list of subjects mentioned in the Gould resolution of inquiry, the subjects for inquiry being as follows:

1. The relations, economic, political and military, of the Government of the United States with the Republic of Mexico from the year 1910 until the date of the report to be made.

2. The conditions and incidents leading up to, concerned in or responsible for such relations.

3. The economic, political, and physical treatment accorded to American and other foreign citizens in

Mexico and elsewhere as to their lives and properties in the Republic of Mexico, subsequent to 1910.

4. The extent to which the Government of the United States, through ministerial assurances to foreign governments or otherwise, has obligated the people of the United States for the collection, payment or liquidation of public or private claims against the government or people of the Republic of Mexico.

5. The policy and activity of the Government of the United States in presenting and pressing claims of American citizens for loss of life and property by violence, confiscation, retroactive legislation, or governmental activity, in seeming violation of the tenets of international law, since 1910, including measures taken and representations made to the government of Mexico in efforts to forestall the inimical effects of such acts or measures of the Mexican government.

6. The individual and factional responsibility for robbery, maltreatment, and murder of American citizens in the Republic of Mexico and on American territory contiguous thereto.

The Senate Foreign Relations Committee has approved the King resolution asking the State Department for information on the following points:

What steps or measures are being taken to prosecute claims made by American citizens for damages in Mexico or what steps are contemplated?

How many Americans have been killed in Mexico since the retirement of Porfirio Diaz?

The amount of claims filed with the department for damages in Mexico.

Full information as to the confiscation of American property in Mexico.

How many Americans have been compelled to leave Mexico on account of disorder?

The value of American property abandoned in Mexico because of disorder?

The number of American citizens now in Mexico and the amount of their property?

Undoubtedly, the State Department has much of this information, and will furnish it, but these questions by no means cover the field respecting which the Senate should inform itself. The same questions might be asked for the peoples of all other nations, not the least for Mexicans themselves, for, as pointed out by the *Journal* last week, foreigners have been small losers as compared with the people of the country.

If the future action of the Government is based solely on the deaths and losses of American citizens, that action is likely to be inadequate for the occasion. It is the unfortunate circumstances of a large percentage of the population and the chaotic condition of nearly all industry that make our consideration of these matters imperative. If we interfere, we must interfere for the benefit of all sufferers—it must be no selfish interference.

The present agitation has brought prompt answers from Mexico City to the effect that vigorous action will be taken immediately to apprehend criminals, but when Mr. Fletcher tells us that so far as he knows there have been few apprehensions and comparatively little punishment administered in the case of murders committed since he has been ambassador, we can expect little from official promises.

Article 27

THE active interest now being shown in Washington in respect to Mexican affairs is aroused through two kinds of acts, those obviously illegal and those committed under the guise of legality. Among the latter, American property holders are particularly affected by the provisions of Article 27 of the new constitution of the republic. Perhaps the greatest interest will center around this article, which is extremely radical and is retroactive with regard to all titles acquired since 1876. Among other things, Article 27 provides that:

"(a) No foreign corporation or individual can legally acquire or hold any mines, oil wells, land or other real property in Mexico unless he renounces his citizenship.

"(b) No corporation, either domestic or foreign, can own agricultural, grazing or other rural lands in Mexico, and if title to such property is already vested in a corporation provision is made for its acquisition by the respective state governments in exchange for state bonds.

"(c) No corporation owning a mine, oil well, factory or other industrial enterprise can hold or acquire land in excess of its actual immediate requirements, the area to be determined by the federal or state executive.

"(d) No foreign corporation or individual can, under any condition, hold or acquire ownership to lands or waters within sixty miles of its frontiers or thirty miles from the seacoast.

"(e) The ownership to all minerals, solid, liquid or gaseous, is declared to be vested in the nation, regardless of existing rights based upon the old constitution.

"(f) All contracts relating to the acquisition of natural resources made since the year 1876 are subject to revision by the present government, and the executive is authorized to declare them null and void."

Attitude of Labor

Regarding Immigration

THE attitude of the labor unions respecting immigration is not entirely clear. A resolution was passed by the American Federation of Labor at its Atlantic City meeting strongly urging Congress to prohibit immigration of all kinds of labor during a period of the next four years. Later, at a meeting of the Pan-American Federation of Labor in New York, it was pointed out that the prohibition asked did not cover political refugees or the families of workers already in this country. "Political refugee" sounds well, but it includes the material that makes I. W. W.-ism, Bolshevism and communism. Do the unions want that? Scarcely. The president of the American Federation is reported to have said: "I would provide that any one might enter who had a union card and who promised to fight to maintain the standards of life for which the American worker had fought."

Now, just what is it that the unions do want and do believe regarding additional supplies of labor coming into this country during the next few years? It is important that we know, because the unions will have influence in shaping new legislation.

The coal mines are, as has been repeatedly pointed out, very short of labor. Metal mines have had a surplus of common labor, at least more than they could employ at the high rate of wages demanded, but there has been no general movement of the metal miners toward the coal mines, which for a number of years have been operated largely by foreign labor. Some of the coal miners have gone to other work; some have returned home; others will do so when they can secure passage; and in the last four years few have come to this country to take their places. If the Federation is urging the prohibition of immigration with the object of cutting off the normal labor supply of the United States in order to keep wages at a high mark, and if this policy is followed by our Government, there is danger, and very grave danger, that the normal amount of fuel will not be mined. If this happens, industry and the labor depending upon it must suffer proportionately. On the other hand, if the Federation asks only that immigrants should possess union cards before entering the States, this is another matter, for it places no restriction on the number of laborers coming into the country.

The Federation says that its object in asking for new legislation is to maintain the high standard of living toward which the American laborer has striven. If this is its motive—and none can be more admirable—would it not be more pertinent to ask that an educational qualification be the determining factor of an immigrant's requirements, rather than that the possession of a union card be made mandatory?

Made in Germany

ARE we soon to see again in our laboratories, on our beakers, evaporating dishes, and sundry apparatus, the little label bearing that mark of quality, "Made in Germany," or is it to be replaced by a label that means superior quality—"Made in America"?

It is announced from Washington that trade between the United States and Germany is to be resumed immediately, dyes, chemicals, and potash being excepted. Whether it is wise or expedient to make these exceptions may be questioned, but the arguments for excepting apply with equal if not greater force to chemical and physical apparatus. For years our colleges and institutions of learning have been permitted to import chemicals and apparatus free of duty, and they did import from Germany, because the material was good and cheap. In consequence of this, many students have known no other material than that bearing the little label. Passing from college into industrial laboratories, chemists have continued to buy and use only that material bearing the insidious motto "Made in Germany."

With the blockading of ports, importations came to an end. When the demand arose, the American manufacturer was able to produce practically everything for which a demand was made. Instruments of precision and apparatus made during the last few years have equaled in quality anything of the type obtained from abroad.

We realize that Germany has bills to pay, and that there will be still more bills when our metals and cotton

start for German ports. Germany has no gold with which it is practicable to pay for imports. The bills must be paid with her handiwork; and yet it will be with deep regret if these bills are paid with such apparatus as German dreams of conquest have forced us to learn to make—to make even better than she wrought.

Hard pressed as our colleges are, they can better afford to dispense with some material than to continue to teach their young men and women that "it can only be made in Germany."

The repeal of the law permitting free importation for institutions of learning will probably do more good in the way of developing and sustaining a key industry, a necessary home industry, than it will do harm in limiting the laboratory equipment of our universities.

International Mineral Statistics

DETAILED plans for the organization of the League of Nations are now being formed. Economists and statisticians in Washington have advanced reasons for the establishment of a mineral statistical organization within the League. Is it not an opportune time for the mining industries to consider the advisability of such an organization, and to express their opinions?

It has been pointed out that figures of mineral production in Europe before the war were camouflaged, but those engaged in our mineral industries depended upon these figures in the absence of more reliable information. Are we to revert to such practice in years to come, or shall we devise a better way of informing the public regarding fundamental data on raw materials, essential for the study of trade conditions?

Arguments in favor of the proposed organization are that it will supply reliable information regarding important mineral developments, prices in the principal markets, and special legislation affecting mineral industries; that it will present more comparable classifications, and encourage common units of measurement. It is claimed that such an organization will serve to lessen speculative elements in world trade, and to stabilize mineral industries.

The Place

For an Engineer

AMONG the able men who have served upon the Interstate Commerce Commission—and there have been several—we fail to note the name of a single engineer. New members are appointed from time to time, and, in the new order of things that may be brought about as the result of our Government's temporary control of the railways, additional members may be necessary to accomplish the fulfillment of all of its functions. The conditions afford an opportunity for one of our engineering societies, or for several of them, to bring to the attention of President Wilson the advantage of appointing an engineer to act upon the commission.

In the creation of the commission it is fair to assume that Congress thought that it was forming an organization that would have a judicial mind, and that rates would be established and maintained that would be equally fair to transportation companies and to the public. Something went amiss. The collective mind was not judicial, or misinterpreted data were placed before it, and there have been many cases of serious in-

justice. The commission has called before it from time to time some of the best engineers of the country, but they have not been a part of the body, and have had no part in its decisions. Engineers have prepared the data for appraisals and rate making. The literature upon valuation, maintenance, and depreciation has been compiled almost entirely by engineers. Its interpretation is properly the work of a technically trained mind. It is unfortunate that there has not been at least one engineer on the commission.

A somewhat similar situation occurs in a mining organization in which the president and all of his directors are men of large affairs, but know nothing or but little of the technique of mines. They employ engineers, and often take their advice, but do so blindly, because of inability to weigh that advice fully.

Nearly all the larger and more successful mining companies of today number one or more engineers on their directorate, and with such a make-up we find that poor advice is seldom taken, and that sound advice is fully appreciated and quickly acted upon. So with the Interstate Commerce Commission we believe that the inclusion of an engineer in its membership would add materially to the wisdom, justice, and rapidity of its decisions, and that inaccurate or erroneous data would stand less chance of receiving serious consideration.

Protection of the

Potash Industry

APART of the protection which the producers of potash have sought from Congress is coming from an unexpected source—from Germany. A dispatch to The Associated Press under date of July 11 says that the potash syndicate has petitioned the government for permission to raise the price of potash 100 per cent, owing to the increased cost of production.

One of the factors that may lead toward cheaper food, for which we all long, is cheap fertilizers, and of these potash is one of the most essential. We are rather inconsistent when we demand cheap food and at the same time ask protection for an industry still in its swaddling clothes. Perhaps the report from Weimar indicates that the cheap potash of former days will not be produced and marketed again, and that the high tariff which seemed essential may not, after all, be necessary to the life of the potash industry in this country.

The "Investment Trust"

THE mineral industry of the United States is vitally interested in the success and early consummation of the "investment trust," proposed by H. P. Davison, or in the "consortium of bankers," as proposed by Frank Vanderlip in his recently published book, "What Happened in Europe." Our metal market will materially improve or become normal, the stock market to the contrary notwithstanding, only when Europe has been provided with a credit with which it can buy. And the only source of that credit lies in the surplus funds of this country. Mr. Vanderlip does not put it too strongly when he says, respecting the arrangement of a credit: "The danger in not doing this promptly, or in not doing it at all, is so extreme that it is no exaggeration to say that failure to do this may mean a breakdown in European civilization which will involve the whole world."

The Platinum Situation*

Shortage in Platinum and Platinum Group of Metals Attributable to Disturbances of Normal Production Created by the War—Uses of Platinum and Possibilities for Maintaining Supplies

BY JAMES M. HILL

Geologist, U. S. Geological Survey, Washington, D. C.

THERE has been some confusion in past discussion of the uses of platinum, which is no doubt attributable to the lack of appreciation of the fact that all commercial platinum is not the pure metal. The pure metal is required for chemical work of all kinds, but for many purposes the iridium alloys are used. Platinum for electrical use contains 15 to 50 per cent iridium, but averages 25 per cent, and jeweler's platinum carries 5 to 10 per cent iridium. Palladium, another of the platinum group metals, is also of importance, chiefly

dental industry also should be classed as essential. Pure platinum is required in the chemical industry for catalyzers in the manufacture of sulphuric acid and for the manufacture of nitric acid from ammonia. For the sulphuric-acid industry, platinum chloride is the primary material containing platinum. Asbestos or anhydrous magnesium sulphate, soaked in platinum chloride and then baked to drive off the chlorine, forms what is known as "contact mass," which is charged into the chambers of contact-acid plants. Very fine-mesh plat-

FIG. 1. MAP OF THE WORLD, SHOWING SITUATION OF PLATINUM DEPOSITS

in the form of palladium-gold alloys, which can be used to replace platinum in the dental and jewelry industries. Rhodium, one of the rarer elements of the platinum group, has a limited utility in electrical pyrometers. Osmium and ruthenium, the remaining members of the platinum group, appear to be of only slight application, though osmium, when properly used, is said to be a possible substitute for iridium to harden platinum alloys.

The essential uses of platinum metals are in the chemical and electrical industries, and probably the

inum gauze is used for the catalyzer in nitric-acid plants. Some gauze made for this purpose has a reinforcing edge of platinum-iridium wire.

Platinum utensils of various kinds, including crucibles, dishes, tongs, and triangles, are required in every chemical laboratory. It is possible to substitute palladium-gold alloys, or even gold, nickel, nichrome, and silica for some chemical utensils, but no substitutes have been found which will entirely replace platinum chemical ware.

Platinum-iridium alloys have been used extensively by the electrical industry, but substitutes are constantly

*Published with the permission of the Director of the U. S. Geological Survey.

being developed. Tungsten, molybdenum, and nickel-chrome alloys are the principal substitutes, but they have not supplanted platinum in the industry. The primary use of platinum-iridium alloys in electrical work is in contact points, and the proportion of iridium necessary in the alloys is directly dependent on the intensity of the current passing through the contacts and the speed at which the contacts move. Probably the largest consumption of platinum alloy is in the manufacture of telephone and telegraph equipment, including sending and receiving instruments, switchboards and relays. There is also a large consumption of platinum for contacts in the magnetos needed for various kinds of internal-combustion engines. Automobile makers are, however, developing starting systems which do not require platinum in their construction, so a lessening future demand from that quarter may be expected.

Platinum has an important application in dentistry, though palladium-gold alloys are being used as substitutes. It would appear, however, that the substitutes are not entirely satisfactory, and it may be necessary to go back to platinum for certain dental purposes. The principal uses in dentistry are for pins for crown work, pins for fastening artificial teeth to plates, and as foil for making cavity molds in which to bake porcelain fillings.

shown that the quantity of platinum in blister copper sent refiners is very small; the highest assays reported by him indicated only 1,825 oz. per 100 tons of blister.

The nickel ores of Sudbury, Canada, are particularly rich in platinum and palladium, but apparently all nickel ores carry some of these metals. A considerable part of the nickel made is not refined electrolytically, but is used directly for making alloys. If this practice were changed, the world's supply of platinum and palladium would be considerably augmented.

The platinum placers of the world are so definitely related to intrusive basic igneous rocks, including pyroxenites, peridotites, and dunites, that there is practically no question of the association of the metal with them. In fact, in British Columbia, Spain, and Russia platinum has been found in place in these types of rocks.

Platinum does not exist in all placers derived from basic rocks, but, so far as known, it is not found in placers derived from other types of rocks. Prospecting for platinum placers, therefore, resolves itself first into a search for deposits of gravel derived in large part from pyroxenite, peridotite, and dunite. A large amount of prospecting has been done in Russia and Spain, based on this theory. Much of this work has been successful in so far as locating platiniferous placers has been concerned, but many recent discoveries do not appear to be of commercial importance.

(a) "Is," abbreviation used for osmiridium.

The non-essential consumption of the platinum metals is in jewelry, and it seems certain that this misuse of these metals must be stopped in order that industrial development may continue, for the world's stock of platinum is small, and prospects for large additions to this stock are far from bright. The chemical and electrical industries have absolute need for platinum. The women of the world should carefully consider whether their wish for ornaments made of platinum is worthy of consideration when the problems of future industrial necessities are under review. On the face of it, the answer must be negative. Let the world's supply of platinum be put to its highest use for the welfare of mankind, and not misused for the gratification of the vanity of the few.

GEOLOGICAL DISTRIBUTION OF PLATINUM

Practically all of the platinum metals so far recovered have been taken from placer mines, although a small quantity of platinum and palladium is won by the electrolytic refiners of copper and nickel matte and gold bullion. Platinum and palladium appear to be common in copper ores from deposits of all types, though the quantity in any particular lot of ore is ordinarily so small that it does not appear in the assay. Eilers' has

Chromite is a characteristic heavy constituent of platinum sands, and in some deposits can be recovered as a byproduct in mining operations. Olivine is also associated in considerable amounts. Magnetite and ilmenite, though ordinarily present in the concentrates from platinum placers, are more characteristic of placers in which gold is the most valuable constituent.

Platinum is such a rare metal, and is found in such small quantities in its mother rock, that certain physiographic conditions are necessary on which to predicate commercial deposits. Most important of these conditions is extremely prolonged or deep and rapid weathering of the primary deposits. In the Russian field, rock-weathering has been in progress for great geologic time. On the other hand, in Colombia, South America, it seems that, though the period of weathering has been relatively short, it has been so rapid that the same result has been obtained. Ordinarily, platinum is not found in commercial quantities in gravels which have not been reconcentrated, and the richer placer deposits of the world appear to be the results of repeated reconcentrations of platinum-bearing material.

Crude or placer platinum is not pure metal, but contains, besides other metals of the platinum group, more or less iron, nickel, and copper. Russian crude platinum is ordinarily sold on the assumption that it contains 83 per cent platinum metals, and Colombian crude averages

^aEilers, A., "Notes on the Occurrence of Some of the Rarer Metals in Blister Copper," Trans. A. I. M. E., Vol. 47, 1913, pp. 217 to 218.

about 85 per cent platinum metals. Some placer platinum, so called, carries a large proportion of osmiridium. Thus, the Oregon and California crude platinum carries from 25 to 45 per cent iridium, and nearly pure osmiridium is found in Tasmania.

The analyses of Russian², Colombian³, and American⁴, platinum in Table I serve to illustrate the wide divergence of metal content of crude platinum.

GEOGRAPHICAL DISTRIBUTION OF PLATINUM

As will be seen from the map, Fig. 1, platinum is found widely scattered throughout the globe, though the importance of some of the localities indicated is prob-

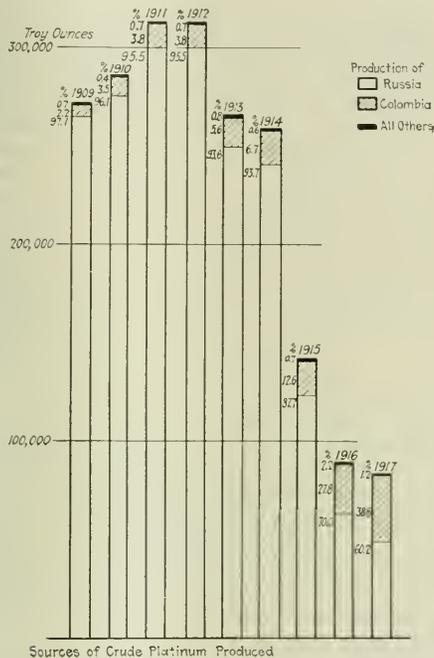

FIG. 2. RELATIVE IMPORTANCE OF THE PLACER PLATINUM-PRODUCING COUNTRIES OF THE WORLD

lematical. The Russian deposits are of first importance, followed in order by Colombia, Canada, the United States, and the Australian provinces. The reason that Canada ranks so high, though her output of placer

platinum is small, is because of the platinum and palladium that are recovered in the treatment of the Sudbury nickel-copper ores.

The relative importance of the placer platinum-producing countries of the world can best be judged by the

²Duparc, Louis, "Le Platine et les Gites Platiniferes de l'Oural"; Soc. des Eng. Civ. de France, Bull., Jan.-Mar., 1916.

³Kemp, J. F., "The Geological Relation and Distribution of Platinum and Associated Metals"; U. S. Geological Survey Bull. No. 193.

past production, which is shown in Table II' and graphically in Fig. 2.

Russian placer deposits have supplied approximately 95 per cent of the platinum in the world. The principal placer deposits rich in platinum are in the central Urals, in the Perm Government, near Nishni-Tagilsk, Nishni-Turinsk, and Verkhoturshi, Fig. 3. The richer deposits are on the eastern slope of the mountains, principally on the Iss and Veeya tributaries of the Tura River of the Obi drainage. Several important placers are found on the west slope of the mountains on the headwaters of the Chusovaia and Kama rivers of the Volga drainage. Near Nishni-Tagilsk, platiniferous placers are worked both on the Taguil, a tributary of the Obi, and on the Martian, a headwater stream of the Volga drainage. There are a few streams south of Ekaterinburg in which platinum and osmiridium are found, chief of which is the Myasai. In these placers, though platinum is the predominant metal, gold is also found.

Most of the platinum has undoubtedly originated from the disintegration of dunitic, pyroxenitic, or peridotitic rocks. The period of weathering has been very long, and there have been many changes in the drainage systems, which have now reached maturity. The stream grades are low, the inter-stream relief is relatively slight. The platinum has probably been reconcentrated many times, and is won principally from present valley gravels, though the pay channels do not always follow the present river channels. Some bench ground representing old river channels is worked, particularly in the Nishni-Tagilsk region. The pay gravels ordinarily rest on bedrock, though concentration on clay false bedrock is fairly common.

The pay dirt varies from a few inches to as much as 6 ft. in thickness. It has few large boulders, but has considerable clay in many places. The overburden varies from 2 to 16 ft. in thickness, averaging from 8 to 10 ft. It consists of a thick basal portion of practically barren gravel and sand, or clay and sand lenses interlayered with gravel, which is overlain by 2 to 3 ft. of clay sand and vegetable matter similar to the "muck" of the Alaskan mines.

The greater part of the Russian output in the past has been obtained by hand-washing, but of recent years much of the ground has been reworked by dredges, though it is still probable that over 75 per cent of the Russian output is from hand labor. In the shallow ground, up to 8 ft., deep hand-mining is carried on by open-cut methods. In the deeper ground, shafts and drifting have been employed. For the deposits in river channels crude hand dredges have long been and still

are used for raising the gravels. About thirty-five modern dredges were engaged in platinum mining prior to the war. Clay is so generally found in the gravels that specially designed machines have been used to save the platinum, and the newer dredges have special devices to cope with this problem.

The platinum district of Colombia covers the upper

⁴Hill, J. M., "Platinum and Allied Metals"; U. S. Geological Survey, "Mineral Resources, 1916," Pt. 1, p. 3, 1917.

waters of the Atrato and San Juan rivers, in the Choco district of northwestern Colombia, Fig. 4. Platinum is known as far north as Beté, on the Atrato, and in many of the tributaries of the San Juan, which enter from the east. (See attached map, Fig. 4, copied from a published report by Granger.) Most of the platinum exported from Colombia has come from the Condoto River, a headwater stream of the San Juan. It is stated that in this stream the platinum is about 75 per cent of the value obtained. On the Atrato the platinum content

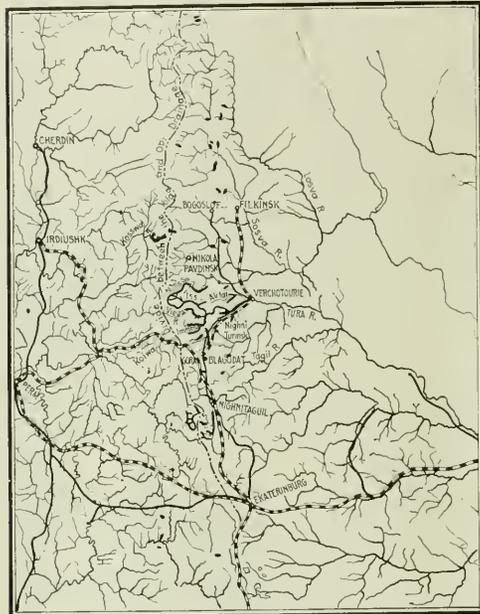

FIG. 3. MAP OF THE PERM GOVERNMENT, RUSSIA, SHOWING IN DETAIL LOCATION OF PLATINUM-PRODUCING PLACERS

is lower, ranging from 5 to 15 per cent. Platinum and osmiridium also occur in the streams south of the San Juan drainage, which enter directly into the Pacific, notably the Micaí and Patia, though little authentic data concerning them are available.

According to Dr. Tulio Ospina⁸, Director of the School of Mines, Medellín, Colombia, platinum is found widespread in conglomerates which cover an extensive area in the Atrato and San Juan basins. The metal has been reconcentrated in the present stream channels from which the major output of platinum comes. According to the statements of various observers, there are places on the interstream areas in which platinum has been concentrated. These areas are, from all accounts, old stream channels. The primary platinum deposits evidently are to be looked for on the west slope of the western ridge of the Andes, though no literature which gives detailed information on the geology of this range has been found. Peridotite, dunite, and other basic igneous rocks are represented in the platiniferous gravels.

There is scant information upon which to base an estimate as to the possible reserves of platinum in Colombia. Little has been published on the subject that gives good data on the geology of the country, but from all accounts it seems safe to assume that Colombia holds much promise and should be more carefully prospected.

Over 90 per cent of the platinum mined in Colombia is won by natives, mostly women, who wash the gravels in *bateas*. One dredge is now in operation in Colombia, though other dredging operations have been tried, which were, through various causes, not successful.

CANADA

A small quantity of platinum is produced each year by the placer operations on the Tulameen River, in British Columbia. The metal was derived from a mass of peridotite and dunite, which outcrops on Olivine Mountain west of the main drainage. The gravels of this area are apparently deep. Some platinum is found in the upper 8 to 20 ft., concentrated on a false bedrock as well as on bedrock. Reports were current during 1917 of discoveries of platiniferous placers on Peace and Willow rivers, but no definite information concerning the size or value of the deposits is yet available.

Most of the yearly output of platinum and palladium of Canadian origin is recovered as a byproduct in the electrolytic refining of the metal obtained from the Sudbury nickel-copper ores. That a far greater production of both metals from this source is possible has been shown by the Royal Ontario Nickel Commission.

UNITED STATES

Placer platinum is won in California, Oregon, and Washington. The dredges at the base of the Sierra Nevada mountains produce a large part of the placer platinum output of the United States, principally because of the great yardage handled rather than because of any particular concentration of platinum in the gravels derived from the Mother Lode belt. In northern California, the Klamath and Trinity rivers, particularly the Hay Fork of the Trinity, carry platiniferous gravels. In southwestern Oregon platiniferous gravels have been found at several places on the Illinois, Sixes, and Rogue rivers. Along the beach from Bandon, Ore., to Eureka, Cal., platinum occurs with the black sands, and has been won at a number of mines both near the present strand line and on ancient elevated beaches. In the Blue Mountains of eastern Oregon, and in the Strawberry Range south of John Day River, a few placers have been worked which carried platinum. In Washington, particularly on the south fork of Lewis River, near Yacolt, platinum has been found, and it is reported on the beaches from the Straits of Juan de Fuca south.

All of the platinum-bearing placers in the United States are closely associated with chromiferous serpentines derived from peridotites or pyroxenites. The concentration of platinum has not been great, the original quantity was not large, and consequently none of the areas seems capable of important production. Most of the crude platinum from the Pacific Coast placers carries considerable osmiridium as well as platinum.

As previously stated, the great bulk of the platinum won in the United States is from the dredging fields at the base of the Sierra Nevada mountains from Butte to Stanislaus County. The gravels in these fields are the result of several concentrations, though their platinum

⁸"Proceedings of the Second Pan-American Congress," Vol. 8 1917.

content cannot be considered high. In practically all of the other stream placer areas the gravels have not been subject to such extensive reconcentration, and in some places recent grave's carrying platinum have been found.

The beach deposits are the result of repeated concentration. The platinum and gold particles are excessively small, flaky, and difficult to separate from the heavy sands. The gold and platinum of the beach deposits are concentrated in the dark bands of sand caused by tidal and wave concentration. The payable lenses are rarely over one foot thick and taper out in short distances. It is, therefore, practically impossible correctly to estimate reserves.

Within the last two years a little platinum has been won from some widely scattered localities in Alaska, chief of which are the Dime, Bear and Sweepstake Creek placers, in eastern Seward Peninsula; the Boob Creek placers, Tolstoi district, Lower Yukon, and from beach deposits on Kodjak Island. Platinum also occurs in the

The greater production has been from the osmiridium-bearing gravels of the Savage River drainage in the Bald Hills mining district, in the northwestern part of Tasmania. Little has been published concerning the extent of these gravels, which were derived from the weathering of a series of sediments intruded by basic igneous rocks.

In New South Wales, beach deposits similar to those of California and Oregon are found from Beachy Head north past Clarence and Richmond rivers into Queensland. Apparently commercial exploitation of these deposits has had the many ups and downs of similar undertakings on our Western coast.

Some platinum was obtained from an old buried channel in the Platina or Fifield district, in central New South Wales. The 6 to 10 ft. of pay gravel of this deposit lies under an overburden of from 20 to 80 ft. Water is scarce in the district, and was not developed in sufficient quantities to warrant large-scale operations. Apparently the channel is strictly limited and has been mined about as extensively as is commercially possible.

SPAIN

Platinum in what may prove to be commercial placer deposits has been found in the Sierra Ronda, in southern Spain, about fifty miles northwest of the port of Malaga. Apparently the gravels have not been handled many times, as the concentration of platinum is not particularly great and it is problematical whether extensive development will be warranted.

OTHER REPORTED OCCURRENCES

A small amount of platinum is produced as a by-product from gold dredges on the Irawady River, in India, and from the tin dredges in the Dutch East Indies. Unconfirmed reports have reached the Survey of discoveries of platinum deposits in Westphalia, Germany; in southern Siberia, at various places in Mexico, and from several localities in Ecuador and Peru. Platinum is known to occur in some of the streams, as well as in certain of the gold deposits, of the Minas Geraes districts of Brazil. In southwestern Borneo platinum occurs in the gravels of streams rising in the Bobaris Mountains, in the Tanath-Laut district. Several Russian writers have provided information on this region, the latest, giving analyses of native platinum and osmium-ruthenium, being published in *Mus. Acad., Sci., Petrograd*, Vol. 6, pp. 49-95, 1915.

CONTROL OF THE WORLD'S PLATINUM DEPOSITS

As will be seen from Table II and the map showing the location of placer deposits, Russia has political control of approximately 90 per cent of the world's supply of this valuable metal. Colombia controls the next largest area of platinum gravels. It seems probable that Canada, in her resource of nickel ore at Sudbury and the known placers in the Tulameen and Barkersville districts, has control of the third largest reserve of platinum. The known deposits under the political control of the United States in Alaska and on the Pacific Coast are relatively insignificant. Great Britain controls the platinum of its colonial possessions in Australia, Tasmania, and India. The output of the Dutch provinces of Borneo and Sumatra is relatively small, although there is a possibility that the production from these countries may be increased. Spain may, perhaps, control a small output of platinum, though it is not dem-

FIG. 4. MAP OF CHOCO REGION, COLOMBIA, SHOWING AREA IN WHICH PLATINUM HAS BEEN FOUND

Upper Kahiltna drainage, north of Anchorage. Copper ores rich in platinum are produced at the Rambler mine, south-central Wyoming; from the Boss mine, in southern Nevada, and ores rich in palladium from a mine recently opened in southeastern Alaska.

AUSTRALIA AND TASMANIA

Platinum and osmiridium have been won in small quantities from Queensland, New South Wales, and Tasmania. Platinum is also reported from New Zealand.

onstrated that the production from that country will ever be large.

Prior to the war French commercial interests practically dominated the Russian platinum industry through the operations of the *Compagnie Internationale du Platine*. This company not only had extensive mining holdings, but also had contracts with some of the Russian platinum producers for their output. There were, however, some Russian companies which were more or less independent of the French company, and there are a large number of small miners and peasants who know no allegiance to any particular buying concern. The larger platinum-producing companies in Russia were the *Compagnie Internationale du Platine*, Shouvaloff's company, the Demidoff company, the Nicolo-Pavdinski company, and the Platina company.

The production from dredges has always been relatively small, as compared with the output made by other methods. It is estimated that about 80 per cent of the platinum won from the Russian placers is recovered by hand labor by lessees (*starateli*), who contracted to dispose of their production to the companies owning the ground and pay a royalty for the privilege of working. Since the war the peasants and miners are virtually in control of all the mines, and the original operators have little to do with their operation or management, and all reports indicate that none of the dredges is in operation and that little if any hand mining has been done.

The most important platinum-bearing placers in Colombia are controlled by American financial interests, and the most important concessions are being operated by subsidiaries of the General Development Co. Late in 1917 a British company was organized for the development of holdings on the Opogodo River, in the upper San Juan drainage. If the present conditions are not changed by action of the Colombia Congress, it is probable that American financial interests will continue to dominate the Colombia platinum.

It is understood that a large part of the placer area of the Tulameen River, British Columbia, is controlled by American capital. A few claims on the Upper Tulameen are controlled by Canadian interests. An American company has recently been organized for the purpose of exploiting certain prospective areas in the Barkersville region, in north-central British Columbia, and it is understood that Canadian capital has rather extensive holdings on the Peace River, in northern British Columbia, which are reported to contain considerable quantities of platinum. The nickel deposits of Ontario, which have a considerable prospective value as producers of both platinum and palladium, are operated by the Mond Nickel Co. and the International Nickel Co.

THE PLATINUM-REFINING INDUSTRIES

It is a peculiar fact that though the larger part of the Russian crude platinum is sold through a French company, England has handled a large part of the output of Russia. The Johnson Matthey Co., of London, is the largest platinum refiner in England. Other English dealers and assayers, as listed by the Munitions Board, are Lees & Sanders, the Warstone Smelting Works, the Sheffield Smelting Works, and Johnson & Sons. The chief platinum refiners in Germany are W. C. Heraeus and G. Siebert, of Hanau, and F. Eisennad & Co. According to Russian figures, about 25 per cent of the Russian output prior to the war was refined in Germany. The chief platinum refiners of France are Quenessen, de

Belmont, Legende et Cie., and *Compagnie Internationale du Platine*, the other refiners being Lyon Allemand, Lecht Lyonnais, Herique Marrett, and Bonnen, Hesse Fils.

In the United States the chief platinum refiners are Baker & Co., the American Platinum Works, Irvington Smelting & Refining Works, J. Bishop & Co., the Chemical Research Laboratory, H. A. Wilson Co., Belais & Cohn, Kastenhuber & Lehrfeld, Goldsmith Bros. Smelting & Refining Co., the Roessler & Hasslacher Chemical Co., Wildberg Bros., and Shreve & Co. There are also a number of refiners of scrap materials who handle platinum.

Prior to the war it is believed that there was more or less interlocking of interests of Johnson Matthey, of London; Quenessen, of Paris; Heraeus, of Hanau, and Baker & Co., of New York, but it has been stated that when war was declared these various companies were separated.

PRESENT SITUATION

As explained, owing to the situation of the chief platinum-producing regions, Russia has been the source of practically all of the world's platinum, though commercially the French controlled the marketing of the bulk of the Russian output. Since 1914 practically no platinum has been exported from Russia, and what little did get out came mostly to the United States. The situation of the various countries can be summarized as follows:

Russia normally used little of her own platinum, exporting it to England, France, and Germany. The country had virtually no platinum-refining capacity, the industry being controlled by French and Russian capital, with more or less German influence. Since the beginning of the Great War, Russia's platinum mines have not been extensively worked, and, in fact, the production from them has decreased at least two-thirds. Any accumulated stocks of platinum that may have been in Russia have probably found their way out of the country. It is doubtful if more than 50,000 oz. of platinum could be obtained in Russia now. There can be no question that a number of the Russian platinum deposits are still very valuable. It is stated on excellent authority that in all probability it would not be difficult for Americans to obtain control of some of the important mines, notably the Shouvaloff and Demidoff, and the purchasing of independently produced platinum might well be in the hands of American interests.

Before the war Germany refined about 25 per cent of the Russian production of platinum. In 1918 it was stated that works had been built at Wenden to treat large reserves of shale which carry one ounce of platinum per ton. Germany had built up great chemical and electrical industries, which required large stocks of platinum, and probably was in fair position with regard to the metal when war was declared. It seems probable that there is a shortage of platinum in Germany at present for any great expansion of either chemical or electrical industries. It is questionable whether German money will be available for investment outside of Germany for some time, and it consequently does not seem that there should be much competition with new German investors. However, it is known that German money was employed in the financing of the pre-war platinum operations in Russia.

France, through her control of the bulk of the

Russian output, was in position to have accumulated considerable stocks of platinum metals, and that she did so is indicated by the fact that the government did not undertake any regulation of the platinum industry until early in 1918. There were fairly large chemical and electrical industries in France, and it does not appear that great expansion of the chief industries requiring platinum was necessary. However, it is believed that the stocks of platinum metals which had been accumulating in France are now for the most part exhausted. In all probability the French *Compagnie Internationale du Platine* will make every effort to renew its contracts with the Russian platinum producers, and surely it will reopen its own mines at the earliest opportunity.

About 70 per cent of the Russian, probably half of the Colombian, and most of the Australian and Indian platinum was sold in England prior to the war. It is believed that not all of this was refined in England, for considerable amounts of crude platinum were exported from England to the United States. However, it cannot be questioned that large stocks of the platinum metals were on hand in England when war was declared. England had to build a great chemical industry during the war, and quickly used what reserves she had, so that the government early saw the necessity of controlling the use of platinum metals. English capital, through its many Russian connections, is undoubtedly in a strong position to enter more extensively than heretofore in the Russian platinum industry, and there can be little question that English financiers have already considered this possibility. That England realizes the industrial importance of platinum metals is evidenced by the government's interest in new ventures in platinum prospecting and mining.

FORECAST OF FUTURE OF THE PLATINUM MINES

At present the Russian platinum fields are practically idle. The dredges are for the most part not operating, and the industry is disorganized by the endeavors of the masses to work the mines. It will require considerable expense and several months, if not years, to rehabilitate the Russian platinum industry. The known deposits of the Russian field are becoming exhausted, and the reserves of identified platiniferous gravels are stated by Duparc to have a life of twelve years, based on the pre-war rate of production, or, stated differently, the known deposits are capable of producing between 3,000,000 and 3,600,000 oz. of platinum before they are exhausted.

Colombia appears to have large reserves of unworked platinum-bearing ground, though so little detailed information is available concerning these deposits that it is unsafe to predict their future. All reports indicate that the Choco district is well worthy of careful prospecting, which will probably be repaid by the discovery of considerable areas of platinum-bearing ground.

The Canadian deposits hold some promise for future production of platinum. Several recent discoveries of the metal along the Rocky Mountains in British Columbia, from the Tulameen to the Stikeen, indicate that further search may be rewarded. If reports are true, there is a considerable area on the Willow and Peace rivers which can be dredged for the recovery of gold and platinum. The most important Canadian platinum reserves are in the Sudbury nickel deposits, but it will require a change from present metallurgical practice

to give the maximum output of platinum and palladium from these ores.

In the United States, there does not appear to be hope for a considerable increase in the production of platinum. In fact, it may be that the output will be materially less when the new refineries for the treatment of Sudbury ores are completed in Canada. The placer deposits carrying platinum are for the most part relatively small. Many of those in northern California and Oregon cannot be worked at a profit, and few of them are available for dredging. As the gold-dredging field along the base of the Sierras becomes exhausted, the output of platinum in this country will decline in proportion, barring the discovery of new ground and deposits of gravel richer in platinum than those now known. Platinum is being discovered in new localities in Alaska each year, and it seems probable that the supply from this source may increase.

The various Australian platinum deposits do not appear particularly promising, as regards future production, with the possible exception of the Bald Hill dredging field, in Tasmania. The Fifield deposits are apparently nearly exhausted, and the beach deposits in New South Wales and Queensland are too low grade, and the values are too erratic in distribution, to appear of much commercial interest. The Spanish deposits have not been sufficiently explored to determine their extent, but from the published reports it does not appear that they will be found to be either large or particularly rich.

CURRENT PRICES

There has been some discussion recently of the value of platinum and platinum metals, the trend of which is to the effect that the present price—\$105 per oz.—is several times the actual value of the metal. Just before the war platinum was sold at \$45 per oz. In 1910 it was priced at \$33, and in 1906 it was about on a par with gold—\$20 per oz.

The price of platinum for the next few years will probably not reach the pre-war level, and it is reasonable to believe that the price for several years will remain nearer \$75 than \$50 per oz. Though some platinum may be released from sulphuric-acid works soon after peace is declared, it is probable that this platinum will be absorbed by other industrial establishments, notably nitric-acid plants, as fast as released. Large quantities of platinum now in industrial use will likely find their way to the general market, which is markedly short of supplies.

The Santa Gertrudis Company, Ltd.—During the quarter ended March 31, 1919, the mill crushed 98,012 dry short tons of ore. Value of bullion produced, £231,676; working expenses, including development and shipping and selling, £158,523; estimated profit at mines, £73,153. Expenditures for construction and equipment, £472. The crushing rate averaged 95.1% of full capacity. The company's profits are being earned at present on ore of an average grade of between 11 and 12 oz. silver, and 1.3 dwt. gold per ton. Total development in the Santa Gertrudis mine amounted to 1854 ft., of which 665 ft. was in payable ore, 498 ft. in vein below pay, and 691 ft. in country rock. Total development in El Bordo mine was 2024 ft.; of which 408 ft. was in payable ore, 119 ft. in vein below pay, and 1497 ft. in country rock, principally counter drifts for haulage ways. The retimbering of El Bordo shaft was completed to the 415-meter level. At the Malinche group, the Santo Tomas shaft has been retimbered for three compartments to the 170-meter level.

The Use of Oil in Diesel Engines*

Specifications Must Be Definitely Established and Conform to Most Efficient Operation—Treatment, Filtering, Conveyance, and Storage of Oil—Construction and Situation Of Tanks Should Be Planned Carefully

By L. H. MORRISON

THE question, "Why do three makes of engines act so different with the very same oil," was asked by Kelly, in the course of a conversation covering several subjects relevant to the use of Diesel engines.

"Because the results obtained depend a great deal on the engine," said Egan. "If the oil is a little heavy, the compression will affect the combustion. If the compression pressure, and consequently the temperature, is low, there isn't enough heat in the combustion chamber to ignite the oil thoroughly, and the exhaust will be smoky, because of unburnt carbon passing into the exhaust. Another evidence of the poor combustion will be the decreased horsepower. As to the high compression necessary to secure proper combustion of the heavier oils, it is well to bear in mind that this requires a higher injection pressure."

"Why so, chief?" asked Kelly, who was trying out one of Egan's cigars and was devoting most of his attention to that piece of "rope."

"A little exercise of your gray matter would prevent that question," retorted J. R., who rather objected to Kelly's cigar confiscation habits. "Can't you see that if the pressure in the cylinder is high, the air pressure must also be high to have the same pressure drop through the atomizer? If heavy oil is to be used, of course, the engine compression can be increased by inserting shims between the connecting rod and the big end. But even with the compression high enough to burn this heavy oil, it is necessary to raise the injection pressure anyway. Before Kelly asks why, I'll say that the heavy oil has greater frictional resistance passing through the atomizer, and a higher air pressure must be used."

"Well, chief," began Woods, "what kind of fuel oil do you recommend? I've just read a catalog, and it looks like that engine can burn any oil."

"Yes, I've read those catalogs, and they claim to burn anything from anthracite to buttermilk. But there is a lower limit as well as a higher limit to the gravity of oil that can be used continuously. Any oil that will flow through an inch pipe can be used in our engines for a day; but I won't state definitely the length of time the engines will be down for cleaning the cylinders and loosening up the rings. The desirable oil is one that will burn clean, leaving no carbon deposits."

"How about kerosene, then, chief?"

"That is a reminder, Woods, of your old days of running a hot-ball engine. Kerosene is the thing in such a mill. With a Diesel engine it is too light and volatile. Even if the fuel-valve cage is water-cooled, it is pretty warm down close to the nozzle, and much of the kerosene will vaporize. This is especially true when an open nozzle is used. When the needle valve opens, the air pressure blows this gas into the cylinder without any 'braking' effect. There then occurs the ignition of a considerable mass of fuel gas, which will cause a knock or

pre-ignition pound. The engine has a tendency to run hot. This, of course, is due to the fact that most of the kerosene is injected at or before dead-center, which means less power production and more heat absorbed by the engine itself.

"The same objection applies to the oil that is popularly known as distillate, which has a gravity of from 36 to 44 deg. Bé. I've found we have had better success using the distillate known as desulphurized fuel oil that has a gravity from 28 to 34 deg. Bé., and, though black in color, is clean and practically free from grit. It flows fairly freely, which is a boon in winter, when the heavier oils are practically useless unless heating coils are used in the storage tank."

"What oil showed up best in the tests, chief?" Kelly inquired.

"The 28- to 34-deg. oil burned better, the exhaust showed clearer, and after a ten-hours' run the cylinders

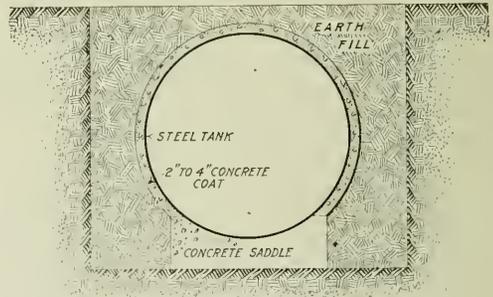

FIG. 1. PROTECTING A BURIED STEEL STORAGE TANK

were clean, and the valves free from carbon. It will cost more per gallon than the 20-deg. oil that we tested the first day, but the amount used per year and the cost of repairs will be less."

"How about that 'slop' which came from Mexico? I didn't fancy that when we ran it out of the barrels." It was Kelly who relieved himself of this caustic opinion regarding the fuel from our southern neighbor.

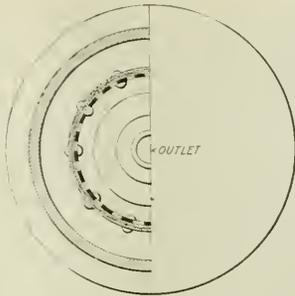

"Your taste, Kelly, for once was very good. I confess I was attracted by that cheap oil. I'd heard of several plants using it. We wrote to one plant, asking their experience, and the reply was favorable. During these tests I learned from the oil man that this identical plant was having trouble.

"The difficulty with that 14-deg. oil is that it gums up the engine. You know how much work we had cleaning the piston heads and loosening up the rings. Such an oil wouldn't do where an engine was to be fully loaded for hours at a time. It has no place in an engine unless used in connection with an ignition oil."

"What oil?" Woods was quick to inquire.

"In a minute, Woods, we'll look into what I mean by

*From an article "Talks on Diesel Engines" in *Power*, May 6, 1919. The article is one of a series on Diesel engines appearing in several issues of that publication.

Sect on A-B

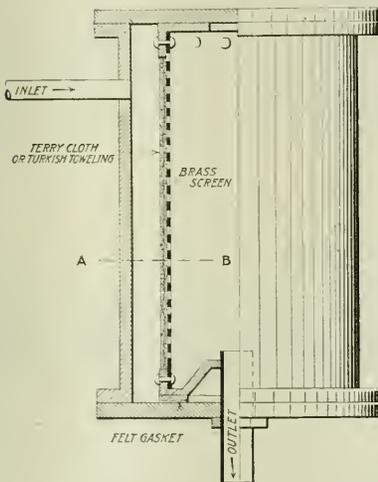

FIG. 2. HOME-MADE FILTER FOR FUEL OIL

ignition oil. I believe you fellows should know what oil we expect to use this year. Here are the specifications: Heat value, not less than 18,500 B.t.u. per lb.; gravity at 60 deg. F., from 28 to 34 deg Bé.; residue, not over 10 per cent after a sample has been heated in an oven for 100 hours at 550 deg. F.; flash point, 160 to 220 deg. F.; burning point, 180 to 275 deg. F.; sulphur, not over 0.5 per cent; water, not over 0.25 per cent; and the oil to have an asphaltum base.

"There should be a filter between the storage tank and the engine tank. We use the home-made type shown in Fig. 2. As you see, the top and the inside screen can be removed for cleaning without breaking a single pipe joint. By the use of the two filters, one can always be at work. There is only one feature that requires care. Always be sure that the felt packing rings are in place when you insert the screen. This screen is made of perforated brass sheet, and is covered with two folds or layers of terry cloth, although we are actually using Turkish toweling, as we have no real terry cloth."

"Mr. Egan, what sort of storage tank is the best?" Woods questioned, as it was evident Egan was through with his filter.

"If a plant is under 500 hp. a steel tank is best, I think. It is more expensive than a concrete tank, but

the ordinary concrete man cannot build a leakproof tank. The size required will not justify securing an expert, and so the steel tank is the best to use."

"How about a wood tank?"

"A wood tank has one thing attractive about it—its low cost. But the low cost proves expensive in a year's time, owing to the rapid evaporation of the oil. No matter how low grade it is, there are some lighter portions, and the hot sun seems to draw these through the wood staves. I'd estimate a loss of at least 10 per cent.

"As to the steel tank, it doesn't pay to use too light a plate. The shell should be of $\frac{3}{16}$ - or $\frac{1}{4}$ -in. material and the heads should be $\frac{1}{2}$ in. thick. The longitudinal seams should be double-riveted, but the girth seams may be single-riveted. If a capacity of 8000 gal. is required, one tank will do, but for a greater capacity use two tanks. Then you have a chance to clean out the slime from one while the other is full."

"How about putting the tanks in the ground?" broke in Woods.

"By all means," said Egan. "If they are above ground, there is always a fire hazard, and the pipes are exposed to injury and meddling. Place them on concrete saddles in a pit about a foot deeper than the diameter of the tank, and pack earth in the pit, leaving about 4 in. between the dirt and the tank, as shown by the cross-

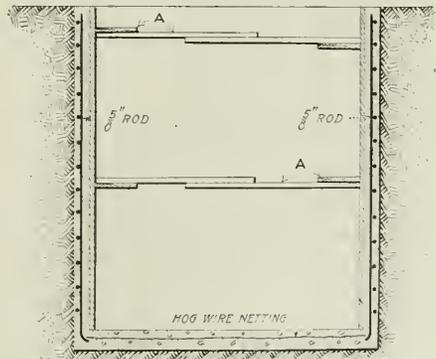

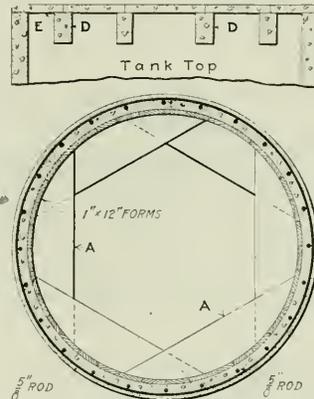

FIG. 3. CONSTRUCTION OF CONCRETE STORAGE TANK

section, Fig. 1. Then pour in concrete, covering the entire surface of the tank. If wooden forms are used, the concrete covering can be made as low as 2 in. thick. Of course, the concrete must be fairly neat to run through this narrow space. You then have a rust-proof storage.

"In making concrete tanks I favor the vertical cylindrical type. Many square tanks have been built, but they all tend to crack at the corners. Some people say that if oil leaks into the surrounding dirt it will form a cement and prevent further leakage. The trouble is that a lot of oil is lost before this cement job is finished.

"It is easy to build a round concrete tank. Dig a circular pit of the necessary diameter and depth, as shown in Fig. 3, and inside it build up a cylindrical form made of boards 1 in. by 12 in., held to shape by the segments A. Use hog wire netting to reinforce the bottom, insert the vertical reinforcing rods about 18 in. apart, and to them wire the circles, spaced about a foot apart. Then run in the concrete between the wooden form and the sides of the pit."

"How about the top?" asked the Scotsman.

"That's the hardest part," said Egan. "Some use a wooden roof, but we covered ours with concrete slabs

a check valve in the line. Run the other end to the coils, and then arrange to discharge the coils into the cooling-water sump. By cracking the regulating valve slightly a circulation of hot water is set up.

"If you ever install an outfit, use considerable care with the oil piping. Every joint should be threaded carefully and made up without red lead or other compound. Remember that oil will leak at joints that are water-tight. Never use anything but heavy-pattern brass valves with nickel seats and valve disks.

"An important adjunct to every Diesel plant is a starting tank of kerosene. Even with a good grade of fuel oil, it is hard to start an engine on cold mornings. Using kerosene for the first five minutes will bring the engine up to speed quickly and warm up the combustion chamber and valves."

"Now, chief, what did you mean by ignition oil?" Woods inquired.

"Well, as I stated, low-grade oils, such as Mexican, ignite slowly. If an engine runs at 180 r.p.m., there are three revolutions per second. If the period of combustion is 10 per cent of the piston stroke, it cannot exceed 1/60 of a second. When you recognize that the beginning of the injection of the fuel and its atomization are necessarily slow, and consider the time spent in

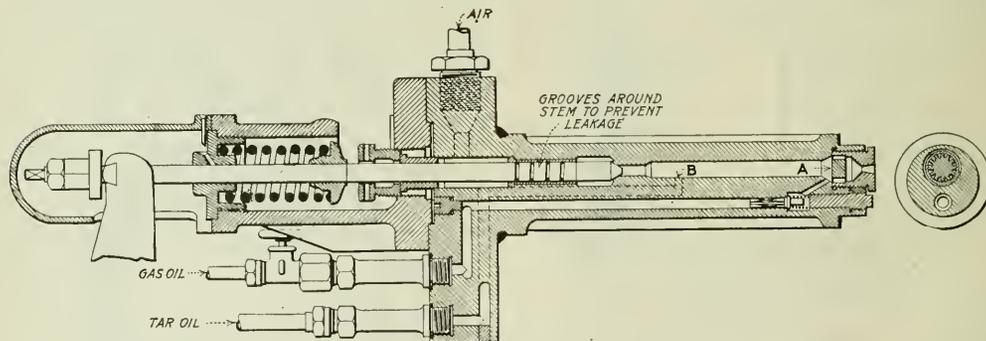

FIG. 4. SECTIONAL VIEW OF KOERTING NOZZLE FOR GAS OIL AND TAR OIL

supported by reinforced girders. Our tanks were 12 ft. in diameter and 16 ft. deep, and we used four girders, *D*, each 8 in. by 12 in. cross-section. To make them we built a wooden form having that cross-section and inserted twelve 1-in. iron rods to reinforce the concrete. We ran the girders of different lengths, to suit their position on the tank. The slabs *E* were not reinforced, but were grouted together, and the job was satisfactory."

"Chief, you spoke of 14-deg. oil needing heating coils in the tank. I notice that our tank has coils, even if we do use light oil."

"That's a thing all storage tanks should have. It makes the fuel easier to handle and no steam boiler is needed. There are two methods of operating the coils without a boiler. The first is to operate the engine cooling-water system under pressure, or, as it is called, use a closed system. By arranging the necessary regulating valves, part of the discharge can be bypassed through the tank coils. It takes some time to heat the oil to 120 deg. F., but once it is warm the coils will keep it at this temperature. The second method is to arrange a jacket about part of the engine exhaust pipe. Connect this to the overhead water tank, using

mixing the atomized fuel and the air, as well as the cooling effect of the injection air, it is evident that there are many factors that tend to retard the combustion. Even when using a high-grade oil this period is none too long.

"Low-gravity oil demands a longer time in which to be atomized, mixed with the air charge, and ignited. The oil particles are larger than in the case of light oils, and the actual time of burning is longer. To utilize a low-grade petroleum oil or tar, one of several methods must be adopted. The first method is to heat the heavy oil or tar to a temperature around 200 deg. F. and to raise the injection-air temperature to avoid any chilling action during the atomization of the charge. This method is fairly satisfactory with oils above 16 deg. Bé., but with lower-grade oils and tar I've never heard of any plant using it successfully.

"The second method is a variation of the first. The oil is heated, and a small amount of gas oil of from 25 to 35 deg. Bé. is mixed with it in the storage tank. It is practically impossible to keep the two oils thoroughly mixed without resorting to some form of mechanical agitator. In one plant a motor-driven paddle wheel such as is found in a brine-cooling tank was em-

ployed. The light oil thus added is called an ignition oil. Its purpose is to supply a fuel that will ignite quickly, raise the cylinder temperature and produce a flame. This plan works with any petroleum fuel, but is not good when tar oil is used. In tests using mixtures of tar oil and gas oil, it has been proved that 25 per cent of tar oil and 75 per cent of gas oil is the best mixture when the engine is to operate on a varying load. If the engine is to develop full load all the time, a 50-50 mixture can be used, because a high temperature is maintained. Consequently, it would be advisable to use gas oil for low and half loads, reserving the use of the tar mixture for three-quarters and full loads only.

"Another method involves the use of a small amount of gas or solar oil that is deposited close to the nozzle and blown into the combustion chamber ahead of the tar oil. The oil ignites at the ordinary Diesel temperature and provides a flame positively to ignite the tar when it enters the combustion chamber. This plan demands a fuel valve that has separate tar-oil and gas-oil connections, as well as separate fuel pumps. In the Koerting valve, shown in Fig. 4, the ignition oil is deposited at *A*, just behind the nozzle plate, and the tar at *B*, and as the valve opens the air blast blows the ignition oil in ahead of the tar."

Metals Required for the German Steel Industry*

Molybdenum and Vanadium Can Be Obtained From Domestic Sources, but Nickel, Chromium, and Tungsten Must Be Imported

THE supply of metals required for the German steel industry is the subject of a recent monograph by Beyschlag and Krusch (1918), who arrive at the conclusion that sufficient molybdenum and vanadium can be obtained from home sources, but nickel, chromium, and tungsten must be imported.

In 1913 Germany consumed about 6,000 tons of nickel and 100 tons of cobalt. About 500 tons of the former was obtained from the nickel-cobalt ores of Frankenstein, Schneeberg, St. Blasien, and Sohland, and the remainder from New Caledonia and Canada, sources which must be tapped again after the war. All the chromium used has hitherto been imported. In 1913, a total of 23,251 tons was obtained from New Caledonia, Rhodesia, and Turkey. In the same year, 400 to 500 tons of tungsten was extracted from native ores, of a total consumption of 4,500 tons, the imported material coming from Spain, Portugal, Argentina, India, Australia, Malaya, and England.

Prior to the war, molybdenum was used in Germany solely as a source of chemical preparations; only in the works at Teutschenthal was ferromolybdenum produced for export to England. The best native source is the Mansfeld copper schists, which contain 5 per cent of molybdenum ore; and the wulfenite deposit at Werdenfels, in Hölenthal, near Garmisch, still awaits exploitation. The total home demand could be met by the vigorous working of the native copper schists.

The demand for vanadium was small before 1914. Today it is from 600 to 800 kg. per month. German South-West Africa (Otavi) formerly supplied 60 to 150 tons of mottremite, containing 8 to 10 per cent of

vanadium. Iron ores and clays have a small vanadium content, and slags show 0.5 to 0.7 per cent vanadium; and the copper schists also contain this metal. Foreign sources of supply are Colorado, Utah, Pennsylvania, New Mexico (Siena de los Cabellos), and Peru (Mina Rapros). In 1911 the last-named produced 2,151 tons of ore, equal to three-fourths of the world's production. The German demand will probably be about eighteen tons, and this should be obtained by recovery from slags.

The authors advise the accumulation of a reserve of the above metals, sufficient to last five years, which could be used instead of gold for covering the issue of paper currency. The state should acquire the following (in metric tons); Nickel, 20,000; chrome ore, 150,000; wolframite, 10,000; molybdenum, 750, and vanadium, 45. These would have a total value of 341.75 million marks (about £17,000,000).

Panama Manganese-Ore Deposits

According to a report of the British Consul at Colon, published in the *Ironmonger* recently, new deposits of manganese ore have been discovered in the high country near Boqueron, in the valley of the Chagres River, in the Republic of Panama. The deposits are "bedded" and outcrop at the surface, and these outcrops are more prominent near the summit of the ridges. Owing to rapid erosion and disintegration, part of the ore has broken up in the form of boulders, which are scattered throughout the intermediate ravines. These boulders are, in almost every instance, of solid ore, and many of them weigh more than 150 tons.

All development work has been confined to open cuts and pits, and at the two mines already started it is estimated that there are approximately 30,000 to 40,000 tons of surface ore in sight, which, with little hand sorting, will average better than 50 per cent manganese. With water-power and cheap labor available, finer ores which are embedded in clay can be concentrated at small cost. The Boqueron River could furnish adequate power for any operations that might be projected, and could produce at minimum flow at least 2,000 hp.

Duty To Equip Mines Modernly

By A. L. H. STREET

Attorney at Law, 820 Security Building, Minneapolis, Minn.

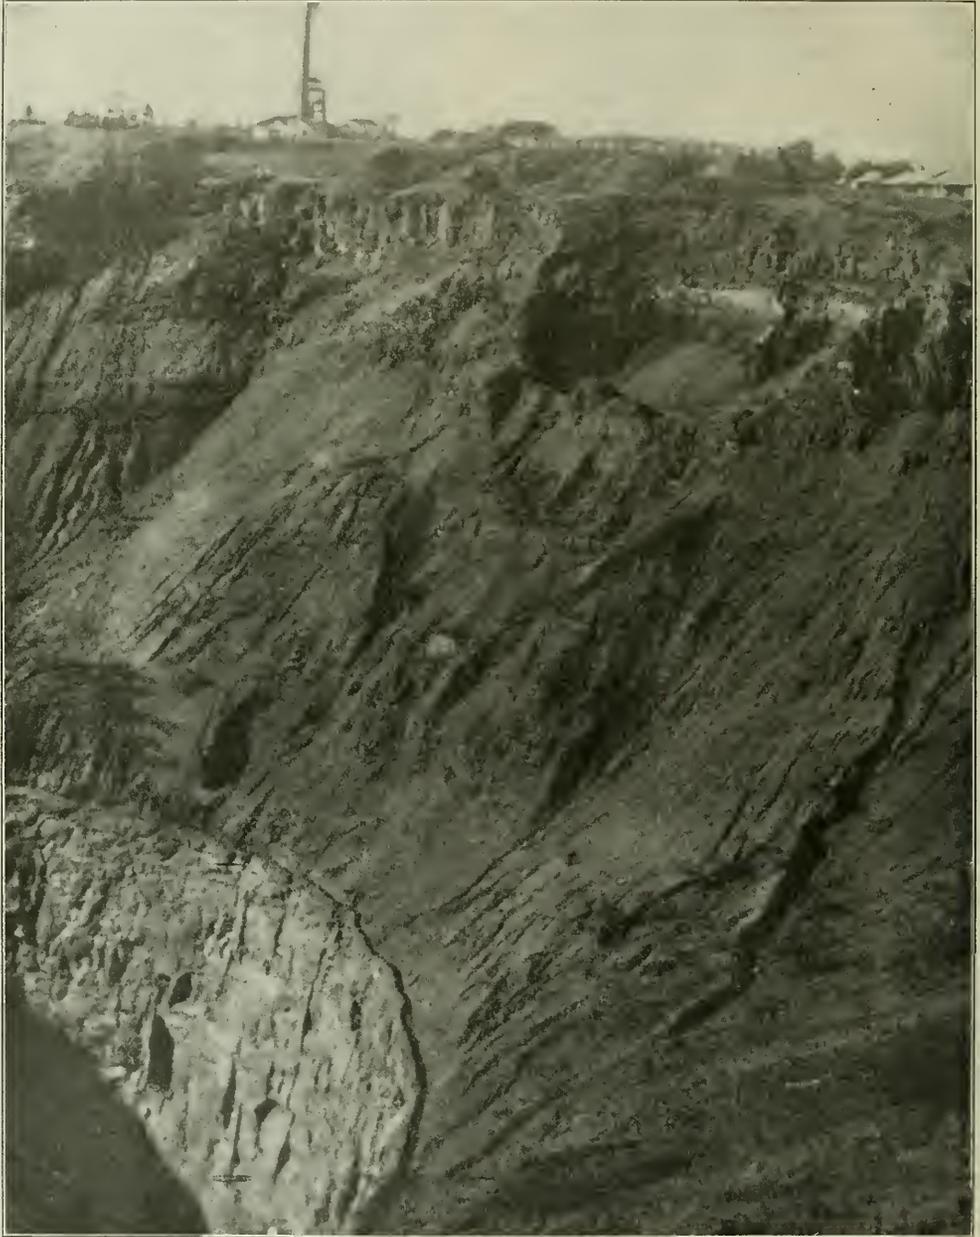

A question presented to the Alabama Supreme Court recently, concerning the liability of a mine operator to an employee for injury to the latter, was whether the operator was guilty of actionable negligence in using poles across a mine entry to prevent cars from running back into the mine, instead of having a derailing switch installed. (*Kilgore vs. Connors-Weyman Steel Co.*, 80 *Southern Reporter*, 454.)

The court took this view of the question: An employer need not adopt machinery and appliances of any particular kind, nor the best and safest to be had. And he need not install every known safety device. His legal duty is merely to discontinue old and insecure methods, and to adopt such improvements as are in ordinary use in prudently conducted mines similarly situated.

The court holds that evidence to the effect that well-regulated mines had derailing switches was in itself insufficient to show that prudently conducted mines in the particular locality, situated similarly to the defendant's mine, used derailing switches.

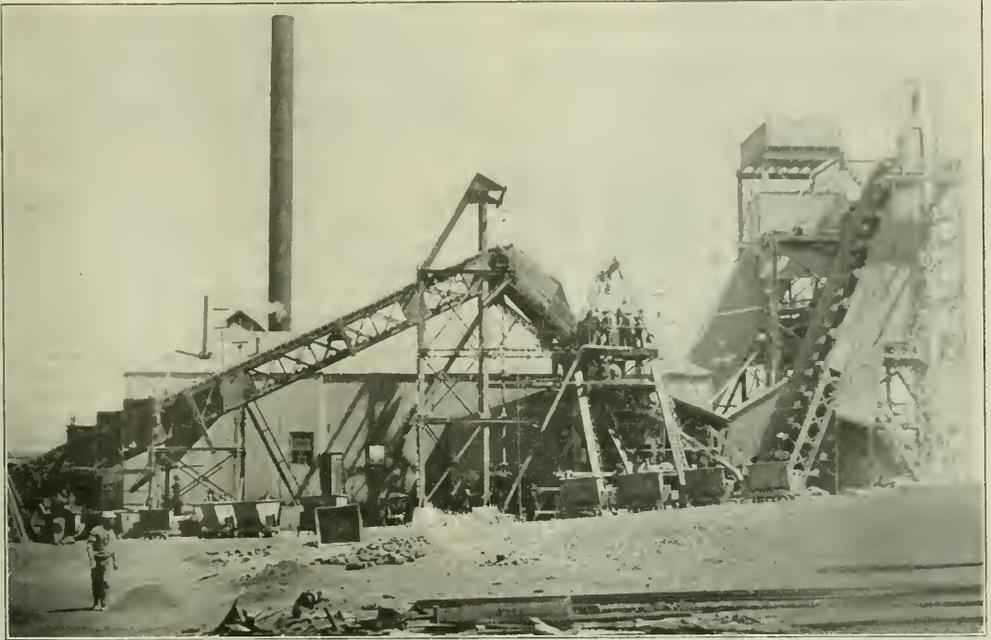

*From a translation in the *Journal of Chemical Industry*, May 15, 1919; from *Metall u. Erz*, Feb. 8, 1919.

Diamond Mines in South Africa

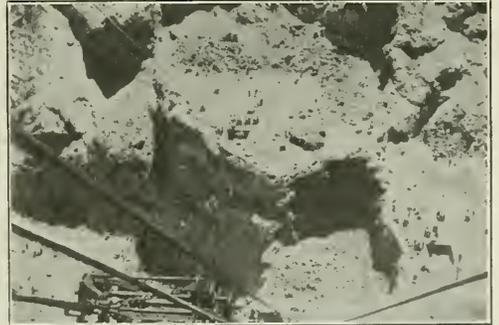

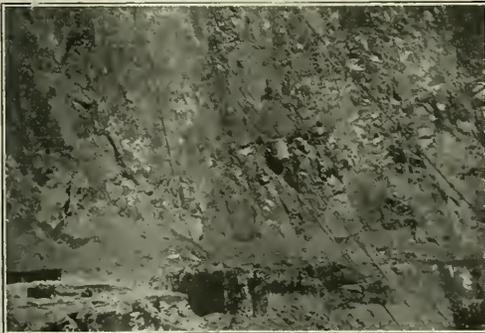

THE KIMBERLEY MINE AT KIMBERLEY, CAPE COLONY

It is impossible to get a photograph showing the entire depth of this pit, nor can the bottom be seen from the edge of the crater. The shaft, which runs down parallel, has now reached a depth of about 4,000 feet.

Rand's Financial Aspect

Yield on Capital Invested Amounted to Less Than 2½ Per Cent—Calculation of the President of the Chamber of Mines—Amortization

By A. COOPER KEY

FOR the five years previous to the Great War, the average profit made by the mines of the Rand was 9s. 9d. per ton, but last year the rate, by the operation of ever-increasing working costs, had fallen to 6s. and the early months of this year have witnessed a further drop. Owing to the greater tonnage coming into the aggregate run from the richer mines in the Far East Rand, the recovery is 1s. 6d. higher than in 1914 and about the same as in 1910 and 1912. Were it not for this factor the profit would only be about half the pre-war figure. In these circumstances it is not surprising to find Sir Evelyn Wallers, president of the Chamber of Mines, declaring in his address delivered at the meeting of that body that "A considerable portion of the Rand shareholders' dividends are, unfortunately, either practically or actually non-existent. . . . Even taking the industry as a whole, it will be found on investigation that it is now paying under 2½ per cent on the capital that has been invested in it."

This statement is characterized by the *London Financial Press* as a "startling assertion" and regarded as a dismal view, the mines of the Far East Rand being looked upon as likely to improve the position; but the expected advances are unlikely to be considerable, except in the case of the new Modderfontein, which has now completed its program of expansion, to be largely defrayed out of present profits, or from those accruing in the next few years; while these may be neutralized by further decline in the dividends of the Central Rand companies. The greatest mine known to the fields, the Robinson, may not be milling this time next year, and even if it is, it will be on only low-grade (main reef) ore. Last year the smallest profit in the whole course of its existence was recorded, the return being about £65,000, compared with £1,000,000 ten years ago.

A CONCISE SUMMARY

Sir Evelyn Wallers puts the excess costs attributable to the war at £6,000,000, of which £4,000,000 represents increased cost of mining supplies. His summary is so clear and concise that it may well be quoted, though I have anticipated some of the figures in an earlier article.

The effect of these increases on the prosperity of the industry was also more marked in 1918 than in any previous year. The dividends declared by the Witwatersrand Gold Mines in 1918 amounted to only £5,144,077, compared with £8,073,436 in 1914. Analyzing the dividends declared as between the Far East Rand mines and the remainder of the Witwatersrand, the heavy fall in dividends becomes still more evident. In 1914, out of the total dividends declared of £8,073,436, the sum of £6,357,933 was declared by mines other than on the Far East Rand. In 1918, those same mines declared dividends of only £1,929,430—a hopelessly inadequate return on the capital invested in them. The working profits decreased from £11,553,697 in 1914 to £7,500,270 in 1918, and from 9s. to 6s. per ton. Working costs increased from 17s. 1d. in 1914 to 21s. 7d. in 1918, and the total costs from £21,943,692 in 1914 to £26,848,547 in 1918. It is true that this increase in working costs (most of which are expended on the Witwatersrand) coupled with the distribution of war expenditure on supplies, separation allowances, and similar charges, has resulted in the unprecedented prosperity of the community, and we have certainly thus expended in working costs an additional sum of at least fifteen millions sterling during the period of the war, assuming equal ton-

nages treated. It is, however, a short-sighted view which considers that the elimination of a reasonable profit to the shareholder by the distribution of that profit in costs is really a satisfactory position, more especially when it is remembered that in many cases the continuation of operations by the mines has been possible only by a policy of extracting the richer ore in too large a proportion, thus shortening the lives of the mines, and, in the long run, the life of the community.

AMORTIZATION OF WORKING CAPITAL

One must avoid rushing to the conclusion of swift mental arithmetic that because the dividends paid are £5,000,000 and the rate on capital is 2½ per cent, £200,000,000 is invested in the Rand mining industry. The explanation of the low yield lies in the large amount required for the amortization of (a) the value of the property being gradually exhausted by every year of mining work, and (b) the value of development and equipment. In 1913, some figures placed in evidence before the Economic Commission by the Chamber of Mines showed the latter to be £2,250,000. We may now increase this to £2,500,000 at least, in view of the larger equipment expenditure of Far Eastern mines during the intervening five years. Last year the tonnage crushed was 25,000,000, so the amortization allowance for working capital amounted to exactly 2s. per ton. To correct any possibilities of duplication of development expenditure under working costs and under capital account, the chamber reduced the total unit figures 18 per cent. The latter would thus become 1s. 7½ d., which compares with 1s. 5d. assumed in 1913. Obviously, the annual contribution for amortization remains fixed; it may even increase if the period of aggregate mine life is reduced, and increases when expressed on the unit basis if the tonnage crushed diminishes, as indeed it has done.

A sum of about 1s. 3d. per ton is required to meet profits tax and war levy, miners' phthisis compensation charges, claim licenses and other similar expenses. Reconstructing the table given in the evidence of the chamber in accordance with last year's results adduces the following:

	Per Ton	Per Ton
Average yield per ton, 1918		27s. 11d.
Working costs	21 a. 7 d.	
Other operating costs (excluding profits tax)	5s.	
Amortization of working capital	1s. 7½ d.	
Amortization of property	1s. 7½ d.	2s. 3d.
		2s. 8d.
Profits tax and war levy		10d.
Margin for remuneration of capital		1s. 10d.

THE RAND'S NOMINAL AND CASH CAPITAL

In the evidence referred to, the chamber took vendor capital (for properties) as being the same amount as the equipment development capital, a figure closely calculated for the purposes of Mining Taxation Act. This appears to give a figure in excess of that shown in statistics issued by the Mines Department. The total capital is shown by the latter as £103,400,000, though a rather lower figure, £91,000,000, is obtained by adding the issued capital, the premiums on shares, debentures, and temporary advances.

Actual cash supplied (which of course excludes vendor scrip given for the properties) was much less, namely £51,500,000, a figure which would be reduced by no less than £17,000,000 by premiums written off and debentures repaid. Some authorities argue that there is no need to amortize the working capital, inasmuch as many of the mines have repaid the original capital several

times over. In support of this line of reasoning they point to the Robinson, which has paid twenty times in dividends the amount expended in development and equipment. The expert can choose among these different sets of figures, but if £100,000,000 be assumed to be reasonably correct, it is clear that the yield of the Rand companies, after allowing for amortization of working capital, but not of vendor capital, is only about 2½ or 3 per cent.

FURTHER FALL IN THE MARGIN FOR REMUNERATION

The rate of profit in January was only 5s. 8d. per ton and in February 5s. 6d. per ton. It has been shown that amortization of working capital, minor expenditure items, profits tax, and war levy alone represent 3s. per ton. This leaves only 2s. 6d. per ton for amortization of property expenditure and remuneration of capital. Even when the profit was 10s. per ton, the Chamber of Mines said: "The producing mines of the industry are as a whole only paying their way in respect of adequate remuneration of capital, and there is no margin whatever for the imposition of further taxation." Since then, the war levy, an entirely new provincial taxation, has been imposed, or, should one rather say, super-imposed?

Of course, all the foregoing applies to average results, those of individual companies varying within wide limits. The Rand industry may not be singular in yielding a poor return upon the investments. One recalls calculations that every sovereign worth of gold has cost 25s. to 30s. to produce and the microscopic financial returns upon both American and British railway investments when, in similar fashion, they are viewed in the aggregate.

Improvised Snowshoes

BY CHARLES E. DUTTON*

Goldfield, Nevada

During January, 1916, many sections in the United States had exceedingly heavy snows. I was in an isolated camp, seven miles from town, short of provisions, and had to move. There was no wood suitable for making skis, so I turned my attention to the problem of snowshoes. At first, I could find nothing to use for a frame, or webbing. After looking at every conceivable object in camp, I finally saw several empty five-gallon Standard Oil tins, and, remembering that they had pulled me out of the hole many a time, having served in various ways from a washpan to a bake oven, I decided to give them a chance, with the result shown in the accompanying photograph.

The top and bottom of the can were cut out first, then the side was ripped at the seam. The remaining sheet of tin was then flattened out, the corners at one end were rounded off for the toe, and the other corners cut down to the heel. This furnished a light binder, or substitute for webbing.

After pulling off a couple of redwood strips of ¼ by 3-in. battening from one of the shacks, they were cut as shown and tacked to the tin with long carpet tacks and cleated on the upper side. The cross-pieces were then tacked to the upper side, after spacing them so that the heel of the boot might rest squarely on the one, and the sole evenly on the other. The tops of old discarded boots were nailed on, thus making it possible for

the snowshoes to be laced over the toe of the wearer's boots.

On account of the shoe being entirely flat, the toes occasionally dug into the snow, but when town was

SNOWSHOES MADE FROM FIVE-GALLON OIL TINS

reached, this was remedied by nailing on the ends of two old automobile fenders. I made several trips to town and back with the improvised snowshoes, and kept them on hand for another emergency.

Increasing the Life of Mine Timber

Mine operators have learned that it is absolutely necessary to keep all timbers used in the interior of the mines in the best of condition. The many cave-ins and accidents that have resulted from the deterioration of timbers are evidences of the necessity of proper precautions. The timbers used as supports and struts across the top of the passageways in the mines are subject to the action of gases and fumes which occur in the mines, and also to insect attack. These different destructive agencies cause the decay of the wood, and as a result the timbers last only about six or seven years on the average. Of course, they may not actually fail at the end of that period, but beyond that time their condition is such that they are considered unsafe.

It has been found that the life of the timbers can be doubled and even trebled by coating them with a creosote compound which will fill up all the pores on the exterior of the timber and prevent gases, fumes, and other agencies from acting on the wood. The coating of the timbers is a simple and easily performed process and is quite economical. Its application will prove a profitable investment.

In Handling Flotation Concentrates at Anaconda no samples are regularly taken of the thickened concentrates discharged from the thickening tanks. Hand samples of the filtered concentrates are taken at two-hour periods, and the samples placed in covered pails. One sample covering each eight-hour shift is weighed, dried, the dry pulp weighed and the percentage of moisture calculated.

A Phase of the Apex Law

How Its Application Has Operated To Thwart Development—Decisions Enunciating Its Principles, and Remedial Suggestions

BY CHAS. E. DUTTON

Mining Engineer, Goldfield, Nev.

IN THE early days of mining there was no deep mining below the surface, and I believe the intent of the early metal miners was to apply the apex principle to "oreshoots and deposits," instead of to the "ledge or vein" as later interpreted by the law. No miner cares much for a vein or ledge after he has mined the ore. Oreshoots are generally about as deep as their length, and they vary in length from a few feet to hundreds, rarely reaching 1,000 ft. Sometimes new oreshoots are found a hundred feet or more below the upper ore occurrence, and yet apex within the claim. At other times no new oreshoots may be found in the vein as far as mining can go. Hence, prospecting underground for new oreshoots must continue, as it did originally near the surface.

It is a fortunate thing for a prospector to make an original discovery of ore on or near the surface. But what about the large number of others who may locate the adjoining ground in each direction, irrespective of ore or ledge. They are also prospectors, and often their claims are developed into mines, sometimes before the original discovery of the district becomes successful. The law does not, or at least should not, play favorites. Here is a Claim X, half a mile east and parallel to the original discovery. A shaft is sunk to gain depth, the four directions are prospected, and ore is found. This stimulates the claim owners between the two strikes. Now, it rarely happens that prospectors keep claims very long when they can sell them, ore or no ore. In either case somebody wants them for their ore value or for manipulation, or both. Years later X, now a corporation, is served with an apex suit by the original claim owner half a mile or more west, now also owned by a corporation. Investigation of the underground workings between the two discloses geological evidence in favor of the continuity of the original vein. To appreciate the result, take as an example the evidence given in the "Booth vs. Jumbo Extension" case at Goldfield, Nev. H. V. Winchell in his report to the Jumbo Extension makes the following statement:

Summarizing the results of my examination, which while not complete as to all of the very extensive workings of the Goldfield Consolidated, yet has led to definite conclusions, I find as follows: (1) There is a large vein on the Booth claim, which outcrops at places on the surface and probably crosses both of its end lines. (2) The Booth end lines are parallel. Hence the claim has dip rights in the directions of its end lines. (3) The orebodies in the Jumbo Extension property are probably on the Booth vein, and in a general way on its descent into the earth, and between the planes of its end lines extended in their own direction. (4) The Booth claim was located before any other claim on this vein, and hence has superior rights upon the dip, in cases of conflict.

In addition to the probability thus clearly indicated that the Jumbo Extension Co. cannot expect to prevail in an apex suit fought to a finish in court, there are other considerations which should be carefully taken into account in this connection. Mining litigation is expensive in many ways. Besides the actual expenses of developments, of lawyers and experts, the mine is often forced to suspend

mining operations over long years, and dividends are consequently stopped. Indeed, the costs of such litigation frequently run into hundreds of thousands of dollars, with both litigants suffering and neither of them deriving any benefit or certain of the ultimate outcome.

As the presumptive owner of ore beneath your surface, you have a certain strength of position; in view of the necessarily great cost of developing and proving their case it can hardly be supposed that the Booth Co. desires to fight the case out. Under these circumstances I would certainly advise you to bring about a settlement of the matter through some sort of compromise or consolidation with the Booth. If you can effect an arrangement by which you would surrender one-quarter of the proceeds derived from your ground you would not only escape from an embarrassing and dangerous position, but would be enabled to continue your operations without delay and save the large expense of litigation.

J. R. Finlay, in his report to the Jumbo Extension, concludes with the following statement:

I do not believe that this present controversy between the Booth and the Jumbo Extension ought to be made any exception to the rule that has been established here. It will be good business to compromise by giving the Booth Co. an interest 25 per cent or less in Jumbo Extension for a vertical side-line agreement. Such a compromise, whatever the abstract rights and wrongs of the case, will, in my judgment, be wise for the following reasons: (1) The Booth has a formidable apex position, which, if decided finally by the courts, might give it absolute ownership of the minerals on the Velvet claim. (2) The mere cost of defending such an attack, plus the loss of time, is worth the compromise suggested above. (3) The various compromises recited above indicate that it has seemed good business for owners of apex rights to make large concessions to the owners of the surface. In no case have they exacted more than perhaps 60 per cent of the mineral rights which they might have claimed. (4) In the present case, the owners of the apex are hampered by a good many considerations of equity and common law which might weaken their position very greatly; but, as nearly as I can make out, you are not warranted in ignoring the strength of the Booth apex position. If we cut the matter short by reducing the Booth claim to one-quarter we get near enough to a fair settlement for all practical purposes. So long as negotiations for such a settlement seem promising, I think you are warranted in concentrating your efforts in putting them through and in the meantime cutting down to a minimum the expenditures for litigation.

Judge S. S. Downer, in his report to the Jumbo Extension, reaches the following conclusion:

In view of the foregoing, and particularly in view of the fact that men of the eminence of Mr. Finlay have, after exhaustive examination, submitted such discouraging reports as to the physical facts involved in the litigation, we recommend that you make the settlement proposed.

Charles S. Sprague, vice-president and general manager of the Jumbo Extension, in a report to his stockholders (1915), giving the history of the Booth apex, says:

Negotiations by both the Reorganized Booth and the Jumbo Extension Mining Co. were carried on in an amicable spirit, with the expressed desire of each to avoid extended and expensive litigation. Without expressing a view as to the justice of the United States apex law, we had to face the fact that the law was upon the statute books and applied in this case in favor of the Reorganized Booth Mining Co. As the latter company could not have legally claimed all the vein within the Jumbo Extension ground and all ore contained therein (or practically everything of value belonging to the latter company), it must be conceded that the Reorganized Booth Mining Co. was eminently fair, if not liberal, in the settlement. In this connection, too, it should be understood and appreciated that the Jumbo Extension obtained from the Booth more than the usual "side line" agreement. A distinction must be kept in mind between a deed to ground and a deed to ore in the same ground. The Merger Mines Co. deeded to the Jumbo Ex-

tioned Co. the Velvet claim, which supposedly carried with it the ore within the claim. But it subsequently appeared that the Velvet claim did not own the ore within its boundaries, but, by reason of an apex, the ore belonged to the Reorganized Booth Co.; in other words, the Velvet claim was of value only because of surface rights and any other possible ore that might be found therein outside of the Booth vein. This is important, in view of the threatened suit against the Jumbo Extension by minority stockholders of the Merger, who were dissatisfied with the actions of the Merger directors in selling the Velvet claim to the Jumbo Extension and who would have the deed to the Velvet annulled. Should this suit be brought, and a decision be given to the plaintiffs, their victory would be a hollow one. While it would restore the claim, it could not deprive the Jumbo Extension of the ore within the claim, which, after all, is practically the only value that attaches to it. To make claim to the ore as well as to the surface rights, the Merger Co. would have to disprove the contention of the Reorganized Booth to apex rights. In this they are stopped, as the Merger Mines Co. has already acknowledged the validity of the apex claim of the Booth by agreeing to give the Booth 750,000 shares of Merger Mines stock for a deed to the Booth-Jumbo Extension vein, which enters the Merger ground after traversing the Jumbo Extension.

The compromise resulted in the Jumbo Extension paying the Booth company 300,000 shares of its capital stock and \$15,000 cash dividends due on the stock. In addition, it cost the Jumbo Extension \$12,000 cash to conduct the case. At this writing the Booth has received 1,550,000 shares of stock in compromise from four companies, besides having agreements with the Goldfield Consolidated, Jumbo Jr., and Lone Star, which have not been made public. All machinery on the Booth claim was removed after the Jumbo Extension settlement in 1915, and no work has been done since.

A recent manager of the Merger stated that the apex litigation cost that company \$40,000. The cost of conducting all these cases probably runs over \$100,000. The Reorganized Booth Mining Co. has never produced a pound of ore, but in one year, 1916, it disbursed \$350,000 in dividends received from the sales of stock which it owned. There are no mining developments to record in its one claim, but, by virtue of its physical lay, the courts have sustained its contentions of apex rights to the main lode of the camp. The company is said to hold in its treasury 250,000 shares of Spearhead, 250,000 shares Kewanas, 600,000 shares Merger Mines, 21,000 shares Tonopah Divide and approximately \$12,000 in cash, and to have no debts. Here is a case of one claim having extralateral rights, interfering with ore extraction and underground developments in twelve or more other claims, without ever producing any ore of its own.

H. V. Winchell said recently: "We are the only people, with the single possible exception of Rhodesia, in Africa, where that extralateral right provision still lingers. We have found it difficult to convince our Congressmen of our sincerity in advocating its abolition, and the mining men have encountered considerable opposition on the part of Western bar associations, when they attempted to minimize the amount of litigation called for."

The only chance the adjoining claim owner has today is to settle out of court, and the Booth case is an illustration of what that means. It is human nature to take what the gods give. After reading the article on "Rand Gold Mining" in the *Journal* of Mar. 15, 1919, which states that "the ore-carrying body is a tilted wall of conglomerate extending from east to west in an al-

most uninterrupted stretch of sixty miles and sloping to the south at an angle of from 30 to 40 degrees in the central portion of the Rand," I can well imagine where most of the \$2,500,000,000 worth of gold produced would probably have gone if rights similar to our extralateral rights had prevailed.

There is no valid reason, in my opinion, why extralateral rights should be retained. British Columbia made the change from the apex law, to the admiration of all mining men who have had experience there. The Philippine code is expressed in similar language. That system, already adopted within the jurisdiction of the United States, is an initial step.

The "extralateral right" is given by Section 2,322, U. S. Revised Statutes. It contains 252 words. The first 121 words give "exclusive right of possession of all the surface included within the lines of the location and of all veins, lodes, and ledges, throughout the entire depth, the top of apex of which lies inside of such surface lines extended downward vertically." These words give no extralateral right; the right is given and defined in the remaining 131 words of the section. It appears to me that the most simple, easy and effective way to abolish the extralateral right will be to amend Section 2,322 by retaining the first 121 words, and repealing the remainder of the section, thereby creating fixed vertical end and side lines, irrespective of strike or dip, of veins, lodes, or ledges.

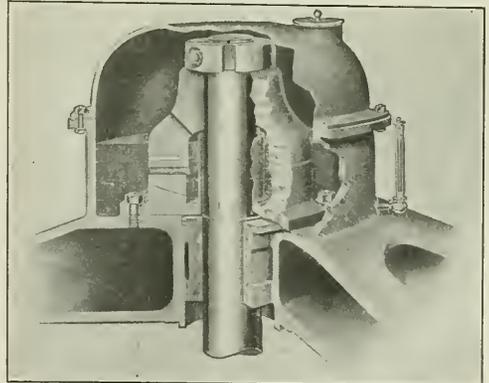

Thrust Bearings

Differentiation of the General Types—Detail of Construction, Installation, Lubrication and Practical Operation

By E. U. GIBBS

Engineering Department, S. Morgan Smith Co., York, Penn.

THURST bearings are of two classes—those in which the load is supported by plates or surfaces between which are placed balls or rollers on which the revolving plate is carried, and those in which the load is supported by plates or surfaces between which is maintained a film of oil. The former are recognized

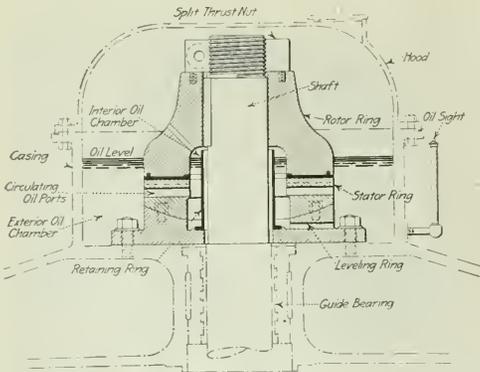

GIBBS THRUST BEARING FOR VERTICAL SHAFT

as the well-known roller-and-ball thrust bearings, and are suited for comparatively light loads and low speeds. Great care must be exercised in making and installing this class of bearing, and provision made to avoid overload; but it has its advantages, especially when the thrust is small and the speed low.

¹A. I. M. M. E. Bull. April, 1919, p. 659.

The second type mentioned is known as the oil-bath thrust bearing, which antedates the ball or roller bearing, having been in use on ships since the use of the propeller. This thrust bearing is known as the marine type, and consists of several collars, turned on the shaft, between which stationary rings are fitted. These are shaped like a horseshoe, for passing over the shaft, and have a soft-metal (babbitt) face for bearing against the collars on the shaft. The bearing surfaces between the collars and the rings are lubricated by means of oil cups attached to the stationary rings, so that the oil is carried by a system of grooves in the soft metal in such a manner that the rubbing faces were constantly covered or separated by a film of oil. Thrust bearings of this character are classified as wet-surface bearings, and operate satisfactorily if the thrust load per square inch on the bearing surfaces does not exceed 50 lb. If exceptional care is exercised in the manufacture and installation of this class of bearing, loads up to 100 lb. per sq.in. have been successfully carried. The demand for a thrust bearing capable of carrying heavy loads was created by engineers in the development of the vertical-shaft hydraulic turbine. About the year 1904, hydraulic-turbine builders began to recommend that vertical-shaft turbines be directly connected to vertical-shaft generators. This type of generator had not been developed to any degree by the generator builders in this country. A small number of machines were installed at Niagara Falls, N. Y., but these were considered large machines at this time. However, European builders had started to specialize and had endeavored to secure contracts in this country. The foreign builders were using ball or roller bearings to support the thrust on the vertical shaft. These machines did not exceed 1000-kw. capacity.

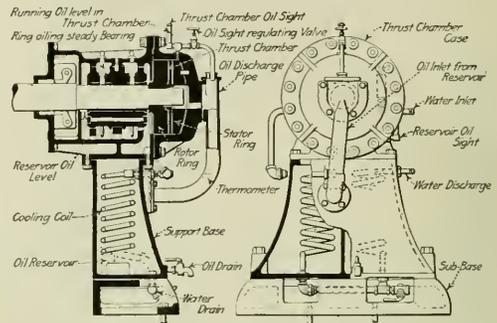

The barrier in the development of the vertical-shaft direct-connected unit was the development of the generator of this type. The problem with the generator designers was the thrust bearing, and in the first installation of this type the thrust bearings were built and installed by the turbine builder. The thrust bearings

DETAILS OF VERTICAL SHAFT BEARING

of the units installed at Niagara Falls consisted of a stationary ring attached to a base, and a revolving ring attached to the shaft, all inclosed in a cast-iron casing. The running faces of these rings were machined so as to form a chamber between them, into which oil was pumped under pressure. This forced the rings apart so that the revolving ring was floating on a film of high-

pressure oil. Should the oil pressure fail for any cause whatever, the metal rings came in contact, and the bearing went out of service immediately; likewise the unit, with an accompanying loss in output of power and the cost of repairs to the bearing. These bearings, with all the necessary pumps and equipment, are expensive to install, and so were used only in large plants.

DETAILS OF HORIZONTAL SHAFT BEARING

It was evident that a new bearing would have to be developed which would operate without external high pressure, and could be installed at a moderate cost. The oil-bath bearing offered the best solution of the problem, and after several years of experimenting along these lines, the Gibbs thrust bearing was developed in 1911. It consists of three principal elements; namely, a rotor ring, a stator ring and a leveling ring, inclosed in a casing and submerged in oil.

An accompanying illustration shows a bearing for a vertical shaft. A leveling ring is bolted to the base of the casing. The top face of the levelling ring is made spherical, to fit the spherical face on the bottom of the stator ring. The top face of the stator ring in this particular bearing has six radial grooves and six wedge faces. The ports in this ring allow the oil from the outer chamber to pass into the inner chamber, formed by the retaining ring and the inside of the stator and both rotor rings. The circulation of the oil is toward the shaft from the outside chamber to the inner chamber and then outward through the radial grooves in the top face of the stator ring. The rotor ring is provided with a sliding fit on the shaft and is held by a feather key. The bottom face of the rotor ring is of genuine babbitt metal and runs on the top face of the stator ring. The split thrust nut is used to adjust the shaft to take up any deflection that may arise in the support or foundation of the machine.

When the average pressure per square inch exceeds 200, the oil in the outside chamber is circulated through cooling coils by means of a low-pressure pump. With average pressure below 200 lb. per sq.in., cooling coils can be placed in the chamber and no exterior circulation of the oil is required, the circulation of the oil within the bearing itself being sufficient.

For a horizontal shaft, two separate bearings are used, a journal bearing and a thrust bearing. The journal bearing is used as a steady bearing to support the shaft and maintain its proper alignment. It is of the standard ring-oiling type, with removable shells in an outer casing. The casing is supported by a hollow base which is filled with oil. Coils, through which water circulates, are placed in the hollow base for cooling the

oil after it passes through the thrust bearing. The thrust bearing proper consists of two principal elements, a rotor ring and a stator ring. The rotor is a cast-iron ring keyed to the shaft, and rests against a shoulder so that it cannot move endwise along the shaft. It has a babbitt-metal face. The stator is a cast-iron ring, and the wearing surface consists of four to twelve sectors, depending on the diameter of the ring, produced by as many radial grooves across the bearing face.

Each segmental face is part flat and part tapered or inclined like a wedge, so that when the rotor is revolving on the stator, in oil, it draws or forces the oil across the inclined surface, and consequently builds up a pressure between the rotor and stator, this pressure being in equilibrium with the load on the rotor. The back face of the stator is spherical and fits into the spherical seat of the case head. This allows for a small alignment with the rotor. The stator is prevented from rotating by means of a dowel pin in the case head.

The thrust bearing is lubricated automatically by the rotor, which is partly submerged in oil, which is a little below the bottom of the shaft. The rotor and stator rings are inclosed in a casing or thrust chamber which is connected by proper opening to the oil chamber under the journal or steady bearing, to which the oil passes from the reservoir or tank beneath.

When the rotor revolves, owing to its being partly submerged, it carries up oil with it and fills the thrust chamber surrounding the thrust rings. The only exit through which the oil may escape is through the radial grooves in the stator to the centre of the stator, where it discharges into the discharge pipe, which carries it back to the oil tank below, thus completing the circulation. The oil, in passing through the radial grooves in the stator, passes across the bearing faces; consequently the bearing is continually flooded with oil. A small pipe is also tapped into the top of the thrust chamber, in which is placed an oil sight gage and a small discharge pipe. This bearing can be used where there is a thrust on a revolving shaft, no matter what the load or speed, and is manufactured by the S. Morgan Smith Co., York, Pennsylvania.

Miami Copper Co.

Annual Report Shows That Increase in Production Causes Larger Ore Depletion Charge, Resulting in Slight Decrease in Net Profits—Remodeling Mill

THE annual report of the Miami Copper Co. for the year ended Dec. 31, 1918, states that the production of refined copper was 58,407,563 lb. and resulted from the treatment of 2,132,941 tons of ore, comparing with 43,863,699 lb. recovered from the treatment of 1,640,206 tons of ore in 1917. The mill extraction was 71.15% and 95% of copper contained in concentrates was returned by the smelter in fine form.

The operating cost for the year, not including depletion of ore reserves or depreciation and obsolescence, was 14.833c. per lb. of refined copper. Depreciation and obsolescence were directly charged at \$573,973, and for mine depletion during the year, \$2,272,836 was set aside. Past and future development based on proved tonnage is figured at 31c. per ton of ore hoisted, which is credited to development account and charged to mining. Four dividends were paid during the year, totaling \$4.50 per share.

Mining was conducted by the top-slicing method in the main orebody and by an improved caving method in

the Captain orebody. Churn drilling on the low-grade orebody was continued, thirteen holes being completed to an aggregated depth of over 9,000 ft. Ore reserves on Jan. 1, 1919, were as follows: High-grade sulphide ore, 12,570,000 tons of 2.38 per cent copper; low-grade sulphide, 36,000,000 tons of 1.06 per cent and mixed sulphide and oxide, 6,000,000 tons of 2 per cent. Underground development work amounted to 14,872 ft., distributed as follows: Drifts, 10,888 ft.; raises, 3,102 ft. and shaft sinking 888 ft. By the end of March the new No. 5 shaft was sunk to a depth of 908 ft. and concreted to a depth of 670 ft. Mining cost was \$1.36051 per ton or \$0.04968 per lb. of copper.

Five sections of the mill have been remodeled and the efficiency is greatly increased. The cost of milling ore to the point of concentrate aboard cars was \$0.72232 per ton. There was produced 76,750 tons of concentrate averaging 40.147 per cent copper.

The profits for the year amounted to \$5,262,419, compared with \$4,952,136 in the preceding year, while depletion this year was charged at \$2,272,836 as compared with \$1,747,876 in 1917.

International Nickel Co.

Annual Report for Year Ended Mar. 31, 1919, Shows Decrease in Earnings—Diminished Demand for Products After Signing of Armistice

THE 17th annual report of the International Nickel Co. for the year ended Mar. 31, 1919, shows that the total income of all properties after deducting manufacturing, selling expense, ordinary repairs and maintenance, but before the deduction of foreign taxes, was \$11,186,304. Administrative and general office expense, including sum reserved for United States and foreign taxes, amounted to \$2,964,363, leaving a net income of \$8,247,158. Provision for depreciation of plants, mineral exhaustion and similar items is charged at \$2,324,528, thereby giving a profit of \$5,922,629. The dividends paid amounted to \$534,756 on the preferred stock and \$4,183,460 on the common.

During the fiscal year, \$3,480,210 was expended for additional property, construction and equipment. Recoveries for the period amounted to \$150,695. Inventories show \$9,692,421, distributed as follows: Ores, matte and metals in process, \$4,220,818; refined metals, \$2,629,240; general supplies, flux, fuel, \$2,842,362 valued at cost. During the first eight months the company operated at full capacity, but after the signing of the armistice production was cut to about one-third.

The plants, mines and ore reserves are in splendid physical condition. The Port Colborne refinery and additions to the Copper Cliff smeltery were completed, and extensive improvements, including a new dam on the Spanish River, which will furnish considerable additional hydro-electric power should it be required, were commenced. The absence of information on development work, grade and tonnage of ore produced and recoveries is noticeable. The noteworthy feature of the report is the increase in earnings and profits from the previous year. Total earnings for the previous fiscal year were \$16,181,500 after the usual deductions and including foreign taxes. Profits in the preceding year amounted to \$10,129,987. Common stock dividends were decreased to 2 per cent in March, and the June dividend was passed.

CORRESPONDENCE AND DISCUSSION

Letters From the Mining and Metallurgical
Industry Dealing With Pertinent
Subjects of Interest

Standard Buildings

The writer notes with interest the article in the *Journal* of May 31 on "Standard Buildings," with illustrations of a truss unit applied to different spans and heights. The economic value of the principle is high, but there are practical considerations which must be understood, to avoid inevitable and grave results. Standardized construction has been developed under war-time conditions to a point of useful service for specific needs, especially where much duplication is possible. Standard buildings may be all that is required for ground-floor storage purposes, but for "mill buildings," for the housing of mechanical operations, their disadvantages must be kept clearly in mind when purchasing or entering into contract for such work. This is true with particular force in the mining business. Efficiency consists not in buying as one would a favorite brand of explosive, or lubricant, or drills, but in placing the work of designing in proper hands.

Economy in design of steel buildings, taking all practical conditions into consideration, is as important to the buyer as is his selection of equipment for the work to be done therein. The designer should know of the industrial processes. The framework should fit the industrial needs. The loads of electric cranes, jib cranes, sheaves and shafting, launders, heavy piping, and other equipment must be provided for. The likelihood of need for future extensions must be considered. With optimistic forethought it is generally so arranged, and the use of standardized units permit extension without difficulty.

The machinery layout should be before the designer. To a certain extent he builds his frame around it, placing his columns to avoid interference with the movements of men and materials, and giving adequate headroom under the trusses and girders. The machinery layout is needed by the designer to achieve the maximum economic value of proper lighting, a detail which rewards careful, scientific study.

Being always in stock, standard buildings are clearly advantageous for quick delivery. However, when trade conditions are such as to involve delay in shipping structural steel work of individual design, the same conditions usually exist in equipment and machinery lines. As for permanently bolting steel framework, no specifications put forth by engineers of recognized standing, nor in the building codes of important cities, permit this practice. Vibration caused by wind loads and by machinery will cause bolted work to loosen, and to reach eventually, unless corrected, a condition of certain failure.

The illustration mentioned allows only radical variations in vertical clearances. The eave detail is considered entirely inadequate to safeguard against wind loads where these are as important as in most Western mining regions. There is nothing in the article or sketches to indicate a variation in size of members in

the standardized truss unit. Therefore, in the 20-ft. spans, the weight is excessive, or in the 40-ft. spans, with top-chord sections unchanged, there is a deficiency of metal which must be corrected by stiffening (lessening the unsupported distance between joints). No provision for same is indicated.

The writer does not condemn any type of standardized steel frame at present on the market. The study of possible standardization is most interesting and valuable. The work of the skilled designer along the lines suggested results in economy of time and capital investment in every type of steel mine, mill and smeltery structure, and the economy of standard structures is limited to those cases where the practical considerations mentioned are not important.

El Paso Bridge and Iron Co.

El Paso, Tex., June 6, 1919

Latin and Greek

I am interested in your recent editorials about Latin and Greek and about the country boy versus the city boy. It seems to me that there have been two tendencies in education in this country that are not quite on the right track. The first is to assume that technical training is equivalent to the old liberal education. Innumerable graduates of technical schools are not educated in any other sense than a carpenter or a blacksmith is educated; they have merely learned certain processes for the sake of earning a living. The second tendency is to exaggerate the importance of school. People are not educated in schools except to a minor extent. They are educated mainly by the example of their parents and by their own activities. Witness the utter failure of public schools to teach good English. The children use precisely the language they hear at home or with other children and not at all what the teacher impresses upon them.

As to the use of Latin and Greek in the colleges, it is difficult to form a positive opinion, but on the question of the function that those studies are designed to fill it is impossible to be too positive. The assiduous study of some language other than one's own, which most of us apparently take for granted, appears to be the only way to develop accurate expression and clear thinking. To do this it is necessary to learn how to figure out exactly what the writer in another language means; why he means that and nothing else, and if by all tests there is still doubt of the meaning, the realization of the defects which cause doubt.

I believe the advantage of the country boy over the city boy comes from a superior education. His advantage is mental, not physical. He sees nature at first hand, he knows the processes of life, he learns to work in compliance with laws which he knows cannot be altered or tampered with. The city boy does not necessarily digest these things. He sees only the complicated mechanism

of society, and he may not realize how it all must be founded upon the resources and processes of nature.

With all our efforts at short-cuts and improvements, it seems impossible to get a better conception of education than its literal meaning—a leading out. He who is led to exercise his mental faculties skillfully is educated; he then creates his accomplishments himself. But this cannot be done by the mere force of convention or curriculum. There is nothing sacred or infallible about a course of study. To realize this it is only necessary to remember that the Athenians had no classics except their own.

J. R. FINLAY.

Pine Knot, Bear Valley, Cal., July 11, 1919

Mining in Venezuela

Permit us to call your attention to the following misstatements appearing in an article entitled "The Mining Industry in Venezuela" in the *Journal*, Vol. 107, No. 10, pp. 439 and 440:

On p. 439, in speaking of the South American Copper Syndicate, the author of the article says: "This company owns its own railway and wharves at the port of Tuscacas." The South American Copper Syndicate, Ltd., is not the owner of the railway and wharves at Tuscacas; they are the property of this company.

Again on p. 440 we find the following: "Last year J. C. Price, the manager of the Bolivar Ry. Co.," etc. We would point out that J. C. Prince is our traffic manager. Our general manager's name is as per signature appended hereto.

THE BOLIVAR RY. CO., LTD.

C. A. Hutching, General Manager.

Puerto Cabello, Venezuela, Apr. 19, 1919.

Successful Milling in South America

During a recent visit to the copper-mining district of Corocoro, in Bolivia, the local concentrating plants were observed to be using a successful milling practice which may be of interest to flotation operators who encounter similar conditions. Though Corocoro is supposed to be a district famous for its production of *charqui*, or native copper, the chief activity in the camp now centers in the flotation plants of the two companies that are the only ones of importance in operation there. One is the so-called "Chilean company," or *Cia. Corocoro de Bolivia* and the other is the "French company," or the Corocoro United Copper Mines, Ltd. Both companies possess modern flotation concentrators, which are producing chalcocite concentrates, these being marketed at Tacoma, Wash., in the case of one company, and in England by the other.

Though the mill ore is considered to be low in copper content, as compared with the native-copper ores that were the original production of the camp, it is really of good grade, and, according to the statements of the mill managers, the copper content varies between 8 and 12 per cent. This ore is being treated by each of the plants mentioned with a combination of modern mill and flotation equipment. In the case of the Chilean company, the mill is a reconstruction of an old jig and table mill; the French company has a new and well-built plant, less than two years old.

The latter mill grinds in Hardinge mills, and the Chilean plant uses Allis-Chalmers ball mills. Classifying and thickening is done by Dorr machinery in both plants. The flotation section in both plants employs generally

accepted equipment, and renders good service in recovery. Each plant uses an Oliver filter to dewater the concentrate product from the Dorr thickener, and the behavior of the latter machines is remarkably efficient. It must be recalled that Corocoro lies at 12,870 ft. above sea level, yet the filter cake being produced at the time of my inspection was extremely dry. The managers of both companies informed me that the work of the filters was always satisfactory, as the water content of the filter cake was often as low as 8 per cent. and almost never exceeded 14 per cent. The concentrate cannot be called coarse, as a typical mesh card from the French company shows 75 per cent of minus 200, and the remaining 25 per cent was minus 100.

Such an example of good practice would be hard to surpass in American flotation mills, and is interesting in itself, as showing the possibility, by intelligent operation, of using vacuum filtration as a means of dewatering fine pulp at extreme elevations above sea level.

Mollendo, Peru, June 5, 1919.

DONALD F. IRVIN.

The Volume of Gas in a Field

The Bow Island gas field, which supplies Calgary and district with natural gas for heating and illuminating purposes, is showing signs of exhaustion. The president of the gas company states that it will be necessary to cut off at least one-fourth of the customers. In the meantime, the company is pushing boring operations in the Barnwell field, in the hope of saving the situation, but, up to now, only one well has been brought in.

There is positively no excuse for springing an unpleasant surprise of this nature on the gas consumers. Given the initial average pressure of a field, and the pressure after a known volume of gas has been drawn off, it is possible by Boyle's law, enunciated 250 years ago, to calculate to a nicety the actual volume of gas contained in a field, and arrangements should be made accordingly for providing customers. Instead of doing this, however, when they strike gas, people often assume that they have struck an inexhaustible supply, and extend their pipe lines without thinking it necessary to ascertain the volume of gas contained in the field.

F. H. MASON.

Victoria, B. C., July 7, 1919.

Mosaic Maps Obtained by Photography from airplanes are not as accurate as desirable, says the U. S. Geological Survey. The principal object in an aerial survey is to obtain on a horizontal plate or film a picture of the area below the camera. If the area is itself a plane, the picture of it taken from an airplane on such a plate is a true map, but no apparatus has yet been devised that will maintain the plate in a truly horizontal position when the airplane is in motion; and as the earth's surface is almost nowhere plane, the photograph must be corrected to obtain a map free from distortion. The nearest approach to an aerial map so far made is the so-called "mosaic map," which is really not a map at all, but merely a patchwork of photographs. The pictures composing such a mosaic show distortions, due partly to the deviation of the plate from the horizontal position and partly to relief in the surface photographed, and these distortions render the picture useless for accurate map construction. Distorted photographs of an area that has been previously mapped can be laid down over a network of points whose positions are known, and, by distributing the errors due to distortion, a mosaic may be constructed that will present a good appearance.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Rebuilding the Steel Industry in France And Belgium

French ownership of iron ore, the coking coal preserves of Belgium, and the fact that they are advantageously situated as to the seaboard will give France and Belgium great assistance in entering the world market for iron and steel products. This is the opinion of A. H. Brooks, the chief geologist of the American Expeditionary Forces, who returned recently to this country. In this connection, Mr. Brooks authorizes the following statement:

The enormous development of the iron and steel industries of Continental Europe during the last two decades has in a large measure been the result of the best economic use of the Lorraine iron ore and the coking coal from the tributary fields. Though the ownership of the iron and coal was distributed among four countries, trade restrictions did not reduce to any important degree the free movement of raw material. As a consequence large iron and steel industries grew up at localities determined by geographic conditions rather than by political boundaries.

The iron mines of French Lorraine have been little damaged relatively, and, given the labor, could soon be restored to a pre-war productive capacity. A large part of the French and Belgian metallurgical plants using Lorraine ore have been destroyed, and it may take five years to restore them to their pre-war capacities. The inclusion by France of the iron and steel plants of Lorraine at Annexee and possibly of the Sarre district will afford little relief, as these will continue to be supplied from the mines on the German side of the pre-war frontier. Therefore, unless the ore be sent to the Westphalian and Rhineland furnaces, the Lorraine mines during the reconstruction period cannot be worked to their full capacities, which would be very desirable, for their product would give a quick asset to impoverished France. Without this outlet the French iron mines can find a market for only about half of the ore which they can produce. Furthermore, it is by no means certain that even after restoration the French and Belgian plants can consume all the iron production of the Lorraine mines. Therefore, however desirable it may be to limit Germany's iron and steel output, such action, certainly during the period of reconstruction, and probably after it, will curtail the output of the French Lorraine iron mines.

The rebuilding of the French and Belgian metallurgical plants will make it possible to install the most modern equipment, and thus will give them some advantage over competitors using pre-war plants. On the other hand, during this period of construction the French and Belgian steel and iron products, in an open market, will be more or less at the mercy of the undamaged, established industries of other countries. A whip hand can be held over Germany by refusing her the iron ore, but this will be to the disadvantage of the French mines and may increase the cost of iron and steel products in both France and Belgium.

The French ownership of iron ore, and the coking coal reserves of Belgium, and especially her geographic position, making the latter country the natural seaboard outlet for the Lorraine field, will give these two countries great advantages in competing in the world market for iron and steel products. These economic conditions will be further improved by a competitive use of Westphalian coking coal, which is favorably situated for cheap transportation into both countries.

Mineral Statistics and the League Of Nations

The organizations sent by the leading allied nations to the Peace Conference at Paris included groups of statistical specialists whose task it was to prepare for the use of the Peace Conference fundamental statistical data covering a variety of subjects, among which raw materials occupied a conspicuous place. It is inevitable that the permanent organization established under the League of Nations should be equipped with a statistical service capable of compiling for the use of the League fundamental data upon raw materials, including minerals. Such fundamental information will be essential for the study of the trade situation, as assistance in the negotiation and interpretation of trade agreements, and as an aid to the understanding and adjustment of territorial disputes.

It is only a step from the compilation of such data for the use of the League to making the information generally available in published form, and this could be accomplished at an expense almost negligible in comparison with the great usefulness of the information so contributed.

For many years there has existed at Rome an International Institute of Agriculture which has able statisticians on its staff, and it has published each year an International Statistical Review of raw products useful in agriculture, including a few mineral products such as sulphur, pyrites, and potash. The results have been of great usefulness to all who are interested in agriculture in its broad international aspects, and the success of this work is indicative of the usefulness which would accrue from the compilation of mineral statistics by some international organization. It is earnestly hoped by economists in Washington that in the formulation of detailed plans for the League of Nations the establishment of a department of mineral statistics will receive careful and favorable consideration.

The work of such an organization might well begin with the compilation of statistics entering into production and consumption, namely, production, imports, and exports, which constitute the fundamental data necessary to an understanding of the international situation. The work might well be broadened to include the recording of important developments, prices in the principal markets of the several countries, and information concerning special legislation affecting the mineral industries in their international aspects.

It is claimed that many benefits would accrue from such statistical work. Comprehensive mineral statistics expressed in a common scale would be a great help to all who are interested in the international movement of raw materials. It would tend to encourage the rational development of mineral deposits throughout the world, and would lessen the speculative element in world trade which rests upon the foundation of ignorance.

Such an international statistical service would also react favorably upon the countries which would contribute to its maintenance. The leading nations now maintain good statistical service, but the proposed organization would foster the establishment of improvement of similar services in other countries. Furthermore, the different countries would be encouraged to adopt classifications of commodities that can be better compared, as well as common units of measurement.

Through extraordinary efforts on the part of its founder, the International Institute of Agriculture was built up as an independent international organization, but a similar accomplishment for mineral statistics would be difficult unless merged with the League of Nations organization. Moreover, the League would be the most effective medium for making the statistics reliable. Figures for the various countries compiled by a central organization would afford many checks as to the accuracy of the statistics supplied by each country, and the nation issuing authentic and reliable statistics would not be at a disadvantage if compared with a country whose statistics were less carefully compiled. As a protection against war, such data would be of great value to the League in forecasting preparation for war by any particular nations, although it would not displace the statistical service rendered to individual governments by their consular officials and others.

Tariff Hearings Postponed

All hearings on the tariff bills covering war minerals have been postponed until September, Representative Fordney, chairman of the Ways and Means Committee, announced to the American Mining Congress on July 17. The removal of trade restrictions with Germany, the bulletin of the congress states, makes imperative the immediate passage of the emergency tariff legislation covering dyes, chemicals, glass, and potash, and the number of special bills covering substances which Mr. Fordney at first desired to include in the special emergency legislation appears to endanger an early decision. It is therefore thought advisable as a national policy to postpone all consideration of the substances which can as well be handled later and allow the committee to report to the House.

Mexico's Mining Code as Model

A new mining code has been prepared for the Republic of Santo Domingo. It was written by J. R. Jones, a law examiner of the U. S. Bureau of Mines, after a careful study, on the ground, of local conditions. The code does not follow that of the United States, which Mr. Jones regards as almost archaic, but follows to a great extent the mining code of Mexico.

Would Transfer Survey Office to West

Transfer of the offices of the U. S. Bureau of Mines and of the U. S. Geological Survey to a suitable place in one of the public land states west of the Mississippi River, to be designated by the President, is asked in House Bill 6,551, recently introduced by Congressman Mays, of Utah. The bill calls for the establishing of a branch of the Interior Department at the place to be selected, where are to be maintained not only the offices of the bureaus mentioned but also those of the Commissioner of the General Land Office, the Reclamation Service, the Commissioner of Indian Affairs, and

the National Park Service as presently constituted by law. This bill is not to be confused with the one recently introduced in both houses to establish a Department of Public Works, which was discussed on page 69 of the last issue of the *Journal*.

Manganese Producers Meet

A group of manganese producers representing several states met in the headquarters of the American Mining Congress, on July 18, and after discussing the tariff situation authorized the congress to prepare the data necessary to a thorough discussion of tariff legislation from the producers' standpoint. A standing committee consisting of A. J. Seligman, president of the Butte Copper & Zinc Co., as chairman and four members to be announced later by the secretary, was appointed to assist in organizing the industry for the campaign. It was decided that manganese producers should be asked to meet the expenses of organization.

Imperial Mineral Resources Bureau

New Body Will Gather Information on Production, Consumption and Requirements of Minerals and Advise on Development of Empire's Resources

CREATION of the Imperial Mining Resources Bureau has been announced from London, the charter of incorporation being dated June 12. The purposes of the bureau are given in the charter as follows:

To collect, coordinate and disseminate information as to the resources, production, treatment, consumption and requirements of every mineral and metal.

To ascertain the scope of existing agencies, with a view ultimately to avoid any unnecessary overlapping that may prevail.

To devise means whereby existing agencies can, if necessary, be assisted and improved in the accomplishment of their respective tasks.

To supplement these agencies, if necessary, in order to obtain any information not now collected which may be required for the purposes of the bureau.

To advise on the development of the mineral resources of the Empire or of particular parts thereof, in order that such resources may be made available for the purposes of imperial defense or industry or commerce.

The bureau is permitted to acquire property, real and personal, and to appoint such officers, servants and other persons as the work may require within the British Empire and abroad. The governors of the bureau are empowered to receive and administer all funds which may be appropriated.

The first president of the bureau is Earl Curzon, of Kedleston. The various parts of the Empire are represented in the bureau, each by a governor named as follows: Sir Richard A. S. Redmayne, chairman, for the United Kingdom; Willet G. Miller, for the Dominion of Canada; William S. Robinson, for Australia; Thomas H. Hamer, for New Zealand; William P. Schreiner, for South Africa; Edward Lord Morris, for Newfoundland; Richard D. Oldham, for India; John W. Evans, for the colonies. The following have also been appointed to serve as governors by the president: Westgarth F. Brown, Frederick H. Hatch, Sir Lionel Phillips, Edgar Taylor, Wallace Thornycroft, and Professor Thomas Turner. Each governor is to hold office for one year. Chairman and governors may receive such remuneration as the appointing authority may determine.

World's Iron and Steel Output*

The output of pig iron and steel by the principal producing countries of the world for the years 1900 to 1918, inclusive, according to the National Federation of Iron and Steel Manufacturers, was as follows:

Year	PIG IRON			
	United Kingdom Tons	United States Tons	Germany (a) Metric Tons	France Metric Tons
1900	8,960,000	13,789,000	8,521,000	2,714,000
1905	9,608,000	22,992,000	10,988,000	3,077,000
1910	10,012,000	27,304,000	14,793,000	4,032,000
1911	9,526,000	23,650,000	15,534,000	4,426,000
1912	8,751,000	29,727,000	17,735,000	4,939,000
1913	10,260,000	30,966,000	19,292,000	5,207,000
1914	8,924,000	23,332,000	14,392,000	(b)
1915	8,794,000	29,916,000	11,790,000	(b)
1916	9,048,000	39,455,000	15,285,000	1,447,000
1917	9,420,000	38,621,000	15,142,000	1,684,000
1918	9,066,000	39,052,000	(c) 11,590,000	1,297,000

Year	STEEL			
	United Kingdom Tons	United States Tons	Germany (a) Metric Tons	France Metric Tons
1900	4,901,000	10,188,000	6,646,000	1,565,000
1905	5,812,000	20,024,000	10,067,000	2,240,000
1910	6,374,000	26,095,000	13,699,000	3,390,000
1911	6,462,000	23,676,000	13,681,000	3,681,000
1912	6,796,000	31,251,000	17,302,000	4,428,000
1913	7,664,000	31,301,000	18,959,000	4,687,000
1914	7,865,000	23,513,000	14,973,000	(b)
1915	(c) 8,560,000	32,151,000	15,258,000	(b)
1916	(c) 9,196,000	42,774,000	16,185,000	1,952,000
1917	(c) 9,804,000	45,061,000	16,587,000	2,232,000
1918	(c) 9,591,000	45,073,000	(a) 14,874,000	1,912,000

(a) Including Luxembourg up to October, 1918. The returns for November and December, 1918, do not include the production of Luxembourg, Sarre district and the disannexed Lorraine province. (b) No returns. (c) Including steel castings.

