are accepted evidence of their ability, but tradition causes us to halt at this recognition, as though the only field in which an engineer could accomplish anything was in the design and construction of some great work. Such things are well enough in themselves, but in the meantime the affairs of business and government are left to men of limited training and narrow vision, and those things which are fundamental in our national life are suffering from the lack of vital direction, which engineers could give.

We have sometimes heard it said of an individual that "he may be a good engineer, but he is no business man." I resent the implied difference. An engineer is a manager, one who carries a project to conclusion in an efficient manner. I might consent to such a statement as "he is a good mathematician, but no business man," or "he is a good surveyor, or assayer, but no business man," but I must contend that if he is a good engineer, he will be a business man. The war has brought out few more striking incidents of management than the direction of the commission for relief in Belgium by Herbert C. Hoover, an engineer of technical achievement in his profession. This commission handled until near the close of 1916, \$227,000,000 worth of supplies, keeping alive a population of 9,000,000 and operating with an overhead expense of but three-quarters of 1 per cent of the gross cost. Such is engineering efficiency in business, organized in an emergency, and administered under constant stress. What might such ability accomplish applied under the normal conditions of business, with ample time for planning and execution?

The engineer is entitled to recognition not only as a producer but as a director of policy. Hitherto he has accepted the responsibilities of operation and production, while the control of the enterprise was in the hands of a banker or merchant. Under these conditions, the work of the engineer might be ever so efficient, and yet the enterprise might fail through ignorant management in the executive or selling department. Complete control on the part of the engineer might avoid such a catastrophe and relieve himself, as well as his associates, of inevitable embarrassment. I think that engineers are coming to demand this form of control, being willing to accept responsibility if they are also given authority. Any form of dual control, with the responsibility still resting on the engineer, is intolerable.

The modern engineer can bring to bear on business all of the general essentials to success. Organization is his forte and management his specialty. With him the handling of men and supplies is a matter of scientific procedure and the keeping of accounts and unit costs a prime necessity. Plainly the ability of such a man should not be confined wholly to the details of operation or production, but should be requisitioned on the board of directors or the executive committee.

Perhaps it is more in the realm of government of

*President's address at the annual meeting of the Colorado Scientific Society, Dec. 8, 1916. Because of the Government's request to conserve paper, the address was not published until June, 1919.

civic and political activity that the engineer is yet to receive his highest recognition. Certainly it is in this field that he must strive most earnestly for a hearing and for a chance to apply his methods. The strongest traditions are against him, and he is handicapped by a lack of familiarity or intimate relation with political organizations. There is no question, however, that his ability, viewpoint, and methods are sadly needed. Accustomed to considering propositions on their merit, and having an abhorrence of waste and inefficiency, he would be less likely to yield to political expediency in matters of great consequence. I doubt if "pork barrels" would appeal to engineers having ethical standards as high as our statesmen would probably assume for themselves. The latter may be good business men in this case, but certainly not good engineers.

There is probably a growing demand for fewer lawyers and more engineers in our civic and political life. There has never been a time in our national history when technical and engineering advice was more needed in matters affecting our industrial growth and welfare. The intricacies of the dyestuff tariff, for example, could not be reckoned with intelligently by lawyers and merchants, nor can the revision of the mining law be sanely undertaken by men who merely own stock in mining companies.

Popular impression prevails that governmental departments are not on an efficient basis, and engineers can render a service to the country by expressing that opinion in a manner so forceful as to show Congress the light.

In matters more vital to the mining and metallurgical industry, Congress has acted with even less discretion. The proposed tax on copper, for the purpose of raising revenue, was a case in point showing how illogically and superficially a profound subject may be approached. Apparently sensing a popular impression that copper was a highly profitable constituent of war munitions, and without first establishing a broad fundamental economic basis for raising revenue in an equitable manner, Congress singled out copper for taxation and gave itself over to class legislation of the wildest sort. Such unfair taxation as was proposed in the case of copper can be charged only to a profound ignorance of conditions. I have no doubt that instances might be multiplied to prove political inadequacy in dealing with technical affairs and showing the need of engineering advice.

One of the finest examples of national service on the part of engineers and technically trained men is the Naval Consulting Board. Through its numerous committees it has attacked fundamental problems of research, gathered technical data on the country's resources, and stimulated interest in the nation's welfare. Another instance is the Public Relations Committee of the American Electrochemical Society. This is composed of its past presidents and is organized for the purpose of advising with Government officials and expressing an interest in various public problems. Through this medium the electrochemists and electro-metallurgists exert their influence on such national problems as the development of hydro-electric power and the fixation of atmospheric nitrogen.

To what extent this voluntary public service can be carried depends wholly on the results obtained and the reception which it is accorded. Ultimately it should arouse a demand for that kind of service and result in

bringing more experienced engineers into public life. The good example thus set should be followed in state and municipal governments also. Our legislatures and city councils are no less in need of engineering advice than is Congress, while state and municipal affairs generally are subject to abuse and need correction. Town planning and management are engineering problems of first rank, wholly beyond the scope of politics and above the grasp of politicians. Numerous departments of government depend upon technical direction for their successful operation and for the economic handling of funds. In such things engineers should not only take an active part, but should advise those in authority.

Some attention also may be profitably turned to the daily press of this country. There is no more potent force in spreading information or creating public opinion. In technical and engineering matters, however, it is woefully ignorant and in need of sound advice. If we could encourage the editors of our dailies to consult with engineers and scientists on pertinent topics before publishing their dispatches or writing their editorials we would prevent the dissemination of a lot of things that are not so and avoid the ridicule which inevitably is heaped upon newspaper science.

I admit there are other things wrong with our newspapers, which engineers cannot correct, and I am not recommending that engineers become editors of our dailies, for I doubt if we would have much in the way of newspapers under such direction; but I do think it is possible to encourage a closer co-operation between newspapers and engineering of scientific societies, so that the public would get more exact information on technical matters.

Some of the most important civic problems which the engineer will have to solve in the future are more human in their aspect and concern the conservation and distribution of labor. Miss Frances E. Kellor, assistant to the chairman of the Immigration Committee in the Chamber of Commerce in the United States of America, believes that this is one of the great industrial problems of the day and that it will be solved only by the application of engineering methods. Writing on the subject of "Engineers and the New Nationalism," in the *Engineering Record*, she states that the stabilizing of the labor supply is of the utmost importance. "The average labor turnover in the United States is about 200 per cent in the industries upon which America must depend in time of war; in other words, for every 100 men kept at work, 300 are employed. This is a sheer waste of men due to lack of combination in the regularizing of industry and employment of men. In the past we have relied upon the economist and the professor to tell us about unemployment, irregularity of work, vocational education, and similar industrial questions. The laboratory for study has been the employment agency and the lodging house, and the remedy—a law. In the future it will be the engineer who studies the problem in the plant, and the remedy will be the adoption of measures within the industry itself, which will make laws as unnecessary as they are useless to deal with such questions. . . . When the engineer grapples with the problem of distribution he will give us a structure on which men can and will travel to work best suited to their needs."

If I have outlined a more or less ideal state of affairs, I do not wish to be understood as anticipating a sudden or immediate realization of my hopes. There

are, nevertheless, many indications that the public duties of engineers are being appreciated by the profession and that the faithful discharge of these duties will open the way to new opportunities. Finally, with a public conscience quickened by the failure of political government to give us a conservative and efficient management of public affairs, a demand will arise for engineering methods, if not for engineers.

Slitting and Perforating Pipes by the Oxy-Acetylene Process

The accompanying photograph (Fig. 1) shows an improvised washing device suspended above a rocking screen. The material being screened passes to the left and the streams of water are inclined slightly to the right; that is, they tend to retard the movement of the material on the screen. The novel feature is the manner in which the openings were cut in the pipe by means of an Oxweld cutting blowpipe. The slits were cut crosswise on the bottom and slightly inclined to the axis of the pipe (Fig. 2). The pipe is 2½ in. in diameter and the slits are about the same length, that is, they extend about one-third around the circumference. The slits in the front pipe were spaced six inches apart and those in the back one, twelve inches apart. The object of this was to determine which spacing gave the best results. It required approximately one-half hour to cut all of these slots, about a dozen in number, by means of the blowpipe. The value of the gases consumed was negligible, probably amounting to less than twenty-five cents. Four to five hours would have been required to do the same work with a hacksaw.

This application of the blowpipe suggests its use for cutting all sorts of perforations in pipes that might be difficult and expensive to accomplish by drilling and sawing methods, and particularly for experimental and emergency applications. For instance, in washing screenings and concentrates it

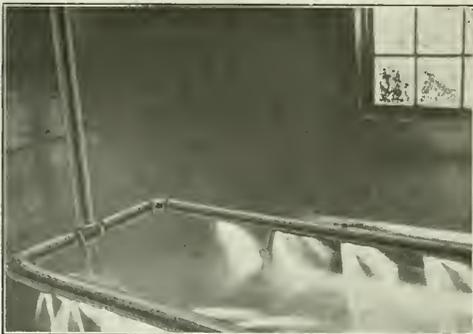

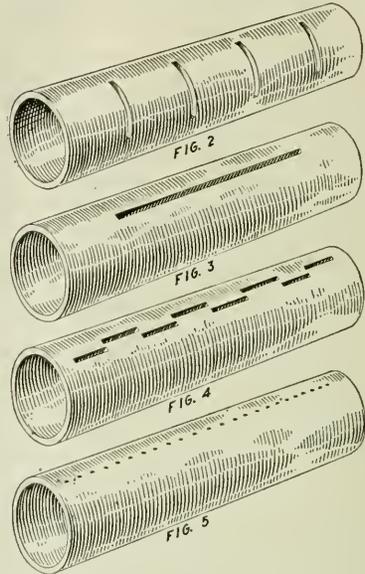

FIG. 1. WASH-WATER SUPPLY PIPE WITH WATER JETS ISSUING THROUGH SLOTS CUT WITH THE OXY-ACETYLENE BLOWPIPE

might be advisable under certain circumstances to run the wash-water pipes across the screen instead of lengthwise. In that case the slits could be cut as in Fig. 3, or staggered, as in Fig. 4, or perhaps circular perforations, as shown in Fig. 5, would give still better results. It is an easy matter to experiment

with different arrangements, to determine the most satisfactory method. The perforations in pipes supplying compressed air for agitating purposes may also be cut in the same manner to advantage. The holes would be sufficiently true in shape for most practical purposes, but if an absolutely perfect cir-

MANNER OF PERFORATING AND SLITTING PIPE

cular shape is desired, it could be easily obtained by applying a drift after cutting. The shapes of the streams of water in Fig. 1 demonstrate the excellence of the blowpipe as a cutting tool. The slight irregularities that appear in the stream forms are largely due to particles deposited from the water.

In making up coils or networks of piping for any of the purposes mentioned above, oxy-acetylene welding may be applied to advantage for joining the pipe sections, thus eliminating all trouble from leakage or loosening that is so common with screwed or flanged joints. Certain types of damaged or worn screens may also be easily repaired by welding in a new metal patch and cutting holes in it to correspond with the rest of the screen perforations.

Use Cone Classifiers To Build Tailing Dam

For building a tailing dam, 1,150 ft. long, the Old Dominion Copper Co., Globe, Ariz., is using twelve Allen cones. After this stretch has been completed, a second "lift" of 10 ft. will be added, which will give storage for several years. In this work the cones are placed 15 ft. apart so that 200 lin. ft. of dam is built without moving. It requires sixteen hours to move the cones to the new position and to make the necessary connection. The sand removed by the cones, although very fine, packs well, and the dam is stable.

Considerable economy is claimed for this method of dam building, the saving in cost over the old method of team and scraper amounting to several thousand dollars.

CORRESPONDENCE AND DISCUSSION

Letters From the Mining and Metallurgical Industry Dealing With Pertinent Subjects of Interest

The American Quicksilver Industry

In a letter published in the *Journal* of July 5, F. F. Sharpless, discussing the future of the quicksilver industry in the United States, suggests some questions which demand careful consideration by those who will finally decide the future of this industry. Whether all protection is to be abandoned and the industry left at the mercy of European monopoly, or sufficient protection accorded so that it will remain alive, is, in my opinion, important enough to justify thorough discussion, and I shall try to answer concisely the questions raised by Mr. Sharpless.

First: "Is the statement correct that the average ore mined in the United States during the year 1918 contained only five pounds of mercury per ton?" As the report for the year 1918 of the U. S. Geological Survey is not yet published, no official data are available regarding this point. At the conference of producers and consumers of quicksilver held by the U. S. Tariff Commission at San Francisco on June 26, 1918, the ore recovery of some California mines was given as 5 lb., and even lower, per ton of ore. However, it must be taken into consideration that the lower extraction per ton during the last ten years is due largely to the higher prices for the metal, which rendered the handling of the lower-grade ore possible. The following table shows a higher extraction than mentioned by Mr. Sharpless:

TABLE I. POUNDS OF QUICKSILVER RECOVERED PER TON OF ORE TREATED^a

Year	United States	California
1910.....	11.7	10.3
1911.....	11.5	10.8
1912.....	12.1	11.0
1913.....	11.1	9.8
1914.....	10.1	8.3
1915.....	9.9	8.3
1916.....	9.0	7.6
1917.....	9.6	6.7

^a U. S. Geological Survey.

Second: "Is it possible to continue to produce in this country approximately its normal consumption of mercury without a protective tariff that will be an actual burden on the consumer?" The yearly consumption for industrial uses can be averaged at about 22,000 flasks. The yearly production before the war was generally not far below that figure (See Table II).

TABLE II. PRODUCTION AND IMPORT OF QUICKSILVER IN FLASKS^a

Year	Production		Imports	
	Flasks	Value per Flask in San Francisco	Flasks	Value per Flask
1910.....	20,601	\$46.51	9 00	\$42.85
1911.....	21,256	46.01	6,292 60	39 950
1912.....	25,064	42.05	1,102.75	36.200
1913.....	20,213	40.23	2,288.70	32.930
1914.....	16,548	43.92(0)	8,198.25	34.175
1915.....	21,033	85.80	5,625.12	50.265
1916.....	29,932	125.89	5,657.25	91.195
1917.....	36,159	105.32	5,206.60	84.515

^a U. S. Geological Survey. Import duty to 1913, \$5.25 per flask, thereafter 10 per cent *ad valorem*.

^b A average of \$38.89, value per flask the first half of the year, and \$48.94 during the second half.

Even at the present low recovery, the quicksilver operators who have their properties in efficient condition

can produce at the present market price, \$85 to \$100 per flask, with some profit. The high cost of operation is due much more to the decrease in the purchasing power of the dollar than to the lower figure of recovery. Leaving depletion out of consideration, labor represents about 60 per cent of the total operating cost. Table III shows the number of flasks produced per man employed in California and in Italy.

TABLE III. COMPARATIVE ANNUAL PRODUCTION OF QUICKSILVER

	Flasks Annual Production Per Man Employed	Extraction in Lb. Per Ton Treated
California.....	25.1 (a)	6.7
Italy, Monte Amiata district.....	23.6 (b)	15.0

^a U. S. Geological Survey. *Mineral Resources*, 1917.
^b Dr. Roland Sterner-Rainer, "The Present Status of Quicksilver Metallurgy in Europe."

The American consumer of quicksilver is then simply expected to pay the difference in cost due to the higher rate of living expenses of the workers, as he does for every other necessity or luxury he consumes, not because the actual production per head is lower.

As to the relation of the London branch of the Rothschilds to the world's production, it must be noted that before the war that house controlled only 34.1 per cent of the total world production. The Rothschilds now control both the Spanish and the Italian production, 57.7 per cent, and will probably also control the former Austrian production, making the total proportion of the world's production under their control, 77.4 per cent. This condition presents an entirely different aspect than before the war, and certainly justifies the statement that, unless some protection be given by the Government, the domestic producers are entirely at the mercy of the interests mentioned.

The producers are satisfied with the present market price; all they ask is that some stability be given to that price and that they be not forced by foreign intervention to close down, in which case the consumer would eventually be in a much worse position than could result through reasonable tariff protection.

That the producers of the less common metallic minerals are small in number, and hence are placed at a disadvantage when trying to protect their interests, has again been emphasized by the decision of the U. S. Attorney General regarding the compensation that operators of the so-called war minerals are entitled to, in the reimbursement of their loss, from the fund appropriated by Congress for their protection. Compare this with the protection granted the dyestuff and potash industries, which have related interests that command consideration. If it is good economic policy to kill the quicksilver industry, because quicksilver can be bought cheaper from foreign countries, is it not equally good economic policy to import cheaper dyestuffs and potash, even if it destroys those two industries, which were developed here only because of war conditions? If the economic policy of internationalism, which has re-

ently found many advocates in this country, is correct, then at least carry it out in all lines of business, and do not restrict its application to those industries which lack sufficient political backing.

I fully recognize that the conditions under which the quicksilver industry operates are different from those of the dye and potash industries. This, however, does not preclude that the former is equally well entitled to protection as are the latter. The domestic quicksilver industry is in the peculiar position that its production can never become an important article of export, especially in the altered conditions of the world's production brought about by the war. On the other hand, it can for years to come cover the demand of the domestic consumption, as it has done for seventy years. This is simply a question of sufficient protection. Though the domestic production somewhat decreased during the last twenty years, it still remained about equal to the domestic consumption. This decrease was mainly caused by the low market price of the metal, which is established in London. When the prices justified it the production was increased from 16,548 flasks, in 1914, to 36,159 flasks, in 1917; which appears to me a conclusive argument that the decreased production was not due to deficiency of raw material, as is often claimed, but to the conditions which govern the market value of the metal.

Under the conditions governing the present world's market the domestic quicksilver industry is at the mercy of the Rothschilds, who, if they so desire, can undersell the domestic producers in all foreign markets, and in the United States, if they are not protected by a reasonable tariff. In fact, the protection of that industry is as much to the interest of the consumer as to that of the producer, because if the latter is wiped out the former is at the mercy of the foreign monopoly, which certainly will avail itself of its opportunity.

In the last years preceding the war production kept up, notwithstanding that the market price was below the cost of production of several of the operators; and even in those years developments of cinnabar deposits were made in some of the Western states, even though on a small scale. This would tend to prove that the exhaustion of cinnabar deposits in the United States is not as complete as maintained by some authorities.

The actual conditions are threatening to the quicksilver producers, and they can protect themselves only by concerted action, and by associating themselves with the body of American producers of all kinds of minerals, and working together for mutual benefit.

WILLIAM FORSTNER.

San Francisco, July 17, 1919.

Pillar-Shaft Gyrotories vs. Lever Type

I have read the very able article of Herbert A. Megraw covering the "Design of Small Metallurgical Mills" appearing in the June 28th issue of the *Journal*. Under the section "Rock Breaking in Small Mills," Mr. Megraw makes the following statement in relation to gyrotory crushers: "Any rock crusher, whether jaw or gyrotory, which takes the crushing pressure directly upon a bearing is mechanically wrong, and has not taken advantage of the features inherent to the type of the machine."

I am taking the liberty of calling attention to a few relative points of the two most distinct types of

gyrotory crushers, i.e., the pillar-shaft machine, taking pressure "directly upon a bearing," and the older lever-type machine. It is probably a fair assumption that neither type of machine is mechanically perfect. The question is therefore one of relative mechanical design for the two types. Mr. Megraw refers this question to the definite point of bearing pressures, and, as such, it is hardly a matter of opinion but one of fact, and the general statement above quoted cannot possibly be made to stand up under a more exact analysis.

In either type of machine pressures are, of course, transmitted to bearings, and this cannot be considered any great crime in machine design. That being the case, the argument logically evolves around unit pressures, which is the case in any machine design—crusher or otherwise.

There are two machines which I have in mind, both working on the same material. One is a pillar-shaft type and the other a lever-shaft type of crusher. The pillar-shaft type machine has a projected inside eccentric area of 688 sq.in. The lever-type machine of the same rating has an inside projected eccentric area of approximately 228 sq.in. The lever-type machine has a lever ratio of two and a half to one, or, in other words, the throw of the eccentric is approximately two and a half times as great as the throw of the head at the bottom of the concaves. Therefore, to exert the same crushing pressure, under identical conditions, the pillar-shaft machine would require a relative projected area of two and a half times the 228 sq.in. area, or, 570 sq.in., whereas it actually has an area of 688 sq.in., a 20 per cent surplus area by the most liberal comparison to be made in favor of the lever-type machine. The respective shafts in shear, as well as beams, are greatly favored by the pillar-type machine in all present designs. When it is borne in mind that the eccentric of the pillar-type machine has an extension greater than the entire length of the crushing head, the reason for this enormous area can be better realized. (Belt speeds and gyrations are about equal.)

The foregoing paragraph is a fair approximation of the definite points to which Mr. Megraw refers on two machines of the same capacity working on the same material.

Now, regarding the general reference to short-shaft machines where "the power for crushing is applied almost directly to the bearing of the eccentric." Whether the shaft is long or short, there is probably no reason to change the number of gyrations per minute for the same conditions. Therefore the r.p.m. on the eccentric would be constant. Consequently, should the designer desire to decrease the shaft length by one-half, he would probably increase his eccentric surface area by two and maintain the identical conditions with reference to bearing pressures, crushing pressures, and like factors, the belt speed and power remaining the same.

Crushing rolls have for years been used with more or less success. They are designed to take the crushing pressures directly on the journals, and this to date has not condemned the machine as anything approaching a mechanical monstrosity.

No crusher is a great example of nice mechanical design. The work which crushers are supposed to do would hardly permit of it. However, should I look over the two machines for unmechanical features I should probably be struck with a shaft loosely hanging by its end.

Reduced head-room is not a fundamental in the design of the pillar-type machine. The discharge of the pillar-shaft gyratory is circular, and by the time Mr. Megraw builds his discharge chute to take care of this he will find that reduction in head-room is more apparent than real. In any event, any advantage in this direction is incidental.

The real advantage of shortness is a greater weight per vertical foot of machine than in the lever-shaft type machine. For instance, a typical lever-shaft gyratory weighs approximately 7,600 lb. per ft., whereas a typical pillar-shaft machine weighs approximately 10,000 lb. In this, the shortness of the machine proper in relation to the total weight is a distinct advantage in the great additional strength which it imparts to the bowl.

This is no attempt to detract from the crushing properties of the pillar-type machine, but I would like to call attention to its crushing stroke parallel from top to bottom, its therefore constant angle of nip, and the use of the general concave surface as a crushing area, instead of concentrating the wear.

Packing Goods for Shipment To South America

The writer has recently returned from a short trip along the West Coast of South America, and has, as most Americans do, heard a great many complaints about the way in which American goods for foreign shipment are packed. Because of the difficult landing conditions for ocean-going steamers along the West Coast, goods have to be especially well packed if they are to arrive in a proper condition. Most of the complaints concerning inadequate packing are unquestionably well founded, and I believe you could do no better service toward the extension of foreign trade for American manufacturers than to either run an editorial or in some forceful way bring this matter to the attention of those expecting to do foreign business.

Packing is, after all, such a simple operation that it would seem only necessary to have this matter placed before manufacturers to insure American goods arriving in foreign ports in a condition as good as or better than goods from other countries.

New York, Aug. 8, 1919.

D. S. McAFEE.

[American manufacturers should take to heart the criticism made by Mr. McAfee. At frequent intervals our shippers have been admonished to pack their goods properly. A little common-sense in this regard would avoid unnecessary damage, not only to the goods but also to the reputation of our manufacturers. The last warning issued by the *Journal*, regarding the packing of goods for shipment to South America, appeared in the issue of July 19, 1919, on page 91.—EDITOR.]

Hoping for a Settlement

In the past I have asked for frequent changes in the address of my *Journal*, but this has been due to the political situation. It would appear from newspaper reading that I am again making a mistake in asking that the *Journal* be sent here, but as we are building a small mill and cyanide plant, and hope to complete the installation by the end of the year, I may as well chance the *Journal's* getting through long enough to be of considerable service meantime. We are out in the hills, have a hard time to gage the course of events, and I value

the *Journal's* political comments more than I do those of any other individual newspaper.

Those of us that suffered directly all the evil effects of the variable policy of our home government regarding Mexico during the critical moments of the revolution, and have hung on here to our properties and tried to protect them, in the hope that time would cause a change in politics, have abandoned hope of that and resolved to try to work the properties under existing conditions, and so are now again exposed to material losses if the existing situation be upset.

It is hard to define our feelings toward the present movement in the States to force an issue on old questions. We hoped and prayed for such action in the past, lost hope and decided to try to do something in spite of conditions, and now find ourselves under way again, and likely to be up against a new turmoil. As, in our hearts, we never did give up faith that eventually the American people could be depended upon to do the right thing, we reluctantly admit that we would rather suffer further troubles, so that the matter may finally be disposed of as it should have been in the first place. We have one consolation: that we know that a large part of the Mexican population feels just as we do about it, and is resigned to swallow pride and to undergo inconveniences in order that affairs in the end may be definitely settled.

A SUBSCRIBER IN MEXICO

[Signature deleted—EDITOR.]

Protection of the Potash Industry

Your editorial of July 26, on the supposed protection to be afforded the potash industry by the Germans themselves may record one of those actions which have been indulged in by the Germans so frequently of recent years as to be termed "Teutonic." It is within the bounds of possibility that the price may be raised in Germany for the very purpose of enabling the potash syndicate so much the better to pursue its usual tactics of destroying competitive business in other countries. Coming as it does just at the time when the American Congress is giving consideration to action at which from tradition American Congresses have always balked, the Teutonic nature of the possibility is all the more to be feared.

When it is so well known that the American potash industry, secured behind the impregnable wall of a license embargo, would rapidly develop to the point where American prices would be cheaper than those of any other country in the world, it seems a shame to allow foreign material to destroy this industry in embryo, or by constantly holding up the bugbear of impending floods of foreign material to prevent American development on any other than the expensive scale which constantly holds itself in readiness to be destroyed in the near future. As a matter of fact, the United States can match Germany in every single potash possibility except the present possession of more than one hundred potash mines with many years of exploitation behind them on which to base knowledge of future activities.

H. D. RUHM.

New York, Aug 2, 1919

The Dutch East Indies exported to the United States during the first three months of 1918 a total of 6,785,933 lb. of tin and 85,751 lb. of potash. In the corresponding period of 1917, the exports of tin were 8,908,595 lb., and of potash, 47,753 lb.

DETAILS OF PRACTICAL MINING

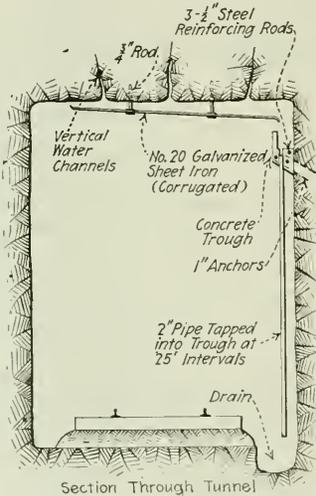

Suggestions From Practice for the Superintendent, Foreman, and Miner

Water Drain for Wet Roof

By ROY H. POSTON

In driving a drift to be used as a main haulage way at a mine in Southeast Missouri, the workmen cut several water-bearing strata that continued to flow after the drift was completed. As a means of preventing the leakage of water from the roof, a system of collecting and draining, shown in the sketch, was satisfactorily installed at a moderate cost and with little consumption of time.

As the continuous dampness made the preservation of

Section Through Tunnel
WATER DRAIN FOR TUNNEL HAVING A WET ROOF

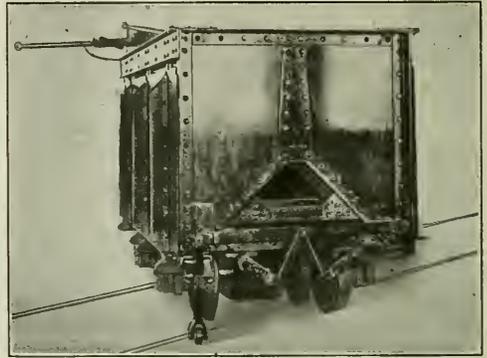

wooden construction difficult, concrete installation was decided upon. Considering that this latter type imposes practically no cost for maintenance, and that the wet part of the tunnel was short, the additional initial expense was considered justifiable and a permanent installation was provided.

Improving Top-Landing Haulage Equipment

By LOUIS C. MOORE

Several changes have been made in the last ten years in the methods used for stocking iron ore in the Lake Superior region, and few of the mines continue to use the man and car system, which is now replaced by either electric locomotive, haulage or endless-rope or gravity tram systems. The objection to electric locomotive tramping is not so much a matter of expense of equipment as it is the danger to which the operator is sub-

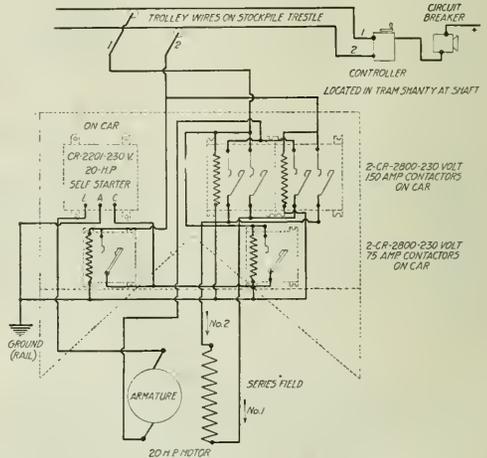

jected, for records show many instances of locomotives that have jumped poorly-constructed ore-trestle tracks and landed below, with the operator either dead or maimed for life. Furthermore, the rolling load, consisting of locomotive, car and ore, as compared with the

SEVEN-TON REMOTE CONTROL STOCKPILE CAR

weight of ore carried, is excessive. This combination has in most cases been abandoned in favor of other methods in stockpiling practice.

The endless-rope system in connection with long trams, though reliable, is expensive and inefficient. Each

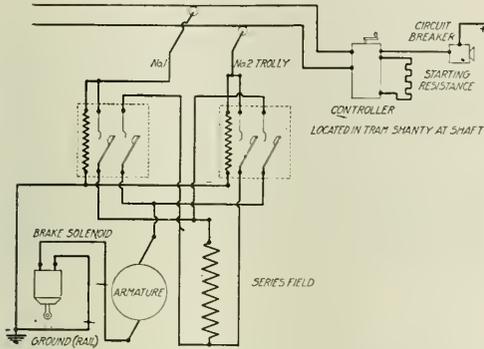

WIRING DIAGRAM FOR SEVEN-TON MOTOR-DRIVEN CAR

winter a mile of 5-in. wire rope is worn out, in addition to the spools, rollers, deflecting sheaves, and other material necessary to the installation. A 50-hp. haulage engine is required to overcome the friction of such a

system, the work of which should be done by a 15-hp. motor. Gravity trams are satisfactory for some stockpiles requiring no trestle, but are too slow and adapted for the longer trams.

As a means of eliminating the bad points of these systems, some pioneer work has been done on the Gogebic Range. In 1914 Carlos Holley, then master mechanic at the Ironton and Colby mines of the McKinney Steel Co., built a 3-ton saddle-back car. This was driven by a Jeffrey 1,080 series motor on each axle, connected

WIRING DIAGRAM FOR THREE-TON STOCKPILE CAR

through a two-trolley wire system over the haulage track, and was operated by remote control, so that the operator could remain at the shaft and start or stop the car on the trestle. The speed was about 1,000 ft. per min. and the car was equipped with brakes controlled by a solenoid placed underneath the car and between the axles. This car was put into service in 1915, it is still being used, and has given such satisfactory results that three similar cars were built, and these are still in service.

Adopting this idea, the Yale mine ordered, from the Lake Shore Engine Works, two 7-ton cars equipped with similar remote control. All brake mechanism on these was left off, each car being stopped by reversing the motor. One of these cars is shown in an accompanying illustration. Another improvement was the door-catch mechanism, which held the door at the bottom in four places, instead of at the ends, and this stopped the door from bulging and permitted lighter construction. A comparison of wiring diagrams for the two cars is shown in an accompanying sketch.

One other property, the Eureka mine, is experimenting with a similar car. In this design the motor is chain driven to the axle, and a ratchet drum controller is attached to the door-catch trip roller on the car, so that each time the door is opened the circuit is reversed at the car. By this method only one trolley wire is needed; whereas the other cars require two. A serious drawback to this method is that if the trip failed to operate on a foggy day, when the car went out the operator might run the car toward the end of the trestle when it should be coming in the opposite direction. With a two-wire trolley no such mistake can be made.

Other schemes are being developed to achieve practicable remote-control operation and control, and the final outcome should produce a car of any capacity needed, operating with a one wire trolley on either 220-

volt a.c. or 240 volt d.c. The car speed will vary from 500 ft. to 1,500 ft. per min., and a braking system will no doubt be evolved that will positively stop the car at critical points. Any manufacturing concern making such a car could develop considerable business on that product alone and such development work would require much less experimenting than more complicated machines, such as mechanical loaders.

The remote-control car, wherever tried, has given satisfaction both during the winter and summer seasons. It requires little attention to keep it in good condition, the up-keep cost is small. There are no ropes or cables to wear out, and no spools, rollers, or deflecting sheaves to replace or oil every morning. If it jumps the track and falls 40 ft., another can be substituted in much less time than with the endless-rope method, and no one is killed or injured. The necessary repairs are small compared with the repairs needed on a locomotive that had dropped the same distance. By means of lamps the operator at the shaft is advised of the position of the car at all times during the darkest night, and if a trolley wheel jumps the wire, which seldom happens, he is instantly notified and can remedy the difficulty. From every standpoint the car is a big improvement over the tram systems now generally used.

Drinking Fountain in Mine

To provide good drinking water for men working underground is most desirable. Formerly it was seldom that the men were able to obtain a drink of pure, uncontaminated water underground. In a number of instances in several districts the practice was to catch a small stream of mine water which was trickling over the wall rock, at a convenient place, in some sort of an improvised vessel. Another method was to catch the water in a

UNDERGROUND DRINKING FOUNTAIN

depression in a rock, from which the men would quench their thirst. The accompanying illustration shows an installation of a drinking fountain in one of the underground workings of the Oliver Iron Mining Co., a subsidiary of the U. S. Steel Corporation. This illustration has been reproduced from the bulletin of the Bureau of Safety, Sanitation and Welfare of that corporation.

The advantages of installing such a simple device at numerous places underground over the old system of making no adequate provision for the comfort of the miners is obvious.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Tariff on Tungsten and Other Ores

Tungsten, magnesite, and zinc are practically assured of the rates of duty proposed by the Ways and Means Committee of the House. Consideration of the emergency tariff bills has gone far enough to disclose definitely that the Republican majority will be able to carry through any plan upon which it agrees. The Democratic opposition is split on the emergency tariff measures, many members of that party being ready to vote for a duty sufficient to insure continuance of the industries built up in the country during the war. The leadership of the Democratic party is urging a license system in preference to a tariff, but is unable to muster the votes to make such a policy general. The Republicans themselves are divided as to the extent to which the licensing system should be applied to dyestuffs.

With the exception of the bill providing new duties for chemical glass and porcelain ware and scientific apparatus, none of the tariff measures, at this writing, has been passed by the House. The tungsten bill was the subject of debate on Aug. 14, and its passage, as it was reported out, is assured.

It had been planned originally to put through promptly all of the emergency tariff bills. The plan was interfered with first by the arrangement to take a six-weeks' vacation. When it was decided to hold the House in session, living-cost and Railroad Administration legislation came in for prior consideration. The Senate, in the throes of peace treaty and living-cost consideration, has made no plans for taking up tariff matters.

The tungsten bill came from the committee with only technical amendments. In urging its adoption by the House, the author of the bill, Representative Timberlake, of Colorado, made the following statements:

This bill asks for a tariff of \$10 per unit, a unit being 20 lb. of tungsten trioxide contained in a short ton, so that this tariff would bring a revenue to the Government of \$10 per unit of every 20 lb. of tungsten trioxide that is imported into this country. With the known fields, it is estimated that we can today produce from 50 to 60 per cent of all the tungsten used in this country, and we feel that with this encouragement, which will aid in the development and seeking out of new fields, it will require only a short time until this country, by reason of the discovery and developments that have been made, will become independent of these other resources for tungsten.

In the course of the discussion, Representative Baker asked the following question:

What effect would the proposed legislation have upon the approximately 5,000 tons of ore now in storage in and about New York? Would they get this raise in the tariff?

To which Mr. Timberlake replied:

I am rather of the opinion that the provisions of this bill could not apply to the product that had already been bonded in this country coming from abroad.

With regard to increasing costs to the consumer, Representative Vaile, of Colorado, endeavored to point out to the House that there would be no important in-

crease in the costs of tungsten products to the consumer. In that connection, he said:

Per pound of finished tool steel, the increase would be not more than 15c. according to my correspondents, allowing for loss in smelting, and they are making a very liberal allowance for loss in smelting. Tungsten tool steel is used in general for the manufacture of high-class steels, and I am reliably informed that only one pound of tool steel is required for the production of from two to three thousand pounds of finished steel. Assuming, therefore, that one pound of tool steel per ton of finished steel is used, it will be obvious that the additional cost of finished steel due to the tariff is entirely negligible. In other words, 15c. would be divided by 2,000, which equals seven and one-half one-thousandths of a cent per pound of finished steel, an entirely negligible addition to the cost of the finished-steel product.

Magnesite Tariff Bill

There is pending in the House a bill (H. R. 5,218) placing a duty of $\frac{1}{2}$ c. per lb. on magnesite, commercial ore, either crushed or ground; $\frac{1}{4}$ c. per lb. on magnesite, calcined, dead-burned, and grain; $\frac{1}{2}$ c. per lb. and 10 per cent ad valorem on magnesite brick.

Some of the arguments made in support of the bill in the report submitted by the Committee on Mines and Mining were as follows:

The sworn statements of six of the largest domestic producers were filed with the committee, showing the average cost per ton, without profit, of the dead-burned magnesite delivered at Atlantic ports to be \$41.20 at the present time. The testimony also showed that the pre-war selling price of the Austrian product, including profit, in the United States was \$16.15, making a difference between the present cost, without profit, of American magnesite laid down on the Atlantic seaboard and the pre-war selling price of the Austrian product \$25.05.

While the magnesite producers urged upon the committee that higher tariff rates are necessary than those provided in the amended bill, yet, owing to the lack of showing and knowledge of future conditions in Austria with respect to this commodity, and particularly with regard to the cost of the same, and having regard to all the testimony and conditions as presented, the committee resolved the matter upon the basis of the rates specified in the amended bill. They believe that under such rates the domestic producers and manufacturers will be able to compete upon equal terms with the Austrian product.

In this connection it appears that a quotation has been made for the delivery of Austrian magnesite, f.o.b. Atlantic ports, at \$26.50 per net ton, as compared with the pre-war selling price of \$16.15 above referred to.

The testimony showed that an ocean rate on Austrian magnesite has been fixed of \$7.50 per ton, as against the pre-war rate of approximately \$2 per ton, and as this material is used as ballast it is possible that the ocean rate may be subsequently reduced to approximately that of normal times. On the basis of such quotation for present delivery a differential between the present Austrian selling price, including profit, and American magnesite at Atlantic ports, without profit, is \$14.50 on dead-burned magnesite, and the tariff rate of $\frac{1}{2}$ c. per lb. provided in the amended bill is therefore deemed adequate.

A tariff of $\frac{1}{2}$ c. per lb. has been placed upon crude magnesite ore, as the testimony shows that without protecting

the crude material it would be possible to defeat the object of this bill by importing crude magnesite into this country and then manufacturing it into dead-burned or calcined magnesite at such a price as to prevent the production of dead-burned magnesite in this country.

The testimony further developed the fact that it requires two tons or more of crude magnesite to make one ton of dead-burned or calcined magnesite.

The testimony shows that magnesite brick consists only of the dead-burned magnesite to which water has been added and then pressed into the form of a brick. It was, therefore, necessary to place the same specific duty on the material in the brick as upon dead-burned magnesite, for the reason that if the brick were imported without this duty they might be broken up and we would have in fact loose dead-burned magnesite admitted without specific duty, and would thus defeat the purpose of this bill.

The Sixty-fifth Congress passed a bill appropriating \$8,500,000 to repay the net losses of American producers of pyrites, chrome and other essential war minerals. Only such minerals as the Interior Department had to urge the production of were included in the bill. These minerals were not dependent alone upon Austria, as in the case of magnesite. The shortage of magnesite was prevented by the prompt action of producers, who, knowing the United States was dependent upon Austria alone, were able to calculate a probable shortage during the war, and the Government was not compelled to stimulate production of magnesite. Had the magnesite producers failed to produce this material the Government would have had to stimulate production, and then the magnesite producers would have been included in the War-Minerals Relief Bill and have been repaid for their losses. They were not included, for the above reason. The proposed tariff will not repay their losses, but will give the magnesite producers an opportunity to endeavor to earn a profit on their war investment of \$3,500,000, and at the same time furnish an essential mineral to the steel, copper, and lead industries.

Minerals Investigations of the U. S.

Bureau of Mines

The usual monthly bulletin on Minerals Investigations was not issued for July, according to an announcement by Van. H. Manning, director of the U. S. Bureau of Mines, but such information as is available will be released at the regular time each month.

The work on minerals investigations was carried on under a special appropriation made during the war, which appropriation expired on June 30, causing a considerable part of the staff engaged in this work to be disbanded. It is expected that in the course of the next month or two the bulletin will be resumed in some form.

The Bureau believes that this work has been of value to the industries concerned, and is willing to make every effort to reorganize and maintain this work on such scale as may be possible.

Awards Under War-Minerals Act

Payment of \$219,607.90 to the Chestatee Pyrites and Chemical Co., in full payment of the company's claim against the Government, has been authorized by the Secretary of the Interior. The company's claim as filed called for \$914,172.73. It is understood that the claimant will not accept the award, except in part payment, and will continue its effort to secure the amount of damages claimed.

While the War-Minerals Relief Commission has made awards in several other claims, none other than that of the Chestatee company has been approved by the Secretary.

Foreign Trade in Metals and Ores

Imports and exports of the more important metals and ores, as reported by the Department of Commerce for June, 1919, and the figures for June, 1918, as finally revised, are as follows:

IMPORTS, JUNE, 1918 AND 1919		
(In pounds, unless otherwise stated)		
	June, 1918	June, 1919
Antimony ore, contents	360,814	Nil
Antimony matte, regulus or metal	1,951,044	1,617,098
Copper:		
Ore, contents	5,079,450	3,560,057
Concentrates, contents	4,195,525	2,985,286
Matte, regulus, etc., contents	2,349,300	1,187,607
Imported from (in part):		
Canada	2,650,674	2,452,560
Mexico	5,415,753	3,862,083
Cuba	1,613,116	632,000
Chile	1,629,185	342,383
Peru	Nil	22,804
Unrefined black, blister, etc.	13,801,332	19,842,478
Refined, in bars, plates, etc.	281,432	3,721,956
Old, etc., for manufacture	100,696	211,034
Composition metal, copper chief value	19,640	Nil
Lead:		
Ore, contents	2,302,941	1,686,453
Bullion, contents	16,479,770	4,664,488
Imported from (in part):		
Canada	1,252,460	799,805
Mexico	17,050,868	5,551,026
Pigs, bars and old	Nil	22,880
Pyrites, long tons	31,172	50,545
Imported from:		
Spain, long tons	13,881	46,787
Canada, long tons	17,291	3,758
	1,060	Nil
Tin ore, long tons		
Tin bars, blocks, pigs, etc.	15,130,205	112,000
Imported from (in part):		
United Kingdom	1,679,910	56,000
Straits Settlements	7,262,750	56,000
Dutch East Indies	1,369,615	Nil
Hongkong	2,121	Nil
Australia	577,920	Nil
Zinc:		
Ore, contents	4,053,254	2,720,726
Imported from:		
Canada	1,142,422	1,176,679
Mexico	2,910,832	1,544,047
Blocks or pigs, and old	1,425	Nil
Manganese ore, long tons	38,427	31,550
Imported from (in part):		
Cuba, long tons	1,817	321
Brazil, long tons	31,481	27,457
Br. India, long tons	4,550	1,000
Tungsten ore, long tons	656	338
EXPORTS OF COPPER, LEAD AND ZINC		
(In pounds)		
	June, 1918	June, 1919
Copper:		
Ore, contents	109,335	2,100
Concentrates, contents	129,428	Nil
Refined, in ingots, bars, etc.	1,069,737	970

Chicago Meeting, A. I. M. E.

One Hundred and Twentieth Gathering of the Institute, Monday, Sept. 22, to Friday, Sept. 26, inclusive, 1919—Headquarters, Congress Hotel—
Program of the Sessions

THE American Institute of Mining and Metallurgical Engineers will hold its 120th meeting in Chicago, Sept. 22 to 26, inclusive. Headquarters will be at Congress Hotel. Carl Scholz is chairman of the committee on arrangements. Other members of the committee are F. G. Fabian, H. H. Stoek, L. V. Rice, J. A. Ede, G. M. Davidson, F. W. DeWolf, R. W. Hunt, F. T. Snyder, E. B. Clark, F. S. Peabody, and Mrs. C. H. MacDowell.

Technical sessions will be held on the following subjects: Mine Taxation, Iron and Steel, Sulphur in Coal, Pyrometry, Non-Ferrous Metallography, Coal and Gas, Milling, Oil, Industrial Organization, Geology, Non-Ferrous Metallurgy, Mining, and Local Resources.

Trips of inspection will be made to the Gary steel plant; zinc smelteries, coal mines, cement works, and permanganate plant in the La Salle district; mining machinery manufacturing plants, and tungsten and molybdenum reduction plants in North Chicago and Milwaukee; lead and oil refineries in East Chicago and Whiting; coal fields at Franklin and McCoupin; and varied metallurgical and manufacturing plants in Chicago.

Summary of the program follows:

SUMMARY OF PROGRAM

MONDAY, SEPT. 22

- 9 a.m. to 9 p.m., registration at convention headquarters, Congress Hotel.
- 11 a.m., special session on mine taxation in co-operation with the Internal Revenue Department (?), U. S. Treasury.
Technical sessions: Non-ferrous metallurgy and metallography. Coal and gas.
- 2 p.m., technical sessions: Coal and gas;
Milling;
Industrial organization;
Geology.
- 8:30 p.m., smoker, at Chicago University Club, Michigan Boulevard, four blocks north of Congress Hotel.

TUESDAY, SEPT. 23

Trip to Gary steel plant.
All-day excursion by steamer from Chicago, direct to the plant of the U. S. Steel Corporation at Gary, Ind.

The steel company's special observation train will convey the members and guests through the various parts of this immense and famous establishment. This will afford an opportunity to see in operation the most modern and approved methods in the manufacture of steel and large-scale production.

Luncheon will be served at the steel plant.

On this and other excursions a large attendance by the ladies is desired.

On the return trip on the boat there will be a session on Iron and Steel, with especial reference to blast-furnace work. (?)

8:30 p. m., technical session on oil.

Technical session on iron and steel, followed by moving pictures of a 240-inch plate rolling mill, the largest in the world.

WEDNESDAY, SEPT. 24

- 10 a.m., technical sessions:
Symposium on sulphur in coal;
Iron and steel;

- Mining and local resources.
2 p.m., technical sessions:
Symposium on sulphur in coal;
Pyrometry, with especial reference to steel;
Non-ferrous metallurgy.
6:30 p.m., president's reception, Congress Hotel.
7:30 p.m., banquet, followed by dancing, Congress Hotel.

THURSDAY, SEPT. 25

- 10 a.m., technical session:
Symposium on pyrometry. (A collection of papers marking an epoch in metallurgical literature.)
All-day excursion to the La Salle district.

Arriving at La Salle, the Illinois Valley Manufacturers' Club and the local Chamber of Commerce will be hosts at a luncheon at the Kaskasha Hotel.

In the afternoon, various parties of members and guests will be formed and taken in automobiles to the zinc smelteries, coal mines, or cement works. For those not particularly interested in these operations, there will be an automobile trip, of particular interest to the ladies, to Starved Rock and the beautiful Illinois Valley.

FRIDAY, SEPT. 26

Optional Excursions

A—North Chicago and Milwaukee:

The trip will be made by special train leaving Chicago over the C. & N. W. R.R. Friday morning, Sept. 26, to visit the mining machinery manufacturing plants of Milwaukee.

The train will stop at North Chicago at the Fansteel Products Co.'s plant, where the members will be shown the complete metallurgical processes in the production of metallic tungsten and molybdenum, from the purification of the crude concentrates as purchased in the market, and including the sintering of finely divided metallic powder into ingots by passing through it electric currents of enormously high amperage.

The operations include all those involved from the treatment of the tungsten ore to the finished product, which includes the chemical treatment of the ore and the purification of the tungsten material; the reduction of tungstic acid to tungsten powder; the pressing of this powder into ingots by means of hydraulic presses; the heat treatment and sintering of these ingots and their swaging to finished rod of various diameters; the cutting of the rod into disks—and the operations connected with the welding of these disks to iron screws and rivets of various kinds—and the finishing operations involved in the production of the final tungsten contact points.

In connection with molybdenum, operations can be seen involving purification of the material; its reduction to powder; sintering of the bars and their swaging to rod and wire; also the operations in producing sheet molybdenum.

Though the operations to be seen at this plant are not large in number, they are out of the ordinary and are of particular interest to most persons who see them, because of their unique character. Visitors to the plant have been much interested in the research laboratory, which is provided with all necessary equipment for carrying on research work in connection with the lines in which the company is interested.

A stop will be made at Cudahy, where the train will be switched in to the plant of the Power & Mining Machinery Works of the Worthington Pump & Machinery Corporation, where the members will be given an opportunity to inspect not only mining machinery but also a full line of internal combustion engines.

From Cudahy, the train will go direct to the plant of the

Allis-Chalmers Manufacturing Co. at West Allis, arriving there in time for luncheon, which will be served at the Allis-Chalmers Club. After luncheon, guides will be provided to pilot members through the plant, and ample time will be given to make a thorough inspection.

For those ladies who may not care to visit the manufacturing plants, automobiles with guides will be provided to take them through the parks and residential parts of the city.

For members wishing to visit any other manufacturing plants of Milwaukee which may be of particular interest to them, suitable arrangements will be made.

The train will be run from the Allis-Chalmers Manufacturing Co.'s plant to the C. & N. W. depot, at the foot of Wisconsin St., where the ladies and members visiting other plants may board the train.

B—East Chicago and Whiting:

Lead refinery of International Lead Refining Co.

Luncheon at Hammond Country Club.

Oil refineries of Standard Oil Co., Whiting, Ind.

C—Coal Trip to Franklin and Macoupin Counties, leaving Chicago late Thursday evening, and spending Friday in the coal fields.

D—Local Industrial Plants, Chicago:

Nearly every industry in the metallurgical and manufacturing line is represented by one or more modern, economical plants in Chicago. The Committee on Local Industries is preparing a list of these which can be visited, and trips for inspection will be arranged in accordance with the desires as expressed by the members.

LADIES' COMMITTEE

The wives and daughters of all members are most cordially invited to attend the Chicago meeting. The banquet and the various excursions are being planned with a special view to their enjoyment by the ladies in the party. Also a special Ladies' Committee has been appointed, of wives of members of the Chicago Section, which is arranging an attractive program for the entertainment of the women guests. They will be shown the points in Chicago which are of particular interest to them.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES

The Fifth National Exposition of Chemical Industries will be in progress at the Coliseum and First Regiment Armory, Chicago, during the week, and at intervals during the meetings members of the Institute are invited to visit the exposition. The badge of the Institute will be the only pass required at the doors. Ladies are invited.

MID-WEEK BANQUET

It is thought that by having the banquet in the middle of the week a maximum attendance at this function can be obtained. Members who for some reason are unable to come to Chicago for the entire meeting will then be able to be present at the banquet, whether they come for the first or the latter half of the week. The members of the Institute and their wives will be the guests of Chicago at the banquet.

LA SALLE TRIP

From the standpoint of scenery, geology, mining, and industry, the itinerary of the trip to La Salle, Ill., is difficult to surpass. The committee has arranged all details with a view to the convenience of the visitors, and will furnish automobiles, luncheon, guidance, and other accommodations.

Viewed in the vicinity of La Salle, the appellation "Prairie" State for Illinois is a misnomer. There are scenic beauties rivaling the Appalachians. The rock structure is unique. Deep canyons abound. Starved Rock and Deep Park are the mecca of tourists. The district is rich in tradition and historic lore.

Geologically, the section is of great interest; the lower formation, or rocky base, of the state is exposed. The La Salle anticline, illustrated in a souvenir booklet, may be viewed and studied readily at first hand.

In the coal fields mining on the longwall system prevails. The room and pillar system, however, may be studied

at one property and also the operation of the panel system with modification. There is an electrically equipped mine, and most modern methods of handling the coal at surface are demonstrated. Mining and quarrying of portland cement rock, quarrying and treatment of glass sand along the escarpment of the Illinois River, mining and quarrying of hydraulic cement, clay products and gravel also are interesting features.

Cement is manufactured by the Marquette, Lehigh and La Salle companies in enormous quantity.

Three big zinc works may be seen in operation—the Matthiessen & Hegeler, Illinois, and Mineral Point companies. The first two possess the largest zinc rolling mills in America.

The Western Clock Co., manufacturers of "Big Ben," rated as one of the model factories of the Middle West, may be visited.

Among other industries that may prove attractive are the Peru Plow & Wheel Co.; the Carus Chemical Co., where the first calcium permanganate in America was produced; several zinc-plating works; a pressed brick manufactory; and the La Salle Tool Co.

The fossilized remains of what once were two breweries are among the curiosities viewable.

DEDICATION OF BUREAU OF MINES EXPERIMENT STATION

First-Aid and Mine Rescue Contest

The Bureau of Mines extends a cordial invitation to all members and guests to visit Pittsburgh, Sept. 29 to Oct. 1, to participate in dedicating the Mines Experiment Station. Accompanying this will be a nation-wide participation in a first-aid and mine rescue contest. The Pittsburgh Chamber of Commerce will co-operate. The Institute will be represented by a special delegate appointed by the president.

MONDAY, SEPT. 29

- 8:30 a.m., bureau building open for inspection.
- 10:30 a.m., dedicatory ceremonies in rear of main building, 4,800 Forbes St.
- 2 p.m., special train and automobiles to experimental mine near Bruceton, Pa.
- 3 to 6 p.m., mine explosion and inspection of experimental mine and of explosives testing plant near Bruceton, Pa.
- 6 p.m., return by special train and automobiles to B. & O. depot, Pittsburgh.
- 8 p.m., informal reception and organ recital, Carnegie Music Hall. Arranged by Carnegie Institute of Technology.

TUESDAY, SEPT. 30

- Nation-wide first-aid and mine rescue contest, Forbes Field, Pittsburgh.
- 9 to 12 a.m., elimination mine rescue contests.
- 2 to 5 p.m., elimination first-aid contests.
- 5 p.m., coal-dust explosion.
- 8 p.m., pageant glorifying the mining industry, Forbes Field.

WEDNESDAY, OCT. 1

- 9 to 12 a.m., final mine rescue contest.
- 2 to 5 p.m., final first-aid contest.
- 5 p.m., coal-dust explosion.
- 8 p.m., smoker, with award of prizes to winning teams.

Kirkland Lake Gold Mining Co., Ltd.—The annual report of this northern Ontario company for the year ended May 31, 1919, shows that a total of 5,406 feet of underground development has been completed to date, together with 898 cubic yards of station cutting. One shaft has been sunk to a depth of 500 feet and the other to a depth of 700 feet. No ore reserves are given, but development has been very satisfactory and there has been no sign of change of formation at depth. A complete 150-ton mill was put in operation this spring, and the first bar of gold bullion shipped on May 17. The total assets of the company amount to \$1,610,181, of which \$1,340,481 represents mining claims and development. The company has issued 2,000,000 shares.

Monthly Copper Production for 1919

The table which appears herewith is compiled from reports received from the respective companies (except in the cases noted as estimated), together with the reports of the U. S. Department of Commerce as to imported material, and in the main represents the crude-copper content of blister copper, in pounds.

MONTHLY CRUDE-COPPER PRODUCTION, 1919

	April	May	June	July
Alaska shipments (c).....	2,153,691	1,134,272	2,374,843	3,021,912

Utah Copper.....	9,420,000	9,125,000	9,528,000	8,405,863
Eastern smelter (b).....	1,400,000	1,400,000	1,400,000	1,400,000
Total reported.....	85,428,998	83,072,975	85,011,570
Others, estimated.....	13,380,000	9,580,000	10,845,000
Total United States.....	98,808,998	92,652,975	95,856,570
Imports: Ore and concentrates etc.....	9,773,655	7,946,560	7,732,950
Imports in blister, etc.....	22,781,489	15,997,164	19,842,478
Grand total.....	131,364,142	116,596,699	123,431,998
British Columbia:				
Granby Cons.....	1,333,523	1,848,802	2,072,964
Mexico:				
Boleo.....	1,433,040	1,322,720	1,256,640	1,256,640
Cananea.....	3,000,000	3,000,000	3,000,000	3,200,000
Phelps Dodge, Mexican properties.....	1,702,000	1,552,000	1,735,000	2,516,000
Other foreign:				
Cerro de Pasco.....	4,780,000	4,034,000	4,026,000	3,984,000
Chile.....	5,024,000	5,066,000	5,003,430
Katanga.....	4,298,970	2,094,370	4,519,430	4,442,270
Backus & Johnston.....	2,036,930	1,970,064	(d)	2,174,000

(a) Only electrolytic cathodes are entered. New Cornelia also produces some copper from ores sent to Calumet & Arizona smelter. (b) Estimated. (c) Official figures of the U. S. Department of Commerce; includes Kennecott production from its Alaska mines. (d) Report not received.

Production of the United States by months since the beginning of the year and the corresponding figures for 1918 were as follows:

	1918	1919
January.....	165,431,568	135,733,511
February.....	160,011,364	111,649,512
March.....	185,525,168	102,040,460
April.....	185,207,096	98,808,998
May.....	191,070,350	92,652,975
June.....	166,723,599	95,856,570

The grand total includes, under "Imports in ore and blister copper," the production of such companies as Granby, Cananea, Braden, Cerro de Pasco, and Chile. As a matter of record, however, the individual figures are given after the total. We also report the copper output of the Boleo and Katanga companies, which does not come to the United States.

Foreign Trade in Copper—Erratum

In the table of copper imports, published in the *Journal* of Aug. 16, the contents of the matte, regulus, etc., imported in June was given as 2,985,286 lb., instead of 1,187,607 lb. With this correction, the total matte and regulus, etc. (contents) imported during the first six months of 1919 amounts to 19,422,846 lb.

Survey Geologists Protest

Building Commission Would Crowd Staff Into Less Space Than Occupied Formerly When Public Health Service Protested

THE members of the staff of the U. S. Geological Survey in Washington recently held a meeting to protest against the order of the Public Building Commission by which the space available to the staff is reduced about one-half, or to an average of that considered to be sufficient for the clerical forces of the departments in Washington.

In a letter sent to the chairman of the commission as a result of the meeting, it is set forth that, by the proposed reduction in allotted space, about 320 geologists, engineers, and other technical employees of the Survey, with about 260 clerical workers, must carry out their official work in 44,000 sq.ft. of floor space. This is about 20 per cent less than was occupied by a similar corps of workers in the Survey's old crowded and unsanitary headquarters, which called forth a protest from the Public Health Service. The conditions at that time led to the preparation of plans for a building specially adapted to the Geological Survey's needs, and in 1913 to the passage of the bill authorizing the construction of the new Interior Building, of which the Survey now occupies about one-third.

The Divide-Tonopah Chamber of Mines

A chamber of mines has been recently formed in the Tonopah and Divide mining districts of Nevada. The purposes of this organization, which is to be known as the Divide-Tonopah Chamber of Mines, is set forth in the following:

To serve and promote the general welfare in the Divide and Tonopah mining districts, to stimulate interest in the mining industry, and to give legitimate publicity to mining activities in this section of the state.

To so advertise the Divide district, its mines, production and activities throughout the United States that treasury stock of legitimate companies will be readily absorbed, and the value of all stock, promotion and treasury, of such companies, stabilized and sustained.

To spread information concerning the Divide district and its mines and mining companies, that the market for the stocks thereof will be greatly broadened and other capital largely attracted thereto besides that of California and Nevada, which in itself, so far as it is devoted to mining, is not sufficient to fully finance and support all the worthy enterprises of the Divide district.

To discourage the formation of dishonest and fraudulent mining companies and enterprises, to expose the attempts of such concerns to defraud the public, and to investigate and report upon each and every complaint made to the Chamber of Mines that any company, promoter, broker, or other person is treating the public or any member thereof dishonestly, fraudulently, or unfairly.

To guard the interest of the people of the Divide and Tonopah mining districts in any matter requiring attention; to protect them from fraud and imposition, and to undertake any reform necessary to or desirable for their welfare and prosperity.

To stabilize business conditions in every way possible; to prevent industrial dissatisfaction, and to adjust differences, in order that there may be no interruption of the present prosperous conditions in the Divide and Tonopah districts.

To secure accurate information of mining corporations, mining activities, developments, and progress in the Divide and Tonopah districts, and to furnish the same to all persons seeking it, and to disseminate generally such information.

BY THE WAY

In a Quandary

Two men of Sierra County, California, recently located some soda springs at Parker Flat, in the same county, with the intention of marketing the waters. Further investigation of the springs resulted in the discovery of a quartz vein 15 ft. wide. Six feet of the vein assayed \$6 gold and nine feet \$4 per ton, it is said. Now the owners are in a quandary as to whether mining operations would be more profitable than the water. With gold mining as it is and a great national thirst impending, we advise them to go after the soda water.

What Some People Think

Below are quoted the words appearing on the front cover of the New Jersey Zinc Co.'s Library Bulletin, issued weekly by the company's library:

The technical or trade journal of today is the liveliest and most "up-to-now" assistant a business man has. It is carefully edited, well printed, fully illustrated and thoroughly indexed, both as to literary matter and advertisements. It is the "always ready reference" of the minute, and the official, head of a department, or even workman who does not use it to its fullest capacity is neglecting one of his best friends.

In no other way can any business man, no matter how high or low his position, keep so fully abreast of the time in his business as by early and careful perusal of his trade and technical periodical, from its front to its back cover, and from no other source can he obtain the "immediately useful" so well as he can from a well-filled and indexed present volume of those same publications.

The Dangers of Mining

Mining is one of the extra-hazardous industries employing more than 1,000,000 men in the United States, of which three or more of every 1,000 men employed are killed each year by accidents. This, according to Albert H. Fay, of the U. S. Bureau of Mines. Though complete data relating to non-fatal injuries are not available, states Mr. Fay, reports to the Bureau of Mines for all metal mines in the United States show that at least 250 men per 1,000 per year are injured sufficiently to cause loss of time. Approximately the same rate will apply to other branches of the mining industry. A reduction of 50 per cent in the number of mine accidents would mean a saving of at least 1,500 lives in the United States every year, a saving of valuable time now lost and an alleviation of much suffering now resulting from more than 250,000 non-fatal accidents that the records show occur annually in the mineral industries.

The Tenderfoot's Lease

Several years ago in the mining town of Gold Hill, Ore., a local attorney, on arriving at his office earlier than usual, found a new arrival awaiting him. The client, a tall lanky youth of probably twenty summers, was clad in a corduroy suit of tan, with high-laced boots. With a prospector's outfit at his side and a gold-pan in hand he represented the typical tenderfoot of the region. Peering through a pair of rimless lenses, the new comer eagerly addressed the attorney as he drew near. "Say

judge, what will be your charges for drawing up a mining lease?" "Five dollars, sir. If it should be an extraordinary document, it will cost you more," replied the student of Blackstone. "Well, judge," began the youth, after he had returned with the lessor, "you make this instrument good and strong—and, I want three carbon copies to post at the mine. I will pay you ten dollars for your services. I just come down from Coeur d'Alene. I had a lease on a mine up there—the blooming thing was showing up fine. Some fellows came along and told me that my lease was no good. They hung around and offered me five thousand dollars for all my right, title, and interest in and to the said premises. I said 'all right.' And—say—judge, what do you think? Well, sir! Those fellows sold that mine the next day for five hundred thousand dollars—a clear net loss to me, of four hundred and ninety-five thousand dollars. Never again—I want one of those leases, that I won't have to sell."

Curves and Nerves

The climate alone was enough to dissuade anyone from staying on the job. Surveying day after day in the rain put the entire corps in an irritable mood, and it was not surprising that the chainmen, rodman, and axemen should drift away under one pretext or another. Came a day when there remained only the fussy general manager, the transit man, and one semi-educated machete wielder to finish the location of the motor-truck road that was destined to link the mine with the river port. The transit man had looked upon his post as but a temporary stepping stone to higher tasks, so it rankled him to see the G. M. usurp his place at the instrument. And still more did it anger him to be compelled to skip about with a stadia rod in accompaniment to weird computations on a slide rule; marking and driving stakes like a mere underling. On the third day of this sort of thing, when ordered to set additional stakes to mark the P. C., P. I., P. T., etc., of various tentative curves, he ventured to argue with his superior anent the foolishness of such attempts to apply railroad survey tactics to a guess-and-by-gosh stadia line. As though by way of punishment for his *lese majesty*, his tasks that afternoon included the setting of some P. C. C. and P. R. C. stakes. By a fortunate coincidence that same day chanced to be pay day. That night some mysterious activities might have been observed at the quarters of the subordinate engineer, including the furtive nailing of boxes and whispered consultations with a couple of camp followers. The next morning he started out on the job bright and early, packing the rod and a stake of unusual dimensions. Hurrying with a halfbreed to the end of the line, he had the instrument set up by the time the G. M. arrived. Stalking on ahead through a cleared space for quite a distance, he affected to misunderstand the frantic signals of his chief. Alternately extending and lowering the rod, moving up and down the hillside but always lengthening the distance between them, he finally dragged his masterpiece into view and drove the stake firmly until it looked like a headstone on a lonely grave. Abandoning the rod, he proceeded up the hillside, mounted a waiting mule, and soon disappeared around a bend in the trail. When the puzzled autocrat reached the stake, he discovered on the hind side of it the neatly crayoned inscription

P. P. C.

PERSONALS

Ray Hardy is engineer in charge of the Divide Extension Mining Co.'s mine.

Richard Taylor is superintendent of the White Caps Mining Co., Manhattan, Nev.

Ellsworth R. Bennett, of Tonopah, recently examined a property near Eureka, Nev.

Charles L. Lawton, manager of the Quincy Mining Co., made a recent visit to Chicago.

Clyde Weed, manager of the Hancock Consolidated Mining Co., is in the East on business.

Col. O. B. Perry is inspecting dredging operations at Pritchard Creek in the Coeur d'Alene district, Idaho.

John D. Ryan has returned to New York after spending a month's vacation at Houghton, Mich.

R. A. Kinzie, of San Francisco, will have charge of mining operations for the Engels Copper Mining Co.

John L. Malm, of the Malm-Wolf Co., visited the Ferris Haggerty properties in Wyoming early in August.

Charles E. Knox is in Tonopah, Nev., in the interests of the Knox Divide Mining Co., in the new Divide district.

W. Parsons Todd, vice-president of the Quincy Mining Co., has returned to New York after visiting the property in Michigan.

Frederick J. Harper has been appointed managing director of the Nitrate Agencies Co., with residence in Iquique, Chile.

J. Parke Channing, president of the Naumkeag Copper Co., operating at Houghton, Mich., made a recent visit to the property.

Rodolphe Agassiz, of Boston, president of the Calumet & Hecla Mining Co., is making his regular visit to the mines in Michigan.

Herbert C. Hoover, head of the Inter-Allied Relief Organization, accompanied by a staff of experts, arrived in Warsaw on Aug. 11.

F. Dean Bradley is in charge of operations at the Goldfield Consolidated Mining Co.'s mill, Goldfield, Nev., for the Goldfield Development Co.

Homer Wilson, of San Francisco, has acquired the property of the Lodi Mines Co., situated some distance from Luning, Nev., and will erect a concentrating plant.

E. E. Hunner, general manager of the Hanna Ore Mining Co., has returned to his duties after a series of serious operations at Johns Hopkins Hospital, Baltimore.

F. W. Draper is in Nevada in the interest of the Louisiana Consolidated Mining Co., which is preparing to work the Tybo mine, sixty miles northeast of Tonopah.

R. M. Kellogg, mining development contractor, who is at present sinking a number of shafts in the Divide district of Nevada, is making a business trip to the Ranger oil field of Texas.

John Fowle, vice-president and general manager of the Silver King of Arizona Mining Co., who has been in California recently on professional business, has returned to Superior, Ariz.

F. G. Cottrell, assistant director of the Bureau of Mines, was delayed in sailing from Europe. Dr. Cottrell had expected to reach the United States Aug. 10, but will not be able to return before some time in early September.

Charles McKinnis, of Wallace, Idaho, manager of the National Copper Mining Co., is sinking two wells near Ranger, Tex. Myron A. Folsom, chief counsel for the Bunker Hill & Sullivan company, has a flowing well in the same field.

PLAQUE OF DR. JAMES DOUGLAS

James Douglas' memory was honored recently by the American Institute of Mining and Metallurgical Engineers by the placing of a bronze plaque of Dr. Douglas, reproduced herewith, in the Engineering Societies Building, New York. Dr. Douglas died on June 25, 1918, at the age of eighty-one years, after having devoted his entire life to the advancement of the mining industry. The inscription on the plaque denotes the distinguished honors conferred on Dr. Douglas by his fellow engineers in recognition of his valuable services to the sciences of geology and metallurgy.

Capt. Lionel H. Lehmaier, late of the 4th Australian infantry and prior to the war assayer and metallurgist with the Sulphide Corporation, Cockle Creek, New South Wales, has been appointed the representative in Australia of the Guaranty Trust Co.

C. W. Sherman, of Hamilton, Ontario, president of the Dominion Steel & Foundry Co., has completed a tour of inspection of the Mesabi and Vermilion

ranges in company with his brother, H. S. Sherman, superintendent of the Hull-Rust mine, at Hibbing.

R. R. Leslie has resigned as general superintendent of El Cuyo Mining & Milling Co., at Guanajuato, Mexico, and will devote himself to personal business. F. H. Lerchen, who has been his assistant, became superintendent on Aug. 1. Mr. Lerchen is at present in Chicago on business.

E. A. Julian, engineer in charge of the exploration department of the Goldfield Consolidated Mining Co., has assumed the management of the Tonopah Divide Mining Co. and the Brougher Mining Co., succeeding A. I. D'Arcy, who is devoting his time to the interests of the Goldfield Development Co.

A. C. D. Bothe, mining and metallurgical engineer, commissioned by the Netherlands government to inspect mining operations in America, spent several days in the Coeur d'Alene district. After visiting other mining sections of the West, he will sail in about a month from San Francisco to Batavia, Java.

Van. H. Manning, director of the U. S. Bureau of Mines, will visit Denver the latter part of August to confer with state and city officials relative to the proposed oil-shale investigations. At present, Denver and Salt Lake are competing for the Bureau of Mines proposed oil-shale plant, for which Senator Henderson, of Nevada, introduced a \$100,000 appropriation bill. Director Manning will be the guest of the Colorado Metal Mining Association and the Colorado Chapter of the American Mining Congress at an informal dinner to be held on Aug. 27.

Colonel Frederick Mears has been appointed by the President as chairman and chief engineer of the Alaskan Engineering Commission in charge of the construction of the Government railroad in Alaska. Colonel Mears was a member of this commission, but retired to return to active duty with the Army during the war. He was with General Goethals during the construction of the Panama Canal in charge of the Panama Railroad, and during the war was general manager of the American railroad lines in France. The President has appointed William C. Edes as consulting engineer to the commission.

OBITUARY

Harry T. Hobson, aged twenty-six, manager of the Marne Divide property in Nevada, was killed on Aug. 6, 1919, by falling a distance of eighty feet into the shaft. Mr. Hobson was a graduate mining engineer of Stanford University in 1917, and during the war held a commission as lieutenant, being assigned as gas instructor to the school at Little Rock, Ark. Mr. Hobson was also identified with the mining industry in Arizona and Mexico.

INDUSTRIAL NEWS

L. H. Sebbes, until recently with the advertising sales department of the *Engineering and Mining Journal*, has accepted a position as manager of the sales promotion department of the Chicago Pneumatic Tool Co. in the Chicago office.

Goulds Manufacturing Co., of Seneca Falls, N. Y., manufacturers of pumps, will open on Sept. 1 a district sales office in Detroit, Mich., in the Dime Bank Building, in charge of E. B. Gould, who has recently returned after eighteen months' service in France.

Davis-Bournonville Co., Jersey City, N. J., announces that the publication of "Autogenous Welding," devoted to the interests of the company and its employees, will be resumed regularly after having been suspended during the war. The July issue has been named the Victory Number, and is largely devoted to the part played by oxy-acetylene welding and cutting in the war.

Norton Company, since July 1, 1919, has been conducting the business of the Norton Grinding Co. which has been reorganized with the following board of directors: George I. Alden, chairman; Charles L. Allen, president and general manager; Aldus C. Higgins, treasurer and general counsel; George N. Jeppson, secretary and work manager, and R. Sanford Riley and John Jeppson.

The Sullivan Machinery Company announces the appointment of R. S. Weiner as district manager at El Paso, Tex., succeeding Don M. Sutor. Mr. Sutor has been transferred to the company's St. Louis office as district manager for Missouri, eastern Texas, Oklahoma, Kansas, western Kentucky and western Tennessee. The company's office at El Paso remains at Room 511 Mills Building, as heretofore.

Traylor Engineering and Manufacturing Co., Allentown, Pa., announces the return of R. R. Shafter to the company's sales organization after an absence of two years as general superintendent of the Traylor Shipbuilding Corporation, which completed more 3500-ton cargo carriers than any other yard on the Atlantic and gulf coasts. Mr. Shafter will have charge of the New York office, at 30 Church St.

H. Gardner, 2 Metal Exchange Buildings, Leadenhall Avenue, London, announces that he has converted his business into a limited liability company with a capital of £1,000,000, of which £650,000 has been issued and fully subscribed. All contracts and liabilities are taken over by the company, which will likewise receive all debts. Directors are: Henry Gardner, chairman; Walter Gardner, Sir Woodburn Kirby, George E. Leon, and William Murray.

Goodyear Tire & Rubber Co., Akron, Ohio, has established a week-end traveling sales school, composed of capable instructors, who will visit the men in

the various branches of the company. They have recently covered Louisville, Memphis, and New Orleans. At present they are in Indianapolis. In the eleven years of its existence, the company's relief association has paid \$78,899.10 compensation for sickness and accident to 4,164 of its members. Death benefits for the same period amounted to \$157,878, covering 158 recorded deaths.

Chicago Pneumatic Tool Co. will remove its general offices from Chicago to No. 6-8 East 44th St., New York. The company is erecting a ten-story building of combination brick and limestone, to be ready for occupancy early in 1920, at which time the transfer will be effected. The construction work will be done by Westinghouse Church Kerr Co. The purpose of the transfer

CHICAGO PNEUMATIC TOOL CO. BUILDING, 6-8 E. 44TH ST., NEW YORK

is to facilitate the administration of the company's six American plants and twenty-six sales and service branches.

TRADE CATALOGS

"C-H Mine Duty Apparatus" is the title of an 8-page 8½ x 11 in. pamphlet issued by The Cutler-Hammer Mfg. Co., Milwaukee, Wis. Special reference is made to the mine-duty apparatus installed in the plant of the St. Louis Smelting & Refining Co. at St. Francis, Mo. The method of handling the ore from three levels until it is ready for shipment is given, as well as a

description of the hoist and conveying machinery and the automatic control and safety apparatus used. The illustrations show the mine-hoist control panel, switches, overspeed governors and electrically operated brakes; also the automatic starters for the crushers and conveyors, which are controlled from push-button stations. The speed of the conveyors and crushers is governed by armature regulators.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c each.

Blast-Furnace Top. Edwin G. Rust, Philadelphia, Pa. (U. S. No. 1,307,884; June 24, 1919.)

Blast Furnaces—Method of Blowing Down and Blowing Out Blast Furnaces. John W. Dougherty, Beaver, Pa. (U. S. No. 1,309,465; July 8, 1919.)

Clays and Earths, Treatment of. Frank Langford, Eureka, Cal. (U. S. No. 1,308,429; July 1, 1919.)

Crushing Machine. Eugene L. Sanborn, Milwaukee, Wis., assignor to Smith Engineering Works, Milwaukee, Wis. (U. S. No. 1,309,104; July 8, 1919.)

Drill—Electric Well Drill. Robert R. Bray, Los Angeles, Cal. (U. S. No. 1,307,847; June 24, 1919.)

Fuel—Combined Air and Pulverized-Fuel Control. William O. Renkin, Oradell, N. J., assignor to Quigley Furnace Specialties Co. (U. S. No. 1,308,368; July 1, 1919.)

Fuel—Device for Aërating Powdered Fuel. Alonzo G. Kinyon, Chicago, Ill., assignor to Powdered Coal Engineering and Equipment Co., Chicago, Ill. (U. S. No. 1,307,365; June 24, 1919.)

Furnace Linings—Protecting Refractory Furnace Linings. Howard F. Chappell, New York, N. Y. (U. S. No. 1,308,481; July 1, 1919.)

Ore Classifying and Separating Apparatus. Lewis H. Falley, Kansas City, Mo. (U. S. No. 1,307,626; June 24, 1919.)

Ore-Concentrating Machine. Frederick E. Small, Kansas City, Mo. (U. S. No. 1,309,307; July 8, 1919.)

Rare Metals—Process of Making Compounds of Rare Metals. Robert McKnight, Pittsburgh, Pa. (U. S. No. 1,308,911; July 8, 1919.)

Reducing Metal to a Finely Divided Condition, Method and Apparatus for. Everett J. Hall, New York, N. Y., assignor to Metals Disintegrating Co., Inc., New York, N. Y. (U. S. No. 1,306,060; June 10, 1919.)

Silicates—Process of Extracting Metals From Silicates. Louis L. Jackson, New York, N. Y., assignor of one-half to Odus C. Horney, New York, N. Y. (U. S. No. 1,305,969; June 3, 1919.)

Steel—Manufacture of Steel. Charles Miris Steel Co., Ltd., London, England. (U. S. No. 1,304,946-7-8; May 27, 1919.) Dear, London, England, assignor to The

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief of Interest to Engineers and Operators

DENVER, COL.—Aug. 16

The New York-St. Louis Syndicate, a \$1,500,000 corporation, owning 1,520 acres of oil-shale land near DeBeque, Col., and a 5,000-acre oil lease in the vicinity of the shale beds, is letting out contracts for the immediate erection of a retorting and refining plant. The plant will be erected either at DeBeque or Grand Valley, and will have an initial capacity of 1,000 tons per day. It will cost about \$250,000. A recent test of the shale was made on East St. Louis, using the Wallace process. An average of 45 gal. of oil was extracted from the shale in two and one-half hours. About 30 gal. of gasoline can be produced from "cracking" of a barrel of oil (42 gal.) in addition to other valuable byproducts. James Duce, Colorado State Oil Inspector, was present when the tests were made, as a representative of Governor O. H. Shoup.

SALT LAKE CITY, UTAH—Aug. 16

Opening of the Uintah Basin is taking definite form, with the prospect of a railroad into the section as a result of efforts on the part of the State with the encouragement of Governor Bamberger. A possible extension of the Moffatt road from Colorado into the basin has been discussed from time to time, and this may be done in the future. The road will start from a point in Utah, the route as outlined making Provo (40 miles from Salt Lake), the outside terminal, and going to Springville, through Hobble Creek Canyon, along the side of the Strawberry River to Duchesne, Myton, and other points in Uintah Basin. At a meeting held at the Commercial Club of Salt Lake City on the evening of Aug. 12, preliminary plans were outlined for the building of the railroad and for the forming of a holding company to take up and work timber, oil-shale, and coal lands in the basin. The sum of \$29,000 in individual subscriptions of \$1,000 was pledged to go for preliminary expenses. When \$100,000 has been pledged, it is planned to make a resurvey of the ground to be covered by the railroad and to undertake the necessary preliminary work of organizing companies to take up options on lands and perform other necessary preliminary work. Chicago men owning coal lands in the section have offered their support in the movement.

WALLACE, IDAHO—Aug. 15

Strike Which Has Been Threatening in the Coeur d'Alene district for several months reached the climax on Aug. 13, when, at a meeting in Wallace, the Coeur d'Alene District Union No. 14, a branch of the International Union of Mine, Mill and Smelter Workers, ordered a strike on Aug. 15 at 7 a. m. The mines affected are the Hecla, Hercules, Morning (Federal), Hunter, Interstate-Callahan and Tamarack & Custer. Practically all the employees went out in accordance with the strike, and all indications point to a long shutdown. A member of the executive committee of the international union was present at the meeting of the district union and protested against calling the strike, and warned the meeting that if the men went out it would be in defiance of the international union. General McWade was also present and protested in the name of the Government against this radical action. The Bunker Hill and Sullivan was not included in the strike order. It is expected that strong pressure will be exerted to close the Bunker Hill also.

The Finding of the Coroner's Jury, after a thorough investigation into the recent accident at the Hecla mine, resulting in four men being instantly killed and three seriously injured, one of whom subsequently died, was to the effect that the death of the man was caused by "an involuntary accident," for which the hoist man was not criminally responsible, a conclusion unquestionably justified by the facts. The men had entered the cage at the collar of the shaft, in full view of the hoist man, and the signal was given to

lower to the 2,000 level. The hoist man pushed the control lever of the electric hoist in the wrong direction and sent the cage up to the sheave wheel, with the result as stated, one of the men falling to the bottom of the 2,000-ft. vertical shaft. Later a searching investigation was made by Robert N. Bell, State Mine Inspector, the result of which confirms the verdict of the coroner's jury. His investigation went further, however, and he found that there was a contributing cause which suggests that there is further need of providing safeguards. Mr. Bell describes the hoist as a first motion, double-reel, electrically driven plant, with flat cables and massive Liven-type post brakes. The cables are 1 in. thick and 3 1/2 in. wide. The contributing cause does not in the least reflect upon the Hecla Mining Co., for Mr. Bell found that every required safety device has been adopted. It simply shows that with all the safeguards provided there is still an element of danger. Mr. Bell says: "Another factor, and a very important one I think, was the fact that two new cables had been very recently put on. These cables when first used are subject to a lengthening stretch of more than seventy ft., and while this stretch is being worked out repeated readjustments of the indicator gears are necessary, and involve the

DULUTH, MINN.—Aug. 15

Great Northern Iron Ore Properties has recently issued the 12th annual report, covering operations for the year 1918. Gross income from the proprietary companies totaled \$4,557,000; income from interest and ground rental amounted to \$37,725. Disbursements for salaries, expenses, and income taxes were \$72,221. Holders of certificates of beneficial interest profited to the extent of \$6,000,000 in dividends of \$1 per share on Mar. 15, \$1 per share on June 27, and \$2 per share on Dec. 17. Undivided profits amounted to \$602,273 on Dec. 31. One new lease was recorded in 1918, being that of the Wade property at Kinney and the Cleveland Cliffs Iron Co. and the Struthers Furnace Co. The company has profited largely by the recent improvements in washing practice and will continue to benefit, as large acreages are held in the western Mesabi district.

MINA, NEV.—Aug. 16

Recent Reports From Active Companies in the Mina district indicate that Mina may soon be a center of activity of southern Nevada. The Consolidated West Extension Simon Mines Co.'s shaft is being sunk rapidly. The two-compartment shaft is now down to the 100-ft. level, and the contractors are sinking at the rate of

Photo by Fred L. Miner, Editor "Western Miner," Reno, Nev.
SIMON SILVER-LEAD MINE, SHOWING SHAFT EQUIPMENT AND EXPERIMENTAL FLOTATION PLANT

temporary disconnection of the Welch speed controller. This is a sensitive device with which the hoist is equipped, designed to shut off the power automatically and apply the brake when the hoist exceeds the maximum fixed speed in passing a danger point near the terminals of its operation."

MORENCI, ARIZ.—Aug. 11

At Morenci, Ariz., plans have been completed and work is about to start on the new high school. Particular attention is to be paid to vocational training to encourage Mexican boys to remain in school after the state law permits them to seek employment. Comparatively few Mexicans get a high-school training, but if something can be offered in the trades, it is believed that a much larger number will continue in school. A distinct novelty of the new Morenci school is the automobile shop, which is worked in conjunction with the machine shop, forge shop, foundry, wood shop and paint shop.

3 ft. a day. The last 30 ft. is in a manganese and calcite vein, which shows signs of strong leaching action. The gangue matter shows a considerable amount of iron pyrites. Reports from the property of the Norman Silver Mining Co., situated about one and one-half miles from the Simon silver-lead mine, are to the effect that a body of ore has been opened in the bottom of the shaft at a depth of 50 ft. At present the shaft is in 3 1/2 ft. of ore. The shaft is a two-compartment one, and is in a contact between lime and granite. The management expects to sink to a depth of 200 ft. and crosscut on the 100- and 200-ft. levels. An additional discovery is reported by the management of the Pagan Mines Co. where a body of galena having a width of 4 ft. is exposed at the bottom of a 30-ft. shaft. In addition to the lead contents, it is stated that assays show silver and gold. The mine is situated about two miles south of the Simon silver-lead mine and adjacent to the Norman silver mine.

ELY, NEV.—Aug. 15

Strike of Employees of the Nevada Consolidated at Ely threatens serious privations to inhabitants of towns in that region, owing to interruptions in train service to that point, isolated in 140 miles of desert. The trouble was apparently the result of the unexpected strike of shermen and minor crafts on the Nevada Northern Ry., which quickly tied up traffic on the road between the mine and mill, making the shutdown of the mill and smelter imminent. Meanwhile, mill and smelter men announced that unless an increase of wages of \$1.25 per day, together with minor demands as to working conditions, were granted before a certain hour on July 29, they would quit at that time, which they did. The smelter management had anticipated this action, and no charges were in the furnace. The company meanwhile offered an increase of 75c per day, claiming that this brings wages to within 25c of pre-armistice levels and was all that the copper market warrants and would establish a scale equal to or greater than that in any other copper camp. The men receded to a wage demand of practically 25c higher than the company's offering, and the deadlock ensued. The company's strategic position is good, with considerable quantity of unsold copper and with the larger operations of affiliated interests at other points it can well afford to abandon operations indefinitely in this high-cost property. Though trainmen are not on strike, there is no one to keep the rolling stock in operating order, and therefore train service to Coble, the connecting point on the Southern Pacific, has been extremely erratic, causing much inconvenience and a prospect of serious famine in Ely. Announcement was made that the company will be unable to operate trains after Aug. 16. The efforts of Governor Boyle of Nevada, the Nevada Railroad Commission and Federal Judge Davis have been so far unavailing. Both at Ely and at the general headquarters at Salt Lake City both sides are holding out. The inhabitants of the district are wondering what they will do when the present limited stocks of staple groceries are consumed. Practically no dairy products are available. The San Francisco Exchange has closed because of labor troubles in Nevada.

AUSTIN, TEX.—Aug. 6

All Pipe Line Companies are held to be common carriers, and must make monthly reports to the Texas Railroad Commission, according to a ruling of the Attorney General. This ruling applies to small as well as large companies, even though handling oil from only one well or company. Pipe lines owned by refineries and used to convey oil direct from the wells to the refinery do not fall under this ruling.

Motion To Modify Injunction against Texas and Prairie companies and other oil companies was taken under advisement by the district judge. The case involves the right of the state to grant a legal lease to one Giraud, of Austin, on a strip of ground left vacant between two surveys, subsequently found to be wrong, in the Ranger field. In addition, Giraud sold to the Humble Oil & Refining Co., and that company obtained an injunction against the other companies preventing them from drilling not only on this strip but within a certain distance on either side. This case will set a precedent, and is of great importance.

COBALT, ONTARIO—Aug. 15

The Labor Situation in the Cobalt camp remains practically unchanged. Though a number of attempts have been made to bring about a settlement of the trouble, the only one that holds out any promise of success is that by the returned soldiers. A short time ago the returned soldiers of the district held a meeting, and sent a deputation to Ottawa to interview the Minister of Labor. They were informed there that the Department of Labor would appoint a board of conciliation, but that before doing this it would be necessary for the striking miners to return to work. This, of course, would necessitate a return under the old conditions and rates of pay. This was refused by the miners' union executive, who also refused to take a vote on the question, either a standing vote or a secret ballot. In the case of a standing vote, there is no doubt that a considerable number of the men would have been in favor of this, whereas, if a secret ballot had been held, there is every reason for believing that the majority would have been in favor of it.

Upon the refusal of the union executive to consider this proposal, the returned soldiers held another meeting, and decided to form another union, having no connection with an international organization, and from which aliens would be excluded. Though nothing definite has yet been done regarding the formation of a new union, and committee of the returned soldiers is meeting the mine managers of the camp to find out what their attitude would be under these circumstances. There seems to be no question that the operators would allow the men to return to work, without discrimination, at the old rates of pay and bonus system. They would be prepared to deal with and recognize a union which had no affiliation with the Western Federation. There is every reason to believe that the mine managers and the returned soldiers' committee will meet in a spirit of conciliation, and that if the returned soldiers' committee can carry out the program that it has outlined, there is a fair chance that the strike will be called off in the near future. In the meantime, none of the mines is making any attempt to work, and the lower levels are being filled with water.