A significant feature of these tables is the fall during the war in the output of iron and steel in both France and Germany, the figures in both cases reaching the lowest level in 1918. The United States, on the other hand, shows a great increase during the war, and in Great Britain the figures show a fairly constant output of pig iron and an increased output of steel.

Potash in Nebraska

At the recent hearing on potash before the Committee on Ways and Means, W. E. Richardson, a Nebraska producer, made some interesting observations as to the occurrence of potash in Nebraska.

"The richest brines are in the lake bed mud and sands, which vary from 15 to 40 ft. in depth," said Mr. Richardson. "These brines are easily obtained by pumping. The supply of brine appears to be inexhaustible, inasmuch as several of these lakes have been pumped dry, and after rains have again been filled by seepage from the surrounding hills, the brine collected being found as rich as that which had been previously pumped from the lakes. Undoubtedly the surrounding hills of sand and brule clay contain a tremendous amount of potash which is continually being released by the elements, and is leached out and washed into the lakes with each succeeding rain."

Drilling Progresses in Derbyshire

Drilling at Hardstoft, Derbyshire, England, where oil was discovered on Apr. 27, 1919, at 3,077 ft., has only reached the top of the oil-bearing sand, according to *Commerce Reports* of July 14. The oil reached the surface on June 7, flowing at the rate of 25-50 bbl. per day. Certain machinery is being installed, when further drilling will be undertaken. As the oil-bearing sand is penetrated the flow is expected to increase. No official analysis of the oil has been published.

Besides the wells at Hardstoft, six other borings are being made at different places in Derbyshire, the present depth of these wells ranging from 750 to 2,950 ft.

Two of them have already given favorable indications that oil will be found. Two wells are also being driven in Staffordshire, which have reached a depth of about 450 ft., and two are being sunk in Scotland in the vicinity of Edinburgh. One of these latter wells is ready to drill and the other to rig.

Foreign Trade in Metals and Ores

Imports and exports of the more important metals and ores, as reported by the U. S. Department of Commerce for May, 1919, and the figures for May, 1918, as finally revised, are as follows:

	IMPORTS, MAY, 1918 AND 1919	
	(In pounds, unless otherwise stated)	
	May, 1918	May, 1919
Metal and ore:		
Antimony ore, contents	72,845	58,880
Antimony matte, regulus or metal	1,975,456	526,400
Copper:		
Ore, contents	6,724,894	3,159,699
Concentrates, contents	2,827,000	1,870,957
Matte, regulus, etc., contents	1,534,399	2,195,904
Imported from (in part):		
Canada	3,116,993	2,342,065
Mexico	4,302,124	4,537,982
Cuba	1,638,965	795,632
Chile	1,314,214	Nil
Peru	137,709	94,781
Venezuela	214,529	Nil
Unrefined, black, blister, etc.	27,892,476	15,997,164
Refined, in bars, plates, etc.	8,878,337	853,436
Old, etc., for remanufacture	89,887	14,995
Composition metal, copper chief value	9,653	Nil
Lead:		
Ore, contents	3,312,494	2,565,390
Bullion, contents	17,983,448	6,831,268
Imported from (in part):		
Canada	2,124,370	801,786
Mexico	17,384,769	6,940,531
Pigs, bars and old	12,635	5,440
Manganese ore, long tons	29,837	19,644
Imported from (in part):		
Cuba, long tons	8,737	195
Brazil, long tons	13,460	12,212
Br. India, long tons	6,600	Nil
Ferrous pyrites, long tons	39,404	33,263
Imported from (in part):		
Spain, long tons	23,406	29,951
Canada, long tons	15,998	420
Tin ore, long tons	4,012	2
Tin bars, blocks, pigs, etc.	10,796,218	449,270
Imported from (in part):		
Straits Settlements	5,608,988	224,870
Dutch East India	796,498	Nil
United Kingdom	1,306,638	224,000
Australia	182,560	Nil
Hongkong	2,263,684	Nil
Tungsten ore, long tons	704	285
Zinc:		
Ore, contents	3,636,092	584,619
Imported from (in part):		
Canada	1,288,422	77,000
Mexico	2,227,470	507,199
Blocks, or pigs and old	7,430	66,898
EXPORTS OF COPPER, LEAD AND ZINC		
(In pounds)		
	May, 1918	May, 1919
Copper:		
Ore, contents	232,223	161,500
Concentrates, contents	134,200	Nil
Unrefined, black, blister, etc.	448,000	Nil
Refined, in long tons, bars, etc.	65,298,223	18,686,929
Exported to (in part):		
France	25,291,592	Nil
Italy	10,894,246	1,368,267
United Kingdom	2,628,116	10,053,311
Canada	2,507,810	1,854,318
Composition metal, copper chief value	1,250	21,249
Old and scrap	1,090	45,885
Pipes and tubes	310,429	433,908
Plates and sheets	2,169,993	856,089
Wire, except insulated	1,038,053	3,971,415
Lead:		
Pigs, bars, etc., produced from domestic ore	13,953,634	372,510
Pigs, bars, etc., produced from foreign ore	4,970,406	1,905,041
Exported to (in part):		
Canada	4,632,414	371,278
United Kingdom	9,893,433	3,568,146
Argentina	309,120	11,212
Japan	2,811,376	Nil
Brazil	239,534	133,907
Zinc:		
Dross	4,951,832	182,703
Spelter:		
Produced from domestic ore	6,752,809	11,076,264
Produced from foreign ore	5,957,576	176,000
Exported to (in part):		
France	7,455,412	1,666,392
Italy	3,132,557	756,758
United Kingdom	744,429	6,288,240
Canada	1,222,406	233,437
Mexico	149,998	2,222
In sheets, strips, etc.	1,928,715	1,336,244

*From the *Economist*, May 31, 1919.

Function of Securities Commissions

State Bureau's Method of Investigation Assures Evaluation of Property, and Secures Protection for The Investor—The Procedure in Minnesota

BY A. C. OBERG

Mining Engineer, 316 Sellwood Building, Duluth, Minn.

STATE securities commissions have been legally established in Illinois, Iowa, Kansas, Michigan, Minnesota, Oregon, Utah, Washington and Wisconsin for the purpose of regulating the sale of securities within the borders of the respective states, and the law is commonly known as the "Blue Sky Act." Before a corporation can market its securities a license must be obtained from the commission in the state in which the corporation wishes to operate and sell stock. In a few states securities can be sold without first obtaining a permit. Other states have limited regulation through banking departments or corporation commissions. In many instances these departments have proved inadequate, and laws are being amended to conform with a uniform standard adopted by the several states having such commissions. A national association of securities commissions has been formed for the purpose of standardizing methods of investigation, inspection, and reports.

The State Securities Commission of Minnesota has divided securities into three classes, financial, industrial, and mining. This article deals entirely with the method of investigating mining investments. There are three kinds of mining and oil stocks now covered by this commission, namely: (a) Sale of stock in regularly incorporated companies, whether organized in this or other states; (b) sale of lots in acreage controlled by so-called syndicates or trusts for the purpose of promoting oil lands held in fee or leaseholds; (c) sale of units in so-called trusts or syndicates where a number of persons try to dispose of leases in oil lands, or for the purpose of raising funds to carry on drilling operations on oil lands of doubtful value. (A) has been satisfactorily regulated by the commission since it was established; (b) and (c) have been evolved by promoters who desired to avoid investigation under (a), but the recent Minnesota Legislature amended the law so that the three propositions are now covered beyond question.

The initial step necessary in connection with securing a license is to file a statement of the company's business, officers, and financial standing on a blank furnished by the commission, with such additional information as is necessary, i. e. deeds, abstracts of titles, maps, plans, cross-sections of orebody, and other particulars. In some instances the commission finds that the applicant has not a clear title to the property claimed, and a perfect title must be secured before the application is given further consideration.

The second step consists of the analysis of the applicant's financial statement. In many instances records of receipts and expenditures are kept in a loose manner, and especially by some so-called trusts or syndicates developing oil lands when their field representatives neglect to make reports of expenditures or progress. Such matters must be remedied, or the application is refused.

With the foregoing measures satisfactorily disposed of, the commission's examining engineer is sent to the property and authorized to conduct a thorough investiga-

tion and examination of the geological features, mining conditions, mining methods, and, if necessary, make a complete survey of the property for the purpose of estimating the ore, coal, or oil reserves, as the case may be. What the commission desires is a complete evaluation of the property in dollars and cents, whenever possible. In making such evaluation, the following are considered: (1) Estimated tonnage of ore or coal reserves and oil production if well is pumping; (2) value of product based on the average price received in the open market during the last five or ten years, depending upon the possible life of the property investigated; (3) mining costs, royalty charges, transportation charges, general expense, taxes and amortization estimated on a five or ten year period, as the case may demand; (4) improvements, plant, and equipment.

The difference between (2) and (3) will give the profit or loss accruing from operations, and, together with (4), will give a fair index as to the merit of the property. It also affords a fair gage as to the amount of stock that should be issued against such a property, as well as giving the commission an opportunity to determine whether or not it will work a fraud on the purchaser of such a security. In other words, the investor should have a fair chance to gain by his investment.

Permits to sell stock are rarely issued for the full amount proposed by the applicant. Many companies are required to change their personnel, revise business methods and plans, escrow or cancel all promotion stock, and to refrain from publishing any advertisements with misleading statements.

In a few cases, development companies have been licensed to explore iron ore or other formations in Minnesota. The examining engineer's report tended to show the promotion somewhat speculative, but as the money was to be spent in developing the state's resources, licenses were granted. Under similar circumstances, for a promotion outside of the State of Minnesota, the permits would have been refused. The commission encourages development at home. No mining or oil company need fear investigation by the commission if its property or business methods are right. A license from the commission is an asset for clean and worthy enterprises.

The examining engineer is able to offer valuable suggestions to the applicant for the operation of its property, and many companies have profited thereby. Few if any oil companies are being licensed, as past experience has shown that they rarely "make good."

Those comprising the Minnesota Securities Commission are: Andrew E. Fritz, public accountant, chairman; John B. Sanborn, Insurance Commissioner; Montreville J. Brown, Assistant Attorney General; F. E. Pearson, Bank Examiner, and Charles J. Andre, executive officer.

Belgian Spelter Works' Report in the *Ironmonger*, May 31, 1919, shows that the Soc. Anon. de la Vieille Montagne made a net profit of 4,999,000 fr. in 1914 and 6,250,000 fr. in 1913. A dividend of 100 fr. will be distributed for all the years of war, of which 32 fr. falls to 1914 and 40 fr. to 1913. The directors state that they were able to secure large stocks of zinc and lead before the German confiscation. The French works of the company had executed army orders for 380,000,000 fr. The works at Baelen were confiscated and those at Hautmont destroyed.

BY THE WAY

Metallomania

A correspondent asks: "Have you ever seen ore so 'excited' that it jumped clean over the spitz, and, pursued by angry yelps of the beforementioned mongrel, dashed wildly through a laundry to be lost in the tails? (shirt tails, perhaps)."

Metallurgists should not let these details escape them. The solution of many an important problem has often pivoted on some apparently insignificant point, which, once mastered, has revealed the entire complex.

In the Limelight

"William F. Miller, who has had considerable experience in the oil fields in various parts of the country, was in Fallon recently," says the *Reno Evening Gazette*, and after looking over the oil fields east of there stated that the indications for oil are promising. He had some specimens of calcium rock which were taken from the foothills, and he said that this rock was found in every producing oil field in California, and that it was caused by the seepage of petroleum gas. Although many geologists, oil experts and men who have had experience in oil fields have examined the oil fields, none of them have made a discouraging or unfavorable report."

A Divinity Student

Belief in the divining rod or similar device apparently dies hard. From New Mexico comes a letter in which the writer says:

Can you give me any information as to where I can purchase any instruments for locating oil, gold, silver, and iron, or if there are any such things in existence? Some years ago I had an instrument that detected gold, silver, and iron, but I only used it to amuse friends with, by having them hide the article to be found, and never tried it in the field. While in New York this last winter I met a man who told me of a radium instrument of his invention that located both oil and mineral, but it sounded too much like "wind" to believe. I am interested in trying to find several tons of bullion in Mexico and should like to try out some instruments.

As for finding bullion in Mexico, our friend should ask Carranza.

The Wage Differential

That wages are lower in foreign countries does not necessarily mean that labor is cheaper there. In discussing the wage differential before the Committee on Ways and Means recently, George Otis Smith, Director of the U. S. Geological Survey, said: "We cannot over-emphasize the fact of the larger productivity of the American workman. Whether we compare him with the Burmese or the English or the best workmen anywhere on the Continent, the higher productivity is really the promise for the future; and it is not enough to compare just the wages. There came across my desk the other day a manuscript extract from a consular report on coal mining in South Africa, and I was interested to indulge in a simple mathematical calculation, and found that during the month of December last in South Africa, with South African and Asiatic labor, which constituted 90 per cent of the labor in those coal mines, only 10 per cent being white, the actual production per

man was 15 tons per month. That is only three-fifths of a ton a day. In other words, compared with a miner in the United States, they were producing in one day just about what one of our miners would produce in one hour. With those facts in mind, it is not enough simply to say they have cheaper labor in South Africa. It is cheaper because it is not worth as much."

A Matter of Principle

"I 'as 'eard a gert deal baout this 'ere shell-shock that 'as caused so much 'avoc with they chaps 'o went over to h'other side," said Cap'n Dick. "Dam-me, it do be a 'orrible thing. Min' you, m'son, unless a man 'as full control of 'is senses 'e can't do fair on 'is work, no matter w'ot it be. I remember 'ow Billy Broad h'acted one day w'en 'e got upset h'over a discovery 'e made. Not that I mean to say 'e wuz shell-shocked, but 'is mental h'attitude wuz h'affected, an', dam-me, 'e did'nt ac' right for 'ol bloody week. 'E come to me one day an' 'e says, 'Cap'n Dick, I 'as made a 'orrible discovery, an' I'm a daown'ear'ted man. Min' you, las' night I faoun' h'out that my feyther wuz one o' these 'ere bigamists.' 'Gos along,' says I, 'I nawed thy feyther for thirty year, an', dam-me, 'e 'ad but one woman.' 'Well, thee's wrong', says Billy; 'for did'nt I read, with my h'own h'eyes, on the church registry that the same year 'e married my mother, in h'eighteen h'eighty, 'e h'also married h'Annie Domminy.'" D. E. A. C.

Potash and Wooden Nutmegs

First prize for the best bunk is awarded to the Potash Patents Corporation, of Hartford, Conn. Its advertisement in the June 30 issue of the *Hartford Daily Courant* cannot be excelled, even by the writer of a circus poster. The company, if it be a company, makes "tonic fertilizers and other vivifying products" from Connecticut potash feldspar, by the "McA. Johnson" secret and patented process that can be carried on in any foundry. To quote from the ad:

"The product so made is remarkably biochemically active and plants can absorb it 5,000,000 times as fast as ordinary rock. It supplies potash and any special or general mineral necessary to the vegetable kingdom when and as needed by plants."

Actual production is going on, it is claimed, at a small brass foundry, and sales have been made even to China. The corporation is also to include among its assets a process for using the slag of smelters, ionized and made supersensitively active with the objectionable smelter smoke, and recovering potash, zinc, and manganese sulphates, to say nothing of gold, silver, copper, and alumina.

The company's premier brand is its "Chinese Special Sulpho-Argentated," containing silver and two other metals in ratios 7-11-13 as dominant chemico-botanic chords. "The brands are offered in the belief that tired people of financial breadth and *thickness* (the italics are ours) will receive a repurifying and revivifying influence from trying for new, fanciful, and fascinating effects and *effertilization* on come 7, come 11, come 13—Oriental and African emotionalized mathematics." (verbatim).

Why go further?—the company has bonds for sale. The ad. concludes: "The 'inventing' business is a lucrative one when rightly managed. Our aim is to cut the cost of food 60 per cent. We plan to employ sailors and soldiers in this work."

PERSONALS

JUDGE ELBERT H. GARY, as announced in the *Journal*, was recently honored by the trustees of the McKinley Memorial Building, at Niles, Ohio, who caused to be placed in the memorial a bronze bust of Judge Gary, as shown in the halftone reproduced from *Iron Age*. The inscription on the block is as follows: "Judge E. H. Gary, Jurist, Financier, Industrial Leader, Distinguished Citizen, Chairman United States Steel Corporation, President American Iron and Steel Institute. Born, October 8th, 1846." Plans are now being made to place a bust of Sir Henry Bessemer among the group, which includes Andrew Carnegie, David Tod, Henry W. Oliver and others, as a fitting recognition of his service in the promotion of the iron and steel industry.

F. R. Weekes has gone to Montana on professional business.

John D. Ryan is in Houghton spending the summer vacation with relatives.

D. C. Jackling left Seattle for the Yukon Gold property on a tour of inspection.

W. R. Doell has been appointed chief engineer for Clement K. Quinn & Co., at Crosby, Minn.

Theodore Schulze has been elected a director of Sinclair Oil and Refining Co. in place of K. Porter, resigned.

Thomas F. Cole, of Duluth, was in Houghton recently and inspected Seneca property in which he is interested.

E. V. Davaler, mill superintendent of the Butte & Superior, is spending the later part of July in San Francisco.

A. C. Oberg has returned to Duluth after an inspection tour through the Cobalt and Porcupine districts of Ontario, Canada.

W. O. Hotchkiss, State Geologist of Wisconsin, has a large field party doing detail geology on the western end of the Gogebic Range.

Major G. H. Morgau has returned from service in France. His present address is care of W. H. Weed, 29 Broadway, New York.

E. Cushing Moore, after three years in the Slocan district of British Columbia, has opened an office at 614 Mohawk Building, Spokane, Wash.

J. A. O. Preus, State Auditor, accompanied by F. A. Wildes, State Mine Inspector, has completed his annual tour of the Minnesota state-owned mines.

William E. Corey, chairman of the Midvale Steel & Ordnance Co., has been elected a director of the Sinclair Consolidated Oil Corporation.

Walter L. Reid recently made an inspection of the San Bernardo property in San Miguel County, Col., for the purpose of selecting a new mill site.

H. C. Cooke, of the Canadian Geological Survey, is making an examination of the area between Kezoami Lake and Swastika and the Matachewan district.

C. M. Weld, consulting mining engineer, has returned from war work in Washington and resumed practice with offices at 66 Broadway, New York. Telephone, Rector, 1421.

Major Lawrence T. Gavin, formerly superintendent of the Cuyuna-Mille Lacs mine, Cuyuna Range, has returned after a year's service overseas and will soon go to the iron range.

Algernon Del Mar, milling and flotation engineer, has opened an office at 1424 Alpha St., Los Angeles, Cal., and will conduct a business in the design and operation of milling plants.

BUST ERECTED TO ELBERT H. GARY

William C. Potter, of Guggenheim Brothers, is a member of the board of directors of the Mexican International Corporation recently organized to finance new enterprises in Mexico.

Captain J. Ellzey Hayden has returned from overseas service with the 310th Engineers, 86th Division, and will resume his engineering duties with the Cleveland-Cliffs Iron Co. on Aug. 1.

Captain Donald M. Liddell will resume the practice of chemical engineering, with offices in rooms 1800-2, 66 Broadway, New York, and laboratory, 961 to 965 Frelinghuysen Ave., Newark, N. J.

Thomas T. Read, formerly associate editor of the *Mining and Scientific Press*, has joined the staff of the Bureau of Mines and will investigate the work

of the Bureau in relation to public welfare.

Charles F. DeArmond, surveyor for Elko County, Nev., recently passed through San Francisco on his way to the Hetch Hetchy Valley, the purpose of his trip being to test a new tunneling machine.

Melvin Brugger has accepted a position as mining geologist and engineer for the Minas de Matahambres Mining Co., operating copper and silver properties in Cuba. Mr. Brugger has left for Havana.

Howard Reusswig, formerly with the engineering force of the Great Northern Iron Ore properties, has returned from overseas service with the 313th Engineers, and will continue to make his home on the Mesabi Range.

Richard A. Parker, of Denver, and R. C. Gemmel, of Salt Lake City, are chairmen of the state committee of Colorado and Utah, respectively, of the organization formed to promote the establishment of a national Department of Public Works.

Melville McDowell, secretary of the Engineers' Club of Northern Minnesota, and for the last two years private secretary to B. M. Conklin, chief engineer for the Great Northern Iron Ore properties, has resigned and will engage in business for himself.

S. J. Truscott will assume the chair of mining in the Royal School of Mines at South Kensington in September, succeeding Professor William Frecheville, who is retiring. Professor Truscott has been assistant professor of mining in this school for the last seven years.

Captain Richard H. Yail, who since the signing of the armistice has been serving with the Mines Section, Engineering Department, of the American Peace Commission, returned to New York on July 18 and expects to receive his discharge in the near future.

A. M. Alderson, newspaper man, has been elected secretary of the newly organized Montana Mining Association. State Senator Charles F. Muffy is president and Lieutenant-Governor W. W. McDowell is vice-president. George L. Ramsey, president of Banning Corporation of Montana, is treasurer.

James Underhill has been elected associate professor of mining at the Colorado School of Mines for the coming year. Mr. Underhill is a graduate of Harvard and of the School of Mines in Paris and has been engaged in engineering practice. Mr. Underhill will maintain his engineering offices in Idaho Springs, as heretofore.

W. A. McGonagle has been re-elected president of the Duluth & Iron Range R.R., also of the Spirit Lake Transfer Ry., which serves the Minnesota plant of the United States Steel Corporation. Directors of the Duluth & Iron Range R.R. are: W. A. McGonagle, J. H. McLean, J. H. Harding, George L. Reis, Thomas Murray, J. A. Farrell and W. J. Filbert.

OBITUARY

William Gibson Sharp, for the last thirteen years president of the United States Smelting, Refining & Mining Co., died recently, as was previously announced in the *Engineering and Mining Journal*. Mr. Sharp was born in Salt Lake City in 1857, and was graduated as a civil engineer from the Rensselaer Polytechnic Institute of Troy, N. Y., in 1879, and later as a mining engineer from Columbia University. He was afterward connected with the U. S. Geological Survey, and subsequently with the Pleasant Valley Coal Co., which ultimately became the Utah Fuel Co. In 1900 he came to New York as manager of the Consolidated Coal Co. of West Virginia, and in 1906 was elected president of the United States Smelting, Refining & Mining Co. Mr. Sharp is survived by his widow. His achievements in the mining and smelting industry were notable, and his financial ability is attested by the number of responsible positions that he had held.

SOCIETIES

American Electrochemical Society has issued a bulletin for July, containing names of recently elected members and a list of names of those making application for membership. The tentative program of the Chicago meeting on Sept. 23 to 26, inclusive, is appended.

The Mining Institute of Scotland has issued the annual report of the council, 1918-1919. The report states that 80 members were killed in the war. The following papers have been published in the transactions: "The Repair of a Circular Shaft of Small Diameter," by Stewart Chambers; "The Economy of Briquetting Small Coal," by John A. Yeadon; "Cooling of Electric Motors, With Special Reference to Totally Enclosed Motors," by P. A. Mossay; "The Electric Head Lamp," by James Cooper, and "Digest of the First Report of the Mines Rescue Committee."

INDUSTRIAL NEWS

Wheeler Condenser & Engineering Co., Carteret, N. J., held a meeting of the board of directors on July 8. J. J. Brown, formerly vice-president and general manager, was elected president, succeeding Charles W. Wheeler, recently deceased.

Chicago Pneumatic Tool Company announces the removal of the Minneapolis office from the Metropolitan Bank Building to Fifth Avenue and Fifth St., South, where a complete stock of pneumatic and electric tools, air

compressors, oil engines and rock drills and parts will be maintained.

Westinghouse Electric and Manufacturing Co. has issued a circular describing the company's achievements in the field of electrical precipitation. The process applies to copper, lead or zinc smelting, blast furnaces, and chemical, acid, and cement plants for the recovery of valuable material otherwise wasted. Water can be precipitated from oil, dust removed from ventilating systems, and similar results obtained with other material.

Smith-Booth-Usher Co., of Los Angeles, Cal., has opened offices at 433 Rialto Building, San Francisco, to give a larger service to central and northern California. The company is the California, Nevada, and Arizona agent for Bessemer Gas Engine Co., Foos Gas Engine Co., Lakewood Engineering Co., Clyde Iron Works, Barber-Greene Co., Ohio Locomotive Crane Co., J. D. Fate Co., Cincinnati Iron & Steel Co., Henry & Wright, C. & G. Cooper, Van Blerck Motor Co., and others.

The Electric Furnace Company, Alliance, Ohio, has just installed a battery of two Baily electric furnaces at the Capital Brass Works, Detroit, Mich. These furnaces are of the standard 105 kw. tilting type, with hearth capacities of 1,500 lb. each. They will be used for melting yellow brass scrap and borings in the foundry. The Buick Motor Co., Flint, Mich., has purchased a second Baily electric furnace of similar type, for melting phosphor bronze. The Akron Bronze & Aluminum Co., Akron, Ohio, has installed a 50 kw. rectangular tilting type with hearth capacity of 300 to 500 lb., to be used for a wide variety of compositions.

The Baldwin Locomotive Works has issued a pamphlet entitled "The Baldwin Locomotive Works War Industries," which is an account of the company's activities during the war, and of the rapid construction of locomotives for the Allies for use in Russia and on the Western Front, as well as the machining of a large number of shells from 4.7 to 12 in. and the formation of a new company, the Eddystone Munitions Co., for the manufacture of ammunition. Seven-inch "caterpillar" mounts for the U. S. Navy were also constructed. The aggregate value of war contracts executed and delivered by the Baldwin Locomotive Works and associated companies was about \$250,000,000.

Denver Engineering Works Co., at the annual meeting, elected the following officers: Frank E. Shepard, president; William W. Torrence, general manager; Edwin S. Kassler, Jr., vice-president and treasurer. A Tellam will continue as metallurgical engineer, Frank A. Lockwood, hoist engineer, and William A. Leddell as sales engineer. Joseph P. Ruth, Jr., inventor of the Ruth flotation machine, has been retained as flotation specialist. The interest in the company formerly owned by the Hardinge Conical Mill Co. has recently been purchased by the present officers and engineers.

MINING SCHOOLS

The Engineering Experiment Station, University of Illinois, has an opening for a Fellow in Mining Engineering to undertake research work, either in mining or metallurgy. Anyone interested should apply to the Department of Mining Engineering, University of Illinois, Urbana, Illinois.

NEW PATENTS

U. S. patent specifications may be obtained from the *Engineering and Mining Journal* at 25c each.

Alloy of Aluminum, Magnesium and Vanadium. William J. Reardon, Pittsburgh, Pa., assignor to Westinghouse Electric and Manufacturing Co. (U. S. No. 1,305,166; May 27, 1919.)

Blast Furnace. Julian Kennedy, Pittsburgh, Pa. (U. S. No. 1,303,914; May 20, 1919.)

Classifier—Mechanical Classifier. Frank E. Marcy, Salt Lake City, Utah. (U. S. No. 1,306,188; June 10, 1919.)

Concentrating—Ore-Concentrating Machine. Nathaniel A. Stratton, Boston, Mass., assignor to New American Ore Concentrator Co., Boston, Mass. (U. S. No. 1,306,450; June 10, 1919.)

Conveyor (Bucket). Joseph A. MacLennan, Philadelphia, Pa., assignor to Link-Belt Co., Chicago, Ill. (U. S. No. 1,300,438; Apr. 15, 1919.)

Crusher—Rock Crusher. Edward Henry Moyle, Los Angeles, Cal. (U. S. No. 1,304,355; May 20, 1919.)

Crushing—Gyratory Crusher Head. Chas. B. Andrews, High Bridge, N. J., assignor to Taylor Wharton Iron Steel Co., High Bridge, N. J. (U. S. No. 1,303,447; May 13, 1919.)

Dewatering, Classifying and Rabbling Apparatus for Ore Pulp. Cyrus W. McArthur, Denver, Col. (U. S. No. 1,304,077; May 20, 1919.)

Drill—Rock Drill. Albert Ball and Thomas Officer, Claremont, N. H., assignors to Sullivan Machinery Co., Claremont, N. H. (U. S. No. 1,304,523; May 29, 1919.)

Electrolytic Cell. Clinton Paul Townsend, Washington, D. C., assignor to Hooker Electrochemical Co., New York, N. Y. (U. S. No. 1,306,237; June 10, 1919.)

Manganese—Process of Extracting Manganese and Making Sulphuric Acid and Manganese Dioxide. George D. Van Arsdale and Charles G. Maier, New York, N. Y. (U. S. No. 1,304,222; May 20, 1919.)

Pump—Circulating Pump. Walther Zacharias, Pittsburgh, Pa. (U. S. No. 1,304,843; May 27, 1919.)

Rare Metals—Process of Making Compounds of the Rare Metals. Robert McKnight, Pittsburgh. (U. S. No. 1,306,070; June 10, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief
of Interest to Engineers
and Operators

SAN FRANCISCO, CAL.—July 17

The Mammoth Copper Co., of Kennett, Cal., has filed a formal notice with the supervisors asking a reduction of \$1,344,400 in value on which this year \$1,963,935, or to \$1,619,164. Included in the valuation are the Mammoth mine, the Keystone mine, the Mammoth smelter, and the zinc plant. In order to arrive at a fair adjustment of the assessment, the supervisors and the company agreed to appoint an advisory committee to go through the property and fix values. The committee, as named, consists of M. E. Dittmar, R. E. Hanley and Fletcher Hamilton.

ABERDEEN, WASH.—July 17

The Standard Oil Co. was in readiness to start drilling by July 15 at the site of its well No. 1 near McClips, it was announced on July 10. The Shell Oil company's geologists, after spending a few days at the end of June going over territory in the vicinity of Montesano twelve miles east of Aberdeen, in company with local timber cruisers, departed without announcing intentions of prospecting the Grays Harbor field, beyond the statement that they would return in a month.

The number of local and outside companies advertising oil stocks for sale and with growing if vague descriptions of grounds to be drilled, has not increased materially in the last few weeks. Office signs of these organizations appear here and there in the business center of Aberdeen, but in sufficient strength to indicate that much encouragement is being given to wildcatting. The attitude of local business concerns, and of the public generally, possibly accounts for the fact that the number of stock-selling concerns has increased but little since the first few weeks following the Standard company's start in installing machinery. There is a disposition, except among promoters, to wait upon developments undertaken by the big companies.

BOISE, IDAHO—July 18

The Empire Copper Co., at Mackay, Idaho, the chief copper producer of Idaho, has been operating for several months with a minimum crew, on company account, owing to adverse labor conditions and high operating costs, but has extended its former leasing system, which the extensive distribution of its ore lenses facilitates. The force engaged includes about 100 men, divided into thirty separate leases. The combined output is approximately 1,500 tons per month of crude shipping ore, which is treated at the Salt Lake Valley smelteries on a favorable freight and treatment charge basis completed. The ore carries 1 1/2 gold and silver to each unit of copper. The property is extensively developed with reserves of low-grade ore, a concentrator is set up to handle the sulphides in anticipation of this move, and to reduce the Shay railway haulage cost from the mine on White Knob Mountain to the Oregon Short Line American Steel & Wire Co., three miles long, with a maximum capacity of 100 tons per hour, has recently been completed. Shay railway equipment has been junked. John Flinn is manager and Morton Weber consulting engineer.

The Horseshoe and Kennedy mines embrace an extensive acre of mining claims adjoining the Empire Copper to the north. They were taken over a year ago by the United States S. P. & M. Co. of Salt Lake, and much valuable equipment has been disclosed some bodies of lead-silver ore. The most recent development on the Horseshoe group is a shoot of sand carbonate and crystallized ore 15 ft. long, which has a maximum width of 22 ft., which has been opened on the 200 level where there is a small gasoline hoist equipment. Recently a large piece of plant and electric generator of 100-hp. capacity has been installed on the surface and a crosscut tunnel extended to the orebody at this level, where a section has been cut for installing an electric hoist to explore the deposit at

depth. The ore mined runs about 30 per cent lead, and 20 to 25 oz. silver. Two cars a week have been shipped, with a small equipment for some time, and the output should be increased materially as soon as the new plant is completed. The Kennedy vein of this company has been developed 200 ft. deep and 700 ft. long, and shows a succession of pipe-like oreshoots, one of which is 50 ft. thick with about 3 per cent lead, 6 oz. silver, and a high excess of iron oxide. The formation is heavy-bedded blue limestone, traversed by pronounced dikes of rhyolite and granite por-

STANDARD OIL CO.'S OPERATIONS NEAR MCCLIPS, WASH., JULY 1919
Photo by A. C. Girard.

phy, the ores occurring at these contacts, of which there are fully a dozen on the property. Fine ashly breccia deposits and scattered carbonates of lead, with shrinkage open caves at the top of the best orebodies, are characteristic and closely resemble a condition at Tintic, Utah. In fact, the geology of the two districts is closely related in age. Thus an interesting new source of desirable lead ore, which seems to increase in silver tenor as development in depth progresses, is in prospect in this district. N. J. Churchill, formerly of the Tennessee mine in Arizona, is in charge. Several other promising discoveries in the district is mineralized over a large area and has bright prospects for future development in both copper and lead-silver ore.

BUTTE, MONT.—July 18

Anaconda Copper Mining Co.'s Decision to embark in the field of fertilizer manufacture follows a series of experiments made by the company's chemical engineers in connection with a method for the cheaper manufacture of sulphuric acid. These experiments have resulted satisfactorily, according to C. F. Kelley, president of the company, and at the Washoe Reduction Works, at Anaconda, a 25-ton plant has been installed, which is producing the acid at one-half the previous cost and with the plant occupying one-quarter of the usual plant area. The company has decided to spend \$75,000 to build an experimental fertilizer manufacturing plant at the Washoe works, where phosphate rock will be converted into soluble phosphate by the application of sulphuric acid. The company has two claims in the Canyon Creek country in southern Montana, near Maiden Rock on the Oregon Short Line R.R., showing a ledge of phosphate rock

averaging 23 ft. in width and carrying up to 30 per cent of phosphate. In addition, the company is said to have tied up by leases a considerable area of phosphate land elsewhere near Maiden Rock, which is about 45 miles from the Washoe works.

Restoration of Wartime Wages throughout the Butte district has brought to a culmination the controversies between the unions and the mine operators, and this, with the abolishing of the sliding wage scale based upon the price of copper, has served to promote a friendly feeling on the part of labor not observed before in this district in years. The leaders of the unions seemed possessed with a fear that to base wages upon the price of copper would be followed by a slump in the price, and when the companies, with C. F. Kelley, president of the Anaconda, the largest individual employer of labor in Butte, acting as spokesman, offered to abandon the sliding scale and have the companies take the risk of a slump in the metal quotations, the highest hurdle in the road of an agreement between the unions and the companies had been cleared. Jurisdictional disputes also were cleared up with the unions, and with the American Federation of Labor dominating throughout the district. The I. W. W. and its cohort organizations were entirely ignored. The metal crafts, consisting of the machinists, electricians, boiler-makers, and sheet-metal workers, known as the radical unions, have yet to negotiate a wage increase with the companies. Their request was refused. Strike talk on the part of the metal-crafts leaders has vanished, as a strike of these workers without the support of the conservative organizations would accomplish no object.

PHOENIX, ARIZ.—July 18

The 1919 Assessed Valuation of Mining Property in Arizona is \$47,704,615.64, as compared with the \$3,680,430 valuation of 1918. This covers mining property only, other operative property of mining companies being assessed at \$7,583,276.86. The same class of property was valued at \$1,861,131 in 1918. This year the State Tax Commission report contains a new class of property owned by mining companies, called non-operative property, consisting of townships, buildings, stores, supply depots and other similar property owned by the companies but not actually productive mining property. This group is assessed at \$7,916,833.94 for 1919. The grand total of all the assessed valuation of the properties, operative and non-operative, is \$48,184,526.44, which is about half the assessed value of all Arizona property.

The highest assessment against any company is \$80,782,134.30, the total valuation of the Phelps Dodge interests. This is a branch of \$65,200,000 for the Queen Mine, \$1,087,411 for producing mining property, \$3,495,927.59 for other operative property, and \$2,287,382.80 for non-operative property. The Phoenix Copper Co. has a total of \$27,040,407. \$8,731,726.50. The second highest is against the Inspiration Consolidated company, a total of \$79,990,063. The United Verde mine carries a third with \$50,273,788. Fourth is Ray Consolidated, with a valuation of \$48,504,837.83. Gila County leads, with a valuation of \$19,654,096.21. Coconino County is next with \$17,040,047 valuation of \$113,258,179.70. Yavapai County has a total of \$84,325,553.40. Pinal County, \$43,752,170.99; Greenlee, \$25,657,883.12; Pima, \$24,578,912.22; and Mohave, \$6,231,102.

SALT LAKE CITY, UTAH—July 18

The Formation of the Utah Steel Co. with a capitalization of \$2,500,000, comprising the Utah Iron & Steel Co. and the Utah Junk Co. will give impetus to the development of iron and other resources of the state. According to the articles of incorporation, the scope of the new company is wide, the purpose being to buy, sell and deal in iron, steel, copper, stone, ores, coal, coke, wood, lumber and other materials.

and to purchase, acquire, lease and operate lands containing these materials. C. W. Whitley, vice-president of the American Smelting & Refining Co., is president of the Utah Steel Co.; Nathan Rosenblatt, formerly president of the Utah Junk Co., vice-president; M. H. Sowles, treasurer; S. Rosenblatt, secretary. W. S. McClellan, Lawrence Green and M. S. Rosenblatt complete the directorate. There are 25,000 shares, par value \$100; 17,500 common stock and 7,500 preferred stock. There is paid up \$1,000,000 of the authorized common stock, representing 10,000 shares. The Utah Iron & Steel Co. and the Utah Junk Co. have been operating for some time. The capacity of the plants will be increased.

DENVER, COL.—July 19

A Bill To Encourage Production of Molybdenum was introduced in the House at Washington on July 13 by Representative Taylor, of Colorado. The bill (H.R. 7548) reads as follows: "Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That on and after the day following the passage of this act there shall be imposed, levied, collected, and paid upon the articles named herein when imported from any foreign country into the United States or into any of its possessions, the rates of duties which are herein prescribed, namely: First, Crude molybdenum ores and concentrates, 40c. per lb. metallic molybdenum therein contained. Second, Metallic molybdenum, molybdenum powder, ferromolybdenum (herein when imported), ferromolybdenum powder, commercial molybdic acid, calcium molybdate, sodium molybdate, and all other salts of molybdenum and other manufactured materials containing molybdenum, including high-speed molybdenum steel, all alloy steels containing molybdenum and all other compounds containing molybdenum not specifically provided for in this section, 6c. per lb. of molybdenum contained therein. Sec. 2. That the provisions of this act shall not be deemed to repeal any tariff now existing upon any substances or materials mentioned in this act."

EL PASO, TEX.—July 18

The State School of Mines has been given an appropriation of \$32,685 for operating and maintenance expenses during the next 1919-1920 term, and the same amount for the term 1920 and 1921. S. H. Worrell has been re-elected dean. J. W. Klidd will be professor of engineering next year, and R. J. Dwyer adjunct professor of engineering. In addition to being dean, Professor Worrell will have charge of the department of metallurgy.

A Party of Railroad Engineers headed by J. L. Jackson, construction engineer for the Southern Pacific R. Co. of Mexico, has just completed an inspection of the railroad through Sonora. The tour included the Tonichi branch in the Yaqui River Valley and was the first inspection trip through that district since 1913. The journey was made on burros. The road is dilapidated. Trees are growing in the middle of the track, the rails and ties having been blown up by Yaqui Indians and bandits. The trip was made as a basis of a report to the Mexican Government, asking for damages.

The Bill Providing a New Mining Law for Texas, that was drafted by mining men of El Paso, indorsed by the El Paso Chamber of Commerce, and presented by Senator R. M. Dudley of El Paso, has passed the Senate and is now awaiting only the signature of Governor W. P. Hobby, which it will doubtless receive. The bill is considered the most important measure affecting the mining industry ever adopted in Texas. It makes it necessary for persons and corporations holding mineral rights to develop them or pay the state an annual fee. This is expected to make railroads develop or pay a heavy tax upon their extensive mineral holdings or relinquish their right to them, so that others may develop them. It is intended to liberalize the present law authorizing the Land Commissioner to issue permits to prospectors for ore, minerals, oil, and gas. It extends the time from one to three months in which prospectors shall begin boring for oil or mining for minerals and also permits grouping of leases by one lessor.

AUSTIN, TEX.—July 10

U. S. Bureau of Mines has selected Wichita Falls as headquarters for branch offices to be established in Texas for purpose of studying conditions thoroughly, and to get into closer relationship with operators in the effort to institute conservation measures for oil and gas, and bring into operation more economic methods of production.

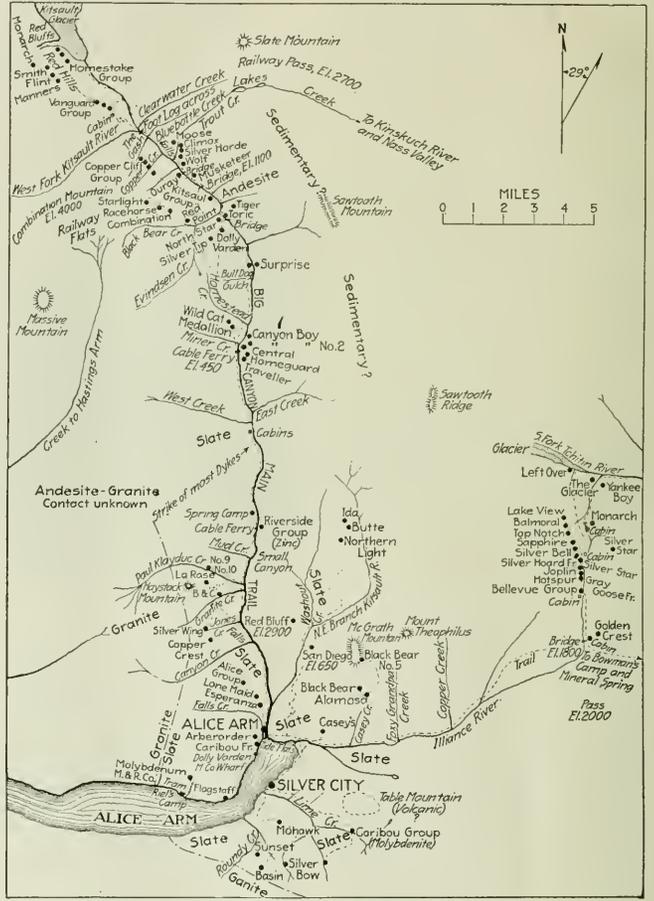

Shutdown of the Burkburnett Field in its northwest extension was ordered by the Railroad Commission for a period of five days, beginning July 12. At the same time a meeting was called to be held at Austin July 16 to give producers a chance to show reasons why the shutdown should not continue in effect for thirty days. During this five-day period there was to be no production, drilling or new wells started. Other drilling might be continued to the sand only, when the well must be cased and work discontinued. Production, it is stated, is far in excess of pipe-line capacity.

Pipe-Line Companies and producing companies have reached an agreement at a hearing before the State Railroad Commission on several contested points, others

JOPLIN, MO.—July 19

The Silver Fox Mining Co. lost its mill by fire on July 12, the plant being situated on the company's lease northwest of Treaco, Kan., in the extension of the Ficher camp field. The mill has been operated steadily for over a year, and has been a consistent producer. Origin of the fire is unknown. The company announces it will rebuild as soon as insurance claims have been settled. F. J. Childress, Galena, Kan., is manager.

Purchase of Several Zinc Mines of the old Commerce camp, four miles north of Miami, Okla., has taken place recently. Homer Seals, of Joplin, and John Newton, of Miami, have bought the Turkey Fat and placed it in operation once more. F. H.

ALICE ARM DISTRICT, BRITISH COLUMBIA. ALICE ARM AND HASTINGS ARM ARE BRANCHES OF FORTLAND CANALS. THE DOLLY VARDEN MINING MINE REFERRED TO IN THE OPPOSITE PAGE IS IN THIS DISTRICT
 Reproduced on Bulletin of British Columbia Department of Mines

being still under discussion. Those agreed upon are: South Texas oil is not to be taken into the pipe carrying more than 2 per cent of foreign sediment and oil, and North Texas oil 1 per cent, temperature of oil not to be higher than normal summer temperature; five days' free storage to be given oil at destination, after which demurrage charges will be made at the rate of one-tenth of 1 per cent per day for first ten days, two-tenths for second ten-day period, and three-tenths for third. Identical oil cannot be delivered through pipe lines, but line companies will deliver similar oil of equal market value. Gathering and delivery charges shall be made separate from those for transportation. The hearing is still being held.

Garung, W. S. Godfrey, and Joseph Ramsey, of Joplin, have bought the Emma Gordon mine, and have changed the name to Dorothy G. It also has been placed in operation. Mr. Seals some weeks ago bought the New State, also at Commerce, and is operating it.

Drainage of 730 Acres of Mining Land in the vicinity of Quapaw, Okla., is assured by the completion of the organization of the Quapaw Royalty & Pumping Co., effected July 17. Between fifteen and twenty companies are interested in the project, which is a co-operative effort, some of the most important including the Brinson-Kirtley, Muskogee, Imperial, Big Three, Wilson, Maubine, F. & F., Greening, Big Jim, True Blue, Red Rose, Burnett, and Springfield.

Lease owners have conceded on an average 2 per cent of their royalty to pay pumping expenses. Four pumping plants are being established, all to be operated by electric motors. A pump of 2,000 gal. per min. capacity will be placed at the Erinson Kirtley mine, a 10-in. Texas pump will be operated at the Muskogee shaft, three Pommas already have been placed at the Imperial, and a 2,000 gal. capacity will be placed at the Maurine. A total capacity of 7,500 gal. per min. will thus be provided, and if this is not sufficient more pumps will be installed. The draining company is capitalized at \$50,000, with \$30,000 paid up. C. H. Cleveland, of Skiatook, Okla., is general manager.

HOUGHTON, MICH.—July 18

The Resumption of the Wartime Wage Scale has resulted in a decided change in the situation, with men returning from the cities. The influx of labor is not to be compared with the outgo that prevailed in June, but the mines at Calumet now report that there is a steady average of fifteen underground men resuming work, all of them being returned miners or trammers.

BATESVILLE, ARK.—July 17

In the Batesville Manganese Field only two companies are working. The Independent Mining Co. is operating one steam shovel at the Polk-Southern mine, near Cushman, and the Cushman Manganese Co. is working on the Rogers & Snapp property. These companies are filling an old contract of 2,000 tons, delivery on which started April 1. One thousand tons have been delivered and the rest will be by Oct. 1. This contract calls for high-grade ore running 50 per cent and over. Letters from some of the largest consumers lead local operators to believe that there will be a market in the future for high-grade ore at a price at which it can be mined at a profit. Representatives of the War-Minerals Relief Commission are still at work investigating claims in the district, and expect to finish in about three weeks.

DULUTH, MINN.—July 19

Reduction of Ore-Carrying Rates is sought by producers of iron ore in the Lake Superior district who have joined forces and have retained Richard Jones, of Youngstown, Ohio, and Francis Sullivan, of Duluth, to carry the matter before the Interstate Commerce Commission. The rates complained of are \$1 per ton on Mesabi ores and 70 and 80c per ton on Old Range ores. These rates, plus the demurrage charge and the stockpile spotting charge, both recent innovations put on in conjunction with remarkable increases in rates, make the shipment of iron ore expensive, and are considered unfair. It was thought at one time that the matter would be dropped for the present season, but the situation has become so galling as to demand immediate attention.

ISHPEMING, MICH.—July 19

Iron-Ore Shipments from Lake Superior ports in June amounted to 7,980,839 tons.

as compared with 9,921,860 tons for June, 1918. The total movement to July 1 reached 16,008,419 tons, as against 18,949,730 tons for the same period of 1918. The difference is not great, owing to the fact that shipments were started earlier this year than last, but the independents are not moving ore at the rate that they should. The Steel Corporation, Fickands, Mather & Co. and the York, Hanna Co. being the only heavy shippers. Only small shipments of ore are going forward from the Marquette Range, and ore is still being placed in stock in some of the iron districts already crowded for stocking room. The situation is far from being what it should at this season of the year.

Below are compared the tonnages for June, 1918, and June, 1919:

Dock	June, 1918	June, 1919
C & N. W. Escanaba...	785,259	594,595

Total 9,921,860 7,980,839
Miners are being paid at the rate of \$5.10 a day, and surface laborers are receiving \$4.25. This is the same scale which was in effect during the war period, no reduction having taken place in the iron fields. Many miners working on contract are earning \$8 and \$10 a day, and some trammers are doing as well. It is difficult to state what action will be taken by the operators if it is necessary to cut expenses in the autumn or winter.

BIRMINGHAM, ALA.—July 19

A Steel Base Price in the Birmingham district is being sought and the matter is now before the Federal Trade Commission at Washington. The fourth keel has been laid at the plant of the Chickasaw Shipbuilding Co. The United States Steel Corporation is said to be planning the construction of ten 12,000-ton cargo carriers, and the Chickasaw company will probably build a number of these, drawing on the Fairfield and Ensley plants of the Tennessee Coal, Iron & Ry. Co. for the necessary fuel. The Stoss-Shield & Co. of Iron Co. is planning to blow in two of its North Birmingham furnaces. These are said to be in good condition, and little time in preparation should be lost before new operations to be financed by seven owners in which this company are in operation.

The company is also planning many improvements to all plants, including furnaces, by-product coke ovens, and the electrification of mines. The Woodward Iron Co. has begun operations at its No. 1 ore mine, which has been shut down for several months. During the shutdown some important repairs that had been held up during the press of war business were completed.

The workmen's compensation act, which will soon become a law, indicates a better understanding between capital and labor, as both sides were compelled to make many concessions in order that a satisfactory bill could be drafted. The struggle over the bill began in the previous session of the Legislature. A tax of 4c per ton on iron ore and 5c on coal is before the Alabama House Ways, Means, and Appropriation Committee. This, if it becomes law, will be a heavy blow to the two main industries of the state, and many representatives of the large operators are now in Montgomery attempting to prevent the passage of the bill. Such a tax would increase the cost of producing pig iron to such an extent that decrease in production would be sure to follow at the present selling price of about \$27 per ton and cost of \$34 to \$28.

VICTORIA, B. C.—July 19

The Molybdenum Mining & Reduction Co., whose mine and mill are situated in British Columbia on the branch of Fortland Canal known as Alice Arm, has been tied up in litigation over one of its claims from the end of 1916 until last month. In June, at Victoria, B. C., a court order was issued requiring that the property be placed at once on the market at a fixed price of \$150,000 for the entire molybdenum and silver-lead holdings. The property consists of twenty-one claims situated 4,200 ft. from salt water and 1,200 ft. above sea level on the north side of Alice Arm. The Dolly Varden mine, also in the Alice Arm district, it is expected, will soon be placed on a producing basis. A. J. Taylor, of the Taylor Engineering Co., and now manager of the Taylor Mining Co., was recently granted the necessary certificates to take possession of the property, which, as heretofore mentioned, has been involved in litigation.

TORONTO, ONTARIO—July 19

A National Conference to consider labor legislation has been arranged by the Canadian government to be held at Ottawa, beginning Sept. 11, in pursuance of a recommendation made by the Royal Commission on Industrial Relations. The conference will also deal with the proposals of the Royal Commission. The federal and provincial governments will be represented, and employers' and employees' organizations will each be invited to send about sixty representatives, bringing the total number of those participating in conference up to about 150. The sessions will probably continue for about one week and will be open to the press and the public.

THE MINING NEWS

Progress of Mining Operations Condensed and Classified for Easy Reference

ALASKA
ALASKA SHIPMENTS of domestic copper ore, matte, etc., to United States in June totaled 2,374,843 lb., valued at \$382.

ARIZONA

Gila County
INSPIRATION CONSOLIDATED (Inspiration)—Latest estimate indicated company had 17,500,000 tons of ore averaging 1.31 per cent copper, leaching of which will be tried in recently completed test plant.

Greenlee County

ARIZONA COPPER (Clifton)—Company does not expect to develop actively at present the recently purchased holdings of Shannon Copper Co., but will await development of a process by which the low-grade semi-oxidized ores contained may become sufficiently profitable.

Final County

ARIZONA HERCULES (Kelvin)—Flotation department to be remodeled in part.

One unit of Schimmin cells to be installed. Recent developments in present practice has made possible flotation of native copper, abundant in the ore.

RAY-ARIZONA (Kelvin)—Arranging to resume operations within six weeks. Silver vein which was slightly prospected in 1917 will be explored at depth. Modern hoist and compressor will be installed.

SOUTH RAY COPPER (Kelvin)—Sampling of old Ripsey or Norman group completed by South Ray Copper Co., headed by W. B. Duvoll. As soon as report can be completed, definite plans will be made. Work at mines in charge of A. Hoch.

SILVER BELL (Price)—Planning to reopen old Silver Bell, north of Price, which has been idle for years, except for short periods when worked by lessees. New operations to be financed by seven syndicate, which plans building substantial roads and equipping property with modern machinery.

Yavapai County

KAY COPPER (Canyon)—Property about fifty miles north of Phoenix operated by George W. Long, discoverer of United Eastern. Development and 1,000-ton mill expected to cost \$800,000, before any return is made. Property on line of projected Phoenix-Verde Valley railroad. Orebody partly developed over length of 7,500 ft. to 500 ft. depth. One lens demonstrated 80 ft. wide and 150 ft. long. Main development to be at 600-ft. depth.

HENRIETTA (Mayer)—New electric hoist being installed in main tunnel for sinking 500-ft. shaft.

ARKANSAS

Marion County

MINE 16 (Buffalo)—Development begun recently on Mine 16 in Cow Creek camp after short shutdown. Mine has about 1,500 ft. of tunnel showing good faces of zinc and carbonate.

PAULINE (Yelville)—Zinc mine in Buffalo River purchased by W. R. Jones

and J. F. Carson, of Yellville, from W. S. Teagarden, who developed it.

CALIFORNIA

Amador County

ARGONAUT (Jackson)—Fire broke out again, but was easily subdued.

CENTRAL EUREKA (Sutter Creek)—Shaft completed to 3,700 level and station being cut. Twenty-five stamps of 40-stamp mill dropping.

Calaveras County

CARSON HILL GOLD (Carson Hill)—Earned net profits in June of over \$61,000. Operations during first five months of 1919 mainly devoted to development work, 70 per cent of ore treated during this period being from development. Net earnings for first half of 1919 were about \$250,000. Average extraction in June from 6,843 tons ore was \$13.83 per ton, extraction recently running over 92 per cent. Operating expenses in June, \$413 per ton. During last three months all debts paid off incurred in early construction, except \$600,000 loan from American Zinc Co., of which \$50,000 will be paid off in July. On 875 level station completed, crosscut run to vein and drifting started. Indications promising on this lowest level. Company comparatively new organization which optioned mines of Calaveras Consolidated Syndicate at Melones and Carson Hill; also property owned by James G. Fair, including Morgan and Union mines.

Eldorado County

BLACKBURN (Placerville)—John E. Patterson, of Los Angeles, made substantial payment on Blackburn property comprising 40 acres.

MANZANITA (Placerville)—Six-foot vein assaying \$12 per ton free gold uncovered in old tunnel. Sacramento people owners.

YUKON JIM (Placerville)—Anthony Clifton has begun work to locate ancient channel under volcanic ash or lava running through Georgia Hill.

Nevada County

EMPIRE AND NORTH STAR (Grass Valley)—These two properties gradually getting back to normal conditions following strike. Unwatering about completed. Mills running normally.

GOLD POINT CONSOLIDATED (Grass Valley)—Instead of sinking new shaft company plans to unwater old Idaho-Maryland shaft and explore and determine ore shoots. Compressor being installed for this purpose.

SULTANA (Grass Valley)—Management decided to unwater workings, install new machinery, and proceed with deep exploration.

Plumas County

ENGELS COPPER (Encelmine)—Prospecting extensive areas of virgin ground by diamond drilling.

STANDARD (Johnsville)—Operating hydraulic property on Wilson Creek. Planning to add to height of dam to increase production next season.

KELSEY FRENCH HYDRAULIC (Johnsville)—Near Walker copper properties. Had successful season, and will be further developed. Owners will build wagon road to Genesee.

Sierra County

CLEVELAND (Downieville)—Additional ten stamps almost completed. Within a few weeks management expects to increase mine force and have twenty stamps dropping.

RAWKYARD (Downieville)—Cleaning out 2,500-foot tunnel level. Activity increased in Old Nigger Tent district.

Shasta County

AFTERTHOUGHT (Ingot)—Will resume operations in flotation plant and reverberatory furnace about July 20. Produces both zinc and lead.

COLORADO

Boulder County

BURLINGTON BOULDER (Boulder)—Officers re-elected at recent annual meeting. Properly being developed.

Mesa County

DE BEQUE SHALE OIL (De Beque)—Will build road to property, consisting of 1,720 acres of shale land at head of Gardner Gulch, with a view of erecting plant. Title acquired when company first located in Roan Creek-De Beque region. Has better transportation facilities.

Montrose County

CASHIN (Paradox)—James N. McBride, general manager, states mining interests

in district are ready to invest \$1,500,000 in an electric line from mines to some point on railroad. Various routes proposed.

Ouray County

TOM CRAWFORD (Ironton)—Mill near completion. Guadalupe mine in vicinity ready to install two-bucket tram to this mill, equipment being in transit.

IDAHO

Shoshone County

NATIONAL (Mullan)—Force reduced about half by labor shortage, making it necessary to stop development. Mill will probably shut down when present available ore is exhausted. Development will be pushed on levels above main tunnel where ore is of better grade than in shaft levels. Low-grade copper and silver.

ANCHOR (Murray)—Option held by Davis given up, after driving crosscut 700 ft. to vein 200 ft. below upper tunnel, in which there is considerable body of lead-silver ore. Drifting on vein below did not prove satisfactory. Work being continued by Mike Melley, owner.

SUCCESS (Wallace)—Two leases making regular shipments of lead. Gardiner lease shipping crude ore and Thompson lease concentrates, its ore containing zinc. About 500 tons zinc concentrates on hand at Success mill, management being unable to sell at profit.

MINNESOTA

Cuyuna Range

IDA MAE (Crosby)—Ownership passes from Franklin Merritt and associates to Cuyuna-Minneapolis Iron Co. Property reopened July 1. Shaft to be deepened 20 ft. and active development work conducted. P. C. Merrill local superintendent.

MEACHAM (Crosby)—Completes shipment of stockpile. Armour No. 2 stockpile also completed. Thomson and Cuyuna-Du-

RECEIVING SECTION OF NEW IRON ORE WASHERY, LEONIDAS MINE, EVELETH, MINN.

luth about half completed. Kennedy starts shipment from stock. All properties shipping from pocket.

MILLE LACS (Crosby)—Deepening main shaft to develop new level at 205 ft.

JOAN NO. 3 (Crosby)—Preparing to unwater property and deepen shaft for new development in anticipation of improved manganese market.

Mesabi Range

STUBLER (Buhl)—Prospect adjoining Grant, just out of extended litigation, to be explored at once. Osterberg & Johnson Co. drilling for Kenneth McDonald and H. O. Johnson, of Virginia.

BILLINGS (Chisholm)—Development work at new underground property of Tod-Stambaugh progressing, some ore being placed on stockpile. Conducting experiments with loading machines as applied to development work.

LEONIDAS (Eveleth)—Transmission line for operation of washery completed. Plant to have daily capacity of 1,000 tons when finished.

DAY (Hibbing)—Oliver Iron operating two drills on prospect adjoining its Burt-Sellers pit.

HULL-RUST (Hibbing)—Oliver Iron working on foundations for three steel bridges to serve stripping trains in crossing Great Northern and Duluth, Missabe & Northern railways and Hibbing-Morton highway.

LAMBERTON (Hibbing)—Rumored Butler Bros. will install drying plant at property, which has been opened up some time, but has so far shipped little, because of high moisture content.

SOUTH AGNEW (Hibbing)—Shaft bottomed in firm ground after many quicksand difficulties. Believed work will progress rapidly. When completely developed will be one of big underground mines of district. Interstate Iron Co. operators, Great Northern fee.

BENNETT (Kewatin)—Working fifty gangs of miners double shift underground and shipping heavily from open-pit section. Will probably divide honors with Dean pit, Buhl, as second largest independent shipper, Mahoning, at Hibbing, being largest, as usual.

HILL (Marble)—Installation completed of deep-well pump to furnish water for village.

MICHIGAN

Copper District

CHAMPION produced 36,000 tons of rock in June. Baltic, 19,000; Trimountain, 15,500; Wolverine, 21,800; Mohawk, 44,000; Michigan, 5,320; Mass Consolidated, 6,032; Osceola Consolidated, 46,000; Ahmeek, 8,000; Centennial, 4,000; Alouez, 8,700; and Isle Royal, 40,000.

MICHIGAN (Rockland)—Has been maintaining steady output and opened considerable good ground. Eighteen machines at work, four running laterals from E shaft to proposed location of new shaft. Production from E shaft will be doubled, possibly by November, when new shafthouse will go into operation.

Marquette Range

CLEVELAND-CLIFFS (Ishteping)—Five new electric driven compressors ordered for Ishteping-Negaunee district. Will replace machines in use for years.

CLIFFS SHAFTS (Negaunee)—Old headframes of wood and corrugated iron to be replaced by new ones of reinforced concrete. Will be 37 ft. square at base, where walls will be 2 ft. thick. Concrete to be drawn as work proceeds upward. Will be 85 ft. high. First all-concrete shaft houses in the country. Mine work will not be interfered with during construction.

KLOMAN (Republic)—Exploration work to start here by Felix A. Vogel, of New York, who has taken option. Mine idle for years.

Menominee Range

PEWABIC (Iron Mountain)—All work stopped. Workings depleted of ore. Was once a producer. Everything of value to be removed.

ARAGON (Norway)—Sinking completed. Station being cut at bottom. All machinery being electrified. New compressor recently installed.

RIVERTON (Stambaugh)—Work of concreting almost completed from collar to depth of 1,050 ft.

MONTANA

Deer Lodge County

SOUTHERN CROSS (Southern Cross)—Owned by Anaconda, but being sunk from 600 to 1,000 level with good orebody opened on 700. Runs well in gold and affords good fluxing material. Heavy water struck, which may be seepage from Georgetown Lake, a mile distant.

Jefferson County

JIB MINING (Basin)—Recently organized to operate old Hope and Katy mines. Machinery will be installed to unwater shafts. Properties adjoin and on same fissure.

Mineral County

TARBOT (Saltse)—Butte faction tried to set control at annual meeting of stockholders at Wallace on July 21. Richard Daxon, manager, returned from East. Says control is safe and that he closed deal for funds to build mill, subject to inspection of property.

Silver Bow County

ANACONDA (Butte)—Entered into agreement with International Union of Mine, Mill and Smelter Workers and branch of American Federation of Labor, and with carpenters' and engineers' unions, also affiliated with American Federation, whereby all union employees were granted advance of \$1 per day, effective from July 1, 1919. Under new contract, which will run until July 1, 1920, and thereafter unless terminated by either party for 30 days notice, miners will receive \$5.75 per day and common laborers \$5.

DAVIS-DALY (Butte)—Development under way to open zone below 2,500 and above 1,900 level. Expecting to resume work at capacity soon.

EAST BUTTE (Butte)—Capital stock increased from \$3,000,000 to \$6,000,000.

NORTH BUTTE (Butte)—Orebody cut on 900 level of Sarsfield property, in eastern section of Butte district, most important development since opening of famous Edith May body at Speculator mine in 1905. Opening 400, 600, 800, 1,000 and 1,200 levels of Speculator mine preparatory to increasing output.

TUOLUMNE (Butte)—Crosscutting well under way for Spread Delight vein on 1,000 level, with 100 ft. weekly being made. Expected to reach fissure within seven weeks. Sinbad shaft down more than 75 ft. below 1,000 level.

NEVADA

Nye County

TONOPAH SHIPMENTS for week ended July 12 totaled 6,370 tons, valued at \$108,290. Shippers were as follows: Tonopah Belmont, 193; Tonopah Mining, 65; Tonopah Extension, 1957; West End, 1024; Jim Butler, 109; Montana, 113; Tonopah Divide, 420; MacNamara, 210; Rescue, 60; Midway Leasers, 10; and miscellaneous, 84.

TONOPAH EXTENSION (Tonopah)—Diamond drilling on southerly end of Red Rock claim to prospect ground near western boundary of California claim of West End Consolidated, on which Ohio vein was discovered and developed within last two years.

White Pine County

CONSOLIDATED COPPER MINES (Kimberly)—Inclined diamond-drill hole put down from 1,300 level to explore formation in advance of sinking shaft. At 1,550 ft. below collar passed through 33 ft. of ore corresponding to horizontal width of 164 ft. averaging 8 per cent copper. New ore averaging about 9 per cent copper recently cut on 1,300 level in crosscut farthest east on level; also near western end of workings on 1,100 level south of any previously cut in that level. Six ft. of 5 per cent ore also recently cut at extreme west end of 1,000 level, being probably extension of ore previously met in crosscuts lying to east. At 1,400 level not yet reached ore-bearing zone. Station being cut on 1,400 level and sinking of shaft 400 ft. deeper will be started as early as possible, which will permit opening up mine to 1,800 level.

NEW MEXICO

Grant County

CO-OPERATIVE (Lordsburg)—Building mill. In market for sinking, station, boiler and sludge pumps. E. W. Walters, mill superintendent.

LAST CHANCE (Lordsburg)—Building pipe line three miles to Aberdeen shaft for water. Mill working half shift. B. Prescott, manager.

85 MINE (Lordsburg)—Rearranging machinery in mill, eliminating tables and cones. Expect to start mill half capacity on Aug. 1. M. Merry, mill superintendent.

NORTH CAROLINA

Rowan County

UNION COPPER MINES (Gold Hill)—Company plans to unwater No. 3 shaft to depth of 600 ft., preparatory to resuming development. Three 100-ft. shot-drill holes have been sunk in company's mineral zone northeast of No. 3 shaft, and assays indicate low-grade copper ore of promising value. Additional drill holes will be sunk as a guide to underground development under consideration.

OKLAHOMA

Joplin-Miami District

DEFENDER (Joplin)—Has purchased Wayland mill at Galena and will move to lease near Picher, Okla. J. H. Wright, Joplin, manager.

W. H. LOGAN (Miami)—Preparing operations at Onky shaft lease option on which was taken by Blue Mound company, but was not closed. Hand gigs being installed at mine.

BLACK HAWK (Picher)—Has taken over Farmington and Lucky Jack mines, near Hockerville, and will operate. Both mines have mills.

FOCH (Picher)—Has started up Sherida-Adams mine northwest of Picher, after several months of drifting to prospect ground.

ROYAL (Picher)—Starting operations after several months' shutdown on account of litigation.

OREGON

Baker County

IRON DIKE (Homestead)—Caving of railroad tunnel forces company to haul ore out by motor trucks.

TEXAS

Hardin County

RECENT COMPLETIONS AT SOUR LAKE: Texas Co. No. 240 Fee, pumping from 2,370 ft.; Saxon Oil, No. 4 Jackson well, pumping from 2,330 ft.; Youngslee Oil, No. 4 Martin, getting ready to pump.

Harris County

GOOSE CREEK COMPLETIONS: E. F. Simms Co. bailing No. 5 Schilling well at 3,000 ft.; Gulf Coast Oil Corporation, No. 20 Gaillard well, pumping at 3,380 ft., and testing No. 4 Gaillard at 3,015 ft.; Gulf Production, No. 15 Stalene well, bailing at 3,375 ft.; Humble Oil & Refining, No. 8 Gaillard Peninsula well, testing at 2,150 ft.

HUMBLE FIELD COMPLETIONS recently were: Southern Petroleum No. 7 Landslide well, pumping from 1,760 ft.; Crown Oil & Refining, No. 14 Hermans, abandoned at 1,260 ft.; Keystone Petroleum No. 4 Fuller well, arranging to pump at 760 ft.

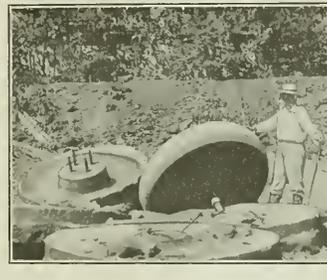

UTAH

Jaab County

TINTIC SHIPMENTS week ended July 12 were 84 cars.

SOUTH STANDARD (Eureka)—Stockholders to meet July 30 to ratify sale of claims to Tintic Drain Tunnel; purchase price \$35,000. Country rock on claims is porphyry. Tunnel will be extended through it. Money from sale to be used for sinking new shaft in limestone by South Standard.

TINTIC PAYMASTER (Eureka)—Electrically driven equipment installed, including double-drum hoist and five-drill compressor.

GRANITE MORTARS AND MULLERS OF CHILIAN MILLS USED IN ROWAN COUNTY, NORTH CAROLINA, ABOUT 1850

Salt Lake County

UNITED STATES (Bingham Canyon)—Strike started July 14 ended. Miners employed in upper workings granted privilege of being lowered through shaft to Niagara tunnel, from which point they walk home to lower Bingham.

VICTOR MINING (Salt Lake City)—Work resumed at this property in Big Cottonwood Canyon adjoining Cardiff and Tar Baby. Fissure encountered at 600 ft. in tunnel being followed.

WASHINGTON

Ferry County

ADDISON COPPER (Keller)—Following officers recently elected: George R. Hodges, president; R. B. Smith, vice-president; C. A. Gray, manager. Recently installed three-drill compressor and 40-hp. boiler. Contract pending for 220 ft. of tunnel.

Stevens County

GREAT BONANZA (Bossburg)—Being unwatered. Exploration work will be carried on. Good milling ore said to remain in old stopes. J. Verwacke in charge.

LOON LAKE COPPER (Chewelah)—W. L. Ziegler, superintendent, reports tailings from new mill contain less than 0.10 per cent copper. Mill feed runs 3 per cent copper; concentrates 0.5 oz. of silver to each per cent of copper. Ratio of concentration about 8 to 1.

UNITED SILVER-COPPER (Chewelah)—Hitherto known as United Copper Mining Co. New bunk house and twelve cottages under construction at mine. Will sink from 1,200 to 1,400 level and drift north to meet winze. Ten carsloads shipped in June. Miners' wages raised to \$5; muckers' to \$4.50.

LEAD TRUST (Northport)—Crosscutting to shoot of good-grade galena exposed in upper workings. Frank Scamson superintendent.

GIANT SILVER (Turk)—Operating Red Cloud group, installing boiler and four-drill compressor to crosscut and replace copper showing found in upper workings. A. H. Anderson superintendent.

CANADA

British Columbia

CROW'S NEST OIL CO. has struck gas at 1,825 ft. at property near Sage Creek. B. C. Gas ignited and burned derrick. Hole dry since 1,674 ft. level.

OLD SPORT GROUP, on west coast of Vancouver Island, has new plant, replacing one destroyed by fire. Two diamond drills at work on surface. Development on larger scale awaits more stable conditions.

SIR DONALD MANN, who, with Sir William Mackenzie, built Canadian Northern Railways, recently passed through Vancouver, B. C., to examine Big Mission prospect and other holdings in Portland Canal district.

CARIBOO (Camp McKinney)—Leo Mader and associates, of Grand Forks, B. C., installing, at installed level, flotation plants to work old Cariboo dump.

WILD HORSE DREDGING (Fort Steele)—Installing machinery to work bed of Foulder Creek.

MAPLE LEAF (Franklin Camp)—Compressor plant installed in steel shed on Grand Forks to facilitate development.

GRANITE - POORMAN (Nelson)—Kootenay Gold Co. sells property to Inland Mining Co. Inland stock held chiefly at Walla Walla, Wash.

RANBLER-CARIBOO (Slocan)—Deal consummated whereby company purchases two adjoining claims. New holdings said to contain 1,600 ft. of vein and valuable extralateral rights.

CONSOLIDATED M. & S. (Trail)—Ore received at Trail smelter in steel and June 30 as follows: Centre Star, Rossland, 1,262 tons; Florence, Princess Creek, 132; Josie, Rossland, 236; Molly Gibson, Kitto Landing, 25; Le Pas, 84; No. 1, Sandon, 46; North Star, Kimberley, 173; Sally, Beaverdell, 26; Sullivan (zinc), Kimberley, 4,241; and Sullivan (lead) Kimberley, 468; total, 6,705 tons.

Ontario

MONDEAU (Boston Creek)—Ogilvie interests of Montreal, have exercised option. Shaft will be sunk from 140 ft. to 200 level.

WICKSTEAD (Bourke's Siding)—Several veins uncovered from 2 to 4 ft. wide and carrying visible gold.

GENESE (Cobalt)—No. 6 vein at 500 level 4 in. wide and well mineralized with cobalt and nickel bloom.

LA ROSE CONSOLIDATED (Cobalt)—Main vein, lost by cave-in some time ago, found opening up old stopes on Princess property.

McKINLEY DARRAGH (Cobalt)—Statement of financial position of company as of June 23 shows cash in bank, \$25,371; ore in transit and at smelter, \$134,000; ore ready for shipment, \$75,700; total, \$30,071.

CAMPBELL-FAIRBARN (Gowganda)—Machinery being brought in.

PALMER-PAINE (Gowganda)—Vein about one ft. wide on surface being drifted on at 175 level.

DAVIDSON (Porcupine)—Clean - up made and gold bar valued at \$8,000 shipped to Toronto. New shaft down 575 ft.

CONSOLIDATED M. & S. (Toronto)—Shareholders have ratified bylaws removing head office to Montreal.

MEXICO

MEXICAN INTERNATIONAL CORP. has been organized in New York for development of Mexico and financing of corporations formed for business in that country. The board of directors is composed of Harold D. Gibson, president, Liberty National Bank; Grayson, M. P. Murphy, vice-president, Guaranty Trust Co.; William E. Potter, of Guggenheim Brothers; Charles S. Sargent, Jr., of Kidder, Peabody & Co., and Eugene B. Thayer, president of Chase National Bank. Company will have 10,000 shares of 7 per cent preferred stock of \$100 par and 25,000 shares of common stock at \$5.

Baja California

COMPAGNIE DU BOLEO (Santa Rosalia)—Copper production for June, 1,256, 6440 lb.

THE MARKET REPORT

23	22.85@23.35	58	5.75	5.50@5.60	7.95	@8.00	

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—July 23, 1919

All of the major metals, except tin, advanced in price this week, and at the end were generally quiet and firm.

Sterling exchange fell to a new low level of 4.28 on July 17.

Freights to Hongkong and Kobe from San Francisco are unchanged at \$14 per ton. Transatlantic freight rates from New York to England are \$18; to Rotterdam, \$22; and to Hamburg, \$30. The rates to French ports are about the same as to England.

Copper

There has been free buying in copper, and at the close the market is very firm, although quiet. Some export business was done, Japan being a buyer in about the same volume as previously. At the close it is reported that

actual business is being done at 23c., including September deliveries, although one or two producers are asking more.

The Anaconda Copper Mining Co. last week entered into an agreement with the International Mine, Mill, and Smelter Workers, a branch of the American Federation of Labor, and with the carpenters' and engineers' unions, also affiliated with the American Federation of Labor, whereby all union employees were granted an advance of \$1 per day, effective from July 1, 1919. Under the new contract, which will run until July 1, 1920, and thereafter unless terminated by either party on thirty days' notice, miners will receive \$5.75 per day and common laborers \$5.

Copper Sheets—The base price of copper sheets is 33 $\frac{1}{2}$ c. per lb. Demand strong. Copper wire is quoted at 26 $\frac{1}{2}$

@27c. in carload lots, f.o.b. mill. Market strong. Heavy buying during last two months. Deliveries full. Most mills reported loaded with orders up to Oct. 1.

Tin

The price for tin of 99 per cent grade is unchanged at 68c. and high-grade tin remains at 70c. There was a fairly good business during the week, and the market is firm.

Straits tin for July shipment from Singapore is quoted at about 52c., August, 51 $\frac{1}{2}$ c., and September, 51 $\frac{1}{2}$ c.

The War Trade Board Section of the Department of State announces that on or after July 14, 1919, all shipments of tin ore and tin concentrates may be imported under the authority of General Import License PBF-37, thus eliminating the necessity of securing individual import licenses to cover importations of these commodities.

Imports of pig tin into the United States in May, 1919, were 449,270 lb., compared with 10,796,218 lb. in May, 1918. During the first five months of 1919, 23,972,564 lb. were imported.

Lead

The lead market continued very active from July 17 up to and including July 21. On July 18, the A. S. & R. Co. raised its price to 5 $\frac{1}{2}$ c., New York, and 5 $\frac{1}{2}$ c., St. Louis. Although the speculative demand was large, it was not as large as in the previous week. On the other hand, the consumers came into the market quite heavily, many of them making inquiry for the remainder of their 1919 requirements. Consequently, lead for shipment during the last quarter of the year sold at a considerable premium, while spot lead was freely offered at the A. S. & R. price. On Tuesday, July 22, the volume of the demand diminished considerably, and it seems probable that the heavy buying wave which began about July 7 has to a large degree spent itself. At the close of the week the market, though quiet, was still firm, and outside sellers were asking a premium over the A. S. & R. Co. price for August-September. The stocks of lead in the hands of producers have been materially reduced, and in some instances wiped out completely.

Lead imported into the United Kingdom in May, 1919, was 27,840 tons, and in May, 1918, 13,661 tons. For the first three months of the same years the figures were: 1919, 129,485; 1918, 99,333 tons.

Zinc

The market was firm throughout the week, and inquiry has grown steadily at advancing prices.

John A. Percival, president of the Consolidated Interstate-Callahan Mining Co., in a letter to stockholders under date of July 8, said: "The zinc market has strengthened considerably and is now over 7c. This price for our principal product justifies the resumption of ore shipments, and we have ordered our mine superintendent to resume shipments under our contracts as soon as the mill can be placed in operation."

French imports of zinc during the first four months of 1919 amounted to 40,744 tons, and in the corresponding period of 1918 and 1917, they were 10,795 and 29,944 tons, respectively.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet.

Antimony—Demand strong, especially for export. Spot is quoted 9½@9¼. Some antimony has been sold for direct consumption in Germany.

Bismuth—Metal of the highest purity for pharmaceutical use is quoted at \$3.10 per lb. for wholesale lots—500 lb. and over. No change.

Cadmium—Quoted at \$1.50 per lb. in lots of 500 pounds. For lots under 200 pounds, \$1.75 per lb. No business being transacted. No change.

Nickel—Ingot, 41c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—Market quiet and steady at \$103. Higher prices are asked, but no sales reported above \$104@105. San Francisco reports \$98, steady.

Exports of quicksilver from the United States during May, 1919, amounted to 78,608 lb., practically all to the Orient. It is stated that the Oriental demand is temporary, due to inability to get European quicksilver. Exports for the first five months of 1919 amounted to 329,276 lb.

The Monte Amiata mines, of Italy, were controlled by German capital at the outbreak of the war and were seized by the Italian government on its entry into the conflict, according to the U. S. Bureau of Mines. The Idria mines, formerly belonging to Austria, will become the property of the same government with the annexation of former Austro-Hungarian territory. About half of the world's production of quicksilver is now assured to Italy, which is considering the establishment of a government monopoly of the metal.

Silver and Platinum

Silver—The market has ruled steady in London, with a higher tendency, closing at 54½d. The New York price has been seriously affected by the weakness and fluctuations in sterling exchange, but closes higher on recovery in exchange rates. The demand from China banks continues, and supplies offering are absorbed for shipment to the Far East via San Francisco. Shipments to London are consequently very small. The market closes firm.

Mexican dollars at New York: July 17, 79½; July 18, 81½; July 19, 82; July 21, 80½; July 22, 80½; July 23, 82½.

Platinum—Market steady. We quote \$105 for refined ingot.

Imports of platinum into the United States in May amounted to 7,291 troy oz., of which 3,368 oz. came from France and 3,878 oz. from Colombia. Imports of platinum for the first five months of 1919 amounted to 21,398 troy oz. In May 38 oz. of platinum was exported; in April, 17 oz.; and in March, 15 oz., making a total for the first five months of 1919 of 70 oz.

Palladium—Quiet at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., July 19—Zinc blende, per ton, high, \$56.60; basis 60 per cent zinc, premium, \$55; Prime Western, \$52.50@55; fines and slimes, \$50@47.50; calamine, basis 40 per cent zinc, \$32@30. Average settling prices: Blende, \$48.76; calamine, \$28.35; all zinc ores, \$48.09.

Lead, high, \$66.05; basis 80 per cent lead, \$65; average settling price, all grades of lead, \$63.93 per ton.

Shipments the week: Blende, 8,022; calamine, 270; lead, 1,170 tons. Value, all ores the week, \$473,560.

Every buyer is at odds with every other buyer, seemingly over the advance of \$10 per ton for zinc blende during the last two weeks. It began last week when buyers were "sitting easy" on offers of \$45 basis, waiting for sellers to accept, when in pips one buyer for 1,500 tons \$47.50 basis, and another for 1,200 tons on the week's market. Some other buyer decided he should pay \$50 for the 1,200 tons, and set that price, and all others had to follow. The \$55 price this week is said to be a "come-back." Sellers expected only \$52.50, and many of them sold on that basis, the \$55 coming late today.

Platteville, Wis., July 19—Blende, basis 60 per cent zinc, \$53 base for premium grade and \$50 base for high lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$62 per ton. Shipments reported for the week 1,974 tons blende, 162 tons galena, and 563 tons sulphur ore. For the year to date the totals are 55,731 tons blende, 3,201 tons galena, and 8,136 tons sulphur ore. During the week 3,632 tons blende was shipped to separating plants.

Other Ores

Chrome Ore—Business was reported at \$25 per ton, f.o.b. California point, for ore running 40 per cent and better.

Manganese Ore—At present buyers seem to be provided with ample stocks and have not advanced their offering prices. It is difficult to transact business on a large scale.

Imports of manganese ore into the United States during May, 1919, showed a big decrease from the preceding two months. The figures are as follows: May, 19,644 long tons; April, 59,470 long tons; March, 48,238 long tons. The total for the first five months of 1919 is 196,675 long tons.

Molybdenum Ore—Little if any actual business. Inquiries at 75c. but no buyers.

Tungsten Ore—Charles Hardy reports: "The market remains firm at \$7.25@7.50 for Chinese ore spot, \$6.75 for Chinese ore for shipment, and \$10 asked for Bolivian ores. Home producers of scheelite are adhering to the price of \$15 f.o.b. California or Nevada, freight payable by the buyer."

Other Minerals

Graphite—Conditions are reported as being practically unchanged from the previous week. Prices remain the same on all grades of Ceylon graphite, as follows: Lump, 13½@14¼c.; chip, 10½@11c.; dust, 7½@8c. All prices are c.i.f. New York, ex ship. Business in domestic grades is dull.

Nitrate—Business is reported as being quiet, with a little activity in spots. The amount remaining in Government control is not definitely known, but distribution continues. Quotations are given at \$2.95@3.00 per cwt., carload lots, for immediate shipment.

Pyrites—Spanish pyrites is quoted at 18c. per unit for furnace ore, c.i.f., New York or other Atlantic port, and 18½c. at Gulf ports. Market slow and unsettled; hand-to-mouth buying. Price will decrease with ocean freights.

Sulphur—Price is quoted at \$18 per ton for carload lots, domestic delivery, at mines in Freeport, Tex., and Sulphur Mine, La. One producer is quoting \$20, in cargo lots, for export, at mine, the difference in favor of domestic business being on account of its permanent character. Other producers quote for export, but only on terms c.i.f. port of delivery. Developments in the export business, which has been fairly brisk, are being awaited by producers. The basis of the foreign demand is largely the labor shortage at Sicily mines, and the outlook is not bright for obtaining relief from this difficulty. Domestic business is quiet, the regular deliveries being made on contracts, which take care of the usual trade requirements.

Iron Trade Review

Pittsburgh—July 22

Operations have increased somewhat at many steel plants, though at a few there have been slight decreases, and on the whole the change from the 70 per cent rate at the first of the month is slight. The total volume of business received by mills is increased somewhat, but as some departments have been receiving orders at a greater rate than their capacity, that fact has had little influence in swelling the production. Orders for rails, shapes, and plates are extremely light. Never in the history of the steel industry has there been such an unbalanced distribution of orders. This situation is doubtless due to the various lines of consumption recovering at different rates from the dislocations produced by the war.

There has been further improvement in the demand for tin plate, and when

Number 5

Is the Light Beginning to Shine?

THAT there is a limit to the wages that can be paid to a man for working a shift in a coal mine is beginning to be realized by those who secured from the British government a rise of \$1.50 per ton in the price paid by the consumer. Now these miners are asking the government to wait a little while before taking such drastic action.

The theory upon which the English coal miner was working—and there are many others who support the same conviction—was this: "My food, clothing, and rent are now all very high, so I must have more money than I have been getting for my day's work. Also, there are a lot of my friends around here who have no work. If I do not work so many hours per day there will be work for them too, so I shall demand that there be fewer hours in a shift and that I get more money for the day's work. As my associates are well organized, I will get what I ask, or the plutocrat manufacturers who need the coal will get none."

This conclusion has had a hard jolt. It now looks to the miner as though the plutocrat manufacturer was not going to require any coal at all, and instead of having to work five days a week there is a fair prospect of having to rest seven days a week. Again, his union is hearing from unions in the manufacturing industries, to the effect that a coal shortage exists, because of which mills all over the country are closing and discharging their operators.

Here is a pretty kettle of fish. The miner has secured from the government the hours and the rate of pay demanded, but the mine has no orders for coal, and he is idle. Meanwhile, union brothers in other lines are urging him to get to work and get out coal so that the mills may run. Surely something is wrong.

There is a lesson in this that it may be well for our own miners to take to heart, without going through the school of experience to learn it. It is possible that the old law of supply and demand will ultimately have more to do with the fixing of the price of labor than will the members of the union. Just so long as there is a demand for the product at high prices, whether it be coal or metal, the miner can ask for high wages and the average-cost producer will pay them. When the demand slackens, one of two things will happen: the miner will either have to stop producing, or he will have to produce his raw material at a lower cost per unit. He cannot live long without producing; obviously, he will have to produce at less cost. This may be accomplished by one of two means, through charging less per hour for his labor, or by producing more units of the material in the day's shift.

From all of which one conclusion must be drawn, a conclusion from which it is hard to get away. To keep up wages and the standard of living that were brought

about through war conditions, labor must become more efficient, either through using its head more, or through making its hands do more work: otherwise wages will sooner or later fall to a figure where they will buy no more than they did before the war.

It is at this point, in the matter of increased efficiency and the maintenance of wages, that a union of employers and employees would be more logical and more useful than any union of the one acting independently of, or antagonistic to, the other.

It may be granted that all miners have some aims and objects in common, as also have all those who own or operate mining property, but the miners of copper, the miners of coal, and the miners of cinnabar have nothing like so much in common as each must have with the operator of his particular kind of a mine. The interests of the copper miner and the copper-mine owner are identical. When one is prosperous the other should be prosperous. When one is on the rocks it should only be because the other is also there.

A union of this kind, where perfect confidence exists between employer and employee, may appear, at first, idealistic, but it is not impossible or impracticable.

At the recent meeting of the Canadian Industrial Relations Commission, David Rees, organizer of the United Mine Workers of America, discussed the formation of a council on which both coal miners and coal operators should be represented. He believed that it would be both possible and practicable, and that much good would result from it. The plan would be equally feasible in each of the metal-mining industries, and the possibilities for good are unlimited.

Mutual confidence and respect among the members of such a body as was proposed would be as essential as in a partnership of two individuals. If doubt of good faith exists, if one party should continually mistrust the other, no good could come of such a union. Some of the larger mining companies are approaching this conception of better industrial co-operation in their industrial relations committees, and the officials are trying to secure, and are securing for themselves, the confidence that they have in their workmen. In this program the operators are, however, confronted by the possibility of opposition on the part of officials of the larger unions of which their men form only a small minority, but with which the men feel a stronger bond than they do with their employers. And some of the larger unions, with the object of strengthening their position, keep constantly presenting to the attention of their members the strong line of cleavage that is supposed to exist between the rapacious capitalist and the downtrodden laborer. If that cleavage plane is destroyed, if there is fusion and obliteration of this imaginary boundary, the blatant type of union labor leader will lose his job and be compelled to work for a living in a less congenial atmosphere.

Collective bargaining and the large unions are here to stay. Their power for good or evil will depend upon the activities of their membership. The opportunities of leaders for efficient service are tremendous, and their duties are onerous. One of their most important functions, neglected by some leaders and feared by others, is that of building up confidence between employer and employee. There are fearless leaders—men who are not holding their positions solely for the salary attached—who are big enough to show their fellows the advantages to be gained by trusting and co-operating with their employers, and some day we believe these leaders will undertake the task. Mutual confidence and a round table will take the place of disinterested arbitration boards, and wages will be “as high as the traffic will bear.”

Taking a Broad View

SOME of the resolutions adopted at the recent meeting of the American Federation of Labor were rather narrow and scarcely in accord with the principles of Americanism as we understand that doctrine, but, on the other hand, such a breadth of mind was shown in other instances that we can be sure that the American laborer of average intelligence thinks along right lines. The resolution in reference to scientific research indicates that the average intelligence of the American workman is high.

Recognizing that scientific research and the technical application of its results form the basis of industrial development—that productivity, gain, and health depend upon research and study—it was resolved by the Federation to favor “a broad program of scientific and technical research, as being of major importance to the national welfare, and such should be fostered in every way by the Federal Government; and that the activities of the Government itself in such research should be adequately and generally supported in order that the work may be strengthened and extended.”

When the workman has learned that the work in the laboratory is conducted for his welfare, and not for the purpose of depriving him of his daily bread, we have reasons to feel encouraged with what has been accomplished in our public schools, for it is to them that he owes a broader vision than his father had.

Research departments will appreciate the encouragement of this resolution, knowing that they are supported both by those who work with their hands as well as by those who work with their brains.

Imperial Mineral Resources Bureau

ON JUNE 12 a charter of incorporation was granted in London to the Imperial Mineral Resources Bureau, upon the petition of the Secretary of State for the Colonies. The bureau's chief purposes are to collect and disseminate information on the resources of every mineral and metal, and to advise on the development of such resources, that they may be made available for the purposes of the imperial defense, industry, or commerce. All parts of the British Empire are ably represented in the bureau, Dr. Willet G. Miller being appointed for Canada.

The study of our own mineral resources, so intensified during the war, should be vigorously pushed in time of peace. Mineral deposits will determine industrial supremacy in the future as they have decided the course of conquest in the past, as Dr. J. B. Umpleby, special

mineral adviser to the Peace Commission, recently stated. The United States today is the richest of all in mineral wealth. But as vast stretches of territory in other parts of the globe are opened, the comparison may become less and less in our favor.

The lament is often heard that the old-time prospector is fast disappearing. Would that he might remain! But, whether he goes or stays, let there be no slackening in organized effort to lay bare and develop our hidden resources.

Lest We Forget

THE Council of National Defense is to receive its unexpended balance for the fiscal year 1918 as its appropriation for 1919, under the Sundry Civil Bill, and is preparing to return to its peace-time function under the Congressional act creating it. It would have been a shame, indeed, had this product of the war been allowed to drop into oblivion. What the Allies learned from Germany under the pressure of great emergency, we, in turn, learned from them, largely through the medium and with the help of the council.

But the continuation of the council is not a matter of sentiment. There is need of an agency that will bring together and study all information bearing on the national defense. Defense, it is pointed out by the council, may not always mean war; it may mean any crisis in the life of the nation arising from unrest at home, from famine, pestilence, anarchy, or dangerous economic conditions. And with economic warfare on the horizon, industry, science, and labor must be mobilized.

Industrial Development Follows the Miner

FROM time immemorial the miner has been the pioneer in those countries fortunate enough to possess mineral resources. Throughout Europe, civilization has followed him. In Africa, industrial development is coming in his footsteps. The miner opened the treasure vaults of the Rocky Mountains from Alaska to Patagonia, and today prosperous cities dot the coast line on the eastern shore of the Pacific. May not mining do for China what it has done for the rest of the world?

Conservatism in China has long prevented anything like active development of its mineral resources, but gradually a change is creeping over her people, and the graves of ancestors are the subject of less respect than they were some years ago, if by chance they happened to be near deposits of ore.

C. W. Harvey in “Association Men” calls attention to 6,184 mining claims covering nearly 1,000,000 acres of land, a rather small area in a country of more than 4,000,000 square miles. Twenty-six mineral products are mentioned, but what is of special significance to China is the importance of her coal deposits, estimated to be large enough to furnish the world with its present annual demands for a thousand years.

With its coal mines developed, and cheap power and transportation available, the industrious Chinaman is awakening to a realization of what industrial activity lies latent in his country. If the miner is not the pioneer of industry in China, we may safely say that he will walk hand in hand with that pioneer through this latest of countries to become conscious of its mineral possibilities.

Business Training For the Engineer

THE practicing engineer appreciates the ever-increasing necessity for business training in conjunction with technical work. This fact was emphasized at the meeting of the Society for the Promotion of Engineering Education, held at Washington, on June 23 and 24. The curricula of many technical schools are deficient in all instruction save that which deals with technical subjects. Knowledge of business principles and ability to use the English language correctly are essential to the engineer. Some engineering students have the good fortune to enter their college work with adequate preparation in these fundamentals, acquired in good high schools or other preparatory institutions. However, the average engineer graduate is handicapped by a deficiency in the knowledge of business principles, and enters his commercial life at a disadvantage which has a tendency to confine his activities along narrow technical lines. Sometimes an engineer's practical experience will supply him with the training in which his university courses were deficient. Nevertheless, if the university would inculcate fundamentals of business along with technical knowledge, the engineer would be supplied with a better-balanced equipment, at a period when he could use it to the greatest advantage.

Evidence of the shortcomings of technical schools and colleges may be found in the popularity of business courses offered by numerous correspondence schools. No doubt more engineers avail themselves of these opportunities than pursue post-graduate courses in their own universities.

In these columns and elsewhere the *Journal* has referred to standardization as an important factor in efficiency, but not without the qualification that standards must sometimes be recast to meet changing conditions. In the past, colleges have prescribed standard courses of study designed to prepare the engineer for service in industry, but with the increasing and broader responsibilities of the engineer, technical schools must consider the need of a new standard.

International Exposition Of Mining Industries

MINING and metallurgical engineers, and buyers of mining and metallurgical equipment, will be interested in the International Exposition of Mining Industries, announcement of which appears elsewhere in this issue of the *Journal*. The exposition will fill a long-felt want in its own particular field, and will no doubt become an important factor in the development of both foreign and domestic trade. The project deserves the support of all manufacturers of machinery used in the production of raw mineral products and their subsequent treatment.

The success of such a project depends on competent management, supported by able advisors. Too much stress cannot be laid on the necessity for exercising care and discrimination in the selection of those who are to direct the destiny of such an organization. Membership on the advisory board should be no mere honorary appointment, but each member should be chosen because he is closely in touch with some important phase of the mineral industry, or in view of his appreciation of its needs, and with the understanding that he is willing to devote to the enterprise his serious attention.

A Letter From Mexico

On the morning of July 18, Mr. Theodore Patterson, manager of the Aranzazu copper mine of the Mazapil Copper Co., of this place, was murdered in the most brutal manner by about 200 workmen of the mine.

Mr. Patterson went out on the dump of the mine, as usual, about 8 o'clock in the morning, when he was set upon by about 200 men, who began throwing stones at him from several directions, showing it to have been a prearranged plan to murder him. Mr. Patterson began backing away for the purpose of not getting in direct contact with them, and to try to get to some house where he could better defend himself. They followed him, when he drew a small pocket pistol, hoping to hold them off until he could reach safety. At this juncture someone shot him with a Mauser rifle. He then took refuge in a small house and closed the door. The bandits tore off a sheet of the roof, and threw dynamite in on him, which is supposed to have killed him, as both jaws and spinal column were found to have been broken. After they had killed him they broke the door open, stabbed and cut his body in thirty-eight places, then tied a rope to his leg, and dragged him some distance.

Mr. Patterson was an English mining engineer of the highest standing, and was loved by everyone who knew him. We buried his body here on the 19th, and said goodbye to a good man.

While committing the murder, they cried, "Kill all the English and Gringos (Americans) and bury them like cats!" The writer heard two of them (presumably) say last night, "There are three more we are going to get," but we do not know which three they are.

The Mazapil Copper Co. has in its employ more Americans than English; therefore the three others may be Americans.

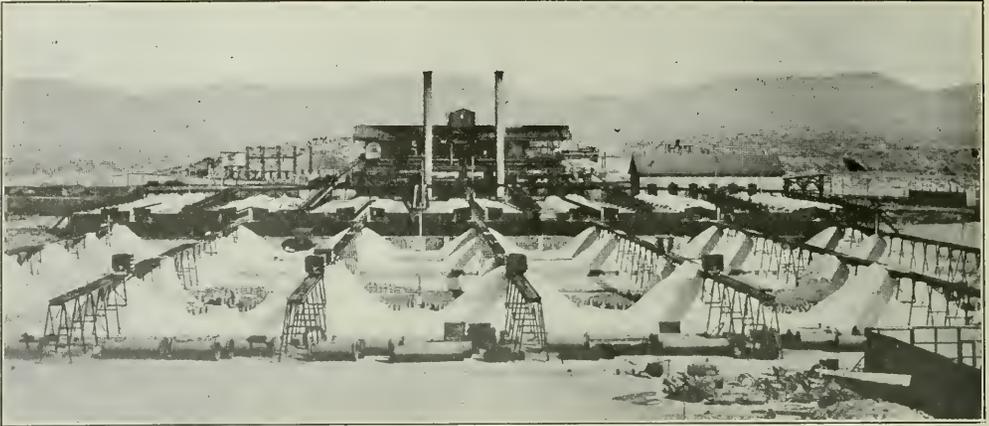

The men who murdered Mr. Patterson are all around here yet, and no apparent effort is being made to apprehend them.

I am an American citizen, have properties in the country, and I consider it my duty to call this matter to the attention of the general public.

You will do me a special favor if you will call the attention of the State Department to the facts I am giving you; they can be substantiated by all foreigners here, and by the English Consul of Saltillo, Coahuila.

It seems that the cause of the murder was that Mr. Patterson was preventing the stealing of rich ore, and for this reason they removed him.

[Signature deleted for obvious reasons. This matter has been laid before the State Department, the chairman of the Senate Committee on Foreign Relations, the chairman of the House Committee on Foreign Affairs, and the chairman of the House Committee on Rules, and all members of these committees have been provided with copies of the letter.—EDITOR.]

OFICINA "PAPOSO" AT LA NORIA (TARAPACA) CHILE. NITRATE PLANT BELONGING TO THE GRACE NITRATE CO. AND OPERATED BY NITRATE AGENCIES, LTD., IQUIQUE

The total production at this plant during March reached the unprecedented figure of 110,000 quintals of nitrate of soda. To produce this quantity of nitrate about 1,000,000 quintals of raw material is handled twice; first it is loaded into the tanks and then the refuse (about 89 per cent of the original load) is removed. This involves the handling of about 3,000 tons of material per day. (Reproduced from the "Grace Log.")

Photographs From the Field

RECENTLY COMPLETED HOIST HOUSE OF QUINCY MINING CO., HANCOCK, MICHIGAN

This building is to house the largest single-rope hoisting engine in the world. The scaffolding platform upon which will rest the hoisting engine parts as they are taken into the building shows in the foreground, the Quincy Library for employees may be seen in the distant background, and the hoisting plant now in use and handling ore from a distance of 3,300 ft. immediately adjoins the new plant on the left. The new building is 100 ft. high, 72 ft. wide and is provided with a 25-ft. solid concrete foundation, 76 by 72 ft. inside. The basement cannot be shown in the picture. The building is referred to by the management as a Michigan College of Mines structure, as it was designed, engineered and constructed by Michigan College of Mines men. Cost is \$75,000. A new hoisting engine built by the Nordberg Manufacturing Co., Milwaukee, Wis., will haul and hoist a distance of 14,000 ft.

The Rotary Method of Well Drilling

Widely Employed Process of Sinking Oil and Gas Wells in Unconsolidated Strata by Means of Bits Used in Alternating Hard and Soft Formations—Combining Rotary and Cable-Tool Methods

BY ALBERT G. WOLF
Mining Engineer, Gulf, Texas

IT HAS BEEN stated that rotary well drilling was invented in 1845. If so, its early development was slow, for the first oil well in this country was drilled by the percussion method in 1859, by Colonel E. L. Drake, at Titusville, Pa. In 1888, however, the rotary method was employed in a crude way in the Gulf Coast country. Two strings of pipe were used, the one to rotate the drill, and the other to wall up or case the hole as it progressed. During the next year it was discovered that thick mud, the more plastic the better, pumped into the hole through the drill stem, would support the walls until the drilling was finished, if the hole was not too deep, thus allowing the casing to be set afterward in one operation. The discovery, credited to B. Andrews, Sr., of New Orleans, La., is the most important in the development of the rotary method. From this time the process was further developed and improved in the oil fields of Louisiana and Texas, where, it is stated, in ten years more than 10,000 wells were successfully completed in formations in which it was impossible to drill and maintain a hole by any other system.

In 1900, Captain J. F. Lucas began drilling at Spindletop, near Beaumont, Tex., with a rotary rig, and in January, 1901, he brought in the first oil gusher drilled by the rotary method. This was after repeated failures had been made with cable- and pole-tool rigs. It may be, too, that the combination method was first used here, for I am informed that after this success the softer formations were drilled with rotary machines, and the hard cap-rock was penetrated by cable-tool rigs.

Another discovery of importance, and one which really made the rotary method a serious competitor of the cable-tool system in moderately hard rock, was that of the Hughes rotary rock bit. The bit was invented by Howard R. Hughes, and its manufacture started in 1909 at Houston, Tex. No other rotary bit is so effective in the harder strata, and its invention has assured the adaptability of the rotary method of drilling in fields where other than soft strata occur. In the years 1905, 1906, and 1907 its use spread all over the world, and during this period it was introduced into California. Here the requirements for drilling considerably deeper wells than the average depth in Louisiana and Texas necessitated the design and construction of heavier machines.

Each succeeding year has brought new improvements and a gradual development of still heavier machines, until now the weight of the rotary on the heaviest machines, for example, has increased nearly four-fold over that of the one used by Mr. Andrews in 1888. Even larger machines, it is thought, may be manufactured.

In the rotary method of drilling, the bit is suspended by means of a string of pipe called the "drill stem," and the bit and drill stem are rotated by the "rotary" in the center of the derrick floor. The drill stem varies in size, depending on the diameter of the hole being drilled, and is made of wrought iron and steel. The rotary

turntable is revolved by a gear wheel underneath, keyed to the rotary shaft, the shaft itself being driven by sprocket-and-chain drive from the draw-works line shaft, which, in turn, is also driven by sprocket and chain, from the engine crankshaft.

The drill stem is suspended while drilling, or when it is being raised or lowered, by a cable, passing from a drum on the drumshaft of the draw-works up over the sheaves of the crown block, on the top of the derrick, and down through the traveling block. This block system of suspension is necessary to make possible handling with ease and accuracy the great weight of a string of drill stem in a deep hole. The drumshaft is driven from the lineshaft by sprockets and chains, two sets of gears being provided for two speeds. The lowering is controlled by a brake on the drumshaft.

Either one or two brake bands are provided. From the traveling block is suspended the C-hook, which in turn engages the bail of the swivel. Onto the swivel is screwed the "grief stem," "groove stem" or "Kelly joint" (the latter being the drillers' field name for it), and this is screwed into the top joint of the drill stem. The grief stem is gripped in the rotary table by a special bushing or by a set of grip rings. By the use of the latter the grief stem can be dispensed with, the grip rings taking hold directly on the drill stem. This, however, results in the serious scarring and denting of the pipe, and, too, the grip rings are more inconvenient than the grief stem with bushing, and consume more time in the operations.

When raising or lowering the drill stem, the grief stem, with swivel attached, is unscrewed from the drill stem, and the latter is suspended by means of "elevators" which hang from the C-hook. While unscrewing a joint of drill stem, or two, three or four joints together, as the case may be (the words drill stem and drill pipe being used interchangeably), the stem in the hole is held by the "slips" in the rotary until the unscrewed length is set aside and the elevators are re-attached to the drill stem. The slips, it should be added, are triangular-shaped pieces of iron with corrugated steel faces, which wedge in between the drill stem and the rotary table. The driller stands at the right of the draw-works, facing the rotary, and controls all the operations, having at hand the brake lever, two levers for operating the two drum clutches, rotary drive-clutch lever, steam throttle, and engine reverse gear.

The swivel is so constructed that it will not only allow the drill pipe to revolve but will support the entire weight of the string of tools, permitting the drill stem to be raised or lowered while revolving. At the top of the swivel is a gooseneck, connected with the manifold between the pumps by means of a wire-wound hose. Through this connection and down through the swivel and grief stem, both being hollow, water or liquid mud is pumped. This passes down through the drill stem, out through two holes in the bit, and up the outside of the drill stem, carrying with it the cuttings. Another

purpose served by the mud pumped into the hole, which gives the rotary system its great advantage over the cable-tool method in loose ground, is that of sealing up the crumbling walls of the well in an unconsolidated formation.

In the general plan of a rotary drilling outfit, Fig. 1, the derrick is centered over the well location and the rotary is placed at about the center of the derrick floor, on a firm foundation of large timbers, with the center of

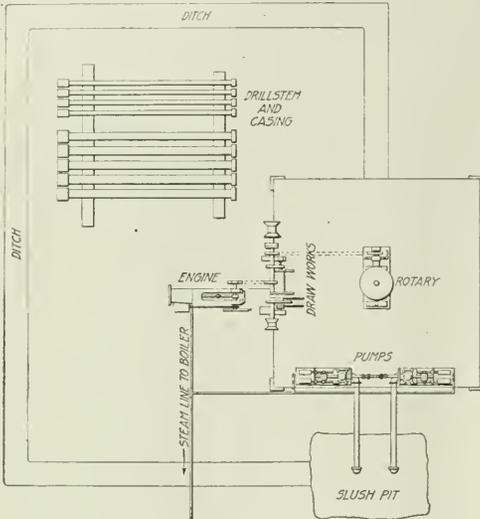

FIG. 1. PLAN OF ROTARY DRILLING RIG

the rotary table over the location point of the well. The draw-works are erected on one side of the derrick, with the engine, on a timber foundation, immediately back of them, outside the derrick floor.

The driller stands at the right side of the draw-works, facing the rotary; and the pumps, two in number, are placed on the side of the derrick floor to his right, at the edge of the floor. The pumps are duplex, and are placed end-on, with water cylinders facing. The discharges are connected by a manifold, which permits the operation of either pump. This is to make it possible to repair one pump while the other is in operation. The suction of the pumps are connected with the "slush pit" by suction pipes fitted with foot valves and strainers at their lower ends.

A ditch leads from the well, out on the opposite side of the derrick from the pit, surrounds half the derrick, usually on the engine side, and leads back to the slush pit. This arrangement returns the water or mud to the pit, thus conserving it; prevents its overflow onto adjacent lands, and gives its sand or shell cuttings a chance to settle out in the ditch before reaching the pit, for it is not desirable to pump sand or shell into the well.

On the opposite side of the derrick from the draw-works are piled the extra lengths of drill stem and casing, all parallel with each other, and with collar ends pointing toward the derrick, for convenience in pulling onto the derrick floor and hoisting into position. On this side of the derrick, up to the top of the second bent, the center one-third of the girts and braces is cut out

and the ends are joined together, leaving a high opening through which the lengths of drill stem and casing are raised and lowered as required.

The boiler is placed at any convenient distance from the rig, say 50 or 100 ft., unless natural gas in quantity is opened, when it is moved back a considerable distance to avoid the danger of fire. Usually the boiler is housed more or less roughly, according to the rigor of the climate, to conserve fuel. Fuel oil is the most commonly used fuel.

In adding to the drill stem already in the well the procedure is as follows: The string is pulled up until the lower end of the grief stem is three or four feet above the rotary, and this joint is then unscrewed. The grief stem and swivel together are then swung to one side, and the stem is lowered into a 20 or 30-ft. hole, already drilled and cased for this purpose, called the "rat hole." The bail of the swivel is released from the C-hook, and a pair of elevators of the correct size for the drill pipe substituted. A length of drill stem is pushed up onto the derrick floor, the elevators are clamped around it just below the collar, and the length of stem is swung into a vertical position just high enough for its lower end to clear the collar of the drill pipe held in the rotary. Some "dope" is put on the threads, and the new length lowered and screwed on. The entire string of drill stem is then lowered until the new piece has taken the previous place of the next lower one; the grief stem, with swivel attached, is replaced and lowered; the pump is started, and drilling resumed.

When a bit becomes dull, all the drill stem must be removed from the hole. The drill stem is hoisted and unscrewed, "broken down," in sections of one, two, three, of four pieces (called "singles," "doublets," "triplets," and "fourbles" by the crew) as the case may require and the height of the derrick permit, and set on one side of the derrick floor, standing up in the derrick. This unscrewing can be done either by hand, using chain tongs or patented tongs, or by means of the rotary and special tongs, the latter a much easier and more expeditious method.

PARTS OF DRILLING RIG

Engine—Drilling-rig engines are usually of the single-cylinder type, in cylinder sizes from 8 by 12 in., of 12 hp., to 12 by 12 in., of 30 hp. There are some as large as 16 by 16 in., of 70 hp., but they are exceptional, as is the use of more than a single cylinder engine. For rotary work the engines differ from those used in cable-tool work only in the substitution of a sprocket for the belt pulley on the crankshaft.

Draw-Works—The draw-works consist of two parallel shafts, the drum and the lineshaft. On the drum-shaft are the hoisting drum, either one or two brake bands, two sprockets, and two clutches for the two hoisting speeds. The lineshaft is above and a little behind the drumshaft, and on it are usually four sprockets, one for receiving the drive from the engine, two sprockets for driving the drumshaft at different speeds (called drum-drive and quick-hoist sprockets), and the rotary-drive sprocket. Sometimes a fifth sprocket is added to drive a mud mixer. In addition, there are two cat heads or winch heads, one at either end of the shaft. The drumshaft diameter varies with the size of the rig, 5 in. and 6 in. being used for the largest rigs, and approximately 4, 4½, and 5 in. for the smaller single brake-band draw-works. Lineshafts are approximately of 3½ to 3¾ in. diameter, and 11 to 12 ft. long. The total

weight of the draw-works varies from about 6,000 lb. to 9,500 lb., and sometimes reaches 11,000 lb. in extra heavy draw-works for export.

Rotary—The rotary consists of a circular table of semi-steel, called the table, turntable or gear table, resting on cone bearings, and under all a heavy cast-iron foundation resting on two skids. The table is driven from below by a pinion, the latter keyed to a shaft and driven by sprocket and chain from the draw-works. By means of a clutch between the sprocket and pinion the table can be thrown in and out of gear with the line-shaft, making it possible to turn the table around by hand when necessary. In the center of the table there is a circular opening through which the tools and pipe are passed, and into which fit the slips for holding the pipe when adding or removing joints or the bushing to hold the grip stem when drilling. When drilling with grip rings, this device rests on the table, with driving posts projecting down into holes in the table top.

Modern rotaries vary in size from 14 to 26 in., the number signifying the width of the largest size bit that will pass through the central opening. The largest size pipe is two inches less. In weight, corresponding to these sizes, they vary from 2,500 to 7,800 lb. complete, or 1,650 to 4,500 lb. without the grip-ring device. These sizes and dimensions are, of course, general, as they vary somewhat with different makes. The diameters of the tables corresponding to these sizes are from 38 to 58 in. Mechanical improvements have been made in rotaries during the last few years, the more important including inclosed cone bearings instead of open ones; a better oiling system, and the use of higher-grade materials throughout.

Pumps—The slush pumps used with the rotary rig are two in number, so that one can be in operation while the other is being repacked or repaired, as the wear and tear on the pumps is heavy. The type of pump is a duplex, steam driven, varying in size from 6 by 4 by 6 in. to 13 by 7 by 14 in. The 10 by 5½ by 12 in. size is a common one in use. Corresponding weights vary from 550 lb. for the smallest size, rarely used, to 7,100 lb. for the largest. The pumps are designed to operate against a high pressure, and have removable water-cylinder liners. Some also have changeable packing and metal valves on the water end.

Boiler—Horizontal, fire-tube boilers are generally used, and range from 20 to 50 hp., although for anything except the shallowest of holes less than 40 hp. is not serviceable. Corresponding heating surfaces are 276 to 620 sq.ft. Pressure rating is usually 100 lb., 125 lb., or 150 lb. Fuel oil or crude oil, wherever available, is the most commonly used fuel, and has several advantages over other fuels. Gas is also used to good advantage. Some of the boilers are mounted on trucks for portability, but with the larger-sized boilers these carriages break down, and are not an advantage. The boilers weigh from 5,700 lb. in the light 20-hp. size to 11,500 lb. for a 50-hp. boiler.

Derrick—The derricks for rotary drilling are not different from those used in cable-tool work. In height they vary from 66 to 130 ft., and in spread from 18 to 28 ft. The height used depends somewhat on the depth of the well to be drilled, although sometimes its size may be limited by the size of the tract of land controlled. The shorter derricks are for shallow holes, and necessitate breaking down the drill stem in doubles (two joints together). For work up to 1,200 ft., an

86-ft. derrick is sufficient, allowing lengths of three joints to be hoisted. For deeper work the higher derricks are used, although the 112-ft. derrick is sufficiently high for all but the deepest work. Derricks are built of either wood or steel, the former being by far the more common and preferred.

The building of derricks is a special branch of the carpenter's trade, and usually there are men in the field who will contract to do this work, and it usually pays to employ the contractor, for the construction of a derrick with labor unfamiliar with the work is a slow and costly job. The following is a list of contract prices for building derricks in a southeastern Texas field, the prices being for labor only, including doubling the legs and putting on double guy wires:

Size of Derrick, Ft.	Cost	Size of Derrick, Ft.	Cost
64	\$75.00	85	\$90.00
74	80.00	90	95.00
82	85.00	112	150.00

Derricks are usually torn down by contract also, and in this work it pays to employ skilled labor because of the greater saving of material.

Crown Block—Crown blocks are made of wood, either hard or soft, or steel I-beams, and steel pulleys. The principal members, four in number, are arranged parallel to each other, and are held apart by spacing blocks. The I-beams are 8, 10 or 12 in. high. The pulleys, five in number for rotary work, run vertically between these main members, and are arranged like the five-spots on a playing card. Pulley sizes vary, a diameter of 22 in. being common. The steel crown block is an improvement on the older wooden crown block.

Swivel—The rotary hydraulic swivel is so constructed that it can support the entire weight of the string, permit the stem to revolve, and allow water or mud to

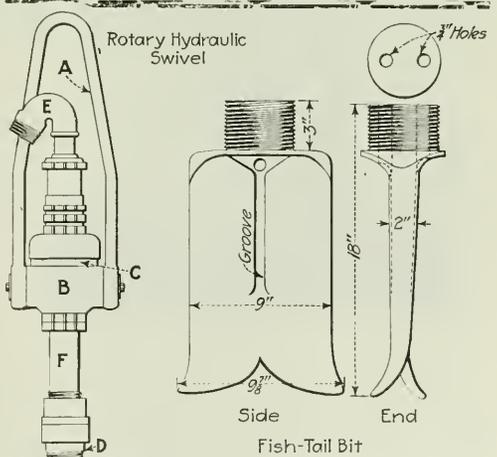

FIG. 2. HYDRAULIC SWIVEL USED IN ROTARY METHOD
FIG. 3. "FISH-TAIL" BIT

be pumped down through it under high pressure without leaking. Fig. 2 shows one form of swivel in use. It is suspended under the C-hook under the traveling block by the bail A, and this, in turn, supports the trunnion B.

On the trunnion is placed the bearing race (designed for ball or cone bearings in different makes), bearings

(inside at *C*, Fig. 2), and bearing seat. The bearings at this point must sustain the entire weight of the drill stem. Water or mud from the slush pit is pumped into the gooseneck *E*, from which it passes down through the standpipe *F*, into the grief stem at its point of connection *D*, and so into the drill stem.

The swivel is tightly held together by various lock collars, permitting the revolution of the standpipe, yet making a water-tight connection with the gooseneck, which, being connected to the hose from the manifold, cannot revolve. Swivels range in size from 3 to 6 in., the number indicating the size of the pipe connection at *D*. A 3-in. swivel weighs from 300 to 400 lb., a 4-in.

FIG. 4. DERRICK FOR ROTARY DRILLING 86 FT. IN HEIGHT

swivel from 600 to 700 lb., a 5-in. swivel from 850 to 1,200 lb., and a 6-in. from 1,350 to 1,800 lb.

Bits—The "fish-tail" bit, Fig. 3, is especially designed for rotary drilling, and though other shapes are used, it is the type most generally employed. It is made of common steel or some of the alloyed steels, but must not be brittle. All sizes, from 4- to 24-in. bits, measured across from tip to tip, can be readily procured, and smaller or larger ones may be had on special order. All dimensions vary with the width of the bit except the shank diameter, which is usually made in three or four standard sizes, for 2½-, 3-, 4- and 6-in. pipe fittings, the largest bits being obtainable only with the largest-

sized shank. Shanks are also made either straight, for pipe collars, or tapered, for special tool-joint connectors.

As a bit is revolved in the well, the two fins, or cutting edges, wear against the formation, cutting it like an auger. Water or mud pumped down through the drill stem passes out through the two holes in the bit, washing the cuttings aside and carrying them up with the current. At intervals of greater or less duration, depending on the hardness of the strata, the bit must be withdrawn from the well, sharpened and tempered. The tempering is of great importance, for on it depends to a large extent the speed of drilling. If the temper is too soft, frequent changes of bits will be necessary, and, if too hard, the bit will break. If the latter should happen in a hard stratum, considerable time will be lost in "wearing out" the piece of steel. Other shapes of bits sometimes used are the diamond point and the drag bit, which somewhat resembles the bottom end of a wood auger.

In hard rock the rotary rock bits, referred to previously, are most successful. These bits have two hard-steel cones on the lower end, each cone on a shaft, leaving them free to revolve separately. The conical surfaces are corrugated, each ridge being a cutting edge divided into teeth. As the bit revolves, the two cones roll around on the bottom of the well, and the great superincumbent weight of the drill stem, grief stem and swivel causes the teeth to wear away the rock. The cones can be resharpened unless too badly worn. An improvement on the original cone bit is the reaming cone bit. This has the same cones at the bottom, and, in addition, two cylindrical cutters of the same character as the cones set in the sides of the bit above the cones. These cylinders ream the hole out to the proper gage. In drilling interstratified hard and soft formations, the cone-roller bit is the deciding factor in favor of the rotary over the percussion method.

ADVANTAGES AND DISADVANTAGES OF THE ROTARY METHOD

In drilling soft strata or unconsolidated sediments, the rotary method has several advantages over the percussion. First, there is the better maintenance of wall of the hole. There is no jarring action, as with the cable or pole-tool methods, the effect of which is to loosen the material for a considerable radius around the hole, causing serious and costly caves. Pumping mud into the hole helps consolidate the soft and crumbling walls, and, where these walls are porous, the action of the water in running off through the formation carries mud with it, rapidly sealing the walls against further percolation. This prevents loss of water, and migration of water from one well to another, with the attendant troubles and damage. The mud consistency can be varied at all times to suit the character of the material being drilled. Less casing is needed, too, because of the better walls.

When drilling in soft material with the cable-tool method, casing must be carried along close to the point of drilling to maintain the well. As casing can be driven only a comparatively short distance before it is held by friction, a new and smaller string must be set every few hundred feet, extending from the top of the well, and drilling continued with a smaller bit. In the rotary system some wells have been completed to a depth of 3,000 ft. with one string of casing, and many wells to 2,000 ft., the hole diameter throughout being

maintained considerably larger than that of the casing, allowing the casing to be set with ease. This means a much lower cost per foot of well for casing, as well as a greater saving of time.

Faster time is made in soft and loose ground, because the method of cutting is more effective in this class of material; the bit is always free from cuttings, less time is consumed in setting casing, and chiefly because it is not necessary to withdraw the bit frequently and bail out the cuttings. It is claimed by advocates of the rotary method, especially manufacturers of rotary ma-

ventor can be fastened to the top of the casing, and thick mud under heavy pressure pumped in, sealing off the gas, and making it possible to resume drilling.