VLADIVOSTOK, SIBERIA—July 17

Little Activity is in evidence throughout the country, and there are hardly any recent developments of importance to record. The dredges of the Orsk Goldfields, Ltd., continue operating in the Ochotsk Province, as they have been all through two revolutions. The Lenskole company is reported to be operating. On account of the low price being paid for gold, namely Rs. 50 per zolotnik, equivalent to about \$9 per oz. for average 800 fine placer gold at today's exchange (Rs. 50 to the dollar), the government is getting little of the output from small miners, who are selling to Chinese merchants along the border, and the gold is taken out of the country. According to reports, the Te-Tu-He zinc mine is being operated by Bolsheviks, who have possession of it.

The Far Eastern Development Co., Ltd., is planning only for work on the Pacific Coast of Siberia in regions accessible by sea transportation and by river freighting on the Amur, as it is believed the railroad will be out of operation for several years.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ARIZONA

Cochise County

SHANNON (Gleeson)—Title to company's property at Gleason and in Yaeger Canyon (Yavapai County) not included in sale of Metcalf mines railroad, and Clifton smelter and mill. Reported work will be resumed at Gleason, shipping high-grade sulphides to Arizona smelter at Clifton.

Gila County

GIBSON (Bellevue)—Mill has had successful test run. Dumps claimed to have more than 200,000 tons ore.

COLE-GOODWIN (Globe)—Work to be resumed under P. J. Hickey, of Phoenix. Property has 470-ft. shaft and 700 ft. lateral development. Mill proposed.

Pima County

W. P. COTTRELL, operating small concentrating mill of his own invention at Greaterville on ores from leases.

PAYMASTER (Tucson)—Reorganization effected under title of Paymaster-Silver-Lead Co. Charles Blenman, of Tucson, president; W. Hogan, treasurer and manager. Stock largely held by Andrew Wank, of St. Joseph, and W. T. Lawson, of New York. Property at Olive Camp, twenty-four miles south of Tucson. Profit secured in shipment to El Paso. Mill to be provided for low-grade ores.

Pinal County

MAGMA CHIEF (Hayden)—Property in Copper Creek field has copper ore in shaft at 235 ft. Will drift on orebody at 220 ft.

ARIZONA HELICOPTERS (Ray)—J. T. Shimmitt states that flotation machine referred to in the *Journal* of July 26 should

not be called the Shimmitt cell. Machine being designed to equip one section is similar to Callow machine and resembles Inspiration-type machine. Was designed to fit into present flotation building and flow sheet.

DAGGS (Superior)—Group of thirty-two claims bonded by Consolidated Holding Co., mainly comprising Hugh Daggs and J. H. Hayes, of Phoenix, to Grand Pacific Syndicate, for \$450,000. Prospective buyer, which already owns much adjoining ground, is composed of New York and Pennsylvania capitalists headed by C. C. Steinbrenner. Property has copper outcroppings. Was under bond to Calumet & Arizona several years ago.

MAGMA (Superior)—Driving service tunnel with face 127 ft. into, through newly acquired Queen Creek ground, to tap shafts at 500-ft. depth. Concentrating ores are to be trammed to mill.

MAGMATIC (Superior)—J. C. Goodwin to resume sinking of main shaft, which has cut large manganese body outside of copper vein.

SILVER KING OF ARIZONA (Superior)—The new shaft is now down 230 ft. and has cut a streak of ore assaying 120 oz. silver to the ton, at 212-ft. depth streak assaying 116 oz. silver was cut. Together four streaks have been cut, all in light-colored porphyry, the country rock. As shaft is being sunk 150 ft. outside main ore chimney in country rock, the discoveries are interesting and encouraging.

Santa Cruz County

TRES DE MAYO (Nogales)—Situating twelve miles east of Nogales, operated by

Bachman-Merritt Co. is shipping silver-lead concentrates to El Paso. Plans made for new mill to handle vanadate, of which 80,000 tons already have been blocked out in parallel formation.

Yavapai County

DUNDEE (Jerome)—Two shifts sinking shaft, now b-low 500 ft., on way to lateral connection with Extension tunnel, which will provide advantageous transportation for ores. Humboldt smelter may get ores from carbonate blanket, which has proved length of 300 ft. and width of 60 ft.

JEROME DELMONTE (Jerome)—To resume work on shaft, to sink from 450 to 1200 ft. Heavier pumping equipment and new hoist needed. Company, headed by Henry Lapham, has \$160,000 in treasury and has spent \$140,000.

JEROME MANHATTAN (Jerome)—Reported about to resume, after two years idleness.

Yuma County

SWANSEA LEASE (Swansea)—Has secured order from Corporation Commission for reopening of Swansea railroad to Bouse. Ore shipments to Commission was advised that drilling had developed much larger and richer ore-bodies than heretofore worked. Flotation mill had proved successful, and that operators' intention was increased from 50 to 200 men. Lease held by W. A. Clark interest. Railroad controlled by George Mitchell, of Los Angeles, Cal.

CALIFORNIA

Alameda County

WESTERN MAGNESITE DEVELOPMENT COMPANY (Livermore)—Five-

year lease granted to Charles S. Malby. Charles H. Spink to be retained as general manager. Has contract to furnish 20,000 tons of magnesite during the coming year. Calcining plant at Red Mountain, 33 miles southeast of Livermore, will be enlarged. Six trucks employed hauling product to Livermore.

Calaveras County

CALAVERAS COPPER (Copperopolis)—Mill including flotation plant, being made ready for early resumption of work. Smeltery now being overhauled.

NAPOLÉON MINES (Milton)—Mill and flotation plant to be operated under ten-year lease held by L. D. Adams.

SHEPHERFRANCH (Sheepcranch)—Stamps of old mill are now dropping, and electric pump with capacity of 2,000 gal. per min. installed in mine. Ore being developed by winze 200 ft. below 1,500-ft. level.

Kern County

KELLY-WILLIAMS (Randsburg)—To be operated under name of California Rand Silver, Incorporated, with fifteen owners. Since June 15, seventeen cars high-grade ore shipped. Air compressor now being installed. Ratio of silver to gold remains consistently three to one in value.

Nevada County

BULLION MINES (Grass Valley)—Transfer of property, comprising 120 acres, to Grass Valley Bullion Exploration Co., with George F. Mainhart as manager. Was developed by 1,500-ft. inclined shaft. Closed for fifteen years. Will start at first to unwater old shaft.

Plumas County

ENGELS COPPER (Engelmine)—Completed and placed in successful operation. Tailings dewatering plant with capacity of 2,000 tons per 24 hours.

WALKER MINING (Portola)—Preliminary work started on aerial tramway from mine to Spring Garden, a distance of eight miles.

Trinity County

ESTABROOK DREDGING COMPANY (Trinity Center)—New 80 cu. ft. dredge, handling 10,000 yd. per 24 hours, with good recovery. Office building being erected and five cottages for employes.

COLORADO

Boulder County

SMUGGLER COUNTY MINING CO. (Ballarat)—Now being operated by Missouri and Nebraska capitalists. Recently made discovery of gold-silver tellurium ore on parallel vein 6 ft. west of the old Smuggler lode. Extent of ore shot not yet known.

NIL DESPERANDUM (Boulder)—In Sunshine district; beginning an active development campaign. Recently purchased 11 claims which adjoin the Intercon mine, which was acquired in 1917. Will operate the whole group through the American shaft, now 525 ft. deep. Plan to sink deeper.

Clear Creek County

THEODORE R. HEINRICH, S. of New York, was in Georgetown recently and ordered new equipment for further development of the St. George property on Douglas Mountain.

SILVER PLUME CONSOLIDATED (Silver Plume)—Operating on Brown and Sherman mountains. Advancing its tunnel 100 ft. a month since installation of new compressor plant last June. Considerable ore being developed, and company has contracts for contracts for small cyanide plant for treatment of low-grade silver ores. Dump at the Snow Drift mine will also be filled.

La Plata County

HIGH PRICE OF SILVER is stimulating mining activity in this section. The following contracts have been let: Cave Basin Mining Co., small amount of development work and assaying of ores on Holbrook-Eclipse for shipping; Harry Lawson Co., a series of contracts on Mary Mine, requiring two years to complete work; Blue Grouse Co. to sink a 100-ft. shaft; Black Prince, a long tunnel to cut lime porphyry contact, which is apparently a much mineralized contact, judging from the surface indications.

Larimer County

SHOWING OF OIL has been encountered in the Rathvon well of the United Oil Co., five miles south of Loveland. Well now 1,300 ft. deep. Structure is similar to that in the Boulder field, but much shallower.

Ouray County

CAMP BIRD (Ouray)—Further development work will be suspended on main vein in the east tunnel until completion of 450 ft. ventilating raise connecting with the ninth level of the No. 3 shaft. Over 2,000 ft. of development work done on this vein. Puzzling geologic feature of vein is that of a cross cut driven 200 ft. south from it showed alternating streaks of quartz and altered andesite.

Park County

MOSQUITO GULCH SILVER (Alma)—Has opened good ore between Orphan Boy and Hook Hocking mines. Claims worked include Gold Coin, Little Eva, Fraction, and Little Edith.

San Miguel County

GOLD RUN (Telluride)—Incorporated by John L. McMenamin, W. L. Kennedy, and R. C. Wood, to treat tailings found in the river below Pandora, the accumulation of the mills from the Savage basin, Marshall basin and other companies above Pandora.

Summit County

FRENCH GULCH DREDGING CO. is making excellent progress this season. The dredge handled 150,000 cu. yd. during May and June and 9,908 cu. yd. per 24-hour day, including shutdown for cleanups. The dredge is rated for only 2,000 cu. yd.

Teller County

DEXTER (Cripple Creek)—Contractors on Anderson & Benkelman lease on Dexter and Trail mines sunk double-compartment shaft to depth of 65 ft. in ten days working two shifts. Sinking started from 15th level, with 100 ft. to go. Lease expires in November and effort will be made to extract ore on new level by that time.

MODOC (Cripple Creek)—Operating the Modoc and Last Dollar Mines on Bull Hill. Completed re timbering shaft and extensive developments being resumed. Constructing up shaft on ore-spring house, and expect to have it completed Sept. 1.

WAR EAGLE (Cripple Creek)—On Aug. 5 directors held special meeting to discuss active developing campaign they have engaged in with the Blue Flag Gold Mining Co. Directors who attended were: Samuel J. Burris, of Denver; Thomas Munson, of Sterling; Thomas Annear, of Denver; Judge Tully Scott, of Denver; T. R. Countryman, and Mollie O'Brien, secretary.

PORTLAND (Victor)—Cave-in on surface near collar of Portland No. 1 shaft seriously interfered with production. Steel trestle being constructed over cave, and within a week shipments are expected to be resumed.

IDAHO

Adams County

RED LIDGE (Landore)—Minnesota owners are said to be considering expenditure of \$1,000,000 in development, if further work confirms present indications. Diamond-drill explorations said to be satisfactory. Properties are on Idaho side of Snake River, seventeen miles from Homestead, Ore., nearest railroad point.

Bonner County

ARMSTEAD (Kootenai Lake)—Orebody 54 ft. wide out in third crosscut below No. 2 tunnel level. Lies between well-defined walls at depth of 1,394 ft. on dip of vein. Fourth and last crosscut proceeding toward vein. After this is reached in about month, development will proceed and ore will be blocked out.

IDAHO GOLD & IRUBY (Leonia)—John M. Schnatterly, president, issued statement to stockholders. Large ditch on which steam shovel has been working several years is completed. There remains to be completed a short flume and control head where water will be diverted into ditch. Also laying of large steel pipe line, setting up hydraulic giants, and construction of sluice boxes for washing gravel containing gold. Plans to sink a 100-ft. shaft.

FALLS CREEK (Sandpoint)—Two feet of shipping ore struck.

Boundary County

IDAHO CONTINENTAL (Forthill)—Ore shipments resumed with thirteen motor trucks, each making two trips in twenty-four hours, hauling four tons per trip over twenty-six-mile route. Cost of hauling averages nearly \$15 a ton. Recently shipped 400 tons to International Smeltery, Utah. In all, 150 men employed.

Custer County

EMPIRE COPPER (Mackay)—Lessees shipping 1,500 tons monthly.

Shoshone County

HYPOTHEK (Kinston)—J. H. Kern, of Moosejaw, Sask., president, recently inspected property, now idle. Will resume operations when mining costs and lead market more favorable.

TARBOX (Saltese, Mont.)—Putting in pipe line for water power. Preparing plans for mill. Large amount of lead-zinc ore available, and work suspended in mine pending mill construction.

SHERLOCK PLACER (Wallace)—Includes twelve claims on upper St. Joe River. S. H. Hayer, representative of California S. H. Hayer & Company, prospecting ground last month. Other possible dredging ground adjacent.

SUCCESS (Wallace)—M. E. Gardner has sold his lease of ground from No. 2 tunnel to surface. In eleven months he shipped ten carloads of crude lead-silver ore, which netted \$5,000. Thompson lease working ground between No. 2 and No. 7, ore from this lease being both lead and zinc, requiring separation in mill. Zinc concentrates stored, over 500 tons being on hand.

MICHIGAN

Copper District

WHITE PINE (Ontonagon)—Suspended operations last week. Expects to resume. Many former employes were employed in lumber work on contract for Ontonagon County interests.

MICHIGAN (Rockland)—Produced 39.07 lb. of copper per ton in July, highest return in Lake Superior district. Stamped 4,715 tons and 184,175 lb. copper recovered. Drifting at rate of 110 ft. per month on 4th and 7th levels east of main shaft. New shaft. Working on rock shafthouse. New payments to permit doubling rock hoisting capacity.

VICTORIA (Victoria)—Produced 6,000 tons rock in July, recovering 16,205 lb. of mineral, including 10,000 lbs. copper. Return averaged 16.5 lb. per ton, being 2 lb. better than June.

Geogic Range

DOCKWORKERS' STRIKE at Ashland continues, with no prospect of a settlement. Mines on range are consequently curtailed operations and some men have been laid off. Crews of some of the vessels at the docks have also been laid off.

MINNESOTA

Cuyuna Range

MEETING OF MANGANIFEROUS PRODUCERS of the range was held in the City Hall at Ironton on Aug. 3 for the purpose of effecting an organization to fight for a protective tariff on manganese and manganiferous ores. Temporary organization effected, and plans laid for a meeting in Duluth in the near future.

MANGANIFEROUS PRODUCERS who have put in claims under the Iron-Manganese Relief Act have their hearings before the commission at Denver, starting Aug. 13. The following Cuyuna companies have claims: Onaham Iron Co., Mines Efficiency Co., Arko Mining Co., Whitmarsh Mining Co., George H. Crosby, Oneida Mines Co., Gloria Mining Co., Northern Minnesota Ore Co., Joan Mining Co., Hopkins Mining Co.

STRIKE OF SHOPMEN on railroads was followed by strike of certain ore dock men, and placing of embargo on shipments of ore and forest products. All open pits and those underground mines which were shipping ore and had no have stockpiling arrangements were forced to close down the latter part of week of Aug. 4.

JOAN NO. 3 (Crosby)—Unwatering shaft, which was started last year and closed down about Dec. 1. Now at depth of 62 ft. and sink to 103 ft. and drift to orebody. High-grade manganiferous property.

MEACHAM (Crosby)—Sinking shaft deeper.

CUYUNA-DULUTH (Ironton)—Finished loading out of stockpile and started underground operations, Aug. 1.

ONAHAM IRON (Trommald)—Reported Algoma Steel Co. will take its 40,000 tons of manganiferous ore from these properties. Ferro and Algoma, which has contracted for under long-time contract; 50,000 tons in stockpile at both properties.

Mesabi Range

MILLER (Aurora)—Pitt Iron Mining Co. plans to install a milling system.

MADERIA (Hibbing)—State has let contract for filling old shafts and test pits on property abandoned as worked out.

NORTH EDDY (Hibbing)—New shaft now at 200-ft. level where first drifting will be started. Dean Iron Co., operators.

SOUTH AGNEW (Hibbing)—Shaft No. 2, which has encountered considerable quicksand, has been successfully ledged in broken taconite at depth of 165 ft. Ultimate depth to be 235 ft. Interstate Iron Co., operators.

MONTANA

Beaverhead County

BOSTON & MONTANA DEVELOPMENT (Wise River)—Drifting on the 900 ft. level of settling conditions of milling grade, with width from 10 to 15 ft. Upper Idaho cross-cut expected to reach Central vein about the middle of the month. Ground softening.

Jefferson County

AMALGAMATED METALS (Clancey)—Showing retarded goad with occasional shipments being made to East Helena smelter.

LEGAL TENDER (Clancey)—Reported on self-sustaining basis. Installation of compressor and electrical hoist in progress.

LIVERPOOL (Clancey)—Watering of workings continuing, with retimbering of shaft, which is badly caved in places.

ANGELICA (Wickes)—Good orebodies on lower levels. Fairly regular shipments to reduction works being made.

Missoula County

POTOMAC COPPER (Potomac)—No. 4 tunnel cleaned and enlarged for distance of 500 ft. Will be necessary to drive 1,000 ft. more to attain depth of 600 ft. under Copper Cliff. The No. 4 tunnel continued will develop the Leonard group of claims at depth of 1,500 ft. No. 3 tunnel also being cleaned out.

Powell County

MONARCH (Elliston)—Compressor installed, together with sawmill. Driving main tunnel.

Silver Bow County

ANACONDA COPPER (Butte)—Outlook for early return to normal stated by officials to be poor. Scarcity of labor, water shortage, and labor troubles operating against capacity production, and little better than 60 per cent at any time this year is expected. Present output around 50 per cent. All of company's larger zinc producers have suspended, and miners have been transferred to copper properties.

BUTTE & SUPERIOR (Butte)—No. 2 shaft of Black Rock will be sunk from the 2,050 level to the 2,350 when the local labor situation clears. Ore deposit now has been opened for continuous distance of approximately 2,000 ft. east of the territory now in litigation with the Elm Orib. Production for July, 7,800,000 lb. zinc in concentrates and 150,000 oz. silver. June production, 9,750,000 lb. zinc in concentrates and 185,000 oz. silver.

DAVIS-DALY (Butte)—Twenty-one hundred drift of Colorado mine reported in good ore, indicating upward situation of rich zone in evidence on 2,300, 2,400, and 2,500. Development regarded as important and establishing a guide to finding ore on the 1,700, the 1,200, and the 1,000.

EAST BUTTE (Butte)—Produced 1,453,420 lb. copper in July; June, 1,513,360; July, 1918, 2,076,460.

NORTH BUTTE (Butte)—Production increased to more than 50 per cent of normal. Ore reserves today amount to the highest tonnage in years. Though operating at only 25 per cent of capacity since the signing of the armistice, development has been performed to the limit of the company's ability.

NEVADA

Nye County

LABOR STRIKE prevails in Tonopah and Divide districts, which, in conjunction with the Elm labor difficulties, resulted in the closing of the San Francisco Stock Exchange for one day, and, in the event of a deadlock between the miners and operators, trading on this exchange will be discontinued until the labor difficulties are settled. The miners in Tonopah are asking for \$1 increase in wages per day. However, the outlook for the prompt settlement of the differences is good, as the state officials of Nevada have been investigating the situation. Governor Boyle, D. C. Jack-

ling and C. D. Lakenan, general manager of the Nevada Consolidated Copper Co., are holding conferences in San Francisco.

UTAH

Juab County

TINTIC SHIPMENTS week ended Aug 9 amounted to 126 cars, as compared with 130 cars in the week preceding.

EAGLE & BLUE BELL (Eureka)—Net earnings for 1918, after deductions for Federal taxes, amounted to about \$104,630 less than in 1917, although more ore was mined. Falling off due to higher costs and lower price of metal. Sum of about \$150,000 on hand, and mine in good condition. Dividends thus far in present year, \$44,657, making total by company \$1,205,747 since Feb. 1, 1913.

EAST STANDARD (Eureka)—Grading under way for installation of recently ordered machinery to be used in shaft sinking.

TINTIC EMPIRE (Eureka)—Group of seven claims lying between Lehi Tintic and Tintic Paymaster to be developed by means of shaft work.

TINTIC DRAIN TUNNEL (Eureka)—Present length 400 to 500 ft.; ultimate length to be six miles. To unwater large mining area cutting Colorado at 1,900-ft. level and Iron Blossom at 2,300-ft. level.

COLORADO (Silver City)—Drifting being done southward on 1,900 level for continuation of Iron Blossom ore. Expense of work met by shipments.

IRON BLOSSOM (Silver City)—During July earnings somewhat in excess of dividend requirements. Considerable development being done.

Salt Lake County

SURVEY OF COTTONWOOD DISTRICT being made by A. S. Butter and F. C. Calkins for the U. S. Geological Survey.

EMMA SILVER MINES (Alta)—Inspection being made by George H. Derm, newly appointed manager.

SOUTH HECLA (Alta)—Shipping 75 to 100 tons of ore daily. July production 23,709 oz. silver and 122,367 lb. copper.

UTAH COPPER (Bingham)—Total gross production second quarter 1919 was 28,046,978 lb. copper, 37,523,000 lb. contained in concentrates and 523,273 lb. in precipitates from leaching plant. Total gross production quarter preceding, 29,261,209 lb. copper. Extraordinary second quarter \$1.8 per cent, as compared with 74.7 per cent first quarter. Average cost per pound of net copper produced, 12.59c, including plant depreciation and all fixed and general charges, but excluding Federal taxes and without credit for gold and silver or miscellaneous income, as compared with 13.72c first quarter.

UTAH METAL & TUNNEL (Bingham)—Work to be resumed at this mine.

Summit County

PARK CITY SHIPMENTS week ended August 9 amounted to 1,461 tons, as compared in 1,552 tons week preceding.

DALY (Park City)—Forty men working. Expected to increase output.

JUDGE MINING AND SMELTING (Park City)—Electrolytic zinc plant expected to be operating full force by first of September.

PARK-UTAH (Park City)—Reported work will be resumed in September, to be continued throughout winter.

Utah County

BELEROPHON (American Fork)—Shipment of ore of good grade made, carrying gold, silver, copper, and lead.

WASHINGTON

Stevens County

ELECTRIC POINT (Boundary)—Said to have closed contract for shipment of 2,000 tons to United States smelter, of Utah. New ore chimney struck, 30 ft. in diameter, 200 ft. from line of Gladstone Mountain Mining Co.

UNITED COPPER (Chewelah)—Value of July shipment almost equal to June, when 10 carloads shipped. One carload a month of high-grade shipped, averaging \$125 a ton.

LOON LAKE COPPER (Loon Lake)—Second carload of concentrates shipped, containing 20 to 24 per cent copper and 8 to 10 oz. silver to ton. Shipments expected to be six to eight carloads a month.

CANADA

British Columbia

MOLLY GIBSON (Paulson)—Tunnel in ore 10 ft., and continues to improve.

STANDARD SILVER-LEAP (Silverton)—Second shift added in mill now handling 100 to 150 tons daily. Intend to increase second shift to handle more zinc ore. Output now chiefly from No. 6 tunnel level.

EVENING STAR (Slocan)—Tunnel to be extended 225 ft. to connect with shaft down 135 ft. duct. Sutherland, owner. William Moore working this and the Silver Nugget.

GOLD BUG-RAMBLER (Slocan)—Reported strike made of 25 ft. concentrating ore, and 18-in. clean silver-lead ore on wall.

INDEX (Slocan)—E. J. Edwards, manager, expects to ship five to seven carloads before Christmas. States vein is 6 to 42 in. wide, carrying silver and lead.

RUTH (Slocan)—Development work has been resumed on No. 6 level.

SILVERSMITH (Slocan)—Third shift added in mill, now of about 100 ton capacity daily. Shipped three carloads in July and two on Aug. 1. Face of oreshoot on eighth level 14 ft. wide, with 4 ft. clean ore. Drift run 11 ft. to 70 ft. will be continued to end of orebody more than 400 ft. long on 10th level, 200 ft. below.

CONSOLIDATED MINING & SMELTING CO. (Trail)—Will give its farm near City scientific agricultural cultivation to demonstrate whether smoke from its smelter damages crops, as farmers claim, and may purchase fifteen acres of orchard to be used for same purpose.

Manitoba

GORDON CLAIM (Copper Lake)—Vein recently discovered traced for 6,000 ft.

Ontario

MILLER INDEPENDENCE (Boston Creek)—Arranging for installation of new refining plant and mill. Small steam-driven plant being taken in for use until large electric equipment is ready.

MONDAY (Boston Creek)—Cross-cutting on 140 ft. level has encountered well mineralized vein near shaft.

CASTLE (Gowganda)—Five veins opened on 300-ft. level and crosscutting to tap continuation of Miller Lake-O'Brien vein system.

MATACHEWAN (Matatchewan)—Drifting in two directions on 170-ft. level, and also crosscutting.

NELSON CLAIMS (Matatchewan)—Exploration resulted in discovery of gold ore, including visible gold.

ATLAS (West Shining Tree)—C. L. Hersman, engineer in charge, reports high-grade ore struck on Evelyn vein in pits at depth of 16 and 14 ft.

WASAPIKA (West Shining Tree)—Shaft down 100 ft. and crosscut in ore for 15 ft. visible gold showing over whole width.

Quebec

HUNTINGTON COPPER (Eastman)—Purchased last year by Eastern Mining & Milling Co., which has since installed a 100-ton concentrator, using the flotation process. Property has been partially dewatered to permit careful sampling. Official figures show ore reserve of about 6,000,000 lb. of copper in ore down to 100-ft. level. Ore averages about 42 per cent copper, and estimated cost of treatment is \$5 to the ton.

MEXICO

Guanajuato

CROSEY & AULD successfully operating small plant between Marfil and Guanajuato and treating tailings from patios of haciendas once owned and operated by old Spaniards.

CARMEN-GUANAJUATO (Carmen)—Operating 10-stamp mill and Carmen mine belonged to company. Also have lease Pinguico mine, owned by Pinguico Mines Co., of Guanajuato.

SAN NICOLAS DEL MONTE (El Monte)—Being worked on small scale, ore being sold locally. Owned by Rocha estate. Abel Solerzano, manager.

KOREA

ORIENTAL CONSOLIDATED (Ulsan)—Cable advices show July cleanup amounted to \$75,820.

TRANSVAAL

RAND GOLD OUTPUT in July 725,000 oz.; June, 702,000; July, 1918, 735,000.

THE MARKET REPORT

Daily and Weekly Metal and Mineral Prices,

20	23@23.10	54@54½	5.90@6.00	5.60@5.70	7.65	@7.70	

The above quotations are our appraisal of the average of the major markets based generally on sales values of the metals for the deliverer and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliverer constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

Aug.	Copper			Tin		Lead		Zinc	
	Spot	3 M.	Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.
14	92½	93½	103	280	264	25½	25½	39	40½

20	101½	100	109	274½	269½	24½	25½	40½	41½

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, Aug. 20, 1919

While there was no special increase in activity this week, copper, lead, and zinc each rallied very well and closed at higher prices than at the openings of the week. This movement probably reflected the completion of the liquidation of speculative accounts.

Transatlantic freight rates remain unchanged at \$18.

The rates from San Francisco to Hongkong and Kobe were advanced to \$14.

The great decline in francs and marks and sterling exchange has made export business more difficult than ever.

The stocks of metals in the hands of the British Munitions Ministry on Aug. 1, 1919, with the corresponding figures for July 1 given in parentheses, were as follows: Copper, 83,395,200 lb. (93,-

227,520); lead, 120,971 short tons (135,671); zinc, 39,540 short tons (44,140); aluminum, 23,520,000 lb. (23,874,080); nickel, 5,491,480 lb. (5,492,480); antimony, 4,940 short tons (4,892).

Copper

The firmer tendency that was already in evidence at the time of our last report continued, and the market became distinctly stronger from day to day. Without any doubt this reflected the completion of the liquidation of speculative accounts, on which realization was desired. Some consumers, including some big ones, came into the market and cleaned it up, not only for the sake of obtaining relatively cheap copper, but also to check any further decline, which might have been prejudicial to their own interests. With this powerful support, the market rallied promptly, and speculators who had gone

short on the decline had to pay higher prices to cover. A considerable part of the business this week was apparently speculative short covering.

The big producers maintained their previous prices of 23½c. asked for August-September, and 24c. for the last quarter of the year, both prices being for copper delivered. No sales were made by them this week, except a few transactions involving special conditions, but today more inquiry developed, and it seemed not unlikely that the principal producers might realize their prices presently.

Germany inquired for small quantities of copper this week, but wanted to buy in marks and at prices far below our market. It is said on good authority that Germany has more copper on hand than is immediately needed, speaking generally, but is short of some special shapes, particularly wirebars.

Copper Sheets.—The base price of copper sheets is 33½c. per lb. Demand strong. Copper wire is quoted at 26½c. in carload lots, f.o.b. mill. Market is strengthened, due to reports that second-hand supplies are pretty well sold out.

Tin

The liquidation of new arrivals produced a further decline in this metal, but at the close of the week the market was firmer. A rather active business was done right through the week.

Singapore quoted £263, c.i.f., London, on Aug. 15; £271 on Aug. 18; £273 on Aug. 19; £272 on Aug. 20.

Straits tin for shipment ranged during the week from 53c. to 52c. At the close, August-September shipment was quoted at 52½c., and September, at 52c. American electrolytic was quoted at 55½c.

Lead

As in the case of copper, consumers came into the market and cleaned up all of the speculative offerings. Being still unsatisfied, they bought also from such producers as had any to sell. Some of the larger producers were so booked up with orders, and were so embarrassed by diminished production, that they could not accept any new business. Some of the consumers who desired to buy large quantities were concerned that had taken a good deal of the Government's lead and now apparently have used it up.

Germany seems to be in great need of lead, her own production having fallen to about 3,000 tons per month. She ought to be able to buy lead from other European countries that are overstocked, but for some reason she seems

to be unable to get it. There have been German inquiries for bonded lead in this market, but the figures that have been mentioned have been too low.

Zinc

On some good buying by galvanizers, the market advanced further. There was also a better demand for high-grade zinc, which was sold at 83½¢, delivered in the East.

Germany has continued to offer zinc in the British market. The break in the latter occurred about July 21, when the Germans offered about 2,000 tons. Since then the German sales are said to have amounted to about 10,000 tons. This selling was doubtless for liquidation of the surplus existing in Germany, which at the mid-year was said to be about 50,000 tons. German production of zinc, which was maintained at a high figure during the war, has now fallen off greatly, and at present is said to be no more than 5,000 tons per month. The falling off is ascribable to the high cost of coal, to the bad labor conditions, and to the turmoil in Upper Silesia, which is the greatest zinc-producing district.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet.

Antimony—The market was very quiet and was easier. Business was done at 99½¢ in the early part of the week, but at the close spot was easily obtainable at 83½¢. Futures were quoted at 9c. duty paid.

Bismuth—Quoted at \$2.95 per lb.

Cadmium—Quoted at \$1.50 per lb.

Nickel—Ingot, 41c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—Unchanged at \$109, market quiet. San Francisco telegraphs \$105, firm.

Silver and Platinum

Silver market in London has been steady, with advancing prices on buying said to be for the Continent. New York price has been seriously affected by the severe drop in sterling exchange, with lessened demand by China buyers, and closes at 110c., with uncertain tendency.

The general stock of money in the United States on Aug. 1, 1919, totaled \$7,525,115,361; of this \$2,989,548,109 was in gold coin and bullion, \$308,978,930 in standard silver dollars, and \$242,876,099 in subsidiary silver. The money in circulation on Aug. 1 was \$5,778,565,018, or \$54.40 per capita. On Aug. 1, 1918, the per-capita circulation was \$52.44.

Mexican dollars at New York: Aug. 14, 86½; Aug. 15, 86½; Aug. 16, 86½; Aug. 18, 86½; Aug. 19, 85½; Aug. 20, 84½.

Platinum—It is conjectured that the Government has stopped selling its platinum, which heretofore it has been offering at \$105. During this week there was a strong market, and pro-

ducers realized up to \$110. We quote \$105@ \$110 for the week.

Palladium—Unchanged at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., Aug. 16—Zinc blende, per ton, high, \$51.90; basis 60 per cent zinc, premium, \$48.50; Prime Western, \$47.50; fines and slimes, \$45@ \$42.50; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$48.09; calamine, \$30; all zinc ores, \$47.69.

Lead, high, \$70.25; basis 80 per cent lead, \$67.50@ \$62.50; average settling price, all grades of lead, \$66.99 per ton.

Shipments the week: Blende 6,274, calamine 84, lead 1,746 tons. Value, all ores the week, \$390,550.

Though producers gained \$5 per ton on zinc blende prices, \$5 per ton was clipped from the price of lead, closing the week \$62.50 basis.

Demand for blende was firm throughout the week, but shipments are seriously retarded because of lack of cars. Sellers, able to hold their ore, turned loose only a small tonnage on this week's price offerings, feeling that within a week or two weeks at the most, a \$50 basis will prevail.

Platteville, Wis., Aug. 16—Blende, basis 60 per cent zinc, premium blende base \$48. High lead or Prime Western grade advanced from \$45 to \$47 at the week end. Lead ore, basis 80 per cent lead, \$62 per ton. Shipments reported for the week are 1,333 tons blende, no lead, and 124 tons sulphur ore. For the year to date the totals are 62,549 tons blende, 3,675 tons galena, and 9,671 tons sulphur ore. During the week 2,727 tons blende was shipped to separating plants.

Other Ores

Chrome Ore—The market seems to be easier, and the quoted price of \$25 per ton, f.o.b., California points, could probably be shaded.

Manganese Ore—Market is very dull. It is quoted nominally at 50c. per unit, c.i.f., Baltimore or Philadelphia.

Molybdenum Ore—Quoted nominally at 75c.

Tungsten Ore—Dull and unchanged as to price.

Other Minerals

Nitrate—Business is being done mostly for immediate delivery, average price being quoted at about \$2.95 per cwt., carload lots. Some firms are refusing to quote on futures. It is reported that Government stocks have been nearly liquidated.

Pyrites—Spanish pyrites is quoted at 17½c. per unit for furnace size ore, free from fines, c.i.f., New York or other Atlantic port. Market slow and unsettled; hand-to-mouth buying. Very little ore coming in. Price will decrease with ocean freights.

Sulphur—Export demand from Europe has been very good, and sales are in the main limited by high shipping rates, which vary from \$25 to \$35 from Gulf ports, according to the port of delivery. The labor situation

in the Sicily mines is still unsettled and is likely to remain so for a long time, as the miners prefer other employment and can easily obtain it. American sulphur is being sold f.o.b. Europe under prices asked for the Sicilian product. Prices quoted for export range from \$20 to \$23 per ton in cargo lots at mine in Freeport, Tex., and Sulphur Mine, La. Domestic supplies are quoted at \$18 per ton in carload lots. The latter market is dull.

Iron Trade Review

Pittsburgh—Aug. 19

Labor unrest is the outstanding feature of the iron and steel trade and also the most important market influence. Iron and steel producers are concerned not only as to their own labor but also as to the labor of their customers. On the whole, more labor is involved in the consumption of steel than in its production, and unless labor conditions are at least moderately favorable the consumption of steel cannot be at its maximum possible rate, no matter how favorable all other factors in the situation are.

Superficially, the labor situation this week is better, as the striking railroad shopmen have gone back to work, and the plants at Cleveland, Gary, and South Chicago that were closed or partly closed on account of the failure of transportation service are resuming, but as these strikes had been contrary to orders of the national officials of the union in the first place, the return of the men does not mean that labor conditions are better. In Pittsburgh the motormen and conductors of the trolley system went out on strike at midnight last Thursday, against an award of the War Labor Board which they had agreed in advance to accept, this strike also being against the orders of national officials. The best information is that the steel-mill employes in the Pittsburgh district are not organized to any extent, but it does not follow that they will not strike. A seamless-tube plant near Monessen closed last week, paying off the men and announcing that there is no work for them, as the company has no orders, but the common assumption is that labor troubles were feared. A large sheet plant at Canton, Ohio, closed last Wednesday night because the men demanded recognition of the union. Such cases are sporadic, but they may become common. The steel manufacturers are little concerned with the matter of wage rates, and not greatly concerned as to hours of labor, but as to union recognition they are very strong, believing that the efficiency of their plants would eventually be lost if any union came to dominate.

Though the report of the Bridge Builders' and Structural Society shows that bookings of fabricated steel jobs in July represented 74 per cent of a month's fabricating capacity, against 65 per cent for June and 49 per cent for May, the fabricated-steel bookings are now running relatively light, investors in construction undertakings being evidently disturbed by the unrest

of labor and the fear that construction jobs undertaken could not be carried through according to program.

Steel prices are firmly maintained all along the line, with the exception that there are some concessions on plates, but these are much less marked than a few weeks ago.

Makers of cold-finished steel bars, formerly commonly known as "shafting," have adopted a new list, whereby prices are made by naming a base price subject to extras, thus supplanting the former system whereby there was a list subject to a discount. The discount was 17 per cent, whereas the base price now in effect is 3.60c., which means the same actual price. The extras are so arranged that some descriptions of material are advanced slightly, but others are reduced, so that on the average there is a slight reduction.

Pig Iron—The market is firm, but not particularly active. Furnaces in blast being well sold up, though there is not a broad enough demand to enable many idle furnaces to get into operation. We quote: Bessemer, \$27.95; basic, \$25.75; foundry, \$26.75; forge, \$25.75, f.o.b. Valley furnaces, freight to Pittsburgh being \$1.40.

Steel

Steel—The scarcity of sheet bars is even more pronounced, and there is considerable inquiry in the open market. Rolling billets are in poor demand, but there is a moderate amount in inquiry for forging billets. We quote: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; forging billets, \$51; rods, \$52.

Ferroalloys

Ferromanganese—English producers a few days ago made a drive for business and sold several thousand tons of 80 per cent ferromanganese at about \$105, delivered, equal to an average of about \$102, c.i.f., when their regular quotation was, and still is, \$105, c.i.f. It is not known whether domestic makers had a chance to figure on the business, their regular quotation being \$115, delivered. Inquiry is light.

Coke

Coke—The Connellsville coke market has undergone one of its sudden changes. Though two or three weeks ago there was much furnace coke on track, held at \$4, but moving at concessions when it moved at all, the whole market has tightened. Sales have been made at \$4.50 and \$4.75, and \$5 is now the asking prices for spot or prompt furnace coke. Foundry coke has continued to stiffen, the market now being \$5.50 to \$6, according to brand. For several weeks there appeared to be a trifle too much production, but in the last few days there seems to have been difficulty in maintaining previous rates of production. The stronger coal market has also an influence.

MONTHLY AVERAGE PRICES OF METALS

Table with columns for Silver, New York, and London, showing monthly average prices from 1917 to 1919.

New York quotations cents per ounce Troy, 1869 Bu London, pence per ounce, sterling silver, 92.5 fine.

Table with columns for Copper, New York, and London, showing monthly average prices from 1918 to 1919.

New York quotations cents per pound, 1869 Bu London, pence per ounce, sterling silver, 92.5 fine.

A Case for Calm Judgment

ANATIONWIDE railroad strike would bring disaster to the country. The railroad shopmen have voted to strike unless their demands for increased wages are met. Here is a critical situation, requiring thoughtful consideration. The shopmen demand increases in wages which are likely to be permanent, in order to meet a temporary situation which in all probability will last only for a limited time. Increases in wages will certainly result in increasing the cost of production, and therefore the cost of living. Hasty action usually means blundering. The shopmen can well afford to heed President Wilson's request to reconsider their action, before they assume the responsibility of plunging many times their own number into suffering.

The President points out that "demands unwisely made and passionately insisted upon at this time menace the peace and prosperity of the country as nothing else could, and thus contribute to bring about the very results which such demands are intended to remedy." He urges that we should "not be guilty of the inexcusable inconsistency of making general increases in wages on the assumption that the present cost of living will be permanent at the very time when we are trying with great confidence to reduce the cost of living and are able to say that it is actually beginning to fall."

May the hot-headed and unreasonable demands born of selfishness be reconsidered and set aside, and the truly American spirit of co-operation prevail in the present crisis.

Mining Ventures In Foreign Lands

CHAMBERS OF COMMERCE, bankers, manufacturers and producers of raw material daily point to the necessity of the United States furnishing credit to European consumers. They repeatedly call attention to the advantages of stimulating commerce between ourselves and all foreign lands. Already private capital is, in a small way, attempting to make it possible for Europe to buy food and clothing in the United States. Already our banks are establishing branches in foreign countries, and our merchants are endeavoring to create transportation facilities in the aid of commerce.

Banking accommodations and steamship lines, though furnishing the means, are not the sole requisites for the establishment of foreign trade. The things that are of prime importance are the development of the resources of the country, the preparation of its natural products for sale and shipment, and the creation of wants that can be satisfied by our manufacturers. With the development of the mineral and agricultural resources of a land, trade grows and yields profit to the mother country that has sent her pioneers to the wilderness, encouraging and protecting them while getting a foothold in the new region.

As has frequently been pointed out in the columns

of the *Journal*, it is nearly always the miner who leads the way. He invests his money, his labor and his life, primarily for his own benefit, but more than incidentally for the benefit of his mother country, to which he ships his ores and from which he draws his supplies. The rancher follows the miner, cultivating, irrigating, or developing stock ranges, and adding to the supply of products to be exported, and to the demand for manufactured articles. Then follow the builders of railways and the organizers of other public-service corporations, all investing funds that are brought from abroad, all contributing to the growth of colonies and adding to the number of private investors. These are the developments that should be fostered; these are the essentials of the foreign commerce that should be encouraged; and in proportion as they are protected and cultivated, or allowed to shift for themselves, so will foreign commerce either live and expand or decrease and disappear.

In the development of trade with South America miners have already done a vast amount of work. Indeed, we commonly think of Chile, Peru, Bolivia, and Brazil as mineral-producing countries, with scarcely a thought for their other and vaster resources, which the agriculturist and the civil engineer will later develop. If we are correct in our assumption that these things must be cultivated and protected if America is to derive any national benefit, and is to have her commerce grow materially and rapidly, it is well to look around and see what the Government has done, and what it expects to do, in the way of encouraging foreign industry, before making heavy investments. Has the United States promised Americans who invest abroad that their persons and property will be protected while they obey the laws of the land? Has she promised that they will be guaranteed the same rights and privileges foreigners enjoy in America? Has she promised that no unjust laws shall be passed or decreed to deprive them of their just right?

Perhaps, as the United States has passed no laws to the contrary, it may be inferred that she considers this her duty, and needs to make no promises. That has been the assumption of many Americans when they have gone abroad to earn their living through labor or investment. We know that England, France, Germany, Japan, Italy, and some of the lesser nations, make a practice of seeing that their nationals receive fair treatment in the land of their labors, and we feel that the great United States will do no less.

As Lord Palmerston said in establishing, or at least in reaffirming, the doctrine which has made Great Britain great, it did not matter to Great Britain if it was the custom of the country to *bastinado* some man charged with a mere infraction of municipal regulations. No such municipal regulations applied to a British subject, even where the use of the *bastinado* was customary. Unfortunately, Americans have no warrant for indulging this feeling of safety, and when

the test has come we have seen the Stars and Stripes furled, and our nationals abandoned to their fate. We are asked to encourage commerce; we are asked to invest abroad. We did it in Mexico; and to what extent have our commerce and our investments, or in fact our lives, been protected there?

The soul of Mexico was in her mines, owned and operated largely by Americans. Mexico could not, and our Government would not, care for them. Hundreds of American miners are dead, thousands have gone, and mines all over the country have been abandoned. American colonists who had developed large areas of fertile land have been driven from the country. Today, Mexican lands are being withdrawn by the government and paid for with valueless state bonds. By retroactive legislation the national government of Mexico is attempting to take over the oil wells. That government has appropriated nearly all of the public utilities, which are operated according to the caprice of the federal or state functionaries.

What has the United States done for American nationals in all these years of suffering? Washington has made useless "representations" and "protestations," and the game goes merrily on. This is the protection that foreign investors are offered; this is the inducement to develop foreign commerce.

Senator Fall on March 9th, 1914, told before the Senate an experience he had had in the State Department at Washington. After talking the Mexican situation over with a certain official, it was pointed out to the Senator that "the Americans who were in Mexico were not Americans who were seeking to make homes there and help the country, but they were solely representatives of corporations, there for the purpose of exploiting the people, obtaining possessions, getting hold of dollars, and coming back to this country," and that "they had no right to demand protection for their property." The person to whom the Senator attributes this declaration is no longer in the State Department, but that such a spirit ever prevailed there, indicates significantly the risk that Americans have been compelled to take in the attempt to develop foreign commerce.

Some of the missionary work that is being done, some of the energy that is being put into foreign-commerce propaganda, might well be spent in Washington, in an effort to arouse our servants there to the realization that foreign investments made for the purpose of producing foreign commerce would be more popular if Washington would give some material evidence of its desire and ability to protect those investments.

Gold Statistics, Wars, and Prices

HERE appears in this issue of the *Journal* a carefully prepared discussion of a timely and important subject, one in which mine operators are especially interested. It might have been entitled "The Case of Gold," for it is in their relation to the production of gold that the author, J. R. Finlay, discusses wars and prices.

The value of gold as money, its power to purchase, is carefully followed for the last hundred years, and although reasoning is somewhat confused through large production following new discoveries at certain periods, the fact remains that the purchasing power of gold has diminished with the outbreak of every war of importance. Its reduced value as money has not been confined

to the period of hostilities, but has extended for years after peace has been declared, and the period of this depression has been more or less proportional to the magnitude and seriousness of the conflict. Following this line of reasoning, and showing why the depression should exist, Mr. Finlay draws the conclusion that the effect of the world war on the purchasing power of gold will be felt for at least twenty years.

Whether the period of depression is to last for twenty years, more or less, we will never know until the time has passed. The depression is with us now, and, for the reasons given by Mr. Finlay, will be with us for some years. An ounce of gold will not purchase the quantity of supplies now that it formerly purchased. Hence, gold production costs more than it did a few years ago, and it is going to continue to cost more.

To the producer of gold this is a matter of most serious moment. The man or company now owning or operating a gold mine faces a most unpleasant situation. The value of ore reserves has suddenly dropped 25 per cent to 50 per cent, and there are no known economies that may be introduced to offset this decrease in value. Where the margin was already narrow, it has entirely disappeared. Continued operation with the hope that supplies and labor may soon fall, and that losses may be avoided, means a continued drain on the resources of the mine owner, with the chances that the mine will be worked out before better times arrive.

Closing down and abandonment of properties that do not quite pay under present conditions is an equally hazardous thing to do. This means absolute loss of plant and community, where the mine is the life of a community. The conservation of the gold in a low-grade mine may be a proper course for the benefit of the generations yet unborn, but it means serious loss and inconvenience to the present generation.

In view of the decreased purchasing power of gold, and the continuance of this condition over an indefinite period, the reporting engineer has to reckon with a series of factors that have recently changed materially in value. In his eyes a 6-ft. vein of \$5 ore is not the same deposit that it was five years ago; the little 3-ft. vein of \$10 ore no longer holds the attractive features of the one-man proposition that it formerly held.

Mr. Finlay suggests that one reason for the decreased purchasing power of gold is the relatively large production of the metal during the last thirty years. The greater part of this metal went into coinage, but the use for the coin did not keep pace with the supply. The peak of this production, however, is passed, so far as we can now see, so that the man with a gold prospect or undeveloped mine has at least one optimistic aspect of his proposition,—the known supply of gold ores is gradually diminishing. This, however, is but a faint ray of hope, and it appears that gold mining must share in the readjustment of industries that is now taking place, and will continue to take place during the next decade.

When Is It Time To Intervene?

WILL a loss of \$15,000 by the Government change its policy toward Mexico? It seems an inconsequential circumstance to cause such a rumpus, and yet in this loss, and in the steps which have followed it, we can see the germ of improved conditions across the border. Sixty thousand troops on our frontier, so long

as they remain on the northern side of the border, do not in the least accentuate the protests and representations sent from our State Department. But let one troop of cavalry cross the line to inflict punishment where it is needed, and the whole of Mexico takes notice. President Carranza demands through his ambassador that our troops be recalled. Every periodical of Mexico discusses the seriousness of the situation; some publications condemn the dishonoring of their soil by the foot of the northern invader, whereas others demand a change in the policy of their government toward foreigners.

It matters little what they say. The point we would make is that a demand accompanied by the slightest show of force is understood by one and all. To a few it suggests war; to many it suggests the idea of intervention. According to a well-informed publication of Mexico City, "Intervention is to be feared by a few, by those who now rule Mexico. Eighty per cent of her population are entirely indifferent, while 90 per cent of the educated class would welcome it."

We would not care to guarantee these figures, but we are very certain that the Mexicans most antagonistic to foreigners are its present officials—those whom our Government has recognized and tried in every way to support. We are equally certain that a very large percentage of the population of Mexico has no faith in the ability of these officials to bring order out of chaos.

We are inclined to believe that Representative Kahn is right in advising armed intervention. A little of it has proved efficacious; more of it may produce correspondingly beneficial results. The *New York Times* criticises Mr. Kahn's suggestions as ill advised at this time, because the 15,000,000 people of Mexico may choose to continue guerrilla warfare; because it would take many more than 100,000 men to pacify the country, and cost a lot of money, and, again, because some of our South American neighbors might not approve of the action. We confess that we do not know how many men would be required to do the work, nor how much money it would take, but we do know that the resources of Mexico, under peaceful conditions are ample to pay for the maintenance of order and the administration of justice, and to pay all of her long-overdue obligations and damages resulting from civil strife.

The 15,000,000 natives are much more anxious to be free from heavy imposts, and to have plenty of beans and corn, than they are to engage in profitless guerrilla warfare, and although some of our Southern friends might not approve of the move, that would not alter the justice of the act.

"Armed intervention can wait awhile" says the *Times*. "There is a general agreement that something should be done, and done quickly. . . . but to make war on Mexico when a more sensible and humane method could be found to teach her the lesson needed would not be the part of wisdom." In the name of all that is good and true, what is that sensible and humane method? Foreigners and natives alike have suffered untold agonies and destruction for eight years while we have sought in vain for the humane method, and it has not been found.

The *Times* answers this question in the same editorial: "If President Carranza cannot suppress brigandage on the border, if he cannot protect our people in the Tampico region, it can be done in a thorough fashion by American soldiers and marines. A few such

lessons, and there would be order on the Mexican side of the border and peace along the coast, and at no great cost, too." The *Times* is absolutely correct, but we fail to see the difference between Mr. Kahn's suggestion and the sensible, humane method of the *Times*.

Protection to Investors In Oil and Mining Stocks

UNDER date of Aug. 4, the State Corporation Department of California issued a list of certain oil and petroleum companies that have, as the circular states, not complied with requirements of the California Securities Act ("Blue-Sky Law"), and that have offered their securities for sale in California contrary to the provisions of the act. Copies of the circular may be obtained from the California State Corporation Department at Sacramento, Cal. E. C. Bellows, California Commissioner of Corporations, in a letter which accompanies the list, says:

"It is obvious that corporations which find it necessary to evade the provisions of the Corporate Securities Act are not organized for the benefit of the investing public. An initial examination and subsequent supervision by the State Corporation Department may be obtained by a company at a nominal cost, and the aim of the department is to have corporations generally conform to the standard of integrity that has been manifest among the decent corporations of California, both before and after the law went into effect."

Mr. Bellows does not maintain that the securities of the companies listed are all of dubious value, but goes on further to say:

"The securities offered for sale by some of these companies may form an attractive investment. Others may be of doubtful value, and some of them may be entirely worthless. There is no intent on the part of the commissioner to limit the right of people to engage in speculative enterprises as long as they are fairly conceived and honestly conducted. However, the investing public has the right to be fairly informed of the hazards which may be encountered and to have such regulations enforced as will protect it from fraudulent schemes and unprincipled schemers."

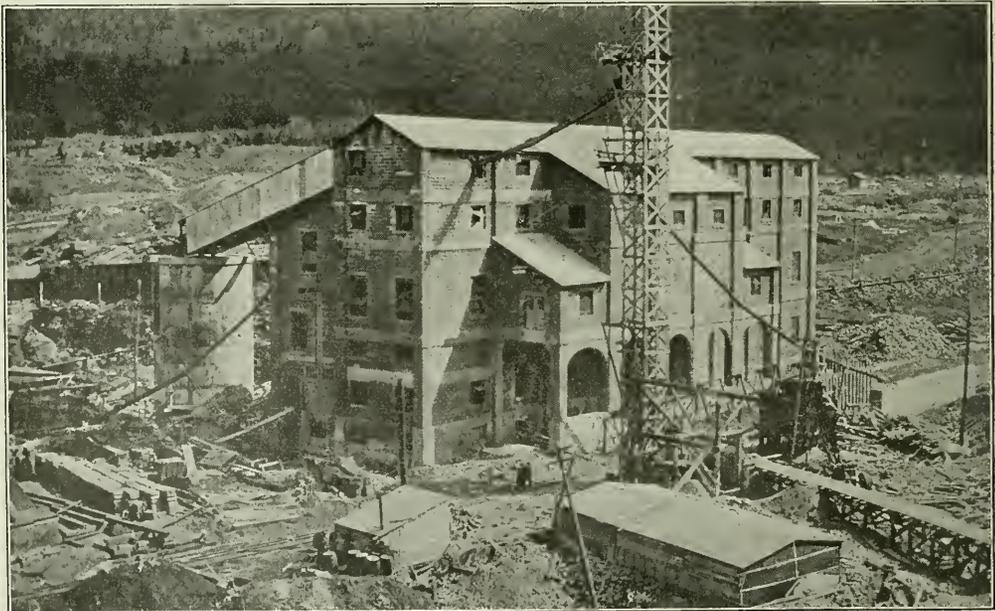

The protection of the investors from fraud, and provision for the proper spending of money in the development of an enterprise, whether highly speculative or conservative, are of great importance to the mining industry. There would be only a small industry if a widespread desire to take a chance when the opportunity is offered did not exist. It is this speculative tendency that is responsible for the opening out of new mining districts and the continued growth of old ones. Many are glad to go into an enterprise if only they can be assured that they will have an "even break" for their money.

The effective working out of the "Blue-Sky laws" has taken time, and for a considerable period there was a feeling among some that the operation of such laws would stifle enterprises of a speculative nature. Such has not proved to be the case. On the whole, they are becoming effective, and in proportion as greater experience is obtained by their administrators they will become more effective. In the specific instance that has come to our attention the possession of a list of companies which have failed to comply with the "Blue-Sky Law" in California is of great practical value to the intending investor in oil stocks.

Gold Statistics, Wars, and Prices

Industrial and Financial Disturbances Have Followed All Armed Conflicts in the Last Century—
The Relation of Gold Production to the Law of Supply and Demand—Marked
Decline in Production for the Last Decade

By JAMES R. FINLAY

THE statistics of gold production are easily obtained and on their face show remarkably little change during the last ten years. It is a commonplace that the war period, 1914 to 1919, more especially the later part of it, was unfavorable to the business of gold mining. Other commodities and labor were in acute demand at prices far above those of former years, but gold remained nominally at the same price. Actually, of course, its price went down in proportion to the decline of its purchasing power. This finally resulted in a rather abrupt decline in production.

But the decline caused by war conditions does not fully explain the position of gold. It is reasonable to suppose that the output would have declined anyway in recent years, or at least would not have increased. South Africa accounts for half the world's yearly supply. The increase of production from 1900 onward has been largely the growth of the South African industry. In fact for the last fifteen years the African production has been the one source of supply that has raised the world output; without it there would have been a considerable falling off. Thus, in 1904 the world production was \$347,377,000, of which Africa yielded \$85,913,000, leaving for the rest of the world \$261,464,000. In 1915, the year of greatest output on record, \$468,725,000, Africa yielded \$217,852,000, leaving only \$250,612,000 for the rest of the world. In 1917, Africa produced \$214,614,000; the rest of the world only \$208,976,000. It is true that disturbances in some countries, notably Mexico and Russia, had something to do with this falling off, but this was not a controlling factor. The main thing is that no new supply of gold ore has been discovered; no new process for obtaining more gold from known sources.

MAXIMUM TRANSVAAL GOLD PRODUCTION IN 1912

The output has varied with the exploitation of districts already under operation. The Boer War, 1899-1902, retarded the growth of mining in the Transvaal, but as soon as recovery had been made from that, and the district had reached full and unhampered activity, the output of that country rapidly approached its maximum, and practically reached it in 1912. Since that year, with the exception of a spurt in 1915, there has been no indication of an increase of gold production. There does not seem to be any reason to anticipate a rapid decline in the near future; but to expect the gold industry to hold its own for the next ten years is about as optimistic as one can reasonably be if reliance be placed on all factors turning out favorably.

Despite these facts, the price of gold has declined. Complaint of the high cost of living was general, even before the war. The amount of other commodities which a given amount of gold would buy has diminished steadily ever since 1894. The strange thing is that this diminution of purchasing value was accelerated during the war in the face of an apparently increased demand. These facts suggest various explanations:

1. It is not improbable that the money value of gold is governed, not by the current output, but by the total amount available in the world. Other metals, once put in use, are not available to any large extent for other purposes. Thus, iron put into railroads, buildings, machinery, tools, and like utilitarian purposes, generally stays in those allocations until it is destroyed by rust or wear. Its manufacture is specialized for certain purposes. In general, it is cheaper to make new iron for a particular use from the ore than to remelt old iron, because such iron is not generally fit for the new purpose. Lead and zinc are used largely for paints, from which recovery of metal is impracticable. Copper is not so completely fixed, perhaps, nor quite so destructible, but by far the greater part of it is put at once into permanent structures from which it is seldom removed. Silver, even, is exposed to considerable destruction by use in household ware, ornaments, corrosion and the wear of common small coins. But gold is not put to any large extent to any fixed allocation. It is merely locked up in treasure vaults to be used as standard for exchanging commodities. Some of it, of course, is used for ornaments and for coins, but even these are jealously guarded.

THE AVAILABLE SUPPLY OF GOLD

Almost all gold is capable of being remelted and put to another use. About the only means by which it is destroyed are the absorption of small amounts in chemicals, the wear of jewels and coins, and absolute loss. Thus the large output of the last twenty years has swelled the stock of available gold immensely more than similarly increased outputs of other commodities have increased the available stocks of those commodities. For instance, the available stock of manufactured or usable iron or copper or wheat ready for consumption is seldom more than a year's supply. If new supplies should be cut off, some part of these metals could be taken from the less imperative uses and put to more necessary ones; but there would be an immediate curtailment of industry, production, and comfort. The people would be headed straight for want and disaster. Of the iron and copper produced a hundred years ago, only an infinitesimal fraction is available for commercial purposes today; but, in the case of gold, a large percentage of that produced a hundred years ago is undoubtedly still subject to exchange. In view of these considerations it becomes interesting to reflect upon the following statistics:

THE RECORD OF GOLD PRODUCTION

The production of gold was stagnant and comparatively small until about 1850, when the great historic discoveries in Australia and California suddenly tapped the gold resources of two virgin continents. These supplies seemed abundant for all necessary purposes. In 1853, the output reached \$155,500,000. This remained the record output for forty years, until 1893.

Production stagnated or declined, going as low as \$90,800,000 in 1874, and to \$95,400,000 in 1883. In forty years, 1851 to 1890 inclusive, the total production was about \$4,500,000,000. About 1890 a revival of gold mining took place, the production climbed to a new maximum of over \$460,000,000 in 1912, and the total production of thirty-eight years, 1891 to 1918 inclusive, was \$9,500,000,000.

There seems to be reason to believe that the world's stock of gold is at least three times as great in 1919 as it was in 1890. Various influences are in favor of the conservation of the metal. It is reasonable to believe that between 1850 and 1890 the proportion of the annual production lost through wear and wastage was much greater than it has been since then. Gold coins were in much more common use. The population among which the metal was exposed to absorption was proportionately greater. In 1890 the new gold per capita was only about 10 cents per year; in 1915 about 30 cents. Now, suppose that at all times each person wears out 5 cents' worth of gold a year. In 1890 such wastage would have been 50 per cent of the total supply; in 1915 it would have been only 16½ per cent.

GOLD PRODUCTION DECREASING

From these observations it may be perceived that though the annual production of gold is not increasing, but actually diminishing, the amount may still be sufficient to swell the available stock of gold even beyond the proportionate demand for it. It is not unlikely that between 1860 and 1890 the stock of gold did not increase in proportion as fast as the general business of the world, and its purchasing power steadily increased, but that since 1890 the stock has increased faster than the world's business, and its purchasing power has proportionately diminished. It is probable that about 1890 the supply of gold ran so low that the demand for it would account for the low prices for commodities of the early '90's. To illustrate this, consider some hypothetical figures.

Suppose that the available stock of gold in 1850, the accumulation of all former times, was \$1,000,000,000, and that between 1850 and 1890, half of the gold produced was added to the stocks. The accumulation would be about \$2,250,000,000 in the period, and the total supply in 1890 would be \$3,250,000,000. Assume, further, that of the total gold produced since 1890, an amount equal to 80 per cent has been added to the stock. The accumulation would be \$7,600,000,000 for the period and the present total amount would be \$10,850,000,000.

RELATION OF GOLD SUPPLY TO INDUSTRIAL DEVELOPMENT

If these figures are even approximately correct it becomes probable that the stock of gold in proportion to the production of the chief staples of commerce is much greater today than it was in 1890; that is, there is more gold in existence today to be exchanged for available iron, coal, copper, wheat or cotton than there was in 1890. In this connection it may be remembered that in the latter part of the nineteenth century the expansion of the world's commerce was proceeding at a rate that perhaps has not been equaled since then. It included the opening up of the interior of America, Australia, and Africa, the construction of nearly all existing railroads, the development of mechanical manufacturing, the factory system of employment, and the

creation of most of the great industrial corporations. Since that time business and wealth have continued to expand, but more through the development of specialties and refinements, less, perhaps, through the discovery of new resources and process, and very likely not at the same rate as in the earlier period.

2. Emphasis should probably be laid upon the tendency to conserve gold more and more for the purposes of exchange. Gold for many years has been handled almost exclusively by banks and the treasuries of the leading nations. Its use as common coin has proportionately diminished. Of late years, as a war measure, all the leading belligerents have suspended specie payments, so that the ordinary citizen has scarcely been able to obtain gold for any purpose. It seems possible that this should be regarded as an additional and special factor superimposed upon the tendencies outlined. It makes gold as a medium of exchange seem distant, even imaginary; it enables governments to make gold go further than ever as a basis of money, and makes the average man use "money" with less and less thought of obtaining the metal.

GOLD MORE PLENTIFUL THAN GOODS

At any rate, whatever the relation of gold to prices, it is evident that, as a result of the recent war, gold, for the uses to which it is put, is relatively more abundant than are the principal staples of commerce. Apparently this is the result of every war to a sufficient degree to cause extensive borrowing by governments, the diversion of large numbers of men from productive occupations, the derangement and prostration of industry through interruption of supplies, and the laying waste of productive areas. If conditions were normal, considering the feverish demand for exchange, a strong demand for gold at the present time might be expected; but the feverish conditions are in themselves a proof of want, and the want of food, tools, and equipment is more consistent than the demand for gold.

A book should be written upon the effect of great wars upon prices and general economic conditions. I have inquired for such a publication, but have not heard of one. In the absence of an authoritative discussion, I am tempted to put down a few observations that I have been able to glean from various sources.

INDUSTRIAL STATUS OF NAPOLEONIC ERA

At the time of the Napoleonic wars the modern industrial world was in its infancy. Only one country—Great Britain—had made any progress to speak of in the use either of mechanical power or intensive manufacture. The population of the leading countries of Europe was from one-quarter to three-quarters of what it is today. Production was generally by handicraft and not by the factory. Transportation of staples was only beginning. Commerce, therefore, between distant points had been confined largely to rare and valuable fabrics and luxuries. Dependence upon the resources of other continents was not at all general but was confined almost entirely to the countries at the western fringe of Europe. During that war an almost complete monopoly of ocean traffic fell to Great Britain and to the comparatively feeble and loosely organized United States. Through this combination of circumstances Great Britain, although at that time producing little or no gold from her own territories, undoubtedly became the principal gold owner of the world and adopted the gold standard. It was a period of general enlight-

enment, of increased knowledge of distant countries, of progress in natural science, of bold intellectual speculation.

THE FINANCIAL PANIC OF 1819

The economic effects were chiefly the diversion of handicraftsmen into military pursuits, including the manufacture of military supplies, and a derangement of ocean commerce which, after all, deprived only a comparatively small number of people of their accustomed supplies. Furthermore, there was an increase of the public debt, which in the case of England, at least, dwarfed anything ever known before. These causes were sufficient to produce a general and prolonged rise in the price of many commodities of general commerce. It is probable that in producing those commodities that were made almost entirely from local raw materials and depended little upon trade (in which a larger part of the population was then engaged than now) the effects varied greatly from place to place, depending upon whether or not they were exposed to direct ravages. The wars themselves were confined to a period of twenty-five years, but the prices of some commodities continued high for forty years, or for fifteen years or more after the war. The economic readjustments at the close found expression in an acute financial panic in 1819, four years after Waterloo.

EFFECTS OF NINETEENTH CENTURY WARS

In the middle of the nineteenth century, between 1855 and 1870, a number of comparatively localized wars disturbed the industrial world. Of these, by far the most important was the Civil War in America. The Crimean War of 1855 and 1856, the Italian War of 1859, the Austro-Prussian War of 1866, the Franco-Prussian War of 1870-71 were either short lived or affected regions of slight industrial importance. But the combined effects were a considerable increase of public debt, very large in France and the United States. During the Civil War there was an important stoppage of one of the world's chief staples—cotton.

Again, there was a prolonged rise in the price of commodities, which culminated in 1864, but which persisted at least until 1880. It may be remarked, in passing, that the severe financial panic of 1873 had little effect on checking the high prices.

DISCOVERIES IN CALIFORNIA AND AUSTRALIA

Just preceding this series of political disturbances occurred the unprecedented discoveries of gold in California and Australia, which not only increased the supply of that metal at an extraordinary rate, but stimulated exploration, colonization, enterprise, and trade in all parts of the world. At no other period in the world's history, except, perhaps, at the time of the Spanish conquests of Mexico and Peru, was the supply of gold increased so rapidly or so generally distributed. The concurrence of this fact with a period of political disturbances and a succession of wars brings about a confusion of economic causes which it is probably very difficult to unravel; but there is certainly every reason to suppose that the increase of gold supply had a good deal to do with stimulating demand and raising prices.

After the Franco-Prussian War there supervened a period of general tranquillity among the chief civilized and industrial nations that lasted, with slight interruptions, for about forty years. In the earlier part of this period there was a general payment or reduction of

public debts and also the stagnation and decline of the output of gold, together with a great expansion of agricultural development. Prices steadily declined until about 1895. At this date the payment of public debts had ceased and the reverse tendency began. Just what caused this condition I have not inquired into critically, but it is not improbable that it was attributable to the renewal of international rivalries, the increase of armaments, and the initiation of national enterprises. At the same time the production of gold had for several years increased rapidly.

The events of the mid-century find some parallel in more recent ones. Again a greatly increased gold production concurred with a period of general prosperity. Wealth and luxuries were produced in unexampled profusion and in new forms. The gas engine, the automobile, and, finally, the airplane were developed and added much to the convenience, activity, and information of millions. Industry was organized in immense units, producing the staples of commerce with much greater facility and in many times greater volume than had ever before been known. These activities centered in certain areas which became the industrial clearing houses of the world. Those areas became populated to such an extent that the people in them were and are absolutely dependent for their prosperity and even for their subsistence upon the constant interchange of staples on an immense scale.

DEVELOPMENT OF NATIONAL RIVALRIES

Great Britain was the first of the principal nations to feel conscious of such dependence upon trade, but with the rapid increase of population, manufacture, and commerce in Germany, that nation became thoroughly conscious of it also. On the other side of the world, too, Japan found herself confronted with the same problem. Thus the principal industrial areas of the world were, by the measure of their indigenous resources, overpopulated. In Europe these areas were occupied by different nations, each imbued with jealousy of its neighbors and intensely unwilling to permit the continuance of its trade, and therefore of its life, to be in any measure at the mercy of its rivals. Thus overpopulation was certainly the underlying cause of formidable international rivalries, giving rise to innumerable schemes of expansion, aggression, and defence; and determining the tone of thought by which such schemes were supported.

The series of wars prompted by these motives has already been long. It includes numerous minor conflicts incident to colonial aggressions of the Europeans, though the collisions between great nations were avoided until the Russo-Japanese War of 1904-1905. But war in Europe was constantly brewing, and was with difficulty avoided on many occasions. Finally, a furious war, all the more violent because so long repressed, involved all the principal nations of the world.

PROBLEMS CREATED BY THE GREAT WAR

The events of the Great War have accentuated rather than mitigated, in Europe at least, the force of the economic conditions outlined. Those who take pains to look the situation in the face must be impressed with the following facts: The total white population of the world is about 600,000,000. Of these, three quarters live in Europe. The total area occupied by white populations is about 20,000,000 square miles, a good part of which is in the circumpolar regions of America and Asia and another portion in the deserts of Australia.

Of this population, half at least, both in number and in area occupied, have been thrown into a state of political revolution and social and economic chaos, and are today suffering in varying degree from all the distress incident to such terrors, from starvation, exposure and danger. Out of the ruins of the empires of Russia, Germany, Austria, and Turkey a number of small nations have been created, or resurrected, without fixed organization, all jealous of their neighbors; some already at war with each other, and each nation far less self-sustaining than the larger units from which it was broken. When it is considered that revolutions, once started, are hard to stop and frequently go on from one stage to another for generations, it is hard to look upon the general situation of the white race with much assurance of a complete return to tranquillity and prosperity.

These conditions do not affect the Anglo-Saxon world within its own territories as they affect every other white nation. The Anglo-Saxons are, as I have pointed out elsewhere, richer in resources, stronger in industry, and firmer in political organization than any other nation; and these facts have been demonstrated as much by the recent war as by anything that ever happened. But the solidity of the English-speaking countries is not the only factor in their relations with the world, unless they can shut out and ignore the rest of that world—and that is precisely what it is proposed not to do.

The economic consequences of such a cycle of events have been just such as one might expect from an attentive consideration of historical parallels. But in this case the tendencies that have been visible on former occasions have operated with multiplied intensity. Prices of staples have been forced to heights only the extreme peaks of which have been passed. It is hard to escape the conclusion that the main factor in these high prices is the tremendous national borrowings. The world has financed itself with promises. There has been a steady decline in the purchasing power of these promises.

WAR DEBT NOW \$200,000,000,000

To return to the general figures mentioned, there are 600,000,000 white people divided among various nations. These nations owe about \$200,000,000,000. At a conservative average, each individual owes about \$300 and each head of a family \$1,500. The theory is that these sums must be paid, principal and interest, not out of product but out of profit—out of savings. It is only, of course, when these debts are owed by one nation to another that these sums mean an actual transfer of goods. The debts of a nation to its own citizens can be paid only through taxes from those citizens, so that, although the process may affect individuals variously, in a national sense it is merely a transfer from one pocket to another. The overwhelming preponderance of public debts must be of this nature. But is it not true that the necessity of giving these pocket-to-pocket transfers the semblance of real money is the potent cause of marking up prices? How can it be avoided?

ACTUAL WEALTH IS IN COMMODITIES

The actual wealth is not money but goods. A nation can produce only a given amount. To repay itself vast sums of money through taxes for interest and principal can be accomplished only through adding to the value of the goods the amount of the taxes. As this addition to value is not expressed in goods, but in money, it fol-

lows that the sum total of goods must be expressed in a larger amount of money, i.e., in inflated or imaginary value, a decreased purchasing power of the dollar, or higher prices—all these expressions meaning the same thing.

Hennen Jennings has pointed out that the only effective check upon the progressive depreciation of the unit of value through these causes is free payment in gold. An ounce of gold is divided into something over twenty dollars. It costs as much effort and as much goods to produce the gold ounce or the gold dollar as it ever did. Therefore, so long as the dollar actually represents a given amount of gold it will always represent a given amount of effort. If a given amount of effort made highly efficient by improved organization and appliances can be made to produce a greater amount of goods, it is likely, also, to produce in a general way a proportionately greater amount of gold. The only influences that would permanently alter this relationship would be fundamental causes, such as the discovery or exhaustion of great sources of gold by which the metal might become relatively easier or more difficult to obtain. When it is obtained only at greater effort than is necessary in the acquisition of other commodities, or through consumption in process of its production of greater quantities of other commodities, then, if secured at all, it must be acquired through the use of greater quantities of those commodities, and it will be manifestly equal in value to a greater quantity of them—will buy more of them. Prices will then be low.

The contrary process is equally imaginable and to specify it would only be repetition.

DETERMINING INFLUENCE IN GOLD PRODUCTION

Thus gold, if freely used, is probably as dependable and fair a medium of exchange as could be devised. It may be remarked further that its equilibrium is maintained in the long run through natural causes which, of course, do not operate instantly, but which do tend to confine the oscillations of value between comparatively narrow limits. If gold is produced in quantity greater than the demand for it, people will not pay so much for it in commodities. This is equivalent to a rise in cost which will force some producers out of business. On the other hand, if the stock of gold runs short, prices will be low, and the inducement to mine more of it will return.

It is pertinent to remark that the influence of prices upon gold production is bound to be felt in the long run, regardless of the cause of the change of prices. It makes no difference in the ultimate effect on the gold industry whether high prices are brought about by the existence of an abnormally large stock of gold, or by the shortage of commodities brought about by decreased production of them for any reason—wars, disasters, disorder, or famine; the tendency will always be to curtail the production. Such influences will bring about considerable swings in the popularity of the industry. The reasons which operate to make gold mining unprofitable will discourage or diminish the search for gold. Plants will go out of business, and a considerable period will elapse before the counter-swing will have much effect.

The gist of these considerations is that in the cycles of high and low prices it is possible to discern the operation of common economic laws. An outburst of national borrowing is in itself either a diversion of labor from its usual channels of production or an evidence of

distress brought about by the shortage of production from some other cause. It will either produce high prices or be produced by them. On the other hand, the widespread liquidation of borrowings can be accomplished only during the periods of tranquillity when labor is employed in full measure for the production of private wants, when there is freedom from calamity. A war, therefore, unless it is local and insignificant, is sure to raise prices. The more general and violent the war, the wider its effect in raising prices. Moreover, the effect of war is not confined to the period of organized military effort, but will persist as long as the exhaustion of resources, the impeding of traffic, and political and social disorders prevent the resumption of peaceful industry in an efficient manner.

The inducement to produce gold will naturally follow upon these influences. Its production will be curtailed during the whole of the period of high prices and high costs, and will not be resumed with full impetus until it has been encouraged for some years by low prices, which means a glut of the chief staples.

LONG PERIOD OF INFLATED PRICES PROBABLE

It certainly is to be expected, and feared, that the present situation of the world indicates a long-continued period of high prices for reasons which may easily be summarized in the order of their importance:

1. Every new or revolutionary government is necessarily unstable. Every nation between the Rhine and Vladivostok and from the Arctic Ocean to the Mediterranean and the Himalayas is the seat of potential, even prospective, revolution. The population of this tract is as follows:

Russian Empire.....	170,000,000
German Empire (including Poland)	65,000,000
Austrian Empire.....	53,000,000
Balkan States and Turkey	40,000,000
Total.....	328,000,000

Every nation in this group is confronted with a long list of burdensome tasks which must be accomplished despite the probability, according to historical precedent, of having its projects deranged by internal disorder. It must establish, or re-establish, public and private credit. It must establish new, or re-establish old, lines of trade and traffic. It must restore or replenish its stock of staples and raw materials, and it must make provision for the payment of foreign debts. How easy it is for national and racial jealousies, actual or latent disorders, to prevent all this, not only locally but throughout the whole area!

2. The white populations unaffected by revolution are as follows:

British Empire.....	60,000,000
United States.....	100,000,000
France.....	40,000,000
Italy.....	35,000,000
Spain, Portugal, Netherlands, Scandinavia.....	45,000,000
South America—Brazil, Argentina, Chile.....	20,000,000
Total.....	300,000,000

These countries are in control of the resources of the greater part of the world, but by a very unequal division. Of the chief resources, the Anglo-Saxons control the preponderance. On the whole, however, there is nothing to prevent this group from resuming, or even increasing, its former prosperity. By returning to peaceful industry, the major portion may soon replenish its warehouses. The chief difficulties are the curtailment of national expenditure and the liquidation of foreign debts. To whatever extent these operations are

dependent upon the prompt payment of obligations and a resumption of good feeling by the great disturbed populations of central and eastern Europe, northern Asia (and it may be added, perhaps, of China and Japan), their success can hardly be regarded at present as other than doubtful.

Even if it is reasonable to believe that the recent cycle of political, social and economic disturbance has passed its acute stage, it still remains certain that these distractions have operated upon a scale and with an intensity scarcely ever known before; and the time required for recovery should logically be at least as long as at any former period. On this reasoning one might expect that the present cycle of high prices will not have fully subsided until about 1940, at the best.

If one were looking for an example of the comparative instability of precious-metal mines, and the dependence of the world for its supplies upon a constant search for deposits in all parts of the world, one would need go no further than to note the changes in the list of representative gold mines, selected particularly because they seemed the most substantial of their type. In the short interval of ten years the Alaska-Treadwell group has practically gone out of existence. So has the Camp Bird, El Oro and Esperanza, the Robinson, the principal Kalgurli mines, and the Goldfield Consolidated. Of those still running, in some cases with a marked decrease of prosperity, one may name only the Homestake, the Liberty Bell, the Kolar mines, and the Portland. Thus the operations that have practically vanished are about ten out of seventeen, about 60 per cent.

DECLINE IN PRODUCING DISTRICTS AND LITTLE PROGRESS IN METALLURGICAL METHODS

This is not all. In the interval two great projects in Alaska for mining the low-grade gold ores of the Juneau district have been initiated, supported enthusiastically, and have proved themselves dismal failures. Districts have not been so roughly treated as individual mines, but even districts have so nearly lost their importance that it is scarcely an exaggeration to say they have vanished. To specify such vanishing districts one may name Douglas Island, Juneau, Ouray, Goldfield, El Oro and Kalgurli. In Cripple Creek and Kolar the output is steadily on the decline. Only at the Homestake and the Transvaal has there been an increase. The latter district produces half the gold of the world, but substantially from a new group of operations, which, however, merely represent a migration, enforced, of course, to lower levels and outlying tracts.

So far as I can learn, not a single radical or even important change in the processes of gold mining has taken root during the last ten years. The appliances are the same to all intents and purposes, although there has been a considerable substitution of ball mills for stamps, some improvements in drilling machines, and some changes in cyanide practice. But the ground work is the same, and results are about the same. The grand feature of the history of the business has been the progress of an economic cycle unfavorable to gold mining.

The Stollberg Mining, Lead, and Spelter Works has been obliged to permit the company's spelter plant at Dortmund to remain idle, and in view of the losses involved in present working conditions expect the closing down of further works, according to the *Ironmonger*, of April 16, 1919.

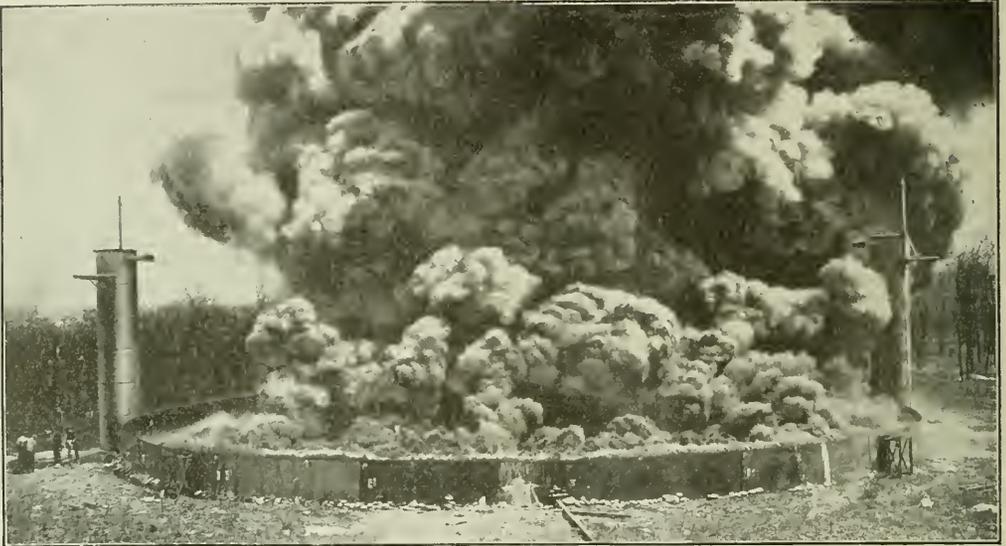

Fire Protection for Oil Tanks

Description of a Method for the Extinguishing of Disastrous Oil-Tank Fires by Using Bubbles Containing Carbonic-Acid Gas To Form a Blanket Covering on the Surface

THE storage of oil or gasoline has always been accompanied by great fire risk, owing to the difficulty in extinguishing the flames by ordinary means. The use of water results in a further spread of the blaze over a larger area on account of the well-

known property of oil to float on water. The use of carbonic-acid gas is ineffective, because of the great diffusion in the atmosphere by the rising currents of air and other natural conditions. Both of these difficulties are reported as being remedied by a method which has

been recently introduced into practical use. The process is based upon the principle of applying a froth or blanket of bubbles containing the carbonic-acid gas, which thereby concentrates the gas so as to make it most effective. It is also said that, by this means, not only

A 55,000-BBL. TANK ON FIRE, WITH A STRONG WIND BLOWING

FIRE EXTINGUISHED WITHIN FORTY-EIGHT SECONDS AFTER THE APPLICATION OF CARBONIC-ACID GAS BUBBLES

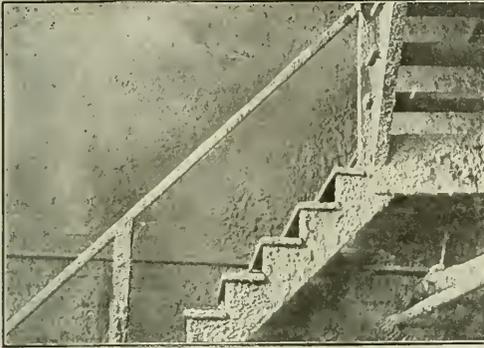

known property of oil to float on water. The use of carbonic-acid gas is ineffective, because of the great diffusion in the atmosphere by the rising currents of air and other natural conditions. Both of these difficulties are reported as being remedied by a method which has

are the flames extinguished but the smoke and fumes are also smothered.

Another advantage stated is the comparative dryness of the foam compared to water, as it possesses no tendency to soak into the material, which results in less

damage. The bubbles are minute in size and hold the gas efficiently. The composition of the solution used for the formation of the bubbles has not been revealed by the inventors. The froth resulting from the release of the liquid from the extinguisher is eight times in volume that of the original liquid, which therefore gives it a large area-covering capacity. The physical properties show the froth to be heavy, tenacious and lasting. Portable means for the application of the method have been provided by the use of fire pails, hand extinguishers, and portable engines. For large storage tanks permanent installations are used.

The first illustration depicts a 55,000-bbl. tank fire at its height, with a strong wind blowing, and the

CARBONIC-ACID GAS BUBBLES ADHERING TO A VERTICAL SURFACE

lower is an illustration of the same tank forty-eight seconds later, showing how the foam blanket smothered the blaze. The tank was 114 ft. in diameter, presenting 10,200 sq.ft. of surface. The method of projecting the liquid is shown by the two containers on opposite sides of the tank. According to the experiments conducted, the amount of the foam required can be calculated in accordance with the nature of the fire risk and the number of square feet of area requiring protection. The distance of discharge is a maximum of 50 ft.

The last illustration shows the great covering capacity of the liquid and its tenacity in clinging to any surface.

This system of fire protection is designed and installed by the Foamite Firefoam Co., New York, and the illustrations reproduced herewith are presented through the courtesy of that company.

United Engineering Society Honors Carnegie

At a recent meeting of the United Engineering Society the following resolution was ordered spread upon the minutes:

Andrew Carnegie's death on Aug. 11, 1919, at Lenox, Mass., brought to its close a career which greatly advanced all the engineering arts and sciences. By the introduction into the United States of the bessemer process for the production of steel, and by the establishment and development of steel plants which became the greatest in the world, he made available for engineers the most useful modern material for engineering construction. In the successful conduct of many industrial enterprises, he amassed great wealth, the possession of which he came to regard with

deep seriousness as a public trusteeship. He devoted himself to the distribution of large portions of his fortune to projects for the benefit of mankind. He distributed his wealth not only in many directions, but also with the exercise of great wisdom based on careful investigation. His munificence provided large funds for the building of a home for the great national engineering societies and many associate societies. He was an honorary member of the American Institute of Mining and Metallurgical Engineers and American Society of Mechanical Engineers. He was personally known and loved by many engineers. In view of these facts, be it

Resolved, That the American Societies of Civil, Mining, Metallurgical, Mechanical and Electrical Engineers, the United Engineering Society, and the Engineers' Club herein express their condolence to the family of Mr. Carnegie and record their sincere appreciation of the great contributions of Andrew Carnegie to the advancement of engineering, and of his friendly assistance in making possible beautiful homes for the Engineering Societies and the Engineers' Club, thus fostering the spirit of unity in the profession.

Shattuck Arizona Copper Co.

The report of the Shattuck Arizona Copper Co. for the quarter ended June 30, 1919, states that development work aggregating 459 ft. was prosecuted on all levels between the 100 and 700-ft. levels, but did not result in finding any new ore. In the fire area below the 700-ft. level, bulkheads have been opened up, and air courses have been opened above the fire zone. Flooding operations have been successful in extinguishing the fire. No smoke or gas can be detected in the fire section, and the work of unwatering the mine below the 700-ft. level will soon be undertaken.

During the quarter, minor alterations were made in the lead mill, and milling tests started again June 15. The tonnage handled is approximately 250 daily. During the quarter, 931 tons of copper ore and 2,578 tons of lead ore were shipped; 2,138 tons of lead ore was smelted, and 65,148 lb. of lead was recovered. The operations for the period reviewed show a loss, exclusive of depletion, of \$93,010.67.

Negligent Track Construction in Mines

BY A. L. H. STREET

To the end of minimizing danger of injuries to his employees, a mine operator is bound to construct parallel tracks in a mine far enough apart to avoid contact between cars on the two tracks, taking into consideration the likelihood of contact due to a moving car being tilted laterally by spreading or other condition of the track, or obstructions, such as rock, on the track.

This point was decided by the Utah Supreme Court in the case of Johnson *vs.* Silver King Consolidated Mining Co., 179 *Pacific Reporter*, 61, involving defendant's liability for fatal injury to a miner while he was working in a tunnel, claimed to have been caused by a car on a main track shoving a car on an adjoining side track against him.

The court recognized the rule that before an employer can be held liable in damages for injury to an employee there must be some reasonable identification of a negligent cause for which the employer is responsible. If the injury can equally well be attributed to any one of several causes, one or more of which would be the employer's fault and one or more of which would not be his fault, there can be no recovery.

Geology of Platinum Deposits—Part I

Increasing Use of the Metal in the Electrical and Chemical Industries and a Shrinkage in Output From Russia Stimulate Study of Sources—Principal Formations and Occurrences

By W. L. UGLOW

Assistant Professor of Geology, University of British Columbia,
Vancouver, B. C.

PLATINUM is derived primarily from two main sources—placer workings and lode deposits. Until comparatively recently the entire world's supply of the metals of the platinum group was obtained from the former source, but in the last few years valuable deposits of these metals have been discovered in certain of the Western states and in British Columbia. Though the output from these deposits is as yet small, there is reason to believe that similar occurrences will be found elsewhere, provided sufficient attention is given by prospectors to the geology of these types of platinum occurrences. This paper is a review of the salient geological features of the world's platinum deposits, which are divided into the two before-mentioned classes.

LODE DEPOSITS

Lode deposits of platinum may be conveniently divided into several groups, based on mineralogical and lithological similarities. Such groups are not necessarily genetic. As far as is known at present, platinum occurs in lode deposits in two forms, as native platinum or as sperrylite. In the former case it is found associated with characteristic rock types the world over. It is usually alloyed with palladium, iridium, osmium, and other members of the platinum group, and is accompanied by chromite. Sperrylite, the arsenide of platinum, PtAs₂, occurs in many types of deposits, but generally in those associated with basic igneous rocks. It is usually accompanied by palladium in some form not yet determined, and frequently by the sulphides of copper and iron. In many cases platinum occurs in ore deposits in such small amounts that the character of the mineral has not been recognized, but it is believed to be either native metal or the arsenide.

The source of the platinum metals in many placer workings has been traced to lode deposits containing the metals in the native form, but in no case yet reported have these lode deposits been successfully mined and the precious metals recovered. On the other hand, deposits containing platinum in the form of sperrylite have been mined on a commercial scale, but no instance is recorded in which deposits of this type have given rise to placers of commercial value. Platinum and other metals of the group have been detected in the following types of deposits:

DUNITE AND SERPENTINE

These are the types of deposits in which the platinum metals are known to occur in the form of native metals or alloys. Few serious attempts have been made to recover the metals from these sources, although in some cases such deposits have been tested and results of an interesting scientific nature obtained.