The rotary method gives way to the percussion process in fields where hard strata predominate, as the drilling speed attained by the rotary method is too low in such formations, and consequently the cost is too high. Also more men are required; an ordinary crew with a rotary rig consisting of a driller, three helpers, one of whom works in the derrick, and a fireman, whereas a cable-tool crew consists usually of two men, a drill-

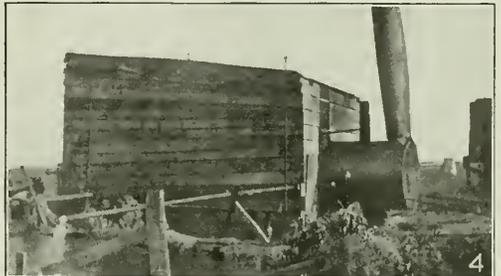

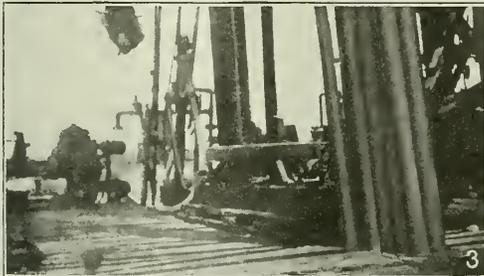

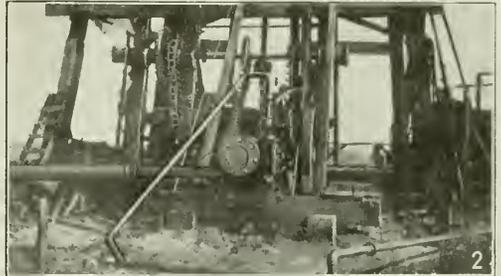

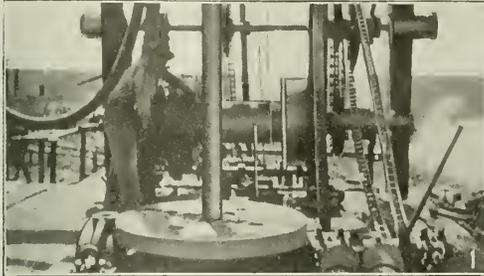

FIG. 5. (1) ROTARY IN FOREGROUND; DRAW-WORKS IN REAR; DRILLER AT HIS STATION. (2) REAR VIEW OF ENGINE AND DRAW-WORKS. (3) ROTARY IN CENTER, DRILL STEM STANDING IN DERRICK. (4) BOILER HOUSING IN GULF COAST COUNTRY

chinery, that as much as 100 ft. can be made in twenty-four hours' drilling. This is not an exaggeration. I have at hand the log of one well in which 200 ft. was made during one ten-hour shift, from 100 ft. to 300 ft. depth, in sand, shale, shell, gumbo and boulders. Another ten-hour days' work netted 120 ft. at a considerably greater depth. Where boulders are encountered in soft strata they offer no serious obstacle as a rule, because frequently they are pushed aside.

An additional advantage of the rotary system is that the driller is always informed of the exact nature of the stratum being drilled, as the cuttings are brought to the surface in a constant stream a few minutes after they are made. Thus it would be impossible for any but a slovenly driller to pass through an oil- or gas-bearing stratum without noting the fact. The cable method also is a good indicator of the strata. By the "feel" the driller can tell instantly when passing through cap-rock into a sand stratum.

In wells developing gas pressure, the hydraulic head of the mud column will often be sufficient to hold the pressure, preventing blowouts, regulating the gas flow, and permitting the drilling to be continued below this stratum. If the gas pressure is greater than the mud column will hold, a specially designed blow-out pre-

er and fireman. In districts having both hard rock and caving strata in quantity, a combination of the rotary and cable-tool methods is employed with great success, and will eventually be universally used under these conditions.

Colorado Mine Lien Law

By A. L. H. STREET

Attorney at Law, Minneapolis, Minn.

The Colorado statutes, providing for liens against mining property for services furnished in developing such property, are so worded as to entitle a mining superintendent to a lien on a mine whose working he has superintended, holds the Colorado Supreme Court in the case of *International Trust Co. vs. Lowe*, 180 *Pacific Reporter*, 579. But it was decided in the same case that the general manager of a mining company could not enforce a lien as against holders of bonds, where he aided in the issuance of such bonds as the company's general manager.

Spain's Export of Iron Ore during 1918 was 4,292,406 tons, as against 5,137,621 tons in 1917, according to *Revista Minera*. There were exported in 1918 a total of 1,035,701 tons of iron pyrites and 22,520 tons of manganese ore.

Experiments in Magnetizing Roasting

A Magnetic Film Coating Each Individual Particle the Objective of the Process—Experimental Results of Tests Made With Pyritic Concentrate—The Preferred Type of Furnace

By GEORGE J. YOUNG

THE separation of pyrite from blende can be effected by a magnetizing roast and the use of a magnetic separator. The minerals must be present in individual grains for complete separation, and the proportion in which they exist as separate grains will determine the degree of separation possible by magnetic means. The thoroughness of the magnetizing roast is an additional limitation.

The magnetic substances that are formed in magnetizing roasting are Fe_2O_3 , mixtures of Fe_2O_3 and Fe_3O_4 , Fe_3S_4 , and FeS . Zinc ferrate, $ZnOFe_2O_3$, forms at a temperature above 600 deg. C., and is magnetic. This compound is usually not present in the roast, or is present only in small amount as the roast is carried out at a lower temperature than 600 deg. C. The presence of zinc compounds and the use of excessive temperatures may produce this compound and result in much zinc being present in the magnetic product.

There is wide latitude in the degree of roasting, as can readily be appreciated in the cut, in which A indicates a particle coated with a thin film of magnetic sulphide; B, a particle that has been roasted to a greater extent and is characterized by a thin shell of ferric oxide over a thicker film of magnetic sulphide; and C, a particle that has been almost completely roasted, being characterized by a core of magnetic sulphide and oxide and a spongy shell of ferric oxide. All three particles would be attracted by a magnet, but B and C represent particles that have been subjected to an unnecessary amount of roasting.

An important objection to the presence of particles coated with a spongy shell of ferric oxide is that this shell is abraded to a greater or less extent when the particles are moved in a stream. When rubbed off, the ferric oxide cannot be removed by the magnet unless some magnetic oxide is attached to the particle of ferric oxide. The objective of the roaster is to form a magnetic film that will be as adherent to the particle as possible.

TIME, TEMPERATURE AND SIZE OF PARTICLES IMPORTANT FACTORS

The important factors in roasting are the size of the particles, the temperature, and the time of roasting. Coarse particles require an appreciably longer time to heat up to the ignition temperature than fine ones. A temperature at least equal to that at which pyrite ignites must be attained and maintained for a sufficient interval of time for a film to form. The time of roasting need not be prolonged beyond this point. A few moments suffice to form the film if the temperature is high enough.

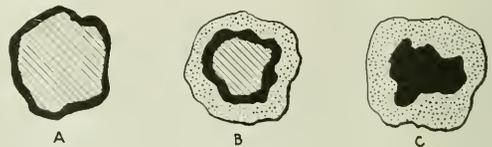

From a number of magnetizing roasting experiments that I made in the summer of 1917 I have summarized the results of three. In each experiment a 1,000 lb. lot of pyritic concentrate was taken and subjected to a roast with the object of magnetizing as much of the pyrite as possible. A rotary furnace was used,

No. 1 Roast—Clean pyrite middling, moderately coarse, 16 to 20 mesh. The maximum temperature reached in roasting was 375 deg. C. and the average 350 deg. C. One-half hour was allotted to the passage of the ore through the furnace. The actual time of roasting was much less, as the pyrite was subjected to a kindling temperature only while passing through the discharge hood of the furnace. The product was composed of particles only slightly filmed. The prevailing color was "light bronze." A 50-lb. sample, No. 1 lot, was passed through a Wetherill separator, and the division obtained was 75 per cent non-magnetic and 25 per cent magnetic. The analyses of the roasted and unroasted pyrite is given in Table I.

TABLE I. ANALYSES OF PYRITE CONCENTRATES, RAW AND ROASTED

	Insol. Per Cent.	Iron, Per Cent.	Sulphur, Per Cent.	FeS, Per Cent.	Calculated Fe ₂ O ₃ , Per Cent.	Insol. FeS, Plus Fe ₂ O ₃ , Per Cent.
No. 1 Lot:						
Raw pyrite.....	2.06	43.62	48.94	92.56		94.62
Roasted pyrite.....	2.66	43.31	47.73	89.49	2.20	94.35
No. 2 Lot:						
Raw pyrite.....	8.66	39.87	45.15	84.65	0.53	94.84
Roasted pyrite.....	8.52	41.29	43.77	82.07	4.27	94.86
No. 3 Lot:						
Raw pyrite.....	8.66	39.87	45.15	84.65	0.53	94.84
Roasted pyrite.....	8.12	44.02	40.35	75.66	12.44	96.22

No. 2 Roast—Pyrite concentrate, containing 8 to 10 per cent gangue minerals, both free and included in the pyrite particles. The maximum temperature reached in the roast was 440 deg. C. and the average about 400 deg. C. The time conditions were the same as on No. 1. The magnetized product obtained was distinctly brown in color. A 50-lb. sample was passed

MAGNIFIED CROSS-SECTION OF ORE PARTICLES,
ILLUSTRATING DIFFERENT DEGREES OF ROASTING

through the Wetherill separator, and the division showed 33.5 per cent non-magnetic and 6.5 per cent magnetic. Analyses are given in Table I. The results indicate about twice the thickness of film as compared with No. 1 lot.

No. 3 Roast—Pyrite concentrate from the same lot as used in No. 2 Roast. The maximum temperature was 500 deg. C. and the average about 450 deg. C. The pyrite was well ignited and was burning as it issued from the furnace. The roasting time was much shorter

than in the preceding experiment. The color of this product was dark brown, and practically no particles of brassy pyrite were visible. A 50-lb. sample was put through the Wetherill separator, and the division showed 7 per cent non-magnetic and 93 per cent magnetic. Analyses are given in Table I, and indicate the presence of a much thicker film than in either No. 1 or No. 2 roasts.

Five products were obtained from the Wetherill on each run, of which four were from the take-off belts and the remaining one was from the discharge of the feed belt. The products are designated 1A, 1B, 2A, 2B and non-magnetic. The numbering is in order of sequence of the take-off belts, beginning with the one nearest the feed-hopper. The front or leading pair of poles of a pair of magnets is designated A and the following pair B. Each product was examined, and the description of the products of the separation of each was as follows:

No. 1 ROAST

1 A—The particles are distinctly reddish brown; have a flat color, and are furry. No visible grains of pyrite. This product is the most responsive to the magnet.

1 B—The particles are darker than in 1 A, and are prevaingly reddish brown. In mass they present a slightly furry appearance. Some iridescent particles and a few particles of slightly bronzed pyrite.

2 A—The particles are brown in color. The mass of grains is characteristically granular and not furry. There is an increase in the number of iridescent particles, as well as a greater number of pyrite particles that are so lightly filmed as to present little difference from unroasted particles.

2 B—A general brownish color; less flat than in the others. Granular appearance; more iridescent and pyrite particles than in 2 A.

Non-Magnetic—Practically all pyrite grains. Some iridescent and some slightly bronzed; general appearance is like unroasted pyrite; some gangue particles noticeable.

No. 2 ROAST

1 A—Reddish brown; furry; flat color; no pyrite.

1 B—Brown, granular, flat color; some bronzed and some dark blue particles of pyrite.

2 A—Brown, granular, flat color; many blue and iridescent particles.

2 B—Lighter brown than 2 A; granular; many blue, iridescent and bronzed particles.

Non-magnetic—Light brown; some bronzed, blue and iridescent particles, but greater proportion consists of pyrite grains.

No. 3 ROAST

1 A—Dark purplish brown; furry; flat color.

1 B—Dark brown; granular; flat color; many particles like bornite; many dark red particles.

2 A—Brown; lighter in color than preceding; granular; many deeply bronzed and iridescent particles.

2 B—Brown; lighter in color than 2 A; granular; many iridescent particles.

Non-magnetic—Distinctly pyritic, although pyrite grains are coated with a brownish film, and the prevailing color is brown. Bright spots of light from pyrite faces; many clean grains of pyrite; many iridescent grains.

The physical appearance of the roasted product is a guide to the roaster. Good magnetizing roasting is in-

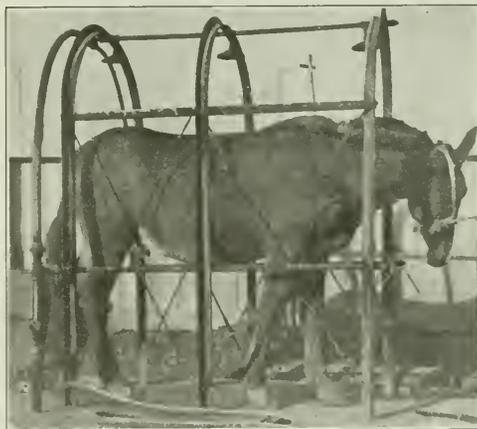

dicated by the absence of characteristic pyrite particles and by a flat or dead color, which ranges from a bronze, through shades of purplish brown, to black. Black is characteristic of a deficiency of air during roasting, or, in other words, of reducing atmosphere.

The color of the roasted product is also influenced by the amount and color of the other minerals present, which may or may not be altered in roasting. A high degree of magnetic susceptibility is shown by the product assuming a furry appearance after it has passed under the magnet. All of the leading pole products obtained from No. 2 and No. 3 roast presented this appearance.

Almost any type of roasting furnace can be used, providing the charge is passed through quickly enough. Furnaces of a type like the old White-Howell should give good service. In my opinion, the discarded Stetefeldt shaft furnace, or some modification of the Gerstenhofer kiln, would be suitable for magnetizing roasting.

Shower Bath for Mine Mules

A shower bath for mine mules has been installed in some of the properties of the U. S. Steel Corporation and some of its subsidiaries. This provides an efficient and easy method for the removal of dirt and perspiration from the mule, the accumulation of which

DETAIL OF APPARATUS FOR PROVIDING A SHOWER BATH FOR HORSES, MULES, OR CATTLE

is unavoidable. Humane treatment and attention to the physical wellbeing of these animals undoubtedly prolongs their life and increases their efficiency. The three perforated nozzles shown in the illustration are sufficient to spray the mule's entire body while the animal remains in the position shown. This illustration is reproduced from the Bureau of Safety, Sanitation and Welfare of the U. S. Steel Corporation.

The Amount of Water Remaining in Flotation Concentrate after passing the ordinary drum filter is subject to wide variation. Concentrate made from ores containing a great deal of colloidal matter gives the most trouble. At the Vindicator mill in the Cripple Creek district, for example, the moisture in the filter product is around 30 per cent. With clean ores and a liberal proportion of coarse table concentrate in the feed, the moisture in the filter cake is sometimes reduced to even less than 10 per cent.

Deep-Level Development in Aspen

Silver-Ore Deposits in Sedimentary Rocks—Concentration by Jigs and Tables—Flotation Applicable Separation From Barite—Cost of Pumping Prohibitive—Drainage Effected by Adits

BY FREDERICK W. FOOTE
Mining Engineer, New York City

ASPEN is one of the oldest mining camps in the State of Colorado. In 1879 prospectors and pioneers went over from Leadville and located several claims, among which were the Durant, Iron, Spar, Monarch, and Smuggler. At first, Ashcroft, 12 miles south of Aspen, was the larger camp, but in 1881, upon hearing of the continued strikes of ore, Ashcroft was moved house by house down the canyon of Castle Creek to Aspen.

TOWN OF ASPEN, COL.

Ashcroft is now deserted. At the height of its prosperity Aspen boasted a population of 14,000. The prosperity of the camp increased and the shipment of high-grade ore in pack trains became so great that both the Denver & Rio Grande R.R. and the Colorado Midland R.R. started spurs to reach Aspen, the former from Glenwood Springs and the latter from Basalt. The railroad building became a race to see which one would run the first train into Aspen. In spite of its greater length, the Denver & Rio Grande R.R. reached Aspen first, in 1887. The Midland arrived a short time afterward. Competition between these roads has always given Aspen the advantage of low freight rates for its products. As the camp came into prominence as the premier silver producer of Colorado, and the value of its deposits became better recognized, much litigation ensued between claimants under apex rights and those under side-line rights. Money was spent freely by both sides in development work to prove their theories.

ELEVATION OF ASPEN IS 8,000 FEET

Aspen is situated on the western slope of the Rockies in a basin formed by the junction of the valleys of Castle Creek with Hunters Creek and the Roaring Fork River. A broad, flat, alluvial plain at an elevation of 8,000 ft. affords an ideal site for a town. It is protected on three sides by mountains, the opening being on the west side down the Roaring Fork to Glenwood Springs. Recently, since the Government has controlled the railroads, the

service of the Colorado Midland R.R. has been suspended so that the daily "mixed" train of the Denver & Rio Grande is the only connection with main-trunk lines.

At an early date it was realized that the continued success of Aspen as a silver camp depended to a great extent upon a proper and comprehensive understanding and interpretation of the geology of the district, which was found to be complex. The Government intervened, and in the summer of 1895 sent J. E. Spurr and G. W. Tower, Jr., to Aspen for the Geological Survey. The report of their six-months' field work was published as "Monograph 31" of the U. S. Geological Survey.

The ore deposits occur in sedimentary rocks, the strata of which do not vary materially from those found in other parts of Colorado. In addition, certain igneous formations are found in definite relation to these sedimentaries. Porphyry, diorite, and granite are found in the region. These sedimentary and igneous rocks have been subjected to severe faulting both before and after mineralization. In addition to these are slips or faults along the bedding planes of certain of the strata. Of these bedding faults, the two most important are the silver and contact faults, along which perhaps 75 per cent of the ore in Aspen has been found, more particularly at the intersection of these faults with pre-mineral north and south faults. The surface ores consist of oxides, sulphates, and carbonates, and at lower depths the sulphides are found. The ores of Aspen are essentially silver ores, the principal deposit being argentiferous galena, but appreciable quantities of silver-bearing pyrites and chalcopyrite are found. Barite (heavy spar)

THE POWER PLANT AT HOPE TUNNEL

is found associated with polybasite, and showings of spar are consequently considered a good indication of ore.

At the height of its prosperity Aspen was producing 8,250,000 oz. of silver annually and 4,500,000 oz. at the time of the crash in 1893. The production had fallen to 575,000 oz. in 1916, this coming from 12 mines, among which were the Durant, Spar, and Smuggler, all of

which were located in 1879. Mining is conducted on the leasing system, on a variable basis of royalty. High-grade ore is shipped to the smeltery at Leadville or Pueblo, and the low-grade ore to the concentrating mill of the Smuggler Leasing Co. This has a capacity of 400 tons a day and is operated by direct-current motors of a total of 200 h.p., operating at 550 volts.

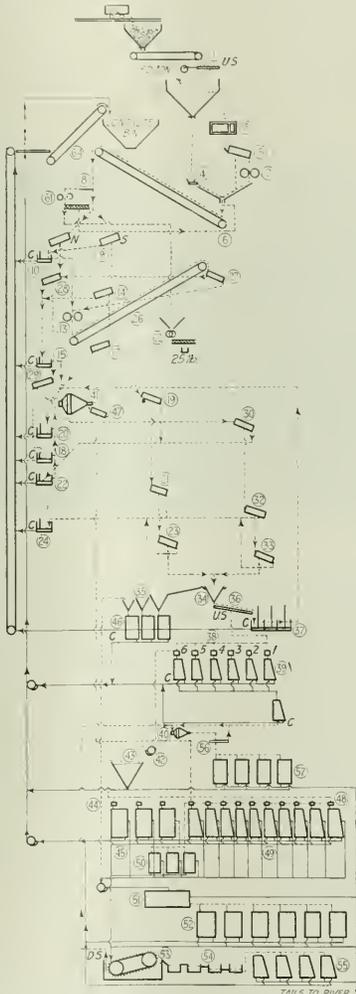

The mill is operated according to the following flow sheet, which is the result of many changes and re-designs by William Cornwall, mill superintendent for the Smuggler Leasing Co. It represents the best prac-

oversize from No. 1 goes to a 10 by 20 in. Farrell crusher. This operates at 300 r.p.m. and crushes to 1½ in. It is equipped with manganese-steel plates. The product from the Farrell crusher goes to a trommel conveyor. The oversize from this trommel goes to roughing rolls (No. 7) 36 by 16 in. set at ¾-in. opening. The product from this crusher goes to a bucket elevator (No. 6). Under the bin (No. 2), of 150 tons' capacity, is a 36-in. disk ore feeder (No. 4) operating at 15 r.p.m. This feeds into the bucket elevator. The first 40 in. of the trommel is made up of ¾-in. steel plate, followed by 30 in. of 25 mm. screen and then 29 in. more of ¾-in. steel plate. The undersize from this trommel goes to the bucket elevator. This is made up of 6 by 12 in. Salem buckets spaced 16 in. apart on a 14-in., 8-ply rubber belt. This elevator is operated at a speed of 375 ft. per min., with a vertical lift of 59 ft. The discharge from the elevator passes through an automatic sampler (No. 8), which takes four splits every five minutes, equivalent to about 10 tons per 24 hours.

JIGS USED ARE OF GERMAN MAKE

The ore is next trommeled and jigged (No. 9-29); 16 mm., 12 mm., and 8 mm. are the openings in the successive screens. The screens are all set at a 12° pitch and operated at 16 r.p.m. The jigs are of German make and were brought to Aspen in the early '80s. They are four-compartment, of the Harz type, and of massive construction. In this jiggling operation the length of stroke is shortened as the feed becomes finer, whereas the rate of stroke is increased. The concentrates from all jigs go, by means of a drag-chain conveyor (No. 12), to a loading bin. The jig tailings are treated in a 6-ft. Hardinge mill (No. 41). The pulp from this mill goes to a 20-mesh Callow screen, the oversize being returned to the mill, and the undersize is subsequently classified and tabled. The undersize from the final trommeling goes to a 4-ft. tank (No. 34). The slime overflow from this tank goes to a three-compartment spitzkasten, and the sands to a 30-mesh duplex Callow screen (No. 36). The oversize from the screen goes to a 3-compartment sand jig (No. 37). The undersize from the screen goes to six pocket classifiers (No. 38) feeding six Hallett tables (No. 39). The concentrates from these tables go to the concentrates bin, and the tailings are retabled and then reground in a 4½-ft. Hardinge mill (No. 40). The overflow from the last pocket of the classifiers is pumped by means of a centrifugal pump (No. 42) to a 12-ft. diameter cone tank (No. 43). The pulp from this tank is discharged through a siphon to a set of three pocket classifiers (No. 44) which feed one corrugated and two smooth-belt Frue vanners (No. 45). The overflow from the tank goes to a spitzkasten which feeds three smooth-belt Frue vanners (No. 46). The concentrates from all the tables are conveyed by shaking pans to common junction points, where they are elevated to the concentrates bin by Frenier pumps.

The undersize from the 6-ft. Hardinge mill is classified and tabled on nine Hallett and one Wilfley tables (No. 48). The slimes are treated on three 6-ft. Frue vanners. All the slime water in the mill is collected and pumped by means of a 5-in. centrifugal pump to a 30 by 12 ft. Dorr thickener (No. 51). The pulp is treated on Frue vanners. The mill tailings are all collected into a 5 by 18 ft. drag classifier (No. 53), the overflow from which is pumped to four 8-ft. settling tanks. The pulp from these tanks, 95% of which is minus 80 mesh, is treated

FLOW SHEET OF CONCENTRATOR—SMUGGLER LEASING CO.

tice for the concentration of Aspen ores: The ore is first dumped from cars on the railway track into an unloading bin, from which a traveling pan conveyor delivers it into a 24 by 48 in. crusher ore feeder (No. 1 in cut), bars set 1 in. apart. The feeder has a 6 in. stroke, 30 to the minute. The undersize from the crusher goes to an ore bin (No. 2) having a capacity of 150 tons. The

on four Hallett tables. The oversize from the classifier goes to the 4½-ft. Hardinge mill for finer grinding and thence through a 40-mesh Callow screen to three Hallett and one Deister Overstrom slime tables. This is the final treatment, the tailings from these tables being sluiced into the river.

The discharge from the automatic sampler is crushed and split until a 25-lb. sample is obtained, the remainder being returned to the mill feed. On a feed containing 2 oz. silver and 8% lead, this flow sheet accomplished an extraction of 68% of the silver contents and 94% of the lead. The method illustrates the advantage in close sizing and saving the metallic contents in as large particles as possible, and thus reducing slime losses to the minimum.

DEEP-LEVEL TUNNELS ARE CHARACTERISTIC OF COLORADO MINING

As the older mines in Aspen were worked down to a point where pumping costs became prohibitive, the question of deep-level tunnels was considered. Deep-level tunnels in Colorado have had a successful history. The Camp Bird, at Ouray; the Roosevelt, at Cripple Creek; the Yak, at Leadville, and the Newhouse, at Idaho Springs, have all rejuvenated their districts. The area to the south of Aspen along Castle Creek contained several paying mines that had been worked to shallow depths, but in which the work had been stopped by too much water and the low price of silver.

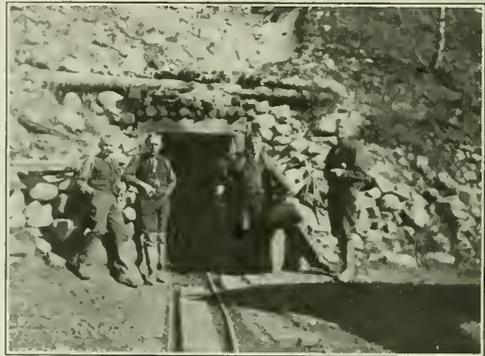

Seven miles from Aspen the Little Annie mine had been worked to a depth of 200 ft. and then discontinued after several hundred thousand dollars' worth of high-grade silver ore had been taken out. B. Clark Wheeler started a tunnel from the banks of Castle Creek to cut these workings at about 2,000 ft. depth, but after going 900 ft. the work on the tunnel was abandoned. The enterprise was too large for his resources. In 1911 a co-operative company was formed of citizens of Aspen, known as the Hope Mining, Milling and Leasing Co. This company took over the Little Annie mine, mill, and holdings and Wheeler's old tunnel, and continued the tunnel into the mountain without interruption. In March, 1919, this tunnel had attained a total length of 9,100 ft. Annual footages and costs are shown in Table I.

TABLE I. HOPE TUNNEL PERFORMANCE

Year	Footage	Cost per Foot
1911 (1 mo.)	15	
1912	715	\$12.89
1913	1724	10.20
1914	1340	10.91
1915	1138	11.89
1916	1252	12.91
1917	1047	14.58
1918	915	17.16
Total, Hope.....	8146	Average..... \$12.93
Famous.....	900	
	9046	

This record for a 4 by 7-ft. tunnel for seven consecutive years speaks well for the ability of the men who are driving it. Drilling is by machines, and tramping by hand. A steam-power plant of 80 h.p. is used to supply the power for the air compressor. A ventilating fan is used, driven by the waste water from the tunnel. When this tunnel has proceeded a few hundred feet further it will be 2,000 ft. under the Little Annie mine on the downward extension of the Little Annie vein. A geological examination made in 1917 showed no reason to anticipate any difficulty in finding the orebody at this depth, and connecting with the Little Annie mine.

Four miles south of Aspen the Midnight Mining Co. is driving a tunnel in from Queens Gulch (a tributary to Castle Creek) to connect with the Midnight shaft, which is on the extension of the Annie contact. When completed, the tunnel will be 5,200 ft. long and will cut the vein at a depth of 900 ft. about 800 ft. north of the shaft. From this point the tunnel will follow the vein to the shaft, thus opening up a block of ground 800 ft. long and 900 ft. deep. Three thousand feet of this tunnel has already been driven. The power plant at this tunnel consists of a crude-oil engine operating an air compressor. A comparison of power costs in 1917 showed that the steam generated by coal power used at the Hope tunnel was 1.46 times more costly than the fuel-oil power at the Midnight tunnel. Several good showings have been disclosed in both tunnels, but have not been developed, all funds being applied to the sole object of advancing the tunnels toward their objectives.

ENTRANCE TO HOPE TUNNEL

On Aspen Mountain, just south of Aspen, the Park Tunnel Mining and Milling Co. is driving a tunnel in a southeasterly direction to undercut the Tourtelotte Park properties. The tunnel portal is at an elevation of 9,500 ft. and, when finished, will be 3,000 ft. long and 800 ft. below the surface and 50 to 75 ft. below the lowest present workings in Tourtelotte Park. The tunnel is already driven to a distance of 735 ft. Electric d. c. current is used from the power plant of the Roaring Fork Electric Light and Power Co. for all power requirements. Data relative to these three tunnels is shown in Table II.

TABLE II. DATA ON ASPEN DEEP-LEVEL TUNNELS

	Hope	Midnight	Park
Length when completed, ft.	9500	5200	3000
Length completed to March, 1919	9100	3000	725
Length to be driven	400	2200	2265
Size of tunnel, ft.	4x7	4x7	5x8
Depth below surface, ft.	2000	900	800
Power.....	Coal-Steam	Crude Oil	Electric

Aspen ores have been tested by flotation, and a commercial process has been worked out whereby low-grade sulphide ores (which are found at depth) can be recovered. By a combination of flotation and gravity concentration, a concentrate free from barite is obtained.

Now that the Government restriction on the price of silver has been lifted, an impetus should be imparted to silver mining that will bring Aspen back to its former prominent position. The deep-level tunnels will open up many years' supply of available ore which has not yet been developed.

Water Rights in Mining

Legal Elements Defining Ownership in Water—Basic Decisions of Courts and Rulings of State Authorities

BY CHESLA C. SHERLOCK

THE courts have long recognized the fact that water is an important element in mining operations. The U. S. Supreme Court has said that the right to use water in mining operations is beyond dispute, but that the use of water in this sense is a public use within the legal meaning of the term. The California court has said that the water of streams in mining regions cannot be made the subject of private ownership so long as it continues to flow in its natural course, but that a right may be acquired to its use, which will be regarded and protected as property, although it does not carry with it any specific property in the water itself.

This view is general among the courts. The property is in use or the right of use, and not in the water itself. Although it may be difficult to draw the distinction in some cases, it is easy to do so in others. Water is a public commodity—something that is owned only by the sovereign or state. It belongs to all, with equal right; hence the property in it cannot pass to individuals so long as the water remains in its natural course, the property in it still being reserved to the state, although the right to use may be acquired by another.

No technical method is required by which the right to use is to be acquired. All that is necessary is the mere appropriation of the water to one's own purposes. One view which the courts take, and which is followed in a great number of jurisdictions, is that the right to use, when once acquired, is a franchise—"like that of digging gold, and is founded on a presumption of general grant from the sovereign and a license from the state."

The right to the use of water is subjected by the courts to a given test, which may be announced as a general rule of procedure. The first test is appropriation and the second test is the use of the water itself. If the water has been appropriated but not used, no right is acquired which can be recognized at law. If no appropriation has been made, but merely an intent to appropriate exists, no right of use is acquired in the water. The courts have likewise said that it is improper to say that the tests to follow are the method and place of the use, these not being sufficient to acquire legal rights in the water.

It is well to keep in mind that the right to use water as outlined above can be acquired only from water of the public domain, and cannot apply to water already under appropriation by another or to water exclusively owned by another.

The Utah court has said that percolating water, so long as it remains in an artificial tunnel or mining claim of the proprietor of land, is not open to the appropriation by another. The Revised Statutes of the United States provide that when rights for the use of water in mining operations have vested, or have been recognized by local custom, laws, or decisions of the courts, the right of way for the construction of ditches shall be confirmed. In Colorado it has been held that all patents are subject to such vested rights in the use of water, but though a vested right in the use of water may carry

with it an appurtenance to the right of way for the ditch through which the water is diverted, it does not carry a right to the land itself.

But mere appropriation will not operate to vest rights in each and every instance. It is effective only when (1) no riparian rights have intervened and (2) no prior rights are invaded. This is to say, if the access to the water is in the hands of a riparian owner at the time the appropriation is made, such appropriation will not vest any rights in the appropriator, and the same is true if such appropriation invades prior rights reposing in other individuals. In other words, appropriation itself is subjected to the rules of priority, and the first to exercise the right is the one to whom the fullest measure of protection is extended by the law.

It has been held that where an owner is entitled to divert water for his own use he may do so in any manner and may change the point of diversion, provided the rights of others are not injuriously affected. In Colorado and Nevada it has been held that the right of appropriation relates to the time when the first step is taken to secure it, and that a reasonable time will be allowed to do the necessary work.

This is a point of great importance to mine operators. If action is not taken within a reasonable time to do the necessary work, the right relates to the time of completion and not to the beginning of it. It is at once apparent that rights may be lost entirely by the intervening appropriation of another, if the work is not pursued diligently and completed within a reasonable time. The California court has said that possession and acts of ownership are conclusive evidence of the right to use water on the part of the appropriator. The right to use water may also be acquired under the rule of adverse possession by continued, uninterrupted and adverse possession or enjoyment of the water during the period limited under the statute of limitations for entry upon the land.

In general, it may be said that the usual rules of priority apply in the case of appropriation of water. The appropriator who was first in point of time has a superior right over all others. But the right acquired does not extend to an exclusive right, except under peculiar circumstances.

The rule is well recognized that the prior appropriator is entitled to water to the extent to which it was appropriated, to the exclusion of any subsequent appropriator for the same or any other use. This means that the appropriator acquires no greater right, by reason of his priority, than he exercised before subsequent appropriators came in. He cannot use half the volume of water and then decide to use it all after another appropriator begins to use some of the water. The rights acquired under appropriation are held to be as perfect and absolute as if they were acquired by prescription or by an express grant from a riparian owner. The extent of the appropriation and practically all questions arising under it have been held to be questions of fact to be determined solely by the decision of a jury, after all the evidence has been presented.

These principles form the settled rules as applied to the manner in which rights may be acquired for the use of water. They in no way apply to or affect instances where the land is already in the hands of individual owners, in which case the right to use is a matter of contract or of purchase.

Mills and Mines in California

FLOTATION PLANT OF THE AFTERTHOUGHT MINING CO., INGOT, SHASTA COUNTY, CAL.

ELECTROLYTIC ZINC PLANT, OF THE U. S. SMELTING, REFINING & MINING CO., KENNETT, SHASTA COUNTY, CAL.

THE MAMMOTH MINE, OF THE U. S. SMELTING, REFINING & MINING CO., KENNETT, SHASTA COUNTY, CAL.

LA GRANGE HYDRAULIC MINE, AT OREGON GULCH MOUNTAIN, TRINITY COUNTY, CAL.

The photograph was taken soon after the last sluicing had been done, and the mine is now closed. It will be noted that what is apparently a cleft is to be seen in the background. This is caused, however, by the gold-bearing gravel slipping down on the bedrock as the "giants" sluice it away.

Notes on Mill Fire Protection

General Arrangement of Fire-Fighting Equipment and Water Supply—Importance of Using Only Standard Fire Hose and Expanding-Ring Couplings

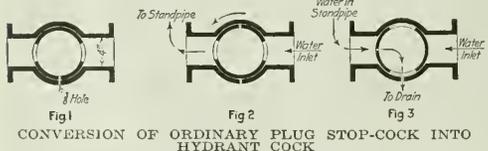

BY DOUGLAS LAY

Mining Engineer, Hawarden, England

ANY ordinary plug-cock can be readily converted into a serviceable hydrant cock, employing the "stop-and-waste" principle, and at trivial expense. With the plug of the cock in the "full-on" position, a hole is drilled through body of cock, and through walls of plug, in a position central to both, as shown in Fig. 1. The size of hole will depend upon the size of the plug cock, a 3/8-in. hole being about the right size for a 4-in. cock. The plug is now turned through 180°, when it will occupy the position shown in Fig. 2. This is the normal position of the converted cock, when delivering a full supply of water to hydrant. Turning the plug through 90° from this position, in the direction shown by circular arrow in Fig. 2, shuts off the water supply completely, and the water in the hydrant pipe is automatically drained through the ports drilled in the cock, thus giving a frost-proof hydrant.

Obviously, the travel of the plug must be confined to 90°, and the direction of rotation must be as indicated. This is readily effected by means of stops so placed that the plug cannot be turned the wrong way. These stops may be either small dowels placed in the body and plug of the cock, or the long tee handle attached to the plug may have at its upper end stops so placed that a turn in the wrong direction is impossible, and the travel is restricted to 90 degrees.

The general arrangement of a serviceable hydrant and hose house is shown in Fig. 4. The hydrant cock, above described, is buried about three feet below the surface of the ground, a wooden box being placed over the cock, to prevent soil from plugging the drainage port. Under and around the cock, coarse rock is packed to facilitate drainage. A long tee handle is rigidly attached to the plug, and extends upward, through a wooden box, through the floor of hydrant house. An indicator is placed over the top of the handle showing plainly the direction of rotation. This, of course, does not obviate the necessity of the stops previously referred to, but no hard thinking should be required in connection with fire appliances at a time of emergency.

CONVERSION OF ORDINARY PLUG STOP-COCK INTO HYDRANT COCK

Clamped to the standpipe is a swinging hose rack containing 50 ft. of 2½-in. standard fire hose, with nozzle attached, which is always coupled up and ready for instant use. Additional hose is hung on racks on the walls of the hydrant house. The 2½-in. gate valve shown gives additional control over the water supply. Such a yard hydrant should be at least 100 ft. distant from the nearest building.

Too little attention is frequently paid to the question of fire protection, in connection with mills. More often than not, the protection appliances are entirely

within buildings, and yard hydrants are conspicuous by their absence. Granted the importance of internal appliances, there should invariably be, in addition, a yard hydrant or several yard hydrants placed at strategic points. A fire may gain such headway that access to appliances within the building is impossible. Again, the menace may be a bush fire. Given a yard hydrant on the outskirts of the group of buildings, and, say, 500 ft. of hose, the surrounding area may be so drenched that all danger from this source may be averted.

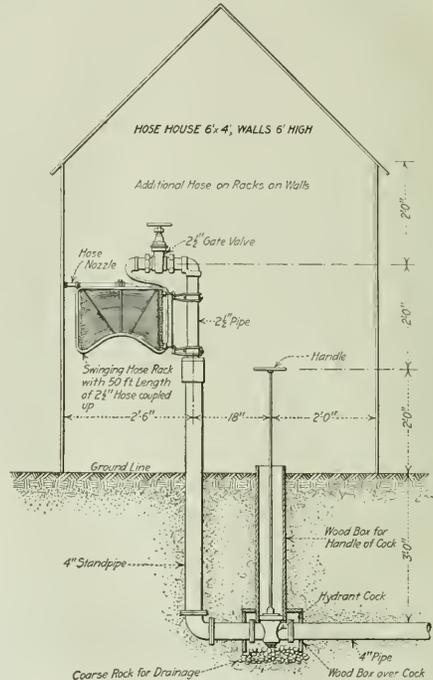

FIG. 4. GENERAL ARRANGEMENT OF YARD HYDRANT

No hose other than standard fire hose, with expanding-ring couplings, should be permitted in connection with fire-protection appliances. To employ any other kind of hose is to dwell in a fool's paradise. Hose couplings, other than expanding-ring couplings, are likely to come apart at a critical time, and render an abundant water supply of no avail.

Changes in Alaska Juneau Ball Mills

When the new Alaska Juneau mill began operating, in the spring of 1917, it was found that the ball mills would grind only a small fraction of what was expected. As the entire mill had been built on the assumption that the ball mills would operate at their rated capacity, the problem was a serious one. Considerable improvement was secured by reducing the size of the feed from 3 in. to 1½ in., but even then the capacity did not reach the desired figure.

According to the fourth annual report of the company, experiment has proved that a greater capacity and a reduced cost can be obtained by converting the ball mills into the closed-circuit, overflow type. The grinding

has heretofore been to approximately 10 mesh, the mill product passing through revolving screens, the oversize from which has been reground in tube mills. It has now been decided to remove the grates from the mills and also to grind all 10-mesh oversize in the ball mills themselves, thus dispensing with the tube mills entirely. For the purpose of returning this material, a bucket elevator is being installed for each two ball mills. During the transition to the new practice, however, the oversize from the overflow mills will be used for pebbles in the tube mills. It is hoped, by this change, to bring the mills more nearly up to the capacity for which the plant was designed.

A slight change has also been made in the flow sheet immediately preceding the ball mills. During 1917 the 50-stamp mill was used to grind the same class of ore that was handled by the ball mills, viz. about $1\frac{1}{2}$ in. Now, however, short grizzlies have been installed for the purpose of splitting the gyratory crusher discharge into plus 2 $\frac{1}{2}$ -in. material for the stamp mills and minus 2 $\frac{1}{2}$ in., or screenings, for the ball mills.

With these and other changes which have been announced, it is expected that the mill will be able to treat 8,000 tons of ore per day, at the same time rejecting an equal amount of waste.

New Method of Adding Water To Conical Mills

Larger Capacity and Reduction of Oversize Accomplished by the Use of a Water Spray in the Discharge Cone—Utility of Water Rheostat

IT IS THE present general practice in the operation of ball mills to add all of the water to the feed end of the mill. Experimentation and tests made by C. W. Dowsett, of the Bluestone Mining & Smelting Co., Yerington, Nev., have proved that, in his case, better results are secured in the Hardinge conical mill by adding a part of the water, or some additional water, just inside the discharge end of the mill. The assumption is that while the ore is coarse little or no water is required, excess water merely acting to break the fall of the balls and wash away the finer ore particles. As the ore passes to the discharge end of the cone, however, the surface area of the ore particles is considerably increased, so that the pulp becomes very thick. This prevents proper classification and results in large pieces of ore, $\frac{1}{2}$ to $\frac{3}{4}$ inches in diameter, discharging with the finer material. The dilution of the water spray allows the proper classifying action in the discharge cone to take place.

Mr. Dowsett has inserted a 1 $\frac{1}{2}$ -in. water pipe in the discharge trunnion of his mill, fitted with a $\frac{3}{4}$ -in. nozzle so directed that a spray impinges on the rising side of the pulp about 18 in. to 2 ft. inside of the mill. He has found that by shutting off this water spray for five minutes the amount of oversize is greatly increased.

While at the Dome, Mr. Dowsett also experimented with a water rheostat in connection with the motor used to drive the 8-ft. by 30-in. Hardinge mill at that plant, coming to the conclusion that a variable speed motor would possess certain advantages for a ball-mill drive. In these tests he found that with a slight variation in the hardness or size of the feed, a moderate increase or decrease in the speed of the mill, obtained by raising or lowering the plates of the water rheostat, was necessary to keep the capacity of the mill at a maximum. Some-

times a variation of $\frac{1}{2}$ to $\frac{1}{4}$ of a revolution per minute made a marked difference in the capacity. In view of this fact, he believes that the motor should be sufficiently oversize to prevent line surging, as this surging will cause considerable fluctuations in the speed of the mill.

Another aid to greater capacity which Mr. Dowsett claims is the use of a restricted throat in the feeder, with large diameter trunnions. In this way he gets more of the action of a Frenier sand pump and an actual hydrostatic head to force the feed into the mill.

Whether or not better results can be secured in ordinary mill practice by the above suggestions can be easily tested. An ammeter may be placed in the power circuit, and the water may also be metered when the spray in the discharge is tried, in order to determine the best conditions of operation. Under certain conditions, a thickening of the coarse ore pulp will result in an increase of both the power required and the grinding efficiency. If the pulp becomes too thick, more power is required but less grinding will be done, so that it devolves upon the operator to secure a critical medium.

Mine Labor Wages in Alsace-Lorraine*

There has been a noticeable increase in the average earnings of miners in the coal, iron and potash mines of Alsace-Lorraine, according to the *Bulletin du Ministère du Travail et de la Prévoyance Sociale*. The following table shows the number employed, shifts worked, and the average wages for specified periods, 1913 to 1918.

INDUSTRIAL DATA, ALSACE-LORRAINE MINES, 1913-1918

Period	No. of Persons Employed	No. of Shifts Worked	All Employees	Earnings		
				Per Shift	Per Quarter	Per Miner
Coal mines						
1913.....	16,333	(a)	(a)	\$1.07	(a)	\$1.27
1914, second quarter.....	15,445	79	\$1,329,577	1.09	\$86.08	1.50
1914, third quarter.....	9,512	76	752,700	1.03	78.17	1.24
1918, first quarter.....	11,229	85	1,816,709	1.88	161.93	2.48
Iron mines						
1913.....	16,975	(a)	(a)	1.41	(a)	1.60
1914, second quarter.....	14,939	74	1,534,350	1.37	102.87	1.59
1914, third quarter.....	8,307	63	691,519	1.32	83.38	1.54
1918, first quarter.....	8,581	77	1,373,388	2.09	160.00	2.85
Potash mines						
1913.....	1,175	(a)	(a)	1.06	(a)	1.19
1914, second quarter.....	1,879	74	145,206	1.03	76.24	1.15
1914, third quarter.....	692	75	52,496	1.04	76.04	1.14
1918, first quarter.....	1,060	78	130,468	1.57	122.94	2.12

(a) Not reported.

Quicksilver Orebodies, as is well known, are usually per quarter in 1918 compared with the nearest corresponding period of 1914 was 88.1 per cent in coal mines, 55.5 in iron mines, and 61.3 per cent in potash mines.

Quicksilver Orebodies, as is well known, are usually irregular in form, and probably for no other group of metalliferous deposits is prediction or quantitative estimation more difficult. By far the greater number of quicksilver orebodies that have been or are being worked in the United States, according to F. L. Ransome in *Bull. 666-FF*, U. S. Geological Survey, are irregular lenses, pipes, or pod-like masses with few or no definite surfaces of demarcation separating them from the enclosing rocks. Where several orebodies occur, they are usually arranged along a principal zone of fissuring, and may have one distinct wall, generally marked by a seam of claylike material, or gouge, produced by the crushing and grinding of the rock along one of the fissures. The ore masses may consist of porous rock through which the cinnabar or other quicksilver minerals are scattered in small crystal particles, or may be made up of rock that is traversed by many irregular veinlets or stringers, in which occur most of the valuable minerals.

Mexico's New Mining Law

Decree Brings Together in One Measure All Mining-Tax Legislation—Property-Tax Rates The Same as Previously Levied—Owner Must Pay, Irrespective of Possession—Text of New Law Translated

WASHINGTON CORRESPONDENCE

BEFORE considering the substances of the New Mexican mining law, just enacted, two general observations are in order as to form. In the first place, the decree is issued under the blanket resolution of May 8, 1917, conferring upon the executive "extraordinary powers in the Department of Finance." The sole justification, if any there be, for this method of "legislating" lies in the abnormal conditions prevailing just after the Constitutionalist revolution triumphed. To continue to use this power after more than two years of a return to constitutional order denotes a complete overshadowing of the legislative branch of the government by the executive. In a word, it seems to be time to call a halt to "legislation by executive decrees." Secondly, the law is drafted in more legal language than has been the case recently. This clearly shows the hand of Cabrera.

The most important changes that have been introduced are as follows:

1. The decree in question brings together into a single measure the different mining tax decrees.

2. The property-tax rates (Art. 3) do not differ in any particular from those prescribed in the decree of Apr. 26, 1918. In this connection it should be noted that the heavier rates applied to larger properties will tend to discourage large mining holdings. Though there can be little question as to the benefit of the partition of large landed estates from the agricultural point of view, the expediency of discouraging large mining properties is certainly open to grave doubt, particularly where ores are low grade.

3. Art. 6 makes payment of the property tax compulsory, irrespective of possession by the owner.

4. In the matter of the production tax, the changes are few. They are as follows:

(a) With the exception of copper, the rates are the same as those prescribed in the decree of Apr. 26, 1918, with a reduction from 3 per cent to 2 per cent in the case of lead, tungsten, molybdenum, graphite, and mercury (Art. 7-D).

(b) A sliding scale, adjusted according to the New York quotations, from 60 per 1,000 when the price is 25c. or over to 1 per 1,000 when the price is under 10c., is provided for copper.

5. The mint is bound to receive only gold from individuals for coinage. The former decree (Apr. 26, 1918, Art. 2) provided for the coinage of gold, in unlimited amounts, and of silver, under special permission from the Department of Finance.

6. Facilities are offered to owners whose mining-tax payments are in arrears. These may be paid in the same number of installments as the number of periods of four months (*tercios*) that are owed. This privilege expires Sept. 30, 1919.

7. The obligation to re-import an equivalent amount of gold for all gold exported is left effective under the present law only as long as restrictions as to free

circulation of gold are in force in other countries.

The previous decree (Apr. 26, 1918) required in the case of silver that 50 per cent of the value thereof be re-imported in gold. This was later modified to 25 per cent in gold and 25 per cent in subsidiary coinage. The present decree abolishes this requirement entirely.

The complete text of the new statute, as translated, is reproduced as follows, without modification.

MINING TAX LAW

Issued under the extraordinary powers in the Department of Finance granted the executive by the resolution of Congress of May 8, 1917.

CHAPTER 1

ON THE TAX IN GENERAL

Art. 1. The mining industry shall pay the following taxes: A, property tax; B, production tax; C, smelter, coinage and assay dues.

CHAPTER 2

ON THE PROPERTY TAX

Art. 2. Mining patents (*titulos*) shall pay, at the time of issuance, a tax of ten pesos for each hectare covered by the patent, irrespective of the mineral substances whose development is authorized. This tax shall be payable in stamps affixed to the patent.

Art. 3. All mining properties shall pay an annual tax, according to the following rates:

A. Properties of one to five claims (*pertenencias*) at the rate of six pesos per claim, per annum; that is to say, two pesos payable every four months.

B. Properties of six to fifty claims at the rate of nine pesos per claim per annum; that is to say, three pesos payable every four months.

C. Properties of fifty-one to one hundred claims at the rate of twelve pesos per claim per annum; that is to say, four pesos payable every four months.

D. Properties of one hundred and one claims and upward at the rate of eighteen pesos per claim per annum; that is to say, six pesos payable every four months.

Art. 4. The progressive rates shall be applicable, provided the claims belong to a single owner and are located within the jurisdiction of the same mining agency.

Art. 5. The tax on mining claims shall be paid every four months in advance. Failure to make any payment when due shall work a forfeiture of the mining property, which shall be declared in accordance with the regulations on the subject.

Art. 6. The property tax shall be payable so long as the patent is in force, whether the property be developed or not, or whether or not effective possession of the property be had by the owner thereof.

CHAPTER 3

ON THE PRODUCTION TAX

Art. 7. Gold, silver, and industrial metals, whether produced within the republic or proceeding from abroad, shall be subject to a tax, according to the following schedule:

A. At the rate of 7 per cent on the value of the gold and silver presented to the mint for coinage.

B. At the rate of 8 per cent on the value of gold and silver for export purposes, when in the form of mineral rock or earth, concentrates, cyanides, or sulphides, smelter tailings, or in any other form in which the metals are com-

bined or blended with substances that are not metals, properly speaking.

C. At the rate of 7 per cent on the value of gold and silver for export purposes, provided they have been treated in the country to such a point as no longer to contain a mixture of other metals, irrespective of the fineness of the product.

D. At the rate of 2 per cent on the value of lead, tungsten, molybdenum, manganese, graphite, and mercury.

E. At the rate of 1 per cent on the value of zinc, antimony, and other metals and minerals not otherwise provided for in this article.

F. At the rates specified below on the value of copper for export purposes when presented in bars, bullion or concentrates, provided these substances contain more than 50 per cent copper and more than 300 grams silver or 5 grams gold per ton:

At the rate of 60 per 1,000 when the value of electrolytic copper, per lb., is 0.25c. U. S. currency or over in New York;

At the rate of 50 per 1,000 when the quotation is from 0.20c. to 0.25c. U. S. currency;

At the rate of 40 per 1,000 when the quotation is from 0.19c. to 0.20c. U. S. currency;

At the rate of 35 per 1,000 when the quotation is from 0.18c. to 0.19c. U. S. currency;

At the rate of 30 per 1,000 when the quotation is from 0.17c. to 0.18c. U. S. currency;

At the rate of 25 per 1,000 when the quotation is from 0.16c. to 0.17c. U. S. currency;

At the rate of 20 per 1,000 when the quotation is from 0.15c. to 0.16c. U. S. currency;

At the rate of 10 per 1,000 when the quotation is from 0.13c. to 0.15c. U. S. currency;

At the rate of 5 per 1,000 when the quotation is from 0.10c. to 0.13c. U. S. currency;

At the rate of 1 per 1,000 when the quotation is from 0 to 0.10c. U. S. currency.

G. At the rates specified below on the value of copper for export purposes when presented in bars, bullion, or concentrates, provided these products contain a fineness of more than 50 per cent copper, but of less than 300 grams silver or of 5 grams gold per ton:

At the rate of 60 per 1,000 when the value of electrolytic copper, per lb., is 0.25c. U. S. currency or over in New York;

At the rate of 30 per 1,000 when the quotation is from 0.20c. to 0.25c. U. S. currency;

At the rate of 25 per 1,000 when the quotation is from 0.19c. to 0.20c. U. S. currency;

At the rate of 20 per 1,000 when the quotation is from 0.18c. to 0.19c. U. S. currency;

At the rate of 18 per 1,000 when the quotation is from 0.17c. to 0.18c. U. S. currency;

At the rate of 15 per 1,000 when the quotation is from 0.16c. to 0.17c. U. S. currency;

At the rate of 13 per 1,000 when the quotation is from 0.15c. to 0.16c. U. S. currency;

At the rate of 10 per 1,000 when the quotation is from 0.13c. to 0.15c. U. S. currency;

At the rate of 5 per 1,000 when the quotation is from 0.10c. to 0.13c. U. S. currency;

At the rate of 1 per 1,000 when the quotation is from 0 to 0.10c. U. S. currency.

H. At the rates specified below on the value of copper for export purposes when presented in the form of natural ores or concentrates of a fineness of not over 50 per cent copper:

At the rate of 80 per 1,000 when the value of electrolytic copper, per lb., is 0.25c. U. S. currency or over in New York;

At the rate of 70 per 1,000 when the quotation is from 0.20c. to 0.25c. U. S. currency;

At the rate of 60 per 1,000 when the quotation is from 0.19c. to 0.20c. U. S. currency;

At the rate of 50 per 1,000 when the quotation is from 0.18c. to 0.19c. U. S. currency;

At the rate of 40 per 1,000 when the quotation is from 0.17c. to 0.18c. U. S. currency;

At the rate of 30 per 1,000 when the quotation is from 0.16c. to 0.17c. U. S. currency;

At the rate of 25 per 1,000 when the quotation is from 0.15c. to 0.16c. U. S. currency;

At the rate of 15 per 1,000 when the quotation is from 0.13c. to 0.15c. U. S. currency;

At the rate of 5 per 1,000 when the quotation is from 0.10c. to 0.13c. U. S. currency;

At the rate of 1 per 1,000 when the quotation is from 0 to 0.10c. U. S. currency.

Art. 8. The mint shall receive from individuals gold for coinage without any limitation as to amount at the rate of 1,333.13 pesos per kg. of pure gold; the same rate shall apply for the production tax and the coinage dues.

Art. 9. The right to mint silver coins pertains exclusively to the federal government, the right of individuals to send this metal to the mint for coinage hereby ceasing.

Art. 10. For the collection of the production tax on silver and industrial metals, the Department of Finance shall issue every month a schedule of rates applicable to the following month, taking as a basis the average of the prices prevailing in the two preceding months for metals and metallurgical products or for natural ores in New York, according to the special circumstances in each case.

Art. 11. In all such cases the rates prevailing on the day of the presentation of the metals to the mint, to federal assay offices or to the custom houses shall apply.

Art. 12. The production tax shall not be paid by:

A. Old Mexican and foreign gold coins presented to the mint for re-coinage; these shall only pay coinage assay, or smelter dues, as the case may be;

B. Gold, silver, copper, lead or zinc, when exported in the form of mineral stone, earth, or dust, whether in the form of sulphides, cyanides, or smelter tailings, provided these substances do not contain the following metals in these proportions: Gold, 2 grams per ton; silver, 250 grams per ton; copper, 3 per cent; lead, 8 per cent; zinc, 15 per cent.

C. Gold, silver, copper, lead, or zinc which, after having been imported into the republic in the form of mineral stone, earth or dust, or scientifically [metallurgically?] treated, are exported within the next four months in a metallic state, after having undergone metallurgical treatment in smelters or other like establishments existing in the country; provided the substances imported have a fineness greater than those specified in the foregoing section (B). The interested parties shall pay the assay dues and inspection charges on such minerals.

D. All metals used in the national industries. In order that gold and silver may be included in this privilege, the interested parties must prove to the satisfaction of the mint, or the federal assay office, that those metals have been put to industrial uses.

E. Samples of minerals exported in their natural state whose weight does not exceed 10 kilograms and whose intrinsic value is not over 10 pesos.

F. Iron ores.

Art. 13. Smelter, coinage and assay dues shall be paid according to the schedules of rates issued by the Department of Finance, or the basis of the cost of the respective operations.

Art. 14. Assay dues shall be paid whenever this operation is carried out by mandate of law, by administrative ruling, or at the request of the interested parties; smelter dues shall be paid when, because of the lack of uniform character of the bars or pieces, it becomes necessary to melt them for assay or coinage purposes; coinage dues shall be paid whenever the metals are coined.

Art. 15. Assay dues shall not be paid when, after the operation has been carried out by mandate of law or by administrative ruling, it is shown that there are only vestiges or traces of metals sought in the products assayed.

CHAPTER 4 ON GENERAL PROVISIONS

Art. 16. The states shall not levy on mining property,

or on the development or output of mines, more than a single tax, which tax shall not exceed 2 per cent of the value of the metal, in the case of gold or silver; nor of 50 per cent of the production tax hereby levied on other metals or minerals. States are accordingly expressly forbidden to levy any other tax, irrespective of its name, on the extraction, output, profit, or utility of mines, of smelters or metallurgical establishments of any kind, including coke factories, on the capital invested therein, or shares and mining stocks, on the transfer of ownership of mining properties or of metallurgical establishments, as well as on entries (*denuncios*), possession, constitution of mining or smelting companies, issuance of certificates or shares or on any operation relating thereto, and in general on all proceedings necessary to the establishment, acquisition, or development of mining or metallurgical properties.

Art. 17. Smelters and other metallurgical establishments of every kind, including coke factories, shall pay to the state government in which they are located, or to the governments of the federal district and territories, as the case may be, a single tax which shall not exceed (?) per 1,000 per annum on the value of the property and its equipment.

Art. 18. The federal tax shall not be paid on taxes paid under the laws and provisions enacted by the state governments within the limits presented in the foregoing articles.

Art. 19. The municipalities shall in no event levy any tax on mining, under any name or designation.

Art. 20. The export of gold ready for mining and of any kind of gold or silver coin of the Mexican currency system, as well as all kinds of foreign gold coins, is hereby prohibited, under penalty of seizure.

The Department of Finance may permit the export of solid silver pesos, provided that within a term of five days there be imported into the country for coinage by the mint an amount of gold equal to the value of the pesos exported.

Art. 21. The importation of Mexican and foreign gold coins is hereby exempted from the payment of consular dues, as well as from the requirement of a consular invoice.

Art. 22. No import duties shall be paid by the following substances provided they are introduced into the country to be used in the treatment of minerals: Zinc and aluminum in bars, fillings, etc. . . . ; sulphur; alkaline cyanides; hyposulphite of soda; lead acetate; and zinc in small perforated sheets.

TRANSITORY ARTICLES

Art. 1. This law shall go into effect from July 1 next (1919).

Art. 2. The decree of Apr. 26, 1918, and all former laws and provisions on mining taxes and privileges are hereby repealed.

Art. 3. All fines owed by reason of the annual tax on mining properties, including those due up to the date of the promulgation of this decree, are hereby canceled.

Art. 4. Persons liable to the tax on mining claims are hereby allowed the months of July and August in which to pay, without surcharge, the taxes due in the first and second periods of four months each of the present year.

Art. 5. Owners of mines that may be owing taxes prior to 1919 and who shall have paid the first two periods of the present year, as prescribed in the foregoing article, shall have the right to pay their arrears in as many installments as the number of periods of four months they are owing, amortizing the amount of one period of arrears each time they make payment of their regular taxes.

Art. 6. The patents of those persons who fail to take advantage of this privilege, or those who being entitled thereto do not make their payments on the dates of maturity, shall be declared forfeited, as provided by law, and such persons shall not have the right to resort to any other recourse.

Art. 7. Those persons who take advantage of the privilege allowed in Art. 5 (transitory) shall be required to file with the Department of Finance a statement (*manifestation*) containing the following data: Office where payment is made, number and date of patent, name of the property, name of the present owner, amount of the arrears, and receipt of the payment of the two periods of the present year. The term within which advantage may be taken

of the privilege granted under Art. 5 (transitory) will end Sept. 30, 1919.

Art. 8. Mining-property taxes and production taxes that may be owing on the date when the present law goes into effect shall be liquidated and paid according to the rates provided in the decree of Apr. 26, 1918, which is hereby repealed.

Art. 9. So long as the international restrictions on the free circulation of gold continue in force, exporters of mixed bars of gold minerals and concentrates of any kind, provided they have a fineness of gold greater than two grams per ton, shall re-import in gold bars ready for minting or in Mexican foreign gold coins an amount equivalent to the amount of gold contained in the bars, minerals, or concentrates exported.

Art. 10. The Department of Finance shall determine the procedure to be followed in guaranteeing the re-importation of gold to which the foregoing article refers.

Art. 11. Gold re-imported under the foregoing articles shall not be subject to the production tax, since the metal on being exported will have paid the said tax.

MEXICO CITY, JUNE 27, 1919.

Permanent Exhibit of Mining Machinery Planned

Will Occupy One Entire Floor of Grand Central Palace, New York—Coal and Oil Industry Included

A PERMANENT exhibit of all the latest and best machinery and supplies used in the mining and metallurgical industry is to occupy 50,000 sq. ft. of floor space in the Grand Central Palace, 46th St. and Lexington Ave., New York City. This announcement, recently made, will be of great interest to all mining men. Heretofore long and costly trips have often been necessary to compare the merits of the various machines used in the industry and actually to see the appliances which are used in the most up-to-date practice. Also, familiarity with the implements of one industry often leads to an appreciation of their applicability to another. Some of the standard machinery at present used in the milling of copper ores, for example, is borrowed from the gold and silver industry.

The International Exhibition of Mining Industries is only one part of the project, as the remaining floors of the building will be devoted to other kinds of business. The whole idea is fathered by the Nemours Trading Corporation, of which Alfred I. du Pont is president. It is represented in all of the leading cities of the world, with 19 branch offices and 3,000 foreign selling agencies, all of which will spread knowledge of the Grand Central Palace exhibits.

The exposition of mining industries will include the machinery and supplies used in the development and exploitation of metal and non-metal mines, coal mines and oil wells; the subsequent extraction, reduction, or refining of the raw products by concentration, leaching, cyanidation, flotation, smelting, distillation, and coking, and the handling and marketing of the products. Howard R. Ward, who will manage the project, is a mining engineer. He has practiced in the West for fifteen years and was for three years consulting mining engineer with the American International Corporation, where he was associated with the organization of its machinery export companies.

It is planned to have the exhibit open by Oct. 15, and remain open, as a permanent, continuous exposition.

Business Training for the Engineer*

Importance of Mastering Fundamental Commercial Principles—Results of Present Curricula Unsatisfactory—Suggestions Respecting Essential Technical Preparation and the Means of Acquiring a Broader Professional Equipment

BY ANSON MARSTON

Dean of Division of Engineering, Iowa State College, Ames, Iowa

I BELIEVE that the demand for business training for the engineer is widespread throughout the engineering profession. In part, it is a more or less unconscious revolt against the conception so common in the business world, that the engineer is merely a highly skilled mechanic, destined by fate and custom to serve only as an employee of some profit seeker. In 1907 the first precautionary measure taken by capitalists when the financial storm burst was to drop most of their engineers from the pay-rolls. Within a week the character of the letters reaching my desk changed from appeals by corporations for more engineers at any price, however high, to appeals by engineers for employment at any price, however low. Alumni who had just resigned permanent positions held for years to accept enticing offers found those offers repudiated while they were en route to their new stations. Moreover, our railways for a generation before the war met each new legislative restriction on rates by small economies, such as in lead pencils and in engineers.

The new thought is, why should not the engineer be his own employer in great industrial enterprises of an essentially engineering character? Why should he not be the organizer, the president, the manager of great industrial corporations rather than a mere hired expert?

PRESENT METHODS GIVING POOR RESULTS

Another cause for the present demand for business training for the engineer is the general dissatisfaction among employers of engineers with the product of our engineering courses of study. Methods of instruction have become standardized to such an extent that it is almost as great a sacrilege for any engineering college to deviate from the general practice as it was for the ancient Egyptian draftsman to vary a line from the orthodox in representing Pharaoh. Of engineering educators it truly may be said that we have looked upon our work and we find that it is good, but we have no inquisition at our command to put down the numerous latter-day heretics who keep on pointing out defects in the results we secure.

The engineer employer needs, above all, men who are qualified for successful executive responsibilities in great industrial undertakings, and he is not satisfied with the product which our engineering colleges are sending out.

Even before the war, then, engineers and engineer employers were demanding business training for the engineer. Since the close of the war comes Uncle Sam himself to tell us that the imperative post-war needs of the United States require great engineer

leaders, with sound business training, to develop our great mechanic arts, industries for economic and profitable production, transportation, sale and use, at home and abroad. Patriotic duty to the country now furnishes an additional reason for the introduction of business training into every engineering course as a fundamental part thereof.

BUSINESS TRAINING AN ADDED QUALIFICATION

I would call attention at this point to the fact that the subject of this paper is "Business Training for the Engineer," not "Engineering Training for the Business Man." The two topics should not be confused.

The schools of commerce are coming to call upon the colleges of engineering for some informational training of commerce students along engineering lines. This call should be heeded, but it is not believed that the great mechanic arts and trade needs of the country can be met adequately by superficial descriptive engineering training of business men to such extent only as to enable them to read with fairly intelligent understanding the reports of hired engineer experts. What we need are great engineer leaders, men who possess the highest engineering qualifications combined with great business ability, and who can conceive great mechanic arts, enterprises, design their engineering details, build their greatest constructions, organize and direct their operations, and who also can interest capital and deliver a fair profit to investors.

I take it that the principal object of all business training (speaking frankly) is financial profit. Public utilities, for example, are successful from the business point of view whenever they make money for their stockholders, although they may poison a city with polluted water, furnish unsatisfactory light and power, cause the traveling public all sorts of inconvenience, or ruin industries by insufficient or inequitable transportation facilities. Toleration of such shortcomings, it is true, might be unwise, but this would be because they might arouse antagonism, cause enactment of legal restrictions, decrease patronage, or otherwise operate to decrease profits.

PROFIT IN ENGINEERING ONLY ONE ESSENTIAL

In engineering, on the other hand, profit, though essential, is only one essential to be attained, and achievement in the successful utilization of the principles of the science of mechanics is the great object. The engineer has been trained to give primary attention to the scientific principles of design, to ingenuity in invention, to industrial organization for construction and production on the greatest scale and at the lowest cost.

In planning business training for the engineer we should not attempt to lower the great ideals of his

*Excerpted from an address delivered at the conference on "Business Training for Engineers and Engineering Training for Students of Business," Iowa State College, June 23, 1919.

profession. We should add business training to the engineer's equipment, not substitute it for engineering qualifications. We should qualify the engineer to take into account, with due weight in the solutions of his problems, the great questions of capital, labor, and profits as well as the scientific principles of engineering theory and experience. The engineer's remuneration should no longer be left to be considered as a mere item on the cost side of the books of the enterprise.

HOW TO PROVIDE SUCH BUSINESS TRAINING

There are those who believe that the problem of how to provide business training for the engineer can be solved best by creating a new branch of engineering to be called "Business Engineering," providing four-year business-engineering courses supplementary to the course in civil, mechanical, and electrical engineering. Some schools of commerce, on the other hand, offer four-year business courses in which a certain amount of engineering training is included in addition to their commerce courses.

Though not denying that they may serve useful purposes at some institutions, I do not believe that four-year combined courses of either type furnish an adequate solution of the general problem of business training for the engineer. Manifestly, only a small fraction of the engineering students, on the one hand, and the commerce students, on the other, can be expected to enroll in such courses. We already have too many special courses in engineering. The present tendency is toward broader rather than more specialized engineering training.

The only really adequate method for providing the business training now needed by engineers is to put it into the regular four-year courses, as required work, to approximately the same extent as chemistry or physics. I earnestly believe that this should be done.

The business subjects should be restricted to simple, fundamental business principles. Economic science, accountancy, business law, corporation finance, industrial organization, and business psychology are examples. These subjects may be taught wholly in the school of commerce or partly in the college of engineering, according to local conditions. If taught in the school of commerce, turning this instruction over to subordinates should not be tolerated.

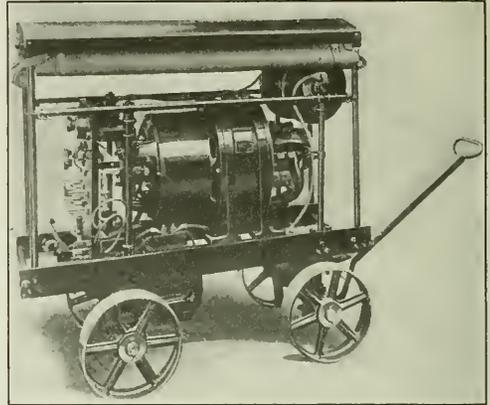

Electric Arc Welder for Portable And Stationary Use

Mounted on a Truck It Weighs 1,500 Pounds and Is
Suitable for Use Where Work Cannot Be Brought
Within 75 Feet of Apparatus

AN INVESTIGATION into the requirements of machine shops, railroads and shipyards has developed a line of electric arc welding machinery to meet the demands of various kinds of work. For use at shops where it is practicable to bring the parts to be welded to within 50 or 75 ft. of the welding apparatus, a stationary type is provided; also a light-weight portable machine is made which may be taken direct to the work.

With a rated capacity of 4 kw. the arc welder gives 200 amperes, direct current, or less, with an arc voltage of 17 to 22 volts and open-circuit voltage of 35 to 65. It is made in the form of a converter for use

on 100 to 125 volts d.c. circuits only, and in the form of a motor-generator for all other a.c. and d.c. circuits. Weighing 665 lb., the converter delivers current at the arc through the arc stabilizing reactor with an efficiency of 65 to 70 per cent. The motor-generator type consists of a $7\frac{1}{2}$ hp. a.c. or d.c. motor on the same shaft with a 4 kw. welding generator. This type is inferentially regulated, compound wound, self-excited, and with dropping voltage characteristic. Practically constant energy is produced in the arc and response is claimed to be instant when the electrode touches the work.

TRUCK USED FOR PORTABLE ARC WELDER

For portable use a truck equipped with motor-generator or converter, panel, reactor, cover and cable reel is supplied. The truck, which is 28 in. wide, 55 in. high over cover and 54 in. long, weighs with complete equipment about 1,500 lb. These welders are manufactured by the U. S. Light & Heat Corporation, of Niagara Falls, N. Y., and a catalog describing the USL electric arc welding machinery is available for distribution.

Mining in South Dakota and Wyoming

The Black Hills mining district of South Dakota produced \$6,565,209 in gold and 159,246 oz. of silver in 1918, according to the U. S. Geological Survey. From Jan. 1, 1918, to Oct. 27, 1918, the Homestake mine and mills were operated at full capacity, but during the rest of the year at only 71 per cent capacity. This property, which produces the bulk of the output of South Dakota, had not reached full capacity in June, 1919. The Golden Reward mines and mill, closed in 1918, have not resumed operations. The Trojan and the Mogul mills have both been operated in 1919. The production for the state in 1919 will apparently not equal the production in 1918.

Mines in Wyoming produced 7 oz. of gold, 253 oz. of silver, and 754,324 lb. of copper in 1918. The shipments of silver-copper ore from the Sunrise mine, near Hartville, the principal producing mine in Wyoming for several years, have not been continuous in 1919. A mill has been built to treat the dump ores of the old Ferris-Haggerty mines (long idle) at Encampment. The Rambler copper-platinum mine at Holmes has been idle in 1919.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Suspension of Assessment Work

No suspension of annual assessment work on mining claims is to be granted to any one claimant for more than five claims, according to a resolution of Representative Hawley, of Oregon, which will be reported favorably by the House Committee on Mines and Mining. Mr. Hawley's resolution originally did not contain the limitation, but after extensive hearings the committee made the amendment referred to and also struck out the provision that the resolution is not to apply to oil placer claims.

The original resolution provided for the suspension of annual assessment work during 1919, as had been granted unanimously by Congress for the years 1917 and 1918. This called forth energetic opposition from Representative Taylor, of Colorado, who insisted that stagnation in prospecting is resulting from the suspension of assessment work. He attempted to show that there no longer is reason why it should be extended. He offered no objections to the exemption of two or three claims and is fairly well satisfied with the five-claim exemption, which the committee agreed upon.

Several members of Congress, and J. F. Callbreath, secretary of the American Mining Congress, and H. N. Laurie spoke in favor of the resolution. The main argument was that the scarcity of labor would interfere seriously with going operations if a large number of men were drawn out of the industry to perform assessment work. It also was argued that under existing conditions, and with present prices, an injustice would be done the holders of claims. Mr. Laurie emphasized the serious consequences that would come to the holders of chrome claims if they were obliged to do their assessment work. He also pointed to the world's need in keeping up gold production, which, even now, is being handicapped by lack of labor.

War-Minerals Work Proceeds Slowly

Complaints are being received to the effect that settlement of war-minerals claims is being prolonged unduly. Some point to the fact that the War Department already has completed its settlement of informal contracts. The cases are not comparable. Direct contact had been made between War Department officials and those with whom informal contracts had been negotiated. The only matters remaining unsettled were formalities. In the case of the war minerals, there had been no understanding as to the purchase of a definite amount of ore or the prices which were to be paid. In all but a few cases, the Government was not consulted as to the wisdom of investments. The War-Minerals Relief Act provides restrictions which require a careful examination of each claim. As 1,200 complicated and intricate claims have had to be examined and an opportunity offered for the claimants to be heard in person, it can be seen that considerable time is necessary.

Every effort is being made to speed up procedure

in the handling of claims. A year has been set as the extreme limit for disposing of the entire work of the commission. The task of that body has been made somewhat lighter as the result of the opinion of the Attorney General. It will eliminate a considerable portion of the claims from any consideration whatever.

An analysis of claims made by the American Mining Congress, which covers about 95 per cent of all claims filed, is as follows:

Alabama: 4 manganese, \$100,225.26; 4 pyrites, \$253,445.80; total, \$353,671.06. Alaska: 1 chrome, \$54,855.67. Arizona: 27 manganese, \$239,785.90; 8 tungsten, \$53,188.38; total, \$292,974.28. Arkansas: 100 manganese, \$1,017,855.52. California: 397 chrome, \$1,692,646.20; 94 manganese, \$523,747.54; 1 pyrites, \$6,894.34; 22 tungsten, \$710,963.57; total, \$2,934,251.65. Colorado: 65 tungsten, \$607,065.35; 21 manganese, \$129,962.79; 1 chrome, \$38,859.18; 7 pyrites, \$671,595.40; total, \$1,447,482.72. Delaware: 1 chrome, \$20,000. Georgia: 17 manganese, \$315,055.60; 11 pyrites, \$1,478,065.84; total, \$1,793,121.44. Idaho: 2 manganese, \$19,909.50; 1 pyrites, \$3,638.75; total, \$23,548.25. Kentucky: 1 chrome, \$19,597.89. Maryland: 1 chrome, \$55,049.04. Missouri: 1 pyrites, \$14,689.66. Montana: 35 manganese, \$426,273.53; 6 chrome, \$48,639.35; 3 pyrites, \$6,800; 1 tungsten, \$2,950.84; total, \$484,663.72. Minnesota: 10 manganese, \$1,417,629.42. New Mexico: 12 manganese, \$178,746.71. New York: 1 pyrites, \$500. Nevada: 32 tungsten, \$312,824.56; 24 manganese, \$140,892.56; total, \$453,717.12. North Carolina: 5 chrome, \$54,766; 4 manganese, \$2,540.34. Ohio: 1 pyrites, \$203,302.42. Oregon: 95 chrome, \$426,310.09; 16 manganese, \$276,591.72. Pennsylvania: 4 chrome, \$84,233.51; 2 tungsten, \$24,070.51; 1 manganese, \$482.40. South Dakota: 1 manganese, \$1,281; 1 tungsten, \$1,000. South Carolina: 2 manganese, \$22,697; 1 pyrites, \$114,011.07. Tennessee: 34 manganese, \$287,467.90; 1 pyrites, \$1,660.38. Texas: 2 manganese, \$6,377. Utah: 13 manganese, \$88,701.18; 3 tungsten, \$8,435.64; 1 pyrites, \$2,186.50; total, \$99,323.32. Virginia: 34 manganese, \$1,875,109.84; 3 pyrites, \$7,586.88; total, \$1,882,696.72. Vermont: 1 manganese, \$3,342.59. Washington: 5 chrome, \$22,948.45; 2 manganese, \$36,000; total, \$58,948.45. Wyoming: 2 manganese, \$38,828.60; 1 chrome, \$38,858.18; total, \$77,687.78.

There are claims from American producers operating outside of the United States as follows: Cuba: 4 manganese, \$765,983.70; 1 chrome, \$25,902.53; total, \$791,886.23. British Columbia: 2 manganese, \$22,736.32; 1 chrome, \$11,604.21; total, \$34,340.53. Mexico: 1 manganese, \$7,931.67. Total foreign claims, \$834,158.43.

All war relief claims may also be divided as follows according to the mineral involved: Pyrites, \$2,764,377.04; manganese, \$7,946,155.59; chrome, \$2,594,271.30; tungsten, \$1,720,498.85.

Freight Rates on Ore Shipments

The practice of stating rates on iron ore in short tons, instead of long tons, has been held by the Interstate Commerce Commission not to be unreasonable or otherwise unlawful.

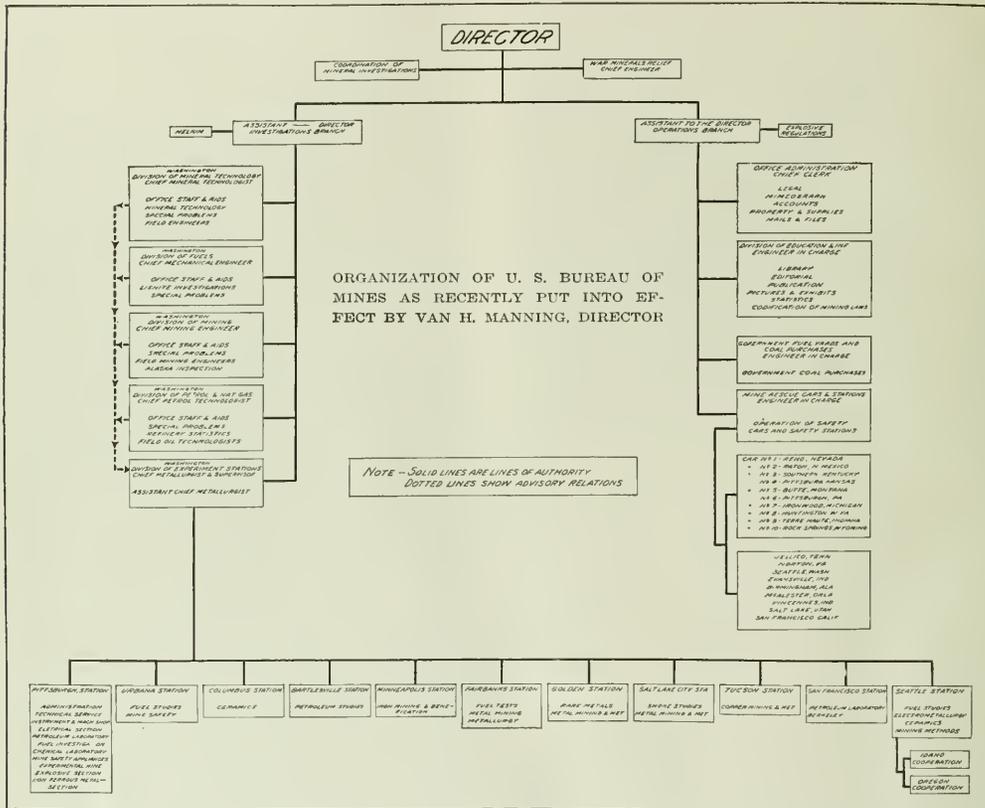

Application has been made to the commission for permission to cancel rates on ore and bullion, in carloads, from Butte, Mont., to Greenwood and Trail, B. C., and on ore and concentrates from Butte and Anaconda to Salida, Col. The reason given is that no shipments are made under these rates.

Bureau of Mines Reorganized

Taking advantage of the lessons in administrative organization which were taught by the war, Van. H. Manning, director of the U. S. Bureau of Mines, has put into effect a new form of organization in the Bureau. This has been divided into two branches, one the investigations branch and the other the operations branch. F. G. Cottrell, who has been chief metallurgist of the Bureau, has been promoted to the position of assistant director and will be in charge of the investigations branch. F. J. Bailey, who has been chief clerk of the

The operations branch has as its subdivisions the office of the chief clerk, which will be presided over by H. E. Meyer; the division of education and information, with T. T. Read in charge; Government fuel yards and coal purposes, with G. S. Pope in charge; mine rescue cars and stations, with D. J. Parker in charge.

One of the very important divisions is that of experiment stations. The stations under the direct charge of Mr. Lyon, with their respective directors, are as follows: Pittsburgh station, E. A. Holbrook; Urbana station, C. A. Herbert; Columbus station, R. T. Stull; Bartlesville

Bureau, has been placed in charge of the operations branch, with the title of assistant to the director.

All research and technical control will be exercised through the investigations branch. The non-technical work, administrative duties, and dissemination of the results of the Bureau's activities will be handled by the operations branch.

Under the investigations branch comes the division of mineral technology, in charge of Dr. C. L. Parsons; the division of fuels, under the chief mechanical engineer, O. P. Hood; the division of mining, under the direction of George S. Rice, the chief mining engineer; the division of petroleum and natural gas, under the direction of J. O. Lewis, the chief petroleum technologist, and the division of experiment stations, under the direction of Dorsey A. Lyon.

station, W. P. Dykema; Minneapolis station, C. E. Julihn; Fairbanks station, J. A. Davis; Golden station, R. B. Moore; Salt Lake City station, Thomas Varley; Tucson station, C. E. Van Barneveld; San Francisco station, L. H. Duschak; Seattle station, F. K. Ovitz. A. E. Wells has been made assistant supervisor of stations.

War Departments' Metal Sales

Sales of non-ferrous metals and scrap made by the War Department up to July 4 aggregated \$18,274,886. The original cost of materials which were sold for the above figures was \$23,680,256. Total sales up to July 4 of surplus supplies of chemicals, acids, and explosives amounted to \$31,861,853. The original cost of those commodities was \$33,043,432.

Meeting of the San Francisco Section of the A. I. M. E.

Members Hear an Important Address on the Creation of a National Department of Public Works by Philip N. Moore, at the Engineers' Club

ON THE evening of July 22, the San Francisco Section of the American Institute of Mining and Metallurgical Engineers held its regular monthly meeting at the Engineers' Club. The guest of the evening was Philip N. Moore, a member of the Minerals-Relief Commission, which completed its work in San Francisco on July 26. In the absence of F. W. Bradley, who is in Alaska, T. A. Rickard acted as chairman and introduced Mr. Moore.

The subject of the evening's address was "New Conditions and Opportunities Confronting the Engineer." Mr. Moore commented on engineering organizations and the tendency of such organizations to become narrow and self-centered. The need for a greater service and more direct contact with engineers on the part of the national engineering societies was emphasized. The formation of the Engineering Council and its rapid growth were described, as well as the work of the National Service Committee, which is keeping in touch with and informing engineers of all national legislation affecting their interests.

The present unsatisfactory condition of governmental engineering service, which is divided among many Government departments, with the result that there is much duplication of effort and consequent loss of efficiency, was brought to the attention of the members by Mr. Moore. Enumeration of the efforts to remedy this condition by the creation of a department of public works, a bill for that purpose having been introduced in both the Senate and the House, and a statement concerning the work of organizing the engineering societies in support of this bill, concluded the address, which was listened to with more than ordinary interest.

After a short discussion and the answering of a number of questions concerning the purpose of the department of public works, the following resolution was circulated and signed by the members present:

We, the undersigned engineers of San Francisco, having read the text of the bill for the creation of the department of public works, desire to express our hearty approval of the measure:

W. H. Shockley
Geo. J. Young
F. H. Probert
T. A. Rickard
W. Burns
Augustus Locke
Clifford F. Dennis
C. N. Schuette

D. H. Harroun
Arthur W. Jenks
Wilbur H. Grant
F. W. Varney
Albert A. Alslip
Fred Corkill
Arthur Jarman

Mr. Moore has recently delivered addresses on the need of organization to voice engineering opinion upon public questions, one of which, on "The Engineer in Civil Life," was delivered at the engineers' symposium held in New York City on Mar. 26.

The Journal Index

The Index for Volume 107 (January to June, 1919) of the *Engineering and Mining Journal* will be mailed with this issue. Any subscriber not receiving a copy of same should notify the Subscription Department at once.

Exposition of Chemical Industries

Recent Developments in Electric Furnaces, Measuring Instruments and Plant Installations—Meeting of the A. I. M. E.—Papers on Many Subjects

THE forthcoming National Exposition of Chemical Industries at the Coliseum and the First Regiment Armory, Chicago, during the week of Sept. 22 to 27, inclusive, will illustrate in a striking manner the recent developments in the metallurgical industry, principally the advances stimulated by the demand for production during the war.

A noteworthy feature of the exposition will be the number of electric-furnace exhibits. The activity of the war period produced an increased interest in metals, not only in new alloys and in treatment of metal but in the method of manufacture. On exhibit will be the Rennerfelt furnace, Hamilton & Hansell, American agents; the Baily Furnace, shown by the Electric Furnace Co.; the Taylor furnace, by the Industrial Electric Furnace Co.; the Detroit rocking furnace, by the Detroit Electric Furnace Co., and the furnace of Booth, Hall & Co. In the metal department there will be exhibits of acid- and alkali-proof bronzes that are prepared for specific purposes—bronze of sush hardness and strength that instruments made of it are used to cut chilled steel—and other metallic compositions the development of which could not properly be made known until now.

The advance of electrochemistry, particularly as related to electric steel, brass, bronzes, and the furnaces used, has created a broader interest than in the strictly electrochemical field, and the American Institute of Mining and Metallurgical Engineers will hold a joint meeting with the American Electrochemical Society on Sept. 24 to discuss electric steel and electric furnaces. In the evening after the meeting a program of motion pictures upon various phases of electric furnaces in their operation will be shown. On Sept. 26, a joint session on the subject of pyrometry will probably be held. The U. S. Bureau of Mines will have on exhibit about thirty metals, showing the complete course of extraction from their ores and the various materials used in each process.

The numerous instruments, devices, and apparatus that have been perfected during the intense war period for precise measurements of temperature, weights, volumes, velocities, flow of liquids, gases, solids, electric current, and any and all kinds of commodities that are to be measured will occupy a large amount of space. Prominent among plant exhibits will be those of conveying systems, elevating systems, weighing and measuring devices, tiering and stacking machinery, as well as hoists and cranes.

The interest of manufacturers and large companies in the health and welfare of workers in plant, factory, and mine has led to the introduction of numerous devices for the protection of parts of the body, for use in the chemical, gas, electric, metal-smelting, mining and manufacturing industries. The protection of the eyes by goggles and shields, the breathing apparatus by masks, hoods, and breathing pieces, and prevention of accidents by signals and devices will be illustrated. The U. S. Bureau of Mines will feature its safety work in

the plant and the mine, and in connection with this a special program is being arranged under the chairmanship of M. F. Leopold, safety engineer of the Bureau.

In addition to the technical papers, there is also being arranged a program of speakers and motion pictures by the exposition managers, which will include men of national prominence.

Many exhibitors will bring moving picture films now being prepared. The U. S. Government is making numerous technical subject films through the Bureau of Mines, embracing all of that Bureau's work, and these will be shown for the first time. The Bureau of Commercial Economics at Washington is again co-operating with the exposition in equipping it with some films now being made. The Bray Studios are preparing several films in which they will show drawings, taken in such rapid sequence as to seem in motion, that illustrate the manner and conduct of chemical action and reactions usually invisible to the eye and conceived only by the mind in abstract form. The showing of these films will be elaborated and discussed by James Handy, vice-president of Bray Studios.

The titles of some of the films are: "Continuous Motion Conveying, Stacking, Elevating, Loading, and Unloading by Brown Portable Handling Machines" (courtesy Brown Portable Conveying Machinery Co.). "Resistance Type Furnace for Melting Non-Ferrous Metals" and "Electric Furnaces in the Heat Treatment of Essential War Materials" (courtesy of Electric Furnace Co.). "The Detroit Rocking Electric Melting Furnace in Operation" (courtesy Detroit Electric Furnace Co.). "Shawinigan Power Development and the Shawinigan Industries" (courtesy Shawinigan Water & Power Co.). "The Manufacture of Zinc Oxide" (courtesy New Jersey Zinc Co.). "Operation of Koppers By-product Coke Plant" (courtesy The Koppers Co.). "Chemistry in Munitions," "Invisible Chemistry of the Electric Battery," "Invisible Phases of Crystallization," "Formation of Coal Made Visible," and "Chemistry of Gas Engines Made Visible."

The managers of the exposition, Charles F. Roth and Fred W. Payne, have established headquarters in the Chicago office at 417 South Dearborn St.

Chicago Meeting of the A. I. M. E.

Steamer To Be Chartered for Excursion to Gary, Ind.—
 Technical Session To Be Held While En Route—
 Entertainment Provided for the Ladies

THE Chicago meeting of the American Institute of Mining and Metallurgical Engineers will be held on Sept. 22 to 26, as previously announced. Among the subjects to receive particular attention will be the iron and steel industry, which has reached such importance in Chicago. It is planned during the meeting for the Institute to make an excursion in a body to Gary, Ind. Arrangements are being made to charter a steamer, which will convey the members and guests across the south end of Lake Michigan, directly to the steel works. A tour will be made through the various departments of the steel plant, and luncheon will be served at Gary. Technical sessions on subjects in ferrous metallurgy will be held on the boat.

The banquet has been scheduled for the evening of Wednesday, Sept. 24, at the Congress Hotel. By putting this function in the middle of the week, it is ex-

pected that a maximum attendance can be obtained. Members able to come for only a portion of the session can then be present at the banquet, whether they come for the first or latter part of the week. An elaborate program for the entertainment of the ladies is being prepared.

Legislation Affecting Mining

WASHINGTON CORRESPONDENCE

A duty of \$10 per unit on crude tungsten, ores and concentrates is provided in a bill reported favorably to the House July 28 by the Committee on Ways and Means. The bill also provides that metallic tungsten, tungsten powder, ferrotungsten, ferrotungsten powder, commercial tungsten acid, calcium tungstate, sodium tungstate and all other salts of tungsten and other manufactured materials containing tungsten shall pay \$1 per pound of tungsten contained therein.

The bill was reported out in exactly the same form as it was introduced by Representative Timberlake, of Colorado. The vote in committee was along party lines, with the exception of Representative Martin, Democrat, of Louisiana, who voted with the Republicans.

The bill providing high rates of duty on laboratory glass and porcelain ware, optical glass, scientific and surgical instruments was also reported favorably. The magnesite bill was discussed, but no agreement was reached by the committee. The potash bill was not taken up.

It has developed that the Tariff Commission is opposed to administering any licensing system. It came to the knowledge of the commission that it had been suggested as the proper body to administer the licensing machinery, and the result was that the commission not only reiterated its opposition to most of the licensing suggestions, but emphatically urged that it not be selected to administer any of the licenses.

Operations at Guanajuato, Mexico

GUANAJUATO CORRESPONDENCE

New capital appears to be interesting itself again in the Guanajuato district of Mexico. It seems safe to say that this camp, formerly one of the greatest producers of silver in the world, will experience another era of prosperity, whether or not intervention occurs. Much interest is being manifested in the coming gubernatorial election, there being two candidates for the office, one Antonio Madrazo, a mining engineer of Laon, Guanajuato, and the other General Frederico Montes, of Irapuato, who holds a commission in the Carranza army. The election promises to be close, as public favor seems to be rather evenly divided.

Owing to the heavy rains that have fallen incessantly during the last month, work has been greatly hampered in the district, the rainy season being the heaviest in ten years. New and more extensive operations are contemplated by the Guanajuato Development Co. at Guanajuato and in outlying districts. Change in the directorate of this company and its subsidiaries, the Peregrina Mining & Milling Co. and the Pinguico Mines Co., was effected on June 12. George W. McElhiney succeeds Willard P. Reid as president. The other officers are P. E. Sharpless, vice-president; Wright Johnson, vice-president and secretary, and W. H. Porter, treasurer. No change in the

management of the mines at Guanajuato will be effected, Keith A. Cunningham still acting as general manager. The New York office of this company is at 50 Broad St.

The Peregrina Mining & Milling Co. is planning to install rock drills, owing to the shortage of labor, which is caused by the natives leaving to plant corn and their reluctance to work in wet stopes caused by the heavy rains.

Construction work on the new 15-stamp mill being erected by the United Mines Co. at Melladito, in La Luz district, has been retarded by the inability to haul freight from Guanajuato as rapidly as heretofore. The road was recently put in fine condition, but wash-outs caused by the rains have made transportation difficult. It is expected that this mill will be operating in the very near future. Joseph MacDonald is general manager.

At Santa Rosa, the Cia. Metallurgica de Santa Rosa is erecting a 15-stamp mill at its Durazno mine, which is expected to be in operation soon. This company is owned and managed by Mexicans, Andre Villafañá being general manager.

The Coal Situation

No Investigation Likely Unless the Prices Jump—
Heavy Buying Expected in Fall—Delay in Ordering May Cause Inconvenience

WASHINGTON CORRESPONDENCE

AS IT IS too late for a coal investigation to do anything but harm, as far as next winter's situation is concerned, it is likely that the matter will be dropped. The Rules Committee of the House already has indicated that the charges made at its hearings are matters for the attention of the Department of Justice. The Senate committee will probably take the same view.

If, however, there should be a decided increase in the price over the present level, there may be a Congressional investigation. The principal influence which worked against a complete investigation at this time was the fear that the public would expect lower prices and would hold off buying.

Domestic stocks in the cities are normal, but in the Middle West and Northwest householders have not as yet laid in their supplies. Large consumers have been buying coal all summer on a hand-to-mouth basis. This includes the railroads. About the time the car shortage, exaggerated by grain movement, becomes most acute, the big consumers will start to buy. Exports will be somewhat heavier, and it is predicted that householders who wait until autumn will have difficulty in securing their supplies. Even in the cities there is a tendency on the part of the public to take chances on another mild winter. If the coming winter should be severe, there will be widespread inconvenience and suffering. If it is mild, there will be no difficulty in meeting coal demands.

Bituminous coal in the ground is plentiful and too widely distributed to make it possible for any group to dominate it. In anthracite the price has reflected the heavy interest and tax charges which must be met by the companies who are holding land for future development. It hardly seems fair that the consumer should pay for the expenses of carrying undeveloped

land—but that is another story. Anthracite will probably be available in practically normal amounts next winter. The bituminous situation may possibly not be as alarming as some may have assumed. However, the advertisements and warnings of the National Coal Association are justified and entirely legitimate. The increase in coal prices is not as great as it has been in the great bulk of commodities.

There is much confusion in the bituminous market, which is the cause of much disparity in prices. Railroad bids on the same coal at the same point of delivery vary from \$1.65 to \$2.50. The same grade of coal was sold in St. Louis week before last at prices varying from \$1.15 to \$2.65.

July Mining Dividends

Disbursements to stockholders in July, 1919, by eighteen United States mining and metallurgical companies making public reports amounted to \$5,705,274, compared with \$5,765,456 distributed by thirty companies in July, 1918. Canadian, Mexican, and Central American companies paid \$1,715,575, as compared with \$864,342 a year ago.

The totals for the first seven months of 1919 are as follows: the 1918 figures being given in parentheses: United States mining and metallurgical companies, \$55,745,066 (\$95,528,466); Canadian, Mexican, Central, and South American mines, \$9,775,856 (\$10,584,028); holding companies, \$900,005 (\$1,066,866).

Italian Imports in 1918

According to *La Metallurgia Italiana*, reprinted in the *Ironmonger*, imports of the principal ores and metals into Italy in 1917 and 1918 were as follows:

	1918, Metric Tons	1917, Metric Tons
Iron ore	1,951	313
Manganese ore	5,452	21,538
Lead ore	5,478	4,838
Copper ore	404	467
Pig iron	115,211	315,953
Steel ingots	5,411	42,894
Aluminum and alloys	5,008	3,996
Nickel and alloys	3,215	3,293
Lead and antimony	45,165	32,372
Copper, brass and bronze	80,533	93,640
Tin and tin alloys	2,241	3,266
Zinc	10,749	19,383

BY THE WAY

Pay Today, Trust Tomorrow

The Department of State has been advised by the American Embassy at Mexico City, as well as by the Mexican Ambassador to the United States, Mr. Bonillas, that the Mexican government will authorize the temporary boring of oil wells provided the interested parties apply to the Department of Industry and Commerce for such permits under the formal promise that they will be subject to legislative regulations that may be enacted in the future by the Mexican government. The Department of Industry and Commerce is to issue at once a circular "relative to this matter."

Pike's Peak Without Busting

Bucking snow drifts for the last two miles at an altitude above timber line, climbing steep grades and rough places where only Dr. Cook would feel perfectly safe, a five-ton caterpillar tractor gained the summit of Pike's Peak on June 16 and had its picture taken. Rather cold for most caterpillars to be out, but not for this one! Having seen what was on the other side of the mountain, like the bear of song and story, it went back to Denver on June 17, after running 235 miles.

A CATERPILLAR ON PIKE'S PEAK

The Origin of the Tank

The cause and origin of the tank was Hugh F. Marriott, president last year of the Institution of Mining and Metallurgy. So said Major General E. D. Swinton at the Institution's dinner on Apr. 10 last in London. General Swinton's remarks are reported in the society's *Bulletin* in part as follows:

In July, 1914, Mr. Marriott wrote to him from Antwerp—where his job at the moment was trying to find out some cheap and efficient form of transport across rough country for mining purposes. He knew all about rope railways, telpherage, narrow-gauge railways, and so on, and informed him that in Antwerp he had seen an American caterpillar tractor which would go over rough country and "climb like hell." This, it must be remembered, was before the war. He (General Swinton) was able to go to the War Office and the Admiralty and tell the people concerned that there was an American tractor in Antwerp which would, in the words of his friend, "climb like hell," and that it was up to them to investigate it for tractive purposes. The machine referred to was the Holt tractor. Shortly after that

he had gone out to the war, as a journalist, and his position gave him an opportunity of seeing and learning a lot. It was then that he became convinced that a machine which could "climb like hell" was a thing not to be lost sight of, and if it could be developed or improved into a bullet-proof machine that could climb "to beat hell" they had something which might meet the German machine guns.

Mr. Marriott replied that had it not been for General Swinton's initiative and determination in the face of inertness and opposition to push the idea of that caterpillar tractor, together with the details of construction which were essential for its success, he did not believe that the British would have had a tank in action.

"Speaking of Operations"

"I 'as mentioned tha fac' befor that this 'ere physical h'examination be a gert thing, m'son," said Cap'n Dick. "Dam-me, there be many o' tha minin' companies 'ave un naow, an' tha practus seems to work h'out 'andsome. There h'often be them 'ookem-snivey rascals 'o is lookin' for some chance to do tha company, an', dam-me, this 'ere seems to be one way to beat un. Then there be they chaps 'o look 'ale an' 'earty, an' in troth they be nothin' but a bloody shell, an' firs' thing tha super naws 'e's payin' h'out 'alf-time wages for sumthin' that's no bloody fault o' tha company's at all. Speakin' o' this physical h'examination reminds me o' tha story baout Jimmy Trebilcock. Jimmy, 'e decided some time h'ago that 'e would take h'out some life h'insurance, so h'up 'e gaws to see one o' they doctors an' 'ave un gaw h'over 'e. Tha doctor 'e geeks Jimmy from 'ead to foot, an' then 'e starts soundin' 'im with one o' these 'ere stethoscopes. After 'e gets h'all through, 'e says to Jimmy, 'Tha h'only thing I can fin' wrong is that thee seems to 'ave some h'organic trouble.' 'What's that?' says Jimmy. 'I says thee seems to 'ave some h'organic trouble,' repeated they doctor. 'Oh, gos along,' says Jimmy, 'thee mus' be wrong baout that. There's nothin' musical baout me.'" D. E. A. C.

Separations, Limited

"Aha, Bill," said the shift boss, as he retrieved his tobacco pouch; "so ye do not favor Separations Limited." "Thanks to recint decishuns av the coorts," replied the thick-skinned borrower, "this here siparayshun av the laborin' man an' his pleasure is goin' beyond the limit. Aftther the byes took to warin' thim buttons that sez 'may we not have our beer?' it looked like we might get to the root av things on a 'percentage decishun. Some fellies contind that with less than 2.75 percent av the necess'ry ingrejint, a good froth is had, and the gang is depressed accordin' to spificayshuns av the killjoys. On the other hand, the bluenoses contind that while a good froth may be had without elevatin' the spirits and that froth may be had at almost anny fraction av the stated percentage, nivertheless it is not the froth alone that is claimed to do the work; but rayther the idea av a percentage av admixture, av which idea the froth was a symbol and constituted, with the aid av the risin' bubbles of gas, a definite means av evadin' the patent fact that the whole object av the aminded process was to prevint anny elevayshun of the spirits; an' that the depresshun av the gang was merely incidental an' not to be regarded as anny fundamental part av the process an' not particularly desirable except as it contribbtyed to the reduction av conviviality, an' thus assisted the major function av the perfected process. An' now, Mister Clancy, I'll trouble ye for a match."

PERSONALS

J. LEONARD REPLOGLE, who was Steel Director of the United States and responsible for the allocation of steel supplies during the war, has been recently made a Chevalier of the Legion of Honor by the French government in recognition of his services.

J. LEONARD REPLOGLE

Photograph from Underwood and Underwood, N. Y.

Mark L. Requa is again in the East after an extended trip through the West.

W. Parsons Todd, vice-president of the Quincy company, visited the property last week.

Leon M. Hall has opened offices as a consulting engineer at 7434 Call Building, San Francisco.

M. O. Carlson, recently mining engineer with Burma Mines, Ltd., Burma, India, has returned to Denver, Col.

Kirby Thomas is making an examination of chrome and asbestos properties at Black Lake and Danville, Quebec.

H. E. Beauchamp, of Douglas, Ariz., is making examinations in the Virginia and Gold Hill districts, near Lordsburg, N. M.

W. Jacobson, of Toronto, Ontario, has taken charge of the developments on the Ross lot for asbestos and chrome at Black Lake, Quebec.

Ralph V. Davies has accepted a position in the technical control department of the Aluminum Co. of America, New Kensington, Pa.

Bennett Bates, representative of the Dorr Co., is visiting the principal mining districts of southern Mexico on business for the company.

Joseph S. Qualey, of New York, president and general manager of the Matachewan Gold Mines, of northern Ontario, is on a visit of inspection to the property.

F. G. Cottrell, who has been studying the mineral situation in Europe, will return to Washington about the middle of August to assume his new duties in connection with the Bureau of Mines.

Douglas D. Moffat, consulting engineer for the Jackling mills, is in Salt Lake City. Mr. Moffat was superintendent of the Ray Consolidated mill at Hayden, Ariz.

Hubert C. Field, one of the directors of the Guanajuato Development Co., is in Guanajuato investigating matters relative to new operations contemplated by his company.

W. R. Crane, of the mineral commission, Washington, has been making an examination of the chrome and manganese deposits in the vicinity of Black Lake and Coleraine.

John L. Church has returned to civil life after serving for 18 months as a captain in the engineer corps. Captain Church has opened an office in Kohrs Block, Helena, Mont.

Henry Leighton, professor of economic geology, University of Pittsburgh, has returned from a month's investigation of mica and feldspar mines in North Carolina and Georgia.

Robert Harvie, geologist, and **Eugene Pointin**, mineralogist, from the Department of Mines, Ottawa, are continuing their investigations of the serpentine belt in the Thedford district.

N. Palmer, formerly manager of the Worthington nickel mine, Sudbury, Ontario, has been appointed general superintendent of the Black Lake Asbestos and Chrome Co., of Black Lake, Quebec.

Adolph Lewisohn was presented with a large silk American flag by Mayor Hylan at one of the series of People's Concerts in Central Park, New York, in recognition of his musical gifts to the public.

L. W. Ledyard has resigned his position as manager of the Beaver Consolidated property in the Cobalt district and the Kirkland Lake gold mine, and will take up his residence in the Southern States.

A. G. Burrows and **Cyril Knight**, of the Ontario Bureau of Mines, are making geological surveys for a map embracing the Kirkland Lake, Boston Creek, Larder Lake, and Skead Township gold areas.

Henry P. Smith, general manager of the Guanajuato Reduction & Mines Co., Guanajuato, Mexico, is at the present time in Los Angeles, Cal. Mr. Smith will return to Guanajuato in the early part of August.

F. C. Wallower has returned to Joplin after attending the Rotary convention at Salt Lake City and visiting some of the larger mining properties in Idaho. Mr. Wallower is manager of the Golden Rod Mining & Smelting Co.

Arthur Thacher, western manager of the New Jersey Zinc Company, with headquarters at St. Louis, made his second visit to the Joplin-Miami district and attended the weekly meeting of the

Tri-State branch of the American Zinc Institute at Picher on July 23.

Arthur Lakes, Jr., mining engineer, has returned from service in France and rejoined his firm of Larson & Lakes at Spokane. Mr. Lakes was promoted to major while in charge of administration, transportation, and construction at Neufonateau.

F. J. Bailey, of the U. S. Bureau of Mines, has been promoted to assistant director of the Bureau of Mines, and **H. E. Meyer**, who has been secretary for the Minerals-Relief Commission, at present in San Francisco, has been promoted to chief clerk of the Bureau of Mines.

T. D. Jarvis, pathologist of the International Nickel Co., Copper Cliff, Ontario, left recently on an extended trip through the West to study the smeltery-smoke problem and its effect on vegetation. His itinerary includes Salt Lake, San Francisco, Anaconda, and Seattle.

N. O. Lawton, general superintendent of the Vermont Copper Co., South Strafford, Vt., is at Pilleys Island, Newfoundland, superintending diamond drilling at the old Pilleys Island mine to explore for the extension of the vein. Mr. Lawton was manager of this mine 13 years ago.

Zach Lamar Cobb, formerly collector of customs and agent of the Department of State at El Paso, Tex., and thereafter attached to the War Trade Board at Washington as adviser on Mexico, announces that he has resumed the practice of law, with offices in Anson Mills Building, El Paso, Tex.

HARRY J. WOLF

Harry J. Wolf, for a number of years a practicing mining engineer with headquarters in Colorado, and professor of mining in the Colorado School of Mines, has become associated with the *Engineering and Mining Journal*, as assistant editor. Mr. Wolf was formerly secretary of the Colorado Scientific Society and his report for the year ended Dec. 18, 1918, has just been published.

MINING SCHOOLS

Cambridge University has received the gift of \$1,050,000 from British oil interests which have united in a scheme for endowing a chemical school at this university. The *London Daily Mail* states that the donors are the Burmah Oil Co., the Anglo-Persian Oil Co., and the Anglo-Saxon Petroleum Co., which give \$250,000 each; Lord Cowdray and Clive Pearson, who give \$125,000 each, and Mr. Deterding, who personally contributes \$50,000.

INDUSTRIAL NEWS

Sprague Electric Works of the General Electric Co., New York, has issued a pamphlet descriptive of Sprague electric ozonators for cold-storage warehouses.

A. H. Simpson Co., dealers in used mining machinery, announce the removal of their salesroom and general offices to 129 Fremont St., San Francisco, Cal.

Chicago Pneumatic Tool Company announces the appointment of N. S. Thulin as special railroad representative on the staff of S. C. Sprague, manager of western railroad sales.

McKiernan-Terry Drill Co., 15 Park Row, New York, has published a bulletin describing three sizes of rotating hammer drills. Sizes F-2 and F-44 are furnished with a water-feed attachment for allaying the drill dust.

United Filters Corporation has recently established a sales office at 35 Montgomery St., San Francisco, Cal., under the direction of the Western Steel & Engineering Corporation. In addition to this office, the company's activities on the West Coast are also taken care of by Kennard & Bierce, of Los Angeles, and the United Iron Works, of Spokane, Wash.

International Motor Co. has distributed a five-page circular by R. E. Fulton, vice-president, in which a comparison is given of the cost of handling freight by motor trucks and railways. A table is included giving relative costs for each kind of transportation between New York and a number of important Eastern localities. A number of other details, including weight of moisture carried by boxes, delivery time and working days and miles per year, are discussed.

Armstrong Cork and Insulation Co., Pittsburgh, Pa., has issued a pamphlet with a circular insert entitled "Saving 63 per cent of the Drinking-Water Expense," and devoted to a discussion on modern drinking-water systems which maintain a palatable temperature, eliminates the use of the drinking cup, and claim a reduction in cost of supplying

drinking water to workmen from \$5 to \$1.82 per man per year, according to milling plant records. The company has published a 48-pp. book on the subject "Drinking-Water Systems," which will be sent free upon request.

Sullivan Machinery Co., Chicago, Ill., announces the resignation of Phillips F. Jarvis as sales manager for the territory controlled from its St. Louis office. The following appointments have been made: Marion C. Mitchell, sales manager in Indiana and Illinois, previously controlled from the St. Louis office, with temporary headquarters at Railway Exchange, St. Louis; Don M. Sutor, formerly manager of the El Paso office, sales manager for western Kentucky, western Tennessee, Missouri, Arkansas, Oklahoma and Kansas (except the oil territory), with headquarters at Railway Exchange, St. Louis; Daniel H. Hunter, sales manager for Louisiana, Texas (except the southwestern section), and the oil fields of Oklahoma and Kansas, with headquarters in Dallas, Texas.

Thompson Starrett Co. has published a brochure containing a number of pictures of the accomplishments of the company since its organization about eighteen years ago. This company organized the Chile Exploration Co.'s construction department, and, in the earlier stages of the construction of the reduction plant in South America, acted as advisory contractor. One illustration shows some parts of a larger construction program originally planned but temporarily restricted by the great war. The cost was \$20,000,000. The Thompson Starrett Co. has executed a total of over 400 contracts, involving a grand total of more than \$300,000,000, of which 52 were over one million dollars, 22 in excess of five millions, 7 in excess of ten millions, and one exceeding sixty-five millions of dollars.

TRADE CATALOGS

Texaco Petroleum Products. The Texas Co.; 9½ x 12; 46 pp.; illustrated. Descriptive of the lubricants manufactured by the company, and their uses.

Hammer Drills. Sullivan Machinery Co., Chicago. Pamphlet 118, 3½ x 5½; 32 pp.; illustrated. Descriptive of Sullivan hammer and rock drills, in which is shown and described a drill for every kind of rock excavation in mine, quarry or on public work. Various types of compressors manufactured by the company are also described.

Soot Cleaners. The Vulcan Soot Cleaner Co., Du Bois, Pa. Bulletin No. 541; 8½ x 11; 8 pp.; illustrated. Describes the Vulcan patented diagonal method for cleaning soot from tubes of horizontal water tube boilers. A discussion on "The Cost of Vulcan Cleaners and an Analysis of Their Value as Investments" is included.

Crushing Rolls. Allis-Chalmers Manufacturing Co. Bulletin 1,816; 8 x 10½; 15 pp.; illustrated. Descriptive of various designs of rolls which have been manufactured for many years. Tables of dimensions are included. Bulletin 1,817 is devoted to the care and upkeep of crushing rolls; also data for the determination of sizes of feed, speeds, and capacities.

Ruth Laboratory Testing Flotation Machine. The Mine & Smelter Supply Co., Bulletin 57; 6 x 9; 8 pp.; illustrated. Descriptive of a laboratory flotation machine which is manufactured in two sizes called Junior and Type "X," 6 in. The Junior will treat a charge of one kilo, and Type "X" will handle about 10 lb. The smaller type has a glass front and weighs, with stand, 115 lb.; the larger weighs, with stand, 165 lb. Both types are composed of a single cell having an anti-swirl plate, and are furnished either with or without a motor.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c each.

Aluminum. Process for Securing Metals From Their Compounds. Victor M. Weaver, Harrisburg, Pa., assignor to Weaver Co. (U. S. No. 1,297,946; Mar. 18, 1919.)

Aluminum Alloy. Archibald O. Mason, Chicago, Ill. (U. S. No. 1,305,300; June 3, 1919.)

Aluminum Alloy. Henry C. Kirk, Roland Park, Md. (U. S. No. 1,305,551; June 3, 1919.)

Bins—Telltale and Means for Controlling the Feed of Material to Hoppers or Bins. Charles J. Gadd, Lebanon, Pa.; Anna Eyre Gadd, executrix of said Charles J. Gadd, deceased. (U. S. No. 1,304,553; May 27, 1919.)

Briquet Machine. Swan E. Moren, Biwabik, Minn. (U. S. No. 1,306,309; June 10, 1919.)

Cables—Composition for Protecting Wire Cables, Ropes and Other Bearing Surfaces. Ephraim J. Keith, Sikeston, Mo. (U. S. No. 1,305,222; May 27, 1919.)

Conveyor Cable. Hugh F. Ellard, Gilmore, Idaho. (U. S. No. 1,305,204; May 27, 1919.)

Drill—Mine Drill. Frank Kalata, Springfield, Ill. (U. S. No. 1,305,219; May 27, 1919.)

Fuel—Feed Regulator for Powdered Coal. Hanson Thomas and John Dahlstrom, Pittsburgh, Pa. (U. S. No. 1,304,407; May 20, 1919.)

Leaching—Apparatus for Treating Solid-Bearing Solutions. Lamartine C. Trent, Los Angeles, Cal. (U. S. No. 1,307,329; June 17, 1919.)

Placer-Gold Separator, Rotary. Otto V. Bauer, Alamosa, Col. (U. S. No. 1,303,233; May 13, 1919.)

Siliceous Ores, Method of Treating George H. Wigton, Eureka, Utah. (U. S. No. 1,305,327; June 3, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief of Interest to Engineers and Operators

PORTOLA, CAL.—July 24

At the Walker Mine considerable progress has been made in the erection of the aerial tramway for connecting the mine with the Western R.R. at St. Louis Garden. This tramway has the following principle features: Length, approximately nine miles; elevation loading terminal 6,000 ft.; elevation discharge terminal 4,000 ft.; elevation high point, 7,000 ft.; initial capacity, six tons concentrates per hour; ultimate capacity, twelve tons concentrates per hour. The tramway is of the Leschen heavy-duty friction-grip type. There will be eight tension stations and 104 towers. The track ropes are to be 13-in. and 1-in. diameter of locked-soil construction, and the traction rope will be 3-in. The carriers for handling the concentrates will be of 6-cu-ft. capacity, and there will be special carriers for handling merchandise and supplies from the railroad to the mine.

RENO, NEV.—July 24

The Old Tybo Mine, 60 miles northeast of Tonopah, will be unwatered at once and developed on a comprehensive scale, according to F. W. Draper, consulting engineer and general manager of the Louisiana Consolidated Mining Co. Plans for building a smelter on the ground are also being completed. The Tybo ores contain silver, gold, lead, and zinc, the silver running quite uniformly two ounces to one per cent of lead. During the 70's the Tybo mine was extensively operated and produced several million dollars' worth of ore, the most of it being smelted, but in 1876 a 29-stamp mill was erected and treated 12,000 tons, producing bullion containing 834,000 oz. of silver and 5,050 oz. of gold. Considerable ore is now opened up in the mine. A report made by John Farish in 1910 estimated the ore to average about 217 per ton, with silver at 52c. per oz. and lead at 4c. per lb. The present operations are being financed by the sale of bonds, most of which were taken by holders of stock in the Louisiana company.

BISHOP, ARIZ.—July 24

At Bishop, an increase of 50c. to \$1 a ton in wages is to date from July 16, has been announced for copper miners in the Warren district, and for smelter employees at Douglas. According to G. N. Powell, general manager of the Copper Queen, the new scale will be on the basis of 24c. copper because of the continued high cost of living.

EL PASO, TEX.—July 24

El Paso Chamber of Commerce, through its board of directors, recently passed a resolution endorsing the National Association for the Protection of American Rights in Mexico, at the same time other chambers of commerce in that section of the Southwest were urged to pass resolutions of a similar nature.

The War Camp Community Service at El Paso has received requests from the Arizona and New Mexico asking the service to send them discharged soldiers who are machinists, mechanics, boiler makers, carpenters, tinmiths, miners and muckers. They offer to furnish transportation.

A Study of Mining Laws of various states is being made by New Mexico mining men, aided by the state mine inspector and members of the faculty of the State College near Las Cruces. An attempt will be made to secure legislation to the end that the interests of the mining industry shall be in just proportion to taxes paid by other industries.

AUSTIN, TEX.—July 23

Small Refineries dependent upon daily production from the Burk Burnett field were taken care of by one of the largest producing companies during the enforced shutdown of the northwest extension of the field. Oil speculators were hard hit.

Burk Burnett Northwest Extension was reopened July 18 by order of the railroad commission after a five-day shutdown. Investigation showed that overproduction leading to a possible break in the price of light crude oil was more feared than wastage, and as former was not considered within commission's jurisdiction it was decided the shutdown would not continue. Orders were issued on July 18 to prevent further wastage by stopping all leaks and overflows of oil.

WALLACE, IDAHO—July 24

Forest Fires have destroyed large bodies of timber on the North Fork of the Coeur d'Alene River, and are still raging. The prolonged dry spell has been especially favorable to fires, and is also making water supply for mining purposes a serious problem. There has been no rain since about June 1. As the usual dry season opens up about this time and continues until September, the outlook for relief is not encouraging.

Wages Have Been Advanced 50c. per day, effective as from July 16, by Coeur d'Alene mine companies. This restores the war-time bonus, making the wages of underground men \$5.25 per day. This increase was one of the demands made several weeks ago by the miners' union. In making the advance, the companies explain that it is due to the recent rise of about half a cent in the price of lead. In a statement issued several weeks ago following the demand of the union, when lead was around 5c., it was stated that an increase of wages was impossible owing to the condition of the lead-mining industry, and that some of the companies were then operating at an actual loss.

Butte Stockholders in the Tarbox Mining Co. failed to oust Richard Daxon as manager at the annual meeting of stockholders held on Wallace on July 21. Daxon controlled in round figures 900,000 shares of the 1,600,000 issued, whereas the Butte faction could muster fewer than 500,000. Protesting against what they claimed was illegal proceedings in the organization of the meeting, the Butte faction withdrew and elected a board of directors, claiming to be a majority of the stock at the regular meeting directors were elected and Mr. Daxon was re-elected president. The Butte stockholders have announced that they will ask for the appointment of a receiver to take over the affairs of the company. The mine is developed to a depth of 1,000 ft., and a large body of lead-silver-zinc ore has been exposed, containing 40 to 50 oz. of silver and 1,000 levels. The mine is about three miles from Saltsee, Mont.

BUTTE, MONT.—July 25

Unprecedented Low Water in Montana may seriously affect the operations of the Washoe reedment works of the Anaconda company. At present the plant is working only 40 per cent capacity owing to industrial conditions at the Butte mines. Silver Lake, near Anaconda, the present source of water supply, will be exhausted within several months. Anaconda is planning to use the waters of Georgetown Lake. The latter is about three miles distant from Silver Lake, from which the water flows by gravity to the Washoe plant. Pumping will be necessary.

SALT LAKE CITY, UTAH—July 24

Underground Accidents in Metal Mines in Utah have thus far in 1919 been unusually few in number, according to the report of the inspector of mines for Utah. He has been able to clear up one case in six months, as compared with sixteen accidents for the twelve months of 1918, showing that the efforts of the mining companies to safeguard their employees, secondarily to the men themselves, are bearing fruit. For surface work the record is not so good, there having been three fatal accidents in 1919, as compared with eight in 1918 and four in 1917.

Wages in practically all of the camps of Utah are being restored to the high level reached during the war, in anticipation of

a better metal market, of which there are indications, and in view of the high cost of living for employees, which has shown no appreciable decline. The wage scale is: Machine men, \$5.25; machine men's helpers, \$5; miners, \$5; muckers, \$4.75; timbermen, \$5.25; laborers, \$4. With the metal market not yet stabilized, costs with few exceptions as high as ever, and both state and Federal taxes heavier than heretofore, the move made voluntarily by the operators is a lien on the future prosperity of the industry, and for the present will be felt by many companies as an added burden. The first relief has come in the rise in the price of silver, and with copper going up there is prospect that the mines—in a number of cases reduced to 50 per cent of their normal output—will soon be able to increase production.

In regard to the price of silver, Utah producers of that metal, through the local chapter of the American Mining Congress, are protesting the proposal of the Treasury Department to deliver 100,000,000 oz. of silver to England for coinage purposes at \$1 an oz. The industry, it is felt, should profit from the favorable price of silver. Price fixing was cheerfully accepted during the war as a measure for stabilizing the market, but it is now felt that peculiar conditions exist, and that the market should be open on equal terms to all buyers, whether foreign or domestic.

DENVER, COL.—July 24

New Freight Rates on ore and concentrates shipped from Boulder, Gilpin, Clear Creek, Summit, and Park counties, Colorado, to the Pueblo smelter became effective on July 21. The new rates are equivalent to a reduction of 20 to 25 per cent. It was announced on June 30 by the Denver district freight traffic committee that authority had been received from Washington to make new rates effective on thirty days' notice to the Interstate Commerce Commission. This action was taken upon application by the Colorado Metal Mining Association, supplemented by the efforts of the local mining organizations of the counties mentioned. The closing of the Globe plant of the American Smelting & Refining Co., at Denver, necessitated shipping to Pueblo at an additional freight cost of \$1.30 per ton.

JOPLIN, MO.—July 26

Labor Shortage has developed in the Joplin-Miami district but there is no semblance of labor troubles. Mine operators are paying \$1.50 per day more than they were three or four years ago, and recently raised wages approximately 25c. per day when the price of ore went above the \$50 mark. This is in accordance with an unwritten agreement entered into between operators and miners several years ago, whereby wages mount 25c. per day with every 10 increase in the base price of zinc ore. The shortage of shovelers, however, has caused a number of different mines, and a bonus is being paid at many properties.

Sale of the M. & M. Mine to the Niangua Mining Co. was recently completed, the consideration being \$150,000. The M. & M. mine is the west twenty acres of a forty-acre tract bought by the Niangua company two years ago from Charles Stricker, of Miami, Okla., for \$10,000. The Niangua company sold the 20-acre lease for \$40,000 to Hare Mining Co., about a year and a half ago. The Hare company developed the tract by drilling and built a concentrator. The Niangua company also built a mill, and both plants have turned out considerable ore, though the Hare plant was shut down on account of low ore prices last year. Seven weeks ago V. Grant, J. K. Moore, S. Walker, and J. W. Keys bought the mine from the Hare company, paying \$100,000. They developed some of the property and made a profit of \$10,000 in the seven weeks they operated, and were loath to close the option they had given for the property to the Niangua company soon after they com-

pleted their purchase from the Hare company. The property henceforth will be known as the Niangua No. 2.

Drainage of a Large Area of zinc and lead lands west of Baxter Springs, Kan. is under way through the Hare Co. which is a subsidiary of the American Metal Co. Pumping equipment includes two 10-in. Pomona pumps, an 8-in. and two 6-in. American two-stage pumps, and two additional Pomona's at another shaft. Water is being hoisted at the rate of 7,500 gal. per min. The drainage plan has been worked out differently than most schemes of the sort in this district, in that a shaft was sunk in solid lime to 100 ft. below the water level, and then 100 ft. to the way.

Before reaching the water a steel gate embedded in concrete was constructed 10 ft. from the shaft, and it is equipped with four 12-in. pipes to permit feeding the water to the shaft in any amount up to 5,000 gal. per min. The Chanute Spletter Co. has erected a big mill at the site of the principal pumping plant, with an intake on the E. side and west of the water, and also owns about 25,000 acres of leases in the same section, upon which no fewer than 20 mill sites have been drilled out. With this drainage work the laudable mines will be started toward full development.

DULUTH, MINN.—July 21

Contract Wages for Miners on the Minnesota iron ranges are averaging \$6.50 and \$7 a day, and the men are pleased with the system, as they are not working nearly as hard as they did four years ago at about half the money. Wages of skilled gangs of miners are running all the way up to \$10 and \$11 a day. In the open-pit mines, men on the trunk line are making \$4.84, and pit men \$5.25 a day. Locomotive firemen, running small mine engines, make \$5.30, and engineers nearly \$7 a day. A shovel crew makes \$7.48, and the runner, the real aristocrat in the mining field, \$10 and \$11 a day. The last named employee, with a little overtime, is able to check his check up to \$400 a month. Under these conditions labor agitators are finding small encouragement in the ranges territory. Meetings have, however, been held at several of the range towns recently, in which the speakers exhorted the men to strike for still higher pay, or for a six-hour day, or for recognition of the union, and incidentally to make liberal donations to the "Red" cause. The miner is asserted, however, to be too smart for the agitator, remembering the 1. W. V. strike of 1916, for which he paid heavily in losses of wages.

IRONWOOD, MICH.—July 26

Labor Situation on the Gogebic Range is satisfactory. The expected large surplus of labor due to demobilization and dullness of steel and copper markets did not appear, although for a time there was a moderate over-supply. Now, however, there is hardly more labor than the usual number of "drifters" looking for employment.

HOUGHTON, MICH.—July 30

Calumet & Hecla on July 30 presented gold medals to all employees who have served the corporation for a period of forty years, silver medals to those in the service thirty years and bronze medals to those who have worked for the company continuously for twenty years. In this the company was following a custom established in 1916, when it celebrated its semi-centennial.

Copper Production in the mines of northern Michigan will not get back to normal during 1919 unless there is a radical change in the labor situation. Though a reasonable number of Michigan miners are coming back from the automobile industries, there will not be enough in total to offset the number who left in the spring. Mine managers believe that the days of cheap production are gone for good. The limits of the metallurgical improvements, it is generally believed, have been pointed out and applied for by the conglomerate and the Pyrrhoidal formations. Other changes that may operate to offset the higher wages will have to come in the mining end.

BIRMINGHAM, ALA.—July 26

In the Bessemer District production is expected to be a big mark within the next few months. The operations on Red Mountain are resuming operations, and furnaces and mills in the city proper are starting up or increasing their output. The Woodward operations were resumed at Songo mines, near Bessemer, and ten cars of ore per day at first is expected, though this will be increased as labor becomes more plentiful. With four of its five fur-

naces going, the company is putting its mines to work on full time, and in some cases has night shifts in order to supply ore needed by the furnaces. This company is said to have sold considerable iron ahead, and with consumers asking for immediate delivery of orders, shipping is expected to be each day.

A strike at the Virginia mines of the Gulf States Steel Co., brought about by the refusal of the men to wear a new safety cap, has been ended by the men finally agreeing to its use.

A tax of 3c. per ton on iron ore and 5c. per ton on coal has been approved by the Ways, Means and Appropriation Committee of the Alabama State Legislature. This tax, should it pass, will be a staggering blow to the two main industries of the state and shows an intention to put an unfair burden of taxes on the coal and iron district of Alabama. It is particularly regretted at this time, when all branches of the iron industry are struggling with some hope of success, to offset the heavy losses of the first half of the year.

A bill has been passed, and is awaiting the Governor's signature, requiring that 100 per cent of the shunting men of the state to procure a \$2,500 state license, and giving the city and county the right to issue licenses also, not to exceed one per cent of the state license. In addition, the bill requires that a bond of \$5,000 be furnished by the labor agent. When it becomes law, the bill will stop the large influx of labor to the North, which has seriously crippled industries in this district, particularly the mining divisions of the larger companies. The labor situation is the slight improvement during the last week of July over the first week, but the shortage is still serious, particularly at Bessemer, the main point from which the labor has been shipped.

PACHUCA, MEXICO—July 23

The Aerial Tramway being installed by A. Leschen & Sons Rope Co., of St. Louis, for the Compañía Beneficadora de Pachuca, A., is being rapidly completed. This is one of the most notable aerial tramway installations in Mexico, the line being about 4 1/2 miles in length, built in two sections, with an angle station at the midway, which is a long series of rollers, and a loading station. The initial capacity of this tramway is 60 tons of ore per hour, with an ultimate capacity of 100 tons per hour. Loaded-car tracks are used, and a patent flattened-strand traction rope. The carriers are of 16-cuft. capacity.

TORONTO, ONTARIO—July 25

All Miners of the Cobalt Camp went out on strike on July 23. About 2,000 men are affected. No attempt is being made to operate, and, as power has been cut off, the mines will be allowed to flood. The company can generate their own power for pumping purposes. The strike in many respects was peculiar, as the men almost without exception stated they did not want to strike. They worked to the last where wanted, and made every effort to assist the management in getting out the pumps and machinery. Practically the only point involved was the recognition of the Western Federation of Miners, which the managers have consistently refused to grant. The wages paid are a few exceptions as high as any paid on the continent, and the working conditions are of the best. A bonus is paid according to the length of time the lowest paid surface men received \$4 a day and the rate underground was from \$4.25 for muckers to \$5 for drill runners. Shaft and winzeil men received \$5.50. The managers it is said have no objection to a union of miners for Northern Ontario which will take out an Ontario charter, and be absolutely dominated by the Western Federation, but would recognize and deal with such a union. The situation has been complicated by the attitude of the Minister of Labor for the Dominion Government.

The American Cyanamid Co., which has a plant at Niagara Falls, Ontario, has been endeavoring to find a market for its low-grade cyanide in northern Ontario. The Canadian contains only about 35 per cent NaCN, as compared with 76 per cent and 96-98 per cent NaCN contained in the imported article. The manufacturer claims that this is impractical for the consumer, who pays only for the actual cyanide present as determined by analysis, and that they can deliver actual cyanide in this form at a cost of from 10 to 20 per cent below the current price of imported high-grade cyanide. They also asserted that, in addition to its having equal efficiency on the basis of NaCN content,

it contains a certain amount of calcium chloride, which accelerates the filtering process in gold and silver extraction. Representations are being made to the effect that the Canadian-made cyanide in the re-treating laboratory of the Haliburton Mining School, under conditions practically identical with those existing at the Cobalt mills. The results will be compared with those of similar tests of high-grade cyanide manufactured in Scotland. The Cassel Cyanide Co. of Glasgow, Scotland, has been the cutting off of the German supply has furnished most of the cyanide used by the mining companies, will endeavor to strengthen its hold on the Canadian market by establishing a subsidiary company in Ontario, to be known as the Cassel Cyanide Co. of Canada, Ltd. This decision is the result of the recent visit to Canada of William Neill, managing director, who was strongly impressed with the opportunities presented for the expansion of the company's business in connection with the mining industry. Mr. Neill will be managing director of the Canadian company, and two of his colleagues, Sir George Bellby and Sir Edward Bellby, of Brotherton, will also be on the directorate.

THETFORD, QUEBEC—July 26

In the Asbestos District of Quebec the business boom still continues. The demand is steady with little if any drop from war prices for crude ore. The market for short grades there has been a decided slump in demand, but inasmuch as the profit lies mainly in the longer grades, generally business conditions have not been noticeably affected. Labor has been decidedly stable, owing largely to the system of piecework adopted last season. By this system the laborers average about an eight-hour day. The employees engaged in the concentrators are working on a varying scale of from \$3.10 to \$5 and are generally less inclined to labor agitation. Construction work on the new storage system of the B. C. Mines of the Asbestos Corporation of Canada is progressing and is expected to be in operation in this fall. The capacity will be about 20,000 tons. It is intended to overcome the difficulty of slackened tonnage resulting from inclement weather as well as to secure a higher rate of production by drying and curing. At the Jacob's mine considerable caving in has developed owing to the underground operations loosening up the sides of the mill. The new water and milling system is now practically complete, however, and is expected to afford a large production.

Beam-shovel mining has now been proved a success in the fibre-producing mines. At East Broughton this system of mining has been adopted at all the mines, and mining costs have been brought in line. In the mines, however, where crudes have to be separated from the milling ore, it has not been found feasible to use the steam shovel. At the Elsie Lake Asbestos mine, where the manager, J. H. Murphy has resigned, and Milton, Hersey & Co., of Montreal, are acting as consulting engineers for the property, E. N. Palmer is acting as mine manager. Maurice Bousseau, of Montminy, purchased the Interstate Asbestos Co., at East Broughton, at a sheriff's sale on July 8.

VICTORIA, B. C.—July 17

British Columbia's Mineral Production in 1918, according to the annual report of the Minister of Mines, just issued, was derived from 2,392,249 tons of ore shipped, which came from 6,118 mines. Crudes shipped over 100 tons each during the year. In all, 4,148 men were employed on surface and underground. The total tonnage of ore produced in British Columbia by districts of the province as follows: Cassiar-Omineca district, 963,260 tons; southern coast district, 745,169; Boundary-Yale district, 723,463; Stoean district, 142,743; East Kootenay district, 41,570; Train Creek district, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937; Nelson division, 15,348, other mining divisions, 1,115, total 2,392,249 tons. Production of the various metals was as follows: Gold (lode), approximately \$3,403,312; gold (placer), approximately \$320,000; Slocan district, 142,743; East Kootenay division, 41,570; Train Creek division, 112,349; Ainsworth division, 44,937;

has been well demonstrated that the gold output is in direct proportion to the number of days in which water is available for piling. The increase in the production of lode gold in 1918 is explained as largely due to the entry into the list of producers of the Surf Inlet property of the Belmont Surf Inlet Mines, which made an output of about 41,600 oz. The Slocan district led all other sections in the production of silver.

The production of lead increased in the Fort Steele, Slocan, and Windermere-Golden districts, and decreased in the Ainsworth and Nelson districts. The Sullivan mine of the Consolidated Mining & Smelting Co. of Canada is situated in the Fort Steele division. Usually it contributes nearly all of the division's output of lead, but in 1918 over 860,000 lb. came from the North Star mine. In regard to copper, the report mentions the large production of the Hidden Creek mines of the Granby Consolidated Mining, Smelting & Power Co. in the Skeena division, and of the Britannia mine in the southern coast district. The production of copper in 1918 according to districts was as follows: Skeena division, 30,190,606 lb.; southern coast district, 18,475,913; Boundary-Yale district, 9,340,125; Trail Creek district, 1,772,916 lb.; Omineca division, 643,843; all others, 578,811; total, 61,483,754 lb.

Zinc was produced in British Columbia in 1918 to the extent of 41,772,216 lb., compared with 41,845,513 lb. in 1917. The production of each district was as follows: Fort Steele, 26,704,806 lb.; Slocan 14,107,682; Omineca, 213,112; Ainsworth, 849,991; all others, 6,225; total, 41,772,916 lb. Thus an increase over 1917 is shown in the Fort Steele district of nearly 6,000,000 lb., which output came entirely from the Sullivan

mines, the ore being treated in the electrolytic zinc plant at Trail. In the Slocan district the heaviest shipper was the Standard mine, with a production of over 7,000,000 lb.

MELBOURNE, AUSTRALIA—June 11
To Aid Prospecting in New South Wales, the Minister of Mines, on the recommendation of the prospecting board, has approved of an amended scheme. Although indications of minerals are at present less numerous than in the early days of mining, it is still reasonable to believe that there are valuable deposits undiscovered. It is proposed to supersede the old method of depending on casual discoveries by the adoption of a more scientific system under the direction of the professional geologist. The granting of aid to promising sites under the present system has led to important discoveries, though in some instances the presence of minerals had been previously known. One notable result achieved under this system was the discovery of the value of the Mount Boppy mine, which to the end of 1918 had produced gold valued at £1,886,815. Equipping and supporting of prospecting parties has been tried in this and other states, but with unsatisfactory results. The new proposal provides for two members of the geological staff to undertake the detailed examination of separate areas, mapping them as far as it is possible, to assist prospectors. It is also intended that the geological surveyor shall be given power to employ labor to assist in detailed examination as the work may require. This would provide that geological surveys and prospecting may be carried out simultaneously, and in addition to the information being obtained for use in subsequent mining operations, it would be avail-

able locally for the guidance of prospectors in such cases assistance up to half the cost could be granted from the prospecting appropriation. Two areas which are considered to be suitable for work under these conditions include Eastern New England, in the northeast part of New South Wales, and the Gurlambone-Cobar-Nymacoe-Mount Hope district in the West. Parliament is being asked to increase the prospecting appropriation for the next financial year to £18,000. Consideration is also being given to the question of assisting in the erection of crushing plants and by moving batteries from worked-out fields and re-erecting them in other promising localities. This form of assistance has already been granted to a limited extent, and to provide for other renewals a grant of £2,000 is being sought.

WAIHI, NEW ZEALAND—June 8
The Waihi Grand Junction Co. has purchased the property of the Waihi Extended Co. Apart from the value of the latter in respect to ventilation, there is always the possibility that further development of the newly acquired area will add to the Junction company's ore reserves. The general manager, Mr. Leah, stated that though improvement in ventilation was the main reason that had weighed in with the management in making the purchase, the further exploration of the Extended mine would no doubt be made in due course. One of the first works in this direction to be undertaken would be on the Mary reef, which had yielded the Junction company a substantial tonnage of milling ore in two or three levels, and at one level had been worked close up to the old Extended company's boundary, with payable results.

THE MINING NEWS

Progress of Mining Operations
 Condensed and Classified
 for Easy Reference

ARIZONA

Cochise County

COPPER CHIEF (Johnson)—Overhauling machinery, cleaning up underground. When fuel arrives work will start under new management. Martin Fishback, manager.

JOHNSON DEVELOPMENT (Johnson)—All work stopped while retrimbering shaft.

Gila County

ARIZONA COMMERCIAL (Globe)—Produced 3,500,000 lb. copper in first six months of 1919, while operating at 60 per cent capacity. Development at depth progressing. Again sinking new shaft and opening up 15th and 16th levels. Ore for first half year averaged about 6 per cent copper. Company has practically continuous orebody from 7th to 15th level.

IRON CAP COPPER (Globe)—Superintendent reports mining in satisfactory condition. Shaft down to 1,300 level, drifting east on vein. Good grade of milling ore exposed. Company has accepted proposal of Inspiration Consolidated Copper Co. for concentrating and smelting Iron Cap ores as temporary measure. Construction program about complete, except for mill. No decision yet from Massachusetts Supreme Court whether it will retain jurisdiction in Arizona Commercial suit.

OLD DOMINION (Globe)—Development of eastern portion of property having satisfactory results. Running crosscuts every 200 ft. on some levels and every 100 ft. on others. Several promising orebodies cut, one being 80 ft. wide and 4-5 per cent copper. Company's mines producing about 1,800,000 lb. copper per month. Reserves increased in last few months by over 200,000 tons.

Graham County

GRAND REEF (Klondyke)—Shaft being unwatered to 3d level, where prospecting work will be done. Drifting and crosscutting on tunnel level with machine drills on contract. Property an old one recently taken over by Aravaipa Leasing Co., H. Hendrickson, superintendent.

SILVER COIN (Klondyke)—Old shaft retrimbered. Section cut at 200 level and sinking started.

TEN STRIKE (Klondyke)—Contract let by Aravaipa Leasing Co. for all drifting, crosscutting and sinking.

Pinal County

SILVER KING (Superior)—On July 22, new three-compartment shaft was down 170 ft., and being sunk at rate of 5 ft. per day. Mill treating 25 tons per day. During last week mill heads assayed from 16 to 23 oz. silver per ton; tailings assayed 1.0 to 2.2 oz. silver per ton, and assay value of flotation concentrates ranged from 1,000 to 1,980 oz. silver per ton. Last shipment of concentrates to smelter assayed 1,375.2 oz. silver, 20.4 per cent lead, and 7.34 per cent copper. John Powie, vice-president and general manager. Company considering erection of power plant surveys and prospecting in Pinal mine. Company has opened and partially developed three new orebodies, overlooked by former operators, that lie outside of main chimney.

Yavapai County

SWASTIKA (Mayer)—Carload of ore recently shipped to Denver, where Dorr Co. made treatment test. Will install cyanide plant. F. W. Giroux, superintendent.

CALIFORNIA

Butte County

DONDERO (Yankee Hill)—Bond on property secured by E. R. Healy. Testing ground by keystone drill followed by decision to install dredge.

Calaveras County

BLAIR CONSOLIDATED (Angels Camp)—Used to state several years ago for taxes and recently purchased from state by Burr Chambers at auction.

Kern County

RANDBURG DIVIDE (Randburg)—Owns twelve claims on which Williams and Kelly made rich silver discovery. Development continued to depth of 16 ft., with encouraging results. Some excitement in district.

Nevada County

EMPIRE (Great Valley)—Work started on addition of twenty stamps to mill.

Sierra County

CLEVELAND (Sierra City)—New 20-stamp mill now running on free gold ore. Vein 28 ft. wide, R. G. Gillespie, Pittsburg, Pa., owner; J. T. Kiel, manager; S. E. Montgomery, superintendent.

Yuba County

BLUE POINT (Smartville)—Gravel being worked by sluicing, as lack of tailings dam has made hydraulicking impracticable.

COLORADO

Boulder County

HUMBOLDT (Ward)—Being unwatered to 350 level, preparatory to resuming active development. Mine buildings under construction and new machinery will be installed. J. Walters, manager.

ROOK (Ward)—New shaft down 200 ft. A 7-ft. vein of silver-lead milling ore opened, containing stringers of high-grade silver ore. Property controlled by L. A. Ewing & Co. Ore will be treated at new White Raven mill, being constructed by Teal & Barr, of Boulder.

STRONG MILL (Ward)—Plant being re-modeled by M. W. Loomis, and receiving ore from Puzosi mine, and from Ward-Columbia dumps.

Clear Creek County

PRINCE ALBERT (Lawson)—An 18-in. vein of payable silver ore opened in east heading at point 275 ft. from crosscut, and about 250 ft. below surface. In west heading, 2-ft. vein of low-grade milling ore opened. Property being developed by Matrix Mines Co.

Montrose County

RADIUM ORE SMELTING (Montrose)—Recent shipment of 36 tons of radium ore assayed 3 per cent uranium oxide. Plant has received over twenty cars of radium ore since starting few months ago. Average assay of material received between 1.5 and 2.5 per cent uranium oxide. Most of ore comes from Paradox Valley. Plant is only commercial radium ore sampler in existence. Large and small shippers send ore to plant to be sampled, assayed, pulverized, and shipped to Eastern market.

San Miguel County

PRIMOS CHEMICAL (Vanadium)—New steel mill under construction, to replace plant recently destroyed by fire.

IDAHO

Boundary County

IDAHO CONTINENTAL (Porthill)—Hauling ore by trucks begun. Two shifts employed in mine and three in mill.

Shoshone County

RICHMOND (Adair)—Crosscut from winze sunk from No. 2 tunnel shows vein 12 ft. wide, with from 2-6 in. of high-grade copper. Will drift 1,000 ft. on this level, at depth of about 600 ft.

CARBONATE HILL (Mullan)—Crosscut from shaft at 400 ft. failed to uncover orebody. Ground being prospected with diamond drill.

NATIONAL (Mullan)—Mill shut down. Work in mine confined to development on and above main working tunnel. Ore copper, but crosscut being run that may uncover body of lead ore. Original discovery lead, combined with little copper. Indications that vein shifts at depth of 400 ft. and that present copper vein is offshoot from main fissure.

INTERSTATE-CALLAHAN (Wallace)—Putting on men as fast as they apply. Management expects to be in full operation soon after Aug. 1.

MICHIGAN

Copper District

COPPER RANGE (Painesdale)—Champion hoisting practically no waste rock to surface. Using it underground for back-filling. Sand-filling plan in vogue last year discontinued. Freight rates high, freight rates and labor costs. Rock for last three months averaged over 37 lb. copper per ton. Mine richest lode producer in district. Baltic second in point of richness. Trumountain improving, averaging 23 lb. per ton, compared with 26.52 in 1918. All mines short of underground men.

Gogebic Range

NEWPORT (Ironwood)—Twentieth level of Woodbury shaft now connected with Bonnie shaft. Ore can be hoisted at latter while engines at former are being leveled.

OLIVER IRON (Ironwood)—Planning erection of fifty houses for miners, twenty-five at Pirritan mine and twenty-five at Davis mine. Houses will be six-room, of frame construction, with full concrete foundation and half-basement, and about 20 x 27 ft.

TOWNSITE (Ironwood)—One stockpile of over 25,000 tons already shipped. Shovel now loading second-grade stockpile. Shipments for season expected to exceed 80,000 tons. Ore taken from ground which was worked over from Norrie shafts years ago.

MINNESOTA

Cuyuna Range

STRIPPING OPERATIONS progressing at Gordon and Sazanore pits at Gordon by Coates & Tweed. Will be ready for shipments this season. Two drag lines at work at Sazanore, being stripped under contract by Weston, Dear & Co. for John A. Savage & Co. Work hindered by water now under control. Expect to ship 100,000 tons manganese ore this season.

CROFT (Crosby)—Mining 800 tons per day. Heavily worked, never recorded. Will start soon to sink 150 ft. deeper. Steel shaft sets bought and at prop. riv.

NORTHLAND (Cuyuna)—Hoisting and stockpiling manganese ore from underground development.

ARKO (Ironton)—Working with reduced forces and developing underground. Grading for spur track. Reported to have sold 25,000 tons of manganese ore.

HILLCREST (Ironton)—Shipping ore from pit. Some hydraulic stripping being done as shown in photograph on this page. Property operated by Coates & Tweed, who are stripping Portsmouth mine by steam shovel. Wilbur Van Evera is manager.

HOPKINS (Ironton)—Bretlung & Co. property shipped 7,000-ton stockpile of manganese ore. Mine still closed down.

WHITMARSH (Ironton)—Developing Martin and Huntington mines and stockpiling manganese ore. Properties rapidly preparing for heavy production.

MISSOURI

Joplin-Miami District

CULBERT (Joplin)—Taken over by B. M. Inman and associates, who have dewatered and again put in operation.

MONTANA

Beaverhead County

BOSTON & MONTANA DEV. (Wise River)—Third raise from 1,000 level of Idanha to 900 level shows seven feet commercial ore. Montana Southern Ry., subsidiary, has steel laid beyond Wise River with about twelve miles of rail laying required to reach Elkhorn mines. Roadbed completed.

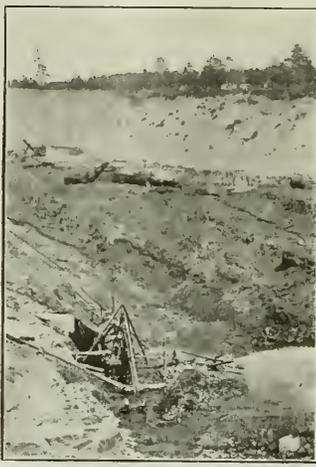

Missoula County

POTOMAC COPPER (Potomac)—Foundation laid for miners' boarding house. Will drive tunnel below old Copper Cliff to depth of 800 ft. below Cliff and 1,200 below Leonard claims. Ore zone 30 ft. wide indicated in Leonard property.

Silver Bow County

ANACONDA (Butte)—Engineers of Boston & Montana works at Great Falls have produced desirable carbide product in ferromanganese plant. Company has not investigated commercial feature of venture. Great Falls zinc plant shut down because of large stock of metal on hand. Ore production about 55 per cent normal, water scarcity interfering with return to capacity at Washoe Reduction Works. Twenty Cottrell smoke treaters now in operation at Washoe works. Last treater recently put in use.

BUTTE - BULLWACKER (Butte)—Operations resumed, and ore shipments will begin soon to leaching plant of Anacoda company.

PIT OF HILLCREST MINE, IRONTON, MINN., ON CUYUNA RANGE. HYDRAULIC STRIPPING OPERATIONS IN FOREGROUND.

BUTTE & SUPERIOR (Butte)—Sinking of No. 2 shaft to start soon. Hayden-Stone interests back of Butte Superior, have taken options on territory adjoining Davis-Daly on south and will sink two large shafts and develop ground traversed by fissures of latter. Planned to acquire about 200 acres.

DAVIS-DALY (Butte)—Orebody at Colorado mine opened for length of 1,200 ft., with ore still in evidence. One of longest shoots in district. Colorado shaft down more than 2,630 ft., with 2,700 as objective.

NORTH BUTTE (Butte)—Crosscut south 100 ft. on 900 level of Sarsfield shaft on east side shows ore zone around 40 ft. wide, with copper content unknown, local office refusing to disclose assays. Five old levels being opened at Speculator mine. Large tonnage of second class ore hooked out ready for mining. Copper production for July will show increase over June.

TUOLUMNE COPPER (Butte)—Fifteen-inch stringer of good grade of silver ore cut by crosscut being driven on 1,000 level for Spread Delight fissure. Shaft down about 1,060 ft., with 1,200 as objective.

NEVADA

Elko County

HOLDEN MINING (Tuscarora)—Fifty-ton mill being erected and will be running

soon, according to C. C. Griggs, general manager.

Mineral County

CANDELARIA MINES (Mina)—Charles D. Kaeding, vice-president and manager of Candelaria Mines Co., and R. C. Warriner, consulting engineer for Crown Mines in Canada and a director of Candelaria company, left Reno on July 22 for Candelaria. Plans for extensive operations being considered.

CONS. WEST EXT. SIMON (Mina)—Machinery installed and shaft being sunk on cropping 70 ft. wide, adjoining Simon Silver-Lead. Company well financed. G. F. Thompson, general manager.

SIMON SILVER-LEAD (Mina)—Drifts on vein at 400 level out 150 ft. each way from crosscut. New machinery en route to mine includes 60-hp. gasoline hoist, 100-hp. engine for generator, and 120-hp. duplex Western gas engine for 700-cu-ft. Sullivan compressor.

Pershing County

PLAINVIEW (Rochester)—Charles Moran, president of Nevada, California & Oregon Ry., has joined C. N. Miller in development of Plainview mine at Rochester. Former visited mine on June 19. Mine has 40,000 tons $\frac{1}{2}$ ore developed.

ROCHESTER NEVADA SILVER (Rochester)—Charles D. Kaeding, consulting engineer, C. A. Dennis, superintendent, have worked out system of faulting on 900 level. Gross output of mill about \$60,000 per month.

Nye County

FLORENCE DIVIDE (Divide)—Shipping seven carloads from lease on Florence at Goldfield, which management says will average \$100 per ton. Shipment of high-grade ore has also been made.

KNOX DIVIDE (Divide)—Opening up new vein which assayed 80c. on surface. At 8-ft. depth vein is 6 ft. wide and samples from \$30 to \$60 per ton.

REVERT DIVIDE (Divide)—New vein 2 ft. wide struck in crosscut on 300 level. Has widened to 4 ft. in drift.

SPANISH BELT (Manhattan)—Company has bought 10-stamp mill, which will be erected soon.

WHITE CAPS (Manhattan)—Changes being made in mill which are expected to result in much better saving.

WILLOW CREEK GOLD (Niyala)—Fred H. Vahrenkamp and Dr. Edward Howes have secured control of Willow Creek mine. High-grade free gold ore developed to 220-ft. depth.

DIVIDE EXTENSION (Tonopah)—Crosscut on 100 level, Caldwell shaft, in vein 21 ft. without reaching hanging wall. Officially announced that ore is all high-grade and that first 12 ft. averages \$197 per ton.

RESCUE EULA (Tonopah)—Opened up new orebody 14 ft. wide on 1,050 level. Ore averages better than \$20 per ton.

STONE CABIN (Tonopah)—Edmond B. Bronson, president Canada Copper Co. (Luning, Nev.) and Arizona Bagdad, (near Hillside, Ariz.), has bought Buckhorn group at Stone Cabin and is installing complete plant of machinery. Vein 35 ft. wide, with stringers of high grade.

TONOPAH BELMONT (Tonopah)—Net profits for June from 8,647 dry tons milled, \$54,194, as compared with \$56,408 for May.

TONOPAH DIVIDE (Tonopah)—Crosscut on 580 level shows ore 35 ft. wide. Face of southeast drift 80 ft. from crosscut in rich ore.

TONOPAH EXTENSION (Tonopah)—Clean-up of mill for first half of July valued at \$48,740.

TONOPAH MINING (Tonopah)—Net profits for June from 1,687 dry tons milled, \$39,000, as compared with \$29,200 for May.

NEW MEXICO

Grant County

EMPIRE ZINC (Hanover)—Doing development work only.

HANOVER-BESSEMER I. & C. (Hanover)—Shipping steadily, rearranging mill. E. Barnes, superintendent.

LAST CHANCE (Lordsburg)—Shipped car silver concentrates July 21 to El Paso smeltery. Value approximately \$25,000. B. Prescott, superintendent.

BLACK HAWK CON. (Silver City)—Increasing working force, as men can be secured. Will develop old shaft. C. B. Lidstone, superintendent.

KING & QUEEN (Steins Pass)—Pushing development. Sinking new shaft, building concrete warehouse and office building. F. H. Perry, superintendent.

BUIRO MOUNTAIN (Tyronne)—Putting new concrete floor in mill. Entire new equipment will be installed. Development work in progress.

LEACH-SNELLY-CASEY (Tyronne)—Have consolidated 32 claims around old Blackhawk-Hose and Albamora silver mines in Blackhawk district, working small force.

Otero County

ORO IRON (Ochays)—James H. Parker, manager, recently in El Paso, looking for Mexican miners.

Sierra County

MOFFITT CONSOLIDATED COPPER (Kingston)—Shipping silver ore to El Paso smelterly from old Virginia silver mine on North Percha Creek, in Black Range mining district. Company has acquired several copper claims west of Caballo Mountain, twenty miles south of Elephant Butte dam.

Socorro County

MOGOLON MINES (Mogolon)—Operating and shipping steadily. Sidney J. Kidder, manager.

SOCORRO M & M (Mogolon)—Property still shut down. Everything ready to start pending court decision. E. Scott, receiver.

OKLAHOMA

Joplin-Miami District

UNDERWRITERS (Donhat)—Starting two new shafts on Lucky Extension lease, which they have been testing by drilling.

HUTTIG (Joplin)—Planning removal of Inspiration mill, which it owns, from north of Blue Mountain mine, to Saturn mine, northwest of Picher.

LARSH (Picher)—Renewing operations after several months' shutdown because of low ore prices.

LEAD BOY (Sunnyside)—Taken over by W. R. Womack and C. M. Evans, of Picher, who have again started mill.

TEXAS

Brazoria County

WEST COLUMBIA PRODUCTION for week preceding July 17 was 22,250 bbl. oil per day. Producing companies: Humble Oil & Refining, 9,605 bbl.; Crown Oil & Refining, 5,600; Texas Co., 3,158; Gulf Production, 2,530; and Hanmecker, 45. Reported 24 wells in field producing and 5 shut off for various reasons; drilling on 3 new wells started.

CROWN OIL & REFINING (West Columbia)—No. 3 Olshewski well brought in recently increasing in flow. No. 3 Marmion, recently completed, good producer.

HUMBLE OIL & REFINING (West Columbia)—Started flowing oil through new pipe line to Lebeck tank farm, where 12 tanks of 5,000-bbl. capacity each are being built, three being completed. Pipe line being constructed from tank farm to Texas City, where docks from which 100,000-bbl. tank steamers can be loaded will be built.

Dallas County

LONE STAR GAS (Dallas)—Capitalization increased to \$10,000,000. Will engage in oil business on large scale. Construction of pipe line from West Texas fields to serve North Texas cities with gas begun; estimated cost \$5,000,000. Company controls 50,000 acres in producing fields of West Texas and 30,000 acres in Oklahoma fields. Now drilling 35 wells, and has four producing oil wells.

Harris County

GULF PRODUCTION (Goose Creek)—No. 16 Stateline well completed July 11 making good production of clear oil.

BRAZOS OIL & REFINING (Humble)—Small well brought in on Falvey lease.

GAMBLER OIL (Pierce Junction)—No. 1 Mowry well, which was being located on Cross Timbers.

Jefferson County

GULF CO. (Beaumont)—McFadden No. 2 well drilled at rate of 100 ft. a day for 23 days; now in hard rock and progress slow. This well of importance, being in Spindle Top section. Delayed on McGuffey No. 1 well, brought in several months ago, which began flowing at 2,900 ft.

TEXAS CO. (Beaumont)—No. 1 Fee well down 500 ft. Well within 100 ft. of McFadden No. 1 well, a producer of Gulf Co.

Liberty County

HOUSE CO. (Dayton)—No. 2 Zeiss & Pickett well south of Dayton started drilling. Interesting in that it is 1,000 ft. off salt dome.

SIMMS CO. (Dayton)—No. 1 Peterson well, northwest of town, abandoned at 1,010 ft.; rig moved and new well started.

REPUBLIC PRODUCTION (Dayton)—No. 20 Doublebar well brought in July 17 flowing strongly from 2,400 ft.

Limestone County

DEEP DRILLING will be done near Mexia, where four wells will be put down; drilling on two now under way. No drilling previously in old field below gas sand that averages 700 ft. deep. Leases in demand.

Runnets County

GULF PRODUCTION (Ballinger)—Russell No. 2 well spudded in, and drilling progressing satisfactorily. Gas from Russell No. 1 well used as fuel.

SINCLAIR GULF (Ballinger)—Down 2,300 ft. in dry hole one and one-half miles east of Russell No. 1 well. Log of latter showed oil in three pieces, but when shot, after drilling to 3,500 ft., no oil found.

UTAH

Juab County

TINTIC SHIPMENTS week ended July 19 amounted to 129 cars.

EUREKA BULLION (Eureka)—New compressor installed and water-line approaching completion. Raising and sinking on ore recently opened on 800 level. Will drift from raise. With new equipment shaft will be sunk below 800 level, 3,000,000 shares, par value \$1, looked for. Company has 20,000 shares in treasury, and \$12,000 cash on hand.

INDEPENDENCE (Eureka)—Stock of company to be listed. Claims east of Copeland, in East Tintic district. Shaft to be sunk. Alex. G. Matson interested.

PLUTUS (Eureka)—Connection being made with Chief Consolidated ground from 1,000 level. Face of drift about 370 ft. from new Chief Consolidated shaft, now down 600 ft. Winz 200 ft. below 1,000 level has cut mineralized quartz.

TINTIC STANDARD (Eureka)—Shipping about two cars daily. New hoist to go into operation soon.

ZITMA (Eureka)—Annual stockholders' meeting held and old officers re-elected. Property in East Tintic.

Salt Lake County

EMMA SILVER (Alta)—Articles of incorporation filed, indebtedness cleared off, and \$100,000 in treasury. Capitalization 1,000,000 shares, par value \$1, with 1,000,000 shares in treasury. Officers: C. S. Burton, president; John Dern, vice-president; F. B. Cook, secretary and treasurer; J. E. Gaigher, J. M. Hayes and H. Hopwood. Estimated to have machinery worth \$25,000. In early days produced \$2,637,227, and sold to English syndicate for large sum, soon after which ore lost through faulting. Large development campaign undertaken in 1915 by Eastern interests. A total of \$280,000 worth of ore was shipped. Company went into receivership, present receivership following, with Utah men interested.

MONTANA-BINGHAM (Bingham Canyon)—Annual stockholders' meeting held July 21 and board of directors elected: C. G. Ballantyne, president; E. A. Vail, J. E. Mossman, J. Benton Leggett, W. E. Hubbard, Imer Pent, Lewis B. McCormick. In future, annual meeting will be held first Tuesday in March. Producing two cars of ore weekly from development. Strike of higher-grade copper ore holding out.

UTAH COPPER (Bingham Canyon)—Understood there is prospect of mine and mill work being signed at full force in near future, owing to rising price of copper.

CARDIFF (Salt Lake City)—Employing about seventy miners. Ore being brought down Big Cottonwood Canyon in trucks at rate of 60 to 70 tons a day.

TAR BABY (Salt Lake City)—Six men working. A. A. Little, superintendent. Tunnel being driven to cut "Cardiff" contact.

Summit County

PARK CITY SHIPMENTS week ended July 19 totaled 2,393,710 lb., shippers being Silver King Consolidated, Judge Mining & Smelting, and the West.

Plute County

MINERAL PRODUCTS (Marysville)—Reported work resumed after shutdown of several months. Amunite property equipped with large mill producing potash.

Utah County

SILVER BELL (American Fork)—Leases at this property being re-approven shipped car of silver-lead ore from surface workings.

WASHINGTON

Ferry County

BEN TILLMAN (Republic)—Property leased and will be developed. Owned in London, England.

LONE PINNACLES-SURPRISE (Republic)—Shipping 50 tons daily from Last Chance mine.

QUILP (Republic)—Surprise shaft down 800 ft. and ore followed 200 ft. on that level. Quilp shaft will be unwatered and extended to 1,000 ft. corner with drift on 800 level. W. G. C. Iansalk, manager.

WISCONSIN

Zinc-Lead District

GEYER LAND (Cuba City)—Loeffelholz Bros. report good strike of zinc ore on Geyer land near Cuba City.

SMITH-RULE TRACT (Linden)—Joe Piquett and Sam Alteneberg developing this lease north of Optimo No. 4 at Linden. Property proved by dity drift holes and shaft showing high-grade disseminated blende. Foundations laid last autumn for 100-ton-mill. Negotiations now under way to provide equipment.

KISTLER & STEPHENS (Platteville)—Lease obtained on Rowe tract, adjoining Rodham mine, at Shullsburg. Property formerly known as Rowe, also as Milwaukee-Shullsburg, also as Brown-Coff. Appeared promising when mill was destroyed by fire four years ago.

ZINC HILL (Platteville)—Big Dick shaft down to ore on Harvey lease at Cuba City, and rich sheet blende encountered.

CANADA

British Columbia

CORK-PROVINCE (Slocan)—Reorganization decided upon at annual meeting. Total 1,250,000 shares of stock to be issued to take place of 8,500,000 shares of 10c stock. This will make some stock available for development. Will retire bonds of \$1,250,000. Extension of workings decided upon.

QUEEN (Slocan)—Examined and surveyed by Carl H. Hand, of Los Angeles, for A. W. McClune, of Salt Lake City.

Manitoba

BROOKLYN (Rice Lake)—Shaft down 70 ft. Drifting will be done when 100 level is reached. A. L. Anderson in charge.

Ontario

PETERSON LAKE (Cobalt)—Offering 400,000 shares of treasury stock to shareholders at 15c per share to raise \$50,000 for further development.

ALLIED GOLD MINES (Boston Creek)—Company, which was organized to take over O'Donald and Cullen-Renaud claims, and secured options on those properties, also owned the other undeveloped claims. Latter allowed to revert to government for non-performance of assessment work. Claims restaked by D. Belec. Litigation allowed, and machinery comprised by company paying Belec \$500 and having claims reinstated.

CHARITTE (Boston Creek)—Shaft down 60 ft. Vein 60 ft. wide showing low gold content being followed.

MURRAY-MOWGRIDGE (Bourkes Siding)—New vein 4 ft. wide encountered.

AGAUNICO (Bucke Township)—Large vein of cobalt mineral, explored some years ago for silver, on passing from conglomerate into Keweenaw formation found to contain high gold content.

BERRY (Kirkland Lake)—Claim L 1,535, one of group of five locations known as Berry claims, situated south of Burnside, purchased by Buffalo interests.

MATACHEWAN RAND (Matatchewan)—Large vein of chloritic schist and quartz uncovered. Contract for 15,000 ft. of diamond drilling placed.

CLIFTON (Porcupine)—Installation of mining plant completed. Drifting being carried on at 100 level on new extension of orebody showing on surface, which shows high-grade ore for 25 ft.

SULLIVAN (Seskinika)—Being explored by diamond drilling.

HOLLINGER CONSOLIDATED (Timmins)—Machinery being installed for addition to mill, which will increase capacity to daily tonnage of 3,500 tons.

Quebec

BLACK LAKE ASBESTOS & CHROME (Black Lake)—U. S. Steel Corporation has secured option until Aug. 22 on chrome iron ore lands of company. Steel company's engineer has made inspection of properties and reported to principals.

26	434 $\frac{1}{2}$	106 $\frac{1}{2}$	55 $\frac{1}{8}$	30	435	107	55 $\frac{1}{8}$

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

July	Copper		Tin	Lead		Zinc
	Electrolytic	Spot		N. Y.	St. L.	
24	22 85@23.35	68	5 $\frac{1}{4}$ @6	5 50@5.75	7 90 @7.95	
25	22 85@23.35	68	5 $\frac{1}{4}$ @6	5 $\frac{1}{4}$	7 80 @7.90	
26	22 85@23.35	68	5 $\frac{1}{4}$ @6	5 $\frac{1}{4}$	7 70 @7.80	
28	22 85@23.35	68	5 85@6	5.65@5.70	7 70 @7.80	
29	22 85@23.35	68	5 80@6	5.60@5.65	7 60 @7.65	
30	22 85@23.35	68	5 80@6	5.60@5.65	7 50 @7.60	

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing value of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

July	Copper			Tin		Lead		Zinc	
	Spot	3 M.	Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—July 30, 1919

The quotations for copper on July 19 and 22 were erroneously printed last week as 22.35@23.90 and 22.85@23.90, respectively. These figures are corrected to 22.35@22.85 for July 19, and 22.85@23.35 for July 22, which figures will be used in computing the July average.

During the last week the metal markets were very dull and were inclined to softness, which exhibited itself especially in zinc. For the moment, buying power seems to have exhausted itself. Japan, which has been so influential a factor, seems to have satisfied its immediate requirements. The Japanese buying during the last few months has run to large figures in the aggregate, not only for copper, but also for zinc and lead. Besides its pur-

chases in this country, Japan has also bought in England.

Transatlantic freight rates are \$18 to British ports and \$20 to French, Belgian and Dutch ports. Freights from San Francisco to Hongkong and Kobe declined to \$12.

On July 24 an agreement was signed in London by the Bank of England and representatives of South African gold-mining companies, removing the restrictions on the export of gold that prevailed during the war. Thus a free market for gold produced in the Transvaal is established, and it is now possible for gold to be purchased in England through the usual channels for shipment abroad, enabling the Transvaal producers to sell their gold in the best market, which will place them in a more advantageous position to meet the rising costs of production.

As an experimental sale, 50,000 oz.

of gold has been shipped to the United States at a price of about 85s. 6d. per standard ounce, which represents a premium of approximately 10 per cent compared with the 77s. 9d. obtained by these companies hitherto.

Copper

With the end of our last week of record the vigorous buying of copper ceased, and this week sales by producers were relatively small. The excitement of the previous week, during which extravagant prices were paid for some small lots of copper for forward delivery, passed away. With the absence of any strong demand, and the feeling in some quarters that the market might have topped, speculative interests undertook to realize, and there was rather free offering of copper for resale at concessions from $\frac{1}{4}$ to $\frac{1}{8}$ c. per lb. below the price—23 $\frac{1}{2}$ c., delivered, equivalent to 23.35c., cash, New York—that was firmly asked by the principal producers for August-September delivery.

Copper Sheets—The base price of copper sheets is 33 $\frac{1}{2}$ c. per lb. Demand strong. Copper wire is quoted at 26@26 $\frac{1}{2}$ c. in carload lots, f.o.b. mill. Market not very strong, but producers are holding firm. Considerable second-hand copper on the market is causing a sag in the price.

Tin

Prices for American tin remained unchanged at 70c. for electrolytic and 68c. for 99 per cent grade. Small business was done in Straits tin, on the spot, at 70c. July shipments from the Straits were quoted at 53 $\frac{1}{2}$ c. at the close. The War Trade Board Section of the Department of State announced under date of July 24 that WTB R-799, issued July 2, 1919, has been amended so as to advance from Sept. 1, 1919, to Aug. 15, 1919, the date on and after which pig tin and all metal alloys containing tin, including tin drosses, tin oxides, solder drosses, type metals, anti-friction metals, waste metals, and other metals containing tin may be imported from points other than points of origin and without reference to the date of shipment.

Pursuant to the above-mentioned amendment, on and after Aug. 15, 1919, pig tin, and all metal alloys containing tin, including tin drosses, tin oxides, solder drosses, type metals, anti-friction metals, waste metals, and other metals containing tin, will be permitted to be imported into the United States under General Import License PBF-37.

Lead

The big demand last week led the A. S. & R. Co. to advance its price to 6c. on July 24, sales having been made previously on that day by other producers at 5.75c. While the principal seller consummated transactions at the new price, the figure was regarded in other quarters as being excessive, and was shaded right from the start. As the week wore on and it became more and more difficult to make sales, the concessions that were offered became sharper, and at the close lead was easily obtainable at 5.80c., New York.

On the recent advance the producers of Mexican lead made good sales of their product and have put themselves in a comfortable position.

Zinc

On the way up from 7 $\frac{3}{4}$ @8c. some very large business was done, and apparently buyers were loaded with all that they could carry for a while. Anyhow, demand ceased sharply at the beginning of this week, and that, together with the news that the Government was going to dispose of its stock of zinc in its own way, threw a shadow over the market, and zinc immediately began to be offered at concessions, and declined sharply from day to day on small business.

During the advance to 8c. for Prime Western zinc, high-grade rose to 9c. The demand for high-grade during the last week, however, was insignificant. On the other hand, zinc dust was in good demand at 12@12 $\frac{1}{2}$ c. for high-grade, and at about 11c. for ordinary prolong dust.

The negotiations between the Government and the zinc smelters, acting through the American Zinc Institute, for the disposition of the Government's stock of zinc, have ended, the office of the Director of Sales of the War Department having decided to sell its holdings in its own way. On July 16 the following memorandum, covering the proposed terms, was issued:

The current market price of Prime Western at East St. Louis to be the base price, to which should be added the following amounts:

(a) Carload rate of freight from East St. Louis to point of delivery.
(b) Add for Grade A, 50c. per cwt. Add for Grade B, 3 $\frac{1}{2}$ c. per cwt. Add for Grade C, 10c. per cwt. Grade D, same as Prime Western.

Prices other than above shall first be approved by the Raw Materials and Scrap Section.

(c) Carload rate of freight will be allowed from present location to point of delivery, provided the delivery point is the nearest available to the Government stocks. Whenever possible, material shall be sold to the contractor at whose plant the material is located.

Material on which the Government is now paying storage or other charges shall be the first to be sold.

It is understood that the Government stocks have already been reduced materially, and what remains consists principally of high-grade zinc.

Our recent advices from Belgium are to the effect that a great scarcity of zinc ore exists, owing chiefly to the unfavorable conditions of freight. The smelters who possess their own mines will probably receive supplies and start smelting soon, but those smelters who

used to rely chiefly on Australian ore will be a long time in getting in operation upon any considerable scale. It is estimated that the present cost of production by Belgian smelters will be from 1,000 to 1,100 fr. per ton, while American sellers have intimated a price of about 850 fr. for their product. However, German producers who have accumulations of zinc to sell are endeavoring to export it, and that competition must be met.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet. Future outlook encouraging.

Antimony—The market continued strong. We quote at 91@91 $\frac{1}{2}$. Few offerings of futures were made.

Bismuth—Metal of the highest purity for pharmaceutical use is quoted at \$3.10 per lb. for wholesale lots—500 lb. and over. No change.

Cadmium—Quoted at \$1.50 per lb. in lots of 500 pounds. For lots under 200 pounds, \$1.75 per lb. No business being transacted. No change.

Nickel—Ingot, 41c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—Prompt supplies have become very scarce in this market, with the result of a further rise in price. We quote \$109. Prospect of a further advance is contemplated in the trade. San Francisco telegraphs \$103. strong.

Silver and Platinum

Silver—Silver has ruled steady in London, with an advancing tendency, closing at 55 $\frac{1}{4}$ d. The New York market has been fairly firm, depending on sterling exchange rates, which have been stronger the last week. The buying has been largely for China account, and the market closes firm on continued demand from this quarter.

Mexican dollars at New York: July 24, 83; July 25, 83 $\frac{1}{2}$; July 26, 82 $\frac{1}{2}$; July 28, 82 $\frac{1}{2}$; July 29, 83 $\frac{1}{2}$; July 30, 82 $\frac{1}{2}$.

Platinum—Market steady. We quote \$105 for refined ingot. No change.

Palladium—Quiet at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., July 26—Zinc blende, per ton, high, \$57.40; basis 60 per cent zinc, premium, \$55; Prime Western, \$55@ \$52.50; fines and slimes, \$50@ \$47.50; calamine, basis 40 per cent zinc, \$32@ \$30. Average settling prices: Blende, \$53.71; calamine, \$30.55; all zinc ores, \$53.20.

Lead, high, \$65.15; basis 80 per cent lead, \$65; average settling price, all grades of lead, \$53.48 per ton.

Shipments the week: Blende, 9,383; calamine, 210; lead, 1,352 tons. Value, all ores the week, \$582,650.

Shipments seven months: Blende, 303,226; calamine, 8,390; lead, 43,189 tons. Value, all ores seven months, \$15,094,200.

Owing to some low-grade lead being marketed, the average price was less

than last week. Though buying was tentatively \$55 basis, and one buyer secured a large tonnage on that base, other buyers received withdrawal orders this morning before contracting the week's orders. A few sellers were offering ore at \$52.50 tonight, and no takers.

Patteville, Wis., July 28—Blende, basis 60 per cent zinc, \$53.50 per ton base for premium grade, and \$51 base for high lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$67 per ton. Shipments reported for the week are 1,560 tons blende, 95 tons galena, and 381 tons sulphur ore. For the year to date the totals are 57,281 tons blende, 3,296 tons galena, and 8,517 tons sulphur ore. During the week 3,487 tons blende was shipped to separating plants.

Other Ores

Chrome Ore—Unchanged at \$25 per ton, f.o.b., California points, for ore running 40 per cent or better.

Manganese Ore—Sellers ask 60c. per unit, and buyers are willing to pay 50c. for metallurgical ore.

Molybdenum Ore—Small business was reported at 85c. per lb.

Other Minerals

Nitrate—Practically no change has occurred, except that the market in Chile has become firmer. The government is still liquidating its stocks. Price is quoted at \$2.95 per cwt., carload lots, for immediate shipment.

Pyrites—Spanish pyrites is quoted at 17 $\frac{1}{2}$ c. per unit for furnace ore, c.i.f., New York or other Atlantic port. Market slow and unsettled; hand-to-mouth buying. Price will decrease with ocean freights.

Sulphur—Conditions remain unchanged, price being quoted at \$18 per ton, carload lots, domestic delivery, and \$20 for export, at mines in Freeport, Tex., and Sulphur Mine, La. The basis of the foreign demand is the labor shortage in the Sicily mines, which, it is predicted, will not be able to attain a normal production for about one year's time; so the prospects of continuation of the present brisk export trade of the United States appear promising for that period. Domestic business is good.

Iron Trade Review

Pittsburgh—July 29

There has been a slight further increase in demand for some forms of steel production, but the demand continues to be poorly distributed as to products, and consequently the finishing departments, which are well filled with orders, are offered the most business, and departments that need business are getting no more than formerly. Easily the greatest gap in the market is that made by the absence of railroad buying. Though some observers are so sanguine that they refer to the possibility of the steel industry being filled to capacity with orders be-

THE MINING INDEX

Listing Special Articles of Interest
and Value to the Miner
and Metallurgist

This index is a convenient reference to the current literature of mining and metallurgy published in all of the important periodicals of the world. We will furnish a copy of any article (if in print) in the original language for the price quoted. Where no price is quoted the cost is unknown. Inasmuch as the papers must be ordered from the publishers, there will be some delay for the foreign papers. Remittances must be sent with order. Coupons are furnished at the following prices: 20c each, six for \$1.33 for \$5, and 100 for \$15. When remittances are made in even dollars, we will return the excess over an order in coupons, if so requested.

COPPER

218—BLAST-FURNACE EXPLOSIONS. E. B. Hood. (Eng. and Min. Journ., July 12, 1919; 2 pp., illus.) Account of explosion at Chromo plant of U. S. Metals Refining Co. 20c.

219—CANADA—Deposits of Native Copper in Arctic Canada. J. J. O'Neill. (Min. and Sci. Press, June 14, 1919; 5 pp., illus.) 20c.

220—CHILE—El yacimiento de cobre de Amolñas en el departamento de Copiapó. A. Ender. (Bol. Minero de la Sociedad Nacional de Minería, Jan., 1919; 64 pp.)

221—CUBA—Informe Sobre El Reconocimiento De La Mina De Cobre "La Niña." (Boletín de Minas, Num. 5, 1918; 114 pp.)

222—FLOTATION—Recovery of Copper From Flotation by Leaching. Percy R. Middleton. (Min. and Sci. Press, June 7, 1919; 2 pp.) 20c.

223—LAKE SUPERIOR—Development in Lake Superior Milling. C. H. Benedict. (Eng. and Min. Journ., July 5, 1919; 54 pp., illus.) 20c.

224—LEACHING—First Year of Leaching by the New Cornelia Copper Co. (Bull. A. I. M. E., May, 1919; 1 p.) Discussion of paper previously indexed.

225—LEACHING OF Oxidized Copper Ores With Ferric Chloride. R. W. Perry. (Min. and Sci. Press, May 17, 1919; 5 pp., illus.) 20c.

226—MICHIGAN—Native Copper and Silver in the Nonescu Formation, Michigan. Keijiro Nishio. (Econ. Geol., June, 1919; 11 pp., illus.) 60c.

227—MILL—The Arizona Hercules Copper Co.'s Plant. (Eng. and Min. Journ., June 28, 1919; 4 pp., illus.) 60c.

228—NODULIZING FLOTATION CONCENTRATES in a Rotary Kilm With Powdered Coal. Robert M. Draper. (Chem. and Met. Eng., June 15, 1919; 1 p.)

229—ONTARIO—North Shore of Lake Huron, Ontario. W. H. Collins. (Can. Geol. Surv., Summary Report, 1917, Part E; 5 pp.)

230—QUEENSLAND—Silver Spur Mine Recent Developments and Future Prospecting. Lionel C. Ball. (Queensland Geol. Surv., Bull. 264, 1918; 354 pp., illus.)

231—REVERBERATORY FURNACES—Prolonging the Life of the Roofs of Reverberatory Furnaces at Anaconda. Oliver E. Jagor. (Min. and Sci. Press, July 19, 1919; 14 pp., illus.) 20c.

232—SHAFT—Sinking and Concreting Mine Shaft 936 Feet Deep. (Eng. and Min. Journ., July 12, 1919; 54 pp., illus.) Procedure at four-compartment shaft of Miami Copper Co. 20c.

233—SOUTHWEST—The Copper Industry of the Southwest. W. Fovote. (Min. Mag., May and June 1919; 20 pp., illus.) 80c.

234—SPEISSES—Treatment of Complex Speisses. Paul Papencordt. (Chem. and Met. Eng., July 1, 1919; 4 pp., illus.) 40c.

GOLD DREDGING, PLACER MINING, ETC.

235—BRITISH COLUMBIA—Cariboo Placers and Lodes. J. A. MacPherson. (Min. and Eng. Rec., May 1919; 4 pp., illus.) 40c.

236—BRITISH COLUMBIA—Notes on the Placer Mines of Cariboo. B. C. J. B. Tyrrell. (Econ. Geol., June, 1919; 104 pp., illus.) 60c.

237—OREGON—Placer Mining in Oregon. A. E. Kellogg. (Eng. and Min. Journ., July 19, 1919; 14 pp., illus.) 20c.

GOLD AND SILVER—GENERAL

238—MICHIGAN—Native Copper and Silver in the Nonescu Formation, Michigan. Keijiro Nishio. (Econ. Geol., June, 1919; 11 pp., illus.) 60c.

239—MILLING in the San Juan, Colorado. Clifford R. Willey. (Eng. and Min. Journ., June 28, 1919; 2 pp., illus.) 60c.

240—NEVADA—Revival of Silver Mining at Cherry Creek, Nev. Geo. H. Ryan. (Salt Lake Min. Rev., May 30, 1919; 3 pp., illus.) 20c.

241—ONTARIO—North Shore of Lake Huron, Ontario. W. H. Collins. (Can. Geol. Surv., Summary Report, 1917, Part E; 5 pp.)

242—ONTARIO—The Origin of the Gold Deposits of Matchewan District, Northern Ontario. H. C. Cooke. (Econ. Geol., June, 1919; 204 pp.) 60c.

243—ONTARIO—The Wasapika Gold Area. Reginald E. Hore. (Can. Min. Journ., July 3, 1919; 12 pp., illus.) 20c.

244—PERU—Estado Actual Y Porvenir De La Industria Minera En Los Departamentos Del Sur. Carlos Basadre y G. (Bol.

del Cuerpo de Ingenieros de Minas del Peru, No. 93, 1918; 64 pp., illus.)

245—QUEENSLAND—Silver Spur Mine. Recent Developments and Future Prospecting. Lionel C. Ball. (Queensland Geol. Surv., Bull. 264, 1918; 354 pp., illus.)

246—RAND'S ORE RESERVES, The. (So. Afr. Min. and Eng. Journ., June 7, 1919; 1 p.; to be continued.) 40c.

247—SOUTH AFRICA—The Greater Heidelberg Goldfields (So. Afr. Min. and Eng. Journ., Mar. 1, 8, 15, 22, 29, Apr. 5, 12, 19, 1919; 24 pp., illus.)

IRON ORE DEPOSITS, MINING, ETC.

248—BRIQUETTING Magnetite Concentrate. F. H. Mason. (Min. and Sci. Press, July 12, 1919; 1 p.) 20c.

249—CUBA—Relaciones Geológicas y Génesis de las Minas de Hierro. Especialar de Santiago de Cuba. James P. Kimball. (Boletín de Minas, Num. 5, 1918; 124 pp.)

250—CUBA—Reseña Historica Sobre La Minería En Oriente, Cuba. (Boletín de Minas, No. 5; 134 pp.) Continuation.

251—DOCK—New York Dock For Iron Ore at Port Henry N. Y. (Iron Tr. Rev., May 15, 1919; 2 pp., illus.) 20c.

252—UNITED KINGDOM—Recent Iron-Ore Developments in the United Kingdom. (Journ. Soc. Chem. Ind., June 30, 1919; 34 pp., illus.)

IRON AND STEEL METALLURGY

253—ANALYSIS—A Study of the Goutal Method for Determining Carbon Monoxide and Carbon Dioxide in Steels. J. R. Cain and Earl Pettijohn. (Technologic Papers of the Bureau of Standards, No. 126; 8 pp.)

254—ACID HEARTH AND SLAG, The. J. H. Whiteley and A. F. Hallimond. (Advance Copy, Iron and Steel Inst., May, 1919; 44 pp., illus.)

255—ANALYSIS—Determination of Uranium, Zirconium, Chromium, Vanadium and Aluminum in Steel. Charles Morris Johnson. (Chem. and Met. Eng., May 15 and June 1, 1919; 4 pp.)

256—BLAST-FURNACE SLAG—Manufacture of Cement From Blast-Furnace Slag. Wm. Gocle. (Proc. Austral. Inst. M. E., Sept. 30, 1919; 20 pp.; reprinted in Queensland Govt. Min. Journ., Apr. 15, 1919.)

257—BRITISH STEEL OUTPUT Up 39 Per Cent. Joseph Horton. (Iron Tr. Rev., May 15, 1919; 2 pp., illus.)

258—CARBON STEELS—The Experimental Investigation of the Influence of the Rate of Cooling on the Hardening of Carbon Steels. A. M. Portevin and M. Garvin. (Advance Copy, Iron and Steel Inst., May, 1919; 90 pp., illus.)

259—CARBURIZATION—The Carburization of Iron at Low Temperatures. Andrew McCane. (Advance Copy, Iron and Steel Inst., May, 1919; 5 pp., illus.)

260—CASE-HARDENING PROCESS, Improvements in the. D. Hanson and J. E. Hurst. (Advance Copy, Iron and Steel Inst., May, 1919; 18 pp., illus.)

261—CAST IRON—Oxygen in Cast Iron and Its Application. Wilford L. Stork. (Bull. A. I. M. E., June, 1919; 54 pp.) 40c.

262—ELECTRIC FURNACES—Grands Fours Electriques Pour La Fusion De L'acier. Victor Stobie. (Journ. Du Four Electrique, June, 1919; 2 pp.) 40c.

263—FLAKY FRACTURES and Their Possible Elimination. Haakon Styri. (Chem. and Met. Eng., May 1, 1919; 6 pp.)

264—FLAKY STEEL—Flaky and Woody Fractures in Nickel-steel Gun Forgings—Micro-Structural Features of Flaky Steel. (Bull. A. I. M. E., May, 1919; 104 pp., illus.)

265—HEAT TREATMENT—Relative Size in Heat Treatment. T. G. Strudwick. (Iron Age, July 17, 1919; 2 pp.) 20c.

266—HIGH-SPEED STEEL—The Manufacture and Working of High-Speed Steel. J. H. Andrew and G. W. Green. (Advance Copy, Iron and Steel Inst., May, 1919; 314 pp., illus.)

267—HIGH-SPEED STEELS—The Molecular Constitutions of High-Speed Tool Steels and Their Correlations with Lathe Efficiencies. John Oliver Arnold and Fred Johnston. (Advance Copy, Iron and Steel Inst., May, 1919; 234 pp., illus.)

268—HIGH SPEED STEEL—The Properties of High Speed Steel. G. J. Horvitz. (Iron Age, June 26, 1919; 4 pp., illus.) From a paper before Am. Steel Treater's Soc. 20c.

269—IRON-CARBON ALLOYS—Graphitisation in Iron-Carbon Alloys. Kunio Tawara and Genshichi Asahara. (Advance Copy, Iron and Steel Inst., May, 1919; 154 pp.)

270—MACRO-ETCHING and Macro-Printing. J. C. W. Humfrey. (Advance Copy, Iron and Steel Inst., May, 1919; 134 pp., illus.)

271—OPEN HEARTH STEEL FURNACES Water-cooled Equipment for. (Bull. A. I. M. E., May and June, 1919; 9 pp.) Discussion of paper of Wm. C. Coffin, previously indexed.

272—PRODUCTION—The World's Iron and Steel Output. (Ironmonger, June 7, 1919; 1 p.) Memorandum from Nat. Federation of Iron and Steel Manufacturers. 40c.

273—RAILS—A Metallographic Investigation of Transverse-pressure Rails with Special Reference to High-Phosphorus Strouks. (Bull. A. I. M. E., June, 1919; 54 pp., illus.) Discussion of the paper of George F. Comstock, previously indexed.

- 274—REFRATORIES—Basic Refractories for the Open Hearth. (Bull. A. I. M. E., May and June, 1919; 4 pp.) Discussion of a paper by J. Spotts McDowell, previously indexed. 60c.
- 275—WAR—German Destruction in Northern France. (Iron Age, July 10, 1919; 61 pp., illus.) 20c.
- 276—WAR Remakes Steel Map of Europe. A. O. Backert. (Iron Tr. Rev., June 26, 1919; 6 pp., illus.) 20c.
- 277—X-RAYS—The Use of X-Rays in Metallurgy. (Iron Age, June 19, 1919; 24 pp.) Discussion at a recent meeting of the Faraday Soc. and the Roentgen Soc. 20c.

LEAD AND ZINC

- 278—AUSTRALIA—A Brief Résumé of the Smelting Plant at the Sulphide Corporation Limited Works, Cockle Creek, N. S. W. Guy Courtney. (Proc. Austral. Inst. M. E., Sept. 30, 1918; 4 pp., illus.) 40c.
- 279—BLUE POWDER FORMATION, Effect of Sodium Chloride on, Reginald S. Dean. (Chem. and Met. Eng., June 15, 1919; 3 pp.) 40c.
- 280—ELECTROMETALLURGY—État actuel des Industries Electrometallurgiques et Electrochimiques du Zinc. (Journ. du Four Electrique, June, 1919; 14 pp.) 40c.
- 281—ELECTROMETALLURGY—L'Electrometallurgie du Zinc. Procédés électrolytiques. (Metaux, Alliages et Machines, 1919; 13 pp.) 40c.
- 282—MISSOURI, ARKANSAS, KANSAS AND OKLAHOMA, Zinc Industry of, Otto Ruhl. (Eng. and Min. Journ., June 28, 1919; 14 pp.) Address before Am. Zinc Inst. 60c.
- 283—MISSOURI-KANSAS-OKLAHOMA ZINC AND LEAD DISTRICT, Conditions in the, W. E. Henry. (U. S. Bureau of Mines, July, 1919; 133 pp.)
- 284—NEW USES For Zinc. George S. Harney. (Eng. and Min. Journ., July 19, 1919; 2 pp.) From an address before the Am. Zinc Inst. 20c.
- 285—ROASTING AND MAGNETIC SEPARATION of Wisconsin Zinc Ores, The, E. G. Deutman. (Eng. and Min. Journ., June 28, 1919; 43 pp., illus.) 60c.
- 286—SMELTING—The Smelting of Zinc Ores. (Journ. Soc. Chem. Ind., May 31, 1919; 1 pp.) From a lecture delivered by J. C. Moulden at Royal School of Mines.
- 287—WAR'S INFLUENCE on the Zinc Industry. Pope Yeatman. (Eng. and Min. Journ., July 5, 1919; 3 pp.) Address before Am. Zinc Inst., June 9, 1919, 20c.

OTHER METALS

- 288—ALUMINUM—Evolution of the Lynite Laboratories of the Aluminum Castings Co. (Iron Age, July 17, 1919; 54 pp., illus.) 20c.
- 289—ALUMINUM—Heat Treatment of Duralumin, P. D. Merica, R. G. Waltenberg and H. Scott. (Bull. A. I. M. E. and M. E., June, 1919; 364 pp., illus.) 40c.
- 290—ALUMINUM—Progress in Aluminum Casting. (Metal Ind., May, 1919; 3 pp., illus.) Describes Plant of McAdamate Aluminum Co. 20c.
- 291—CHROME—Maryland Sand Chrome Ore, Joseph T. Singewald, Jr. (Econ. Geol., May, 1919; 9 pp., illus.) 60c.
- 292—MANGANESE—Cost of producing Ferro-Grade Manganese Ores, C. M. Weld and W. R. Crane. (U. S. Bureau of Mines, Minerals Investigations Series, No. 13, 1919; 214 pp.)
- 293—MANGANESE—Resena Historica Sobre la Mineria en Oriente, Cuba. (Boletim de Minas, No. 5; 134 pp.) Continuation.
- 294—MANGANESE—Uses of Manganese Other Than for Steel Making, W. C. Phelan. (U. S. Bureau of Mines, Mineral Investigation Series, No. 16, May, 1919; 14 pp.)
- 295—MOLYBDENITE—Colorimetric Estimation of Molybdenite in Low-Grade Ores and Tailings, G. Spurge. (Chem., Eng. and Min. Rev., June 5, 1919; 1 p.) 40c.
- 296—MOLYBDENITE DEPOSITS in Ireland. (Statist., June 21, 1919; 1 p.)
- 297—PLATINUM—Comparative Tests of Palau and Rhotanium Ware as Substitutes for Platinum Laboratory Utensils, L. J. Gurevich and E. Wichers. (Journ. Ind. and Eng. Chem., June, 1919; 3 pp.)
- 298—SELENIUM—Selenic Acid and Copper Selenate, L. M. Dennis and J. P. Koller. (Journ. Am. Chem. Soc., June, 1919; 21 pp.)
- 299—THALLIUM—Note on the Extraction of Thallium from Pyrites Flue Dust, George Sisson and J. S. Edmondson. (Journ. Soc. Chem. Ind., Mar. 31, 1919; 3 pp.)
- 300—TIN—Ancient Tin Mines of the Transvaal, Max Baumann. (Journ. Chem., Met. and Min. Soc. of So. Afr., Apr., 1919; 44 pp., illus.) Discussion of paper previously indexed.
- 301—TIN—Slime Treatment on Cornish Frames, S. J. Truscott. (Bull. I. of M. and Min., June, 1919; 11 pp.) Contributed remarks on paper previously indexed.
- 302—TIN—Tasmanian Production of Tin Oxide, Cyril W. Gudgeon. (Chem., Eng. and Min. Rev., May 5, 1919; 1 p.) 40c.
- 303—TUNGSTEN—Thermo Electric Ore Reduction Corporation, Limited. (Queensland Govt. Min. Journ., May 15, 1919; 24 pp., illus.) 40c.
- 304—VANADIUM—A Proposed Metallurgical Process for the Treatment of Vanadium for the Recovery of Lead and Vanadium, J. E. Conley. (Chem. and Met. Eng., May 15, 1919; 44 pp., illus.)

NONMETALLIC MINERALS

- 305—ASPHALTS—Melting Point of Asphalts, Leland M. Proctor. (Chem. and Met. Eng., July 15, 1919; 23 pp., illus.) 40c.
- 306—DIAMONDS—Notes on the Geology of the Diamond Region of Bahia, Brazil, Roderic Crandall. (Econ. Geol., May, 1919; 244 pp., illus.) 60c.
- 307—DIAMONDS—The South-West Protectorate Diamond Taxation. (South African Journ. of Ind., Apr., 1919; 4 pp.)

- 308—ELATERITE—Occurrence of Elaterite, or Elastic Bitumen, in a Fluorite Vein at Madoc, Ont. Cyril W. Knight. (Can. Min. Journ., June 4, 1919; 1 p.) 20c.
- 309—WHITE IRON, Port Elmsley District, Lanark County, Ontario, M. E. Wilson. (Can. Geol. Surv., Summary Report, 1917, Part E; 134 pp.)
- 310—GRAPHITE MINING AND MILLING in Alabama, H. P. H. Brummel. (Eng. and Min. Journal, July 5, 1919; 13 pp.) 20c.
- 311—LIME in 1917. G. F. Loughlin. (Mineral Resources of the U. S., 1917, Part 4; 11; 31 pp.) 20c.
- 312—MAGNESITE—The Hydro-Magnesite Deposits of British Columbia, Ronald Campbell Campbell-Johnston. (Min. Journ., May 17, 1919; 24 pp.) 40c.
- 313—MICA AND FELDSPAR—North Shore of Lake Huron, Ontario, W. H. Collins. (Can. Geol. Surv., Summary Report, 1917, Part E; 134 pp.)
- 314—MOLDING SAND—Production of Albany Molding Sand, Robert W. Jones. (Iron Age, June 5, 1919; 24 pp.) 20c.
- 315—NITRATES—The Prieksa Nitrates. (So. Afr. Min. and Eng. Journ., Apr. 12, 1919; 23 pp., illus.) 40c.
- 316—PHOSPHATE—On a New Phosphate Deposit in the Howqua District, near Mansfield, Victoria, Ernest W. Skeats and E. O. Teale. (Econ. Austral. Inst. M. E., Dec., 1918; 24 pp.)
- 317—PHOSPHATE INDUSTRY, The, James Hendrick. (Journ. Soc. Chem. Ind., May 15, 1919; 23 pp.)
- 318—POTASH—The Passing of the American Potash Famine, P. G. H. Boswell. (Journ. Soc. Chem. Ind., June 16, 1919; 14 pp.)
- 319—PYRITE DEPOSITS in Ohio Coal, W. M. Tucker. (Econ. Geol., May, 1919; 21 pp., illus.) 60c.
- 320—SALT—The Salt Industry and the Possibilities for the Future Development in Canada, Le Heber Cole. (Can. Min. Rev., May 14, 1919; 11 pp., illus.) 20c.
- 321—SULPHUR—Flotation and Retorting of Sulphur, P. F. Junehomme. (Eng. and Min. Journ., June 28, 1919; 3 p.) 60c.

PETROLEUM AND NATURAL GAS

- 322—ALBERTA—Peace River Oil, J. J. Rutledge. (Can. Min. Journ., Apr. 4, 1919; 13 pp.) 20c.
- 323—DRILLING—Perfection Plant for Oil-Well Drilling. (Engineering, June 27, 1919; 4 pp., illus.) 40c.
- 324—GEOLOGY—Petroliferous Provinces, E. G. Woodruff. (Bull. A. I. M. and M. E., June, 1919; 53 pp.) 40c.
- 325—OIL SHALES—The Winning of Oil From Rocks, Arthur J. Hoskin. (Min. and Sci. Press, May 24, 1919; 64 pp., illus.) 20c.
- 326—OIL SHALES—Value of American Oil Shales, Charles Baskerville. (Bull. A. I. M. E., June, 1919; 4 pp.) 40c.
- 327—PRODUCTION, ETC.—Petroleum in April and March. (Eng. and Min. Journ., July 12, 1919; 14 pp.) U. S. Geological Survey data. 20c.
- 328—WATER—Sealing Water in California Oil Fields, Seth S. Langley. (Eng. and Min. Journ., July 5, 1919; 74 pp., illus.) 20c.
- 329—WATER TROUBLES in the Mid-Continent Oil Fields and Their Remedies. (Bull. A. I. M. E., May, 1919; 3 pp.) Discussion of a paper by Dorsey Haeger and G. W. McPherson.

ECONOMIC GEOLOGY—GENERAL

- 330—INDIA—Notes on Structure and Stratigraphy in the North-West Punjab, E. S. Pinfold. (Rec. Geol. Surv. of India, Dec., 1918; 2 pp.)
- 331—ORE DEPOSITS—The Genesis of Igneous Ore Deposits, W. H. Goodchild. (Bull. I. M. M. E., June, 1919; 12 pp.)

MINING LAW

- 332—PROPERTY LINES—The Location of Property Lines, Wm. C. Wattle. (Col. School of Mines Mag., June, 1919; 53 pp.) 40c.
- 333—WORKMEN'S COMPENSATION, Chesla C. Sherlock. (Eng. and Min. Journ., July 19, 1919; 1 p.) 20c.

MINING—GENERAL

- 334—ACCIDENTS—Metal-Mine Accidents in the United States During the Calendar Year 1917, Albert H. Fay. (Tech. paper 224, U. S. Bureau of Mines; 794 pp.)
- 335—BLASTING—Electric Blasting Equipment, L. D. Rowell. (Eng. and Min. Journ., July 5, 1919; 2 pp., illus.) 20c.
- 336—BLASTING PRACTICE in Joplin District, R. H. Summer. (Du Pont Mag., July, 1919; 24 pp.) 20c.
- 337—CABLES—Oiling Mine Cables in Place, Wm. Fleet Robertson. (Min. and Sci. Press, May 31, 1919; 14 pp.) Paper read before Can. Min. Inst. 20c.
- 338—COST KEEPING for Small Metal Mines, J. C. Pickering. (Tech. Paper 223, U. S. Bureau of Mines; 1919; 46 pp.)
- 339—CURVES—Laying Out Short-Radius Curves, John Faber Hanst. (Eng. and Min. Journ., July 19, 1919; 3 p., illus.) 20c.
- 340—EXPLORATION—Progress in Methods of Exploration, Hugh M. Roberts. (Min. and Sci. Press, July 12, 1919; 44 pp.) 20c.
- 341—EXPLOSIVES—The Use of Explosives in Mines, H. Y. Russell. (Bull. Can. Min. Inst., June, 1919; 8 pp.) 40c.
- 342—HOISTING—Electric Hoisting Equipment at the Butte & Superior Mine, Oliver E. Jager. (Min. and Sci. Press, July 5, 1919; 5 pp., illus.) 20c.
- 343—ORE RESERVES—The Application of the Theory of Probability in the Determination of Ore Reserves, G. A. Waterman. (Journ. Chem. and Min. Soc. of So. Afr., Apr., 1919; 7; pp., illus.) Discussion of paper previously indexed.
- 344—PERU in 1917. (Min. Journ., June 21, 1919; 13 pp.) 40c.
- 345—SHAFT—Sinking and Concreting Mine Shaft 936 Feet Deep. (Eng. and Min. Journ., July 12, 1919; 53 pp., illus.) Procedure at four-compartment shaft of Miami Copper Co. 20c.

Signs of the Times

IF THE handwriting on the wall can be read aright, public control of many utilities will be an accomplished fact within the next decade. Insofar as ownership and operation by Federal authority are concerned, we are further away from that than we were twenty years ago. With few if any exceptions, the public wishes to see no more of Federal mismanagement and extravagance. Whether justly or not, the people attribute many of their grievances, high costs, and inadequate service during and after the war to the Government, and ask that former relations be resumed.

On the other hand, the public has learned that the Government can control much of the business on which our lives and happiness depend, and it will demand that this control be exerted. Previous to the war and during it we have had the experience of several overdoses of control, where large quantities of the remedy brought about conditions worse for the public than was the original disease. The Interstate Commerce Commission has done some excellent work, but it has gravely impaired the credit of our transportation lines. The Federal Trade Commission, established as a guide and adviser to the business men of the country, has developed into a prosecutor of successful business enterprise.

Whether Federal control will be limited to public-service corporations or will extend to various types of industry, no one can tell. Today the public is not finding fault with the former, but feels more than unkindly toward the purveyor of the necessities of life.

It is of the highest importance to American business that the tendency of the times be recognized, so that men of business will co-operate with legislators to produce intelligent and reasonable regulations. Opposition to the principle or disregard of legislative action will lead to the enactment of oppressive control that will throttle business to suffocation.

Henry A. Wheeler, President of the Chamber of Commerce, in an address delivered in Chicago April 29, suggested that cordial acceptance by organized business of the principle of larger public regulation may tend to accomplish a number of desirable ends:

1. To set aside definitely all public thought of the necessity for Government ownership and operation of any of the instrumentalities of commerce so long as regulation can be assured to preserve the public from being exploited.

2. That opposition will be removed to the broad application of the rule of reason wherein agreements between business men made in the public interest would not be regarded as criminal acts.

3. That all business, whether it be manufacturing, mining, or farming, shall enjoy a clear interpretation of the measure of co-operation and combination permissible in the public interest, and thus remove one of

the most obstructive features of our pre-war period in which the business man found no authority from whom he could secure definite approval or disapproval of proposed agreements with his fellows.

4. That the larger responsibilities resting upon the Federal agencies charged with the guidance of business, and of safeguarding the public, would compel greater care in the selection of personnel, and would invite acceptance of Federal appointments by men who, in the past, have not felt inclined to separate themselves from their own interests for a service not recognized as constructive in any large degree.

The nationalization of coal mines has already been suggested. Some control of our fuel supply is sure to come, and in due course supervision and control of the production of metals may follow.

It will be well if miners heed the suggestion and take active part in the consideration of any regulatory legislation that is proposed.

Engineers, Politics, And Civic Activities

TECHNICAL societies all over the country have recently been discussing, individually and collectively, the lack of that intimate touch which should exist between engineers on the one hand and politics and civic activities on the other. Something is wrong somewhere, for it is true that the engineer is distinguished by his absence, and not on account of his leadership, in matters politic and civic.

At the conference called by Engineering Council in April to discuss the creation of a Department of Public Works, M. O. Leighton, of the National Service Committee, spoke some unpleasant truths that will bear repetition. Among other things he said:

"But I really think that unless a change comes over you engineers, the organization in Washington that attempts to guide you and keep you informed, and expects your help in return, is going to have a very hard row to hoe. I don't suppose that there is one engineer in a hundred who realizes how poorly engineers are regarded in Washington so far as potentiality in political affairs is concerned. You don't stand as high as the undertakers, and when you are compared with trade unions you are so far behind that no one knows you exist. I sometimes think the reason is that you don't care for anything better, and again it seems to me that you don't know the conditions. If you did you would remedy them yourselves as a result of personal pride.

"Some of us remember when a committee of most distinguished engineers went to Washington to give advice to a Senate committee on an important engineering matter. You would have supposed that the cream of the engineering profession of the United States would have secured a respectful hearing. They barely

got inside the door of the committee room. The Senate committee promptly adjourned. They wouldn't treat a plumbers' union like that, nor a committee from the American Bar Association, nor yet a conclave of Presbyterian ministers. They have fallen into the habit of discounting engineers. The facts are, you don't count at all, and it is simply and solely the result of your indifference as illustrated by the response to the invitation of Engineering Council to come to this conference.

"I realize that I am talking to the wrong people. Your societies came forward and you are here, but you are the exceptions that prove the rule."

Committees may be appointed having upon them the best men in the profession, and they may be given full power, yet they accomplish little or nothing. Names count for nothing in a campaign. Vital, active, aggressive force must be used to make an impression. Without these, and the individual interest that makes them possible, there will be no results.

Lack of influence of engineers as a body is essentially due to lack of organization for co-operation, and the latter does not exist because the individual members making up each body are not interested in those things that may be done through co-operation.

Mr. Leighton further pointed out that as a first step in co-operation it was necessary to record the existence, membership, and activities of American engineering societies. He had been working for three months upon this with the assistance of the best-informed associations, and had gathered a list of only about 180 out of 300 or 400 probably existing. In closing he used these words:

"Why don't you authorize that Washington committee to spend a little money to dig out these engineering societies and get them to work? In other words, my friends, why don't you use the intelligence of a carpenters' union or a plumbers' union or the American Federation of Labor? Sometimes it seems as though you are temperamentally unfit for that kind of a job. Perhaps you are not; but, believe me, gentlemen, you act as though you were. Influence can't be acquired without participation. I believe influence means influx. That is what the engineers lack—influx. You don't flow into things. You stand on the outside looking in."

And Mr. Leighton was most heartily applauded for the scolding that he had administered.

The Raw Material In College Work

TOO many discussions of educational matters fail to bring to bear upon the question of education the most vital element involved—the raw material with which the educator has to deal. In university work, the entering student is supposed to have passed the high school and to have acquired habits of study and application. He is presumed to have given some serious thought to the selection of a life work.

In addition, students fall into one of several groups—one group characterized by men who have no objective, and are indifferent to the work in which they have enrolled; another composed of those on pleasure bent, and who are willing to sacrifice their own and their neighbors' time to accomplish their objective, and the last, and by far the smallest group, consisting of men who have a definite object, who realize the value of their time and who desire to apply themselves

earnestly to the work in hand. The percentage proportion of entrants falling into each group varies in different institutions. Men do not necessarily permanently adhere to the group in which they start, although once a man starts in the preferred class, he usually remains in it.

Indifferent men sometimes develop and change radically for the better. In considering raw material one must never fail to remember that youth is in the plastic state and that the man is in process of development. Wretchedly poor material may suddenly change into better. A student who has been a trial throughout his college work, and who has just scraped through, may yet develop into a useful man. Sometimes a graduate finds himself only after some bitter experience which directs his attention to his own shortcomings and stimulates in him a desire to begin in a new and better way.

A high quality of finished metal requires good raw material as the starting point, else great skill and knowledge will be required in bringing it to the requisite standard. Similarly, a college may graduate a high-grade man if it starts with good raw material. But the unskillful handling of a high-grade iron ore may produce an indifferent steel. So it is in an educational institution. Not only must there be a careful selection of good raw material, but there must also be competent handling of it, else such material may be spoiled in the making. Thus the two essentials, good raw material and competent instructors, may be taken as the prime requirements for the production of high-grade men, whether they be mining, civil, electrical, or mechanical engineers.

In striving for large numbers of students educational institutions are prone to overlook the fact that by so doing they often increase their own difficulties in producing a high-grade or even a fairly satisfactory graduate. First-class men are submerged in the mass of indifferent ones. It is like mixing rich ore with poor ore. On the other hand, however, the presence of a few good men in a class benefits many of the less able and tends to sweeten the product, although at the expense of the more competent men. It is for this reason that any plan for the segregation of such men generally from the ordinary run of class work would meet with objection. Nevertheless, for the benefit of these men additional work under the direction of the best leaders of the educational staff should be provided in each institution, and they should be relieved from a corresponding proportion of less important work. Recognition in this way would have an excellent influence upon all of the students.

International Trade Conference

AN INTERNATIONAL TRADE CONFERENCE will be held in Atlantic City during the week of Sept. 29 under the auspices of the Chamber of Commerce of the United States. Great Britain, France, Italy, and Belgium have been asked to participate, and have accepted the invitation. After the conference, which will be attended by a large number of American business men, the foreign representatives will tour the United States for about a month under the guidance of the National Chamber.

The main purpose of the conference is to acquaint American business men with present conditions abroad and bring about closer relations with our European as-

sociates in the war. Unless European countries can soon begin production on a large scale, they will be faced with danger of being unable to pay for food and clothing and inability to reduce their war debts.

America must come to the aid of these countries, not only because of their unfortunate condition but to protect our own social and financial interests at home.

Satisfactory Work of the War-Minerals Relief Commission

THE selection of Philip N. Moore as a member of the War-Minerals Relief Commission was a particularly happy one. Mr. Moore is a well-known mining engineer, and has the esteem and confidence of his brother engineers. Having a thorough knowledge of mining operations, he was enabled to bring out the testimony of the miners and mining-company officials who presented their cases at the hearings which were held in San Francisco, July 5 to 25, and reported on page 238 of this issue of the *Journal*. More than this, those who presented their cases were immediately at their ease as soon as they recognized that here was a man who not only understood the language and technical terms which they used to describe their operations, but who also was sympathetic with them.

Mutual understanding breeds confidence, and we believe that Mr. Moore's presence upon the commission and the way that the commission has conducted its hearings have created a feeling that, whatever the decision may be, claimants have been fairly and squarely heard, and that every facility was given them to present their claims. The two other members of the commission, John F. Shafroth and M. D. Foster, served on the committees of Mines and Mining, the former on the Senate committee and the latter as chairman of the House committee. Both bring to the commission a full knowledge of mining legislation.

Service Rendered

WHEN the United States Government has paid all of its war bills and wiped the slate clean, there will still remain an obligation that will not appear of record. This liability is large, but it is not measurable in dollars and cents. We refer to the debt that the Government owes to hundreds of men connected with the business of mining and metallurgy. Other men have served equally well in their civilian capacities, but our knowledge of the work of miners and metallurgists is more intimate.

Literally thousands of men participated in the national service, held themselves subject to call without regard to personal inconvenience or business interests, and responded without hesitation when needed by the war agencies of the Government.

This form of patriotic service merits more than passing mention, because it was offered with no thought of public recognition or possibility of applause; it carried no Government commission, donned no uniform, nor hoped for inclusion in that long and honored list of Government appointees at a dollar a year.

The men of the mines and mills, privates behind the lines, have contributed as much to the making of history as those who went over the top at the front, and without their aid our first line might have had little more strength than was developed by the vast armies

on the Eastern front. They will not be cited, nor will they wear chevrons that the public may know of their services.

There may be no appropriate manner in which to give public recognition of such service, but it will not go unrewarded. The work of some is known to their fellows, and has already commanded an admiration and a respect deeper than can be created by the wearing of insignia; but of still greater moment is the fact that the worker has the consciousness that he saw an opportunity for service and rendered that service to the best of his ability. He alone knows the sacrifice involved. His citation will come from a higher source and be of greater value than honors from a department or generalissimo.

A Responsibility and An Opportunity

IN A LETTER to college and university officers in this country the Commissioner of Education writes: "The higher educational institutions of western Europe have been prostrated by the war. Large numbers of the leading scientists and of the younger men whose scientific careers were just beginning have been killed. Because the intellectual resources of the United States have not been similarly drained, the Western nations are looking to the United States to assume the responsibilities of leadership in education and in science."

Will the colleges, universities, and technical schools of the United States seize this opportunity to help build up the civilization of the future by opening wide their doors to students from all over the world? Will Germany be allowed to re-establish her educational prestige and draw students to her, first from the Near East, and later from other countries against whom she fought in the war? Are we willing to admit that there has been any justification for Germany's assumption of educational prestige at any time during the past quarter of a century?

These questions are put squarely up to our institutions of higher education. Will they appreciate their responsibility and opportunity? Some of our schools are giving the problem serious attention. All should do so. Students in foreign countries should be made familiar with educational opportunities in the United States.

A Letter From Mexico

OUR presentation of the facts in connection with the murder of Theodore Patterson, manager of the Aranzazu copper mine of the Mazapil Copper Co., as published in the *Journal* of Aug. 2, has been acknowledged by the Department of State and the chairmen of committees of the House of Representatives to whom the information was transmitted, and we are advised that the matter will receive proper attention.

We are informed that, on several recent occasions, the American Embassy at Mexico City, under instructions from the department, has urgently requested the Mexican Foreign Office to take action looking to the adequate protection of the property and employees of the Mazapil Copper Co. With regard to the murder of Mr. Patterson, who was a British subject, the department is advised by the American Consul at Saltillo that several persons have been arrested in connection with that crime.

PILING TIMBER NEAR TRACKS IS ADJUDGED BAD PRACTICE IN MINES

Although timber piled alongside of the track in haulageways may clear the train, the vibration caused by passing loads will often cause the pile to slip and slide toward the track, so that the train will strike it.—Courtesy of the *Anode*, June, 1919.

Mining in the Belgian Congo

Production During 1915 to 1918—Growing Importance of the Region—Output Principally Copper, but Gold, Tin, Diamonds, and Coal Are Produced—Transportation Facilities Inadequate, but Are Now Being Developed

By SYDNEY H. BALL* AND MILLARD K. SHALER†

MANY years ago, a pessimist asked Leopold, King of the Belgians, man of affairs and colony founder: "What will become of the Congo if the synthesis of rubber is discovered?" He replied: "One should not worry. The Congo has had its ivory period; it now has its rubber period. Tomorrow it will have that of its mineral wealth; eventually that of agricultural products." The "tomorrow" arrived during the period of the war, thirty-two years after the founding of the Congo Free States and nine years after the annexation of the colony by Belgium.

It is natural to expect that the economic life of European colonial possessions in Africa sustained a marked setback during the war. That the mining industry of the Belgian Congo weathered the stormy period satisfactorily is shown by the following annual gross value of its mineral production:

TABLE I. VALUE OF BELGIAN CONGO MINERAL PRODUCTION, 1913-1918

1913.....	\$3,000,000	1916.....	\$13,107,000
1914.....	3,850,000	1917.....	18,232,000
1915.....	7,420,000	1918.....	14,110,000

The Katanga copper accounts for about three-fourths of the production; the gold produced is worth about double that of the diamonds. The gold and diamond production has increased steadily during the period under consideration, although the increase in diamonds has been relatively more rapid. The copper production increased notably until 1918, when a shortage of native labor and of coke and other supplies, as well as of freight cars, together with an acute influenza epidemic, cut down the output. As to the future, no great increase is to be expected for a year or two years, after which time, however, a largely increased mineral output can be looked for confidently. At present the Belgian Congo's yearly mineral production is about half that of Alaska. The betterment in the financial status of the colony is indicated by the fact that the colonial deficit of \$4,000,000 in 1913 had decreased to \$1,400,000 in 1918.

The Great War naturally did not stimulate mining, and in reality was responsible for many vexatious and costly delays in the receipt of supplies, and the conditions created by the abnormal situation resulted in operation with insufficient white staffs and native labor, and in delays in programs of expansion. The most serious effect of the war, namely, restriction of investments in much-needed means of transportation, may only be fully realized later.

Although perhaps scarcely in place here, a few words upon the warfare waged in Central Africa will serve to remind the American reader that the war was bitterly fought, not only in Europe and Asia but in Central Africa as well. When the war broke out, the Belgian Colonial Government held that the Berlin treaty of 1885, entitled "General Act Relating to Civilization in Africa,"

prohibiting warfare in the Congo Basin, should be enforced. Germany, however, on Aug. 22, 1914, attacked Lukuga, and the Belgian Congo was forced into the war. About 20,000 troops were mobilized and took part in campaigns in Rhodesia, British East Africa, German East Africa, and the Cameroons. The most important campaign in which Belgian Congo troops were engaged was that in the former German colony of East Africa. Native Congo troops, officered by whites, conquered all of the northwestern part of that colony. As a result, a Belgian now administers, from Tabora, a territory, once German, of about 77,000 square miles, or six times the area of the Belgian homeland. By Dec. 1, 1917, practically the last German had been cleared from East Africa. With the previously lost colonies of Togoland, the Cameroons, and German Southwest Africa, the German flag disappeared from over 930,000 square miles of African territory.

Counterbalancing in part the ill effects of the war in Central Africa are certain advantages, which may be enumerated as follows: (1) the war demonstrated the practicability of the use of airplanes in the tropics; they will undoubtedly be used there for commercial purposes. (2) Some of the 700 miles of telegraph laid, the roads made and wireless installed are of permanent value. (3) The greatest benefit will doubtless be the reluctance of many soldiers—formerly city dwellers—to return to city life, and the consequent gain to the Belgian Congo of many virile and intelligent colonists.

That the Peace Conference is not apparently to add to the Belgian Congo that part of German East Africa conquered by the Belgian Congo troops seems unfortunate. This appears to be the most highly mineralized part of the former Teuton colony. With the defeat of Germany in Europe, the fear that the Belgian Congo might form part of a German "Mittel-Afrika" passed. Great Britain and France had as early as September, 1914, assured to the Belgian Government the integrity of the Belgian Congo, and on April 29, 1916, this engagement was not only repeated by France and Great Britain, but the foreign offices of Italy, Japan, and Russia joined them, promising, in addition, a special indemnity for the losses suffered by the colony.

Germany's desire for the Belgian Congo, as a step toward her ambition to found a vast "Mittel-Afrika," dates back at least twenty years. "Mittel-Afrika" was to include, besides Germany's old colonies, the Belgian Congo, Angola, the north half of Portuguese East Africa, Rhodesia north of the Zambesi, and all Africa south of the Sahara, to say nothing of the Azores, Madeira, Cape Verde Islands, Prince's Island, St. Thomas, and Zanzibar. Even more generous was the German who made the map captured by the South Africans at Windhoek, then capital of German Southwest Africa, which showed all of Africa German, except the Orange Free State and Southern Transvaal (the Rand was German), which were marked "Boer Reserves"! Here she was to obtain raw tropical prod-

*Mining geologist, Rogers, Mayer & Ball, 42 Broadway, New York City.

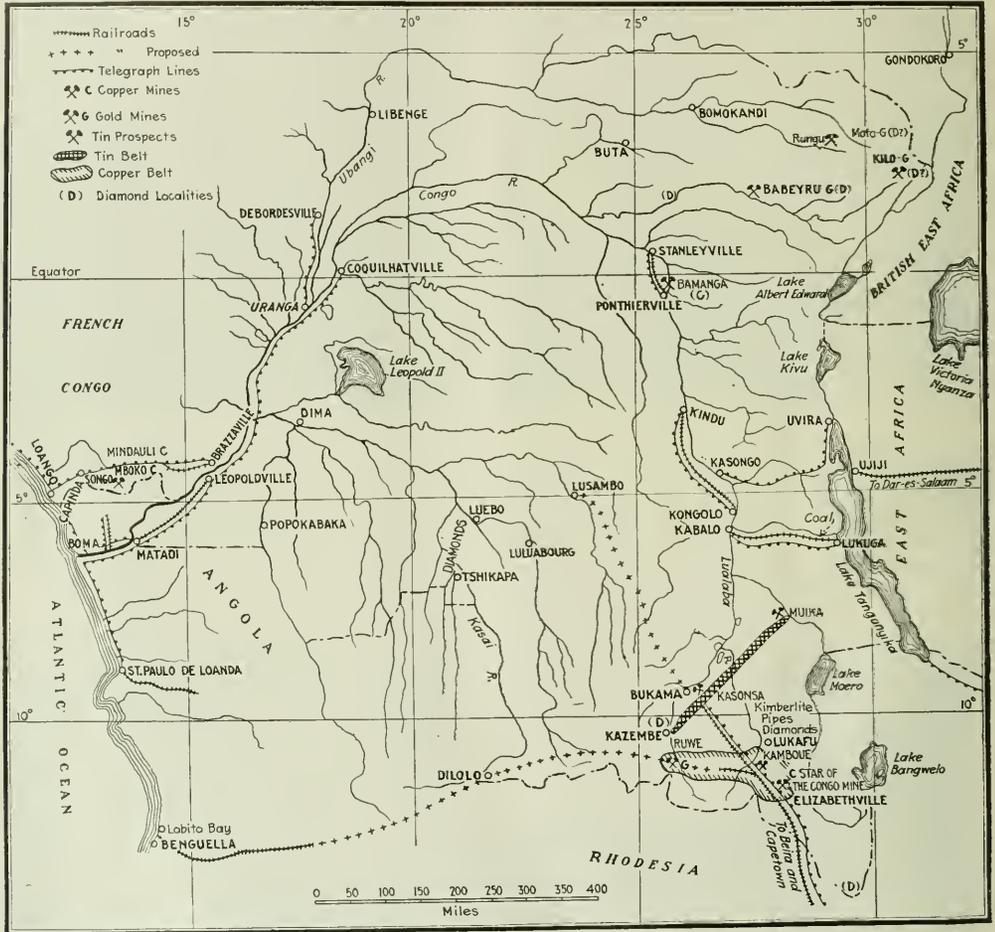

†Mining engineer, 5 Montague du Parc, Brussels, Belgium.

ucts, here she was to train millions of black soldiers for a future war, and from Africa harbors she was to strike at the trade of Africa, India, Australia, and South America.

One of the mildest indictments against Germany's colonization methods, so far as the natives are concerned, is to quote the statement made in 1888 by the German East African Company: "The aim of colonization is to enrich without scruple and with decision our own people at the expense of people more feeble."

its tributaries, non-navigable stretches being paralleled by railroads. In all, there are within the colony over 9,000 miles of rivers navigable to steamers of light draft. More than 100 steamers, of which about one-half are the property of the state, ply upon these waters. The service on the whole is slow and costly, the chief necessity being larger and more modern river steamers, although river improvements are required locally.

There are within the colony about 1,020 miles of

MAP OF THE BELGIAN CONGO REGION, SOUTH CENTRAL AFRICA

The Belgian Congo has an area of 908,000 square miles. It has a population variously estimated at from 9,000,000 to 15,000,000, the true figure probably being about 10,000,000. The white population in 1916 was 5,364, of whom over 10 per cent were engaged in mining. The colony, in normal times, is linked with Europe by an adequate steamer service, but U-boat depredations and more pressing need of shipping elsewhere made the service distinctly unsatisfactory in 1917 and 1918. It is hoped that this shipping shortage will soon be remedied. Interior transport follows the Congo and

railroad, or about four times the Alaskan railroad mileage. During the war railroad building was delayed, but the links between the Congo River (Kabalo) and Lake Tanganyika (Albertville) and between Elizabethville and Bukama were finished. The trip by rail and water from the Congo mouth to Elizabethville now takes about six weeks of actual travel, as opposed to an equal number of months ten years ago. Further, the first-named link completed an all-steamer-train trans-African route between Matadi and Dar-es-Salaam. From Ujiji to Dar-es-Salaam about 600 miles of railroad, once Ger-

man, is now operated by the Belgians. The Elizabethville-Bukama railroad similarly completes the Matadi-to-Capetown route.

Present transportation facilities are good in comparison with many colonies, but are unsatisfactory provided products less valuable than copper, gold, and diamonds are to be exported in quantity. Betterment of the Lower Congo-Katanga railroad around Livingstone Falls is imperative, as is also the construction of the Lower Congo-Katanga railroad which will not only connect the Katanga copper belt with a Congo seaport, but also pass through a country rich in minerals and forest products. Further, auto routes or other feeders to the principal railroads are essential.

The Benguela railroad, in Portuguese Angola, with the Katanga copper belt as its objective, is completed for a distance of 325 miles and has been graded for a further 75 miles. Construction was stopped during the war. A motor road exists from Buta to Bambilii, and that from Aba to Refaj (130 miles) is presumably completed. There is a wagon road between Stanleyville and Kilo. The length of these and other auto roads, about 650 miles, must be increased many times properly to serve as feeders for the present railroads and steamer routes.

A direct cable links the colony with Ostend, Belgium, and in the colony an excellent wireless service has been installed. There are also about 1,660 miles of telegraph lines. The pipe line from Ango Ango, near Matadi, to Kinchasa, near Leopoldville, furnished fuel oil for the river steamers until it was impossible to get deliveries of oil from Europe. Prior to the war, two hydroplanes were sent to the colony, and it is probable that in the future these and others may eventually find a certain use in carrying passengers, mails, and light express. The rivers are excellent landing places, and in addition a landing ground for airplanes has been established at M'Toa, on Lake Tanganyika. The Banque du Congo Belge, the colonial bank of issue, had seventeen branches last spring and eight more were to be established.

The Union Minière du Haut Katanga is expanding operations in its copper belt, in the southeast portion of the Belgian Congo, which contains many large high-grade mines. The publication of digests of yearly reports of the Tanganyika Concession Co. (which owns a little less than 40 per cent of the stock of the operating company) in the mining journals the last three years renders details unnecessary here.

The production of copper in metric tons by the Union Minière is given in Table II.

TABLE II. COPPER PRODUCTION OF THE UNION MINIERE

1911	Matte and Black Copper		1915	Matte and Black Copper	
	Matte	Black Copper		Matte	Black Copper
1912	86	2,492	1916	300	14,054
1913	162	7,407	1917	562	22,149
1914	259	10,772	1918	1,021	27,463
			(a) 1000	(a) 19,000	

(a) Approximate.

As before mentioned, the decrease in output in 1918 was due to transportation difficulties and labor shortage, and to an unusually severe influenza epidemic. In 1917 and 1918 only sixteen companies were large copper producers. The staff, including a number of Americans in the more important of positions, consisted in 1915 of about 250 whites, and in 1918 of approximately 450. A profit-sharing system, based on tonnage handled, is in operation among the white employees. The black laborers for the same years numbered respectively 3,500 and

7,000. During the war the Star of the Congo and the Kambove mines continued to furnish practically all of the ore, the Kambove mine being by far the larger producer in 1916-17-18. The Luishia mine and the Likasi produced a small amount, and the Chituru mine is now connected with the railroad and is being opened up. The Chituru and Likasi mines are on the railroad twenty-five miles from Elizabethville.

The quantity of ore in the belt, which is about 200 miles long, is unknown, but it is probably great. P. K. Horner, in May, 1916, estimated that there were positively developed at the Kambove and Star of Congo mines ore containing 304,000 tons of copper, and, in addition, "probable ore" containing 376,000 tons of copper (H. Foster Bain, *Mining Magazine*, March, 1917, p. 145). Such figures are sufficient to indicate that this is a most important copper region, as these are but two of the more important deposits. An extensive diamond-drilling campaign was carried on in 1915 and 1916. In 1916 and 1918 from 20,000 to 22,000 tons of ore per month was mined and treated.

The siliceous oxidized-copper ore requires much limestone and iron-ore flux and is smelted in blast furnaces to a black copper, containing 96 to 97 per cent copper. At the end of 1914 three furnaces were in operation, and two were completed in 1916. Nos. 6 and 7 were blown in in 1918. The daily capacity of these seven furnaces should be about 1,000 tons of ore, or 30,000 to 40,000 tons of copper per year. For various reasons only two to three of these furnaces were in operation during the last few months of 1918.

Experiments carried on at Elizabethville in concentrating and leaching in 1915-16 evidently were favorable to the latter process. A. E. Wheeler has now planned a large leaching plant, for which bids are being received. The plant is to have a capacity of about 55,000 tons of copper per year, and is to be operated by electricity generated by a 60,000-hp. hydro-electric power plant. As practically all the ores are oxidized, sulphide ores or sulphuric acid must be brought in from South Africa.

Costs, as given in the annual reports, do not include debenture or amortization charges. In 1914, mining, smelting, freight, and marketing cost about 10c. per lb.; in 1915, 9c.; in 1916, 8.41c. in the new furnaces and 9.51c. in the old furnaces, and in 1917, 11.8c. In 1918, owing to war conditions, the costs were 13.4c. In 1916, an average of 22.1c. per lb. was received for the copper and in 1917, 25.3c. Prior to the war, the copper was sold in Germany, but since then it has been shipped to England, although at least one small shipment reached the United States.

The Belgian Congo produced, to the end of 1918, from its gold placers, about \$14,600,000. Recent exports of gold from the colony follow:

TABLE III. BELGIAN CONGO GOLD PRODUCTION 1911-1916

Kilos		Kiloes	
1911	908	1914	930
1912	967	1915 (a)	3,955
1913	1,476	1916	2,852

(a) Owing to war conditions, the greater part of 1914 output was exported in 1915.

Most of this gold is carried by porters from the placers, which are in the northeast part of the colony, to the Uganda railroad, and thence shipped to Europe via Mombasa. In 1918 the gold, however, was shipped via Elizabethville and the Cape-to-Cairo railroad. Recent productions have been as follows: 1915, \$1,667,700;

1916, \$1,944,000 (3,240,212 kg.); 1917, \$2,215,500 (3,692,551 kg.); 1918, \$2,308,100 (3,846,786 kg.).

The colony operates the two more important gold placers—Kilo and Moto. Until 1918, these placers were operated by a single management, but in that year the mines were placed under separate managements. From 8,000 to 10,000 negroes are employed. Kilo, early in 1915, was seriously hampered by a shortage of white staffs, and in 1918 by a meningitis epidemic. In 1915 it produced 1,623,259 kg.; in 1916, 1,637,651 kg.; in 1917, 1,793,159 kg., and in 1918 about 2,213 kg. In 1916 it was stated that 14,000 kg. of gold was contained in reserves, so that the placer presumably has a life of three years at the present rate of production. In 1915 approximately forty sluices were in operation. Costs are reported to be about \$1.25 per cu.yd.

The Moto placer produced in 1915 a total of 999,519 kg. of gold; in 1916, 1,360,561 kg.; in 1917, 1,759,352 kg.; and in 1918 about 1,503 kg. The Babeyru placer, operated by the Société Internationale Forestière et Minière du Congo, in 1915 produced 164,306 kg.; in 1916, 241,914 kg.; in 1917, 137,609 kg., and in 1918, about 130 kg. In 1918 it was worked out. Costs were from 85 to 90c. per cu.yd. In the same general region several new gold prospects are reported, but none of these appears to be important. The Geomines has done nothing with its gold placers in the Katanga region.

DIAMOND PRODUCTION

The Kasai diamond field, owned by the Société Internationale Forestière et Minière du Congo, had produced to the end of 1918 somewhat over 400,000 carats of diamonds. Recent productions follow:

TABLE IV. BELGIAN CONGO DIAMOND OUTPUT, 1915-1918

	Carats		Carats
1915.....	48,935	1917.....	100,000
1916.....	53,940	1918.....	164,200

Thirty white men and about 3,800 blacks are employed. The Kasai company has found a number of diamondiferous areas to the northeast of the Forminière's ground, and the Lower Congo-Katanga R. R. Co. has made discoveries still further northeast. The Kundelungu Exploitation Co., which owns a number of slightly diamondiferous kimberlite pipes in the Katanga region, has done no work since the war began. In the same region the Simkat, which owns about seventeen pipes, carried on rather extensive washing tests. Diamonds occur in at least certain of the pipes, although none are exploitable. Scattered diamonds continue to be picked from the placer sluices in the northeastern part of the Belgian Congo.

TIN PRODUCTION

The Geomines is exploiting its tin placer at Kiambi by monitors and sluices. About ten white men and from 500 to 600 blacks are employed. It is understood that approximately \$4,000,000 worth of gravel of low grade (from 1/10 to 1/100 per cent) has been blocked out. In 1917, approximately 300 tons of concentrate containing about 50 per cent metallic tin was produced. Its other tin placer at Naulonga-Kikondja is not being worked.

The Union Minière du Haut Katanga has done little at Busango since the war began. In 1917 the railroad reached a point within thirty-eight miles of the mine, and exploitation on a small scale was resumed. The

Simkat, it is understood, is to again begin exploitation at Muika in the near future.

The Geomines has been opening up coal at Kilometer 262, on the Kabalo-Lukuga railroad. The company has sunk 40 m., cutting four seams of coal from 1.2 to 1.8 m. (4 to 6 ft.) thick, and it has drifted 100 m. on the best seam. This coal field has been described in detail by P. Fourmarier.¹ The coal occurs in a series of rocks of Karoo age, which are also coal bearing in South Africa. The principal coal outcrops are in the Valley of Nikuha and Kaseke creeks, and also at Kakuiga. The beds vary from horizontal to almost vertical. There are five coal seams, the most important in places being almost six feet thick. The weathered coal contains 61.9 per cent of carbon and 13.25 per cent ash and produces 5,891 B.t.u. It clinkers badly, but doubtless can be used locally on the railroad.

General prospecting, particularly in the Katanga, has been greatly curtailed by the war. The Kasai company has had men prospecting for gold in the northeast part of the colony, without, however, marked success. The various parties sent out by the Grand Lakes railroad into the country to the west and northwest of the northern part of Lake Tanganyika have all returned. A small gold placer, probably not exploitable, was located, and gem corundum deposits are said to have been found about 200 miles northeast of Kasongo. The rubies of these placer deposits are, however, small and the larger sapphires are off-color.

The law of Jan. 21, 1915, permits areas exploited for precious metals and precious stones to be closed to protect the products from theft. In the Katanga, because of the war, the period of legality of both general prospecting and mining permits has been extended. The period of validity of prospecting concessions in other parts of the colony will presumably also be extended.

OREBODIES IN NORTHWESTERN EAST AFRICA

That part of East Africa conquered by the Belgians and now administered by them is the best mineralized part of the former colony of German East Africa. It is a gold region of considerable importance, and a number of promising gold prospects are known. The Senkenke mine, owned by the Kironda Goldminengesellschaft, is the most important producer. The mine, opened in 1906, produced from 1909 to 1913 gold to the value of about \$642,000. Iron, copper and other metals and non-metals of value occur within the area.

Immediately north of the Belgian Congo border, near the Atlantic Ocean, is the M'Boko Songo-Mindouli copper belt, in the French Congo. A small amount of rich ore, said to contain 45 per cent copper, is shipped annually from the Mindouli mine to France. Ore shipments have been as follows:

TABLE V. FRENCH CONGO COPPER-ORE SHIPMENTS, 1913-1916

	Tons		Tons
1913.....	1,271	1915.....	463
1914.....	1,451	1916.....	600

The decrease in production in 1915 and 1916 was due to transportation difficulties, all ore being shipped over a light railroad to Brazzaville, thence by boat across Stanley Pool, and from there to the coast by the Lower Congo railroad. With proper transportation, the output could be considerably increased, but scarcely tenfold, as some French engineers claim.

Pump Troubles

Repairs and Renewals—Slime and Tailings Pumps, and Plunger Pumps—Equipment and Tools Needed To Effect Replacements and Readjustments—Care and Conservation of Parts

BY CHARLES LABBE

Mechanical Engineer, Johnnie, Nev.

A PUMP is a simple machine when in good working order and operated under favorable conditions, and is one of the most reliable and important adjuncts to be found in mill or plant. To maintain the condition known as good working order requires a knowledge of the fundamental principles of operation and construction. Considerable study and foresight are required to maintain conditions under which pumps will run effectively. Many persons consider a pump too simple a device to justify much thought and attention, and the result is that considerable work will be required sooner or later if the pump is to be kept in effective condition. The smaller the pump the less attention will be given to it; and, as with many other things, so long as it runs, no care is thought needed. But the pump may not give any warning. It may run today and quit tomorrow. Whatever the trouble, it appears slight at first view, but it often takes a good deal of experience to remedy it.

If only clear water is handled, little difficulty may be expected, but in many mills and cyanide plants the pulp and tailings must be pumped. In pulp and tailings pumps there is much scouring, and operating difficulties are limited mostly to repairs and renewals of worn-out parts. With water and clear solution more mechanical troubles are experienced, because pumps handling these materials are more complicated and must fill two functions—suction and pressure. With slime pumps the function is principally pressure.

Even if the simplicity of a pump is generally known, it will not be out of place to go over the fundamental principles. Suction may mean vacuum, but vacuum will not raise water. Pressure is needed to force water up. This pressure, the atmospheric pressure, must be applied on the water to force it into the vacuum created by the pump. It is known that at sea level the atmospheric pressure will force water up 33.83 ft. into a vacuum. The best pump in the world will not suck water an inch higher. Theoretically and practically, the suction depends on the elevation above sea level, less the mechanical losses, and it must be remembered that no pump reaches for water, but water must come to the pump after the vacuum is created. Whatever the pump, plunger, centrifugal or rotary, the suction troubles are nearly the same, and under this head can be classified three-fourths of all difficulties encountered in the operation of pumps.

LOCATION OF PUMPS

A pump must be placed where sufficient room can be provided. Accessibility from all sides is of prime importance. It is difficult at best to correct pump troubles, without fighting for room in cramping positions. The foundation must be of ample size to prevent vibration, which would tend to loosen or break pipe joints. Light, natural or artificial, must be a little more than sufficient. Drainage must be provided for every cir-

cumstance, and the pump must be placed where it will be a pleasure to work on it. The pump must be as near water as possible, and the suction pipe must be as short and as straight as the place will permit. Avoid long suction pipes where a high vacuum must be maintained, as a small leak will cause much trouble. Avoid air traps. They have caused the failure of many a pump to start. If the pump is not already provided with flanged connections, it will save future troubles and time lost in repairs to put them in. To make the change, plain, straight flanges with bolts are the best. Unions are good, but in the larger sizes, from 2 in. up, they are unhandy. The pipe must be pushed back to join, the nut may start cross-threaded, and most of the piping and pipe lines can be moved sidewise, but hardly lengthwise. Reduce to the strictest minimum the number of fittings used. They are expensive in first cost and in running, on account of the friction they cause.

HORSEPOWER AND PIPE SIZES

The formula for horsepower necessary to raise water is very simple: *Weight of water in pounds* \times *feet friction* = *hp.* \div 33,000.

In every case friction is the hardest to ascertain. It varies with the size of the pipe and the number of elbows. In the following formula, *Gal. per minute* \times *total lift* \times 0.00034 = *hp.*, the friction is included. The size of the suction pipe may have to be figured out. Remember that the velocity of 200 ft. per min. in the suction pipe gives the best results, from which the formula is obtainable: *Area of plunger* \times *plunger speed in ft. per min.* = *area of suction pipe* \div 200.

The size of the suction pipe is commonly the same as the flange connection. The principal reason why the suction pipe is larger than the discharge is because water must travel at a rate of 200 ft. per min. for the best results. Any extra friction lowers the efficiency of the pump considerably; whereas, in the discharge pipe, a speed of 350 ft. per min. is most satisfactory. The water moves faster and a smaller pipe is sufficient.

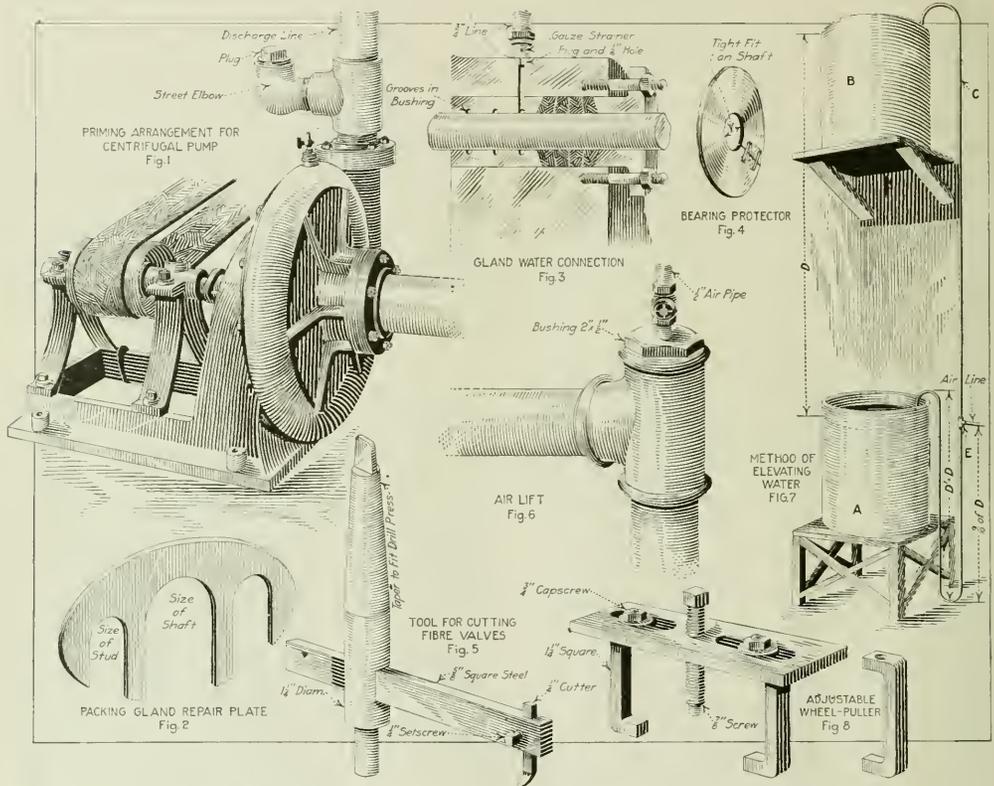

CENTRIFUGAL PUMP TROUBLES

Trouble can often be avoided by making a thorough inspection at regular intervals, five times a year as a minimum, but this is seldom done, as few like to disturb a centrifugal pump so long as it is pumping well. A slight change in conditions will stop the pumping, and trouble will come at the most unexpected moment. Nearly all centrifugal pumps taking water from below the level of the pump, if stopped and started often, must have a foot valve. All pumps with double suction runner make good vacuum, but most pumps with a one-sided runner do not. The operator may learn when a pump needs a foot valve, by holding his hand (if this can be done) at or near the end of the suction pipe. He can feel the water go into the pipe a foot or so,

and then come back. This may happen about twenty times a minute. A vacuum gage on the suction line will show the same thing—a vacuum of an inch or so, then back to zero.