In many places where platinum metals have been derived from placer workings, careful search has revealed the presence of dunite, serpentine, or related types

within the drainage basins of the river systems which carry the precious metals, and analyses of these rocks have demonstrated the presence of platinum. Rocks of this type consist essentially of olivine, serpentine, pyroxene, chromite, and magnetite, with their alteration products, magnesite, hematite, limonite, and kaolin. They are the characteristic home of chromite; and the frequent association of the latter mineral with platinum in placer ground points to the origin of the precious metal in those rocks in which chromite most commonly occurs.

SOURCES OF PLATINUM

A few of the most important districts containing deposits of this type are mentioned below:

Ural Mountains, Russia—The streams in Russia whose drainage basins have produced the greater part of the world's platinum cross during their courses large areas of dunite and serpentine in which grains of platinum have been recognized. Experiments have been carried on by V. N. Chorzhevsky¹ with the dunite of the Nizhni-Tagilsk district in the Urals, which occupies about twelve square miles, in an endeavor to concentrate the contents of platinum metals into a recoverable form. The method adopted was to grind the rock finely and collect the chromite concentrates by tabling. Platinum was leached from these concentrates. A representative sample of the concentrates derived from 9,720 lb. of material gave, after being cleared of all visible metal, 200 oz. of platinum; and the gray fines, consisting of tailings and undecomposed dunite, assayed 11 gm. (about $\frac{1}{2}$ oz.) of platinum from 3,600 lb. of material.

Tulameen District, British Columbia, Canada—Large dike-like masses of dunite considerably altered to serpentine and containing lenticular masses of chromite are found in this area, cutting older sediments and volcanics, and associated with pyroxenite and augite syenite. Several investigations of these dunites have been made in recent years with regard to their platinum content, but no attempts at a commercial extraction have been undertaken.

The best results were obtained from the rock in which alteration had taken place to serpentine or in which the rock was rich in chromite². Assays of serpentine veins in peridotite yielded platinum varying in amounts from a trace up to nearly two ounces to the ton, but this distribution was found to be irregular. Masses of chromite also gave good results, which varied up to $\frac{1}{2}$ oz. to the ton. Here again the distribution was found to be uneven.

*Ronda Mountains, Spain*³—In this new platinum district of southern Spain, which stretches along the Mediterranean coast eastward from Gibraltar, the origin of

¹Mineral Industry, 1916, p. 596.

Memoirs 26, 1913, pp. 153-154.

³U. S. Geol. Surv., "Mineral Reserves of the U. S., 1915," p. 147.

the extensive platinum placers is said to be in central masses of dunite and serpentine, with which are associated small bodies of chromite. Platinum has been identified, associated with the chromite, scattered in small particles through the mass; and investigations have recently been made by the Spanish government to determine the commercial value of this lode deposit.

United States of Colombia—Specks of platinum have been found in olivine-bearing rocks of the Choco district of Colombia, from which a large part of the output of placer platinum is being derived.¹

Tasmania—The platinum content of the Tasmanian placers has been traced to a ledge of sheared serpentine which is found to contain minute particles of platinum.²

California—It is believed that the ultimate source of the platinum of California gold placers is in the serpentine and the olivine-bearing rocks of the Sierra Nevada and other ranges, which are in portions of the drainage basins of the streams.³

NICKELIFEROUS DEPOSITS IN BASIC IGNEOUS ROCKS, AS GABBRO, OLIVINE GABBRO, NORITE, PERIDOTITE, SERPENTINE

In Sudbury, Ontario, Canada, the following important occurrences are summarized:

Vermilion Mine⁴—The arsenide of platinum, sperrylite, was identified by Wells and Penfield in the ore of this mine in 1889. It is a silvery-white metallic mineral, occurring in minute cubes apparently associated with the chalcopyrite-rich portions of the ore. The

in the main of augite, hypersthene, and labradorite. The ore-bearing minerals are chiefly pentlandite, pyrrhotite, and chalcopyrite, with small amounts of pyrochlore and dymite.

Until recently the only information available as to the actual content of platinum metals in these ores was derived from the analysis of nickel-copper mattes. The International Nickel Co. reported the average content of precious metals per ton of matte for three years ending in 1915 as follows:⁵

	Ounces per Ton		Ounces per Ton
Platinum	0.10	Gold	0.05
Palladium	0.15	Silver	1.75

Assays of roasted mattes gave results as follows:⁶

	Ounces per Ton		Ounces per Ton
Platinum	0.1235-0.988	Gold	0.64-0.296
Palladium	0.197-0.984	Silver	1.04-6.156
Iridium	0.046-0.065		

From such data as these it was estimated that one short ton of Sudbury nickel-copper ore contained:⁶

	Ounces		Ounces
Platinum	0.01	Silver	0.2
Gold	0.01	Palladium	Not given

The analyses given in Table I have recently been published by Roberts and Longyear.⁷ They are the only figures available showing the actual amounts of the platinum metals in specific samples of ore. The samples were taken by diamond drilling through large undeveloped orebodies.

The average content of these sixteen analyses is 0.0068 oz. of platinum metals per ton.

The ore in the Alexo Mine, Ontario, consists chiefly

deposit consists of a number of small veins and irregular bodies of ore from a few inches to fifteen feet in diameter, enclosed in greenstone, quartzite, and norite. The minerals of the ore deposit are pyrrhotite (nickeliferous), chalcopyrite, bornite, chalcocite, native copper, cassiterite, gold, millerite (NiS), polydymite (Ni₂S₃), sperrylite, and quartz. Platinum and palladium both occur, the latter in the greater amount. The valuable minerals were found both in the gossan and in the unaltered ore. A. P. Coleman⁸ states that 198.23 tons of ore mined in 1902 carried the following amounts of precious metals per ton: 4 oz. palladium, ½ oz. platinum, ½ oz. gold, 4 oz. silver. The figures are far above the average.

Nickel-Copper Ores of the Main Sudbury Basin—Platinum and palladium have been known to occur in these nickel-copper ores for several years, but whether the platinum is present as sperrylite, as in the case of the Vermilion mine, has not been determined. The highest platinum returns have been derived from the copper-rich portions, whereas the palladium seems to favor the nickel-rich portions of the deposits. These orebodies occur as marginal differentiation products at the base of a thick sill of intrusive norite, consisting

of nickeliferous pyrrhotite, chalcopyrite and pentlandite in a gangue of altered peridotite and serpentine. In 1915 a shipment of between 5,000 and 6,000 tons of this ore showed 0.03 oz. of platinum and palladium per ton.¹²

In the Great Eastern and Key West Mines, Clarke County, Nev.,¹³ large basic dikes 10 to 50 ft. wide cut an older series of granitic gneisses, interlaminated with green and black schists, and associated with pegmatite and aplite. The Great Eastern dike is essentially an enstatite-mica perite, consisting of augite, olivine, biotite, enstatite, with accessory magnetite, pyrrhotite, and chalcopyrite. Assays from portions of the dike are given in Table II.

1 From decomposed dike near surface; 2 from specimen showing high percentage of sulphides; 3 from picked sample of ore from dump, which came from orebody between levels 2 and 3; 4 represents carload shipment of 91,600 lb. of ore assayed by the North American Lead Co.; 5 from same shipment assayed by Ledoux & Co.

From the nickeliferous pyrrhotite of the Insizwa Range, Griqualand, South Africa, platinum may be commercially extracted.

The ore contains:¹⁴ Cu, from 1.5 to 20 per cent, with an average of 4 per cent; Ni, from 1.5 to 10 per cent, with an average of 4 per cent; Pt, between 2 and 3 pwt. per ton. Some samples show several ounces per ton. Norwegian nickel ores yield about 50c. per ton in platinum and palladium.¹⁵ One large parcel of nickel ore from Tasmania is stated to have contained 0.06 oz. platinum per ton.¹⁶ Platinum occurs in a copper-nickel gossan at Mulga Creek Springs, near Broken Hill, N. S. W., associated with gabbro and decomposed gneisses and schists.¹⁷

DIKE-LIKE MASSES OF PYROXENITE, HORNBLENDITE, OR DIORITE, WITH OR WITHOUT OLIVINE

This type of deposit differs from that of the preceding group chiefly in the absence of nickeliferous pyrrhotite. Platinum is present in one of the occurrences in the form of sperrylite, and this mineral may be the chief platinum carrier in deposits of this class. Chalcopyrite is usually present. According to the available descriptions the rocks containing the platinum do not occur in the shape of large irregular intrusions, but tend to take on an elongate form, simulating dikes. The following are specific occurrences:

*Rambler Mine, Near Laramie, Wyo.*¹⁸—Basic dikes, consisting of green hornblende, brown biotite, and Labradorite or bytownite feldspar, and accessory apatite, pyrite, and magnetite, and called diorite by J. F. Kemp, intrude a country of granite gneiss with some quartzite and massive granite. Near the Rambler shaft the rock is a hornblende peridotite, consisting of green hornblende, olivine, and hypersthene. Outcrops are not common, as the area is covered with a loose wash. These dikes appear to have been originally charged with sulphides of iron and copper, and with some platinum minerals, and to have undergone considerable hydrometamorphism. Covellite (CuS), chalcocite (Cu₂S) and chalcopyrite (CuFeS₂) seem to replace the diorite, and the outcrop consists of limonite, azurite, malachite, and kaolin.

Sperrylite, arsenite of platinum, has been separated from the covellite by Professor Penfield, and seems to

constitute the source of the platinum. During 1917, about 350 tons of concentrates were refined, which carried considerable palladium and about one-third as much platinum. It is reported that recent work at greater depth in the mine has disclosed a new orebody that carried both platinum and palladium in workable amounts.¹⁹

Franklin Camp, Grand Forks Mining Division, British Columbia—The presence of platinum was detected in the "Black Lead" of the Franklin camp in 1918. This rock is described as a shonkinite-pyroxenite, and is a marginal phase of the augite syenite intrusion. It is black to dark green in color, and a microscopic measurement of the relative amounts of constituent minerals in a typical specimen gave the following results: Augite, 73.13 per cent; orthoclase and microcline, 17.06 per cent; hornblende, 1.47 per cent; magnetite, 6.06 per cent. Accessory minerals consist of titanite, pyrite, chalcopyrite, bornite, and apatite.²⁰ Various portions of this "Black Lead" were sampled by the Canadian Munition Resources Commission and the Geological Survey of Canada in 1918, and the assays, given in Table IV, were obtained.²¹

TABLE IV. PLATINUM ASSAYS OF "BLACK LEAD"

Property	No. of Samples	Ounces of Platinum Metals per Ton
Maple Leaf	3	0.15, 0.17, 0.38
Lucky Jack	3	0.04, 0.06, 0.08
Mountain Lion	2	0.02, 0.09
Golden Age	1	0.06
Averill Group	2	0.09, 0.09
Buffalo	2	0.08, 0.19
Ottawa	1	0.06
Columbia	1	0.04

A sample of pure chalcopyrite taken from the "Black Lead" by J. J. O'Neill for the Geological Survey of Canada assayed 0.38 oz. of platinum metals per ton. Most of the samples represented minable widths and were taken from portions of the lead which showed small amounts of metallic minerals.²²

Tulameen District, British Columbia—Platinum has been detected by assay in samples from pyroxenite dikes, cutting through the peridotites of Olivine Mountain. The assays showed from a trace to 0.25 oz. per ton.²³

Walhalla Copper Mine, Victoria—Platinum occurs here in a lode formation in a hornblende diorite with chalcopyrite, gold, and silver. The ore contains from 0.1375 to 0.392 oz. of platinum per ton, the payable minimum being about 0.017 oz. per ton.²⁴

La Plata Mine, Liberty Hill District, Nevada County, Cal.—Samples of platinum-bearing ore from this mine were received by the U. S. Geological Survey in 1916. The orebody is reported to occur in gabbro, west of the main serpentine area, but outcrops of serpentine rich in chromite and olivine are said to lie near the vein. Associated with the ore are pyrrhotite and chalcopyrite in a greenish siliceous gangue.²⁵

Other Occurrences—At the Thompson River copper mine, Victoria, platinum is found in a hornblende rock rich in chalcopyrite.²⁶ At the Goodro Mine, Prince of Wales Island, Alaska, platinum occurs in diorite, associated with bornite, chalcopyrite and chalcocite.

Boss Mine, Yellow Pine Mining District, Nevada—In 1914 platinum and palladium were found in certain ores in the Yellow Pine Mining District, Nevada. The ore deposit on the Boss claim was discovered about thirty years ago, having been located for copper, the presence of which is plainly indicated by chrysocolla and other oxidized minerals. The deposit consists of a fine-grained quartz mass, which in the main replaces irregularly the Carboniferous dolomites along a series of vertical fractures. A small mass or dike of granite porphyry intrudes the dolomite about 600 ft. north of the mine, but no basic intrusives occur; in fact, none are known to occur in the Yellow Pine Mining District, is the most productive lead-zinc district in Nevada.

The orebodies so far developed may be briefly described as oxidized copper shoots and gold-platinum-palladium shoots. The copper ores consist largely of chrysocolla and other oxidized compounds, but these ores carry only minor quantities of the precious metals. The gold-platinum-palladium shoots consist of a fine-grained quartzose ore containing a small quantity of a bismuth-bearing variety of the rare mineral plumbojarosite (a hydrous sulphate of iron and lead). The principal ore shoot disclosed by the present workings forms an irregular pipe pitching at a low angle to the northeast. In this shoot at the time of visit from 1,000 to 2,000 tons of ore had been developed, averaging in ounces per ton, Au, 3.46; Ag, 6.4; Pt, 0.70; Pd, 3.38. The precious metals are associated especially with the plumbojarosite; pockets of the pure mineral carry 100 oz. or more of platinum and palladium and several hundred ounces of gold per ton. This great richness points to a concentration of the precious metals in the oxidized ore by surface solutions, so that in depth the pockets of extremely high-grade ore, such as are now being extracted, will give place to ore of moderate grade. The only sulphide so far found in the mine is chalcocite, and this is probably of secondary origin.²⁷

According to *Mineral Industry* for 1914, plumbojarosite is a lead-potash-iron alum, $Pb(Fe(OH)_2)_2(SO_4)_2$. This mineral probably originated from some such mineral as bournonite, which has oxidized in the presence of potash. Plumbojarosite is a yellowish green earthy mass, noticeably heavy and inclined to form soft lumps. The average amount of precious metals recovered from one ton of ore is, according to this authority, as follows: Cu, 80 pounds; Au, 31.1 gm.; Ag, 62.2 gm.; Pt and Pd, 46.65 gm. Such ore has a valuation of over \$250 per ton. It is said that the platinum ore has been developed to a vertical depth of 1,500 or 2,000 ft. on the dip of the vein.²⁸

During 1917, there were recovered 107 oz. of platinum and 400 oz. of palladium, which was derived from 442.54 tons of copper-gold-platinum ore.²⁹ A sample of high-grade ore sent to Ledoux & Co. assayed as follows:³⁰ Au, 111; Pt, 99.08; Pd, 16 oz. per ton. This occurrence is exceedingly interesting, on account of the absence of the association with basic igneous rocks, and also because of the possibility of the plumbojarosite being an alteration product from some such mineral as bournonite. See "Associations with Tetrahedrite."³¹

Assays of material from a two-foot vein, 410 ft. from the tunnel mouth and 1400 ft. beneath the surface workings, gave Au, 3.20 oz.; Pt, 5.09 oz.; Ag, 3.05 oz. per ton; Cu, 3.5 per cent. This ore is worth over \$500 per ton. Details as to the geology of the deposit are not available.

Associated With Tetrahedrite, Bournonite, Malachite, Arsenopyrite—At Guadalcañal,³² a few miles northeast of the Rio Tinto District, Spain, platinum occurs in ore resembling tetrahedrite in a gangue of calcite, barite, and quartz in a country rock of mica schist. The amount of the platinum varies between a trace and 10 per cent. Platinum occurs in tetrahedrite in metamorphic limestone, above Chatelard,³³ in the Valle du Drac, Hautes Alpes. The gangue is dolomite, quartz, and barite. At St. Arey, near La Mure (Isere), France,³⁴ platinum occurs in bournonite, in dolomite, and altered limestone. Near Presles in Savoy, France³⁵, platinum occurs in argentiferous tetrahedrite and malachite. Platinum is found in a quartz vein with gold and arsenopyrite in the Lucknow and Alma auriferous reefs at Gympie, New South Wales.³⁶

GOLD-QUARTZ VEINS

A picked sample of ore from the shaft of the Northern Manitoba and Development Co.,³⁷ near The Pas, Manitoba, gave \$49 in gold and \$17 in platinum per ton. Platinum is also reported from McCafferty's Prospect³⁸ about five miles from the above locality. Five assays of ore from the Quinn claims near the Croesus mine, Munro Township, Ontario,³⁹ gave platinum values between \$180 and \$1,800 per ton (with a value of \$40 to \$50 per oz. for platinum). Platinum has been found in a gold-bearing quartz vein on the Mother Lode claim, Burnt Basin, B. C., of the Contact Consolidated Mines, Ltd.⁴⁰ Samples of ore sent to Baker & Co., Newark, N. J., gave from a trace to 0.25 oz. of platinum per ton. The quartz carried free gold, chalcopyrite, pyrite, galena, sphalerite, molybdenite. Other occurrences have been reported from Beresovsk mines, Ural Mountains, Russia,⁴¹ from the Esperanza veins, Minas Geraes, Brazil⁴²; from a vein near Boyertown, Pa.,⁴³ from the Choco district, Colombia⁴⁴ and from the Thames and Tenarakau Rivers, New Zealand.⁴⁵

(To be continued)

Two Types of Classifiers are in use at the Washoe Reduction Works of the Anaconda Copper Mining Co., the hydraulic hindered settling type, for partially desliming the feed to Wilfley tables, and mechanical classifiers, for separation of the coarse and finer particles in the trunnion discharge of the regrind conical mills. The hydraulic classifier used is the No. 7 Anaconda deslimer and its operation has proved satisfactory. For the mechanical separation of coarse and fine particles in the conical-mill discharge, the Dorr classifier has met all requirements.

Application of Air Drills to Mine Sampling

Making Narrow, Deep Channels by Drilling a Row of Shallow Holes and Cutting Out the Intervening Ribs Results in the Saving of Both Labor and Time—
Jackhammers With Ordinary Crossbits Used

By JOHN H. EGGERS

Mining Engineer

AT THE suggestion of several well-known mining engineers who witnessed a part of the operation of cutting the samples, and all of the results of the sampling, a record of the operations is here presented. Some years ago, a short article appeared in one of the mining periodicals which described a method of taking samples with the non-rotating jackhammer, or plugger type of machine drills, with whichmoil bits were used. In the instance at hand, the work was done with ordinary jackhammer drills and also, though to a less extent, with the stoping drill, using both the regular cross and Carr bits.

Special small non-rotating jackhammer or plugger type of jackhammer drills andmoil bits should be of decided advantage in place of hammers and moils in cutting out channel samples, but such special equipment would probably not be available at a property under investigation, whereas the method herein described makes use of the jackhammer and stoping drills, which are more likely to be found as part of the mine equipment.

This method of sampling has probably been used by others, but it is not known that any articles have been published about it, and this description is offered in the belief that it may contain information of service to other engineers, as it represents a successful application of ordinary machine drills and bits to the sampling of a mine. In the instance at hand, a preliminary inspection of the ore to be sampled, as well as trials by two crews at cutting the samples with hammers and moils, indicated that the rock was extremely hard, and that either a larger crew than desirable or some other method would have to be employed, if the necessary number of channel-cut samples were to be taken in the limited time available.

It was thought best to attempt to apply machines in place of hand labor. At first it was planned to try the jackhammer drill andmoil bits, as this method was understood to have been previously used. However, after a consideration of various suggestions (some made by the working crew, for which credit is due), it was decided to use the jackhammer drills and the ordinary crossbits; the plan being to drill two rows of shallow plug holes along the line of the channel to be cut, and to then chip,moil, and break out the undrilled rock remaining between the holes, saving the drillings and the chips as the sample.

As the work progressed, it became apparent that one row of holes drilled sufficiently deep (several inches) would be adequate for the sample, and also that, if the holes were drilled closely enough, the rock between the holes in the row would break out during the drilling. This served to shorten the time required in taking the samples, for one row of holes was found to be sufficient, where at first it had been thought that two rows would be required. It also saved the labor and

time necessary to cut out the rock that remained between the two rows of holes.

The channel cut by drilling one row of holes was rather irregular in outline, being the full width of the drill bit opposite the center of each hole, but only about two-thirds of this width between the holes, so that, instead of being represented by two parallel straight lines, the sides of the channel were represented by two wavy lines that diverged opposite the holes and converged between the holes. This resulted from the shoulders or corners which were left between the holes, and which were difficult to drill out.

The first cuts were greatly improved upon, when, as the men became accustomed to the work, it was found that by moving the drill and bit from one side to the other, or back and forth along the line of the sample, a channel could be cut out that would be uniform and regular. The final result was a channel, slightly wider than the drill bit, that could be cut to any desired length and depth. The latter dimension would be determined by the character of the ore, and by the requirements of the sampling, and other considerations.

CHANNEL CUT IS NARROW AND DEEP

The channel cut as described may be made practically identical, as far as dimensions go, with the usual channel cut in sampling; the only difference being that the greater dimension of the cross-section of the channel, which is usually the width (of from three to six inches), becomes, instead, the depth of the channel, and is dependent on the depth to which the drill is driven into the rock. This may be considered, ordinarily, as an advantage than otherwise, for, owing to the decreased area of the usual irregular surface of the face to be sampled, it allows an approach to a more ideal section or channel. In fact, the face or surface of the rock or ore to be sampled may be cleaned and evened off by drilling a shallow preliminary channel along the line of the sample. The drillings from this preliminary cut would be discarded, and the sample would be taken by deepening the preliminary channel and saving the drillings therefrom as the sample, as described in the details which follow.

Though nearly all of the samples were taken in very hard ore or rock, some samples were also cut in softer material with satisfactory results. There seems to be no reason why the use of machine drills should not be possible in the sampling of many types and structures of rocks and ores, where the employment of the apparatus is justifiable from an economic point of view, as the practice is dependent largely on the accessibility of the air line, hose and machine drills, and the comparative time required to make the necessary connections. It is obvious that it is of more advantage in a place where a number of samples can be taken from one air-line connection than where the entire apparatus

must be moved and a new connection made for each sample cut.

Though the samples taken in the work described were comparatively small, they were sufficiently large for the purpose at hand, and it is apparent that much larger samples can be cut, with equal and possibly greater advantage, when desired. The use of the machine drills in this particular examination resulted in the securing of a greater number of necessary samples, at less cost per sample, and with a greater degree of accuracy, than would have been possible had hammers and moils been used, and it is believed that these advantages will hold in a large number of examinations, particularly where the ore to be sampled is very hard, and much time and labor are required in cutting each sample.

PERSONAL EQUATION IS LARGELY ELIMINATED

An additional advantage is to be found in that, as the work of the crew becomes largely mechanical, the matter of the personal equation and its possible effects on the sample is largely eliminated. It was also found that practically all of the chips and drillings cut from the channel were saved in the sampling, whereas it is not uncommon, when using hammers and moils, and catching the chips in a candle box, to lose at least a small percentage.

Possibly the greatest advantage is that the method permits the use of power drills instead of hard manual labor. It is significant that though machinery has been adopted for use over a wide range of operations about the mines, most of the work of sampling is still done by manual labor, and there is little reason why the advantages in the use of machinery should not, at least to a considerable degree, be also applicable to this work. Modifications in the apparatus and method would undoubtedly be necessary under varying conditions, as in any method of sampling, but the process and equipment described can often be used to good advantage.

The same procedure applies to the use of the stopping drills in taking overhead samples across the roofs of levels or other workings. However, the action of the stopping drill does not allow of moving the drill backward and forward along the channel, as when using a jackhammer in taking a face sample. For this reason it is necessary to plug holes along the line of the sample; but it is also readily possible to cut out the intervening or undrilled rock remaining between the holes, as well as to cut out all corners, so that, when completed, the channel may be considered as fairly regular and uniform. If the channel is cut sufficiently deep, the sample secured should be an accurate one. Greater speed is obtained in using the stopping machine in cutting overhead samples than in using the jackhammer on a face sample, but more care is required to prevent the inclusion of pieces of extraneous ore or rock that might fall from the roof.

SAMPLING DETAILS

The details of the use of the machine drills in sampling in this instance are more fully described in the following paragraphs. The accumulated muck or dust sticking on the walls and roofs of the workings to be sampled was first cleaned off with water under pressure, and also with a broom, and all loose pieces of rock or ore were knocked off. The thorough cleaning of the walls or places before sampling is advisable, not only because the accumulated muck along the channel does

not belong with the material to be sampled, but because it is generally necessary at the completion of the sample to brush off the drillings and chips from the channel that fall and stick or hang on to the slightly inclined portions of the rough wall below the channel. Under such conditions it is of advantage to the accuracy of the sample to have had a clean wall in the beginning, so that any foreign material will not become mixed with the sample.

The portion of the face to be sampled may be further cleaned by drilling a preliminary channel, say about half an inch deep. In the work described the preliminary channel was not cut, owing to the hardness of the rock and the limited time available, but it would be advisable under certain conditions.

Two pieces of canvas, each about six by eight feet, were then laid down on the floor of the level, in such a manner that one piece overlapped the other several inches. Two pieces were used instead of one large piece of canvas, because they are more easily handled. The area of the canvas should be sufficient so that all of the drillings, say from a 5-ft. sample, can be caught on it, thus avoiding any loss of time that would otherwise result if the canvas had to be moved before the completion of the cutting of the sample.

In the case of the wall samples, the edge of the canvas was turned up along the wall. A third strip of canvas was then placed against the wall and supported by inclined pieces of drill steel or other means, in such a manner that it covered the lower several feet of the wall, reaching from just below the line of the sample and overlapping the floor canvas. This was found to be necessary, as, without the third strip of canvas, much of the sample might be lost by falling down under the edge of the floor canvas.

TWO MEN ON DRILL ADVISABLE

Though it is possible for one man to operate the jackhammer without a support, it is advisable, particularly in hard rock or ore, to use two men and to furnish a support for the drill, as it is not as tiring, and a greater amount of work and a higher degree of accuracy will result. Two supports were used at different times. One was a short piece of ladder and the other a cross-stand. The stand was made of two pieces of 2-in. pipe about 4 ft. long and two pieces of 2-in. pipe about 6 in. long, screwed into a 2-in. cross, forming an X, in which the two longer pieces were the legs of the stand and the two shorter pieces on top formed the saddle or crotch, in which the jackhammer was placed in an approximately horizontal position, and at right angles to the plane of the stand. Elbows should be screwed on to the lower ends of the legs, as otherwise the sharp edges of the pipe will cut through the canvas. Though 2-in. pipe was used, it is thought that lighter and smaller pipe will serve the purpose as well; if not better.

The cross-stand support, with the longer lengths of pipe down, was placed on the canvas parallel to the wall, and the jackhammer was then placed in the upper crotch between the short pieces of pipe, at such a distance from the wall that the drill-bit would rest at the rock or face.

The driller operated and directed the jackhammer with the assistance of the helper, who at times was required to hold the drill bit at the working face when starting a cut. In addition, the helper had at all times to hold a sack saddled over the drill and against the

face, covering the channel sufficiently above and below, so as to prevent the chips and drillings from being lost through flying or scattering off the floor canvas. The sack of cloth was about 12 x 16 in. in size. On one of the longer edges a light stick was nailed, and from the other long edge of the sack a cut or slit was made at right angles for about 8 in. and toward the edge on which the stick was nailed, so that when held horizontally and lowered over the drill, the sack would saddle the drill and permit it to be operated through the slit, the sack covering the face of the rock or ore being sampled. It serves the purpose of a buffer, against which the chips and drillings strike, and then fall to the floor canvas. This was found to be necessary, for, without it, the chips and drillings scattered off the canvas to a considerable extent, and the accuracy of the sample was consequently impaired.

Upon the completion of a cut or channel, the walls (which at the start had been washed clean) were lightly brushed down, so that all drillings or chips which had clung to parts thereof were collected with the remainder of the sample on the floor canvas. To eliminate as much as possible of the error that might be caused by pieces of rock or ore falling off the face or walls, it was decided that all such pieces should be discarded, and that the samples should consist only of the drillings and chips actually cut from the channel. This was considered more advisable than to attempt to make proportional allowances in the channel for pieces of ore or rock that would fall from the face, as the latter course would probably have introduced additional errors. Therefore if any pieces of rock or ore had fallen off the wall, these pieces were picked out of the samples, cleaned off, and thrown away. The sample was then transferred from the canvas to a powder box, and then to a sack, which was labeled by tags inside and out, and sealed.

The holes in the ends of the drill bits may be plugged with wood, so as to decrease the amount of dust and possible loss therefrom. The cross bit has the advantage over the Carr bit, at least when starting a cut, but both kinds were used, as some of the crews preferred the Carr bit, whereas others preferred the cross bit. Several check samples were taken toward the end of the work, and the results showed a close comparison with the original samples.

Portable Electric Arc Welder

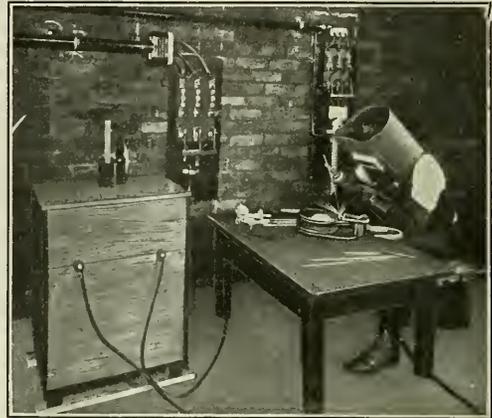

Electric arc welding of the past has been thought of in the light of large installation of considerable cost. It has further been understood that since the installation consists of a motor generator set entailing moving parts, there might be some difficulty in connection with its operation from time to time. It has always been understood to be inefficient on cast iron and in connection with over-head welding.

The new "Zeus" arc welder manufactured by the Gibb Instrument Co., of Detroit, Mich., consists of a simple transformer with no moving parts. It has been found that the current consumption is from 20 to 40 per cent less than the motor generator type. One feature is its adaptability to overhead welding, which class of welding has given considerable trouble in the past. It has further been found to be adaptable to the welding of cast iron.

This type of welder is comparatively small, and, because of its convenient size, it is portable. It is built on a unit system whereby a 150-ampere machine

may be installed, and when the work becomes heavier a duplicate may be connected in parallel with the original machine.

One of the features of the welder is its arrangement for regulation. It is not necessary to change the connections in any way in the regulation of the

PORTABLE ELECTRIC ARC WELDER IN USE

arc. A wheel connected with the secondary and extending through the top of the case, raises and lowers the secondary and provides for the regulation of the current necessary for different sizes of electrodes. The inherent reactance automatically stabilizes the arc for different arc lengths.

Nechi Mines, Ltd., (Colombia)

The annual report of the Nechi Mines, Ltd., Colombia, for the year ended Sept. 30, 1918, states that 1,076,558 cu.yd. were dredged from Nechi ground during the first six months of the year, the gross value of gold recovered being \$253,787, averaging 23.57c. per cu.yd., with an average depth of 45.3 ft. The field costs averaged 4.9c. per cu.yd. During the previous twelve months, 1,883,659 cu.yd. was dredged, the gross value of the gold recovered being \$489,959, averaging 26.01c., with an average depth dredged of 55 ft. The field costs averaged 5.55c. per cu.yd. The sum of \$1,000 per month for rental was paid to the Pato Co. for the use of its plant.

During the second half of the year, 1,066,371 cu.yd. was excavated by the Nechi dredge from Pato grounds, the field costs averaging 6.7c. per cu.yd. The dredge operated 76.1 per cent of its full time, as compared with 61.8 per cent for the previous year. The original estimated gross value in the Nechi prospected area was \$4,926,600. There has been extracted by dredging operations since the formation of the company \$1,287,985. The year's extraction for 1917-18 was \$253,787, making the extracted value since the beginning of operations \$1,540,872, and leaving available for dredging on the tested areas \$3,385,728.

The net receipts, including gold returns, £50,229, platinum, £225, and the company's share of the profit from the working of the Nechi dredge on the Pato ground, £8,320, amounted to £64,199. Field costs were \$18,552.

The War Minerals Relief Scandal

UNDER the above caption, in the *Mining and Scientific Press* of Aug. 16, 1919, beginning on page 219, appeared the following editorial:

We return to this subject because it is vital to a large number of miners in the West and concerns a matter of public policy that ought to interest every citizen. We regret to observe several signs of an effort on the part of Government officials to over-zealousness, verging on cheap smartness, in the interpretation and administration of the Act passed by Congress for the purpose of compensating those who, in response to a patriotic call, engaged in the production of chrome, manganese, pyrite, and tungsten, and who, in their attempt to fulfil a national duty, suffered financial loss, chiefly through the bungling of the Ferro-Alloys Section of the War Industries Board last year. In our issue of July 19 we criticized the way in which the Secretary of the Interior, in whose hands the administering of the Relief Act was placed, "passed the buck" to the Attorney-General, and the latter's technical interpretation of the Act in such a way as to exclude from relief a large number of miners who were importuned to produce the needed minerals by the press propaganda of Secretary Lane himself. We note that the Relief Commission, now in session at Medford, Oregon, has received a letter from Mr. Henry M. Parks, the Director of the Oregon Bureau of Mines, in which he testifies to having ordered the field staff of his bureau "to do everything possible to encourage new development, and speed up the production of manganese and chrome." According to the Attorney-General's ruling, the fact of engaging in the mining of these minerals at the instance of the Oregon Bureau of Mines will not suffice to justify the award of compensation, because the claimant cannot prove that he had been "asked specifically by one of the five Government agencies named in the Bill." Yet Mr. Parks testifies that in October, 1917, he received a letter from Mr. George Otis Smith, Director of the U. S. Geological Survey, requesting him "to exert every effort to increase the domestic production of chrome ore" and "to this end," Mr. Smith added, "the hearty co-operation of your organization is earnestly invoked." Is the Government to go back on Mr. Parks and the members of his staff, stultifying and dishonoring them in the eyes of the men who trusted in them and believed them to be authorized in their efforts to stimulate the production of chrome and manganese in Oregon? Legal gentlemen say that "good conscience" should determine the validity of claims; we ask what kind of conscience has an official who distinguishes between a request made by "one of the five Government agencies named in the Bill" and a request made known by persons to whom the said agencies appealed for help in advertising their urgent demands, whether it be the director of a State bureau in Oregon or the editor of a respectable paper in San Francisco. In our issue of August 2, we criticized the nature of the cross-examination to which claimants are being subjected by the Relief Commission. There is this further point to be made, that the claimants for larger amounts are able to present briefs prepared by a competent lawyer and they go before the Commission accompanied by a lawyer, so that the amiable attempt to subject them to a crude and misleading psychological test does not succeed, although it does succeed in raising an entirely false issue when applied to the less sophisticated claimants.

Now we come to another unpleasant phase of this affair. We are informed that Mr. J. E. Spurr, Chief Engineer for investigative work under the Act, insists upon having all reports sent to him direct at Washington. When the Relief Bill was passed, a corps of examiners was organized for the purpose of scrutinizing the correctness of the claims presented to the Commission. The reports of these examiners are essential to the adjudication by the Commission, yet the Chief Engineer has refused to allow this necessary information to be given promptly to the Commission, insisting upon the reports being sent to Washing-

ton, to be abstracted by him, thereby further delaying the awards, which in any event are going to be unconscionably belated. What is worse, he has seen fit to dismiss an engineer for telling the truth. We regret to make this strong criticism, because the Chief Engineer has just arranged to become the editor of our competitor at New York, but this is a matter too important to be set aside on personal grounds; it concerns the profession deeply, as will be shown. Among the engineers retained by Mr. Albert Burch, acting for the U. S. Bureau of Mines in its campaign to promote the production of war minerals, was Mr. R. H. Toll, whom we have known for 20 years as an intelligent, trustworthy, and honorable mining engineer. In the performance of his duty he told Mr. L. R. Payne, of Fresno, of the need for intensifying the production of chromite and of the Government's intention to protect the producer by market control. At Mr. Payne's request, he confirmed his verbal statement by a written one to the same effect. This letter was submitted by Mr. Payne as part of his evidence when he presented his claim for compensation to the Commission. Meanwhile Mr. Toll had been again engaged by the Government, this time as an examiner under the Relief Act, and he was doing his work when he received the following telegram from the Chief Engineer: "With reference to claim 480 L. R. Payne & Co., Fresno, California, on March 12, 1919, you wrote the manager a letter in which you state 'In addition to patriotic motives in doing this you had the assurance of the Government through me that you would be protected at least a year on the prevailing market price.' You must be aware that no branch of the Government ever gave such assurance or had the authority for so doing and that you have no authority to make this statement; under the circumstances it would evidently be better if your present temporary appointment, which expires July 31, should not be renewed; will you turn over the claims and data which you have on hand to Mr. Hyder, who will leave for San Francisco within a few days." Whereupon Mr. Toll replied by quoting from two statements made by the Chief Engineer himself and now to be found in the records of the Relief Commission. The first was a telegram of August 8, 1918, to Mr. Burch, as follows: "War Board in Washington are all agreed that California chrome production shall be maintained and are ready to take whatever steps are necessary. Just what these steps [are to be] will be determined promptly." The second was a letter of September 30, 1918, to Mr. Charles H. Holbrook, as follows: "Reply to your letter of September 12th has been delayed pending a survey of the chromite situation by various Government departments. The War Industries Board telegraphed to Mr. Burch of San Francisco as follows: 'It may be announced that it is the present intention of the War Industries Board to arrange for continued production in the United States for the first half of 1919 at the rate proportionate to the rate of 1918 production, and the trade will be asked to purchase chromite produced in the United States during the first half of next year at this rate.' No doubt machinery for carrying this program into effect will be devised by the War Industries Board." On September 27, 1918, Mr. H. W. Sanford, chief of the Ferro-Alloys Section of the War Industries Board, telegraphed a little more explicitly: "It is the present intention of the War Industries Board to arrange for continued chromite production in the United States for the first half of 1919 at a rate proportionate to the rate of 1918 production, and the trade will be asked to purchase chromite of suitable grade produced in the United States during the first half of next year at this rate. No announcement can be made regarding prices. Believe tonnage of domestic chromite produced during the balance of this year can be sold at the average prices paid this summer by the California Chrome Company. If unable to find ready market for ore, wire this office, giving tonnages ready for immediate delivery and guaranteed analysis and prices wanted and to whom already offered and refused. Chemical refractories and steel trades likely buyers." This

telegram was addressed to the President of the San Francisco Chamber of Commerce. The references to 'market' and 'rate' made in the statements of Government agents have no meaning, of course, unless they signify a price at which the products mentioned could be sold remuneratively. It seems to us that Mr. Toll was justified in the statement he made to Mr. Payne in June, 1918, and confirmed by letter subsequently. Mr. J. S. Diller and other representatives of the Geological Survey told the Californian miner to start the mining of chrome before the War Minerals Bill was passed; the miner in the hills was told that it was "as good as passed"; in the Bill it was stated: "The Secretary of the Interior, with the approval of the President, is authorized from time to time to enter into contracts for necessities for periods not exceeding two years," which was an implicit guarantee of a profitable market for at least two years. One of the oldest games in the world is for a superior to tell a subordinate to do something and then fail in moral courage to back him up later. Mr. Toll's statement to Mr. Payne was based on what he had been told by those in charge of the chrome propaganda; it was made in good faith both to the Government and to the chrome miner. Is a professional man expected to say one thing to the buyer and another to the seller? Is he a mere hireling?

These people at Washington do Uncle Sam small honor if they suppose that so frank, big-hearted, and honorable a gentleman could desire his servants and assistants to employ such pawky tactics. It appears that the new editor of the 'Engineering and Mining Journal' is to follow in the tradition of his predecessor, who opposed both the War Minerals Bill and the Relief Bill, which was its logical sequence, and, not content with such opposition, has seen fit to sneer at the miner of the West as a 'profiteer' and 'patrioteer'. One word more, to summarize the whole affair: what would be the attitude of the mine, not to the Government, but to the representatives of the Bureau of Mines, Geological Survey, and Department of the Interior, if the United States became involved in another war, calling again for an intensive production of sundry minerals? What would the miner say to these gentlemen? His language, like that of Bret Harte's hero, would be, we venture to guess, "painful and free."

Under date of Aug. 20, 1919, reply to the above editorial was made as follows:

Editor, *Mining and Scientific Press*,
San Francisco, California.

Dear Sir:

I note your editorial on the War Minerals Relief "Scandal" in your issue of August 16, and it apparently calls for a reply. I will not attempt to follow the sinuosities of your article, but will go straight to the point and give certain information which you could have had before if you had wanted it.

1. It may interest you to know that on May 9, 1919, I submitted to the proper authorities a plan to interpret the provision which Congress had inserted in the War Minerals Relief Act (limiting the possibility of compensation to those who had produced certain minerals "in compliance with the request or demand" of certain Departments and War Boards), by assuming that the *general Government campaign of stimulation* could be interpreted as such a request or demand. There follow extracts from my presentation, which was a long one and contains much that is not germane to the point I wish to make:

"The proper application of the Act and the correct interpretation of the phrase above quoted can only be made through a close knowledge of the history of the situation which led miners to feel that the Government had enlisted assistance in a program of which the Government itself failed to carry out its part, and led Congress to see the justice of their complaint and

to provide for compensation at the Secretary's discretion.

"The activity of the Government which gave rise to the situation on which the claims of the miners for compensation were based, was that of the Shipping Board and the War Trade Board, which, in accordance with the Executive Order of the President to secure ships for military purposes by cutting down imports, formulated and put into effect a program for the restriction of imports of pyrites, chromite, and manganese, and called on the country in unmistakable and vigorous terms to produce enough to make good the deficiency as an act of patriotism.

"The general active stimulation and vigorous encouragement which amounted practically to a general 'request or demand' by the Government concerning these minerals warrants, in my opinion, a general plan of compensation for the losses entailed in mining these minerals as a consequence of this governmental campaign of stimulation; and is a far stronger justification for compensation by the Government than the representations or informal advice, opinion, or encouragement of any minor official or officials of the Government."

2. You must know, however, that in the United States the only body or individual authorized to dip its hand into the public Treasury is Congress. The question was, therefore, not what I or you, the Commission or the Secretary, would like to pay out of the Treasury, but what Congress had authorized to be paid out; our personal opinions do not warrant our tapping the public funds, whether for our own enrichment or that of our friends, or of attempting to do so; and, fortunately for the public, there would be little guarantee of personal safety to anyone thus attempting to carry out his convictions. The matter was finally referred to the Attorney General, as the official interpreter of legislative language, and he rendered on July 1, 1919, a decision, in which he clearly showed from the language of the act and its history, the intent and authority of Congress. He stated, "The language used could hardly be more clear or allow less room for construction. No claim based upon a general solicitation or appeal is recognized by it, but to come under the statute the claimant must have been asked specifically by either the Department of the Interior, the War Industries Board, the War Trade Board, the Shipping Board, or the Emergency Fleet Corporation to produce or prepare to produce one or more of the four named minerals."

Even the Attorney General, you must know, has no authority to modify legislation. Your editorial would indicate that you thought he had.

3. The work done by Mr. Burch and his assistants in stimulating the production of chromite and other war minerals on the Pacific Coast was of the most effective and valuable character, and their patriotic services have always been fully appreciated by their colleagues in Washington. The stimulation was of the most vigorous kind which circumstances and their authority permitted; not only individuals were exhorted, but addresses were made by the engineers at public gatherings in mining districts. (Entirely similar activity, it may be noted, was carried on by Government engineers and geologists in the East.) It was on account of this most valuable work and their familiarity with the field that on the organization of the War Minerals Relief field examinations as many of the old

staff as could be secured were re-engaged. Only Messrs. Shonts (in Oregon) and Cameron and Toll (in California) could be secured.

4. All decisions relative to War Minerals Relief are in the hands of the Commission. On request, I undertook (dare I say for patriotic reasons?) to prolong my war time connection with the Government long enough to organize the investigative force, but no longer. The function of this force is to provide the Commission with such facts as they may request, whereon to base their decisions. Therefore, I do not know what their attitude may be on any question, but personally (not officially) I have always felt that the case of the Pacific Coast chrome miners was one of the strongest which they will have to consider on this very point of "request or demand," and precisely on account of the requests presented by our field engineers. And in the case of each claim which comes up for examination (this applies to the whole United States) the field engineer or other Government official who is named by the claimant as having made upon him a request or demand for production, is immediately interrogated by special letter as to the facts, and such testimony is very influential in determining the order of examinations. In the case of large numbers of claims, we have the written testimony of engineers, nearly all of them now on our staff or on that of the Geological Survey, that they made such request or demand, and, in my personal opinion, these represent a very strong class of claims for the Commission to consider.

5. The claim of L. R. Payne & Co., No. 480, was judged on the basis of Mr. Toll's testimony to belong in the above class, and a field examination was ordered July 18, 1919, by Harry Sheafe, engineer (employed on recommendation of Mr. Burch) and E. L. Fleming, auditor.

6. What, then, was the basis for discontinuing Mr. Toll's services as field examiner, of which he and you make a national issue?

You state that he was dismissed "for telling the truth." Judged on the basis of this statement alone, you would have been in little danger of dismissal had you been in Mr. Toll's place.

In the interval between his engagements as Government engineer he made reports and affidavits for various claimants, whose mines he had examined while in the Government's employ in order to assist them in collecting from the Government. But I find no valid reason for criticising him for this. The reasons why his attitude might be considered by some as having become slightly unjudicial were:

a. He made these reports, letters, and affidavits for the claimant for a monetary consideration, as I was advised by the Commission when in San Francisco.

b. In his letter written for the Payne Co. to exhibit he overstated the facts. He stated that he gave claimant certain sweeping Government guarantees on June 7, 1918. When his authority for this was challenged he cited first a letter written by me to another party on September 30, 1918, second a clipping from the San Francisco *Examiner* of October 1, 1918, and third a telegram from myself to Mr. Burch dated August 8 or 9, 1918. In my reply to Mr. Toll I summed up as follows:

"All of this would seem to indicate to me that you derived your impression from the above letter and telegram, but at a subsequent time from that which you assign in your letter of July 23 to me and refer

to in your letter of March 12, 1919, to the L. R. Payne Co., and that accordingly your letter to the L. R. Payne Co. was an error of recollection. This would indicate a zeal in supporting the claimant which is hardly judicial."

It was felt that, to be above criticism, any question as to the judicial attitude of any examiner should be settled by relieving him of further responsibilities. Examiners must be prejudiced neither for nor against claimants. All appointments are temporary, as is (let us hope) the character of our work. No onus was involved, and it is too bad that Mr. Toll decided to rush into publicity and that you were hasty enough to take it up. Several other examiners have had their terms of employment terminated, but so far have not appealed to the President to be put on the payroll again.

Having given you a deal of information, I should like to have some myself:

1. What is your motive in rushing into a personal attack, without trying or apparently wanting to ascertain the facts? Many months ago, touched by your editorial efforts to comment intelligently on what was going on in Washington, I wrote you, offering to write or telegraph information whenever you wished it. You have never called for any.

2. This is a psychological problem. Why is it that an editor who hates the daily yellow press as laudably as you do should himself tend so strongly in the direction of technical yellow journalism?

I shall be glad if you will publish this letter in full.

Yours very truly,

J. E. SPURR.

Federal Taxation of Mines

The mines of the country are called upon to bear a large part of the enormous taxes which must be raised. The Internal Revenue Bureau, which is charged with the assessment and collection of these taxes, desires that the taxation laws shall be administered in a fair and businesslike way. The application to mines, however, which have wasting assets, involves questions of particular complication and difficulty. To meet this situation, there has been established in the income-tax branch a section of mine valuation, in which these specific problems of the industry will be handled by competent engineers. It is realized, however, that something more than this is required for the satisfactory application of the tax laws to the mines, namely, as complete understanding as possible between the Government and the taxpayer, a spirit of co-operation as between the two, and every possible assistance and advice from mine owners and mining engineers.

At the Chicago meeting of the A.I.M.E., Dr. L. C. Graton, a member of the valuation section of the Internal Revenue Bureau, will outline the general problems involved in the mine-taxation program, and will present the methods for accomplishment of that program which are now under consideration and which it is hoped may be improved and made authoritative by the suggestions which may come from the members of the Institute. In this way it is hoped that fundamental principles may be established and individual settlements reached that will be so reasonable and fair that they will be final. The Government entertains the earnest desire, and a similar wish is shared by the institute, that the fullest discussion may be given to this subject at the Chicago meeting.

Chicago Meeting, A. I. M. E.

Papers To Be Presented Include Great Variety of Subjects—Special Arrangements Made for The Entertainment of Wives and Daughters of Members—Informal Talks At Smoker—Programs of the Sessions

THE program of the technical sessions to be held at the 120th meeting of the American Institute of Mining and Metallurgical Engineers, Chicago, Ill., Sept. 22 to 26, includes a large number of papers covering a wide variety of subjects. These, arranged by sessions, are as follows:

SESSION ON NON-FERROUS METALLOGRAPHY†

MONDAY, SEPT. 22, 11 A.M.

- "Manufacture and Electrical Properties of Manganin." By J. E. Bash.
- "Grain Growth in Alpha Brass." By F. G. Smith. Illustrated by lantern slides.
- "Five Foundry Tests of Zinc Bronzes." By C. P. Karr.
- "Manufacture and Electrical Properties of Constantan." By J. E. Bash.
- "In Fusible Boiler Plug Manufacture and Testing." By L. J. Gurevich and J. S. Hromatko.
- "Heat Treatment of Aluminum Alloy Castings." By Zay Jeffries and W. A. Gibson.
- "Influence of Heat Treatment on Gun Metal." By C. F. Smart.
- "Deterioration of Nickel Spark-Plug Terminals in Service." By Henry S. Rawdon and A. I. Krynitzky.
- "Heat Treatment of Duralumin." By Paul D. Merica, R. G. Waltenberg, and H. Scott.
- "Mechanical Properties and Resistance to Corrosion of Rolled Light Alloys of Aluminum and Magnesium With Copper, Nickel and Manganese." By Paul D. Merica, R. G. Waltenberg, and A. N. Finn.
- "Simplification of Inverse-Rate Method for Thermal Analysis." By Paul D. Merica.
- "Constitution and Metallography of Aluminum and Its Light Alloys With Copper and With Magnesium." By Paul D. Merica, R. G. Waltenberg, and J. R. Freeman, Jr.
- "Some Properties and Application of Rolled Zinc Strip and Drawn Zinc Rod." By C. H. Mathewson, C. S. Trewin, and W. H. Finkeldey.
- "Physical Properties of Certain Lead-Zinc Bronzes." By Homer F. Staley and C. P. Karr.
- "Physical Properties of Nickel." By David H. Browne and John F. Thompson.

SESSION ON MINE TAXATION

MONDAY, SEPT. 22, 11 A.M.

- "Mine Taxation." By Dr. L. C. Graton.

SESSION ON COAL AND GAS

MONDAY, SEPT. 22, 11 A.M.

- "*Research in the Coal-Mining Industry." By E. A. Holbrook.
- "*Some Factors That Affect the Washability of a Coal." By Thomas Fraser and H. F. Yancey.
- "A Use Classification of Coal." By George H. Ashley.
- "Distribution of Anthracite." By A. S. Learoyd.

SESSION ON COAL AND GAS

MONDAY, SEPT. 22, 2 P.M.

- "*Height of the Gas Cap in the Safety Lamp." By C. M. Young.
- "*Engineering Features of Modern Large Coal Mines in Illinois and Indiana." By C. A. Herbert and C. M. Young.

†These papers, which will be presented at the Philadelphia meeting of the Institute of Metals Division, Sept. 29-Oct. 2, will be read here by title only to afford opportunity for discussion. Papers marked * will be presented by the authors; ** by the authors' representatives; all others by title only.

- "*Gas-Producer Practice." By G. S. Brooks and C. C. Nitchie.
- "*Testing of Coals for Byproduct Coking and Gas Manufacture." By Horace C. Porter.
- "*Coals of Ohio and Their Limitations for Byproduct Coke." By Wilber Stout.
- "*Outdoor Substations in Connection With Coal-Mining Installations." By H. W. Young.

SESSION ON GEOLOGY

MONDAY, SEPT. 22, 2 P.M.

- "*Chrome-Ore Deposits in Cuba." By Ernest F. Burckhard.
- "*Recent Studies of Domestic Chromite Deposits." By J. S. Diller.
- "*Manganese-Ore Deposits in Cuba." By Ernest F. Burckhard.
- "*Correlation of the Formations of the Huronian Group in Michigan." By R. C. Allen.
- "*Mud Volcanoes in Colombia." By Stanley C. Herold.
- "*Magnesite; Its Geology, Products and Their Uses." By C. D. Dolman.
- "*Titaniferous Iron Sands of New Zealand." By V. W. Auhel.
- "*Recent Studies of Domestic Manganese Deposits." By E. C. Harder and D. F. Hewett.

SESSION ON MILLING

MONDAY, SEPT. 22, 2 P.M.

- "*Chilean-Mill Practice at the Portland Mill." By Luther W. Lennox.
- "*Graphic Metallurgical Control." By H. M. Merry.
- "*Mill Operations at the United Eastern During 1917-1918." By Wheeler O. North.
- "*Crushing Practice at New Cornelia Copper Co." By W. L. Du Moulin.

SESSION ON INDUSTRIAL ORGANIZATION

MONDAY, SEPT. 22, 2 P.M.

- "*Method of Curtailling Forces at the Copper Queen." By Charles F. Willis.
- "*Educational Methods at the Copper Queen." By Charles F. Willis.
- "*Physical Examination Previous to Employment." By Charles F. Willis.

SESSION ON IRON AND STEEL

TUESDAY, SEPT. 23, 2 P.M.

- "*Blast-Furnace Refractories." By Raymond M. Howe.
- "*Effervescing Steel." By Henry D. Hibbard.
- "*Aircraft Steels." By Albert Sauvour.
- "*Determining Gases in Steel and the Deoxidation of Steel." By J. R. Cain.
- "*Effect of Time and Low Temperature on Physical Properties of Medium-Carbon Steel." By G. A. Reinhardt and H. L. Cutler.
- "*Erosion Tests of Rifle Barrels." By A. E. Bellis.
- "*Metallography of Rifle-Barrel Steel." By G. F. Butterworth.

SESSION ON IRON AND STEEL

TUESDAY, SEPT. 23, 8 P.M.

- "*Industries of the Chicago District." By T. W. Robinson. Illustrated with lantern slides.
- "*Manufacture of Steel Rails." By Robert W. Hunt.
- "*The World's Largest Plate Mill." By C. L. Hunter.

SESSION ON OIL

TUESDAY, SEPT. 23, 8 P.M.

- "Irvine Oil District, Kentucky." By Stuart St. Clair.
 "Petroliferous Provinces." By E. G. Woodruff.
 "Investigations Concerning Oil-Water Emulsion." By A. W. McCoy, H. R. Shidel, and E. A. Trager.
 "Essential Factors in Valuation of Oil Properties." By Carl H. Beal.
 "Application of Law of Equal Expectations to Oil Production in California." By Carl H. Beal and E. D. Nolan.
 "Value of American Oil Shales." By Charles Baskerville.

SESSION ON IRON AND STEEL

WEDNESDAY, SEPT. 24, 10 A.M.

- "Cooling Properties of Technical Quenching Liquids." By N. B. Pilling and T. D. Lynch.
 "Differential Crystallization in Cast-Steel Runner." By Francis B. Foley.
 "Manufacture and Properties of Light-Wall Structural Tubing." By H. J. French.
 "Oxygen in Cast Iron and Its Application." By Wilford L. Stork.
 "Graphitization of White Cast Iron Upon Annealing." By Paul D. Merica and L. J. Gurevich.
 "Experimental Data Obtained on Charpy Impact Machine." By F. C. Langenberg.
 "Heat Treatment of Cast Steel." By John H. Hall, Arvid E. Nissen, and Knox Taylor.
 "Deep Etching of Rails and Forgings." By F. M. Waring and K. E. Hofamann.

SESSION ON SULPHUR IN COAL

WEDNESDAY, SEPT. 24, 10 A.M.

- "Geographic Distribution of Sulphur in the West Virginia Coal Beds." By I. C. White.
 "Occurrence and Origin of Finely Disseminated Sulphur Compounds in Coal." By Rheinhardt Thiessen. Illustrated by lantern slides.
 "Mechanical Separation of Sulphur Minerals From Coal." By J. R. Campbell.
 "Sulphur in Coal—Geological Aspects." By George H. Ashley.
 "Forms in Which Sulphur Occurs in Coal." By A. R. Powell.
 "Effect of Sulphur in Coal Used in Ceramic Industries." By C. W. Parmelee.

SESSION ON SULPHUR IN COAL

WEDNESDAY, SEPT. 24, 2 P.M.

- "Removal of Sulphur From Illuminating Gas." By W. W. Odell and W. A. Dunkley.
 "Low Sulphur in Coal." By H. M. and T. M. Chance.
 "Low-Sulphur Coals of Kentucky." By Willard R. Jillson.
 "Low-Sulphur Coal in Illinois." By Gilbert H. Cady.
 "Sulphur in the Coking Process." By S. W. Parr.
 "Commercial Recovery of Pyrite From Coal." By S. H. Davis.
 "Sulphur in Producer Gas." By F. Crabtree and A. R. Powell.

SESSION ON MINING AND LOCAL RESOURCES

WEDNESDAY, SEPT. 24, 10 A.M.

- "Wisconsin Zinc District." By W. F. Boericke and T. H. Garnett.
 "Mineral Resources of the La Salle District." By J. A. Ede.
 "New Angles to the Apex Law." By John A. Shelton.
 "Mining Methods of Alaska Gastineau Mining Co." By G. T. Jackson.
 "Tunnel Driving at Copper Mountain, B. C." (Columbia Section Paper). By Oscar Lachmund.
 "Geology and Mining Methods at Pilares Mine." By W. Rogers Wade and Alfred Wandtke.

"Wedging Diamond-Drill Holes." By O. Hall and V. P. Row.

SESSION ON NON-FERROUS METALLURGY

WEDNESDAY, SEPT. 24, 2 P.M.

- "Electric-Resistance Furnace of Large Capacity for Zinc Ores." By Charles H. Fulton. Illustrated by lantern slides.
 "Water and Chlorides in Cement Copper Briquettes." By Edward Keller.
 "Chemical and Electrochemical Problems Involved in New Cornelia Copper Company's Leaching Process." By Henry S. MacKay.
 "Electrolytic Zinc." By C. A. Hansen.
 "Treating Antimony Ores." By George P. Hulst.

SESSION ON PYROMETRY WITH SPECIAL REFERENCE TO IRON AND STEEL METALLURGY

WEDNESDAY, SEPT. 24, 2 P.M.

- "Report of Committee on Pyrometry of National Research Council." By George K. Burgess.
 "Pyrometry in Blast-Furnace work." By P. H. Royster and T. L. Joseph.
 "Pyrometry and Steel Manufacture." By A. H. Miller.
 "Electric Open-Hearth and Bessemer Steel Temperatures." By F. E. Bash.
 "Some Thermal Relations in the Treatment of Steel." By Charles F. Brush. Illustrated by lantern slides.
 "Pyrometry in the Tool Manufacturing Industry." By J. V. Emmons.
 "Rate of Heating and Cooling of Large Ingots for Forging." By F. E. Bash.

SYMPOSIUM ON PYROMETRY¹

THURSDAY, SEPT. 25, 10 A.M.

- "Temperature." By J. S. Ames.
 "Standard Scale of Temperature." By C. W. Waidner, E. F. Mueller, and Paul D. Foote.
 "Metals for Pyrometer Standardization." By C. W. Waidner and George K. Burgess.
 "Fundamentals of Pyrometry." By C. E. Mendenhall.
 "Thermoelectric Pyrometry." By Paul D. Foote, T. R. Harrison, and C. O. Fairchild.
 "Potentiometers for Thermoclement Work." By Walter P. White.
 "Self-Checking Galvanometer Pyrometer." By H. F. Porter.
 "Some Factors Affecting the Use of Base-Metal Thermocouples." By O. L. Kowalke.
 "Tables and Curves for Use in Measuring Temperatures With Thermocouples." By L. H. Adams. Illustrated by lantern slides.
 "Reference Standard for Base-Metal Thermocouples." By N. E. Bonn.
 "Alloys Suitable for Thermocouples and Base-Metal Thermoelectric Practice." By J. M. Lohr.
 "Recent Improvements in Pyrometry." By R. P. Brown.
 "Automatic Correction for Temperature of Cold Junctions." By F. Wunsch.
 "Hot Wire Anemometer With Thermocouple." By T. S. Taylor. Illustrated by lantern slides.
 "Porcelain for Pyrometric Purposes." By F. H. Riddle.
 "Pyrometer Porcelains and Refractories." By R. W. Newcomb.
 "Porcelain Pyrometer Protecting Tubes." By F. A. Harvey. Illustrated by lantern slides.
 "Porcelain Tubes for Thermocouples." By R. B. Lincoln.
 "Melting Point for Refractory Materials." By Leo I. Dana.
 "High-Temperature Scale and Its Application in the Measurement of True, Brightness, and Color Temperature." By Edward P. Hyde.
 "Theory and Accuracy in Optical Pyrometry With Particular Reference to the Disappearing-Filament Type." By W. E. Forsythe. Illustrated by lantern slides.

¹Presented at the June, 1919, meeting of the American Society for Testing Materials, and read here by title to afford opportunity for discussion.

²In co-operation with the National Research Council and the U. S. Bureau of Standards.

"Optical and Radiation Pyrometry." By Paul D. Foote and C. O. Fairchild.

"Industrial Application of the Disappearing-Filament Type of Optical Pyrometers." By F. E. Bash.

"Use of the Optical Pyrometer for Control of Optical-Glass Furnaces." By C. N. Fenner.

"Emissive Powers and Temperatures of Non-Black Bodies." By A. G. Worthing. Illustrated by lantern slides.

"Recording Thermocouple Pyrometers." By Leo Behr.

"Recording Pyrometry." By C. O. Fairchild and Paul D. Foote.

"High Temperature Control." By C. O. Fairchild and Paul D. Foote.

"Resistance Thermometry." By F. W. Robinson.

"Tin; an Ideal Pyrometric Material." By E. F. Northrup.

"Resistance Thermometry for Industrial Use." By Charles P. Frey.

"Thermocouple Installation in Annealing Kilns for Optical Glass." By E. D. Williamson and H. S. Roberts.

"Annealing of Glass." By A. Q. Tool and J. Valasek.

"Pyrometry Applied to Bottle-Glass Manufacture." By R. L. Frink.

"Pyrometry in the Manufacture of Optical Glass." By Albert J. Walcott.

"Pyrometry as Applied to the Manufacture of Optical Glass." By Carl W. Keuffel.

"Pyrometry Shortcomings in Glass-house Practice." By W. M. Clark and Charles D. Spencer.

The program of entertainment which has been arranged for the benefit of the wives and daughters of Institute members includes the following:

Monday: Theater party at the Riviera.

Tuesday: Trip to Gary, Ind.

Wednesday: Trip to Great Lakes Naval Station, leaving Congress St. station at 11 o'clock and returning from station at 3.45 p.m.

Wednesday evening: Banquet.

Thursday: Trip to La Salle, Ill.

Friday: Luncheon at the South Shore Country Club. Sears, Roebuck & Co. have extended an invitation to visit their plant, and guests are to be given a luncheon while there.

At the smoker to be held on Monday evening, Sept. 22, at 8.30, at the Chicago University Club, George S. Rice, F. G. Cottrell, and Frank H. Probert will speak on

their investigations and experiences in the war area. Mr. Rice will talk on coal and other features in the north of France, in the Cologne district, southern France, Westphalia, Belgium, and Great Britain, and will take up the subject of liquid oxygen as he observed it in Germany. Dr. Cottrell will talk of his own metallurgical observations in Germany and Austria as well as France, and Mr. Probert will speak on destroyed iron mines and steel plants in France.

The Sulphur Trade of Norway

The greater part of sulphur imported into Norway is used in connection with the sulphite paper-pulp industry, according to a recent consular report. The following table shows the imports and exports of sulphur by Norway from 1910 to 1918, inclusive, in metric tons:

NORWEGIAN SULPHUR IMPORTS AND EXPORTS, 1910-1918

Years	Imports	Exports	Years	Imports	Exports
1910	10,279	618	1915	6,804	41
1911	8,782	166	1916	7,262	..
1912	13,911	1,003	1917	4,071	..
1913	15,411	117	1918	3,036	..
1914	10,347	334	1919 (January and February)	116	..

From this table it is seen that the use of sulphur before the war was almost twice as large as the use since 1914. This was probably due in part to the substitution of pyrites for sulphur at the pulp mills, and also to the use of substitutes in other lines, because of the advancing prices. Also, there is a probability that the stocks of sulphur in the country have been almost completely wiped out since 1914, and thus the actual use since that date has been somewhat greater than the figures indicate.

In connection with the use of pyrites, the report states that, though pyrites constitute one of the leading exports from Norway, they are also extensively used in the paper-pulp industry. The introduction of the pyrite process has been progressing rapidly since 1904, and now it is reported that the greater number of the mills are so equipped, and hence normally use pyrites instead of sulphur. In this connection the following figures showing the production of pyrites are interesting: 1911, 369,055 metric tons; 1912, 464,326; 1913, 441,291; 1914, 414,886; 1915, 513,335 metric tons. The statistics subsequent to 1915 are not available, but the annual production has been at least as great as in that year, as the demand has been large, and at relatively high prices.

During the war, exports of pyrites did not keep pace with the increased production, this signifying that the domestic use of pyrites increased soon after 1914. Exports of pyrites during the last five years were: 1914, 350,228 metric tons; 1915, 466,759; 1916, 253,362; 1917, 242,909; 1918, 240,774 metric tons.

Prior to the outbreak of the war the principal sources of supply of sulphur were Great Britain, Italy, and Spain, whereas in 1915 and 1916 Great Britain and Italy furnished almost the entire supply. Detailed statistics are not available since 1916, but it is known that in 1918 the United States furnished more than 50 per cent of the imports.

The present condition of the sulphur market in Norway is uncertain. The sulphite mills are facing difficulties with respect to marketing their products, and there are rumors that extensive shutdowns are probable, which, of course, will affect the market. Until these conditions become settled, conservatism in buying large quantities of supplies may be expected.

The Chemical Exposition at Chicago

Fifth National Congress of Chemical Industries Will Surpass Former Accomplishments in The Display of Attractive Exhibits—Program of the Sessions and of Papers and Entertainment Features

THE forthcoming Fifth National Exposition of Chemical Industries at the Coliseum and First Regiment Armory, Chicago, during the week of Sept. 22, promises, with the attendant society meetings, to be an assemblage worthy of the past accomplishments of this exposition. The managers report that there are as many exhibitors as at the last exposition, and that there are several who have never before been exhibitors and for whose displays visitors may look forward with interest. The old-established exhibitors have nearly all newly developed products, in which the chemical profession and industries will be interested.

The following program is of course subject to addition and revision, but from it the comprehensiveness of the meetings and discussions may be discerned.

The exposition hours are from 12 noon to 10:30 p.m.

MONDAY, SEPT. 22, 1919

12 m.—Opening of exposition.

2 p.m.—Meeting American Institute of Mining and Metallurgical Engineers at Congress Hotel.

8 p.m.—Opening addresses at Chemical Exposition Auditorium. Governor Frank O. Lowden of Illinois will make the address of welcome. Charles H. Herty, chairman of advisory committee, will respond. John W. O'Leary, president Metal Trades Association of Chicago, "The Relation of the Chemist to the Manufacturer."

9 p.m.—Motion pictures, in Chemical Exposition Auditorium.

TUESDAY, SEPT. 23, 1919

8 a.m.—Departure of members of the American Institute of Mining and Metallurgical Engineers and American Electrochemical Society on an excursion to the steel mills at Gary, Ind.

2 p.m.—Symposium on "America's Case in Chemistry," at Chemical Exposition Auditorium, Ellwood Hendrick, chairman.—Chairman's address.—"Dyestuffs," J. Merritt Matthews, editor *Color Trade Journal*.—"Chemical Porcelain," Herman S. Coors, of Herold China and Pottery Co.—"Laboratory Supplies," lamp-blown glassware and general apparatus, C. G. Fischer, of Scientific Materials Co.—"Instruments of Precision," J. M. Roberts, secretary Apparatus Makers' Association of U. S.—"Fine Chemicals," H. T. Clarke, of Eastman Kodak Co.—"Glassware," "Optical Glass," Harvey N. Ott, of Spencer Lens Co.—"Essential Metal Minerals" and "Pharmaceuticals" will be discussed.

8 p.m.—Motion pictures in Chemical Exposition Auditorium.—"History and Utilization of Coal": 1, "Story of Coal" (four reels accompanied by discussion by M. F. Leopold, of U. S. Bureau of Mines); 2, "The Manufacture of Beehive Coke" (one reel); 3, "Byproduct Coking With Koppers Ovens" (three reels).—Joint Technical Meeting of American Institute of Mining and Metallurgical Engineers and American Electrochemical Society at Congress Hotel.

WEDNESDAY, SEPT. 24, 1919

10 a.m.—Meeting at Chemical Exposition of American Electrochemical Society, for reading and discussion of the following papers: "The Effect of Amalgamation Upon the Single Potential of Aluminum," by Louis Kahlenberg and John A. Montgomery; "Depreciation in Small Dry Cells With Age," by A. J. Helfrecht; "Manganin," by A. Hunter and J. W. Bacon.—Registration and meeting at Chemical Exposition of Technical Association of Pulp and Paper Industry, in officers' room, First Regiment Armory. Address

of welcome. Opening address by president. Report of executive committee. Report of secretary-treasurer. Reports by standing committees.—Meeting at Chemical Exposition of American Ceramic Society.

12:30 p.m.—Adjournment for luncheon of all societies and for inspection of exhibits.

2 p.m.—Joint technical session American Electrochemical Society with American Institute Mining and Metallurgical Engineers at Chemical Exposition Auditorium. Subject: "Ferrous and Non-Ferrous Metallurgy." Among the papers to be presented are: "Electric-Resistance Furnace of Large Capacity for Zinc Ores," by Charles H. Fulton; "Electrolytic Zinc," by C. A. Hauser; "Treating Antimony Ores," by George P. Hulst; "Water and Chlorides in Cement Copper," by Edward Keller; "Chemical and Electrochemical Problems Involved in the New Cornelia Co.'s Leaching Process," by Henry S. Mackay; "Radiant Resistor Furnace," by A. J. Fitzgerald; "Electric Heat in the Typewriter Industry," by A. M. Clark; "Electric Furnace for Experimental Work," by A. J. Fitzgerald. Other papers are in the hands of the American Electrochemical Society Paper Committee for acceptance for these meetings. After meeting is adjourned, the electric furnace exhibits will receive careful inspection.

2:30 p.m.—Adjourned meeting at Chemical Exposition of American Ceramic Society resumed.

3:30 p.m.—Adjourned meeting at Chemical Exposition of Technical Association of Pulp and Paper Industry resumed.

6:30 p.m.—Dinner of Technical Association of Pulp and Paper Industry at Union League Club.

8 p.m.—Motion pictures in Chemical Exposition Auditorium: 1, "Resistance-Type Furnaces for Melting Non-Ferrous Metals"; 2, "Electric Furnaces in the Heat Treatment of Essential War Materials" (both films by courtesy of Electric Furnace Co.); 3, "The Detroit Rocking Electric Furnace in Operation" (courtesy of Detroit Electric Furnace Co.); 4, "Shawinigan Power Development and the Shawinigan Industries" (courtesy of Shawinigan Water & Power Co.); 5, "The American Chemical Society Meeting, April, 1919, at the National Aniline Chemical Co.'s plant, Buffalo, N. Y." (courtesy Community Motion Picture Bureau); 6, "The Making of Cut Glass"; 7, "Manufacture of Glass."

THURSDAY, SEPT. 25, 1919

9:30 a.m.—Meeting at Chemical Exposition of Technical Association of Pulp and Paper Industry, general business meeting.

10 a.m.—Meeting of American Electrochemical Society jointly with American Institute of Mining and Metallurgical Engineers, Symposium on "Pyrometry" at Congress Hotel.

12 m.—Technical Association Pulp and Paper Industry adjournment for luncheon as guests of Sears, Roebuck & Co., to be followed by visit to the paper mill plant.

2 p.m.—Meeting at Chemical Exposition Auditorium. H. E. Howe (Division of Industrial Research, National Research Council), "The Organization and Plans of the National Research Council, With Special Reference to the Industries"; Price Green (Industrial Commissioner, Canadian National Railways), "Fields for Industrial Development, Canadian National Railways"; Henry B. Faber (Industrial Filtration Corporation), "Filtration"; Thomas W. Pritchard (vice-president Fuel Products Corporation), "Destructive Distillation of Bituminous Material With Reduced Vapor Tension and Complete Temperature Control."

4 p.m.—Committee meetings of Technical Association Pulp and Paper Industry at Chemical Exposition.

8 p.m.—Motion pictures at Chemical Exposition. Jam Handy (vice-president Bray Studios), address during show-

ing of first two films: 1, "Formation of Coal Made Visible"; 2, "Chemistry of Gas Engines Made Visible."—American Electrochemical Society smoker at Congress Hotel.

8:30 p.m.—Technical Association Pulp and Paper Industry smoker at Union League Club.

FRIDAY, SEPT. 26, 1919

9 a.m.—Technical Association Pulp and Paper Industry will visit Forest Products Laboratory at Madison, Wis.

9:30 a.m.—Meeting American Electrochemical Society at Chemical Exposition Auditorium. Subject: Symposium on "Catalysis."

12:30 p.m.—Adjournment for luncheon.

2 p.m.—Meeting resumed on "Catalysis" by American Electrochemical Society.

8 p.m.—Motion pictures. Jam Handy (vice-president Bray Studios), "Art Exposes the Invisible in Chemistry," during the showing of special films: 1, "Chemistry in Munitions"; 2, "Chemistry of Photography"; 3, "Invisible Chemistry of the Electric Battery"; 4, "Invisible Phases of Crystallization." Price Green (Industrial Commissioner of Canadian National Railways), "Natural Resources on Canadian National Railways," during showing of stereopticon and motion pictures.—Award of Willard Gibbs Medal to W. A. Noyes, of University of Illinois, by Chicago Section of American Chemical Society.

SATURDAY, SEPT. 27, 1919

9:30 a.m.—Meeting at Chemical Exposition Headquarters of Technical Association of Pulp and Paper Industry for adjourned business session in Auditorium.

Afternoon—Technical Association Pulp and Paper Industry official visits of inspection to exhibits at Chemical Exposition.

2 p.m.—Meeting at Chemical Exposition Auditorium. Symposium on "Safety in Plant and Mine," under chairmanship of M. F. Leopold, safety engineer, U. S. Bureau of Mines.

8 p.m.—Motion pictures, depicting safety work in the plant and mine, by courtesy of U. S. Bureau of Mines.

During the week at the Chemical Exposition there will be shown upon the motion-picture program the following films not already placed by definite dates on this program:

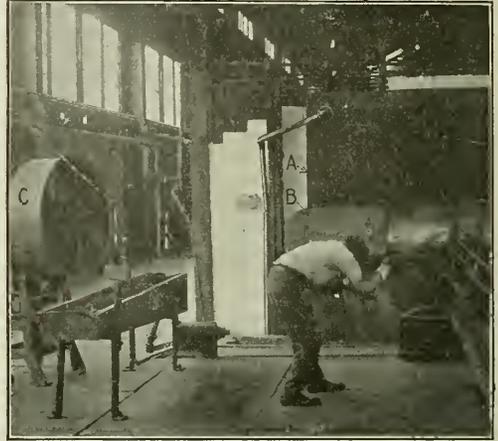

1. "Operation of Koppers Byproduct Coke Plant." (Courtesy the Koppers Co.)
2. "Continuous Motion Conveying, Stacking, Elevating, Loading and Unloading by Brown Portable Handling Machines." (Courtesy Brown Portable Conveying Machinery Co.)
3. "The Manufacture of Zinc Oxide." (Courtesy New Jersey Zinc Co.)
4. "The Making of Matches."
5. "Gold Mining in Canada."
6. "Building a Great Nitrate Industry at Muscle Shoals, Ala., by American Cyanamid Co."
7. "Quarrying Canadian Asbestos."
8. "Manufacturing Rubber Hose."
9. "Making Lime."
10. "The Silk Industry."
11. "The Steel Industry."
12. "The Iron Industry."
13. "The Oil Industry."
14. "Silver Mining in Bolivia."

These are all recently completed films. Others now being made will be finished in time for the exposition. The U. S. Bureau of Mines is completing a large series of films, on the metal and mineral mining and manufacturing industries, showing the progress of the mineral from its situs in the earth to the finished commercial metal or article. The titles of these films were not announced at the time of going to press.

The registration badges of all society members meeting at the exposition will admit them at the doors without other tickets.

Protecting Workmen From Heat

A heating furnace equipped with a water-cooled door, AB, in combination with an electric fan, C, which is designed to provide ample means for the protection of workmen compelled to work in an exposed position as shown, is illustrated herewith. The increased efficiency from the installation of such devices to alleviate the fatigue resulting from alternate exposure to the furnace heat and comparatively cool room atmosphere has warranted their more general adoption.

USING A WATER-COOLED DOOR AND ELECTRIC FAN FOR HEAT PROTECTION

The photograph is reproduced from the Bulletin of the Bureau of Safety, Sanitation and Welfare of the United States Steel Corporation, and shows the arrangement used at the works of the National Tube Co.

Brass Cartridge Cases for Sale

A million and a half brass cartridge cases are to be offered for sale by the War Department at 20 per cent above the current market price of their metal content. Aircraft manufacturers have advised the Director of Sales that there are many novelty and souvenir uses for these condemned shells.

The offering includes artillery cases of the following sizes: 75-mm., weight 2.61 lb.; 4.7-in., weight 8.25 lb.; 6-in., weight 7.03 lb.; 3-in., anti-aircraft, weight, 6.75 lb.

The Weight Per Rated Horsepower of a combined steam turbine and alternating-current generator is materially less than for a unit made up of a reciprocating steam engine and a generator of equivalent capacity. The floor space and volume space per unit of rated power are also less than for the reciprocating engine generator set. The following table gives approximate figures for a compact steam turbine and generator unit:

Size of Unit, Kw.	Equip. Hp.	Weight Per Kw.	Weight Per Hp.	Cost Per Kw.	Cost Per Hp.	Cost Per Lb.
200	264	82.5	62	\$45.60	\$34.3	\$0.55
300	402	59.0	44	35.00	26.1	0.393
500	670	43.6	32	27.70	20.7	0.6

The weight of the heaviest piece of the first unit is 4500 lb.; of the second unit 5100 lb.; of the third unit 7500 lb. when prepared for sectionalized shipment. In figuring a given unit, the weight and cost of a condenser of sufficient capacity must also be figured in. The cost figures give first cost only, and do not include freight.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Tungsten Tariff Bill Passed

By a vote of 171 to 133, the House of Representatives, on Aug. 21, passed the tungsten tariff bill. The measure provides a duty of \$10 per unit of tungstic trioxide contained in crude tungsten, ores, and concentrates. On metallic tungsten, tungsten powder, ferrotungsten and other compounds containing tungsten, a duty of \$1 per lb. on the tungsten content is provided.

Amendments to the bill reducing the rate of duty were offered at every opportunity by Democrats. Finally on a motion to recommit, the Democrats suggested a 10 per cent ad valorem duty on tungsten ores of all kinds and a 20 per cent ad valorem duty on tungsten powder and ferrotungsten. The motion to recommit was lost, 170 to 138. An important amendment by Representative Green, of Iowa, was adopted. It reads:

That there shall be levied, assessed, and collected upon all tungsten ore and concentrates which have been imported prior to the passage of this act from any foreign country and held or kept within the United States, when such ore has been purchased by the owner thereof at a price less than \$17 per unit of tungsten trioxide therein contained, a tax equal to the difference between the purchase price so paid by the owner and the price named above in this section.

This amendment was inserted to meet the most effective Democratic argument made against the bill. It was claimed by the Democrats that millions in profits would be made by the owners of stocks of imported tungsten.

Senate Discusses Leasing Bill

Far more opposition than had been expected developed during the more consideration of the General Leasing Bill. Senator La Follette, of Wisconsin, hears that the West is ablaze against the measure as being in the interest of foreign ownership and control of mines. Senator Kenyon, of Iowa, told the Senate that he had been advised that the bill would place the Standard Oil Co. in possession of practically all of the land covered by the bill. Senator Walsh, of Montana, contended that exactly the opposite would be the case and that the Senate would play into the hands of the Standard Oil Co. by failing to pass the bill. Senator Thomas, of Colorado, voiced the feeling of many Western Senators when, in describing his own position, he said:

I am for the bill because I cannot help myself. I am for the bill because it is the only thing that justice can wring from this Congress. It is the only thing the approval of which we can expect upon the part of the Executive. It is the only thing which stands between a good many honest people of the West and bankruptcy. It is the only thing under whose provisions the oil reserves of the West can be developed and the oil itself added to the constantly increasing stream of demand. It is the only source, in fact, to which we can look for an increasing supply of an element which in these days is perhaps more essential to the material well-being and progress of the nation than anything else, unless it be the item of coal.

In view of the feeling that some improvement over existing conditions would be brought about by the bill, and the fact that Senator La Follette, its chief opponent, will be satisfied when he has done his best to get through his amendment, the enactment of the bill into law at this session is practically assured. In the course of the discussion, Senator Ashurst, of Arizona, said:

For ten years it has been utterly impossible for a man of modest means to get an oil claim or a coal claim; it has been utterly impossible for a man, unless he were a millionaire, to get hold of any oil land; and why? A citizen goes out upon the public domain and locates a claim with his strong arm, puts up his monuments, and begins work. It now costs \$60,000 to drill an oil well, and one-third of the holes drilled even in proven ground are failures. Moreover, when the citizen locates a claim and complies with the law the Executive power withdraws the land. President after President seem to fall under the same baleful view that we must conserve the resources of the country by taking them from our people.

Records of the War Industries Board

All records of the War Industries Board have been transferred to the Council of National Defence. These records will be available to those interested. This excepts, of course, the data submitted to the War Industries Board in confidence. The policy in regard to the records is outlined by the council as follows:

The War Industries Board was originally created by the council, and remained under its direction for nearly a year. Since the records deal in such a vital way with the American industrial and economic capacity for war, they are naturally reassigned to the council, which, as a permanent body, is charged by the Congressional act creating it with the coordination of industries and resources for the national security and welfare. It is the intent that these and similar war records shall, as material bearing directly upon the national defence, be carefully studied and catalogued by the council, not only to preserve in the most coherent form the lessons learned from the war on the industrial and economic side, but to make the data quickly and effectively available against future emergency. It is also the intent to make the records available to American business wherever proper to do so, though, of course, all confidential information given to the council and the War Industries Board throughout the war days will be scrupulously safeguarded. The director of the council has initiated steps to organize these records for their most efficient use.

Assessment Bill Signed by the President

The President has signed the bill providing for the suspension of annual assessment work during 1919. As already reported in the *Journal*, this provides that no such suspension shall be granted to any one claimant for more than five claims. It is also provided in the bill that "every claimant to obtain the benefits of this resolution shall file or cause to be filed in the office where the location notice or certificate is recorded, on or before Dec. 31, 1919, a notice of his desire to hold his mining claim under this resolution."

BY THE WAY

Fluorspar and the Liberty Loan

The steel industry obtains a large percentage of its fluorspar requirements from the district of which Marion, Ky., is the center, says *Iron Trade Review*. In Crittenden County, in fact, of which Marion is the seat, the principal industry is the mining and shipping of fluorspar. In the Victory Loan campaign, the Crittenden County Liberty Loan committee obtained a huge oversubscription, with the result that it was given the privilege of naming a vessel to be launched from the huge Government yard at Hog Island. Accordingly, the committee decided to name the vessel "Fluorspar." The ship took the water at Hog Island on June 16, its sponsor being Miss Frances Gray, of Marion, Ky.

A High Turnover

"I once had a partner," wrote Dan De Quille, "whose one dream of life was to be able to turn a flapjack. If he could only flip one into the air and catch it all right, he thought he would be happy, whether the diggings paid or not. One day he announced he would turn one in the air or die. Taking hold of the handle of the frying pan with both hands, and getting out into the middle of the floor, he hustled the cake about in the pan until it was loose on all sides. Then, squatting nearly to the floor and giving a mighty heave, he sent the pancake flying upward. This done, he stood, frying pan in hand, ready to catch the cake. But that pancake never came down; it struck batter-side against the ceiling, and there it stuck as fast as the wafer on a love letter."

Passing of the Single Jacker

The revolutionary effect of the machine drill upon the mining craft was strikingly illustrated at the Fourth of July celebration held in Wallace, Idaho, last month. "A few years ago," writes our Wallace correspondent, "the big event of Independence Day in the mining districts was the rock-drilling contest. It was typical of the industry, and among all the sports and contests received the largest purse. Every mine had its crack drill team, and the entire force turned out to back it with noise and cash. Generally, a liberal purse was offered for 'single jackers' also. This year the people of Wallace decided to revive this old-time contest and offered a purse of \$500, open to all comers, believing that it would attract many contestants from the Coeur d'Alenes and from Montana and more distant places. In this they were disappointed, for only two local teams entered. Ten years ago there would have been a dozen entries. The machine drill has done its work. No more purses will be offered in Wallace for hand-drilling contests."

The Deepest Well

Named in the order of depth, the four deepest wells in the world are the J. H. Lake, 7,579 ft.; the Goff, 7,386; a well at Czuchow, Germany, 7,348; and the R. A. Geary, 7,248 ft., according to the U. S. Geological Survey.

The R. A. Geary well, of the People's Natural Gas Co., is about four miles northwest of McDonald, Pa.,

and about twenty miles southwest of Pittsburgh. The mouth of the well is about 1,050 ft. above the sea level. The well penetrates the Gordon stray sand, the last of the usual gas sands in this region, at a depth of 1,971 ft. From this point to a depth of 6,700 ft. the strata penetrated are alternately "lime" and "slate," and from 6,700 ft. to the bottom, 7,248 ft., they are "sand" and "lime" interspersed with about 60 ft. of rock salt. The second deep well was drilled by the Hope Natural Gas Co. on the farm of M. O. Goff, about eight miles northeast of Clarksburg, in northern West Virginia. Its mouth is 1,164 ft. above sea level. The well begins 200 ft. below the level of the Pittsburgh coal and penetrates the usual oil-bearing and gas-bearing sands, the lowest being the Bayard, which lies at a depth of 2,210 ft. The strata in the remainder of the well are alternately "lime" and "slate." The J. H. Lake well, of the Hope Natural Gas Co., is about eight miles southeast of Fairmont, W. Va. It is about twenty miles north of the Goff well and about sixty miles south of the Geary well. The mouth of the well is about 1,300 ft. above sea level. The Bayard sand, the lowest of the gas sands, was found in this well at a depth of 2,050 ft. The remaining strata are alternately "lime," "slate," and "sand." A bed of ocean water was found in the Geary well at 6,260 ft.

Food for Thought

"Well, Mister Clancy," said Bill, licking the broken wrapper of a near-Corona, "what do ye know about profiteerin'?" The shift-boss flushed guiltily as he denied any complicity with the timekeeper. "Ye misunderstand me intirely;" replied the super, making a mental note of the bit of circumstantial evidence. "'tis about this here food question I'm talkin'. Some fellies wud have it that a boonch av these warehouse speculators an' delicatessen clerks ought to be taken out in front av a firin' squad. Wan sez that the big manipulators keep storin' up a heavy surplus; while another sez the middlemen an' retailers are pullin' down all the crooked graft; an' still another sez the blame shud be put on a minin' ingineer that tuk pity on the poor downtrodden farmers. Now, mebbe they're all right an' all wrong to wanst. Have ye not rayficted that patriotism is at the bottom av it all. Ye'll raymimber that the dimmycrats, foreseenin' the need av plinty av work, figured out the income tax to eddicate us in complex arithmetic an' cut down our dhrink money. Whin insults made us forget the kind of mollycoddle pride that had kept us out av war, the need av more pork was noticed. More income tax an' folks began to holler. Some hollered that food wud win the war, some hollered that patriotism wud win the war, an' some just began to feel holler. The pathriots that knew how to figger the best saw that the more profits they cud make, the bigger percentage the guv'mint wud get on the income tax; so they kept gettin' more an' more pathriotic. Food seemed the nacheral way to make the surest profits, for every wan must eat. A man can go barefute, he can wash his last year's straw hat, but food he must have or he can do no work. Speakin' av food, the keeper av the boardin' house tells me that thim six new muckers ye've had on the graveyard shift for the last tin days niver ate but the wan meal. Pork is all right in its place, but sometimes it's hard to digest. Whin there's anny surplus av it around this mine, I'll start a little cannin' factr'y."

NEW PUBLICATIONS

The Kantishna Region Alaska. By Stephen R. Capps. Paper, 6 x 9; pp. 116, illus. Bull. 687, U. S. Geological Survey, Washington, D. C., 1919.

Contributions to Economic Geology (Short Papers and Preliminary Reports) 1918. Part I.—Metals and Non-metals Except Fuels. F. L. Ransome, E. F. Burchard and H. S. Gale, Geologists in Charge. Paper, 6 x 9; pp. 147, illus. Bull. 690, U. S. Geological Survey, Washington, D. C., 1919.