All centrifugal pumps must be primed before starting. The intake pipe and the pump must be filled with water. There are many ways of priming pumps, the simplest being with bucket and funnel, but any other way is as reliable. It is advisable, to facilitate priming, and to help in finding the cause of later troubles, to put at the discharge a *T* with a street *L* and plug (Fig. 1.) By taking the plug off, one can pour water into the pump or connect priming water from an independent

will be experienced. When renewing it, be sure to take all the old packing out and at the same time notice the condition of the shaft. If badly worn or rough, or out of center of the gland, do not expect the best packing to last. Square flax packing of the exact size of the stuffing box must be used. Most of the square packing will stand slight hammering (up to $\frac{1}{2}$ in. out of size) to make a good fit. Rubber packing does not give satisfactory service in the stuffing boxes of centrifugals. There is not enough room for the elasticity of rubber to act, and it soon burns if in contact with the shaft. Always use plenty of flake graphite and oil when packing pumps.

MECHANICAL KINKS IN PUMP INSTALLATION AND OPERATION

line. Large pumps are primed with a steam ejector or a water ejector. Whichever way the pump is primed, the water must come to a point above the pump to avoid air pockets. Many a time small centrifugals have been started by holding the intake pipe level with the top of the pump, filling it with water, starting the pump, and at the same time dropping the pipe in the water. This may do with a small pump, with temperature above 32 deg., and if not attempted too many times, but a leak will soon occur in the suction line, which will prove annoying.

The packing gland must be tight, but not so as to make the shaft heat and burn the packing. The packing must be renewed when it has lost its elasticity. Do not wait until it gets as hard as wood, or trouble

Do not coil packing in one piece until it fills the stuffing box, and then cut the end off. The best way is to cut rings that will fit the shaft exactly. Place one ring in at a time, pushing it squarely into the stuffing box with the packing gland. See that the joint of the next ring is opposite the one just put in. Mark on a convenient place the exact size and length of packing it takes to make a ring, so that it will be an easy matter to make another good-fitting ring when needed. If in packing the pump the shaft is not in the center of the stuffing box, it is probable that the bearings are worn, and consequently it will be hard to make the packing hold, as one side is too loose and the other too tight.

Unusual wear of the shaft may be caused by the belt being too tight or the motor out of line. Either con-

dition will cause the bearings to heat, but if the shaft vibrates, and the wear is all on one side, the runner is out of balance. Fill the stuffing box nearly full with packing, but do not screw up the nuts on the gland too tight. Do not tighten the nut on one side more than on the other, or the gland will break or be cramped and score the shaft. The purpose of the packing gland is to prevent leakage, so keep it just tight enough. Any extra tightening will only increase friction and cause the shaft to heat. Sometimes, on account of chemicals in water, the oil or grease in the packing does not last, and in a short time the packing is lifeless. Under such conditions, before putting the packing in next time soak it in a mixture of white lead and graphite.

REPAIRING GLANDS

Whatever may cause a packing gland to break, the commonest repair is to fit a plate of stout sheet iron to slip over studs and shaft (Fig. 2) without taking anything apart. Such a plate may be kept on hand.

Broken studs are more troublesome. To hold the gland a bolt and nut can be so set that the end of the threaded part goes into the hole of the gland with the head against the closest part of the pump (as nearly in line as possible), and the adjustments made with the nut. Later on, the broken part will have to be drilled out and a new stud made. If the stud has stripped the thread in the casting, the hole must be tapped out to the next larger size, but sometimes the next larger size cannot be used. Then the hole must be tapped with the nearest pipe tap, and one end of the new stud must have the same pipe thread. Never replace a stud by a capscrew, because if the screw is taken out often it soon wears the threads off the casting, and before long the hole will have to be tapped out for a larger size.

TROUBLES IN RUNNING

If, when the pump is properly primed and started, the water does not come in quantity "as it used to," it is possible that the impeller is worn. The speed may be increased. If the priming is lost after the pump has started, there is probably a leak in the suction, or the packing is loose. From 5 to 10 drops of water per minute dripping off the gland lubricates the packing and helps to keep it soft and airtight, but more is not advisable.

If the shaft goes back and forth, the pump needs priming. There is air in the intake line, or possibly the runner is off the shaft or the shaft itself may be broken. Should the pump pull hard and overload the motor, the runner will be found to be rubbing against the casing on the suction side. Either the balancing device is broken or the thrust collar has moved on the shaft.

After running a while the casing of a centrifugal pump may get hot, sometimes nearly to the temperature of boiling water. This is a sure sign that the pump is not working. The runner keeps on churning the same water. Probably nothing is coming to the pump. A valve on the intake line may be closed or the pipe clogged. The pump casing will heat and the packing gland will leak badly, and tightening will not improve matters. In case of the pump casing heating, a pressure gage will prove useful. Connect it to the pump casing. If there is excess pressure the discharge line is closed, but if the pressure is a few pounds, or lacking, the trouble is with the intake.

Sand pumps are made only in the centrifugal, volute, and turbine types. All are made with renewable liners and impellers, to allow for wear. To keep the sand off the bearing and packing gland, water of higher pressure than that generated by the pump is introduced on the bearing side. In action and construction they are all centrifugal pumps, and subject to the same operating difficulties.

On account of the weight of the material to be pumped, the slime pump does not work well on suction. In nearly every case the pump must be set below the supply. The pulp must come to the pump. The only exception is the dredging pump, in which the impact of the water carries the gravel, but this is not a slime pump proper. The intake line must be as straight as possible. Elbows here are out of place, on account of foreign matter—wood, rags, and like substances present in pulp—which usually stop at the elbow and finally clog the pipe, and also on account of the friction, which soon wears a hole through the elbow.

GLAND WATER

The gland water must come from an unfailing supply, and the pressure must be at least a pound for every foot of pulp elevation. The best practice is to have a special tank of clear water (or clear barren solution, if the lime percentage is not high) placed in the highest part of the plant. To get the benefit at the gland, of the true pressure, the water is brought in a $\frac{3}{4}$ -in. or $\frac{1}{2}$ -in. pipe, and the last nipple on the pump is reduced to $\frac{1}{16}$ in. by plugging the nipple and drilling a hole (Fig. 3).

There will be no chance of clogging if, in the union just before this nipple, a metallic gauze screen of conical shape has been placed. Inspection will be an easy matter. In some pumps the gland water is connected to a loose gland-water ring, which is placed about the middle of the stuffing box when packing the pump; but the best practice is to connect the water to the bearing close to the packing. If grooves have been provided, connected together, the bearings last longer. If the gland water stops, shut down the pump at once, as if allowed to run the sand will enter between the shaft and bearing, and in a few minutes the shaft bearing, packing, and gland may be worn so as to make their renewal imperative.

To protect the next bearing from water or even from pulp, on the shaft, next to the packing gland, put a washer made of 4- or 6-ply rubber belting about 3 to 6 in. in diameter, fitting tightly on the shaft. If not put on when putting the pump together, the washer may be put on afterward by making a cut into one side and tightening it with wire (Fig. 4). The washer will revolve with the shaft, and any leakage will be thrown out sidewise, instead of following the shaft.

Pressure gages used on tailings pumps must be protected by a siphon having at least two coils; and before being put in operation must be filled with water. They are used only for a few minutes at a time, because if left in circuit with the pump the pulp will soon take the place of the water and the gage will be filled tight and rendered useless.

The material used in pump liners is usually chilled iron and manganese steel. Impellers are made of the same substances. The open runner may not be as efficient as the closed type, but the preference is decidedly in favor of the former. When the liners are worn

down to a safe limit they must be replaced, as, if they wear through, the outer shell, being soft, will not last long.

In replacing liners, the ground parts must join exactly without gaskets. After the casing bolts have been tightened, the setscrews holding the liners in place are made fast. Even if the ground joints of the liners are as good as can be made, some pump men take the extra precaution of pouring cement (one part cement and two parts sand) between shell and liner to avoid eddies or leaks, as eddies will wear holes in the liners or through the shell.

Liners must be handled with some care, as they break easily, and repair on them is out of the question. They are so hard that they cannot be drilled. Holes have been filled and small runners rebuilt, but their brittle character prevents large repairs from being successful.

In setting the thrust bearing of the runner shaft, bring it against the liner on the suction side; then bring the shaft back $\frac{1}{8}$ in. This is a safe margin, because when the pump runs, the force of the suction will bring the impeller a trifle closer still.

Multi-stage slime pumps have not been used extensively, for the reason that a sand pump must be as simple as possible. Two-stage or compound pumps are often made with two centrifugal pumps of the same size in series (one right hand, one left hand), the outlet of the first one being through a number of elbows discharging in the intake of the second pump, and both driven by a common shaft with pulley or motor in the center. Such an arrangement is common, but is of low efficiency. The principle of the series pump is to have the water delivered to the next one, with pressure but no speed. Two things that are positively worthless on a slime pump are foot valves and globe valves. The best valves are those of the quick-opening gate type.

In direct-connected pumps, flexible couplings are always used, and much wear takes place in them. They are made in many styles, the multiple-leather links being about the best. Rubber wears out too quickly. Iron to iron wears also surprisingly fast and is noisy. When iron to iron is used on the studs or bolts, I slip on a lead bushing about $\frac{1}{4}$ in. thick. To make the bushings as needed pour a bushing about 12 in. long and saw off required lengths. A supply can be kept on hand, and, when necessary, old ones may be replaced. Their cost is slight. They are noiseless, and do not wear into the flanges.

In making the regular pump inspection see that the pump shaft is in line with that of the driver. This may be done by putting a straight-edge on the coupling flanges, trying in two or three places, making sure, also, that the foundation and base bolts are tight. Never run a pump without water, as damage may result. All parts have but little clearance and will bind and heat. Do not use a check valve on the discharge line of a slime pump, as when the pump is stopped all the sand or slime will settle on top of the valve.

Single- or double-acting plunger pumps have a piston or plunger made either entirely of metal or with leather cups. The suction and discharge valves are part of the pump. The troubles of suction are the same in all pumps, but as these pumps have valves to hold the water they are somewhat more complicated than centrifugals, though they have a greater centrifugal. Having

more working parts, they require more attention. They must be inspected regularly, the valves at least once a month. The packing, being placed around the plunger, requires a larger quantity, having also to hold the water from passing outside.

VALVES ON PUMPS

Valves are one of the main wearing parts of a pump. In handling clear water they are expected to last well, but with any grit in the water, valves and valve seats will not last long. They must be replaced and the seat refaced. Under normal conditions the iron valve seat and the hard-rubber valve are the most economical and give the best service. They form an ideal combination for the cyanide plant, where brass is out of place. Red fiber also gives good service and is to be recommended where odd sizes are used. Fiber valves can be cut on the drill press as well as on the lathe. They are traced on the sheet, the stud holes drilled first, and the outside cut to size with the tool shown in Fig. 5. The valve seats are faced on the lathe. Often the grooves worn in the seats are rebuilt with the oxyweld, and then either dressed on the smooth side of the emery wheel or turned down. In out-of-the-way places, where supplies do not always come when expected, flat valves made of pieces of boiler plate have given surprisingly good service. They were made of the same thickness as the original rubber valves. When slightly worn, they were turned over and later refaced on the lathe. No springs were used in connection with them, and they did not wear any harder on the studs than either the hard rubber or the fiber.

Valve seats are removed by unscrewing them from the pump, or, if driven, by pulling them out with the wheel puller. Studs wear mostly on one side and must be replaced when in bad order. New studs must not have over $\frac{1}{4}$ in. clearance between the end and the plate cover, so that if the stud works loose it cannot fail. The yoke holding the valve cover must be made of cast iron, and must not be replaced by a solid bar of iron or steel. It works as a safety in case the pump be started against a closed valve in the discharge line, and its breaking releases the valve cover. The cost is moderate, and if anything else should break serious damage would result. To prevent breakage, a relief valve is installed on the by-pass line, but to be reliable it must always be kept in good condition and tried often.

PACKING FOR PUMPS

For the packing, the same conditions prevail as in the centrifugals. Each ring of packing must fit exactly, and the joints must be opposite or staggered. It is of little importance whether the ends are cut square or 45 degrees.

Plungers must be trued up when grooved, although the worst condition is when they are not parallel. After they have been turned down, it is good practice to put a turned ring of iron in the bottom of the packing box to make up for the difference in size and to prevent the packing from extending too far past the casting.

In packing plungers, an alternation of square flax and rubber fabric lasts longer than if packing is entirely of the same material. Use flake graphite freely, and about once a day oil the wearing surface of the plunger. When the service of a pump requires the packing to be changed every month, or more frequently, the flax packing can be used again by turning it over,

putting the inside worn face outside. Large packing glands which have stood much wear may be slightly bored out on the lathe and babbitted.

BEARINGS

Bearings must not be allowed to become loose, as the lost motion will crystallize the bolts, and they will snap off. A bad practice is to cut down bearing caps when the shims have all been taken out. When a bearing is worn out, a new one should be put in. Bad bearings and worn gears make noise and require more power. It is economy to make good permanent repairs.

AIR CHAMBERS

To take up the shocks and fluctuations of the plunger, and to form a steady flow, an air chamber is attached to the discharge pipe. It is usually made of cast iron, but can be made with a piece of pipe with a cap at one end. In some cases the action of the water, and also of cyanide solution, makes it porous, and in a day or two all the air will be out of the air chamber. The result is a steady pounding in the pipe. The air chamber must be taken out and treated, about once a year: dried, filled with paint and left under air pressure for about forty-eight hours. Some of the paint will fill the pores and leave a good coating inside, leaving the air chamber tight. Some air chambers are provided with a glass gage, but too often the glass is broken, or most of the air leaks out through the fittings, and as gages require much care they are not in high favor.

Pounding in a reciprocating pump may be due to the piston striking against casting, to loose bearing, unscrewed rod, air chamber full of water or discharge valve out of order. To find the cause, a good way is to follow the action of every plunger and notice exactly at what part of the stroke the pounding occurs. When running with a closed or nearly closed valve on the suction line, the pump runs light, and every bearing makes a noise from lost motion that is never heard when the pump is under load. The gears also are noisy.

Priming of a reciprocating pump is recommended, although not always necessary if the packing and valves are air-tight and the lift is not too high. If the pump takes air from any source, it is likely that it will pound, and operate as though all the plungers were striking regularly on something hard. The pump must be stopped and filled with water, after opening all vents to let the air out, and the leaks must be attended to.

A pressure gage connected to the discharge line of a pump will show whether the plungers are doing the same amount of work. In a triplex pump, the gage hand will show three even fluctuations per revolution. If one is weaker than the other, it either leaks at the packing or something is wrong with the intake valve. A valve may stick on the stud and stay open; the spring may be broken and may have worked in between the stud and the valve; the gage will show an irregular pulsation, and the valves must be inspected. By listening, a pump man can soon tell that something is wrong.

Sharp pounding in the pipe indicates that an air chamber is full of water, and the hand of the gage will work up and down quickly. An extra air chamber placed about half way in the line may help considerably. Insufficient water supply will cause a jerking of the plungers and a pound, indicating failure of the supply or that the intake valve or line is partly stopped. A plunger loose on the rod will produce the same effect. Too

quick seating of the valves may cause a pound, or the springs may be too tight. In fast-running pumps, a pound may be heard in the intake line as the intake valves close too quickly, but this is of rare occurrence. The remedy is to put a vacuum chamber on the intake line close to the pump.

DIAPHRAGM PUMPS

In many mills diaphragm pumps are used as sump pumps for transferring pulp from one tank to another. They are simple in operation, but their range of work is limited. The rubber diaphragm acts as plunger with a valve which is part of it. There are no other adjustments but the stroke, which, when once set, is seldom changed. The repairs are mostly limited to the renewal of worn-out parts. The valve seats can be either rebuilt with the oxyweld or faced down on the shaper or on the emery wheel. Being only rough castings, they are discarded when worn down too far. Nearly all the troubles are caused by worn parts. The pulp may be so thick that the pump will not handle it, but the pump is not to blame. Diaphragm pumps must be primed before started, and often the diaphragm must be covered with water to make it airtight. When not in use the diaphragm is taken out, wrapped in paper, and stored in a cool place; otherwise it may be so dried out and cracked as to be worthless.

AIR LIFTS

Where compressed air is available, air lifts are the cheapest and most simple pumps; and they should be mentioned in any discussion of pumping practice. They may not be the most economical when crudely made. In most cases they are made only when needed, of fittings on hand. Fig. 6 shows a type which can be made in a short time with a 2-in. T, one reducing bushing, one length of 2-in. pipe, one $\frac{1}{2}$ -in. valve, one length of $\frac{1}{2}$ -in. pipe, a foot or so shorter than the 2-in. pipe, with about a dozen $\frac{1}{8}$ -in. holes drilled near the end. The one drawback is the depth of submergence that air lifts must have. The footpiece in rough-and-ready mill work is not important, small holes drilled around the bottom of the air pipe being the best. For a large and steady amount of water, specially designed and ready-made footpieces are used, and in many cases the costs for pumping are less than with any other kind of pump.

Solution in tank A (Fig. 7) is to be lifted to tank B, without cutting any holes in the tanks. The pipe C will be connected so as to form a siphon over the rim of tank A (priming valve on top of siphon) and extended down to a distance equal to D. The air pressure will be connected through a tee at E, a point nine-tenths of the distance D on the up pipe.

Dirty and gritty mill pulps cause pump trouble as a rule, and tanks should be made 5 or 10 ft. deeper in the first instance and an air lift used.

USEFUL TOOLS

Besides the usual set of tools and wrenches, the repair man must have one set of pipe wrenches, chain tongs for the large sizes, two small crowbars, with one end chisel-bit and the other round and pointed; three or four punches not over 12 in. long, the smallest size being $\frac{3}{8}$ in. and the largest 1 in. They are specially useful when connecting large flanges. First, the round end of the crowbar is placed through two holes of the

flanges. This will hold the pipe line in place. Next the gasket is slipped in, one hole of the gasket facing any hole in the flange. There a punch is driven fairly tight, the crowbar taken out, the gasket holes brought into place, and the second punch is driven in any hole about opposite, thus bringing all the flange holes in their exact place. The bolts are then put in the other holes without the slightest trouble, whatever size the flanges may be, and, when well tightened, the two punches are hammered out and bolts put in their places.

Packing hooks are of all sizes. The most commonly used are made of $\frac{1}{16}$ -in. steel wire, one end with a ring handle, the other end corkscrew. An adjustable wheel puller for replacing pinions and gears, pulling out bushings and valve seats—a strong one and easy to make—is shown in Fig. 8. A small automobile screw-jack which can be handled with one hand where crow-bars cannot be used is likewise essential, as are also several chisels of different shapes for cutting gaskets, and a vacuum and a pressure gage for testing pumps. Scrapers made of old files for cleaning flanges and a fine wire brush for cleaning threads should be provided.

On pipe joints use a mixture of graphite and linsed oil. If in narrow places and high pressure there is trouble in holding gaskets, use soft sheet zinc about $\frac{3}{32}$ in. thick in one or two thicknesses. If taken out often, the zinc sheets must be annealed.

Advantage of Washing From a Flowing Stream

The illustrations show the application of the shower to the ordinary type of faucet for washing purposes

APPLICATION OF THE FLOWING STREAM

in change houses. This improved method of washing from a flowing stream permits a workman to perform his ablutions in a more thorough manner than is allowed by the usual method. The advantages are ap-

parent, as the upper part of the body can be easily reached by the stream, much to the satisfaction of the workman. The sanitary feature of the installation is a distinct advantage, as the operation is claimed to be absolutely germless.

WASHING VARIOUS PARTS OF THE BODY

This installation is used by the United States Steel Corporation and the photographs are reproduced from Bulletin No. 7 of the Bureau of Safety, Sanitation and Welfare of that corporation.

Transvaal Gold Output

Output of gold at Transvaal mines during the first six months of 1919 amounted to 4,147,484 oz., valued at £17,617,391. This compares with 4,256,334 oz. in the same period of 1918. The following table shows the monthly figures for the last four years, in fine ounces:

	1919	1918	1917	1916
Jan.....	676,959	714,182	782,634	787,467
Feb.....	636,728	659,759	721,321	753,594
March.....	712,379	696,81	787,094	796,689
April.....	694,944	717,099	742,778	754,672

Schedule C, Now in Effect at Trail Smeltery

Consolidated Mining & Smelting Co. Issues New Schedule in Place of Schedule B—Action Follows Recent Investigation of Smelting Rates

VICTORIA CORRESPONDENCE

THERE has been dissatisfaction on the part of independent shippers of British Columbia with the treatment charges of the Consolidated Mining & Smelting Co. of Canada at its Trail smeltery as set forth in what is known as Schedule B. This, it will be recalled, led to an investigation by a special committee having authority from the dominion government, the report of which was issued a short time ago. The matter was discussed at a recent mining convention at Nelson, when it was announced by J. J. Warren, general manager of the Consolidated company, that a new schedule was being prepared and would be issued soon. This schedule, Schedule C, has now been published and is effective. It provides the promised reduction in ore-treatment rates and more especially affects those ores containing zinc and sulphur. The schedule is as follows, the introductory table being the basis of payment for silver and lead:

SCHEDULE C ISSUED BY CONSOLIDATED MINING & SMELTING CO. OF CANADA

SHOWING BASIS OF PAYMENT FOR SILVER AND LEAD

	Silver Payment, Per Cent.	Lead Payment, Per Cent.
10% zinc or under	95	90
Over 10% and including 11%	94	89
Over 11% and including 12%	94	88
Over 12% and including 13%	93	87
Over 13% and including 14%	93	86
Over 14% and including 15%	92	85
Over 15% and including 16%	92	84
Over 16% and including 17%	91	83
Over 17% and including 18%	91	82
Over 18% and including 19%	90	81
Over 19% and including 20%	90	80
Over 20% and including 21%	89	79
Over 21% and including 22%	89	78
Over 22% and including 23%	88	77
Over 23% and including 24%	88	76
Over 24% and including 25%	87	75

Silver: Will be paid for to the extent shown by the above schedule on the fire assay at the average of the *Engineering and Mining Journal*, New York, quotations for the second calendar month succeeding the date of sampling at Tadanac, B. C. In no case will the deduction from the silver assay be less than one-half (0.5) oz. per ton.

Lead: The lead contents will be determined by the wet method of analysis, deducting one and one-half units to arrive at the dry lead assay. Lead will be accounted for on the dry lead assay to the extent shown by the above schedule; provided, however, that in no case will the deduction from the said dry lead assay be less than one unit or twenty pounds per dry ton of ore.

The price for lead to be used in settlement will be our sales price delivered at destination in Canada less one and one-half cents per pound for refining and marketing as now in effect under the existing pooling scheme, which will be continued. There will be deducted also from the delivered sales price, \$2.30 per ton on sales at Toronto and common points and \$4.50 at Montreal and common points and similar differentials to other points. This freight adjustment is to cover actual increases in freights, e.g., should sales in any month be 2,000 tons and say 1,200 tons for delivery at Toronto and 800 tons at Montreal, the freight adjustment would be three-fifths at \$2.30 and two-fifths at \$4.50, or \$3.18 per ton of lead.

The pooling scheme is outlined as follows:

(a) Settlement is based upon sales price as above provided and only to the extent of actual sales from month to month.

(b) Whenever sales are sufficient to settle for a full month's lead receipts, this is done promptly.

(c) Lead from our own mines is pooled with that purchased from others and is treated in exactly the same way.

(d) Each month a statement is issued showing the condition of the pool. All shippers have been sent a copy of the last one issued.

DEDUCTIONS

Smelting per dry ton of material, \$9.50 as a base rate, which will be modified in accordance with the following formula:

(1) Add to the base rate per ton, 60c. per unit for all zinc contained.

(2) Deduct from this result the total units of silica, iron, manganese, lime and magnesia at 9c. per unit.

Provided that in no case shall said base rate be reduced more than \$4 per ton as the net result of the said additions and deductions.

Provided, also, that in making the above computation, iron, silica and lime if 1 per cent or under, and manganese and magnesia if 3 per cent or under, will be disregarded.

Sulphur: A charge will be made in addition to the above for all sulphur contained in excess of 2 per cent, at 30c. per unit per dry ton of material, provided that such charge shall not exceed \$3 per ton in any case.

Moisture: A minimum moisture deduction of 1 to 4 per cent will be made. The following penalty for moisture will apply to fine concentrates and clayey ore only: If over five per cent, charge for all contents at 10c. per dry ton per unit.

Size: Coarse and fine concentrates and ores should be shipped separately. If mixed so that over 30 per cent will pass through a ¼-in. screen, an extra charge of 50c. per ton will be made.

Sampling: If the shipment is less than a car lot or contains more than one lot per car, a deduction may be made for extra sampling, assaying, etc., of \$10 per lot.

Weights and Samples: Those used in settlement shall be those made at the smeltery.

Representation: Shippers are expected to notify us as to who will represent them while their shipments are being weighed and sampled. Failure to do so will be construed as meaning that the smelter will have authority to appoint one of the local mine representatives at the shipper's expense unless the local shipper notifies us that a representative is not required.

Assays: Shippers will supply the smelter with their assays on smelter pulps shortly after sampling. In case of difference in assays requiring it, the umpire pulp will be referred to an umpire mutually agreeable. The party whose result is furthest from the umpire's result will pay his fee.

Settlement: (a) Shortly after sampling, an advance payment of 90 per cent of the apparent value is made. The prices used in estimating the apparent value will be the New York price for silver and the Montreal price for lead at the date of sampling.

(b) When final settlement is rendered possible by silver quotations being available for the second calendar month after sampling and by all of the lead received during the calendar month in which the ore is sampled having been sold, the final value will be computed and any adjustment necessary will be made between the smelter and mine.

(c) Advances made on account will be carried by the smelter without interest until the last day of the second calendar month in which the ore arrives. Interest at 6 per cent will be charged on advances upon lead after that date.

The above rates will be effective on shipments received here on July 1, 1919, and are subject to change without notice.

The Work of Accident Prevention*

A Consistent Decrease in Accident Percentage Not To Be Expected—Low Accident Rates Dependent in Large Measure on the Overcoming of Carelessness When Miners Work at High Speed

BY WILLIAM CONIBEAR

Safety Inspector, Cleveland-Cliffs Iron Co., Ishpeming, Mich.

THE work of accident prevention in the mining industry in the United States has been in progress for about eight years. Its necessity and value in the economic life of the country may not be recognized and appreciated by all mine managements, although the movement is gaining momentum, and most operators are putting forth laudable efforts to eliminate personal injury to their employees. The entire country is awakening to the fact that this work is desirable not only from a humane standpoint but also as a business proposition. The voluntary aid which the Government has rendered through the Bureau of Mines cannot be overestimated, and those familiar with the situation and without prejudice must acknowledge that the responsibility of the operator of an iron or coal mine is lessened because of the assistance which is offered by the men whom the Bureau has stationed in the principal mining districts of the country.

An eight-year period is relatively short to use as a basis for a comparison from which may be deduced the results required to analyze the big problem of accident prevention. Safety experts of foreign countries state that it requires from ten to fifteen years to stop the natural tendency toward an increase in the percentage of accidents. It has been stated by men familiar with American industrial conditions that more than one-half of all accidents here are preventable. In support of this statement bulletins have been issued which cite figures to prove that certain operators have succeeded in reducing accidents in their mines or plants by 50 per cent or more during the first year or two of special safety activity. The publication of instances of this kind may be of value as a means of attracting the non-interested employer, but credit for such reductions may not be due entirely to a brief campaign of safety work. The annual fatality rates of the mining industry of the country may not show rapid fluctuations from year to year, but the rates of individual operators rise and fall and frequently a minimum annual rate may be followed by a maximum rate, or vice versa.

RESULTS OBTAINED BY SAFETY CAMPAIGNS VARY FROM YEAR TO YEAR

In 1911 one of the large mining companies organized a safety department, which was accepted wholeheartedly by all of its officers. Low fatality rates were obtained during 1911 and 1912; in fact rates that compared favorably with the low percentages prevailing in many foreign countries. A zealous safety inspector might appropriate this reduction and credit it to his department, but under these circumstances it would not be unreasonable to ask him to continue to produce similar results if he desired to retain his position; a most difficult task. The annual

fatality rates of this country prior to 1911 show a fluctuation which varies as much as 150 per cent, and since 1912 the low rates of the first two years of the safety department have been reached but once. There has been no relaxation in safety precautions, but considerable effort and money have been expended to maintain as low an accident rate as possible. It is therefore evident that the rates of 1911 and 1912 were the result of the special safety precautions during the years when the swinging of the pendulum, which periodically has characterized the history of every mining company having a long life, had reached its lowest point.

EDUCATION OF EMPLOYEES AND INSTALLATION OF MECHANICAL DEVICES

It is not intended to minimize the value of safety work, but the fact should be recognized that, despite every effort to prevent personal injury, there is a fluctuation in the number of accidents which occur from year to year that is beyond control. This fluctuation may indicate that 50 per cent of the accidents about mines are preventable, and on the other hand, it may be advanced as an argument that, regardless of the best efforts, accidents are inevitable and it is useless to spend time and money in endeavoring to prevent them.

Two special features of accident-prevention work which have been emphasized in this country are safety devices and education of employees. There has been ample time in which to devise and install safety guards for the elimination of danger that is self-evident and preventable, but the problem of training men to be always on guard against personal injury appears to be more difficult to solve. If the miner of the United States is more careless of the first law of nature than the workman of other countries, I have failed to read or hear of a satisfactory explanation. The Director of the Bureau of Mines recently stated that the foreigner unable to speak English and working in the mines of this country was most liable to injury. Rules and regulations are printed in foreign languages, and as a general rule non-English speaking men associate with fellow countrymen who speak English more or less, so in a comparatively short time a miner is capable of understanding the habits and customs that prevail in the mine where he works. Hazards of coal or iron-ore mining are similar the world over, and the foreigner is not entirely ignorant of the danger that follows his trade. However, the number of those who do not understand English is so comparatively small that this phase of the problem may be considered negligible in the attempt to find a solution of the task that is offered by accident prevention.

The average fatality rate in the coal industry of the United States from 1911 to 1918, representing years during which time safety work was carried on,

*Paper read at the Lake Superior Metal Mine Safety Conference, Duluth, Minn., June 19-20, 1919.

was 3.37 per 1,000 men employed. For the eight years prior to 1911 the figure was 3.78, a reduction of 11 per cent. The average rate in the metal mines from 1911 to 1916 was 3.59 per 1,000, but there appear to be no figures available for the years prior to 1911. The death rate from various causes of accidents in and about all the mines of Great Britain has not reached three per 1,000 men employed since 1873, and the average rate since 1889 has been approximately 1.35. The history of mining in other countries also shows low fatality rates. Is the American miner, native born or foreigner, less skillful or more careless than the miner of foreign lands, or is he working under less favorable conditions, to account for this disparity in fatality rates?

The early history of coal mining in this country was characterized by low annual death rates; from 1875 to 1889 there were but three years in which the rate reached three per 1,000 men employed. Since 1898 there has not been a year when a rate less than three per 1,000 men employed has been attained. Why should a long record of low fatality rates be followed by so many years of much higher rates?

A comparison of the seven principal causes of accidents reveals slight fluctuation covering the two periods designated, namely, 1873 to 1898 and 1898 to 1918. Falls of coal and like occurrences were responsible for 46.68 to 48.81 per cent; mine cars and locomotives caused 12.59 to 13.48 per cent; gas and dust explosions, 9.82 to 14.95 per cent; explosions, 7.29 to 7.96 per cent; accidents in shaft accounted for 3 to 7.96 per cent; those on the surface, 7.10 to 8.70 per cent, and miscellaneous causes were responsible for 7.63 to 8.39 per cent. It is evident from these figures that no one or two principal causes can be designated and charged with the responsibility of the high fatality rate prevailing in the coal mines, and the same may be said of the iron-ore mines.

INDUSTRIAL DEVELOPMENT HAS DEMANDED INCREASED PRODUCTION

The development of this country has been rapid and extensive, and the demand for coal and iron has been so imperative that operators have been compelled to produce annually an exceedingly large tonnage. Rich resources have made possible the wonderful advancement which has marked the growth of industrial organization, but skill and efficiency in operation have not been neglected. The annual average production per man employed in coal mining from 1875 to 1898 was 458 tons, and from 1898 to 1918 it was 687 tons, a gain of 50 per cent. In 1873 it was 543 tons, and in 1879 it was 501 tons, whereas since 1899 there were but two years during which the annual production per man fell below 600 tons. This increase in production has been possible because large deposits of coal have been discovered, because invention of improved machinery has facilitated the handling of large outputs, and because the American miner applies himself more intensely and constantly to the daily discharge of his work than does the foreign miner.

In 1916 the iron-ore mines of Minnesota and Michigan shipped 66,748,466 tons of ore. Fatalities totaled 113, or an average production of 599,560 tons per each death. The same year Great Britain produced 14,845,734 tons of metal ore and suffered a loss of twenty-five employees, or an average of 593,821 tons

per each death. When the risks involved in mining iron ore from the open pits of Minnesota are compared with those involved in deep underground mining, it must be admitted that the hazards of mining in this country should not be greater than those existing in distant lands.

The American mine operator is to be commended for the high degree of efficiency that he has produced in his profession. Nobody enjoys the benefits resulting thereby more than the American miner, whose mode of living is in keeping with the high ideals of American life. But the fact must be faced that no matter how intelligent or skillful one may be, he is more liable to injury when he works at a high rate of speed than when he works slowly.

During 1916, 174 men were killed in the copper and iron-ore mines of the Lake Superior district, and of this number 56, or approximately 33 per cent, were killed by falls of rock or ore from roof or wall. Methods of extracting ore are not responsible, because the best methods known to the profession have been applied. Is the miner, then, occupied so intensely in his work that he pays less attention to his personal safety than the miner in foreign lands? This would seem to be the fundamental question that is presented in the endeavor to find a solution to the problem of accident prevention.

Sicilian Sulphur Exports

According to the International Institute of Agriculture, which takes its information from official sources, exports of crude and refined sulphur from Sicily in 1918 were 230,769 metric tons, compared with 162,971 in 1917, 396,035 in 1916, 359,806 in 1915, and 338,308 in 1914. In January and February, 1919, there was exported 13,615 and 13,303 metric tons, respectively.

Stocks of sulphur on hand at the ports in Sicily were as follows, according to the same source of information:

Dec. 31	Metric Tons
1918	112,050
1917	156,801
1916	155,376
1915	323,391
1914	369,001

Automatic Tuyère Punching

The problem of punching converter tuyères automatically has to an increasing degree engaged the attention of engineers in recent years. Up to the present, however, none of the methods devised has found practical application. One reason for this is the fact that the tuyères do not always stay in the same place, gradually getting out of alignment, owing to the shifting of the lining of the shell.

The latest device for automatic punching to be patented¹ is the invention of C. J. Arch, of Douglas, Ariz. Each punch bar forms the piston of a motor actuated by compressed air or steam to give the necessary punch. When the punch bar of the first tuyère nears the end of the stroke, it automatically opens a valve admitting air to the second cylinder, and so on, the tuyères being punched successively. Apparatus is provided for cleaning and cooling the punch bars; also for cutting out any which it is not desired to operate.

¹U. S. Patent No. 1,302,753, dated May 13, 1919.

California's State Mining Bureau

Present Organization Had Its Beginning in 1880, but Much Exploration Work Had Been Done in California in the Forty Years Preceding—Reports Cover All Phases of Mining Activities

BY WILSON T. LUNDY
Mining Engineer, San Francisco, Cal.

MINING has been the fundamental industry of California from the beginning, and it is therefore natural that questions relating to geology and mining should have received early official recognition. The present California State Mining Bureau was started in 1880, but prior to that time many steps had been taken leading up to its establishment. It may be of interest to recall some of the events that preceded the organization of the Bureau.

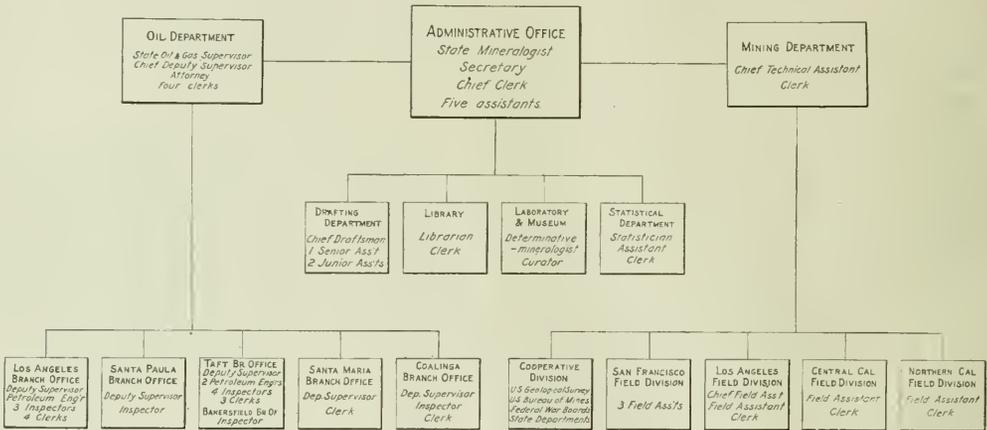

The U. S. Exploring Expedition, under command of Captain Charles Wilkes, U. S. N., visited California during the years 1838-1842 with James D. Dana

with the State University, and while there wrote several valuable books on California's geology and mineral resources.

OFFICE OF STATE GEOLOGIST CREATED IN 1853

On May 6, 1853, the office of State Geologist was first authorized, Dr. John B. Trask being appointed to the position. His first report was published that year, followed by others in 1854, 1855, and 1856.

The beginning of the present organization dates from Apr. 16, 1880, when the State Mining Bureau and the office of State Mineralogist were created, with

ORGANIZATION OF CALIFORNIA STATE MINING BUREAU

as geologist. Mr. Dana's report represents the first official publication relative to the geology of the Pacific Coast region which was ever issued.

John C. Fremont explored California and Oregon during 1843-1844 with James Hall, of New York, the former's report being published in 1845. In 1849, Bayard Taylor undertook a reconnaissance survey of the state at the direction of Congress. In the same year T. Butler King and Philip T. Tyson were sent to California by the Federal Government, and a report on the geology and topography of the state from Benicia to the American and Calaveras rivers was published by the Senate of the Thirty-first Congress, as Executive Document No. 47.

In 1853-1854, under the direction of the War Department, an expedition was sent out to explore a route for a railway from the Mississippi River to the Coast. Twelve large volumes, known as the Pacific Railroads Reports, were printed as the result of this work. W. P. Blake was chief mineralogist and geologist of the expedition. Professor Blake, who later became State Geologist, was subsequently connected

Henry G. Hanks as first executive head of the department. Although since then there have been periods when the financial condition of the Bureau has been poor, nevertheless the office has operated continuously with the constant purpose of assisting the California miner to develop the resources of the state.

During the last few years the scope of the Bureau's activities has been considerably broadened. Previous to 1913 the department staff consisted of the secretary, determinative mineralogist, statistician, librarian and one geologist, the latter devoting his time to petroleum. At present there are under the State Mineralogist, the state oil and gas supervisor, secretary of the Bureau, mining engineer, chief field assistant, statistician, determinative mineralogist, four field assistants in mining, and five deputy oil and gas supervisors, together with assistants and clerks at headquarters in the Ferry Building, San Francisco, and at the branch offices, which are situated at 512 Union League Building, Los Angeles, and at Santa Maria, Santa Paula, Taft, Bakersfield, Coalinga, Auburn, and Redding.

The department of petroleum and gas was established by law Aug. 9, 1915. It is under the general jurisdiction of the State Mineralogist, who is authorized to appoint as supervisor an engineer or geologist experienced in the development of petroleum. This officer has supervision over the drilling, operation, maintenance, and abandonment of oil and gas wells, so as to prevent damage from infiltrating water and other causes.

OIL AND GAS WASTE LESSENED BY BUREAU'S WORK

It is of vital interest to the general public that waste of the natural supply of petroleum and gas in California be prevented, and much good has resulted in the short time which has elapsed since the work of this department was inaugurated. Much of the damage caused in the past has been owing to lack of knowledge of underground conditions. Information in this regard is being constantly gathered and systematized by the Bureau and the results placed at the disposal of all interested parties.

Since 1914 a detailed survey of the mineral and other industrial material resources of the state has been completed and the result published. The annual statistical bulletin showing mineral production has grown from merely a single tabulated sheet to a volume, and the information thus presented has proved to be of considerable aid to prospective investors and buyers of ores, as well as to the producers in the state. Many other reports covering the mining laws, detailed occurrences of useful minerals, production and transportation of petroleum, as well as geological maps, have been made available for the mining public.

BUREAU'S HEADQUARTERS CONVENIENTLY SITUATED

The Bureau maintains a technical reference library of more than 5,000 volumes at the main office in the Ferry Building, San Francisco, which is consulted by scores of mining men daily. Copies of all the leading mining and trade journals, as well as newspapers from most of the mining camps, are also on file in the reading room.

The museum, which occupies a floor space of 7,500 sq.ft. in the same building, is a valuable asset of the Bureau. Twenty thousand mineral specimens, a large proportion being from California, are on display and have been so arranged that a study of the minerals and rocks may be easily undertaken.

A laboratory is available where determinations are made, free of charge, on samples which any one in the state may send in. Advantage is constantly being taken of this service by hundreds of prospectors, who send their samples to the State Mineralogist, at the Ferry Building, accompanied by a letter, giving the locality where the minerals were found and the nature of the information desired.

A general mining information bureau is a well established feature of the State Mineralogist's office, and numberless inquiries, both written and personal, are answered daily relating to every phase of the industry. The chief object of the entire organization is to keep in touch with the practical side of mining in California, whether it be prospecting for, developing, producing, marketing or buying mineral substances. Technical and scientific problems are naturally important and also receive due attention.

Fletcher Hamilton is State Mineralogist, and the executive officers of the Bureau acting under his supervision are: W. W. Thayer, secretary; R. P. McLaughlin, oil and gas supervisor; E. S. Boalich, mining engineer and chief technical assistant in the mining department; and W. B. Tucker, chief field assistant. The accompanying chart shows the present organization of the Bureau in detail.

Mining in New Mexico in 1918 and 1919

During 1918 mines in New Mexico produced \$681,000 in gold, 782,000 oz. of silver, 8,235,000 lb. of lead, 98,300,000 lb. of copper, and 24,100,000 lb. of zinc, according to the U. S. Geological Survey. The statistics for 1919 will show a considerable decrease in the output of all metals except gold. The Chino Copper Co., which in 1918 produced 79,340,372 lb. of copper and \$39,732 in gold and silver, produced only 11,512,133 lb. of copper during the first quarter of 1919, owing to curtailment of operations. This company hopes to be able to continue operations at 50 per cent capacity. The Burro Mountain branch of the Phelps Dodge Corporation, which in 1918 produced 53,146 tons of concentrates averaging 14.9 per cent copper, has been so seriously affected by the drop in the price of copper that it has suspended operations. The Santa Fe Gold & Copper Co. has also ceased operations at San Pedro.

During the first five months of 1919 the 85 Mining Co., at Lordsburg, shipped a quantity of siliceous copper-silver-gold ore almost equal to that shipped by it during the entire year 1918. Development at Mogollon may maintain an output of silver equal to that of 1918, when the Fanny mill was operated only five months. The combined gold districts of Nogal, White Oaks, and Baldy have so far produced ore at an increased rate.

The decreased shipments of lead and lead-zinc ores from Magdalena and the discontinuance of the shipments of lead from the Organ Mountains district will greatly reduce the output of lead from the state. The suspension of operations at Pinos Altos and the curtailment of operations at Hanover and Kelly will naturally result in a greatly decreased output of zinc.

St. John Del Rey Mining Co., Ltd.

The eighty-eighth annual report of the Morro Velho mine for the year ended Feb. 28, 1919, shows that the mine yielded 167,854 tons, of which 4,312 tons, or 2.57 per cent, was rejected as waste. The total tonnage stamped was 165,000. The assay value of this in fine gold, after taking into consideration the value of the tonnage at the beginning and the end of the year, is 5,724 oitavas per ton, or 2,793 pounds sterling per ton, or a total value of £460,839. Of this there was extracted by the first process £312,000, and by the second process £111,000, or an extraction of 67.71 per cent and 24.09 per cent, respectively. The total yield was £423,000, or a total extraction of 91.80 per cent. There is, however, an unavoidable discrepancy in this, inasmuch as 310 tons of rusty concentrates, purchased in the vicinity, had to be run through the process, giving an estimated yield of £2,300, thus reducing the total yield from ore stamped to £420,700, and the extraction to 91.29 per cent, against a yield of £465,206 for the year previous, a falling off of £44,500, attributable to

the lower tonnage stamped and lower percentage of extraction.

The output from the mine was seriously affected by the epidemic of influenza, which reached Morro Velho at the end of October and continued with great virulence throughout November, during which month it was possible to raise only about half the normal tonnage of ore. The company's operations were also hampered by floods during the exceptionally heavy rainy season.

The profit for the year, £124,338, compares with £153,649 in the preceding year, and makes, with the balance of £21,135 brought forward, a total of £145,473, as compared with £157,736. The directors propose that the usual final dividend of 1s. 3d. a share should be paid, and that £35,000 should be transferred to capital works account, the balance of £19,255 being carried forward.

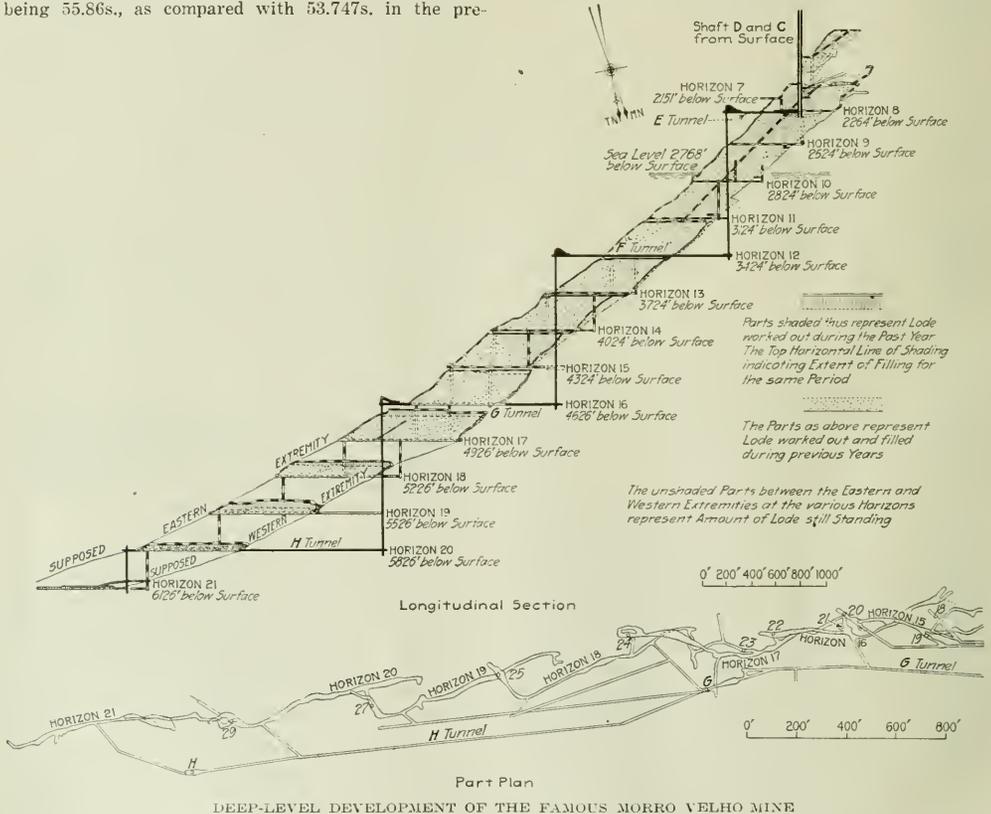

The increase in the size of the lode which has taken place in the lower horizons is a satisfactory feature. An improvement is shown in the ore, the assay value being 55.86s., as compared with 53.747s. in the pre-

Mining in Venezuelan Guiana

Large Bodies of Low-Grade Ore Amenable to Cyaniding Await Capital—Changes in Mining Code—Hematite Mines Near Mouth of Orinoco

CIUDAD BOLIVAR CORRESPONDENCE

IN VENEZUELAN Guiana gold is found over a large area, extending from the Caroni River, an affluent of the Orinoco, to British Guiana, the greater part of which has not been systematically prospected. Even in the long-known Yuruary district, of which Callao, where the Callao mine is situated, may be called the center, the ground has never been proved below 1,000 ft. and then only before the days of the cyanide process. The quartz mines, with a few exceptions, are all within forty miles of this center. During the war, most of them closed down, partly owing to the heavy increase

vious year. The reserve at the end of the year is estimated at 1,209,104 tons. This reserve, if consumed at the full possible output of 192,000 tons per annum, will last 6.3 years.

To illustrate the method of operating this famous property, the above extract from the annual report is accompanied by a longitudinal section and plan of part of the lower levels.

in costs and machinery and stores, wages having remained the same, but also to want of efficient administration, the usual fault in Venezuela. In 1914, there were six companies crushing ore, and at the end of 1918 only one, the latter on a very reduced scale. The output of gold, however, in 1915 and 1916 trebled that of 1914, owing to the production of alluvial gold from the upper Cuyuni River. In 1917 the output, according

to government returns, was 30,800 oz. That for 1918 is not yet published, but is certainly less.

The alluvial goldfields on the upper Cuyuni are situated about eighty miles south of El Callao, and were first discovered in 1913. Since then concessions covering an area of approximately 35 by 55 km. have been taken up, chiefly by two syndicates, one of which shipped over 30,000 oz. in 1916 and 1917. The gold being recovered by means of bateas, toms, and rough sluices, the loss is considerable, and costs are excessive. Diamonds are also found in the same district, in the alluvial formation, mostly small but of good quality. They also occur in the Caroni and Paragua rivers in alluvial formations. The Paragua River lies west of the Caroni, of which it is an affluent.

LACK OF PROPER ROADS RETARDS GOLD MINING

At present the outlook for gold mining is not favorable, owing to the higher cost caused by the war and the want of good roads. There are, however, great possibilities in the district, as there are large bodies of low-grade ore, which requires only sufficient capital for opening and working on a scale large enough to reduce costs. The ore is easily amenable to treatment by the cyanide process. It is also probable that conditions of transport may soon be improved, as a private company is trying to arrange with the government for building a new road to the mines for motor transport.

During the last few years there have been several new quartz reefs located and worked within forty miles of El Callao, one of which shows considerable promise. They have, however, not yet passed the stage of prospects.

STIPULATIONS INCLUDED IN NEW MINING CODE

A new mine code was passed by Congress in 1918, which came into force at the end of the year. The principal alterations are: 1. Increase of surface tax from one to two bolivars per hectare on quartz concessions, and from one-half to one bolivar on alluvial concessions, 2. It is no longer necessary to keep ten men employed on a concession after it has been declared in exploitation. 3. A concessionaire may at any time reduce the area of his concession, should part of it be of no value. 4. Concessionaires under previous laws have the option of adopting the new one. Concessions on quartz reefs can be obtained in blocks up to 200 hectares, and alluvial concessions up to 2,500 hectares. Both have to be either in squares or rectangles. The gold tax is the only other tax imposed and amounts to one-tenth bolivar. Under the mine code all machinery and mine stores can be imported free of duty, but in every case a permit to obtain the rebate has to be applied for. This does not cover explosives, to import which a special permit must be obtained from the government.

The Imataca iron mines are situated near the mouth of the Orinoco. They were opened and worked on a large scale by a Canadian corporation for a time, but closed down a few years ago, owing to the supply of ore being inadequate. This area is also worthy of further investigation, as the ore is hematite of excellent quality, and cargo boats can load at the mines. Gold has also been found in the same area.

It may be added that a large part of the country lying between the Caroni and Cuyuni rivers is suitable for raising cattle, the latter being easy to export via the Orinoco.

Alaska Juneau Gold Mining Co.

Increase in Bullion Production—Proposed Changes in Mill Construction—Deficit for the Year Ended Dec. 31, 1918, Amounted to \$325,499

THE fourth annual report of the Alaska Juneau Gold Mining Co. for the year ended Dec. 31, 1918, shows the bullion produced amounted to 18,773 oz., valued at \$334,255, compared with 12,923 oz., valued at \$229,465, during the previous year. Production of concentrator amounted to 640 tons, valued at \$125,188, compared with 1,419 tons, valued at \$231,199, during 1917. Recovery of gold, silver, and lead averaged \$0.80 per ton. The crude ore assayed \$0.94 per ton.

The amount of development work done was only 5,501 ft., most of which was performed on Nos. 3 and 4 levels, making the total amount of development 81,564 ft. On the No. 4 level, in addition to 3,192 ft. of development, an area of 50,662 sq. ft. (slope measurement) was undercut. From this area and the development work, 1,339 muck samples showed an average of \$1.49. The preparatory work necessary for this stope was about 95 per cent completed at the end of the year. The east half of the stope was completed in October, and four pillars and two powder drifts were blasted, about 40,000 tons being broken.

Gloryhole mining was conducted on the surface of the south orebody during the summer, and 47,934 tons averaging \$1.73 was mined. The gold assay value for the entire mine as shown by 6,921 muck samples was \$1,041. Tonnage sent to mill was 592,218, of which 540,757 tons was crushed in the new mill, 33,528 tons was stamped to $\frac{1}{2}$ -in. mesh in the 50-stamp mill, 16,230 tons was rejected as waste, and 1,703 tons remained in the bins.

No radical change was made in the mill from the year before, but the attempt to force the ball mills to a duty that would give the entire mill its promised capacity was abandoned. A definite program was adopted for waste rejection on a large scale, and also for introducing refinements into the milling practice, which will increase capacity and avoid extremes in labor and supply costs. The estimated cost of carrying out these changes is \$500,000, and upon completion the new equipment is expected to tram 16,000 tons per twenty-four hours, reject 8,000 tons as waste, and mill 8,000 tons of ore.

Unusually heavy rains in September caused a debris slide, resulting in damages amounting to \$26,919 to the new mill and railroad. The company expended \$166,973 upon construction work. Of this amount \$104,674 was spent in the new mill, \$30,508 in the power plant, and \$10,805 in the 50-stamp mill.

The sum of \$785,822 is debited on the profit-and-loss account, which includes mining, milling, and handling costs, plus marketing expenses, including storm damage. Bullion and concentrate production, plus other miscellaneous revenue, is credited with the sum of \$460,322. The excess operating costs over revenue for the year amounted to \$325,499.

Manganese Exports From Brazil during the first two months of 1919, according to a recent consular report, amounted to 59,270 metric tons, compared with 71,101 metric tons in the corresponding period of 1918.

Industry Dealing With Pertinent
Subjects of Interest

A Silverless Islet

I am interested in your article on "A Silverless Islet," which appeared on the "By the Way" page in the issue of July 19. On Aug. 17, 1897, I visited Silver Islet in company with a representative of the owners and was shown the maps of the property.

Mr. Winchell's description of the geology is correct. The country consists of a series of dark slates and other sedimentary rocks lying roughly in a horizontal position. Running east and west through the island is a dike of basalt standing nearly vertically. Running north and south through the island and cutting this dike at right angles is a vein which has a slight dip, in which direction I do not remember. The vein presumably continues north from the island and may be seen on the mainland cutting through the slates. The peculiarity of the vein is that where it cuts through the basalt dike the filling is calcite; but as soon as it leaves the dike and enters the slate the filling is quartz and the vein narrows up both to the north and to the south.

The story of the discovery of the island is well known, and the history of the exploitation of the mine is to be found in mining literature. After going down a certain distance the silver played out, and an attempt was made to prove its continuation at depth by a series of diamond-drill holes paralleling the dip of the vein. As I remember it, the result of this drilling was negative, but Captain Frue, the manager, was not satisfied, and sunk the shaft further, and discovered another body of silver ore, one of the drill holes passing within a few inches of it. When this second body played out I believe the shaft was sunk about 300 or 400 ft. deeper, and drifting done the full length of the dike, but no appreciable amount of silver was found.

One theory advanced is that the precipitation of the silver in the vein was due to the character of the slates, and that, where the vein was rich, the slates probably contained carbon, which acted as a precipitant for the silver. Carbonaceous slates are found in the country, and the report is that these were the conditions which obtained in Rabbit Mountain, a district where silver had been found previous to the discovery of Silver Islet. This theory is borne out by a statement made to me in Butte about ten years ago by a foreman in the Silver Bow mine who had formerly worked at Silver Islet. He told me that in driving a drift they had encountered inflammable gas, the phenomenon being similar to that found in coal mines. This would lend color to the theory of the carbonaceous slates.

The islet, however, is not silverless. There still exists (or at least in 1897 there existed) the "silver roof." This was the top portion of the vein which was left as

a pillar, or floor, to protect the mine from the waters of Lake Superior, and it was claimed that there was in this roof probably 100,000 oz. of silver. The owners of the property hesitated to take this out, having a lingering hope that, perhaps, some day the mine might be unwatered and explorations continued at depth.

Silver Islet, itself, when originally discovered, had but a few square feet of surface, but it was built up to quite a respectable area. The collar of the shaft had been carefully cemented in with asphaltum, so that presumably it was, and is, safe from the waters of Lake Superior.

Captain Frue, who managed the Silver Islet property, was the inventor of the Frue vanner, and designed it to fit the particular case of the low-grade ores from Silver Islet, which were concentrated on the mainland. At the time of my visit I was shown in an old barn a wooden vanner which, I was told, was the first machine that Frue had built. The belt was gone, and I presume by this time the vanner, as well as the barn itself, must have rotted away. Another relic on the shore was a clinker-built Mackinaw boat with a brass plate on it showing that it belonged to the British expedition led, I think, by Sir Garnet Wolseley against Riel in his rebellion.

The scenery on the shore of Lake Superior at that point is most impressive, Thunder Cape standing out boldly into the lake, the only evidences of civilization being the shafthouse on Silver Islet and a few of the old buildings on the mainland.

Most of the above is simply from memory, and if I have made errors I must be given credit for the lapse of twenty-two years.

J. PARKE CHANNING.

New York, July 24, 1919.

Technical Ability and General Culture

Several years ago you published a diagram contributed by Mark R. Lamb, the purpose of which was to assist a mining engineer to gage his rank in the profession. As I recall it, the locality where the subject had worked was an important factor (Boston, the North, Latin America, and various other districts, being criteria as to his standing), and other curious considerations affected the distinction supposed to be due him. Although Mr. Lamb obviously had devised the diagram with his tongue in his cheek, someone took it seriously enough to remonstrate at the idea of incidental and external circumstances having so much weight in the appraisal of an engineer, and wrote to you, stating that in his opinion an engineer should be judged as to whether or not he could do efficient work at a mine.

Of course, efficient workmanship should be the principal basis on which a technical man is judged, and undoubtedly such is the practice of employers. Is it not possible, however, that the principle has been carried too far, and that men in modern industry have been

[Mr. Winchell is not responsible for the title "A Silverless Islet" used over the article referred to, although the title is justified by the text.—EDITOR.]

judged on too narrow a basis? The papers lately have recorded the extraordinary ignorance of a very successful technical man, Henry Ford, as shown in the testimony at his suit against the *Chicago Tribune*. In one narrow field Mr. Ford has shone brilliantly; of most other matters he is astonishingly unlearned.

His case very likely is an exceptional one, just as his financial gain has been exceptional. But is it not likely that many exceedingly unbalanced technical men have been given preference in industry over their broader-minded fellows for the sake of temporary results?

And has not the promotion of highly specialized but narrow-minded men into responsible executive positions made for unrest and discontent among the workers under them? Is it not possible also that in the long run a company loses by permitting a narrow-minded or ignorant man to represent it, for instance in contact with outsiders?

I am not arguing against high specialization. I am merely suggesting that technical men should know something about fields of knowledge other than their own, and that in the long run it pays a company to encourage men of wider outlook and more liberal culture than perhaps has been the case in the past. If I may be permitted to say so, nothing is more distressing than a "highbrow," as that term is commonly understood, and I am not advocating "high-browism" for engineers. A mine manager or superintendent, however, may be a man of liberal culture without being a "highbrow." The point is that he should not be a technical man exclusively, as Mr. Ford apparently is, and that Mr. Lamb possibly made a serious point after all.

P. B. McDONALD.

North Adams, Mass., July 25, 1919.

As a Miner Sees It

I have just read with a great deal of interest an editorial in the *New York Times* of July 16 entitled "Making Work by Stopping Work," and as the *Journal* is often read by working men I wish you would call their attention to that article.

As a working man I confess that I want to secure for my labor all that I can get for it. Through our union here and co-operating mine managers we have been receiving wages respecting which no one can justly complain, but yet there is some grievance, and it seems to come from two causes: First, many of us are afraid that the mine owners are at times making too much money and not dividing profits properly with us; and, second, we nearly all desire to secure just a little bit more for our day's work, with an equal desire to have that day shortened just a little.

Not being a professor of logic, I doubt if I could show a brother miner how he is thinking wrong, but I can tell how these matters appear to me.

It is my idea that about all of the earthly goods that we receive come as the result of work, and the harder we work the more of these goods we get. Some labor with their brains and some with their hands; generally they do it honestly and earn their living. A few brain workers and a few hand workers are dishonest and do not earn what they get, but these are in the minority and need not be considered.

We are told that labor receives from 60 to 75 per cent of the money paid out for producing copper, but it seems to me that it must be even more than this, for every one of the supplies, such as rails, timber, powder,

and tools, is made by labor, and according to that view nearly 100 per cent of the money must go to labor.

I suppose there are some dollars paid for interest on borrowed money and things of that kind which figure in the cost of copper, but, getting down to brass tacks, it would seem that labor is getting pretty nearly all of the cost of the metal.

Between the producing cost and the selling price of the metal there is sometimes nothing, but generally the difference amounts to a few cents per pound, and it is the distribution of this margin that worries some of us. Personally I would like to see those few cents become many cents and know that they went to the men who had the nerve and good judgment to put their money into a business from which I make my living. "But it's unearned," my neighbor says; "and the fellow who buys copper isn't paying the price all to labor." Wrong. It is earned, and much more is earned that he never gets when you take into consideration the blanks that the capitalist draws while he is paying good wages for prospecting and developing.

As to these few cents' difference not going to labor, here again my neighbor is wrong. It goes to pay labor that has been stored up for the very purpose of helping us fellows over the rough places. This capital is simply stored up labor. Like the energy in a big flywheel, it runs pretty low sometimes, while we are getting ours right along, and we must give it a chance to build up when the building is good, so that there will be something behind us when another low-price day comes along. "But that's not labor," my neighbor insists.

I own a house that cost me \$3,500, and I hold somewhat over fifty shares of Anaconda that cost me about as much. Every dollar that these two things cost me I got for working, and by working fairly hard I have put away about \$7,000—half of it to work for me—and now my nest egg of \$3,500 is just as much of a laborer as I am; better too, for it ought not to wear out and get stale.

As to wanting a little more money per shift and rather shorter shifts, it looks to me as though the unions, if they include most everybody, can keep on for quite a while, getting what we want a little at a time. But a fellow don't have to be a philosopher to see that some time the limit will be reached, and if all miners' unions are standing together we will wake up some day to find that the companies are getting no orders for copper. At about the same time we are going to hear from those unions that are using copper to the effect that their jobs are gone, that their employers can't buy copper, and they will be asking us to get to work, just as the users of coal in England are asking the coal miners to get busy now, according to the article quoted.

It may be that I view this thing all wrong, but it strikes me that the more copper we can get out the more jobs there will be in manufacturing plants where they use copper. This condition will cut down idle labor, make less idleness in this camp, raise the demand for labor and with it keep up the price or raise the price of labor here without anyone demanding it. Personally I know that the harder I work the more fun I get out of living. I know it is the case with some other men, and I wish I could prove it to some of my neighbors who spend a lot of time thinking how they can work less and earn more money at it.

Butte, Mont., July 21, 1919.

ORE DRESSING AND METALLURGY

Practical Suggestions and Progress
in Invention and Use of
Mechanical Appliances

An Improved Copper-Casting Machine

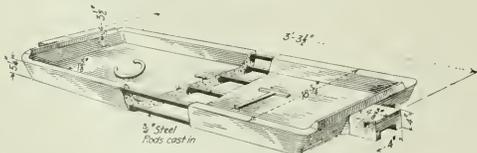

By T. W. CAVERS

A simple and efficient copper-casting machine, suitable for plants producing from 15 to 30 tons of copper daily, has been installed at the smeltery of the Tennessee Copper Co. It was designed and manufactured by the engineering and mechanical staffs of the company.

The device consists of three long trucks, each carrying 14 molds, operated on a straight track by a small slow-speed electric locomotive; a cradle car on a track at right angles to that carrying the trucks; and a pouring ladle which is tilted by a small electric hoist. One man operates the ladle and both cars by means of two controllers placed close to the point at which the copper is poured. The pouring ladle is made of cast steel, and will hold about nine tons of copper when properly lined with a slag hull. It is provided with lugs so that it may be handled by the traveling crane. Below the lugs are brackets to support the ladle when set in the cradle car. Just beneath the lip is a bearing which rests on two cast-iron brackets attached to the car, and about which the ladle turns when copper is being poured. The ladle, lugs, supporting brackets, and bearings are one solid casting.

The cradle car is short and of heavy construction. Two cast-iron guides engage the brackets of the ladle when it is lowered into the car by the crane. The end of the car, opposite that from which the copper is poured, is weighted with heavy castings bolted to the frame to prevent up-ending. The mold car consists of a frame of 8-in. I-beams, riveted together, and set on two pairs of wheels provided with suitable bearings. Each car accommodates 14 molds; and three cars with the locomotive attached are operated on 165 ft. of track.

The locomotive is small but massive. Two pairs of wheels support a heavy cast-iron frame, to which additional castings may be bolted if greater weight is found necessary. The axle of one pair of wheels is geared to a 7½-hp. direct-current motor rated at 760 r.p.m. A worm gear provides the necessary reduction of speed.

CONVERTER-COPPER MOLD

At one end of the locomotive is a frame which carries three trolley wheels, and these provide connection between the three trolleys overhead and the motor. The motor is operated by a controller situated at the pouring stand. Three different speeds are permitted by means of the trolley system which has been mentioned.

Above the junction of the two tracks carrying the mold cars and the cradle car is a small electric hoist by means of which the ladle in the cradle car is tilted. The cable connecting the hoist with the ladle passes

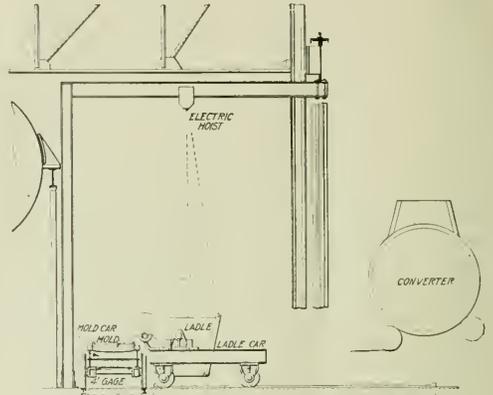

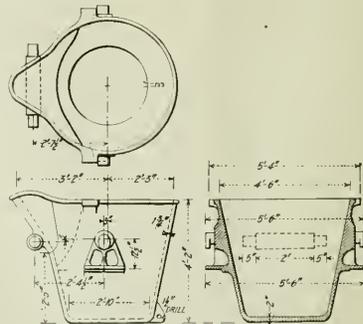

DIAGRAM SHOWING DETAILS OF OPERATION

through a set of triple blocks, and the copper is poured as slowly as desired. The controller by which the tilting of the ladle is effected is situated beside the one used for moving the mold car, so that only one man is necessary for casting the copper.

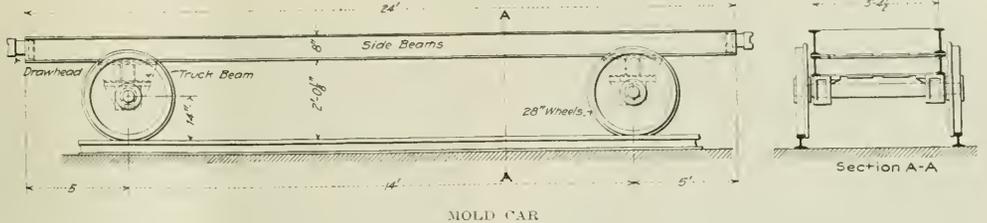

COPPER-POURING LADLE

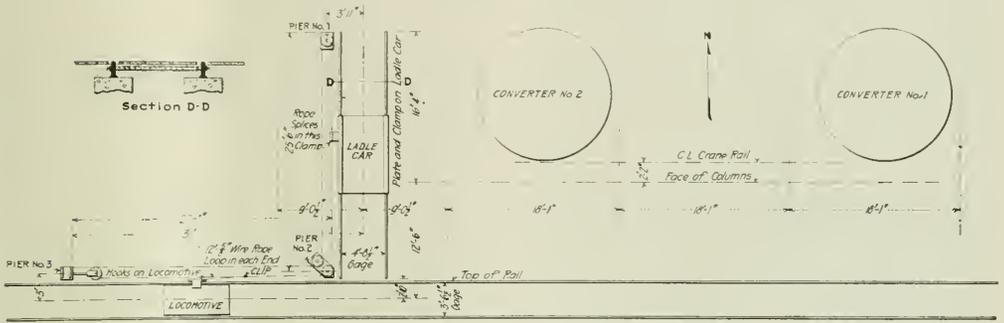

Before a charge is finished, a ladle is prepared by filling with converter slag and allowing a hull about 1½ in. thick to form before pouring off the remaining molten portion. When the copper has been poured from the converter, the traveling crane transfers the ladle to the cradle car, which is then run out to the pouring position. The car is attached permanently to an endless cable and may be run in and out by "hooking up" to the

mold-car locomotive. When the hook at the end of the chain attached to the hoisting blocks has been slipped into the clevis of the ladle, the copper is ready for pouring.

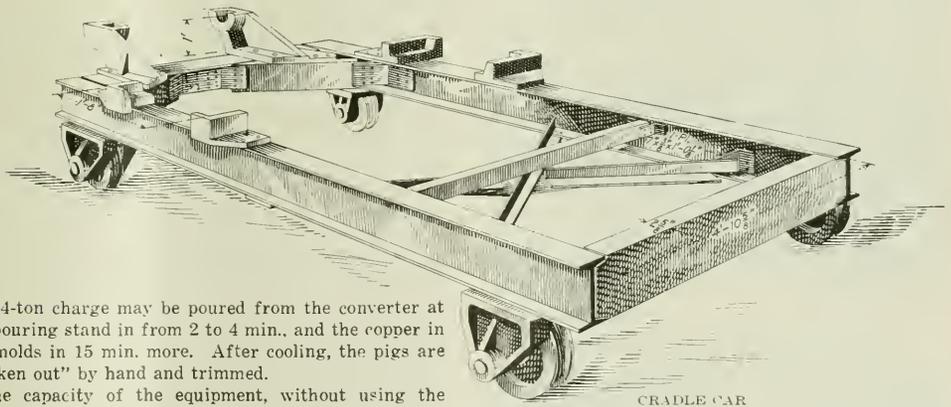

2. The advantage of leather over all the substitute belts persists at all speeds up to at least 5000 ft. per min., and at all tensions within the range practicable for power transmission.

MOLD CAR

GENERAL LAYOUT OF PLANT

CRADLE CAR

A 4-ton charge may be poured from the converter at the pouring stand in from 2 to 4 min., and the copper in the molds in 15 min. more. After cooling, the pigs are "broken out" by hand and trimmed.

The capacity of the equipment, without using the molds a second time, is over six tons. For handling a larger output, another mold car would be put in service. No difficulty is experienced with a copper skull in the ladle; and the slag lining is removed after each pour.

Features of Leather Belting

Tests to determine the characteristics of leather belting were recently conducted by Ernest A. Wilson at the Mellon Institute of Industrial Research of the University of Pittsburgh. The conclusions reached were as follows:

1. Leather belting possesses a much greater power transmitting capacity than fabric.

3. The relative capacities of the various belts remain the same on various kinds of pulleys.

4. Leather belting, at its rated horsepower, possesses a big overload capacity, whereas fabric belts at much lower horsepower possess no overload capacity whatever.

5. Leather belting improves with age, though the fabric belts are at their best when new.

6. Wherever a fabric belt of a given width is carrying its load with some degree of success, a suitable leather belt three-quarters as wide will do better work than the fabric.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

War-Minerals Relief for the Small Producer

Liberalization of the statute providing for the relief of producers of certain of the war minerals is the object of a joint resolution introduced by Senator Henderson. Senator Henderson explains the purpose of the resolution as follows:

When the relief measure was originally introduced it was as a separate bill, but, with time pressing for adjournment, and so many matters before Congress, it had to be made an amendment to the Informal Contracts Bill to secure passage at that session. It was our original intention to take good care of the smaller producer and miner, as the larger operations were always in touch with the Government bureaus, and had undoubtedly received specific requests. But there were many small and practically unknown operators which the Government wanted to reach, and as chairman of the Mines Committee, I knew that Government agencies had given widest publicity to the war need for chrome, manganese, tungsten, and pyrite, and that their interviews, articles, and advertisements had appeared in probably every mining paper in the United States. Now, the Attorney General has so construed this act as to eliminate many of the smaller operators who relied upon this widely disseminated information. I am sorry that the act is so worded as to cause him to do this. It would seem to the prospector and miner, not knowing or caring about the finer legal technicalities, that such construction would imply that though a private concern can advertise its wants, the Government can not. I hope my resolution will remedy this situation. As a matter of domestic policy, it would be most unfortunate and unwise to so administer the relief act as to lose to the Bureau of Mines and the Geological Survey the confidence of the miner and prospector. For years these two bureaus have been the chief reliance of these men as to their country's wants. Their bulletins and publications have been accepted as the last word by the prospector, and if we do not now endorse and back up their late activities in stimulating the production of manganese, chrome, pyrite, and tungsten, we will destroy the structure of confidence and reliance in them which the Bureau of Mines and Geological Survey have been so long and so carefully building up.

A similar bill has been introduced in the House by Representative Garland, chairman of the Committee on Mines and Mining.

The Foreign Potash Situation

H. S. Gale, of the U. S. Geological Survey, who has returned recently from a painstaking personal investigation in Germany, France, and Spain, expresses the conclusion that though there are no large supplies of potash in either Germany or Alsace to be dumped into the United States, considerable supplies of fertilizer salts will soon be available and the amount of potash exported may increase rapidly.

Labor troubles, lack of fuel, inability to secure railroad transportation, the run-down condition of refining plants, and the general disorganization which prevails in Germany are responsible for a condition which will not permit the German mines to produce a great amount of potash in excess of domestic requirements.

Among the other important facts established by Mr.

Gale in his personal investigation in Germany is that no appreciable surplus of potash was accumulated in Germany during the war. As a maximum, Mr. Gale does not anticipate that Germany will be able to furnish more than 50,000 tons of K_2O material for export to the United States. A similar amount probably will be available in Alsace. When these are added to the 30,000 tons which will be produced in the United States, the aggregate will be considerably below the amount needed for the coming crop season.

Mr. Gale encountered no reticence on the part of the Germans as to the giving out of information pertaining to their potash industry. They are anxious to restore normal conditions, as they recognize that potash in the future must be the cornerstone of their export trade. In addition to the actual physical difficulties of production, the Germans are facing the uncertainty as to national policy. Heavy taxes are certain to be levied, and as much of the burden as possible will be placed on exported commodities. This, combined with the increased wages which must be paid and higher costs generally, leads Mr. Gale to think that prices under \$1.50 a unit for German potash need hardly be expected. In the course of Mr. Gale's investigation he discussed the situation exhaustively with Herr Schüddekopf, the general director of the Kalisyndikat.

Difficulty is being experienced in moving such potash as is available for importation into this country, on account of the fact that few ships can be prevailed upon to delay sufficiently to load potash. The high rate being paid for handling eastbound cargo makes it much more profitable for the vessel to turn around quickly and make the west-bound passage without cargo, or at least without a cargo requiring the amount of labor and time to load that are necessary with potash. As the east-bound rate falls, there will be an increasing inducement to load potash for ballast on the return trip.

In Alsace, Mr. Gale found that the seventeen shafts in that field had produced 40,000 tons of K_2O in 1913. The capacity for production, however, was greater and had been limited to that amount by the syndicate. That capacity can readily be attained again, as no malicious damage was done to any of the potash shafts. One of the mines is in a dangerous condition, owing to the fact that it was worked in an ignorant and careless manner during the war period, but it is believed that it can be put in good condition in a short time. Most of the lower galleries of the mine were flooded during the war, but, other than dissolving the salt faces back a few inches and making necessary some renovations of a minor nature, no damage was done.

Almost immediately after the armistice, the French took over the operation of the shafts. They were placed under military control, and technical men were assigned to the work. They are bringing the properties back into production very successfully. One property in the district is being operated privately, as it had been French owned prior to the war and is continuing to be operated by its owner. The other properties are

under the supervision of the Sequestre, the French organization exercising the function similar to that of the Alien Property Custodian in this country.

The total production from the Alsatian shafts in 1919 will reach 150,000 tons of K_2O , Mr. Gale estimates. Despite the urgent need on the part of the French to overcome the adverse trade balance, it will be impossible for them to export more than 50,000 tons.

As a result of his personal examination of the Spanish deposit which is forty miles north of Barcelona, Mr. Gale regards it as nothing more than a good prospect. It is the same type of deposit as are those of Germany. Boring has developed that it is extensive in area, but not comparable to the German deposits in thickness. A shaft is being sunk, but it has not reached the bed, which at that point is about 200 ft. beneath the surface. The working of the deposit will probably involve great practical difficulties. It lies in a valley through which runs a river, and the formation is such as to make the water problem a most serious one. A former shaft had to be abandoned because of inability to handle the great volume of water which is made.

Though Mr. Gale did not visit the African deposits, his information is that the prospect of important production is slight.

Tariff on Tungsten Ore

A tariff of \$10 per unit on tungsten would fix the price of American mined tungsten at \$18 to \$20, in the opinion of the majority members in the Committee on Ways and Means. The establishment of a domestic tungsten industry is held to be of vital national importance, especially in view of the fact that cheap sources of supply in all parts of the world are disappearing, with the probability that this country may find it necessary to supply all of its needs from domestic mines. Extracts from the report of the committee, which was written by Representative Timberlake, of Colorado, are as follows:

Competent witnesses stated that, under normal conditions and the protection asked for, the domestic mines could produce 50 to 60% of the amount consumed in ordinary domestic manufacture and the remaining 40 to 50% would of necessity be imported. Eventually, however, the percentage of imports would be greatly reduced and the domestic demand almost wholly met by domestic production.

The evidence of the U. S. Tariff Commission shows that about 50% of the domestic output is produced at a cost of \$10 to \$15 per unit and 50% at a cost of \$15 to \$25 per unit, averaging \$20.

The evidence shows that the present added cost of tungsten production in the United States is not based entirely upon increased labor cost or on that of supplies. It is in part a physical condition due to the fact that the surface deposits, which were mined very cheaply, averaged up to 60 and 65% tungstic trioxide. Operators who testified explained that as mining operations extend downward into the ground the percentages of tungstic trioxide are gradually reduced from 65 to as low as 4 and 5%, and these ores then have to be concentrated by the miner to a high-grade product, analyzing about 60% tungstic trioxide. To illustrate the point, it would take about 15 tons of 5% ore to concentrate into 1 ton of 60% ore, after making due allowance for the loss occurring in the process of concentration. The necessity of making this concentration compels the installation, equipment, management, and maintenance of large, costly mills and concentration plants, as an entire new element of cost in addition to the cost of development and extraction of the ore. Because of these facts the protection asked for is not due solely to the difference in labor cost between the countries.

A careful analysis of mining conditions in the Orient furnished ample evidence that 60% ores may readily be delivered to our seaboard from southern China at \$6 or \$7 per unit and still afford the Asiatic miner a fair profit. The labor employed in mining Asiatic tungsten ore is coolie labor, which is reported as being paid approximately 50 cents per day for men and 20 cents per day for women and children. Most of the deposits of South America are mined by native Indian laborers, who are paid somewhat better than the coolie labor of China. In Portugal women and boys are used in the sorting of ore at a daily wage of from 16 cents to 20 cents. Mine labor, recruited from the peasant classes, is paid from 50 cents to 60 cents per day.

Suspension of Assessment Work

Only one vote was registered in the House of Representatives against the bill providing for the suspension of requirements of annual assessment work during 1919. An attempt was made to amend the measure so that no suspension would be granted to any one claimant for more than three claims. This was disapproved, however, and the committee amendment limiting the suspension to five claims carried. Objection was made to the committee amendment allowing the bill to apply to oil-placer locations. This was explained by Representative Taylor as follows:

The Mines and Mining Committee has never been in favor of making any discrimination in annual assessment work between oil-placer claims and any other kind of placer or lode claims, and there is no reason now why one should be exempt and another not. The last time this bill was passed by the House, in 1917, the gentleman from Wyoming (Mr. Mondell) inadvertently, I think, made the motion on the floor of the House to amend the bill to exempt oil-placer claims for the suspension, and his amendment was adopted, and so the oil-placer claims have been required to do the annual work during the past two years that all others have been relieved from.

Validity of Public-Land Locations

Representative Vaile, of Colorado, has introduced a bill providing "that where public lands containing deposits of gold or iron ore have heretofore been located in good faith under the placer-mining laws of the United States, and assessment work has been annually performed thereon, such locations shall be valid and may be perfected under the provisions of said placer-mining laws, and patents, whether heretofore or hereafter issued thereon, shall give title to and possession of such deposits."

War Department To Sell Chemicals

Bids have been requested by the War Department for the purchase of 46,000 lb. of aluminum trichloride and 900,000 lb. of white arsenic. These lots of chemicals are offered f.o.b., Ben Hur Plant, Willoughby, Ohio, and the bids will be opened at 10 a.m. on Aug. 22 at the Zone Supply Office, 1819 W. 39th St., Chicago, Ill. No bid for less than a carload lot of the white arsenic will be considered. No minimum is established for the offering of aluminum trichloride.

An investigation of the oil-shale resources of the United States is provided in a bill introduced recently by Senator Henderson, of Nevada. The bill carries an appropriation of \$140,000 and specifies that the work is to be done by the Bureau of Mines.

Work of the War-Minerals Relief Commission

Satisfaction Expressed at Open and Fair-Minded Attitude of Commissioners at the Hearings Conducted in Western States—Number, Character and Amount of Claims—Further Action By Congress Needed To Protect Producers Excluded Under Recent Ruling

SAN FRANCISCO CORRESPONDENCE

THE shortage of shipping during the latter part of 1917 and throughout 1918 caused general attention to be directed to the problem of maintaining the supply of minerals and ores critically needed in the manufacture of war materials. Pronounced decreases in the available supply of manganese, chrome, pyrites, and tungsten, as well as some minor minerals, were expected to result, and to anticipate such a condition active steps were undertaken to stimulate domestic sources of supply. The War-Minerals Act, by which it was proposed to make about \$50,000,000 available for the development of and production from domestic mines of the needed minerals, was introduced in Congress, and, after considerable discussion and change, the measure received the signature of the President on Oct. 5, 1918, and became a law.

Practically no expenditures were made under the new law, as oversupplies of some of the important minerals began to appear, and by December, 1918, the Department of the Interior officials realized that the War-Minerals Act was a white elephant, as the signing of the armistice on Nov. 11, 1918, removed the necessity for further intensive development of domestic sources of minerals. The statute was so worded that the appropriation could not be used to defray expenses incurred by private individuals and corporations in anticipation of its passage.

Prior to the passage of the War-Minerals Act, concerted efforts were undertaken to start domestic production of manganese, chrome, pyrite, and tungsten. The price for manganese was fixed by the War Industries Board on June 1, 1918, and was sufficiently high to attract the attention of mining men and others, which fact, taken in conjunction with the appeals that were made on the score of patriotism and war needs by various Government organizations, resulted in widespread and successful effort in opening up manganese deposits in many states.

Financial assistance loomed up as it became apparent that the War-Minerals Act had possibilities of passage. So successful were the efforts of the producers that by Nov. 2, 1918, a surplus of manganese ore had been developed, and with the signing of the armistice the market for metallurgical ore disappeared and remained in this condition for a number of months.

The market for chrome ores was high during the greater part of 1918, and this was in itself a sufficient inducement to stimulate production from sources already producing or from producers who were already operating. The appeal to patriotism and the energetic efforts of the same Government agencies were all that was necessary to cause a great number of individuals and companies to enter the field and to find and develop new deposits. On July 13, 1918, the ruling price for chrome was \$1.50 per unit for 40 per cent ore, but in the latter part of September an oversupply began to appear and the price of chrome ore became weaker and reached a nominal condition. With the signing

of the armistice, the market disappeared completely. Chrome ore is now offered in California at 50c. per unit.

A similar condition ruled in the tungsten industry, although this industry had been established in the United States for several years in a stable condition. Nevertheless, under the same stimulation new producers came into the field and new deposits were developed. With the signing of the armistice the market for tungsten ores became sharply depressed; and the price declined from \$24 per unit to the present nominal quotation of \$10. A similar state of affairs, although to a lesser degree, perhaps, than in the case of the before-mentioned minerals, prevailed in the pyrites industry.

The disappearance or practical curtailment of the market for these minerals left many projects in a state of uncertainty, and many of those interested faced large financial losses, owing to their energetic efforts to assist the Government in its prosecution of the war. It was realized that a moral responsibility rested with the Government to straighten out the situation for the producers and potential producers, and it is a matter of satisfaction to record that there was no tendency on the part of officials to dodge this obligation. Nevertheless, it is probable that little would have been done had it not been for the efforts of the Pacific Coast Chrome Producers' Association, the American Mining Congress, and others. Because of their energetic representations before Congress, the War-Minerals Relief Act was passed as the best solution of the difficulty.

Under the provisions of the War-Minerals Relief Act, the sum of \$8,500,000 was appropriated for the expense required and for the settlement of the claims arising out of the stimulation of the production of manganese, chrome, tungsten, and pyrites. The Secretary of the Interior was required under the act to adjudicate the claims and appointed a commissioner to undertake the settlement of the claims by recommending to him such sums in the case of each claimant under the act as the commission considered just.

ORGANIZATION OF THE WORK OF THE COMMISSION

The commission as organized consists of the chairman, John F. Shafroth, former Senator from Colorado; M. D. Foster, former Representative in Congress from Illinois, and Philip N. Moore, former president of the American Institute of Mining and Metallurgical Engineers. H. E. Meyer is secretary of the commission and Paul S. Black, counsel. In addition, there are clerks and stenographers.

The following engineers, under the direction of J. E. Spurr, of the U. S. Bureau of Mines, are engaged in making field investigations of claims where requested by either the commission or claimants: Fred P. Williams, of Batesville, Ark.; Curtis B. Locklin, of Los Angeles, Cal.; R. Clyde Cameron, of Berkeley, Cal.; Harry J. Sheafe, of Saratoga, Cal.; Bidney L. Shonts, of Prairie City, Ore., and Stanley C. Sears, of Salt Lake City,

Utah. The auditors, whose function is to examine and determine the accuracy of the accounts kept by the claimants, are as follows: William H. Dunn and R. C. Evans, of Batesville, Ark.; Guy L. Langron, of Los Angeles, Cal.; Arthur S. Trelawney, of Prairie City, Ore.; P. F. Roosa, of Phillipsbury, Mont., and E. L. Fleming, of San Francisco, Cal.

After the organization of the commission, a questionnaire was sent out, which was to be filled by each claimant and filed with the commission at Washington not later than June 2, 1919. By law, no claim filed later than June 2 could be considered under the Minerals-Relief Act. The questionnaires contained questions designed to bring out the principal facts forming the basis of the claim made by the claimant. In addition, each claimant was allowed to file such supplementary information as was deemed necessary more fully to substantiate his claim. In some instances maps and photographs of operations were included.

Under the act the Secretary of the Interior was authorized to adjust, liquidate, and pay such net losses as have been suffered by any person, firm, or corporation, by reason of producing or of preparing to produce manganese, chrome, pyrites, or tungsten in compliance with the request or demand of the Department of the Interior, the War Industries Board, the War Trade Board, the Shipping Board, or the Emergency Fleet Corporation. The Secretary of the Interior delegated to the commission the task of investigating the claims and of making specific recommendations to him for their proper adjustment. Under this authority the commission began holding hearings of important claimants and such claimants as desired to be heard. These hearings have taken place in Washington, St. Louis, Mo.; Little Rock, Ark.; Tucson, Ariz.; Los Angeles, Cal., and San Francisco, Cal. Additional hearings are to be held in Medford, Portland, and Baker City, Ore.; Spokane, Wash.; Butte, Mont.; Salt Lake City, Utah; Denver, Col., and a final hearing in Washington, D. C.

Classification of the claims, the work of the field engineers and auditors, and all clerical work necessary to the advancement of the investigation toward completion are proceeding simultaneously with the hearings. It is expected that the work of the commission will be completed in the autumn of this year.

The commission has applied itself diligently to a task which is recognized by all as being extremely difficult. The first case, the claim of the Chestate Pyrite Chemical Corporation, was heard in Washington during April and May, and has already been reported in the columns of the *Journal*. In all, 1,287 claims, totaling \$18,000,000, have been filed.

At the hearings in San Francisco, July 5 to 25, a representative of the *Journal* was in attendance for a part of the time and had an excellent opportunity of observing the work of the commission. Though the burden of proof rests with the claimant, it was evident that the commission approached each case with an open mind and made every endeavor fairly to determine the pertinent facts surrounding each claim. The principals in each case heard were asked to appear, and, though they were permitted to have an attorney present, the commission obviously preferred to have the claimant state his own case. In some of the hearings the claimant's attorney conducted the examination, assisted by the commissioners whenever it was necessary to go deeper into particulars.

Maps and any additional papers that were required to substantiate or make clear the replies in the questionnaire were presented and were filed along with the original claim. In general, the questions asked by the commissioners were along the lines of establishing the chronological sequence of the events leading up to the claimant's entry into the business of mining the particular mineral in question, the amount of actual development done, and the ore produced and sold, as well as the road, trail, mill, or other construction necessary for access or operation. The statements of costs were inquired into, and explanations were asked of such items as were not clear. The ownership of the property and the way in which it was acquired were brought out. Claimants were asked whether they considered the project a commercial one at the time of beginning work and also at the time of discontinuing operations. Such facts as the thickness of the vein of mineral, its grade, royalties to be paid, and wages and salaries allowed were ascertained where pertinent.

The hearings were conducted with rather less formality than is customarily found in a court of law. In fact, the commissioners endeavored to get around the table with claimants and secure a free and frank discussion of the merits of each case. How much patriotism and how much the desire to make money were motives for taking up a project were fully and pleasantly discussed. Both claimants and commissioners recognized the difficulties of the situation, and each met the other, with few exceptions, in a broad spirit of mutuality.

IMPORTANT CLAIMS IN CALIFORNIA

There were about 290 California claimants, of which over 233 were for chrome, 34 for manganese, 8 for chrome and manganese, and 5 for tungsten, and there was one claim for tungsten and chrome projects. Among some of the more important claims presented to the Minerals-Relief Commission at its San Francisco sessions were the following:

Claim No.	Name	Amount of Claim
1018	Pacific Tungsten Co.	\$44,880.00
1180	Plecer Chrome Co.	205,867.60
71	Steele Chrome Co.	138,929.31
1020	F. M. Neely	133,470.26
648	C. S. Maltby	77,500.00
55	St. Anthony Lasing Co.	75,000.00
684	Holbrook & McGuire	11,850.00
955	Holbrook & McGuire	33,193.00
1163	Holbrook & McGuire	8,851.00
697	Noble Electric Co.	67,355.81
807	Western Rock Properties	39,353.00
274	Whitney & Loss	54,855.00
680	Tedco Co.	49,607.00
760	Sawyer Tanning Co.	7,662.76
761	Sawyer Tanning Co.	20,192.53
762	Sawyer Tanning Co.	10,129.71
1178	H. H. Noble	35,114.00
970	S. L. Schwartz	12,976.00
971	S. L. Schwartz	10,145.00
917	Santa Margarita Chrome Co.	31,714.83
1113	Dickey, Druebeck & Murry	30,836.60
136	Sulphur Gulch Mining Co.	29,370.00
170	J. F. Barnabee	20,693.00
691	F. W. McNear	20,149.00
961	Western Ore Co.	19,380.00
1059	Daisy Chrome Co.	19,135.81
933	Hillside Mine	16,921.80
156	Wells Chrome Co.	15,868.00
410	Samuel Dolbear	15,493.69
133	Hymer and Rufener	14,266.47
937	Frank W. Griffin	14,250.00
864	G. Howard Garrison	13,733.40
48	J. Bouse	13,000.00
771	A. H. Jarmon	13,929.00
750	Holter & Faucher	14,172.00
1107	J. T. Geisendorfer	10,912.00
44	K. G. McLoughlin	15,000.00

At San Francisco about 180 claimants were heard. At St. Louis, out of 25 claimants, 16 were given hearings. At Little Rock, out of 63, 11 claimants were heard. At Tucson, out of 33, 11 were heard; and at Los Angeles, out of 79, 35 were heard. As only

a small percentage of the questionnaires were fully and adequately prepared, the necessity for hearing as many cases as possible was recognized by the commission early in the inquiry, and every effort was made to have claimants attend the hearings.

The most important claim presented at the San Francisco hearing was that of the Pacific Tungsten Co. The amount of this claim was \$444,880. The ownership of the Pacific Tungsten Co. is vested in W. J. Loring, of the firm of Bewick, Moering & Co., San Francisco, Cal.; Charles H. Sergerstrom, of the First National Bank, of Sonora, Cal., and Edward A. Clark, of Boston, Mass., as well as other stockholders. W. J. Loring was the principal witness, and the examination was conducted by Judge John F. Davis. The mines of this company are situated eight miles from Mill City, Nev. The company operated two groups of claims, totaling 76 mining claims, covering an area of 1,850 acres. The first claims were acquired March 6, 1918, and it was then proposed to start operations with a mill of from thirty to forty tons' capacity.

Upon representations made by Government agents of the great need for tungsten production, the first plans were enlarged, additional mining ground was acquired, refinancing undertaken, and a mill of 125 to 150 tons' capacity erected. The mill was finished on Nov. 15, 1918. Buildings, a four-mile narrow-gauge railroad, and power lines were constructed. An extensive water system was installed, and preparations for the rapid production of a large tonnage of tungsten ore were made. The failure of the tungsten market left the company in financial difficulties.

The recent interpretation of the War-Minerals Relief Act by the U. S. Attorney General, which was given in full on page 107 in the *Journal* of July 19, will materially reduce the number of claims which will be allowed by the commission. Under this ruling only those claimants who received a request from the Department of the Interior, the War Industries Board, the War Trade Board, the Shipping Board or the Emergency Fleet Corporation stand a possibility of securing a return of their expenditures. Undoubtedly there are many claimants who responded to the widely spread requests which emanated from official sources and who did not receive a specific request either by letter or from an authorized agent. This is a greatly to be regretted outcome, and it would seem that the commission should take active steps to determine the justice of such claims and recommend them for further action by Congress, as that course appears to be the only solution of the present difficulty.

Water Jack-Hammer Contest At Tonopah

Exciting Tests in Which Individual Skill and Quickness, as Well as Judgment in Selecting Sharp Drills, Win Decision

By J. A. CARPENTER
Consulting Engineer, Tonopah, Nevada

THE big event of Tonopah's Fourth of July contest this year was the water jack-hammer contest, which was carried out on a large block of granite placed at the intersection of the main streets of the

town. The published conditions covering the contest were as follows:

Open to miners of Nye, Esmeralda, and Mineral counties.
Purses—\$1,000, the money to be divided as follows: \$400, first; \$300, second; \$200, third; \$100, fourth.

Entrance Fee—\$10 per man. Entrance fee must accompany application. All contestants must be vouched for by superintendent of mine employed.

Rock—California Rockland granite.

Kind of Drills—Jack-hammer class, with piston of not over 2½-in. diameter. Drill not to weigh over 50 lb. Either new or old machines from stock.

Time—Seven minutes, including connecting up air and water.

Holes—Vertical holes, water jack-hammer held by hand. All holes to be blown before measuring.

Bit—Any style. No bit to be less than 1½-in. gage.

Steel—¾-in. hexagon.

Water Pressure—From Tonopah water mains. Standard pipe fittings for air and water will be used. Each contestant to make his own air and water connections.

Conditions—Each contestant must have his machine fitted with standard ¾-in. nipples for air and water. Contestants must point hole so as to avoid holes previously drilled. Failure to do so loses contest. Each contestant will be allowed one trial connection for air and water prior to drilling. Each contestant must be ready to drill within five minutes after being warned by judges. Each contestant will be allowed one coach on the rock, coach not to touch any equipment or the driller. Violations of this rule forfeit contest. Each contestant will be allowed to have representative from the company manufacturing the machine as a time inspector, to be governed by the judges' watch only. The representative will not be allowed to make any decisions nor to pass on any of the equipment.

Allotment Space—Granite block will be marked in squares and numbered, and contestants will draw for time and place on rock.

Place—Main St., Tonopah, Nev.

Entries Close—At 5 p.m., July 1. Drawing for place to be held at 7:30 p.m., July 1, at Justice of Peace Court.

Special—Any conditions arising not covered by above rules will be left to a decision of the judges of this contest.

The large purses offered, and the confidence in their ability shown by the miners, brought out thirty-nine contestants. Each of these men depended on his favorite blacksmith to sharpen his steel, and each had to decide upon the type of bit he thought would be best suited to the rock. In addition, he had to choose between the many makes of machines offered him. For days the men practiced out on the surface or underground, and each had his throng of admirers.

At the contest each man in his turn laid his steel at the side of his drill, put both air and water hoses close to the machine and pipe connections, and at the word "Go!" connected up his machine first, sprang to his pipe connections, connected them, using hand-pressure only; turned on air and water, jumped back to his machine, put in his starter, stuck it between his toes, and, leaning over the machine, turned on the air.

A few of the contestants used longer steel and kept their machines up nearly breast high, but the best drillers used short steel, rode their machines, and drilled down to the shank on each steel. A few used only three steels, but the winners used four, ranging from a short starter to a final 6-ft. steel. Two or three men used the steel holder on each steel, but most of the drillers used it only in an emergency. A few left it off the drill entirely, assuming that if a steel stuck they would lose anyway.

The favorite bit was the single bit, ranging from the Carr bit to many variations, which applied to the cutting angle, cutting edge, and the position of the

water hole. The choice of machine was influenced a great deal by the agents of the drills, some of whom, it is said, paid the entrance fees and even offered additional rewards to purse winners. This action is to be regretted, as it places too much emphasis on the make of the drill and not enough on the men behind the drill.

The contest is essentially a test of skill between miners. The depth of hole drilled in the 7 minutes by the men varied from $27\frac{5}{16}$ in. to $56\frac{3}{8}$ in., with one man entirely out of the race because he stuck a drill beyond recovery; another because a steel broke in the hole; another because his coach touched the water valve, another because his blacksmith forgot to temper one of his drills. Two other drillers were making excellent records, when, in one case, a drill shank broke, and, in another, the machine-water hose broke. An-

drove each steel down to the collar and made his changes of steel in from 6 to 8 seconds. His record for the 7 minutes was $56\frac{1}{8}$ in., which gave for the actual drilling time of $6\frac{1}{4}$ minutes a drilling speed of 9.07 in. per minute.

The average time to get started was about 40 seconds, with a maximum of over a minute. The average time to change a steel was 10 seconds, with a maximum of 18 seconds. Boyd exceeded the average man by 18 seconds in getting started to drill, and in his drill changes, or a drilling equivalent of $3\frac{3}{8}$ in. He exceeded George Lynch, the winner of second money, by over this amount, showing that his drilling time was also the fastest. The winners of the purses were:

First—Dan Boyd, of the Divide Consolidated, $56\frac{1}{8}$ in., Cochise machine, crossbit.

Second—George Lynch, of the MacNamara Crescent, $52\frac{7}{8}$ in., Cochise machine, crossbit.

Third—Adam Ogi, of the Montana Tonopah, $49\frac{1}{8}$ in., Sullivan machine, single bit.

Fourth—Ed Yender, of the Gypsy Queen, $48\frac{1}{8}$ in., Sullivan machine, single bit.

Many of the spectators complained that the contest was not as interesting as the old double-hand contests. There is not the spell that binds one in watching a powerful man striking rapid accurate blows upon the head of a small steel that another man grips and churns without a blink of an eye at the flashing hammer. However, the day of the double-jack is gone in modern mining, and it is no longer a representative contest between the miners of the district. The jack-hammer contest brings out contestants from nearly every mine, and is a contest that appeals to every miner and mucker in the district. The excited comments of "Change your drill!" "Ride it hard!" "More water!" and "Blast it out!" show the spirit that surrounds the drilling platform.

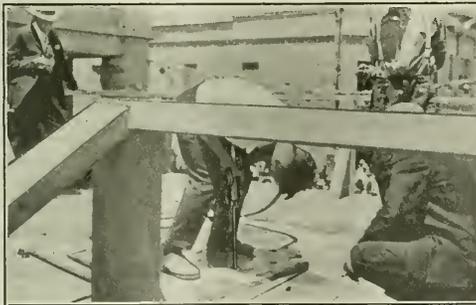

INTENSE INTEREST DISPLAYED BY SPECTATORS

The betting spirit of the miners was manifest. Odds of thirty to one were posted at first against any single entry, but gradually the odds grew less on the favorites. The interest toward the end of the contest resembled the finish of an exciting race. In this contest the last man to drill won the contest.

The man who won the first contest two years ago was a Finn, who used the same Ingersoll machine that the others used, but, for his steel, just picked his pieces from those ready to go down in the Belmont mine. He drilled 61 in. in the 8 minutes given. This year, to keep from drilling through the rock, the time was cut to 7 minutes. If this year's winner had been given 8 minutes, he would have considerably exceeded the 1917 record.

The contest was in every way a success, and it greatly stimulates the interest of the miners in the work and knowledge of drilling with jack-hammers. Fourth of July and Labor Day celebrations in mining camps should always have contests to try out the skill of the miners in their own line of work. It causes much useful discussion of drilling for months afterward, both in the bunkhouse and down in the mine while "taking five."

This article has dealt at length with the conditions governing the jack-hammer contest at Tonopah, with details of the contest, in order to give information of value to celebration committees in other camps.

SCENES AT TONOPAH DRILLING CONTEST

other twisted himself and his hoses up in a bad tangle trying to get his long drill to rotate.

That the records with the same drill varied greatly is shown by the fact that the high and low record made with one type was $45\frac{5}{16}$ in. and $27\frac{5}{16}$ in.; with another $56\frac{3}{8}$ in. and $32\frac{3}{8}$ in.; with a third $47\frac{5}{8}$ in. and $28\frac{3}{8}$ in.; with a fourth $49\frac{1}{8}$ in. and $36\frac{1}{8}$ in.; and with a fifth $44\frac{1}{8}$ in. and $44\frac{3}{8}$ in. The highest two records were made with the Cochise No. 39 drill. This drill had an advantage, as it has a $2\frac{1}{16}$ -in. piston bore, compared with the $2\frac{1}{4}$ in. of all the other makes, except the Chicago Pneumatic, which is $2\frac{3}{16}$ in. The other firms had jack-hammers with over $2\frac{1}{4}$ -in. bore, but they weighed over the 50 lb. maximum of the contest. The lightest drill was the Sullivan, with a weight of 38 lb.

The winner of the contest was Dan Boyd, an experienced miner employed in shaft sinking at the Divide Consolidated, in the Divide district. It took him only 22 seconds to connect his hoses and start drilling. He

To Drill Gold-Placer Ground in Dutch And French Guiana

Further Investigation To Be Made of Property Along The Moroni River Held Under Concession From the French Government

AN EXPEDITION sailed on July 30 on the S. S. "Prince der Nederlander," of the Royal Dutch West India Mail S. S. Co., for Dutch Guiana, to prospect gold-placer ground, held under concession from the French government, along the Moroni River, the boundary line between French and Dutch Guiana. It is reported that the deposit is 200 miles inland, and the river is not navigable by steamer for that distance.

A preliminary inspection of the ground was made about one year ago by W. S. Gage, and the present party expects to drill the ground in order to block out sufficient yardage for dredging operations. The work will be performed with an Empire drill. One 85-ft. motor-driven yacht, formerly a submarine chaser, to be used for navigating the shallow river, is a part of the equipment.

The party was in charge of Perry Tiffany, with M. J. I. Page as assistant. The remaining personnel consisted of Edmund V. Gillespie, E. Barnett, James W. Coulter, F. J. Canavan, and William Adams, a topographical surveyor. J. F. Van Name, of R. T. Wilson & Co., 120 Broadway, New York, is one of the officers of the company, which is known as the Liberty Development Co. The headquarters of the party will be at Paramaribo, one of the principal ports of Dutch Guiana.

Opportunities for the Marketing Of Manganese Ores

Those of High Grade Find Application in Several Lines Other Than Steel Making—Dry-Cell Manufacture of Importance

NOW that manganese is happily no longer required for war purposes, domestic producers of ores of this metal must find other outlets for their product. The U. S. Bureau of Mines is preparing a bulletin on manganese, a part of which, devoted to the uses of this metal other than for steel making, has already been published in mimeographed form.

The market absorbs about 50,000 tons of manganese ore per annum in addition to that used in steel. Most of this ore is the highest grade of pyrolusite, generally spoken of as chemical manganese ore, and so commands a much higher price than the lower grades used for metallurgical purposes. Before the war, most of it was imported from Russia, Saxony, Japan, and Nova Scotia, but in the last few years some excellent domestic properties have been developed. Some of the more important uses discussed are:

Dry Cells—The modern dry cell consists of a sheet-zinc container forming the negative pole, lined with absorbent paper to keep the zinc moistened with the electrolyte, while preventing contact with any solid particles. A carbon electrode forms the center of the cell. The space between the paper and the carbon rod is then filled with the depolarizing mass called "mix." This consists of ammonium chloride, which is the electrolyte; ground graphite and coke, to render the "mix"

more conductive; zinc chloride, to combine with the ammonia liberated when the cell is in use; and manganese ore, to furnish oxygen for the hydrogen produced; the reaction being

The manganese ore for this purpose should preferably contain 80 to 85 per cent MnO₂ and less than 1 per cent iron, with practically no copper, nickel, cobalt, or arsenic. Lower-grade ores have been used during the war, with good results, however, so that any ore running over 70 per cent MnO₂ may possibly find a market for the purpose named. The higher grades are still required for the manufacture of flashlight batteries.

Ceramics—A slight amount of iron in the form of ferrous silicate gives a green tint to glass. This is most commonly neutralized by the addition of a small amount of manganese ore, the quality required being about the same as for dry-cell manufacture. From two to fifteen pounds of ore is required per 1,000 pounds of sand. The addition of more manganese results in an amethyst tint, and if as much as 3 per cent is added, a black glass, such as is used for ornamental purposes, is produced.

Paint—Manganese dioxide and salts prepared therefrom are extensively used as driers in mixtures of linseed or other oils. The action is probably catalytic.

Miscellaneous Chemicals—Manganese chloride is used for dyeing cloth a brown or bronze. The sulphate finds a market for calico printing, porcelain painting, and as a drier. The persulphate is an oxidizing agent in the manufacture of organic products. Permanganate of potash is used in treating wood, for bleaching textile fibers, for disinfecting, and for purifying various gases.

Manganese Bronze—This term is somewhat a misnomer, as the alloy does not contain more than 0.05 per cent of manganese, and the consumption of manganese for this purpose is, in consequence, small.

Chronology of Mining, July, 1919

July 1—Cornerstone laid for new U. S. Assay Office, New York.—War Trade Board transferred to Department of State.—Consolidated Mining & Smelting Co. of Canada put Schedule C in effect at Trail, B. C.—New Mexican mining law went into effect.

July 6—Downtown pay office of Anaconda company dynamited in Butte, Mont.

July 7—Calumet & Hecla and subsidiaries announced that all underground men will be re-employed.

July 8—Conference took place in Butte, Mont., between mining-company officials and union representatives.

July 10—New suits brought at Bisbee, Ariz., for deportations on July 12, 1917.

July 12—Northwest extension Burkburnett oil field shut down for five days by Texas Railroad Commission to avoid overproduction.—Steel workers' unions at Washington meeting recommend that strike vote be taken.

July 14—Weimar dispatch stated German potash syndicate had asked permission of government to raise price of potash 100 per cent, owing to increased production cost.

July 15—War Trade Board announced that nitrates of soda and potash, also tin ore and tin concentrates

may be imported freely under general import license.—Calumet & Hecla and Mohawk-Volverine mining companies raised wages 15 per cent.

July 16—Wages increased in Warren district, Arizona, for copper miners, also for smeltery employees at Douglas.—War-time wage scale restored at mines in Coeur d'Alenes, Idaho.

July 17—Hearings on war-mineral tariff bills postponed until September by House Committee on Ways and Means.—C. E. Lescher, of U. S. Geological Survey, told Rules Committee of House that big coal shortage confronts Eastern and Northwestern sections of United States.

July 21—New freight rates effective on ore and concentrates shipped from Boulder and adjoining counties, Colorado, to Pueblo smeltery.

July 23—Miners struck at Cobalt for recognition of union.—Anaconda abolished sliding scale and raised wages of union employees \$1 per day, effective for year beginning July 1, 1919.—Announced that Mexican government will permit temporary boring of oil wells provided companies will submit to possible future legislation.

July 23.—Tungsten tariff bill reported favorably to House.

July 30—Calumet & Hecla presented medals to employees for long service.

Bauxite Lands in British and Dutch Guiana

The restrictions on taking up bauxite lands in British and Dutch Guiana have not been removed in either colony, according to a recent consular report. In British Guiana prospecting licenses are still issued and persons are allowed to prospect for bauxite and enter applications for the lease of crown lands, but there is no certainty that leases will be granted for the lands prospected. Acting under instructions of the British government, the colonial government has granted no leases for bauxite lands during the last two years, and at present it is impossible to obtain any information as to the British government's intention.

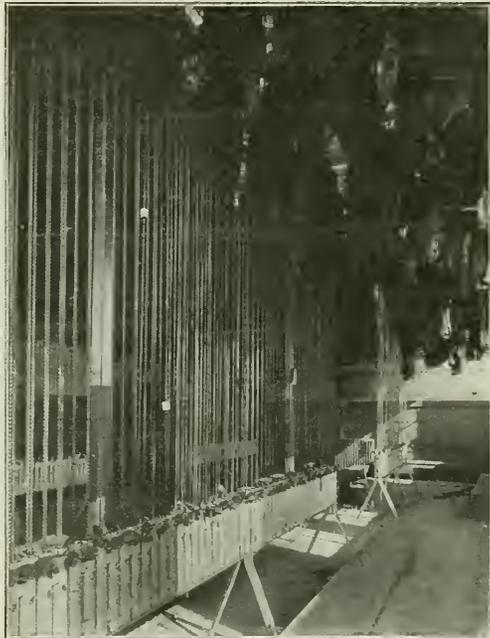

The Demerara Bauxite Co., Ltd., an American concern with offices in Philadelphia, Pa., purchased private lands containing bauxite, and in addition to these tracts secured leases from the government for about 2,500 acres of crown land containing bauxite. This occurred more than two years ago, or before the British government directed that no more leases be granted, and it is believed comprises all bauxite lands leased up to the present time.

In Dutch Guiana leases have been granted for about 125,000 acres of bauxite lands. These leases were granted under the old mining laws, but in March, 1918, a bauxite ordinance was passed by the Dutch Guiana government and the issuing of licenses under the old law discontinued. This new ordinance has not yet been approved by the Dutch government in its original form, but it is understood that the colonial government has been advised recently that it has been approved with certain changes. Pending the passing and approval of this ordinance, all prospecting for bauxite was stopped, and no leases were granted, and it is not now known when the restrictions will be removed.

There is no information available as to the estimated area of bauxite lands in either colony, as all prospecting has been done by private interests.

Overhead Hanging Arrangement For Clothes

A simple and sanitary arrangement possessing special advantages in the solution of the clothing problem in change houses is illustrated herewith. In the upper part of the picture the clothes are shown hanging suspended by a light chain, which passes over a series of pulleys and is fastened below. The arrangement also provides a convenient means for taking care of the loose chain, shown in the lower left-hand corner. The cylindrical containers are numbered so that no confusion will arise when the workman wishes to obtain his clothing. A particular feature of the installation is the provision made for the individual locking of the chains, which provides ample security against theft or other interference with the clothing during the absence of the men.

OVERHEAD HANGING ARRANGEMENT FOR CLOTHES

The advantage of having working clothes exposed to the free circulation of air which is obtained by the above method will be realized by operators who have had experience with the defects of the ordinary change house.

This illustration is reproduced from the "Bulletin" of the Bureau of Safety, Sanitation, and Welfare of the U. S. Steel Corporation, and shows the arrangement as installed by the Tennessee Coal, Iron & Railroad Co.

Mexico's New Mining Law

The last clause of Art. 17 of the new mining law of Mexico, the text of which was given in the issue of Aug. 2, should read "a single tax which shall not exceed 5 per 1,000 per annum, on the value of the property and its equipment."

BY THE WAY

An Item in the Cost of Tin

Transportation charges on six bundles of picks and handles sent during the war from New York to Jos, in the Nigerian tin fields, amounted to about \$275, figuring exchange at \$4.61. Jos is practically at railhead and 700 miles inland from the port of Lagos. The Railroad Administration cannot be blamed for this.

Smoke Farming

Some of our British friends are not alive to the possibilities of smoke farming. The *Ironmonger* recently called attention to protests voiced in the daily papers against the proposal to begin the manufacture of aluminum wares at Stratford-on-Avon. One protestant takes this to mean the erection of "blast furnaces and smelting factories." Even so—sentiment should not stand in the way of a community's welfare, especially the welfare of the hard-working farmer. On this side, the cloud of smelter smoke has had its silver lining for the thrifty tiller of the soil. Then again, when taxes are to be levied, the mining and metallurgical industries have proved a godsend to him.

Oil Stocks and the Movies

Oil-stock advertisements without any additional illumination seem to be bright enough to attract most of the "speculation moths," but it remained for a moving-picture firm to devise a method by the use of which stock-selling agents can surely induce the uncertain ones to part with cash for stock. "Seeing is believing; when they believe they buy; show them with moving pictures," reads part of the advertisement. A choice line of gushers, flowing wells, tank farms and refineries is offered. Think what an irresistible argument a gushing well photographically adjacent to the "X. Y. Z." ten-acre tract would be to a wavering would-be speculator in the stock of that company! The world moves; and moving pictures and stock brokers are well in advance of the main body of the procession.

Problems in Seating Capacity

The school men of the Middle Ages, it is said, were fond of debating such problems as how many angels could sit on the point of a needle. Time rolls on, and today in New York and elsewhere subway experts and others are confounding their brains with similar problems. The vexing question bobs up again in the Interior Department at Washington, where, by recent order, each employee has been restricted to 78 sq. ft. of floor space. Almost a mutiny has resulted, according to our Washington correspondent. Though this amount of space may be sufficient for stenographers and clerks, it is not sufficient for geologists and engineers. The latter, who must have space for map cases and for cabinets of specimens, as well as the usual desks, chairs, and bookcases, are certain that they cannot get along in such confinement. But everything has its compensation. What if a geologist be confined bodily within narrow limits! How fancy free he is to roam! With what mental strides he skips from Archean time to the glacial period without even a thought of the layman at his

side. Let him take similar thought with Lovelace that "stone walls do not a prison make," and perhaps even out of his confinement will come a masterpiece.

A Time Consideration

M'son, this 'ere pro'fition be 'ard for some chaps to h'understan'," said Cap'n Dick. "May be a bloody good thing for tha country, although, min' you, I'm not speakin' my feelin's, so thee does'nt naw 'ow I stan's on tha matter. 'Owver, as I wuz sayin' be'fore, I naws some chaps 'o does'nt like un, an' per'aps they 'as good reason h'after h'all. Tha h'other day Billy Penglase an' Sammy 'All wuz walkin' from tha mine after shif'. Min' you, it 'ad been their custom for years to stop at 'Arry Nesbit's place an' stan' h'each h'other to a pint afor' they went 'ome. An' this time w'en they gaws by, an' sees tha ol' place closed h'up like a las' year's bird's nes', they wuz pretty much dis'eartened, Billy 'specially. So Sammy, by way o' cheerin' 'im h'up, sez, "I tell 'e, Billy, let's gaw to one o' these 'ere soda fountains an' see w'ot we can do there.' So in they gaws, an' Sammy, 'o'd been there h'often, sez, 'Ere, boy, bring me some chocolate soda and get Billy 'ere a strawberry sundae.' An' Billy, 'e starts h'up an' makes for tha door. 'Wot's tha matter naow', sez Sammy. 'W'y, dam-me,' sez Billy, 'if I can't 'ave un naow, I don't want un. I'll be blawed if I'll wait till Sunday.'"

D. E. A. C.

A Glance Into Ancient History

The first technical book produced by any of the ten papers now published by the McGraw-Hill Co. appears to have been Dr. Edward Dyer Peters' "Modern American Methods of Copper Smelting," published in 1887. Through succeeding editions the sale reached the surprising total of 15,000 copies. Though Dr. Peters later produced two big books on the subject of copper smelting, his original work under the title of "Modern Copper Smelting" is still in print and in good demand. In 1890 came Professor Henry Marion Howe's "Metallurgy of Steel"—another classic of metallurgical literature, which remained actively in print for twenty years, and now commands high prices whenever it appears in the second-hand market. It was reprinted from the type pages of the *Engineering and Mining Journal*.

The *Journal* under the guidance of Richard P. Rothwell developed a notable series of books on mining, metallurgy and geology. Among these should be mentioned Hofman's "Metallurgy of Lead," Richard's "Ore Dressing," Ingalls' "Metallurgy of Zinc and Cadmium," Campbell's "Manufacture and Properties of Iron and Steel," Kemp's "Ore Deposits of the United States and Canada" and numerous others, most of which, though fully twenty-five years old, have in various revisions held their places as standard works.

Similarly, the *Electrical World*, under the direction of W. J. Johnston, contributed some of the most important books in the literature of electrical engineering. The works of Charles P. Steinmetz, which he has loyally revised and to which he has constantly added new volumes first appeared in this regime. Again, the works of Dr. Louis Bell, Silvanus P. Thompson, and Kempster B. Miller are to be included.

Up to 1909 the book departments of the various papers had produced about 200 books. In the ten years that have elapsed, the list has grown in the hands of the McGraw-Hill Book Co. to approximately 1,000 titles.

PERSONALS

EDSON S. BASTIN, who is in charge of the mineral resources division of the U. S. Geological Survey, has accepted an appointment to the chair of economic geology in the University of Chicago. He will continue his work with the Survey until Jan. 1, after which he will enter upon his new duties.

A. D. Cox is making an examination of a placer deposit at Kirkland, Ariz.

W. A. Simkins, Lieutenant of Engineers, has returned to San Francisco from France.

Fred Hellmann passed through Reno, Nev., on July 29 after visiting the Divide district.

C. C. Van Nuys, of the Air Reduction Co., has gone to Petrolia, Tex., on professional business.

H. R. Hanley, superintendent of the Mammoth Copper Mining Co.'s zinc plant at Kennett, Cal., has resigned.

Everett H. Patterson, mining engineer now of Long Beach, Cal., has been visiting his former home in Spokane.

L. F. S. Holland will return to California early in August from Bingham Canyon, Utah, where he is making examinations.

C. A. Hoffmaster, for fifteen years purchasing agent for the Mammoth Copper Mining Co., at Kennett, Cal., resigned on Aug. 1.

A. H. Graham, recently construction engineer with the Burma Mines, Ltd., at Namtu, Burma, has returned to New York.

Donald R. MacKay, has left the Sunnyside mine at Eureka, Col., and is now at his permanent address, 766 York St., Denver, Col.

N. C. Sheridan, mining engineer of Wallace, Idaho, is now general manager of the Snake and Opportunity mines at Hillsboro, N. M.

Adolph Knopf, of the U. S. Geological Survey, arrived in Tonopah, Nev., July 26, for the purpose of making a preliminary report on the Divide district.

John H. Eggers, mining engineer of San Francisco, recently completed an extensive examination of mining property on the Mother Lode in California.

Charles F. Haselton returned from France with the 27th Engineers and will soon assume a position with the Modoc Consolidated Mines Co., Victor, Col.

Lieutenant H. K. Bowen has returned from overseas, where he served in the R. A. F. Lieutenant Bowen will soon resume practice as a mining engineer.

Harry Donaldson, who has latterly been engaged in mining near Madoc, Ontario, has been appointed superintendent of the Beaver Consolidated mine, Cobalt.

D. McPhail, who has been in charge of operations at the Hudson Bay Mines, of Cobalt, has succeeded C. Randall as resident manager of the Dome Lake property, Porcupine.

John T. Reid, mining engineer of Lovelock, Nev., has recently returned to Lovelock after extended mine examination work in the Blue Mountains of northeastern Oregon.

Lieut. Col. S. R. Elliott, of the 28th Engineers, has returned to Ishpeming, Mich., and resumed his duties as assistant general manager of mines of the Cleveland-Cliffs Iron Co.

A. H. Jones, superintendent of mills of the Tonopah Belmont Development Co., has resigned to accept a position with the Butters Filter Co., with headquarters at Salt Lake City.

Photo by Harris & Ewing, Washington, D. C.

EDSON S. BASTIN

D. L. Goddard has been appointed manager of the smeltery at the Chillagoe works, in Queensland. Mr. Goddard was manager for nine years at Cloncurry under W. H. Corbould.

Charles W. Burgren was appointed assistant superintendent of the Dolores Mines of the American Smelters Securities Co. at Matehuala, S. L. P., Mexico, instead of superintendent, as previously announced.

Rene J. Mechin has resigned as engineer for the Nacozari Consolidated Copper Co. and has accepted a position in the engineering department of Cia de Santa Gertrudis, S. A., at Pachuca, Hidalgo, Mexico.

C. Lonsdale Smith has been appointed manager of the Tungsten Mines, Ltd., Frogmore, N. S. W. Mr. Smith was formerly manager of the Macdonald Kitchner molybdenite mines, Queensland, and Butler's tin mine, N. S. W.

D. M. Faries, civil and mining engineer, of Wallace, Idaho, has been appointed chief deputy of the State High-

way Commissioner. He will supervise road construction in all parts of the state, making his headquarters at Boise.

Olaf P. Jenkins and **E. D. Wilson**, of the Arizona Bureau of Mines, have returned from Jerome, where they have been engaged in areal mapping and making a study of the geology of the Jerome Quadrangle and along the Verde River.

Major W. M. Henderson-Scott has been appointed to the secretaryship of the Imperial Mineral Resources Bureau in England. Major Henderson-Scott is a graduate of the Royal School of Mines and the winner of the De La Beche medal of that institution.

C. L. Larson, of Kellogg, Idaho, has accepted the position of manager of the Boston & Arkansas Mining Co., at Gillham, Ark. For the last four years Mr. Larson has been in charge of experimental work for the Bunker Hill & Sullivan company, at Kellogg.

Robert Slessor left Australia recently for Hongkong to assume a position with a British firm as consulting engineer. Mr. Slessor had been for the last fourteen years occupying a similar position with Messrs. Brandeis, Goldschmidt & Co., metal merchants.

H. W. Stotesbury has resigned his position as engineer and mine superintendent with the Tonopah Mining Co. after twelve years service and will engage in consulting business for himself. Mr. Stotesbury is temporarily in Reno, Nev., but expects to open offices in Los Angeles, Cal.

J. Parke Channing will attend an industrial conference to be held at Silver Bay, Lake George, N. Y., beginning Aug. 29. The general theme is "Human Relations and Betterment in Industry." The conference will be held under the auspices of the International Committee of Young Men's Christian Associations.

W. C. Clemons, superintendent of drilling of Beaumont district for Gulf Production Co., has been promoted to superintendent of drilling of West Columbia, Goose Creek, Humble, and nearby fields, with office in Houston. Mr. Clemons will be succeeded by J. V. Reddick, now field superintendent at Sour Lake.

Captain W. J. Rose, M. C., 3d Pioneer Battalion, and formerly chief metallurgist of Amalgamated Zinc, Ltd., returned to Australia via America and New Zealand by the SS. "Makura." Captain Rose is on leave and came to America in the interests of the Electrolytic Zinc Co. He has been on active service for three years.

Marshall D. Draper is chief of a mining exploration party, capitalized by a syndicate composed of Denver, New York, and Boston men, to conduct a thorough exploration of the mineral resources of southwestern China. Several American engineers joined the party in San Francisco, where they sailed for Hongkong on the "Persia Maru."

Major Charles Will Wright recently arrived in Sault Ste. Marie, Mich., with his family from Sardinia where he was managing lead-zinc mines and during the war had charge of the American Red Cross work. Major Wright intends to return to Italy in September. His present address is care of J. S. Dunstan, 42 Broadway, New York.

J. C. Farrant is the author of a series of articles being published in "The Mining Magazine" entitled "Four Years as a Prisoner of War." Mr. Farrant is at present the London representative of the Hardinge Conical Mill Co., as was announced in a recent issue of the *Journal*. He had been taken a prisoner of war and sent to Russia.

W. C. Robinson, a director of the Bureau of Oil and Natural Gas Conservation of the U. S. Food Administration, has been elected a director of the Massachusetts Oil Refining Co., recently incorporated. Mr. Robinson is also president of the Pittsburgh Pipe Line Co., vice-president of the Pittsburgh Oil Refining Co., and president of the W. C. Robinson & Co.

D. W. Kerr, through the sale of his stock in the American Zinc Products Co., Greencastle, Ind., and Fort Smith, Ark., has transferred control to the Valley Iron Co., Youngstown, Ohio. Mr. Kerr has resigned as president and is succeeded by C. W. Martin, formerly vice-president of the DeForest Sheet & Tin Plate Co., Niles, Ohio. C. C. Stewart is the new vice-president, and C. H. Stewart the new secretary. The New York offices will be continued at 50 Church St. with Marcus L. Filley as Eastern sales manager.

INDUSTRIAL NEWS

Rossendale-Reddaway Belting and Hose Co., Newark, N. J., announces the appointment of E. O. Floyd as its general sales manager to take effect Aug. 1, 1919.

Morse Bros. Machinery and Supply Co. have issued a stock list of machinery at Denver, Col., which includes all kinds of power house, milling plant, laboratory and underground equipment.

L'Eclair Building, No. 15 Boulevard des Italiens, Paris, is now in the process of completion and will be the only American type of office building in Paris. For information regarding the leasing of premises apply to Mark R. Lamb, Woolworth Building, New York.

Acieral Products Co., 25 Church St., New York, has issued a pamphlet on "Acieral", an alloy of aluminum and steel. The physical properties of this alloy and uses are listed and a table of acieral aluminum sheets giving a report of tests conducted by the Bureau of Standards, Washington, D. C., is included.

The Electric Furnace Co., Alliance, Ohio, has just shipped to the Dayton Engineering Laboratories, Dayton, Ohio, an electric furnace for melting and re-

fining aluminum in the Delco plant. This furnace has a hearth capacity of 500 lb. and a melting rate of 200 lb. of aluminum per hour. It is equipped with a double charging door in the front and rear, and otherwise is similar to the standard Baily electric furnace of 105-kw. electrical capacity, and 1,500-lb. hearth capacity.

United Filters Corporation announces that, in addition to the present filtering equipment it is marketing, additional filter presses of the plate and frame and recessed types will be added. It is now in a position to furnish the three types of filters in general use—the pressure leaf type represented by the Kelly and Sweetland filters, the continuous suction type represented by the American filter, and the plate filter presses known as the United. Bulletin No. 50 illustrates the new filter presses and will be sent on request.

Hercules Engineering Corporation announces the following additions to the staff: Major M. G. Donk, previously associated with and in charge of government work at Midland, Mich., will undertake work of a special character on the installation of equipment. J. T. Brewster, who has acted in a consulting capacity with the corporation for the last three years, has succeeded A. H. Alberger in charge of the technical and engineering departments. Previous to his association with the corporation, Dr. Brewster was connected with the Du Pont organization.

Chas. Butters & Co., Ltd., 90 West St., New York, announces that Charles Butters, who has been acting as managing director, is no longer associated with the company. Arrangements have been completed whereby the company retains all its former business and assets intact. American offices have recently been established at 90 West St., New York, where a general business in metallurgical engineering and in the application of the company's special processes and apparatus to metallurgical and chemical problems will be conducted under the direction of F. L. Bosqui. This is the only official representation the company has in the United States at the present time.

TRADE CATALOGS

Large Power Drives. Morse Chain Co., Ithaca, N. Y.; Publication No. 14 revised, entitled "A Chain of Evidence"; 6½ x 9; 22 pp.; illustrated. A pamphlet illustrating and describing the Morse Silent Chain and showing a few large power drives.

Mining, Quarry, and Gravel Pit Machinery, Smith Engineering Works, Milwaukee, Wis. Bulletin Nos. 261, 266; 7½ x 10½; 36 and 16 pp. respectively; illustrated. Descriptive of Tel-smith primary breakers, reduction crushers, screens, elevators, conveyors, washers, and bin gates. The last pages in Bulletin 266 are devoted to blank

forms to be filled in when ordering any machinery required for rock-crushing plants or gravel-washing equipment.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c each.

Conveying Fine Ore—Apparatus for Pneumatic Conveyance of Materials. Jens Westly, Lysaker, near Christiana, Norway, assignor to Sulitelma Aktiebolag, Helsingborg, Sweden. (U. S. No. 1,308,464; July 1, 1919.)

Copper-Cadmium Alloy, Method of Making. Walter C. Smith, Roselle, N. J., assignor to United States Smelting, Refining & Mining Co. (U. S. No. 1,307,642; June 24, 1919.)

Crushing—Ball Mill. John R. Ball, Durango, Col. (U. S. No. 1,307,951; June 24, 1919.)

Crushing—Ball-Mill Liner. John R. Ball, Durango, Col. (U. S. No. 1,307,952; June 24, 1919.)

Crushing—Roller Mill. Frank E. Marcy, Salt Lake City, Utah. (U. S. No. 1,309,210; 1,309,211; and 1,309,212; July 8, 1919.)

Drill—Percussion Rock Drill. James Fletcher, Newnes, New South Wales, Australia. (U. S. No. 1,305,349; June 3, 1919.)

Drill—Rock Drill. Wilhelm Mauss, Johannesburg, Transvaal, South Africa. (U. S. No. 1,303,705; May 13, 1919.)

Drill—Rock-Drill Hose Connection. Malcolm S. Beaton, Jeppetown, and Stewart Youngson, Johannesburg, Transvaal, South Africa. (U. S. No. 1,304,248; May 20, 1919.)

Drill. Cornelius J. Esseling, Heerlen, Netherlands. (U. S. No. 1,306,674; June 10, 1919.)

Drill-Bit-Pulling Device. William M. Williams, Tonopah, Nev., assignor of one-half to Burney Langston, Reno, Nev. (U. S. No. 1,305,184; May 27, 1919.)

Electric Heating and Melting Furnace. Victor Stobie, Dunston-upon-Tyne, England. (U. S. No. 1,305,177; May 27, 1919.)

Fuel-Feeding Device (for Pulverized Material). Charles S. Heffelfinger, Lebanon, Pa. (U. S. No. 1,304,973; May 27, 1919.)

Furnaces—Pre-Heating Apparatus for Furnaces. Horace E. Smythe, Pittsburgh, Pa., assignor to the S. R. Smythe Co., Pittsburgh, Pa. (U. S. No. 1,305,176; May 27, 1919.)

Furnace-Charging Apparatus. William E. Moore, Pittsburgh, Pa. (U. S. No. 1,304,351; May 20, 1919.)

Ingot Tongs. Angus A. Hanlan, Gary, Ind. (U. S. No. 1,306,255; June 10, 1919.)

Locomotive—Storage-Battery Locomotive. Raymond Mancha and Joseph Teipel, St. Louis, Mo., assignors to Mancha Storage Battery Locomotive Co., St. Louis, Mo. (U. S. No. 1,306,371; June 10, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief of Interest to Engineers and Operators

SAN FRANCISCO, CAL.—July 30

A Wage Increase of 50c a day has been announced by the Bully Hill Mining Co. of Shasta County, Cal., effective immediately. This raises the wages for miners from \$4 to \$4.50 per day and for muckers from \$3.50 to \$4 per day. These are the highest wages paid on the Shasta County copper belt, and are a little higher than wages now paid in the Grass Valley district.

Comstock Northend Mines, at Virginia City, Nev., for the two weeks ending July 26, produced a total of 1,128 tons, valued at \$32,000. Of this Consolidated Virginia produced 614 tons, which contained \$13,200, and Ophir 496 tons, valued at \$18,800. A noticeable feature of the conditions at the mines is the high-grade character of the ore coming from the Ophir. Fourteen bars of bullion were shipped to the San Francisco mint.

A New Schedule of Rates for electric power for gold-dredging purposes has been fixed by the Railroad Commission to be charged by the California-Oregon Power Co., and is as follows: First 50,000 kw.-hr. per meter per month, 1c. per kw.-hr.; next 50,000 kw.-hr. per meter per month, 0.8c. per kw.-hr.; up to 100,000 kw.-hr. per meter per month, 0.7c. per kw.-hr. These rates apply in all California territory served by the company and are for all installations of 300 hp. or over.

California Oil Fields in June produced 8,455,152 bbl., an average of 282,838 per day. This makes a total production for the first six months of 1919 of 50,903,451 bbl., a daily average of 281,236, and increase of 2,617 bbl. per day over the production for the corresponding period of 1918. Shipments for June were 7,712,455 bbl. a daily average of 257,082. Shipments for the first six months of 1919 averaged 2,754,423 bbl. per day, compared with a daily average of 2,921,153 in the first six months of 1918, a decrease of 16,722 daily for 1919.

In the oil field of the state activity is noticeable in every section, with many companies busy on proved territory or wildcatting. Some of the oldest and most conservative oil countries in the state are even leading the wildcat work and are meeting with success. In southern California more than fifty oil companies are at work. In the Midway Summit No. 1 Kern River field much new work is being planned, and the Standard, in the Elk Hills and near the Kern River field, is increasing its drilling operations. In many localities where wells were drilled several years ago and abandoned, operators are going back and trying again with more up-to-date equipment and sinking deeper holes. The wells recently drilled in the Elk Hills by the Standard are maintaining output, and in the south some of the big wells are making large production. Near Santa Maria, in Santa Maria and leased by the Palmer Union, a gusher came in recently, spreading a pool of heavy black oil hundreds of feet wide on the surrounding land. This well in the Standard No. 1, which yielded at the rate of 15,000 barrels a day after being shot. It required eight hours of hard work to cap the well.

Amendments to the Workman's Compensation, Insurance and Safety Act, as adopted by the last California Legislature, became effective July 22, 1919, and are as follows: Compensation will be payable to the injured man on the eighth day after he leaves work as the result of an industrial injury, instead of the eleventh day, as heretofore. When an employee under sixteen years of age is injured, it shall be the presumption that such injury was not caused by serious and wilful misconduct. Serious and wilful misconduct cannot be charged against the injured employee by the employer if the injury is caused by the failure of the employer to comply with any provisions of law or any safety order of the commission with reference to the safety of places of employment. Injurious acts and omissions and wilful misconduct made against the employer, the general superintendent is made responsible for the corporation, as

well as the executive or managing officer. Non-resident aliens are required to prove their dependency and cannot be conclusively presumed to be dependent. Applications for adjustments of controversies may be filed with the Industrial Accident Commission by the attorney or other representative of the injured employee, if authorized to do so in writing. A lien against compensation will be permitted for the support of dependents, as well as for the living expenses of the employee. Self-insurers shall not be required to pay any sums into the State Compensation Insurance Fund to cover liability for compensation, excepting a life-pension case. It is a misdemeanor not to report forthwith a fatal industrial injury, by either telephone or telegraph, to the Industrial Accident Commission. An injunction may be issued against an unsafe place of employment, if it constitutes a serious menace to employees, provided that such application for an injunction comes from the Industrial Accident Commission or a member of the commission. Chapter 183 creates a liability on the part of the employers or their insurance carriers in addition to any liability heretofore fixed by law in cases of the death of an employee who leaves no dependents. Under such conditions it is required that a death benefit of \$350 be paid. The Industrial Accident Commission is authorized to draw upon the fund created for the promotion of re-education and rehabilitation of persons disabled in industry in California. The fund has been passed in response to a public demand that crippled men be aided in acquiring new occupations. It will reduce dependency and prove of material benefit to the citizens of the state.

GRASS VALLEY, CAL.—July 31

Miner Workers' Protective League of July 26 voted to ratify the agreement under which the miners in the Grass Valley district, who struck in June, returned to work on June 30. This agreement is to run until July 1, 1920, and may be suspended by either side upon due notice.

PHOENIX, ARIZ.—Aug. 1

The Basic Wage Scale of Arizona miners has been raised 75c. a day, anticipating a 24c. market for copper, under a decision reached at a late meeting of the Arizona Chapter of the American Mining Association. Miners and machine men have been given extra pay beyond this flat increase. The basic pay for miners will be \$5.65 a day. A small degree of labor trouble has been known at Miami, where W. W. agitators tried to start a movement for \$6 a day for six hours' work. The leader was jailed as a vagrant and the movement died.

SPOKANE, WASH.—July 31

Francis A. Thomson, dean of the School of Mines of the University of Idaho, has announced that during this summer the newly created State Bureau of Mines and Geology will survey a tract fifteen miles square in the Seven Devils copper district, in central Idaho. This work will be done in conjunction with the U. S. Geological Survey. Professor D. C. Livingston, of the University, will be in charge. A specialist in contact metamorphic deposits will be detailed for the work.

The War Minerals Relief Commission will be in Spokane about Aug. 15. The principal hearing in Spokane will be in regard to the claims of the Tri-State Chrome Co. formed during the war, of which J. D. Sherwood, Walter J. Nichols, and A. L. White, all of Spokane, are the principal stockholders. This company remodeled the old Fred Diggins gold mill, near Canyon City, Ore., in the Grant County chrome area, and operated for a short time before the bottom fell out of the chrome market.

WALLACE, IDAHO—July 31

The Attitude of the Unions in the Coeur d'Alene district has been affected by the success of the unions at Butte in securing all their demands from the mining companies. Up to that time they had been

satisfied with demanding an increase of 50c. per day, eight hours "from portal to portal" and recognition of the union. The increase of 50c. per day was allowed, though not in response to the demand of the union. About the same time an advance of \$1 per day was allowed at Butte, making the scale 50c. per day more than in the Coeur d'Alene—a difference that has always prevailed and which is regarded as justified owing to the difference in working conditions. But it appears that this difference is no longer to be recognized, for Coeur d'Alene operators are now asked for another raise of 50c. per day, making the rate \$5.75, and, in addition to the two other demands, they are also asked to allow time and a half for overtime and double time for Sundays and holidays, these having been conceded in Butte. These additional demands have not been formally presented, but at a mass meeting of the unions in Wallace on July 27 the chief spokesman stated that every concession granted at Butte would be demanded in the Coeur d'Alene. As the operators have refused to confer with union representatives or to recognize the union in any manner, the unions have called a referendum on the question of striking.

SALT LAKE CITY, UTAH—July 31

The Assessed Valuation of mining property in Juab County, which includes most of the Tintic district, according to the State Board of Equalization, is \$5,990,107, this being more than one-third of the total assessed valuation of property in the county, which is \$17,050,425.

Wages at the Utah Copper Mine in Bingham Canyon, where operating conditions require a large number of surface workers, have been increased, according to announcement, so that all day labor paid more than \$3.25 a day receives an advance of 75c. per day, and all day labor receiving \$3.25 a day or less, 70c. per day, the increase being effective July 16. In regard to the above changes in the wage scale, R. C. Gemmel, general manager of the Utah Copper Co., is quoted as saying: "The advance announced is a recognition of the continued high cost of living, the principle of a living wage, an improved copper market, as well as an effort on the part of the management to demonstrate its appreciation of the attitude of its loyal employees at the time of the reduction in wages made last February, which reduction was necessitated by the stagnation of the copper market at that time. Since then a considerable improvement in the copper market has occurred, and it is hoped that it will continue, but the advance in wages now announced is based more on a belief in a better market in the future rather than upon present conditions. The present market conditions do not justify an increase now made. It is true that the copper quotations in the daily papers have recently shown an advancing price, but our daily information on the copper quotations apply to small sales of spot copper and not to any appreciable quantity that would absorb even present production. As an illustration, our production for June (and it should be borne in mind that we are operating on a 50 per cent basis) was approximately 9,000,000 lb. Our net sales for that month totaled about 4,100,000 lb. and, therefore, it is apparent that they were less than 50 per cent of production and but 25 per cent of our capacity. The average price we received from these sales was 16.5c. per lb., a trifle less than 16.5c. per lb. Moreover, this is not all, because on June 30, 1919, we had on hand a very large amount of unsold copper."

DENVER, COLO.—July 31

Boulder County Metal Association met July 28 to discuss plans for celebrating the fiftieth anniversary of the Boulder County silver-mining industry.

The State Mines Development Association, recently promoted by M. Brokaw, of Denver, is intended to arouse and restore public interest and confidence in mining in Colorado. To accomplish its purpose a subsidiary company is to be organized in

at least ten of the important Colorado mining districts. Thus far subsidiary companies have been formed at Leadville, Silverton, Ouray, Georgetown, Red Cliff, Buena Vista, and Aspen. A definite project will be planned in each district to secure financial support. At present the stumbling block appears to be the location of such a definite project for each camp.

C. Barlow Willmarth, president of the Radium Ore Sampler Co., of Montrose, predicts radium ore will be in demand during the war, when the price reached a maximum of \$175 a milligram, European countries could not procure American radium, and were compelled to use substitutes such as mesothorium. At present radium prices are down to \$80 to \$100 a milligram. Despite these low prices, the following leading producers of radium ore are regularly making small shipments: Standard Chemical Co.; Cummings Chemical Co.; Radium Co. of Colorado; Colorado Radium Products in Paradox Valley; American Rare Metals Co.; Chemical Products Co., at McIntyre, and Carnotite Reduction Co., at Gateway. In Paradox Valley, radium is found in carnotite ores. The increased demand for vanadium has obtained a byproduct in the recovery of radium, makes possible maintenance of the present production.

Dredges in the Breckenridge District almost every season encounter heavy sulphides of zinc and lead ore in the stream beds. Recently the dredge of the French Creek Dredging Co., operating about three miles east of Breckenridge, struck some heavy sulphide ore in the bed of the stream, on the Emille placer. The material which was scooped up was so unusually heavy that it completely filled the bins of the dredge aboard the dredge. The superintendent, Trevor Thomas, had to change the course of the boat to prevent the loss of gold. He marked the spot where the material was found and notified Mark Evans, manager of the company. The latter has organized a prospecting and developing syndicate and is following up the bed-rock veins encountered in the placer beds. Associated with him are E. R. Winn and D. A. Fairbanks, of the American Harvester Co., of Chicago; T. Crane, of Philadelphia, and W. P. Hamon, gold-dredge operator of San Francisco. The syndicate purposes to sink a number of vertical shafts to bed rock level. Several of the known veins which have been disclosed by dredging operations, and by necessary drifting and bed-rock tunneling endeavor to ascertain the most promising ore-shoots before sinking working shafts.

LEAD, S. D.—July 31

The discovery of Geologic Structure favorable to the occurrence of oil near Fairburn, S. D., has caused much activity in the vicinity. Several concerns have obtained leases on land and are preparing to begin drilling. The Roxana Oil Co. with headquarters at Cheyenne, Wyo., was the first to enter the field, and has secured a large acreage on which drilling will be started as soon as rigs can be brought in. One of the larger Wyoming operators has scouts in the field, and all favorable ground is being taken. This is an entirely new field, and drilling will be rushed to determine the depth to oil.

AUSTIN, TEX.—July 31

The Texas Railroad Commission has no authority, according to a decision of the Attorney General, handed down to the commission, to issue permits for wells, under the terms of the Oil and Gas Conservation Act, on account of overproduction. This decision indicates that the commission exceeded its authority in stopping production in the northwest extension of the Guernsey burnett field for a period of five days recently.

New Oil and Gas Conservation Rules have been adopted by the Texas Railroad Commission, and will be issued by the rules conform closely to the temporary rules adopted a few weeks ago. The commission has decided to issue rules and regulations which are as strict as possible upon a recent hearing. The only point left at issue at the close of this hearing was the amount of production from the strapping of tanks. This has later been fixed at 1 per cent for coastal fields, and 2 per cent for north Texas fields.

The Texas Company is restrained from drilling for oil and gas other minerals, according to an injunction issued July 23 by District Judge Calhoun, upon a strip of land in Eastland County claimed by the lease to it by the Refining Co. to be under the custody of the Resurvey of the tract of land purchased by the Texas Co. showed an excess in acreage in the form of a strip about 240 ft. wide and two miles

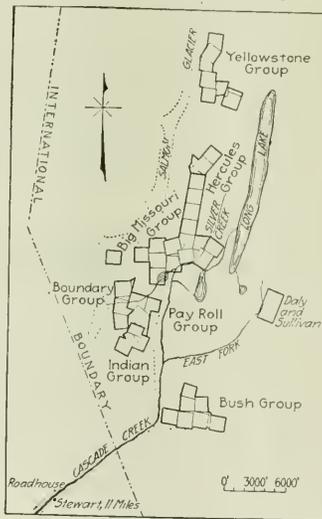

long. This was filed on by Eugene Giraud, of Austin, who secured a mineral lease from the state, and later sold it to the Humble company for a price reported to be \$200,000. The state is defending the lease originally given to Giraud because of its far-reaching importance, there being much excess of acreage in some of the original surveys of railroad land.

MOUNTAIN HOME, ARK.—July 31

The Rising Price of Zinc is creating a little activity in the North Arkansas zinc field. A number of smaller properties are starting up, and some ore is being sold. Two cars having been shipped from Zinc in July. None of the large producers are likely to start unless assured that the price of ore will remain long enough for them to make a profit. Heretofore many of the larger operators have had smelter contracts, and if these can be had now, covering a stipulated tonnage, or the production over a certain period, all camps will become active again. Nearly all the larger mines in the field have good reserves and are in shape to make a record production. F. E. Heywood and associates, of Yellville, Ark., are considering the erection of a plant in St. Louis for making zinc chemical products from Arkansas carbonates. J. H. Haddox, of Oklahoma City, president of the Magnolia Lead & Zinc Co., which operates the Tar Kiln mine, in Zinc camp, states that the Oklahoma Ore Storage Association may build a warehouse at Zinc.

DULUTH, MINN.—July 31

All Ore-Lading Records were broken by the new No. 6 ore dock of the Duluth, Missabe & Northern R.R., on July 17, when 12,683 tons of ore was placed in cargo hold

SALMON RIVER DISTRICT, BRITISH COLUMBIA
Reproduced from Bulletin of British Columbia Department of Mines.

in 35 minutes. Sixteen men performed all the hand labor required.

The Kennedy and Meacham Mines, on the Cuscuta River in the recent merger of the Otis Steel Co. and the Cleveland Furnace Co., both operating at Cleveland, Ohio. The new company will perpetuate the name of the Otis Steel Co. and its directorate will interlock with that of the Cleveland-Cliffs Iron Co., which has recently entered upon a period of expansion in the Lake Superior district.

Vermilion Range Iron Ores in practically all respects are the most desirable ores mined in the Lake Superior district, according to figures recently issued by the Lake Superior Iron Ore Association, which has offices in Cleveland. The report covers the period from 1902 to 1918 inclusive, and shows that Vermilion ores which average close to 58 per cent in natural iron have always ranked highest with those of the Gogebic, Marquette, Mesabi, Menominee and Cuyuna ranges following in order named. The highest average silica content is found on the Marquette, the highest average phosphorus on the Menominee, the highest average moisture on

the Mesabi, and the lowest average physical structure of Vermilion ore is of course unexcelled. Average analysis on the bulk shipment of 27,585,000 tons from the entire Lake Superior district in 1902 was 55.77 per cent natural iron, 0.075 per cent phosphorus, 6.23 per cent silica, and 8.71 per cent moisture. Of the 62,836,000 tons of ore shipped in 1918, the average chemical elements was: 51.29 per cent natural iron, 0.104 per cent phosphorus, 8.12 per cent silica, and 7.57 per cent moisture. During the period covered by the shipments from the Lake Superior district increased 128 per cent, and shipments from the Mesabi Range alone increased 203 per cent. Bessemer ore has constituted 95 per cent of the total shipment in 1902, had decreased to 33 per cent in 1918.

ASHLAND, WIS.—Aug. 2

All Workers on the Ore Docks at Ashland, Wis., owned by the Chicago & North-western Ry., walked out on Aug. 1, demanding a 33 1/3 per cent increase in wages and time and a half for overtime. At most of the mines on the range, trestles are being stockpiled, so that ore hoisted can be put on hand to hold one or two days, but are now full. An effort will be made by dock officials to settle the strike promptly.

ISHPEMING, MICH.—Aug. 2

No Labor Surplus exists on any of the iron ranges in Michigan, despite the fact that all returned to seeking employment have been given places in this field. On the Menominee Range, workers are a number of the mines are idle, that they would experience difficulty in getting men if orders were received now to operate at full force. The ore movement is about the same as it has been for several weeks, no increase in production being noticeable, so it is impossible to state just now what the winter will bring. There is some time yet before many of the ore piles, but the mining business and time to experience retardation if the demand for iron ore does not show improvement by September.

VICTORIA, B. C.—July 31

Efforts to Finance a Railroad to be built from Portland Canal to the mines, of the Salmon River district in British Columbia, are being made. Charles F. Caldwell, of Kaslo, E. C., and Spokane, is president of a company incorporated in Washington and to be known as the Portland Canal Rail & Terminal Co. Preliminary surveys already have been made and plans filed at Victoria. Mr. Caldwell hopes the road will be completed by the end of the coming winter. Ore can then be shipped out from the Premier, Missouri, Forty-nine, Little John, Bush, Yellowstone, New York, and other properties which are rapidly acquiring importance. Ore from these properties will be shipped to the new railroad by tramway, and steam locomotive extension of the road is built on the British Columbia side of the boundary.

TORONTO, ONT.—Aug. 2

Strike Situation at Cobalt remains unchanged, with no indications of any immediate settlement. The lower levels of some mines contain considerable water, though the flooding process in most cases is comparatively slow. The mine managers, though remaining firm in their decision to refuse to recognize the union, state that if the men of each mine will organize committees independent of the union they will be given opportunities to discuss matters with their respective managers. This was the custom before the strike, but many of the strikers have left the camp. One result of the strike has been to give a stimulus to development of the Gowganda district, where many of the men have gone. Some of the companies whose properties at Cobalt are closed down are now devoting their attention to Gowganda prospects.

QUEBEC, Q.E.—Aug. 2

Production of Asbestos in Quebec in 1918, according to the report of the Bureau of Mines of the province for 1918, exceeded that of any previous year, both in quantity and value. Asbestos in the shape of "crude" and "mill" was shipped to the amount of 142,375 tons, valued at \$9,019,899, in addition to 16,850 tons of asbestos, a byproduct of low price, making a total tonnage of 159,225 tons, of the value of \$9,653,945. As compared with the figures for 1917, 154,452 tons, valued at \$7,240,697, this shows an increase of 3 per cent in quantity and 23.5 per cent in value. Returns were received from thirteen producers operating eight mines.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ARIZONA

Cochise County

PHELPS DODGE (Bisbee)—July production of copper from Phelps Dodge smelteries as follows: Copper Queen branch, 5,011,000 lb.; Moctezuma Copper Co., 2,516,000; Burro Mountain branch, 530,000; custom ore, 357,000; total at Douglas smelter, 8,394,000. Detroit branch (Morenci, Ariz.) produced 1,361,075 lb.

SHATTUCK-ARIZONA (Bisbee)—Large orebody cut on 1,700 level of Denn. Management will install larger pumps for prospecting on 1,800 level.

Pima County

NEW CORNELIA (Ajo)—New flotation test mill about complete.

SILVER BELL (Silver Bell)—American Smelting & Refining Co. to resume production. Ores to be sent to company's Hayden smelter, to which El Tiro is also shipping. Sasco smelter will not be operated at present.

SABRAGANSETT (Tucson)—Company defendant in foreclosure suit brought by Albert Steinfeld & Co. on four notes aggregating \$300,000. Property consists of sixteen claims in Helvetia district. Inactive lately.

SILVER VIRGIN (Tucson)—J. J. Adair, superintendent, reports development of 10,000 tons of ore averaging above \$56.

Pinal County

POLAND COPPER (Ray)—Shaft down 350 ft., with 50 ft. more to go before cross-cutting begins. Extensive development planned for 400 level.

Santa Cruz County

BACA FLOAT GRANT mines to have concentrator for handling low-grade copper and silver ores developed.

Yavapai County

DUNDEE-ARIZONA (Jerome)—Opened new residential addition to Jerome on its property.

U. V. EXTENSION (Jerome)—Report of president to stockholders on Aug. 1 states company has been making about seventy tons copper daily since June 9, when blast furnace was blown in. Smelter shut down Feb. 13, which permitted all available mining force to be used in concreting Audrey shaft and the tunnel where necessary. This concrete work will probably be finished in ninety days. Raises have been completed to surface from 1,200 level to provide filling for stopes from surface. Crosscutting will start in about a month on 1,300 level. Will increase output when demand justifies. Necessary to build employees' houses and hospital and to pay for construction of much-needed schoolhouses at Jerome and at smelter. On July 1 there was 17,594,000 lb. copper in transit and in hands of selling agent, mostly unsold.

BIG LEDGE (Mayer)—Purchased Good Luck group of six claims from P. E. O'Brien, E. C. Hill, and W. J. O'Brien.

PECK (Prescott)—Company has purchased Pat Dolan claims adjoining from R. H. Burmister. New Peck mill operating on 30,000 tons of second-class ore. J. J. Macrs in charge.

ARKANSAS

Boone County

BOO-GRA-LOO (Zinc)—Company developing Frisco tract has six headings opened, assuring steady supply for mill.

COON HOLLOW (Zinc)—Folk Kendall lease in Coon Hollow bought by J. H. Deyerle, who is cleaning up ground and starting production of hand-cobbed zinc silicate.

HARVEY MINING (Zinc)—Getting from one to two tons of hand-cobbed silicate a day with small force. Property in Coon Hollow.

RHODES-MANCHESTER (Zinc)—McCurry M. & M. Co., operators of Rhodes-Manchester zinc mine, are running new mill.

Marion County

DIXIE GIRL (Buffalo)—Good body of zinc carbonate developed. Now opening body of zinc sulphide.

KATIE AND PACE (Rush)—D. J. McCargars interests bought by H. M. Kelsall and William Harticon, of Fall River, Mass., and development resumed.

CALIFORNIA

Butte County

INDIAN SPRINGS GRAVEL (Magalia)—Preliminary work begun under management of J. Woodruff. Adjoining Hupp property will be operated through main working tunnel of Indian Springs, which is 4,000 ft. long. Litigation between these two properties has delayed operations for several years.

Inyo County

WILSHIRE BISHOP CREEK (Bishop)

sive mine developments. Engels recently examined by D. C. Jackling and engineers. E. E. Paxton general manager and John Reimiller superintendent.

WALKER (Portola)—Flotation capacity increased to 160 tons a day by adding Marcy ball mill, Callow cones, and 12-rr filter. Big drainage and haulage tunnel being driven at rate of 400 ft. a month, and now in over 1,400 ft.

Sonoma County

WESTERN QUICKSILVER (Cloverdale)—New rotary furnace giving excellent results, production for June being 197 flasks.

Trinity County

JACOBS (Junction City)—Jafet Lindere has purchased Jacobs property on Trinity River. Has not been worked for years, on account of scarcity of water. Purchaser owns ground adjoining with suf-

SAVAGE BASIN, SAN MIGUEL COUNTY, COLORADO, SHOWING MILL AND CYANIDE PLANT OF TOMBOY GOLD MINES, LTD.

—Mill running two months, with average capacity of sixty tons per day giving 80 per cent extraction. Ore averages \$12 per ton, and costs, inclusive of tailings loss, \$6.40, leaving profit of \$5.60 per ton. Reported there are 25,000 tons of ore in sight.

Kern County

RANDBURG DIVIDE (Randburg)—Sale of seven-sixty-fourths interest for \$50,000 reported.

Nevada County

EMPIRE (Grass Valley)—N W 20-stamp addition to mill well advanced. Milling stopped at Pennsylvania mine, where mill will be dismantled when new unit is completed. Draining of mine progressing rapidly. Mine nearing normal production.

HIGHWAY GOLD (Grass Valley)—Shaft down 20 ft. Crosscut being run to cut second vein. First vein cut 2 ft. wide.

PITTSBURG GOLD FLAT (Nevada City)—Pacific Gas & Electric has instituted proceedings by means of sheriff's sale to collect debt of \$2,382 incurred for power.

Plumas County

ENGELS COPPER (Engelmine)—Meeting of stockholders on Aug. 5 to vote on increase of capital stock from \$2,000,000 to \$5,000,000. Stated that one million new shares will be sold to strong interests at \$1.50 per share, proceeds to be used to increase flotation capacity and for exten-

sive mine developments. Engels recently examined by D. C. Jackling and engineers. E. E. Paxton general manager and John Reimiller superintendent.

Tuolumne County

BUCKHORN GROUP (Jacksonville)—Bonded by D. Cushman for \$25,000. Development work to start immediately under J. L. Gibbs.

PORTUNA MINE (Soulsbyville)—Equipment good for considerable depth being installed.

CARLOTA (Tuolumne)—Operations will be resumed when transformers are connected. Carlota Gold Mining Co. is developing Pennsylvania mine also.

COLORADO

Lake County

C. S. DOLD (Leadville)—Company recently made promising strike on property in Poverty Flat section. Has been shipping manganese ore for several months, but recently contract expired. Before discontinuing operations, C. S. Dold, manager, decided to drift on manganese ore-body on 640 level toward Penderly fault. Ore gradually changed into hard compact lead carbonate, which at present is exposed for three sets in length. Where first encountered was 8 in. wide, and at third set 4 ft. wide. 512 sacks sorted out.

IBEN (Leadville)—Annual meeting of stockholders held at offices of A. V. Hunter, president, on July 24. New directorate as follows: A. V. Hunter, J. J. Brown, Gerald

Hughes, John Campion, F. L. Smith, John A. Ewing, and J. C. Mitchell.

Montrose County

CASHIN (Paradox)—H. C. Carlton, president of Michigan Colorado Copper Co., operating Cashin mine in Paradox Valley, expects to have first unit of flotation mill completed within ninety days. Will build other units as output of mine warrants. Also planned to build smelter at mine to handle flotation concentrates, instead of shipping them to Durango.

San Miguel County

SHIPMENTS FROM TELLURIDE during June were as follows: Tomboy, 60 cars of lead concentrate to Durango; Smuggler-Union, 25 cars lead concentrate to Durango and 20 cars of zinc concentrate to Blende, Col.; Liberty, Bell, Jesses, 2 cars; and Carraron, 2 cars; total, 109 cars. Ore produced from Argentine and Montana properties, of Tomboy Gold Mines Co., Ltd., was concentrated in Tomboy mill. A Savage Basin, shown in the illustration on preceding page.

COLORADO VANADIUM (Telluride)—Dismissing and tearing down old Simmons mill to erect modern vanadium concentrator on site. Also developing properties recently acquired on Leonard Creek near Sawpit.

Summit County

AMERICAN DREDGING (Brokenridge)—Company, operated by S. L. Bright of Chicago, and promoting in upper Swan Valley, is drilling recently acquired placer ground prior to installing dredge.

IDAHO

Shoshone County

LINFOR (Etnaville)—Linfor Copper Co. organized to take over Horn-Fowler property on Little North Fork Empire Copper Company built 150-ton mill and developed and shipped considerable ore while holding option on the property, but failed financially. William Beaudry, formerly director and manager of Stewart property, will manage new company.

ELTORADO (Kellogg)—Crosscut near vein at depth of 350 ft. Upper work shows strong lead-silver vein carrying high silver.

STEWART (Kellogg)—After losing apex suit with Ontario three years ago, remaining known orebody was quickly exhausted and operations were suspended. Work recently begun to find vein east of fault.

BULLION (Wallace)—Company will prospect ground from lower tunnel with diamond drill.

NORTH BUNKER HILL (Lardner)—Preparing to sink 200 ft. further. Shaft down 200 ft. Crosscut to vein shows 6 ft. of lead-silver ore of milling grade.

MICHIGAN

Copper District

SENECA (Calumet)—Shaft down 1,842 ft. and second crosscut to start soon. Character of lode rock good wherever opened.

FRANKLIN (Demmon)—Continuing sinking with small force. Shaft now 165 ft. below 37th level. There will be no 38th level. Will cut a station at 34th level. Planned to resume mining this fall if market warrants. Company has worked intermittently for 62 years.

QUINCY (Hancock)—Receiving parts for new No. 2 boiler and engine for two years ago. Erection in progress.

WINONA (Houghton)—Operations resumed, 75 men being put to work. Force will be increased as men can be secured. Two weeks required to cut No. 1 and No. 4 shafts in condition for hoisting ore. Mill will also be operated. At time of shutdown flotation plant machinery had begun to arrive and building had been completed. Machinery now on ground, and will be erected without delay.

MASS CONSOLIDATED (Mass)—Wages further increased. Needs at least 200 more men. Shipping 300 tons ore daily.

MICHIGAN (Rockland)—Will be connected with railway to facilitate shipments, now handled by motor truck. Construction of new rock house progressing.

VICTORIA (Victoria)—Advertising for miners.

CHEROKEE (Winona)—May resume operations soon. Company has \$20,000 in treasury and small working plant. Shaft is 35 ft. deep, being in copper rock for half this distance.

Gogebic Range

ELECTRIC LIGHT & POWER (Ashland, Wis.)—Started water-power development project on Flambeau River near Ladysmith, Wis. Power generated here will be sold to mines on Gogebic Range. Transmission line will be built from plant through Park Falls to Ironwood, Mich., and there will connect with present line, new line being about seventy-five miles long. Construction of line to be rushed so that power can be sent over it from present system and used in construction of new power plant. About 15,000 hp. can be developed, with available head of 100 ft. Company closely identified with Commonwealth Edison interests, of Chicago. Mines will furnish ready market for electric power, as it is desirable for driving pumps and compressors. This has been shown by Peninsular Power Co. on Menominee Range.

DAVIS (Ironwood)—Fatal accident occurred July 31, when laborer fell off coal dock and had no fall.

PAIST (Ironwood)—Crosscut on 24th level of H shaft encountered slates of Palms formation 502 ft. north of shaft.

Marquette Range

IN CASCADE DISTRICT Isabella, Richmond, and Maitland properties are active shippers this season. Volunteer and Empire idle. Richmond and Maitland are pit mines, and ship low-grade ores. Isabella an underground mine, with ores of low and high grades.

REPUBLIC (Republic)—One of working shafts out of operation temporarily. S4B road damaged. Only one shaft can be used until repairs made.

Menominee Range

BRISTOL (Crystal Falls)—Shaft being sunk another level. Some ore shipped. Bulk of stockpile still intact.

MCKINNEY STEEL (Crystal Falls)—Stockpiles being moved at Dunn and Tobin mines. All ore in stock will probably be shipped this year.

ODGERS (Crystal Falls)—Shaft concreted from collar to ledge. Sinking operations resumed. Shaft work will be hastened by raising. All ore in stock shipped.

MINNESOTA

Mesabi Range

BOURNE (Hibbing)—New property of Cleveland-Cliffs Iron Co. progressing rapidly with work preliminary to development. Planned to install two 200-hp. hoists.

HAROLD (Hibbing)—Increasing number of underground loading machines after extensive experimenting.

STEVENSON (Hibbing)—Resumed operations July 24 after two months' shutdown. Has 90,000 tons in stock, which will be shipped in addition to 60,000 tons direct from workings. Belongs to McKinney Steel Co. Formerly open pit, but now milling. Shipped 13,800,000 tons to end of 1918 season.

ADRIATIC (Mesaba)—Shipment of stockpile begun. Underground workings remain idle. R. M. Sellwood, operator.

JULIA (Virginia)—Ownership passes from Inland Steel Co. to Julia Mining Co., subsidiary of Gates & Co. Property originally opened in 1900 by Franklin Rockefeller and associates, who disposed of it to Republic Iron & Steel Co., which company, in turn sold the property to Inland Steel Co.

Vermilion Range

MCCOMBER (Ely)—Two-compartment shaft 372 ft. down and working pit blackjaper. Will be bottomed at 400 ft. and drifting north to orebody will begin. Mutual Iron Mining Co. operators.

L'LLIVAN (Ely)—Algonquin Iron Ore Co. announces intention to sink shaft on subsidiary, adjoining Chipewau mine of Chipewau Iron Mining Co., which is controlled by same interests.

MONTANA

Beaverhead County

BOSTON & MONTANA (Wise River)—Raise from 1,000 level on Idanha vein expected to hole through into upper Idanha tunnel within two next two weeks. Orebody continuous thus far in raise. Ore shows in roof of Idanha tunnel and on surface.

Missoula County

POTOMAC COPPER (Potomac)—Preliminary surface work on Leonard group shows mineral zone approximately forty feet wide.

Silver Bow County

ANACONDA COPPER (Butte)—Further efforts to develop sufficient flow of gas in northern Montana to warrant construction of pipe line to Boston & Montana smelteries abandoned after spending \$250,000. Copper production in July 11,222,000 lb.; June, 10,500,000 lb.

BUTTE-BULLWHACKER (Butte)—Will resume ore shipments within ten days.

BUTTE-DULUTH (Butte)—Shipments begun to leaching plant of Anaconda company at Washoe works.

BUTTE-NEW ENGLAND (Butte)—Oreshowing good on 150 level, with silver content holding up. Mining in Hesperus vein of Davis-Daly.

BUTTE & SUPERIOR (Butte)—Federal court has set Oct. 27 for hearing on accounting for damages in Minerals Separation case. Report that court had decreed damages to Minerals Separation from \$15,000,000 to \$23,000,000 is in error. Court also held that when more than 1 per cent of oil was used in flotation process there was no infringement of patent, and management of Butte & Superior stated company had been employing this percentage of oil and would continue, using this amount. Hearing of Elm Orlu supplemental suit begun Aug. 29.

CRYSTAL COPPER (Butte)—Tong shaft down to 600 level. Carload of ore will be shipped this week. Two carloads shipped in June. Three-foot orebody cut by shaft, which will be crosscut to from 600-level station.

DAVIS-DALY (Butte)—Sinking of Colorado shaft rapidly progressing toward 2,700 level. Six veins in evidence on 2,500 level will be cut. Colorado mine now producing about 250 tons daily, which will be doubled when capacity operations are resumed. June copper production 775,600 lb., against 620,000 for July, 31,400 oz. silver, against 25,000 for May.

NORTH BUTTE (Butte)—Production of Speculator mine being increased. Daily tonnage now over 700, compared with 450 ten days ago. Heavy tonnage of second-class ore developed on upper levels.

TUOLUMNE COPPER (Butte)—Crosscutting on 1,000 level for Spread Delight vein advancing about 100 ft. weekly. Expect to cut fissure fault by Sept. 1. Sinking of Sinbad shaft continued.

NEVADA

Esmeralda County

GOLDFIELD DEVELOPMENT (Goldfield)—Using 350 hp. of dynamite, 6,000 tons of ore was broken up in Red Top mine on July 23, ore averaging \$23.80, according to management. On July 15, 3,000 tons broken by one blast.

Elko County

BULL'S HEAD (Tobar)—Company reopening old mine in Spruce Mountain district, thirty-five miles south of Wells, and will build 50-ton shaft. District has produced over \$1,000,000.

Storey County

CONSTOCK (Virginia City)—Official report from Ophir mine of July 23 shows ore shipments for week averaged \$45.92 per ton. Con. Virginia shipments for same time averaged \$26.89 per ton.

Lyon County

DAYTON PLACERS (Dayton)—Bulkeley Wells and associates have acquired large acreage of placer ground near Dayton. Preparing to sink large dredge. Roy Elliott will be in charge.

Nye County

DIVIDE EXTENSION (Divide)—Drifting north and east begun on foot-wall side of vein on 100 level of Caldwell shaft, where it shows 14 ft. high-grade ore. Winze also started in this foot-wall ore. Crosscut not yet reached, hanging wall shipping regularly to West End mill ore averaging \$40 per ton.

TONOPAH DIVIDE (Divide)—Shipments to mill continue at rate of 60 tons a day. Southeast drift on 830 level advanced 110 ft. and still in commercial ore. Crosscut on 370 level being driven to pick up gold vein which was original discovery on property.

CONS. SPANISH BELT (Manhattan)—In west drift from tunnel top of oreshoot found carrying principally silver, with lead and zinc. Winze will be started soon. East drift on same level in good mill ore.

TONOPAH EXTENSION (Tonopah)—Net earnings for June were \$58,490 from 9,073 dry tons milled, producing 981.64 oz. gold and 104,749 oz. silver bullion. Con-

nction made between 1,760 and 1,680 level, giving better air in long crosscut.

SOUTH DAKOTA

Custer County

ARGENTINE POTASH (Burckett)—Machinery being moved to ground six miles west. Company purposes producing potash as soon as installations are completed.

Lawrence County

CUTTING (Deadwood)—Water has interfered with shaft sinking and work will be delayed until new pumps can be installed. Work being continued in main drift and good grade of ore developed.

DEADWOOD LEAD & ZINC (Deadwood)—Motors arrived and being placed in position. Plant will be placed in operation in short time, and with ore developed should be able to run continuously.

MOGUL (Terry)—Several ore verticals are being opened in Ofer-Mogul tunnel, and good tonnage being sent to mill from this source. One ton of ore has been worked at normal capacity.

TEXAS

Brazoria County

WEST COLUMBIA PRODUCTION third week in July averaged 26,000 bbl. per day. Producing companies: Gulf Oil Refining Co., 10,000 bbl.; Gulf Production Co., 2,000 bbl.; Humble Oil & Refining Co., 6,500 bbl.; Hannicker Co., 35 bbl.; Sun Co., 450 bbl.; Texas Co., 7,000 bbl.

CROWN OIL AND REFINING (West Columbia)—Marmion No. 3 well came in July 18 at 3,060 ft., making large production of high-gravity oil.

GULF PRODUCTION (West Columbia)—No. 1 McCMeans well, over 3,500 ft. deep, spraying crude containing oil with drill stem stuck in hole. Oil of high gravity; other oils of district lighter.

Goliad County

DRILLING TO BEGIN on Eckhardt land one mile south of Goliad. Men and materials on hand.

Harris County

GOOSE CREEK COMPLETIONS recently as follows: Joint well of Crown and Gulf Coast struck No. 4 Gallard, pumping; Gulf Production Co., No. 15 State land, testing; Atlantic Oil & Production Co., No. 1 well, testing; E. F. Simms Co., No. 24 Smith testing and No. 5 Schilling, pumping; Humble Co., No. 6 Beaumont, will pump soon.

BRAZOS OIL & REDUCTION (Humble)—No. 5 Fuller well came in as small pump.

F. D. GEORGE CO. (Humble)—Took over Mennis & Horn lease recently. Several wells cleaned out and production increased from 30 to 114 bbl. daily.

PETROLEUM REFINING (Humble)—No. 30 Stevenson well cleaned out, and now making fair production on pump.

Howard County

DEEP DRILLING near Big Springs will be done by L. C. House, independent operator.

Lampasas County

NELMS-MARVIN No. 2 Well, on McCrae ranch, now down 900 ft. Passed through shallow oil sand at 800 ft.

SMITH NO. 1 WELL on Smith ranch, has derrick built and is waiting arrival of rig. Several other wells in district will be drilled when rigs are obtainable.

TILBURY OIL (Lampasas)—Douglas No. 1 well down 400 ft. Standard rig being substituted for Star rig, and deeper drilling will be done.

La Baca County

SHAWNEE OIL (Hallettsville)—Large acreage secured by lessees, and test wells will be sunk for oil.

Liberty County

SUN CO. (Hull)—No. 1 Carr well being tested; indications good for production. Well abandoned several months ago in salt at 900 ft. Drilling resumed later, and salt passed through.

Tom Green County

OIL DRILLING NEAR SAN ANGELO under way. San Diego & Texas Oil Co., drilling on T. J. Flegg ranch, 15 miles north of town, passed 800 ft. oil sand at 800 ft. Tucker Oil Co., of Dallas, down 1400 ft. on Harris Bros. ranch, 25 miles north of San Angelo, just over Coke County line. Central Oil Co. has moved rig from Maryneal, Nolan County, to John Saut ranch, in Coke County, where test well will be drilled 4,000 ft. if necessary.

Wichita County

TEXAS OIL, GAS & MINERAL PRODUCTS (Burkburnett)—Gusher brought in July 22 that shot over derrick. Company controlled by W. C. Munn and associates, of Houston. Drilling also being done in Grimes County.

RED RIVER PIPE LINE (Wichita Falls)—Incorporated recently under Delaware laws for \$1,000,000. Right-of-way secured for pipe line from northwest extension of Burkburnett field to Wichita Falls. Pipe purchased, and construction will begin at once. Capacity, 20,000 bbl. daily.

UTAH

Beaver County

GOLDEN REEF (Frisco)—Work being done in hope of finding extension of Horn Silver vein in adjoining Horn Silver property.

Juab County

EUREKA BULLION (Eureka)—Ore showing good and working force to be increased at this East Tintic property.

NORTH STANDARD (Eureka)—New 35-hp. motor at property. Work shows increasing mineralization.

PROVO MINING (Eureka)—Rumored control of small territory in East Tintic gained by Tintic Standard adjoining.

TINTIC DRAIN TUNNEL (Eureka)—Shaft to be sunk on line of tunnel, at point about midway between Iron Blossom and portal of tunnel, to be of use in tunnel work as well as to open promising mineral ground.

PINION QUEEN (Eureka)—Understock Knight interests have gained control of this East Tintic property, situated near North Standard.

Morgan County

UTAH SILVER-LEAD (Peterson)—Old Carbonate Hill, credited with production of \$400,000 to \$700,000 in early days, taken under bond and lease by Utah Silver-Lead company; J. Howard Garrett, G. W. Morgan, and W. H. Exwater interested. Old workings total 6,000 to 7,000 ft. Considerable ore opened on Silver Zone claim by new work, 700 to 800 ft. from old workings. Tunnel being driven to get under orebody in 1,000 ft., with about 240 ft. more to go. Property comprises seven patented and four unpatented claims. Lease runs for period of years, royalties to go toward payment for property. Bonded indebtedness, \$125,000; first payment of \$10,000 made in about two years. Company has 400,000 shares in treasury.

Salt Lake County

UTAH CONSOLIDATED (Bingham Canyon)—Reported mill of Utah Metal & Tunnel Co. leased for three months' experimental work and that mill to treat low-grade lead ores will soon be built.

Summit County

PARK CITY SHIPMENTS week ended July 26 amounted to 2,835,110 lb. Shippers—Ontario Silver, Daly West, Naldrivier, Judge Mining & Smelting, and Silver King Coalition.

GLEN ALLEN (Park City)—Contract let for small mill. Development work being pushed. M. P. Braffet, Major S. A. King, and E. G. Schuler interested.

ONTARIO SILVER (Park City)—Lessees forced to cease work at time of strike again operating.

Tooele County

WESTERN UTAH COPPER (Gold Hill)—Work on concentrator being pushed. To be operated on custom basis. Development on lower levels encouraging. Working force doubled. Shipments of copper and lead ores resumed, owing to better market.

WASHINGTON

Pend Oreille County

BEAD LAKE GOLD (Newport)—Has moved to its property the mill machinery purchased from Western Union Mining Co. in Coeur d'Alenes. Expect to erect small concentrator. W. E. Allen, of Spokane, manager.

Snohomish County

SUNSET COPPER (Index)—Operations resumed in mine and mill.

Lincoln County

O-LO-LIM COPPER (Dayenport)—Company operating on Spokane Indian Reservation about three miles from Detillion Bridge shipped ten 20-ton cars averaging 9 per cent copper to Tacoma smeltery in last six

months. Ore hauled 26 miles to railroad at Dayenport. James Keith, of Spokane, president.

Stevens County

ELECTRIC POINT (Northport)—Hauling ore by auto trucks to railroad at Boundary while awaiting better market and smelting conditions. Handcapped by inability to ship to Trail. Exploration work in progress. Roy Young manager.

COLVILLE VALLEY COAL (Valley)—Will ship first coal in August to Loom Lake Copper Co. latter hauling it twelve miles by truck. Said to be first coal marketed in Washington from mines east of Columbia River.

CANADA

British Columbia

MOLLY GIBSON (Paulson)—Ore struck 240 ft. from portal of tunnel on 300-ft. level.

CANADA COPPER (Princeton)—Settlement of strike said to be near at hand, miners to get 50c. advance for nine-hour day. Construction of railroad and power line will be resumed as soon as strike is settled, but delay of nearly four months caused by strike may prevent operation of property before next spring.

GIBSON (Slocan)—President D. K. Macdonald, Spokane, invited at annual meeting held at Kalso, B. C.; E. H. Latham, of Spokane, secretary-treasurer. Other directors are Robert Gunning, Spokane; Joseph Dasebach, Opportunity, Wash.; and F. E. Archer, Kaslo.

GOLD CURE (Kaslo)—Crew of men put to work. Charles F. Caldwell, of Kaslo, president.

Ontario

KILPATRICK CLAYM (Gowganda)—Property situated near Miller Lake-O'Brien taken over by W. Young and associates, and will be actively developed.

REEVE-DOBIE (Gowganda)—Installation of flotation plant completed.

WEST END (Port Arthur district)—Being worked by Mining Corporation of Canada, which recently made shipment of ore.

NORTH DAVIDSON (Porcupine)—Power transmission will be laid from Davidson to property.

NORWOOD (North Porcupine)—Has let contract for 6,000 ft. of diamond drilling.

MEXICO

San Luis Potosi

MANGANESE ORE being shipped through Charcas station from Santo Domingo district 30 miles west of Charcas. Petronilo Lopez in charge.

SAN DIEGO (Charcas)—J. T. Murphy shipping about 1,200 tons of ore from dump each month. Property about five miles west of Charcas.

TIRO GENERAL (Charcas)—Being unwatered by air lift. Depth of 650 ft. has been reached in one stage. High silver price causing considerable ore to be shipped from dump. S. F. Shaw, superintendent.

DOLORES (Matehuala)—Operating at about two-thirds capacity. E. E. Reyser superintendent.

SANTA MARIA DE LA PAZ (Matehuala)—Operating steadily owing to high price of silver. G. M. Wastehys general manager.

Zacatecas

BONANZA (Bonanza)—Long prospect tunnel being driven. S. F. Shaw, superintendent.

MATTHEWS AND IANKES operating property in San Pedro de Ocampo district.

MAZAPIL COPPER operating two copper furnaces at Concepcion del Oro. Lead smelting at Sattillo in steady operation. San Eligio mine producing lead ore and Aranzazu group copper ore. Both properties near Concepcion del Oro. R. H. Jeffreys general manager.

PURCELL INTERESTS operating Catacillas and other properties in Mazapil district. P. K. Lucke consulting engineer.

AUSTRALIA

New South Wales

AT BROKEN HILL, mine buildings valued at \$500,000 have been destroyed by fire, according to London press dispatch dated July 31. Incendiarism given as cause.

BELGIAN CONGO

UNION MINIERE DU HAUT KATANGA (Elisabethville)—Copper production in June was 4,519,430 lb.

Daily and Weekly Metal and Mineral Prices,
Metal Market Conditions, Average
Monthly Prices, Stock Quotations

Silver and Sterling Exchange

July Aug.	Sterling Exchange	Silver		Aug.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
31	435 $\frac{1}{2}$	107 $\frac{3}{4}$	55 $\frac{9}{16}$	4	435	109 $\frac{3}{4}$	56 $\frac{1}{2}$
1	435 $\frac{1}{4}$	108	55 $\frac{3}{4}$	5	435 $\frac{1}{2}$	108 $\frac{3}{4}$	56 $\frac{1}{2}$
2	435	109 $\frac{3}{8}$	56 $\frac{1}{2}$	6	431 $\frac{1}{2}$	109 $\frac{3}{4}$	57

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

July-Aug.	Copper		Tin		Lead		Zinc	
	Electrolytic	Spot	Spot	N. Y.	St. L.	St. L.	St. L.	
31	22.85 @ 23.10	68	5.75 @ 5.85	5.60 @ 5.65	7.40 @ 7.50			
1	22 $\frac{3}{4}$	67	5.75 @ 5.85	5.60 @ 5.65	7.20 @ 7.30			
2	22 $\frac{3}{8}$	66	5.75 @ 6.00	5.65 @ 5.70	7 @ 7 $\frac{1}{2}$			
4	22 $\frac{3}{4}$	66	5.75 @ 6.00	5.65 @ 5.70	7 $\frac{1}{2}$ @ 7 $\frac{3}{4}$			
5	22 $\frac{3}{4}$	65 $\frac{1}{2}$	5.75 @ 6.00	5.65 @ 5.70	7 $\frac{3}{4}$ @ 7 $\frac{3}{4}$			
6	22.35 @ 22.45	65 $\frac{1}{2}$	5.75 @ 6.00	5.65 @ 5.70	7 $\frac{3}{4}$			

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, Aug. 6, 1919

All of the metal markets this week were extremely dull and were rather disturbed, neither of which conditions was surprising in view of the phenomenally large sales that were made in July and the collapse in the stock market on Monday.

Freight rates to British and French ports are \$18. From San Francisco to Hongkong and Kobe, \$12.

In a recent hearing before a subcommittee of the House of Representatives, the following was testified respecting the ordnance stocks of metals and the disposition thereof: Antimony, total stock, 3,330,914 lb., whereof 2,918,000 lb. has been sold, principally to the Wah Chang Trading Co., at about 63c. per lb. Copper ingot, 100,000,000 lb., all sold. Lead, about 15,000 tons,

whereof about 12,000 tons has been sold. Zinc, 42,500 tons, whereof 1,000 tons has been sold at 7c. per lb. Platinum, 19,000 oz., whereof 8,650 oz. has been sold at \$105 per oz. The Government's large stocks of brass manufactures remain unsold, as also is about 20,000,000 lb. of copper in semi-manufactured forms. Also, the Government has 170,000,000 lb. of other brass, whereof none has been sold, but in connection with which a contract is now pending.

It is plainly the intention of the subcommittee headed by Representative Graham, which is investigating ordnance expenditures during the war, to show that the Government agencies were improperly influenced by the copper producers in making arrangements for the disposition of the Government's surplus stock of copper after the war. E. C. Morse, assistant director of sales, submitted the following figures:

Pounds
 April sales by producers... 89,864,239
 Government's share of same... 12,972,920
 May sales by producers... 207,649,198
 Government's share of same... 36,529,838
 June sales by producers... 202,539,751
 Government's share of same... 35,507,950

The remainder of the Government's copper was sold in July. All of the Government copper was sold on a rising market. The Government realized the same price that the producers did for their own copper, sold contemporaneously, less the usual selling commission of 1 per cent.

Copper

No business was done this week by any of the big producers. The market was established by the reselling of copper by speculators and by consumers who found themselves overbought. A good deal of such business was offered at prices that were shaded from day to day. In such a market variations in terms are naturally to be expected, and we can do nothing more than generalize. However, a round lot was sold Wednesday morning by a small producer on terms equivalent to 22.45c., cash, New York, and during Wednesday afternoon August-September contracts were offered at the equivalent of 22.35c., New York. But for the moment there is no further buying demand worth mentioning. On the other hand, the principal producers are firm in asking their previous price of 23.1-2c., delivered.

Germany bought 1,000 tons of copper through the Export Association last week.

Sales of copper by American producers in July were larger than those of any other month this year, which is saying a good deal.

Copper Sheets—The base price of copper sheets at 33c. per lb. Demand strong. Copper wire is quoted at 26 @ 27c. in carload lots, f.o.b. mill. Market not very strong, but producers are holding firm. Considerable second-hand copper is being offered.

Tin

With the arrival of the first lots of shipment tin permitted to enter this country, and the consequent increase in the supply, the market for tin of 99 per cent grade began on Aug. 1 to decline sharply, and up to today has fallen about 23c. per lb. The market for Straits and electrolytic tin, however, has remained steady at 70c. From now on there will be steady arrivals, and with the increase in supplies in this market further declines may be expected.

Straits tin, July shipment, was quoted at 54c. on July 31; at 54½c. on Aug. 1, 2 and 4; at 54½c. on Aug. 5; and at 54½c. on Aug. 6. August shipment was about 1c. less.

Singapore quoted, c.i.f., London, as follows: July 31, £269½; Aug. 1, £269½; Aug. 5, £271; and Aug. 6, £271½.

Lead

The lead market, like that for copper, was dull. Lead held speculatively was offered freely at 5.75c., and consumers bought at that price. On the other hand, the principal producers found themselves able to get the price that they asked, viz. 6c., from some of their regular customers. The market can, therefore, be characterized only as irregular. It is certain that no large tonnage could be bought at 5.75c., or could be sold at 6c., but without doubt liberal supplies could be obtained around 5c.

The statistical position of lead is excellent, and without doubt is better than that of any of the other metals. There was a sharp reduction in stocks during July.

Germany has been buying lead in Great Britain.

Zinc

Under the influence of efforts to re-align, the sharp decline in the market continued, and during the morning of Aug. 2, 7c. was touched. From 7½c. down to 7c., however, there was found to be strong resistance to the decline. Speculative interests attempting to cover their short contracts, and others endeavoring to institute new bull accounts, found that they could not easily buy what they desired. Therefore, a sharp rally naturally ensued, and the week closed with the market at 7½c.

The Great Falls zinc works of the Anaconda company are closed.

Germany is selling zinc in England, which has had the effect of depressing the price there to a point that is far below our parity and has therefore killed any immediate prospect for export sales to Europe.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 32½@33c. per lb. Market dull. Very little business.

Antimony—Unchanged at 9½@9½c. for spot, with market quiet but firm. Owing to interruption of cables there were no quotations for futures.

Bismuth—Metal of the highest purity for pharmaceutical use is quoted at \$3.10 per lb. for wholesale lots—500 lb. and over. No change.

Cadmium—Quoted at \$1.50 per lb. in lots of 500 pounds. For lots under 200 pounds, \$1.75 per lb. No change. A little increase in business.

Nickel—Ingot, 41c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—Unchanged at \$109, at which price the market is strong. San Francisco telegraphs \$103, steady.

Silver and Platinum

Silver—The market has ruled firm, with an advancing tendency in London, closing at 57d. With comparative steadiness in sterling exchange, New York price has been strong on buying for China, and offerings have been absorbed for export to the Far East at prices over the London market equivalent. Market closes firm, notwithstanding weakness in sterling exchange.

Mexican dollars at New York: July 31, 83½; Aug. 1, 83½; Aug. 2, 84½; Aug. 4, 84½; Aug. 5, 84½; Aug. 6, 84½.

Platinum—We quote refined ingot at \$105.

Palladium—Unchanged at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., Aug. 2—Zinc blende, per ton, high, \$56.85; basis 60 per cent zinc, premium, \$48; Prime Western, \$47.50; fines and slimes, \$45@42.50; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$52.12; calamine, \$31.50; all zinc ores, \$51.73.

Lead, high, \$67.95; basis 80 per cent lead, \$67.50; average settling price, all grades of lead, \$63.72 per ton.

Shipments the week: Blende, 7,805; calamine, 148; lead, 1,079 tons. Value, all ores the week, \$481,770.

Buyers had light orders for this week, and all stood firm on offerings of \$47.50 basis, a drop of \$7.50 from last week. Some sellers declined to accept the low price level, but others sold. Settling prices are based on last week's purchases, settlements of which were made this week.

Platteville, Wis., Aug. 2—Blende, basis 60 per cent zinc, \$50 per ton base for premium grade. One car of Prime Western grade sold Friday at \$50 base, but buyers declined to buy Saturday at \$47.50 base. Lead ore, basis 80 per cent lead, \$67 per ton. Shipments for the week are 1,637 tons blende, 182 tons galena, and 553 tons sulphur ore. For the year to date the totals are 58,928 tons blende, 3,478 tons galena, and 9,069 tons sulphur ore. During the week 3,200 tons blende was shipped to separating plants.

Other Ores

Chrome Ore—Unchanged at \$25 per ton, f.o.b., California points, for ore running 40 per cent or better.

Manganese Ore—Unchanged at 60c. per unit asked, and 50c. bid.

Molybdenum Ore—No business reported. The last quotation was 85c.

Tungsten Ore—Some business in Chinese ore was reported at \$7.27@ \$7.75. High-grade ore was sold at \$9.25. Altogether, however, the market was small.

Other Minerals

Nitrate—Dealers are quoting a price of \$3 per cwt., but little business is being transacted, in view of anticipated changes in price of nitrate from Chile. Nitrate production in Chile during May, 1919, according to *Commerce Reports*, amounted to 3,039,390 Spanish quintals or 154,157 tons of 2000 lb., compared

with 268,574 tons in May, 1918. Exports at present are negligible.

Pyrites—Spanish pyrites is quoted at 17½c. per unit for furnace-size lump ore, free from fines, c.i.f., New York or other Atlantic port. Run-of-mine ore is quoted at 16½c. Market slow and unsettled; hand-to-mouth buying. Price will decrease with ocean freights.

Iron Trade Review

Pittsburgh, Aug. 5—Unfavorable influence in general trade, the continued high rate on dollar exchange, labor unrest, agitation over the high cost of living, the threat of railroad men to strike if their proposal for tripartite operation of the railroads is not accepted, and the strikes of railway shopmen in various sections have not visibly decreased the total volume of steel orders placed or arrested the tendency to increase production. At some points, particularly at Gary, there is forced curtailment of pig-iron and steel production by the absence of transportation facilities, caused by railroad shopmen's strikes.

Steel producers recognize, however, that factors unfavorable to the future have developed, and progress of the iron and steel industry to a stage of full operation may be slower than was expected a month or two months ago. The exchange situation has clearly operated to curtail the buying of American products by Great Britain and Europe, but there remains good buying by Japan, China, and South America.

Though no definite expectation had been entertained as to when a resumption of railroad buying of steel and other products could be expected, it is recognized that the additional uncertainties injected into the general situation as to what is going to be done with the railroads tend to postpone the inception of railroad buying, and this is a matter of great importance, as the hope recently entertained in some quarters that the steel industry could reach the full protective activity without the support of railroad buying has been abandoned.

Without allowing for the temporary curtailment in tonnage caused by railroad strikes, the steel industry is operating at fully 75 per cent of capacity. Pipe, wire, sheet, and tin-plate mills are operating almost full, and plate, structural, and rail mills are operating at relatively low rates. Structural-mill operations are increasing. Merchant bar production is at not far from capacity, and the distribution of orders for bars, as to classes of consumers involved, is improved.

Effective Aug. 1, rivet makers have advanced prices \$4 a ton, to 3.90c for button-head structural rivets and 4c for cone-head boiler rivets.

Pig Iron—Trading is of moderate proportions, in point of tonnage. Foundry iron is well sold up, as to the operating furnaces, but idle furnaces would have some difficulty in selling enough backlog tonnage to justify blowing in unless they should cut prices.

J. E. Spurr To Become Editor Of "Engineering and Mining Journal"

JOSIAH EDWARD SPURR, mining geologist, founder of *Economic Geology*, for many years actively in the service of the United States Geological Survey, and familiar with most of the important mines of North America, will become Editor of the *Engineering and Mining Journal* on Oct. 1, 1919. This preliminary notice of Mr. Spurr's appointment will be supplemented by a complete biography and a more extended announcement in a subsequent issue.

The Mexican Issue Must Not Be Sidetracked

IMPORTANT as our domestic problems are, their existence does not alter conditions abroad. When our troubles at home become magnified they simply cause foreign troubles to look small by comparison—they overshadow but do not remove the latter. Authentic news coming from our correspondents in Mexico indicates no noticeable improvement in conditions there.

It is reported from Washington that the Administration has let it be known that there is to be no change in the United States Government's Mexican policy. The impression is given that the various outrages recently committed are not to be taken seriously, and that Carranza is to be excused because of the difficulty of furnishing protection. Though it is quite true that there is nothing new in Mexico, the old conditions are extremely aggravating, and it was to be hoped that the Administration would find time to give serious consideration to the affairs of that country, and that it would evolve a substantial change in its policy toward the Mexican government.

One small grain of comfort may be gathered from the fact that the President has found that there exists in Mexico a condition of domestic violence promoted by the use of arms or munitions of war procured from the United States, and admonishes the people of this country to cease the exportation of arms to our neighbor. The passing of arms and munitions into Mexico at this time means two things: First, a continuance of domestic violence because of the impossibility of keeping these supplies out of the hands of revolutionists and bandits, and second, that more Americans will be killed by American bullets if it becomes necessary to send a military force across the border. We must congratulate the authorities at Washington upon even this small discovery.

However, in addition to domestic violence, has not the President "found" that hundreds of Americans have been killed and thousands driven from their legitimate occupations in Mexico? Has he not "found" that property of inestimable value has been destroyed or con-

fiscated? Has he not "found" that the government to which he gave recognition is utterly incapable of restoring Mexico to its former prestige?

We believe that the State Department at Washington contains documentary evidence of all these things, and we believe that the President is not in ignorance of them. We hoped there would be a change of policy when the press was again permitted to tell what was going on to the south of the border; that there would be an end of "protests," and "representations," and hints of intervention. Such procedure has accomplished nothing, and there is no prospect that it ever will accomplish anything. If history may be taken as a guide, there is evidence that such language is not comprehended.

The intelligent Mexican who hears of our desire to bring about "friendly intervention" thinks of us as two-faced cowards. To him friendliness means peace, and intervention means war, and the terms are incompatible. He is incapable of understanding how peaceful methods can be used to bring about desired results; he has seldom used them, or had them used upon him. He quite understands how results may be accomplished through force, but to him force means war.

As we understand that term, the United States wants no war with Mexico. Mexico has made some previous mistakes either through ignorance or inability to do what is right; and those mistakes continue to be made. They must be stopped.

Though we maintain that order should be restored, because of the suffering inflicted upon natives, Europeans, and Americans alike, it may be more practicable for us to consider, for the moment, only the plight of our own countrymen. In this alone we have sufficient reason for demanding order. And yet, while making demands, we know that they cannot be met, because the means of meeting them are not available, and will not be for years unless supplied from some outside source.

Primarily we demand protection of life and property. This requires an honest, competent, well-paid and provisioned constabulary, which the country does not and can not possess without a well-filled treasury honestly administered. That a treasury may be in a healthy state, reasonable taxes must be honestly collected from the industries of the country. When only a fraction of the normal industries are in operation, an adequate tax, that is at the same time reasonable, cannot be collected. To restore industry to normal conditions it is necessary to restore banking facilities, transportation, and property rights—in short, to restore order; all of which requires money. Thus it is evident that an endless circle exists, each part depending for its success on some other part, and no part capable of complete solution by the present government.

Order is the primary but not the only requirement. Compensation for the losses that have been suffered is

equally necessary, and beyond all is the demand that Mexico's affairs be so administered that the disorders of the past few years shall not be repeated.

With order restored, all of the other demands can be met without difficulty. Shall we loan Mexico money to enable her to bring about what we demand? No. We cannot do that, because we know that the government we recognize is either incompetent or dishonest; we cannot trust it, although we would like to do so.

There is but one course open that will yield results. The United States must furnish the money, and do these things herself. The United States must see that the constitution is followed, that justice is administered and that laws are enforced; that just taxes are levied, collected and accounted for; that restitution of property is made, and that just compensation is paid for losses; that industry is rejuvenated; that educational facilities are restored and expanded; that a just agrarian policy is established, and that peace reigns throughout the land.

We would call this intervention. Mexico would call it war. Perhaps it is better so, for "war" is a word that she understands. It signifies that someone is going to be forced to do something that he ought to do, whether he likes it or not. It may be contended that we are not justified in going to war, but for the sake of countless Americans, Europeans, and Mexicans we are justified in doing that which some Mexicans would call "making war on a small nation." Let us not hesitate to do our duty because an ugly word is used ill-advisedly.

The Rules Committee of the House keeps steadily at the task of trying to learn what has been done in Mexico for ten years past, and the Senate on August 8 adopted without a dissenting vote a resolution which provides that

The Committee on Foreign Relations or any subcommittee thereof is authorized and directed to investigate the matter of damages and outrages suffered by citizens of the United States in Mexico, including the number of citizens of the United States who have been killed or have suffered personal outrages in Mexico, and the amount of proper indemnities for such murders and outrages; the amount of damages suffered on account of the destruction, confiscation and larceny of personal property and the confiscation and deprivation of the use of lands and the destruction of improvements thereon; the number of citizens of the United States residing in Mexico at the time Porfirio Diaz retired from the Presidency of Mexico and the number of citizens of the United States at present residing in Mexico and the nature and the amount of their present holdings and properties in said country, and in general any and all acts of the government of Mexico and its citizens in derogation of the rights of the United States and of its citizens, and for this purpose to sit at any time or place during the session of Congress or during the recess of Congress, and with authority to subpoena such witnesses and documents as may be necessary, and to make a report of findings in the premises to the Senate; and said committee shall further investigate and report what, if any, measures shall be taken to prevent the recurrence of such outrages.

The President, the House and the Senate may keep us out of war with Mexico, but they will have to shut their eyes, stop their ears and hold their noses if they do not undertake to do what ought to be done. "Try as we will," the *New York Tribune* says, "we cannot get away from the Mexican problem. The Mexicans will not let us. Unless it is their purpose to force intervention, it is hard to understand their course."

Pulverized Coal in the Metallurgical Industry

ONE of the greatest improvements made along metallurgical lines in the last eight years has been the commercial application of pulverized coal as a fuel for reverberatory furnaces. The old hand-fired furnaces are practically extinct in this country, with the exception of small installations, and in the refining industry. Indeed, pulverized-coal firing is now successfully applied to copper-refining furnaces, those of the American Smelting & Refining Co., at Perth Amboy, N. J., being so equipped.

Elsewhere in this issue we publish an account of experiments which have been made with a view of substituting the cheaper powdered coal for coke as a charge to blast furnaces. The work which is being done is of absorbing interest, for if it proves successful an enormous field of possibilities will be opened in the smelting of practically all ores, including iron, and also in cupola work.

At the works of the Tennessee Copper Co., where the tests were first conducted, the results were most successful, and practically all of the coke formerly used could be replaced by coal. This, too, was accomplished without material change in furnace design. At Copper Cliff, however, many difficulties have been encountered, largely attributable, in all probability, to the refractory character of the ore. In ordinary practice about 12.5 per cent coke is required in the charge, whereas at the Tennessee plant about half that amount is necessary. In the latest work the design of the furnace has been completely changed to afford a large combustion chamber in front of the tuyères. Experiments with this furnace are now being made, and the results will be awaited with interest.

Should pulverized coal be successfully applied in blast-furnace practice it may mean the salvation of this branch of copper smelting. Heretofore the cheapness of coal as compared with coke has been one of the principal reasons why present-day operators have been leaning so strongly to the reverberatory. When it is considered that about 70 per cent of the cost of blast-furnace smelting is included in the coke, it may be easily seen that any material cut in the fuel cost will have a considerable effect on the total.

June Exports, \$918,000,000

EXPORTS in June totaled \$918,000,000, an astounding figure, and yet not so surprising as the trade balance for June in our favor, about \$625,000,000. Will it go on? It cannot continue much longer, or it will grow so large that it can never be paid, principal or interest. So long as Europe can pay interest and accumulate a sinking fund, these balances, or the obligations representing them, mean wealth, but should conditions be brought about that would prevent such payment, this accumulation of wealth would vanish. Europe and its colonies do not produce enough gold to secure these obligations. They can be made good with manufactured and raw materials if we will permit it.

Our producers and manufacturers are today beseeching Congress to prohibit, or make impossible, the importation of hundreds and thousands of articles that may be purchased in Europe for less than they can be produced here. Among these solicitors, begging for an opportunity to live, are many of our own friends, pro-

ducers of ores and the products from ores. We sympathize with them deeply, for if they do not get the protection asked for they must cease production. If protection is given to the new mineral industries, we must not deny it to other industries standing in an equally precarious position. If granted to all—if a wall be built that will allow everything to pass out but permit only little to come in—a disaster will confront us that will affect every industry.

There is a protection that this country needs today that it has never needed before. It is the safeguarding of that wealth which has been acquired so suddenly and unexpectedly—a wealth that we scarcely realize or know how to use. This is the country's wealth. It belongs to no capitalists and to no class. It belongs to all workers. If amply protected, we will all share that protection; if lost, every man will feel the loss.

Our problem today is that of feeding Europe and restoring her to a condition of normal production, taking our pay in promises that for several months may be as large as those for June. However, our problem does not end there: we must for our own salvation help Europe to make those promises good. And, as contrary to self-interest as it may seem, opposed to the interest of manufacturer and laborer, we should be searching for lists of those things that Europe can make cheaper than we can make them, rather than be compiling lists of those things which she must not send us.

Self-preservation is the first law of nature, but if the individual asks for and receives the maximum protection as his only means of preservation, is there not a grave danger of sacrificing the national wealth which will very quickly reflect upon every individual composing the nation?

Labor Threatens Labor

IF THE Railroad Brotherhood does not succeed in forcing the present Government to take over the railways on terms agreeable to the Brotherhood, the railways are to be shut up tight—not a wheel is to turn; such is the threat that has gone forth. Will it be made good? It certainly will not if the members of other unions fully appreciate the significance of the threat.

About three-fifths of the income of railways in normal times is derived from moving the raw and finished products of mines. Some fuels are worth less than railway freight charges, but most ores and metals are worth many times the freight tariffs. The value of mine products is several times the cost of moving them. The value of these products is made up chiefly of the various forms of labor that go into their production. As large as the collective income of American railways is, three-fifths of it measures but a fraction of what is paid to labor to mine the coal and ore and to produce the metals which it hauls. This is only a portion of the labor which the Railway Brotherhood threatens, but it is an intelligent portion and will not submit quietly to the dictation of another group as to whether it shall continue to work and earn a living, or starve.

There is no doubt that it is physically possible for a well-organized union of all the railways to stop rail traffic completely by simply refusing to work. But it is extremely doubtful if the leaders advising such drastic course would be supported by a majority of their followers. It is certain that they would not be supported by the members of unions depending for

their living on the rapid movement of a large amount of freight.

Coal miners, the miners of iron and other base metals—those who smelt and refine—would not sit quietly and see their women and children starve in order to place the railways in the hands of incapable experimenters. What could the miner do to help himself if the railways cease to function? He might quote from a member of the Brotherhood who remarked that "obstructors ought to face a firing squad," but this contingency will not arrive. There is too much intelligence, patriotism, and self-interest at stake for the 4,000,000 affiliated union members to support 2,000,000 railway men in a proposition containing no justice and little wisdom.

The proposal of the Railway Brotherhood is not to be sneered at. It may be foolish or unjust, but it is backed by hard workers; it will not die quickly. It must be opposed by harder workers than those that support it. Every miner, every smelterman, laborer, operator, and owner is keenly interested in seeing our railways efficiently operated at the minimum cost. So far, experience has shown that our interests are best conserved when the railways are operated by their owners under proper control of the Interstate Commerce Commission. It is the duty of each of us to see that our representative at Washington does not make a false step at this critical time.

The Passing Of a Great Man

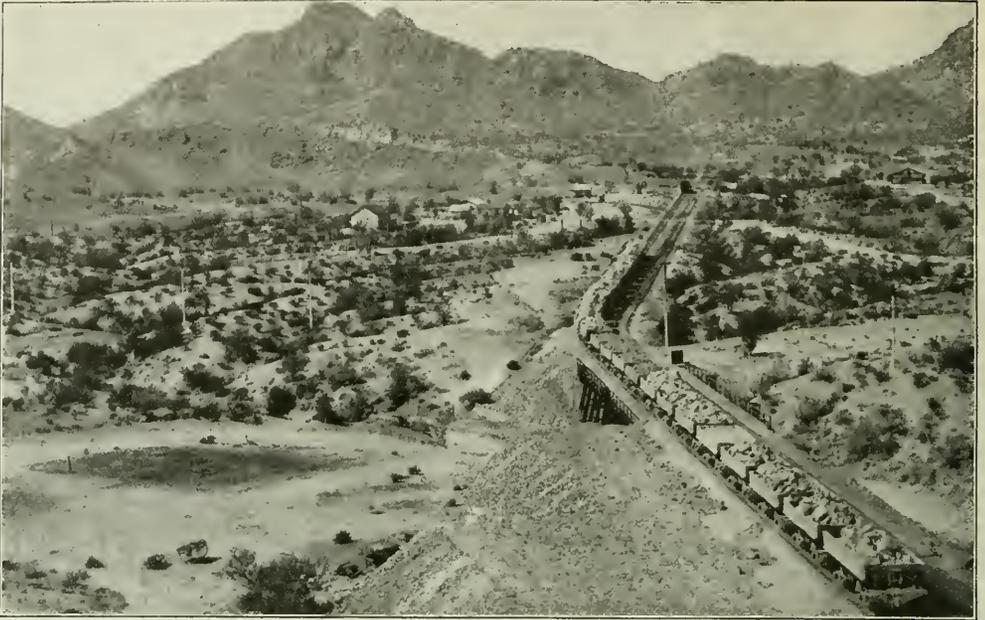

ANDRREW CARNEGIE, ironmaster and multi-millionaire philanthropist, died of an acute attack of bronchial pneumonia on Aug. 11, at Shadow Brook, Lenox, Mass., in his eighty-fourth year. He was born in Dumfermline, Fifeshire, Scotland, on Nov. 25, 1835, in poverty, but with health, capacity for work, and ability to take advantage of opportunities. Starting business life a messenger boy, he became the greatest manufacturer the race has ever produced.

After achieving great success in industry, Carnegie devoted his fortune and his energy to the causes of education and peace. He possessed the faculty of inspiring others to unusual efforts, and achieved his objects by expressions of appreciation rather than by criticism. He was ingenious in devising means to encourage and sustain all that is best in human nature. In his confidence in youth, and his practice of searching out men with superior natural ability, and bringing them quickly to the front, he set an example that every employer may profitably heed.

In Carnegie's death the world has lost a great man, beloved and admired by all who knew him.

No Engineers On the Job

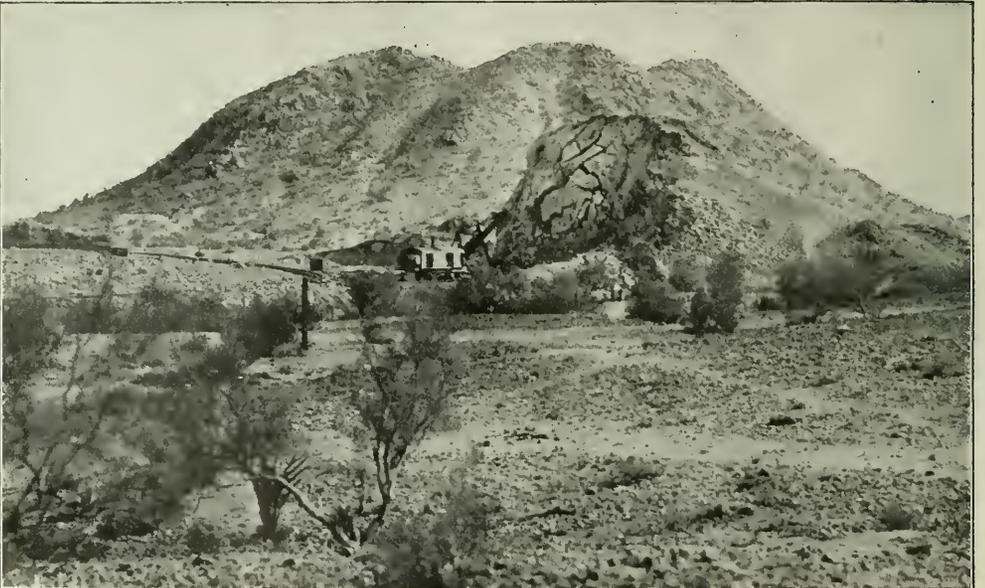

THERE is one big business concern in the United States in which engineers have no part. The House of Representatives, with a membership of 435, contains not a single engineer to participate in its deliberations or to sit upon its committees. Nothing can be more eloquent of the fact that engineers fail utterly to assume the duties that they should in the civil and political affairs of their country. They are not sufficiently self-assertive to make themselves known among their own people, and hence they fail to get that public recognition to which their abilities entitle them.

ORE TRAIN ON THE WAY FROM NEW CORNELIA STEAM SHOVEL OPERATIONS TO TREATMENT PLANT

Photographs From the Field

A BLAST AT HILL NO. 2, NEW CORNELIA COPPER CO., AJO, ARIZONA

West Shining Tree Gold District, Ontario

A New Field Which Has Attracted Interest Owing to the Occasional Discovery of Rich Ore—
Sufficient Development Work Not Yet Done To Establish
Its Future Importance

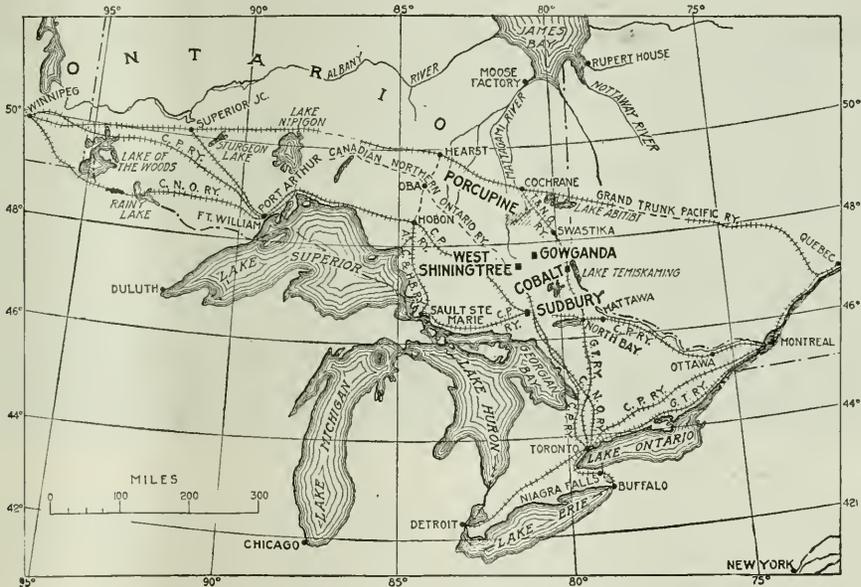

BY L. H. GOODWIN

Mining Engineer, with Rogers, Mayer & Ball, 4, Broadway,
New York

THE West Shining Tree gold area of northern Ontario is now attracting considerable attention. Although it has been known for several years that gold is present in this section, not enough work has been done to put the district in the producing rank, nor even to prove definitely that it has the necessary richness to warrant mining on a large scale. Early development was retarded by the indisposition of prospectors to work their claims sufficiently to expose their possibilities to the engineer, and at the same time prices were put on the prospects which would hardly have been warranted for fully developed mines. Later, the war and conditions induced by it retarded prospecting and development work. At present, however, there is evidence of a reawakened interest in the district.

northwest of Sudbury, and about 340 miles from Toronto. It comprises parts of the townships of Macmurehy, Churchill, Asquith, and Fawcett, in the Sudbury mining division, and is within the Temagami Forest Reserve. The Porcupine gold camp lies about sixty miles north, and the Gowganda silver district is about twenty miles to the northeast. The principal prospects occupy two sections, about three miles apart, and both some distance east of West Shining Tree Lake.

A government road is cleared the entire distance from Westree to the northern part of the district, and in winter the prospects can be readily reached over it. Grading and bridges are completed to a place called the Bridge, or the Halfway, which is at the point where the route crosses the Opickinimika River and about

MAP SHOWING SITUATION OF WEST SHINING TREE DISTRICT

A notable feature of the prospects in this area is the presence of spectacularly rich specimen ore, carrying heavy gold. That is not always considered a favorable factor when judging future possibilities, as it carries the implication that the gold probably occurs in small rich pockets which may be difficult to find and follow.

TRANSPORTATION NOW DIFFICULT

The district is situated about twenty-five miles northeast of Westree, a station at Mileage 64 on the Canadian National R.R., Westree being about eighty miles

half the distance to the region. Transportation in summer is, therefore, a difficult matter, as the wagon road cannot be used beyond the Bridge, except as a trail. Supplies must be carried by canoe from this point, and the canoe route involves a roundabout course and several portages.

To add to the difficult canoe trip, the condition of the road in to the Bridge has been deplorable, so that summer transportation has been especially difficult. At present, however, the provincial government has a large crew of men at work on the road, and it is hoped

that by the end of the season a serviceable wagon road will have been completed over the entire distance. Another canoe route into the district is by way of Ruel, a station twelve miles south of Westree. The canoe landing is two miles from the station over a marshy trail, and as this route involves a longer trip it has been little used.

GOLD DISCOVERED IN 1911

Gold was first discovered in the West Shining Tree area in August, 1911, by prospectors, considerable dispute being made concerning the exact identity of the original discoverer. In the autumn of that year R. B. Stewart, geologist with the Ontario Bureau of Mines, made a brief visit to the section, and his report was published in the 21st Annual Report of the bureau. The following year, W. H. Collins, geologist for the dominion government, spent considerable time in the district,

The topography of this section is typical of that covering extensive areas of northern Ontario. It is a rocky plateau of an elevation about 1,400 ft. above sea level. The relief is slight, the summits of high ground being generally less than one hundred feet above the surrounding low land. The height of land skirmishes the western part of the area, drainage to the east of it finding an outlet into the St. Lawrence River, and to the west into James Bay.

Glacial lakes form a prominent feature and cover an appreciable proportion of the area. Muskeg swamps, most, if not all, former lake bottoms, occupy another considerable proportion of the terrain. The higher ground is generally covered by drift, which, although thin, covers effectively most of the land surface. Despite these drawbacks, rock exposures are frequent, and prospecting is fairly easy over large areas.

THE WESTREE PROSPECT IN THE WEST SHINING TREE DISTRICT

and his observations were incorporated in a memoir on the Onaping Map Area.¹ His investigation was entirely geological, and as an area of seventy-two square miles was covered, it is evident that the work could not be done in great detail. It is intended that P. E. Hopkins, of the Provincial Geological Survey staff, shall make a detailed study of the geology this summer.

Up to 1916 no actual development, aside from the necessary assessment work to keep claims in good standing as specified in the Mines Act, was done in the district. During that year a little shaft sinking was done on several properties, and steps were taken toward substantial development, but owing to labor shortage not much was accomplished. During the present season more interest is shown in the area. Several prospects are being actively developed.

The lakes are connected by wide, deep, sluggish creeks which represent the water erosion which followed that of the glacier. An occasional rapid in these creeks necessitates short portages, but generally the connected lakes are accessible to canoes, and the waterways so formed are an important feature in the pioneering work. The connecting lake system is intricate in the extreme. A case in point is the shore line of West Shining Tree Lake, which is said to be over 100 miles in extent. The lakes, aside from any economic consideration, are beautiful and afford interesting scenery, except in those areas which are so unfortunate as to have suffered from the dreaded forest fires of this section.

PRE-CAMBRIAN ROCKS UNDERLIE THE ENTIRE AREA

The geology of this section is similar to that covering large areas of the surrounding portions of Ontario, and is made up entirely of pre-Cambrian rocks. In

¹No. 77, Geological Series, Canada Department of Mines, Ottawa, 1917.

neighboring areas these formations are separable into two distinct divisions, the ancient pre-Huronian, which was succeeded by a major unconformity, and the much younger Huronian (the Cobalt series). The West Shining Tree area, however, is composed entirely of the older pre-Huronian rocks. This classification, as employed by Collins, is apparently only a refinement of the term Keewatin schist, expressing a more exact knowledge of sequence than was formerly held.

The greater portion of the area was mapped by Collins as undifferentiated schist-complex. The complex consists largely of trachytes, andesites, and rhyolites. A tuff of the volcanic series grades into a series of volcanic sediments, consisting of conglomerates, arkose, and slates. The sedimentary series is at least 400 ft. thick, probably much more than that; and it is prominent in the vicinity of Okawakenda Lake.

There appear to be two well-defined systems of mineralized veins, each probably dependent upon distinct periods of shearing. The strongest and most persistent veins are those of the north-south system. The strike in all observed cases is nearly true north and south, and the dip is steep or vertical. The veins vary in width between wide limits, and are noticeably irregular in that dimension, but are exceptionally persistent in length. The Ribble vein, upon which the Wasapika prospect is situated, can be traced for over a mile, and is supposed to be much longer than that. The Gosselin vein also has a considerable length, although most of the quartz on this property appears to occur in large masses rather than in veins. The Saville vein (McVittie property) and the Knox vein (Herrick property) are other examples of this series.

The east-west system of veins are generally shear

SECTION NO. 1 VEIN AND MAIN SHAFT AT THE BUCKINGHAM

Centered about West Shining Tree Lake lies a considerable area of ellipsoidal andesite. In the vicinity of Michikawakenda Lake there are outcrops of a conglomerate, and it is considered by some that there is a considerable thickness of sediments here. The vein being explored on the Herrick property is a persistent quartz body inclosed partly in conglomerate and graywacke and partly in a porphyritic igneous rock.

All other geological formations are cut by broad, north-south trending dikes of quartz diabase and olivine diabase. They are apparently the youngest rocks of the district, and are not considered a part of the schist-complex. The dikes have not been favorable for ore deposition, and they are apparently the only rocks in the district which do not contain quartz veins. They are thought by some, nevertheless, to have helped in the mineralization of the quartz veins, and to have enriched the quartz veins where the two intersect.

zones in which the fractures are occupied by irregular veins, or lenses, of quartz. Occasionally a continuous vein may be traced for some distance, but generally they are small. The zones are often wide, frequently attaining a width of twenty feet, and the length also is usually satisfactory. The strike is usually approximately east-west, but is not as uniform as in the case of the north-south veins. Dips are also irregular, some being toward the south and others toward the north and at varying angles. The Holding, Atlas, West Tree, and Buckingham prospects are examples of this system.

In both systems of veins mineralization occurs both in the quartz and in stringers of the wall rock inclosed in the vein, but is particularly in evidence at and near the contact between the quartz and wall rock. Much of the quartz in the district is of a glassy variety which does not appear favorable to mineralization.

The property of the Wasapika Gold Mines, Ltd., has

been worked for over a year, and previous to that considerable stripping and sampling had been done. George R. Rogers, mining engineer of Toronto, has been actively interested in the undertaking from its inception, and is now president and manager for the company. The property is equipped with a steam power plant which is entirely adequate for the requirements of the prospecting work, and it is intended to push the preliminary development as rapidly as possible.

A description of the work, and the results of the preliminary sampling upon which it was begun, was given in the *Canadian Mining Journal* of Aug. 15, 1918. The original sampling was confined to the main quartz vein, but later work has furnished grounds for the hope that a band of ferrodolomite, which forms the hanging wall of the vein proper, will also prove to be workable ore.

FOLDED VEIN AT THE WASAPIKA

Owing to the width and continuity of the ferrodolomite formation, there appears a possibility that a relatively low-grade but large body of ore can be developed.

As has already been indicated, the vein strikes in a general north and south direction, and the dip is to the west at a steep angle. The country rock to the east, forming the foot wall, is a massive dark green component of the schist-complex, and the hanging wall is a ferrodolomite which has the appearance of a highly altered lava. It is a schistose rock, in color dark green with irregular patches of lighter green, and contains a large amount of quartz. The quartz occurs in small lenses and as narrow veins which are quite persistent. The rock as a whole is similar to the gray ferrodolomite at the Hollinger mine, of Porcupine.

The ferrodolomite hanging wall is readily weathered, whereas the massive foot wall is resistant, and this has

given rise to an escarpment or bluff, which stands a few feet above the surrounding low land on the hanging-wall side and has the quartz vein as its face. To the west a diabase dike borders the ferrodolomite, and another dike cuts the vein at a small angle. The vein itself is intricately folded and irregular, although continuous. The folding is more pronounced at the point where the dike cuts the vein. The vein matter is a dull grayish quartz, containing lenses of schistose wall rock impregnated with iron pyrite. Free gold is found, but not in the spectacular form in which it occurs at some other properties of the district.

OTHER PROPERTIES BEING PROSPECTED

Other properties at the northern end of the district which are being prospected are the West Tree, the Herrick (Knox), the Atlas, and the Bennett, and active work will doubtless be undertaken on other prospects during the season. The West Tree is working in a shear zone and has two shafts about 40 ft. deep and 500 ft. apart, from one of which spectacular high-grade ore has been taken. It is intended to deepen both shafts and connect them by a drift. The Herrick is working a rather narrow but persistent vein, and at the time of visit had a shaft down about 50 ft. Sinking by hand is expensive, however, and it was the intention to use diamond drills for further prospecting.

At the southern end of the district, also, work is being pushed. The Buckingham has a narrow but persistent vein, with an inclined shaft about ninety feet deep. The Holding property carries a wide and persistent shear zone, which has been explored by a 40-ft. shaft and short drift. Both of these properties have yielded rich ore. The quartz appears glassy, and does not impress one as being favorable for deposition of metal, but is evidently deceptive, and most of the gold occurs along the contact between the schist and the quartz.

In conclusion, gold is widely distributed throughout a large area in this district. Though the veins are somewhat irregular and the occurrence of gold in them is erratic, they appear to warrant more systematic and fuller development than they have as yet received.

New Thickener for Pulps That Are Hard To Settle

A new thickener has been put on the market by the General Engineering Co. under the name "The Genter Positive Thickener." While designed primarily for other than metallurgical work, it is likely that it will find a place in some ore-dressing plants where pulp is very dilute and hard to settle.

The principle of operation is entirely different from that of the large tanks in common use. The Genter thickener effects the separation of the clear liquid from the unthickened material through a series of cylindrical filter elements submerged in the material to be thickened. When a thin layer of solids has collected on the filter surface, the current is reversed for an instant, the clear filtrate flowing back through the canvas, thereby forcing the cake off. The sludge then falls into the bottom of the chamber, from which it is removed through a valve. The reversal of the current is automatic and can be set to occur at any time and for as long a time as is found necessary. The discharge would probably be of approximately the same moisture content as that of the thickeners now in use.

Losses in Furnace Slags

Influence of Slag and Matte Composition and Temperature on the Copper Content of Slags at Copper Cliff—A Summary of the Results of a Series Of Experimental Tests

BY EDWARD H. ROBIE

THE interesting discussion in a recent number of the *Journal* on copper slag losses brings to mind some work which I did at the smeltery of the International Nickel Co., Copper Cliff, Ontario, two years ago. Mr. Maier and Mr. Van Arsdale confined their experiments to the form in which copper occurs in slag, whereas my idea in this work was to determine if possible how changes in furnace practice would affect the slag loss.

The Copper Cliff slags contain nickel as well as copper, in about the same ratio as these metals occur in the ore and matte—roughly, one part of copper to two parts of nickel. The nickel, however, merely replaces copper which would otherwise be present, so that the figures given for combined copper-nickel are comparable to an all-copper slag. The general practice in smelting nickel-copper ores up to the white metal stage is identical with that used for straight copper ores.

At the time these observations were made there were seven blast furnaces in operation. Four-sevenths of all converter slag made was poured into the settlers of four of these furnaces, and no cold converter slag was carried on the charge. The remaining three-sevenths of converter slag was poured on the ground, broken up, and charged to the other three furnaces, along with the regular charge.

The work at Copper Cliff was done in 1917. At that time, there was some discussion as to what effect an increase in the coke on the blast furnace charge would have on the CuNi content of the slag. It was thought possible that a slight increase in the coke would raise the temperature of the slag, thereby making it less viscous and allowing the prills of matte to settle out to better advantage. This brought up the question of just what factors influenced the slag loss, and at that time the following outline was made:

CuNi in blast furnace slag probably occurs as:

1. Particles of matte or sulphide in suspension, the amount depending on
 1. Per cent CuNi in matte, depending on
 - (a) Per cent sulphur in charge.
 - (b) Oxidation of sulphur.
 2. Viscosity of slag, depending on
 - (a) Composition of slag.
 - (b) Temperature of slag.
 3. Specific gravity of matte and slag, depending on composition.
 4. Length of time allowed for settling, depending on
 - (a) Amount of material put into a settler.
 - (b) Amount of slag in the settler.
 5. Distance the matte particles have to fall, depending on amount of slag in the settler.
 6. Size of matte particles.
2. Oxidized Cu and Ni, the amount depending on¹

1. Size of coke charged to furnace.
 2. Weight of individual charges of coke and ore.
 3. Height of ore column.
 4. Per cent SiO₂ in furnace charge.
 5. Grade of matte made.
3. Dissolved CuNi sulphides, the amount depending on
1. Composition of slag.
 2. Temperature of slag.

The above outline is not complete and probably not correct in all particulars, but was intended to form a basis on which to work.

Several of the conditions mentioned on which the slag loss is assumed to depend are fairly constant in the International Nickel Co.'s practice, as follows:

1. Amount of slag in settler (one settler carries about the same slag layer as another).
 2. Size of coke charged to furnaces.
 3. Weight of individual charges of coke and ore.
 4. Height of ore column.
- Most of the other factors outlined are embraced in:
1. Per cent CuNi in matte.
 2. Per cent SiO₂ in slag. (Other constituents are in a fairly uniform ratio in all slags.)
 3. Temperature of slag.
 4. Amount of material put through a settler.

During the months January, February, March, September, and October, 1917, temperature readings were made twice daily on the slag-matte stream from the furnaces then running. Any furnaces running on special charges, and the furnaces with settlers in which converter slag was poured, were kept separate. The grade of matte, percentage of silica in the slag, and tonnage put through the furnaces were also noted. The results were then summarized as follows:

1. *Per cent CuNi in slag compared with per cent CuNi in matte.* (Per cent SiO₂ in slag, tons charged per day, and temperature constant.)
2. *Per cent CuNi in slag compared with per cent SiO₂ in slag.* (Per cent CuNi in matte, tons charged, and temperature constant.)
3. *Per cent CuNi in slag compared with temperature of slag-matte to settler.* (Per cent SiO₂ in slag, per cent CuNi in matte, and tons charged per day constant.)
4. *Per cent CuNi in slag compared with tons charged per day.* (Per cent SiO₂ in slag, per cent CuNi in matte, and temperature constant.)

It was found that in many cases the individual figures were discordant, but the averages, which were plotted, show interesting tendencies.

Attention is directed first only to those furnaces which carried solid converter slag on the charge, viz., Nos. 1, 5, and 6.

Curve 1 shows that the tonnage charged has no pronounced effect on the slag loss, other factors being the same. That is, it is possible to get the same per cent

¹See "Peters' Practice of Copper Smelting," p. 194.

of CuNi in the slag whether 375 or 475 tons are put through a furnace. The extra tonnage would not allow quite so much time for settling but would probably keep the settler a little hotter.

In view of the information given by Curve 1, the other curves were constructed without regard to the tonnage put through, the only factors considered being the temperature, per cent SiO_2 in slag, and per cent CuNi in matte.

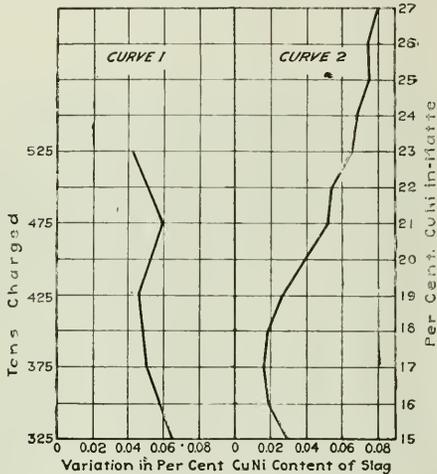

Curve 2 shows how the grade of the matte affects the slag loss, with the temperature, and SiO_2 in the slag constant. Between the limits of 18 and 27 per cent

hotter slag of a given SiO_2 content is more limpid than a colder slag, and therefore it is reasonable to expect better settling, but there is evidently a more compelling reason working the other way.

Comparison of the temperatures obtained (over 2,000 readings) with the percentage of SiO_2 in the slag and the grade of the matte, indicates that there is no relation between the temperature of the slag-matte stream and (1) the CuNi in the matte, or (2) the SiO_2 in the slag. A furnace running on green ore will deliver a low-grade matte and a highly siliceous slag, but at the same temperature as a roast-ore furnace, though not necessarily on the same amount of coke.

No attempt was made to find what factors influenced the temperature of the slag-matte stream. No doubt increasing the coke would raise it, and probably increasing the air pressure within certain limits would also raise the temperature.

At the time these records were taken, furnaces Nos. 2, 3, 4, and 7 were having their proportion of converter slag poured into the settlers, instead of having it charged to the furnace. It was therefore possible to find out with approximate accuracy how much the slag

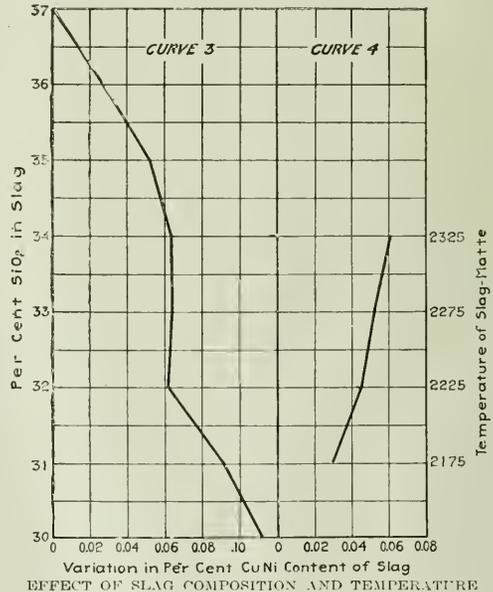

EFFECT OF TONNAGE CHARGED AND MATTE GRADE

matte, a decrease of 1 per cent CuNi in the grade of the matte results in a decrease of about .008 per cent CuNi in the slag. A 16 and 17 per cent matte gives about the same slag loss as an 18 per cent matte, and below 16 per cent CuNi, the slag loss becomes greater as the grade of the matte is lowered. This was an unexpected condition and indicates that with low-grade mattes some other factor apparently enters which tends to raise the slag loss.

Curve 3 shows the effect of the percentage of silica in the slag on the slag loss. From 37 to 34 per cent SiO_2 the CuNi in the slag seems to increase about .02 per cent for every decrease of 1 per cent SiO_2 . From 31 to 32 per cent the percentage of SiO_2 seems to have no effect, but below 32 and down to 30 per cent the slag loss increases again, a little over .02 for every 1 per cent decrease in SiO_2 . This indicates that for some reason a 34 per cent SiO_2 slag will not give any better slag loss than a 32, but a 32 per cent is better in this respect than a 30, and a 36 per cent is better than a 34.

Curve 4 shows the effect of temperature, and it is just the opposite of what was expected. Unfortunately, there was not a large temperature range, most of the readings being between 2,200 and 2,325 degrees. A decrease of 50 degrees in the temperature of the slag-matte stream results in a decrease of about .008 in the CuNi in the slag. As the slag gets colder, the slag loss drops, within the limits, of course, of the proper running of the furnace, for a very cold slag would without doubt increase the slag loss. There is no doubt that a

EFFECT OF SLAG COMPOSITION AND TEMPERATURE

loss was increased by pouring the slag into the settlers instead of charging it solid.

With the following factors in each case (Nos. 1, 5, and 6, and Nos. 2, 3, 4, and 7) constant:

1. Temperature of slag-matte stream,
2. Per cent CuNi in the matte tapped,
3. Per cent SiO_2 in slag from settlers,
4. Tons put through furnace + slag poured into settler,

the slag from the settlers taking liquid converter slag averaged .045 CuNi higher than that from the others. In other words, with the amount of converter slag normally made with mattes of about 23 to 24 per cent CuNi, the slag loss will be .045 higher if all the slag is poured into the settlers than it will be if all the slag is charged

to the furnaces cold. With much lower-grade matte, and the proportionately larger amount of converter slag which would then be made, there might be a greater difference than this.

It was found in the case of the settlers taking liquid converter slag that the greater the tonnage the greater the slag loss. This was particularly evident when more than 475 tons per day was charged.

Too much reliance must not be placed on the numerical results exhibited in these curves, as the work was not sufficiently exhaustive to be more than indicative of general tendencies.

Industrial Democracy

Progress in the Development of Plans Designed To Eliminate Industrial Strife—Advantages and Disadvantages of Systems Now Under Tests

BY F. C. HENDERSCHOTT

Managing Director, The National Association of Corporation Schools, New York

IT IS difficult to determine to what extent the readjustment of working conditions in the industries of the United States is giving the workers a voice in management. The effort to democratize the industries is making steady progress, but so far results are not conclusive.

The National Association of Corporation Schools, with headquarters in New York City, which is studying the problem of a more equitable distribution of created wealth, through industrial pursuits, and also attempting to eliminate present wastes, due to lockouts, strikes, and other forms of industrial strife, through scientific employment, training of the industrial workers, and other personnel problems, and in which 133 of the larger industrial institutions of the United States have membership, advises that a recent inquiry among several hundred industrial corporations reveals that three plans are being used, all designed to give employees more voice in management, especially as relating to working conditions, hours, and wages. The results of the inquiry indicate that a considerable majority of the larger industrial institutions have either experimented with one of the three plans or are studying the various plans and gathering data on results so far obtained, with a view to determining which of the plans they will inaugurate. The plans are known as the "works' committee" plan, the "industrial council" plan, and the "house and senate" plan. The purpose of the three plans is practically the same, but the method of operation differs. So far as known, none of the plans involves direct representation on the part of the workers on the board of directors. However, it is anticipated, if it is found, as a result of experiments, that employees assume the responsibility which logically they must assume if they are to have a continuing voice in the management, that ultimately they will be permitted to name a minority representation upon the board. Such action will probably occur only in industrial institutions where a considerable number of employees are stockholders, and the representation which they secure upon the board of directors will be dependent upon the amount of shares of stock represented by the employees who have a right to vote for such representation.

In one of the largest industrial institutions, where the "industrial council" plan has been made effective, the immediate result was a request on the part of the em-

ployee's representatives in the industrial council for an increase in wages and shorter working hours. This was followed by an avalanche of requests from individual employees for increases in wages. When it was pointed out to the representatives of the employees, by members of the industrial council representing the stockholders and management, that such action would necessarily involve an increase in the cost of the product of the company, and that this increase would bring the selling price of the company's product to figure considerably higher than the selling price of their competitors, the request for shorter hours and increased wages was temporarily, at least, withdrawn. In other words, the immediate results of giving a voice to employees through delegated representatives were wholly selfish and not based upon investigation as to conditions, and were made without any assumption of responsibility whatsoever.

In at least three large industrial institutions where some one of three plans has been introduced strikes have followed within a period of one month. In other companies the plans have worked well, although the period of trial is of too short duration to admit of conclusions as to what will be the final results and as to what definite attitude the representatives of employees may ultimately take. The assumption may be safely made, however, that employees of industrial corporations will continue to demand a voice in those problems of management which affect wages, working conditions, and hours of labor.

Whether or not the representatives of the workers in industrial councils will assume a fair portion of responsibility remains to be determined. So long as shorter hours and higher wages can be secured through strikes, it is probable that the new co-operative plans will make slow progress, but when the time arrives, as it inevitably must arrive, that strikes are no longer successful, and when the public will demand to be heard in the settlement of wage disputes, it is believed that more constructive progress can be made in the working out of co-operative management, and that the workers will then assume a more definite responsibility for production.

The survey also disclosed that plans to insure stock ownership by employees in the company by which they are employed are rapidly becoming installed, the number of companies now installing this feature being far in excess of the number that were working on similar plans prior to the construction period. Stock ownership plans almost invariably include provision for service annuities or retirement pensions.

The belief expressed by Judge Gary, chairman of the United States Steel Corporation, that efforts to unionize the employees of various subsidiary companies of that corporation would not succeed because the men realize that they are better off under the "open-shop" conditions than they would be under the control of unions, is confirmed by many other industrial executives. In fact, the present effort is not only to secure employee or co-operative effort in management, with proportionate responsibility, but also to provide conditions whereby the workers of the larger industrial institutions will receive a greater degree of advantage than would be possible under the unions' control and direction.

The crux of the situation seems to be the acceptance of responsibility by the representatives of the workers for greater output commensurate with shorter hours and higher wages.

Sealing Formations by Slime-Laden Fluid

For the Control of Gas Pressure, To Prevent Migration of Oil, Gas, and Water, and To Prepare Wells for Abandonment, the Method Described Offers Important Advantages

BY SETH S. LANGLEY
Mining Engineer, Taft, Cal.

MUD-LADEN fluid is the term commonly applied to the slush that is used to seal underground formations in well-drilling operations. As some operators do not recognize the difference between a real mud fluid and one containing sand and shale, it would be better terminology to adopt the expression "slime-laden fluid." Any engineer who has had experience in ore dressing will recognize the distinction between an all-slime fluid and one made of sand, shale, and slime. As it is the slime, and not the sand, that seals the pores of a filter, so it is the slime, and not the sand, that seals the pores of a formation. For the reason given the term "slime-laden fluid" will be used in this article.

The primary use of slime-laden fluid is to seal the formations penetrated by the drill. Rotary drilling

swivel joint at the top of the drill stem permits a hose connection to be made from the pumps, and fluid is pumped down the drill stem through the drill, and, rising up through the hole to the surface, carries the cuttings away from the drill. From the collar of the well, the fluid passes through a settling sluice or pits to the collecting sump of the pump. The clear water added while drilling, and the displacement of the drill stem, make a greater volume of fluid than can be carried in the circuit, and the excess is by-passed to an overflow pit. Should the percentage of sand become too great, all of the fluid can be discharged into the first overflow pit, a pump being used to deliver from the second pit to the sump. The arrangement affords easy control of the quantity of sand in the fluid.

If the surface formation does not furnish enough clay to supply the required slime, clay is brought to the well until the cuttings of the drill make up the necessary slimes. Sand, coarse shale, or gravel, will not aid in sealing formations, and when casing is being carried may lodge behind the couplings, causing the casing to become collar-bound. A further disadvantage of coarse material in the circulating fluid is the tendency to bridge between the casing and the wall of the hole-forming channels, or even to choke the discharge completely. If the circulating fluid is confined to channels, only that portion of the formation along the channels is mudded, and the coarse material will settle between the casing and the wall, with a tendency to freeze the casing. Note Fig. 2.

DESCRIPTION OF FLUID

The percentage of slime in the fluid will be governed by the conditions to be met. The inexperienced will probably conduct operations with too thin a fluid. A consistency of porridge, not bouillon, or, in terms of weight, from 7 to 15 or 16 per cent heavier than water, is a fair guide. Specific gravity is not a satisfactory method of control, as of two fluids of the same specific gravity one may be more viscous than the other. A fluid that flows freely and pours like neat cement will meet most requirements. A "too-thin" fluid will penetrate a coarse sand for long distances, and yet leave the sand open, whereas a "too-heavy" fluid will clog the formation along the walls of the hole before it can enter far enough to build up a penetrating seal. As the result desired is a formation so clogged with slime that no filtration can start, a sticky gumbo that will barely pass the pumps would serve no beneficial purpose. If filtration is once started, the fluid or gas will widen the passage, and the sealing will be destroyed.

Casing is not carried down the hole as depth is made in rotary drilling, but is run in when the point of shut-off is reached. Throughout the drilling, slime is pumped into the hole, and it will either rise to the surface or pass off into a porous formation, whichever offers the least resistance. As long as the fluid passes off into a

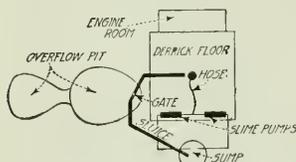

Fig. 1

Fig. 2

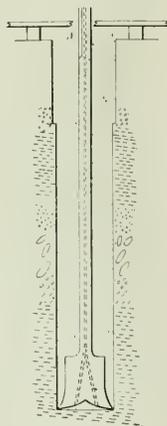

Fig. 3

PLAN OF EQUIPMENT AND ARRANGEMENTS USED IN ROTARY DRILLING

demonstrated that formations were effectively sealed by the column of drillings in suspension being forced to the surface, and this led operators to use the same type of fluid to seal formations when using standard tools. As operators became familiar with the action of slime-laden fluid, they began to make use of it in a variety of ways.

USE OF SLIME-LADEN FLUID IN ROTARY DRILLING

A ground plan of the equipment and arrangement commonly used in rotary drilling is shown in Fig. 1. As the name implies, rotary drilling is effected by rotating the drill. The bit is connected to a hollow stem, which, at the collar of the well, is square and passes through a turntable. The turntable is revolved by a drive operated by a slide-valve engine, with clutch and reverse gear as part of the driving mechanism. A

formation, the formation in question has not been slimed, and, conversely, when it is slimed, the fluid will rise above it to the surface, or into an upper open formation. It may happen that an upper formation, thoroughly slimed, when drilled through will clean itself when relieved of the hydrostatic head of the circulating fluid. This may happen when the fluid is passing off into a lower formation. Before the casing is landed for a shut-off, the fact that all formations have been thoroughly slimed is assured by pumping the fluid into the hole until it rises to the surface. See Fig. 3. As the drilling proceeds, the formations are slimed, and the walls plastered by the whirling action of the drill stem, the coating helping to support the walls of the hole.