Mexico Under Carranza. By Thomas E. Gibbon. Cloth, 5 x 7½; pp. 270. Doubleday, Page & Co., Garden City, N. Y., 1919.

Mr. Gibbon's book could not have been more timely, but what is more to the point, the subject is handled in such a manner that the contents appeal to one as bearing the stamp of accuracy as to statements of fact, and the conclusions have been carefully and logically reached, and as convincingly presented. A mass of intensely interesting data is condensed into a small space. One who knows Mexico will find the book of interest, in that it will confirm and strengthen the views he already has, adding much to his knowledge of the history of the country and its people. We would recommend the book more particularly to those who do not know Mexico and care little about it. One evening spent with this volume would convince the most disinterested that the United States has a duty to perform, a duty that is pressing and of immediate importance.

The Iron Hunter. By Chase S. Osborn. Cloth, 5½ x 8; pp. 316, illus. The Macmillan Co., New York, 1919.

The over-critical reviewer might take exception to the title assumed by Mr. Osborn in the presentation of his autobiography, but viewed in the light of a narrative embracing the life story of a virile, active man, a lover of the great out-of-doors, and a keen observer of human nature, the title is aptly given, and could well be applied, even supposing all references to iron ore were omitted. Interspersing his personal experiences, adventures, and opinions, Mr. Osborn has included a wealth of information concerning the formation, mining, and treatment of iron ore in many districts, and has produced a happy combination which carefully avoids the dryness of a strictly technical publication, although partaking of the nature of a valuable addition to the history of iron and steel. Though disclaiming the expert knowledge of the astute technologist, Mr. Osborn displays in all of his references to iron ore a well-founded knowledge of the subject. Of particular interest to the iron-ore student is the chapter dealing with the mining and treatment of siderite at the Magpie mine, in the Michipicoten district.

Timber, Its Strength, Seasoning, and Grading. By Harold S. Betts. Cloth, 6 x 9; pp. 234, illus. McGraw-Hill Book Co., New York, 1919.

This book is intended for engineers, manufacturers, users of lumber, and students of engineering and forestry. The author presents in readily accessible form much technical information regarding wood, similar to that available on other structural materials.

The data given are derived mostly from tests and investigations on the mechanical properties of wood made by the Forest Service of the U. S. Department of Agriculture. Various bulletins, circulars, and papers of the Forest Service, especially those prepared by the author and those with the preparation of which the author was closely concerned, have been drawn upon freely. Most of the diagrams have already appeared in Department of Agriculture publications.

The book contains a review of the timber resources of the United States, and data on the strength of wood, with results of tests on North American woods, relations indicated by the tests, and the methods of conducting them. The author discusses the effect of moisture and of pre-

servative and conditioning treatments on the strength of wood, the seasoning of wood, and the strength of wooden products. A chapter is devoted to the principles of lumber grading, and the presentation of the rules governing the grading of lumber by manufacturers' associations. Statistics on lumber produced and used in the United States, in the manufacture of wooden products, form a valuable feature of the work, which is well written, and profusely illustrated with halftones, line cuts, diagrams, graphs, and tables.

Graphic Methods for Presenting Facts. By Willard C. Brinton. 7½ x 10½; pp. 371; illus. The Engineering Magazine Co., New York.

The engineer accustomed to the construction and interpretation of curves will, on glancing through this book, be impressed with how little he knows about the graphical presentation of facts. We are familiar, of course, with the picture of the big market basket showing what a dollar would buy before the war, standing alongside the diminutive cut of what we can buy for the same amount today. Few of us realize, however, how many different ways there are of picturing information and how much better some of them are than others. This is Mr. Brinton's object in publishing his book, which is illustrated by over 250 examples of various graphical methods of stating facts.

The mining or metallurgical engineer must not expect a book at all like "The Construction of Graphical Charts," by Peddle. Mr. Brinton's work is intended for the advertising man, for the social worker, the business man, the legislator, and the statistician. Mathematics has been entirely eliminated. At the same time there are many valuable suggestions in the principles here discussed.

The author says: "We daily see facts presented in the hope of creating interest and action for some really worthy piece of work to benefit the people as a whole. In many of these cases the attitude of the person presenting the matter seems to be that the facts will speak for themselves and that they need little or no assistance. Ordinarily, facts do not speak for themselves. When they do, the wrong conclusions are often drawn from them. Unless the facts are presented in a clear and interesting manner, they are about as effective as a phonograph record with the phonograph missing."

There is some information directly applicable to the engineer. For example, Mr. Brinton states: "For most statistical work it is much better to join the points (of a curve) showing the observations by straight lines without any attempt to draw smooth curves. Smooth curves would, by their smoothness, imply a degree of accuracy in the data much greater than would ordinarily be justifiable. By using the straight lines instead of the smooth curves to connect points, the reader is warned that the chart represents facts as found, rather than facts which are assumed to be in accordance with any definite laws."

Emphasis is also placed, and rightly, on the fact that too often statistical data are given to the unit figure and sometimes even to decimals, thus implying an accuracy far greater than it is possible to obtain. A report which states that your mine contains 874,367 tons of ore of an assay value of \$11.26 shows that the one who made the report, to say the least, has not much idea of the general fitness of things.

It is hard to discern, in such a mass of material drawn from so many different sources, how examples of such familiar things to the mining fraternity as contour maps, mine models, and metallurgical flow sheets should have been omitted from the book. However, these would not be missed unless one were looking for them. The book is really very complete and well arranged, considering the character of the subject.

A feature to which the author does not refer, but which the casual reader is bound to notice, is the interesting and varied character of the information given by the charts. Graphical methods are used to show everything, from the production of copper in different countries for one year to the probable span of a daughter from finger-tip to finger-tip for any given span of the mother. The book is a veritable illustrated "World Almanac."

PERSONALS

CHARLES M. SCHWAB was recently decorated as a chevalier of the Legion of Honor by the French Government in recognition of his services during the war. The event took place on Mr. Schwab's estate in Loreto, Pa., and was attended by a large gathering. M. Casenave, French Minister Plenipotentiary, conducted the ceremonies.

Frederick W. Foote left for Cuba recently on professional business.

A. P. Watt has returned to New York after a trip to Canada.

Charles A. Chase was in Silverton, Col., recently on professional business.

Herbert S. Kohlberg is in New York. His address is 108 West 43d St.

C. J. Carvin has returned to Arvada, Col., after an extended trip through the Northwest.

Robert A. Bryce, of Toronto and Cobalt, recently examined placer properties in Cariboo, B. C.

S. F. Shaw is inspecting properties at Zacateca City, Mexico, and Asientos, Aguascalientes.

Van. H. Manning, director of the U. S. Bureau of Mines, was in San Francisco Aug. 15-18.

Bulkeley Wells arrived in Ouray, Col., on Aug. 5, en route to the Genesee mining group, near Red Mountain, to inspect that property.

Fred G. Farrish, geologist of the Smuggler Union Mining Co., Telluride, Col., left for Durango during the early part of August.

R. P. McLaughlin has been reappointed as California State Oil and Gas Supervisor for a term of four years.

Leonard Wojomir Orynski, lieutenant in Engineer Reserve Corps, has returned to San Francisco from France, where he served fifteen months.

J. P. Hutchins has been at Constantinople since May 22. Mr. Hutchins has made two trips to Baku, and intends to go to Odessa soon.

Major D. G. Irions, mining and metallurgical engineer, has accepted a position in the mail-order circulation department of *Engineering and Mining Journal*. Major Irions has recently been discharged from military service.

W. M. Drury, M. B. Stewart, and H. Cooper are visiting properties of the American Smelting & Refining Co. at Angangueo, Michoacan; Asientos, Aguascalientes; Charcas, S. L. P.; and Matehuala, S. L. P.

S. G. Blaylock, assistant manager of the Consolidated Mining & Smelting Co., has been appointed general manager, in the place of J. J. Warren, who was recently elected president of the company.

Arthur D. Lakes and Roy E. Clark, of Spokane, are in the Republic district in Washington in connection with the suit of the Northport Smelting and Refining Co. vs. Last Chance Mining Co., involving apex rights.

Major R. A. Black, mining engineer, who was with the Australian forces in France, has gone to Northern Manitoba to inspect and report on properties owned by the Produce Trust & Loan Co., of London, England.

Vincent Ferguson, who for eighteen years has been manager of the Bessemer plant of the U. S. Cast Iron, Pipe, and Foundry Co., resigned his position on Aug. 12. Mr. Ferguson will be succeeded by Gordon E. Jones, manager of the company's Anniston, Alabama, plant.

Carl A. Davis has resigned his position as general manager of the Brakpan Mines, Ltd., to accept the appoint-

Photo by Underwood & Underwood.
CHARLES M. SCHWAB

ment as consulting engineer to the Consolidated Mines Selection Co., Ltd., and the Anglo American Corporation, Ltd., both of Corner House, Johannesburg, South Africa.

Leonard B. Miller, of the ore firm of Oglebay, Norton & Co., Cleveland, Ohio, has returned to his duties after an illness of two and one-half years. Mr. Miller was in charge of the company's mining operations when taken ill.

Joseph Keele, of the Canadian Geological Survey, is examining the area north of Cochrane, Ont., along the proposed extension of the T. & N. O. Ry. to Hudson Bay, to ascertain if conditions are favorable to the occurrence of oil.

S. Harbert Hamilton, mining geologist, of Overbrook, Pa., is engaged in studying the magnetic iron ores of east Tennessee. The results will be published as a monograph by the State Geological Survey of Tennessee under the direction of Wilbur A. Nelson, State Geologist.

A. W. Carroll, G. E. Fulton, and M. H. Merriss, of the Raritan Copper Works, Perth Amboy, N. J., recently made a business trip through the West lasting several weeks, in the course of which they visited many of the large mines and smelteries.

Horace B. Patton announces that he has removed his office from his residence at Golden, Col., to 911 Foster Building, Denver, where he will continue the practice of his profession as geologist, devoting special attention to examination of oil and gas properties, and to ore deposits.

OBITUARY

J. P. Johnson, formerly of the staff of the *South African Mining and Engineering Journal*, died recently at the age of thirty-eight years. Mr. Johnson was educated at Duwich College and at the Royal School of Mines. After leaving there, he was employed at the Dolcoath and Tincroft Mines, Cornwall, leaving in 1903 to go to South Africa, where he was connected with the Jumper's Deep Mine and subsequently with the Saxon group of mines. Later he was engaged in surveying the Roberts Victor Diamond mine and in prospecting certain areas in Orange River Colony for the Vindex Diamond Syndicate. Mr. Johnson eventually established himself in Johannesburg as a consulting mining engineer and geologist. He came to be an authority on diamondiferous properties, and was frequently engaged in expeditions in various parts of South Africa, north of the Transvaal, in Griqualand West, and elsewhere. His mining experiences were published in a series of monographs, and his books on "The Ore Deposits of South Africa" and "The Mineral Industry of Rhodesia" are standard works. He was on the Council of the Geological Society of South Africa.

SOCIETIES

Spokane Association of Engineers will inspect the mines of Stevens County, Wash., on the annual excursion Sept. 12 and 13.

Northwest Mining Association will hold a session Sept. 4 in Spokane. Frank C. Bailey, secretary, says the proposed establishment of a National Department of Public Works will come up for indorsement.

National Safety Council will hold the eighth annual safety congress in Cleveland, Oct. 1 to 4. Approximately 3,000 men and women are expected to attend, and 160 speakers are scheduled to make addresses. There will be four general sessions and thirty-five sectional meetings. The metals and mining sections each hold three meetings.

American Petroleum Institute held a meeting of the board of directors in Colorado Springs on Aug. 26 in connection with research work being conducted in the laboratories, in methods of refining oils and in perfecting field operations. Among those present were Henry M. Blackmer, president Midwest Refining Co., chairman of the meeting; Captain John Barneson, president of the General Petroleum Co.; Walter C. Teagle, president of the Standard Oil Co., of New Jersey; A. C. Bedford, chairman of the board of trustees of the Institute; E. L. Doheny, president of the Pan-American Petroleum Co.; Henry L. Doherty, president of the City Service Co.; J. W. Van Dyke, president of the Atlantic Refining Co.; Harry F. Sinclair, president of the Sinclair corporations; Van. H. Manning, director of the U. S. Bureau of Mines; Thomas A. O'Donnell, who served as assistant director of the Petroleum Division of the U. S. Fuel Administration during the period of war; and K. R. Kingsbury, president of the Standard Oil Co. of California.

INDUSTRIAL NEWS

The Jeffrey Manufacturing Co., Columbus, Ohio, has opened an office in the Book Building, Washington St., Detroit, Mich., in charge of O. B. Westcott.

The Denver Engineering Works Co. has recently contracted for the exclusive manufacture and sale of commercial sizes of the Sanson crusher.

Walter E. Becker, formerly of Becker & Smith, contracting engineers and sales agents, has completed arrangements to assume the position of general manager of the Layne & Bowler Co., pump manufacturers, and will be situated at Memphis, Tenn.

The Lunkenheimer Co., Cincinnati, Ohio, announces its intention to increase its manufacturing facilities by the erection of a complete plant at a cost of about \$2,000,000. The site comprises about 70 acres situated in Carthage, a suburb of Cincinnati.

Eugene P. Reading, having severed his connection with Hubbard-Floyd Co., of 90 West St., announces the formation of an organization under the firm name of Reading Engineering Co., Inc., for the purpose of carrying on a general equipment business, with offices in the Tribune Building, New York City.

Richardson-Phenix Co. announces the appointment of L. E. Strothman as vice-president and general manager. J. W. Peterson will become president and treasurer. Mr. Strothman was formerly connected with the Allis-Chalmers Manufacturing Co. and the Nordberg Manufacturing Co. He was appointed associate member of the Naval Consulting Board in 1916.

Western Research Corporation, Denver, Col., has issued a pamphlet describing the field of activity covered by

the organization in laboratory research, ore testing, and mine examination. A financial department has been organized to act as a clearing house in selecting mining properties of merit and to prepare properties for investors. Various engineering tables and other technical data are included.

The R. D. Nuttal Co., Pittsburgh, Pa., has carried on considerable experimental work in order to perfect mine locomotive gearing having the requisite hardness to withstand long wear, together with a sufficient toughness to avoid breakage. It is claimed these qualities are combined by special heat treatment, resulting in better gears.

TRADE CATALOGS

Jeffrey Straitfluo Ventilators. Jeffrey Manufacturing Co., Columbus, Ohio. Bulletin 270; 7½ x 10½; 8 pp.; illustrated. Describes a mine fan which is claimed to eliminate the back flow when operating against pressure, with consequent loss of power.

United States Civil Service Commission announces open competitive examinations for the positions of superintendent of melting shops and superintendent of forge shops at a salary of \$5,000 a year each. Applicants should apply for Form 1,312 to the Civil Service Commission, Washington, D. C.

Condenser Tubes. Wheeler Condenser and Engineering Co., Carteret, N. J. Pamphlet entitled "What Worried Admiral Jellicoe Most," which discusses the importance of condenser tubes. Several tables of dimensions and weights of seamless brass and copper tubing, and a price list, are included.

Holbeck Pulverized Coal Systems. The Bonnot Co., Canton, Ohio. Catalog; 8½ x 11; 136 pp.; illustrated. Describes the use of powdered coal as a fuel, using air as the carrying agent, and various mechanical arrangements required in the system. Some installations in large plants are also described. Fuel and labor saving are discussed.

Refractories. Los Angeles Pressed Brick Co., Los Angeles, Cal. Catalog; 4 x 6½; 48 pp.; illustrated. Describes various standard and special shapes of fire brick manufactured by the company, including general information on refractories. Tables for the calculation of brick work and on high temperatures involved in metallurgical processes are also given.

Pelton Water Wheels. Pelton Water Wheel Co., San Francisco and New York. Bulletin No. 12; 7¼ x 10½; pp., 48; illustrated. Describes impulse water wheels of the Pelton type and in general the Pelton system of power. A section is also devoted to a discussion of hydraulic pipe lines and their construction and to Pelton centrifugal pumps. A table of working heads and weights of riveted steel pipes is included, as are pipe-friction tables.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Belt Conveyor. William Kingman Page, assignor to Chile Exploration Co. (1,313,111; Aug. 12, 1919.)

Blast Furnace—Method of Preventing Gas Explosions in Blast Furnaces During Temporary Stops. John W. Dougherty. (1,309,466; July 8, 1919.)

Blasting—Safety Cartridge for Mining Purposes. Emmanuel Lemaire. (1,310,666; July 22, 1919.)

Classifier. Edward F. McCool. (1,310,917; July 22, 1919.)

Converters—Attachment for Forming Tuyère Openings in Converters. Michael Zippler. (1,310,230; July 15, 1919.)

Crusher—Jaw Crusher. Ray C. Newhouse, assignor to Allis-Chalmers Manufacturing Co. (1,309,807; July 15, 1919.)

Crushing—Gyratory Crushing Apparatus. Joseph E. Kennedy. (1,310,798; July 22, 1919.)

Dewatering—Apparatus for Dewatering and Separating Ores, Sands, Etc. Lewis H. Falley. (1,312,027; Aug. 5, 1919.)

Dredge-Bucket Lip. Lewis D. Hopfield. (1,310,570; July 22, 1919.)

Dredge Buckets, Latch for. Eugene J. Moynihan. (1,310,030; July 15, 1919.)

Drill—Underground Portable Drill. Willie F. Branning. (1,310,274; July 15, 1919.)

Electrode. E. A. C. Smith. (1,311,096; July 22, 1919.)

Electrolytic Method of Recovering Metals From their Ores. Dell F. Harbaugh. (1,306,480; June 10, 1919.)

Excavator Bucket. Eugene J. Moynihan. (1,307,747; June 24, 1919.)

Filtration—Process of Treating Mixtures of Liquids and Solids. Michael H. Kuryla, assignor to Merrill Metallurgical Co. (1,302,814; May 6, 1919.)

Fuel—Apparatus for Storing and Handling Pulverized Fuel. William Oran Renkin, assignor to Quigley Furnace Specialties Co. (1,308,367 and 1,308,369; July 1, 1919.)

Magnesium—Electrodeposition of Magnesium. George O. Seward, assignor to American Magnesium Corporation. (1,310,449 and 1,310,450; July 22, 1919.)

Magnetic Separator. Robert A. Manegold and George H. Fobian, assignors to Dings Magnetic Separator Co. (1,310,802; July 22, 1919.)

Manganese Steel. Manufacture of. R. A. Hadfield. (1,310,528; July 22, 1919.)

Mica From Feldspar, Process of Separating. George J. Bancroft. (1,310,939; July 22, 1919.)

Molybdenum-Tungsten Alloy, Manufacture of. Frederick G. Keyes, assignor to Cooper Hewitt Electric Co. (1,308,907; July 8, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief of Interest to Engineers and Operators

DENVER, COL.—Aug. 23

Mining Activity in Park County is rapidly increasing and the old silver producers of this district are attracting attention. A sale of the Russia Mine has just been consummated and a substantial first payment has been made. This property has a record in production of over \$1,000,000 in high-grade silver ore and the dumps and old stopes are filled with good grade milling ore. Recent work has opened another orebody which may prove of considerable importance. The property, which was owned by the estate of G. W. Brunk has been purchased by K. C. Huston, who represents a large Eastern company which will undertake extensive operation at once and will build a mill for the treatment of the lower grade ores. The work on the property of the Reserve Mining Company has progressed to the point of production. The lower tunnel has been reopened and retimbered and ore for shipment to the smelter is now being saved.

The Louisiana-Colorado Mining Company is operating both the mine and the mill—a force of about forty men is employed in and around the mine and the mill is working at its full capacity of 150 tons per day. A carload of high-grade concentrates is now ready for shipment to the smelter. These concentrates carry a high percentage of lead and in the neighborhood of 200 oz. of silver to the ton.

The Commonwealth Mining Company has a small force of men working on the Magnolia Mine on North Star Mountain. The London Mining and Milling Company, driving a new crosscut tunnel, will reach the vein with 100 ft. of additional driving. The work is being pushed as rapidly as possible with two Leeper drills working abreast in the tunnel heading. About thirty-five lessees are employed in the old South London workings and are keeping the teaming of the district busy hauling the ore to the railroad. The Victory Mining Company, having leased the entire North London workings, is remodeling the mill into a granite plant. A large force of men is employed and the work is being rushed with all possible speed.

Joseph Castle and associates, of Denver, have purchased from George Shelton, of Alma, a lease and option on the Sweet Home Group in Buckskin Gulch. Operations have been started and a good showing of ore is reported.

The Silver Gem Group on Mount Cross adjoining the Dolly Varden and Moose properties has been taken over by Ernest Montgomery and associates, of Denver. This property covers the same contact as the neighboring properties and has a good record as a silver producer.

The Sacramento mine is being equipped with machinery in preparation of continuing the sinking of the shaft. The ore showing at present is said to be excellent. The Silver Mine on King Mountain has a large force of men employed on the Hill Top, and a mill for the treatment of the low grade ore is in contemplation. A large body of high-grade ore has recently been opened, from which a steady production of smelting grade ore will be maintained as soon as the railroad between Fairplay and Leadville is repaired and put into shape for operation.

The Whale mine and mill at the head of Halls Valley are being operated with a full force. The milling of the last three years is proving a decided success. Lessees are now operating in a small way the Atlantic and Pacific, Champaign, King Oscar, Kennebec, Paris, Red Lion and other properties throughout the district.

The Yuba Dredging Company, which has been testing the ground near the town of Fairplay for the last three years, has now contracted for the excavation of a dredge pit, which is to be 150 ft. square and 10 ft. deep. It is rumored that three dredges are to be installed as rapidly as possible, all of which are to be boats of larger capacity than any now in operation in Colorado.

Hessrs, Rhoades and Goldberg, of Chicago, who have purchased the placer and lode mines formerly owned by the Green

Mountain Mining Company, are at Alma planning for extensive operations to be started next spring. Plans are also being formulated for testing by churn drills the placer ground between the towns of Alma and Fairplay for the purpose of installing dredges.

OURAY, COL.—Aug. 23

Revival of Mining in the San Juan district is making progress; though somewhat slow, it is none the less apparent in the new operations around Silverton, Telluride and Ouray. At Ouray, the Ironton-Red Mountain section is showing considerable activity. The Summit Copper Mining Co., Red Mountain, has a considerable quantity of copper-silver ore which has long needed a milling plant. The property was recently

winter a good strike of heavy copper-silver ore was made, and some good shipments resulted.

Recently, the A. E. Ackerson lease on the Guadeloupe struck more of the high-grade ore, 600 ft. further south than the first strike, and indications are good for a considerable production. The company expects to have its mill operating this autumn, when the tram is completed, treating not only Guadeloupe but several other ores in the vicinity, taking some custom ore.

The White Cloud Mining Co. has unwatered its shaft and is now diamond drilling from the shaft in search of the orebody, which is one of the old Red Mountain "chimney" type.

BILLION TUNNEL, SMUGGLER UNION MINE, TELLURIDE, COL. LOOKING WEST ACROSS MARSHALL CREEK

ISHPEMING, MICH.—Aug. 23

The Dock Workers Refuse to Work at Marquette, Escanaba and Ashland, despite the fact that E. D. Brigham, of Duluth, who is in charge of ore, grain and coal movements for the Government in the Northwest, has informed them that if they do not return to their places the docks might be closed indefinitely. Most of the men employed at Duluth, Two Harbors and Superior went to work after Brigham issued his statement, but the men at the Michigan docks followed the advice of the union officials and refused to go to the docks until their claims had been satisfied. It is difficult to state what action will be taken by the Railroad Administration. A few men were engaged for work on the L. S. & J. dock at Marquette, and two boats were loaded there with Marquette range ore this week. Only a few shipments have been made from the mines in over two weeks, and most of the mines are again stocking. The extra cost to the operators will be high, as it requires considerable money to stock ore and then load it again for shipment to the Lake ports, and this must be done or discontinue operations underground. The dock workers are demanding 64c an hour, with

examined by Kirby Thomas, of New York, and mine repair and development work is now in rapid progress. Some milling apparatus was recently bought and hauled to the property, and it is understood that the company will probably build a mill this autumn or next spring.

The Red Mountain Mines Co., Ironton, in charge of George E. Collins, of Denver, has been developing and repairing some of the famous old Red Mountain copper-silver mines, notably the Genesee, Yankee Girl, and Joker Tunnel. The Yankee Girl shaft is now being unwatered, being open to the 11th level. A small mill has been about completed and may operate this season. An examination by Eulikeley Wells, with Fred Parish and Wilbur Grant, his engineers, has resulted in the announcement that Mr. Wells has taken an active interest in this company.

The Barstow mine, Ironton, continues shipments of high-grade gold concentrates made on the property, from the recent strike of gold ore.

The Ouray Consolidated Mining & Refining Co. has bought an interest in the company operating the old Guadeloupe mine, and is completing a mill at Ironton. A line has been cleared for an aerial tram and a compressor was placed at the mine. Last

time and a half for overtime, and recognition of the union. Mr. Brigham stated that their claims would be presented in Washington and that the men could just as well be working while a settlement was being made as to have their boats tied up in port. Three wheelmen had to be discharged at Marquette because they refused to sail on a boat which had been towed by a had little difficulty in getting three men to fill their places. The outlook is certainly not encouraging for the operators of the mines, as they have not succeeded in disposing of a great deal of ore this season, sales from the Michigan field being exceptionally light, and they want to at least move what has been sold. It is to be hoped that the strikers will soon awake to the realization that they can gain nothing by remaining away from work, and that shipments can be resumed.

DULUTH, MINN.—Aug. 23

Shipments of Iron Ore from the Lake Superior district had fallen off 1,427,885 tons on Aug. 1, 1919, as compared with a corresponding date in 1918. The embargo imposed on ore shipments Aug. 8 because of the strike of the railway shopmen has been raised slightly and speedily by the cause of the coal dock men occurring at the same time is still in effect and is threatening to tie up both the roads and is shipping such ore as is required to care for boats tied up at the head of the Lakes, but the Steel Corporation has shipped practically no ore since the placing of a meeting held in St. Paul on Aug. 21, decided to bring suit against Local No. 24 of the International Brotherhood of Electrical Workers, alleging conspiracy to prevent men from working on the coal docks of those cities. Granting an early adjustment of all claims, the season will have to become stagnant, the season will have to approach one of great activity in order to approach the tonnage moved in 1918.

Shipments in tons to Aug. 1, 1919 and 1918, follow:

Doek and Harbor	Shipments, 1918	Shipments, 1919
C. & N. W., Escanaba.....	2,012,271	1,804,424
C. M. & St. P., Marquette.....	83,096	617,139

Totals.....	29,608,933	25,181,848

SALT LAKE CITY, UTAH—Aug. 23

Metal-Mine Insurance Rates for Utah operators under the Workmen's Compensation Act have been lower than the first year fixed by the insurance companies for the present year. The rate of increased payments to injured workmen provided for by amendments to the law. The multiplier 2.7 will be used, instead of 3.15, and in the former as in the latter case, 1c. per hundred dollars of payroll added. Last year \$622,000 was paid in premiums, according to the Insurance Commissioner for the state; and although this year more companies are self-insuring, last year's premiums for this self-insuring with the multiplier 3.15 would, it is estimated, amount to about \$740,000. The multiplier of 2.7 will be a reduction of \$85,000 from the latter figure. Insurance companies are making arrangements to settle in various ways matter of excess premiums already paid this year.

SPOKANE, WASH.—Aug. 23

Metal Production in Washington will probably increase as conditions adjust themselves to normal times, but the output during the first half of 1919 was seriously curtailed by the drop in prices, according to the U. S. Geological Survey. The metal output in 1918 was \$1,467,421. A decrease from \$2,288,285 in 1917. The present rate of output indicates that there will be a decided decrease in the output of gold, silver and lead in 1919.

BOISE, IDAHO—Aug. 22

Laws and Regulations Pertaining to Surveying in the State of Idaho were changed by the last Legislature only in respect to the law now stands. The Department of Law Enforcement assumes the duties of the old Board of Examining Surveyors. The examination for licensed land surveyors will be held here on Tuesday in September. Robert E. Jones is the Commissioner of Law Enforcement, with office at Boise.

JOHNSON, ARIZ.—Aug. 23

Revival of Operations in this district is expected in the near future and indications are that a large tonnage will be shipped there. With the exception of two small properties doing development work, this camp has been shut down for the last six months, and the town was almost deserted, the miners going to other places to secure work. On July 20th, the Arizona United Mining Company put a few men to work cleaning up and getting the machinery in shape for operation. In a few more men have been put on each day. The railroad which connects with the main line of the Southern Pacific at Dragon, and hauls ore and supplies in, is in good condition, owing to the six months' idleness and recent heavy rains. A force of men are repairing the road bed and putting the track in condition for hauling. The Arizona-Michigan property has been taken over by the Mines and Development Corporation and mechanics have been overhauling the machinery which this company owns at the mine. This property will start as soon as the railroad begins operating which will allow shipments of fuel oil to be hauled in. The company has the collar of its main shaft. Connections will be made with this shaft from the old incline and all hoisting done in the perpendicular shaft.

BIRMINGHAM, ALA.—Aug. 23

United Mine Workers of America, Alabama District No. 20, are choosing delegates to represent this district at a convention to be held at Cleveland, Ohio, on Sept. 9. Fifty delegates are expected to go from this district. It is believed that the matter of a 6-hour day, for a week will be the cause of much discussion.

Production of Iron in Alabama showed a decided increase for July as against June, 142,772 tons of pig iron being produced, a gain of about 14,000 tons over June. Production in 1920 is not looked for so much. August is expected to show a corresponding gain over July, as several furnaces are being prepared for operation. Pig iron is expected to advance another dollar a ton soon, and manufacturers in the Birmingham district are paying little attention to further orders for last quarter delivery and no effort whatsoever is being made to get orders for 1920 delivery. Production was affected somewhat during the second week in August by the strike of railway shopmen, but before the situation became much more serious.

The shipbuilding industry in Mobile is calling for considerable Birmingham iron and steel, particularly fabricated steel, plates, girders, bolts, rods and other materials. The building of concrete ships at Mobile calls for large quantities of steel rods, and the Birmingham district will be required to furnish these. The Chicago Steel Building Company has three steel boats under way and this company is said to have contracts for eight more large ships from the Federal Shipping Board. This and other orders at Mobile depend on the Birmingham district for the greatest part of their steel products.

TORONTO, ONTARIO—Aug. 23

Vocational Training for Returned Soldiers will be given in accordance with the request of many war veterans of northern Ontario, and a class will be established at the Halesbury School of Mining. The course will include milling and assaying, and the veterans will receive full pay and allowances while they are receiving instruction.

The Consolidated Iron & Steel Corporation, Ltd., a new company representing Toronto and Detroit interests, and capitalized at \$8,000,000, has opened an office at 5 King St. East, Toronto, and is developing two large iron-ore deposits. One of these is a hematite mine situated at Furnace Falls, Leeds County, and the other is a magnetite mine at Brockville, comprising 1,500 acres, where several thousand tons of ore are now ready for shipment. The other property is situated at Mileage 150 on the Algoma Central R. R. where diamond drilling has been carried on since November, 1917, proving large deposits of ore to a depth of 500 ft. Engineers estimate that tonnage at high figures. Work on both properties is being actively prosecuted.

In the Development of the Peace River Oil Field of Alberta, a critical stage has been reached, the future of the field appearing to be dependent upon whether the difficult occasions by a heavy flow of salt water can be successfully overcome. So far, every well sunk into the Devonian sand formation beneath the Peace River in the established field below Peace River

crossing has produced the oil-bearing stratum. But directly beneath this is a stream of salt water subjected to an enormous pressure of wet gas, the upward flow of which has necessitated the use of several promising wells. It is now realized that the success of operations depends upon finding oil below the salt water and overcoming the menace of flooding. Dr. J. D. McArthur, has been working continuously since 1916, in which year well No. 2 was sunk about fifteen miles downstream from Peace River. It reached a depth of 1,125 ft., at which point the drill was in the recognized oil stratum, when the water suddenly gushed up 300 ft. about the derrick, driven by an enormous pressure of gas and putting an end to operations. The well was abandoned, and in July last struck at 962 ft. The oil sands were upstream from its 365,000 gal. When a depth of 1,032 ft. was reached the oil had risen to a depth of 425 ft. in the well. But at 1,085 ft. the salt water was encountered and the flow under the enormous pressure submerged the derrick and rendered all attempts to resume operations futile. Last year the company began sinking for the first time on a site on the west side of the river five miles below the town. The operators had to face practically the same conditions as those previously encountered. The salt water difficulty was overcome satisfactorily to a depth of 1,200 ft., its objective being the oil deposit believed to occur below the salt-water stream.

The Canadian Island Oil & Gas Co. is operating almost opposite well No. 2 of the Peace River Co. on the opposite bank of the river. The company has had to contend with the same hindrance from the flow of salt water, but has succeeded in checking it and is now drilling to reach the lower oil stratum. The Three Creeks Oil Co. is operating on the west side of the river, about 1,155 ft. Drilling has been suspended for some months by reason of the flow of salt water, which it is hoped to shut off soon.

VICTORIA, B. C.—Aug. 19

The Complex Ore Reduction Co., which was organized a few years ago to operate the French process for the extraction of zinc from complex ores and for its electrozinc from complex ores, has closed down. The British Columbia government fathered the process, guaranteeing the company's bonds to the extent of \$85,000. The government of course, will lose the money guaranteed.

The Granby company is shipping quartz ore from the mine to the Portland cement works to be blown in again, at any rate, so far as the Granby company is concerned. The Boyle Brothers have undertaken a contract for extensive diamond drilling on the Big Missouri, Salmon River district. Development work is said to be well up to a good point. The Standard mine, owned by Silverton, is developing a new ore body. Carl C. Hand, of Los Angeles, and A. W. McClune, of Salt Lake City, have made an examination of the Queen mine. The tunnel is 1,200 ft., and it is expected the Queen vein will be cut at 1,500 ft. The Yellowstone vein was cut at 700 ft.

GUANAJUATO, MEXICO—Aug. 14

Returns from the gubernatorial election held on July 20 were delayed considerably. Contrary to expectations, election returns did not bring the Anahuacites who had been anticipated owing to the friction that had manifested itself among the followers of the two principal candidates, Montes and Madrazo, a change in the local government is always associated with great interest to operators; because, with Bolshevism and labor agitation in other countries, a conservative administration is greatly desired. As all mills in the Guanajuato district are treating very low-grade ore, the strictest economy must be practiced, and excessive demands on the part of the laborers would cause a cessation of operations. What this means to the camp was clearly illustrated by the famine and pestilence which followed the closing down of the properties in 1915, which conditions have also helped to bring about the present dearth of skilled workmen in the district. There are, at present, approximately from 3,000 to 4,000 men at work in the various mines and ranches. During the last week, the rains have abated somewhat. It is hoped that the men who have refused to work in the mines, owing to the present conditions, and those who have left for ranches, will return and relieve the labor shortage, which has caused curtailment of operations.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ALASKA

ALASKA SHIPMENTS of domestic copper ore, matte, etc. to the United States in June totaled 3,021,912 lb., valued at \$483,580.

ALASKA GOLD (Juneau)—Milled 153,000 tons in July, averaging 97.4c. per ton. 75 per cent extraction, 81.32. Tailings loss, 18c. per ton. In June milled 159,510 tons, averaging 94c. In July, 1918, milled 74,830 tons, averaging \$1.319.

ARIZONA

Maricopa County

DRAGON (Wickenburg)—The Dragon Mining & Development Co. purchased two carloads of mining and milling equipment from Butress & McClellan, of Los Angeles, which is being shipped to the property, twelve miles east of Allah and about sixteen miles southeast of Wickenburg. Equipment includes 28 hp. Western gas engine hoist, a 12 x 14-in. Laidlaw Dunn Gordon compressor, a 60 hp. Commercial gas engine, a No. 2 Cameron sinker pump, and complete equipment for 50-ton concentrating plant.

Final County

RAY BOSTON COPPER (Kelvin)—Has been organized to take over the property formerly owned by the Kelvin Sultana Cop. per Co. New company capitalized at \$5,000,000, is in part a reorganization of the old Kelvin Sultana stockholders. A. H. Westfall, of Phoenix, president of the old company, is president of new company. C. E. Hart, of Miami, will be consulting engineer and general manager. E. F. Worthington will be superintendent. Has planned extensive diamond-drilling campaign to further prove property. Is well equipped with modern mining equipment, including steam-driven power plant, furnishing electric power. A 250-ton concentrator is on the ground. Considerable amount of development work has been done. Main shaft is 500 ft. deep, with lat-done. Closed down in September, 1916, at the instance of the bondholders. A. L. Flagg was then appointed receiver. Was purchased by the bondholders at foreclosure sale in January of this year. Reorganization being carried out by the Baldwin Syndicate, of which G. P. Baldwin is president.

WHITE METAL (Kelvin)—Most of the recently purchased mining equipment has been moved to the camp. Heavy rains damaged the roads and held up this work. Expected active development work on large scale will be begun by Sept. 1. J. C. Devine is in charge.

BROKEN HILLS (Ray)—L. D. Hutton, president, is on the property laying out further development work on the original holdings and on some of the recently acquired properties adjoining. Lower tunnel is still being driven to the eastward.

Yavapai County

McMAHON GROUP (Kirkland)—Leased to J. F. Hildner, of Phoenix, Ariz., who will do some development work.

CALIFORNIA

Calaveras County

MORGAN MINE (Carson Hill)—Clean-up for July said to exceed \$100,000. Good results obtained in developing 675-ft. level.

El Dorado County

MOUNT HOPPE (Placerville)—Being operated by J. Baring Good. Contracted for crosscut tunnel. Mine fully equipped with stamp mill, air compressor and hoist.

WHITE ROCK (Placerville)—Large deposits of white quartz being operated by the Drake Company, of San Francisco, under management of G. G. Frasier. Dry ton estimated 6,000 ft. long and 20 ft. thick, averaging approximately 99 per cent silica.

Kern County

CALIFORNIA RAND SILVER, INC. (Randsburg)—Shaft is now 24 ft. deep and twenty cars of ore have been shipped. Syndicate of Bakersfield men headed by L. V. Olcese is reported to have purchased a one-eighth interest for \$100,000.

Nevada County

GOLDEN CENTER MINE (Grass Valley)—Struck new vein in 500 west crosscut.

KENOSHA (Grass Valley)—New electric pump with capacity of 500 gals. per min. has been installed. Mine now being pumped and equipment being completed. Expected that operations will soon be resumed. Loyd Root is in charge.

MOUNTAINEER MINES CONSOLIDATED (Nevada City)—Purchased by Peter Bender at auction sale for amount of judgment and costs.

BROWN BEAR GRAVEL MINE (St. Charles Hill)—Gravel found in raise 40 ft. above main tunnel, which is being driven ahead to get under next channel.

Plumas County

ENGELS COPPER (Engelmine)—By appeal to Railroad Commission power bill has been reduced \$40,000 a year.

COLORADO

Boulder County

SMUGGLER (Bellara)—C. E. Schultze, of St. Louis, recently acquired large interest. Recent developments are promising.

BLUE BIRD MINES (Caribou)—W. S. Jennings, of New York, who recently examined the mines, stated he and his associates have decided to develop. If production warrants they will build complete reduction plant. Property is an old-time high-grade silver mine.

Clear Creek County

GEORGETOWN TUNNEL COMPANY has a large force engaged in excavating for mill-site. Construction will be pushed as rapidly as possible. In addition, a large force is at work in mine on development, and small force engaged in stopping high-grade silver ore from Clara E. lode. As result of high price of silver, a great amount of active work is going on in region, and numerous old properties are being reopened and examined.

Gunnison County

GUNNISON A-1 OIL CO. (Gunnison)—Composed of local men, has begun drilling first hole of Dollar branch on site selected by geologists as being centre of dome on Ohio Creek anticline. Several operators in locality have recently developed small amounts of oil on this anticline. It is expected that this well will be drilled to much greater depth than any of the other holes.

Lake County

CRESCENTIA (Leadville)—One of the shafts belonging to the old Emmet Mining Co. has just been reopened by Rogers & Co. Now down 600 ft. and has developed good body zinc ore, from which shipments will be made.

MATCHLESS (Leadville)—New York owners have begun a vigorous development campaign. Operations will be confined to lower ore horizons. Dr. Bailey, of New York, is in charge. Surface plant has already been repaired and placed in operation, and when shaft is repaired sinking will begin.

Park County

THE COLORADO POWER CO. is extending one of its lines to Hilltop mine, a lead producer. Property is inaccessible and fuel scarce, and expected that with electric power will become important producer.

Saguache County

EAGLE MINE (Bonanza)—On Kerber Creek, two miles east of Bonanza, has recently been taken over by C. M. Glasgow and associates, of St. Louis, Mo. Last year C. K. Kelso unwatered the mine, thoroughly sampled it, and conducted experiments on the method of treating the ore. A 50-ton flotation mill is being built, and a power line of the Colorado Power Co. has already been extended from the Shawmut mine, near Bonanza, and unwatering of mine is again about to be undertaken. Last year 200 tons of 12-in. fair-sized tonnage of argentine in a rhodocrosite gangue available. Ore averages 10 oz. in silver. Dump of 5,000 tons will also be treated.

Summit County

NORTH LONDON (Alma)—Mill expected to resume operations soon. Considerable activity going on, and believed that no difficulty will be encountered in maintaining sufficiently large ore reserves to keep operating continuously.

IDAHO

Bogday County

IDAHO CONTINENTAL (Port Hill)—Shipped 60 tons concentrates daily since July 23, when road became good enough for hauling. Using 12 motor trucks for the 26-mile haul. According to Robt. N. Bell, state mine inspector of Idaho, the "smel'er returns from several thousand tons recently shipped show general average of 60 per cent lead and 22 oz. of silver. With 1,700 tons of finished product in bins, mill treating 250 tons daily making 25 to 30 tons concentrates, a large output of shipping ore is assured if metal market is maintained. Estimates of 80,000 tons above No. 4 level were ultra conservative and reserves now indicate ten times that amount of probable and possible ore."

LOUISIANA

SOUTHWEST LOUISIANA DEVELOPMENT COMPANY has been organized to lease lands in this state and sublease them to drilling companies. Possible oil land, 26,000 acres in extent now under lease. Contract closed with Shreveport and Chicago company to drill. Work will begin soon.

LARGE ACREAGE IN ALLEN PARISH leased to Oklahoma company and drilling will begin at once. Land, known as West Bay, covers several thousand acres.

Catibone County

WILD-CAT WELLS being drilled in Bienville, Claiborne, DeSoto, Red River and Webster parishes. Good well recently brought in on Bull Bayou at 2,500 ft. Gas found in several of North Louisiana parishes, and oil boom is expected.

STANDARD OIL CO. (Homer)—No. 2 Oaks well came in recently flowing 6,000 bbl. a day. It is reported, from depth of 2,100 ft. Oil is 38 BE, exceptionally high as Gulf Coast oil is usually about 22. Number of smaller wells in this district making good production from depths of 1,100 to 1,200 ft.

MICHIGAN

Copper District

WOLVERINE (Kearsarge)—Produced in July 331,736 lb. refined copper from 24,038 tons of rock, being 13.8 lb. per ton.

MOHAWK (Mohawk)—Shows extraction of 23.73 lb. refined copper per ton stamped. Largest producer is No. 6 shaft, which is turning out more than 45 per cent of the total. No. 1 produces nothing. No. 5, 20 per cent of total and No. 4, remainder. No. 3 being sunk below 20th level and No. 6 below the 16th.

MINNESOTA

Cuyuna Range

DRILLING being done on Section 20-126-26, north of the Mississippi River and three miles north of Mangrove.

MINE RESCUE STATION to be established at Crosby, is proposed by B. O. Pickard, district representative of the Bureau of Mines. Plans have been prepared. Building and equipment estimated to cost \$20,000. Four men would be maintained, and present plans call for the expense of building, equipping and maintaining to be assumed by mine operators.

BWANAGO (Crosby)—Drilling NE-NW Section 12-46-29, in platted portion of Crosby by immediately south of the Croft mine.

IDA MAE (Crosby)—Sinking shaft 30 ft. deeper. Will put under contract and change main haulage drifts to permit of large output. Let contract to McCoy, of Trommald, for digging ditch to drain chain of lakes, some of which lie over or body.

NORTH RANGE IRON (Trommald)—Property on Section 4-46-29, on which shaft was sunk and underground development done last year, being again drilled by Abdar Development Co.

Meabi Range

BOURNE (Hibbing)—New property of Cleveland-Chiffs Iron Co. grading for shaft. Not yet announced whether property will be open pit or underground. If open pit, shaft will be for drainage purposes only. When developed will complete the circle of mines surrounding the present site of the village of Hibbing.

PHILBIN (Hibbing)—Oliver Co. completed shipment of 70,000-ton stockpile.

SARGENT (Keewatin)—Big new open pit of Wisconsin Steel Co. had just prepared to enter shipping list when shut off by embargo on ore shipments. Will probably ship heavily with lifting of embargo. Established record for development, having been stump-covered wilderness one year ago.

VEGA (Mesaba)—Report sale of 30,000 tons manganiferous ore guaranteed 10 per cent manganese. Vega Mining Co. operators. Formerly known as Mayas and operated by Coates & Tweed.

FRANKLIN (Virginia)—Property, opened by Franklin Rockefeller and associates in 1893, has made final shipment. Total shipments, 2,233,000 tons.

MONTANA

Beaverhead County

BOSTON & MONTANA DEVELOPMENT (Wise River)—Drift on 900-ft. level on Idaho vein continues in ore maintaining width of 10 ft. of good milling grade. Rails of Montana Southern Ry., designed as outlet for ores, now laid to within ten miles of Elkhorn mines.

Missoula County

POTOMAC COPPER (Potomac)—No. 2 tunnel in 500 ft., with country rock well seamed. Chiefly a drift, one of best grades working, ahead approximately 1,000 ft. No. 2 tunnel also will cut Leonard group of claims at depth of 1,500 ft. Preliminary development in Leonard zone 30 ft. wide of milling grade and with streaks up to a foot in width.

Powell County

CHAMPION (Deer Lodge)—Crosscutting for fissure under, with breast in softer ground. Now believed to be near vein.

Silver Bow County

ANACONDA (Butte)—Labor situation gives evidence of clearing, with period of stability to follow. Metal crafts s-like slowly disintegrating; other organizations declining to walk out. Development work being pushed. Scarcity of miners prevents return to normal capacity for some months. Cold weather expected to cause return of miners from the fields and forests.

BARNES-KING (Butte)—Quarterly report of opening drift, one of best ending June 30 shows earnings for North Moccasin of \$223, Shannon \$50,402, and Kendall \$1,530. Loss on the Peigan-Gloster operations, \$20,637. Net profit for quarter, \$27,371.26.

DAVIS-DALY COPPER (Butte)—High-grade ore zone northwest on the 2,100, corresponding with that on the 2,300 and other levels below, appears to be coming in. Rock is showing marked improvement, and there is believed to be little doubt that lower zone will be found to extend upward. Significance of improvement indicates now, it is thought, location of the ore bodies nearer the surface in the Davis-Daly.

NORTH BUTTE (Butte)—Produced 1,005,810 lb. copper in July; June, 767,468; July, 1918, 1,835,551.

NEW JERSEY

Middlesex County

UNITED STATES METALS REFINING (Chroma)—Plant has shut down, owing to labor troubles.

OREGON

Baker County

HUMBOLDT (Greenhorn)—A. R. Sweet and associates purchased this gold property under foreclosure and will work it if they do not sell it. Mine equipped with three-stamp mill, crushers and concentrating tables.

TEXAS

REPORTS OF OIL COMPANIES to Texas Railroad Commission must show all business, including capitalization, amount of stock sold, price obtained and seepage paid for selling and promotion costs, also production, situation of wells, amount of oil sold, price obtained and the purchaser.

PROHIBITING OF STORAGE in earth tanks of North Texas light crude oil, because of loss by evaporation, commission will probably be first conservation step taken by Texas Railroad Commission under

authority granted it by Oil & Gas Conservation Act.

Brazoria County

HUMBLE OIL & REFINING (West Columbia)—No. 4 Giraud well brought in recently at 2,200 ft. Making large production by flowing in heads. Liquid about 60 per cent oil and 40 per cent water.

TEXAS CO. (West Columbia)—No. 18 Hogg well brought in, flowing from 3,000 ft. has sanded. Now being washed in attempt to recover.

Dallas County

SALE OF ASSOCIATED PETROLEUM COMPANY'S holdings to Keystone Ranger Development Co., of Pittsburg, Pa. for sum of \$3,000,000, reported here; cash payment of \$750,000 made. Associated Petroleum Co. was local organization holding leases on 284,702 acres, and had twenty-nine producing wells.

REPUBLIC OIL & REFINING CO. (Dallas)—Announced construction of 5,000-bbl. oil refinery will commence Sept. 1. Has purchased tract west of city, capitalized for \$2,000,000; has two producing wells, and is drilling others. J. A. Jones, Jr., manager.

Hardin County

RIO BRAVO OIL CO. (Saratoga)—No. 34 Jordit well brought in at 1,300 ft., now making fair production by pumping.

SUN CO. (Saratoga)—No. 133 McShane well being tested.

TEXAS CO. (Sour Lake)—Arranging to pump 250 Fe. at Saratoga, No. 4 Ogden well is 2,900 ft. deep.

Harris County

NEW SURVEYS AT GOOSE CREEK of lands formerly leased from state, forfeited on account of non-compliance with terms, will be made at once. Surveys will materially change size and shape of tracts, an effort being made to make all submerged tracts accessible from the shore line. As soon as the surveys are completed, the Goose Creek tracts will be open for bids.

SEVERAL ABANDONMENTS OF WELLS made recently. Taylor Lake Oil Co., abandoned No. 2 Curry; Gandler Oil Co., No. 1 Mowry; Crosby Petroleum Co., No. 1 Fleming; Clear Creek Oil Co., No. 1 Tarson, temporarily.

CUCU REFINING CO. (Houston)—Purchased 500 acres on Houston ship channel at Deepwater, and will build refinery and tanks of large storage capacity. First tank to be 10,000 bbl. capacity. Reported that chief source of crude oil supply will be Central and South America, where contracts already made.

Liberty County

TEXAS GULF (Hull)—Morris Phillips well flowing by heads from 2,500 ft.

SUN (Hull)—No. 1 Joseph Carr well flowing by heads from 1,800 ft.

Orange County

BIG SIX OIL (Orange)—Will drill test well 8 miles west of town on Chesson farm. Rig on ground. Company locally financed.

Sterling County

TEXAS ELKHORN OIL CO., drilling on Richardson ranch, has well 3,350 ft. deep. Has penetrated 83 ft. of Gray Marble Falls sand containing oil throughout. Casing set and cemented at 3,746 ft. Leases in district still being acquired, although little activity within three miles is open for lease or purchase.

UTAH

Juab County

TINTIC SHIPMENTS, week ended Aug. 16, amounted to 127 cars.

CHEF CONSOLIDATED (Eureka)—Produced about 2,500,000 oz. silver in 1918.

NORTH BECK (Eureka)—Amendment of articles of incorporation permitting increase in capitalization to \$1,600,000. Property in northwestern part of Tintic, adjoining Centennial-Eureka, Gemini and Ridge and Valley. E. J. Raddatz and associates interested.

YANKEE (Eureka)—Shaft down, 1,100 ft.; making 2½ ft. daily. To be continued to 1,800 ft.

Salt Lake County

EMMA SILVER MINES (Alta)—Statement by trustees covering finances up to Aug. 12, 1919, issued. Shows receipts from assessments of \$176,613; from underwriting, \$74,609; subscriptions and underwriting stock, \$47,893; claims into stock for credit or stockholders, \$28,825; a total of \$327,952. Disbursements—including cash plus securities of \$100,000 held as trustee for Emma Silver Mines Co.—were of like amount. Probable that operations will be

resumed soon and that water in workings below Bay City tunnel will be pumped out.

MICHIGAN-UTAH (Alta)—Shipping up to a car of ore daily. About fifty men employed.

MONTANA-BINGHAM (Bingham)—Smeltery settlements of eight cars of ore recently shipped brought \$16,448, or about \$2,000 per car net. The ore is a pyritic copper ore carrying small amounts of gold and silver, allantanyte is president and general manager.

Summit County

SILVER KING CONSOLIDATED (Park City)—Reported silver-lead ore opened in raise in Electric Light claim. Raise starts from 1,625 ft. level up about 200 ft. Property has shipped no ore since August, 1918, and has made no regular shipments since May, 1918. During last year long drain tunnel in process of being driven in 10,000 ft.

WASHINGTON

Okanogan County

TIP TOP (Nespelem)—F. C. Hammond has taken a bond and reports ore at bottom of 100-ft. shaft, carrying silver, lead and gold. Vein said to extend 1,000 ft. on surface.

Stevens County

CONSOLIDATED COPPER (in Cedar Canyon district)—Shipped 208 tons, silver, copper and gold ore this year.

REARDO COPPER MINES (in Cedar Canyon district)—Shipped 137 tons this year.

AICHEN BEE (in Deer Trail district)—Has driven tunnel 103 ft. at cost of \$16.44 per ft. during this year. Said to have gone through 33 ft. of ore averaging 44 oz. silver and 32 per cent lead.

QUEEN AND SEAL (in Deer Trail district)—Reported sold to New York interests for \$60,000 by Charles Turner and associates of Davenport, Wash.

CANADA

Alberta

THE IMPERIAL OIL CO.'S geologist, Charles E. Taylor, announces that as the result of a geological survey by twelve crews in the foothills area, the company will soon start drilling southwest of Lethbridge. The drilling campaign includes a series of test holes in the first anticline east of the mountains all the way from the international boundary to the Mackenzie River basin.

British Columbia

LUCKY JIM (Slocan)—Senator Lendrum McMeans, of Winnipeg, contemplates foreclosing second mortgage, but will protect interests of stockholders if possible.

SILVER BELL (Slocan)—Second car, 26 tons, shipped and returned 237.4 oz. silver to ton, lead 31.1 per cent, zinc 7.1 per cent.

Ontario

CROWN RESERVE (Cobalt)—Purchased two claims in Larder Lake situated to the northeast of the Harris Maxwell.

MOND NICKEL (Coniston)—Cable advice received from the head office in England to ship bessemer nickel-copper matte at the rate of 3,000 tons per month. A large quantity has been stored at Coniston during the war, on account of lack of shipping facilities.

AVOUB CLAIM (Kirkland Lake)—Vein 6 to 8 ft. in width showing visible gold has been opened up.

ASSOCIATED GOLD FIELDS (Larder Lake)—Crosscutting at 100-ft. level of Dr. Redick property struck what is believed to be the Kerr-Addison deposit of low-grade ore 300 ft. wide. This orebody is 1,200 ft. long, on the Kerr-Addison, and the new strike, if supposition is correct, will lengthen it to 2,000 ft.

CLIFTON (Porcupine)—Drift on first level now 100 ft. in; ore showing visible gold in places.

MEXICO

BRITISH INTERESTS, according to official figures of the Mexican government, have acquired 2,431,000 acres of oil lands in Mexico. The Doherty group is second, with 586,692 acres. Total acreage owned or leased by foreign corporations is 5,436,271. During May, 6,897,962 bbl. of oil was shipped out of Mexico, the largest quantity for any month of the current year.

INDIA

Upper Burma

BURMA CORPORATION, LTD. (Bawdwin)—Cable advice received in London report ore found in raise above No. 5 level shows 31 oz. silver, 39 per cent lead, 23 per cent zinc and 4 per cent copper. Width, 66 in.

26	98½	99½	110	271½	268½	247	251	38½	39½

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—Aug. 27, 1919

The metal markets this week were dull, save for a few large and interesting transactions, and exhibited a good deal of irregularity. Copper was distinctly weaker, owing to the reappearance of resale lots.

Transatlantic freight rates are unchanged at \$18, and transpacific at \$14.

Copper

In our last report we said that "it seemed not unlikely that the principal producers might realize their prices presently." At that time business was pending, which was consummated on the following day. A brass manufacturer placed a very large order, which was divided among three producers, whose price was paid. Presumably this buyer had contracts to cover and could

not obtain so large a quantity of copper from any other hands. Following this transaction, however, producers did no other business worth mentioning, and copper immediately began to be offered down by some of the smaller agencies and by second-hands. On Aug. 22 a round lot was sold at 22½c. As the week wore on, offerings through brokers, in lots of considerable size, increased, and it appeared that the liquidation of copper held by speculators and others, which was supposed to have been absorbed, had by no means been completed. Toward the end of the week one very large lot was offered, and at the close copper was freely offered at 22c., with the probability that it could be bought for considerably less. Even at such a concession buyers showed no interest.

Other important features of the week were the offering of copper in round lots by Japanese houses. It is known

now without any doubt that some of the copper bought by the Japanese a few months ago was taken speculatively. None of that ordered from the Export Association has come back, but there was a good deal of Japanese buying outside of the Association. British houses this week offered ingot bars for import from Great Britain.

The Director of Sales announces that the War Department is preparing to offer for sale under sealed bids its surplus of brass, totaling approximately 192,347,057 lb. The material embraced in the proposed offering includes anvil brass, brass rods, brass bars, brass billets, cast bars, component parts of ammunition, disks, "gilding brass," leaded brass, primer metal, sheets and coils, spring brass, tubing, and scrap. The material to be offered is divided into two general classes, namely, that known to the trade as "70-30," which was used in the manufacture of small arms and field artillery cases, and that known as "60-40," which was used in the manufacture of fuses for sharpnel and high-explosive shells.

Copper Sheets—The base price of copper sheets is 33½c. per lb. Demand strong. Copper wire is quoted at 26@26½c. in carload lots, f.o.b. mill. Market is quiet.

Tin

A fair business was done at not much change in prices. Tin of 99 per cent grade was steady at 54@54½c. throughout the week. Straits was quoted at 56c. up to Aug. 26, when it declined to 55½c., rallying to 55½@56c. today. Straits for shipment was quoted at 52½@52½c. Singapore quoted £279, c.i.f. London, on Aug. 22; £276 on Aug. 25; and £275½ on Aug. 27.

Lead

Some producers reported a good deal of inquiry, including some from abroad, especially from China and South American countries. Other producers had very little inquiry. However, all of the principal producers were quite indifferent, owing to the full extent to which they are already booked. Consumers bought some round lots from independent producers in the early part of the week, paying 6c., New York, and that price was realized on smaller business right through the week. At the same time second-hands were making offers of lead in lots of 100 to 300 tons at around 5c. right through the week, and considerable business was done on that basis. The only explanation of this difference is that some consumers refuse to accept contracts with some of the concerns that are offering

lead cheaply. Just as speculators often have to pay a premium on purchases, at other times they have to accept a discount on sales. Larger interests that might clean up the market may be disinclined to do so, owing to the size of the accumulations that they have already.

Zinc

The market was dull and easier, declining a little from day to day. High-grade zinc quoted at about 87c., with only small business done.

Zinc dust is at 10c. for ordinary prolonged dust, 10½c. for atomized.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet.

Antimony—The market was again dull and declining. We quote spot at 85½@87c. Some of the Chinese houses have refused to meet these prices, saying that they are not justified by the economic conditions of the industry.

Bismuth—Unchanged at \$2.95.

Cadmium—Quoted at \$1.40.

Nickel—Ingot, 41c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—Opening the week at \$109, sales were made at declining prices, \$103 being quoted on Aug. 25. On Aug. 26 a sharp cut to \$95 was made. Light demand and freer arrivals and the throwing of a large quantity on the market are given as the explanations. San Francisco telegraphed \$102, firm.

Silver and Platinum

Silver market has continued firm, with steadily advancing quotations from London, which closed at 61½d., a figure that had not been touched since July, 1866. With firmer market for sterling exchange, New York quotations have kept pace with London, and close at 115½c. China demand has fallen off, as Chinese exchanges have not risen in proportion to the London market. Market closes steady.

Mexican dollars at New York: Aug. 21, 85½; Aug. 22, 86½; Aug. 23, 86½; Aug. 25, 86½; Aug. 26, 87½; Aug. 27, 88½.

Platinum—The advance to \$110 last week was maintained, the metal being in strong demand.

Palladium—Unchanged at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., Aug. 23—Zinc blende, per ton, high, \$51.30; basis 60 per cent zinc, premium, \$48.50; Prime Western, \$47.50; fines and slimes, \$45@42.50; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$47.65; calamine, \$30; all zinc ores, \$46.79.

Lead, high, \$65.25; basis, 80 per cent lead, \$62.50; average settling price, all grades of lead, \$63 per ton.

Shipments the week: Blende, 5,685; calamine, 299; lead, 1,274 tons. Value all ores the week, \$360,120.

Shipping is in a most deplorable condition. One smelterman reports 2,400

tons between the purchase and delivery. At the Ottawa station of the Frisco railway there are reported between 260 and 300 carloads of ore that the railroads are not attempting to move. Today it is reported the switches down near the mines, at Tar River and other points, are filling with loaded cars of ore. It is roughly estimated that there are over 400 cars of ore loaded and on sidetracks in Ottawa County alone.

Platteville, Wis., Aug. 23—Blende, basis 60 per cent zinc, \$48.50 base for premium grade and \$46 to \$47 base for high lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$62.50 per ton. Shipments reported for the week are 2,242 tons blende, 127 tons galena, and 444 tons sulphur ore. For the year to date the totals are 64,791 tons blende, 3,812 tons galena, and 10,115 tons sulphur ore. During the week 2,852 tons blende was shipped to separating plants.

Other Ores

Chrome Ore—Quoted nominally at \$25, f.o.b. California points, but that price can be shaded sharply.

Manganese Ore—Unchanged. Consumers seem to be well supplied.

Molybdenum Ore—Dull and unchanged.

Tungsten Ore—Business has naturally come to a standstill pending consummation of tariff legislation. The House of Representatives has passed a bill putting a large duty on the importation of tungsten ore.

Other Minerals

Nitrate—Conditions reported dull. Spot supplies are quoted at \$2.90 to \$2.95 per cwt., carload lots. According to an estimate received from one trade source, Government stocks remaining unliquidated amount to as little as 5,000 tons.

Pyrites—Spanish pyrites is quoted at 17½c. per unit for furnace size ore, free from fines, c.i.f., New York or other Atlantic port. Market slow and unsettled; hand-to-mouth buying. Very little ore coming in. Price will decrease with ocean freights.

Sulphur—No change has occurred in the general situation during the week. Prices are still quoted \$18 per ton, carload lots, domestic delivery, and \$20 per ton, cargo lots, for export shipments. Both quotations are at mines, Freeport, Tex., and Sulphur Mines, La.

Iron Trade Review

New York, Aug. 27, 1919

Nothing in the events of the week has changed the judgment of the steel trade that the strength of the strike movement engineered by the American Federation of Labor has been greatly overstated, according to *The Iron Age*. The number of men voting has been carefully suppressed. The President's stand against a sweeping railroad wage advance has not helped the steel strike drive. If steel works mechanics strike, they may shut down some departments,

but the large majority of mill workers are opposed to being thrown idle.

A significant development was the action of representatives of Midvale Steel & Ordnance Co. employees, gathered in their quarterly meeting, in declaring against a shorter day's work and an increased wage, and calling for "increased production and the stabilization of prices in conformity with wages now being paid."

Neither manufacturers nor consumers of steel appear to be taking any of the safeguarding steps as to stocks or shipments of material that are commonly seen when a strike is considered imminent.

At one Eastern and one Western steel plant eight-hour turns have just been granted, but at the former the output went down because enough men could not be found for three shifts.

Export trade, made up of so many kinds of material in moderate and small tonnages that its magnitude is scarcely appreciated, is still expanding.

Pittsburgh—Aug. 26

Up to the time of the President's general statement to the public, given in Washington dispatches published this morning, there was no small possibility of a strike being called in the steel industry by the representatives of the American Federation of Labor who have been attempting to organize the industry, and there were also possibilities of plants being closed in anticipation of labor troubles. The so-called "strike vote" ordered July 20 by the representatives of twenty-four unions affiliated with the Federation, and having more or less membership in the iron and steel industry, was announced on the evening of Aug. 20 as having been 98 per cent affirmative, and a special committee of six of the general organizing committee was instructed to approach the iron and steel manufacturers, seeking a conference. Failing to make arrangements within ten days, or by Saturday, Aug. 30, the committee had authority to call a strike. "Though the attitude of the steel producers as to engaging in a conference has not been made known, it has been absolutely certain that unionization of the mills and furnaces would be resisted, the issue presented being that of recognizing the union and establishing principles such as the check-off.

The President's public statement calling plainly upon everyone to declare a truce in labor matters until conditions are settled, and stating that wage advances would make futile the present efforts to reduce the cost of living, is generally received in the steel trade today as laying down a clear course of conduct, and it is believed that in the circumstances the Federation committee of six, under the chairmanship of Samuel Gompers, will not make any radical demands.

The entire iron and steel market situation has been under the domination of labor conditions and prospects. Though some buyers have been less disposed to place orders, others have

The Potash Situation

THE hearings before the Ways and Means Committee respecting legislation for the protection of the potash industry brought out some interesting points in regard to the potash resources of the United States. Perhaps the most important information is that even in the opinion of the high-cost producers, within a period of five years an American potash industry could stand upon its own merits in competition with foreign sources.

Much of the time allotted to the hearing of the potash question was consumed in an endeavor to solicit answers that could be used to political advantage, while the main question was often entirely overlooked. It is regrettable that partisan politics took such a prominent part in the hearing, for the heart of the matter is not a partisan question.

From our point of view the question at issue is this: Is it to the interest of the American people at large that there should be maintained within the United States a new industry, the raw material for which is here in abundance, and the finished product of which is essential to our welfare? Or is it to the interest of Americans generally that we should continue to derive our potash from foreign sources, save the public the expense of establishing a new industry, lose the experience and money already invested in the business, and remain dependent upon foreign supplies?

That potash is the substance under consideration is only incidental to the foregoing issue. A national policy is involved that with justice should be applied to all new industry. It is exactly similar to the glass, porcelain, chemical, and dye industries, and involves the possibility of high costs, until the new industry is strong enough to compete with foreign offerings.

There are two sides to the question, with more or less reason on both. However, history has proved that the prosperity of this country is built largely upon our industries, for a time artificially cultivated. This is admitted by the free trade advocates, and that the majority of the people believe it is evidenced by the various tariff laws that have been put in force to encourage the growth of industry.

What advantage would accrue to the American people through the establishment of a successful potash industry in the United States, and what would it cost them to establish it? While these questions were incompletely answered, the following points bearing upon them were brought out at the hearing: The normal consumption of potash in this country under pre-war conditions was approximately 250,000 tons, worth at Atlantic ports about \$10,000,000. Very little of this was brought to the country in American-owned vessels. Hence, approximately \$10,000,000 was spent by the United States for the benefit of foreign labor and capital. In these days when the public thinks of bil-

lions as it used to think of millions, this may not appear to be a very large sum, and yet if expended in labor, transportation and interest on invested capital, it means considerable industrial development.

At the hearing the opinion was expressed that in the post-war period the price of the imported material lacking domestic competition might be expected to reach nearly double the above sum, or \$20,000,000, assuming that imports would be practically the same. And it is fair to assume that they would equal former imports even at double the figure, because our farming districts have suffered materially for lack of potash salts during four or five years. Hence it appears to be a question of either spending at home or abroad \$20,000,000 and no economist could say that it would be disadvantageous to have this amount of money working in America rather than abroad.

However, it is believed that protection should not be so complete as to prevent all importation, but preferably that a portion of our normal supplies be permitted to come from abroad. Under these circumstances the whole of the estimated figure, \$20,000,000, would not be retained for home industries. Some competition is necessary, but should the industry be developed to a degree permitting of competition with German and French potash, we may ourselves begin to export to those countries favorably situated geographically, so that the ultimate aim is not merely that of supplying a portion of our own needs, but rather the cultivation of an industry that will do this and at the same time expand continuously, supplying both home and foreign markets.

The second gain of importance to America in the development of domestic supply is scarcely measurable in dollars. It is being independent of imports at a time when imports are impossible. We never expect to see that day, but it is just as possible to come in the days ahead as in those that are past. The price paid for potash during the war, when it reached more than ten times the normal figure, is an indication of the importance of such a domestic supply. But this is not the true index of the necessity, for it remained practically unobtainable for agricultural purposes for a long time. The money loss to agriculture cannot be calculated, but it is probably large.

The third advantage in establishing the industry lies in the conservation of the capital that has already been spent in building plants, in the preservation of the experience that has been gained and the skill that has been developed.

There may have been unwise or dishonest promotions in the potash industry, but there has been a very large amount of money spent legitimately and intelligently in an endeavor to make our resources of commercial value. Valuable experience has been gained and labor has acquired skill in conducting operations. Loss of these means national loss. The fact that a few plants

have been able to write off a portion or all of their invested capital does not make the national loss any less if those properties must now be abandoned.

The fourth point of advantage lies in the fact that the encouragement of the domestic industry would form the basis for further investments of a legitimate nature in this country. There will undoubtedly be further fraudulent or unwise promotions, but probably no more than in any other line of business.

One great difficulty a Ways and Means Committee or a Tariff Commission always encounters in its efforts to appraise correctly a manufacturing situation is that the high-cost producers are most vociferous in their demand for protection, while the low-cost producers sit back and take whatever Congress will give them as so much added margin. A policy acceptable to a great proportion of thinking men is that which provides tariff protection equal to the difference in cost of production here and abroad. Theoretically this is simple; practically it is most difficult to get an idea of correct costs at home, and almost impossible to appraise foreign conditions.

Here lies the difference between the potash industry and the glass, porcelain, chemical, and dye industry. With an almost unlimited amount of raw material, with a market absorbing potash by hundreds of thousands of tons, with the well-known American faculty toward quantity production, the potash industry as a whole has yet to demonstrate to a critical observer that with sound financing and correct technology it cannot *now* put potash on cars in quantity and at a profit at the same price Europeans can put it aboard ships. If this be true, cannot we reduce our post-war costs as rapidly as can they? And do we then need a higher tariff than would equalize rail and water freights?

We have learned that potash probably cannot be produced commercially from kelp. The Nebraska potash men now admit that they can get their salt more economically than in the past. Potash recovered as a by-product at cement plants promises to amount to a very respectable tonnage, and in our opinion will eventually command the local market. We have in many feldspars percentages of potash almost equal to that contained in the German and French salts as mined, and though their commercial use in quantities has not yet been realized, the question of their utilization may soon be solved, to the great advantage of the United States.

Danger!

MINE-OWNERS and refiners of metal, you are paying 35%* of all the money that is collected from the public for railway service. You are more vitally interested in low railway tariffs and adequate service than any other class of producers in the United States. What steps are you taking to see that your interests are protected? Are you prepared to see the Government take over the railways and place them in the hands of those who are now asking that this thing be done?

You may ridicule the idea as grotesque, as inconceivable for a sane people, as impossible; but it is no more impossible than that a wave of prohibition swept over the land, to the astonishment of millions; no more impossible than that we were at war with Germany

in a few short months after it was positively asserted that civilization would not permit such a thing. You are not facing what is for the moment a popular fancy. You confront a well-organized body of determined men, backed with the force of numbers.

This is not an imagined danger—it is a real one that threatens you, demanding active resistance, as active and as aggressive as the force that is contending to destroy our present industrial life. Can you imagine that with the railways in the hands of a labor party, your industries, so dependent upon transportation facilities, can thrive as they have done in the past? Your industries and those depending upon them are sure to suffer. The fact that your laborers are going to cast their votes for Government ownership and suffer in consequence is no reason for your not making every effort to protect yourself and to protect them from their own acts due to ignorance or misinformation. You face something worse than increased costs and decrease of business. Raising transportation charges will not be the end. From the ownership of inter-state railways and their management by their workers it is only a step to the ownership of other public utilities; only two steps to the national ownership of our fuel supplies, coal mines and oil wells; only three steps to the nationalization of all mines and of all private industry.

The boasted strength of the labor unions is not a vain boast. Theirs is a real organization, supplied with money, votes, and misguided but able brains, which can be overcome only by abler men acting in harmony for the safety of their country. Unfortunately, the latter will be supported by an indifferent public united by no bonds, and recognizing and supporting no leaders.

Though this soviet idea will be supported by the votes of many laboring men it must not be regarded as a class contest. It is a national question, a contest for the preservation of individual rights, for the fundamental principles that have made America what it is today. If the railway labor organizations insist upon making government ownership a question of party politics, and any party makes this one of the main planks of its platform, then the contest will have to be fought on political lines. This would be unfortunate and should be avoided if possible, as it will inevitably develop a labor party and a class spirit in respect to a matter wherein the true interest of laborer and investor are identical.

The avoidance of a class contest can best be accomplished through the enlightenment of labor, by showing labor what line of action will be to its advantage and what to its disadvantage. The average American laborer is not stupid; he will take the right course if he can be shown what is the right course. If it is pointed out to the miner that his leaders in Washington have made the threat that under certain circumstances "the railways will be shut down so tight that not a wheel will turn," he may wonder what is going to happen to him and his family while no trains are moving. If it is drawn to his attention that those leaders are opposed to the right of a man to will his savings to his children, the miner can see that he is following a leader who is opposed to one of the dearest privileges that the human being possesses, the right to care for and protect his offspring.

Above all other things, that one for which labor should strive, or even fight, is the opportunity to do honest work and accumulate a fund as a protection to old age,

*Bureau of Railway News and Statistics, year ending June 30, 1911.

or for dependent children. Any device conceived by man to interfere with this the workingman should fight with vigor, and the proposal now made by the leaders of the railway organizations is a long step toward the removal of the privilege of every worker to be the master of his own destiny.

Mining Investments

A FEW years ago it was not uncommon when speaking of mine investments, even to those who made a business of mining, to hear the idea expressed that the investor preferred gold mining to the mining of any other metal because he could safely count on the market value of his product. The prices of coal, iron, petroleum, copper, and silver all varied with the rapidly varying demands and new discoveries, while gold was always worth \$20.67 per ounce. We confess to having shared to some extent in the wisdom or fallacy of this attitude and to have thought that gold was not exactly a commodity in the sense that other useful metals are so regarded. However, conditions in the gold mining industry today are such that, so far as marketing is concerned, there is a very close resemblance between gold and any other natural product.

We are learning that \$20.67 is only a yardstick. It means no more than "an ounce of pure gold"; that the value of the metal is not to be gaged in dollars but in the amount of necessities, happiness or luxuries that a unit of it may be traded for. Our faith in gold has been shaken. We can no longer say that a vein of \$10 gold ore is just as good as money in the bank, or that a 50c. placer makes an absolutely safe dredging proposition. We are learning that in the discussion of new business it is not so important to consider what the element is which is to be mined, but the important point is to determine the market for it.

We may not wish to consider petroleum, potash, or copper mining for some real or imagined difficulty inseparable from the business, and yet any one of them may be good or poor business, depending upon the amount that can be produced per unit of endeavor—capital or labor—and the amount of necessities a unit of product may be traded for. The same argument applies to gold mining.

It may be suggested that we are simply calling attention to the fact that gold mining should no longer be set upon a pedestal as being without risk, and should be placed upon the same plane as other mining ventures, with all their attending uncertainties. That is not quite the idea. We would rather say that the business of mining other elements does not occupy an inferior position to that of gold mining. The prices of other natural products may rise or fall more rapidly, but all are influenced more or less by the same laws, the laws of supply and demand.

In mentioning uncertainties, we would not give the impression that there are more uncertainties in mining than in industrial enterprises generally, for there are not. And this is another thing that we are learning: The gilt-edged security is something that is passing into history. Not long ago the securities of public utility corporations were classed as safe investments for trust funds. Today your banker is reluctant to mention any investment as safe. Not long ago we believed that there was at least one thing that the American people would continue to do forever, that was to ride to and from their business and pay for

the accommodation. Hence we thought that shares in transportation systems (some of them) would form gilt-edged securities. People will always ride, but at the present day they are not paying for it. Our reasoning was slightly at fault. Today we believe that for years to come people will be moved by gasoline, hence the economical production of gasoline must be good business, and better and safer than the building of railways. But some day people may decide not to pay for this privilege, as is now the case with railways. If so, Standard Oil shares will be flat.

Whether it be manufacturing, building or mining, and whether it be the business of pumping oil, mining coal, iron or other metal or gem, no product can be considered to have a permanent value. The value of the product and the success of the business, other things being equal, will depend upon the market for the output. If the value in trade is above the average cost of production the business may succeed; if below, it will fail. Gold is no exception.

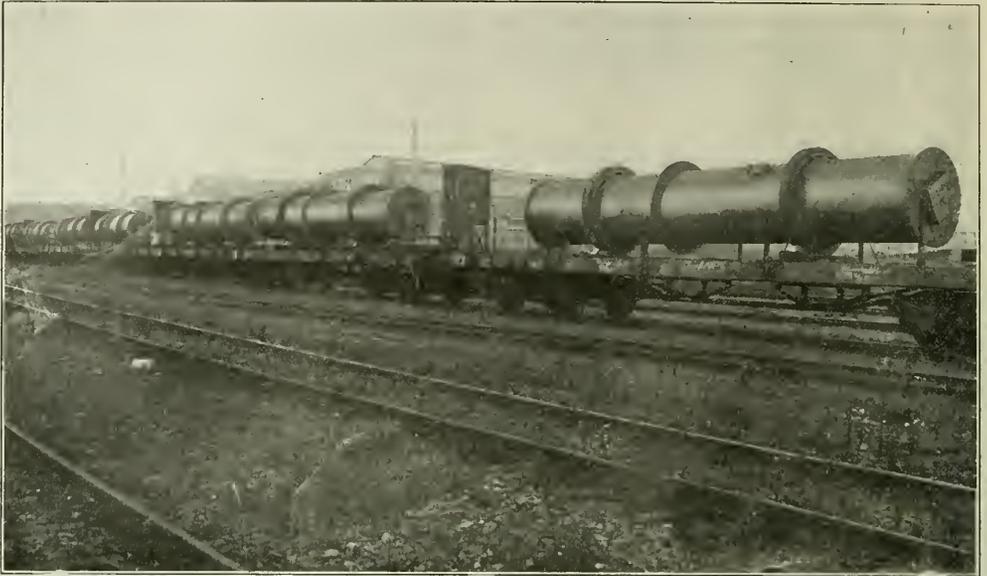

Industrial Corporation Schools

THE success that has attended the establishment of trade schools in various industries offers sufficient argument for their continuance. As applied to the mining field, the results obtained in the few instances where such systems have been put into practice have proved of such value that there is every reason to believe that further development is to be expected. A general analysis of the labor situation will serve as additional argument in their behalf. Foreign labor, upon which mine operation has been largely dependent, will undoubtedly be restricted, and its supply, plentiful in the past, will for some time be only irregular and intermittent. The increasing interest in labor-saving devices in the last few years suggests that operators anticipate the time when labor will be at a premium. In many instances machine-performed work has been done at a saving; in others it has been found that the costs parallel those obtained by hand labor, and in some cases the former resulted in a loss; but the work has been necessary regardless of cost.

Assuming, then, that there is to be a general adaptation of mechanical devices and the utilization of modernized machinery, it is to be expected that their operation will require the services of highly skilled labor. The rising costs of supplies make conservation necessary, and this is obtainable only through the employment of labor that is thoroughly familiar with the methods that effect efficient mine operation. The further education of men in subordinate positions assures a future supply of executives which will in turn demand higher intelligence from the men under them.

So-called trade schools must necessarily differ from institutions of ordinary learning. In the first place, their requirements demand specialization of thought. The success of a practical mining course depends on the selection of a schedule that will encourage independent thinking and co-ordination of ideas.

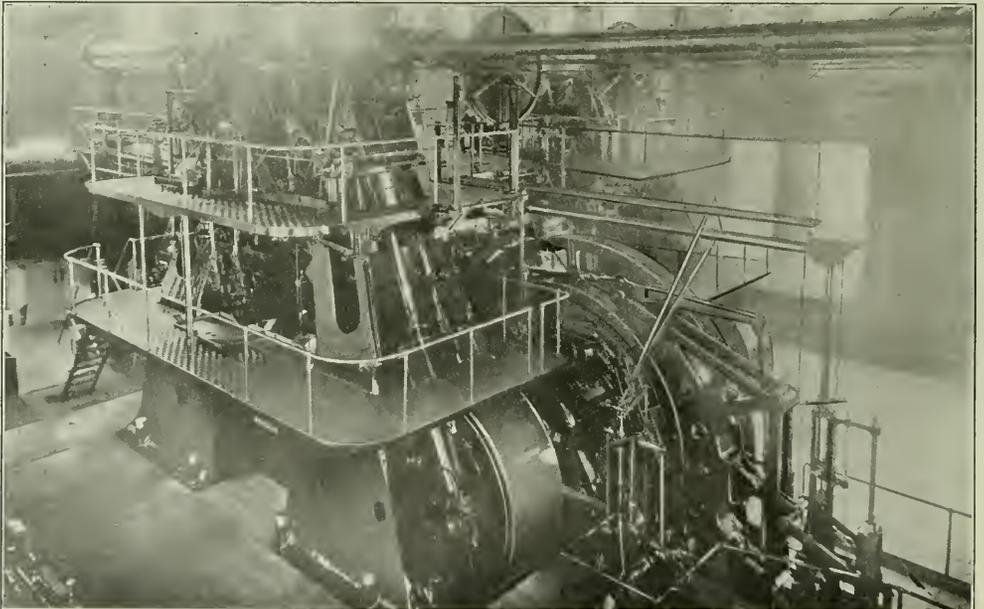

The opinions of capital and labor are not infrequently at variance with each other, but such institutions as industrial trade schools will greatly aid them in a better understanding. A common point of contact is established. Capital, on the one hand, acquires a better understanding of the capabilities and capacities of labor, and the latter receives a clearer insight to the requirements demanded in the operation of enterprise.

The Discovery of the Klondike

A New Version of the Story—Great Strike Principally Due to John McDougall, Though He Had No Part in the Gold Rush—Carmack, Actual Discoverer, Established a Unique Record, After Camping Five Years on Rich Ground

BY HENRY BOURSIN
Ozone Park, N. Y.

ABOUT the last of February, 1895, the Steamship "Alki," David Wallace commanding, left Puget Sound and British Columbia ports on her regular northbound trip to Sitka and way ports. Her passenger list included a few old-time Yukoners: a half-dozen or more French-Canadians, owning claims on Miller and Glacier creeks, in the Sixty-mile district, and a pioneer Yukoner named Sam Lansing. Of the chechakos, there were three with whom this story deals—a tinsmith who had sold his business in Butte, Mont.; John McDougall, originally from Bruce County, Ontario; and Dan Hart, a Scotchman.

McDougall's first mining experience had been gained in the Cariboo district in British Columbia, in 1879. Later he had been a subcontractor on the construction of the Canadian Pacific Ry. through British Columbia, and, after the completion of that road, had been a general contractor in British Columbia and Washington. Hart had quit his vocation as carpenter on a British warship, and was going North in search of gold. These three were strangers to each other, but having the same destination and purpose, they had agreed to go into the Yukon country as partners before the "Alki" reached Juneau.

The party disembarked at Juneau, which was then the jumping-off place for Yukoners. In those days two pioneers of Juneau, John Olds and Morris Orton, were running the Occidental Hotel. The three gold seekers put up there, and, a few days later, having purchased Yukon outfits, were impatiently awaiting favorable weather for crossing Chilkoot Pass.

When a man intends prospecting a country new to him, he acquires in advance such information as he can gather concerning it. McDougall had been doing this on the way up the coast and at Juneau. He learned that the Stewart River bars were worked out, and that there was small chance of locating pay ground in Forty-mile and Sixty-mile districts; further, that the latter districts were on the same gold belt; and finally, that the country rock there was schist and slate, trending seemingly toward the Stewart River diggings.

McDOUGALL HAS A BRIGHT IDEA

McDougall had not gone far into these details when there occurred to him a suspicion which rapidly grew to the dimensions of a theory. It was this: Perhaps those three districts were on the same gold belt; if so, between Sixty-mile and Stewart River was a good place to prospect.

One day while loafing about the hotel, McDougall searched out Lansing, who had mined in all the districts mentioned, to renew their talks about Yukon diggings. To get his fragmentary information straight in his mind and keep it so, and to focus that information on a definite place, he had gone to Dick Nelson's Post Office stationery store and procured a sheet of paper. Returning to the hotel, he put the paper on a

billiard table, and, in the presence of fifteen or twenty men, with Lansing dictating the position of diggings and streams, he made a map to jibe with Lansing's idea of the lay of the land. It was not a pretty map, but it is not often that a Geological Survey cartographer with a string of initials trailing after his name can make one that leads to more gold.

After getting Lansing's ideas on paper, McDougall drew a line from Forty-mile diggings to Stewart River diggings, and asked: "Where's the highest ground along that line?" "There," said Lansing, indicating a place between the Yukon and Stewart rivers. "Has anybody prospected there?" was the next question. "No," was the reply. "That's where the fresh meat for Forty-mile comes from; it's called the 'moose pasture.'" McDougall drew half an oval, which with the straight line inclosed the north half of the "moose pasture," and, turning to his partners, said: "Boys, we will prospect on the north slope of the 'moose pasture.'"

In reaching this conclusion McDougall put to astonishing use what he knew of the occurrence of placer gold near Barkerville, B. C., where the extremely rich creeks flow northerly from a prominent mountain, whereas the south creeks are comparatively poor, though all are in schist and slate country rock.

The map was handed to Hart, who stowed it away in an inside pocket. Surely, not a man present had the least suspicion that on it was exactly shown one of the richest placer fields ever discovered, and that it would be found by following that crude sketch. They saw only a tall, quiet, big-boned man making a map of a country he had not seen.

FATE SPOILS THE GOLD SEEKERS' PLANS

Before the end of this recital of mining history is reached, it will be seen that Fate never intended McDougall, Hart, and the tinsmith to reap fame and fortune as the discoverers of the Klondike; that will stick out like an ounce nugget in a spoonful of black sand. Those men fully intended prospecting there and nowhere else. Their outfit had been bought, and they awaited only favorable weather for crossing Chilkoot Pass. It is at this fair-seeming stage when Fate first shows a contrary, even malevolent, disposition toward McDougall and Hart.

Although the calendar said "spring," the weather belied it. There were frequent and heavy snowfalls on the pass, and the danger from snow-slides was great. Some of the Frenchmen boarded a steam launch every week or ten days and went to Dyea to see how the pass looked. With disgusting frequency the report was the same. They were as eager as any to cross the range; their courage was undoubted, and they were learned in the treacheries of sullen mountains; so when they returned and said, "She's bad; better we go bam-bye," the unanimous opinion prevailed that a start bye and

bye was soon enough. Thus the start was delayed until the middle of April.

In the meantime other things conspired with the weather to sidetrack McDougall. A mild mining excitement developed at Juneau concerning the beach diggings at Latuya Bay, where gold had been found a few years before. It was reported that George Wheelock and Captain Cole were working fifteen men on ground seven miles west of the bay and were clearing \$150 a day; and that Dave Spurgeon, working alone on ground four miles east of the bay, was washing out from \$7 to \$20 a day.

MCDUGALL URGED TO GO TO LATUYA

These rumors sounded good, and three men from Portland, Ore., were seized with a strong desire to try their luck in that region. The little schooner "Seagull" lay in the harbor at the time; so the Portland men tried to induce the owners, two cousins named McKinnon, to take them to Latuya, transportation free, the McKinnons to share and share alike with the prospectors in any locations made. The McKinnons were tempted but not stampeded; it cannily occurred to them that they knew nothing of the gold-finding capability of the Oregonians, whereas, there was a man in town in whom they had large confidence. So they agreed to go if McDougall joined the party.

The reason why the McKinnons wanted McDougall to go dated from 1889, when the latter was a contractor at Port Townsend, Wash., and the McKinnons were halibut-fishing out of that port. About twenty or more years before, a Mexican had found gold on the beach at Port Townsend, where, tradition says, he worked out a small patch which paid \$2 a day with a rocker. This beach gold was supposed to have been thrown up by the sea, until McDougall, in 1889, found that it came from the bluff above. The result was a brief but vivid mining excitement on ground which had been trodden by the feet of countless thousands. Wherefore, McDougall's judgment on beach-diggings was held in high esteem by these schoormen. Of course, McDougall was strongly urged Latuya-ward.

During this time of delay and of doubt as to which of two contrary courses promised the fairest, McDougall had in mind the probability of securing a contract in British Columbia the following autumn, and that in case he found nothing surely profitable in the meantime, he would return to British Columbia in the hope of securing the contract. At that time there was no railway from tidewater to the Yukon. The miners who crossed the range hand-sleighed their outfits from Dyea to the lakes at the head of the river, where they whip-sawed lumber and built boats in which the journey was continued down-stream to some tributary, then up-stream to diggings or failure. It all consumed time, as may be imagined. To come out in the autumn by the same route they poled a boat up-stream six hundred miles. To go in and out of the country the same season left but a fraction of a Yukon summer for prospecting. In the McDougall case, every day of delay in starting was a day off that fraction.