As it is claimed that the contents of properly slimed formations cannot migrate, the question may be asked, "Why cement the casing?" If the hydrostatic head of

by the slime-laden fluid. Well No. 5 was drilled to test the gas shown in No. 3. The 12½-in. casing was cemented at 1,800 ft., and in drilling ahead with cable tools the gas was found at 1,835 ft., a correlative depth with 1,845 ft. in No. 3. The hole was finished at 1,900 ft. as a gas well. Well No. 4 had been drilled to 2,505 ft. and the 10-in. casing cemented at that point before No. 5 was completed. The same gas sand was passed in No. 5 as in Nos. 3 and 4. When testing the shut-off of the 10-in. casing at 2,505 ft., gas broke in, shooting the bailer out of the hole. No. 5 was controlled, and is a gas well. Well No. 5 undoubtedly went wild because the hydrostatic head was removed from the gas stratum, allowing it to clean itself of slime.

The cement shut-off was probably a failure, and, in bailing to test, the slime-laden fluid back of the 10-in. casing entered the hole, replacing the water bailed out. With the slime-laden fluid gone, the gas cleaned the pores of its formation, destroying the effect of the sliming. The use of slime-laden fluid in this field has made it possible to produce oil from a horizon below a gas pressure so great that it would be dangerous to drill through it by any other method. Fig. 4 shows a typical underground condition in a field where the same sands may be oil-bearing in one well and water-bearing in the next location; the conditions cannot be foretold. Well No. 1 was drilled as follows: Rotary tools, with slime-laden fluid, were used to 604 ft., where the 12½-in. casing was cemented with 150 sacks of cement by the Perkins method, making a tight water shut-off. The hole was then finished by standard tools to the depth of 979 ft., and production showed no water. Well No. 2 was drilled as follows: It was located 390 ft. south of well No. 1. Rotary tools, with slime-laden fluid, were used to 631 ft. and the 12½-in. casing was cemented as in well No. 1. When drilling ahead with standard tools, water was encountered in the tar sands logged at 645 ft. to 658 ft.; 680 to 695 ft.; and from 728 to 740 ft., and in the oil sands logged from 750 to 760 ft. This made it necessary to cement the 10-in. casing below 760 ft. The 10-in. casing was run to a depth of 770 ft., all formations between 770 ft. and the shoe of the 12½-in. casing at 631 ft. being slimed.

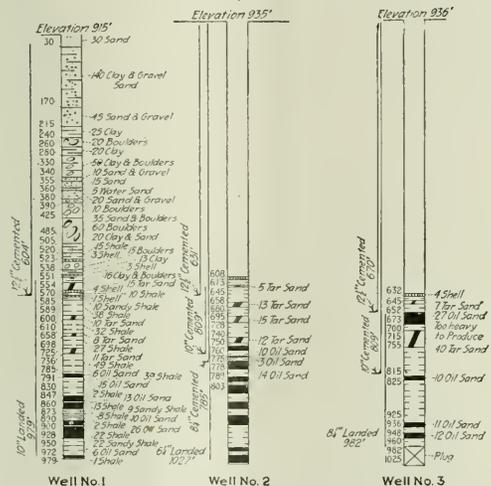

FIG. 4. WELLS SHOWING UNDERGROUND CONDITIONS AND MANNER OF DRILLING

the column of fluid is removed, the pressure within the formation may be great enough to clean the pores and so destroy the effect of sealing. To retain the fluid between the casing and the wall of the hole, the casing must be shut off by some one of the usual methods. Slime-laden fluid is a shut-off for formations, but is not a shut-off for casing.

It is common practice in California to drill with a rotary to the depth of shutting off the first string of casing, then to finish the hole with standard tools. Slime-laden fluid is used to the lowest shut-off depth, but from there to the bottom of the hole no sliming is done. This is due to the fact that it is not expected that water-bearing formations will be encountered while carrying the oil string.

A recent experience in the Elk Hills field demonstrated the action of slime fluid in controlling a heavy gas sand during drilling with a rotary, and, also, the fact that the hydrostatic head must be maintained after sliming. Well No. 3 was drilled by a rotary to 2,455 ft. with 12½-in. casing cemented at that point; the hole finished by cable tools and brought in as an oil well at 2,683 ft. A strong gas showing was encountered at 1,845 ft., but the gas was confined to its own stratum

After sliming, the 10-in. casing was cemented at 773 ft. by dumping ten sacks of cement. The test showed no water to be entering the well, and drilling was resumed. At 775 ft. to 778 ft. an oil sand was encountered, which could not be correlated with any oil or tar sands in well No. 1. The sand carried water, thus necessitating cementing the 8½-in. casing in the first suitable formation below 778 ft. A shale stratum was encountered at 778 ft. and the 8½-in. casing was cemented at 785 ft., after sliming all formations back of it, up to the shoe of the 10-in. casing at 773 ft. The well was then finished at 1,027 ft., with 6½-in. casing as the oil string.

Well No. 3 was drilled as follows: It was located 425 ft. south of well No. 2. With the experience gained in well No. 2, well No. 3 was finished at 982 ft. Only three strings of casing were used. This was accomplished by cementing the 12½-in. casing at 670 ft.; from there on, all formations encountered which were correlative with the water-bearing strata of No. 2 were tested, as reached, and the 10-in. casing cemented at 809 ft., after sliming all formations back of it, up to the shoe of the 12½-in. casing. The 12½-in. casing should have been carried to 809 ft. in well No. 3, or no 12½-in.

casing used at all, and the 10-in. casing carried to 809 ft., as thorough sliming would have shut off all formations above 809 ft., there being no commercial oil sands above that point. This is an illustration of an opportunity to save one string of casing by the proper use of slime-laden fluid.

The sliming with cable tools may be done by carrying slime-laden fluid in circulation while drilling with the casing carried close to the bottom of the hole, or drilling can be done in the usual way and the hole slimed when ready to land the casing for shut-off. Should the formations encountered while drilling with standard tools contain a great deal of sand, gravel, or boulders, which are liable to stick the tools or freeze the casing, it is best to proceed without slime, and, when ready to land the casing for shut-off, to clean the hole thoroughly and slime the formations.

INFLUENCE OF SLIME-LADEN FLUID ON CEMENT

Laboratory tests have shown that cement will set well when mixed with 30 per cent of slime, and even 50 per cent will not prevent a "fair set." From these tests, it seems doubtful if it is necessary to use clear water as a flush to drive slime away from the point of cementing. The clear water will wash the slime off the wall, and, if confined to channels, the formation will be under-scoured and so produce a condition favorable to caving. It is my belief that cement will carry the slime ahead of it, leaving a clean surface for a bond between the wall and cement.

SLIME-LADEN FLUID IN RE-DRILLING

In Fig. 5, A is illustrative of the conditions presented by the encroachment of edge water in upper sands after the well had produced some months. The condition after re-drilling is shown at B, Fig. 5. Re-drilling was begun Jan. 1, 1918, and was completed Mar. 25, 1918. The 12½-in. casing was cemented at 714 ft., and the 10-in. casing landed at 1,115 ft. This was the condition before re-drilling. The production was very low and carried no water. In the hope of increasing production, the oil sands at 820 to 835 ft., and 837 to 855 ft. were perforated. The well was put on production and showed large quantities of water. This pointed to edge water in the oil sands at 820 to 835 ft., and 838 to 855 ft. To exclude this water, the following operations were carried out:

The adapter between the 12½-in. casing and the 10-in. casing was fished out and 10-in. casing screwed on the 10-in. casing by a die nipple. The hole was then cleaned to the bottom and swabbed to 885 ft. (see B, Fig. 5). A rope and rock bridge was put in from 1,115 to 1,030 ft. and the 10-in. casing shot with 40 lb. of 50 per cent dynamite at 1,030 ft. The hole was cleaned out and twenty sacks of cement were dumped in the cavity at 1,030 ft.

Tested sands above 1,030 ft. showed a great deal of water and no oil. The hole was filled to 920 ft. with rock and brick, with chopped rope on top. A 40-lb. shot was put in at 920 ft.; the hole cleaned, and twenty sacks of cement dumped in the cavity at 920 ft. Test showed hole still making water and no oil. Jar-down spear got vibration at 840 ft. The hole was shot at 880 ft. with 25 lb. of dynamite. Pipe was free and raised to 722 ft. Rope, rock, and brick bridge put in to 723 ft. and test showed hole still making water. The 10-in. casing was freed, and, after cleaning the hole, six sacks of

cement were dumped in it at 723 ft. The top of the cement was found hard at 715 ft. The 10-in. casing was pulled out and test showed hole to be dry, thus showing that water above 715 ft. was prevented from entering the formations below that level. The hole was then cleaned to 892 ft. and bridged to 881 ft.

The 10-in. casing was run in, and all formations back of it up to the shoe of the 12½-in. casing at 714 ft. were thoroughly slimed under pressure. After circulation the 10-in. casing was cemented at 880 ft. with thirty-five sacks of cement with Baker retainer. Test showed water above 880 ft. was prevented from entering formations below that point. The hole was re-drilled to 1,115 ft., carrying 8½-in. casing, and a new hole drilled to 1,146 ft., where the 8½-in. casing was landed as the oil string.

CONTROL OF GAS BY SLIME-LADEN FLUID

Drilling with cable tools in a field having heavy gas pressure may result in enormous waste of gas, and in fires, and even fatalities among the drilling crew. Where the formations are not too sandy it is best to carry slime fluid while drilling. Should this be impossible, and a well "go wild," it may be put under control by introducing slime fluid either by the tubing method,

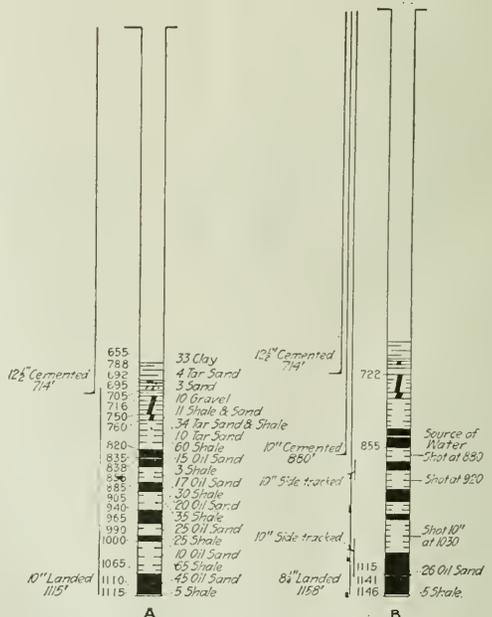

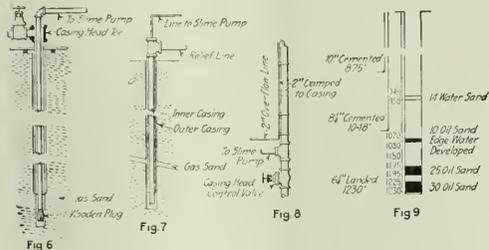

FIG. 5. CONDITIONS BEFORE AND AFTER RE-DRILLING OF A PRODUCING WELL

through a lubricator, or by using a string of casing as the tube. The tubing method is applicable when the well cannot be shut in. The tubing should be two or three inches in diameter and is lowered to a point below the formations to be slimed. The fittings at the collar of the well consist of a casing-head T through which the tubing passes, and a nipple, with relief valve on the side outlet of the casing-head T (Fig. 6). The line of tubing should have a valve between the casing head and the slime pump, and a wooden plug is placed in the end of the tubing before lowering in the well. This plug will keep the tubing clear, and when the slime is pumped

will be blown out. A metal check valve could be used, but it may fail to function and has no advantage over a wooden plug.

When the tubing is in, the slime pump is started with the relief valve open. The relief valve must not be closed, because the gas pressure would blow the tubing out of the casing-head T. After the slime-laden fluid has been pumped into the hole, it will begin to be blown out of the relief valve, and, at this time, the valve should be used as a throttle to prevent all of the slimes being ejected and to maintain enough pressure to force a por-

METHODS USED IN CONTROLLING GAS AND SEALING FORMATIONS

tion of the slime up along the formation being mudded. The pressure at the relief valve will begin to fall until the hole will stand full of fluid with the valve open and the pump stopped. The tubing can now be removed and the casing landed for a shut-off, or drilling may continue, as the case demands. It is dangerous to proceed in any manner which is likely to produce the sudden relief of the hydrostatic pressure of the slime fluid, as this may allow the gas formation to clean itself, and the work must be done all over again.

In using casing as the tube, if there are two or more strings of casing reaching to the collar of the well, and it is known that fluid will pass out of the inner casing up the wall to the formation to be slimed, the problem differs in no way from that of ordinary sliming under pressure. The only requirements are connections at the casing head (Fig. 7) which will allow a relief valve on the casing, so arranged that the slime can be pumped down the smallest string while the gas is free to escape from the well.

If the gas pressure is not too great to allow the well being shut in, the lubricator method (Fig. 8) can be used with good results, and the apparatus can be made up from the usual fittings employed in drilling. Two joints of casing are made up with a nipple and a T at one end and a 2-in line run out of the other end back along the casing, securely clamped to it. The casing is connected to the casing-head control valve with the T end down, while the slime pump is connected to the T, and the 2-in. line run to the slime pit with a control valve conveniently placed. With the casing-head control valve closed, and the overflow valve open, slime is pumped into the casing until the overflow appears in the 2-in. line. The line is then closed and the casing head valve opened. The slime fluid will then fall into the hole while gas fills the space which it occupied. After allowing a few minutes for the slime to drop, the control valve is closed, the overflow line opened, and the gas allowed to escape from the lubricator. This operation is repeated until the gas is shut in.

Old wells drilled without sliming will sometimes require great quantities of slime when abandoned. This is

due to the channels formed in strata which have been discharging water, oil, or gas, into the hole back of the water string. As they were not slimed when passed through in the original drilling, there has been nothing to prevent the intercommunication of their contents, and adjacent wells might be injured if no precautions were taken. It is not safe to assume that the shut-off of the water string will remain tight after abandonment.

Fig. 9 illustrates the method applied by an operator in the Midway field, and shows the original condition of the hole when production began. After producing several years from sands, logged at 1,070-1,080, 1,150-1,175, and 1,195-1,225 ft., edge water appeared in the sand at 1,070-1,080 ft. The 8½-in. casing was cemented at 1,048 ft., shutting off the water above. Later mechanical trouble developed which made it unlikely that the 8½-in. casing could be re-cemented, and abandonment was decided upon.

The 6½-in. casing was pulled from 1,070 ft. and the 8½-in. casing shot and pulled from 1,030 ft. The hole was then cleaned to the bottom and the 8½-in. casing run in to 1,110 ft. A 50-hp. boiler and a slush pump were set up some distance from the well. It was necessary to carry clay to the mixing pit. The slime-laden fluid was prepared by running clear water into the pit and passing it through the slush pump. As the suction of the pump was about 150 ft. from the mixing point, such sand as was in the clay settled out before reaching the sump. The 2-in. discharge of the pump led to the top of the 8½-in. casing. The slime fluid was pumped in the well for thirty days, the valve being controlled to maintain the hole full of fluid, but not so as to force it out between the 10-in. and the 8½-in. casings. When the sands were so slimed that they took no more fluid, a casing head was put on with a packing clamp between the 8½-in. casing and the 10-in. casing, and pumping was resumed until the pressure registered 250 lb. and decreased only 25 lb. in an hour and a quarter. The sands were slimed in succession downward, beginning with the formation nearest the shoe of the 10-in. casing. The fluid used in the first few days of operation was rather thin, in order to obtain penetration, but later the fluid was thickened to build up a retaining dam behind the deeper penetration.

In conclusion, the slime-laden fluid is the best method, in my judgment, to control heavy gas pressure; to prevent migration of oil, gas, or water; to prepare wells for abandonment; to seal formations not reached by cement; and to protect casing from corrosive water. Slime-laden fluid is a shut-off of formations, but not of casing, and often can be used to save a string of casing.

Manganese Ore Exports from the district of Santiago de Cuba for the years 1888 to 1917, inclusive, are summarized by the Boletin de Minas, No. 5, 1919, Havana, Cuba, in the following table:

Year	Tons	Year	Tons
1888	1,942	1903	20,438
1889	704	1904	14,500
1890	21,810	1905	4,500
1891	21,987	1906	19,000
1892	18,751	1907	35,645
1893	10,640	1909	2,500
1895	1,394	1914	1,300
1898	1,800	1915	6,338
1899	12,558	1916	38,883

Pulverized Coal for Blast Furnaces*

Interesting Experiments Carried On by Tennessee Copper Co. and International Nickel Co.—
Coal Blown in Tuyères—Considerable Economies Expected—Estimated
Cost of Pulverized-Coal Installations

By E. P. MATHEWSON AND W. L. WOTHERSPOON

THE use of pulverized coal in reverberatory furnaces, cement kilns, open-hearth furnaces, boilers and other similar furnaces has been described extensively in many papers and publications. The present paper will be confined to the application of pulverized fuel to blast furnaces, wherein the mixture of fuel and air is injected into the lower portion of a piled mass of material, and combustion takes place under pressure.

Until recently the history of pulverized coal in blast furnaces contained nothing but records of failures. Sir Lowthian Bell, in his book on the "Principles of the Manufacture of Iron and Steel," published in 1872, which deservedly ranks among the world's metallurgical classics, mentions an attempt to introduce finely divided coal with the blast at the tuyères in an iron furnace. The attempt was soon abandoned, and Bell remarked that it needed little consideration to insure the rejection of all such schemes.

About 1902, W. J. Forster, of Darlston, England, satisfied himself by a great number of experiments at the Darlston furnaces, "that nothing but failure can be expected from the addition of cold materials into the hearth of the furnace with the blast."

In 1913, U. A. Garred became interested in the application of pulverized fuel to blast furnaces, but it was two years later when he applied some of his ideas in a practical way, by melting blister copper in a blast furnace. The design provided special facilities for combustion, and the tuyères were so arranged that in the event of the charge becoming frozen they would remain clear. During the experiment over a million pounds of blister copper was melted.

EXPERIMENTS AT THE TENNESSEE COPPER Co.'S SMELTERY

Experiments at the smeltery of the Tennessee Copper Co. were decided upon early in 1918, one of their standard blast furnaces, 22 ft. 6 in. long by 60 in. wide, being used. Ten tuyères on one side of the furnace were equipped for the use of pulverized fuel, and the first test run of importance lasted from April 22 to May 4, during which period the percentage of coal to the charge was 3.8, as against 5.7 of coke used on the other furnaces during the same period, when operating with a similar charge. The second test run started May 9 and continued until May 24. The percentage of coal used was 3.6 and a small amount of coke was charged intermittently.

A third test run was then made, feeding a little coke on the side of the furnace where no coal was fed previously, as it had been found there was a tendency for crusts to form on that side of the furnace. It was then decided to apply the coal in ten tuyères on each side, but experimental work was postponed,

owing to the possibility of some unconsumed carbon in the furnace gases causing discolorization and affecting the quality of the sulphuric acid made, which is an important product of the company. The company returned to the experimental work in January, and is continuing, with various modifications, the methods of applying the coal.

As the Tennessee company had not used pulverized coal previously, it was necessary to install a coal-preparation plant. A plant with a capacity of three tons per hour was constructed at a cost of about \$35,000. The cost of the feeding apparatus at the furnace was about \$5,000.

An analysis of the average ore smelted at Copperhill, Tenn., during 1918, is as follows: Cu, 1.55 per cent; Fe, 34.6; S, 24.6; SiO₂, 20.3; CaO, 4.9; MgO, 2.0; Zn, 1.4; Al₂O₃, 4.3. The furnace has 27 tuyères on one side and 24 on the other, and the air blast is maintained at 35 to 45 ounces pressure. Fig. 1 presents a general arrangement showing the method of applying pulverized fuel to the experimental furnace.

EXPERIMENTS AT THE INTERNATIONAL NICKEL Co.'S SMELTERY AT COPPER CLIFF, ONTARIO

The International Nickel Co. became interested in the work being done at Copperhill, and in June, 1918, secured the services of U. A. Garred, whose work has already been mentioned, to carry out experiments in the blast-furnace department of its smeltery at Copper Cliff, Ontario. It was decided to utilize one of the company's standard blast furnaces, 25 ft. 6 in. long by 50 in. wide. The furnace bottom is lined with magnesite brick to within 14 in. of the center of the tuyères; the two lower rows of jackets are cast iron, inclosing water-cooling pipes, and the two upper rows of jackets are of the standard water-cooled steel type. The furnace has 48 6-in. tuyères, 24 on a side, spaced about 12 in. centers. These are connected to a main bustle pipe with 6-in. galvanized branch pipes fitted with canvas sleeves. The bustle pipe is supplied by an offset from the main delivery pipe, which feeds seven other furnaces, the normal pressure of air carried at the tuyères being 23-24 oz.

The furnace charge consists mainly of a refractory copper-nickel sulphide ore, a large proportion of which comes from the company's roast beds. The composition of the charge and the average size and analysis of the charge and products are as follows:

COMPOSITION OF CHARGE

	Percentage of Charge to Blast Furnace, Av. 6 Months
Roast ore.....	74.8
Raw Creighton.....	2.8
Raw Crean Hill.....	8.0
Total ore.....	85.6
Converter slag.....	10.2
Converter scrap.....	3.2
Limestone and quartz.....	1.0
	100.0

The furnace, under normal conditions of smelting, treats about 500 tons of charge a day, utilizing 60 tons of coke, the average coke consumption for six months being 12.5 per cent of the charge.

Regarding air conditions, only approximate estimates

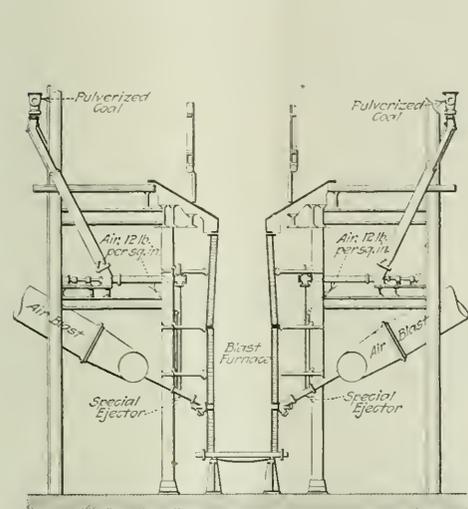

FIG. 1. GENERAL ARRANGEMENT OF BLAST FURNACE AT COPPERHILL, ON WHICH PULVERIZED COAL EXPERIMENTS WERE MADE

were available, owing to the whole of the blast furnace plant being supplied from a central blower installation. General observations indicated that the furnace charge is kept about 7 ft. deep, and the smelting zone is from 2 to 3 ft. above the tuyères. Blow holes form quickly after a fresh charge, but the amount of dust made is about normal, namely, 1.5 to 2.0 per cent of the ore.

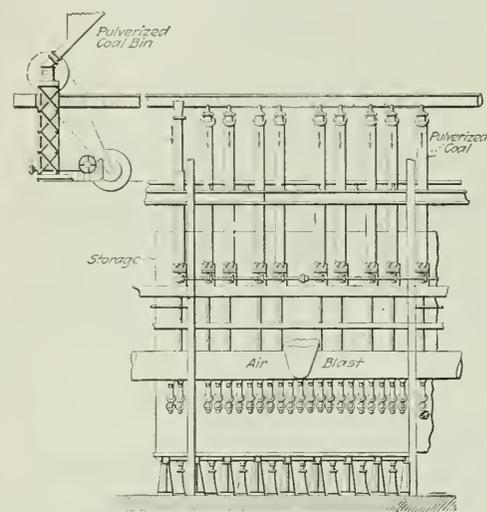

The tuyères require punching regularly, the method being to remove the tuyère cap, and, by introducing a rod, to stir up the ore in the vicinity of the tuyère. It was usual, when cleaning these tuyères, for some loose ore to be blown out on the furnace floor in a condition which indicated that the ore close to the tuyères had not been strongly heated. Through the tuyères the charge appeared black, and usually there was no appearance of fire until near the middle of the furnace.

Arrangements for conducting the experiments were greatly facilitated because the company had utilized pulverized coal in reverberatory furnaces since 1911. Some difficulty was first encountered in transferring the powdered coal from the bins at the rever-

beratory to the blast-furnace plant, but satisfactory arrangements were finally made for blowing it over by compressed air. It was found that 2½ tons of coal could be transmitted in five minutes through a 3-in. pipe 1,100 ft. long and with an elevation of 50 ft.

The feed or service bins at the blast furnace are about 13 ft. long, 3 ft. wide at the top, 14 in. wide at the bottom, and about 6 ft. deep. They are constructed of No. 14 gage steel plate, and are completely closed, a manhole being provided, and an air vent pipe, to which a cyclone separator is fitted. The bins each hold about 3½ tons of pulverized coal. At the bottom of each are twelve common screw feeders, operated from a line shaft through bevel gears, each feeder having a small clutch, the line shaft being driven from a variable-speed motor.

The feeders can be operated satisfactorily at speeds

between 40 and 100 r.p.m., to deliver from 3 to 6 lb. of coal per minute; and any individual feeder can be stopped without interfering with the general operating conditions. The screws are made of special length and pitch, being made in a lathe, and in calibrating these at different speeds for the discharge of the coal no flushing effects have been noticed. This arrangement of feeding the coal is positive, sufficiently accurate, and mechanically simple. The twelve feed screws at each bin discharge the coal into 1½-in. diameter pipes, which are in turn connected with the blast pipes or tuyères at the furnace, the coal being transmitted by ejectors, using a small quantity of high-pressure air, which is beneficial in the mixing of the fuel and air for the furnace.

METHODS OF INTRODUCING COAL

In beginning the experiments, the air blast for the combustion of the coal and for smelting was furnished in the regular way under normal operating pressure, and the pulverized coal was introduced directly into the blast before entering the tuyère. It was found that the coal could be introduced rapidly in this way while

the furnace had its regular charge of coke and ore, but when the coke was cut below 50 per cent of normal, it was found that the tuyères became closed, coal dust would lodge in the tuyère pipes, and a certain quantity would find its way into the bustle pipe, causing trouble at any leaky joint, thus rendering conditions around the furnace dangerous. At this time the joints between the furnace jackets and the tuyères were not as tight as they should be, and there was considerable leakage of coal dust. Tuyères of several designs were tried to avoid leakage, and the canvas sleeves on the branch pipes were replaced with 5-in. standard pipes, having flexible joints. Improved results were obtained in this way, and some of the arrangements used are illustrated in Fig. 2. Later on, the coal was introduced into the blast by means of an ejector like that used by T. W. Cavers at the Tennessee Copper Co.

During this stage of the experiments, the main troubles were at the tuyères, which required regular

leading to tuyères that were open. It was therefore agreed that any possibility of explosions could be effectively prevented by arranging check or explosion valves in the bustle pipe itself.

The experiment was then made of introducing the coal between and slightly above the tuyères, by boring a hole through the jacket and connecting to these the coal supply pipe from the ejectors at the screw feeds, thus introducing a dense mixture of coal and air into the furnace independent of the main air supply. This was found to be a clean method, and a test was made over a period of eight days. During this time the coke was reduced from 12 to about 6 per cent, with promising results; the most important and necessary conditions still being that of keeping the tuyères open. It was observed that the small openings (1½-in. pipe) through which the coal was introduced into the furnace required little punching, the main trouble being with the large tuyères; and by observation through the Dibley valve, the combustion and the smelting of the ore in the furnace could be seen. It was then decided to use specially designed furnace jackets at the tuyère level of the furnace. The design finally adopted is shown in Fig. 3.

The jackets, it will be seen, provide means for a more even distribution of the blast, and it was thought that they would give better opportunity for combustion at the entrance to the charge. It was also believed that

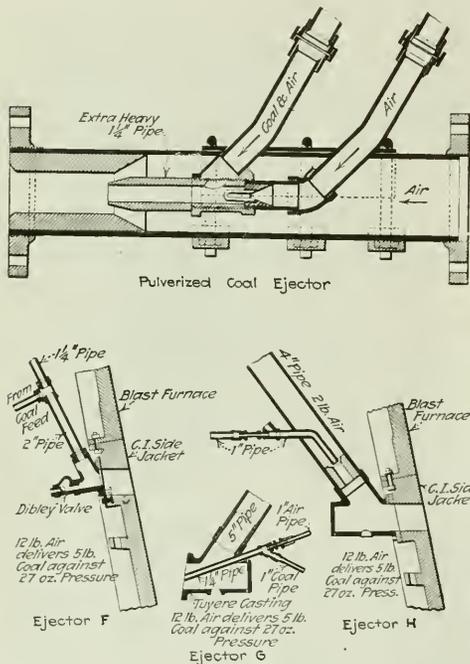

FIG. 2. DETAILS OF VARIOUS EXPEDIENTS TRIED FOR INTRODUCING PULVERIZED COAL INTO BLAST FURNACE TUYERES AT COPPER CLIFF, ONTARIO

punching, and there was some leakage of coal. The coal was applied to only half the tuyères on each side of the furnace, being introduced to alternate tuyères, those on the front of the furnace being staggered with those at the back. Mr. Garred experimented with check or explosion valves, which were placed in the branch pipes. It was found these check valves were not effective except when they were carefully designed and placed in every branch pipe, and this was a complication of apparatus that was not considered desirable. It was then found that if any individual tuyère was choked, the coal was drawn into the bustle pipe by suction and found its way down the branch pipes

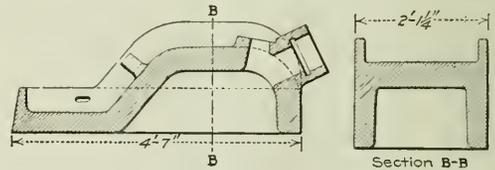

FIG. 3. ONE TYPE OF SPECIAL JACKETS USED

furnace jackets designed on this principle would not be more expensive than those of regular design, as two tuyère castings, with their joints and machine work, would be dispensed with. The furnace is now equipped with some of these jackets, but it is too early to state, definitely, the degree to which they are advantageous.

EXPERIMENTS WITH NARROWED TUYÈRE ZONE

Experiments have been made with a standard blast furnace reduced in width from 52 in. to 36 in. at the tuyère level, with the air blast at various pressures, and melting a variety of furnace charges. Considerable study has also been given to modifying the design of furnaces to obtain ideal conditions in smelting. Fig. 4 illustrates one of these modifications, and jackets of this design are now being tested on the experimental furnace.

To summarize the results of the experiments at Copper Cliff and Copperhill, it can be said that under difficult conditions it has been demonstrated that important economies are possible at many smelting plants by the utilization of pulverized coal, thus replacing a considerable portion of the coke.

It is a foregone conclusion that the characteristics of the charge will have an important bearing on the results obtained. At Tennessee the charge consists of run-of-mine ore and quartz in large pieces, with a high percentage of sulphur, and melting conditions that call for relatively small quantities of fuel. At Copper Cliff,

the ore is comparatively fine, over 74 per cent of the charge coming from the roast beds, from which it is reclaimed and handled two or three times, and the final sulphur content does not much exceed 12 per cent.

There are some blast furnaces operating in conjunction with reverberatory furnaces, under conditions in which the blast-furnace charge is favorable for easy smelting, due to the slags and other byproducts being treated therein. It is generally believed by those conversant with the experiments that successful work at Copper Cliff can assuredly be followed by successful work in a large proportion of the blast furnaces smelting non-ferrous ores elsewhere.

It is often stated that large pieces of incandescent coke are necessary in the charge to support the burden. This may be so under certain conditions, but the experiments indicate that it is not essential in smelting copper-sulphide ores, and it is not believed to be a matter of great moment when treating other non-ferrous ores.

Another point of great importance is the effect of the Garred-Cavers process on the tuyères and the amount

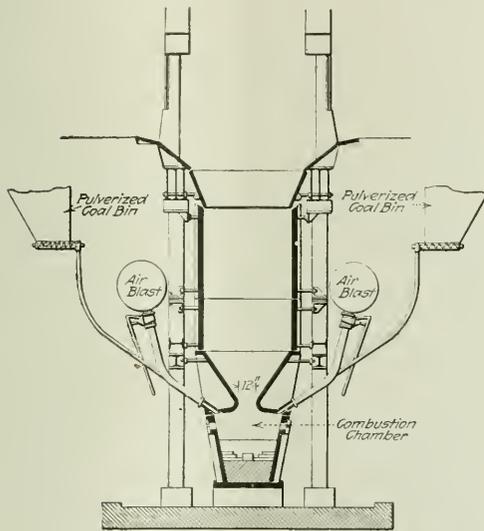

FIG. 4. FURNACE WITH LARGE COMBUSTION CHAMBER

of tuyère punching. Tuyère punching, under normal conditions, entails a good deal of hard labor, and it is our opinion that the conditions in this connection will be greatly improved. The moisture content in the charge may be high without causing trouble; during the experiments several charges of wet fines, the clean-up from storage bins, have been handled.

The most important influence on operating costs is in connection with the fuel utilized, the normal practice being to use coke alone, whereas these experiments show that coke can be replaced, to a large extent, by pulverized coal. The relative costs of coal and coke vary a great deal, but, on the average, coke may be stated to cost twice as much as coal delivered at the smelters.

The cost of preparing pulverized coal will vary considerably, as there are several factors bearing on the matter, among which are labor, power, fuel for drier,

and repairs, in addition to interest and depreciation on buildings and equipment. The power required for crushing, drying, elevating and conveying the pulverized coal will be about 20-hp.-hour per ton of coal handled, and with modern equipment under average conditions, the cost will be about 8c. per ton per hour.

At the International Nickel Co.'s smeltery, the average cost of preparing and delivering the coal to the furnace, in 1913, was as follows:

Labor.....	\$0.15
Power.....	10
Repairs.....	145
Coal for drying.....	055
Total.....	\$0.450

The present costs are abnormal, owing to war conditions, and will undoubtedly be reduced in the near future. They are as follows:

Labor (6 mos.).....	\$0.384
Power (June-Nov., 1918, inc.).....	084
Repairs.....	284
Coal for drying.....	108
Total.....	\$0.860

In this connection it may be stated that the cost of drying is excessive, because the moisture content of the coal averages about 10 per cent, and the amount of labor employed could conveniently prepare a much larger tonnage of coal. The item "repairs" includes all repairs to coal crackers, grinders, conveyors, fans, belting, and like equipment. Four men on an eight-hour shift are all that are necessary to prepare and deliver 100 to 200 tons per day.

The costs in connection with lignite are, of course, greater than with other fuels, due to the large increase in drier costs on account of the moisture. This, to a certain extent, is compensated for in reduced repair cost to pulverizing machinery, as lignite is easily ground. Some of the average operating costs, under recent conditions, are reported as follows:

- Small plants (2 to 5 tons per hour), \$1.20 per ton.
- Medium plants (10 to 15 tons per hour), 75c. per ton.
- Large plants (20 tons and over per hour), 45c. per ton.

The preparation of lignite calls for more attention than that of other fuels, because of the high moisture content, which is frequently in excess of 50 per cent, and on account of the large amount of volatile constituents. It is usual to reduce the moisture to about 6 per cent; to attempt further reduction is to invite trouble in the way of fires and excessive drier costs, and all to no avail, because it will again absorb this much moisture from the atmosphere. Various tests show that lignites lose 2½ per cent of their volatile combustible matter when exposed to a temperature of 284 deg. F. for a period of thirty minutes. Such losses cannot be allowed, and so the drying must be done at lower temperatures, and therefore with increased equipment, recent practice being to arrange the driers in series.

We have prepared a table showing the approximate costs of plants of different capacities:

ESTIMATED COSTS OF PULVERIZED COAL PLANTS			
Daily Capacity in Net Tons per 24 Hours	No. of Mills Required	Total Cost	Building Only
20	1 33 in.	\$34,000	\$5,500
50	1 42 in.	40,700	7,500
100	3 33 in.	49,500	10,700
200	3 42 in.	66,000	12,500
300	2 57 in.	79,200	14,750
400	3 37 in.	92,500	15,300
500	4 57 in.	106,700	16,000
750	5 57 in.	143,000	19,000
1000	7 57 in.	177,000	21,750

These costs are for complete plants, but there should

be added 10 per cent for engineering. They are for January, 1919. The estimates are for construction in the eastern or middle regions of the United States. We also include the distribution of an estimate for a plant of 500 tons per day.

COAL PLANT, CAPACITY 500 NET TONS PER DAY,
OR 333 TONS PER 16 HOURS
Building, 32 Ft. by 120 Ft. Erected

Structural steel	\$10,200

Excavations	1,000
Miscellaneous erection, labor	3,750
Total	\$85,458
For building and machinery, total	\$101,538
Engineering, 10 per cent	10,150
Grand total	\$111,688

GENERAL CONCLUSIONS

The experiments described give a general outline of the work done by Garred and Cavers, and the authors have presented general information obtained to date. The experiments of the Tennessee Copper Co. are continuing, with encouraging results, and at the plant of the International Nickel Co. the most recent work has been to endeavor to operate the furnace entirely without coke, following earlier work where an average of about 50 per cent of the coke had been replaced. The results, with all coke eliminated, have not as yet been satisfactory, but are sufficiently encouraging to warrant continuing the experiments with that object in view.

The processes involving the application of pulverized fuel to blast furnaces have been patented in the United States, Canada, and many foreign countries. The patentees, Garred and Cavers, both were engaged in work connected with the smelting of non-ferrous ores, and both were simultaneously working on practically the same problem, of the combustion of finely divided fuel in a blast furnace. Owing to the magnitude of the problems involved, a consolidation of their interests was effected recently, by the formation of the Garred-Cavers Corporation, New York, which company has acquired the patents issued and pending in connection with this work. It is expected that experiments on the smelting of silver-lead ores will be made in the near future, and there is reason to believe the prospects are good for increasing the efficiency of lead blast-furnace practice.

During the last few years, from twenty to thirty million tons of non-ferrous ores per year have been treated in blast furnaces in the United States, Canada, and Mexico, and it is believed that further developments

of a satisfactory nature in connection with this work will enable a large proportion of these ores to be smelted with considerable economies in fuel.

Right To Surrender Lease

By A. L. H. STREET

Attorney at Law.

Where a lease of mining property specifies its duration as extending over a certain period of years, with provision for the payment of minimum royalties, is the lessee entitled to surrender his rights before expiration of that time and release himself from liability for further royalties, when it appears that the ore has been practically exhausted?

This question was involved in the recent case of Virginia Iron, Coal & Coke Co. vs. Graham et al., 98 *Southeastern Reporter*, 659, decided by the Virginia Supreme Court of Appeals, and was answered in the affirmative.

Plaintiff company held a lease on defendants' lands for 40 years, and less than one-half that period had expired when plaintiff gave notice of a cancellation of the lease on the ground that iron ores could no longer be found in merchantable quality or in quantities which could be profitably mined. Defendants denied right to cancel and indicated that they would seek to hold plaintiff liable for the stipulated minimum royalty.

The contract contained no clause specifically providing a privilege in the lessee to surrender the lease in the contingency stated, although mining leases frequently contain such clause. But the lease did contemplate the shipment from the mine of not less than 20,000 tons of ore annually.

The trial judge dismissed plaintiff-lessee's suit to cancel the lease, but the Supreme Court of Appeals reversed the decree, saying, in part:

"If one makes a contract to do a thing which is in itself possible, he will be liable for a breach of the contract, notwithstanding it is beyond his power to perform it. But where, from the nature of the contract itself it is apparent that the parties contracted on the basis of the continued existence of the substance to which the contract related, a condition is implied that if performance becomes impossible because that substance does not exist, this will and should excuse such performance. . . .

"Applying these principles to the lease here involved, it appears clear that the main purpose of the contract was to mine iron ore, the existence of which in quantities great enough to justify the continuance of mining operations for 40 years was assumed as a fact by both parties, and by its express language the lessor was to receive 50c. per long ton as compensation, 'for each ton of good merchantable ore mined and shipped.' The subject and substance of the contract is merchantable iron ore, to be mined and shipped, and the obligation to pay therefor, or to pay such royalty on the minimum quantity which both parties assumed could be so produced. . . . It is manifest, then, that if the facts alleged in the bill can be proved, and the ore does not exist, the lessee should be relieved of its obligation to pay the royalty provided for in the lease, because the paramount consideration of the contract has failed, and performance thereof by the lessee has become impossible."

Chicago Meeting of the A. I. M. E.

C. M. Schwab Will Speak—One Hundred and Fifty Papers To Be Presented—Trips to Whiting And East Chicago

CHARLES M. SCHWAB will be a speaker at the banquet of the American Institute of Mining & Metallurgical Engineers to be held in Chicago, Sept. 22 to 26 inclusive. Elaborate plans for both the technical and social side of the meeting have been perfected. Engineers who make the trip to Chicago for this occasion are assured of a most interesting annual meeting. In addition to about 150 papers which have been prepared for the sessions, trips to the zinc-smelting districts, the steel works at Gary and the refineries at Whiting and East Chicago are included. A boat trip on the lake, together with numerous social events, has been arranged for the ladies. The Fifth Annual Exposition of the Chemical Industries will be held in Chicago at the same time as the meeting, and members of the Institute are cordially invited to attend the exposition and become better acquainted with the allied industries.

South African Mint Proposed

The establishment of a South Africa mint at Johannesburg is authorized in a bill that was read a third time in the Union House of Assembly on June 19. It is intended to mint the gold produced annually by the country, which some anticipate will result in a considerable saving to the mining industry.

"It now seems fairly assured," says Samuel Montagu & Co., of London, "that a government mint will be set up in the Transvaal, probably at Johannesburg. The Dominion of South Africa will follow the example of Australia, Canada, and India.

"The British sovereign has enjoyed universal popularity. It has commanded, and does still command, a premium in certain places over gold, coined or otherwise. If the whole output from the Transvaal be minted (instead of only a part, as heretofore) the British sovereign is likely to be still more conspicuous throughout the world, although shortage of gold bullion, consequent upon such increased mintage, would probably impel a considerable quantity of the new coin into the melting pot, after a brief and barren lease of life."

Conditions in the Callao District of Venezuela

By C. F. Z. CARACRISTI
Caracas, Venezuela

The properties of Lo Increible Gold Mining Co. in the Callao district of Venezuela are reported to be under option to an American syndicate for, it is said, \$2,000,000. The adverse climatic conditions of the Callao region must delay development on a large scale until an effort is made to improve sanitary conditions. Besides, labor is scarce and supplies are high. Labor from the island of Trinidad is used at the mines, but this is permitted by the government as a matter of courtesy, as the law provides that two-thirds of all manual labor must be native. The native labor of the region that devotes its time to mining usually prefers to work streams or placer deposits on its own account, thus earning more money. These placer deposits, while sometimes rich, are small and scattered and cannot form the basis of

organized mining. However, the region is rich in low-grade ores (\$4 to \$7 in value) that will be worked whenever the labor and sanitation problems are solved.

Recovering Manganese From Ores of the Cuyuna Range by the Jones Process

During the war, every effort was made in this country to bring the manganese production to the highest possible figure, but it was not considered economically feasible to extract this metal from the manganese iron ores of the Cuyuna Range and elsewhere, where the association of the manganese and iron is so intimate that ordinary methods of gravity or magnetic separation are impracticable. John T. Jones, however, devised a direct reduction process applicable to these ores, on which considerable laboratory work was done at the Minneapolis Experiment Station of the Bureau of Mines, the results having recently been published.

The original ore assayed Fe, 40 per cent; Mn, 13; SiO₂, 10. The process consists in first crushing the ore to pass 10 mesh, then mixing with about 20 per cent of coal, and heating in a crucible for one-half hour to two hours at 1,250°C. This produces a metal containing approximately 94 per cent Fe and 1 per cent Mn, and, after the addition of lime, a slag assaying Fe, 5 per cent; Mn, 29; SiO₂, 31. The slag is then crushed to 30 mesh, mixed with lime and 25 per cent of coke, and heated in a graphite crucible at 1,450°C. The metal produced is essentially a silico-ferro-manganese assaying Fe, 15 per cent; Mn, 60 to 67; Si, 10 to 25. The manganese recovery is about 72 per cent.

The metal produced in the first stage is suitable for conversion into steel by any basic steel process. The manganese product obtained in the second stage would be new to the steel industry, but it is believed that it could be used to advantage. The laboratory work demonstrated only that the process is metallurgically possible.

Foreign Trade in Copper

Exports of copper from the United States in June, 1919, and for the first six months of the year are reported by the Department of Commerce as follows:

	June, 1919	Jan.-June, 1919
	Pounds	Pounds
Ore and concentrates, etc., contents.....	2,100	488,346
Unrefined, in bars, pigs, etc.....	970	270,421
Refined, bars, etc.....	24,250,659	177,079,491
Old and scrap.....	725	408,468
Plates and sheets.....	514,136	10,466,234
Pipes and tubes.....	536,422	3,077,017
Wire, except insulated.....	4,766,354	33,292,139
Composition metal, copper chief value.....	10,175	295,091

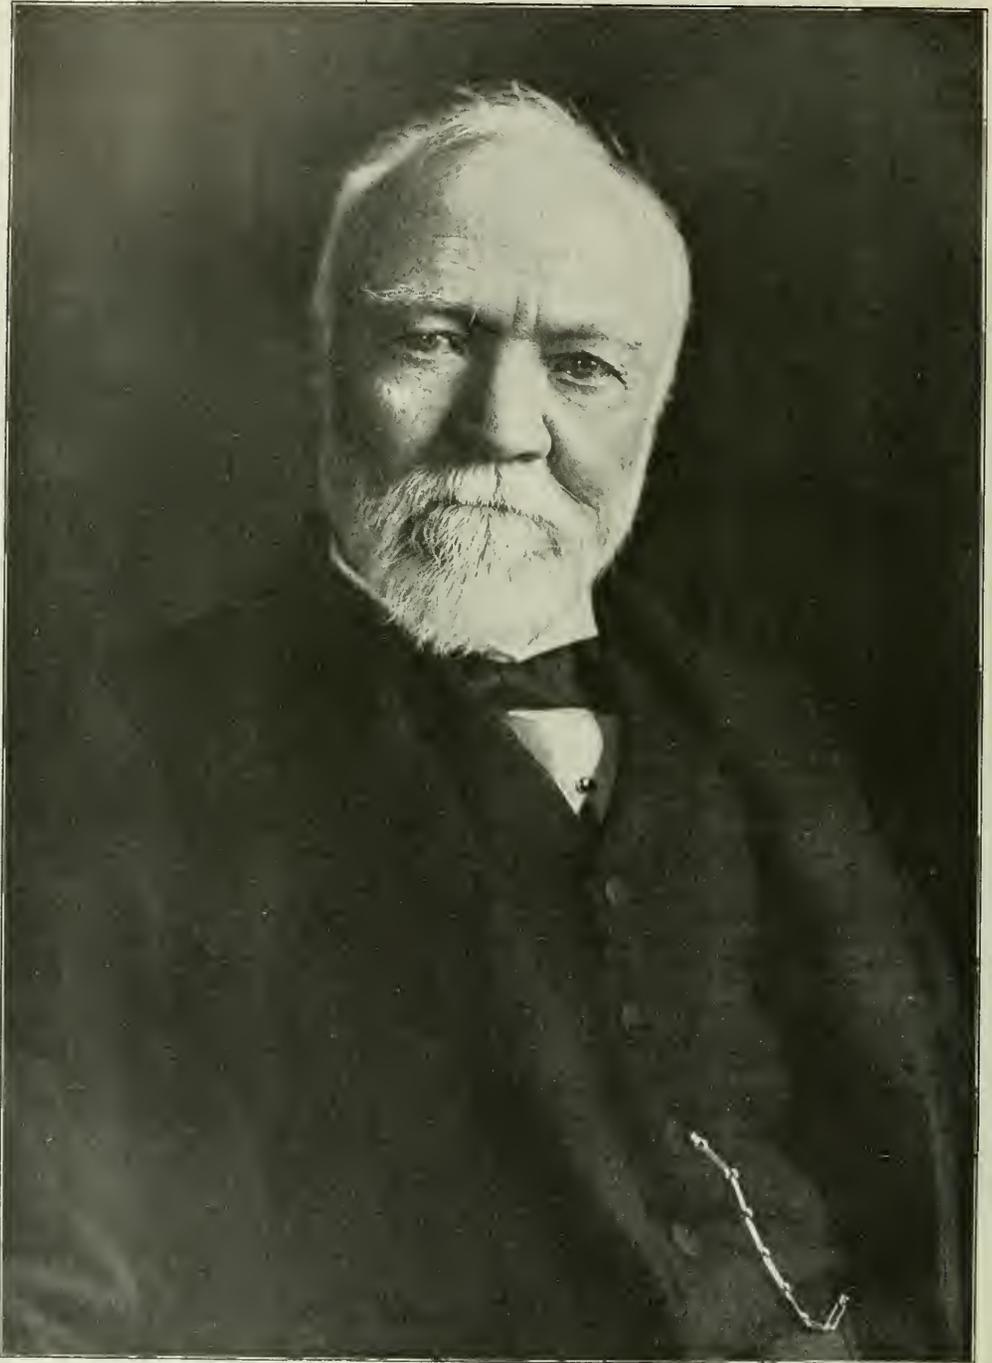

The weight of ore exported in June was 35 long tons.

Imports of copper in June and the first six months were:

	June, 1919	Jan.-June, 1919
	Pounds	Pounds
Ore and concentrates, contents.....	6,545,343	39,927,888
Matte and regulus, etc.....	2,985,286	21,220,525
Unrefined, in bars, pigs, etc.....	19,842,478	146,620,976
Refined, in bars, etc.....	3,721,956	11,032,460
Old, etc., for remanufacture.....	2,110,034	4,890,264
Composition metal, copper chief value.....		19,400

Ore imported in June amounted to 20,460 long tons; concentrates, 11,215; matte and regulus, 2,186 long tons.

ANDREW CARNEGIE

Andrew Carnegie

WHEN Andrew Carnegie came to America, at the age of thirteen, and began working as a bobbin boy in a weaving industry at \$1.20 a week, he little thought, and still less did the world think, that he was destined to become the American steel magnate. And yet his progress was logical. Too ambitious to be a bobbin boy, he resigned to become a telegraph messenger; and too ambitious for this work, he made the most of his opportunity for learning telegraphy. The next step, of course, was to become an operator, a position which he secured with the Pennsylvania RR. Then came a wreck. The division superintendent could not be found. The circumstance created an opportunity for Carnegie to assume responsibility, and he showed a willingness and ability to do things which was characteristic throughout his life. He sent orders to the various superintendents, and signed them with his superior's name, which quickly cleared the situation. He carried the message to Garcia, without even being told to carry it.

Mr. Carnegie's ability recognized, he was quickly promoted to higher positions. It was in England, after the Civil War, while selling Pennsylvania RR. bonds that he obtained the idea which led him from railroad-ing into the steel business. He observed that the English railways were discarding iron rails for steel. Investigation of the subject impressed him with the possibilities of this change in railroad practice, and on his return to America he organized the firm of Carnegie, McCandless & Co. This company purchased a large tract near Pittsburgh, and it was here that a large bessemer steel plant was erected under the name of the Edgar Thomson Steel Works.

Carnegie never pretended to be a practical master of the iron and steel trade. His place was "to look after the advertising and drive the band wagon." Important work, too, for band wagons must be driven properly. The new method of steel manufacture thrived and Carnegie saw to it that the company, in which he gradually acquired a controlling interest, maintained its supremacy. By 1891 he had become absolute master of steel. For the next ten years he was actively engaged in the industry, eventually selling out his interests to the United States Steel Corporation in 1901 for \$460,000,000, the greatest transaction of the kind ever recorded. With this event, Carnegie ended his active participation in business at the age of sixty-six years.

Mr. Carnegie's business acumen was well typified by the class of men whom he attracted to his employ. He was quick to judge a man and had a particular preference for eager young men who had radical ideas. To such as proved their ability, he afforded every facility for rapid promotion. His was a business in the making—it was not fettered by traditions—and new discoveries and improvements were constantly being evolved. For such an industry, men who were impatient for progress were required, and to these Carnegie looked to fill his organization.

Carnegie was a successful business man, but he was much more. During his declining years he escaped to a considerable degree the criticism which has been directed against American millionaires, and deservedly. He worked hard to accumulate his great wealth, but he also spent a great deal of time in an endeavor to "die poor." He realized that thoughtless charity did more harm than none at all, and it was no small problem to expend half a billion dollars to the best advantage. He once stated: "I never give a cent to a beggar; nor do I help people of whose record I am ignorant. This, at least, is one of my really good actions." Deprived of the opportunities of education himself, he realized its value in the upbuilding of the commonwealth, and a large proportion of his benefactions went into educational work. Six highly endowed foundations owe their existence and maintenance to his philanthropy, and he made numerous gifts to universities and to negro educational institutions. Carnegie libraries are found even in the Fiji Islands.

In religion Carnegie was an agnostic, a student of Herbert Spencer, and it is noteworthy that he never gave money for the support of a church, believing the highest good would not come of this form of giving. He did, however, contribute over \$6,000,000 to the purchase of church organs. The engineering profession had a great friend in Mr. Carnegie, and several years ago he financed the United Engineering Societies Building on West 39th St., New York City, at a cost of \$1,500,000. This building is the headquarters of five separate organizations of engineers.

Carnegie probably took more interest in peace propaganda than in any of his other public activities. Some remarks made in 1907 will throw an interesting light on his attitude in these matters:

"Not so long ago a speaker recited in my hearing how he had seen the most powerful naval vessel in the world—the 'Dreadnought'—with her 18,000 tons displacement. When my turn came I said that I must regret to dispute the statement. I, myself, had seen the most powerful naval vessel in the world. She was a tiny, yacht-like vessel, painted a beautiful white, with a flag at her masthead and a toy cannon on her deck—for use in firing salutes, mostly.

"Such dainty vessels as these serve to maintain the neutrality of the North American Great Lakes. The little white yacht was the true dreadnought. The name of the other, the vast, gloomy and terrible engine, should be 'Dreadeverything'—dread wounds, dread shot, dread drowning, dread savagery, hellish passions, dread miserable, tortured, fruitless death."

The late war was a heavy blow to Mr. Carnegie, as it shattered one of his greatest dreams. Nevertheless, when America entered the conflict he proved he was a true American in thought and deed.

Carnegie's life may well be an inspiration to the plodding American, but it may also be a model for the retired millionaire. The acquisition of the good things of life is no more a problem than their proper dispensation.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Suspension of Assessment Work

Without amendment, the Senate, on Aug. 7, passed the bill providing for the suspension of annual assessment work on certain mining claims during 1919. The bill already had passed the House and now goes to the President for signature.

Perfunctory objection to the limitation of the suspension to five claims was voiced by Senator King, of Utah, who foresees "very grave difficulties arising from the attempt to secure the benefit of this bill limited to only five claims, where they may be a group of claims." Senator Smith, of Arizona, in addressing himself to the bill, said: "I cannot help protesting against this relief, which comes under the guise of helping the poor, but which gives a great deal of comfort to those who easily could afford to do their assessment work. The whole assessment work proposition is wrong. There are some who hold title who are digging ten feet of soft ground anywhere on the surface of the claim in order to keep the title perfect."

Senator Thomas, of Colorado, predicted that the suspension would be demanded and passed again for 1920, and in his discussion of the matter brought out some interesting points, as follows:

If this joint resolution passes at all it should retain this limitation, in my judgment.

The act of 1872, under which practically all mining locations have been made, as an evidence of good faith required the bona fide expenditure upon every mining claim prior to patent of not less than \$100. The operation of that requirement has been, I think, beneficial. No limitation is placed by the law upon the number of claims which a citizen may locate, and in many sections of my state, and I have no doubt in others, that privilege has been taken advantage of by the location of a large number of claims held either for speculative purposes or upon the contingency of some development in the neighborhood proving valuable, and thereby making the groups valuable. That practice has interfered, I will not say frequently, but occasionally, with the bona fide development of mining property by holding out of the public domain premises which many citizens would like to exploit; but they were unable to do so because of these pre-existing locations.

I do not believe in suspending such a requirement in the absence of extraordinary conditions, and not then unless the necessity for it is overwhelming. This provision of the law was very severely criticized in the West in the elections of 1872. It was inserted in the bill at the instance of the then Delegate to Congress from Colorado, afterward United States Senator, Jerome B. Chaffee. He was a candidate that year for re-election upon the Republican ticket, and a very vigorous fight was waged against him because of what was dubbed in the campaign the Chaffee requirement of the expenditure of \$100 upon these claims prior to patent. Mr. Chaffee's answer seemed to me to be conclusive, as it certainly was to the people of the territory, who returned him by an increased majority to Congress. It was that the privilege of unlimited location ought to carry with it a sense of obligation to the Government; that the man who would locate a claim and then be unwilling to spend \$100 upon it did not appeal very strongly to him as a bona fide locator. He also called attention to the fact that this annual expenditure can be terminated at any time by securing patent for the claim, and patent can be se-

cured, the law having been complied with otherwise, upon the expenditure of at least \$500 in the improvement of the claim. So that those who do not like to pay this assessment can easily terminate it by applying for and securing patents; and, of course, the receiver's receipt, being the entry or the equivalent of a patent, suspends the work as soon as the money is paid to the Government for the claim.

The panic of 1893 struck the Western mining interests very hard. During the summer of that year the Indian mints suspended the coinage of the rupee, and the subsequent business disaster to the world is of too recent occurrence for me to do more than refer to it.

Congress during that year by special act suspended the operation of this law, relieving the holders of mining claims in the West from the necessity of making this expenditure. With that exception, I think no suspension was made, although it may have been asked for, until last year and the year before, when, owing to the pendency of the European war, the operation of this requirement was again suspended.

One great drawback to the suspension of these requirements is that once it is done it operates as a precedent, and those having the benefit of the suspension want its continuance, somewhat analogous to a man who, once having ridden upon an annual pass, never pays his fare without a sense of injustice. We are about to get into the habit, in other words, of suspending this requirement, and it is not good for the mining industry. If a man has a claim worth anything, he ought to be willing to pay \$100 every year or patent it; and until he patents it there should be some overweighing reason why the law itself should be suspended. I predict that if the joint resolution becomes a law, as it probably will, it having passed the House, we will repeat it next year. The high cost of living, the general turbulent conditions, and the scarcity of labor will all appeal to those who desire its suspension, and they will appeal to Congress.

Before reporting the bill providing for the suspension of assessment work on mining claims, the Committee on Mines and Mining of the Senate was inclined to insist on an amendment specifying that its provisions apply to Alaska. To avoid the delays of a conference, it was desirable to report the bill exactly as it passed the House, and Senator Henderson was assigned to make a study of the statutes involved, to see if the House bill would include Alaska. He was able to establish that the bill will apply to Alaska without specifically mentioning that territory.

A copy of the discussion of the proposed suspension of assessment work on mining claims for 1919 may be secured gratis on application to Paul Wooton, Union Trust Building, Washington, D. C., our special correspondent.

War-Minerals Relief

Senator Henderson's bill proposing to liberalize the War-Minerals Relief Act has received tentative consideration by the Committee on Mines and Mining. Before undertaking any extensive discussions of the measure, however, it was referred to the Secretary of the Interior for a report. While the Secretary has not formulated his reply at this writing, the feeling is manifested in the department that the War-Minerals Relief

Act should not extend beyond those who were solicited directly by Government agencies in the matter of producing war minerals. If some liberality of action is allowed in the interpretation of just what constitutes a direct request or demand, it is believed that the moral obligation of the Government will have been discharged. The idea is held by some at least that a very dangerous precedent would be set if any claim is allowed where there has not been direct contact between the claimant and representatives of a Government agency. Otherwise, producers of foodstuff and of a wide range of commodities would have the same moral claim against the Government.

Attention is called to the fact that with very few exceptions the Government was not consulted in any way as to expenditures. The natural tendency, it is argued, if a producer felt that he was entering into an informal contract with the Government, would have been to make some little inquiry at least before expending thousands of dollars.

There is some discussion as to the advisability of introducing a bill in Congress providing for the prorating of the payment of war-minerals claims. Of course such legislation would not be necessary unless the law is liberalized, as, under the Attorney General's decision, there will be ample funds to pay such of the claims as may comply with his interpretation of the act.

The War-Minerals Relief Commission expects to return to Washington by Sept. 1. In order to expedite the hearings, each of the commissioners has been conducting separate conferences with producers in the West. The members of the commission, however, were to reunite in Salt Lake City on Aug. 11, for a hearing at that place. The entire commission will sit at the hearing in Denver on Aug. 18. It had been hoped to have another hearing at Minneapolis for the Minnesota claims, but it has been found necessary to have claimants from that state appear in Denver or in Washington after the return of the commission.

Basing Point for Steel

The Federal Trade Commission has announced its intention to attempt the solution of the admittedly difficult question involved in the selling of steel on a basing-point basis. The matter was precipitated by an application of the Western Association of Rolled Steel Consumers to do away with the practice of selling rolled steel on a Pittsburgh basing-point basis. The association alleges that the present practice is repugnant to the Federal Trade Act and to the Clayton Act. Judge Gary, of the United States Steel Corporation, characterizes this action as "the biggest lawsuit ever tried in this country."

The commission, analyzing the complaint, says in part:

The applicant submits that the normal, reasonable price for rolled steel should be measured by cost of production with addition of reasonable profit and without addition of a large and arbitrary increase which forms no part of the production cost and is over and above such reasonable profit. The applicants declare that despite the fact that steel is made more cheaply at Gary, the complainants are compelled to pay a set price plus a freight rate of \$5.40 per ton from Chicago to Gary, although, in fact, the steel is not actually shipped from Pittsburgh at all.

The question raised by the applicant may not be the only question involved in this matter, and the remedy suggested by the applicant, namely, to make Chicago a basing point,

may not be the only remedy, or the appropriate remedy, even in the event that the applicant's contention is found to be valid. In other words, the whole question of the practice of having basing points for making rolled-steel prices may be involved, as well as the question whether Pittsburgh, or some other place, should be the sole basing point, or whether there should be more than one basing point.

Zinc Tariff Bill Reported

After having listened to producers and others concerned, and after thorough discussion among its members, the Committee on Ways and Means has recommended to the House of Representatives the re-enactment of the zinc schedule contained in the tariff act of 1909. As proposed by the committee, the duty would be as follows:

Zinc-bearing ore of all kinds, including calamine containing less than 10 per cent of zinc, shall be admitted free of duty; containing 10 per cent or more of zinc and less than 20 per cent, 1c. per lb. on the zinc contained therein; containing 20 per cent or more of zinc and less than 25 per cent, 1c. per lb. on the zinc contained therein; containing 25 per cent of zinc or more, 1c. per lb. on the zinc contained therein.

Zinc in blocks or pigs, and zinc dust, 1½c. per lb.; in sheets, 1½c. per lb.; in sheets coated or plated with nickel or other metal, or solutions, 1½c. per lb.; old and worn-out, fit only to be remanufactured, 1c. per lb.

Tariff on Laboratory Apparatus

Without a record vote, the House of Representatives on Aug. 2 passed the bill imposing a tariff on laboratory glassware, laboratory porcelain ware, optical glass, and scientific and surgical instruments, after ineffectual efforts were made to amend the bill reducing amounts of duty. The bill came in for an unusual amount of discussion on account of the fact that it gave the first opportunity for extended discussion of tariff matters. The principal opposition to the bill was based on the allegation that the increase in duty would cost the students of the country \$12.23 each. The arguments for the measure were overwhelming, in view of the fact that Japanese products already are on the American market in large quantities, produced at a rate far below costs in this country, a fact attributable largely to the higher wage paid to American labor.

Potash Restrictions Removed

The bars were let down to German potash when the War Trade Board Section of the State Department on Aug. 7 amended the General Enemy Trade License to that effect. German potash now may be brought into the country without individual import licenses, but potash from Hungary and those parts of Russia under Bolshevik control is still prohibited, if it was produced in Germany.

Before the action was taken, the board gave consideration to arguments presented by the producers of domestic potash and also to those presented by the representatives of organizations of farmers. The latter were insistent that all restrictions on the importation of German potash be removed.

The Committee on Mines and Mining of the Senate has referred Senator Henderson's bill providing \$140,000 for an oil-shale investigation to the Secretary of the Interior for a report on the advisability of such an investigation.

Mine Taxation

Special Meeting To Be Held at the Annual Convention at Chicago To Consider Plan Outlined By Internal Revenue Bureau

A SPECIAL session of the American Institute of Mining and Metallurgical Engineers will be held at the Chicago meeting on Monday, Sept. 22, at 11 a. m., for the purpose of discussing mine taxation. It appears that there exists a feeling on the part of many mining companies that the Internal Revenue Bureau regards them with suspicion, and is likely to follow a narrow-minded, arbitrary and exacting policy, which it will apply in an arrogant fashion. Such a feeling is not conducive to the simplest and easiest administration of the tax problem. To administer the present heavy taxes in a fair and businesslike way is a big job, and incapable of accomplishment unless there exists between the principal classes of taxpayers and the Government a reasonably good feeling of understanding and co-operation.

The program of mine taxation is now in a critical and formative stage. Those who are trying to solve the problem need advice and assistance from engineers and mine owners the country over. The Internal Revenue Bureau desires to place the problem clearly before those who are interested. At the special session on Sept. 22, L. C. Graton, representing the Internal Revenue Bureau in connection with a study of mine valuation under the income-tax law, will present an outline setting forth tentative proposals as to the proper methods of solving the problem of mine taxation. It is hoped that this presentation will result in a full discussion of the matter, both at the time of its presentation and later by contributions and correspondence. Members who are interested in mine taxation are urged to attend this special session.

Earnings of Porphyries Increase

Utah Copper, However, the Only One To Earn Its Dividend in Second Quarter—Continued Improvement Expected

ALTHOUGH all earnings improved over the first quarter, the Utah Copper Co. was the only one of the four big porphyries under control of the Jackling interests to earn its dividends in the second quarter of the current year. At present, the companies are paying the following dividends per quarter: Utah Copper, \$1.50; Nevada Consolidated, \$0.375; Ray Consolidated, \$0.50; and Chino, \$0.75. During the last quarter they earned, respectively, \$1.63, \$0.09, \$0.20, and \$0.42. At present selling prices (Aug. 8) the second-quarter figures show that the stocks are earning as follows; Utah, 7.6 per cent; Nevada Con., 1.9 per cent; Ray Con., 3.3 per cent; Chino, 3.8 per cent.

Production of the Utah Copper Co. amounted to 27,523,600 lb., a slight decrease from the first quarter. The average cost of this output, excluding Federal tax deductions and credit for gold and silver, was 11.59c., as against 13.72c. in the first quarter.

Nevada Consolidated produced 11,149,362 lb., also a slight decrease from the first quarter. The average cost was 18.07c., compared with 16.85c. in the first quarter of the year.

Ray Consolidated shows a production of 11,306,118 lb. at a cost of 14.64c. In the first quarter there was produced 12,291,381 lb. at a cost of 15.15c.

Chino's output amounted to 10,541,471 lb. at a cost of 14.16c. per lb., compared with 15.03c. in the first quarter on a production about 10 per cent greater.

Nevada Consolidated is therefore the only one of the companies whose costs have not been lowered. Considerable improvement is shown by all of the companies in the matter of profits, Utah Copper being the only one which was able to show a surplus available for dividends in the first quarter. The report predicts increased foreign and domestic demand, and a continued improvement in the position of these companies may be expected.

Bunker Hill & Sullivan Mining & Concentrating Co.

Detailed Information Respecting Mining and Concentrating Costs—Ore Reserves Increase—Kellogg Smeltery in Continuous Operation

OPERATIONS at Kellogg, Idaho, were continued on a reduced scale during the year ended Dec. 31, 1918, on account of labor shortage. Earnings were also slightly reduced, the balance carried to surplus account being \$1,631,242, compared with \$1,891,580 for the previous year. Dividends paid on the 327,000 shares amounted to \$1,553,250. The company is practically a close corporation, but is unusually liberal in publishing costs and operating data. The report which has just been issued gives complete and detailed mining and concentrating costs, covering about twelve pages. No smelting costs are included, due, no doubt, to the fact that the smeltery handles a considerable amount of custom ore. Also, no mention is made of the agreement with the A. S. & R. Co. whereby it is understood one-half of the Bunker Hill product may be smelted at Kellogg. A total of 387,027 tons of ore was mined and milled during the year and 84,170 tons of middling and concentrate was made and shipped to the Tacoma smeltery. The mill feed averaged 10.65 per cent lead and 4.32 oz. silver per ton, the concentrates assaying 45 per cent lead and 16 oz. silver. The ore blocked out in tons at the end of 1917 and 1918 in the various mines was as shown in the following table:

ORE IN BUNKER HILL & SULLIVAN MINES

	1917	1918
Stemwinder mine	25,170	16,434
Sullivan mine	157,045	135,429
Bunker Hill mine	3,275,204	4,210,111
Total	3,457,419	4,362,024

A significant item in the concentrating costs which has not appeared in preceding reports is that of \$23,076 for royalty to Minerals Separation. This amounts to 5.9c. per ton of total ore milled.

It is expected to have the smeltery construction practically finished this year. Experimental work is now being done on the production of copper, which metal is contained in considerable quantities in matte from the smeltery.

The Golden Cycle Custom Mill at Colorado City, Col., is said to be the largest mill in the world treating gold ores by a combination of roasting and cyaniding. Most of the Cripple Creek high-grade ores and concentrates are shipped to this mill.

Pyrites Mining at Mineral, Va.

SPECIAL CORRESPONDENCE

Pyrites mining at Mineral, Louisa County, Va., the principal mining activity of the district, has fallen off considerably since the armistice was signed. Mines having wide deposits, however, are still pushing work and making the most of the present market. The Sulphur Mining & Railroad Co., producing pyrites, is one of the oldest and largest in the district and is still producing at the rate of 100 to 125 tons of concentrates daily. Little development work is being done, most of the work consisting of recovering ore from old pillars and levels. The orebody has been worked to about 600-ft. depth.

The Arminius Chemical Co.'s mines are now operated by the Grasselli Chemical Co., which is pushing development. The main working shaft was destroyed by a cave-in in 1916, and only the 200 and 400 levels have been worked since then. A new 60-degree inclined shaft is being sunk in the foot wall and is down 750 ft. It was recently connected with the old workings on the 700 level, and ore is now being hoisted from it. The mine is being dewatered as the shaft progresses. The orebodies were opened to the 1,200 level in former times, and show no signs of diminishing, averaging 30 to 50 ft. in width.

The Boyd-Smith property, now owned by the Du Ponts, has been closed down, although there is a good showing of ore at depth. The lenses do not lie with regularity, as in the other properties of the district, and considerable underground prospecting must be done as development proceeds.

The Armour's began development of the Julia property in 1917, and found an orebody about 1,000 ft. long, but rather low in grade, and mined it to a depth of 150 to 250 ft. They erected a mill of 100-ton daily capacity, and during the war maintained a considerable production, but at present the mine is closed down and the equipment is being disposed of. The same interests also did considerable work on the adjoining property, known as the Kent, but never tried to make a producer of it, although some very good showings were found by a shaft sunk below the Iron Cap.

The labor situation has improved since the demand for men from nearby cantonments and shipyards ceased. Only local labor was used until last year, when Government competition forced operators to bring in men from outside, most of whom are still in the district. The Dolan gold mine, near Mineral, has been taken over by New York capital.

Chile Copper Co. Quarterly Report

Chile's report covering the first quarter of 1919 has only recently been published. On account of the condition of the copper market, operations have been curtailed to approximately a 50 per cent basis, the production for the quarter averaging a little over five million pounds per month. An average of 216,000 tons of ore per month, containing 1.57 per cent copper, was treated. The copper in stock increased considerably, only four million pounds being sold during the quarter out of a production of over fifteen million pounds. On this account, this and future reports will base the cost of copper on the number of pounds produced rather than on the amount sold, as has heretofore been the custom,

the copper on hand being inventoried at the cost price.

For the first quarter, the cost of producing copper, including depreciation and general expense, but excluding the cost of delivering and selling, excess profits tax, obsolescence, depletion of ore reserves, interest and amortization of bond discount, was 15.25 cents per pound, compared with 13.15 cents per pound for the last quarter of 1918. As the average price realized for copper during the quarter was 18.72 cents, the net profit on copper delivered showed a loss of \$74,276. Adding to this the accrued bond interest of the Chile Copper Co. and also taking account of other minor charges and credits, a loss of \$660,770 is shown for the quarter.

On account of the recent rise in the price of copper, the operations for the second quarter should show an improvement. With the new world price level in force, however, it is extremely unlikely that the company will ever be able to deliver copper in New York for six cents a pound, as originally proposed.

Cerro Gordo Mines Co.

The annual report of the Cerro Gordo Mines Co. for the year ended Dec. 31, 1918, shows that 2,166 tons of silver-lead ore, valued at \$70,528; 619 tons zinc ore, valued at \$10,128; and 9,389 tons of slag, valued at \$37,071, were produced during the year. Actual operations indicate a deficit of \$26,481, which was partly owing to the fact that 4,602 ft. of new development was accomplished at a cost of \$58,155. The sum of \$91,694 was charged off for depreciation and depletion.

During the previous year, the Jefferson orebody was cut off by a fault near the 900-ft. level, and although over 500 ft. of exploration work has been done, the faulted segment was not discovered. As the width of the brecciation is over 250 ft., it was decided to abandon operations in this part of the mine. The lower-grade ore deposits have until recently remained unexploited, but arrangements have been made to mine these ores under lease to H. R. Layng and associates, the lessees agreeing to erect a milling plant.

International Nickel Earns 2c a Share

Net earnings of the International Nickel Co. for the quarter ended June 30 showed a decline of \$2,825,651 from the corresponding period of 1918, and amounted to \$1,012,855. To this amount income from other sources was added, bringing the total to \$1,032,454.

Administration and general expenses aggregated \$129,612 and depreciation and mineral exhaustion \$486,294. After United States and foreign taxes were written off, profits were \$174,929, equivalent, after the payment of a preferred dividend of \$133,689, to 2c. a share, compared with \$1.02 a share in the same period of 1918. As no dividend was paid on the common stock, the balance carried forward was \$41,240. It is understood that the market for the company's products is improving.

Flotation of the Sulpho-Telluride Gold Ores of Cripple Creek is accomplished under difficulties, owing to the excessive amount of colloidal, clayey matter or primary slime present. To counteract the effect of this to some extent the impellers of the Minerals Separation machines are run at the high speed of 2,000 peripheral ft. per min. A mixture of 0.5 gal. Florence fuel oil and 0.11 gal. G. N. S. No. 8 is used per ton of ore.

BY THE WAY

Underground in New York

Another link between New York and Brooklyn was completed recently when the headings met in the new tunnel that runs from 14th St., Manhattan, to North 7th St., Williamsburg. The tunnel has been built by Booth & Flinn, Ltd., for \$6,639,000. It is 7,089 ft. long, 3,000 of which is under the East River. There are two separate tubes. The remaining bore will be holed through soon.

Miners Paid in Butter

Sixty thousand laborers in the Ruhr district of Germany have declared that they are willing to work overtime to produce sufficient coal to enable them to compensate Denmark for butter, according to a consular report. A part of the butter is to be divided among the laborers who do overtime work. In some of these mines the so-called butter divisions already work twelve hours out of the twenty-four, instead of eight, as formerly.

Oil for Foolish Virgins

The advertisement of a certain Western broker, who is dealing in oil stocks, is undoubtedly meant to catch the eye of the fair bargain hunter. "Oil Stock à la Department Store," it proclaims. "Monday being the favorite day for the department stores to startle you with 'bargains,' we decided just for once to copy their methods. As the department stores tell you sometimes that quantities are limited and that you must 'shop early' to get the plums, so do I tell you the same thing. Naturally, all the offers are subject to prior sale, and I think you had better wire." Then follows a list of bargains "for Monday only."

Metric and Poetic

"Uneeda Meter-Liter-Gram." The World Trade Club, of San Francisco, says so, and so does Henry Ford. This clinches the matter. The club, representing over 500 of San Francisco's leading manufacturing merchants, has begun its campaign for world-wide adoption of the metric units of measurement. Another of the club's slogans is "Get the Thing Done," and still another "Our Weights and Measures Made in Germany." The club argues that the weights and measures now used by Great Britain and the United States were forced upon England by the Hanseatic League centuries ago. It looked as if the club would have uphill work until Mr. Ford lent his assistance. The metric Ford taking Socony in liters will indeed be a subject fit for poets.

Lake Superior District's Importance

"The importance of the mining industry of the Lake Superior district," says Albert H. Fay, mining engineer in charge of statistics of the U. S. Bureau of Mines, "is evidenced by the fact that in 1917 there was employed in this district 29 per cent of the men in the metal mining industry of the United States. In 1916, the Lake Superior district employed 27 per cent. The Lake district produces 81 per cent of the iron ore of the United States, and employs 72 per cent of the men engaged in iron mining. The Upper Peninsula produces

27 per cent of the copper of the United States and employs about 25 per cent of the men engaged in copper mining. The total number of men employed in the Lake Superior district in 1917 was 42,500, and in 1916 the number was 41,840, as compared with about 200,000 employed in the metal mines of the United States."

Within the Law?

In a certain section of Cuba an engineer was endeavoring to obtain data sufficient for the rendering of an advisory report for a client who had stated, in a positive manner, though possibly in a Pickwickian sense, that he had in mind a straight development proposition among just a few friends and not any stock-peddling business at all. In the course of trips over an extended territory, accompanied by a guide best described as a smooth fixer from the south of Spain, it was noticed that in the description of claim boundaries in the denouncement papers Victor had adhered largely to the form "for the point of reference, an excavation commenced in that neighborhood; thence so many meters to the point of departure, etc." In order to get an idea of the relation of the boundaries to some scattered croppings of gossan, it seemed rather desirable to learn just exactly what excavation was referred to. So Señor de la Santissima Trinidad was asked to elucidate. The request provoked a flood of Andaluz meriment, the explanation being more or less as follows: "There is no excavation. That is what makes these claims more valuable, since they are so conveniently elastic. You see, Don Caramelo Rapadura is so busy that he leave all those things to his cousin; and Don Trompeta is so busy he tell me to go ahead and fix it. We have a good friend in the Montes y Minas office, who is so foolishly honest that I would not dare offer a bribe to him. Only, I say if he orders the survey too soon, people will suspect that he is get some money. Ha! ha! Ho! ho! Excuse me to laugh; but do you see the funny thing? Meanwhile we are pretending to wait for the survey, some — fool is sure to come digging around and looking for copper. By the time we get the *acciones* all sold we are ready to tell the government engineer where is the *punto de partida*."

Song of the Gold Dredge

Oh! this the whine of bucket line—the plaint of grinding gear—
The song that lifts through graveyard shifts by hour, day
and year—
The anguished grind as buckets bind in stress and strain
and shear:

"Gold—Gold—futile gold!
Of wasted steel a wealth untold,
Of useful steel the ransom made,
Of squandered steel the purchase paid!
For Gold—Gold—Gold!"

Oh! this the sob as winches throb and straining gussets
creak—
As bucket grates on tumble plates, as tortured bushings
shriek—
As motors come with rising hum to overloaded peak!

"Gold—Gold—pliant gold!
For steel of uses manifold—
For sturdy steel in endless loss—
For squandered steel the senseless dross—
Of Gold—Gold—Gold!"

W. H. GARDNER.

PERSONALS

H. N. LAWRIE, after serving as chairman of the Oregon Bureau of Mines and Geology Commission, has assumed the position of chairman of the Division of Precious and Rare Metals of the American Mining Congress in Washington. This division intends to investigate, in the interests of the mining industry, the economic problems in the gold and silver situation and the decrease in gold production.

Waldemar Lindygre, of the U. S. Geological Survey, is in San Francisco, Cal.

H. E. Ferguson, of the U. S. Geological Survey, is now at Manhattan, Nev.

William F. Ward has left Puerto Andes for Barranquilla, Colombia. Address care of Wesselhoeft and Weisner.

James E. Strong, superintendent of mines for the Sloss-Sheffield Co., Birmingham, Ala., has resigned.

George J. Young, Western Editor of *Engineering and Mining Journal*, spent a few days recently in Divide, Nev., and vicinity.

H. Daniel, consulting engineer, of Roumania, has removed to El Paso, where he will continue his engineering practice.

L. D. Cooper, manager of the mining department of the E. J. Longyear Co., made a visit recently to Denver and Telluride.

Ralph C. Nowland spent several days in July in Divide, Nev., inspecting the Belchers, Victory, and Divide Extension properties.

F. A. Beauchamp, of Hamilton, Beauchamp, Woodworth, Inc., has left for Lark, Utah, and expects to be away about ten days.

Heath Steele, head of the mining department of the American Metal Co., Ltd., has returned to the office after several months' absence.

George S. Backus, who recently resigned from the staff of the Minerals Separation, has become affiliated with the Oliver Filter Co., of San Francisco.

Amor F. Keene, of the Gold Fields American Development Co., Ltd., accompanied by John E. Teeple, is at the property of the American Trona Corporation, Trona, Cal.

O. Falkenberg, an electrochemist of Christiana, Norway, is en route to Clifton, Ariz., to examine copper properties in conjunction with John Christy, a mining engineer.

N. H. Emmons, 2d, after four months' professional work in Louisiana, has returned to the East, and for the remainder of August will be at Camp Wabasso, Laconia, N. H.

C. E. Leshar will be in charge of the mineral resources division of the U. S. Geological Survey while **E. S. Bastin**, head of the department, is visiting the Western offices of the Survey.

Milnor Roberts, dean of the College of Mines of the University of Washington, Seattle, Wash., has been examining mining properties in the Kootenay district, British Columbia.

C. M. Young has resigned as assistant professor of mining research at the University of Illinois to become professor and head of the department of mining engineering at the University of Kansas.

James A. Farrell, president of the U. S. Steel Corporation, will be honored by the directors of the McKinley Memorial by having a bust of himself placed in the memorial building at Niles, Ohio.

H. N. LAWRIE

C. W. Wright, manager of copper properties at Ingurtosu, Sardinia, Italy, is visiting relatives in the Michigan copper country. During the war, Mr. Wright was a captain of engineers in the Italian army.

Charles O. Olsen has opened a mining engineering office in the Hutton Block, Spokane, Wash. For the last two months Mr. Olsen has been making surveys and plats for the Gold Hunter Mining Co. at Mullan, Idaho.

John Uno Sebenius, general mining engineer for the Oliver Iron Mining Co., will represent the U. S. Bureau of Mines in an investigation of Swedish methods of handling iron ore. He has arranged to sail from New York for Sweden on Aug. 20.

B. L. Thane, of San Francisco, and **Howland Bancroft**, of Denver, announce the consolidation of their engineering offices, with headquarters in the Crocker Building, San Francisco. Mr. Bancroft will continue to specialize in the examination and valuation of mining property.

James Underhill has been appointed associate professor of mining in the Colorado School of Mines. Professor Underhill has been active in the Clear Creek district of Colorado since 1895, and is at present engaged in general engineering and surveying business in Idaho Springs.

E. D. Johnson has resigned as purchasing agent for the Calumet & Hecla company and will reside at Grand Rapids, Mich. Mr. Johnson was employed by the Calumet & Hecla for thirty-five years, with the exception of seven years when he was clerk at the Quincy company.

L. W. Trumbull, for the last six years State Geologist of Wyoming, and formerly professor of geology at the State University, has resigned to devote his time to private practice and his personal interests in the oil fields. After Sept. 1 his residence will be at 1835 Gaylord St., Denver, Col.

A. L. D'Arcy, consulting engineer for the Tonopah Divide, has resigned his position with that company in order to give his entire attention to the Goldfield Development and other interests in Goldfield, Nev. **E. V. Julian**, consulting engineer of the Goldfield Consolidated, will succeed him for the time being at least.

R. C. Gosrow has changed his address to Box 846, Seattle, Wash. Mr. Gosrow is now touring from Denver, Col., to Seattle by automobile where he expects to arrive about Sept. 1 and will open an office as electrometallurgist and metallurgical and sales engineer. Mr. Gosrow will be the agent for the Pittsburgh electric steel furnace in the territory west of Denver, Col.

Reginald E. Hore, mining geologist, who has since June, 1913, been the Editor-in-Chief of the *Canadian Mining Journal*, is retiring from active direction of that journal to take up professional consulting practice. Mr. Hore will continue to be associated with the paper as consulting editor. **F. W. Gray**, who has been associate editor of that publication at the office at Ste. Anne de Bellevue, will assume the editorship. Mr. Gray has been a regular correspondent since 1907.

Van H. Manning, the director of the U. S. Bureau of Mines, and **F. J. Bailey**, the new chief of the operations branch of the Bureau, are engaged in a general inspection tour of the Bureau's stations. The trip is being made on one of the Bureau's mine rescue cars. Pittsburgh, Birmingham, McAlester, Bartlesville, Petrolia (where the Bureau is experimenting with helium), Tucson, San Francisco, Portland, Seattle, Butte, Salt Lake City, and Minneapolis are the points to be visited. **O. P. Hood** is acting chief of the Bureau.

Lester S. Grant has been appointed professor of mining in the Colorado School of Mines, succeeding **Harry J. Wolf**, who resigned to accept the position of Assistant Editor of the *Engineering and Mining Journal* as has been previously announced. Professor Grant was graduated from the Colorado School of Mines in 1899, and has been a practicing engineer for thirteen years in Cripple Creek, two years in Peru as manager of the Inca Mine, and for the last five years on the Mother Lode of California and in oil operations in Wyoming.

SOCIETIES

American Chemical Society will hold the autumn meeting at the Bellevue-Stratford Hotel, Philadelphia, Pa., under the auspices of the Philadelphia Section, from Sept. 2 to 6, 1919, inclusive. The Philadelphia Section, situated near the center of chemical activities, is planning an extensive program, and it is expected that the meeting will be the largest in the history of the society. On Sept. 2 a council meeting will be held and the following day a general meeting will be called, at which the address of welcome will be made by Secretary of War Newton D. Baker. Excursions to industrial establishments will be made on Sept. 4. A banquet will be held on Sept. 5, and the meeting will conclude on Sept 6 with a boat ride to the industrial plants on the Delaware waterfront.

INDUSTRIAL NEWS

Jonathan Bartley, known as a manufacturer of crucibles, is now at 50 Church St., New York, as manager for George F. Pettinos, importer and refiner of graphite and foundry supplies.

Chicago Pneumatic Tool Co. announces the appointment of J. L. Canby as district sales manager at Chicago, succeeding Nelson B. Gatch, who has been appointed district sales manager at New York.

Jardine Machinery Co., dealers in used mining machinery and equipment, and for many years at 55 New Montgomery St., San Francisco, has moved its general offices and warehouse to 115 Main St., San Francisco.

Deister Concentrator Co., Fort Wayne, Ind., has issued a new political map of Europe, in colors, 14 x 22 in., showing the national boundaries as determined by the Peace Conference, in comparison with the old outline of all countries. This will be sent free on request.

N. S. Braden formerly sales manager, has recently been elected vice-president of the Canadian Westinghouse Co., Ltd., of Hamilton, Ontario. **H. M. Bostwick**, assistant sales manager, has been appointed sales manager, to fill the vacancy created by Mr. Braden's promotion.

Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., announces that **Arthur B. Reynders**, formerly director of production at the East Pittsburgh plant, has recently been made works manager of the East Springfield plant. **A. E. Kaiser**, who has been assistant to the director of production since 1912, succeeds Mr. Reynders as director.

Green Engineering Co., East Chicago, Ind., has appointed the firm of Bull &

Livensparger as its sales representatives in Chicago and northern Illinois territory. The new representatives will have charge of the Chicago sales office at 14 E. Jackson Block. **E. H. Bull** has been connected with the company hitherto as engineer and **D. A. Livensparger** as a member of the sales force.

Hazard Manufacturing Co., Wilkes-Barre, Pa., opened a new sales office and warehouse on July 1 at 1415 Wazee St., Denver, Col., in charge of Ernest P. Kipp, district manager. The Denver office will include in its territory the states of Colorado, Wyoming, Montana, Idaho, Utah, New Mexico, and the western portions of Nebraska and South Dakota. A full stock of wire rope and rubber insulated wire, including Olympic brand wire rope and mining machine cables, is carried at the Denver warehouse. Mr. Kipp was a captain in the U. S. Engineers.

Jualin Alaska Mines Co., 16 Rue de Turin, Brussels, Belgium, states that it is receiving many inquiries from American mining machinery companies, most of which are inadequately stamped; that while it in no wise objects to paying the extra postage, it thinks that possibly other European concerns, who may receive similar insufficiently stamped letters, will hold that American concerns should acquaint themselves with this matter. The company states that Belgian postal regulations require a five-cent stamp, and not a three-cent stamp, regardless of what information contrary to this may be given out from any other source.

TRADE CATALOGS

Pelton Centrifugal Pumps. Pelton Water Wheel Co., San Francisco and New York. Bulletin No. 11; 7 $\frac{1}{2}$ x 10 $\frac{1}{2}$; pp. 12; illustrated. Describes centrifugal pumps for irrigation and general utility.

Telsmith Jaw Crushers. Smith Engineering Works, 1154 32nd St., Milwaukee, Wis. Telsmith Bulletin No. 264; 7 $\frac{1}{2}$ x 10 $\frac{1}{2}$; pp. 15; illustrated. This catalog describes stationary and portable jaw crushers.

Forgings. Allis-Chalmers Manufacturing Co., Milwaukee, Wis. Bulletin 1,538; 8 x 10 $\frac{1}{2}$; 18 pp.; illustrated. Describes the operations in the manufacture of forgings, which for ordinary shapes can be made up to forty tons' weight, and the maximum in shafts is 40 in. in diameter and 60 ft. long.

Osgood Steam Shovels, Cranes, Dredges, and Similar Appliances; Osgood Co., Marion, Ohio. Catalog; 8 $\frac{1}{2}$ x 11; pp. 31; illustrated. Descriptive of steam shovels of various types, ranging in capacity from $\frac{3}{4}$ cu. yd. to 6 cu. yd. Locomotive cranes, railroad ditchers, unloaders and dredges are also described, with illustrations.

Oliver Filters. Oliver Continuous Filter Co.; Bulletin 12; 6 x 9; 46 pp.;

illus. A general description of the use, construction and operation of Oliver filters, including a list of parts, with detailed drawings of each, is given in the first part. A chapter is devoted to the art of filtration, with a discussion on the various general types of filters classed under four heads: gravity, press or squeeze, positive pressure, and vacuum filters. Other auxiliary equipment of the company also described includes vacuum pumps and compressors, motor-driven centrifugal pumps, and sand-table filters. Several installations of the sand-table filters are illustrated, one being that at Nitrate Oficina, Chile, and another illustration shows an airplane view. The remaining pages are devoted to special filters for laboratory and acid-proof requirements. A partial list of Oliver installations is given in the remaining pages.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Drill—Percussion Drill. Lewis L. Scott, St. Louis, Mo. (U. S. No. 1,308,811; July 8, 1919.)

Electric Furnace for Fusing Metals. John Thomson, New York, N. Y. (U. S. No. 1,308,877 and 1,308,880; July 8, 1919.)

Flotation—Apparatus for Concentrating Ores. Fred De Mier, Picher, Okla., assignor to himself and Arthur E. Bendelari, Picher, Okla. (U. S. No. 1,308,049; July 1, 1919.)

Gases—Apparatus for Electrical Treatment of Gases. Arthur A. Schmidt, Los Angeles, Cal., assignor to International Precipitation Co., Los Angeles, Cal. (U. S. No. 1,309,221; July 1, 1919.)

Mechanical Shovel. Fred Lerch, Virginia, Minn. (U. S. No. 1,307,448; June 24, 1919.)

Mine-Car-Wheel-Attaching Device. John H. Rutherford, Knoxville, Tenn. (U. S. No. 1,308,996; July 8, 1919.)

Molybdenum—Separation of Molybdenum Ores. Tormod Reinert Förlund, Haugesund, Norway. (U. S. No. 1,308,735; July 1, 1919.)

Open-Hearth Furnace. George F. Downs, Buffalo, N. Y. (U. S. No. 1,308,404; July 1, 1919.)

Scrap—Apparatus for Recovering Metal From Scrap Material. John W. Brown, Lakewood, Ohio. (U. S. No. 1,301,374; Apr. 22, 1919.)

Shoveling Machine. Frank M. Hewitt, Butte, Mont. (U. S. No. 1,304,683; May 27, 1919.)

Steel—Producing Steel and High-Phosphorus Slag. William R. Walker, New York, N. Y. (U. S. No. 1,299,072; Apr. 1, 1919.)

Tin—Process of Extracting Metal Values. Walter Zacharias, Neville Island, Pa. (U. S. No. 1,304,842; May 11, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief
of Interest to Engineers
and Operators

SAN FRANCISCO, CAL.—Aug. 6

A decision has been handed down by the U. S. Circuit Court of Appeals in the case of the Petroleum Rectifying Co. vs. the Reward Oil Co. The court holds that the patented process of refining petroleum known as the Speed and Mitchell process has been infringed upon, and the court has issued an injunction restraining the Reward company from further use of the process and has ordered an accounting made to the owners of the process. Similar suits are now being prepared against other large oil refiners by the Petroleum Rectifying Co., which will endeavor to secure payment of royalties by all the concerns which have used this patented process.

GRASS VALLEY, CAL.—Aug. 7

Agreement Between the Mine Workers' Protective League of the Grass Valley district and the larger mining companies of the district as finally adopted on July 26, following the strike in June, is here given in full as signed by the companies:
"To aid our surface and underground men we believe that the following proposition, to remain in force for the period of one year from date, will help the living conditions of our miners as well as make it possible for the gold-mining industry of the district to continue.

"1. We will abolish the bonus system.
"2. We will establish a free market at no cost to the purchaser or seller. This will eliminate the middleman and his profits. This free market will be able to supply goods to the consumer at the lowest cost, overcoming expensive hoarding, delivery, and service costs. The free market will handle boots, drygoods, meats, groceries, and, in fact, goods of every description.

"3. We ask that hereafter should any grievances arise that these be taken up with the management and discussed freely and in a proper manner before any drastic action be taken. We welcome the appointment at each mine of a committee of three of our employees, to be chosen by you, to bring to our attention any grievances that may arise. Such committee to hold office for six months.

"4. Whenever an employee has worked for us continuously for three months he shall be paid 10 per cent. of the total wages earned by him during that period. Absence through leave or sickness will not cause the forfeit of this percentage wage increase.

"5. As a proof of our sincere desire to aid you we will pay on next pay day one-half of the wages lost on our employees, provided that you return to your former work promptly after the settlement of this matter.

"6. We will pay time and a half for overtime and time and a half for Sunday work with the exception of routine and day work, such as Sunday work in mill, cyanide plants, pumppens, engineers, watchmen and shaft sinking in mines conforming their work entirely to development.

The agreement is signed by J. B. Bennett as president and F. C. Osborne as financial secretary of the Mine Workers' League; George W. Starr for the Empire Mines Co.; J. A. Powers for the North Star Mines Co.; J. A. Fulton for the Idaho-Maryland Gold Quartz Mining Co.; and E. R. Abadie for the Golden Center Mining Co. The managements of the Sullivan Allison Ranch and the Norabagua mining companies have been approached with the object of their also becoming parties to the agreement.

MEDFORD, ORE.—Aug. 8

The War-Minerals Relief Commission arrived in Medford, Ore., from San Francisco July 27, and began its session July 28, consuming the entire week in taking testimony in the cases of 173 applicants for relief in the Medford district, which includes all of southern Oregon and northern California. The largest claim to come before the commission was that of Dr. J. P. Reddy, of Medford, who sought to recover \$80,000 losses in chrome mining in Siskiyou County, Cal. The next largest was that of the Man-

guese Metal Co., of Tacoma, Wash., for \$85,000.15, which operated in the manganese deposits at Lake Creek, east of Medford. In his statement, Herbert Brewitt, president of the company, sets forth that the money was expended in equipment, erection of a reduction plant, building roads, ditches and dams, and in purchasing the property in which the ore was located. Other claimants for large amounts were Malme & Reichman, of Fort Jones, chrome miners in Siskiyou County, Cal., in the sum of \$29,435.66, and a clay of the Superior Co., chrome operators, in Coos County, Ore., for \$27,516.

H. M. Parks, director of the Oregon Bureau of Mines and Geology, appeared before the commission in behalf of the Oregon operators, and filed a communication, showing how the mineral production in Oregon was increased by direct Government solicitation. It reads in part as follows:

"As director of the Oregon Bureau of Mines I am appearing before you to make clear the part taken by the bureau and the members of its staff in encouraging and stimulating the development of new properties and the increase of production of war minerals during certain periods of years 1917 and 1918. In October 1917, I received a letter from George Otis Smith, Director, U. S. Geological Survey, a copy of which is inclosed, in which he requests me to exert every effort to increase the domestic production of chrome ore. During the month of May, 1918, I had occasion to visit Washington, D. C., and called upon Mr. W. K. Lethbridge, the War-Minerals Import and Export Committee, who called my attention to the impending crisis in war minerals, due to the shortage of ships for importing such materials from foreign countries, and requested me to assist with the greatest speed the development of all manganese and chrome properties in Oregon.

"On account of this critical situation in connection with the war-minerals demand, I ordered the field staff of the Oregon Bureau of Mines to do everything possible to encourage new development, and speed up the production of manganese and chromite. To this end the staff of the bureau visited many manganese and chrome properties in Oregon and came in direct touch with the miners and prospectors both by correspondence and personal conferences. In all cases where in our judgment an extra effort was warranted, we requested on the behalf of the Government the speeding up of production and development.

"This activity on the part of the staff of the Oregon Bureau of Mines caused many prospectors and miners to engage in an effort to produce these war minerals, as is shown by the fact that Oregon's production of chromite in 1918 over 1917 increased from 7,500 tons to 10,000 tons, and the production of manganese increased from 26 to 59. Many others engaged in development work, but did not have sufficient time before Nov. 11, 1918, to bring their properties to production."

BUTTE, MONT.—Aug. 8

Hearing of the Supplemental Suit of the Elm Orlu Mining Co. against the Butte & Superior company, involving ownership of a portion of the Rainbow vein beneath the surface of the Black Rock claim of the latter, was devoted during the first week of testimony of experts for the plaintiff, who endeavored to show a continuous apex of the Pyle vein within the confines of the Elm Orlu claim. If this apex be proved, by virtue of the prior location of the Elm Orlu claim over the Black Rock, the Rainbow vein becomes the Pyle below its point of union with the latter, at about the 100-foot level of the Elm Orlu claim, a ruling made by Federal Judge G. M. Bourquin at the original hearing of the Elm Orlu case. The outstanding feature of the evidence thus far is that though the apex of the Pyle vein is broken up into a number of strands, they are easily recognizable and all combine into one fissure before a union is had with the Rainbow vein.

The defense of Butte & Superior has not yet been outlined, but it is believed that an effort will be made to correlate some of the Pyle apices strands with northwest veins, on a claim that these strands are not part of the Pyle vein. Counsel for plaintiff stated that since the original hearing approximately 500,000 had been spent in proving and working other development necessary to establish its case. It was also stated that both sides had driven about six miles of crosscuts, drifts and raises.

It is expected that the presentation of evidence will require another week. Each side by stipulation will present the evidence of five geologists and one practical mining man. For Elm Orlu the following among others, will be heard: Horace V. Winchell, of Minneapolis; Professor J. F. Kemp, of Columbia University; Dr. C. K. Leith, of the University of Wisconsin; W. E. Fisher, of San Francisco; J. F. Searies, Jr., of San Francisco, and Russ J. White, of Wallace, Idaho. For Butte & Superior, among others, are the following: Hart Lurch, of San Francisco; Professor William H. Emmons, of the University of Minnesota; Walter H. Wiley, of Los Angeles; Percy Earl, of Seattle; Carl H. Hand, of Los Angeles, and Samuel Barker, of the engineering firm of Barker & Wilson, of Butte.

SALT LAKE CITY, UTAH—Aug. 7

The Bureau of Mines Rescue Car No. 11 will be stationed at Lingham Canyon on the Bingham-Caribou siding at the Utah Copper Co.'s warehouse until Aug. 16.

A Reduction of Freight Rates to Salt Lake City is being sought by the Commercial Club, which is seeking to raise a fund of \$100,000 for use in the recently started campaign to bring about the proposed reduction. It is sought to lower the rates raised during the war, if not to the pre-war standard, in any case to some intermediate figure, and also to get the Salt Lake City same schedule of rates as that in force at Ogden, which is a common point on the Southern Pacific and Union Pacific railroads in regard to ore shipments, such a reduction would effect chiefly ores from Nevada and outside camps coming into Utah, but an effort is also being made to obtain a reduction in rates on ores from Utah camps.

DENVER, COL.—Aug. 8

Boulder County Metal Mining Association held a joint meeting on July 30 with several other commercial and industrial organizations at which it was decided to hold a Boulder County Silver-Mining Jubilee on Sept. 1, to commemorate the discovery of silver at Caribou in 1869. An elaborate program is planned.

Upon Motion of the Colorado Metal Mining Association and Boulder, Gilpin, Clear Creek, Park and Summit County associations, the Denver District Freight Traffic Committee will hold a hearing on the subject of a lower through rate from Salt Salida, so as to force the Pueblo smelter of the American Smelting & Refining Co. to compete with the Salida plant in buying ore.

At Cripple Creek, a contract has been entered into between the Blue Flag Gold Mining Co. and the War Eagle Consolidated Mines Co., which it is expected will prove of benefit to all property owners of the western section of the district, especially those on Bull, Raven and Gold hills. Work was begun on Aug. 1 on one 1,800 feet of the Blue Flag shaft from which point a drift 450 ft. long is to be driven on the Happy Year vein to connect with the Opheila or Moffat tunnel. Work will then be continued to a point directly under the Scott shaft of the War Eagle company. The shaft at present is only 550 ft. deep, and connection will be made by raising. When this is completed the ventilator will be improved and the Happy Year group will be further developed. It is planned to bring the Moffat tunnel, at present 1½ miles long, into use again as a public trans-

mining and drainage tunnel. This will greatly stimulate leasing. To encourage lessees, a reduced scale of royalties will be introduced.

Many Test Holes for Oil have been drilled in various parts of Colorado during the last year. Practically all of these have been in "wildcat" territory. Following is a list of some of the most important developments that have been undertaken recently: The Roxana Petroleum Co. recently let a contract to the Keough-Hurst Drilling Co. to drill a test hole on the Wellington structure, three miles west of Dulzer Station, near Fort Collins. The Allied Oil & Leasing Co. is drilling below 750 ft. near Eads, Kiowa County, Col. This well had several showings at lesser depths last year. It was originally started by another company. The Black Canyon Oil & Gas Co. abandoned as a dry hole its test near Delta, and is moving its rig to Texas.

The Chandler Creek Oil & Gas Co. is drilling below 1,300 ft. near Canyon City; Continental Oil Co. on Rathburn Dome near Loveland, in Larimer County; Fry Creek Oil & Gas Co. below 520 ft. four miles west of Loveland; El Paso Oil Co., about 4 miles east of Colorado Springs, near Rush; and the Eman Oil Corp. around 1,000 ft., near Watkins, in Adams County, twenty miles northwest of Denver.

The Flarler Oil & Gas Co. is drilling around 3,000 ft. near Flarler, in Kit Carson County. The Grover Oil & Gas Co. is drilling below 945 ft. near Grover, in Lincoln County. Kaywood Oil & Gas Co. has started a new hole on the Miller ranch, thirty miles south of La Junta.

The Lincoln County Oil & Dev. Co. is drilling at Bovero, near Hugo, in Lincoln County, and the Monarch Oil Co. in Pueblo County. The Morgan County Oil & Gas Co. will resume drilling soon near Morgan, where it lost two wells on account of acid sand. The Nee-No-Shee Oil Co. is drilling below 940 ft. near Eads, Kiowa County. The Ranger Oil & Gas Co. is drilling below 900 ft. south of Rocky Ford. The Red Rock Oil & Gas Co. has encountered gas showings and salt water south of La Junta. The Sterling Oil Co. has resumed work below 3,750 ft. near Padroni, fourteen miles north of Sterling.

AUSTIN, TEX.—Aug. 8

Mineral Royalty Act was signed by Governor Hobby at Austin, Tex. on July 31. This provides that owners of land purchased from the state with the mineral rights reserved shall be allowed one-sixteenth royalty on oil and gas produced. The act revising the state mining laws, as they apply to hard minerals, to conform to the Federal laws, was also signed.

Blue Ridge Farm Bill, passed recently by the Texas Legislature, instructing the Prison Commission and Governor to enforce the state's option to buy the Blue Ridge prison farm, was signed by Governor Hobby. This property is a prospective oil land of considerable value, the oil having been discovered after the state acquired the option.

Raise in Wages of 50c. per day for oil-field workers in southern Texas and Louisiana was agreed upon July 31 at a meeting of executive committee of Texas Gulf Coast & Louisiana Oil & Gas Association. New wages for 10-hour shift are as follows: Drilling crews' drillers, \$275 per month; helpers, \$47.5 per day; derrick men, \$6; firemen, 12 hours, \$5.25, less than 12 hours, \$4.75. Production operators: firemen, 12 hours, \$5.25; pumpers, 12 hours, \$5.25. Other work, such as pipe gangs, foremen, \$6; derrickmen, \$5, helpers, \$4.75.

State Will Cancel Leases in the Goose Creek field on which the lessees have failed to do the work required by the terms of the leases. Some of these tracts are of considerable value. Other leases on tracts on Matagorda Bay, in the Big Hill district, will also be canceled. After cancellation of these leases new surveys will be made, and the land will be offered for sale by advertisement and bonus under the new act passed by the special session of the Legislature. The list of state lands that will be sold Sept. 1, comprising about 2,000,000 acres, will be ready. All of this land can be acquired without conditions of actual settlement, and this will probably be the last big sale of land conducted by the state.

Rules for Conservation of Oil and Natural Gas have been issued by the Texas Railroad Commission, after an open meeting with the producers. Practical application of the rules will be made, and to further this work the commission has already appointed one conservation expert, to be stationed first at the Eureka-

nett field. Under the rules relative to gas "waste" is defined as follows: Permitting the escape of natural gas into the open air from a stratum recognized as a natural gas stratum; drowning with water a stratum capable of producing gas in commercial quantities; underground waste; the burning of gas that could be utilized or kept in the ground; the wasteful utilization of gas (four flammable only allowed to a derrick) and burning it between 8 a. m. and 5 p. m. unless regulated on a meter.

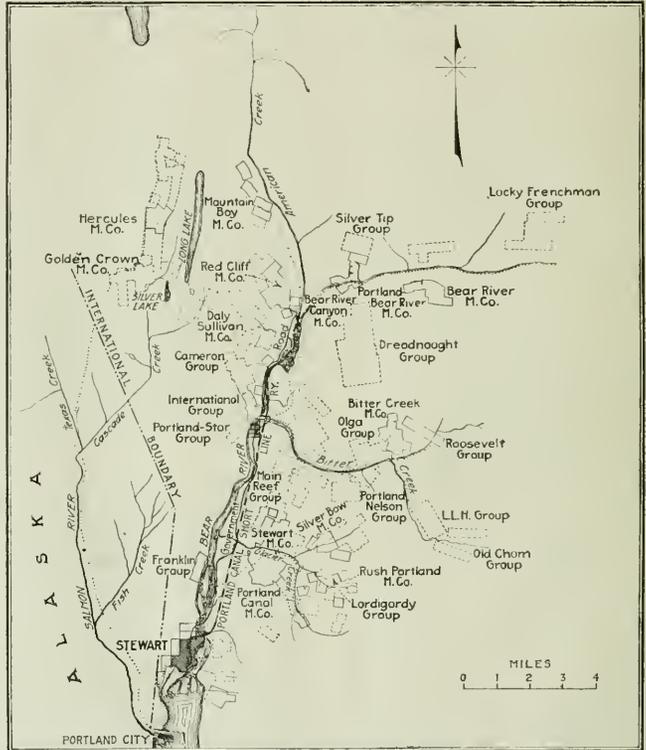

DULUTH, MINN.—Aug. 8

The Strike of Shipmen on ore-carrying railroads on Aug. 4 spread to the coal docks on the following day. The Alouze ore docks of the Great Northern Ry. Co. shut down Aug. 6 on account of the refusal of the demand for \$1 per day wage increase. Possible demands by the men on the docks of the Duluth, Missabe & Northern and the Duluth & Iron Range railroads were forestalled by the Railroad Administration

with nearly two-thirds of its receipts of the year in the treasury. It is an active organization and is taking part in civic and general engineering affairs. Its organization, a year ago, was owing in a large part to the work of the retiring president, W. G. Swart. Mr. Swart's valedictory address was on the education of the engineer, in which he urged the need of a broad culture in the humanities, in contrast to a strictly technical training. The meeting, besides the regular election, was devoted to the Duluth-to-the-ocean deep waterway. The club has decided to take up the subject of forest fire protection in northern Minnesota, and to study the engineering needs of Duluth from the city-planning standpoint.

BIRMINGHAM, ALA.—Aug. 9.

The Tennessee Coal, Iron & Ry. Co.'s ore mining division on July 29 went back to the ten-hour day, with time and one-half for all time over eight hours, and was fol-

PART OF PORTLAND CANAL MINING DIVISION, BRITISH COLUMBIA. SALMON RIVER DISTRICT LIES IN UPPER LEFT CORNER. Reproduced from Bulletin of British Columbia Department of Mines

by closing down those docks on the night shift. Beginning Aug. 7 the day shift started to clean up the boats at the docks, and when this is done the tie-up will be complete. Open-pit mines and washing plants shut down on Aug. 7. Beginning Aug. 8, underground mines began to stockpile their ore. It is estimated that the tie-up may last for thirty days.

Duluth Engineers' Club held its annual meeting on Monday, Aug. 1, resulting in the election of the following: President, Colonel F. A. Pope, U. S. Engineers; vice-presidents, W. A. Clark, chief engineer Duluth & Iron Range Railway, and J. L. Pickles, resident engineer Canadian Government Railways; secretary, W. H. Woodbury, valuation engineer Duluth, Missabe & Northern Railway; treasurer, A. U. Shipman, assistant city engineer; representative on Minnesota Joint Engineering Board, W. G. Swart, manager Messers Syndicate directors, W. G. Swart, J. R. Stack, W. H. Hoyt and F. E. Downing. The club closes its first year with a membership of 136, and

loved in this move on Aug. 1 by the Republic Iron & Steel Co.'s Raimund mines. The eight-hour day has been in force since the latter part of April and has proved a decided failure; the opposition of the men to the shorter day being the principal cause for this failure. The longer day will mean a considerable increase in wages, and as a result of the change all mining companies on the western end of Red Mountain have had large additions to their crews, and considerable increase in tonnage is noted. The clerical department of the Bessemer division of the Tennessee company is expected a 15 per cent wage increase during August.

The strike of the railway shippers in the Birmingham district is causing no little concern, and embargoes on iron and steel are expected to spread to all roads quickly, some shipping already having been interfered with. Though the bins are filled at the furnaces, a steady supply of raw materials is necessary, and, unless there is some improvement in the railroad situation

in the next 36 or 48 hours, it is probable that some of the furnaces will have to bank fires. As a result of the strike, the ore mines are being affected by a car shortage, several companies reporting no empties received recently.

With iron up \$1 a ton, sales in the district are still for third-quarter delivery, with an occasional sale for fourth quarter. As yet no orders for 1920 delivery are being accepted, though many inquiries are being made.

Suit has been brought by Warwick Saunders against R. N. McDonough, J. J. Shannon, J. H. McDonough, W. A. Fowler, Self-Fluxing Ore & Iron Co., W. H. Coverdale, Standard Steel Co., and the Gull States Steel Co., claiming \$5,000,000 for the alleged conversion of 9,970 shares of the Self-Fluxing Ore & Iron Co., with interest to date and damages for their retention. The complainant was interested with the defendants in the organization of the Self-Fluxing Ore & Iron Co., and alleges that, after he and the defendants had secured an agreement with W. F. Aldrich to convey to them some ore lands, Aldrich refused to carry out the agreement, but later carried it out with defendants without consulting the plaintiff or giving him a one-fifth share of the company's stock, as previously agreed upon.

The tonnage tax provided in the bill before the Alabama Legislature has been changed from 5c to 2c per ton on coal, but remains at 3c per ton on iron ore. This bill has passed the House and is now before the Senate. Every effort to prevent its passage is being made by the Birmingham district.

HOUGHTON, MICH.—Aug. 9

Student Miners are now established in regular classes in the Calumet & Hecla mine as part of a general educational campaign to develop better miners. Other mines are planning to adopt this practice. Young men, nineteen to twenty years old, are given machine drills and put in charge of an experienced miner. While learning the students are paid good wages, with the understanding that as soon as they are experienced enough to work without instruction they will be given a contract such as is given to any other miner.

Stockholders of New Arcadian and New Baltic Copper Companies are to meet Oct. 7 at Houghton, Mich., to take action on a unanimous vote of the directors looking to a consolidation of the two properties. The new company is to have an authorized capital of 250,000 shares, par \$25, which will equal the aggregate capitalization of the New Arcadian and New Baltic. Of the 44,042 shares of the new company, 44,042 shares will be issued to New Baltic stockholders, 150,000 shares to New Arcadian stockholders, and 42,958 shares will be retained in the treasury, with 13,000 remaining shares held as unissued stock. The name Concord Consolidated Copper Co. is proposed for the new company.

VANCOUVER, B. C.—Aug. 7

In the Salmon River District, a map of which was published in the last issue, development of the various properties is progressing. On the Premier, the No. 2 tunnel crosscut is still advancing in ore. A three-story boarding house is being built,

and, when the road is complete, machinery will be hauled up hill. The sawmill has been moved to the lower tunnel and is cutting lumber. Work has started on the Fresh Extension, situated between the Premier and Bush mines. A camp is being established, and prospecting by surface cutting will be done. O. E. Bush and Grant Mahood recently bought this ground from Lake and O'Leary. At the Bush mine, the open crosscut has been advanced 100 ft. across the orebody. On the Big Missouri, work of exposing the orebody by surface cut is continuing. A large development program is being formulated by the management. At the Forty-nine, a tunnel has been started on the ore. The Mineral Hill people will build a warehouse at Hyder and a camp at the mine.

TORONTO, ONT.—Aug. 6

Reports of Gold Discoveries at Copper Lake, situated east of the Pine Flon copper mines and north of The Pas, have been confirmed by Dr. R. C. Wallace, commissioner for northern Manitoba. The find was made by Jacob Cook, who was engaged in development work on the claim of J. P. Gordon, formerly chief engineer of the Hudson Bay I. R. The vein is 4 ft. in width, consisting of quartz veinlets and greenstone schist, which pass very coarse gold. Dr. Wallace states that he "has never in his experience seen gold specimens to equal those brought to town. It is actually all the tenacity with which the quartz, owing to the quartz layers together." Boats leaving The Pas for Sturgeon Landing were crowded with prospectors.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ARIZONA

Cochise County

CALUMET & ARIZONA (Bisbee)—July production of copper, 4,302,000 lb., of which 4,234,000 lb. were available for company; June, 4,142,000 lb. for company; July, 1918, 4,214,000.

Gila County

OLD DOMINION (Globe)—July production of copper, 1,629,000 lb.; June, 2,015,500; July, 1918, 2,523,000. New orebody struck in crosscut from A shaft on 18th level north. Thought continuation of one found on 12th level. Heading 12 ft. in ore, with hanging wall not reached. Ore is chalcocite and bornite, and runs 5-6 per cent copper. New crosscut started 100 ft. west on 18th or lowest level, also one on 16th level 200 ft. above. Company, with other producers in district, increased wages of miners \$1.25 per day, muckers 50c. per day, with corresponding increases for surface men.

INSPIRATION (Inspiration)—July production of copper, 6,000,000 lb.; June, 6,300,000; July, 1918, 9,000,000.

MIAMI COPPER (Miami)—July production of copper, 4,113,452 lb.; June, 4,385,865; July, 1918, 4,734,082.

Pima County

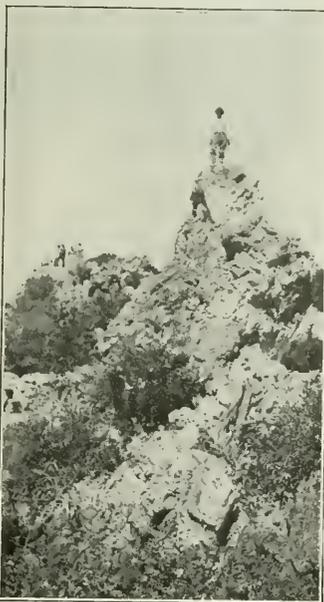

NEW CORNELIA (Ajo)—July production of copper, 3,240,000 lb.; June, 3,410,000; July, 1918, 3,900,000. Of July output, cathodes composed 2,736,000 lb.; smelting ore, 198,000, and cement copper, 306,000.

Pinal County

ARIZONA HERCULES (Kevin)—Cloud-burst on Aug. 1 carried out company's tailings dam and did considerable damage to water line. Mill lost about two shifts.

BUNKER HILL COPPER (Winkelman)—Preparing to develop holdings extensively. High-grade copper-silver ore recently uncovered in shaft being shipped to El Paso. Sinking will be continued to 500 ft. and drifting done at 200 and 400 levels. A 7 x 9 Sullivan compressor recently purchased. Development to be directed by G. G. Wald, formerly with Ray Consolidated Copper Co.

DRIPPING SPRINGS COPPER (Winkelman)—Planning to resume operations at property in Dripping Springs district. New Sullivan 10 x 10 compressor purchased of

OUTCROP OF A CALIFORNIA MAGNESITE DEPOSIT

Kelvin Lumber & Supply Co. Development will be in charge of Joe Bandauer. **SUNSET COPPER (Winkelman)**—Shipping ore from property in Copper Creek district. George Parsons and Jack Steele, of Hayden, are principal owners.

GRAND PACIFIC (Superior)—Thirty-two claims belonging to Consolidated Holding & Trust Co. purchased by Grand Pacific Copper Co. Superior. Group long known as Dags group and was located in 1899 by A. J. and H. R. Dags. Monte Carlo and Touchnot claims have been large producers of silver in past. C. C. Steinbremer, president of Galena Silver & Copper Co., is president of purchasing syndicate, which is made up of Pennsylvania and New York capitalists. Walter Harvey Weed is consulting engineer and A. C. Denton general manager. New company plans to install central electric power plant for operation of both properties.

CALIFORNIA

Amador County

CALIFORNIA SLIME CONCENTRATING (Jackson)—Flotation plant being added to equipment.

EDWARD HAWKE and associates, of San Jose, Cal., operating small dredge on Hawke ranch, on Deer Creek, west of Nevada City. Working old mining debris.

Nevada County

JOEL BASTIAN (Grass Valley)—Purchased by Idaho-Maryland company.

GRASS VALLEY BULLION EXPLORATION (Nevada City)—Articles of incorporation filed with county clerk. Capital stock \$1,000,000; shares of \$1 par value. Incorporators E. H. Armstrong, George Mainhart, John T. Leatham, Frank Mainhart, and John G. Curtis. Will engage in general mining business.

Plumas County

ENGELS COPPER (Engelmine)—Borings have recently shown ore-body persists 600 ft. below present mine workings.

San Francisco County

HOFF MAGNESITE (San Francisco)—John D. Hoff, president, granted patent No. 1,507,794 for manganese kiln, specifically designed for calcining magnesite to be used in making plastic flooring and stucco work. Plants at Red Mountain and Oakland running and shipments going East. Selling at small margin of profit. Users low in stock, and apparently fear imposition of protective tariff, according to Mr. Hoff.

Office of company is at 333 Monadnock Building, San Francisco.

Missouri County

MAMMOTH COPPER (Kennett)—Miners' wages increased to same scale as was recently adopted by Bully Hill mining company. Announcement of this increase in wages made voluntarily by both companies.

Siskiyoun County

BOXBURY MINING (Yreka)—Application made to State Water Commission for water rights of 60 cu ft. per sec. from Canyon Creek and 65 cu ft. per sec. from Honey Creek. To make this water available at mine requires construction and repair of ditch lines at estimated cost of \$80,000. Advantages to be derived are all-year mining and larger-scale operations than are possible at present.

Yuba County

SMITHERS (Brown's Valley)—Shaft re-enters and stamp mill being repaired for early resumption of operations.

COLORADO

Clear Creek County

PRIMOS CHEMICAL (Empire)—Operations resumed on small scale at molybdenum mine shut down several weeks ago. Only development work at present. Mill not running.

Dolores County

MARMATITE (Rico)—Development of Enterprise vein of Pro Patria mine begun. **SILVER GULCH** (Rico)—Building concentrator to treat low-grade silver ore from Rosebud mine and dump. At present only high-grade ore being produced.

WELLINGTON (Rico)—Expects to start up. Shut down during winter because of depressed market for copper.

Ouray County

CAMP BIRD (Ouray)—Important decision rendered by county court reducing taxation value from \$400 to \$21 an acre.

Guadalupe Leasing (Ouray)

Crawford, York and Aderson have recently re-discovered old Guadalupe orebody in old workings of mine. Full extent of discovery not yet ascertained.

Park County

LONDON (Alma)—Development work resumed in South Side tunnel. At present rate vein will be encountered within thirty days. Also over thirty groups of lessees working.