The conspiracy of events succeeded. It would have fooled anybody. McDougall sold his share in the Yukon outfit to Hart and the tinsmith, and went to Layuta. There he found opportunity only for more capital than he had, and returned to Juneau the latter part of June, thence going to British Columbia. He was in Cariboo,

B. C., when the news of the Klondike strike reached him.

Hart and the tinsmith had left Juneau the middle of April in company with Lansing and the Frenchman. Lansing pointed out the "moose pasture" to them on the way down river, but instead of stopping to prospect, they continued on to the town of Forty-mile to replenish their stock of provisions, a part of which had spoiled from getting wet. At Forty-mile the tinsmith abandoned his prospecting notions on finding that he could earn \$20 a day as the town tinker, which seemed a good-enough gold mine to him. In after years he owned a hardware store at Dawson, and later was in the same business in a large way at Nome. Perhaps he is there yet. The reason his name is not mentioned is because McDougall has forgotten it.

One man can go nowhere up-stream poling a boat on the upper Yukon and tributaries. Consequently, the brisk demand for a tinker having deprived him of his partner, Hart cast about for another, and found one in a Scandinavian named Hansen.

These two then poled up the Yukon to prospect the north slope of the "moose pasture." The river now known as the Klondike is the stream they should have turned into on leaving the Yukon. The east side of the Yukon along that part of the river is bad poling, so that all up-river boatmen hug the west shore, which is the opposite one from the Klondike side. So, when their goal, the hills now known as Dome Range, was neared, they were on the opposite side of the Yukon, where the poling is good, and failed to see the mouth of the Klondike, which was hidden by wooded islands. Here was an error in judgment. When they finally crossed over to the east side they had passed the mouth of the Klondike; and, instead of dropping down, they continued upstream and pulled into the Indian River, the first tributary south of the Klondike.

HART AND HANSEN MISS THE BIG STRIKE

The boat was taken up the Indian River to the mouth of Quartz Creek and left there. Both Hart and Hansen could see before this that they were south of where they wished to go—that they were on the south slope of the "moose pasture." So they began packing their outfit up the valley of Quartz Creek. On coming to its second tributary, since known as Little Blanche Creek, they headed up that valley which runs from the south side of the Dome Range, as the easiest way to reach the north side. Unfortunately, at a place near the mouth of Little Blanche Creek where they camped, a coarse-gold prospect was found in shallow ground. It was the first native gold Hart had ever seen, and he told McDougall years after, "It looked good to us." There they stayed, washing out gold, until a shortage of supplies should compel a return to Forty-mile.

Although Hart still had the map, it had ceased to pull him along. Several times he suggested going over the range to the north side, but Hansen always demurred, arguing that they ought to stay at work and wash out enough gold to buy their outfit for next year. They never knew how much gold they washed out that summer, having no scales with which to weigh it, but they guessed the total at \$2,000. Had they gone five miles further, just across the Dome Range to the northern slope, they would have found Eldorado Creek, world-wide fame, and a million dollars to the five-hundred foot claim. When most of their food had disappeared, and

the remainder was nearing an end, and when the frosty nights hinted at winter's swift approach, and their raiment was a time-worn joke, they took the back track for Forty-mile.

They arrived there, agreed on a crafty plan, namely, to tell no one about their diggings, and to expend their joint capital so as to put in a year of prospecting in the "moose pasture."

*The best-laid plans of mice and men
Gang aft a'gley.*

It seldom falls to the lot of man, however, to miscalculate by so wide a margin as did Hart and Hansen. If they had agreed to go on a \$2,000,000 spree, the plan would not have gone awry, for that is about what happened. Just how it occurred is, of course, somewhat hazy, but Hart remembers that Carmack was there. Anyway, when their exhilaration had passed, they had splashed their dab of dust into the channels of trade, and where it came from was no secret.

GEORGE CARMACK "DISCOVERS" THE KLONDIKE

George Carmack, assisted by his two Indian brothers-in-law, supplied the town with moose meat; which they obtained, as has been said, in the "moose pasture." Hence, when Carmack and family went to the "moose pasture" the next spring, they had pick, pan and shovel with them. Also the same spring, Bob Henderson began prospecting on the north slope of the pasture, and found pay diggings on a creek which he named Gold Bottom.

Not until 1897 did Carmack take out enough gold to convince the old-timers that he actually had struck something good in the "moose pasture." Cheechakos were more credulous; they believed the impossible—and found themselves rich.

As a gold discoverer George Carmack has a record that is absolutely unique—it probably never will be beaten. For five years he camped every summer where the very spot occupied by his tent was underlaid by some of the richest gold gravel ever found. Following his "discovery" other men found gold in plain sight on the bare bedrock of Big Skookum Gulch, about 1,000 ft. from his camp. At about the same distance, on No. 2 above Carmack's Discovery claim, three pans of gravel, averaging \$1,100 to the pan, were taken from a depth of one foot below the surface. Gold Hill, also but a few hundred feet distant from his camp ground, had a string of claims averaging \$500,000 to the claim. Year after year he camped on and walked over gold galore without the shadow of a suspicion crossing his mind that the country was worth a tinker's dam except for moose meat.

Hart was several hundred miles down the Yukon, repairing a river steamer for Jack McQuestion, when the news of Carmack's Klondike strike became known. From sheer disgust with himself, no doubt, he never returned to the Little Blanche diggings or went to the Klondike, but continued on at his trade during the gold excitement. In 1901, when McDougall first went into the Yukon country, he met Hart at Forty-mile. The latter was then in charge of the mining operations of the North American Transportation & Trading Co. in the Copper River country. He said: "If you had been with me, we would have got there." What became of Hansen is unknown.

McDougall was in the Yukon country off and on from 1901 till 1904, but found no claim which paid well. The best he did there was \$7 a day on a claim on Clear

Creek. As late as 1904, Lansing was in charge of the mining operations of the Ladue company in the Klondike.

It is probable that gold would have been found in the Klondike region years before 1895 but for the presence of Carmack there. It works out thus: The district was known for years to all Yukoners as his hunting ground; and, although he was not a prospector, it would seem inconceivable that anyone could camp and roam in a gold country for years and never see a sign—this in a land where every man and woman was supposed to be a bit of a prospector and the very babes played at mining. To most men it would appear as if there were too many impossibilities to consider that one. Again: By the time two men poled store-grub up a river or two, then packed or sleighed it over a divide or two, the cost of that grub-pile in money and hardship was such that its use as food might almost be classed as a luxury. In fact a man and his dog-team would devour \$1,000 yearly. Consequently, what game and fish he could get was a matter for serious consideration, for under the most favorable circumstances he could cut 75 per cent from the cost of his provender. Therefore not only was the Carmack presence in the "moose pasture" regarded as conclusive evidence that it contained no rich diggings, but his business there was distinctly harmful from the prospector's point of view, for by every moose he killed the probability of a prospector going there was thereby lessened.

Increase in Steel-Ingot Output

The output of ingots by steel works in the United States in the month of July amounted to 2,984,858 gross tons, or 114,802 tons a day for twenty-six working days, as compared with 2,640,984 tons, or 105,639 tons daily, in June, according to *Iron Age*. The July output was at the rate of about 35,473,886 gross tons a year, based on 309 operating days and on reports to the American Iron and Steel Institute from thirty companies, which in 1918 made 84.03 per cent of the total production.

The accompanying table gives the tonnage of steel ingots produced in 1918 by twenty-nine companies, making in 1917 about 85.10 per cent of the entire

MONTHLY PRODUCTION OF STEEL INGOTS, IN TONS

amount, and for the last seven months figures from thirty companies making 84.03 per cent of the production in 1918.

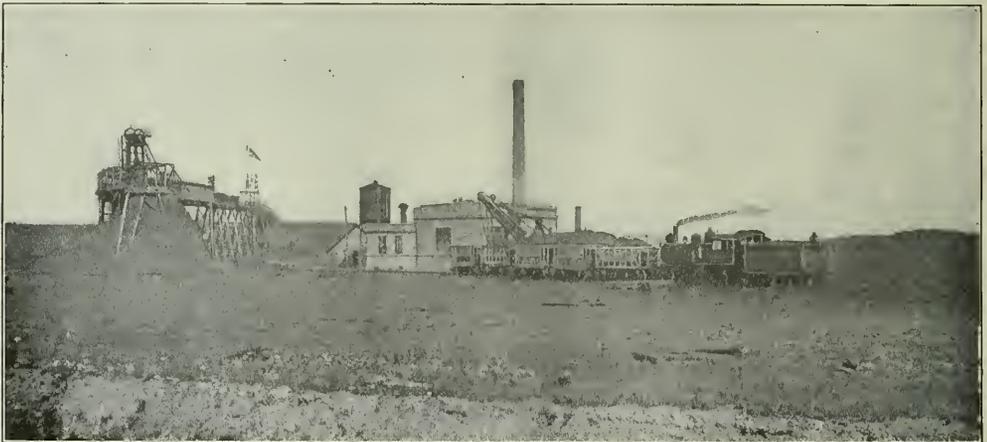

Transvaal Gold Production in July was 725,497 oz., compared with 736,199 oz. in July of last year. The total for the first seven months of the year is 4,872,981 oz.

Minnesota State-Owned Iron Mines

Administration of Commonwealth Lands, Leased to Operators on a Royalty Basis, With Minimum Yearly Shipments Specified, Vested in State Auditor and an Organized Mines Department—Official Report Pronounces System a Success

EARLY in its history as an organized state, Minnesota, under Federal grant, became possessed of 8,402,046 acres of land, or one-sixth of the total area of the commonwealth. With the advance of settlement, new acreages became valuable and passed to private ownership in fee simple until in 1889, when the increasing number of iron-ore discoveries in northern Minnesota caused the Legislature to enact laws reserving to the state mineral rights in all state lands thereafter sold in St. Louis, Lake, or Cook counties. This enactment was later amended to include all state lands, and by virtue of these statutes the State of Minnesota is the largest single fee owner of iron-ore deposits in the United States.

from the date of its execution, provides that the lessee shall be permitted during that period the privilege of removing all the "merchantable, shipping, iron ore" which is to be procured "in such manner only as is usual and customary in skillful and proper mining operations of such character." It is provided, also, that within five years after a railroad has been laid within one mile of the property the lessee shall ship therefrom at least one thousand tons of iron ore, and that each year thereafter he shall ship a minimum of five thousand tons annually. Failing this provision, the lessee shall pay the state a minimum ground rental equivalent to the income which would have been derived from royalties on such shipment. The royalty so paid

THE PHILBIN MINE, NEAR HIBBING. ONE OF THE STATE-OWNED MINES IN MINNESOTA

The property comprises 31,560 acres on the Mesabi Range, 4,640 acres on the Vermilion Range and 4,200 acres on the Cuyuna Range, according to the limits of these districts as now recognized by the best authorities. In addition, there are large acreages in the prospective Gunflint, Highland, and Ottertail districts, and about 520 acres in the magnetic formation at the eastern extremity of the Mesabi Range. The proved tonnage on such portions of these tracts as are already under lease is estimated by the Minnesota State Tax Commission at 173,137,125, as compared with 1,430,711,297 tons which the commission recognizes as the total amount of merchantable iron ore now proved to exist in the state. The same Legislature which reserved to Minnesota the mineral rights of state lands also established the state as a fee owner and determined its duties as such. Laws were enacted making provision for a standard lease, stipulations were made covering the necessary mine inspection, and adequate distribution of the income was arranged.

The state lease, which is operative for fifty years

is 25c. per ton, and payment of such money in the failure to ship iron ore has been held by the courts to be in no sense an advance royalty, but merely a ground rental, and is forever lost to the lessee. Under this law, 373 leases have been made, of which all but 91 have been canceled, and of these 33 have been developed and become active shippers.

The question of ownership of iron ore underlying lake bottoms was in dispute for some time, but has been decided in favor of the state, and the 1917 Legislature enacted laws covering the leasing of these properties. It is provided that all such leases shall be sold at public auction to the highest bidder, but that the minimum bid acceptable shall be at least 50c. per ton royalty. The other terms of the lease are to be decided for each property thus disposed of by a committee consisting of the Governor, the Attorney General and the State Auditor. A proved orebody of 3,000,000 tons lying under Syracuse Lake, at the eastern end of the Mesabi Range, has been leased for the minimum under this law.

Shipments from state properties to Aug. 1, 1918, totaled 25,546,168 tons, the royalties from which had yielded the state \$6,386,542. Based on the present estimated tonnage, and assuming that none of the state properties excepting those now under lease will ever yield any iron ore, the ultimate return to the state from royalties alone will amount to \$49,670,883.

The following is a list of state-owned properties which have been developed and have entered the shipping list:

STATE-OWNED IRON-ORE PROPERTIES IN MINNESOTA

Mine	Operator	Tons Shipped in 1918
Missabe Mountain	Oliver Iron Mining Co.	1,173,312
Leonidas	Oliver Iron Mining Co.	656,735
Pool	Oliver Iron Mining Co.	191,434
Grant	Interstate Iron Co.	117,407
Hanna	Consumers' Ore Co.	116,082
Woodbridge	Fort Henry Mining Co.	209,414
Wacontah	Consumers' Ore Co.	279,442
Wacoutah "B"	Consumers' Ore Co.	947
Seranton	Pickands, Mather Co.	947
Helmer	Cleveland-Cliffs Iron Co.	207,643
Duncan	Oliver Iron Mining Co.	5,159
Minnewas	Oliver Iron Mining Co.	7,703
Fay	Virginia Iron Mining Co.	251,989
Shiras	Oliver Iron Mining Co.	128,402
Frantz	Consumers' Ore Co.	169,777
Seville	A. B. Coates	7,203
Hill Annex	Interstate Iron Co.	559,727
Kevin	Butler Bros.	21,601
Philbin	Oliver Iron Mining Co.	233,484
Prindle	Oliver Iron Mining Co.	251,989
Majora	Hobart Iron Mining Co.	251,989
Morton	Dean Iron Co.	39,292
Smith	Butler Bros.	4,067
Margaret	Oliver Iron Mining Co.	175,587
Wanless	Oliver Iron Mining Co.	175,587
Draper	Draper Iron Co.	175,587
Pilot	Hanna Ore Mining Co.	175,587
Tompson (Cuyuna Range)	Inland Steel Co.	152,648
Martin (Cuyuna Range)	Whitemarsh Mining Co.	1,421
Northland (Cuyuna Range)	Northern Minnesota Iron Co.	1,421
Total		4,638,283

The following properties have been abandoned as being worked out:

STATE-OWNED MINES NOW EXHAUSTED

Mine	Operator	Total Tonnage Shipped
Alberta	Lily Mining Co.	136,534
Cavour	Cavour Mining Co.	177,952
Section 17	A. B. Coates	20,802
Eaton	Eaton Mining Co.	3,547
Yates	Consumers' Ore Co.	678,990
Silver	Virginia Ore Co.	174,813
Maderia	Maderia Mining Co.	195,494
Deacon	Oliver Iron Mining Co.	347,511
Total		1,735,643

Under the law, each parcel of iron-ore land is credited to one of three funds: either the permanent school fund, the permanent university fund, or the swamp-land fund. The income from each lease is placed in a permanent accumulation and credited to its particular fund. The principal remains forever inviolate, the interest only being applied to the purposes designated. Through the fiscal year ending July 31, 1918, the permanent school fund had accumulated \$5,514,962, the swamp-land fund, \$646,986, and the permanent university fund, \$224,593. Investments are made by a committee composed of the Governor, the Treasurer, the Attorney General, the Auditor and the President of the Board of University Regents, and are limited by law to state and municipal bonds.

ORGANIZATION OF THE STATE MINES DEPARTMENT

The entire detail of handling the properties, from the execution of the lease to the collection of the last dollar of royalty, is in the hands of the State Auditor, with headquarters in St. Paul. Under him, and in direct charge of all mine inspection, is the Superintendent of Mines, with offices in Hibbing. This office is maintained by an appropriation from the general

fund which amounts at the present time to \$80,000 annually. The personnel, in addition to the superintendent, comprises ten mining engineers, two chemists, and an adequate office force, besides several practical mining men, who are employed as inspectors. The activities of the office extend throughout the three ranges (Mesabi, Cuyuna and Vermilion), and, owing to the variegated character of the mines under their inspection, it is safe to say that the work of the mines department includes every phase of mining activity now found in Minnesota. The office has on file complete and up-to-date surveys of all mines under lease, keeps accurate account of all ore shipped, and by means of its laboratory facilities is able quickly and satisfactorily to settle any dispute which may arise as to the merchantability of any particular deposit of ore. Beneficiation of iron ore is of interest to the department because the state owns large tonnages of every known variety of lean ore, and considerable experimentation with washing, drying, screening, sintering, or briquetting of low-grade ores has been performed.

At the request of the State Auditor, the Bureau of Mines recently completed an extended investigation of the method of conducting Minnesota-owned properties. J. R. Finlay and H. T. Eddingfield, mining engineers, were selected for this work, and their report, submitted to the last Legislature, contains a detailed study of the entire iron and steel industry in the state. After going over the drill records, recalculating the ore reserves, observing the manner in which engineers in the State Auditor's office have kept a record of the extraction of ore, and making a close study of the schedules of ore prices which determine the merchantability of iron ores, both investigators declared themselves convinced that the state-owned iron mines have been well and properly administered.

Government Soon To Make Armor
And Heavy Forgings

The new naval ordnance plant at South Charleston, W. Va., is soon to begin the manufacture of armor plate and forgings for guns of large caliber, entirely new lines of work for Government plants. The South Charleston plant is a \$19,000,000 enterprise occupying more than 200 acres of land. It will be ready soon for making armor and heavy forgings.

Engineers, metallurgists, and mill and machine shop men will be interested in the positions which are to be filled in the supervisory and subordinate forces. The U. S. Civil Service Commission has announced for this plant the need of a superintendent of melting shops at \$5,000 a year, a superintendent of forge shops at \$5,000 a year, foremen of heat treatment of armor plate at from \$10 to \$14.40 a day, foremen of heat treatment of large guns at from \$8 to \$12.56 a day, foremen of 14,000-ton presses for armor and large caliber guns at from \$11.84 to \$13.28 a day, foremen of small guns at \$8 a day, and foremen of heat treatment of projectiles at \$8 a day.

Detailed information and application blanks may be obtained from the U. S. Civil Service Commission, Washington, D. C., or from the secretary of the local board of civil service examiners at the post office or custom house in any of 3,000 cities. Journeyman workmen and helpers should apply direct to the labor board at the South Charleston plant.

Geology of Platinum Deposits—Part II

A Surprising Number of Occurrences in Association With Other Minerals Has Been Discovered
—Placer Deposits of Platinum Constitute the Most Important
Source—Production of Various Districts

By W. L. UGLOW

Assistant Professor of Geology, University of British Columbia,
Vancouver, B. C.

PLATINUM occurs in graywacke, slate, shale and mica schist. Investigations have been made regarding the platinum content of a graywacke rock near Wenden, Westphalia, Germany, by means of borings. According to Paul Krusch,⁴⁶ the graywacke is an elastic rock which consists mainly of quartz and slate, which is bound with a clay cement. It is therefore made up of the fragments of other rocks. The fragments were laid down by water with imperfect separation by specific gravity. The graywacke contains, besides small particles of platinum, small amounts of gold, copper, lead, zinc, silver, nickel, and chromium. In borings in an area of 500 acres, platinum was found in nine different holes. The amounts so far obtained vary from a trace to 33.5 gm. (31 gm. = 1 oz. troy) per ton, and consequently make certain portions of the rock a valuable commercial source of platinum.

It is suggested that the deposit may represent a fossil placer, whose values were originally derived from the breaking down of former platiniferous terranes, such as dunite, peridotite, or serpentine. This is one of the newer discoveries, and the platinum content was not suspected until 1913.

At *American Localities*. The occurrence of platinum has been noted in assays of clay slate containing pyrite, chalcopyrite, and galena, and mica schist from Lancaster County, Pa.⁴⁷; in black Triassic shale from Boyertown, Pa.⁴⁸; and from shales in the Grand Canyon of the Colorado.⁴⁹

Platinum has also been discovered in connection with certain vanadium-bearing coals from Australia, whose ultimate analysis⁵⁰ showed 3.8 per cent sulphur and 1.7 per cent ash. Two analyses of the ash from this coal are given in Table V.⁵¹

TABLE V. ANALYSIS OF ASH FROM AUSTRALIAN COAL

	1 Per Cent.	2 Per Cent.
Vanadium.....	25.1	2.90
Platinum metals.....	3.6	0.23
Oxygen with above.....	44.0	5.10
Sand, earthy matters.....	27.3	91.77
Totals.....	100.0	100.00

No. 2 represents an analysis of the ash of the coal in bulk. The No. 1 analysis is equivalent to 14.7 oz. platinum metals and 102.3 oz. vanadium per short ton of coal.

The presence of platinum has been detected in contact metamorphic deposits in association with rhodolite, garnet, biotite and iron sulphides at the top of Mason Mountain, Macon County, N. C.;⁵² and with wollastonite on the island of Sumatra.⁵³

Platinum has been found, in quantities varying from a trace to one-eighth of an ounce per ton, in shear zones in granite, from Siwash Creek, Tulameen District, B. C.⁵⁴

Occurrences of platinum in association with pyrite and limonite have been reported from Westland, New Zealand,⁵⁵ and from the Departments of Charaste and Deux Sevres, France.⁵⁶

IN BULLION, BLISTER COPPER, AND COPPER MATTE

Refiners of bullion and blister copper from the gold and copper ores of the Western United States report the presence of platinum in these substances in amounts varying from 0.3 to 1.8 oz. per 100 lb. of copper. In Table VI, the data of which were compiled by the Ontario Nickel Commission,⁵⁷ the presence of platinum and palladium in blister copper from various localities is indicated. The amounts are given as ounces of platinum and palladium per 100 lb. of blister copper:

TABLE VI. PLATINUM AND PALLADIUM IN BLISTER COPPER

	Ounces per 100 Lb. Blister Copper	
	Pt	Pd
Garfield, Utah.....	0.342	1.183

Cerro de Pasco, Peru.....	0.319	0.589
Mount Lyell, Tasmania.....	0.624	1.374

This table shows an apparently genetic association of platinum and palladium with copper ores, and the advisability of adopting careful methods for their detection. The growth in the practice of electrolytic refining should work in the direction of increasing the supply of the metals of the platinum group from ores of this type. They are so sparsely disseminated in the ores themselves, that only careful analytical work would give a fair idea of their relative amounts.

PLACER DEPOSITS

Up to the present, over 99 per cent of the world's supply of platinum has been derived from placer workings, chiefly in Russia and the United States of Colombia. In these deposits the metal is found entirely as native platinum, which appears to be a natural alloy containing, besides platinum, the associated metals palladium, iridium, osmium, and rhodium, and important amounts of iron. The analyses given in Table VII indicate in general the composition of this mineral.

Sperrylite, the arsenide of platinum, is unknown in placer deposits. Native platinum occurs in these deposits as small flakes, grains, points, pellets, and nuggets, the largest record nugget weighing 252 oz. and coming from the Ural Mountains, in Russia. It is as-

cassiterite, and garnet. Chromite and sometimes olivine are characteristic associates.

A study of the various platinum placer fields of the world leads to the conclusion that the original source of most of the placer platinum was in rocks of the dunite, peridotite, or serpentine type, consisting essentially of olivine, chromite, magnetite, serpentine, and some alteration products. No occurrence is known where the source of the metal may be traced to lode deposits of the other types described, which contain sperrylite, accompanied by the sulphides of iron and copper. Despite the rather widespread distribution of rocks of the dunite, peridotite and serpentine type, new placer districts are being discovered infrequently.

Placers are derived by the erosion of materials from the deep secular decay of rocks containing the precious metals, which become concentrated in the gravels. It is most important, therefore, in the search for new deposits, not only to investigate areas containing rocks of the type described, but to pay strictest attention to those which have undergone at least one physiographic cycle, and have hence been subjected to periods of long-continued weathering and erosion.

Short descriptions of the chief platinum placer fields of the world, showing their relation to the physiography and geology of their respective districts, may tend to emphasize these salient features.

DISTRICTS IN WHICH THE DRAINAGE BASINS OF THE PLATINIFEROUS STREAMS ARE KNOWN TO CONTAIN ROCKS OF THE DUNITE, PERIDOTITE, SERPENTINE, OR OTHER OLIVINE-BEARING TYPES

*Ural Mountains, Russia*⁵⁸—The platinum fields of Russia are in a comparatively limited area on the eastern and western flanks of the Ural Mountains, almost entirely within the confines of the Government of Perm. The entire area is comprised within a block of country extending less than 400 miles north and south and about 300 miles east and west. There are seven chief producing areas, known as (1) the South Verkhotur, comprising the districts of Nizhne-Tagil, Nizhne Turin, and Verkhne Turin, which is the chief producer; (2) the Perm area, east of the city of Perm, comprising the Iss, Veeva, and Tura river systems, which is the second largest producer; (3) the North Verkhotur area; (4) the Cherdyn area, about 100 miles northwest of the last named; (5) the South Ekaterinburg area, in the neighborhood of the city of Ekaterinburg; (6) the new Nikolae-Pavdinsk and Rastes area, north of the

North Verkhotur area; and (7) the drainage system composed of the Vagran, Lobva, Aktai, Talits, and other rivers.

Along the crests of the Urals and near the headwaters of many of the present streams are outcrops of dunite, peridotite, and serpentine, in which have been identified small particles and specks of platinum. The topography of the country is mature, and consequently these platinum-bearing rocks have undergone a great amount of disintegration and decomposition. In this way the precious-metal particles have been released for concentration in the gravels.

Some of the rivers are platiniferous for over 100 miles, and workable deposits have been found at distances of 800 ft. on either side of the present stream courses. The gravels which have been worked vary from a few feet to sixty feet in depth, and the chief platinum recoveries have been obtained from thin paystreaks close to bedrock.

Estimates have been published by various writers of the platinum content of these gravels. According to one authority⁵⁹ the product of the Iss River up to 1897 had averaged 60c. per cu.yd. (the platinum being valued at \$10.18 per oz.) for an average width of 350 yd., and a depth of 3½ yd. from the grass roots to bedrock. Two dredges working on the Iss River gravels in 1911 recovered 77.7c. per cu.yd. in platinum (the platinum being valued at \$37.80 per oz.). The average tenor of the ground worked has been gradually decreasing, as shown in Table VIII, and it has been estimated that unless new productive fields are soon opened up, the rich platinum deposits of the Urals would be exhausted in 8⁰⁰ to 12⁰¹ years from 1916, if mined at the pre-war rate.

TABLE VIII. SHOWING DECREASING AVERAGE TENOR OF RUSSIAN PLATINUM PLACERS⁶²

1850-1883.....	0.33		

Tulameen District, British Columbia, Canada—Platiniferous gravels are found throughout portions of the Tulameen drainage basin, which is about 100 miles directly east of the city of Vancouver. Small rich workings have been located on portions of Granite and Slate creeks, which are tributaries of the Tulameen, and along certain portions of the Tulameen and Similkameen rivers.

The platinum is found in the form of small points and grains, and in small nuggets rarely exceeding half an ounce in weight, associated with black magnetic sand, carrying chromite and olivine. The gravels vary in thickness from a few feet up to 60 or 70 ft., and in the shallower portions the paystreak is concentrated on bedrock.

It has been fairly well demonstrated that the original source of this platinum is in the dunite and pyroxenite rocks of Olivine and Grasshopper mountains,⁶⁰ especially where they are rich in chromite. The richest platinum gravels have been found in those stretches of the valleys immediately below the localities in which the dunite or pyroxenite has been tapped by the drainage systems.

A great deal of the shallower ground of the narrow stream valleys has been fairly well worked out during the last thirty years, by small hand operations; but there are still great stretches of almost virgin ground in the valley flats of the larger streams, which, judging from the results of preliminary investigations by the Canadian government in 1918, may supply considerable amounts of the white metal.

The region lacks the condition of mature topography, and consequent deep secular decay, which, if present, would no doubt make it one of the world's important platinum producers. Nevertheless, sufficient platinum has been taken out of the Tulameen district, particularly during the last fifteen years of the last century, as shown in Table IX, to maintain for it the position of premier platinum producer of North America.

*Ronda Mountains, Spain*⁶⁵—Platinum-bearing sands and gravels have been recently found to occur in the river systems in the region of the Ronda Mountains, Province of Malaga, southern Spain. The area comprises twelve or fourteen river systems, and the deposits are loose peridotite sand found in the river beds at depths of ten to fifteen meters. The platinum is associated with magnetite, chromite, ilmenite, gold, zircon, and brookite. The topography of the area is youthful, and the platinum-bearing streams flow through steep-walled, narrow valleys.

After the announcement of the discovery, the Spanish government took possession of the ground, prohibited prospecting in the vicinity, and arranged for financing the necessary drilling and testing to determine the extent and value of the deposits. Reports indicate that this work has been completed on the rivers Verde and Quadaiza, and that platinum has been found to be present in reasonable quantity. One report states that the platinum content of part of the Verde bed varies between 0.002 and 0.006 oz. per cu.yd. There is a gradation from coarse to fine gravel from surface to bedrock, and though there is slightly more platinum near bedrock than in the upper part of the gravels, there is no sharply marked pay streak.

The geology of the area is not essentially different from that of the Ural Mountains, Russia, or the Tulameen District, B. C. It lacks, however, the mature topography of the Russian districts. The rock system of the Ronda Mountains has been the subject of careful study, and it has been found to consist in part of peridotite, with central cores of dunite containing masses of chromite, through which minute particles of platinum are disseminated. This, no doubt, is the mother lode of the placers.

New South Wales, Australia—The most important of all the Australian occurrences of platinum are at Fifield and Platina, districts about a mile and a half apart and about fifty-four miles west of Parks, in New South Wales. The associated rocks, principally slates, are

the same in both localities, and the platinum appears in a gravelly wash, together with osmiridium and gold. The beach sand deposits of the northeast coast of New South Wales furnish platinum just as do those of the southwest coast of Queensland. In these black sands, platinum, osmiridium, gold, cassiterite, and monazite are found in very fine grains, associated with chromite, magnetite, ilmenite, garnet, and zircon. Though the sources of all these minerals are not easily determinable, the platinum and osmiridium are believed to have come from the serpentine area forming part of the western edge of the Clarence Coal measures.⁶⁶

The total production of New South Wales up to 1911 was 11,500 oz. of crude platinum. Most of the material has come from Fifield, where the shafts to bedrock are from 50 to 60 ft. deep, and the thin paystreak, 6 in. to 13 in. thick, on the bedrock yields one part of gold to seven parts of platinum.⁶⁷

Borneo—Platinum is found with gold in the gravels of certain streams in the southeast of Borneo, in the Tanath-Laut region. The streams rise in the Bobaris Mountains, which are formed of crystalline schists and gneisses that have been intruded by basic dikes ranging from dunite with chromite to olivine gabbro. These rocks have been altered to serpentine. In the gravels which have been formed from these rocks, olivine, chromite and platinum are found with gold. The locality has yielded at least a few thousand ounces.⁶⁸

California—The principal occurrences of platinum in the United States are in California. Here a small amount of crude platinum occurs in the principal placer mines of the gold belt of the Sierra Nevada, but in no place is the metal so abundant that the deposit can be worked for platinum alone. The source of the metal is undoubtedly in the serpentine and peridotite or pyroxenite, which occur as intrusive masses throughout the gold belt. In many cases, silvery white scales of iridosmine are more common than the platinum itself. Little or no platinum was recovered until the beginning of dredging operations on a large scale along the foothills of the mountains.⁶⁹ The most productive counties are Trinity, Siskiyou, Calaveras, Yuba, Butte, Humboldt, Merced, and Del Norte.

DISTRICTS IN WHICH THE MOTHER LODE ROCKS OF THE PLATINUM ARE NOT DEFINITELY KNOWN TO OCCUR

United States of Colombia, South America—The gold-platinum alluvial deposits cover an area of more than 5,000 square miles, which lies west of the central ridge of the Colombian Andes, in the Atrato and San Juan drainage basins, and extends south of the mouth of San Juan River along the coast to Mira River. The richest deposits and those most worked in the past are near the headwaters of San Juan River, principally on the Condoto River. The platinum is found in greatest abundance in the present stream channels, but it is also found in conglomerates of Tertiary age. Platinum is found in the streams only where the conglomerate has been eroded. Stream beds above the areas underlain by that formation are barren. The stream deposits are reconcentrations from the older gravels. The Tertiary conglomerate is composed of rounded boulders of basic rocks, among which diabase, melaphyre, peridotite, and dunite have been recognized.

⁶⁵*Mineral Industry*, 1916, p. 596; U. S. Geol. Surv., "Mineral Resources of the U. S.," 1915, p. 147, and 1916, p. 16; *Mineral Industry*, 1915, p. 579.

⁶⁶*Mineral Industry*, 1917, p. 543.

⁶⁷U. S. Geol. Surv., "Mineral Resources of the U. S.," 1911, p. 14.

⁶⁸U. S. Geol. Surv., "Mineral Resources of the U. S.," 1916, p. 12.

⁶⁹U. S. Geol. Surv., "Mineral Resources of the U. S.," 1911-1917.

In the gravels of the San Juan drainage basin there are about equal quantities of platinum and gold, but in the Atrato basin platinum constitutes approximately 15 per cent of the value, the remainder being gold. What appears to be a conservative estimate gives a total of 336,000,000 cu.yd. of gravel that can be considered as reserves, with 68,000,000 cu.yd. as proved ground, capable of producing at a profit under present working conditions. It is well understood that prospecting in the Choco is difficult, and these estimate reserves may be revised in the light of future work.⁷¹ Chromite is present in the sand with the platinum which points to a peridotite as its original home.⁷¹

A promising new source of platinum was discovered in Colombia in 1917. This was in the Caceres district, in the basin between the Cauca and Nechi rivers, in the department of Antioquia. The tract covers 12,096 acres, extending for 144 miles along the Caceri River, principally on the north side, where it reaches back for about a mile and a quarter. On the south side the width is about 300 ft. The loose gravelly soil would make extraction easy, and the sands extend downward to a depth of 25 ft.⁷²

California and Oregon Beaches—The presence of platinum is characteristic of the beach sands along the Pacific Coast from San Bernardino County northward to the mouth of the Columbia. The richest beaches are in Humboldt and Del Norte counties, Cal., and in Coos County, Ore. Bullard, in Coos County, and Port Orford, in Curry County, have proved, perhaps, the richest beaches. It is difficult to give the percentage of platinum occurring in the sand, as the fine scales are concentrated into thin paystreaks on the beach.⁷³

North Saskatchewan and Peace Rivers, Canada—Gold and platinum-bearing gravels have been found in the bars and benches of the North Saskatchewan River, in the vicinity of Edmonton, Alberta, and also of the Peace River and its tributaries, the Finlay, Omineca and Ingenca, in northeastern British Columbia. The platinum is usually in the form of fine flakes and grains, associated with gold, magnetite, chromite, and garnet. No mining operations of any account have yet been carried on in these areas.

The original source of the platinum is unknown. No basic rocks of the peridotite or olivine-chromite-bearing type have been identified anywhere in the vicinities of these gravels. It is possible, however, that the precious-metal particles might exist in the form of fossil placers in the sediments of the Rocky Mountains, where they were deposited in earlier geologic eras. The rivers are now eroding these sediments and may be concentrating therefrom such precious metal particles as they contain.

Cariboo District, British Columbia, Canada—Platinum is known to occur in certain of the river systems of the Cariboo districts, chiefly in association with the gold-bearing placers, and along the Quesnel River. Owing to the small amount of geological investigation that has been carried on in this region, it is not known whether or not basic rocks of the olivine-bearing type occur in the neighborhood.

Inferences from the study of the foregoing classified descriptions of platinum deposits should direct at-

tention to the following types of rocks and orebodies, as possible new sources of the platinum metals:

Lode Deposits—(1) Basic intrusive rocks, of dark green to black color, consisting chiefly of pyroxene, hornblende, basic feldspar, or olivine, and containing appreciable amounts of chalcocopyrite, pyrrhotite, pyrite, bornite, and covellite. Preference should be given to those areas in which such rocks occur as the smaller intrusive masses, like sills, dikes, and sheets. (2) Copper-gold veins, especially if they contain such minerals as bournonite, tetrahedrite (gray copper), chalcocopyrite, arsenopyrite, and covellite. (3) Nickeliferous orebodies in general, especially those of the magmatic segregation type. (4) Rocks of the dunite, peridotite, and serpentine types, especially where they are known to contain chromite in disseminated or massive form. (5) Sedimentary beds, of the fragmental type, which might be fossil placers. (6) Bituminous deposits the ash of which carries appreciable amounts of vanadium.

Placer Deposits—(1) Gravels, with which are associated particles of chromite and olivine. (2) Gravels, found in watercourses which drain, or drained at the time of their formation, areas containing rocks of the olivine-bearing type, such as dunite, peridotite, and serpentine, in which chromite occurs. (3) Gravels, in areas of such basic rocks, which have passed through at least one physiographic cycle, during which mature topography has developed, resulting in the deep decay of rock and the consequent release of the precious metal particles. The richest deposits of the world are found, as stated, in areas in which these types of rock occur, and where the valleys are broad and mature, and the river gradients low.

Eight-Hour Day in Metal and Mining Industries in France*

Representatives of the metallurgical, mining, mechanical construction, electrical and manufacturing employers' union, and of the Federation of Metal Workers of France have agreed upon the following articles:

There shall be an eight-hour day in all these industries. The employees will adapt themselves to the modern development in machinery and to reasonable methods of work in order that production may early resume its former status and attain the proportions necessary to the general welfare. The employers recognize that in order to maintain and develop production it is expedient to establish piece rates, premiums, and bonuses, and they agree to guarantee a wage based upon production under normal conditions; and if, by reason of the activity and efforts of the employees, production exceeds this base, the employees are assured that their intensified production shall not be considered as a reason for a reduction of wages.

The reduction of the hours of labor to eight per day shall not work a decrease in wages. Employees working by the hour shall have compensating increase of hour rates, but changes in piece rates shall be demanded only when such rates, without change in equipment, do not afford, with normal effort, an opportunity to earn the usual wages. Foreign workmen having equal occupational skill as French workmen may be employed when industrial conditions demand it and shall receive equal wages and remunerations.

A New South Wales Lead Smeltery

The Cockle Creek Silver-Lead Works of the Sulphide Corporation, Ltd., Treat Complex Ores By Roasting and Blast-Furnace Smelting, Followed by Refining of the Base Bullion—Sulphuric Acid Also Made

A COMPLETE description of the silver-lead smelting works of the Sulphide Corporation, Ltd., at Cockle Creek, New South Wales, was recently published¹ in Australia. Through not as large or as modern in all respects as some other plants, the company has prospered in the face of many difficulties. The works are of interest from the standpoint of the complexity of ores treated, which include lead, antimony, arsenic, silver, gold, copper, bismuth, and zinc, and also because of the diversity of the products. In addition to the metals, there is produced in a year 19,000 tons of chamber sulphuric acid, from which is made 25,000 to 30,000 tons of superphosphate, together with smaller quantities of coal gas, fuel oil, sulphate of ammonia, pitch, nitric acid, and other byproducts.

ROASTING

Most of the ore treated comes from the company's Broken Hill mines, although custom ore of the most complex character is accepted from outside sources. Ores containing over 3 per cent sulphur are crushed by jaw crushers and Krupp mills to pass a ¼-in. screen. Should the ore or concentrates be high in sulphur, a preliminary roast is given in gas-fired Godfrey furnaces to bring the sulphur down to about 10 per cent, and also to agglomerate the fine particles for subsequent treatment in the Huntington-Heberlein pots. A typical charge to the roasting furnaces would contain: Pb, 50 per cent; SiO₂, 7; FeO, 7.5; CaO, 6; MnO, 2.3; ZnO, 10; S, 15 per cent.

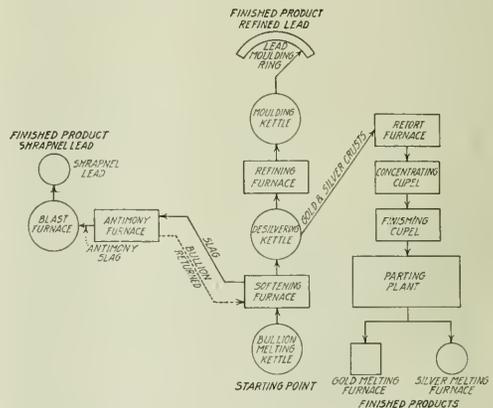

There are twenty-four cast-iron H.-H. pots of elliptical form, hung on hollow trunnions. Each has a capacity of five tons, the charge resting on a horizontal perforated plate set 6 in. from the bottom of the pot. The 10 to 12 oz. air blast passes through the hollow trunnion, down a pipe outside of the pot, and thence into the wind-box. The ore charged is red hot, as it comes from the Godfrey furnaces, so that no fuel is needed, roasting throughout the charge beginning as soon as the air is turned on. After six to eight hours the pot is turned over, and the sintered mass dumped out and cooled by a water spray, and then broken up into 6-in. lumps.

SMELTING

The H.-H. product, along with about one-third of its weight of reverts and fluxes, after proper bedding and mixing, is charged, along with coke, to the blast furnaces, of which there are three. No. 1 has a crucible area of 49.5 sq.ft., measuring 11 ft. 6 in. by 5 ft. at the tuyères. Blast enters through thirteen 3-in. tuyères at 60-oz. pressure. Working normally, this furnace is capable of treating 300 tons of charge per day, exclusive of returned slag and coke, with an output of 100 tons of lead.

Tapped slag flows into a cast-iron forehearth mounted on wheels, where the lead and matte is caught, the slag

overflowing into a 3-ton cast-iron pot, from which it is poured on the dump, the sculls being re-smelted. Forehearth are replaced several times a shift, the full ones being taken to the matte shed, where they are drained of matte and lead, and the shells knocked out. Any slag tapped out of these forehearth, together with the shell, is returned to the blast furnace. Nos. 2 and 3 furnaces are similar to No. 1, but are smaller. On account of the large variety of ores treated, the slags are of varying composition. As an illustration, however, the following analysis is given: Pb, 0.7 per cent; FeO, 36; MnO, 1.6; CaO, 17; SiO₂, 24; ZnO, 12 per cent.

FLOW SHEET AT COCKLE CREEK REFINERY

The lead, tapped from the forehearth in small cast-iron pots, is run across to the dropping furnace. This is a small reverberatory of about seven tons' capacity, from which is obtained lead bullion (carrying most of the gold and silver) and dross. The dross, on being removed from the top of the lead, is still fairly "wet," and is transferred to a liquating furnace, where most of the lead is sweated out and returned to the dropping furnace, the more or less "dry" dross being re-smelted in the blast furnaces after a sufficient amount has accumulated. Lead matte, caught in the forehearth, is cast, cooled and ground in the Krupp mills for subsequent incorporation in the H.-H. charge. The lead from the dropping furnace is cast into bars of about 85 lb. each and sent to the refinery.

REFINING

The flow sheet of the refinery is shown in the accompanying cut. The bars of base bullion are first charged into the 50-ton copper-drossing kettle, where they are melted at a low temperature and the copper dross is skimmed. This dross is treated in a small liquating furnace, the liquated bullion being returned to the refinery, and the copper dross going to the copper smelters. The molten metal in the kettle is then transferred

¹Proceedings of the Australasian Institute of Mining Engineers, Melbourne, No. 31, pp. 1-39; joint authorship.

to the antimony softener by means of a direct-coupled electrically driven Rumsey centrifugal pump. This type of pump is an innovation in Australian refinery practice. It is permanently fixed in a frame which rests on the circumference of the kettle, and immersed to the full depth of the latter. Forty tons can be pumped in twenty minutes.

The antimony softener is of the usual reverberatory type, lined with magnesite brick at the litharge level. An oxidizing atmosphere is maintained, the resultant litharge, carrying the antimony and arsenic, being constantly run off. After eight to twelve hours, which is required to remove the antimony and arsenic, the "clean" metal is tapped into one of two desilverizing pans and the gold and silver separated by the Parkes process.

The skimmed litharge is mixed with fine coal to reduce the metal, and is charged intermittently to one of the blast furnaces reserved for the purpose. The slag from this furnace carries the antimony and arsenic. After further treatment, the antimony is recovered in a final product mixed with lead, which is sold as shrapnel lead. Two zincings are made, regardless of the gold and silver content. The first zinc alloy is pressed off by the Howard press, which is worked by pneumatic pressure, the second zincing being skimmed by hand. The desilverized lead is then syphoned to the usual jacketed type of reverberatory, where the remaining zinc and antimony are skimmed by hand, the refined lead being cast for shipment.

The pressed silver-zinc alloy is charged to retort furnaces for the volatilization of the zinc. There is one four-bottle regenerative gas-fired furnace, and there are two single-bottle oil-fired tilting furnaces. The latter are fired with a heavy distillate made from coal tar, which has proved efficient. The life of the retorts in the tilting furnaces is good, and the furnaces are simple to operate. The retorted bullion, assaying from 2,000 to 2,500 oz. Ag per ton, passes to the concentrating cupels, where the lead passes off as litharge and the concentration is brought up to 16,000 oz. of silver and gold per ton. Further cupeling results in a pure doré, which is molded into anodes of approximately 100 oz. for the parting operation.

The electrolytic parting plant is furnished with thirty-six earthenware cells of the Balbach type. Each cell contains two wooden paraffined cradles with inner frames holding the 10-oz. linen duck cloths. The anodes lie horizontally on the cloths and are just immersed in the electrolyte. This solution is essentially silver nitrate, containing a considerable quantity of copper nitrate, with some lead nitrate and about three grams per liter of free nitric acid. The silver is deposited on carbon cathodes lying on the bottom of the cell, which are raked forward periodically, drained, washed, and dried. When comparatively dry, the silver is put in very light calico bags, melted, and run into bars of 1,050 oz. This silver is remarkably pure, assaying 999.9 fine, and carrying not more than 0.2 oz. of gold per ton. The gold remains as a sludge on the cloths. This is dried, inquarted with three times its weight of silver, and re-parted to give a denser product. Any remaining silver is dissolved by boiling with concentrated sulphuric acid, the gold washed and melted and cast into 600-oz. bars.

Two separate units for the manufacture of sulphuric acid are in operation, one utilizing the gases from py-

ritic ores roasted for the purpose in Herreshoff furnaces, and the other utilizing the gases from the Huntington-Heberlein pots. The latter presents several unusual features. The plant consists of four chambers and seven towers, including two Glovers, two inter-chamber towers, one regulator, and two Gay-Lussacs.

The Glover towers do not function as concentrators, on account of the low temperature of the entering gases, but, by observing several conditions, they serve as efficient denitrators. The chief function of the inter-chamber towers is to keep alive rapid chemical action by thoroughly mixing the gases, and so minimizing the retarding effect of the CO₂ present as an impurity in the gas. The regulator is placed between the last chamber and the Gay-Lussacs. Its chief function is to prevent any SO₂ entering the Gay-Lussacs on account of sudden variations in the gas supply. The Gay-Lussac towers absorb the nitrogen oxides and operate in series. The chambers are built narrow and high to keep the gas moving rapidly. Their dimensions are as follows: Two chambers in parallel, each 30 in. high, 20 in. wide and 80 in. long; following chamber, 30 in. high, 20 in. wide and 80 in. long; last chamber, 30 in. high, 20 in. wide and 40 in. long.

The gases are drawn from the H.-H. plant through the dust chambers and Glover tower by the suction of a lead fan. The casing and impellers of this fan are made of antimonial lead, the impellers being mounted on a 3-in. steel shaft covered with lead sleeves on that part of its length exposed to the acid gases.

British Imports and Exports

The following figures of British metal and ore imports and exports for June, 1919, and the first six months of the year have been reported by the Board of Trade, and published in the *Ironmonger* of July 19, 1919.

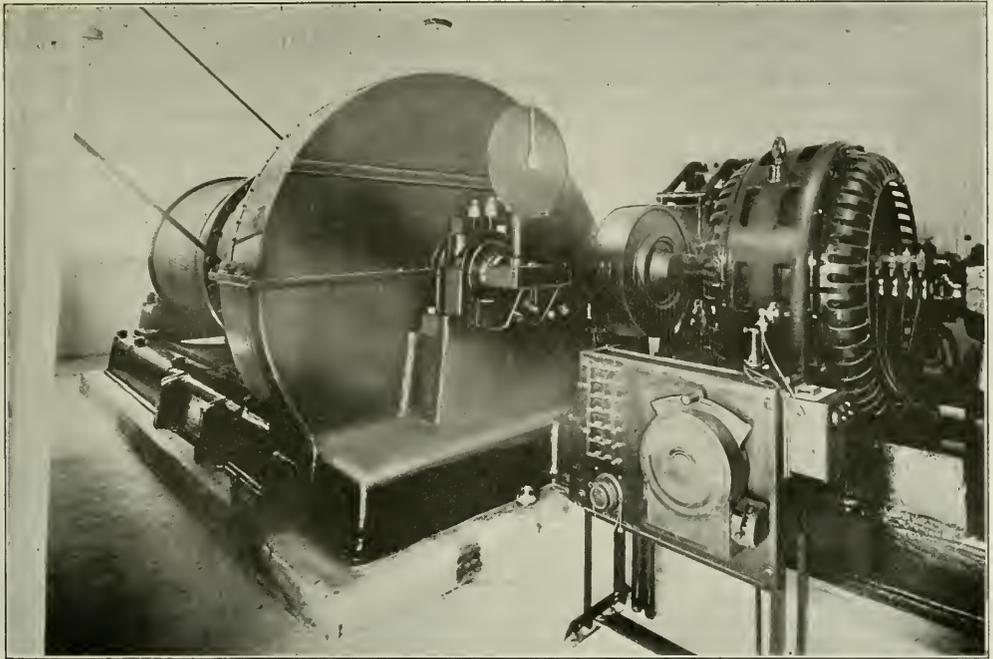

BRITISH IMPORTS (In long tons)			
	June, 1919	Jan.-June 1919	
Iron ore, manganeseous.....	7,527	88,154	
Iron ore, other sorts.....	316,156	2,467,730	
Pig iron, basic.....	848	65,468	
Pig iron, forge and foundry.....	1,759	7,326	
Pig iron, hematite.....	3,115	11,349	
Pig iron, other grades.....		1,964	
Steel blooms, etc.....	2,828	6,417	
Iron bars, angles and rods.....	1,905	9,263	
Copper ore.....	417	8,760	
Copper, regulus.....	140	5,895	
Manganese ore.....	15,380	194,601	
Pyrites of iron and copper.....	14,064	136,005	
Copper, unwrought and part wrought.....	5,002	68,861	
Lead, pig and sheet.....	22,773	152,258	
Tin ore.....	2,852	20,774	
Tin, blocks, ingots, slabs.....	1,467	8,585	
Zinc, crude.....	4,577	54,805	
Zinc, manufactured.....	321	1,184	
BRITISH EXPORTS (In long tons)			
	June, 1919	Jan.-June 1919	
Pig iron, basic.....	25	155	
Pig iron, forge and foundry.....	12,849	74,762	
Pig iron, hematite.....	9,955	41,981

Iron bars, rods, shapes, etc.....	3,963	17,675	
Iron ore.....	105	1,029	
Copper ingots, etc.....	564	1,950	
Lead, pigs, etc.....	1,073	6,016	
Tin, unwrought.....	689	4,491	
Zinc.....	334	1,111	

Directors' Report of the Lobitos Oil Fields, Ltd., shows that production amounted to 85,213 tons for 1918, compared with 91,548 tons in 1917. The net profit, after deduction of all charges and depreciation, amounts to £74,587, making a total credit to profit-and-loss account of £109,296. A dividend of 15 per cent less income tax is recommended.

Old Diamond-Drill Hole as Cableway For New Churn-Drill Hole

From a Churn Drill on the Surface a Cable Is Lowered Through an Old Diamond-Drill Hole to Workings, Where Bit and String Tools Are Attached

BY ROY H. POSTON
St. Francois, Mo.

AT ONE property in the southeast Missouri lead district, a complete system of drinking-water lines is maintained separately from the main mine drainage and fire system, for the plant employees and the adjoining towns. The original system drew its water from several small underground diamond-drill holes scattered through the various mine stopes, the water from these several holes being piped to a central drinking-water pump. Increased demands for more water from the growing towns, and mine development that

tion, clean them out, and start operations. Two holes were used, one to serve as a cableway and the other as a conduit for a signal cord to be used for conveying signals between the men underground and those on top while the work was in progress. At first a whistle cord, as shown in Fig. 1, was tried as a signalling device, but later a telephone line that gave more satisfactory service was installed in its place.

The method of operation was simple, the churn drill being set up in the usual manner over the selected hole on the surface and the drilling cable dropped through the hole to the mine workings below, where the bit or "string of tools" was attached. The mine stope selected for the churn-drill hole had, of course, to have sufficient head-room to permit the changing of bits, bailing out of sludge, and other necessary work, and was examined carefully as to "loose" roof, every morning before work was started. A "sleeve," or piece of pipe a little larger in diameter than the gage of the bit was properly set in place to guide the bit in starting and to maintain its true course downward.

No unusual difficulty was encountered in the course of putting the hole down in the usual manner to a depth of 105 ft., where it was considered bottomed. It was feared that the steel rope attached to the bit would wear rapidly because of its rubbing on the side of the diamond-drill hole, and to counteract this, the rope was well greased with a heavy cup grease before being lowered into the hole, and thereafter a gallon of black oil was poured into the hole from the surface at eight-hour intervals, while drilling. Either as a result of this treatment or because of the soft limestone rock encountered, the rope was subjected to no extraordinary wear during the entire drilling.

The services of three men were required for the drilling operations. The motive power for the churn drill was supplied by a gasoline engine, and consequently an operator on the surface was required to look after this engine, to oil the rope, and perform other duties, while two men were employed underground to guide the bit, change bits, and bail out the sludge. Several holes

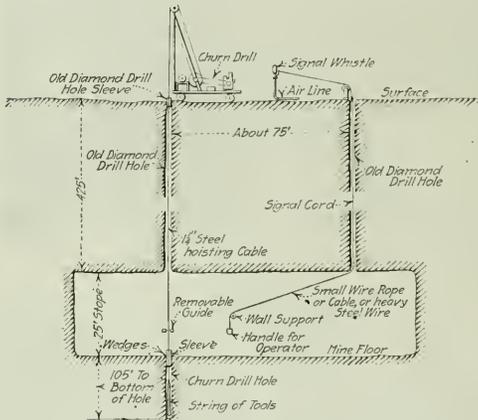

FIG. 1. GENERAL ARRANGEMENT OF DRILLING EQUIPMENT

seemed to diminish the existing supply, made it necessary to find a more dependable source of water.

As it was an established fact that the sandstone formation underlying all the mine workings carried the necessary water supply, it was only necessary to provide suitable wells to make this water available. Previous experience having demonstrated that underground diamond-drill holes were inadequate for this purpose, because of their small diameter, it was decided to sink wells by means of churn drills, thus making one hole produce as much water as the combined efforts of several small ones. However, as the beginning of the sandstone formation was about 400 ft. below the surface, this proposal meant drilling through 400 ft. of ground that contained no available water for the desired purpose, and the project accordingly hung fire on account of the excessive cost, until the idea was evolved of using a previously drilled prospect hole as a cableway for the new churn-drill hole.

All the country over and adjoining the mine in question had been previously prospected by surface diamond drills, and as these holes were in no case more than 100 ft. apart, and practically all were cut by the the mine workings it was only necessary to select two holes near the underground pumping sta-

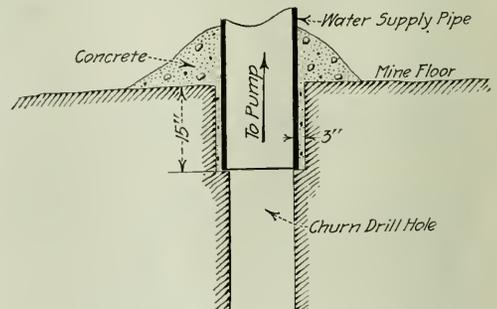

FIG. 2. METHOD FOR MAKING WELL WATER-TIGHT

were sunk in this manner, without serious problems of operation arising.

Fig. 1 presents a general sectional view of both surface and underground, and shows the general arrangement of the drilling equipment and the existing conditions at both places. Fig. 2 shows how the top of the well is made water-tight, when finished, in such a manner that no water may get either in or out at the collar of the well.

Zinc for Roofing

Used for That Purpose on New Plant of Central Foundry Co. at Joplin, Mo.—Other New Uses for Zinc

JOPLIN CORRESPONDENCE

THE Central Foundry Co. of Webb City, Mo., lost its plant by fire about a year ago. A site was secured in Joplin, and a new plant completed early this summer. H. T. Hornsby, president of the company, determined to try zinc for roofing, and decided upon a roof of sheet zinc, with standing seams to allow for the

ZINC ROOF ON CENTRAL FOUNDRY AT JOPLIN, MO.

expansion and contraction of the metal. The seams are about one inch in height, and the sheets are approximately 12 ft. long and 18 in. wide. The new roof was constructed by local tinsmiths, who had no previous experience in working with zinc.

STANDING SEAM THAT PERMITS CONTRACTION AND EXPANSION OF ZINC SHEETS

The seams are about one inch in height, and the sheets are approximately 12 ft. long and 18 in. wide.

It is now planned to put a new roof of ornamental zinc shingles on a church at Commerce, Okla., the money having been raised for the purpose. The shingles, it is expected, will be purchased from a firm at Nevada, Mo. A zinc-products factory has been established at Quapaw, Okla., which will manufacture numerous household

articles of zinc. One firm has made an offer of \$50 for the first zinc washtub, and another an offer of \$5 for the first zinc cup.

The Oklahoma-Kansas-Missouri branch of the American Zinc Institute is planning to arrange an exhibit of different articles now made of zinc with the idea of loaning it to county fairs and other public expositions.

Roosevelt Memorials Planned

Monument To Be Erected in Washington and Park Created in Oyster Bay—Popular Subscriptions To Finance the Project

THE ROOSEVELT MEMORIAL ASSOCIATION has been organized by a number of friends of the late Colonel Roosevelt, and a campaign for subscriptions to a fund of at least \$10,000,000 will be prosecuted during the week of Oct. 20 to 27 of this year. These dates have been selected because Oct. 27 was Colonel Roosevelt's birthday.

The object of raising the fund is to erect in Washington, seat of the Government and scene of Colonel Roosevelt's most important labor for the public good, a national memorial monument; and to create at Oyster Bay, his home for so many years, a park which may ultimately include his estate of Sagamore Hill, to be preserved in the same manner that Mount Vernon and the Lincoln home at Springfield have been.

Of the thousands of suggestions for fitting memorials that came from Roosevelt's friends and admirers, it seemed that these two forms were most nearly significant of his life and personality. Washington, the capital of the country, where Roosevelt had spent so many of his years in work that left its impress on the history of the nation, could be left out of no plan for a permanent memorial to him.

Equally fitting for a memorial to Roosevelt as a man and as a lover of nature is the scene of his ideally happy home life at Oyster Bay. In his lifetime he loved it all—its woods and fields, the shores of Long Island Sound, the flowers and the birds. He loved the outdoor life and he wanted others to love and share and benefit by it. During his lifetime in fact he endeavored to obtain an outdoor park for his friends and neighbors at Oyster Bay, but did not live to see the accomplishment of his wish. With his passing, a wider significance will be given to this cherished aim. The creation of a park will give his fellow-citizens opportunity for rest and recreation and upbuilding of mind and body; the inclusion of his home, with its fields and woodlands, its furnishings, its library and trophies and gifts from all over the world will make it particularly a spot associated with his memory and a Mecca for all Americans.

A memorial to Colonel Roosevelt will not so much honor him as honor America and the citizens who raise it to him. Checks may be sent to Albert H. Wiggin, Treasurer, Roosevelt Memorial Association, 1 Madison Ave., New York City.

Oil-Shale Refinery Established at Elko, Nev.

In co-operation with the Southern Pacific R.R. Co., the Bureau of Mines has established, at a cost of \$40,000, an oil-shale refinery for the purpose of carrying on experimental work on a commercial scale with oil shale from different deposits of the West. The plant has a capacity of forty tons per day.

The I. X. L. Copper Prospect

Property in Heath Mining District, in Adams County, Idaho, Described as a Possible "Porphyry Copper" Deposit, Though Evidence of Zone of Surface Oxidation Is Lacking—
Natural Features of District Favorable To Operation

BY ROBERT N. BELL

State Mine Inspector of Idaho, Boise, Idaho

TO DATE, Idaho has been of little importance as a copper producer, but nevertheless it presents certain geological advantages that favor the discovery of copper deposits of merit. One of the most interesting copper developments recently made is that of the I. X. L. prospect, in the Heath mining district, in Adams County, Idaho. This property, which is owned by the

which has a maximum elevation of 8,000 ft. The central boss of this mountain is probably about five miles in diameter, and consists of a formation resembling quartz hornblende diorite, but which has been classified as monzonite. The strike is generally north and south with a slight dip to the east. The mountain is bordered on the north, south, and east by almost horizontal flows

VIEWS OF I. X. L. PROPERTY IN HEATH MINING DISTRICT, ADAMS COUNTY, IDAHO

(A) PROPERTY FROM UPPER CAMP SHOWING NEARLY HORIZONTAL LAVA FLOWS ON MONZONITE ON NORTHEAST RIM OF BASIN. (B) SADDLE IN SOUTH RIM OF BASIN THROUGH WHICH LOWER ZONE PASSES UPPER ZONE. SADDLE SITUATED BEYOND TREES. (C) LOWER CAMP OF I. X. L. PROPERTY. (D) DUMP AND PORTAL OF 750-FT. CROSSCUT TUNNEL IN UPPER ZONE

Idaho Copper Mines Co., is situated seventy-five miles north of Boise, ten miles from the Huntington branch of the Oregon Short Line, and sixteen miles over an easy grade from the Pacific & Idaho Northern Ry., which branches off from the Short Line at Weiser. The I. X. L. property now suggests the possibility of its turning out to be a large disseminated "porphyry copper" deposit.

The Heath mining district embraces the flat top circular summit and adjacent slopes of Cudday Mountain,

of Columbia basalt lava. Near the crest, an old erosion channel is filled with several hundred feet of undisturbed flows of the same formation which are unmineralized.

The western exposure of Cudday Mountain toward Snake River Canyon shows a range 6,300 ft. in elevation above the river at the highest point. A cross section of the mountain, beginning a mile below the summit, and running toward the river, shows, besides the

monzonite, large bodies of old greenstone porphyry, with included reefs of marbleized limestone, accompanied by contact metamorphic minerals and characteristic sulphide ore lenses. On the lower slopes are found extensive exposures of slate, shale, and limestone reefs, with dikes and intrusions of andesite, basalt, and other igneous rocks. The sediments range in age from Carboniferous to Jura Triassic.

TWO WELL-MINERALIZED ZONES ON PROPERTY

The I. X. L. group, embracing about sixty lode claims, covers a large part of a steeply inclined, circular erosion basin, two miles in diameter and facing west. The middle slopes are well timbered, and several low rib-like ridges divide the tributaries of Brownlee Creek, which meet at the lower west end of the group. Traversing the property along its eastern border, near the crest of the mountain, there is a well-defined zone, 400 ft. wide and nearly a mile long, of more altered monzonite, striking N 30° E and dipping slightly to the southeast. Numerous shallow surface cuts show copper carbonate stain and threads of chalcopyrite within a few feet of the surface. The mineralization is also indicated by large patches on the surface where the rock is stained brown with iron oxide. These patches lie between bounding reefs and bluffs of less altered monzonite.

Lower down the slope, a second zone traverses the middle of the group. This is approximately 800 ft. wide and is traceable at the surface with prospect pits for fully a mile. Here the formation strikes due north and south, with a flat dip to the east. This zone is also well mineralized, with both carbonate and sulphide ore showing wherever the surface has been cut. The two zones are entirely in the monzonite area, and, aside from magnetite, show limited evidence of the contact metamorphic mineralization so conspicuous in the greenstone a little further north. The rock is granitic, of medium grain, and shows small but conspicuous hornblende crystals and biotite with both orthoclase and plagioclase. The ore-bearing zones differ from the general formation, especially near the edges, in displaying a splashy bluish segregation of quartz and a chalky phase of the feldspar. Few of the crystals reach half an inch in length.

EVIDENCE OF SURFACE OXIDIZED ZONE LACKING

I have repeatedly called attention to the possibilities of this prospect as a "porphyry copper" in my annual reports for the last fifteen years. The deposit has been examined by some well-known engineers during this period, including several of the leading "porphyry copper" people of the country. Engineers of the latter opposed the idea of its being a "porphyry," for the reason that evidence of a surface zone of oxidation is lacking. As the sulphides can be knocked off the surface croppings, they were thought to be confined to shrinkage and cleavage planes. M. R. Staight, of New York, was probably the first to give the deposit serious consideration. Mr. Staight enlisted the interest of some local stock men of means who are pushing development at present on the property with a small gas-driven compressor plant. The most important part of this work is a crosscut tunnel starting at the foot wall of the upper zone and striking directly across its course. The tunnel is now advanced 750 ft., the face being 550 ft. below the surface. In the first 350 ft. driven, the ore is largely confined to the joints and bedding planes.

Careful soil sampling in ten-foot sections which I made along the succeeding 300 ft. of the tunnel to the face on June 15, 1919, gave an average result of a little over 1 per cent copper, with 50c. per ton in gold and silver. Combined samples from one forty-foot section gave nearly 3 per cent copper. This section may conform to some of the lens-like brown-stained patches on the surface. The last 100 ft. driven has not been sampled at the date of writing.

CHALCOPYRITE THE PREVAILING MINERAL

The prevailing mineral is almost pure, soft chalcopyrite, which occurs in kidneys and in seams up to two inches thick along shrinkage and bedding planes and is also fairly well disseminated in the grain of the rock. It is associated with a smaller amount of marcasite, and, throughout the last 100 ft. driven, magnetite was conspicuously mixed with the chalcopyrite. Incidental seams of green carbonate and rusty gossan lines are met, and, recently, a narrow water course was penetrated that exhibited rich stringers of malachite and bornite. The rock of the formation is generally hard.

The bedding planes of the formation dip flatly to the east about 20 degrees, and are fairly uniform. They conform to the main bedding of the monzonite through an east-and-west cross section of the mountain. At the summit they become nearly horizontal and give the formation the appearance of a flat anticlinal dome, with a faulted or eroded western face. Some small foils and blunt crystals of molybdenum are occasionally found with the ore; also, as depth is gained, the coarser chalcopyrite shows black facings of secondary chalcocite.

CONJECTURES AS TO ORIGIN OF DEPOSIT

It was suggested recently by a prominent engineer from Butte that the deposit was an aplitic differentiation in the form of a thick sill. The lower zone also has the same appearance. The occurrence of the mineral suggests primary magmatic diffusion and segregation, but there are also some interesting associated intrusives. One big fault cuts the zone in a northwesterly direction.

Between the two zones at the surface there is a belt, several hundred feet in width, of highly altered and disintegrated rusty brown granite, that is well seamed and fractured. This looks like a more favorable gangue for disseminated ore than the ore zones themselves, but shallow surface cuts show no conspicuous evidence of copper.

Between this belt of brown granite and the lower zone is a thick bed of felsite, or fine-grained aplite, probably 300 ft. wide and of undetermined length and shape. There are two conspicuous outcrops of siliceous black rock on the lower zone indicating a dike from two to ten feet thick, which carries copper carbonate where it has been opened with surface cuts.

Above the upper zone and intersecting it is a narrow dike of white aplite; also a dike of basic rock ten feet wide, which strikes northwest, with a flat northeast dip roughly parallel to the big fault. The latter dike appears at a distance like a steep trail on the bare mountain side near the summit. It is composed of a greenish-gray rock resembling altered diabase. The fault crosses the upper zone at an oblique angle, but does not interrupt the mineralization, which is exhibited in surface cuts on each side of its course.

It is the plan of the present operators to crosscut the

upper zone, then drift 500 ft. each way on the best center of mineralization, and crosscut again at the end of each drift, before deciding on milling equipment or undertaking the development of the lower zone. The latter, owing to a flat dip and a little easier slope of the mountain side, lends itself admirably to churn-drill sampling.

It is possible, judging from the greater dissemination of the sulphide mineral in the rock as the crosscut advances toward the hanging wall of the deposit, that the average value may be sufficient to warrant working the deposit on a large scale, over a width of several hundred feet.

The I. X. L. ore is similar to that of the Iron Dyke mine, at Homestead, Ore., occurring under related geologic conditions. The chief difference between the two ores is that the I. X. L. ore contains a larger proportion of magnetite and a smaller amount of pyrite.

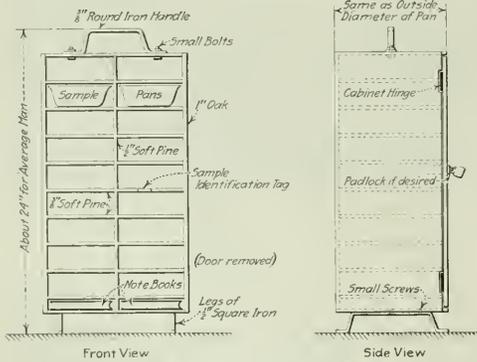

Among the natural advantages of the locality favoring future operation are several million feet of yellow pine and red fir timber growing on the middle slopes of the company's holdings. A good mill site is afforded at the lower end of the property, with a minimum flow of a little over three second-feet, or 150 miner's inches of water. Conditions readily permit of opening the property by means of a crosscut tunnel. A preliminary railroad survey has been made from Cambridge, on the Pacific & Idaho Northern Ry., to the mine, over a route sixteen miles long, with a maximum grade of 2½ per cent, which will make the property reasonably accessible.

Carrier for Mill Sample Pans

Wooden Cabinet Designed for Transportation of Samples From Mill to Testing Laboratory and To Obviate Loss by Overturning

BY ROY H. POSTON
St. Francois, Mo.

A WOODEN cabinet designed to be used for the transportation of pan samples from the mill to the testing laboratory is illustrated in the accompanying sketch. It is apparent from the cut that the chest

WOODEN CABINET FOR CARRYING MILL SAMPLES

is in no way elaborate and may be quickly constructed by the average mill carpenter at trifling cost.

As shown it is designed and dimensioned to be carried by hand, but if other means of transportation are available, it may be adapted thereto, though in

either case the legs should be retained, in order to keep it off the wet mill floor.

Each sample and pan are allotted a separate compartment, which may be permanently indicated on both the pan and its respective compartment, if the sampling is of the used routine nature. Separate compartments are also added for notebooks, pencils, and other articles.

If the cabinet is neatly joined together, and the several compartments are made absolutely tight, an accidental overturning will not mix the various samples if the door is closed, it being only necessary after such an accident to turn the cabinet on its back, open the door, and remove the spilled samples one at a time. Dimensions of the box must of course be made to conform with size and number of pans, distance to be carried, size of sample, and other operating and practical considerations.

California Mineral Production in 1918

The accompanying table shows the mineral production of California, in 1918, as compiled from the final returns to the California State Mining Bureau. The 1917 figures are given for comparison.

MINERAL PRODUCTION OF CALIFORNIA, 1917, 1918

Substance	Unit	1917	1918
Antimony ore	Tons	158	229
Asbestos	Tons	156	100
Barytes	Tons	4,420	2,561
Bituminous rock	Tons	5,590	2,561
Borax	Tons	109,944	88,772
Cement	Bbl.	5,790,734	4,722,921
Chromite	Tons	52,379	75,955
Clay (pottery)	Tons	166,298	112,423
Coal	Tons	3,527	6,343
Copper	Lb.	48,534,611	47,793,046
Dolomite	Tons	27,911	24,660
Feldspar	Tons	11,792	4,132
Fuller's earth	Tons	220	37
Gold	Dollars	20,087,504	16,529,162
Gypsum	Tons	30,825	19,695
Infusorial and diatomaceous earths	Tons	24,301	35,963
Iron ore	Tons	2,874	3,108
Lead	Tons	10,826	6,732
Lime	Tons	500,730	436,843
Limestone	Tons	237,279	208,566
Lithia	Tons	880	4,111
Magnesite	Tons	209,648	83,974
Magnesium salts	Tons	1,064	1,008
Manganese ore	Tons	15,515	26,075
Marble (a)	Cu.ft.	24,755	17,428
Mineral paint	Tons	520	728
Mineral water	Gal.	1,942,020	1,808,791
Molybdenum ore	Tons	243	243
Natural gas	M.cu.ft.	44,343,020	46,373,052
Petroleum	Bbl.	95,396,309	99,731,127
Platinum	Oz.	610	571
Potash	Tons	129,022	49,381
Pumice and volcanic ash	Tons	525	122,114
Pyrite	Tons	111,325	128,329
Quicksilver	Flasks	24,382	22,621
Salt	Tons	227,825	212,076
Sandstone	Cu.ft.	31,090	900
Silica (sand and quartz)	Tons	19,376	23,257
Silver	Dollars	1,462,955	1,427,861
Soapstone and talc	Tons	5,267	11,760
Soda	Tons	24,505	20,447
Strontium	Tons	3,950	2,900
Tungsten concentrates	Tons	2,466	1,982
Zinc	Lb.	11,854,804	5,565,561

(a) Includes onyx and serpentine in 1918.

In addition, there was produced cadmium, fluor-spar, graphite, and molybdenum, which are not reported separately, probably to conceal individual business.

The total value of California's mineral production in 1918 was \$199,753,837, compared with \$161,202,962 in 1917.

As compared with the 1917 output, the notable features of 1918 are the enormous increase in petroleum valuation and the decrease of over \$3,000,000 in the gold yield. Of the metals, copper decreased approximately 740,000 lb. in quantity and \$1,444,000 in value; gold decreased \$3,558,342; manganese increased in tonnage and value; and quicksilver slightly in value. Silver, lead, zinc, and tungsten showed decreases.

Siberian Mines*

Present Mining Outlook in Old and New Districts—Primitive Methods of Prospecting and Exploitation—Effects of the War on Mining Development—Status of Gold Dredging—Mining Problems of the Future

THE years 1907 to 1915, inclusive, witnessed a remarkable activity in the development of a few of the gold and base-metal deposits of Siberia and the Urals, under the auspices of British capital and the technical control of American engineers.

KYSHTIM COPPER MINES

The Kyshtim Mining Corporation, Ltd., was built up from the ruins of a semi-defunct Russian company which had mined copper in a desultory way for a period of nearly a century before 1919. About £900,000 was raised in London by means of debentures, and pyritic smelting of the ore was introduced from abroad. This was found to be the salvation of the property, and under the able direction of Messrs. T. J. Jones, R. Gilman Brown, D. P. Mitchell, and H. H. Knox, the Kyshtim, from being an abandoned mine, became the largest copper producer in Russia. In 1916, the last full producing year, the output approached 15,000,000 lb. of metallic copper annually. This, although large for Russia, is only from one-quarter to one-tenth the output of the large "porphyry" copper mines of the United States. A considerable output in gold was obtained yearly as a byproduct.

DEVELOPMENT ESTABLISHED LARGE RESERVES

The published reports indicate that when the mine was closed down owing to "nationalization," about three million tons of 3 per cent ore still remained as reserve, established by development. Much of the ground is still unprospected, and, besides important iron deposits which are worked on the property, an important discovery of nickel ore has been made.

The pre-war cost of producing copper at the Kyshtim property compared favorably with the average cost at American copper mines. Following the political crash in Russia, the expenses of operation became prohibitive, and at present, only destructive work is in progress in the Urals and in Russia. Also, there is no demand for the product, even did the political conditions allow the property to be operated. It will probably take from three to five years to restore this property to its former productiveness, even after the restoration of peaceful conditions in the Urals.

NUMEROUS PROMISING PROSPECTS

Other copper-mining properties in the Urals were the Sissert Co., Ltd., the Verk-Isetz Co., the Bogoslof Co., the Revdinsk Co., and the Tanalyk Corporation, Ltd. In the Kirghese steppe region, the Atbazar Mines, Ltd., and the Spassky Co., Ltd., also operated in a small way. The last three mines mentioned were controlled largely by British capital. Both the Sissert and the Revdinsk properties, near Ekaterinburg were in the development stage, but with good promise for the future, the ore being in many respects similar to that of Kyshtim. The Tanalyk property, in the Orenburg

district, although started as a copper mine, was proving to be a more important producer of gold than of copper when operations were suspended in 1917.

A most important copper deposit of "porphyry," or disseminated ore, is stated to have been partly prospected by drilling by the engineers of the Irtysh Corporation, Ltd., This property is situated adjacent to the Ekibastus coal field, to the west of Pavlodar. In the published reports, the company has merely referred to the deposit in a general way, but it is said to be of large dimensions.

Altogether, the production of copper in Russia and the Caucasus in pre-war days was small, not filling the demand. It was infinitesimal as compared with what will be possible when the known deposits are exploited. Siberia, unquestionably the world's greatest storehouse of copper as well as of gold, produced practically no copper previous to the closing down of the industries due to the revolution. The Spassky Co., previously mentioned, produced a few million pounds annually, but with this exception probably no copper was produced in Siberia. Doubtless the first successful copper mining on any considerable scale will be in the porphyry deposits which can be mined by open cut with steam shovels, a minimum of hand labor being required.

LEAD, SILVER, AND ZINC

The two well-known base-metal districts of Siberia are the west Altai and the Nerchinsk-Argun regions. A much less known region recently developed for the production of zinc is the Te-Hu-He area, about two-hundred miles north of Vladivostok, only twenty miles inland from the seacoast.

Notwithstanding the fact that the Nerchinsk mining district was known over two hundred years ago, like the Altai region, to which reference has been made, it is still in the development stage. Both these districts are extensive, as large as whole states in the United States or Mexico, and contain deposits which are of great importance. They have both been held since discovery as the private property of the Russian Crown, only recently abolished.

An antique system of administration retarded the development of lead and zinc mining in both the Altai and Nerchinsk mining regions and stifled any attempt at industry. Silver has been produced from rich surface ores during the last century and a half, largely by forced labor.

WEST ALTAI REGION

In 1912, the Russo-Asiatic Corporation, Ltd. was formed in London, and D. P. Mitchell was sent to examine the so-called Cabinet Concessions in the West Altai. He selected as the best of the largest three mines, the Ridderski Kope, situated about fifty miles northeast of Ust-Kamenogorsk. A lease was obtained from the Cabinet of the late Emperor, and the Irtysh Corporation, Ltd., with a capital of £2,000,000, was founded to develop and operate this property. This

*Reprinted from a series of articles by C. W. Purington appearing in *Echo*, June 27, 28, and 29, 1919.

company also obtained the control of the Ekibastus coal mines, formerly part of the Popof properties, west of Pavlodar, and connected with the Irtysh River by fifty miles of standard-gage railway.

ORE-TREATMENT PROBLEMS SOLVED

In the five years preceding 1917, another railway was constructed by the company, connecting the Ridderski and Sokolni mines with the Irtysh River. Coke ovens and zinc retorts have been constructed, a concentrating plant has been erected at the mines, and a large amount of development and diamond drilling has been accomplished on the ore deposits. Some of the best mining and metallurgical talent has been employed, and the problem of effectually treating the complicated base ores is thought to have been solved. All preparations were made for a regular and profitable output of zinc, lead, silver, and gold, the four principal recoverable metals present in the ore.

LARGE ORE RESERVES ESTIMATED

It is estimated by competent engineers that the amount of ore in the Ridderski and its neighboring mine, the Sokolni, was sufficient, on a conservative basis, to net the shareholders £10,000,000 in the course of ten to twelve years after operations were well under way. This was estimating ore to only a moderate depth in two deposits; twelve other deposits of the famous hornstone were known to exist on the property, where surface indications were of similar character to the developed mines. Besides the deposit mentioned, the coal mines of the company were under competent management and a large amount was spent in preparations for an assured annual production, both for coking purposes in smelting the ores and for filling contracts with the Trans-Siberian railway.

It should be noted that the estimated future production of the Ridderski mine in gold, merely as by-product, was £1,000,000 annually or as much as the average production of the Lenskoie Gold Mining Co., which produced 25 per cent of the gold output of Siberia previous to 1915. It is one of Russia's unwritten tragedies, not yet realized, that this fine fabric of industry, the product of much thought, and well-directed energy, by high-class specialists, should be brought dangerously near to the verge of destruction just on the eve of its fruition, by the senseless acts of those who would have gained the most from it.

Other portions of the Altai zinc-lead domain have been developed by the Russian Mining Corporation, Ltd., of London, and this company in 1916 made copper discoveries on its property which may prove of importance. Altogether it is said that more than four thousand prospects exist in the Altai region showing silver-lead mineralization, only a small percentage of which have been worked or even inspected during the last three or four decades.

LACK OF SYSTEMATIC MINING

The Nerchinsk mining region, known to English readers since the time of Robinson Crusoe, who may be said, if one is to believe De Foe, to have been the first Trans-Siberian traveler, has not been the object of modern development. There are indications that it may yet become the seat of profitable base-metal mining, and it is perhaps fortunate for the future Siberian commonwealth that this great area has, as it were, been

protected from half-hearted private exploitation in the past by the old Cabinet system. Under that régime, the convicts employed merely "gophered" out the rich streaks of silver ore near the surface, and did not attempt systematic mining of the important bodies of lead and zinc.

POSSIBILITIES OF COAST REGION

The coast region, as has been stated, contains the Te-Hu-He zinc mine, which has produced in the last few years a notable quantity of high-grade ore, and is not unlikely to be of importance in the future for the production of mixed base ores on a considerable scale. This region has the great advantage of being on the seacoast, and therefore is not dependent on a domestic market for the concentrates and zinc produced. Ample deposits of coking coal are also available in the vicinity; and should the region of these ores prove extensive, it is highly probable that the southern Sikota Aline may become the seat of an important lead- and zinc-smelting industry.

MINES OF THE ALTAI

Alexander von Humbolt is authority for the statement that gold has been mined in Siberia since the time of Herodotus, and the probability is that it was mined many centuries before that historian was born. All travellers in the southern Altai agree that ancient workings are numerous, although dates are not assigned. It is practically certain that much of the gold wrought into personal ornaments by the Greeks of the Chersonese found its way there from the Altai.

The recorded production of Siberia and the Urals since the middle of the eighteenth century is slightly less than £300,000,000 and with the thieving and illicit production which is the invariable accompaniment of gold mining, one may place the output during this historical period at not less than £400,000,000. The greatest single contributions to this output have been from the North Yenisei district and the Vitim district, which may be estimated at £50,000,000 and £80,000,000, respectively.

In 1751, a twelve-stamp mill was erected by a German engineer at Bereozovsk, near Ekaterinburg. The property on which this mill operated has continued to produce both quartz and placer gold with more or less regularity up to the present. Up to 1820, when location of claims by private parties was first allowed in Siberia, the Urals produced most of the gold recorded. Quartz mining was never an important factor, and placer mining became the greatest source of the metal.

DISCOVERY OF THE LENA DISTRICT

In the late 30's, the North Yenisei came into prominence; for several years before the discovery of gold in California this district was producing at the rate of from £1,000,000 to £1,500,000 per year. About 1842-50 the ore became exhausted, according to the standard of the work carried on, and the miners migrated east. One Trapeznikof located a claim on the Homolko river, a branch of the Zhuya, in the Olekma district, in 1847, and there was a rush to the region, now famous for the world over as the Lena gold district.

It was not, however, until 1867 that Michael Sibirya-kof located the famous Blagoveshensky mine, on the Nakatami, a branch of the Bodaibo Creek, tributary to the Vitim, and is said to have found by chance the deep-lying gravel which has since made this stream

and the Bodaibo known wherever placer mining is of interest. The claim mentioned proved the richest gold-gravel area of which there is record, 1,000,000 cu.yd. of bedrock gravel having produced £3,330,000.

The fame of Bodaibo Creek, which may be estimated to have produced over £40,000,000 in forty miles of length, is too well known to need description. A reality considered, it is but a fraction of the gold-bearing territory of the Vitim and Olekma districts, and, although worked out by the present Lenskoie company, there still remain important reserves of gold to be recovered by modern contrivances.

ANTIQUATED MINING METHODS

Up to 1914 the methods pursued in mining the drifting ground by the Lenskoie Gold Mining Co., were of that archaic description introduced into the Urals by some disciple of Agricola in the time of Katherine the Great. The so-called washing machines were of great historic interest, and one regretted that, on account of their bulk, it was impossible to transport them to some museum of antiquities.

Fortunately, in 1913 Reuben E. Smith, a mining engineer and specialist on placer mining, was engaged by the company. He at once essayed to improve the methods employed, and in the course of three years, in the face of most intense opposition by the Lenskoie board and many of the local officials of the company, succeeded in greatly reducing the cost and increasing the gold output. Stealing of coarse gold from the drift faces and dumps, which had for several years averaged £300,000 annually, was reduced to less than £100,000 in 1915. This was the result of the introduction of all-the-year washing of gold, instead of exclusive summer washing, as formerly. A most ingenious system was developed by Mr. Smith which allowed the gold to be washed every day of the year, even in the record winter temperature of 1914-15, when 88 degrees below zero, Fahrenheit, was recorded.

By this and other improvements, the introduction of standard Alaskan sluices, and the saving of fine gold which had formerly been lost, the output was gradually raised until in 1915 the record production of £1,800,000 in gold was reached. This, in fact, was a large output.

Underground improvements, such as the recovery of timber put into the workings, the reduction of man and horse power, and all round general cost-cutting had been introduced and the Lenskoie property, so far as working cost and production were concerned, was fast getting in line with the world's well-administered mines. But unfortunately the board at Petrograd had engaged the doctor when the patient had nearly expired, and the inevitable fact remained that Bodaibo Creek was worked out. Therefore, irrespective of any political disturbances, the Lenskoie output began to decline in 1916, and has steadily done so since. Although it is reported that the property is still being operated, the 1919 output will probably not reach more than 20 per cent of that of 1915.

ANCIENT RIGHTS HANDICAP EXPLOITATION

New discoveries of drifting gravel are reported from eastern areas of the property, remote from Bodaibo. Though it is possible that these will lend for a time a new drifting life to the property, a thorough liquidation of the present organization will be necessary, before even the richest gravel can be worked at a profit. Ancient poodage rights, imports, and other charges must

be met by many of the best claims, serving to handicap their profitable exploitation, even were all the unnecessary overhead charges eliminated.

Aside from the Lenskoie Co., the output of any one mine in the Siberian or Ural territory is insignificant. The aggregate pre-war annual output of Russia was from £5,000,000 to £6,000,000 in gold. This was less than the daily cost of the war to Great Britain. Of this sum, the Lenskoie Co., annually contributed from 25 per cent to 30 per cent. Thus, notwithstanding the fact that Siberia promises to be the world's great gold-producing country of the future, it may be said to be at that turning point where the alluvial gold is largely worked out and the initiation of quartz mining, and the obtaining of gold as a byproduct from base-metal mines has not begun.

To select the areas where deep mining will be possible, and to develop the deposits, and determine the proper processes for extraction of the metal will require the services of foreign engineers from America, South Africa, and Australia. There is no intrinsic reason why the Siberian output will not eventually equal or even exceed the present annual output of the Transvaal, but the evolution of the industry will be slow.

Gold dredging, which has attained success in other countries, will also have a wide field, but up to the present it has hardly begun. Of about fifty dredges which have hitherto been installed in various districts in Siberia, only five are of any value as machines. Two of these are on the Pacific Coast, at the property of the Orsk Goldfields, Ltd., and three are in the Ural region, at the property of the Nikolai Pavdinsk Co. Gold dredges are only significant in increasing notably the gold production of a region when they are installed in multiple units on large areas, as the recoverable tenor of the gravel on which they operate is generally low, a few pence per cubic yard.

PLATINUM DREDGING

I am credibly informed that twenty-seven so-called platinum dredges in the Ural region, mostly on the Iss and Tagil fields, were sunk during the political disturbances, but, with one or two exceptions, one may say that the loss of these mechanical contrivances is not greatly to be deplored. For the sake of the future of the platinum industry, it is to be hoped they will remain scrapped and be replaced by modern dredges.

The entire pre-war platinum output averaged about 150,000 oz. troy annually, and so far as can be gathered sunk to 80,000 oz. in 1917. The Iss field, by far the most important, if worked intensively by dredges for ten years, with an annual output of, say 300,000 oz., would probably be exhausted. It is not unlikely that other platinum fields will be discovered, either in the Urals or elsewhere, to take the place of this field when exhausted. It is also possible that certain zones of the Iss dunitites may be found workable as a rock-source of platinum, since it is known that the platinum occurs in the dunitite in recoverable quantity. The same may be said regarding the adjacent less important fields of the Pavdinsk estate and the Tagil.

I do not attempt to touch on the subject of coal and iron deposits, or of the great group of non-metallic mineral products, as these subjects merit treatment in separate articles. The best general résumé of Siberian and Russian mineral deposits in English was published some years ago in a small book entitled "The Times Book of Russia," obtainable from the London *Times*.

ORE DRESSING AND METALLURGY

Practical Suggestions and Progress
in Invention and Use of
Mechanical Appliances

A New Flexible Coupling*

Many designs of flexible couplings have been used for connecting shaftings in order to eliminate mechanical troubles due to misalignment, and although they have served their purpose to good advantage, there is always room for improvement.

The "Karge" cushion and flexible coupling, manufactured by the Three Rivers Machine Tool and Die Corporation, Phoenix, N. Y., is designed to take the place of flexible joints, gears, pulleys, beltings and any other

helical spring in appearance, and this member is shrunk in the sleeve at each end, being secured to the shaft or machine, as the case may be. A flexible spindle extends through the center of the coil, and a flexible sleeve is also placed on the outside of the coils for the same purpose as the spindle.

Where the flexible coupling is applied to a shafting or as a connection between two units, it can be bent and placed at almost any angle. It will absorb all shock and strain, and transmit the power in a satisfactory manner.

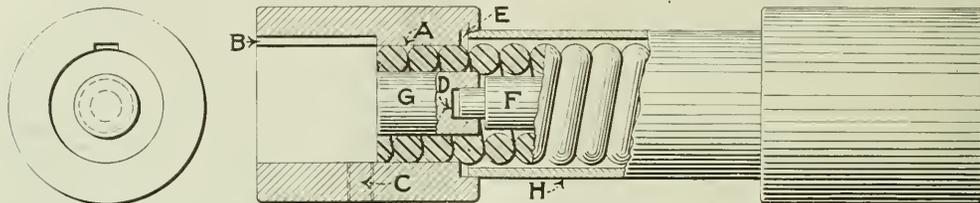

FIG. 1. DETAILS OF CONSTRUCTION OF FLEXIBLE COUPLING

mechanical devices used for the transmission of power. The cushion coupling is constructed of a special alloy steel and consists of a coil within a coil, wound in op-

Fig. 1 shows the details of construction. The end of the coupling is secured to the shaft by either a key or setscrews, as shown at B and C. The space between the plug and the floating spindle is to allow for contraction and expansion of the spring lengthwise, as shown at D. The space between the coupling and sleeve is to allow for contraction and expansion of the spring lengthwise, as shown at E. The floating spindle F limits the contraction of the spring, and has a sliding movement in the plug G. The sleeve H limits the expansion of the spring and has a sliding movement in the coupling.

Fig. 2 illustrates an application of the flexible coupling. All couplings are made of cast iron and the compression sleeves of steel. It is the practice to make the inside diameter of the coil spring the same as the outside diameter of the shafting with which it connects. When constructed in this manner, the couplings are claimed to have 30% more strength in torsion than the solid-steel shaft. The devices are made in various sizes for shafting from $\frac{1}{2}$ to 6 in. in diameter.

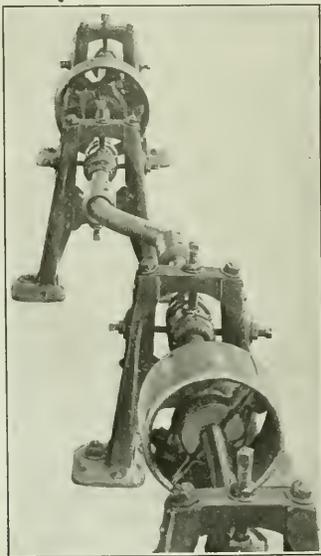

FIG. 2. COUPLING IN USE

posite directions. In other words, the coupling proper is formed in a cylindrical shape, so that it resembles a

Circulating-Water System

By C. E. DUTTON

Gas engines and compressors using water for cooling give considerable trouble in winter, owing to the water in exposed pipes and in the cooling tank freezing after a temporary shutdown. It is well known that still water in an open tank or vessel always freezes on the top first. A satisfactory method of overcoming these difficulties is shown in the accompanying sketch. The pipe connections to the tank are made in the usual way, excepting that the top connection is at least 1 ft. below the top of the tank, and no valve is placed on the overhead

line outside the tank. Instead, the line is run into the center of the tank and turned down, the valve *B* being at least 1 ft. below the elbow. A lever is then connected to this valve in the manner shown. The tank should always be kept full of water, and whenever the machine is shut down in cold weather valves *B* and *C* are closed at once and the engine is drained at *D*.

A temporary shutdown in the coldest weather will not interfere with the resumption of operations; in fact

METHOD OF PREVENTING THE FREEZING OF CIRCULATING-WATER PIPE

the tank would have to freeze almost solid before the system would be affected. The lever operating the valve will be frozen in, of course, but a little hot water, or drilling, will release it. Valve *C* and the nipple in the tank are generally protected by packing, but, if necessary, they could also be extended into the tank and operated like *B*.

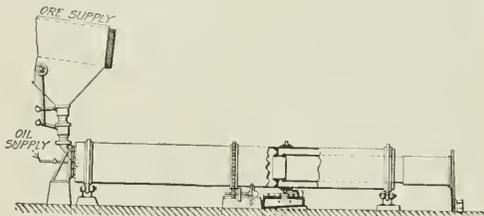

Such tanks are usually placed outside the engine room, and another good practice is to board them in, leaving about a foot of space between the tanks and walls, filling this space with manure or other handy non-conducting material to a foot or so of the tops of the tanks and then covering the shed with doors. This will not only keep out the cold winds but prevent undue vaporization in summer.

Handling Flue Dust

At the Nichols Copper Co.'s refinery on Long Island, N. Y., flue dust is mixed with cement in a concrete mixer. Just sufficient water is added to make a stiff mud. The mixed batch is poured into a charging buggy and wheeled into a yard contiguous to the blast furnace. Here it is dumped and allowed to harden for 24 hours. It is then broken up and shoveled into the charging buggies, wheeled to the elevators, and taken to the charging floor of the blast furnace, where it forms part of the charge. The method is one that requires little new equipment—practically nothing but the cement mixer. It is effective and is well worth the attention of smeltery managers who are starting up new plants. The amount of cement used is about 10 per cent of the weight of the flue dust.

Converter for Magnetizing Treatment

R. W. Irwin, has been granted a patent for an apparatus for treating ores preparatory to magnetic separation (No. 1,295,719 issued Feb. 25, 1919), comprising a converter having an inlet and an outlet and adapted to receive and permit passage of the ore and its associated gangue, means for feeding the ore and gangue, means for maintaining a magnetizing reagent in the converter which is adapted to render the ore magnetic, and means for sealing the inlet and the outlet against the entrance of air and adapted to permit free passage of the ore and gangue to and from the converter.

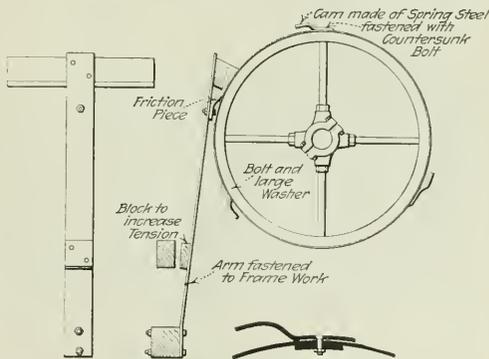

APPARATUS FOR MAGNETIZING ORES

The apparatus is shown in the accompanying cut. A pipe conveying oil at high pressure projects into the cylinder, as shown, and a gaseous hydrocarbon atmosphere is maintained. Certain ores, such as limonite and red hematite, are non-magnetic, but are rendered magnetic by a treatment in the converter described.

Trommel Screen Cleaner

BY CHARLES LABBE

In screening a roll product, the apertures of the trommel often become clogged, but may be freed by means of a spring arm attachment. This is made of a good piece of 1-in. x 4-in. lumber, about 6 ft. long, with a crosspiece of fairly hard wood 18 to 24 in. long. The arm is fastened at one end with bolts on one side of

SPRING-ARM TROMMEL CLEANER

the framework. The cams are made of discarded wagon spring, and measure not less than 2 in. wide by $\frac{3}{8}$ in. thick. The friction piece on the arm is made of the same material, and the cams are fastened on the screen itself by countersunk bolts and large washers.

COMPANY REPORTS

Annual and Quarterly Reviews
of the Activities of
Operating Mines

Utah Copper Co.

According to the forty-fifth quarterly report of the Utah Copper Co., covering the second quarter of 1919, the gross production of copper contained in concentrate for this quarter is as follows: April, 9,309,256 lb.; May, 9,058,715 lb.; June, 9,155,629 lb.; total, 27,523,600 lb. Average monthly production, 9,174,533 lb.

In addition to the above, a total of 523,378 lb. of copper was contained in precipitate from the leaching plant, making the total gross production for the quarter 28,046,978 lb., as compared with 29,261,209 lb. for the previous quarter.

During the period there was treated at the Arthur plant a total of 1,242,500 tons, being 284,000 tons less than for the preceding quarter. The average grade of the ore was 1.35 per cent copper, as compared with 1.27 per cent copper for the first quarter, and the average recovery was 81.80 per cent, as compared with 74.70 per cent for the preceding quarter, being a decided improvement.

The average cost per pound of net copper produced, including plant depreciation and all fixed and general charges, but excluding Federal taxes, and without credit for gold and silver or miscellaneous income, was 11.59c., as compared with 13.72c. for the first quarter, calculated in the same way. The value of the gold and silver in concentrates and the miscellaneous income for the quarter amounted to 5.40c. per net pound of copper produced.

The financial results of the operations for the quarter are as shown below:

Net profit from operations.....	\$1,043,757.53
Other income, rents, etc., in Utah.....	1,233,158.80
Income from Nevada Cons. Copper Co. dividends.....	375,187.50
Total net profit.....	\$2,652,103.83
Disbursement to stockholders.....	2,436,735.00
Net profit.....	\$215,368.83

The earnings for the quarter are computed on the basis of 14.74c. per lb. of copper, as against 12.89c. for the previous quarter. The low carrying price is due to the small sales of copper made during the period and the increase in the amount of copper unsold and carried at 13½c. per lb. The regular quarterly disbursement of \$1.50 per share was paid on June 30.

Operations were continued on the curtailed basis of approximately 50 per cent of normal. The operating cost per pound of copper for the quarter is lower than it has been for a long time, fulfilling the prediction made in the report covering the first quarter of this year.

During the period there was removed a total of 333,048 cu.yd. of capping, being an average of 111,016 cu.yd. per month, as compared with 379,264 cu.yd. and 126,421 cu.yd., respectively, for the first quarter of the year. This decrease was due to the second curtailment of operations, which took effect about Mar. 1.

A daily average of 6,753 tons of ore and of 1,981 tons

of commercial freight was transported over the Bingham & Garfield Ry. making a total daily average of 8,734 tons, as compared with 13,520 tons per day for the previous quarter. This decrease was caused by the curtailment in the operations of the Utah Copper Co.

Nevada Consolidated Copper Co.

The fortieth quarterly report of the Nevada Consolidated Copper Co., for the quarter ended June 30, 1919, states that the production of copper for the three months was 11,149,362 lb., as compared with 12,201,444 lb. for the quarterly period ending Mar. 31, 1919. During the quarter, 558,525 dry tons of ore of an average grade of 1.42 per cent copper from the shovel pits and the Ruth mine was treated, as compared with 529,692 dry tons, averaging 1.79 per cent copper, for the previous quarter. Of the tonnage milled during the quarter 68 per cent was supplied from the pit, and 32 per cent from the underground workings of the Ruth mine. No custom ore was offered for treatment during the quarter.

The cost of production per pound of copper for the quarter, including charge for depreciation of plant and equipment, and the usual overhead or fixed and general expenses, but without credit for gold and silver recovered and miscellaneous earnings, was 18.07c. per lb. The value of gold and silver recovered and the miscellaneous earnings for the second quarter amounted to 4.61c. per lb. of copper. The costs for the preceding quarter, calculated upon the same basis, that is, including charge for plant depreciation and the fixed and general expenses, but excluding credit for miscellaneous earnings, were 16.85c. per lb. of copper.

The total production for the first six months of the current fiscal year averaged 3,891,801 lb. of copper per month, as compared with an average of 6,500,000 lb. per month for the first six months of the preceding year, indicating that the program of production curtailment made necessary by prevailing industrial conditions has been consistently observed.

The financial results of operations for the quarter, as below, include charges to cover depreciation of plant and equipment as operating costs:

FINANCIAL STATEMENT NEVADA CONSOLIDATED COPPER CO., SECOND QUARTER, 1919

Operating loss.....	\$329,970.55
Earnings from investments and miscellaneous.....	514,748.23
Net gain.....	\$184,777.68
Distribution to stockholders.....	749,796.38
Net deficit.....	\$565,018.70

The operating income upon which the earnings for the quarter are based is computed at 15.12c. per lb. of copper, as compared with 13.6c. per lb. for the preceding quarter. This slight increase in the carrying price is due to the fact that the sales of copper during the quarter were increased to some extent, all unsold copper being carried, as usual, at 13.5c. per lb. The actual sales of metal for the quarter, however, did not equal

the production for the period, which resulted in a further increase of unsold copper on hand and in transit.

A general improvement in industrial conditions at this time would seem to indicate a slow but gradual increase in domestic consumption and a decided stimulation of foreign demands. Though this fairly well-defined improvement in the copper market gives promises of further expansion, the management has considered it advisable to continue the output of copper on the present basis of curtailment until some part of the company's accumulation of copper stocks can be marketed to advantage.

Canada Copper Corporation, Ltd.

The annual report of the Canada Copper Corporation, Ltd., for the year ended Dec. 31, 1918, was issued July 17, 1919. Operations at the Mother Lode mine and at the smeltery at Greenwood, B. C., terminated on Nov. 26, 1918, upon which date the plant closed down owing to the low grade of the remaining ores in the company's older mines. So far as can be foreseen, the company's operations in the Boundary District have been brought to a conclusion.

During the year, 154,332 tons of Mother Lode ore were mined and smelted. This compares with 203,478 tons for 1917. From this, and custom ores purchased and smelted, the production of metals was as follows:

Copper (fine), lb.	2,813,993
Silver (fine), oz.	60,495
Gold (fine), oz.	12,662.8

During the last few months, the grade ran off rapidly, until the shipments were running below 0.7 per cent copper. Under such circumstances, it was evidently impossible to operate at a profit, so measures were taken to close down. These included a careful survey of the mine and the stoping of any ore of pay grade. After this had been extracted, operations ceased. The average analysis of the ore produced during the year was as follows:

Copper, per cent.	0.856
Silver, oz. per ton.	0.185
Gold, oz. per ton.	0.039

The Lone Star Mine was operated until July 23, during which period 3,540 dry tons of ore was shipped. Greater care was used in sorting the ore, so that the grade was slightly higher than in 1917, containing copper 2.04 per cent, silver 0.14 oz. per ton, gold 0.022 oz. per ton. The expense was, however, much higher. This property is in much the same condition as the Mother Lode. It contains a considerable quantity of low-grade material, but it is practically impossible to produce ore of payable grade at a cost low enough to leave a profit.

At the Copper Mountain property, the permanent development and construction program begun in 1917 was continued up to Sept. 1, when, most of it being completed, the work ceased, to be resumed in the spring. The ore reserves remain as last year—10,000,000 tons assured and 2,000,000 tons probable, of an average grade of 1.74 per cent.

The development performed consisted of 1,710 ft. of tunneling, 146 ft. of drifting, and 3,694 ft. of raising, or a total of 5,560 ft. Also, 289 ft. of level workings were widened. No prospecting was done to develop additional ore reserves.

Up to April, 1919, construction of the mill at Allenby proceeded at a satisfactory rate, but labor trouble which then developed in the forces of the railroad construction has since caused delay.

Chino Copper Co.

The thirty-first quarterly report of the Chino Copper Co., covering the second quarter of 1919, was issued on Aug. 5, 1919. The gross production of copper contained in the concentrate from milling operations for the period under review was 10,541,471 lb., compared with 11,512,133 lb. for the previous quarter. The total amount of ore treated for the three months was 401,100 tons, equivalent to an average of 4,408 tons per day. This daily average is 1,083 tons less than that milled for the first quarter of 1919. The average assay in copper of the ore treated for the second quarter was 1.83 per cent as compared with 1.80 per cent for the first quarter of 1919. The ore milled during the second quarter was considerably more favorable to concentration than that treated during the previous quarter.

The recovery per ton of ore milled for the quarter under consideration was 26.28 lb. of copper, as compared with 23.29 lb. for the first quarter of 1919. There was produced 26,830 dry tons of concentrate, averaging 19.64 per cent copper, as against 41,539 dry tons, averaging 13.84 per cent copper, for the first quarter.

The cost per pound of net copper produced from milling operations for the second quarter, after allowing for smeltery deductions and including depreciation, was 14.16c., as against 15.03c. for the first quarter of 1919, calculated the same way. The cost figures shown do not include any charge for federal income or excess-profits taxes, nor do these costs take into consideration miscellaneous income. There were no gold and silver credits from the concentrates produced during the second quarter.

The financial results of the company's operations for the second quarter are shown in the following table:

Net income from copper production (only).....	\$44,031.05
Miscellaneous income.....	326,384.19
Total.....	\$370,415.24
Disbursement to stockholders.....	652,485.00
Deficit after disbursements to stockholders.....	\$282,069.76

The above figures are based on a carrying price for copper of 14.60c. per lb. for the second quarter of 1919, calculated in the usual manner of inventorying the unsold copper at 13½c. per lb. A disbursement of 75c. per share was made to stockholders during the second quarter of 1919.

During the period under review there was removed by steam shovels at Santa Rita a total of 1,084,668 cu. yd. of material, equivalent to an average of 361,556 cu. yd. per month, as compared with a total of 1,060,765 cu. yd. of material during the first quarter of 1919, and an average of 353,588 cu. yd. per month. Of the total material removed during the second quarter, 818,195 cu.yd. was stripping, the remainder being equivalent to 546,423 tons of ore, of an average grade of 1.62 per cent copper, according to mine sampling and assaying. The difference between the tonnage mined and the tonnage milled during the second quarter is in part oxidized ore, which was sent to the mine stockpiles.

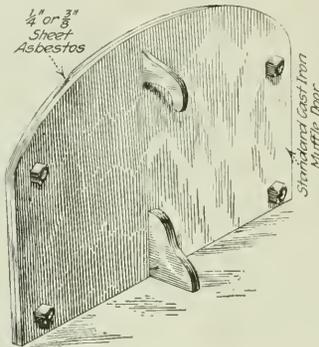

Camp Bird, Ltd.—During the quarter ended Mar. 31, 1919, the tunnel level east was extended from the end of the tunnel company's ventilating drift a distance of 206 ft.; crosscuts and drifts therefor, 465 ft.; raises, 47 ft.; total development, 718 ft. The company's ventilating raise was advanced 19 ft. The drive east is in vein of no commercial value. The supply of labor is fair. Wages in the district have been again advanced 50c. per day, making the minimum wage scale \$4.50.

ASSAYER AND CHEMIST

Laboratory Methods and Hints
for the Mine Assayer and
Works Chemist

Improved Muffle Door

The cast-iron muffle door used in connection with assay furnaces and sold by any chemical supply house is to be preferred to the tile door, because of its greater durability and especially because it can be handled more easily. It has, however, one fault, that of radiating the muffle heat too rapidly. This objection may be overcome satisfactorily in the simple manner shown in the accompanying illustration. A piece of $\frac{1}{2}$ -in. or $\frac{3}{8}$ -in. sheet asbestos is cut to conform to the size and shape

IMPROVEMENT ON STANDARD CAST-IRON DOOR FOR ASSAY MUFFLE

of the door. Four or more holes are drilled through the iron door and asbestos sheet, the latter is placed on the rear side of the door, and $\frac{1}{2}$ -in. bolts, provided with large washers, are slipped through from the rear, and drawn up tight by means of the nuts. This asbestos sheet is a good heat insulator, lasts for considerable time, and is easily changed.

A Bone-Ash Economy

By C. R. COREY

Having observed the waste of bone ash in used cupels that were not entirely saturated with litharge, it occurred to me to investigate the matter, and the following experiments were conducted:

One hundred pounds of used cupels, a fair sample of a quantity that had accumulated during the last few years at the laboratories of the University of Washington, was revolved, without previous crushing, in a cylindrical mill, containing neither balls nor pebbles, for 15 minutes. The product was then screened on a 20-mesh sieve, the oversize, containing the hard saturated part of the cupels, was put aside, and the undersize, the unstained or unsaturated part, together with some small pieces of saturated bone ash, was screen sized.

The weight of the material passing the 20-mesh sieve was 35.83 lb. The part that passed the 80-mesh sieve, 13.34 lb., was mixed and made into new cupels in the

usual way. These were dried for one month, together with others made from the regular stock of bone ash. Tests for hardness, absorption of litharge, and silver were then made.

Rate-of-absorption tests for litharge were made by cupeling 20 gm. of pure lead in each cupel, the two different lots of cupels being placed side by side in a gas-fired muffle furnace, four cupellations being made at one time and four different lots being run. Practically no difference was observed in the rate of absorption of the litharge.

The next and last test was to note the silver lost. Eight cupellations were made. The weights of the silver before and after cupeling were as follows:

ABSORPTION OF SILVER IN RE-MADE AND NEW CUPELS

Number of Cupel	Silver Taken, mg.	Silver After Cupellation, mg.	Silver Lost, mg.
1	19.85	19.80	0.05
2	19.90	19.76	0.14
3	19.95	19.87	0.08
4	19.30	19.62	0.18
5	20.00	19.77	0.23
6	19.87	19.70	0.17
7	19.84	19.60	0.24
8	19.92	19.65	0.27

Odd numbers are the re-made cupels; even numbers, those made from stock bone ash. The temperature at the start of cupellation was 850° C. At the end of two minutes all were "driving"; at the end of five minutes the temperature was 830° C. It was further lowered to 790° C. and when near the finish was raised to 880° C.

The tests show that nearly 36% of the bone ash was knocked loose in the ball mill, and half of this would pass an 80-mesh screen without further grinding; so 18% was available for re-use. The color of the recovered bone ash was only a little darker than that of the original, and the material proved to be as effective as the original and unused bone ash.

Copper Ore Treatment

U. S. Patent 1,296,523, has been issued to Joseph Irving, under date of Mar. 4, 1919, for an invention which relates to a process for the treatment of cupriferous ores, compounds, or products, for the extraction of metal therefrom in soluble form, and for the recovery of the metal. Its objects are to effect in such a process a continuous regeneration of the reagents the presence of which is desired, and simultaneously to eliminate undesirable reagents, to avoid waste, to reduce the amount of added chemicals required to a minimum, and to render the process cyclic in all its parts in so far as is possible.

The process includes subjecting the ore to the action of an iron-containing electrolyte from the copper-depositing tanks, removing the electrolyte and the copper therefrom, washing the treated ore with an iron-containing solution, passing the solution over iron, thereby reducing the iron salts contained therein and precipitating copper therefrom, and again washing the treated ores with the solution.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

The Oil Land Leasing Bill

Indications point at this writing to an early vote on the Oil Land Leasing bill. Senator La Follette, after many hours' debate in opposition to the bill, began the presentation of his amendments on Aug. 30. Some of those presented have been accepted, but the more important ones do not meet with approval. For instance, one of Mr. La Follette's amendments provides: "That the Government hereby reserves the right at all times, under rules and regulations to be prescribed by the President, to determine, fix, and control the selling price of all products derived from lands leased hereunder, whether in the crude or natural condition or in other merchantable form, which shall be a reasonable price both as to the producer and the consumer; and the reservation of such right shall be expressly stated in each lease."

The mooted question as to what extent the bill invalidates present locations upon which no discoveries have been made was brought to a head when Senator Jones, of New Mexico, presented to the Senate telegraphic protests from his state alleging that thousands of claims would be voided for lack of discovery. Senator Smoot claims that Section 36 of the bill protects such cases as these cited by Senator Jones. Section 36 reads:

That the deposits of coal, phosphate, sodium, oil, oil shale, and gas, herein referred to, in lands valuable for such minerals shall be subject to disposition only in the form and manner provided in this act, except as to valid claims existent at date of the passage of this act and thereafter maintained in compliance with the laws under which initiated, which claims may be perfected under such laws.

Commenting on the question, Senator Smoot said:

The bills that have been heretofore introduced used the language "except as to valid locations" and that has been changed to "valid claims." That was done as the result of the decision of the United States Circuit Court, in which the court upheld the Western American Oil Co. in the claims that they had which were contested by the Government of the United States. I am quite sure that under Section 36 of the pending bill if the parties referred to by the Senator have complied with the law and have made their locations under existing law and continued to comply with the law so that up to date they have valid claims, under Section 36 of this bill they will not be interfered with in any way.

Freight Rates From Pacific Ports

A supplemental tariff covering ocean rates from Pacific Coast ports to European ports has been issued by the Shipping Board. In this tariff the rate on arsenic to United Kingdom ports is \$1.90 per 100 lb.; on brass and copper scrap in packages, \$2 per 100 lb. Quick-silver in flasks and sulphur take the same rate. Tin scrap in bales takes a rate of \$1.75. An addition of 25c. per 100 lb. is charged when the destinations are French Atlantic ports, Antwerp or Rotterdam. The addition for Christiania, Copenhagen and Gothenburg is 50c., while the addition to Stockholm is 75c.

New Law Will Affect Appropriations

It is believed that appropriations for Government bureaus are certain to suffer as a result of the recently enacted statute preventing officers and employees of the Government from communicating with members of Congress in regard to such appropriations. In the past it has been customary for specialists in many of the Bureaus to explain the need of the appropriation for their work to individual members of the House and Senate. Members of Congress have so many demands on their time that they can study into all phases of such a situation only infrequently, unless they are particularly interested. It has been found that a few minutes' personal talk on the part of someone who can present briefly and concretely the need for the money is one of the best methods of getting essential information to a lawmaker. That the law will have a particular effect on the technical bureaus is certain since the nature of their work is less understood.

The law also forbids Government officials and employees from engaging in propaganda among the public in behalf of appropriations. To that provision there is no objection on the part of the officials.

Tariff Bills in the Senate

There is no tendency on the part of the Senate to rush through any of the tariff bills which have been passed by the House and are now pending before the Committee of Finance. Senator Penrose, of Pennsylvania, the chairman of the committee, is of the opinion that world conditions are too disturbed at this time to permit of intelligent legislation on the tariff, and apparently he is not greatly impressed with the assertions that higher duties must hurriedly be made effective. Nevertheless, he expects to take the matter up in the near future with the committee, and if it is decided to go ahead with the legislation at this time an opportunity will be given to those interested to be heard.

Rulings on Child Labor

A series of rulings have been issued by the Commissioner of Internal Revenue relating to the child labor provisions of the 1918 revenue act. A tax of 10 per cent is levied on the entire net profits of any mine or quarry in which children under sixteen years of age are permitted to work. A similar tax is imposed on mills, canneries, workshops and factories. The law does not apply to children who may be employed in offices or such operations which are physically separate from the mine or manufacturing establishment.

A contract for 500,000 bbl. of oil fuel has been placed with the Mexican Petroleum Corporation by the U. S. Shipping Board. The price was \$1.18 per bbl., and it is to be delivered at the American bunkering station at St. Thomas, W. I.

Manning Discusses Petroleum Industry

Co-Ordination of American Petroleum for Purposes of Research—American Participation in Development of Foreign Oil Fields Essential

AT A CONFERENCE held on Aug. 15 at the Engineers' Club of San Francisco, Cal., Van. H. Manning, Director of the Bureau of Mines, addressed the local oil men on the necessity of perfecting the organization of the American Petroleum Institute and of securing an annual fund of \$1,000,000 for the purpose of encouraging research in petroleum technology. Mr. Manning presented the following review of the petroleum situation:

I expect to see improvements in the technique of the recovery of oil and the protection of oil and gas against waste take place in the general development of this country. I am looking forward to the future; to the growth of better methods for producing and utilizing oil and gas. I am confidently expecting tremendous progress along these lines, and look forward to the day when the methods which are now used in our oil fields will be looked upon as most crude and inefficient. I expect to see more oil taken from the ground than is now thought possible. I expect to see it recovered with less loss. I expect to see it utilized with far greater efficiency, and that the producers and refiners of oil and those who consume oil and its products will derive far greater benefits from it than at present. In this progress, in this development, it is my hope that the Bureau of Mines will take a most commendable part.

There is the advantage of doing a public service and of having the public confidence, so I do not feel that our contributions will be negligible. I hope the Bureau of Mines will be an active agent in inducing progress. To use a chemical term, it should be the catalyzer of the industry.

I take advantage of this opportunity to speak of the American Petroleum Institute. On this subject, I shall speak both in my private capacity as Director of the American Petroleum Institute and in my public capacity as Director of the Bureau of Mines. The American Petroleum Institute is essentially a getting together of all the oil and gas men into a one-unit organization for the purpose of inducing progress. What I have said about the progress I expect to see in the next twenty years in the petroleum industry I confidently hope will come about largely through the American Petroleum Institute. It will be the greatest mistake in the history of the oil industry if the industry does not take this opportunity to promote the Institute and foster its growth in every possible way. It is a big conception, but it is by no means a new thing, as similar institutes have been founded in other industries and have been of inestimable benefit. The interests of the petroleum industry and of the country will be harmed unless the industry supports this movement, and I feel that the progress in oil and gas will be greatly retarded if advantage of this opportunity is not taken.

The following may be enumerated as some of the objects of the institute:

1. To present a united front in all matters relating to the industry when it is of national import.
2. To serve as spokesman for the industry itself, to Congress and to Government and state agencies.
3. To avoid political embarrassments on the part of legislation.
4. To draft uniform law and urge its adoption in all the states.
5. To safeguard the industry both at home and abroad, from the standpoint of foreign competition.
6. To study foreign and domestic commerce.
7. To conduct a statistical bureau.
8. To study various problems such as cost accounting, labor conditions, tank car traffic, and similar matters.
9. To publish a bulletin through which the various needs of the industry can be co-ordinated.

10. To conduct a welfare committee.

11. To establish a research bureau.

Through this agency, various producing, refining, and internal-combustion interests could be co-ordinated by the establishment of a research fund, which would encourage Government and private initiative, and would attract inventors and owners of patents and patent rights, whose patents could be tried out on a commercial scale, and, if successful, adopted by the entire industry on a payment of a small royalty, which would provide a revolving fund after the first investment is made, which fund would be used in the payment of a bonus or a royalty to the patentee.

I have estimated that to carry on this work in a successful manner a million dollars per annum should be provided by the petroleum industry, which amount should be distributed between the producers of oil, refiners, and producers of natural gas. The total gross production in 1918 was about \$2,500,000,000. To raise this one million dollars would take one-twenty-fifth of 1 per cent, or \$1 out of each \$2,500 gross profit.

I want to say a word concerning the international policies affecting the petroleum industry. On July 29, 1919, there was published in the *Congressional Record* a report which I submitted to the Secretary of the Interior on this subject. There is no other situation in respect to future supplies of essential raw materials for the United States, and in respect to our future trade, which is at the present time so important and so critical as the petroleum situation. In so far as America is concerned, the whole complexion of our petroleum industry has changed within the last two years. We are now consuming more crude oil than we produce, depending upon imports to make up the deficit. The geologists of the Department of the Interior say that there has been taken out of the ground and used up 40 per cent of our natural petroleum reserves, whereas we have used up but 1 per cent of our coal. On account of our past over-production, and apparent abundance of petroleum at home, Americans have not gone extensively abroad for petroleum supplies and reserves. American oil-producing companies are to be found only in Mexico, Central and South America, and Roumania. The vast potential resources of Africa and of the Near and Far East have been neglected by our nationals up to this time, partly on account of our plentiful but fast diminishing supplies at home, and partly because they have felt that large investments of this nature far abroad would not be secure.

This country holds the premier position in the petroleum industry of the world, and now produces yearly between 65 and 70 per cent of the world's total production. This position has been and is our national right because of our immense production, and more because of our even greater consumption.

The latest statistics disclose the fact that in 1918 our domestic consumption was practically equal to our domestic production, and more than 5.3 times greater than our exports, which were abnormal, on account of ten months of war, during which time more than 80 per cent of all the petroleum products consumed by Great Britain, France, Italy, and the A. E. F., as well as neutral Europe, had to come from this country, for reasons of limited ocean transport.

Production and not refining and marketing organizations is going to be the key to independence in respect to the world's petroleum trade of the future. Inspection of a map showing the petroleum reserves of the world disclose that many of these areas, particularly the most promising ones, are now closed to the entry of America, through being already possessed or controlled by the nationals of other countries—those of Great Britain and of Holland, especially. It is further disclosed that practically all of these areas, with the exception of Mexico, and parts of Central and South America, lie within British and French possessions or spheres of influence.

British and British-Dutch nationals practically control all of the world's petroleum industry that is not controlled by our own companies. Great Britain and British nationals are alive to the fact that production—production scattered all over the world—will be the dominating factor from now

on, and it is their plan to secure concessions, or other rights, covering these probable and possible oil-productive areas. Unless Americans are encouraged to go abroad and secure at once rights and privileges to produce oil from the world's fast-dwindling reserves that are not open to them, future oil production will all be in the hands of other nationals within the next few years. No greater and more lasting and far-reaching service can be rendered to this country at the present time than making possible and effecting the securing by or for American citizens their rightful participation in the development of all of the world's reserves of petroleum.

American Progress in Spanish Industry*

Great Britain Concerned Over the Position Held by American Machinery, Particularly in the Mining Fields—Spanish Iron-Ore Reserves

THE British authorities are worrying over the progress which American steel industries are making in Spain. Copies have reached the United States of an interesting document issued by the British Department of Overseas Trade concerning conditions and prospects of the iron and steel industries and engineering projects in Spain.

The report, which has been prepared by William Thomson Anderson, deals at great length with the activities of Americans in Spain seeking trade, and cites numerous instances where the British have lost trade. It also calls attention to the fact that American trade papers have gained wide acceptance in Spain and are proving of immense value in establishing American goods in the minds of Spaniards. The report refers specifically to *The Iron Age*, declaring that it is found everywhere among miners and the manufacturers of iron and steel goods, building materials and hardware. It also refers to the *Engineering and Mining Journal* as being universally taken by managers and owners of Spanish mines. As a result, the demand for American mining machinery and equipment is great. Mr. Anderson recommends a similar propaganda for British goods.

SPANISH IRON-ORE RESERVES

	Tons
Vizcaya—All mines fully exploited.....	60,000,000
Gipuzcoa and Navarra—Partly exploited.....	10,000,000
Santander—Exploitation almost complete.....	30,000,000
Oviedo—Exploitation insignificant.....	60,000,000
Lugo—Exploitation partial.....	65,000,000
Estremadura, Segovia, etc.—Not yet exploited.....	10,000,000
Leon—Wagner, Ferradillo, Monte Teleno, etc.—Not yet worked.....	300,000,000
Huelva—Exclusive of sulphur ores unimportant.....	20,000,000
Sevilla—Exploitation unimportant.....	33,000,000
Malaga—Exploitation partial.....	30,000,000
Almeria—Exploitation important.....	30,000,000
Murcia—Exploitation limited.....	15,000,000
Peru—Exploitation large.....	150,000,000
Ciudad Real—No exploitation as yet.....	10,000,000
Catalonian provinces—No exploitation as yet.....	15,000,000
Aragon—Exploitation partial.....	40,000,000
Logrono—Exploitation none.....	20,000,000
Total tonnage.....	900,000,000

In the Asturias, which is the center of the most active development and production of coal in Spain at the present time, Mr. Anderson believes that there is in prospect an immediate demand for boilers, briquetting machinery, washing and screening plants, lubricating oils, iron and steel pipe, iron and steel bars, nails, and similar requirements, hoisting engines, air compressors, cranes for loading ships, steam, compressed air, and electric haulage engines, explosives, shop tools, hardware, light railway equipment, locomotives, miners' tools, pulleys, all kinds of rolling stock, ropes, safety lamps, ventilating fans, and auto-meter weighing machines.

*Extract from *Iron Age*, August 21, 1919.

Concerning iron, Mr. Anderson gives an optimistic report based upon figures collated by Julio de Lazurtegui in 1918. The accompanying table shows in condensed form the estimated quantity of iron ore unmined and the state of development and operation.

The Germans had been taking ores that were relatively high in phosphorus. The English, on the other hand, demand ores very low in both phosphorus and sulphur. They, however, tolerate considerable amounts of silica, and are content with comparatively low per cents of iron in the ore.

Mr. Anderson maintains that Spain is destined to reach an annual output of 1,500,000 tons of pig iron. Before the war it was approximately 450,000 tons, and during the war it increased to nearly 700,000 tons. Of this amount 60 per cent was produced by the great Spanish concern called the Altos Hornos de Vizcaya at Bilbao. Other large contributors to the total were the Fabrica de San Francisco, of Bilbao; Fabrica de Nueva Montana, of Nueva Montana, Santander; and the Fabrica de Mieres, of Mieres, Asturias. The iron and steel business in Spain is fairly well organized into the steel syndicate known as the Central Siderurgica, comprising the following concerns: Altos Hornos, Duro Felguera, Fabrica de Mieres, Fab. de San Francisco, Fab. de Moreda y Gijon, Fab. de Bidasoa, Hijos e Romualdo Garcia, Santa Ana de Bolueta, Sociedad Material para Ferrocarriles, and the Union Carrajera.

Referring to mining machinery, Mr. Anderson directs especial attention to the aggressive and successful work accomplished in Spain by the Ingersoll-Rand Co., of New York, which he thinks gained a strong lead in Spain for air compressors and rock drills of all kinds. The Sullivan Machinery Co., New York and Chicago, also has done business in Spain. It appears that the Americans have practically absorbed the compressor business in this country, to the exclusion of others. Also, America takes the lead, according to Mr. Anderson, in steam shovels. The Rio Tinto mines in Huelva have seventeen Bucyrus shovels at work, these ranging from 65 to 100 tons, loading up to 2,500 tons per ten hours.

Crushing machinery for the mines, however, is mainly British and German. Copper converters are almost exclusively supplied by the Power and Mining Machinery Co., which company also furnishes other mining machinery in Spain. Ore cars are supplied to the Spanish mines mainly by the German firm of A. Koppel & Co.

Determining Water Ratio in Flotation Pulp At Anaconda

Anaconda copper concentrator flotation equipment receives its feed directly from the overflow lip of the Dorr classifiers, each operating in closed circuit with one Hardinge ball mill. The mill feed is the reject from the Wilfley table section of the concentrator. There is no stabilizing system between the Wilfley tables and the Hardinge mills. As a consequence, the ratio, water to solids, varies considerably, as the rate of feeding the ore varies. The only control possible is to divert as much as possible of the table head water to the slime-thickening tanks.

For the above reasons no regular determinations of water to pulp ratio are made, and there is no attempt to maintain a constant ratio. It has been found that 18 to 23 per cent solids in flotation feed give the best

results. With a lower percentage of solids the tailings are not improved and the grade of concentrates is lowered; above 23 per cent solids the concentrates are improved at the expense of the tailings.

At the slimes-floatation plant treating copper concentrator slimes (95 per cent—200 mesh), the slimes are thickened to about 16 per cent solids and then diluted with hot water to 10 per cent solids. The percentage of solids is determined by means of an ordinary sp. gr. hydrometer for liquids heavier than water. Each hydrometer is roughly calibrated by checking the percentage of solids as calculated from the reading against a weighed and dried sample of the pulp.

At the zinc concentrator the feed to the Hardinge mills is the undersize of $1\frac{1}{2}$ by 12 mm. trommels. The ratio of water to pulp is maintained at the minimum amount required to carry the pulp in the launders from the crushing to the grinding division. The overflow from the Dorr classifiers goes direct to the floatation division and is thinned by the cleaner tailings and return floatation middlings. The rougher concentrates are about 30 to 35 per cent solids and are thinned to about 20 per cent solids by means of the clear overflow from the thickening tanks.

Engineer Urged for I. C. C.

Engineering Council Sends Letter to the President Requesting Appointment—Technical Knowledge Required

ENGINEERING COUNCIL, of which J. Parke Channing is president, has written President Wilson urging that a member of the engineering profession be appointed to the vacancy on the Interstate Commerce Commission. The letter is as follows:

The transportation systems of our country are largely the creations of its professional engineers. This statement can be made without disparagement to the statesmen, the financiers, the manufacturers, the lawyers, the educators, the mechanics, the laborers and many others, who, with the engineers, have contributed to the development of transportation. Through all stages of preliminary exploration, final survey, construction, upkeep and operation, in financial management, and in adjustment of the relations of transportation to the public, the genius and knowledge of the engineer are essential. Not only in technical physical matters, but also in determinations of policy, his contributions have supplemented and must ever supplement those of other men. These declarations hold good for all the carriers of commerce, by rail, by highway, by water, by pipe-line, by wire, or by air. Hence, it follows that the body established by Government to regulate the commerce, the carriers and the ways of communication, embracing so many engineering features, should number among its nine members, men of engineering training and experience.

Engineering Council, being aware of a vacancy on the Interstate Commerce Commission, begs leave to request the Chief Executive that in filling this vacancy he give earnest thought to the selection of a man who, to his other qualifications, adds the training and experience of an engineer familiar with transportation problems.

Engineer members wisely chosen would bring to the investigations and deliberations of the Interstate Commerce Commission not only technical knowledge of great value, but also experience in executive duties, a judicial attitude gained through the direction of work under contracts, minds of analytical habit, familiarity with costs of construction and operation, experience in dealing with employees of many vocations, and integrity of thought cultivated by that inescapable obedience to the laws of Nature involved in the practice of this profession. The engineer's training fits him for that mode of thinking which is indispensable

to impartiality of judgment. One important function of the commission is valuation of public utilities and another is the determination of relationships and responsibilities of the management of such utilities to the public. No other body of men has given so extensive and so scientific consideration to these matters as have members of the engineering profession.

Council's purpose is not to further the interests of any individual or group, but solely to serve the nation by strengthening one of its most important regulatory bodies. Upon the wisdom, intelligence and courage of this commission depends in large measure the commercial welfare of the country. It is believed that the engineering profession can and should contribute to the country's well-being through the channel of membership in the Interstate Commerce Commission.

Very respectfully,

J. PARKE CHANNING, Chairman.

Notes on Luxemburg's Steel Industry in 1914 to 1918*

Effects of the War—Germany Benefited Greatly Through Control of Output of Iron Plants Running to Full Capacity in 1915 and 1916

By ANDRÉ SURNY DE BONNIER
Mining Engineer, Liège, Belgium

THE critical state of the iron market in 1913, particularly in Belgium, caused a curtailment in the iron industry in Luxemburg at the end of 1913. The need of iron and steel in the Balkans was great, but the financial condition of these countries was deceptive. Furthermore, the negotiations opened in Dusseldorf at the Stahlwerk Verband, the difficulties between the United States and Mexico, and the absence of business in the Orient were the principal reasons for the inactivity of the market.

Mining statistics show a decrease in production of 3,200 metric tons of ore per day in Luxemburg during the first half of 1914, compared with the corresponding period of 1913. When the war broke out, operations stopped abruptly, only the men necessary to protect the mines being kept at work. By Aug. 10, 1914, of 5,400 laborers, 4,130 had been sent away. But by December, 1914, almost 80 per cent of them had been taken back.

During 1915 all male labor was employed, and it became difficult to find trained men by the second half of the year. The same situation existed during 1916 and the first part of 1917. In consequence, there was an increased use of machinery and mechanical devices of all kinds, the average production per man likewise increasing.

The price of ore, sold in 1913 at 3 fr. per ton, increased monthly. From 3.21 fr. in 1914 it rose to 4.50 fr. by August, 1915, for calcareous ore carrying 30 per cent Fe, and 3.90 fr. for siliceous ore with 35 per cent Fe. In 1917, calcareous ore was quoted at 5 fr., and siliceous ore sold up to 6.5 fr. At the end of 1917, the total extraction of ore was 30 per cent less than in 1915, because of the greater use by German blast furnaces of ore from the district of Briey, which is richer than the minettes of Luxemburg.

The iron resources of Luxemburg were a great help to Germany. More than 25 per cent of the total production of minette in 1913 was exported to countries independent of the Zollverein, but in 1915 less than 3 per cent was exported to these countries.

*Data taken from yearly reports of the Chambre du Commerce, of Luxemburg.

In August, 1914, the metallurgical plants became as greatly disorganized as the mines. During the first week of August, forty-two out of fifty furnaces were shut down. The Germans having removed the railroads for military use exclusively, the plants could not receive the coke required to keep them in operation. However, this abnormal situation did not last long, and in December the production of pig iron was 111,523 metric tons, or nearly one-half of the normal production. During 1915 and 1916 the plants ran at full capacity, the production being slightly lessened at the end of 1917.

as follows, the year 1918 figures being given in parentheses: Mining and metallurgical companies, \$61,466,935 (\$105,848,575); Canadian, Mexican, Central and South American companies, \$10,402,370 (\$13,573,665); holding companies, \$910,005 (\$1,425,005).

Occurrence of Iron and Nickel On Celebes Island

The British Bureau of Mines has issued a mimeographed report of eleven pages on the manganese-chrome iron ores and the nickel ores occurring in the Verbeek Mountains of Central Celebes and on neighboring islands. Celebes lies on the equator, south of the Philippines and east of Borneo. The iron ores are of the same type as those found in Cuba. There are four fields in Central Celebes, containing approximately the following number of tons of massive ore: Larona, 7,500,000; Lingkona, 1,500,000; Lingkobale, 1,500,000 and Karipenan, 1,300,000. Two analyses, the highest and the lowest, from the Larona field, showed the following results:

ANALYSES OF LARONA IRON ORE

	Per Cent.	Per Cent.		Per Cent.	Per Cent.
Loss on ignition.....	12.2	15.4	Al ₂ O ₃	7.0	10.8
SiO ₂	0.5	0.8	C ₂ O.....	1.7	2.3
F ₂ O ₃	70.1	73.6	MgO.....	0.3	0.4
Mn ₂ O ₄	1.5	2.0	P ₂ O.....	0.08	0.11
NiO.....	0.3	0.6			

These and other deposits on neighboring islands may be summarily described as follows:

1. *Deposits of the Verbeek Mountains.*—Quantity of ore estimated at 1,000,000,000 tons; 200,000,000 proved. Favorably situated. About 300,000 hp. available from the Mailili River.

2. *Kilone Dale.*—Hasty reconnaissance indicates considerable ore. Situated just across from an export harbor, more favorably than the territory in which Verbeek Mountain deposits occur; also better prospects for water power.

3. *Group of Islands in Laeot Straits.*—About 25,000,000 tons on Poeloe Soewangi, at the disposition of the government, and 300,000,000 tons on Poeloe Seboekoe, in private hands. Favorably situated near coal mine on Poeloe Laeot and convenient for shipment.

4. *Obi Islands.*—No data on ore, but in large amount. Not as favorably situated for power, but more so for export shipment.

Nickel deposits have been found in association with the iron ore, their origin being closely connected. They belong for the most part to the garnierite group of hydrated magnesium nickel silicates, such as are found in New Caledonia. Two experimental pits in a nickel deposit at Soroako, on the south shore of Lake Katano, gave throughout a depth of 9 and 12 m., respectively, an average content of 2.3 and 2.5 per cent Ni. Eleven pits on Nendjangan hill average 2.5 to 3.0, and 21 pits and trenches on Boetoh hill averaged over 5 per cent Ni. The total amount of this ore was estimated at 60,000 tons, but 1,000,000 cu. m. of material would have to be removed in development. Several other essentially nickel deposits are known, and, as has already been mentioned, the iron ore is nickeliferous. The investigations are being continued.

Tungsten Ore Imports into the United States in June, 1919, amounted to 338 long tons. The countries of origin and amounts were as follows: Chile, 136 long tons; Peru, 59; Japan, 53; Argentina, 50 long tons.

Hoover Banquet Arranged

General and Executive Committees of the American Institute of Mining and Metallurgical Engineers
Appointed by President H. V. Winchell

HERBERT HOOVER expects to arrive in America some time before the middle of September—the exact date to be determined by cable from him.

The engineers of America, under the auspices of the American Institute of Mining and Metallurgical Engineers, have decided to express their admiration for Hoover's services during the last five years, in international affairs, by giving him a large dinner, to be held in New York, shortly after his arrival. Mr. Hoover expects to go to his home in California, where he will resume his practice of engineering.

An organization has been completed consisting of a general committee and also an executive committee appointed by President Winchell of the A. I. M. E.

The personnel of the executive committee is as follows:

- | | |
|-------------------------------|--------------------|
| W. L. Saunders, chairman, | M. L. Requa |
| Chas. F. Rand, vice-chairman, | E. G. Spilsbury |
| E. P. Mathewson, treasurer, | Edgar Rickard |
| Albert C. Ludlum, secretary, | Edward B. Sturgis |
| A. B. Thayer | Arthur Williams |
| A. R. Ledoux | Horace V. Winchell |
| E. E. Oicott | J. Parke Channing |

W. L. Saunders is also chairman of the general committee with Charles F. Rand and E. P. Mathewson as vice-chairmen.

August Mining Dividends

Dividends disbursed in August, 1919, by 15 United States mining and metallurgical companies making public reports amounted to \$5,702,821, compared with \$10,320,109 distributed by 21 companies in August, 1918. Canadian and Mexican companies paid \$626,514, as compared with \$1,980,163 a year ago.

United States Mining and Metallurgical Companies	Situation	Per Share	Total
Am. Zinc, Lead & Sm., pfd.....	U. S.	\$1.50	\$120,810
Anaconda, c. a. s.....	Mont.	1.00	2,331,250
Arizona Copper.....	Ariz.	.18	227,000
Barnes King, c. g.....	Mont.	.05	20,000
Caledonia, Is.....	Ida.	.01	26,050
Chief Cons., Is.....	Ariz.	.063	57,475
Cresson Cons., g.....	Colo.	.10	122,000
Golden Cycle, g.....	Colo.	.03	45,000
Homestake, g.....	S. D.	.30	125,580
Intermt. Nickel, pfd.....	U. S.-Can.	1.50	133,689
Miami, c.....	Ariz.	.50	373,557
Mohawk, c.....	Mich.	1.00	100,000
New Jersey Zinc.....	U. S.	4.00	1,400,000
United Easterns, g.....	Ariz.	.07	95,410
United Verde Ex., c.....	Ariz.	.50	525,000
Canadian and Mexican Companies			
Amparo, g.....	Mex.	.05	100,000
Coniagas, s.....	Ont.	.123	100,000
Hollinger, g. s.....	Ont.	.05	246,000
McIntyre Porcupine, g. s.....	Ont.	.05	180,514

The only holding company to pay in August, 1919, was the White Knob Copper and Development Co., preferred, which disbursed 5c. a share (\$10,000).

The totals of the first eight months of the year are

BY THE WAY

Alluring Gold

"It is surprising how many people are duped into buying spurious bars of gold," said the *Ironmonger* recently. "Hundreds of pounds have been paid for single bars of what afterwards proved to be brass. It is quite a weekly occurrence; the 'sharps' on the lookout for pigeons to pluck frequent liquor bars, and sometimes pose as pioneers and prospectors who have 'struck 'ile.' There is much secrecy observed, and all sorts of subtle excuses. Sometimes the bars have a film of gold and pass the acid test. On Mar. 7 a member of the Provincial Council was duped, he alleged, to the tune of £200 for a bar of alloy of 63 per cent copper and 37 per cent zinc, the lot said to be worth 1s. 6d. It was palmed on to him as South African Republic gold, which is of lighter color."

A Matter of Habit

"There gaws tha bloody whistle naow a'blawin' like some creature possessed," says Cap'n Dick. "But I tell e, m'son, 'er do 'ave a powerful h'influence on these 'ere chaps oo works daown in tha bal. W'y, dam-me, they h'eats, works, an' sleeps by un, an' days w'en there's no blaw to 'er, don't seem as 'ow tha boys be themself's. I suppose any 'abit be pretty much tha same, an' once a man's formed un, it's bloody 'ard to break 'is ways. An' 'e naws it, m'son. H'out in Butte nummer o' years h'ago—thinkin' on this 'ere whistle reminds me o' this story—tha pastor o' one o' tha churches figger'd as 'ow 'e'd raise enough money to buy a bell to 'ang in the belfry so that Sunday moornin's tha sexton could ring un, an' let tha boys naw w'en to come to church. So h'out 'e starts collectin'. Some o' tha boys gave 'im one day's pay an' some wuz more liberal. Finally 'e come to Jan Tregar, oo, min' you, was'nt one o' these 'ere stingy chaps but 'e wants to naw jus' w'ere 'is money's gawin' to. So tha preacher tells 'im. 'Oh gos along, reverend,' says Jan, 'W'ot thee wants is not a bell, thee wants a bloody 'ooter. Tha boys is more like to turn h'out w'en they 'ears 'er a'blawin'.' An', dost thee naw, m'son I do believe a whistle might be more persuadin' to some, jus' from force o' 'abit." D. E. A. C.

A Tribute to Oil

An oily tongue maketh smooth speech, and the following from a Texas broker does not require sand papering:

Mineral oil is liquid sunshine. The sun itself may be an incandescent globule of oil. Forests of ancient ages locked in the earth are solidified sunshine. Oozing from them through eons of time is crude petroleum gathered into vast subterranean lakes and rivers. Man has tapped those reservoirs, refined their products and restored the liquid sunshine again to illuminate, lubricate, glorify and bless the world.

Oil is 85 per cent carbon; so is the sun. It is 15 per cent hydrogen; so is the sun. The body of every animate being on the earth, above the earth and in the sea contains and is dependent upon this liquid sunshine or oil. All vegetation contains and is dependent upon oil as a life element. Cut off all oil and the earth would be a cemetery in ninety days.

Every bit of machinery, every wheel, shaft, spindle and cog in the industrial world depends upon oil to move. Every engine, ship and aeroplane would stop but for oil. Not a

banking house, factory, store, office, shop could open in all the marts of trade if there was no oil. Not a church, schoolhouse, theater, movie or game could bless, educate, give pleasure, delight and recreation without oil. No hospital or sickroom could offer hope of health without oil.

The oil springs of Is, on the banks of the Euphrates, that furnished oil for the building and glorifying of Ninevah and Babylon, are still running. There is an oil spring in the Ionian Islands that has flowed for over two thousand years. The oil wells of Rangoon have supplied over 400,000 bbl. of oil annually for more than ten generations. There are oil wells in Burkesville, Ky., that have flowed since 1826. Other wells in Oil Creek, Pa., which have flowed since 1858. You should worry.

Put your ear to the ground. Do you hear the march of industry? It is oilward. In the next twenty-five years the demand for oil and oil products will be more than double that of today. There is no substitute for oil. It can't be done. Oil is in a class by itself. If you wish to be in the march of progress, be abreast of your times, be one in the front ranks of success, and win wealth, power and honor, become an active investor and promoter in the oil industry. There are a few choice seats with the winners left. Cut out doubt, unbelief and distrust; go in now.

Get your oil and be in at the feast.

Rocks and Literary Indigestion

A San Francisco contemporary seems perturbed because a reporter referred to a mine as being in the ideal geological formation of "anthracite and porphyry," and takes pains to suggest that rock conditions at Tonopah indicated that perhaps "andesite" was meant. Had the reporter (or the compositor) taken the trouble to consult the *Mining & Scientific Press* of June, 1908, p. 23, he could have found a plausible pretext for the error in an article by C. W. Purington on Treasure Mountain, in the Eureka mining district of San Juan County, Col. In speaking of the outcrop of the big vein on the Cinnamon fault, the author says that it resembles a wide series of alternate bands of quartz and anthracite coal. A careful reader might notice that the coal effect is due to weathered rhodonite. Still more interesting is the allusion to the crosscut in the Gold Prince mine, where a solid wall of rhodonite 30 ft. wide resembled a wall of pink ice cream. In these days of the cost of high living becoming so burdensome, why should reporters neglect opportunities? Horse-flesh ore might do for folk who are not too squeamish, while kidney ore suggests stunts with a chafing dish. Peacock ore would serve for a Sunday or company dinner. Honey stone, ground to proper size, should prove a boon to dishonest grocers. And so on, *ad nauseam*. About twenty-five years ago Prof. J. F. Kemp was on a geological jaunt in the Franklin Furnace district of New Jersey with a group of students. Among other specimens gathered were some interesting pieces of banded willemite, calcite and rhodochrosite that looked something like slabs of chocolate-vanilla-strawberry at a Sunday-school picnic. The sight of them actually spurred the appetite (not the greenish hexagonal crystals) and an approaching baker's wagon was hailed with glee. By a phenomenal coincidence the food vendor's only stock consisted of some cake that was gotten up as a camouflage for ice cream, being in streaks of brown and white and vivid pink. Thinking that the professor also might be hungry, several of the boys proffered chunks of the treasure trove. Taking a slice in one hand, "Jimmie" compared it with a rock that he had been looking over. With a merry twinkle in his eyes the pious geologist remarked "I asked for stones, and ye gave me rhodochrosite cake."

PERSONALS

CHARLES L. PARSONS, mineral technologist of the U. S. Bureau of Mines, has returned from Europe where he has been making an investigation of a number of chemical processes. Dr. Parsons was also in attendance at the London and Brussels meeting of the Interallied Chemists.

F. F. Sharpless is in Tennessee on professional business.

A. W. Grier-son has been appointed manager for the Kirkland Combined Mines, Ltd., at Kirkland Lake, Ontario.

Edwin J. Collins has returned to Duluth from Cobalt, Ontario, where he has been on a ten days business trip.

R. L. Chase of Denver, Col., has returned from examining properties at Lake City.

L. G. Harris, general manager of the North Davidson Mining Co. of Porcupine, has gone to England with the object of raising funds for development.

C. L. Colburn was in several districts of Colorado recently, including Breckenridge, Leadville, Cripple Creek and Denver.

F. A. Thomson, dean of the school of mines of the University of Idaho, has concluded a tour of all the mining districts in southern Idaho.

R. R. Rose has resumed his duties as assistant secretary of the Canadian Mining Institute after an absence of nearly five years on military service.

W. F. Gowans is now in charge of the underground work at the Miller Independence Mines at Boston Creek, Ontario.

M. L. Regua contributed a comprehensive article to the Washington Star, Aug. 24 on the subject: "Striking at the Root of the Profiteering Evil."

Ellsworth Y. Dougherty has been appointed mining geologist in Southern Oregon for the Oregon Bureau of Mines and Geology.

J. E. Perrault has been appointed Minister of Colonization and Mines for Quebec Province, in place of Honore Mercier, who becomes Minister of Lands and Forests.

H. M. Richmond, professor of geology at Williamsville, Liberty, Mo., has been making an examination of the Wyoming Mining Company's mines south of Lander, Wyo.

F. G. Cottrell, the assistant director of the Bureau of Mines, has returned from an extended stay in Europe, where he made an investigation into the general mineral situation existing there.

Olof Zetterlund, general manager of El Arco Mines Co., Sinaloa, Mexico, was in New York recently, and has gone to Denver, Col., to purchase mining equipment necessary for the operation of his properties.

Rudolph Gahl, consulting metallurgist, of Denver, is conducting experiments on the chloride volatilization process at the Utah station of the Bureau of Mines, on a copper-silver ore from Peru.

V. K. Ting, director of the Geological Survey of China, visited Washington recently. Mr. Ting intends to visit some of the Western stations of the Bureau of Mines before sailing from San Francisco on Sept. 26.

T. S. Carnahan, who has been appointed safety engineer for the Utah Copper Co. recently, made a trip to Arizona and New Mexico for the purpose of investigating steam shovel operations.

Seth S. Langley will change his headquarters from Los Angeles, Cal., to San Antonio, Texas on Sept. 15. Mr. Langley expects to be actively engaged in Western Texas, and the Gulf Coast district as a petroleum technologist.

CHARLES L. PARSONS

Irving A. Palmer and **Samuel Z. Krum**, of the metallurgical department of the Colorado School of Mines, recently made a tour of inspection of the ore dressing plants in the San Juan district.

H. C. Parmelee, **Howard R. Ward**, **H. H. Stock**, **Charles W. Merrill**, **S. A. Taylor**, **Frederick G. Clapp**, **Ralph Arnold** and **Kenneth Seaver** constitute the advisory committee of the International Exposition of Mining Industries.

John Seward of 152 Halsted St., East Orange, N. J., having been discharged from the Army, has been appointed manager of the El Salvador Silver Mines Co., Inc., with properties in El Salvador, including the Butters Divisadero mine.

James Freeburn, general manager of the Chicago Mining Co., and **George Oswell**, general manager of the Ebner Mining Co., have returned after a northern trip in the course of which they inspected properties in which they are interested.

SOCIETIES

American Mining Congress will hold its Twenty-second Annual Convention in St. Louis, Mo., Nov. 17 to 21.

Colorado Scientific Society has issued the year book dated Jan. 1, 1919, containing the constitution, officers for the present year and a list of members.

Canadian Mining Institute, as a result of the recent balloting of the members, will be known as the Canadian Mining and Metallurgical Institute, or the Canadian Institute of Mining and Metallurgy, as the council shall determine. The total number of votes polled was 435, of which 343 were affirmative. On the proposal to create a new class of "Professional Members" there were 248 affirmative and 15 negative votes.

Colorado Metal Mining Association and the Colorado Chapter of the **American Mining Congress** jointly held a banquet in honor of Van H. Manning on Aug. 25 at the Denver Club. George M. Taylor, president of the Portland Gold Mining Co. was toastmaster. Dr. Manning spoke on "Coöperative Effort in Development of Our Mineral Resources." Other speakers were Bulkeley Wells, D. W. Brunton, and R. B. Moore.

Chemical, Metallurgical, and Mining Society of South Africa has elected the following officers and council for the ensuing year: President, James Gray; vice-presidents, J. Chilton, G. A. Watermeyer, and A. Whitby; treasurer, J. R. Thurlow; members of council are H. R. Adam, R. A. Cooper, C. J. Gray, C. H. Greathead, H. C. Hilton, J. H. Johnson, A. King, J. J. R. Smythe, F. W. Watson, F. Wartenweiler, E. M. Weston and H. A. White.

The **Institute of Metals**, London, England, will hold a meeting on Sept. 24 and 25 in Sheffield. The program will include visits to industrial plants, inspection of the University of Sheffield, and the presentation of a number of papers, followed by discussions. Among the papers are the following: "The Ternary Alloys of Tin-Antimony-Arsenic," by J. E. Stead; "Graphite and Oxide Inclusions in Nickel Silver," by F. C. Thompson; and the "Solidification of Metals From the Liquid State," by C. H. Desch.

Winnipeg Mining Association. On Aug. 21 a meeting of mining men was held in Winnipeg, Man., and an organization effected. The membership includes mine and claim owners, shareholders of existing companies, brokers, and financiers. The objects of the association are to encourage legitimate mining enterprises, to secure reliable information, to obtain government aid in the building of roads and other public improvements, and to establish rules governing the sale of mining shares and claims. The following officers were elected: J. Murray Baird, president; John Beckman, vice-president; J. Mur-

ray Baird, John Connor, and W. Tobias, directors. The association proposes to establish a bureau of information where the public can obtain accurate data regarding mining developments.

INDUSTRIAL NEWS

The Michigan Smelting & Refining Co., of Detroit, has opened a branch office at Pittsburgh, 945 Oliver Building.

N. S. Thulin has been appointed special railroad representative on the staff of S. C. Sprague, manager of Western railroad sales for the Chicago Pneumatic Tool Co.

S. F. Bowser & Co., Fort Wayne, Ind., has issued a circular which describes a storage system for lubricating oil. The system permits the addition of more units when required.

B. F. Goodrich Rubber Co. announces the appointment of F. O. Slutz as manager of the railroad sales department, effective July 1, succeeding C. M. Woodruff, who resigned to accept a position with Akron Board of Education.

Collins & Webb, mining machinery merchants, of Los Angeles, announce the removal of their general offices and salesroom to 447-449 East 3d St., Los Angeles, Cal., where they will have much larger space and facilities.

Coast Equipment Co., Merchants' Exchange, San Francisco, Cal., has been appointed representative of the Atlas Car and Manufacturing Co., for California and Nevada. All inquiries from this territory should be addressed to them.

Green Engineering Co., East Chicago, Ind., announces the appointment of E. L. Sullivan to represent the company in the Pittsburgh district including western Pennsylvania, eastern Ohio and western West Virginia. Mr. Sullivan will maintain the present offices at 2545 Oliver Building, Pittsburgh.

Wood Equipment Co., Chicago, Ill., will change its name to Car Dumper & Equipment Co., better to represent the nature of its business, but no change will occur in the active organization. The principal products of the company are rotary dumpers for mine and railroad cars.

The Overstrom Manufacturing Co. announces that its Los Angeles factory and offices have been closed, the factory having been moved to Berkeley, Cal. This company therefore requests that all communications be sent to its main office, 1,215 First National Bank Building, San Francisco.

The Griscom-Russell Co., 90 West St., New York, has placed on the market the G-R Duplex strainer, designed for installation in the suction or discharge lines of lubricating or fuel-oil systems for the removal of solid foreign material in suspension. This strainer is also suitable for straining

the water supply from such sources as rivers and lakes. This apparatus is described in Bulletin 1,150 published by the manufacturer.

"Industrial Transportation" is the title of a pamphlet issued by the Bicycle Manufacturers' Association, Hartford, Conn., which claims the bicycle is the lowest cost means of transportation and is the solution of the problem of carrying workmen to and from their places of employment. Letters from employers are included, attesting to the adaptability of the bicycle for this purpose. Joseph Goodman is secretary of the association.

TRADE CATALOGS

McCool Pulverizer The McCool Co., Cleveland, Ohio; Bulletin 49; 7 x 10; 16 pp.; illustrated. Describes a pulverizer for laboratory or assay work. A capacity of reducing one pound of material to 100 mesh in 30 seconds is claimed for the 9½ K size.

Surveyors' and Engineers' Instruments The A. Lietz Co., 61 Post St., San Francisco, Cal. Catalog; 61 x 9½; 612 pp.; illustrated. Contains a list of the instruments manufactured by the company and a large number of engineering books and publications. The company also carries a large stock of other manufacturers' goods.

Excavating Machinery. The Marion Steam Shovel Co., Marion, Ohio. Catalog 188; 5½ x 8; 64 pp.; illustrated. Describes the excavating machinery manufactured by the company, which includes steam shovels, dredges, and kindred equipment. Tables of specifications and working diagrams are included.

Automotive Electrical and General Supplies and Garage Equipment. Hendrie & Bothoff Manufacturing & Supply Co., Denver, Col. Catalog No. 50; 6½ x 10; 488 pp.; illustrated. This comprehensive volume should prove valuable for reference to mining and metallurgical men. It describes a large number of automotive, electrical, and general supplies and garage equipment, with directions for ordering. Eleven pages are devoted to a cross index.

Marine Equipment. Llewellyn Iron Works, Los Angeles, Cal.; 7¼ x 11; 56 pp.; illustrated. Describes the manufacture of parts of marine engines, boilers, propellers, marine railways, cargo winches and many other similar products in the two plants at Los Angeles and Torrance, Cal. It is stated that practically everything entering into the construction of Llewellyn products is manufactured by the company. Open hearth steel furnaces, rolling mills and a grey iron foundry are in operation. The last three pages are devoted to a list of various kinds of machinery manufactured by the company, which includes a number of other fields besides the marine.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Alloy of Copper, Nickel and Zinc. Foster Milliken. (1,310,363; July 15, 1919.)

Alloys—Method of Making Alloys of Aluminum, Magnesium and Uranium. Hermann G. C. Trofehn, assignor to Light Metals Co. (1,310,309 and 1,310,310; July 15, 1919.)

Aluminum Materials, Process of Purifying. Otis Hutchins, assignor to the Carborundum Co. (1,310,342; July 15, 1919.)

Drilling—Percussive Engine. Wilhelm Mauss. (1,309,649; July 15, 1919.)

Electric Furnace. Otis Hutchins, assignor to the Carborundum Co. (1,310,341; July 15, 1919.)

Electrode Rack. John Spense Finlay, assignor to Anaconda Copper Mining Co. (1,311,958; Aug. 5, 1919.)

Flotation—Concentration of Ores. Harry Vernon Seale and Wilson Shell-shear, assignors by mesne assignments, to Minerals Separation North American Corporation. (1,311,919, and 1,311,920; Aug. 5, 1919.)

Flotation—Ore-Concentrating Process and Apparatus. Edward Hopkins Emerson, assignor to Minerals Separation North American Corporation. (1,311,882; Aug. 5, 1919.)

Flotation—Sulphidation and Flotation of Ores. Raymond F. Bacon, assignor to Metals Recovery Co. (1,312,668; Aug. 12, 1919.)

Flotation Apparatus. Joseph P. Ruth, Jr. (1,309,219; July 8, 1919.)

Flotation Ore-Separating Apparatus. Alfred L. Blomfield, assignor to the Dorr Co. (1,310,051; July 15, 1919.)

Fuel Storage—Yielding Supporting and Vertically-Guiding Apparatus. William O. Renkin, assignor to Quigley Furnace Specialties Co. (1,308,370; July 1, 1919.)

Jig. James B. Barbee and Otto J. Cross. (1,312,429; Aug. 5, 1919.)

Nitrogen—Process of Recovering Combined Nitrogen from Blast Furnaces. Edward W. Haslup. (1,310,480; July 22, 1919.)

Open-Hearth Furnace. Albert Miller. (1,309,149; July 8, 1919.)

Ore-Cleaning and Concentrating Apparatus. Lewis H. Falley. (1,312,028; Aug. 5, 1919.)

Ore Separator. Owen Hawkins. (1,312,324; Aug. 5, 1919.)

Potash—Process of Producing Potassium Hydrate from Green Sand. Benjamin A. Peacock. (1,309,744; July 15, 1919.)

Potash—Treatment of Ores for Production of Metal and of Potassium Compounds. Charles Catlett, assignor to The British Potash Co., Ltd. (1,311,043; July 22, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief of Interest to Engineers and Operators

SAN FRANCISCO, CAL.—Aug. 28

Recent Mine Accidents in California were as follows: One man killed on July 16 at Carson Hill, held in court scenes by skip jumping track, one killed by fall of rock on Aug. 4 at Plymouth Consolidated at Plymouth; one killed by falling on Aug. 11 at Pennsylvania Mines, Tuolumne.

Comstock Northern Mines at Virginia City, Nev., produced 2,152 tons, valued at \$67,438, for the first week ended Aug. 23. Of this Consolidated Virginia produced 1,113 tons valued at \$34,817 and Ophir 1,039 tons valued at \$32,621. Twenty-seven bars of bullion were shipped to the San Francisco mint.

A Mine Rescue Station will be established at Berkeley, Cal., in connection with the University of California, providing the board of regents will make provision therefor at its next meeting. Following a recent conference between Van H. Manning, director of the U. S. Bureau of Mines, with Dean F. H. Probert, of the department of mining of the University, it was said that the University had suitably selected as the location of the station. A Congressional appropriation of \$25,000 has been made for such a station in California. The station will be in charge of mine rescue work in the state and Government engineers will be in charge.

RENO, NEV.—Aug. 30.

The Nevada Consolidated Strike at Ely ended Aug. 30 by men returning to work. The company will improve working conditions and establish a company commissary. Speedy settlement of the strike at Tonopah and Divide, which has closed down all the mines at these places, seemed assured a week ago, both sides appearing confident. But, lately, the operators seem to be less favorably disposed, though speaking well of Joseph Lord, the Federal mediator.

At the urgent request of Governor Boyle, the Comstock miners, who had voted to strike to enforce their demands for a dollar a day wage increase, postponed going out until the governor's arrival. It is hoped in a settlement may be reached at a joint conference of the operators and miners with the governor.

NESPELEM, WASH.—Aug. 28

Silver Mining in the Nespelem District is displaying renewed activity. There are now six small producing companies in operation. Practically all are on a narrow mineralized belt running north and south two miles south of Nespelem. The district is hampered by high transportation costs, being 40 miles from railroad. This handicap has been largely met by the erection of an 80-ton flotation plant, owned by the Great Metals Mining & Milling Co. This plant first went into local dump ore averaging 10-20 oz. silver. The Great Metals company has just finished sinking its shaft to the 200 level and is ready to crosscut to get under a promising surface lead. The Double Head Mining Co., operated under bond and lease by E. S. Jenkins, of Seattle, has a crew of four men on development at Beggs and Trowsky, are shipping 25 tons daily from the Great Metals mill from the Apache property two miles away. The Panama property, operated by H. B. Dickinson, of Seattle, has about 100 tons of ore in the bins. A. J. O'Neil, Elmer, is operating a small crew is engaged. The Rebecca Mining Co., ten miles east of Nespelem, is diamond drilling its property.

BUTTE, MONT.—Aug. 28

The Suit Against Butte & Superior brought by the Clark Montana Realty Co. has been settled by compromise. By the stipulation of the agreement the Elm Orlu, which is owned by the Clark-Montana Realty Co., was awarded 186 ft. additional eastward on the Rainbow vein below 1,200 ft. and the Butte & Superior Copper Co., that portion above 1,200 ft. The Jersey Blue vein west of a new plane below 1,300 ft. is awarded to the Elm Orlu. Each side will pay its own costs. Butte & Superior closed last year with net current assets over all liabilities of \$4,200,000. There remains now only the agreement

upon damages which Butte & Superior must pay to the Mineral Separation Corporation, Ltd., for the infringement of the latter's oil flotation patents. An accounting is now in progress in an endeavor to determine the extent of Butte & Superior's liability and the amount of damages it should pay. Return of these findings is scheduled for Oct. 29.

SALT LAKE CITY, UTAH—Aug. 30

Dr. Van H. Manning, director of the U. S. Bureau of Mines, addressed the Utah Chapter of the American Mining Congress at a luncheon given in his honor on Aug. 21 at the Commercial Club in Salt Lake City. Dr. Manning urged the need of greater co-operation between the Bureau and mining men, looking to the day when the Bureau, at present receiving annual appropriation of about \$2,500,000, compared with the \$30,000,000 given the Department of Agriculture, will be as important and well fostered as the latter. He also outlined the work of the Bureau on toxin gases, airplane bombs and helium gas during the war, and pointed out the need of increased production of petroleum in the United States.

A Solution of the Smoke Problem, recurring in Salt Lake City during the winter months, is being sought by the U. S. Bureau of Mines in co-operation with city officials, and by means of funds furnished in part by the government, and in part by the city. Dr. Van H. Manning, director of the Bureau, is in the city in company with Osborn Monet, consulting fuel engineer. Consultations with the city commission have been had. Thomas and local of the local bureau also attending. S. Q. Canon, city engineer, will also take part in the investigation. It is planned first to look into the locomotive problem and high-pressure plants operating the year round to determine what percentage of the trouble is directly traceable to these sources, before the smaller plants and local furnaces start up for the winter. It is the purpose of the investigators to determine upon a sane and reasonable program of procedure without taking rash or drastic action.

DENVER, COL.—Aug. 23

The State Mines-Development Association of Colorado has opened offices in the Kirtland Building. This will be the headquarters for the central organization, which will co-operate with the subsidiary organizations in ten of the mining camps of Colorado. The president of the central organization is Lee M. Brokaw, who was its promoter. The chairman is W. F. Kendrick. The Board of Engineers attached to this central organization are Forbes Ricard, Arthur J. Hoskin and E. S. Shuttleworth. These are all well-known engineers in Denver, and in co-operation with the mining engineers of the various subsidiary organizations will pass upon the advisability of each case presented to the attention of the organization.

HOUGHTON, MICH.—Aug. 28

Production of Copper from the mines of the Michigan district continues to depend entirely upon the labor situation in the camp. The output has not as yet reached a point where it may be a strong factor in increasing the copper output. Mines of the copper country are also suffering from labor shortage, and it is doubtful whether they have no control. The law fixing the minimum age at which a boy can go to work in the mines is so drawn that mine managers are in doubt as to whether a mining company may hire boys under 18 years of age, no matter what class of work they are required to perform. Under the law the boys can go underground if less than 18 years of age and the opinion has been expressed that a mining corporation runs the risk of violating the law if it employs boys under 18 in any capacity whatever. The problem, therefore, from the viewpoint of the community, is a serious one. Practically the only industry in the copper country is mining and there are few other jobs in other lines at which these boys may work. There is no complaint about the state law. It would, however, in

some cases be easier for the companies to get men and to keep them if it were possible for their sons to secure work in the same district.

AUSTIN, TEX.—Aug. 28

All Oil Companies must at once file reports with the Texas Railroad Commission giving full particulars regarding the organization, holdings, production, etc. Failure to comply with this law involves a penalty of \$500 fine.

New Oil Refineries will be built at Galveston and Houston. Carson Petroleum Co. will build storage and terminal facilities at Galveston for supplying Missouri, Kansas and Texas R.R. Contract is for 3,000,000 bbl. yearly for five years. The railroad company will finance construction of terminals and conversion of locomotives to oil burners of the Mexican Petroleum Co. and the Pan American Petroleum Co. It is estimated the saving to the railroad by this change will be \$3,000 daily. An application has been made to the city of Galveston for Galveston for supplying Missouri, Kansas & where it is desired to build an oil refinery of 1,000 bbl. daily capacity. At Houston is the Louisiana Petroleum Refining Co. has purchased 37 acres on the north side of the ship channel, and will build an oil refinery at once of a daily capacity of 1,000 bbl. The city of Galveston has also secured land near Houston with a frontage of 600 ft. on ship channel, and will build an oil refinery, the first unit to have 1,000 bbl. daily capacity. R. A. Fouts, of Chicago, will be general manager, and C. W. Shearer, Houston, will be in charge of construction.

DULUTH, MINN.—Aug. 28

The Wash Ore Area of the western Mesabi Range continues to be the main feature of the development of this range. It is reported that negotiations have now been completed for the leasing of what is known as the Trumbull prospect by the Great Northern Ore interests to the Cleveland Cliffs company. A feature of wash ores which largely offsets their additional cost is their popularity with furnace men, and this feature probably accounts more than any other for the recent development of silicious orebodies. Finished wash ores compare very favorably chemically with the straight shipping ores from the other districts and the removal of a large percentage of fines in the process of washing transforms them into an excellent furnace charge.

BIRMINGHAM, ALA.—Aug. 26

A Strike at the Mines of the Sloss-Sheffield Steel & Iron Co. took place during the third week of August but was of short duration, being settled by the company granting the men's demand for a ten-hour day with eleven-hour pay. This is the plan now in vogue at the Tennessee Coal, Iron & Ry. Co. and ore mines are followed by the Republic Iron & Steel Co. at their mines on Red Mountain, the Woodward company being the only one in the south end of Red Mountain now operating on a straight ten-hour day. Members of a Roumanian commission were in Birmingham during the third week of August for the purpose of placing the Birmingham Steel Corporation relative to placing an order for a large tonnage of fabricated steel for bridge building. This order is said to be for a large quantity of steel in connection with the company placing a bridge over a branch of the Danube River which was destroyed during the war.

NEW YORK—Aug. 26

The Directors of the Cerro de Pasco Copper Corporation at a meeting held Aug. 13 definitely authorized the construction of a new smelting plant at Oroya, Peru, the construction point of the Peruvian Republic and Peru and the Cerro de Pasco Railway. The plant will consist of two blast furnaces and two reverberatories with necessary adjuncts. The estimated capacity will be about 2,800 tons of raw ore per day. It is hoped that the plant will be in operation early in 1922.

TORONTO, ONTARIO—Aug. 30

Much Survey and Exploration Work is being carried on this season in that part of Northern Ontario lying between the Transcontinental Railway and James Bay, which is expected to result in securing valuable information concerning the mineral and other resources of that region. Among the different parties in the field are a survey party of the Geological Survey of Ontario Ry., completing survey for extension of the line and estimating the possible water power development; a party from the Ontario Bureau of Mines mapping the geology of the area; and a party sent out by the Canadian Geological Survey to investigate coal, clay and oil indications. A general description of the area will be given by James Stewart.

At Cobalt, a committee of business men has been attempting to bring about a settlement of the miner's strike, but without result. The mine managers have issued a statement defining their position. They say that "the present labor dispute has narrowed down to a positive difference of opinion as to whether or not the local branches of the Western Federation of Miners, now known as the International Union of Mine, Mill and Smelter Workers, should be recognized. On one side the union officials and the Minister of Labor insist that it must be recognized, and on the other side the mine managers are just as positive in their determination that the union will not be recognized. The mines which have now been shut down since July 23 are gradually filling with water.

The Ontario Government has interfered to put a stop to the expensive advertising of stock in oil companies of doubtful standing and prosecutions have been instituted against four promoters dealing in shares of such companies as follows: Glen Craig Tobias, Canada Petroleum & Refining Corporation, Ltd.; Thomas F. Fleming, Texas Producing & Refining Co.; O. J. E. Yersley, Texas Globe Oil Co.; and A. G. Rogers Dollar Oil Wells. They are being prosecuted under the Ontario Companies Act, which provides that a company before offering shares to the public shall file a prospectus giving full particulars as to the original incorporators, and directors, number of shares subscribed for, amount paid for

property, commissions, preliminary expenses and other data, indicating the character and financial standing of the company. They were arraigned at the Toronto Police Court and remanded for one week, being released on bail.

VICTORIA, B. C.—Aug. 29

The Canada Copper Corporation has settled its dispute with its employees and operations will be resumed at once. The delay caused by the four-months' strike will prevent starting the concentrator before next spring.

Tests of the Fleet Electrical Smelting Furnace in handling British Columbia magnetite ores are taking place. The Provincial Government has supplied a quantity of ore from Texada Island for this purpose. One test made recently was witnessed by the Provincial mineralogist and other officials. While it was not as successful as might have been desired, others, it is understood, are to be arranged.

Vancouver Mining Development Syndicate has been organized with a capitalization of \$500,000, of which \$100,000 has been subscribed. The object is to bring mining prospects of British Columbia to the attention of the investing public. The syndicate plans to aid a prospector locating promising properties. Nicol Thompson, A. M. Whiteside, J. H. Greer, A. H. Wallbridge and A. Erskine Smith, all of Vancouver, B. C., are members of the board of the new organization.

The Cariboo District of British Columbia is attracting the attention of men with experience in dredging operations in the Yukon. James Moore, one of the largest operators in the Yukon, is placing a dredge on Antler Creek, in the Cariboo. His associates have secured a promising placer tract on the Swift and Little Swift rivers, and their preliminary investigations have arranged to install a large dipper dredge. The Dominion Government, according to William Sloan, provincial minister of mines, is making a geological and topographical survey covering 16 sq. mi. of this section, the work centering at Harper's Camp. The International Dredging Co. has a machine equipped for a dredge on the Yukon. The work of North and South forks of Horsey River a drag-line scraper is being put in

by Victoria mining interests, whose experiment is being watched with interest.

LONDON, ENGLAND—Aug. 25

Chemical & Metallurgical Corporation held its statutory meeting in London on July 31, at which the report of the directors was presented, where it was pointed out that the contract with Frank Elmore had been completed, company acquiring the world rights of Elmore's patented invention for separating the lead and zinc-lead ores by an economical and efficient chemical process. The price paid was £25,000 in cash and £1,000,000 in ordinary shares. The chairman, Herbert Guedella, stated that the company is arranging to establish a plant in Great Britain for treating middlings and concentrates; that a supply of middlings from Australia has been contracted for; and that the company is negotiating further for a contract supply of raw material.

As regards the foreign situation of the patents it was stated that the Burma Corporation has an option to call for a license in Burma and India on certain terms. This option extends to May, 1920. The option with regard to the United States and Canada has been exercised, and calls for formation of a company with a capital of £400,000, of which the corporation will receive £200,000 in fully paid shares. The option with regard to Mexico and Central America has also been exercised, and the corporation will receive £115,000 in fully paid shares in a company with a nominal capital of £200,000. Another group has exercised the option with regard to Russia, Norway and Sweden, and this case the company will receive £150,000 in fully paid shares in a company with a capital of £300,000. The company is completing an agreement for the establishment of a trial plant to demonstrate the process in Australia in connection with the chief mining companies there, and an agreement is almost completed with most important mining interests in France for the acquisition of the patents for France, North Africa, Spain, Portugal, etc. The option with regard to Southern Africa has not yet been exercised.

When the corporation was formed, Elmore also transferred to it the benefit of an option on the rights to the Francois cementation process for shaft sinking through waterlogged strata.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ALASKA

AT WILLOW CREEK about six good properties operating with 100 men.

KENNECOTT (Kennecott)—Employing all miners available. Supply insufficient.

ALASKA GASTINEAU (Thane)—Laying off miners, who are being hired by Alaska Juneau.

JUALIN ALASKA (Jualin)—All bids rejected on large tunnel contract. Companies doing work itself. Miners hard to obtain.

ARIZONA

Cochise County

ARIZONA UNITED (Johnson)—Kirby Thomas, of New York, inspecting this property.

COPPER CHIEF (Johnson)—Leased by Mines and Development Corporation of Arizona, which will build concentrator. Martin Fishback, manager.

EMPIRE (Johnson)—Being examined by D. G. Kidder, of Los Angeles, for California company.

O. K. SHAFT (Johnson)—Compelled to stop work on account of water. New pumps being installed.

Pinal County

MAGMA COPPER CO. (Superior)—Drill hole sunk 400 ft. below 1,800 level, and core indicates that last 47 ft. is in ore averaging 5 per cent copper, and 4 oz. silver per ton. Bottom of hole still in ore.

SILVER KING OF ARIZONA (Superior)—New shaft down 245 ft. On Aug. 27 sinking was speeded up by addition of third shift. Shaft has been equipped with new hoist and cable, and machinery for sinking to 1,000-ft. depth. New compressor installed.

Sinking under contract discontinued, and work being done on company account under direction of John Fowle, general manager. Mill now running three shifts. At least average about 20 oz. silver per ton. Extraction by flotation reported to be well above 95 per cent.

CALIFORNIA

Nevada County

GOLDEN CENTER (Grass Valley)—Discovered 17 two-foot vein of good ore announced by E. A. Abadie, superintendent. Ledge encountered in crosscut driven 500 ft. west of shaft and opens up large territory to development.

UNION HILL (Grass Valley)—Hoisting plant being dismantled to be moved to Idaho Maryland ground.

CENTRAL CONSOLIDATED (Nevada City)—Property on Greenhorn Creek three miles south of town being reopened. Complete plant will be needed. Paul W. Smith, formerly superintendent, again in charge.

COLORADO

Boulder County

BOULDER COUNTY TUNNEL (Cardinal)—R. D. George, state geologist, and Fred Fair, ex-county surveyor, examining tunnel and mine for G. J. Clark, of Boulder, and Fred A. Spies, of Chicago, who have recently taken property over.

Eagle County

BAILEY COPPER (McCoy)—William H. Rathbun, of Minneapolis, Minn., and associates, recently purchased equipment to develop Bailey Copper mine at Copper Spur near McCoy. Ore copper carbonate in granular sandstone. Incorporated under name of Electro Copper Co. Planned to build leaching and electrolytic plant.

Park County

POWDER RIVER GOLD (Fairplay)—Excavations begun for largest gold dredge in Colorado. Company recently purchased large acreage on Middle Fork of South Platte River. Dredge to be entirely of steel and will have 9-cu.ft. buckets and capacity of over 3,000 cu.yd. a day. W. F. Hammon, of San Francisco, president. Operation will begin half mile below Fairplay.

Pitkin County

HOPE M. & M. (Aspen)—Tunnel advanced 76 ft. last month. Heavy water encountered, which will require upper workings. Mill being remodeled and power line extended to plant. Operation expected to start about middle of September.

San Juan County

SUNNYSIDE M. & M. (Eureka)—Mill again in operation. Daily capacity 500 tons. Property forced to suspend several months ago because of \$250,000 fire which destroyed building and hoist. New mill also big warehouse, commissary department, steam and crusher plant.

SOUTHERN

EL PASO EXTENSION (Cripple Creek)—Plans to erect concentrator at Clara D shaft of old Lexington Gold Mining Co. Numerous blocks of ground leased and leases developing milling ore. Some leases reworking dumps.

PORTLAND (Victor)—Recently struck rich smelting ore when drifting on Lee No. 1 vein of Portland No. 2 shaft. Body five feet wide containing coarse iron 1 to 3 in. wide of almost solidylvanite. Discovery at 2,131-ft. depth below collar of Portland No. 2 shaft at Roosevelt tunnel level.

IDAHO

Boundary County

IDAHO CONTINENTAL (Porthill)—This property, 26 miles from Porthill, Boundary County, adjoining International boundary line, is concentrating 250 tons of ore a day, which in connection with its stock pile has afforded daily shipments of 80 tons of concentrates carrying 60 per cent lead and 22 oz. silver since July 22. Twelve motor trucks used in transferring product from mine to Porthill, a distance of 26 miles. The mine shows a very substantial ore reserve, has a large unproven territory of exceptional promise and in fact is one of the largest surface distributions of clean lead-silver mineral in Idaho outside of the Coeur d'Alene district.

LOUISIANA

ALUMINUM ORE CO. (Pittsburgh, Pa.)—Has purchased land at Baton Rouge, La., for shipping terminals.

MICHIGAN

Copper District

CALUMET & HECLA (Calumet)—Reclamation plant at Lake Linden recovering more copper than at any time before. Dredge working well. Additional flotation plant ready on Sept. 1. Hardinge mills being relined with Belgian flint bricks, first cargo having arrived.

FRANKLIN (Demmon)—Sinking operations continuing. Shaft now down 3,000 ft. and in footwall of Pwabic amygdaloid, mineralized portion of which may be reached by crosscut to west. Alouez conglomerate approximately 420 ft. east. Ob-

hydraulic stripping. One shovel to load ore for balance of season.

Mesabi Range

SEVILLE (Buhl)—Shipping from stockpile. Underground property owned by A. B. Coates.

THORNE (Buhl)—Installation of compressor completed. Plans under way for electrification to provide for underground and stockpile haulage. Hanna Ore Mining Co., operators.

MONROE (Chisholm)—Oliver company dismantling old No. 2 shaft house. Fire recently destroyed power plant.

MAHONING (Hibbing)—Advantage taken of lull in shipments to continue stripping. Four shovel crews now adding to total of 11,000,000 cu.yd. of overburden already removed.