San Juan County

GOLD KING EXTENSION (Silverton)—Mill at Gladstone again in operation. Capacity, 500 tons daily. Machinery recently installed includes Gates gyratory crusher, amalgamating tables, Card tables and tube-mill equipment. Company includes former Gold King Mining Co., which was consolidated with it.

San Miguel County

GOLD RUN PLACER CO. incorporated by John L. McManis, W. J. Kennedy, and R. C. Wood to treat sands of San Miguel River if they prove worth milling after testing. Lease executed on river sands from Pandora to Keystone hill. Test plant now working at Pandora.

METALS EXPLORATION (Telluride)—Subsidiary of Smuggler-Union Mines Co., of Telluride, has recently taken over Genessee group of mines on Red Mountain. Genessee formerly heavy producer.

Summit County

QUEEN OF THE WEST (Kokomo)—This group on Jacque Mountain in Ten-Mile district recently examined by engineers representing Chicago and New York interests. Has produced over \$2,000,000. Controlled by John W. Springer, of Denver.

MICHIGAN

Copper District

CALUMET & HECLA (Calumet)—New flotation plant will be running in September, according to present plans, and will handle all conglomerate sands. Steel work completed.

ISLE ROYALE (Houghton)—Getting back old miners faster than other producing in copper in August. Production coming from three shafts. Three-head mill running full time, including Sunday. Further increase in rock output will mean shipments to Point Mills.

WINONA (Houghton)—Surface plant in good condition despite long suspension of operations. Will work three shafts at once, deepest being 1,500 ft.

QUINCY (Quincy)—Changing mill over to utilize recent metallurgical improvements. Ball mills and slime tables added.

Gogebic Range

DAVIS (Ironwood)—Miners resumed

work Aug. 4 after four months' shutdown caused by fire in shaft. Shaft now repaired and water lowered to within 50 ft. of 21st level.

DUPONT POWDER (Bessemer)—Ding sued for \$6,000 by two miners who claim that while working at Newport mine in September, 1918, they were seriously injured by premature blast caused by defective fuses.

PLYMOUTH (Wakefield)—Pit being widened to north, one shovel stripping there. 300-ton shovel down in pit stripping on south side.

Gogebic Range in Wisconsin

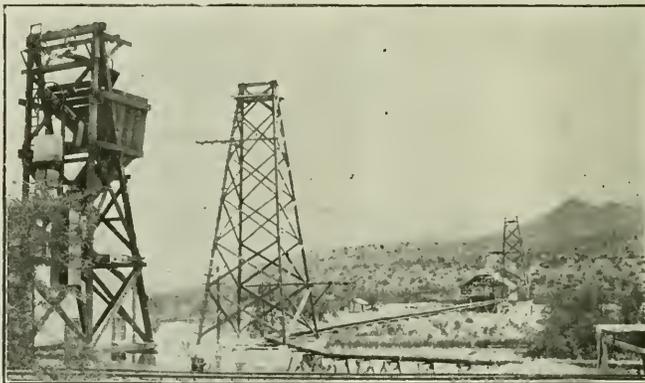

PLUMMER (Hoyt, Wis.)—Republic Iron & Steel Co., has had this property for about two years and is spending much money in exploration. Several diamond drills working on deep holes from surface and underground workings unwatered. Now planned to sink shaft from 1,300 level to 1,500 level.

MINNESOTA

Mesabi Range

BILLINGS (Chisholm)—Tod-Stambaugh made first shipment from new property Aug. 1. About eight gangs on development work. Stockpiling two grades for direct shipment via Great Northern.

DUNCAN (Chisholm)—Steam shovel working on old development stockpile July 26. Property opened by Oliver company in 1912 closed down in 1914 because off-grade. Previous shipments from stockpile hand loaded.

ARIZONA HERCULES CO.'S PUMPING PLANT AND PIPE LINE ON GILA RIVER. WATER LINE ON AUG. 1 WAS DAMAGED BY CLOUDBURST

HARTLEY (Chisholm)—Oliver Iron Mining Co. has removed shovels which have been loading ore to unstripped portion of pit and will continue to employ full force during failure of shipping facilities.

LEONIDAS (Eveleth)—New wash concentrator of Oliver Iron Mining Co. completed at cost of \$200,000. Trial run being made.

WEBB (Hibbing)—Winston-Deare contractors working clean-up shovel on open pit section of property. Night shift resumed underground, with small force, Aug. 3. Shenango Furnace Co., operators.

MONTANA

Beverhead County

BOSTON & MONTANA (Wise River)—Ore continuing in Idanha raise. Crosscut from upper Idanha tunnel in softer ground.

Jefferson County

LEGAL TENDER (Clancy)—Power line constructed. Car of ore ready to ship.

LIVERPOOL (Clancy)—Re timbering shaft still in progress. Electric power available. Expect to be mining within ninety days.

ANGELICA (Wheeler)—Large body of silver-lead-zinc ore opened on lower levels and regular shipment being made.

Powell County

CHAMPION (Deer Lodge)—Cross-cutting for vein continues, with ground softening.

EMERY (Deer Lodge)—Fifty-ton flotation plant at old mine dump to be started

as experiment. Efforts under way to re-finance property.

Silver Bow County

ANACONDA (Butte)—Shortage of water interfering with milling operations at Anaconda, and company will be unable to increase production materially over 55 per cent capacity. Scarcity of miners also interfering. Men taken from zinc properties and placed in copper mines, four zinc producers having temporarily suspended.

BUTTE COPPER & ZINC (Butte)—Mining suspended at Emma mine owing to shutdown of Anaconda's zinc plant at Great Falls.

BUTTE-NEW ENGLAND (Butte)—Mining operations suspended in consequence of ore found being in extralateral rights of Davis-Daly. Company in negotiation with Hayden-Stone interests looking to sale of property.

BUTTE & SUPERIOR (Butte)—Hayden-Stone interests, back of Butte & Superior, installing large hoisting plant on Otisco claim, adjoining Davis-Daly to south, and will develop extension of Hesperus vein of latter. Territory already optioned by Hayden-Stone or under negotiation aggregates more than 200 acres.

CRYSTAL COPPER (Butte)—Car of ore shipped averaging over 35 oz. silver. Orebody cut in shaft two feet wide. Cross-cutting on 600 level.

DAVIS-DALY (Butte)—Colorado shaft has cut stringers of high-grade glance ore at 2,650 ft. Concrete foundation for new ore bins and skip dumps nearing comple-

tion. Colorado shipping 300 tons of high grade daily. Lessees at Hiberna shaft doing well.

TOLUMNE COPPER (Butte)—Sinbad shaft down 1,070 ft., with 1,200 level as objective.

NEVADA

Esmeralda County

FLORENCE GOLDFIELD (Goldfield)—F. Sommer Schmidt, consulting engineer for company, now at mine inaugurating a comprehensive plan for development.

Lyon County

LAHONTAN (Ramsey)—Company in Ramsey district fifteen miles northeast of Virginia City plans cleaning out old workings, sinking inclined shaft from 330 to 500 level, with drifts on vein, and adding cyanide equipment to mill. E. P. Howell, formerly operating Beck mine, at Gold Circle, Nev., president; Edwin M. Eddy, of San Francisco, vice-president, and Parker Liddell, of Reno, secretary and treasurer. Operations suspended in 1910 owing to litigation, and since then owing to war conditions. Produced about \$80,000 before suspending. Formerly known as Ramsey Consolidated Mining Co.

Nye County

BELCHER DIVIDE (Divide)—As result of disclosures made after cleaning out 400 ft. of old workings from 60-ft. shaft, where good average ore was found, new shaft has been started. Crosscut on 200 level of main Belcher shaft advanced 65 ft. and has cut two stringers of high-grade ore, but will have to go 100 to 125 ft. to pick up big vein.

BELCHER EXTENSION (Divide)—Vein cut 30 ft. from shaft on 300 level and drifting started.

DIVIDE EXTENSION (Divide)—Crosscut on 425 level of No. 1 shaft has struck good ore. Drifting both ways on vein on 100 level of Caldwell shaft continues, with little change in average values. Winze being sunk on same foot-wall vein 45 ft. northeast of shaft. Crosscut also started on 100 level to pick up another foot-wall vein, which Roy Hardy, consulting engineer for company, believes will be cut within 50 ft.

KNOX DIVIDE (Divide)—Shaft down 20 ft. on vein recently found on Knox. Vein 5 ft. wide between well-defined walls. Assays range from \$28 to \$121, according to George Badgett, superintendent. Quartz similar to Tonopah quartz.

BUTTE DIVIDE (Divide)—At 100 ft. depth shaft in ore. Vein goes through Belcher. Roy Hardy, consulting engineer for Herbert Humphrey, spotted shaft on Butte and is supervising operations.

TONOPAH DIVIDE (Divide)—Crosscut on 375 level advanced to south side, starting point 350 ft. from main crosscut. Object is to prospect big fractured zone and to open up at depth east-west gold vein on which original strike was made, which is expected to be cut within 400 ft. Believed by George H. Garrey, geologist for company, that gold vein mentioned will join main silver vein at point southeast of present Tonopah divide workings. Southeast drift on 580 level advanced 125 ft., with face in good grade of ore and whole drift in commercial ore. Southeast drift on 270 level driven 400 ft. Take being driven at 350-ft. point in drift, both raise and face of drift being in good ore. Sinking of main shaft will be resumed in thirty days.

TYBO (Tonopah)—Louisiana Consolidated has contracted with Nevada-California Power Co. to extend power line from Manhattan to Tybo. Contract calls for completion within sixty days. Expected 150-ton smelter will be completed in thirty days thereafter. Low bid received by bond issue of \$25,000, practically all of which was bought by directors of company, including Julius Seigrist, Herman Rawitser, Frederick Hausman, and Roswell P. Nichols. Last named is treasurer and spent ten days at mine recently. F. W. Draper manager.

White Pine County

AT CHERRY CREEK several old silver producers reopened and producing steadily. Population has increased several hundred.

NEVADA CONSOLIDATED (Ely)—A mine and smelter closed onough strike for higher wages. Men demand \$1 per day increase. Company offered 75c. At Consolidated Coppermines notice posted advancing wages 75c with statement that any advances made by Nevada Consolidated would be promptly met, with result that men are still at work at Kimberly. Fires have been drawn from Nevada Consolidated furnaces at McGill. No violence reported.

WYOMING (Ely)—Wyoming Mining & Milling Co. erecting 100-ton cyanide plant at Taylor camp. Expected to be in operation by Sept. Dr. D. Bennett, president, recently visited property.

NEW MEXICO

Grant County

EL DORADO GROUP (Lordsburg)—A. J. Inderreiden states item was incorrect that appeared in issue of June 23 to effect that option had been secured on El Dorado group by himself and others.

LAST CHANCE (Lordsburg)—Making regular shipments of concentrates to El Paso smelter. Installing pipe line from El Aberdeen shaft two miles to mill to insure water supply.

Lincoln County

JACK'S PEAK TRAMWAY & MINING (Dahart, Tex.)—Building tramway 8 miles long from iron deposits near Carrizozo, N. M. Has contracts for 200 tons of ore per day. N. W. Vennard, president and manager.

Sierra County

SILVER MONUMENT (Chloride)—Sold to El Paso interests. Details not given out. C. B. Hullinger, superintendent.

UTAH
Juab County

TINTIC SHIPMENTS during July were 143 cars.

CENTRAL STANDARD (Eureka)—Contract let for sinking shaft to 400 ft.

SOUTH STANDARD (Eureka)—Machinery to be moved to site of proposed shaft and sinking to be started. Controlled by E. J. Kaddatz, of Tintic Standard.

TINTIC ZENITH (Eureka)—Shaft to be sunk in this East Tintic property. A. L. Hurley in charge.

Utah County

DELLEROPHON (American Fork)—Tunnel to be continued to connect with old workings and to prospect porphyry dike for milling ore. Mill again in operation.

Salt Lake County

MICHIGAN-UTAH (Alta.)—Ore shipments being made from Lavinia vein, in Grizzley tunnel. Patsy Marley vein to be prospected for at greater depth and Solitude tunnel to be extended, work starting from Big Cottonwood side to get under, old workings.

WASATCH (Alta.)—Tunnel to unwater and develop large area, now in 4,000 ft., has cut porphyry dike in Columbus Consolidated, where ore was left in old workings. Water receding in Columbus Consolidated shaft.

MONTANA-BINGHAM (Bingham Canon)—Shipping ore being mined from Mayflower vein at depth, opened by drift from main tunnel, now in 5,500 ft. from Bingham side of property.

WARDIFF (Salt Lake City)—Shipping about sixty tons of ore daily down Big Cottonwood Canyon by trucks. Winze from 800-ft. level down about 15 ft., with ore all way. Value of ore increasing with drift. Drift from 800-ft. level has entered Kennebec ground.

PRICE (Salt Lake City)—Stringers of ore showing in drift, which is being driven for limestone contact, 400 ft. ahead. Expected to cut fissure within 60 ft.

WASHINGTON
Stevens County

OLD DOMINION (Colville)—W. H. Linney, mining engineer, of Spokane, will again work this silver-lead property, which twenty-five years ago is said to have made large production.

HIGH GRADE (Deer Trail)—Attorney A. H. Kenyon, of Spokane, secretary, killed Aug. 2, and Henry Carstens, vice-president, badly injured when en route to mine, by collision of their auto with train. Kenyon, also secretary of Lucile Dreyfus Mining Co., was one of owners of Pittsburg property in Okanogan County, Wash., and had extensive other mining interests.

LOON LAKE COPPER (Loon Lake)—First 30-ton car of concentrates shipped.

CANADA
British Columbia

FRED A. STARKEY, of Nelson, gathering an exhibit from Kootenays for display next month at Vancouver. He urges all large mines to send in exhibits.

INLAND (Nelson)—Second payment made of \$10,000 on purchase of Eureka mine. Total amount paid to date is \$17,000.

PERRIER (Nelson)—Trevor Starkey making examination for Seattle investors. Seventy per cent of ore said to be free milling.

IRON DOLLAR (Sheep Creek)—Twenty-foot ledge shows considerable milling ore and is being shipped.

IRON MOUNTAIN (Sheep Creek)—Plans to install 30-ton concentrator on Emerald mine, to test ore.

VANCOUVER QUEEN AND KOOTENAY BELLE (Sheep Creek)—Long tunnel in 1,500 ft. with 300 ft. more to go to reach Queen vein. At 700 ft. Vancouver vein was reached and 200-ft. crosscut run east. Properties under bond to A. W. McCune.

STANDARD SILVER-LEAD (Silverton)—G. H. Alard, of Victoria, and Charles Hussy, of Spokane, vice-president and secretary, have inspected property.

INDEX (Slocan)—Elmer J. Edwards and associates, of Spokane, have bond on this and will incorporate in British Columbia. Installation of water-power plant, two-drill compressor, and buildings about completed. Deep crosscut tunnel started to reach four parallel veins.

RAMBLER-CARIBOO (Slocan)—Additional issue of 250,000 shares, recently added to capitalization, subscribed in full. On No. 9 level, across end line of newly purchased Jennie claim, 9-ft. vein exposed. No. 9 level carried along side line of Jennie claim for 130 ft. showing orebody 2 to 7 ft. wide. Sixty feet ahead of face of No.

10 level, a raise carried up from No. 12 shows same orebody, thus demonstrating continuation of new orebody for 220 ft. on strike and 150 ft. in depth.

SILVER BEAR (Slocan)—Francis Helme has given bond on this and Broughton claims to R. F. Green, who will develop them with adjoining properties.

SILVERSMITH (Slocan)—No. 8 level drift shows 12 ft. of good ore thirty feet west of new raise from No. 10 level. Superposed foot wall broken through and five feet more ore exposed.

GRANBY CONSOLIDATED (Vancouver)—June production of copper, 2,637,184 lb.; May, 1,848,892; June, 1918, 3,438,521.

Manitoba

GABRIELE (Rice Lake)—Shareholders approved increase of capitalization from \$100,000 to \$1,000,000. Treasury stock to be sold as occasion arises to obtain funds for development.

Ontario

KERR LAKE (Cobalt)—Shareholders have ratified by-law to reduce capitalization from \$3,000,000, with shares at par value of \$5, to \$2,400,000, par value \$4 per share.

CAMPBELL-FAIRBAIN (Gowganda)—Owners of this property, who are lessees of Foster, at Cobalt, are dismantling latter and removing mining plant to Gowganda.

DAVIDSON (Porcupine)—Shareholders at meeting held on Aug. 8 authorized plan submitted by directors for organization of new company under name of Davidson Consolidated Gold Mines, with capital of \$2,000,000, consolidating company's property with adjacent territory, enlarging area from 120 to 420 acres. Shareholders will receive bonus of one share of Consolidated stock for every share in original company. After issuing sufficient stock to pay for additional acreage, new company will have 1,000,000 shares in treasury, in addition to 125,000 cash. Of treasury stock, 500,000 shares will be underwritten at 75c net, to provide funds for extensive development and operation.

HOLLINGER (Timmins)—According to agreement with employees, company has begun building hospital and has taken over three stores, where goods will be sold at low prices.

SOVEREIGN (Timmins)—Preliminary development opening up promising orebodies. One vein reported 30 ft. wide. Shaft down 60 ft. Five thousand feet of trenching done.

VACUUM GAS & OIL (West Dover Township)—Has purchased leasehold adjoining producing wells of Union Natural Gas Co. in West Dover, which there are seven completed wells over 3,000 ft. deep, all producers.

MEXICO
Durango

AMERICAN S. & R. (Velardena)—Smelter operations ordered resumed.

Sonora

GREENE CANANEA (La Cananea)—Produced in July 2,200,000 lb. copper, 143,500 oz. silver and 700 oz. gold.

CHILE

CHILE COPPER (Chiquicamatá)—June production of copper 5,003,430 lb.; June, 1918, 9,280,000.

PERU

CERRO DE PASCO (La Fundicion)—July production of copper, 3,984,000 lb.; June, 4,026,000 lb.

BURMA

BURMA CORPORATION, LTD. (Nantun)—Lead production for June, 2,981 tons gross. Iron 5,284 tons of lead-bearing material (including secondaries); refined lead, 1,331 tons; refined silver, approximately 178,647 oz.

KOREA

ORIENTAL CONSOLIDATED (Umsan)—Tons milled in June at Tabowie and Tarsco mill 5,284 and 9,635 respectively. This was below normal for Paracel, owing to ore-transportation crew striking twice for higher wages. Crew now receiving same wages as before, which are good for this class of labor. Men scarce and difficulty expected in keeping full crew. Clean-up for June of \$84,832.05 positively low and will be low for July and August, owing to decision to run low-grade ore through plants during hot weather and rain season, which affect extraction. On Siribong power project 3,344 cu.yd. of masonry and cement was placed in dam during June.

13	21.75 @ 21.85	55 @ 56	5.50 @ 5.60	5 $\frac{1}{2}$	7.40 @ 7.45			

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—Aug. 13, 1919

The metal markets this week were rather feverish and were almost wholly in the hands of speculative interests, the principal producers being well booked with orders and holding aloof pending developments.

The hearings in Washington before a Congressional subcommittee with respect to transactions between the Government and the copper producers during the war, and afterward, continued. These hearings have developed no facts that were not commonly known when the arrangements were made, and apparently the present developments are for political purposes. No serious attention is given to them in the copper business.

Freight rates from San Francisco to Hongkong and Kobe were unchanged at \$12.

Copper

The principal producers made no sales. A rather large business was done, however, by the smaller agencies and by brokers handling speculative accounts and resales by consumers. In the effort to make a market, these parties made sharp concessions in price, and in the early part of the week there was some exhibition of real pressure. Speculators desired to liquidate their accounts, consumers were inspired to resell, and it was intimated that some copper held in storage here for the account of a foreign government was being offered. On the other hand, there was good buying by domestic consumers, who were moved to take advantage of the opportunity to secure what appeared to be relatively cheap copper. Some of the largest consumers bought. There was also some export business, which was done outside of the Copper

Producers' Association. Japan bought, and so did a European country. Germany inquired for a small quantity, but bid under the market, and, anyhow, the decline in marks made the consummation of German business difficult.

Toward the close the selling pressure eased off and the price stiffened a little.

British advices are to the effect that the copper and brass manufacturers over there are full with orders, but before the end of July they had covered their immediate requirements. Wire bars have been very scarce and have commanded a premium over other forms. The Government took no advantage of its stocks to hold prices in check.

Copper Sheets.—The base price of copper sheets is 33c. per lb. Demand strong. Copper wire is quoted at 26 $\frac{1}{2}$ c. in carload lots. f.o.b. mill.

Tin

Large arrivals of tin of 99 per cent grade began to come in on Aug. 8, which precipitated a sharp decline in the market. On the other hand, there was good demand by consumers, especially by tinplate makers, and toward the close there was a distinctly better tone.

Straits tin, August shipment, opened the week at 53 $\frac{1}{2}$ c., declined to 52 $\frac{1}{2}$ c., and closed at 53 $\frac{1}{2}$ @53 $\frac{1}{2}$ c.

Singapore quoted, c.i.f., London, as follows: Aug. 7, £271; Aug. 8, £270; Aug. 11, £263; Aug. 12, £273.

Lead

Large offerings of lead from second-hands reappeared, and buyers being hesitant, there developed some real pressure to sell at a great reduction in price. The principal producers, being well booked up, made no efforts to dispose of anything further, but there was considerable ground for the suspicion that the selling of this week was not confined to second-hands, but probably included some of the smaller producers.

Labor troubles are brewing in the mining district of southeastern Missouri, where the men demand recognition of the union and higher pay.

Zinc

This market was rather feverish and was largely the plaything of speculators. The advance to 7 $\frac{1}{2}$ c. last week did not hold at that figure for more than a moment, some pressure to sell developing immediately, which resulted in putting the market down to 7 $\frac{1}{2}$ c. during the afternoon of Aug. 11. At that price there was good buying both by

consumers and speculators, and a sharp advance again followed.

Zinc production has been sharply curtailed, largely by labor troubles, and at the moment is perhaps no more than at the rate of 30,000 tons per month. However, increased output is already in sight. The two smelters at Henryetta and the smeltery at Cherryvale are still idle, but the troubles at Meadowbrook and Clarksburg have been composed, and resumption of operations at those places is now being made.

Business in high-grade zinc is dead as a doornail in so far as producers are concerned, and is likely so to continue while the Government is selling its surplus.

The price for zinc in London declined further under German offerings. Belgian smelters cannot meet the present market over there and still less can the British smelters, whose costs were £56@£67 before the recent advance of 6s. for coal. The present British price is below our parity, so American smelters have no inducement to sell for export.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet.

Antimony—The market was dull and a little easier. We quote spot at 9@9½c. Futures were quoted at 8½@9½c, duty paid.

Bismuth—Metal of the highest purity for pharmaceutical use is quoted at \$3.10 per lb. for wholesale lots—500 lb. and over. No change.

Cadmium—Quoted at \$1.50 per lb. in lots of 500 pounds. For lots under 200 pounds, \$1.75 per lb. No business being transacted. No change.

Nickel—Ingot, 41c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—Quiet and steady at \$109. San Francisco telegraphs \$105; firm.

Silver and Platinum

Silver has ruled steady in London, with advancing tendency, and closes at 58½d. New York price has been firm, with China banks paying a premium over London market. The Secretary of State for India has announced that on and after Aug. 12, and until further notice, the Deputy Master of the Ottawa Branch of the Royal Mint, Ottawa, Canada, will sell on behalf of the Secretary of State for India immediate telegraphic transfers on India without limit of amount in exchange for gold tendered at the Ottawa Mint at the rate of 1 rupee for 10.3585 grains of fine gold. This raises the pound sterling value of the rupee from 1s. 8d., to 1s. 10d., and the pre-war value of 1s. 4d. This action by the British Treasury is in recognition of the sharp advance in the price of silver and an endeavor to make the exchange value of the rupee exceed the bullion value of the rupee.

Mexican dollars at New York: Aug. 7, 85½; Aug. 8, 85½; Aug. 9, 86½; Aug. 11, 86½; Aug. 12, 87½; Aug. 13, 87½.

Platinum—Refined, ingot, \$105.

Palladium—Unchanged at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., Aug. 9.—Zinc blende, per ton, high, \$56.80; basis 60 per cent zinc, premium, \$43.50; Prime Western, \$42.50; fines and slimes, \$40@37.50; calamine, 40 per cent zinc, \$30. Average settling prices: Blende, \$49.32; calamine, \$31.74; all zinc ores, \$49.04.

Lead, high, \$70.45; basis 80 per cent lead, \$67.50; average settling price, all grades of lead, \$63.13 per ton.

Shipments the week: Blende, 6,486, calamine 109, lead 1,746 tons. Value, all ores the week, \$438,880.

The ore settled for this week was largely of last week and the previous week's purchases, and though the basis price has rapidly declined, the average settling price has remained strong. Sellers practically forced to raise funds were about the only ones that accepted the offerings on \$42.50 basis this week. Buyers with full orders fell short of filling. The market closed with a strengthening tendency tonight, and at least one buyer is late in the market with orders to fill, possibly at an increased price.

Platteville, Wis., Aug. 9.—Blende, basis 60 per cent zinc, premium blende base and high lead blende base of \$45 per ton were authorized to buyers, but no open market sales are quotable, due in part to freight embargo ordered on account of railroad strike. Lead ore, basis 80 per cent lead, \$64 per ton. Shipments reported for the week are 2,288 tons blende, 197 tons galena, and 418 tons sulphur ore. For the year to date the totals are 61,216 tons blende, 3,675 tons galena and 9,547 tons sulphur ore. During the week 2,807 tons blende was shipped to separating plants.

Other Ores

Chrome Ore—In a little better demand and quoted at \$25 per ton, f.o.b., California points, or 80c. per unit, delivered in Pennsylvania, for ore running 40 per cent or better.

Manganese Ore—Market very dull, and, with ferromanganese on the downward grade, buyers are reluctant to contract for ore.

Molybdenum Ore—Nothing reported done. Quotations nominal at 75@85c. per lb.

Tungsten Ore—Charles Hardy reports that stocks of ore, mainly of foreign origin, in this country, exceed 5,000 tons, and that all the mines in California, Nevada, and Colorado are shut down. There was coloring but small business done this week. Chinese ore was quoted at \$7.25@7.50. Business in high-grade Bolivian ore was done at \$10.

Other Minerals

Nitrate—The average price is quoted at \$2.95 per cwt., carload lots, for immediate shipment, with only slight change for futures. Business is reported as dull for the present, and only

small quantities are being imported from Chile.

Pyrites—Spanish pyrites is quoted at 18c. per unit for furnace ore, c.i.f., New York or other Atlantic port, and 18½c. at Gulf ports. Market slow and unsettled; hand-to-mouth buying. Price will decrease with ocean freights.

Iron Trade Review

Pittsburgh—Aug. 12

The monthly ingot report of the American Iron and Steel Institute shows that in July there was produced 2,508,176 gross tons of steel ingots, by thirty companies which in 1918 made 84.03 per cent of the country's total steel-ingot production. This indicates that production by the industry was at the rate of 35,700,000 tons of steel ingots a year. Estimating capacity at 49,000,000 tons, this would represent 73 per cent of the productive capacity, against 67 per cent for June, 54 per cent for May, and 67 per cent for April. The estimate of 49,000,000 tons' capacity at this time is based upon actual output in 1916 plus allowances for new capacity. As production has been increasing rather steadily from week to week, the present rate of output may be taken at between 75 and 80 per cent; July showed 73 per cent. In some quarters the rate of operation is reported higher, due to a divergence in the capacity assumed. Thus the Steel Corporation regards its present operation as above 90 per cent, either through its not making full allowance for capacity added or through its regarding its 1916 production as in excess of a normal capacity rating. Such slight divergences are of minor importance, the important fact being that actual production is one-half greater now than at the middle of May, representing a remarkable increase for less than three months.

An unfavorable feature of the situation is the fact that the buying pressure is by far the greatest in the lines which were already fairly well sold up several weeks ago, whereas it remains light in the lines in which orders have been light right along. Wire products, pipe and sheets belong to the former category; rails, shapes and plates to the latter. The circumstances suggest that some of the buying occurs because buyers are afraid that otherwise they would not secure timely deliveries. Such a condition, however, has featured every regular buying movement in the steel trade.

The Steel Corporation's unfilled obligations at the end of July amounted to 5,578,661 tons, indicating an increase of 685,806 tons during July, against an increase of 610,545 tons during June, and fairly uniform decreases, averaging 640,000 tons a month, from December to May inclusive. The tonnages, however, include contract obligations as well as actual shipping orders, and contracts may or may not be specified against. The corporation has sometimes had a fair operation when it was booking no contracts at all, merely re-

ceiving shipping orders and specifications against contracts previously entered.

Throughout the iron and steel trade a more conservative feeling as to the immediate future is manifested, it being recognized that the increasing unrest of labor and the universal demand for a reduction in the cost of living are influences tending to defer the making of investments in large construction projects on which, in the long run, the steel industry must depend for a large part of its business. The recent buying of finished-steel products for ordinary every-day consumption has been remarkably heavy, and there is naturally a question whether such buying can continue indefinitely at the same rate.

Exports of steel products in June represented a rate of nearly 6,000,000 gross tons a year, in terms of finished rolled steel. Capacity is about 37,000,000 tons in rolled steel, and June production was at two-thirds capacity. Thus the steel exports represented about 16 per cent of the steel capacity and about 24 per cent of the production. In 1912, the best export year before the war, steel exports were about 2,400,000 tons, equal to about 10 per cent of the average capacity for the year.

Steel

Steel—Demand for sheet bars continues fairly heavy, consumers not being entirely supplied by their own production or by regular contracts. A sale of about 10,000 tons is reported, and a producer-consumer, normally with a slight surplus of sheet bars, is inquiring in the open market for 18,000 tons. Rolling billets are in light request, and there is a fair run of forging billet business, in the usual small tonnages. We quote: Billets, \$38.50; forging billets, \$51; sheet bars and small billets, \$42; slabs, \$41; rods, \$52.

Ferroalloys

Ferromanganese The market is quiet, with asking prices on 80 per cent at \$105, c.i.f. for English, and \$115, delivered, for domestic. The latter price would probably be shaded in case of any important inquiry.

Pig Iron

Pig Iron—The merchant furnaces in this general district that are in operation are comfortably sold up until almost the end of the year, and thus there is no pressure on the market, which, indeed, displays considerable strength. The market as a whole, however, cannot be considered strong fundamentally, when about 45 per cent of the country's merchant furnace capacity is out of blast. No doubt much of the idle capacity is awaiting a broader consuming demand, rather than higher prices, for it to get into blast, and though some districts, such as Birmingham and Chicago, have lately reported price advances, a different aspect may be created when idle furnaces begin to get into blast, at the same time selling backlog tonnages on which to operate.

Number 8

The High Cost of Striking

IF ONE word is used more often than another in the headlines of the press nowadays it is "strike." Just how many of the country's workers are out on strike is hard to determine, but the number must be large. And now we are threatened with a railroad strike which will tie up the country's transportation systems "so tight that they will never operate again" if the union demands are not met. What are these men striking for? In the vast majority of cases it is either for a reduction in the cost of living or for higher wages, and in the latter we include the demand for shorter hours, for the same pay is expected regardless of the shorter time worked.

The reasons for this social unrest are varied, but there is an important one which is given too little attention. The workingman cannot understand why he is not living better than before the war. As a matter of fact, in many cases he is; the theaters, baseball games, and seashore resorts are crowded as never before, and it is not the salaried men or the rich who are patronizing them more than usual. However, we will consider only the cases of those who are not living as well as formerly, but insist that their standard of living shall be raised instead of lowered. They do not understand that most of the war is yet to be paid for, and that until it is paid for the standard of living of everyone should equitably be lowered.

Millions of men and women were engaged for four years in work which did not add one iota to the sum total of human wealth. The result was a scarcity of the essential things of life, followed, of course, by higher prices. Prices will come down when goods are more abundant, and they will be more abundant when more people work at essential industries, or when they work harder, or longer hours.

Every time a man strikes he increases the average cost of living in the world; every week that he works forty-four hours when he should work forty-eight he makes things just that much harder for himself and for everyone else.

What the world needs is more production—the wages that a man gets are unimportant from the world viewpoint. It is just now better for the community if a man does nine hours' work for \$6 than eight hours' work for, say, \$4, provided he does not become so affluent that he lays off for a month or two.

The workingman must be educated up to the fact that the war must be paid for, that the only way to pay for it is by more work, and that the high cost of living cannot be reduced by selling a comparatively small amount of army supplies at cost, or by legislation. It is just as important to refrain from luxuries now as during the war if we want to keep the cost of living down. Every time we indulge in a luxury we make some one work for our pleasure who could better be employed in producing something useful.

The best service that the American Federation of Labor could perform would be to discourage and prevent all strikes for a certain period of years and to recommend that every one work overtime as much as possible. Production would increase, prices would come down, and profiteering would decrease. Profiteers do not thrive in a falling market. By striking for better conditions the workingman is increasing the cost of living for himself as well as for others.

Coal Producers Face Competition

MINING and metallurgical plants throughout the United States are feeling keenly the rise in cost of fuel. Demands for metals during the war made the rise from \$1 per ton at the pit mouth to \$2.75 per ton bearable, but now that the war demands have ceased, the further threatened rise, due to the demands of labor for a six-hour day and a five-day week, points toward serious difficulties. When an elastic band is stretched too far it breaks, and the fellows at either end get stung. Just so with the price of coal: it cannot be stretched beyond the elastic limit, or something decidedly unpleasant will happen. And that unpleasantness is going to be felt by the consumer, the coal-mine owner, and the coal miner.

That many consumers of coal feel that the price has gone beyond the economic limit is evidenced by the failure of the public to respond to the entreaties of Government officials and coal producers to order their winter coal now. The public may be mistaken. Perhaps the economic price of coal belongs where it is or even higher, but it appears to the consumer that it would be more to the point if operators would devote their selling energies to the task of convincing labor that the price of coal must not go higher, and that if labor wants greater compensation than it is now receiving the best way to secure it is by getting out additional tonnage per man employed. This will be a hard task if it can be done at all, for labor feels so thoroughly entrenched that it is prepared to defy operators rather than to listen to reasonable arguments from them. Labor's attitude seems to be one of antagonism rather than of assistance in this crisis.

There is, however, the possibility of relief to the consumer from an entirely outside source. Fuel oil, when once adopted, is seldom replaced by coal. Both mine owners and coal miners now face this formidable competitor, both as a fuel to be used under boilers, and the lighter forms direct in oil engines. The change from solid fuel to heavy petroleum for making steam is not an expensive operation. The installation of a modern high-class oil engine is costly, but once in place its economy of operation is apparent, and those employing it seldom revert to the use of coal.

The Atlantic ports are particularly favored for the

introduction of liquid fuel, because of the vast stores on the coasts of Mexico. Already Massachusetts manufacturers are considering its use. The Standard Oil Co. is building a large refinery at Providence, and another is being built at Charleston, S. C. The Sinclair company will build refineries at Boston, New York, and Philadelphia.

Our whole coast line is in a position to change advantageously from solid to liquid fuel; and the consumption of coal along our shores is no slight portion of our normal output.

Only a small quantity of the lighter fuels are distilled from the Mexican oils, but their amount is sufficient to more than pay the cost of transportation and refining, leaving a fuel residue that may be sold profitably at almost any price. Four barrels of heavy fuel oil are equivalent to about a ton of coal, and the cost of the former at any Atlantic port need not exceed the cost of carrying an equivalent weight of coal from the mines to the same port.

The Shipping Commission recently advertised for 34,000,000 bbl. of fuel oil for its vessels, the equivalent of about 9,000,000 tons of coal. It behooves coal operators to point out to their miners that the rising price of coal is encouraging the introduction of oil-burning plants and that at no distant date the miner may be begging for a week to be increased to six days rather than demanding that his working period shall be reduced to five.

The smelter and refiner may see a ray of hope in the possibility that the liberal substitution of oil for coal, by others, may increase the stocks from which their own supplies are drawn.

A Fable

IT HAPPENED that a Dog had got a piece of meat and was carrying it home in his mouth to eat it in peace. Now, on his way home he had to cross a plank lying across a running brook. As he crossed, he looked down and saw his own shadow reflected in the water beneath. Thinking it was another dog with another piece of meat, he made up his mind to have that also. So he made a snap at the shadow in the water; but as he opened his mouth the piece of meat fell out, dropped into the water, and was never seen more. Beware lest you lose the substance by grasping at the shadow."

Man has not changed in a thousand years. The fable has its counterpart in modern metallurgy:

"A Corporation once secured control of a useful process. It had an opportunity to render valuable service to thousands of smaller organizations engaged in the recovery of minerals. The small companies were willing to pay for the privilege of using the process, to pay a fair price, cheerfully, and for an indefinite period. They were ready to regard the large Corporation as a benefactor, a big brother, a powerful friend who extended to them a helping hand; one who could indicate to them a way to transform a doubtful venture into a profitable enterprise. The large organization was given the opportunity to make thousands of grateful friends, to render a great service, and to receive willing tribute which would have poured into its coffers in a steady stream to be measured in millions. The expenses of the large Corporation would have been small compared to its income.

"But the large Corporation was covetous and ex-

ortionate. These qualities blinded it to its opportunity. It lacked broad vision. It missed its chance. The small companies, that would have paid reasonable royalties willingly, were amazed, and then exasperated. Possible friendship was converted into enmity. Co-operation was replaced by opposition. Then followed estrangement and bitterness.

"And litigation without end."

The Chemical Foundation

CRITICISM has been offered both of the work and the objects of the Chemical Foundation, but it must have come from those not fully informed. At a meeting of the National Cotton Manufacturers' Association A. Mitchell Palmer related the experience of his office in tracing the ownership of the German chemical industry in the United States, and Francis P. Garvan gave the reasons for the acquisition of German-owned patents and the formation of an organization to own them.

Conan Doyle never wrote a story that held the reader's attention more closely until the last page was read than Mr. Palmer when he set down his experience of detecting the camouflaged ownership of German industries in this country. Moreover, in the latter's story was the added interest of truth surpassing fiction. The care with which German industry, supported and abetted by its government, had laid its plans to control all chemical manufacture and trade in the United States is fully set forth. And then, when the Great War started, perfect team work was shown in arranging, by legitimate means where practicable and by illegitimate means at other times, to keep out of their enemies' hands large quantities of munitions that would normally have reached France from this country. And still later is related the part that enemy aliens played in making our entry into the war of as little moment as possible. Not only did these things happen, but congratulatory letters were exchanged on the success of the perpetrator's duplicity.

We offer just one instance to illustrate the point. The following is quoted from a letter of appreciation addressed Dr. Albert, "Very Honorable Privy Councillor":

"The breadth of high-mindedness with which you at that time immediately entered into the plan has born fruit as follows: One and one-half million pounds of carbolic acid have been kept from the Allies; this equals 4,500,000 pounds of picric acid. This tremendous quantity of explosive was withheld from the Allies by your contract. (A contract that was, by the way, very profitable to its holders.) This is equivalent to three trains of explosives of forty cars each. Picture to yourself what a military coup would be accomplished by an army leader if he should succeed in destroying three trains carrying 4,500,000 pounds of explosives."

One's thoughts are divided between contempt for the authors who were capable of stooping to such means of gaining their objects, and admiration for the skill shown in working out the plans that succeeded.

Every American citizen should know of the work done by the Alien Property Custodian and the various Government departments that assisted in the work. A knowledge of what was found would be the strangest possible incentive toward the curtailment of importation of those things from Germany that can be made equally well in America.

The Chemical Foundation occupies about the same attitude to chemical industry that the Research Corpo-

ration holds toward metallurgy, and it merits corresponding support. It has taken over more than four thousand German patents, by far the greater part having to do with the manufacture of medicinal chemicals and dyes. There are many, however, that have a bearing on metallurgical operations and the manufacture of chemicals used in the treatment of ores.

We recommend to chemical and metallurgical engineers that they examine the list of patents now controlled by the Chemical Foundation. The rights for operating under these may be procured at trifling cost, and even this small tax goes toward the further development of the processes controlled.

Improving the Patent Office

MINING and metallurgical engineers will be interested in noting the progress being made by Engineering Council in its efforts to strengthen the Patent Office. With the co-operation of the National Research Council and the staff of the Patent Office, remedial legislation has taken form, and three bills have been introduced bearing on this question. H. R. 5011 detaches the Patent Office from the Department of the Interior and simplifies the procedure of the courts with reference to assessment of damages or profits for infringement. H. R. 5012 establishes a single Court of Patent Appeals, and H. R. 7010 increases the force and salaries in the Patent Office.

If legislators realized the importance of the proposed changes as do many engineers the proposed measures would be enacted speedily. Unfortunately, many legislators have not come into close contact with patent litigation, and fail to realize the crude condition of our laws. Unless advised of this by their constituents, and impressed by them with the necessity of revision, enactment will probably fail, or be indefinitely postponed.

National Highways

THE National Chamber of Commerce, because it has been strongly advocating a national highway system, calls attention to Senate Bill 1309, also introduced into the House, for the establishment of a national highway system and creation of a Federal Highway Commission.

To one point in the Chamber of Commerce report we take exception. It states that the national needs are "for interstate commerce, agriculture, postal delivery, common defense, and general welfare." Our exception is to the omission of the needs of mining operations, for they are as pressing as are any others.

Perhaps it is because of the small amount of direct revenue which mines yield to the states that their transportation requirements are generally overlooked by county and state authorities.

Many a prospect in the West has not been developed because of lack of roads, and many a small mine is small because no wagon or truck road reaches it. Throughout the Western states a small mine in an isolated locality must shift for itself until it becomes a rather large producer of ore or consumer of freight. Then county officials take notice, and a wagon road is built in time to take out the mill when it has passed into the condition of scrap.

In British Columbia they do things differently. Just as soon as the prospector in the North has shown enough

to warrant his building a cabin for himself, up comes the surveyor, and a pack trail is cleared out. Then, as soon as there is any real evidence of a commercial quantity of ore being developed, the provincial authorities either build or assist in building a road.

Our mines are a national not a state industry, and any national system of highways should provide for extensions not only for the benefit of moving agricultural products but for the movement and development of mineral wealth. A striking example of this necessity came to light in 1918, when it was found that the West possessed rather extensive chrome deposits, but owners were unable to move their ore because of its distance from good roads. The same was true to a greater or less extent with manganese.

We heartily approve of a National Highway System, but we insist that the movement of mine products is as essential as the movement of agricultural products.

In the bill as drawn the commission is to be made up of three members elected from different geographical sections of the country, "not more than two to be of the same political party." It would have been better had it read, "not one of whom should be of any political party."

It is intimated that the three \$10,000 commissioners are to be non-technical men, who are to have authority to appoint a chief engineer. This undertaking, if brought to fruition, will be one of strictly technical character, and though recognizing that engineers must be employed for laying out and doing the work, the spirit of the bill does not recognize that the commission should itself be made up of men already skilled in the science and practice of engineering. Perhaps a bill could not be passed wherein the best salaries were paid to men who understood the work they were called upon to perform, but it strikes us that the committee of the Chamber of Commerce, active in the campaign for national highways legislation, is of such calibre that it must see and know the importance of placing this work in the most competent hands available—the hands of engineers.

The Need for a Silver Exchange

THE United States is now the chief producer and distributor of silver, but the price of the metal is still regulated in London, where it has been controlled for many years. Has the time come when the producer shall have something to say regarding the price of his product?

It is evident that more adequate facilities for trading in silver, and stabilizing the price thereof, are needed. On page 301 of this issue of the *Journal* we publish an article by Srinivas R. Wagel, who suggests a medium whereby control over the price of silver may be exercised in the United States. We believe that Mr. Wagel's presentation will be read with interest, and we hope it may lead to instructive discussion and constructive criticism.

Citations

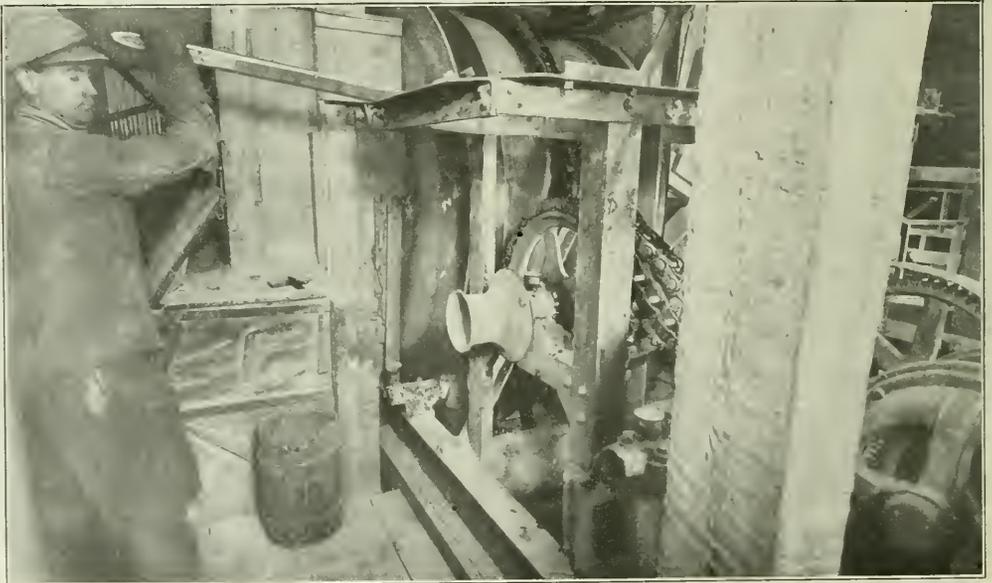

THOSE mining and metallurgical organizations which promised to re-employ, have re-employed, or are now re-employing their old service men who left to take part in the war are entitled to citations from the War and Navy departments. The Assistant Secretary of War requests that all employers who are entitled to this citation make application to him for it.

A Silver Exchange for New York

Unprecedented Demand for the White Metal, and the Passing of London as the Primary Market, Emphasize the Need of More Adequate Trading Facilities and of Stabilization Possible Only Through the Medium Suggested

BY SRINIVAS R. WAGEL

AFTER the demonetization of silver by the principal nations of the world, and the enthronement of gold as a sole standard of value, it was the general assumption that silver could play only a minor part in the currency of the world, serving principally as subsidiary money. Few believed in a war that, among other changes, would bring about a complete *volte face* in the relation between gold and silver and money. Gold no longer functions as the standard of value; it is not allowed even to circulate or to settle international balances of trade.

GOLD NOW ONLY A RESERVE

It is beginning to be realized that under conditions that are likely to prevail for the next few decades gold can serve only as reserve for circulation. Even as a reserve, it is unable fully to perform its function, because of the expansion in the issue of paper money, the circulation of which in all parts of the world is estimated at \$35,000,000,000—exclusive of Russia. But the total gold reserve, outside of the United States, is barely \$2,000,000,000. In countries like Spain, Italy, Norway, Denmark, and Switzerland silver performs the function of reserve side by side with gold. The only money in circulation consists of paper and silver. The demand for silver, principally for currency purposes, has been so great that the price of silver has actually doubled in the last three years. This demand is certain to increase with the settling down of the new states of Europe and the resumption of activity in the old countries.

UNITED STATES, MEXICO, AND CANADA SOLE SOURCES OF SILVER PRODUCTION

The only parts of the world where silver is produced in appreciable quantities are the United States, Mexico, and Canada. Nature has lavished upon these countries a wealth of silver; and the whole world is dependent upon their production to provide the metal needed for the regulation of its economic life. Canada is a poor third, because the production there is decreasing, the total for 1919 being estimated at less than 18,000,000 oz. The output of the United States and Mexico in 1919 will be about 120,000,000 oz. of the total estimated production of the world of 160,000,000 oz. But this total will be far from sufficient to meet the needs. The average offtake in India and China in a normal year is about 120,000,000 oz. In 1918, shipments from the United States ports to India and China amounted to 192,000,000 oz. Most of it, however, was contributed by the melting of silver dollars in the U. S. Treasury.

Every country is clamoring for silver, and the only way to meet the demand will be by the increased production from the mines of the United States and Mexico. Apart from the question of profits, it is imperative that the nations, many newly created, be assisted to get on a sound financial basis, and that

responsibility lies almost entirely with the United States. Enterprise in Mexico is three-quarters American, and both geological and political conditions necessitate development of the friendly influence of the United States in Mexico.

UNITED STATES CHIEF DISTRIBUTOR OF SILVER

In former years, although the largest producer in the world, the United States was content to let Great Britain distribute the metal and control prices. Today such distribution of the metal is being done mainly by the United States. In 1911 America sent 51,000,000 oz. to the United Kingdom, 9,000,000 oz. to Asia, and the remainder of 4,000,000 oz. to the rest of the world. In 1917 the United States sent 27,000,000 oz. to the United Kingdom, 50,000,000 oz. to Asia, and the balance of 2,000,000 oz. to other countries.

Direct exportation to the various countries is the present practice. Nevertheless, the price is still being regulated from London, except during the period of about twelve months when the Treasury fixed the maximum price, after consultation with British interests. The price of silver has for many years been determined by London, whatever may be the condition of the local market or the consuming markets of the world.

It has not generally been understood that the London dealers who acted as middlemen between the United States producers and the consumers in the various parts of the world have no interest in the high price of silver; that the British government in India, being the largest purchaser of the metal for coinage, is not likely to look with favor on any effort to maintain the price of the metal; that the China markets, controlled by European interests, will not favor the high price of silver, because it affects the volume of trade; and that a foreign market will not look with favor on any effort to benefit the producers of the United States. It is all very well to say that supply and demand regulate prices, but a great deal depends upon the regulation by the interests that act as distributors.

LONDON, BOMBAY, SHANGHAI, AND HONGKONG THE CHIEF FOREIGN SILVER MARKETS

The principal silver markets of the world outside of the United States are London, Bombay, Shanghai, and Hongkong. In all these places stocks are kept, and prices vary from day to day, according to the stock on hand, the volume of trade, the nature of the trade, and the demands of currency. London takes stock of all these conditions, and generally of the status of the New York market, in fixing prices from day to day. Except in special periods, prices in all of these places have always tended to stabilize themselves; for if the metal was cheaper in one place than another, the demand naturally went to that center to buy until the price was raised to the level prevailing in other countries. But the regulation was manipulated, so that the

tendency was always toward depressing the value of the white metal and ignoring the interests of United States producers altogether. London was not interested in a big demand for silver in India, China, or in any other country; the pound sterling was the medium of trade, and the lower the value of silver the better for the country that controlled the international medium of circulation.

It is not to be presumed that London had a deliberate plan for purposely keeping down silver prices, or to work against the interests of the United States and other silver-producing countries. It was purely a question of self-interest. London was a buying and distributing market, and it is only natural that such a market should take no pains to keep the price of silver at a high level. It is against human nature that a buyer should be anxious to pay a higher price than he has to. It is equally against all experience that the seller, as the United States has been in the silver market, should voluntarily lose all control over the trade in the commodity that he sells.

INSTABILITY OF STERLING EXCHANGE HAS MADE AMERICAN DOLLAR STANDARD OF VALUE

There has been a material change in conditions as a result of the war. The most noteworthy and important of all is the instability of sterling exchange. In former times, the only currency that had a fixed value, and in terms of which the moneys of the world were measured, was the pound sterling. At present, the value of the pound sterling varies from day to day, and the only currency that has any stability is the American dollar. In former times, it might have been valid to argue that the fixing of the price in sterling was the most logical proceeding. Today, such an argument cannot be considered sound.

The second important modification in conditions is the relative position of Great Britain and the United States in world commerce and international finance. Before the war, Great Britain was the greatest creditor nation; the United States, with all its wealth and resources, remained a debtor. Today the United States alone, of all countries, is the greatest creditor nation, and England owes as much as five billion dollars to America.

The third change is the elimination of London as the intermediary in international finance. In former times, every nation brought its surplus funds to London, and consequently all nations that wanted to borrow went to London to find accommodation. Great Britain, being a borrower today, cannot accommodate other nations, and both neutrals and belligerents are coming to the United States to obtain money and materials.

The fourth is, as I have already mentioned, the increased importance of silver in the currency of the world. When London was the money center of the world, the British Empire was, as is the case at present, the producer of two-thirds of the total output of the world's gold. When gold is no longer serving the purpose of a circulating medium, it is fortuitous that the United States should be the largest producer of the only metal that is the basis of the circulating metallic money of the world. No great argument is needed to show that the rehabilitation of the world is greatly dependent upon increase in silver production—in the United States and Mexico.

The United States can perform its full duty only if control of the market is firmly established. If

extraneous conditions and agencies should have the power to decide upon courses of action which will not be strictly in keeping with the interests of the United States, the country can do little or nothing but drift—as it has been doing for the last three or four decades. For instance, the price of silver has been at a materially low level for the last three weeks for no other reason but that sterling exchange in New York has been weak. This has nothing to do with supply and demand, and certainly not in the interests of American miners or trade. Still, the domestic market appears to have been helpless, because there is no agency by means of which it is possible to control the market.

Though there is legitimate complaint that the interests of all producers have not been safeguarded, it is neither fair nor advisable that the question should be treated solely from that point of view. Owing to the advent of new conditions, especially the part that the United States will have to play in the hegemony of the world, any proposed step should have an international import. Silver being for all practical purposes the only metallic circulating medium—for the present at least—the United States must consider not only domestic interests, but also those of the various nations with which America trades. Even within the United States itself, the interests of the miner, smelter, and dealer are not all identical; and, consequently, a plan for the better regulation of the silver market of the world should take into consideration not only the interests of the miners, smelters, and dealers in the United States, but also the consumers and traders in other friendly countries.

It is not often recognized that, although not producers of the white metal, India, China, and Spain have sufficient stocks to disorganize the market of the United States if American producers take advantage of the present demands to force prices up to unconscionable levels. India has been known as the sink of silver, and supposing, for argument's sake, silver goes up to \$2 per oz. there is no question that India can easily part with 500,000,000 or 600,000,000 oz. China, at a pinch, can sell over 100,000,000 oz., and Spain an equal amount—not to speak of the smaller European countries which have large stocks of silver. The international value of silver depends upon prices remaining high, consistent with stability, for at least a decade.

After careful consideration of all the points that I have detailed, it seems to me that the only plan by which it is possible to assure essential regulation of the silver market is that of creating a major market in New York—that to be achieved by the establishment of a Silver Exchange. It is an erroneous conception that this will mean a fight between London and New York. It is not at all improbable that the Exchange may lead to a closer co-operation between London and New York. Even before the war there were markets, independent of London, in Bombay, Shanghai, and Hongkong. Though there was interdependence between these markets, there were periods when it was cheaper to buy in Bombay or Shanghai than in London, although these two former markets were invariably supplied by London with the actual metal—originally shipped from New York. It was New York alone that had no volition and simply translated the London prices into United States currency.

The first essential of a sound market is that there should be equal facilities for both buying and selling. In all other silver markets, except New York, buying

and selling can be done to an extent several times that of the actual silver changing hands. New York alone has remained a selling market pure and simple. Such selling being in the hands of a few interests which have facilities for marketing in London, the great majority of producers are at times practically helpless. On the other hand, in London, Bombay, and Shanghai, where not an ounce of silver is produced, one can buy and sell a million ounces in a day.

It may be averred that these markets are speculative, and that it is an advantage that the United States has little or no speculation in silver. Anyone who is conversant to the slightest extent with economic principles will know that a market which is solely a buying or selling market can never be healthy, and that speculation is necessary to stabilize prices. This is evidenced by the operations in shares in the Stock Exchange, as well as in commodities like cotton, coffee, corn, and wheat in the several produce exchanges. If one follows the logic of eschewing speculation, there ought to be no selling market at all in London, Bombay, or Shanghai. That these markets both buy and sell in unlimited quantities, and have done so for decades, is proof positive of the fact that such is necessary and beneficial.

PRESENT PLIGHT OF THE SMALL PRODUCER

The actual condition of the silver trade in New York is almost deplorable. The larger interests that have connections in foreign countries, of course, are not affected by the present situation; but numbers of smaller miners find it absolutely impossible to sell their silver except at reduced prices and to the bigger concerns. By retaining the market in London, certain large interests are able to control almost the whole of the production in the United States and Mexico. By allowing London to distribute the metal, such organizations avoid or minimize competition in the United States. It is not to be presumed that such a course is intentionally pursued. I believe it was an accidental evolution, and that it is only natural that those who exercise control should be unwilling to give it up easily.

But the situation in every respect is changing rapidly. First of all, London in the past was able to offer certain advantages which our market was unable to give. The London dealers financed purchases in China, India, and other countries with the aid of their banks, acceptances. Today, they are unable to offer the same facilities. Furthermore, several countries in the world are anxious to do direct business with the United States, the banks of which are in the enviable position of being able to offer the credit facilities which London was able to grant in the past.

Banks and bankers from all countries would gladly purchase silver in the United States, and avoid the double freight, insurance and the middlemen's profit which they have been obliged to pay for in London. But their friendly offers are always spurned here. Why? Because those who buy in this market can do so only if they have opportunities of selling the silver, whenever necessary. Silver purchases, except for that part used in arts, are mainly exchange transactions.

It is well known that it is not always necessary to ship the metal in order to conclude such exchange business. When done in volume, the silver is resold frequently in large quantities. There are no facilities for resales here, and purchasers are reluctantly returning to London. If there were an organization like the pro-

posed Silver Exchange, purchases and sales could be made in large volume, as in other countries. Of course, care should be taken that speculation does not overreach itself. If purchases and sales are done by responsible parties, as, for instance, in the several well-established exchanges, speculation can always be kept at a healthy point.

In spite of the fact that the United States is the largest producer of silver in the world, the domestic silver trade is thoroughly disorganized. Concerted action even by the producers has many obstacles to encounter, owing to the special conditions prevailing in the market. There must be a mechanism to adjust the differences between the several parties interested in the silver trade, and such does not exist at present. The success of the trade depends on the smooth regulation of the differences between the producer, the dealer, the buyer, and the consumer. With the Silver Exchange in New York, all these parties could come together, and any differences could easily be adjusted.

The silver market will be healthy when the several points of view are disclosed to all those who have vital interests in the satisfactory progress of the commerce in silver. The main advantage of the Silver Exchange to the trade would be the creation of a buying market in the United States. As I have already stated, London buys and sells, and thus regulates the market. So also do the Bombay and Shanghai markets. For instance, if the consuming markets be dull, and it is known that the future is certain to bring about a good demand, the Exchange will be able to maintain prices by trading between the members.

CENTRALIZED TRADING WOULD PROVE A BENEFIT TO COMMERCE IN GENERAL

Of even greater import than this is the advantage that would accrue from having all the parties interested in the trade in one center. The buyers of silver come from all countries, and are generally banks of repute. It would add to the prestige of the United States if these buyers should deal here, directly or through representatives, and such direct representation would be not only a benefit to the silver trade but also to the general commerce of the United States with the rest of the world. New York is fast becoming a money center, and the establishment of the Exchange would facilitate this process.

With the changes brought about by the war, the trade of the United States is expanding, and it is the laudable ambition of American merchants to take their wares to all parts of the world. Incidentally, this means that they should buy largely in other markets. The Asiatic markets are not negligible, and if the American people are to trade with Asia they ought to have a correct appreciation of the silver position. Imports to China, for instance, although sold on a gold basis, are concluded on a silver basis by the Chinese dealers. Consequently, the American exporter must follow the silver market if he is to succeed. He must also operate in silver exchanges, as the Manchester dealers have done for a long time. How is it possible to do so if silver prices are controlled by London, and the Manchester dealers and other dealers of the European continent have the advantage over the American merchant? The merchants of the United States can develop the full strength of their position only if there be created a Silver Exchange in New York.

AMERICA SHOULD ENCOURAGE PRODUCTION OF SILVER

Silver is fast becoming the sole metallic money of the world, and as the wealthiest and most powerful country of the world, the United States has a responsibility which it cannot shirk. This responsibility lies in encouraging silver production in the United States and in adjacent countries in which the influence of the United States is potent. Such development will be greatly hampered if America does not exercise control over the price of silver, and such control cannot be obtained without a Silver Exchange.

Although it is beyond the scope of the producers or the consumers of silver to take direct interest in the international currency regulation, it may soon become necessary to make joint efforts at the present period of reconstruction, when silver bids fair to play a large part in the currency of the world. It is for the good of the world that the United States must maintain the lead which it has now attained, more by chance than by organized effort.

The American people must keep watch over legislation in Washington, as well as other countries, with regard to silver, and in every way make concerted efforts to protect the interests of that metal. Such efforts can be made successfully and results achieved, only if there shall be established a Silver Exchange in New York.

Audible Electric Signals in Industrial Plants*

Advantages of the Electric Horn With Code System Over the Ordinary Telephone for Notifying Employees When They Are Wanted

By V. KARAPETOFF

Professor of Electrical Engineering, Cornell University

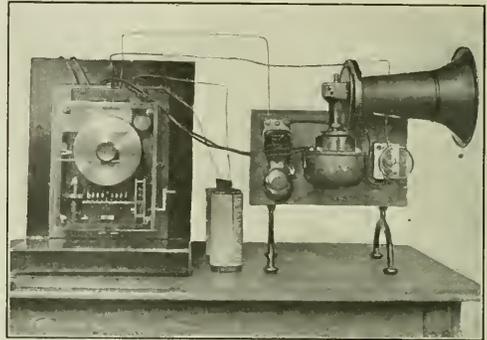

A PRIVATE telephone system, however extensive, promptly establishes communication with any important employee only so long as the needed man is at his desk. As soon as he leaves his desk the problem of finding him becomes a hit-or-miss proposition. On the other hand, a superintendent, a foreman, or a repair man is ordinarily useful only in so far as he can move about the plant or property freely, without the fear that someone of importance may need him.

An electric signal can be introduced for notifying heads of departments or foremen when they are needed at the head office, and it is similar in construction to the familiar electric "horn" used on automobiles. It consists of a diaphragm with an anvil at its center. A toothed wheel driven by a small electric motor strikes the anvil many times a second and causes it to vibrate vigorously. The device is provided with a projector or horn, the shape of which depends on whether it is desired to scatter the sound, to intensify it in a horizontal direction, or to deflect it downward. Such motor-driven signals are now made much more powerful than automobile horns, and are wound for 110 or 220 volts, direct or alternating current, so that they can be connected to a lighting or power circuit, and do not require a separate low-voltage battery.

When someone who may be anywhere in the plant is desired, the telephone operator simply sounds this particular man's call, whereupon he comes to the near-

est telephone, and reports, and the operator then connects him with the person at the other end. A special code-calling automatic instrument has been developed for this purpose. The operator merely sets the desired person's-code number on a dial and pulls a lever. A contact-making mechanism is thereby set in motion, which closes the electric circuit and operates the code signals throughout the plant the required number of times (usually three times) and it stops automatically.

A further application of loud electric horns in industrial plants is for extensions to telephone bells. The ordinary telephone ringer is not loud enough in

APPARATUS FOR USING THE ELECTRIC SIGNAL HORN

many shops when the foreman is away from his desk. In this case, a relay is connected in parallel with or in place of the telephone ringer, and when it is actuated it closes a secondary circuit, which causes an electric horn to sound. This call should be a single blast, to distinguish it from code calls.

A modern coal mine may have miles of passages and rooms underground, so that the superintendent and his assistants have to cover an extensive area. A system of powerful horns installed throughout the mine and connected to a code-calling instrument outside the mine would instantly convey any call, and the superintendent or whoever is called would come to the nearest telephone and report to the operator.

A further improvement of this system might consist in providing the superintendent, the foremen, the electrician and others with portable telephones, which could be connected to the line wires at any point. This is possible in many mines in which bare steel wires are used for the telephone circuit. In some mines, especially where rope haulage is used, the man on the train is given a piece of metal with which he short-circuits these two wires, and causes a signal gong to ring at the winding engine. In this case the telephones are connected through condensers, and electrical connections are used similar to those which permit simultaneous telegraphy and telephony over the same wires.

The same acoustic signals may be used for sounding emergency calls or for a general alarm, although the exact arrangement would have to be worked out separately to meet the conditions in each individual mine.

Rubber is one of the Few Commodities which has not advanced in price since the war began. The average New York wholesale price for Para Upriver fine grade in 1913 was about 92c. per lb. In July, 1919, the price was 55c.

*Abstract from a paper presented before the Rochester (N. Y.) Section of the American Institute of Electrical Engineers, Apr. 25, 1919.

An Automatic Iron-Ore Unloader

Electrically Driven Machines Are Used To Remove Iron Ore From Lake Carriers to Cars or Stockpiles Ready for Shipment to Furnaces—Entire Operation Automatic, And Controlled by Two Men

ONE of the most successful machines for removing iron-ore cargoes from Lake steamers that has been devised is the Wellman-Seaver-Morgan automatic unloader, shown in the accompanying illustrations. Although of large proportions, the design has been simplified, and the operation of the machine is such that excellent control is maintained at all times. The unloader consists of a main framework, mounted on trucks which travel along guide or runway rails, which extend back to the rear runway over a temporary storage pile, where the ore can be discharged if desired. Space is provided for railroad tracks between the front and rear runways, and cars placed under the machines

In addition to the main parts of the machine, there is also a hopper, placed at the forward end of the main framework and between the main girders, which receives the ore discharged from the bucket. The hopper, which has a capacity of about three bucket loads, serves as a balancing point for the ore between the bucket and the cars or storage as the case may be. The bottom of the hopper is provided with outlet gates, and the contents are discharged as required into a larry, which runs on an auxiliary track suspended from the under side of the main girders. The larry, after receiving its load from the main hopper, moves to a point where its contents can be discharged either into the cars stand-

EIGHT ELECTRICALLY OPERATED IRON-ORE UNLOADERS ON THE DOCKS AT ASHTABULA, OHIO

may be loaded with ore for transportation to the furnace plants.

The girders of the main framework form a support for runway rails. A trolley supporting a balanced walking-beam, from the outer end of which a stiff bucket leg depends, travels on the rails. At the lower end of the leg is the bucket, which is operated by machinery placed on the walking-beam. All horizontal movements of the bucket are accomplished by means of moving the trolley backward and forward on the girders, and vertical movements are effected by the operation of the walking-beam. When the forward portion of the beam is out of balance, the bucket descends by gravity as soon as the brakes of the hoisting mechanism are released. The hoisting-mechanism control is housed at the rear end of the walking-beam. Ropes from the winding drums of this mechanism pass around sheaves placed at the rear end of the trolley and are anchored to the walking-beam.

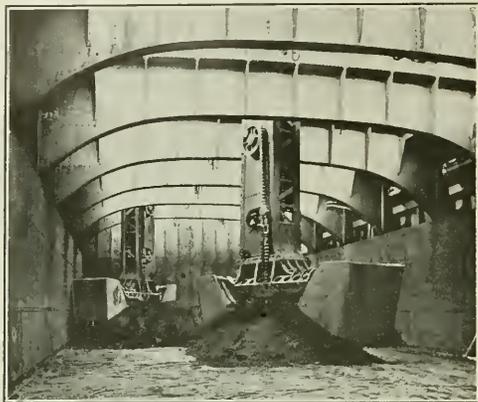

ing on the railroad tracks beneath the main span of the girders or into a temporary storage pile under the cantilever at the rear of the machines. The ore so placed in this temporary stockpile cannot be reclaimed by means of these machines, as their function is solely one of unloading the cargo from the ships.

Unloading machines of this type have been made in two sizes, the smaller size having a capacity of ten tons and the larger a capacity of seventeen tons in the bucket shells. The larger type of machine, such as shown in accompanying illustrations, is electrically driven throughout, and its speeds are regulated so as to complete the cycle of operation in about fifty seconds.

Some idea of the tonnage unloaded by this method may be gathered from consideration of a record that was made at Ashtabula, Ohio. Eight machines, having a capacity of fifteen tons each, unloaded seven boats, at a total capacity of 70,000 tons, in twenty-two hours' actual time. At other points, four machines, working

in boats having capacities as high as 13,000 tons, have unloaded these cargoes in about three hours and twenty-five minutes.

The operation of the machine is as follows: After the boat has been docked, the machine is moved opposite one of the hatches and the bucket is lowered through the hatch into the ore. As soon as the bucket is filled, the walking-beam hoist mechanism is put in operation and the bucket hoisted out of the boat. Simultaneously, the

HOLD OF IRON-ORE BOAT, SHOWING BUCKET LEG OF UNLOADER IN THE ACT OF SCOOPING ORE

trolley moves back so that the bucket is brought over the main hopper between the girders in the main framework, and the contents are discharged into the hopper. The bucket is then immediately returned to the boat for another load. The ore in the main hopper is discharged into the larry, which has been brought to a point directly underneath the discharge gates of the hopper. The larry hopper is filled, and the larry moved over the desired discharge point, where the gates are opened to discharge the ore as required. The hopper is provided with scales so that the contents are accurately weighed and recorded. In this manner, a car can be loaded to capacity and an accurate record kept, thus eliminating the necessity for the use of track scales.

If railroad cars are not available for immediate shipment, the larry is moved to a position on the rear cantilever and its contents are discharged on a temporary storage pile, from which the material is usually reclaimed for shipment or storage by means of a bridge, situated on the runway at the rear of the unloader.

UNLOADING OPERATION CONTROLLED BY TWO MEN

Only two operators are required for the entire operation of one of these machines. One occupies a station in the bucket leg directly over the bucket shells, and controls all of the motions of raising and lowering the bucket, of traveling the trolley back and forth, and moving the machine along the dock from one hatch to another. The second operator is stationed in a cab on the larry, and controls the movement of the larry, the operation of the larry gates, and the weighing of the ore.

The bucket shells are each made of a single piece of plate and are usually provided with manganese-steel cutting lips, which are essential to resist the abrasive

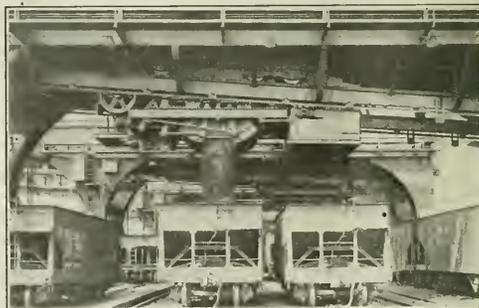

action of the ore. The shells themselves are carried on heavy cast-steel arms mounted on rollers that travel in guides in the fixed portion of the lower end of the bucket leg.

The motor used to operate and close the bucket is situated in the machinery house at the back of the walking-beam. Ropes from the bucket-closing mechanism are carried through the walking-beam and the bucket leg and are attached to a power drum in the bucket leg directly over the operator. This drum is geared to the closing chain drums. The bucket is closed by rotating the drums in the proper direction and opened by reversing the motor, which forces the bucket shells apart by means of an opening chain placed in the center of the bucket leg between the two closing chains.

UNLOADING FACILITIES OF BUCKET LEG

In addition to the vertical movement, which is given to the bucket leg by means of the walking-beam, it also has rotation about its vertical axis. This is accomplished by means of ropes attached to a segment on the bucket leg itself, the ropes being carried back in the walking-beam to a rotating mechanism placed adjacent to the bucket-closing mechanism. This motion is introduced for the purpose of turning the bucket at right angles to the hatchway to secure as great a reach lengthwise of the boat as possible, so that the bucket is enabled to reach out under the hatches and remove the ore not directly beneath the hatch opening. The distance from point to point of the bucket shells when open is approximately twenty-one feet.

The scale larry, into which the main hopper discharges, has a capacity of between thirty-five and forty-five tons, and two larry loads constitute a full carload of ore. The discharge gates of the larry are suspended from the sides of the larry frame and are operated by connecting rods which attach to cranks, also connected to the main larry frame. The gates are operated by means of a small motor which is carried at the rear of

SCALE LARRY DISCHARGING ORE

the larry, and are so arranged that all or a portion of the contents of the larry may be discharged. The hopper of the larry is suspended in the frame on scales so that the contents may be wholly or partly discharged and be accurately recorded.

The mechanism for moving the larry back and forth on its track is also situated on the larry and consists of winding drums upon which ropes are wound, the end of the rope being attached to the rear end of the cantilever on the main framework.

Although usually electrically driven, these machines have been made to operate by steam and hydraulic cylinders, water being supplied to the operating cylinders by means of a steam accumulator, which furnishes water at a pressure of 1,000 lb. per sq.in. The electrically operated machines are usually designed for a 220-v. direct current. Alternating current is never used. Motors required for the equipment of one of these machines are as follows: Beam hoist, 1 motor, 275 hp.; bucket closing, 1 motor, 120 hp.; bucket rotating, 1 motor, 25 hp.; trolley travel, 1 motor, 120 hp.; hopper gates, 1 motor, 100 hp.; longitudinal travel, 1 motor, 100 hp.; larry travel, 1 motor, 150 hp.; larry gates, 1 motor, 40 hp.

The regulating equipment for the motors is of the magnetic-switch type throughout, having master controllers placed in the operators' cabs in the bucket leg and on the larry.

Current is conducted to the machine by means of insulated rails running the length of the main runways, being collected from the rails by means of pick-up shoes and distributed to the various parts of the machine. A similar collecting device is also employed for supplying the main current to the trolley. Conductor rails are attached to the main framework, and the current is collected by means of pick-up shoes attached to the trolley.

ADVANTAGES CLAIMED FOR UNLOADER

Among the points of superiority claimed for the Wellman-Seaver-Morgan ore unloader are the following: The design is heavy. There is little to get out of order, which results in a low maintenance cost per ton of material handled. The control is accurate and positive, and manual labor is reduced to a minimum. The bucket is positively guided in passing through the hatches of ships, thus eliminating the danger of damage, either to the boat or to the machines, arising from the use of rope-suspended buckets. The operator travels with the bucket into the boat, and can always see exactly what he is doing. The bucket is of large capacity, but is so suspended from the walking-beam that the weight resting on the tank top of a boat is less than one-third of the weight of a rope-suspended bucket of equal capacity. In fact, it is impracticable to use a rope-operated bucket of the size attained on these unloaders.

An important consideration is the low operating cost obtainable with these machines. Records extending over long periods show unloading costs ranging from 2½ to 4½c. per ton, which includes superintendence, labor, repairs, and materials on the machines, as well as the cost for power and light.

Owing to the extreme reach of the bucket, it is possible for the machine to discharge a much higher percentage of a ship's cargo than can be accomplished by ordinary rope-operated buckets. The bucket can be rotated at right angles to the hatch and reach out for ore which would be entirely inaccessible to an ordinary bucket.

Mining in Colorado in 1918 and 1919

During 1918 Colorado mines produced \$12,705,000 in gold, 6,900,000 oz. of silver, 66,000,000 lb. of lead, 6,190,000 lb. of copper, and 86,550,000 lb. of zinc, according to statistics compiled by the United States Geological Survey. The statistics for 1919 will show a considerable decrease in the output of all metals

in the state. The production of gold alone will decrease at least \$2,000,000.

If production is continued at the rate maintained for the first five months of 1919 the mines of Cripple Creek, which produced \$8,125,000 in 1918, will produce \$1,500,000 less in 1919. The Telluride district, which for several years has been the most persistent producing district in Colorado, will probably not equal its output of 1918, for the prevalence of influenza and lack of electric power reduced the output considerably during the winter and spring. The recent resumption of work at the Humboldt mines will help to maintain the output of silver.

The closing of the Smuggler mine and the idleness of the Wasatch mill, at Silver Plume, will mean a greatly reduced output of silver, lead, and zinc from Clear Creek County. Though development work and production in Gilpin County have been resumed, the closing of the Argo mill, at Idaho Springs, and of the associated Fremont mine will cause a decrease in the production of gold which can be offset only by increased production at several mines.

At Leadville, the closing of the Iron Silver Mining Co.'s mines and the Greenback mine and the abandonment of the Western Mining Co.'s operations will entail a greatly reduced output of silver and zinc from the district. The cancellation of contracts for manganese to be supplied from this district has resulted in the suspension of the shipments of lead-silver ores from mines at which manganese was a product.

The low price and the lack of market for lead and zinc have resulted in the closing of the Wellington mine, at Breckinridge, and the Eagle mines, at Red Cliff. The snowslides and fire at the Sunnyside mine, at Silverton, have handicapped operations there. The removal of the pumps from the lower levels at Aspen naturally indicates a heavy decrease in the production of silver-lead ores in that district. The shipments of silver ore from Creede have not equaled those of 1918.

Development work is being done in several districts. The silver output of Boulder County may show a small increase and the Camp Bird mine, at Ouray, may resume milling during the year. Development is continuing at many mines that have stopped shipments until the prices of metals increase.

The closing of the Globe smeltery, at Denver, will put an additional burden of freight charges on shippers from Boulder, Clear Creek, and Gilpin counties, who will now ship to Pueblo. Only four lead smelters are now operating in Colorado, none of them at full capacity, and some at less than half capacity.

July Pig-Iron Production

July pig-iron production amounted to 2,428,541 gross tons, or 78,340 tons daily, as compared with 2,114,738 tons, or 70,495 tons a day, in June, according to *Iron Age*. There was a net gain of 39 stacks during the month, 46 being blown in and 7 blown out. The estimated capacity of the 239 furnaces in blast Aug. 1 is 85,635 gross tons, as compared with 200 furnaces, having a capacity of 71,700 tons, active on July 1. Of ferroalloys 14,805 gross tons were made, this rate of production now having held for a full quarter. Output increased 55 per cent in the Wheeling district, 45 in New York, 23 in the Mahoning Valley, 19 in the Pittsburgh district, 13 in the Shenango Valley, and 10 per cent in the Chicago district.

Determination of Magnetite in Matte and Slag

Troubles Caused by Magnetic Oxide—Qualitative Tests of Little Significance—Quantitative Method Has Been Proved To Be Sufficiently Accurate,
And It Is Also Rapid

By F. G. HAWLEY

Chief Chemist International Smelting Co., Miami, Ariz.

MAGNETITE is a common though undesirable constituent of most copper furnace charges. It may originate in the raw ore treated or be formed during some of the smelting operations. As magnetite is chemically rather inert, it does not readily combine with the other elements of the charge, and because of its high melting point it has a tendency to collect in granular particles. As the smelting proceeds, part of it enters the slag, part enters the matte and some of it may collect in rather large pasty masses and float on top of the matte. This prevents a good separation and may be the cause of high slag losses.

A qualitative test for the presence of magnetite in slag is sometimes made by means of a magnet, but such a test is of doubtful significance, as many samples will be quite strongly magnetic though containing little magnetite. Generally the sample will be contaminated with minute particles of iron from the grinding machinery, that adhere so strongly to the particles of slag that the two are attracted to the magnet as one. Other compounds of iron that are quite magnetic are apt to be present, such as particles of matte which are frequently magnetic even when no magnetite is present. Possibly the most reasonable explanation of this is that most matte contains an excess of iron in the form of a solid solution of Fe in FeS.

The following experiment will give some idea of how misleading a test for magnetite by means of a magnet may be: A sample of converter slag known to contain considerable magnetite was ground to pass a 100-mesh sieve, and tested by a small and rather weak permanent magnet. Over 90 per cent was magnetic enough to be removed in this manner. A partial analysis of this slag gave: SiO₂, 23.4 per cent; Al₂O₃, 3.9; Fe, 45.8; Cu, 3.5. It is certain that the SiO₂ would be combined with more than its own weight of FeO to form silicate, so it is obvious that there could not possibly be over 30 to 40 per cent of magnetite present. Its amount was afterward found to be approximately 24 per cent.

A reliable quantitative method for the determination of magnetite in slag or matte would frequently be very useful, but so far as I know no simple method has been published.

Several years ago I devised such a method, and it has been improved and pretty thoroughly tested since, so that now I feel justified in offering it to others who may have occasion to make the determination. Extreme accuracy is not claimed, but I believe it to be capable of giving results that are sufficiently near the truth to be of considerable value in commercial work. Duplicate results will usually check to within 0.1 to 0.2 per cent, but probably the absolute accuracy is not greater than 0.5 to 0.6 per cent. The method is in frequent use at two large copper smelteries and is giving satisfactory results.

It is a well-known fact that when magnetite is dissolved in a strong acid such as HCl it forms one mole-

cule of ferric iron and one molecule of ferrous iron, thus: Fe₃O₄ + 8 HCl = Fe₂Cl₆ + FeCl₂ + 4H₂O. The formula for the ferric chloride can also be written 2FeCl₃ but the result is the same, for in either case two items of ferric iron are shown.

It occurred to me that there was little or no ferric iron present in either matte or slag except that contained in magnetite, and that by determining the amount of ferric iron present a fairly close approximation to the amount of magnetite could be calculated. The presence of metallic iron or matte would interfere, but a way was found to overcome that difficulty.

Probably everyone will concede that there can be no ferric iron in matte except that present as magnetite. It may not be quite so apparent that this must also be the case with slags, but consideration of the following facts has led me to believe that it must be at least approximately true:

At high temperatures the tendency of most chemical combinations is to dissociate and form new compounds in which the elements have lower valences. It is very common to have heat alone act as a reducing agent. Thus at high temperatures, CuO is reduced to Cu₂O, MnO₂ to Mn₂O₃, As₂O₅ to As₂O₃; SO₂ to SO, and Fe₂O₃ to Fe₃O₄. Ferrous oxide is a much stronger base than ferric oxide, and at the temperature at which slag forms ferrous silicate is much more stable than ferric silicate. When ferric oxide alone is heated to a very high temperature it is reduced to Fe₃O₄, even when no reducing agent is present, but if silica is mixed with ferric oxide it is further reduced to ferrous oxide, which combines to form ferrous silicate. The presence of lime or alumina does not alter this tendency.

Magnetite itself is a rather stable compound that does not easily react with other substances. It resists both oxidation and reduction better than other iron compounds.

In ordinary furnace practice slags are almost always formed in contact with some reducing agent. In the blast furnace there is carbon, carbon monoxide, sulphur dioxide, and a small amount of sulphide dissolved in the slag, all of which have a reducing action.

In reverberatory smelting the conditions for reduction are not quite so favorable, but there is always sulphur dioxide and the dissolved sulphide present. F. W. Clark¹ quotes Vogt as stating that hematite rarely if ever occurs in furnace slags.

DETERMINATION OF MAGNETITE IN SLAG

The method for determining magnetite, as applied to slag, is as follows: Grind the slag to about 100 mesh and weigh 0.5 to 1 gm. into an Erlenmeyer flask of about 175 cc. capacity. Prepare a mixture of equal parts of concentrated nitric acid and a 15 per cent solution of sodium chlorate in water. Heat this nearly to boiling and add about 20 cc. to the sample in the

¹"The Data of Geochemistry," 3d ed., p. 347.

flask; shake a little to prevent sticking to the glass and then heat just to boiling; remove and quickly dilute with about 100 cc. of cold water.

The sulphide and metallic iron are now in solution while all but a trace of the magnetite is in the insoluble residue.

Let settle a few minutes and decant through a small filter; wash several times by decantation and also wash filter until free of acid. Add 7 cc. of water to the flask and cover with a platinum dish, or anything else suitable; set on a wire screen placed over a flame and heat to boiling to expel most of the air. Remove the cover an instant and add approximately 10 cc. of a previously prepared mixture of one part hydrofluoric and three parts hydrochloric acid which is mixed in a platinum dish and heated quite hot before using. If much magnetite is present, more hydrochloric acid may be needed. Replace the cover and heat to boiling as quickly as possible; remove the filter that contains the small portion of slag that was filtered out, tear off as much of the clean portion as possible and place the rest, containing the residue, in the flask. Boil until the sample appears to be entirely decomposed and the filter is disintegrated, then add about 5 cc. of a saturated solution of boric acid in warm 50 per cent HCl. While still boiling, titrate with a standard solution of stannous chloride from a burette so placed that the tip is just at the mouth of the flask. The solution is run in rather quickly, with constant shaking, until the yellow color of the ferric chloride can scarcely be seen. At boiling temperature and under the conditions given, the end-point is quite sharp, and there is little difficulty in telling when it is reached.

From the equation $\text{Fe}_2\text{O}_3 + 8\text{HCl} = \text{Fe}_2\text{Cl}_6 + \text{FeCl}_2 + 4\text{H}_2\text{O}$ it is seen that 2Fe in the ferric state are equivalent to one molecule of Fe_2O_3 ; therefore the iron value of the stannous chloride solution $\times 2.073 =$ magnetite.

The time required for a determination by this method is not long, and a little practice is all that is needed. After the apparatus is assembled and the solution standardized, one assay can easily be made in 20 minutes and three or four assays may be made in half an hour.

When it is desired to determine magnetite in matte the method is modified as follows: Weigh 0.5 to 1 gm. of matte into a flask as before. Dissolve 3 cc. of bromine in 3 cc. of acetic acid and add to the flask, shake to mix, and let stand about 10 minutes in a warm place. Add cautiously about 20 cc. of the same dilute nitric acid and chlorate solution as used for slag; heat just to boiling and proceed exactly as before. The sulphide of the matte may be dissolved with the chlorate mixture alone without the use of bromine, but the results are more satisfactory when the latter is used. The solvent effect of bromine on magnetite is very slight. The presence of a few flakes of unoxidized sulphur does not seem to have any harmful effect on the determination.

Slag or matte that has weathered on the dump for some time will be oxidized, so it is not advisable to try to determine magnetite by this method on any except fresh samples.

To make the standard solution, dissolve 21 gm. of hydrated stannous chloride ($\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$) in 100 cc. of water + 55 cc. HCl + 5 gm. of tartaric acid, and then dilute quickly to two liters and place in a closed bottle; 1 cc. is equivalent to about 0.005 gm. of Fe.

To minimize as far as possible the oxidation caused by contact with air, the solution should be kept in a five-pint bottle, with the burette permanently attached, so that it can be filled by forcing the solution up through a rubber tube by means of compressed air from a rubber bulb. If it is desired to keep the solution for some time it is well to attach a tube or bottle containing an alkaline solution of pyrogallol acid to the inlet air tube to absorb the oxygen.

To standardize the solution, weigh out 700 mg. of ferrous ammonium sulphate, which contains 100 mg. of Fe, into a small flask; add 15 cc. of water, 7 cc. HCl, and when dissolved add 5 cc. H_2O_2 , or enough to oxidize the iron. Set on the hot plate and boil for five minutes to completely decompose the excess H_2O_2 . Add a few drops of HF and 5 cc. of H_2BO_3 solution, so that the conditions approximate those of the regular assay; then titrate with the tin solution. It is generally necessary to standardize the solution every day.

Magnetite could be used as the standard, but it should be remembered that most of that found in nature contains considerable titanium, whereas that formed in smelting operations contains but little.

The presence of boric acid is not absolutely necessary, but is beneficial, as it combines with the HF and has a tendency to retard oxidation; it also counteracts the bleaching effect of the HF on the ferric iron and retards the etching of the flask. Of course the HF will attack the flask considerably, but usually one flask will last for 15 to 25 determinations.

PROOF OF ACCURACY OF THE METHOD

Following are some tests made to determine the solubility of magnetite in the nitric-acid mixture used to remove sulphides. A sample of nearly pure magnetite was ground to 150 mesh in an agate mortar, and samples were weighed and treated in beakers with the acid for varying lengths of time. The assay was then diluted, filtered and the amount of Fe found in solution.

The acid used was concentrated HNO_3 diluted with an equal volume of a 15 per cent solution of NaClO , in water.

SOLUBILITY OF MAGNETITE IN NITRIC ACID MIXTURE

Acid Used	Time Boiled	Magnetite Taken	Magnetite Dissolved
1. 25 cc.	6 min.	500 mg.	22.0 mg.
2. 10 cc.	10 min.	20 mg.	1.5 mg.
3. 10 cc.	1 min.	20 mg.	0.8 mg.
4. 5 cc.	1 min.	20 mg.	0.7 mg.
5. 10 cc. Conc. HNO_3	4 min.	500 mg.	22.0 mg.
6. 5 cc. Conc. HNO_3	10 sec.	500 mg.	2.0 mg.

Another experiment was made on crystallized magnetite found in the walls of a reverberatory furnace, ground to 100 mesh.

EXPERIMENT ON CRYSTALLIZED MAGNETITE

Acid Used	Time Boiled	Magnetite Taken	Magnetite ^a Dissolved
1. 10 cc. HNO_3 + 15 per cent chlorate	2 min.	500 mg.	5.0 mg.
2. 10 cc. HNO_3 + 15 per cent chlorate	Just boiled	500 mg.	2.0 mg.
3. 10 cc. HNO_3 + 15 per cent chlorate	Just boiled	20 mg.	0.5 mg.
4. 3 cc. HF + 2 cc. H_2O	3 min.	400 mg.	170.0 mg.
5. 3 cc. HF + 2 cc. H_2O	15 min.	400 mg.	90.0 mg.

From these figures it may be seen that when but little acid is used and it is not boiled long the loss due to solubility is small.

Numerous tests were made to see if any error would be caused by oxidation of the solution of magnetite by the air, either before or during titration, or from any reducing action the filter paper might have. It was found that if the directions were followed no trouble need be feared from either condition.

In order to see how the method would check on

synthetic samples, the following was tried: A sample of slag was selected as free as possible from magnetite and matte, and run in the ordinary way. This gave 0.4 per cent of ferric iron, which is equivalent to about 0.8 per cent of magnetite. Several samples of this slag were weighed out and varying amounts of magnetite added. This magnetite was not pure but contained 97 per cent of Fe_2O_3 .

SLAG WITH ADDED MAGNETITE

	Magnetite Found, Per Cent.
1. 1 gm. slag + 0 magnetite.....	0.7
2. 1 gm. slag + 0 magnetite.....	0.8
3. 1 gm. slag + 1 per cent magnetite.....	1.7
4. 1 gm. slag + 2 per cent magnetite.....	2.9
5. 1 gm. slag + 2 per cent magnetite.....	3.0
6. 1 gm. slag + 4 per cent magnetite.....	4.3
7. 1 gm. slag + 4 per cent magnetite.....	4.6
8. 1 gm. slag + 10 per cent magnetite.....	10.2

It has already been pointed out that under the conditions of slag formation it would be impossible for any considerable amount of ferric iron, other than that contained in magnetite, to be present. However, it should be remembered that the reactions, in which ferric iron is reduced to ferrous, are reversible and that under these circumstances it might be possible for a normal slag, free from magnetite, to contain a very little ferric iron.

A good many experiments were made in trying to test this point. The experiments, though not absolutely conclusive, seemed to indicate that in most cases there was from 0.3 to 0.7 per cent of ferric iron present, exclusive of that in magnetite.

In one experiment, several samples of slag were ground quite fine in an agate mortar, the magnetic particles removed with a magnet, and then the ferric iron determined in the residue. The most satisfactory way found to remove the magnetite was to place about 10 gm. of the sample in a small porcelain crucible with about 10 cc. of gasoline. The sample was stirred with one pole of a straight-bar electro-magnet, tapped a few times, and the magnetic portion removed. The gasoline was then decanted and the residue dried. By working under gasoline in this manner the tendency of the non-magnetic particles to adhere to the magnetic particles is partly overcome. Tests for ferric iron in the non-magnetic residue gave about 0.4 per cent for blast furnace slags and 0.6 per cent for reverberatory slags.

It was thought desirable to check these figures by a different method, so an attempt was made to decompose the slag without dissolving the magnetite and then to determine the ferric iron in the solution.

Samples of properly chilled slag rather low in magnetite and known to decompose very easily were treated with warm dilute sulphuric acid and a little silver sulphate added, to combine with any H_2S that might be evolved. The solution was then quickly decanted and the ferric iron in both the solution and the residue determined. Of course this method is not very accurate, as with even a short treatment some magnetite will be dissolved. However, some separations seemed fairly good, and these in a general way checked pretty well with those obtained after removing the magnetite with a magnet.

I think there is warrant for assuming that all ferric iron found in matte and nearly all of that in slag is derived from magnetite. Probably there will be present in slag a few tenths of 1 per cent of ferric iron combined as ferric silicate, but, if desired, a deduction can be made for this small amount before calculating the results to magnetite.

The Sources and Uses of Cadmium

The U. S. Geological Survey has recently published a twelve-page pamphlet entitled "Cadmium in 1918," by C. E. Siebenthal, which contains much valuable information on the sources, production, prices and uses of this comparatively rare metal. During the war, cadmium was used as a substitute for tin and nickel to the extent that its production permitted.

Germany and the United States are practically the only producers. No commercial cadmium ores are known. The metal is a byproduct of the zinc industry, practically all spelter containing a fraction of 1 per cent of cadmium, which could be sold as such if the demand warranted. The production of cadmium in this country has never amounted to much over one hundred tons per year, but it could easily be increased to four or five times this figure. Practically none has been imported in recent years. The price at present is about \$1.50 per lb., though before the war it was considerably cheaper, selling as low as 53c. in 1909.

Cadmium lowers the melting point of alloys in which it is used, and is therefore employed in making easily fusible alloys and soft solders, such as those used in the fusible plugs of automatic sprinkler systems, boilers, and electric fuses. Cadmium can replace tin in solders, a solder of the composition lead eighty parts, tin ten parts, and cadmium ten parts having much the same properties as one composed of equal parts of lead and tin, and also being somewhat cheaper at present prices. It is suggested that better results can be secured in nickel plating by making the first deposit of cadmium, as it is a better rust preventive than nickel, though it tarnishes more easily. About one-fifth of the production is sold in the form of cadmium sulphide, a brilliant yellow pigment which is unaffected by coal smoke, whereas the common yellow pigments (lead chromes) are blackened in a smoky atmosphere.

Warning Miners Against Dangers

BY A. L. H. STREET

A rule of law governing an employer's liability for injuries to employees is that a worker assumes all risks of injury which are naturally to be appreciated by him, considering his experience and ability to discern the dangers, but that he does not assume risks not appreciated by him because of his inexperience and their latent character.

The United States Circuit Court of Appeals, Eighth Circuit, lately applied this rule in the case of *Silva vs. Ozark Smelting & Mining Co.*, 255 *Federal Reporter*, 821, holding that the danger that an ore chute in a mine might, after becoming clogged, open with such rush as to swallow miners shoveling ore, was such latent peril that a mine operator may be held liable for fatal injury to an inexperienced miner who was not warned against the danger.

However, it was decided by the Utah Supreme Court in another recent case—*Macky vs. Bingham New Haven Copper & Gold Mining Corporation*, 180 *Pacific Reporter*, 416—that defendant was not bound to warn an experienced miner and timberman of the location of chutes, which did not constitute latent defects, the miner having full opportunity to observe the situation and condition of chutes in the performance of his routine duties which took him to different parts of the mine.

The Care of the Human Machine

Proper Treatment of Injuries Has Resulted in a Reduction of Fatalities—Supplying of Wholesome Food and Proper Care of the Body Aid in the Conservation of Health, and Promote Efficiency

AT A MEETING of the Mining and Metallurgical Society of America on May 1 Dr. Thomas Darlington addressed the members upon the subject, "Man as a Machine." Much that he said is of such deep concern to the mining and metallurgical industry that the following extracts from his address will be of timely interest:

"I am going to talk to you about man as a machine and the necessity of keeping that machine in working order. Medicine has opened a new field, particularly in prevention of disease, and we have begun to consider man in a different light. We know, and have known for a long time, that it pays to take care of an accident, and we know that it costs something every time a man loses his finger. It used to be, even ten years ago, that in some of the steel plants when men became injured the wound would become septic in fully 50 per cent of the cases. Today in various plants, the United States Steel Corporation, Carnegie, Cambria, and Youngstown Sheet & Tube, the rate is only one out of a thousand, and in the Bethlehem Steel much less than that. In the big plant at South Bethlehem in four years of accidents, taking every little injury into consideration, fifty or sixty cases a day, there have been only two cases of septicemia.

"The deaths in the army, both from disease and those killed in battle, are nothing compared to those who become ill and die in industry.

"And how have we looked upon the man in industry and in the Army, and how have we been treating him? We think that hardship hardens a man, and we look at the brown faces of the men that have come from abroad and say they are 'hard as nails,' but I am thinking of all those that went down, of many deaths, for which there seemed to me to be no necessity. Given a well man, and you have absolute control of him. Why should he get ill?

"From my standpoint, efficiency depends primarily on health. The German philosopher Münsterberg said it depends on a man's psychology, but what does psychology depend upon? Flow of blood to the brain, and flow of blood to the brain varies with all kinds of things, with the weather, the pressure of the barometer. Suppose your liver is out of order. Don't things look with a green and yellow hue? Psychology depends on health. Efficiency depends on health, and it pays to take care of a workman.

"As a matter of fact, illness in industry already has an effect on operating costs that is far from being realized. Whenever a man is absent from his work because of illness, it is usually necessary to have someone else take his place. The substitute, as a rule, is a less efficient worker; he makes a smaller output for the day's wages; he spoils more raw material; he requires more supervision from the foreman, who is thus distracted from more important work; and procuring and sending the substitute to the work needed involves a cost and usually a delay in the operations.

"Efficiency depends on health, and health depends on

three things: the care that a man gives himself, the care that industry gives him, and the making and enforcing of health laws—city, state, and national. What can people do for themselves? Before I take up that question it is proper that I state that I have been told some of the members here are interested particularly in the question of fatigue. Fatigue means much to a worker. If a person catches cold it is when he's tired. If you catch an infectious disease it is when you're tired. Fatigue lessens resistance to disease. Fatigue is the one great thing in this world that we want to avoid. What makes people tired? Work? No. Very seldom. It isn't work. Cold will make you tired. It makes every cell in the body work fast. A great many things make fatigue, but seldom work. That is a different idea from that which most workmen have. How do people get tired? Now, to know that, you have got to understand a little physiology. We must understand the body. Every part of the body is in motion all the time. When any part isn't in motion in the body it is dead. You are manufacturing heat; you are getting energy all the time. That comes from your food. Food goes into the body, is taken up and stored in the body, and you have it to use. It is then burned up by means of the oxygen which you breathe. All the time in the body there is a breaking-down process; all the time there is a building-up process.

"Energy depends first upon the food you eat: the kind of food, whether the system can use it or not, whether you digest it and store it away. Next upon the oxygen which is carried by the red blood corpuscles, the hemoglobin in the blood. The first thing, then, in the question of fatigue depends upon the character of the food that people eat. Few persons understand that, and so far as workmen are concerned, few of them or their wives know anything about feeding the man, and any old thing goes in the lunch bucket. One day I opened 250 lunch boxes in a Carnegie Steel plant. The first bucket opened contained a whole boiled cabbage. How much $C_6H_{12}O_6$ did he get to use in the muscle; how much energy could he develop from that cabbage? The next man had nothing but cake and honey. He got all the $C_6H_{12}O_6$, but what did he get to make up for the loss of protein and muscle? Nothing, and he was thin.

ENERGY AND ITS RELATION TO FOOD

"But it is not alone a question of the kind of food that he gets. Does the man digest that food? Was it mingled with bacteria in the mouth and fermented in the stomach? Did the sugar split up into acids in the stomach before it got into the muscle? Don't you see that energy is the converse of fatigue and fatigue the converse of energy? Energy depends first upon food and its digestion, its absorption and utilization, and next, how are you going to burn it? It is burned with the oxygen. Take a drop of blood from a man and examine it under the microscope and we find that he has a 5,000,000 blood count. Yes, that is a good healthy

man. It is up to normal. The next man we take we find he has 2,500,000 blood count. Doesn't it take twice as rapid the circulation of the 2,500,000 to carry the hemoglobin as with the man with the 5,000,000? Yes, the blood has to work twice as fast because he has anæmia. What does anæmia come from? Dark, unventilated rooms, infectious disease, poor food, lack of movement from the bowels, bacteria in the mouth, in the tonsils.

"Next, getting rid of the ashes of waste. And how do we do it? The blood takes it up and takes it away. If a person drinks a great deal of water, that helps. If you have a shower bath, you drive the blood inside, and then it returns to the surface again, and that helps, and soon you get rid of all fatigue, and the waste goes out through the kidneys. But other waste produces fatigue. In fermentation we have bacteria in the bowels all the time. In fermentation, particularly of protein food, you develop certain poisons. These poisons are known as indol, skatol, mercaptan, and certain phenols. The last develop particularly from eggs and milk. The most common poison found is indol. That is absorbed and becomes a sulphate in the system, and that is known as indican. When you have a urine examination you see so much sugar, so much albumen, and so much indican.

"To show you how it works and how a lack of regularity of the bowels produces fatigue: A man gets up in the morning, and he hurries. He goes to work. He has got a lot to do, and the small amount of liquid material in the lower part of the bowels is absorbed and the desire to evacuate the bowels passes off. The poison is taken up by the blood and permeates all the muscles of the body, and the man becomes tired.

"This has been proved numerous times by injecting indol into the blood of perfectly fresh men, birds and animals, always with the same result, fatigue. The man has only about a little more than one-third the efficiency of the other man, so far as his actual muscular capacity is concerned. If the one man is worth \$6 a day, this man is worth \$2.30.

THE NEED FOR PERSONAL HYGIENE

"I said that a man's efficiency depends upon what he can do for himself. Now, among the many things of personal hygiene besides the question of taking baths, care of the eye, the ear and the nose and everything else of that kind, and regulation of a man's meals, there are simple things like the brushing of teeth. How many workmen in the factory brush their teeth every day? To be efficient men they must brush their teeth seven times a day. Do you suppose any of your workmen know that? Not a one of them. Why must they do it? The manufacturer is interested in it because of his output. If I had a factory I'd make every man a present of a toothbrush. It was done in the Army. I helped to take care of fifty thousand men, and had to talk to them. Pneumonia killed some of them, because they didn't brush their teeth. What did they do with the toothbrush? Used it around the edge of the shoes to get the mud out. What is the first thing about the teeth? Well, we need them for enunciation. In the Army it was absolutely necessary that orders should be distinct. The chewing of food means a lot in energy. Still, that means little compared with some of the other things. In the mouth are forty-eight varieties of bacteria. If you chew the food without brushing the

teeth you swallow those bacteria, and the food ferments in the stomach, and often it passes the quarantine of the stomach and goes down to the bowels.

"The gastric juice of the stomach will keep indefinitely, but swallow saliva and it quickly spoils from contamination with the bacteria that the saliva carries down. Do you know that in the Army in the grip epidemic few if any died from grip? They all died from pneumonia. Why? There are four types of pneumonia germs. Nearly all died of the fourth type. That is a mouth bacteria. They got the grip, and then the pneumonia bacteria that inhabited their mouth and grew there went into the lungs and killed them. If they had all brushed their teeth regularly, many of them would have lived. Many, very many of the 600,000 persons that died in the United States, would be alive today if they had brushed their teeth in that epidemic. But that is little compared with the other thing. A tooth dies, but you do not always know it. At the root of that tooth there comes a very small abscess. From this, bacteria and the toxin are absorbed in the system. Just the same as in the tonsils. The tonsils and the teeth make over 90 per cent of our infectious disease. The poison may go into the heart, producing vegetation of the valve; or go into the kidneys, and make Bright's disease; or go to the bladder and make inflammation of the gall bladder. Nearly all rheumatism comes from bad teeth.

"Do your workmen know that anæmia, the loss of the red blood corpuscles which carry the oxygen to the tissues, is often due to abscesses at the roots of the teeth or old roots in the mouth? Have you got a dentist in every factory pulling out those old roots? No. The first thing I did at Hog Island where I was consulting surgeon was to put three dentists there.

"Deaths from shock and hemorrhage! Men die in a few minutes from shock, but if you have blood to inject into them right away you often may save them. We hired three men, and gave them \$1,200 a year apiece and fattened them up and kept them raking leaves, and when a man got injured we took some blood from them and injected it into the injured person. We saved three men worth \$5,000 each according to the Pennsylvania Compensation Law the first month—\$15,000 against \$300 in the first month!

"How about washing of hands? It is from dirty hands that bacteria get into the mouth. What does the surgeon do? Simply wash his hands? No. He puts on rubber gloves, even after he has put his hands into absolute alcohol with bichloride. Take the case of 'Typhoid Mary.' How did she give typhoid to twenty-eight different families? Because she had typhoid germs on her hands. Very little—but it gave disease. Does every workman wash his hands before he eats lunch?

"There is one thing that workmen generally do not know. The man who does not sweat does not live as long as the worker. To live long you have got to work. Work leads to longevity. The rich man of today, what does he do? Does he do like the man in the Bible who said, 'Now, soul, we will enjoy ourselves and eat, drink and be merry?' The rich man today builds an eighteen-hole golf course and works like the devil to keep his health. Work doesn't hurt anybody.

"That is what we have got to teach the workman.

"We have in the neck a gland called the thyroid. We have more important ones over the top of the kidneys, little thin glands called the adrenals. These are like

the governor on an engine. They control our circulation. If you lose those glands, you die. These adrenals throw out a powerful drug. I know of two men on the front where a big shell burst and adrenaline was thrown out so that every hair stood on end for a week. A grouch, grief, anger, or worry are ruinous to the body. They cause adrenaline to be thrown out. But joy, love, laughter prolong life. What does that mean? It means that we must teach the employee cheerfulness; that every man shall find in his daily work his greatest happiness. Just as God Almighty found happiness in the creation of the earth, we, made in His image, must find our happiness in our daily work, no matter what that work is.

"We now come to another side of it, and that is this: Cain's answer by the Garden of Eden was, 'Am I my brother's keeper?' The Bolsheviks and the Socialists have used that for a great while, this cry of the brotherhood of man, which means nothing to that class. When I was in the Department of Health we had 187 laws. They all meant one law. How can you translate them into one law? The man that loves his neighbor won't spit on the sidewalks. He won't sell his neighbor bad food. He won't let smoke come out of his chimney. He won't let his child with contagious disease run around and spread the disease. That is the thing that we must teach workmen—the love of their neighbors. It is a great thing to relieve suffering. It is a far greater thing to relieve penury and crime, so we can say with Abou Ben Adhem, 'Write me as one who loves his fellow men.'"

Steam-Shoveling Muskeg

The illustration shows a condition that was encountered last winter in Minnesota on the Mesabi Iron Range during the process of removing the overburden from the orebody of one of the large iron-mining properties. The material which the steam shovel is digging is muskeg, or swamp land, and, as will be noted, the removal of this material is effected only with difficulty, owing to its tendency to spread and the fact that its consistency is such that the surface gives little support to any weight placed upon it.

Under severe weather conditions the frost in Northern Minnesota extends from three to eight feet below surface, and though this condition is a detriment in the stripping of the ordinary overburden, which consists mainly of glacial till, it is of some advantage in the removal of muskeg. The frost, however, is of little consequence after the first cut is taken, and it is necessary to keep the steam-shovel tracks blocked up to prevent settling of the shovel in the mud which soon forms in the bottom of the cut. The shovel tracks in this instance are entirely embedded in the mud, and though the digging bank shows a solid appearance, the underlying material is wet and swampy.

The steam shovel shown is known as Model 91, weighing about 120 tons, and is the type generally used in Mesabi Range stripping operations, as well as for loading the iron ore after it has been uncovered. During the last three years a larger type, weighing 360 tons and known as Model 300, has been adopted to some extent in stripping work.

In the foreground will be seen the loading tracks that carry the dump cars into which the material loaded by the shovel is placed. It cannot be said that

the alignment of the tracks is maintained, for a similar "sinking" results after a time, although not to such a degree as that which effects the steam-shovel tracks. The steam shovel is equipped with adequate safety devices, in accordance with standards adopted by many of the mining companies in that section. Guard rails

STEAM SHOVEL OPERATING UNDER DIFFICULTIES

extend along the running boards on either side, as well as along the ladders on the boom. All the running gears are substantially protected, and, where possible, the movable parts are covered. A short cable extends from the top of the "A" frame to the top of the boom, and this arrangement prevents the dropping of the latter in case the "hog rods" or supporting members of the boom should break. The steam-shovel dipper has a capacity of 3 cu.yd., and the material is loaded into dump cars of 12-cu.yd. capacity.

Annual Report of the Buffalo Mines Co.

The thirteenth annual report of the Buffalo Mines Co. for the year ended Apr. 30, 1919, shows that the mill treated 28,572 tons of ore from the mine, 2,000 tons from stockpiles, and 77,239 tons of sand tailing. The total production of silver, including ore and bullion, amounted to 625,786 oz. There are 17,607 tons of broken ore in the mine carrying approximately 11 oz. silver per ton, and 3,000 tons of doubtful grade. Two additional bodies of a better grade of ore were opened, which will assure the steady operation of the mill during the coming year. About 33,000 tons of sand tailing averaging 6.5 oz. silver remain for further treatment.

The revenue from the sale of ore containing 794,531 oz. of silver was \$802,426, and from the sale of bullion containing 9,206 oz. of silver, \$9,236. The value of ore and bullion on hand on Apr. 30, 1919, was \$288,700, as against \$441,872 on Apr. 30, 1918.

That a Small Percentage of Copper in basic open-hearth steel tends to prevent corrosion was shown by D. M. Buck in a paper entitled "The Influence of Very Low Percentages of Copper in Retarding the Corrosion of Steel," presented at the Atlantic City meeting of the American Society for Testing Materials. Copper to the extent of 0.12 per cent is said to be sufficient to neutralize the influence of 0.055 per cent sulphur. Even if the sulphur is much higher than normal, copper to the amount of 0.15 per cent is sufficient to protect the steel from corrosion.

Status of Flotation in Spain

The Process May Be Utilized To Recover the Mineral Content of Dumps Dating Back to Early Rome—Ramifications of Minerals Separation in the Future Development Of the Spanish Metal Industry

MADRID CORRESPONDENCE

MINING engineers in Spain have reached the conclusion that it is no longer possible to concentrate low-grade ores by older processes in competition with ores concentrated by flotation, owing to the lower cost by flotation and to the higher percentage of recovery obtained by that method. It had been observed by these engineers that today the bulk of the copper and lead concentrates produced in the United States is derived from plants using the flotation process. They are informed regarding the practices in the important lead-producing plants of southeast Missouri, Idaho, and other centers of large production, and the large copper producers, such as the Utah Copper Co., in Utah, the Nevada Consolidated at Ely, Nev.; the Miami, the Inspiration, and the Ray, in Arizona; the Chino, and the Burro Mountain, in New Mexico, and many more.

It has been observed that, almost without exception, the great mineral producers have denied the validity of the patents of the Minerals Separation Co., for reasons that are a matter of court record and of general knowledge. The opinion is freely expressed here that the resistance from the metal producers would not have risen had the terms of the Minerals Separation Co. been more generous. However, it is admitted that the discovery of any process so revolutionary as the flotation of minerals means that the old processes are destined to play an inferior role in the future, and that either the process will be used by the world at large, as was done in the case of the cyanide process for extracting gold, or the mineral industry must become in effect a monopoly controlled by the owners of the patents, until the patents have expired.

For some reason the flotation process has not hitherto been used in Spain, although it is covered by Spanish patents, obtained by British subjects, the same as those who patented the process in the United States. The Spanish mining engineers have not had an opportunity to see the process in operation, and consequently the great possibilities for its use in this country have not been improved.

The large low-grade deposits of minerals, especially of copper and lead, invariably constitute the most dependable source of supply of those metals for any country. The richer deposits, that can be smelted without concentration, are usually of limited extent. The permanence of pyritic copper mining in the Province of Huelva depends on the facts that the ores are exceptionally free from silica, the sulphur can be burned off and used in making sulphuric acid, the copper can be extracted from the calcine, and the residual iron tailing may be used for smelting. These conditions are exceptional.

The quantity of low-grade ores in Spain is far in excess of the ores that are available for smelting direct. In so far as concentration is applied it is of the old sort, and to a large extent is limited to the use of Cornish jigs of antiquated design, and in less degree

to various forms of table concentrators. Large deposits of low-grade lead ore are available, most of which contain above 10 oz. of silver per ton, and there are also important deposits of copper ores suitable for concentration by a cheap process, such as the flotation method patented by the Minerals Separation company's staff. Furthermore, there are numerous dumps in many districts, that have accumulated from mining operations dating back to the time of the Romans, and in some cases to the era of Punic control. The tonnage in dumps of low-grade ore and tailing in the Cartagena district is amazing. Much of this material could be economically treated by the flotation process, but not otherwise.

It is reported that a contract has just been signed between the Sociedad Minera y Metallurgica de Peñarroya and the Minerals Separation, Ltd., of London, whereby the Peñarroya becomes the sole owner of the patents in Spain. The Peñarroya has organized a separate corporation for the development of the flotation business, and the Minerals Separation, Ltd., has taken stock in this new company for at least part pay for the rights assigned. At present no outside parties can contract with the Peñarroya for the right to use the process, but the head of the Peñarroya company in Spain is quoted as saying that later the company would extend the right to others to use the process under terms which had not yet been decided upon by the board of directors. It is evident that the Peñarroya company regards itself as being in control of the situation, and it is thought that this means that those controlling that corporation will give the right only to operators who will contract with them for the smelting of the concentrate produced.

The Peñarroya company is in even more absolute control of the lead industry in Spain than is the American Smelting & Refining Co. in control of the industry in the United States. It either owns or controls every lead smelter in the kingdom. It is impossible to ship the ore out of the country in any considerable amount, owing to the distance of most of the mines from the sea. Accordingly, the lead-ore producers are subject to the demands of the Peñarroya lead trust, and though data are not available concerning the terms exacted, it may be recorded that popular opinion is exceedingly antagonistic. It is perhaps more bitter in its condemnation of the smelter trust than is the Western miner in the United States.

There are two sides to these squabbles between the ore shippers and the smelters, and it often happens that the criticism of the smelter is unjust, and his demands and "rake-offs" are exaggerated. Nevertheless, it must not be overlooked that the Peñarroya is absolute in its control of every avenue to market for the independent lead producer. The acquisition of the flotation patents enables it to insure its control, for the life of those patents, over concentrate as well as ore.

The small producer is thus placed at the mercy of this company. A large enterprise backed by abundant capital, seeing opportunities in the development of the lead and copper industry based upon the large low-grade deposits and dumps, might undertake to follow the example of the producers in the United States, and contest the validity of the patents in the courts.

The Peñarroya company is reported to have produced lead exclusively for the Allies during the period of the war. This was natural, as it is a French corporation, controlled by the Rothschild interests in Paris. It is closely associated in Spain with the banking house of Bauer. This is said to be Swiss, but with German leanings. However, there would seem to be doubt as to the accuracy of this report, from the fact that there has been no evidence of a rapprochement between the Peñarroya and the German owners of the Spanish mines. The Germans own the famous mine at La Carolina, near Linares, known as El Guindo, which is reported to be the largest lead mine in Spain. It has at the present time ore reserves, blocked ahead of production, amounting to over 200,000 tons. This refers to smelting, and not to concentrating ores. The Guindo organization has been backed by the Banco de Urquijo, a great private bank belonging to the Marqued de Urquijo, of Bilbao, with branches in Madrid and elsewhere. It must be noted, in passing, that this house, though accused of Teutonic leanings, advanced large sums of money during the war to facilitate American purchases in Spain for shipment to France.

A prominent Spaniard is quoted as saying, "Urquijo is in business to make money, regardless whether it comes from the United States, or Germany, or any other country." It is reported that recently Urquijo has been extending credits in considerable sums for the purchase of lead mines in Spain, and it is also said that the arrangement is with the old ring that engineered the Metallgesellschaft of Frankfort-am-Main. The object of the Germans is said to be to get underneath of the Peñarroya. This seems hopeless, especially now that the Peñarroya has acquired the flotation patents, unless the Germans contemplate attacking the validity of these patents.

The Peñarroya possesses a further advantage in the fact that the house of Bauer, which represents the same capitalistic interests, owns the railroads popularly known as the "Ferrocarril de Mediodia," from Madrid south and throughout a large part of Andalucia. Thus these allied railroad interests cover the great mineral districts that are tributary to the smeltery of Peñarroya. One of these smelteries is in the town of Peñarroya, one in Linares, and two are at Cartagena. Superior facilities are thus offered for the movement of ores, coal and coke. The Peñarroya owns coal mines, and is active in securing additional coal territory in the south. It has extensive batteries of byproduct coke ovens, and manufactures these byproducts at its works at Peñarroya.

It is of interest to note that the house of Bauer is the owner of the contract with the Spanish government for the sale of the quicksilver output of the great mines at Almaden. It will be seen, therefore, that the Rothschilds are strongly entrenched in the mineral industry in Spain.

It has been reported that the Marqués de Aldama and his friends have been the actual backers of the Cia. Minera el Guindo, but that they have been closely re-

lated to the house of Urquijo. It is regarded as certain that the latter house has just bought the "Los Quinientos" mine, at Linares, that the Germans are there in control, and that the same house has negotiations pending for other mines.

It may be of interest to note that the smeltery owned by the Peñarroya company at Linares is called the "Société Anciennes de Sopwith," though at Cartagena the smelteries that are operating are merely associated by contract with the trust. One of these belongs to a man named Enthoven, and the other, situated at Portman, near Cartagena, is owned by Miguel opata.

The annual production of pig lead by the Peñarroya company ranges from 140,000 to 150,000 metric tons (154,000 to 165,000 avoirdupois tons). At the present time the market is so dead that the company has 40,000 metric tons of pig lead in store. Nevertheless, the smelters are still receiving ore under contracts with shippers. For lack of any other outlet for its product, the Cia. Minera el Guindo is shipping to the Peñarroya.

The Peñarroya company has contracted with Bradley, Bruff & Labarthe, of San Francisco, Cal., for a new large smeltery to be erected at Peñarroya. Mr. Labarthe has been given full authority as engineer and purchasing agent to specify and contract for the necessary equipment. The design is rapidly nearing completion, and it is expected that the erection of the plant will begin early next year, and that the smeltery will be ready for operation early in 1921.

The Cleaning of Manganese Ore

The U. S. Bureau of Mines has just issued a mimeographed bulletin on the "Preparation of Manganese Ore," by W. R. Crane. As is well known, the production of manganese in this country was considerably stimulated during the war, many small companies beginning operations in the Virginia, Georgia, Arkansas, Montana, and other fields. Practically all of these companies went into the business without expert advice, merely following the practice of others in the district, which was usually bad. For this reason the Government sent engineers into the various manganese districts to assist the operators in the proper mining and treatment of their ores. Mr. Crane's paper presents outlines of the methods used in the various districts, pointing out their bad features and suggesting an improved flow sheet for the washing and jigging operations commonly employed.

The ores are ordinarily treated by some combination of grizzlies, log washers, screens, picking belts, and jigs. The chief fault found with the general practice was in the lack of proper screening, which gave the jigs an unsized product that could not be handled efficiently. Mr. Crane points the way to the proper operation of the jigs, going into considerable detail regarding the correct proportioning of the various units in his model plant as influenced by various conditions.

Though most of the manganese producers have sought greener fields since the war ended, the work done in an effort to improve the practice will prove valuable should conditions be more favorable to the domestic industry. It may be some time before Russia resumes her place as the leading producer, but the deposits of India, and to a lesser extent of Brazil, have been proved to be of considerable commercial importance and will doubtless contribute a large part of the world's supply.

Civic Duties and Opportunities of the Engineer*

Advisability of Utilizing the Services of Engineers in Public Affairs—The Value of Scientific Societies to the Government—Functions of the Engineer in Modern Business—Status of Engineering as a Profession

By HOWARD C. PARMELEE

ONE of the fundamentals in advertising is that if you say a thing often enough, you will not only convince all who hear you, but ultimately you will believe it yourself. It is on some such principle as this that I propose to discuss a subject that has been the theme for many presidential addresses during the year, hoping always that if the world is told often enough of the need for engineers in civil and political life, the people will be convinced, and engineers themselves will finally believe it.

Human experience has shown clearly that there are compensations for many incidents which in themselves seem wholly disastrous and without recompense; and so it is that out of the admitted cataclysm of war which has engulfed the world has come a definite demand for engineers, a keener appreciation of their service, and a belated recognition of their need in business and government. I have reason to believe that this recognition is a world-wide as well as a voluntary tribute, and that it offers the engineer an advantage which he must grasp if he would retain it. Had he the tradition or the training of the lawyer, he would not only accept this position of eminence from those who are willing to accord it, but would exercise his gift of speech to persuade the remainder that no mistake would be made in committing to his care the conduct of the world's affairs. But our engineer has been so unused to the limelight that he is likely to shrink from the public gaze and retire modestly to his laboratory or works. Being the lineal descendant of the artisan, and having long been accepted in the public mind as a glorified mechanic, he will be apt to retire all too readily to the background. He needs, as never before, the support and encouragement of the professional society to give him that solidarity and community of interest which will enable him to stamp his influence on the affairs of the world.

I think we may justly claim to have established a profession of engineering, although some may contend that we still have merely a "procession of engineers." By definition, a profession is that calling or occupation which one professes to understand, a vocation in which a professed knowledge of some department of science or learning is used by its practical application to the affairs of others. Formerly, theology, law and medicine were specifically known as "the professions," but I think we may fairly claim to have established engineering on a more solid and scientific basis than any of them. Theology has been almost wholly speculative, the law technical, and medicine empirical. Each has been irrational, and all have gained prestige by claiming it.

On the score of service to humanity, also, I think that engineering may fairly claim professional standing. The achievements of engineers in all parts of the globe