Vermilion Range

CONS. VERMILION & EXTENSION (Ely)—Property transferred to Phoenix Mining Co. C. Butler, of Butler Bros., president of new concern. Surface plant and development in good shape except that mine, which has had checkered career, requires unwatering.

MONTANA

Mineral County

TARBOX (Saltse)—Managerial board of three members of the directorate created, following disagreement between Wallace and Butte stockholders. Further development of ore suspended, as ample tonnage now in sight to warrant construction of mill. Assessments will probably be continued to finance proposed concentrator.

from old dumps and tailings, has closed down and camp practically deserted.

ROCHESTER SILVER MINES (Lower Rochester)—Under direction of Charles D. Kaeding, general manager, and C. A. Bennett, superintendent, about 1,000 ft. of development work being done each month on company's three mines, the Rochester Mines, Rochester Merger and Nenzel Crown Point. Good milling ore found on 1,000 level, where there was little showing before. Ore has been picked up beyond fault on 900 and 1,000 levels, new orebodies being in virgin ground. Transportation tunnel relaid with heavy steel rails and heavy electric motors installed. Improvements being made in Rochester mill expected to result in saving of from \$2,500 to \$3,000 per month and to increase capacity to 160 tons per day.

Washoe County

STANDARD METALS (Reno)—Flotation plant running steadily. Capacity estimated 75 tons per 24 hours. Erected under supervision of "Garve" Logan.

OKLAHOMA

Joplin-Miami District

ADMIRALTY ZINC (Douthat)—Installing sand jig and additional tables. W. B. Shackelford manager.

DUDLEY MILLING (Douthat)—Erecting tailings mill to treat tailings from Admiralty No. 2.

HOPE LEAD & ZINC (Hockerville)—Moving old Scott Eagle mill from Quapaw to Hockerville.

UNDERWRITERS LAND (Picher)—Erecting new concentrator at No. 4 shaft at St. Louis, Okla.

COUNTRY NEAR RENO, NEV., SHOWING PROPERTY OF STANDARD METALS CO., WHICH OPERATES PEAVINE MINE

jective of present sinking operations to develop these two formations. There will be no 35th level. No plans made to resume production, but this may be done in short time if desired.

Geologic Range

DOCKWORKERS' STRIKE at Ashland, Wis., settled Aug. 23 and mines on range resumed shipping promptly. At most of mines steam shovels also working and ore being rushed to docks as fast as boats can take it away.

AT IRONWOOD all mines and business houses in or near city closed Aug. 28 in honor of soldiers and sailors homecoming.

OLIVER IRON (Ironwood)—Has started surveys for transmission line from Pabst power house to Puritan mine. Construction will be rushed this fall.

PURITAN (Puritan)—Head wireman for power company electrocuted at mine sub-station while trying to rescue fellow workman caught on wet pole. Latter saved by the act.

MINNESOTA

Cuyuna Range

IDA MAE (Crosby)—Will increase boiler capacity. Complete electrification contemplated.

PORTSMOUTH (Crosby)—New open pit property of Coates & Tweed has completed uncovering large manganese orebody and in position to ship when market improves.

SAGANORE (Ironton)—Winston Deare, contractors to John A. Savage Co., complete large stripping contract in which two drag line shovels were successfully used. Understood operators will continue

NEVADA

Clark County

YELLOW PINE (Goodsprings)—New mill completed, except calciner, and working steadily. Only one shift employed, but another will be added.

Humboldt County

IN SUNSHINE DISTRICT, W. S. O'Brien has stripped vein for 85 ft. on promising discovery. Values largely in silver. Johnson-Baldwin property also shows high-grade in several openings. Ratliff lease on Gem Five has made several shipments. Lease equipped with good hoist, air compressor and jackhammer drills. Joe Shell has opened up good lead-silver ore on his property.

Lyon County

NEVADA-DOUGLAS (Ludwig)—Report just issued estimates company has 190,000 tons of sulphide ore in sight running between 3.65 and 3.5 per cent copper.

Mineral County

PILOT MOUNTAINS (Mina)—Bugg and Drew have opened up cinnabar ore, carrying gold and silver also, in 200 level of their mine 12 miles east of Mina. Three flasks of quicksilver being produced daily from ore on upper levels.

Nye County

WHITE CAPS (Manhattan)—Cleanup of White Caps mill for first half of August estimated at \$15,750, which is richest cleanup yet made by property.

Pershing County

SEVEN TROUGHS COALITION (Love-lock)—Mill, which has been running on ore

RIGHT GOOD (Quapaw)—Moving old McCurdy mill from Hockerville to Quapaw. E. Dunlap superintendent.

TEXAS

Bell County

B. & W. OIL & REFINING (Belton)—First test well 20 miles south near Jarrell, showing oil in boiler, although no oil sand of commercial thickness passed through. Company locally organized, and holds leases on 18,000 acres of land in Bell and Williamson counties.

Brazoria County

WEST COLUMBIA FIELD PRODUCTION for third week in August 28,600 bbl. liquid daily, of which 18,000 bbl. was oil. Producing companies: Humble Oil & Refining Co., 13,800 bbl.; Gulf Production Co., 5,800; Crown Oil & Refining Co., 5,400; Texas Co., 4,000; Hanmcker Co., 35. Twenty-three wells producing in field, largest being Humble company's No. 5 Japhet, making 4,500 bbl. oil daily. Several wells making 3,000 bbl. liquid, which settles out only 10% oil.

Hardin County

HUMBLE OIL & REFINING (Batson)—No. 1 Garza well down 300 ft.; good progress being made.

SAN BERNARD OIL (Saratoga)—No. 5 Hooks well making fair production by pumping from 1120 ft.

Harris County

DRILLING IN SHELDON FIELD being done by Crown Oil Co., Gulf Coast Oil Corporation, Crosby Petroleum Co., and Prendergast and associates.

Wichita County

PENN OIL & GAS (Burk Burnett) — Michna well No. 1, on block 819, one mile west of producing area, has just struck top of sand at 1,530 ft. Good showing made, and casing being set. Most westerly discovery made in field.

UTAH**Juab County**

TINTIC DRAIN TUNNEL (Eureka) — Present length of tunnel 3400-3500 ft. and not 400-500 ft., as reported in issue of Aug. 23.

Salt Lake County

EMMA SILVER (Alta) — Directorate of newly formed company; C. S. Burton, of Columbia Trust Co., president; John Dern, National Copper Bank, vice president; J. E. Gallagher, J. M. Hayes, A. L. Hoppaugh, F. B. Cook, George Deem, general manager.

SOUTH HECLA (Alta) — Management reports operations but little interfered with by recent cave-in.

UTAH CONSOLIDATED (Bingham Canyon) — About twenty dwellings housing employes, majority belonging to company, destroyed by fire during night of Aug. 26.

UTAH METAL & TUNNEL (Bingham) — Particulars concerning re-financing contained in recent report from head office in Boston; 50,000 shares of stock purchased by syndicate at \$4 a share. This stock part of 100,000 shares held by company for conversion of \$750,000 7 per cent bonds. Company converted \$375,000 of its bonds into stock, exchanged \$225,000 for a like amount of 6 per cent bonds, which matured April 1, and still has about \$150,000 bonds in

LOON LAKE COPPER (Loon Lake) — First two cars of concentrates shipped from flotation plant. Mill receiving about 75 tons daily on two shifts and expects to add third shift when labor supply will permit.

WYOMING**Albany County**

NATIVE COPPER (Tie Siding) — Company operating mines at Tie Siding, 20 miles south of Laramie on Union Pacific R.R., has discovered small amounts of platinum in copper ore.

WISCONSIN**Zinc-Lead District**

ROSS (Linden) — David MacKay and Milwaukee interests have taken over and will operate Ross mine at Linden.

VINBGAR HILL ZINC (Platteville) — Continued drilling on Coulthard land east of Field-Thompson gives assurance of another mine. Good borings found in extensive drilling on Duxton-Sherry-Pedely tracts, east of old drum at lead mine. New run located by drill 1,000 ft. south of North Unity mine. Drilling and shaft sinking in progress at Copeland, near Shullsburg, and drilling has begun on William Fields land at New Diggings.

WISCONSIN ZINC (Platteville) — Drilling on David Booty land adjoining Winskell on west, at New Diggings, gives promise of shaft development. Edge tract of 800 acres, at New Diggings, and Bushnell land just east of Platteville have been leased for drillings.

ZINC HILL (Platteville) — Milling started at Little Dick No. 2 at Cuba City.

Ontario

MILLER INDEPENDENCE (Boston Creek) — Contracts made with Northern Ontario Light & Power Co. for power to operate new mining and milling plant.

FOSTER (Cobalt) — Bought by Mining Corporation of Canada.

MIPSSING (Cobalt) — Financial statement as of Aug. 23 showed cash in bank, war bonds, ore in hand and in process and bullion ready for shipment to amount of \$3,863,386. Company has secured leases of important oil lands in Texas on which drilling has reached depth of 1,200 ft.

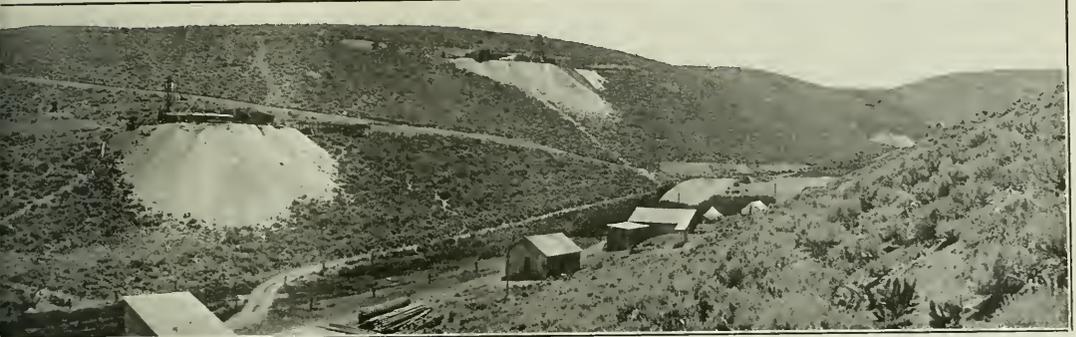

WELSH-McARTHUR-MILLER (Goudreau) — Six claims of this group in Algoma district purchased by Consolidated Mining & Smelting Co. of Canada, conditions including construction of plant to cost \$500,000. Contract for diamond drilling let to Smith & Travers, of Sudbury, and power will be secured from Michipicoten Power Co.

GRANBY-KIRKLAND (Kirkland Lake) — Has two claims about one mile northeast of Tough-Oakes, on which three promising veins varying from 3 to 5 ft. in width have been opened by trenching.

KIRKLAND - PORPHYRY (Kirkland Lake) — Has gone into voluntary liquidation and assigned to F. C. Clarkson, Toronto.

ANZAC (Porcupine) — Name of company changed to Wakenda.

DOME (Porcupine) — Unofficially stated that mill has latterly been treating ore of average grade of \$9 per ton at the rate of about 600 tons per day. Operating costs are understood to be high. Mill heads will

COMPANY RECENTLY INSTALLED 75-TON FLOTATION PLANT, WHICH IS NOW RUNNING STEADILY

treasury. Outstanding 750,000 shares. Floating debt of approximately \$30,000 will be paid off and company will have \$120,000 in treasury to renew mining operations.

Summit County

PARK CITY SHIPMENTS week ended Aug. 24; 2,825,600 lb. ore and concentrates. Shippers: Silver King Coalition, 1,180,620 lb.; Ontario, 640,000 lb.; Judge Mining & Smelting, 378,650 (zinc 100,000 lb.); Daly West, 221,500; Silver King Consolidated, 220,000; Iowa, 83,000.

NEW QUINCY (Park City) — Operations resumed at this property adjoining Daly West.

THREE KINGS (Park City) — P. J. Mackintosh, manager, to succeed W. R. Elliott, elected president of company.

WASHINGTON**Ferry County**

IRON CREEK (Keller) — Mill of 25-ton capacity being erected. L. R. Richards, formerly with Canada Copper Corporation, has been elected manager.

Spokane County

ROSELLE MINING (Spokane) — Allen Property Custodian ordered sale of 337,766 shares of common capital stock of Roselle Mining Co. and 99,996 shares of common capital stock of American Tungsten Consolidated Corporation. Sale to take place at office of Roselle Mining Co., 605 Columbia Bldg., Spokane, on Sept. 27. Prior to war these companies owned and operated about 659 acres of tungsten claims in Stevens County, Washington, originally developed by Germania Mining Co. Stock of Roselle company held by Charles S. Cullen, of Ocala, Fla., for Schillman & Bene, of Hamburg, Germany.

PAQUETTE (Shullsburg) — Platteville company assembling small milling equipment at this property, already opened up by shaft.

CANADA**British Columbia**

BIG MISSOURI GROUP in Salmon River district owned by Sir Donald Mann to be diamond drilled, necessary plant having arrived at property. Drilling contract awarded to Eosly Brothers, of Anyox, B. C.

BULLION (Barkerville) — Ward-Hopp litigation for possession of this placer property decided by Privy Council in favor of Ward. Property reputed to be largest hydraulic mining operation in this region, lease before courts for last five years with property idle in meantime.

SPOKANE GROUP (Bayonne District) — Owners building an arrastra to be run by water power. Two carloads of gold and silver-lead ore have been packed out in last two years.

LUCKY JIM ZINC (Bear Lake) — Foreclosure proceedings to be taken immediately against owners of Lucky Jim mine in Slocan district. Action based on second mortgage of \$35,000. Reorganization expected to follow.

CANADA COPPER (Grand Forks) — Nearly 150 men working at Copper Mountain building ore bins and preparing mine for producing as soon as railroad and mill are ready.

EVENING STAR (Slocan) — Cars, rails and other mine supplies forwarded through Nelson for operating Evening Star property on Dayton Creek near Slocan and Silver Nugget property near Silvertown. William Moore supervising work.

be reduced gradually as the milling capacity is increased.

DOME EXTENSION (Porcupine) — Three crosscuts at 600 level show good ore and fourth started.

PORCUPINE CROWN (Porcupine) — Entirely dewatered and working force largely increased. Operations will be conducted on large scale.

MARGOLD (Swastika) — New orebody encountered on 200 level.

AUSTRALIA**New South Wales**

DETAILS OF FIRE at Broken Hill which destroyed buildings of Broken Hill South mine on July 30 are as follows: No. 1 shaft, including top brace, crude ore bins, Gates breaker structure, crushed ore bins completely destroyed. Mill engine house gutted. Table section and grinder section saved. New power house and winding engine safe. General manager estimates not less than 12 months required to replace destroyed building and machinery. Underground quite free of fire. Main shaft not much damaged by fire and water. Plant destroyed covered by insurance, \$33,000.

NORTH BROKEN HILL (Broken Hill) — Mine still shut down.

Western Australia

GREAT FINGALL CONSOLIDATED'S report for 1918 states that mine closed in February, 1918, it having been found impossible to continue work without heavy loss. Since then every effort made to, realize to best advantage assets of company in Western Australia. Considerable sales effected, but at end of year large portion of plant remained unused. Efforts being made to realize on assets.

THE MARKET REPORT

Daily and Weekly Metal and Mineral Prices,
Metal Market Conditions, Average
Monthly Prices, Stock Quotations

Silver and Sterling Exchange

Aug.	Sterling Exchange	Silver		Sept.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
28	424	111	58 3/4	1	418 1/2	113 3/8	59
29	420	108 1/2	58	2	418 1/2	113 3/8	61
30	420	108 1/2	58	3	418	113 1/2	61

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

Aug.-Sept.	Copper		Tin		Lead		Zinc
	Electrolytic	Spot	N. Y.	St. L.	N. Y.	St. L.	St. L.
28	21 3/4 @ 22	54 1/2 @ 54 3/4	5.80 @ 6.00	5.60 @ 5.65	7.45		
29	21 3/4 @ 22 1/2	54 1/2 @ 54 3/4	5.80 @ 6.00	5.60 @ 5.65	7.45		
30	21 3/4 @ 22 1/2	54 1/2 @ 54 3/4	5.80 @ 6.00	5.60 @ 5.65	7.45		
1	22 @ 22 1/2	54 1/2 @ 54 3/4	5.80 @ 6.00	5.60	7.45		
2	22 @ 22 1/2	54 1/2 @ 54 3/4	5.80 @ 6.00	5.60	7 3/4		
3	22 @ 22 1/2	54 1/2 @ 54 3/4	5.80 @ 6.00	5.60	7 3/4		

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

Aug. Sept.	Copper			Tin		Lead		Zinc	
	Spot	3 M.	Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.
28	97 3/4	98 3/4	...	271	266 1/2	24 3/4	25 3/8	37 3/4	38 3/4

3	101 1/2	102 1/2	...	278 1/2	272 1/2	24 3/4	25 3/8	41	42

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—Sept. 3, 1919

All of the markets were distressingly dull this week. There were scarcely any changes in prices and no new features of special interest.

Copper

The Export Association did a little business with neutral countries. This was mainly transacted by its foreign agents on c.i.f. terms. There was some inquiry from France in this market, which did not result in business. Germany bid for a few hundred tons, but did not offer to pay anything like our prices.

Domestic business was confined to second-hands, the principal producers holding firmly to their previous prices and making no sales. From second-hands copper was freely offered at about the same terms as in the previous

week, but toward the close of this week it looked as if these offerings had been pretty well cleaned up by consumers and by more powerful interests that were willing to buy for an advance.

Nothing more was heard this week of offerings by Japanese and British houses, but in the early part of the week American interests bought copper in London. These were probably in the nature of arbitrage transactions.

Copper Sheets—The base price of copper sheets is 33c. per lb. Demand strong. Copper wire is quoted at 26 @ 26 1/2c. in carload lots, f.o.b. mill. Market is dull.

Tin

The market for this metal stiffened a little during the latter part of the week, and on the whole a fair amount of business was done. At the close, tin of 99 per cent grade was quoted at

54 1/2 @ 54 3/4c., and Straits tin at 56c. Straits tin for September shipment from Singapore was 52c. at the beginning of the week and 53c. at the end. Singapore quoted c.i.f. London, £272 on Aug. 28 and 29, £270 1/2 on Sept. 1, £271 1/2 on Sept. 2, and £273 on Sept. 3.

Arrivals of tin in this country in August were 5,215 tons, of which 3,000 was Straits and 2,215, other kinds. Deliveries were 2,270 at Atlantic ports and 2,075 at Pacific ports. Stocks, landing and in warehouse, were 920 tons at the end of the month.

George Armsby, chief in charge of tin of the War Industries Board, on Aug. 28 issued a statement to the tin trade giving the statistics on the tin situation while under control of the board. It is shown that there were received and distributed from Pacific Coast points 812,250 lb. at a total cost of \$554,469, or 68c. per lb., while from points east of Chicago 21,982,866 lb. was received and distributed at a total cost of \$15,281,016, or about 69 1/2c. per lb., a total of 22,795,116 lb. with the cost \$15,835,484, or a slight fraction under 69 1/2c. A refund of nearly 3c. per lb. has been made to each buyer of the tin.

Lead

About the same conditions prevailed as in the previous week, lead being still offered at low prices by second-hands, but the amount of such offerings diminished. Producers did scarcely any business.

Zinc

The market was very dull throughout the week. Prime Western zinc was offered from numerous quarters at 7 1/2c., and could be bought at 7.45c. On Sept. 2 a fair amount of business was done at that price, partly with galvanizers and partly with dealers. On Sept. 3 there was a distinctly weaker tone. Large dealers offered at 7.40c., and a large producer offered to sell at 7 3/8c.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet.

Antimony—The market was very quiet at substantially unchanged price. We quote spot at 8 3/8 @ 8 3/4c. Chinese houses maintain their optimistic attitude, and antimony for shipment is quoted at higher prices than for spot. Probably 9 @ 9 1/2c. would have to be paid.

Bismuth—We quote at \$2.97.

Cadmium—Unchanged at \$1.40.

Nickel—Ingot, 41c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—A large arrival from Italy influenced the market. The price quoted during the week was \$95, at which figure it was rather weak.

Silver and Platinum

Silver—The silver market has experienced wide fluctuations in the last week. Closing at 61½d. in London on Aug. 27, the price broke to 58d. on Aug. 29 and has risen to 61d. again on Sept. 2. These violent changes in London are due to a scarcity of spot silver, so that any urgent demand for the trade on the Continent is likely to cause a spurt in the price, and any large offerings a fall in the price.

On the sharp advance in the London price, China stopped buying, so that silver was thrown on the London market. On the break in London price, China buyers reappeared and absorbed all offerings. The London market is very limited and sensitive, but there seems to be a broad demand for the Far East.

Mexican dollars at New York: Aug. 28, 86½; Aug. 29, 84½; Aug. 30, 84½; Sept. 1, holiday; Sept. 2, 86½; Sept. 3, 86½.

Platinum—This metal continued in strong demand, with the result of further advance in price. We quote refined ingot at \$110@115.

Palladium—Unchanged at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., Aug. 30—Zinc blende, per ton, high, \$49.75; basis 60 per cent zinc, premium, \$48.50; Prime Western, \$47.50; fines and slimes, \$45@42.50; calamine, 40 per cent zinc, \$30. Average settling prices: Blende, \$46.47; calamine, \$30.40; all zinc ores, \$46.24.

Lead, high, \$65.05; basis 80 per cent lead, \$62@64; average settling price, all grades of lead, \$62.85 per ton.

Shipments the week: Blende, 7,527; calamine, 112; lead, 1,035 tons. Value, all ores the week, \$421,260.

Shipment eight months: Blende, 337,004; calamine, 9,142; lead, 49,629 tons. Value, all ores eight months, \$17,202,320.

The blende tonnage is 19,916 greater than the same period of last year; the calamine tonnage is 4,781 less, a net gain for all zinc ores of 15,135 tons.

Railroads have furnished a few more cars, and there is an improvement in moving out loaded cars, yet there are over 300 loaded cars on sidetracks in the district.

Platteville, Wis., Aug. 30—Blende, basis 60 per cent zinc, \$46 base for both premium grade and high lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$65 per ton. Shipments reported for the week are 1,777 tons blende, 275 tons galena and 637 tons sulphur ore. For the year to date the totals are 66,568 tons blende, 4,087 tons galena and 10,752 tons sulphur ore. During the week 3,481 tons blende was shipped to separating plants.

Other Ores

Chrome Ore—Recent sales have been on the basis of \$20 per ton, f.o.b. California points.

Manganese Ore—Metallurgical ore is quoted at 50@60c. per unit.

Molybdenum Ore—A little more inquiry was reported, but no business seems to have resulted.

Tungsten Ore—Chinese ore was offered at \$7.50 per unit and Bolivian ore at \$10, duty to be paid by the buyer if tariff be imposed. Buyers seem to be unwilling, however, to pay those prices, and those who were recently offering to pay \$7@7.25 seem to have disappeared.

Other Minerals

Graphite—Decided dullness is reported in both Ceylon and Alabama grades, the effect of any increased steel production not being felt, owing to stocks remaining in the hands of crucible manufacturers which were purchased last autumn and winter. The prices for Ceylon grades have remained firm, because of the fact that the rupee has maintained its price level in foreign exchange and on account of the comparatively high cost of labor, preventing profitable operation at lower prices. The market for Alabama grades continues very dull, producers having adopted a waiting attitude and making no attempt to sell. Quotations for Ceylon grades are as follows: Lump, 13½@14c.; chip, 10½@11c.; dust, 7½@8c. All prices are c.i.f. New York, ex ship.

Nitrate—Conditions continue to be reported dull, no change occurring from the previous week. Spot supplies are quoted at \$2.90@\$2.95 per cwt., carload lots.

Pyrites—Spanish pyrites is quoted at 17c. per unit for furnace size ore, free from fines, c.i.f. New York or other Atlantic port. Market slow and unsettled; hand-to-mouth buying. Very little ore coming in. Price will decrease with ocean freights.

Sulphur—No change has occurred from the previous week. Prices are quoted at \$18 per ton, carload lots, domestic delivery, and \$20 for export. Both quotations are at mines, Freeport, Tex., and Sulphur Mine, La.

Iron Trade Review

New York, Sept. 3

With labor difficulties temporarily out of the way, the iron and steel trade is now beginning to devote itself closely to the likely commercial developments of the next few months, according to *The Iron Age*. Multiplied bits of evidence have fully proved that the sentiment among the wage earners is heavily against a test of union strength, and so far as wage advances are concerned there is a widening circle of thinking workers who realize the impossibility of reducing living costs with continual wage advances and at the

same time little consideration to increasing unit production. The more cheerful outlook comes largely from the President's proposal for a conference of employers of labor and labor officials, whatever may be the disposition of the "putting the whole question of wages upon another footing."

Pittsburgh—Sept. 2

The great change that has occurred in the labor situation and prospects in the last week is the dominant factor in the iron and steel market. A feeling of relief pervades the entire trade, as it is now practically a certainty that there will be no interruption to production from labor disturbances. At no time was it the balance of probability that there would be a strike or a voluntary closing of plants, but there were distinct possibilities of such occurrences. Immediately after the publication of the President's statement referred to a week ago, a committee constituted by the unions that had been attempting to organize the iron and steel industry endeavored to secure a conference with the manufacturers, approaching Judge Gary to this end, and threatened to call a strike if a conference were not arranged. As the Steel Corporation has always conducted an "open shop," and does not deal with organized labor in any manner, Judge Gary refused a personal interview. Meanwhile, Samuel Gompers, president of the American Federation of Labor, returned from a trip abroad. It is believed he disapproved strongly of the strike threat. Last Friday the committee endeavored to enlist the President's influence in the matter of bringing about a conference, and the President evidently refused. Yesterday a statement of the President was published to the effect that he intends to call a general conference on labor matters, which will probably be held early in October, whereby all questions may be settled peacefully. It is remarked that the strike committee has made such utterly untrue statements as to the condition of steel workers that the steel manufacturers would be glad to have the actual facts brought to public attention. It is not beyond the possibility that the abolition of twelve-hour work in the iron and steel industry, which has been in progress for years, will soon be made practically complete, with an increase in the rate paid per hour, but with a decrease in the daily rate.

Iron and steel prices are absolutely stabilized by present conditions. There is no general disposition to advance prices, even if that could be done without bringing about fresh demands on the part of labor, while in quarters where there has been such a disposition the feeling has been disappearing. If it is even probable that should there be a slight increase in manufacturing costs in the next couple of months through wage adjustments, leading producing interests would be disposed to absorb the increase rather than pass it on to the buying public.

THE MINING INDEX

Listing Special Articles of Interest
and Value to the Miner
and Metallurgist

This index is a convenient reference to the current literature of mining and metallurgy published in all of the important periodicals of the world. We will furnish a copy of any article (if in print) in the original language for the price quoted. Where no price is quoted the cost is unknown. Inasmuch as the papers must be ordered from the publishers, there will be some delay for the foreign papers. Remittance must be sent with order. Coupons are furnished at the following prices: 20c, each, six for \$1, 33 for \$5, and 100 for \$15. When remittances are made in even dollars, we will return the excess over an order in coupons, if so requested.

COPPER

- 346—BELGIAN CONGO—Mining in the Belgian Congo. Sydney H. Ball and Millard K. Shaler. (Eng. and Min. Journ., Aug. 9, 1919; 4 pp., illus.) 20c.

The Advantages of Contact

THIS edition of the *Journal* is devoted in large measure to the 117th meeting of the American Institute of Mining and Metallurgical Engineers, to be held at Chicago, Sept. 22-26. The New York meeting of the Institute in February of this year was of special significance; as, following closely the date of the signing of the armistice which terminated the war, it offered the opportunity for an accounting and a recognition of the various activities of individual members and of the Institute as a body. It now seems fitting that the coming convention should be held in a section so closely identified with industries that played an extensive part in the winning of the war.

Chicago has long held a foremost place in the steel industry, its supremacy as a center for machine manufacture is unquestioned, and its growing importance in the metallurgical field and its situation with reference to several important mining districts are such that it will always have an intimate connection with the mineral industry. Certainly that portion of the program of the meeting outlining the many trips for which arrangement has been made is indicative of the extent of territory that will be covered and the various industries that will be inspected. Such opportunities come seldom, and it seems almost unnecessary to point out the many advantages that are to be gained by those attending the convention.

We have many times emphasized the importance of contact, interchange of ideas, and the advantages of securing varied opinions on mining and metallurgical problems. The high standing of the mining profession and the industry today is due to co-operation and interchange of opinion, and extension of the opportunity for further conference promises a continual improvement in the methods employed in the industry.

Textbooks and the technical press are important means for the propagation of information, and practical experience in operation is essential, and all may be regarded as indispensable to a well-rounded knowledge of actual conditions in the mining or metallurgical field. Supplementing these should come the necessary adjunct of observation. The mere viewing of a plant in operation may not secure a complete knowledge of existing conditions, nor is it expected that the observer will grasp, first hand, all the details thereof, but he is conscious of an addition to his store of knowledge, greater or less, depending upon his interest in the subject under observation.

The papers that have been prepared for the forthcoming meeting offer a mass of information to those interested in the various subjects treated, and these are arranged and grouped so that separate sessions include the reading of papers on related topics. In this connection it may be mentioned that the mere reading of papers at a meeting, either by the author or his substitute, often does not do full justice to the

subject and that great good will result from subsequent discussion. Engineers particularly appreciate the value of this in connection with their problems.

To all mining men the meeting should be an inspiration, and the opportunity of attending it should not be neglected. The interchange of ideas, the consideration of problems that are slightly different and yet closely allied with one's own line of endeavor, and the forming of new friendships constitute important needs in the mining industry today.

In considering a list of the advantages to be gained by the attendance at an Institute meeting one cannot overlook the benefits to the engineer that may be found by association with others of his profession. The elder members, schooled in experience, should be able to look to the younger members for inspiration; whereas the young engineer should be appreciative of the opportunity given him to "rub shoulders" with his older associate. A feeling of comradeship and of confidence creates a healthy atmosphere for the profession and for the perpetuation of such a worthy and useful institution as the A. I. M. E.

The Artful Dodger

A NOVEL expedient has been adopted by the Carranza government in its latest attempt to avoid responsibility for the safety of United States citizens in Mexico. Holders of passports from the State Department, authorizing them to visit the Tampico region, are asked to sign a formal release of the Carranza government's responsibility for what may happen to them. If the traveler declines to waive his right to protection from bodily harm, Mexican officials may refuse to visé the passports, on the ground that under international law a government may refuse foreigners permission to travel in a region where it cannot guarantee their safety.

Is this new artifice of Carranza calculated to inspire confidence in his ability to improve conditions in his country? In the light of the peculiar circumstances surrounding the recent robberies of oil companies in the Tampico district, and the firing upon and wounding of a United States aviation officer while he was on patrol duty on the American side of the border, is this latest device of the Mexican President to be regarded as an answer to General Salvador Alvarado's accusation that the present Mexican government is a "despotic, corrupting, and ultra-personal regime, without responsibility or legal restraint?"

We were informed that the news of the firing upon American aviation officers and the wounding of Captain Davis B. McNabb was received in Washington with "mixed indignation and surprise," and that the vexed officials who received the reports "would take steps to get at the facts without delay." This "getting at the facts" is becoming less satisfying with every new outrage.

The message of the Mexican President in answer to our recent expedition over the border in an effort to capture bandits who had seized United States Army officers and held them, under threat of death, for ransom, contains no word of apology. In fact, it is, as the *New York Tribune* aptly remarks, "practically an announcement that the season for hunting Americans in Mexico is now open." We cannot forbear again asking the question, "When is it time to intervene?"

The Hoover Dinner

AN IMPORTANT EVENT, and one which must be of unusual interest to the engineering profession, will occur on Sept. 16, in New York, when a banquet will be held in honor of Herbert C. Hoover, soon after his arrival in this country. The affair will mark Mr. Hoover's at least temporary retirement from public service. The banquet will be given under the auspices of the American Institute of Mining and Metallurgical Engineers; and it will be the only public celebration of Mr. Hoover's return, after five years spent in many patriotic activities in fields of endeavor far removed from the mining industry.

Mr. Hoover has reflected great honor on the profession of mining engineers by his achievements in various administrative capacities. His work is a demonstration of the especial abilities which are developed by the practice of engineering, and the record of his service pointedly suggests the conclusion that further advantage should be taken of the engineers' ability and training by more generally placing engineers in public office. The constructive genius required in the handling of great and difficult tasks is developed to no greater degree in any other field.

The Hoover dinner will be a function of importance to the engineering profession. It will serve strikingly to emphasize the value of the engineer in public affairs.

The Strike Fever

AS ONE views the recent recurrences of the strike fever, now at Tonopah and Divide, yesterday at Ely, and the day before at Oatman and in the Coeur d'Alenes, to say nothing of the disturbances in Eastern coal fields, alarm may be, perhaps, momentarily tingled with amusement. The very time that the President and his followers have put a noticeable dent in the cost of living is seized upon by the unions as the proper time to strike. It almost seems as if the unions were afraid that the high cost of living would really come down appreciably, and thus take away the legitimate reason they have had for jamming their demands down their employers' throats.

In that happy day when the cost of living shall become less of a bugbear than it has been during the last few years, with what pretexes will the strikers strike? Almost anything will serve, it seems. The determined man needs no pretexes. Lenine and Trotzky used them for a while, but soon cast them aside.

The experience of the Railroad Administration furnishes proof of this. The car inspector—that individual who walks alongside the train when it stops at Caliente or Barstow and looks for possible hot boxes, tapping each cover shut after glancing within—the car inspector, after having his salary increased from less than \$900 to a figure two and a half times as great, again seeks further increase. The cost of living no

longer serves, so the demand is based upon the ground that his remuneration does not compare favorably with that of some of his fellow employees. This would indicate that jealousy, rather than the desire for a square deal, was at the bottom of the demand.

What Is Your Policy Going To Be?

SUPPOSE a German—and by that term we mean a Sreal German from Germany—should ask you for a job as a chemist, let us say. Suppose he were well qualified for the position, and that you needed another laboratory assistant. Would you employ him?

Five million Germans have applied for permission to leave Germany. This was to be expected, for the burdens of the war in defeated countries will be onerous in the extreme. Also, our American boys from the occupied regions report unlooked-for friendliness on the part of the population, particularly from the girls, who appear to be trying to arrange for future homes on this side of the ocean. The German horde will probably not be released, and if it is, Representative Johnson has introduced a drastic bill into Congress to keep it away for two years, and President Wilson has recommended that the passport law be continued for another year to keep out undesirable aliens. But supposing the German does come—will you give him a job, and why?

Here is another thing to consider: Will you buy German beakers, chemicals, dyes, manufactured steel products, potash, and toys? The German wants your copper, and you want to sell it to him, so that your mines and mills will run to capacity. To pay for these things, he must work for us and send back to this country the things he can make cheaper than we can make them. We would not want his gold if he had any available. We want his manufactured goods, to increase our supply and reduce our prices.

But it is not necessary to kill off all our infant war industries by allowing a flood of more cheaply produced foreign materials to enter the country. Possibly the solution will lie in a protective tariff, or license, so adjusted that American manufacturers may continue to supply a certain percentage of our requirements for such goods. This will be the spark of fire which will keep these industries alive until such time as we may again be cut off from our main supply. A blind determination never to buy another German-made article sounds like the Hymn of Hate, which was never enthusiastically received outside of the "Fatherland."

Making Prohibition Easier To Bear

WE DEVOTE one of our pages this week to a short article on the importance of providing good drinking water in mining camps. This is a subject too often neglected, chiefly on account of carelessness or ignorance. Although in some cases the provision of pure drinking water may cost considerable money, it is a very simple matter to determine the quality of that normally supplied. Many works chemists are prepared to make the necessary determinations, or samples of the water, taken in properly sterilized bottles, can be sent to the various state boards of health for a report. A few cents spent monthly in testing the water

supply may save thousands of dollars later. Possibly trouble has never been encountered, but epidemics often occur when least expected.

The healthy worker is in general a happy and an efficient worker. Disease is too expensive to tolerate. The Federal Government learned this lesson in 1898, and in the Great War took extraordinary precautions to keep the doughboys in good health. If such care was necessary on the surface in France, it is vastly more important where workers are underground.

The "Health Almanac for 1919," Public Health Bulletin No. 98, which is, by the way, well worth writing to the Superintendent of Documents for, says "it is the patriotic duty of every loyal American to keep well." Until the millennium arrives, when we will all know how to keep well, it is necessary for most of us to be kept well, or as well as possible, and the laborer must rely to a large extent on the intelligence of those in charge of conditions where he works.

Now that the Long Drought is upon us, the large foreign element, not to mention the American element, in our population will be deprived to a large extent of its favorite beer. At least its palatability will be lessened to such a degree that many will no doubt seriously consider the use of the well-known combination of hydrogen and oxygen as a beverage. It devolves upon us, therefore, even more than formerly, to see that the drinking water is as inviting as possible and free from the *bacillus coli* or his friends.

The provision of a supply of pure water also often includes proper disposal of sewage, and this subject, too, deserves more attention from the standpoint of health and cleanliness than it usually gets in mining communities. Complete sewage systems are not often practicable, but there is no excuse for depositing the refuse of a house in the back yard or gutter. Provision may at least be made for a cesspool, properly drained, which means away from a well. Garbage should be collected at least once a week during warm weather and either burned or otherwise denatured.

The large companies are paying a great deal of attention to these things, and if it pays them it will pay the small plant, also. It is not a question alone of social welfare; it is downright good business.

Oil Lands Suit

Settled by U. S. Judge

THE long-drawn-out litigation between the Government and the Southern Pacific over title to about 162,000 acres of oil-bearing land in the lower west San Joaquin Valley of California has reached a turning point. Judge Benjamin F. Bledsoe, of the U. S. District Court, Southern District of California, recently decided that the Government had failed to sustain its charge that the lands in question had been patented fraudulently, and dismissed the six consolidated suits of the Government against the Southern Pacific company and 221 other companies and individuals. The decision is, of course, not final, for the Government may appeal the case to the Circuit Court of Appeals and from that to the U. S. Supreme Court. We hope that this will not be done, and that the decision rendered by Judge Bledsoe will mark the termination of the litigation in so far as these particular cases are concerned. The oil industry of California has had more than its share of litigation, and it will materially advance the interests of the industry if such disputes reach a speedy decision.

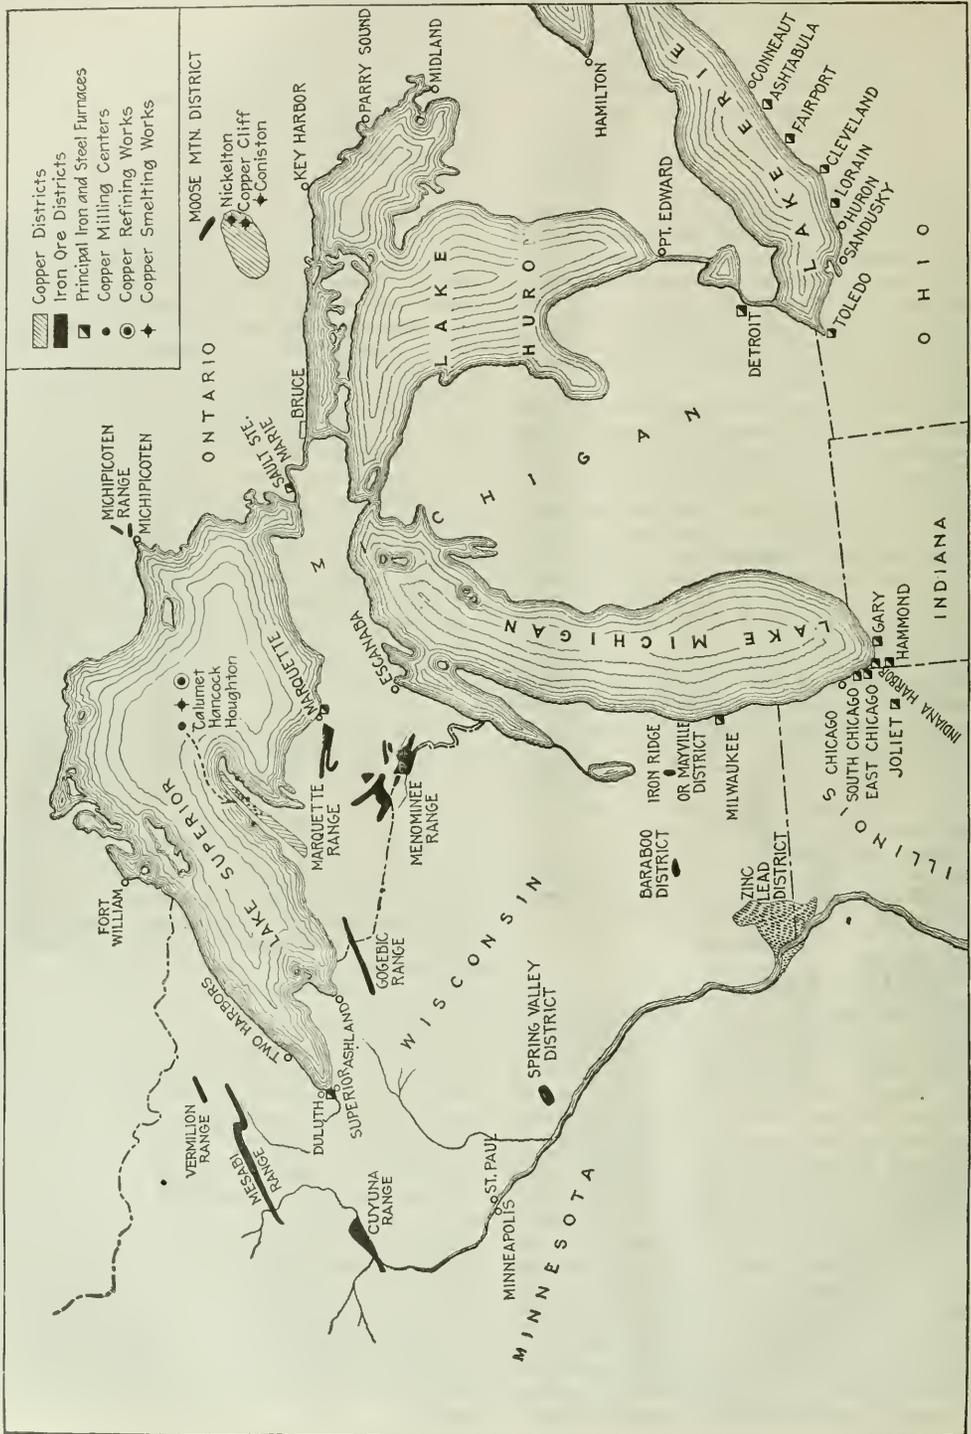

Rejuvenation of the Iron Districts

TWO important facts are emphasized in the development of orebodies that has taken place during the last year and a half on the Gogebic iron range. The first of these, which is perhaps more of local concern to the district, is the strengthening of the belief that the so-called "north vein" ore is likely to be found in many of the mines, and this conviction is well founded since the discovery of extensive orebodies well north of the foot wall in the Montreal, Townsite, Norrie group, McKinney Steel Co., Newport, Anvil, and other mines. The earliest discoveries were in "north vein" territory, and were recognized as such on the early commercial maps. Owing to the 60-degree dip of the formation, the early shafts soon struck the foot-wall quartzite on the south side of the formation. As ore occurred here, and the top of the quartzite was easily followed, mining soon limited itself to the foot-wall ore horizon, and little work was done for many years to explore the northern part of the formation.

The second feature, which was brought out by recent development on the Gogebic, is the tendency on the part of the various iron districts comprising the Lake Superior region, to "come back." The original development of each of the ranges has been slow for the most part, due to a lack of interest in the iron market, a hesitancy on the part of capital to invest money in a new and heretofore unexplored district, or a doubt as to whether proper shipping facilities would be obtainable. With the overcoming of each of these retarding influences, the various ranges have developed in turn, and each has had its boom. Continued exploration and further study of the iron formations have brought about discoveries that have had a distinct bearing on the location of new orebodies, and without exception each of the iron ranges has gone through a period of rejuvenation, which has obtained for it, during that particular period, the center of interest in the iron-mining field. It is not to be assumed that this supremacy is based on a tonnage production, for the Mesabi Range, has, of course, maintained the position of the greatest producer for a quarter of a century. However, judged by the standard of interesting geological features, and the development of knowledge that has led to the discovery of new orebodies, each iron range has commanded particular attention at some time since its original opening.

Continued exploration and study show that iron-ore reserves in the Lake Superior district are sufficient for many years; the recent strides that have been made in iron-ore beneficiation will make available a great tonnage of ore heretofore regarded as being too low grade to be merchantable, and an optimistic belief in regard to iron-ore supplies in that region prevails, despite occasional discouragements in the iron markets.

Mr. Hotchkiss' article, "The Geology of the Gogebic Range and Its Relation to Recent Mining Development," the first installment of which begins on page 443 in this issue, will be found interesting not only to those that are engaged in mining in the Lake Superior region but to all others who are concerned with the study of geology applied to mining, and the encouragement offered as to possibilities that may be expected with further exploration is sufficient to convince mining men of the importance of this feature of their industry.

MAP OF THE PRINCIPAL MINING, MILLING AND SMELTING DISTRICTS OF THE NORTH CENTRAL STATES

Some Facts and Figures About the A. I. M. E.

THE membership of the American Institute of Mining and Metallurgical Engineers is composed of men engaged in the different branches of mining, metallurgy, geology, and chemistry. Although metallurgy was always considered to be within its field, it was believed that many metallurgists had been reluctant to join what they erroneously considered, because of the former designation, American Institute of Mining Engineers, solely a society of mining engineers, despite the fact that over 35 per cent of the papers published in the *Transactions* during the last five years have dealt with metallurgical subjects. It was therefore thought advisable to change the name to the American Institute of Mining and Metallurgical Engineers, and it was so voted by the members on Feb.

IRON AND STEEL—Joseph W. Richards, Chairman.
 REDUCTION AND REFINING OF LEAD—Heinrich O. Hofman, Chairman.
 REDUCTION AND REFINING OF ZINC—George C. Stone, Chairman.
 REDUCTION AND REFINING OF MISCELLANEOUS METALS—Charles H. Fulton, Chairman.
 PETROLEUM AND GAS—Ralph Arnold, Chairman.
 COAL AND COKE—H. H. Stoek, Chairman.
 NONMETALLIC MINERALS—George F. Kunz, Chairman.
 MINING GEOLOGY—James F. Kemp, Chairman.
 MINING METHODS—Louis S. Cates, Chairman.
 MILLING METHODS—Robert H. Richards, Chairman.
 ACCOUNTING METHODS—Judd Stewart, Chairman.
 LEGISLATION AND PUBLIC POLICY—Mark L. Requa, Chairman.
 INDUSTRIAL ORGANIZATION—T. T. Read, Secretary.

MARTIN CORYELL
 Secretary A. I. M. E., 1871-1872

THOMAS M. DROWN
 Secretary A. I. M. E., 1873-1884

18, 1919. It is expected that this change, definitely including metallurgy in the title, will result in increased interest in that branch of the Institute's field. The initials "A. I. M. E." are retained.

It would be interesting were a compilation to be made showing the manner in which the various geological, mining, and metallurgical subjects have been covered in the *Transactions* and in papers presented at meetings of the Institute; how much attention has been paid to gold, how much to copper, iron, and other metals. However, it is certain that the field of the Institute has been and is a broad one, and every effort is made to meet the varied needs of its members. This is evident from the following list of technical committees, whose purpose is to obtain papers of high merit on subjects covered by the titles of the committees:

REDUCTION AND REFINING OF COPPER—E. P. Mathewson, Chairman.

EXTRACTION AND REFINING OF PRECIOUS METALS—F. Lynwood Garrison, Chairman.

The following, taken from the Year Book of the Institute, defines its aims and purposes:

The Institute aims to promote the arts and sciences connected with the economic production of the useful minerals and metals, and the welfare of those employed in these industries, by means of meetings for social intercourse, and the reading and discussion of professional papers, and to circulate among its members by means of publications the information thus obtained.

THE EARLY DAYS OF THE INSTITUTE

In this brief space it will be impossible to give more than a few notes regarding the early history of the Institute. Some features, not generally known, are of especial interest. The first mention of the American Institute of Mining Engineers in the *Engineering and Mining Journal* appeared in the issue of Feb. 7, 1871, when reference was made to a circular prepared and signed by Eckley B. Coxe, Richard P. Rothwell, who later became editor of the *Journal*, and Martin Coryell, whom the editor described as "three mining en-

OFFICE OF BRADLEY STOUGHTON, SECRETARY, A. I. M. E.

OFFICE OF PERCY E. BARBOUR, ASSISTANT SECRETARY, A. I. M. E.

gineers whose reputations are a guaranty that the proposition they have issued is intended in good faith to promote the interests of their profession, and not, like some others of the kind, to favor the schemes of adventurers or foist insignificance into notoriety."

The response was favorable, and on May 16, 1871, the first meeting of the Institute was held at Wilkes-Barre, Pa., twenty-two engineers being present. Of the three men who issued the circular, E. B. Coxe became vice-president, Martin Coryell, secretary, and Mr. Rothwell served as one of the managers. David Thomas was the first president, and J. Pryor Williamson, the first treasurer. Of the members who were present or represented at the organization meeting, and therefore were the founder members, the following are still living: Willard P. Ward, Henry S. Drinker, and Edmund C. Pechin. Dr. Drinker and Mr. Pechin have served as officers of the Institute a number of times, and the former is now one of the vice-presidents.

Among those who attended the first meeting was Dr. Rossiter W. Raymond, who was one of its most active supporters, becoming a vice-president in 1871 and again in 1876 and 1877, and president from 1872 to 1875. In 1884 he became secretary, which position he held until 1912.

To Dr. Raymond and Mr. Rothwell are due the success of the Institute in its early days. Mr. Rothwell served as manager in 1871, 1898, and 1899 and 1900; as a vice-president in 1872, 1873, and 1877; and in 1882 he was unanimously elected president. In writing some reminiscences Dr. Raymond called attention to the interesting fact that it was Mr. Rothwell who urged him to attend the organization meeting of the Institute, and although Mr. Rothwell was one of the founders of the Institute, he devoted himself in later years to the *Engineering and Mining Journal*, while Dr. Raymond, who was with the *Journal* in its early days, gave his later energies to the Institute.

The story of Dr. Raymond's work with the Institute has already been told, and it is necessary only to record here that in 1912, when more than seventy years old, Dr. Raymond retired with the title of secretary emeritus, and Dr. Joseph Struthers became secretary.

At the first meeting of the Institute five papers were read, and at subsequent sessions from ten to fifteen, so that during the first year forty-four papers were presented at four meetings. These were by twenty-six authors, and covered a wide range of subjects.

In the beginning, by arrangement with the publishers of the *Engineering and Mining Journal*, all of the papers appeared first in that periodical, but this arrangement was discontinued Dec. 31, 1877.

The annual dues at the time of the organization were \$10, and remained at that figure until they were increased by action of the membership of the Institute within the last few years.

The suggestion to change the name of the Institute was made as early as 1876, but apparently no steps were taken at that time and any other attempts were unsuccessful until the action of 1919.

The first list of members, published in Vol. I. of the *Transactions*, February, 1873, contained 243 names. In December, 1881, about ten years after its founding, the Institute had 6 honorary members, 849 members, 125 associate, and 51 foreign members, and had become well established.

The Institute has gone steadily forward, broadening its influence and increasing its services to the mining

industry. The present roster includes 15 honorary members, 6,514 members, 485 associates, and 590 junior members, a total of 7,604. There are 6,431 members residing in the United States, 229 in Canada, 150 in Mexico and 794 in other foreign countries. For a large number there is no permanent address.

The Institute has added to its local sections, the advantages of which are obvious, until now there are seventeen, covering all the important mining centers. There is active co-operation with other organizations, including Government bureaus. On July 1, 1918, the American Institute of Metals affiliated with the American Institute of Mining Engineers, as the Institute of Metals division. This brought the alloying, founding, and metallography of the nonferrous metals within the scope of the Institute.

To date 119 meetings have been held, covering every important mining and metallurgical district in the

BRADLEY STOUGHTON
Secretary since 1913

United States, and including seven meetings in Canada, one meeting in Mexico, one in England, and one in the Canal Zone.

SPECIAL PUBLICATIONS OF THE INSTITUTE

The Institute has published two special treatises, one on the "Genesis of Ore Deposits," by Franz Posepny, and "Ore Deposits," by S. F. Emmons. The supply of the former has been exhausted. There have been a number of innovations in the *Bulletin* in recent times, one of these being the starting of a mining and metallurgical index, in September, 1918. The *Year Book* was enlarged in 1919, and now gives, in addition to the list of members, a mass of interesting information regarding the Institute and its activities.

WAR WORK OF THE INSTITUTE

The Honor Roll of the Institute is an impressive one. When the last list of members known to be in active military service was compiled, on Mar. 5, 1919, it comprised 845 names. This list, however, is no doubt incomplete, for many members failed to inform the Institute of their military connections. Twenty-six mem-

MEMBERS' WRITING ROOM, A. I. M. E.

STENOGRAPHIC DEPARTMENT, A. I. M. E.

bers died in active service. As a fitting memorial, to pay tribute to these men who had made the supreme sacrifice, meetings were held by the members of the Institute in connection with its 119th meeting in New York, in February, 1919, and in Colorado the preceding year. Brief biographical notices were read, as the portraits of those who had died in service were shown on a screen, and two buglers sounded "taps."

In addition to those in military service, a large number of the members rendered great service to the Government during the war in many capacities, and at a personal sacrifice. The foregoing relates to individual effort. The Institute as a body also made its contribution. Among its activities were assistance in the recruiting of the 11th Engineers, active participation in the work of the Naval Consulting Board and the War Committee of Technical Societies, and financial and other support of the National Research Council and of the War-Minerals Committee. It was active in stimulating the production of manganese and chrome, and aided in supplying a great many engineers for Government work.

THE INSTITUTE HEADQUARTERS

When first organized, the A. I. M. E. had no regular headquarters, it being thought inadvisable to do anything which might create the impression that the Institute was in any sense a local organization. Correspondence and other business was carried on from the office of the secretary wherever he happened to be, and the necessary papers were carried to each meeting. Later, previous to the completion of the Engineering Societies Building, the Institute had its office at 99 John St., New York City, the accommodations being, of course, in striking contrast to its present rooms on the ninth floor of the building at 29 West 39th St., which are, no doubt, familiar to most mining engineers who have visited New York. For those who have not had this opportunity, some views of the headquarters are given herewith, showing how adequately the needs of the members are taken care of, and the efficiency of its business organization.

The number of persons employed by the Institute at present is sixteen, exclusive of the secretary and assistant secretary and the advertising manager. The equipment is up to date, and such modern office appliances as the automatic typewriter, the dictaphone, mimeograph, and addressograph are employed in getting out the large amount of correspondence, circular announcements, and wrappers for the bulletins.

The members' rooms have been recently enlarged and are suitably furnished for the purpose they serve, the color scheme of the hangings and floor covering, a deep blue, being especially agreeable. Facilities are provided for receiving or sending mail or telegrams; and a member may dictate letters and meet acquaintances; in short, may make his headquarters there, and be as much at home as in his own office.

The offices of Bradley Stoughton, secretary, and Percy E. Barbour, assistant secretary, adjoin, and, as the pictures show, are commodious and well arranged.

The Institute has an excellent collection of photographs which are interesting to all visitors. These are hung in the different rooms, the directors' room having a complete set of portraits of honorary members; the large room for the accommodation of members, pictures of ex-presidents of the Institute; and the small room for the members, and the secretaries'

offices, a collection of photographs of distinguished members. In Mr. Stoughton's office many of the pictures are framed groups of photographs of prominent mining men and metallurgists which have appeared from time to time in the *Engineering and Mining Journal*.

WOMAN'S AUXILIARY OF THE A. I. M. E.

In any article describing the activities of the Institute, mention should be made of its Woman's Auxiliary, and in response to our request, Mrs. Sidney J. Jennings, secretary, has furnished information regarding its organization and work.

The idea of forming a woman's auxiliary to the A. I. M. E. had its inception in 1916, when the distressing condition of Belgium and Mr. Hoover's appeal for aid engaged the interest of the Institute members, and resulted in prompt and efficient response. This was a work in which women would naturally be interested, and Mr. Hoover's appeal crystallized an idea that had been considered by some of the wives of the A. I. M. E. members since the autumn meeting of the society in 1916, held in Arizona. The boundless hospitality of the West, the admiration aroused by the splendid spirit of friendliness and co-operation, suggested the thought, "Why cannot the women who so largely helped to bring about the results obtained join in an organization which will be ready to stand beside the Institute to help whenever needed, and to render service to their country in any way that directly or indirectly pertains to the interests of the engineering profession?" The women of the New York Section, where naturally the relief work centered, felt that, with the aid of the women of other sections, help for the Belgians could be gathered from quarters that the men could not reach.

The answer to the appeal was an affirmative and encouraging one, and at the meeting of the Institute in February, 1917, the ladies present organized, and agreed on a tentative constitution, the object of the organization being "to render service to the country and to the community, or to humanity at large, through all that pertains to the interest of the profession of mining engineering."

The president for the first year was Mrs. Sidney J. Jennings, with Mrs. Arthur S. Dwight, Mrs. H. W. Hardinge, and Mrs. Karl Eilers as vice-presidents, and Mrs. Bradley Stoughton and Mrs. Axel O. Ihlseng as secretaries.

During the first year the following work was accomplished: The sum of \$12,000 was collected for Belgian relief; the Emergency Committee collected money and clothing for the sufferers in the Halifax explosion, and filled 500 Christmas comfort bags for our soldiers; work was done in food conservation, and in Seattle a shop was opened where canned fruit and vegetables were sold for charitable purposes, the Woman's Auxiliary for that section being put in charge of the food-conservation tent at the Interstate Fair.

In 1918 the following were officers: Mrs. R. C. Gemmell, president; Mrs. L. D. Huntoon, Mrs. Karl Eilers, and Mrs. L. P. Holbrook, vice-presidents; Mrs. Sidney J. Jennings, secretary; Mrs. H. K. Masters, treasurer. Activities increased during this year, and among the important work accomplished was the establishment of a dispensary bearing the name of the New York Section of the A. I. M. E. at Briey, France. This was done through the Foreign Relief Committee under the chairmanship of Mrs. H. H. Knox and Mrs. Jesse Scooby, successively. In addition, \$3,000 was sent to

ACCOUNTING DEPARTMENT, A. I. M. E.

SHIPPING DEPARTMENT, A. I. M. E.

France, \$1,720.51 was contributed for emergency dispensary work among refugees, and \$966 was contributed for the purchase of sheep for stocking reclaimed districts in France.

The Emergency Committee, with Mrs. H. N. Spicer as chairman, did good work in helping to supply comforts for the 27th Engineers, the special mining regiment. The Western section helped in this, and a large number of knitted articles were provided. In New York, Utah, and Montana, French and Belgian children were adopted and provided for, and in Utah and Montana gifts for Belgian relief are still coming in.

In 1919, Mrs. James F. Kemp was elected president, with Mrs. L. D. Huntoon, Mrs. H. P. Henderson, and Miss Madeline Stone as vice-presidents, Mrs. Sidney J. Jennings, as secretary, and Mrs. Masters as treasurer. Mrs. Masters resigned and was succeeded by Mrs. Karl Eilers.

The war is over, but there is still work for the Auxiliary to do, and plans have already been made for the continuance of its efforts. Americanization has been chosen as a work in which the efforts of the Woman's Auxiliary can and should be engaged. It is the purpose of the Auxiliary to have such work include not only friendly, helpful assistance to foreign-born women and children, but the study of economic problems, legislation, and kindred subjects, the understanding of which will make better American citizens of the members of the Auxiliary themselves. Another splendid thing the organization is doing is the collecting of funds for the endowment in perpetuity of a bed or beds in the American Memorial Hospital, to be built at Rheims, the beds to be endowed in memory of those members of the A. I. M. E. who died in the Great War.

Continuity of Veins

In a suit involving title to a quartz vein, the U. S. District Court, Northern District of California, decided that a segment of a vein, beginning fifteen feet or more below where a vein apexing in complainant's claim terminated in a fault, was properly regarded as a continuation of the same vein, which complainant was entitled to follow in its dip through the side lines into defendant's adjoining claim. (Original Sixteen to One Mine, Inc., vs. Twenty-One Mining Co., 245 *Federal Reporter*, 630.) The court said:

On the trial a vast amount of expert testimony was offered by the plaintiff, tending to show the identity of the vein from the outcroppings or apex on the surface of the Sixteen to One claim down through the various workings, and perhaps an equal amount of testimony was offered by the defendant tending to show the contrary. The experts on each side consisted of geologists, mining engineers, and practical mining men. It is almost needless to say that the opinions of these experts were positive and unequivocal in favor of the party who called them, and little would be accomplished by adding one or more additional experts to the long list already in the record. It was conceded throughout the trial that there is a vein on the Sixteen to One claim; that this vein dips in an easterly direction at an angle of 45 to 50 degrees; that the vein terminates at a fault at about the 200-ft. level; and that by dropping down a distance of fifteen to twenty feet at the shaft, and a distance of thirty-five or forty feet at the northerly boundary of the claim, another vein is picked up, likewise terminating at a fault. The witnesses for the plaintiff testified that these two segments were one and the same vein, while the witnesses for the defendant testified to the contrary. Their theory is that, while there are two segments of veins there, the upper segment of the lower vein was thrown up several

hundred feet above the present surface of the mountain and has eroded away, while the lower segment of the upper vein can probably be found several hundred feet lower down. The jury found it much easier to join the two existing segments together, thus making a single vein, than to speculate as to what has become of the two lost segments, and with that conclusion I am in full accord.

Uncomplimentary

In conversation with M. O. Leighton, chairman of the committee working for a Department of National Public Works, an acknowledged statesman and keen observer of people and events made the following remarks, which are somewhat uncomplimentary:

Your task is appalling. You have been elected to lead engineers into a political reform. They are the most unresponsive citizens that we have. Your organization has a praiseworthy purpose, but if it were sponsored by almost any other group of reputable men than engineers there would be more promise of success. If your organization succeeds I believe that you will find that it will not be the engineers who have carried it through. Their aloofness and indifference in all matters outside of their own professional sphere are among the unexplainable things in our political life.

Submarine Diamonds

Dredging for diamonds in the sea along the coast of the Southwest Protectorate, formerly German South West Africa, was recently undertaken by a company specially formed for this purpose, under a concession granted to it by the Union Government, according to a consular report. This concession covers a very extensive area of the sea channel between the islands off the coast and the mainland. Reports seem to show that the Pomona diamonds found in the South West Protectorate are of sea origin, and that a deposit exists under the sea within the area that lies between Possession Island and Pomona. The stones on the mainland, according to this theory, have been washed up and carried by the wind into the drifting sand dunes. Under the terms of the concession the Union Government receives a royalty of 40 per cent on all the diamonds extracted and all the stones must be turned over to the Government for disposal. A ship fitted out with the necessary dredging and diving apparatus left Cape Town for the scene of operations in the first week of March, but unfortunately was wrecked on Possession Island. Work has, therefore, been postponed until a new vessel and new equipment can be obtained.

Optimism of Youth

When a fellow has been a high flier, it is hard to keep him down. A recently discharged flight lieutenant sells securities, but he will admit that anyone else in his line of business is simply peddling stock. Having conceded in an unguarded moment that his father had once been stung on some Cripple Creek mining stock, he hastily hedged by alleging that the camp in question was simply impregnated with gold and silver for miles around. Taxed with the undeniable fact that the hills in that vicinity were gophered with innumerable holes that were never anything more than the pretext for the unloading of fake stocks, he retorted, "Oh, well, the land itself is bound to be good for something or other some day. Why, the shale there is just loaded full of oil and things, and it is only a question of time before they begin to take it out."

Mine Machinery Manufacture in the Middle West

Much of the Mining and Metallurgical Equipment Installed Throughout the World in the Last Fifty Years Originated There—Reminiscences of Early Installations
In the West and in South Africa

THE machinery manufacturers of the Middle West have to a large degree developed the mining and metallurgical industry of the world. Hardly a plant of even moderate size can be found in any of the better-known mining districts which does not contain machines designed by Illinois, Indiana or Wisconsin engineers. Equipment of almost every kind suitable for the mining industry has been produced, and a detailed list of the various machines manufactured is obviously beyond the scope of this article. However, there are some types that represent milestones in the industry, and they should have at least passing notice.

The stamp mill, or, more specifically, the stamp battery, is one of the most generally used means of ore reduction, especially in the treatment of gold and silver ores. For more than fifty years, this type of machine has stood the test of time, and that alone speaks volumes for its success. Probably no fewer than 25,000 stamps, with their auxiliary equipment, have been manufactured in the Middle West. In the last three or four years not many stamp mills have been built, as other methods of ore crushing in connection with the improvement in processes of treatment have become more popular. There are many thousands of stamps, however, that are adding to the wealth of the world, and it may be said, without entering into detailed discussion, that they have proved their economic worth.

A LARGE STAMP MILL

It would hardly be proper to pass from this subject without a reference to one of the largest historic stamp milling plants. In the '70s, gold was discovered in the Black Hills of South Dakota, and in the latter part of that decade about 640 stamps were being operated by the Homestake Mining Co. These have since been augmented, until the total at present is 1,000. The greater part of this equipment has been supplied from the Middle West district.

In 1897 the Alaska Treadwell Gold Mining Co. placed an order with Fraser & Chalmers for 520 stamps and other equipment aggregating 6,000,000 lb., which was considered at that time, and probably still is, the largest individual order for machinery of that class ever purchased in one contract.

The large steam stamps which are so successfully used in the Lake Superior copper mines should also receive mention. These machines were tried out on an extensive scale in the late '80s at a large gold mine in South Dakota, in large concentration works in Montana, and also in Australia. They were not entirely successful, because of the nature of the ores, and the metallurgical treatment following crushing, and have long ago been superseded by other apparatus. However, these steam stamps continue to be useful in the Lake Superior district. The greater number, by far, have been built in this territory.

A great step forward in the process of ore treatment was made in the introduction of the Frue vanner, about 1873. This machine was built almost exclusively in

the Middle West, several thousand of the vanners having been shipped to all points of the world. They are still built, but their application in recent years has been rather limited, on account of changes in the treatment of ores.

The gyratory crusher was brought out in the '70s, and has had a wide application in the mining industry. It is today, notwithstanding its early introduction, in extensive use; it is being built in greater numbers than ever before, and it bids fair to continue its successful career for an indefinite period.

In the '80s and '90s the pioneer mines of the Rand were being extensively equipped. Conditions then were much different from those of today. Most of the equipment furnished consisted of stamp mills for gold ores, accompanied with Frue vanners for concentration of the sulphides, and this represented the best method of treatment then known. Special means for the transportation of this equipment were required. There being no large timber available, it was necessary to supply it from here. This resulted in the sending of men to the Southern states along the Gulf, where timbers were sawed ready to assemble at the destination. The tonnage for shipment was so large that on many occasions entire vessels for carrying the timber and machinery were chartered for direct sailing to South Africa.

Conditions naturally changed in this field as well as elsewhere, and now greater development has resulted in the specialization of industries, so that lumber, as well as other materials and supplies, is available from local dealers. In the early days, supplies, including hardware, window glass and similar equipment, had to be furnished by the machinery manufacturer.

The development of the famous De Beers diamond mines also required a vast amount of machinery, and, in the early stages, most of this was shipped from Chicago. The gold mines on the west coast of Africa also required a large amount of equipment, and in later years the enormous copper deposits in the Belgian Congo have drawn largely from the Middle West market for their equipment.

AMERICAN ENGINEERS ON THE RAND

It is pertinent to record the fact that the early development of the Rand was largely under the direction of engineers from the United States. However, the story has been told frequently, and there are still among us many who had an active part in those early installations. Many famous mining and metallurgical engineers were engaged for Africa, and scores of mechanics, operators and millwrights were sent from here. South Africa still continues to draw a large amount of her machinery requirements from the Middle West district.

The barrel chlorination process for the treatment of gold ores reached its zenith in the late '90s. Many of the largest installations were built in the Middle West, including those in Colorado for the treatment of Cripple

Creek ores. These plants were the largest of the kind ever built.

The application of the cyanide process began in the '90s. The process has since been greatly developed and improved, especially its mechanical applications, so that it is almost universally employed in the treatment of gold and silver ores. From its inception it has been exploited by the building of many large plants, which have been shipped to all parts of the world.

In the latter part of the last century the development of the mining industry had been so rapid, and the processes of ore treatment had so changed, that the written technology of the subject could not keep pace. The catalogs of the manufacturers in those days were more than mere illustrations of equipment, and they went at great length into the metallurgy and methods of ore treatment. They also contained much useful information in the way of operating hints, engineering data, and general technical information, and were recognized as the best sources of data available. Many of the schools where mining courses were given made use of these catalogs in their classes. Time has changed this practice, and there is now available in the published books on various branches of metallurgy complete and detailed information for the operator and the student. There are also many handbooks on engineering. Above all, there is the great diffusion of knowledge through the technical press. This latter is the current source of up-to-date information on what is taking place, and keeps posted those interested in what is happening in all corners of the globe, long before the information is available in book form.

MANUFACTURERS FORMERLY HANDLED ALL NEEDED SUPPLIES

The machinery manufacturer in the early days had, if possible, a more varied demand upon him than at the present time. Not only was the necessary machinery for the plant furnished, but all supplies required for its operation. These included drills and powder for mining, chemicals and supplies for milling, and often groceries, provisions, and even drugs for the maintenance of the camp. Shipment of coal in sacks for blacksmithing was common. Another extensive demand was for candles and oils, both lubricating and illuminating.

When the application of electric lighting was a demonstrated commercial success, the mining industry was quick to adopt it. It was an easy task to show that the cost of the lighting plant would readily pay for itself in the saving of candles and kerosene, to say nothing of the cost of attention to lamps, which were usually ill kept. Truly in those times the sales engineer had to have a versatile knowledge and experience.

The use of cement was not formerly as general as it is now. The production in this country was limited and confined to the Eastern states. Transportation was not available, and the cost was prohibitive. For this reason many of the old foundations and retaining walls were built of masonry and have proved very durable. Construction was often finished off with cut and dressed capstones, which occasionally were supplied by the machinery builder.

It will be recalled that railroad and transportation facilities were, until comparatively recently, rather limited in the West, and numbers of shipments were made to Missouri River points to be hauled by ox teams several hundred miles to destination. For these rea-

sons, and on account of the inaccessible situations of mines in the mountains, there was formerly an enormous demand for machinery built for transportation on the backs of men and animals. As progress was made in other lines, better means of transportation became available. There is not one sectional plant built now where formerly ten such plants were needed. It is wonderful, however, to recall the enormous plants which were built in sections for muleback transportation and which were shipped all over the world from the Middle West. These included engines, boilers, pumps, compressors, and smelting and milling machinery of capacity and size that taxed the ingenuity of the engineer.

Another requirement of the earlier days was for pumping equipment, which recalls the enormous Cornish pumps with which some of the mines were equipped. Many of the largest of these installations were manufactured in Chicago. Pumping is still a necessary expense in many mines, but modern pumping equipment is not so massive or cumbersome.

Hoisting engines are in use wherever ore is mined. Each installation is a special problem, as the equipment must be made to suit the mine. To refer to any individual type of installation or to many that have been shipped from the Middle West would be without the scope of this article. Suffice to say, the number of machines built is in the thousands and the destination everywhere there is mining. Only a few weeks ago, inquiry was received for repair parts for an engine built over fifty years ago and still operating.

Tramways, both of the surface gravity and the aerial types, were within the scope of the mining machinery manufacturer years ago, and numerous installations were shipped from the Middle West. In recent years, however, this branch has become more specialized with certain rope and cable manufacturers.

Reference should be made to the activity in silver mining during the latter half of the nineteenth century. The large amount of machinery required in the silver milling plants, and the great number of them built, would be in itself a history of interest. The dry crushing and roasting plants, wet crushing silver mills, continuous and combination milling plants, leaching and hyposulphite plants, required a large amount of heavy machinery and many skilled engineers. These plants were shipped to the great producers of silver in Nevada, Montana, Utah, Arizona, Mexico, South America, and, in fact, all over the world, but they have nearly all passed out of existence.

DEVELOPMENT OF SMELTING MACHINERY

Smelting machinery has undergone a great many changes. Forty years ago there probably were twenty smelteries to every one now in operation, as these plants were in smaller units than is now customary. The number of smelting plants shipped from here for both lead and copper can be reckoned by hundreds.

The reasons for the changed conditions now are due to better transportation facilities, enabling shipment of ores to large custom plants, and cheaper operation on the larger scale, making it more economical to ship instead of smelting locally.

Coupled with smelting, the art of copper converting was introduced into the Western states, and some of the first converters were built in Chicago. The development of the industry due to this advance in metallurgy has resulted in the equipment of many large

smelters from this territory, in turn permitting lower operating costs, making it possible to handle grades of ore that could not be treated commercially in the smaller plants.

The roasting of ores has been changed materially from the heap and stall type roasters and hand-rabbed furnaces, to the mechanical types such as the Howell-White, Bruckner, Brown, Holthoff-Wethey, Jackling, McDougal, and kiln.

Probably the greatest of all world's fairs was the World's Columbian Exposition at Chicago in 1893. Here were exhibited not only the products of mines from all over the world, but actual mining and milling processes were in daily operation. Naturally, the exhibition was operated from power developed by machinery furnished by local manufacturers.

POWER DEVELOPMENT

The development of power for mining plants has been an extensive and interesting engineering problem, and likewise has been a vast source of business for the Middle West district. The isolated or individual power plant has been developed to a high degree of efficiency, largely because of remote conditions of location. There has been in later years a growing use in mining districts of electric power wherever possible, especially where developed by hydro-electric plants. Many mines have also made use of gas power installations, and at present there is extensive application of the Diesel engine for power in places where oil is available.

EQUIPMENT SUPPLIED TO IRON INDUSTRY

About 80 per cent of the iron ore produced in this country is mined in the Lake Superior district. Here mining operations are carried out on a larger scale than in any other place in the world. The district being

contiguous to this manufacturing center, it is only natural that a large amount of the machinery required has been locally supplied. Included in the list are hoisting engines, pumps, steam, hydraulic and electric power plants, ore-crushing plants, and ore-washing plants.

MACHINERY IN MOST OF THE NOTED CAMPS

The discoveries and development of the Black Hills, the Rand, Cripple Creek, Mount Morgan, Kalgoolie, Tonopah, Goldfield, Thunder Mountain, the Porphyry Coppers, and many other noted camps have been, in a large degree, responsible for expanding the manufacturing facilities for mining and metallurgical machinery in the Middle West. That it has been possible to make this the largest source in the world for such equipment speaks well for the engineering skill and the manufacturing facilities found in this part of America.

Barnes-King Development Co.

Report of the Barnes-King Development Co. for the quarter ended June 30, 1919, shows that the company earned in that period \$52,998.71, and expended \$25,627.45, leaving a net profit of \$27,371.26.

The North Moccasin property produced \$52,598.76 from 6,298 tons, or \$8.35 per ton. Development work, 756 ft. The Piegan-Gloster property produced \$25,172.50 from 3,801 tons, or \$6.62 per ton. Development work, 597 ft. The Shannon property produced \$105,864.50 from 9,017 tons, or \$11.74 per ton. Development work, 962 ft. In the Mount Pleasant property exploration work to the extent of more than 1,000 ft. was accomplished, but nothing was found to justify further operations. The Silver Bullion shaft has been sunk to a total depth of 200 ft.

Geology of the Gogebic Range and Its Relation To Recent Mining Developments—Part I.

Alterations of the Iron Formation Have Changed the Iron Carbonate to Oxide, Removed Chert From Parts of the Iron-Bearing Series and Caused the Formation of Ore-bodies—Factors Governing Activity of Alteration Processes

By W. O. HOTCHKISS

State Geologist and Consulting Engineer, Madison, Wis.

THE purpose of this series of articles is to describe the details of the geology of the Gogebic Range; to discuss their bearing on the origin of the ore-bodies, particularly on some of the orebodies which lie well north of the foot wall; and to discuss also their bearing on the discovery of new "hanging" deposits.

The general outline of the series of articles is as follows:

Introduction and acknowledgments.

Brief résumé of topography and general geology as given in publications by Van Hise and others.

The geology of this range was first comprehensively described by Irving and Van Hise, whose work appeared as Monograph XIX of the U. S. Geological Survey and was published in 1890. Later it was described in Monograph LII by Van Hise, Leith, and others. There is little to be added to the general descriptions there given, but recent studies have shown new facts of importance relating to the details of the iron formation. It is with these details, which, however, have an important bearing on successful exploration and development, that this series is chiefly concerned.

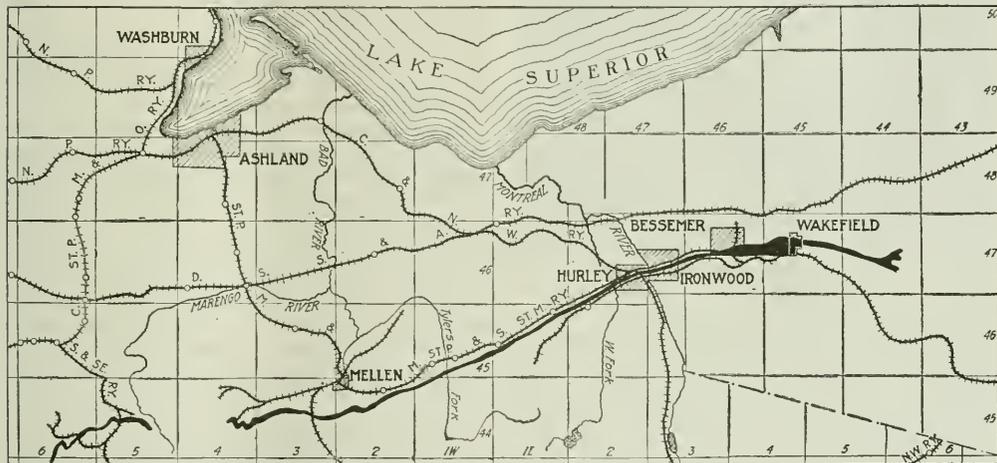

FIG. 1. MAP SHOWING SITUATION AND EXTENT OF THE GOGEBIC IRON RANGE

Detailed description of the Ironwood formation.

General composition.

Origin.

Distinctive characteristics of the various beds.

Discussion of constituents of the formation.

Various forms of chert, iron minerals, conglomerates.

Alteration of the Ironwood formation.

Discussion of the controlling factors, foot wall, dikes, faults, porosity, and folds.

Detailed description of the members making up the Ironwood formation and the lower part of the Tyler.

1. The Plymouth granular chert member.
2. The Yale ferruginous slate and chert member.
3. The Norrie granular chert member.
4. The Pence ferruginous slate member.
5. The Anvil granular chert and jasper member.
6. The Pabst fragmental beds and ferruginous slate beds.

Structure and intrusives of the Ironwood formation.

Occurrence and origin of ore deposits.

Exploration and future possibilities.

The work on which these articles are based was done first for the Wisconsin Geological and Natural History Survey, which will publish a report on the Wisconsin end of the range. Observations were later extended in the course of professional work for private clients; and finally, in order to get comparative data for the whole range, some time was spent visiting mines on the Michigan end of the range and making measurements of the thickness of the various beds which make up the iron formation.

All the mining companies on the range have contributed information and co-operated in securing the desired data. A list of those to whom acknowledgments are due would include nearly every man in an executive or engineering capacity in the district, and my thanks are extended and obligations acknowledged to all of them. It has been a pleasure to meet them and receive their hearty co-operation. I hope they may find in this compilation of their data and my own

observations some partial recompense for the courtesy extended me.

Fig. 1 shows a general map of the range prepared from the general map of the Lake Superior district in Monograph LII and from unpublished field work of the Wisconsin Geological Survey. Three generalized cross-sections showing the configuration of the surface and the geological formations present are given in Fig. 2. In this figure Section A is taken across the Geneva mine, Section B gives the contour of the

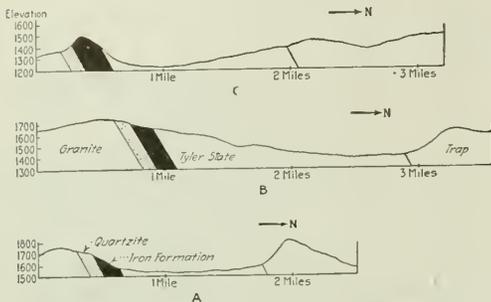

FIG. 2. CROSS-SECTIONS SHOWING THE TWO RANGES, THE "IRON RANGE" AND THE "TRAP RANGE," AND THEIR RELATION TO THE GEOLOGIC FORMATIONS

range at the Montreal mine, and Section C shows a cross-section at a point just west of Penokee Gap. It will be noted that at the Geneva mine the granite makes the crest. Farther west at the Montreal mine the quartzite makes the crest. At Penokee Gap and in general in the western part of the range the iron formation makes the crest of the southern ridge. In the extreme east part of the range, east of Sunday Lake, the quartzite again makes the crest of the ridge and the granite and green schist lie in a depression to the south. Referring to Fig. 2 it will be noted that there are two distinct ranges of hills—the southern one being made by the iron formation or the formations immediately south of it and the northern one by the Keweenaw trap rocks—the copper-bearing series. The valley between is underlaid by the Tyler graywacke slates. The present streams, however, cut almost directly across the ranges and the longitudinal valley between them and pursue a precipitous course of a few miles to Lake Superior, which is about 1,000 ft. lower than the iron range.

In the central part of the district, which has been the most productive, the iron range has been reduced for the most part to isolated elongated hills separated by broad gaps. The same is true of the Keweenaw trap range to the north of the Tyler slate valley. East of Sunday Lake and west of the Montreal River the trap range is much less broken.

GEOLOGICAL FORMATIONS OF THE GOGEBIC

Fig. 2 shows the major geological divisions, which have a general northward dip of about 60° . The oldest is farthest south in the section and is made up of granite and green schist, both being igneous in origin.

Lying upon this base there is the Bad River cherty dolomite. This formation is found in isolated remnants, most of it having been eroded away before the succeeding formation was deposited, and consequently it is not shown in Fig. 2. At the eastern end of the

district the dolomite has a quartzite at its base, known as the Sunday Lake quartzite. The maximum thickness of dolomite is on the Marengo River and is not less than 300 ft. The dolomite lies unconformably on the granites and schists below it, and there is frequently a well-developed conglomerate at the contact.

Upon the dolomite, or on the lower formations when the dolomite is absent, lies the Palms formation. This contact represents an unconformity, but it is marked only by occasional thin lenses of conglomerate. Fig. 3 shows the contact with the granite as seen in the shaft crosscut in the Yale mine. The granite blocks are angular and the granite surface is broken and irregular, showing little rounding by erosion. The lower part of the Palms formation is a quartz slate. It is composed almost wholly of very small quartz sand grains, with a small amount of slaty material. It is made up of very thin, even, to slightly irregular ripple-marked beds. The Palms formation usually varies from 400 to 500 ft. in thickness, but east of Sunday Lake it is as much as 800 ft. thick in places. The upper part of the Palms is a hard glassy quartzite varying from 30 to 100 ft. in thickness. This makes the foot wall of most of the orebodies developed heretofore, and is usually the formation in the minds of the mining men when "foot wall" is mentioned.

Upon the Palms quartzite lies the Ironwood formation, in which practically all the orebodies are found. Descriptions of this and its relation to the quartzite will be given later in detailed form.

Lying unconformably upon the Ironwood formation is the Tyler graywacke slate. It has heretofore been believed that the Ironwood and Tyler were deposited without any erosion period intervening, but conclusive evidence of unconformity has been disclosed by recent work. The Tyler varies from nothing to two miles in thickness. At the eastern and western ends of the district it has been entirely eroded away, so that the Keweenaw deposits rest directly on the iron formation or on lower formations. The extreme lower part of the Tyler is quite heavily ferruginous in many places, sufficiently so to form orebodies. This part is described in detail with the Ironwood formation. There is much

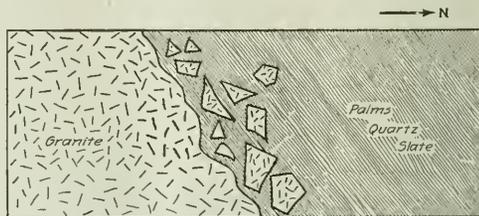

FIG. 3. CROSS-SECTION OF MAIN CROSSCUT IN YALE MINE, SHOWING CONTACT OF THE PALMS QUARTZ SLATE AND THE GRANITE

iron carbonate in the Tyler, and it is not at all impossible that ore may some day be found well north of the Ironwood formation. The exposures are so few, however, that little information is available with regard to this.

The Keweenaw formations lie unconformably upon the Tyler slates. The first of these is a formation that in some places is a sandstone and in other places is a quartzite with a very well-developed conglomerate at the base. Then follow the successive volcanic flows,

for the most part dark green diabases and amygdaloids with porphyries and syenites.

The Ironwood formation is what is commonly called the "iron formation" in the district. It is dominantly composed of some form of cherty silica and some form of iron. Away from the orebodies the iron minerals usually range from 25 to 50 per cent of the formation by weight and the silica from 50 to 75 per cent. Owing to the silica being lighter, the 50 to 75 per cent of the iron formation which it makes by weight would make from 67 to 86 per cent of the volume. In addition to these two predominant constituents, certain phases of iron formation contain moderate percentages of carbon, and of clayey or argillaceous matter, the presence of which is indicated by the alumina in the analyses.

The Ironwood formation was deposited in water, in the same general way as limestone, and so is sedimentary in origin. The deposition of a sedimentary formation is a very slow process. To accumulate 600 to 1,000 ft. of this iron formation doubtless required many thousands of years. During this long period there were slow, gentle oscillations in elevation of the land and of the sea bottom, possibly no more rapid than the rate at which the Lake Superior region is known to be rising at the present time—a few inches in a century. The changing of elevation during the long period of time in which the Ironwood formation was being deposited caused corresponding changes in the character of the deposits. In the shallow-water periods deposits of ferruginous cherts were formed. When the water became deeper, deposits characteristic of deeper water conditions were laid down, namely, the ferruginous slates. When the bottom was elevated, some of the near-shore deposits were raised above the surface and subjected to erosion, and conglomerate beds resulted. Along with these broad general changes less general or local variations were taking place, which resulted in similar differences of deposition on a smaller scale. These lesser variations are sometimes limited to a few miles, and sometimes to a few thousand feet in extent along the range.

As the deposition of a formation of this character, extent, and thickness would require a body of water of considerable area, it is evident that as *general* changes occurred they would be reflected in changing character of the deposit over *wide* areas, and because of this we find certain well-defined members of the formation which can be traced throughout its full extent. Changes which were not so widespread in their nature resulted in more or less local deposits, which are found as minor lenses extending over only a few miles, or over a few thousand feet. Some of these minor changes affected such small areas that variations are found on the different levels of a single mine.

The foregoing description will serve to give a general picture of this iron formation. It is made up of five well-defined divisions, each of fairly considerable thickness, which are identifiable throughout the range. Within each of these five larger divisions there are minor subdivisions, which may extend several miles as definite beds, and still smaller members, which may be identifiable only for a few thousand feet.

It is important to remember that in a sedimentary formation of this kind, deposited on a flat sea bottom, changes in character of any particular bed cannot be abrupt, because of the nature of the conditions under which it was deposited. A proper appreciation of this fact will greatly assist the mining engineers of the dis-

trict in studying the geology of the mines. A thick ferruginous slate bed on one level does not become a hard granular chert bed on the level below. If the slate bed is not found, it is seldom proper to assume that it has changed in original character. Such a thick bed will usually extend considerable distances before pinching out, and any change in the original character of a thick bed requires thousands of feet to be completed. If a thick bed is identified on one level and not on the next, its absence is almost certain to be due to faulting, or failure to correlate oxidized and unoxidized phases of the same bed. The most common difficulty is failure to recognize a soft, red, ferruginous slate on one level as the much-altered equivalent of a hard greenish gray, thin-banded iron carbonate on the next level.

The differences in character between the various members which make up the formation are due, first, to the differing character and amounts of the various constituents which form them, and, second, to the difference in bedding. Some beds contain one variety of

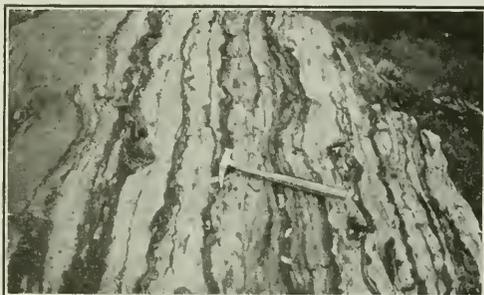

FIG. 4. CHARACTERISTIC "WAVY-BEDDED" GRANULAR
CHERT AND HEMATITE
(Taken at outcrops on Tyler's Fork, by W. O. Hotchkiss)

chert, and adjacent beds may contain different varieties. In some of the beds a large amount of iron was deposited and in other beds a relatively small amount. This particular feature, the variation in original iron content of various beds, is one of extreme importance in searching for orebodies, as it is in these originally more heavily ferruginous beds that orebodies are most likely to be found.

In some beds the iron is chiefly in the form of iron carbonate; in others it is chiefly in the form of magnetite and hematite; and this feature serves as a distinctive characteristic in recognizing various beds. In other beds more or less noticeable amounts of clayey material were deposited, and these form the so-called slaty portions of the formation.

The second feature causing difference between the various members making up the formation is the character of the bedding. In the dominantly cherty portions of the formation certain members of the formation are peculiarly irregularly bedded. As a convenient short term to characterize this bedding the term "wavy bedded" is used. The appearance of this bedding is given in Fig. 4. It will be noted that the bedding planes are never parallel for any appreciable distance. The wavy-bedded portions of the formation are usually composed of thicker individual layers than the other portions of the formation.

In strong contrast to the wavy-bedded structure is

what is called the "even-bedded" structure. This even bedding is shown in Fig. 5. In these beds the bedding planes are parallel for long distances and usually the beds are very thin. The similarity to the bedding in slate has resulted in the proper and rather general practice of mapping practically all soft even-bedded portions of the formation as "slate." The hard unaltered portions of these same beds, however, when found in other parts of a mine, have not been recognized always as equivalent.

The bedding characteristics just described are remarkably consistent in the various major members

FIG. 5. CHARACTERISTIC "EVEN-BEDDED" FERRUGINOUS SLATE OF THE IRON FORMATION. THE SCALE LIES UPON A BED OF GRANULAR CHERT

(Taken by W. O. Hotchkiss on east side of Penokee Gap)

of the formation and serve as a basis for distinguishing them.

While it cannot be stated positively as a fact, it is believed that the wavy-bedded members of the iron formation are relatively shallow water deposits in which the bottom was within reach of the action of waves that disturbed the bottom and produced the wavy-bedded structure, and the water contained abundant oxygen to oxidize the iron as it was deposited. The even-bedded portions of the formation are believed to have been deposited in deeper water where the bottom was

below the reach of wave action and contained so little oxygen that the iron could persist as carbonate.

One of the most common changes in character, found as a particular bed is traced along the range, is in the ferruginous slates. In places these are almost entirely free from the thin flinty chert layers. As the bed is followed from mine to mine the number of platy flint layers increases gradually until they make up a major part of the bed. Such beds on the one end of the range can be properly correlated with those on the other end only by tracing them carefully through the intervening area.

Another common variation along the range is found in the granular cherts. From the Davis mine west these cherts contain very few jasper grains. Eastward the jasper grains increase gradually in amount until some of the beds become "granular jaspers" and are made up almost wholly of iron oxide and round jasper grains.

Similar changes occur down the dip, but owing to the relatively short distance that observations can extend, these changes are not so marked.

DETAILED DESCRIPTION OF CONSTITUENTS OF THE IRON FORMATION

As there is no standard terminology in use in all of the mines to describe the various kinds of iron formation, it is necessary to give some discussion to this subject here, so that there will be no doubt as to what is intended by the terms used in this series of articles.

The constituents of the iron formation may be tabulated as follows:

Chert.

1. Granular chert. When the individual grains are jasper this is called "granular jasper."
2. Fine-grained chert.
3. Flinty chert.
 - (a) Clear, colorless.
 - (b) Yellow.
 - (c) Green.
 - (d) Vermilion, or "jasper."

Iron minerals.

1. Hematite.
 - (a) Non-hydrous or "hard blue" and earthy, red hematite.
 - (b) Hydrous—red, yellow, or brown limonite.
2. Siderite (iron carbonate).
3. Magnetite.

Slaty material.

The present form of the small amounts of clay originally deposited in the ferruginous slates.

Conglomerates.

These are almost invariably made up of pebbles of iron formation material.

Minor constituents.

Very small amounts of quartz sand, lime, magnesia, pyrite (rare), manganese, phosphorus, and carbon are found in the iron formation.

Chert—Both by weight and by volume the largest portion of the iron formation is made up of silica. This silica occurs in a variety of forms, all of which are included under the general name of chert. According to Van Hise, chert includes all forms of amorphous and finely crystalline, non-fragmental silica. It is distinguished on the one hand from sandstone or quartzite in that it is deposited from solution instead of being carried as fragments of sand in suspension and deposited by the water. On the other hand, it is distinguished from vein quartz, which also is deposited from solution, by its finely crystalline or amorphous character.

The descriptions given here apply to the unaltered

forms, the altered chert being described later under the general title "Alterations of the Iron Formation."

There are three principal varieties of the chert in the iron formation. What is spoken of in this article as "granular chert" is composed largely of grains of chert approximately $\frac{1}{8}$ in. in diameter. These grains are egg shaped to round in form, and the spaces between are usually filled with clear flinty chert and iron oxide, which gives more or less contrast of color between the matrix and the granules. This chert has been called "taconite" from the likeness in appearance to the granular Mesabi taconite, but it differs in that the grains are in general not iron silicate, as they are on the Mesabi. It is also called "oolitic" chert, but as the grains show only rarely the characteristic concentric markings, it is not a true oolite, so it is given the more descriptive name of "granular chert." Associated with this granular chert and making an important part of it are abundant thin beds and grains of iron minerals.

The second variety of the chert is what is referred to in this article as "fine-grained chert." This differs from the granular chert in that it has no noticeable coarse granular texture. However, it has a distinct grain and breaks with an uneven fracture much like very fine-grained maple sugar, or like chocolate. In this fine-grained character it differs from the third variety. The iron minerals occur in the fine-grained chert in exactly the same way as in the granular chert.

The third variety of chert is what is called in this article "flinty chert." When in its fresh state this flinty chert is semi-transparent in thin splinters, breaks with a smooth curved surface like the fracture of glass, and has no visible granular texture. The term "jasper" as used is limited to the particular variety of flinty chert which is stained a brilliant vermilion by finely disseminated hematite. The term jasper has oftentimes been used as synonymous with "iron formation," making it an even broader term than chert, but it seems desirable here to limit its application to the very definite and easily notable brilliant red flinty chert.

The flinty chert occurs most commonly in the thin and evenly bedded parts of the formation as thin pure flint or jasper bands between ferruginous bands. The grains of which the granular chert is made up are themselves usually the flinty form of chert, but the term as used here is not applied to these granular forms.

In distinguishing these different cherts it must be borne in mind that it is rarely possible to make absolutely sharp distinctions between similar varieties of rocks. Gradation phases are common. It is easy to find hand specimens of chert which are difficult to assign to one of the three chief varieties described, but when large masses are studied, it is easy to tell which variety they are.

Iron Minerals—In the iron formation there are three principal types of iron minerals—hematite, magnetite, and siderite (iron carbonate). Hematite is the most abundant iron mineral present both in the unaltered and the altered phases of the iron formation. In the extreme west end of the range there are some particular parts of the formation in which the percentage of magnetite probably exceeds that of the hematite, but usually magnetite is a very minor constituent compared to the other iron minerals.

In the unaltered iron formation the hematite is entirely of the hard, blue, non-hydrous variety, and

occurs in rounded granules of the same size and shape as the granular chert grains, as thin solid beds, or as finely disseminated particles. In the altered phases of the iron formation some of the hard, blue, non-hydrous hematite is found, but it is exceeded in amount by the red, yellow, and brown, more or less hydrous forms of hematite.

Magnetite occurs in small quantities throughout the formation, both in the altered and unaltered phases. In the productive part of the range it is more abundant in the ferruginous slates than it is in the cherty portions of the formation.

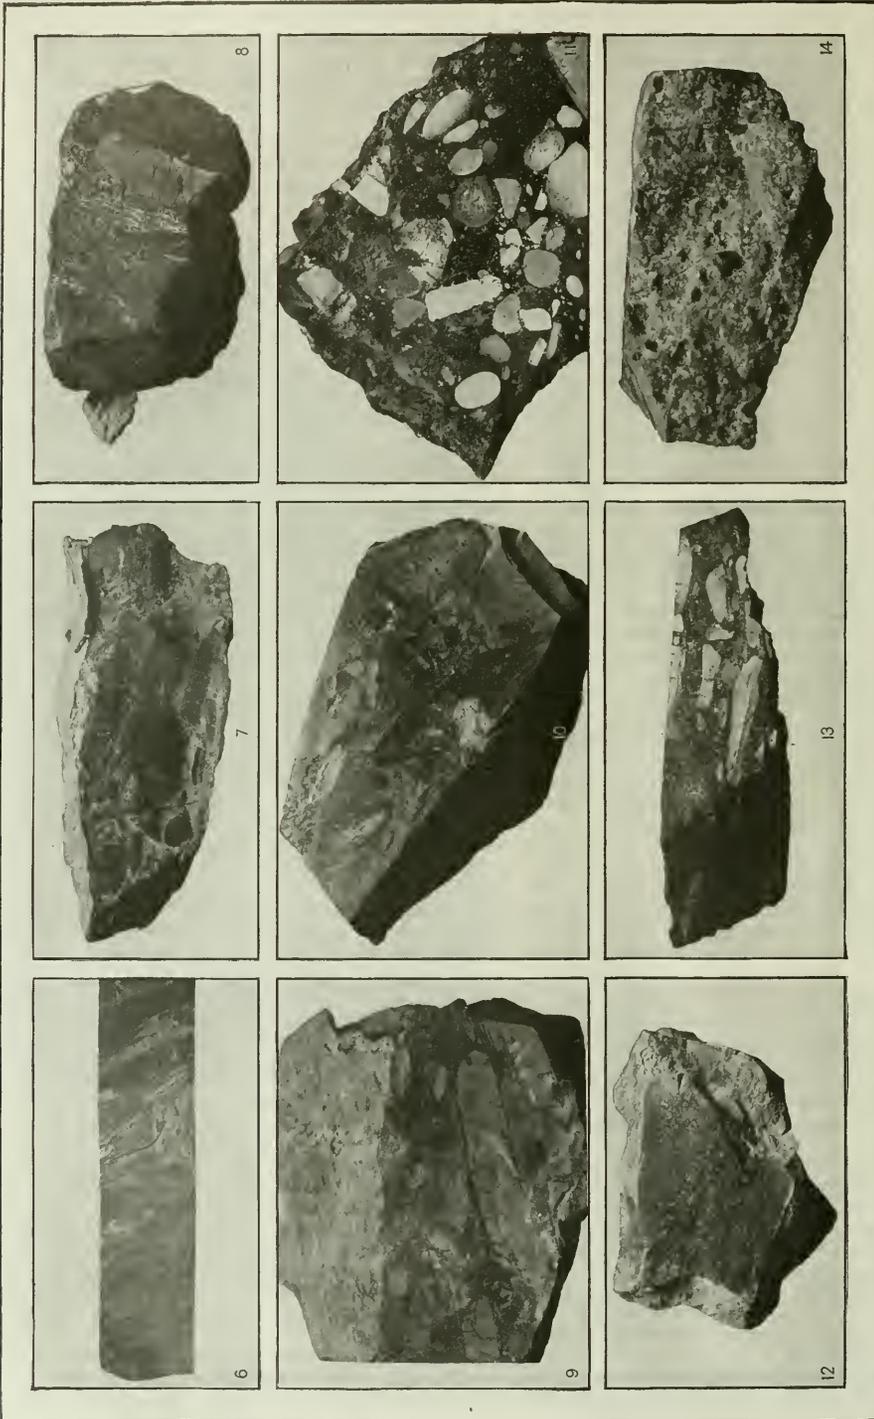

Siderite occurs both as coarsely crystalline beds, and in beds of a massive fine-grained form, which is best described as having the appearance of a consolidated iron-carbonate mud. This latter phase is the most common and almost invariably exhibits very fine parallel bedding.

In the dominantly cherty portions of the formation—the "granular" and "fine-grained" cherts—hematite, magnetite, and carbonate occur both as separate granules and thin beds. When these formations are oxidized, the carbonate and much of the blue hematite and magnetite are altered to more or less hydrous hematite of earthy consistency and various shades of red, yellow, and brown in color.

Color—The color of the unaltered formation, as seen in drill cores and in some new mine workings, is dominantly gray with a prevailing tinge of green. The more heavily ferruginous phases of the original formation are darker than the more cherty phases. The color of the altered formation is dominantly a brownish red from the great abundance of earthy iron oxide. Various thin beds of the formation alter to very characteristic colors, which are oftentimes persistent over considerable distances. These characteristic colors help to identify beds of only a few feet in thickness over distances of several miles. The fine-banded jasper is a case in point. As a consequence, the color of a particular bed is oftentimes of very great use in correlating the various strata in different portions of a mine.

"Slate"—Certain phases of the iron formation are frequently referred to as "slate." While in some particular cases the bands so described may contain as much as 30 to 40 per cent of argillaceous or slaty material, in many cases what is termed "slate" in the iron formation is so called largely because of its thin, even bedding, which is like that of a true slate. When these so-called slate beds are found in their unaltered condition they are dominantly iron carbonate rock, with varying percentages of blue hematite and magnetite and flinty chert. In most cases the true slaty matter is a relatively insignificant part. Nevertheless, the term is well fixed in usage in the district, and there is no suitable short term to use in its place. Most of the so-called slate beds, as seen in the mine workings, should be properly described as "somewhat slaty, oxidized iron carbonate rock, with flinty chert bands." Consequently the term "ferruginous slate," which is used for these beds in this article, should convey to the reader's mind the idea that they are not dominantly slate, but that iron oxide, or iron carbonate, and flinty chert make up nearly the whole of the rock so designated.

The argillaceous material present in this type of rock was brought in by the streams entering the body of water in which the iron formation was being deposited.

ROCK SPECIMENS FROM GOGEBIC IRON RANGE

Fig. 6—Polished section of a diamond-drill core, showing concretionary chert conglomerate at base of Ironwood formation. Fig. 7—Polished specimen of fresh unleached conglomerate from test pit at the Plummer mine. Cut across beds. Fig. 8—Polished specimen of the conglomerate marking the contact between the Norrie and Ponce members. From the Montreal mine. Shows effect of leaching. Cut across beds. Fig. 9—Polished specimen of yellow flinty chert conglomerate about 140 ft. north of the foot wall in the Plummer mine. Shows effect of leaching. Cut across beds. Fig. 10—Polished specimen of fragmental jasper or fine jasper conglomerate from base of Ironwood formation. Fig. 11—Cut parallel to beds. Fig. 12—Polished specimen of fragmental jasper or fine jasper conglomerate from base of Ironwood formation. Fig. 13—Same specimen as Fig. 11. Cut across beds. Fig. 14—'Worm-eaten chert' from the Plummer mine. Shows an early stage of leaching of the chert in which the water has attacked irregular, more easily leached parts.

It was carried in suspension and deposited with the iron carbonate and chert.

Conglomerates—Possibly it should be explained in beginning the description of these conglomerates that some of the mining engineers of the district are rather inclined to believe that some, at least, of what are called conglomerates in this article are "growths in place" representing enlargements of the grains of the granular type of chert with which these conglomerates are usually associated. While it may be admitted that this is a possible explanation for the occurrence of these pebbles, it is not believed to be the correct one. The fact that most of them exhibit no concentric arrangements of material, such as would be characteristic of a concretionary growth in place, and the further fact that the pebbles are composed of several different varieties and colors of chert and of hard blue hematite, with bedding planes in various inclined attitudes, are satisfactory evidences that they are eroded fragments of older beds. Some of the well-developed phases of these conglomerate beds are shown in the illustrations, Fig. 6 to 13. From these it is evident that there can be little doubt of their true conglomeratic nature.

The pebbles are almost invariably of the much elongated form characteristic of pebbles derived from thin bedded or platy formations. (See Figs. 11 and 13.) A pebble half an inch in thickness may be six inches in its longer dimension. Some of the pebbles of the conglomeratic jasper marking the lower part of the Plymouth member are definitely of concretionary origin (Figs. 6 and 10), showing beautiful examples of the banding characteristic of concretionary growth. But as these concretionary growths were formed, they were oftentimes battered about by the waves, broken and rounded, so that the outlines of the pebbles frequently do not conform to the rounded outlines of concretionary growth. In some cases pebbles derived from the more massive beds of chert are more nearly round in form and correspond in shape to the ordinary round pebbles which we find in the glacial drift.

The form of a pebble is always characteristic of the type of material from which it is derived. Crystalline rocks make round or egg-shaped pebbles. Thin bedded rocks and those that break into thin plates make thin flat pebbles. In the usual textbook illustration, and the specimens exhibited in collections ordinarily shown to students, conglomerates are composed of well-rounded pebbles derived from massive formation, such as granite or quartzite or other crystalline rocks. The textbooks seldom give adequate consideration to the conglomerate derived from material which has a tendency to break into thin plates, and, as a consequence, the average student gets only a partial idea of the truth as to the forms assumed by conglomerate pebbles. A formation which breaks into thin plates makes flat rounded-edged pebbles, as most of the wear on such pebbles is confined to the thin edges.

A common characteristic seen in conglomerates derived from thin-bedded formations is that these thin flat pebbles oftentimes stand upon edge across the bedding, instead of lying flat upon their sides; hence the name "edgewise conglomerates." Wherever the conglomerates found in the Ironwood formation are composed of thin flat pebbles, almost invariably the flat sides of the pebbles are parallel to the bedding or nearly so. Just exactly what this signifies is not known with certainty, but it is believed to indicate either

gentle current action or moderate wave action, rather than vigorous action of any kind. I have observed pebble beds forming on the shores of modern lakes where the material was derived from a thin, platy limestone subjected to vigorous wave action, and the pebbles all stood upon edge. It is believed that if the flat pebbles in this iron formation conglomerates had been subjected to similar wave action, they also would stand on edge. Instead of calling these formations "edgewise" conglomerates, they could more properly be called "flatwise" conglomerates.

Further evidence of their true conglomeratic character is the occurrence of three of them at horizons which are believed to represent unconformities. These include the one at the base of the Plymouth member, the one at the base of the Pence member, and one in the Pabst member. The fourth one, at the top of the Plymouth member (or the base of the Yale member), may or may not indicate an erosion interval, but suggests that in further work the evidence on this should be carefully sought.

In addition to the conglomerate beds mentioned, scattered pebbles are quite commonly found in the granular cherts, especially toward the eastern end of the district. These are believed to indicate that the granular cherts were deposited in relatively shallow water where the larger waves due to occasional storms could transport larger fragments fairly considerable distances.

Minor Constituents—Quartz sand grains are found in certain parts of the Ironwood formation. They occur as scattered grains of sand in the chert, but never, so far as is known, in sufficient abundance to make beds dominantly of sand. Their occurrence suggests the probability that they were wind-borne, rather than washed in by currents and waves, as are ordinary sands. The impure quartzite which is found associated with the heavily ferruginous beds of the lower part of the Tyler formation is of different character, however, and was an ordinary wave- and current-carried bed of sand.

The lime, magnesia, manganese, phosphorus and some of the other constituents that occur in minute amounts are disseminated through the formation quite generally. They are not in sufficiently large quantities to be visible as a rule, excepting the manganese. The amounts present in various beds differ decidedly; ore derived from one member of the iron formation may be low in phosphorus, while ore making part of the same orebody but derived from beds to the south or north may be much higher in phosphorus. Whether there is any uniformity throughout the mines in the high or low phosphorus or manganese content of ore derived from a particular bed is a question that would be a very interesting and important one to solve on account of its bearing on the problem of ore grading. The information from which to do this for the range as a whole has not been available, but in some mines there is no question of the definite relationship between the phosphorus content and certain beds from which the ore was derived. It is quite possible that there is a similar relation between the manganese content and the various beds of the formation.

The pyrite and carbon are found almost exclusively in the ferruginous slates. The pyrite is quite rare; in fact, Gogebic ores contain as little sulphur as any of the Lake Superior ranges.

The carbon, when present, is always in particles too small to distinguish without a microscope. In one of

the ferruginous slates it is present in sufficient abundance to give a black color. This carbon is almost unquestionably derived from minute organisms that lived in the sea in which the iron formation was deposited.

ALTERATION OF THE IRON FORMATION

The particular alterations which are of interest to mining men are: (1) Those by which the iron carbonate has been changed to iron oxide; (2) those by which chert has been removed from certain portions of the iron formation, thereby forming the ore deposits; and (3) those by which iron has been carried and deposited in certain favorable locations, thus assisting in forming orebodies.

The iron carbonate requires the removal of carbon dioxide and the addition of oxygen to alter to iron oxide. In this process the iron oxide united with water, so that the first product was limonite. This hydrated iron oxide gradually lost water and the oxide changed in color from the yellow characteristic of limonite to the red of the earthy hematite.

The chert was altered by being partly dissolved by the water, and became a soft, white, chalky form of silica, which is a very fine powder in its final form, and is easily carried away by the circulating water, either in solution or suspension.

This alteration to chalky chert goes on quite uniformly in the flinty varieties, but in the granular and fine-grained cherts it is much more irregular in its action. In these it frequently affects spots which are usually $\frac{1}{4}$ to $\frac{1}{2}$ in. across. The chalky chert is removed very quickly from these spots, and they are either left as holes with iron-stained walls or are filled with iron oxide. This results in a peculiar appearance usually referred to as "worm-eaten" chert. This appearance is shown in Fig. 14 and is quite characteristic of certain individual beds of the formation.

The iron minerals were in part dissolved and carried to places favorable for deposition and in part carried in suspension and deposited in the openings caused by the removal of the chert.

All these alterations were caused by the circulation of water coming from the surface and carrying air with which to cause the oxidation. In considering the different factors which resulted in the greater or lesser activity of these altering processes in particular situations, it can be stated in general that any factors which aided in the circulation of water or any conditions which permitted or controlled its concentration in particular beds or in any particular situations have been effective in promoting the greatest degree of alteration of the iron formation. It is probable that the time of the most active alteration was in the period immediately following the Keweenaw folding, when topographic relief was greater than at present, and, presumably, more arid conditions prevailed.

FACTORS CONTROLLING THE CIRCULATION OF WATER

The factors which have had an obvious control of the circulation of water may be stated as follows: Foot wall, dikes, faults, physical condition of beds, porosity, folds.

Foot Wall—The influence of the foot wall on the circulation of water through the iron formation is due to its general dip of about sixty degrees to the north and its relatively impervious character. It is obvious that this foot wall must have served to concentrate the

circulation of water into that portion of the formation immediately upon the quartzite. Similarly, any impervious bed in the iron formation has served in the same fashion to concentrate the water in more porous parts of the formation above it. If other conditions were right and this impervious bed was sufficiently extensive it might form the foot wall of an orebody. Thus, orebodies may occur immediately north of such an impervious bed, wherever it may be. The ferruginous slate beds make these secondary foot walls in many cases. In other cases dense massive beds of the chert serve as foot walls.

Dikes—There are numerous dikes present in the iron formation. When fresh they are quite impervious, and under the influence of water altered to an equally impervious clayey substance. As these dikes are nearly perpendicular to the beds of the iron formation, they made an impervious trough with any impervious foot wall that they intercepted. These impervious troughs usually have an eastward pitch, but there are many cases of westward pitch. They served to concentrate the circulating water effectively, bringing it southward toward the foot wall. The most common type of orebody is one which owes its origin largely to, and is found at the intersection of, a pitching dike and an impervious foot-wall formation.

Orebodies of large size frequently occur in places where a westward-pitching trough, made by a dike and a foot wall, has carried the water downward to the west to the intersection of an eastward-pitching dike which has carried the water downward to the east.

It must be borne in mind that the trough formed by a dike and a foot wall represents only two of the factors which controlled the circulation of water. If, for any reason, the iron formation in such a trough was too impervious, the water did not get through. If the formation was porous, but too lean in its original iron content, the leaching was not likely to proceed far enough to clean the silica out, and this trough will not contain any ore. As a matter of fact, probably not more than half of these dike and foot-wall troughs will be found to contain workable orebodies. In such situations one or both of the factors of porosity or of original high iron content are lacking, with the result that the alteration in this portion of a trough has not proceeded far enough to develop ore.

Faults—Faults were of importance in the alteration of the iron formation because in many cases they made ready channels for the circulation of water. The great fault parallel to the beds, which is known practically throughout the whole productive portion of the range, has played an important part in the formation of many ore deposits. Where the brecciation, due to the faulting, was in ferruginous clay parts, the formation was usually left in a porous condition and was quite likely to be altered to ore along dikes controlling the water circulation, because of the greater freedom with which the water circulated. On the other hand, where this bedding fault occurred in the relatively impervious ferruginous slates, it has in most cases resulted only in mashing them and leaving them still impervious. As a consequence, the alteration has rarely gone to the stage of producing ore in such situations.

In addition to the bedding fault, there are faults in many directions in the iron formation, and these various directions of faulting played an important part in the formation of ore. The faults which go directly across the formation and are approximately vertical

in their dip have in many cases permitted the circulation of water to go down across the formation and spread out into the richer and more porous portions of the formation, developing portions of these beds into blanket-like orebodies. Usually, however, as these blanket types of orebodies come to a dike below, they thicken in cross-section, as indicated in Fig. 15. In this illustration the fault lies parallel to the plane of the paper.

There are other faults known in the formation which have the attitude of a normal eastward-pitching dike in which the portion of the formation lying below the fault is set out north relative to the portion above the fault. In some cases this has resulted in bringing relatively impervious parts of the iron formation or of the quartzite below the fault underneath the relatively pervious and rich portions of the formation above the fault. This condition has served to control the water circulation much as though a dike were present. It is believed that some of the orebodies in the Mikado and Asteroid mines are due to situations of this kind.

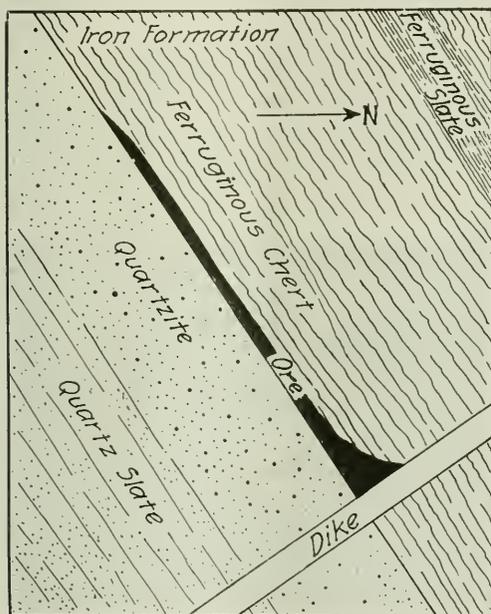

FIG. 15. THIN "BLANKET" TYPE OF OREBODY ON THE FOOT WALL SHOWN IN CROSS-SECTION

Physical Condition of Beds—Some beds in the iron formation are relatively much more porous than others in their original condition. These porous beds favored the circulation of water, while the more impervious beds relatively impeded it, and so were subjected to a less less active circulation. Of two beds, equally rich in iron originally, a porous one is much more likely to have developed into an orebody than one which was impervious. This controlling factor even goes farther than this statement would indicate. For instance, many of the ferruginous slates in their original condition contained a larger percentage of iron than some of the ferruginous chert beds; and yet these ferruginous slates have been altered to ore much less frequently than the

chert beds, the relatively impervious nature of the thin-bedded ferruginous slates acting to retard the alteration process.

The cherty members of the iron formation seem in general to be more porous than the ferruginous slates. In these more cherty portions the massive parts where the chert beds are much thicker are in general less porous than the beds in which the bedding planes are closer together. In some places orebodies rest upon a foot wall of massive, dense, lean, ferruginous chert, which has proven to be sufficiently impervious to the

FIG. 16. SKETCH OF WEST SIDE OF A CROSS CUT ON THE 14 LEVEL OF THE PURITAN MINE

Shows the irregular top of an orebody and the way the form is influenced by thickness of beds. Where beds are thinnest the formation is altered to ore higher than where they are thicker.

circulating water to serve effectively as a foot wall, and thus act to concentrate the circulation in the thinner bedded ferruginous chert above it.

In an orebody, especially near its north or south edges where large chunks of rock are found in the ore, it is found on tracing these along the beds that they are remnants of the unusually thick single beds of chert. Thus it almost invariably happens that, while the bottom sides of an orebody are relatively smooth planes, because they rest upon a dike and a foot wall which control the form, the top of the orebody or the "cap rock" is of an irregular shape. The alteration to ore has proceeded higher in some beds than in others, and in between these places, where the ore goes high, the "cap rock" projects down into the ore. The principal factors controlling the alteration of the iron formation in dike troughs, and hence the shape of the top of the orebodies in cross section, are the richness of the original beds in iron and their porosity. Where the beds are richer and more porous than usual the ore goes highest. In other words, the alteration of the original formation has proceeded farthest. Rock masses which project down into the orebody represent the leaner or less-porous portions of the formation, and the chert masses which project farthest are usually both relatively impervious and relatively lean in their unaltered condition. These facts are illustrated by Fig. 16, in which the beds under bracket (1) are thicker, more impervious and contain less iron than the others. Those under brackets numbered (2) show somewhat thinner bedded chert. Those under brackets numbered (3) are thin bedded and contain the greatest percentage of iron and are most porous. The alteration to ore has proceeded higher up on these beds than in the thicker bedded, less porous, leaner beds. This is a sketch from a crosscut through the top of an orebody in the Puritan mine.

Folds—Folds seem to be much less important in relation to orebodies on the Gogebic than in other Lake Superior ranges. They are unimportant in the main productive portion, because the formation has simply been tilted to an angle of about sixty degrees, with almost no crumpling of the beds. In the western portion of the district, however, the structure is somewhat different in that there are several large folds

which form westward-pitching troughs. One of these of very large size occurs in Sections 9 and 10 of T.44, R.2W. Two other large folds of this character are known in Sections 16 and 18, T.44, R.3W., west of Penokee Gap.

In the much-faulted area lying between the Anvil mine and the big Sunday Lake cross fault east of the Mikado and Wakefield mines, the faulting has been accompanied with folding, which has developed at least one pitching trough in the formation.

No orebodies are known in any of these pitching troughs, but exploration up to the present time has been so meager in these structures that it cannot be said whether or not they have influenced the water circulation to such an extent that orebodies resulted. It is believed, however, that conditions of this sort present favorable places for future exploration.

(To be continued.)

Power Rates for the Engels Copper Mining Co.

California State Railroad Commission Determines Readjustment on Basis of Consumption and Adverse Natural Conditions of Supply

READJUSTMENT of rates and service by the Railroad Commission for the Engels Copper Mining Co., of Plumas County, Cal., which is served by the Great Western Power Co., was contained in a decision handed down on Aug. 13 in the complaint of the mining company against the power company which is expected to reduce the copper company's bill for power approximately \$40,000 a year. The Engels company is one of the largest consumers of power on the Great Western system, its demand exceeding 1,000,000 kw.-hr. per month, at a cost of more than \$175,000 a year. To supply the mine the Great Western constructed a 22,000-volt delivery line from Veramont to the Engels mine, ten miles distant. This line connects with the sixty-mile line at Las Plumas, on the Feather River. The mining company consumes 88 per cent of all the power sold in Plumas County.

In its complaint the mining company alleged that the Great Western Co. has been charging its highest rate for this class of service, and the Engels company demanded not only that the rate be reduced to the cheapest rate for the same class, but, in addition, that the power company be required to enlarge its delivery facilities in order that the mining company could make many improvements, all of which would require further use of power. The power company put great stress on the risk of the business of the mining company and the great expense necessary to supply it at all. The special line is constructed at high altitude over heavily timbered regions and in a district where there is no probability of further industrial development. The company contended that it was entitled to the highest rate because of the equity of covering this great cost, approximately \$400,000, in its rates. The mining company presented facts to show that it has enough ore blocked out and a profitable market to keep it operating at least ten years.

The decision requires the power company to construct within ninety days such additional facilities between Veramont and the mine as shall provide adequate line capacity. The mining company contended that the ca-

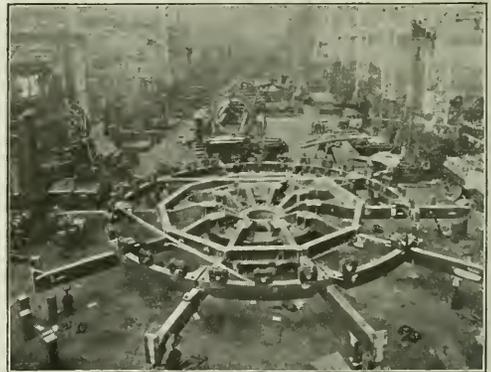

capacity was not equal to its demand and that it had been subject to many costly and avoidable interruptions by reason of the lack of diligence on the part of the power company. The commission explains that the power company cannot be held responsible for acts of nature and climate where the line is in such an exposed condition. In its decision the commission bases the new rate upon the demand of the mine and not upon the connected load at the Veramont station. The commission holds that the extension of the lowest rate to Plumas County would not adequately compensate the power company.

The rates fixed for the Engels company are effective Aug. 22, and are: Demand charge, \$1.50 for the first 200 kw.; \$1.25 for the next 800 kw.; \$1.00 for all over 1,000 kw. per month, plus an energy charge of 1.0c. for the first 100,000 kw.-hr.; 0.9c. for the next 400,000 kw.-hr.; 0.7c. for all over 500,000 kw.-hr. per month.

The minimum charge of \$50 per month is established, and the measured maximum demand is fixed at the highest average demand in kilowatts recorded during any fifteen-minute period of the month.

A Copper-Casting Machine

The photograph reproduced herewith illustrates the general supporting frame of a copper-casting machine while the machine was being assembled at the plant of the Worthington Pump & Machinery Corporation, Cudahy, Ill. The entire part shown revolves, and carries with it the molds, which are placed at the outer

WALKER CASTING MACHINE IN PROCESS OF CONSTRUCTION

periphery. This particular machine will carry thirty-six molds when turning out wire bars, three molds fitting into each segment or opening between the radial arms. When the machine is being used for slabs, two molds are placed in a segment. This casting machine is of the well-known Walker type, in general use for a number of years in copper refineries.

Amalgamated Zinc (De Bavay's), Ltd., have had considerable success in using the Cascade system of flotation on Broken Hill blende ores; in fact the results are said to equal those obtained with that company's original practice. At the Central Mine, the results were not as good as had been obtained with the sub-aeration cells, particularly as regards the percentage of gangue in the blende concentrates.

Drinking Water and Morale

The Consideration of the Mine Supply Should Be Regarded as an Essential Part of Welfare Work—
The Dangers of Natural Contamination

BY RAY W. ARMS

THE subject of drinking water supplies for mining camps is one of those important but seldom discussed topics which should receive more consideration than it gets. Everyone recognizes the need of providing good drinking water, and a source of supply of this necessity is among the first essentials to be established in a new camp. Too frequently, however, managers are easily satisfied, and congratulate themselves on an easy solution of the water problem, when they could, with profit, spend more time and trouble in that particular. After several years of wandering from one camp to another, I am convinced that bad water is the cause for much of the unrest among workmen, and that good water will, directly or indirectly, remove much of the difficulty arising from this discontent.

A certain well-intentioned superintendent in California regarded the case of his mine water supply indifferently, and the final solution caused trouble. The mine was twenty miles from a railroad, and surface operations were conducted on manganese deposits. Water was hauled over the road from railroad tank-cars and stored in an iron tank on the hillside in the full glare of the desert sun. The nearest available water containers for the transportation over the road were whiskey barrels, of which there was a plentiful supply in a near-by town. These were pressed into service, and used to carry water from the railroad to the supply tank. But the containers gave to the water not only an odor, but a taste of bad whiskey as well. The superintendent, fearing the water was contaminated at its source and by frequent handling, adopted the only expedient of which he knew, namely, added chloride of lime as a germicide, and added plenty of it. The result was vile, and one hot day there was a walk-out of the men. In passing, I might say that in the office of this same superintendent there was an olla filled with good water which came in bottles from the city.

Often, when the water is only slightly impure the effect will be more subtle and hard to define. A slight indigestion will be followed by a feeling of lassitude and indisposition to work. Discontent will have its inception within each individual, and not in adverse mining conditions. Men will quit without knowing exactly why. Grumbling and complaining will be directed at everything about the premises, strange to say, but the real cause.

MUNICIPAL WATER SUPPLIES RECEIVE CAREFUL SCRUTINY

The water supplies of cities are watched with jealous care by organized and medical boards whose duty it is to see that the proper examinations and analyses of the water are made, and also that sewage-disposal plants and other possible contaminative sources are not in dangerous proximity. The mining camps receive their water as nature gives it to them, and if it happens to be a little bad, either from salts in solution or from contamination, the circumstance is considered unfortunate, but often that is as far as it goes.

Water exerts a varying influence on the system. That from natural sources of supply contains bacteria which may or may not be harmful. Typhoid is directly traceable to water supply, and other diseases just as serious may have the same source. In a certain mining camp in New Mexico distress was in evidence every spring. This was said to have been caused by the spring rains, which washed bacteria from the plants and the surface into the water supply. At other seasons, when the people would of necessity go to the extra trouble of getting their water from the natural springs, this universal indisposition was not in evidence.

VARYING EFFECTS PRODUCED BY CHANGES IN CONDITION OF WATER

Again, certain soluble salts, added to spring water as it meanders its way through cracks and crevices in the rocks, have a variable effect on the men, depending on their physical condition, and, to a large extent, on the kind of water to which they have previously been accustomed. Magnesia, lime, soda, and potash in the form of sulphates, chlorides, carbonates, and a host of other elements and combinations occur in water and exert their influence on the health and feelings of each individual. These naturally affect different persons in different ways. An occasional case of illness in a newcomer should not be viewed with much alarm, as a change in water has long been known to cause a shake-up in one's interior organization, resulting in temporary turmoil until the system fortifies itself against the attack from new quarters and abandons those reserves in the now quiet sectors.

A change in the bacteria condition of the water no doubt causes the greatest redistribution of the body's digestive forces, but the chemical salts also demand varying methods of elimination, depending on their nature and quantity. A widespread and persisting occurrence of ill feeling among mining-camp inhabitants should be viewed with the same concern that it inspires in the cities, and investigation will often trace the cause of the discomfort to an improper or insufficient consideration of the water supply.

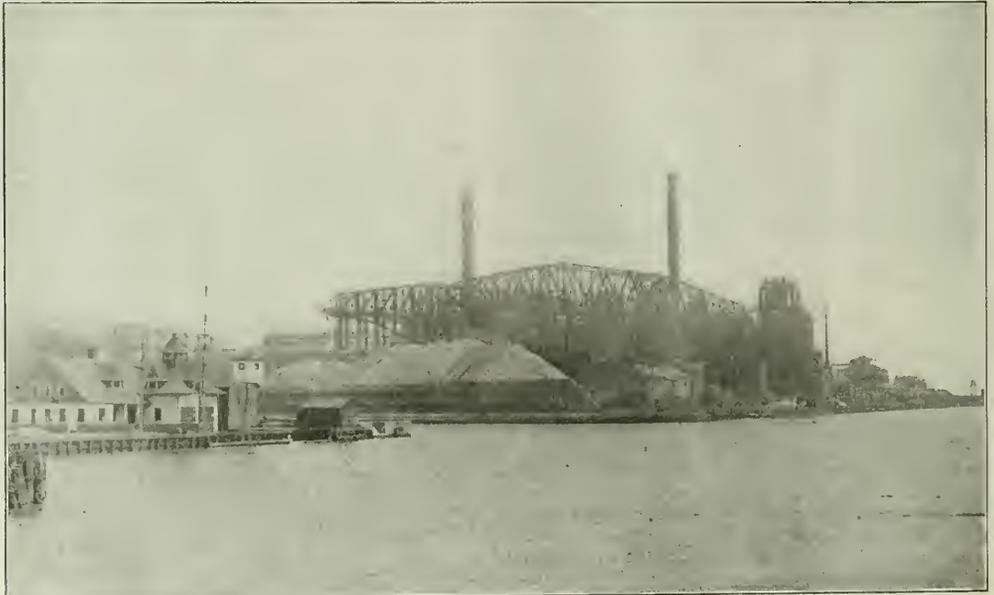

It is not within the scope of this article to give a panacea for the evils of water supply nor to hint at the best solution for any one's difficulties in this respect. Primarily, every case presents its own phases. Whether the well or spring should be deepened, cased or abandoned; whether the intake pipe should be nearer the middle of the stream or farther up or down the stream; whether or not there is a substance which can be added to the water with benefit; whether a sand filter or actinic rays will do the work best—all are subjects that should be discussed. In most cases where the water is bad the best method of improvement will be perfectly apparent, although perhaps expensive. Oftentimes a little effort on the part of the mining companies to furnish more nearly pure drinking water will bear fruit in an improved morale of the men, if not an absolute removal of a definite source of discontent.

A New Invention, Called Conducting Aluminum M. 277, which is said to be attracting considerable attention in Switzerland, has been made by Dr. Georges Giuliani, the famous expert in the aluminum trade. The new metal is produced by putting ordinary aluminum through a special patented process, by which it is reported to acquire the same mechanical qualities and capacities as bronze, copper, and brass without changing its specific weight.

Pulverized Coal To Be Used in Cerro de Pasco Blast Furnaces

Tests at the Peruvian Smeltery Have Proved Entirely Satisfactory—Experiments by the International Nickel Company Still Unsuccessful

PULVERIZED coal is to be used in the copper blast furnaces of the Cerro de Pasco Copper Corporation at La Fundición, Peru, as a result of recent experiments by that company, which have been very encouraging.

There are five 15-ft. blast furnaces at this smeltery, and bituminous coal mines are only a short distance away. Provision for powdered-coal firing is also being made in the plans for a new smeltery to be constructed by the company, the design of which is under the supervision of A. G. McGregor, of Warren, Ariz.

The Cerro de Pasco is the third company to secure a license from the Garred-Cavers Corporation for the use of powdered coal blown in blast-furnace tuyères. Work done by the Tennessee Copper Co., and by the International Nickel Co., of Canada, Ltd., was described in the *Journal* of Aug. 16. The exhaustive experiments which have been carried out by the latter company at Copper Cliff, in an effort to smelt copper-nickel ores without coke, have so far been unsuccessful, and it is probable that the work will soon be terminated. The ores of the Sudbury district are exceedingly refractory, and, despite their comparatively high sulphur content, all attempts at pyritic smelting, of which a large number have been made, have proved fruitless. From 12 to 13 per cent of coke on the charge is ordinarily required, and it has not been found possible to burn sufficient coal in the furnace to provide an equivalent amount of heat, or even sufficient heat for smelting under the improved conditions supposed to result from the application of the fuel under the charge.

In this connection it is interesting to recall that a few years ago an attempt was made at Copper Cliff to substitute the comparatively cheap lump coal for some of the coke used on the blast-furnace charge. The experiment was not an economic success, the value of the coal which it was necessary to use for the same rate of smelting being greater than that of the displaced coke.

Mining in Eastern Australia

Labor Unrest in the Cloncurry District—Improvement in Conditions Probable—Government Operation of Mines, Smelteries and Railways

UNDER the heading of "Mining in Eastern Australia" in the *Journal* of Mar. 15 last, a Queensland correspondent referred to the "closing down of several copper concerns in the Mount Elliott district, owing principally to the dislocation of normal operations caused by the influence of the extremist element in the labor party, the officially non-existent I. W. W." We are informed by a reliable authority who has been in close touch with the Queensland mining industry for the last twenty years, that this should have read the "Cloncurry district," of which vast area Mount Elliott, where there is one smeltery only, is but a small part. Our informant goes on to say:

"Though there has been a good deal of trouble in

the Cloncurry district, caused by the extremist element in the labor party, the immediate cause of the closing down of all the principal copper mines of that district was the big slump in the price of copper, following on the release of large stocks in Great Britain after the signing of the armistice. All the big copper mines in Australia except two closed down for the same reason. One of these two—Mount Morgan—managed to keep going because the company was able to get its blister copper treated at the Mount Kembla Refinery Works, in New South Wales, and thus to realize on the extracted gold contents.

"Owing to a coastal maritime strike, the transit of the blister copper was lately stopped, and the big mine had to cease operations for a short time, but has now resumed. Mount Morgan has, however, a large quantity of copper on its hands, and still accumulating, on which at present (July 7) it cannot realize, both because of the low price prevailing and the difficulty of procuring overseas shipping accommodation.

"Though in Queensland mining as well as many another industry has been retarded by the extreme labor element, there are, in the opinion of many qualified to judge, indications that the extremist has nearly reached the end of his tether, and that the more moderate and reasonable influence will prevail, to the benefit of both employer and employed.

"The taking over by the government of the Chillagoe railways, mines, and smelteries, referred to by your correspondent, has now been accomplished, and preparations for active operations are in progress. The mines include the Einasleigh copper mine, which is a large cupriferous deposit that has been worked occasionally for a number of years, but which has been idle since the closing down of the Chillagoe smelteries some years ago. The resumption of operations at the smelteries is sure to cause a revival in mining in the district, or at any rate as soon as metal prices are such as to encourage it.

"It is true that the gold production of Queensland, as indeed of the whole of Australia, has steadily declined for years, but this is mainly because known auriferous areas have become exhausted, and there have been no new discoveries. The increased cost of production has, of course, accentuated the trouble. But it is wrong to state, as your correspondent does, that gold mines, even when favorably situated, must produce an average of 2-oz. ore to be profitable. In pre-war times an average of 1 oz. was considered a good return, and at the present time, speaking generally, it may be said that anything over an average of 1 oz. is profit. It may interest you to know that at the present time, in the case of one mine at Charters Towers, about eighty miles from the coast, it costs £5 to mine and raise a ton of ore from a depth of over 1,700 ft., and that the last monthly return was £1,624 from 194 tons, or a yield of over £8 7s. per ton.

"Writers and others who refer to Queensland's declining gold yield are prone to treat this as a decline in our mining industry generally, and to ignore the compensating increase that has taken place in other minerals. There was a time when gold production was the mining industry of Queensland, but this has long ceased to be the fact. Though the yearly gold yield fell from £2,839,813 in 1903 to £761,639 in 1917, there was a great increase in the production of other minerals during nearly all this period."

The McClure Hydro-Electric Plant

Water Flows Through 13,600 ft. of 7-ft. Pipe Under 420-ft. Head—Hydraulicking Used in Preparation of Grade for Pipe—Power Utilized in Electrification of Company's Iron Mines on Marquette Range

THE work of construction of the Dead River power project, situated about seven miles west of Marquette, Mich., and now known as the McClure plant of the Cleveland-Cliffs Iron Co., was begun in August, 1917, and was recently completed.

The many and unusually interesting features attending the situation, construction, and final completion of the plant, which is the largest hydro-electric project in northern Michigan, have occasioned considerable in-

terest among engineers, and the enterprise represents an accomplishment which does great credit to the Cleveland-Cliffs company and particularly to O. D. McClure, chief mechanical engineer, who had entire charge of the undertaking and for whom the plant was named. A description of the work preparatory to the building of the dam has already appeared in the *Journal*.¹

The completion of the McClure plant, which supplies 5,000 hp., secured for the Cleveland-Cliffs company a total of 8,800 continuous horsepower for use at the company's mines in Marquette County. Previously constructed plants with corresponding horsepowers are as follows: Carp plant, 2,500 hp.; Au Train, 500, and the Hoist plant, 800 hp. In addition there is a 400-hp. plant at the company's Republic mine, at Republic, Mich.

The completed dam, which is shown in an accompanying illustration as in the course of construction, is of the gravity type and is 500 ft. in length. The spillway

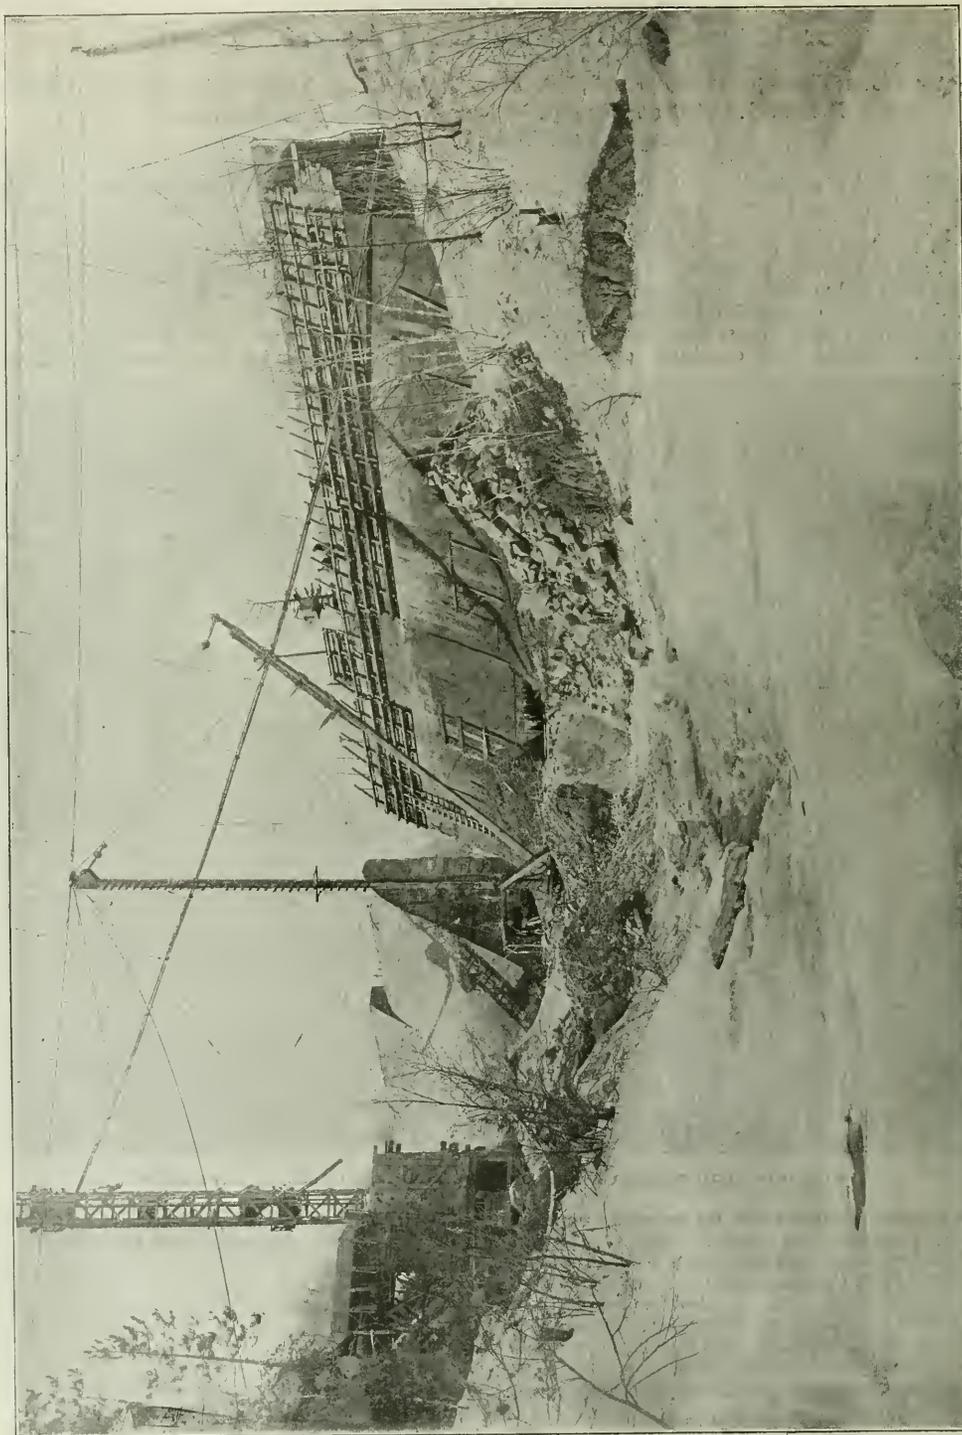

HYDRAULICKING THROUGH A HILL FOR THE PIPE LINE OF THE McCLURE PLANT

terest among engineers, and the enterprise represents an accomplishment which does great credit to the Cleveland-Cliffs company and particularly to O. D. McClure, chief mechanical engineer, who had entire charge of the undertaking and for whom the plant was named. A description of the work preparatory to the building of the dam has already appeared in the *Journal*.¹

The completion of the McClure plant, which supplies 5,000 hp., secured for the Cleveland-Cliffs company a

is 200 ft. long, and a 200-ft. section placed 4 ft. above the spillway proper serves as an overflow space if excessive water should raise the level to this height. This section terminates in a rock bluff at the south end of the dam, and on the north end a core wall 6 ft. higher than the highest part of the spillway and 100 ft. in length extends into the bank. The core wall has the same cross-section as the main dam, and is provided with a 7-ft. diameter opening through its entire length. This opening is provided with screen and stoplog spaces at the point where the core wall joins the main dam,

¹"New Hydro-Electric Development on Dead River, Michigan," *Eng. and Min. Journ.*, Aug. 17, 1918.

THE 500-FT. GRAVITY-TYPE DAM UNDER CONSTRUCTION AT McCLURE PLANT OF THE CLEVELAND-CLIFFS IRON CO., NEAR DEAD RIVER, IN NORTHERN MICHIGAN

and at the other end there is a 7-ft. pivot valve connected to the pipe line.

In the construction of the dam, which was built by the Foundation Co. of New York, under a "cost-plus" contract, 17,000 cu.yd. of concrete was used. Its height is 50 ft. from the foundation, the width in solid concrete at the base is 50 ft., and this tapers to 4 ft. at the top of the spillway. In spite of the extremely unfavorable winter during 1917-1918, remarkable progress was made, and there was little or no interruption in the construction work.

SEVEN-FOOT DIAMETER PIPE LINE TO POWER HOUSE

Separated by an interval of 80 ft. from its juncture with the dam is a 13,600-ft. pipe line that extends to the power house, which is built at a point where Rainy

1-in. iron, spaced 2 in. A 7-in. diameter steel pipe which completes the remaining 3,600 ft. to the power house varies in thickness from one-half to three-quarters of an inch and was made by the Walsh Steam Boiler Works, of Holyoke, Mass.

Midway on the wooden pipe line is a surge tower. This is built of reinforced concrete, is 30 ft. in diameter and has a height of 40 ft., with walls 2 ft. thick. It is banked to the water line with earth, to prevent freezing in severe weather, and is roofed with steel.

The preparation of the grade for the pipe line involved considerable cutting and filling and the use of hydraulic washing, the latter being done when it was impossible to reach the desired point by means of the crane used and also to bring material for the fills. The country through which the grade was made is rugged,

MAKING THE FILL FOR THE PIPE LINE ON THE DEAD RIVER POWER PROJECT

Creek enters Dead River. The intervening space between the dam and this pipe line is connected by a steel pipe. In this length is a 7-ft. diameter riser, which extends to a height a few feet above the dam and serves as an air vent when the control valve is closed. The riser is made of sufficient size so that it may be entered and the passageway cleared in the event of accumulation of ice. Joined to the steel line and extending 10,000 ft. in the direction of the power house is a 7-ft. diameter fir pipe line. This line was built by the Continental Pipe Co. and is banded on its upper reaches with 1-in. iron, spaced about 6 in. and on its lower reaches with

as shown typically in an accompanying illustration, and it was necessary to make a maximum fill and cut of 35 ft. and 24 ft., respectively. Throughout its entire length the wood-stave pipe is without reverse grade and joins the steel pipe at a point where the head of water is 200 ft. The steel pipe is provided with two inverted siphons, which have the usual air valves.

The country which the 3,600-ft. steel pipe traverses is badly broken, and the handling of the pipe was a difficult undertaking. It was placed by means of two hoists that were set up on high points on the grade and which operated standard track trucks over a rail track

laid in the trench graded to receive the pipe. The pipe was shipped in 36-ft. sections weighing from twelve to sixteen tons each. The pipe farthest from the station was delivered first, and gradually the lengths were placed where, according to profile, they should be wanted.

The power house, which is 45 x 90 ft. in plan and 25 ft. high, is of solid brick and is provided with a fire-proof roof. The interior is of buff glazed brick, the only ornamental feature being a large fireplace.

POWER-HOUSE EQUIPMENT

The power-house installation consists of duplicate General Electric 5,000-kva. generators coupled to 7,000-hp. turbines manufactured by the S. Morgan Smith Co., of York, Pa. One of these sets is sufficient to develop the minimum continuous horsepower. To carry peak loads, however, or in the event of a breakdown in some other part of the company's electric system, both units may be operated by drawing more generously on the reserve water supply. Water is delivered at the station inlet from the pipe line from an orifice 3 ft. in diameter.

SURGE TANK IN COURSE OF CONSTRUCTION AND 84-IN. WOOD PIPE LINE, McCLURE PLANT

The outlet is beneath the floor of the station, whence a channel to carry the flow to the nearby river is provided.

The station transformers are, according to the latest practice, set up outside the station, immediately south. They receive the current at 2,200 v. and step it up to 30,000 v. for distribution.

The fall from water level above the dam to water level in the race beneath the floor of the station is 420 ft., and represents the maximum attainable fall on the Dead River project.

Development Off the Vein Upheld

SAN FRANCISCO CORRESPONDENCE

In the suit of the Twenty-One Mining Co. against the Sixteen to One Mining Co., in which the former company alleged a trespass by the latter company, the point at issue was the extent to which a mining company can depart from the vein in following its extra-lateral rights. The Sixteen to One company in following down upon its vein continued sinking its shaft in the foot wall, and from this position raised to the vein and placed an ore and waste pocket in position. A change of dip caused the departure of the incline shaft from the vein, the latter becoming of less inclination.

The plaintiffs contended that the shaft and all connecting workings should have been made in the vein and that all work outside of the vein constituted a trespass. Defendants answered by showing that the departure from the vein was necessitated by the exigencies of mining and that they were within the scope of the law which allows a reasonable latitude in following the extra-lateral right. The trial resulted in a decree for the defendant, and the injunction asked for by the Twenty-One Mining Co. was denied. The case was heard in San Francisco on Aug. 22, before Judge W. C. Van Fleet, in the U. S. District Court of California. John B. Clayberg and Frank R. Wehe were counsel for the Twenty-One Mining Co. and William E. Colby, John S. Parttridge, and Harold Searles appeared for the Sixteen to One Mining Co.

Tuolumne Copper Mining Co.

The annual report of the Tuolumne Copper Mining Co. for the year ended Dec. 31, 1918, states that the Tuolumne mine remained closed during the entire year, because of high operating costs. In the Colusa-Leonard mine, 215 ft. of two-compartment shaft was sunk during the year.

During 1918 there was mined from the Main Range mine 25,405 wet tons of ore, or a total of 23,534 dry tons. The average assay value of this ore was 2.253 per cent copper, 8.082 oz. silver, and 0.0075 oz. gold. The total net smeltery returns from this ore amounted to \$248,220, or a net value per ton of \$10.54. Development work performed during the year consisted of 511 ft. of shaft sinking, 990 ft. of crosscutting, 1,059 ft. of drifting, 125 ft. of winzes, 118 ft. of raises, and 3,730 ft. of station cutting. The total operating expense for 1918 amounted to \$221,377. Returns from ore shipments during this period amounted to \$26,843 in excess of the expenditures.

Production from Main Range mine for the month of January, 1919, amounted to 3,588 tons, of which 493.5 tons averaged 8.143 per cent copper and 19.764 oz. silver, and 3,094.5 tons averaged 2.246 per cent copper and 8.716 oz. silver. The average grade of the total production for the month was 3.057 per cent copper, 10.235 oz. silver, and 0.01 oz. gold. The net cost per pound of copper produced during the month was 8.316c.

During February 2,840 tons of ore, averaging 2.18 per cent copper, 7.03 oz. silver, and 0.0075 oz. gold, was produced, of which 153 tons, averaging 6.37 per cent copper and 12.49 oz. silver, was shipped as first class, and 2,687 tons, averaging 2.61 per cent copper and 6.72 oz. silver, was shipped as second class. The estimated cost per pound of copper that was produced in February, 1919, is 10c.

Chief Consolidated Mining Co.

The report of the Chief Consolidated Mining Co., in Utah, for the quarter ended June 30, 1919, was issued July 24, 1919. Development work performed during the quarter totaled 5,880 ft. Total shipments were 12,069 dry tons, yielding, after smelting, transportation, and sampling charges, \$458,415. The net profit after payment of all charges was \$167,337. Average gross value of the ore mined and shipped to the smelters was \$55.57 per ton.

Development of the Collinsville Zinc Corporation

Early Operations of the Plant Included Original Installations of Equipment Used in the Zinc-Smelting Industry—Enterprise, Started in 1873, Used Refuse Slack From Coal Mines—Additions to Original Plant

THE plant of the Collinsville Zinc Corporation is situated at Collinsville, Ill., on the Pennsylvania R.R., eleven miles east of St. Louis, Mo. The nucleus of the present plant, which has been remodeled for the manufacture of lithopone, was the zinc smeltery built at Collinsville in 1873 by Dr. Octavius Lumaghi, for the purpose of utilizing as fuel the refuse slack from his coal mines in the immediate vicinity. He first constructed one block of furnaces containing 68 retorts on each of two sides, making a total of 136 retorts, and one small single furnace containing 60 retorts. In connection with this he also constructed a blende-roasting furnace, which was operated by hand, and a lime kiln for burning his carbonate of zinc.

style of furnaces and increased the capacity of the plant, building hand roasters and, later on, mechanical roasters. In 1886, this firm was succeeded by the Collinsville Zinc Co., which immediately began the construction of a new plant, the old furnaces being kept in operation. The new unit included a Belgian block furnace of 266 retorts, massed in one block, whereas the former furnace had only 136 retorts, so that the capacity was doubled and the consumption of coal reduced. Hand roasting furnaces were still in use.

In 1890 the first mechanical roasting furnace ever used in the zinc industry was built at Collinsville, and was known as the Brown roaster furnace, having been invented by Herman Brown, metallurgist. The Brown

PLANT OF THE COLLINSVILLE ZINC CORPORATION, COLLINSVILLE, ILL.

In 1878 Otto F. Meister and Henry Wyman leased the Lumaghi plant. Five additional acres of land were purchased, together with a furnace containing 80 retorts owned by Louis Heintz, the capacity of the original unit was materially increased and modernized as of that day, and the plant was operated by Otto F. Meister & Co. The total production of zinc in the United States in 1878 was not over 33,000 tons. The present production in the United States is about 750,000 tons.

It is singular that the original zinc smeltery at Collinsville was constructed to use waste coal from the mines of Dr. Lumaghi, and that at that time Illinois was a virgin field for coal mining, most of the coal in this vicinity being mined at Cheltenham, Mo., which is now included within the city limits of St. Louis.

Subsequently, Otto F. Meister & Co. changed the

roaster then used was a circular furnace, having a hearth ten feet wide. The ore was raked mechanically without the use of manual labor. The records of the Collinsville Zinc Co. show that the advantages of this mechanical furnace were so ably demonstrated by the inventor, Mr. Brown, and presented in such a convincing manner, that the company authorized the construction of one unit. This furnace, from the time of its first operation, and viewed from a labor-saving standpoint, effected good results in fuel economy, low depreciation, lower costs for repairs and greater production, so that four additional furnaces of a similar type were constructed. The history of this furnace is included in Ingalls' "Metallurgy of Zinc."

In 1887 the company began making its own firebrick and retorts and was one of the first to make retorts by screw presses. The present plant, with five Brown

mechanical roasting furnaces, having a capacity of 100 tons per day, has also nine Belgian block furnaces, each consisting of 256 retorts, making a total of 2,304 retorts.

Otto F. Meister, president of the Collinsville Zinc Corporation, and long identified with the zinc industry, both under the firm of Otto F. Meister & Co. and Collinsville Zinc Co., was graduated from Washington University as mining engineer in 1876. Other officers of the corporation are: Treasurer, Robert W. Barrell; secretary, W. R. Wild; directors, Henry W. Schultz, Joseph Carr, and C. D. Lukens; general manager, A. F. Versen; general superintendent, H. E. Gillaspay, and director of operations, A. J. Meier.

The Lost Hill mines, situated at Moselle, Mo., are owned by the Collinsville Zinc Corporation and have been developed to the extent of showing sufficient ore to supply the manufacturing plant for a number of years. The ore "in sight" has been estimated at from 190,000 to 300,000 tons. H. A. Kruger, a graduate of the Colorado School of Mines, recently resigned as underground superintendent of the St. Joseph Lead Co., to take charge of the mining operations at the Lost Hill mines.

Lithopone is an accepted paint pigment of extraordinary quality and characteristics, and it is used in the manufacture of paints, enamel, rubber tires, oilcloth and linoleum, shade cloth, wall paper, printing inks, and in other industrial applications. The demand is far in excess of the production of all of the lithopone manufacturers combined, for with the advancement and progress made in its perfection in recent years, this product can now be used for exterior as well as interior work.

The St. Louis industrial district embracing Collinsville, Ill., is conceded to be the logical center of lithopone manufacture, because Missouri ranks first in the production of barytes, and the deposits are less than 100 miles distant.

Commercial Recovery of Pyrite From Coal

Greater Demand for Sulphuric Acid and Shortage of Pyrite Imports Have Increased Need for Domestic Product

BY S. H. DAVIS

THE supply of pyrites used in making sulphuric acid in the United States has been largely imported from Spain and Canada, the Spanish imports amounting to nearly 1,000,000 tons per annum in the pre-war period. The greatly increased use of sulphuric acid and the cutting off of these Spanish imports, incident to war conditions, brought about a threatened shortage of sulphur supplies during the war period.

The bituminous-coal mines of certain districts have long furnished a small tonnage of pyrite in the form of coal brasses. A mechanical concentrator at Danville, Ill., for a number of years has been treating hand-picked lump pyrite and coal from the picking belt and from the mines, and a small plant near Gillespie, Ill., for a few months has been recovering pyrite from washery refuse.

Many mines throughout Illinois, Indiana, Western Kentucky, Ohio, and Pennsylvania have shipped an oc-

casional car of the hand-cleaned lump pyrite. Only a small percentage of the available pyrite has been recovered in this way, however, as usually the miners throw such lumps into the gob with slate and other impurities. It has been estimated that the western Indiana coal field could furnish annually more than 100,000 tons of pyrite. The present production is small, and although the possibility of furnishing the domestic trade with pyrites recovered as a byproduct from coal-mining operations appears attractive, there are certain features that are difficult to overcome.

Pyrite, to be used in acid making, must meet with certain requirements as to size and purity. Lump ore for grate burners should be under 3 in. and over 1 in. in diameter. Fines for use in mechanical roasters should be under quarter mesh. The material should be high in sulphur, free from arsenic and phosphorus, and as low in carbon as possible. The pyrite obtained from coal can be made to meet all the above requirements, but it is difficult to remove all the carbon. The pyrite in coal occurs as bands and nodules of varying thickness and size and of comparative purity, but mixed with this is more or less web sulphur. The web sulphur carries with it admixed coal, which may make the concentrate run up to several per cent carbon. This makes the concentrate subject to fringing, causes heavy consumption of niter, and lowers the acid plant capacity, which is due to dilution of gases. The hand-cleaning methods and the present plants have failed to overcome this entirely, so that it may be necessary at the acid plant to mix this material with other ore.

Each year a large tonnage of pyrite is thrown in the waste at the coal mines, but there are certain difficulties in making this material available. Hoisting the crude pyrite from the coal mines involves, in most instances, a serious handicap to the coal-mining operations. Injury to the chutes and screens is inevitable, which necessitates separate loading facilities; and the miner must co-operate. These difficulties have not been overcome at most of the larger mines. In treating washery refuse, this difficulty is not present, but there are few washeries at which the refuse contains sufficient pyrite or where the refuse is in sufficient quantity to make it attractive.

The recovery of pyrite from coal will not be extensively practiced, it is felt, so long as the Louisiana brimstone can be obtained at present or pre-war prices. The acid plant that uses pyrite must have a greater investment in burning and dust-settling equipment than if brimstone is used. It is true, however, that at certain points farthest removed from the source of supply of brimstone, and near the coal fields, coal pyrite can be used advantageously.

Iron Ore Reserves in the Orient are reported by F. T. Edgingfield, in charge of reports on the iron and steel situation for the Bureau of Mines, according to *Iron Age*, as follows: Taoshung mine, containing 20,000,000 to 30,000,000 tons of ore, supplies the Oriental Ironworks Co. Taiyeh mine, containing about 50,000,000 tons, supplies the Government Ironworks at Yawata, Japan; also furnaces near the mine supply the Yawata Ironworks with pig iron. At Anshanchan Ironworks of the South Manchuria Railway Co., furnaces are being set up and further enlargements are proposed. Large deposits of iron ore are reported in this neighborhood. Penchiifu Coal & Iron Co. has blast furnaces and electric furnaces. They are reported to have a large supply of coking coal. Chienerhpu Iron Works, Chosen (Korea), operate two blast furnaces.

*Paper presented at the Chicago meeting of the A. I. M. E., Sept. 22-26, 1913.

Bulkheading Open Stopes*

Conditions Subsequent to the Caving of Ground Mined by the Sub-Stope and Back-Stope Methods Require the Placing of Bulkheads To Prevent Flooding—Removal Of Surface Water From Mine Caves Advisable.

By M. E. RICHARDS

General Manager, Judson Mining Co., Alpha Mich.

THE sub-stope and back-stope methods of mining, which are in more general use on the Menominee Range than at any of the Lake Superior iron districts, are particularly adapted to deposits in which the ore occurs in lenses of comparatively small width, with rock capping, in steeply pitching folds in the foot wall. The backs are thus narrow, if properly arched, and strong enough to hold up the surface when the lens is being mined. The ore must be such that it will not cave too readily. The hanging wall must be hard or tough enough so that it will not fritter away, or cave into the stope and mix with the ore, thereby spoiling the grade.

A lens-shaped orebody, not too large, is ideal for sub-stoping. The orebody coming to a peak at the top makes a natural arch, which supports the back. When the orebody is too large, extending over approximately 150 ft. in width, it becomes necessary to leave pillars of ore, at regular intervals, in order to hold up the back.

REMOVAL OF ORE PILLARS

The orebodies are usually stoped down several levels before the stopes on the upper levels begin to work, and finally fill. If conditions allow, the ore pillars are robbed out before the stopes fill. However, if it is unsafe to remove the pillars before the stopes fill, they are left in until rock and surface fill the open stopes, and then the pillars are removed by top-slicing, or a combination of stoping and top-slicing.

Large open stopes above the ore where miners are working are always a source of more or less danger, and several serious accidents have occurred when these stopes filled. When the back comes in, there is usually a strong air blast, which resembles a cyclone, blowing cars, timber, and men in front of it like paper. Sometimes the miners receive a few bruises, but usually the results of these air blasts are not serious.

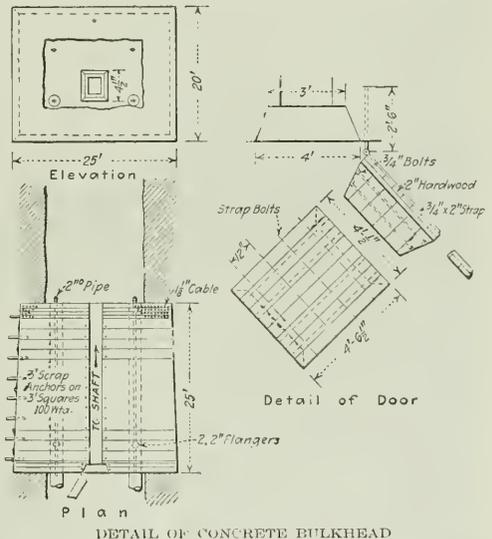

If there is water in the surface above the orebody, great care must be taken to prevent a rush of sand and water into the mine. Usually, after the mine has been working for a couple of years, the water drains out of the surface, although there are conditions, such as the occurrence of an impervious layer of clay or rock, which prevent this drainage.

BULKHEADING TO PREVENT FLOODING OF THE MINE

Before a stope fills, bulkheads should be built in the main drift, or in all openings to the working parts of the mine or to the shafts, in order to prevent a rush of sand and water which may be caused by the surface that caves into the stope. Such caving plugs up most of the holes into the stope, but some part of the stope or old workings often remains open, the water dams back, and if there is a point weak enough and the head is sufficient, it will break loose and rush

into the mine. The dammed-back water sometimes acquires a tremendous force, so that the greatest care must be exercised in the building of such bulkheads. It is customary to use reinforced concrete, where a considerable quantity of water is expected, but if the surface is practically dry, timber bulkheads will answer the purpose.

Bulkheads that are to be built in the drifts should be made from 6 ft. to 12 ft. in thickness, depending on the size of the drift and estimated pressure. Niches should be cut in the bottom, top, and sides of the drift, three to five feet deep, in order to prevent the water getting around the bulkhead. Great care should be used

in cutting these niches not to blast too heavily, for doing so may crack the rock too much around the bulkhead. When clearing out the niches it is best to use a pick as much as possible, so that all the broken rock may be worked out. If a seam of part rock or other weak material should be encountered, this should be dug back very deep and filled, exercising care before pouring the concrete into the niche that all dirt is washed from the sides and bottom. After the niche has been thoroughly cleaned the sides are painted with a thin mixture of water and cement. The niche in the bottom of the drift should be dry, and should there be any water running down the drift it is necessary to build a launder, or run pipes across the niche to carry it away.

The difficulty of thoroughly filling the top of the bulkhead with concrete is overcome in the following

*Paper read at the Lake Superior Metal Mine Safety Conference, Duluth, Minn., June 19-20, 1919.

manner: A 10-ft. raise is driven about 10 ft. back from the bulkhead, and from this a small gopher hole is driven over the bulkhead. A raise is then put up to connect the latter to the gopher drift, and through this opening the top of the bulkhead can then be poured, and a thorough filling is assured.

Four to six pipes should be set in the form through the bulkhead, before the concrete is poured. The two bottom pipes on the floor of the drift will serve to take off any flow of water that might occur. Extra heavy pipe should be used, and extra heavy valves should be placed on all of the pipes, in order to close down the flow of water in case it should become excessive. In addition to handling the water, the pipes through the bulkhead will relieve any strong pressure of air that may accumulate behind the bulkhead after a cave.

It is sometimes necessary to leave a small door through the bulkhead so that inspection of the stopes may be made, and also in some cases to aid ventilation. These doors should be built on the inside, and so arranged that they will not swing outward quite ninety degrees. This precaution will cause any sudden heavy pressure to close the door automatically. The doors

be placed in the bottom of the pit and the water kept down close to the bottom so that it will not gain sufficient head to break through into the mine with a rush.

After the stope commences to fill there are likely to be several settlements of the surface, so that the pump should be placed on skids, made from long stringers, along the slope of the pit. These stringers should be held in place by steel cables that are fastened to a dead man about 100 ft. from the edge of the pit. In the event of a slide of earth, the stringers will hold the pump and the dirt will slide under, thereby saving the pump.

A small drop shaft in the bottom of the pit close to the pump, about 15 to 25 ft. deep, will aid materially in keeping the sand away from the suction of the pump and will drain the water down below the bottom of the pit and thereby assist greatly in draining out the ground.

In some cases, a small rock drainage drift is driven out around the sides of the pit, just below the top of the ledge, and this aids materially in draining off the surface if water is running on top of the ledge.

THE JUDSON MINE OF THE JUDSON MINING CO., AT ALPHA, MICH.

should be made of several layers of 3-in. hardwood plank, with steel plate on the inside or I-beams to help strengthen them. Iron guides should be set in the concrete all around the door to prevent the door from being pushed sideways by any lateral pressure. An accompanying sketch shows the details of these bulkheads.

PRECAUTIONARY SURFACE DRAINAGE

When a large stope fills, after breaking through to the surface, a good-sized open pit usually results. If the surface contains some clayey material and surface water collects in the pit, conditions are quite favorable for the accumulation of a large body of water. Under these circumstances a pump should immediately

Arizona Binghamton Copper Co.

Report of the Arizona Binghamton Copper Co., for the year ended May 31, 1919, states that the mill crushed 36,605 tons of ore, from which 1,873,358 lb. copper was recovered. The mining cost was \$4.61 per ton of ore, or 9.01c. per lb. of copper; the milling cost was \$2.65 per ton of ore, or 5.18c. per lb. of copper; and the smelting cost was 5.65c. per lb. of copper, making the total cost of 19.84c. per lb. of copper, as against an average selling price of 20.45c.

The new shaft is being sunk to the 900 level. On the 750 level an orebody has been cut which is 15 ft. wide and averages 5 per cent copper. This is the same ore shoot encountered on the 400 and 600 levels.

Crushing Practice, New Cornelia Copper Co.*

Ore Is Reduced by Stages in Two Crushing Plants, and
The Product Obtained Is of Sufficient Fineness To
Permit Satisfactory Treatment by Leaching

BY W. L. DUMOULIN

A DETAILED description of the entire plant and leaching process in use at the New Cornelia Copper Co. was given in a paper recently presented¹, so this paper will cover briefly only the company's crushing practice for the year 1918.

The ore, which is mined by steam shovels and loaded in side-dump cars, passes through two crushing plants. The primary plant reduces to less than 3 in. and the secondary plant to 1 in., which is sufficiently fine for satisfactory percolation of solution through the ore in the leaching tanks and to give good extraction. The ore is then conveyed to the leaching tanks by a system of 28-in. belt conveyors. On the way to the leaching tanks it passes through an automatic sampling plant, where a 1 per cent sample is taken.

From the primary crushing plant, the ore is conveyed by means of two 36-in. belt conveyors to a 10,000-ton steel storage bin, with a reinforced-concrete flat bottom. The ore discharges from the bottom of this bin on to four 20-in. belt conveyors, which deliver it to the four units of crushers in the secondary crushing plant. There is no storage bin between the mine and the primary crushing plant. The ore breaks very coarse, is hard, and contains a great many boulders. Jams that are formed in the bowl of the coarse crusher in the primary crushing plant, as a consequence, are freed by means of an immense steel hook operated from a 40-ton electric traveling crane. The crushing plants were constructed to crush the ore required by a leaching plant of 5,000 tons' daily capacity, during a crushing period of 16 hours.

THE PRIMARY CRUSHING PLANT

The primary plant consists of one No. 24 Gates, Style K, gyratory crusher, followed by four Gates No. 8, Style K, gyratory crushers. All the ore from the mine is dumped directly from the mine-ore cars, loaded with about 35 to 37 tons of ore each, into the bowl of the No. 24 gyratory. This crusher will take boulders as large as 4½ by 4½ by 10 ft. and reduce them to approximately 9 in. at a rate of 500 tons of ore per hour. The ore crushed by the No. 24 crusher discharges into the bowls of the four No. 8 gyratories, after passing over grizzlies with 3-in. spaces. The No. 8 gyratories take the 9-in. discharge from the No. 24 and reduce it to approximately 4 in. There are two No. 8s on each side of the No. 24, which discharge on to one of the 36-in. belt conveyors carrying the ore to the 10,000-ton storage bin. All crushers in this plant are belt-driven by alternating-current induction motors.

When crushing to the size indicated, the discharge from the No. 24 would "flood" the No. 8s; therefore, as the head is not adjustable, the bottom row of concaves in the No. 24 was replaced by a row of thicker concaves, and a new lower section of the mantle of larger diameter was placed on the head, so that this crusher now reduces

the ore to approximately 6 in. This throws more work on to the No. 24 crusher and slows its rate of discharge sufficiently to give a fairly uniform feed to the No. 8s, resulting in an increase in the capacity and a reduction in wear and cost of repairs in connection with these smaller crushers. The increase in the capacity of these smaller crushers was so great that it was possible to set out the bottom row of concaves, and so obtain a product of less than 3 in. This balances the work between the primary and secondary crushing plants in a more economical manner. Previously, the rate of crushing in this plant was limited by the No. 8s, but now it is determined by the No. 24 gyratory, which has an average capacity of 400 to 450 tons per hour, crushing to less than 6 in., the rate depending on the percentage of large boulders that are to be found in the ore that is being treated in the crushing plant.

THE SECONDARY CRUSHING PLANT

The secondary plant consists of four units of 48-in. Symons vertical shaft (pillar) disk crushers, each unit consisting of three crushers, one coarse Symons and two fine Symons. The coarse and fine Symons are identical, with the exception of the upper disk, which, in the coarse crusher, has a grinding surface 4-in. wide, and in the fine crushers, 6-in. wide. Each crusher in this plant is driven by a special, direct-connected, 75-hp. alternating-current induction motor having a speed of 400 r.p.m. As the ore is harder than was anticipated, it was soon demonstrated that to crush the 5,000 tons in the desired time would crowd the crushers too much for economical maintenance, so a fifth unit of three 48-in. Symons vertical-shaft disk crushers has just been added to the equipment already installed.

The ore from the primary crushing plant is conveyed to the storage bin of 10,000 tons' capacity, from which it is fed to the coarse Symons at a uniform rate, and crushed to approximately ¾ in. The discharge from these coarse crushers is divided, one-half passing to each of the two fine Symons crushers in each unit, where it is crushed to approximately ¼ in. Screens ahead of the fine Symons crushers bypass a large percentage of under-size. The capacity of a unit depends somewhat on the character of the ore, and varies from 90 to 100 tons per hour.

FINE CRUSHER HAS HEAVY REPAIR COSTS

The coarse Symons have a capacity of 100 tons per hour, crushing to ¾ in. with small cost of repairs; but the fine Symons have each a capacity of only 50 tons per hour, crushing to ¼ in. with rather heavy repair costs. As this type of crusher may be considered to be in an experimental state for crushing as fine as ¼ in., it developed that certain parts of the machine required strengthening, when it was found advantageous to substitute cast steel for cast iron, as well as otherwise to strengthen this design. But even under these circumstances, this type of crusher has proved satisfactory for the service required of it and gives the most uniform product that has the minimum amount of oversize and fines.

A great deal of trouble has been experienced with tramp iron in the crushers, but this has been eliminated largely by the suspension of large and powerful magnets over the conveyors leading from the primary crushing plant. These magnets were installed in addition to the magnetic pulleys already in service.

*Abstracted from a paper to be presented at the Chicago meeting of the A. I. M. E., Sept. 22 to 26, 1919.

Deep-Mine Pumping in the Lake Superior Iron Districts

Single-Lift Pumps, Electrically Driven, Handle 500 Gal. per Minute Against a 2,400 ft. Head—Pumping Costs Reduced by Use of Electricity

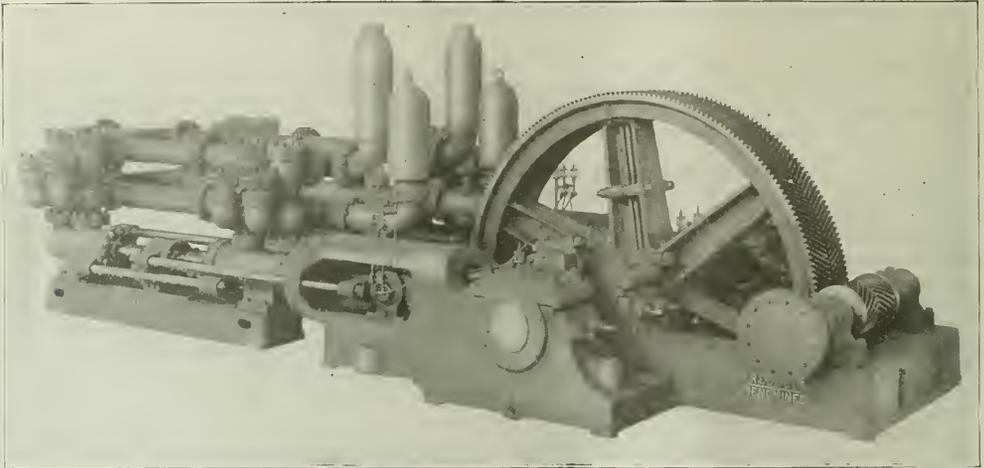

EARLY in 1918 the Cleveland-Cliffs Iron Co. installed an important pumping plant at its Athens mine, Negaunee, Mich., and there is now being placed a duplicate of the first pump, both equipments having been built by the Prescott Co. of Menominee, Mich. Each of these pumps has a capacity of 500 gal. per minute against a vertical head of 2,400 ft., and the pressure due to that head, static and friction, is approximately 1,150

quality of materials which have come about within recent years it is anticipated that there will be no difficulty in successfully pumping water against any

SOME DEEP-MINE PUMPS IN THE LAKE SUPERIOR IRON DISTRICTS

Company	Gal. per Min.	Ft. of Head
McKinney Steel Co.	1,250	1,000
Cleveland-Cliffs Iron Co.	1,000	1,100
Montreal Mining Co.	500	1,350
Oliver Iron Mining Co. (thru) ..	400	1,700

increased head that the mines may develop, and that at a lower cost than was possible under older prevailing conditions.

ONE OF THE TWO 500-GAL. PUMPS AT THE ATHENS MINE, NEGAUNEE, MICH.

lb. per sq.in. At other mines water has been pumped from greater depths, but it has always been shambled or relayed from one pump to another at different levels. In this instance the water is delivered from the bottom of the mine to the surface in one lift.

The pumps are electrically driven, and each is operated by means of a 400-hp. motor, the power being transmitted through single-reduction sets of double helical gears commonly known as the herring-bone type. The use of these gears is of distinct advantage in that a greatly increased mechanical efficiency is obtained and high ratios of reduction are permissible between gear and pinion. The pumps themselves are of the duplex, double-acting plunger type, and the entire water ends are of steel.

Several deep-mine pumps have recently been built for service in the iron districts and show that the tendency is toward deeper mining. A few years ago shafts in the iron country having depths of 1,000 to 1,200 ft. were considered quite deep, but now 1,400- to 2,000-ft. shafts are common, the deepest of all being the Athens, referred to above. In this connection, a list of some of the pumps built by the Prescott company is given in the adjoining column.

There is evidence that pumping from even greater depths than these will be reached in iron mines, and with the application of electricity and the improved

Annual Report of Fairview Round Mountain Mines Co.

The annual report for the year ended Dec. 31, 1918, of the Fairview Round Mountain Mines Co., shows that 12,561 tons of ore was trammed to the surface, from which 3,753 tons of waste was sorted out and placed on the dumps. The remaining ore yielded bullion valued at \$178,801, representing an extraction of 93.1%, the tailings loss being \$1,4931 per ton. The total operating cost per ton, exclusive of depreciation, was \$7.1645, of which \$2.1048 was the milling cost. Development work amounted to 1,546 ft. at a cost of \$9.04 per foot.

During the first half of the year operations were confined to the south segment of the Fairview vein and the fault fissure between the north and south segments. During the last half of the year 85% of the ore milled was taken from the north segment.

The Roasting of Zinc Ores has developed along the line of long-period roasting at relatively high temperature, Matthiessen-Hegeler, Zellweger, and other types of straight-line furnaces being until recently used almost exclusively. Wedge furnaces have been successfully introduced, however, at some electrolytic zinc plants, including Trail, B. C., where it is necessary to keep the roasting temperatures reasonably low to secure good results on low-grade concentrates.

New Screen-Sizing Scale Proposed

Importance of Proper Screen Tests in Ore-Dressing Plants—Troubles Caused by Lack of Standardization of Sieves Now Used—Advantages of the New Bureau of Standards Scale

BY EDWARD H. ROBIE

PROPER screen sizing is extremely important in modern milling. Although possibly not of the same relative importance as correct sampling and assaying, nevertheless, it is essential to the most economical operation of the mill. Since flotation has been so widely applied, screen tests are more important than ever, as with any given ore there is usually a limiting size beyond which the flotation machine used will not give satisfactory results. Most mills of even moderate size have a satisfactory series of screens, giving results which can be intelligently interpreted by the metallurgists in charge. These are not always intelligible to others, however. It is, of course, the opening between the wires, and not the number of meshes to the inch, which determines the size of the particles passing through. Unfortunately, a screen of a certain mesh sold by one manufacturer will not always have the same opening as one of the same mesh sold by another maker. Thus, a published screen test which does not give the opening as well as the mesh is of little value for comparative purposes. Also, if the series of openings used is not a standard one, the results, though perfectly intelligible in the mill in which the tests are made, are incomparable with those obtained at other mills using a different standard.

THE TYLER STANDARD SCALE

In most American ore-dressing plants the Tyler standard screen scale has been adopted, and the Tyler Co. deserves a great deal of credit for what it has accomplished in this field. The basic screen in this system is that of 200 mesh with an opening of 0.0029 in., arbitrarily adopted. The next larger sieve is of 150 mesh with an opening of $0.0029 \times \sqrt{2} = 0.0041$ in. The opening in each screen is that of the next finer screen multiplied by $\sqrt{2}$. Where results are given in mesh and the Tyler scale is specifically mentioned, the tests at different plants are comparable.

In 1916, the Bureau of Standards, after conferring with representatives of many of the national societies representing trades and professions in which screen testing was important, promulgated a new screen scale to take the place of the Tyler scale. The basis of this new scale was a screen having an opening of 1 mm. between the wires—certainly a more logical foundation than 0.0029 in. The next finer screen had an opening of 0.5 mm., and so on, each screen having an opening one-half of that in the next coarser screen. Intermediate screens were also provided for the finer sizes. This screen scale, although it had been devised by experts, was not adopted in practice to any extent. The chief explanation for the disinclination to accept the proposed scale was the same as that given for the failure of the metric system to secure adoption in this country. It is more logical, but its adoption involves scrapping too much valuable material. Millmen refused to throw away their stock of screens, and reports of screen tests under the new system would not

be comparable with the former. Furthermore, those who were willing to try the new screens found considerable difficulty in getting them, as the manufacturers stuck to the old standards.

THE NEW BUREAU OF STANDARDS SCALE

With these objections in mind, and also taking into consideration the troubles caused by the mesh designation, and the adoption of the unscientific basic screen in the Tyler system, the Bureau of Standards has now devised a screen scale which deserves adoption in every mill. No Tyler standard screens need be discarded, for they fit into the new series. Metallurgists must, however, forget the term "mesh," which means nothing of any importance when applied to screens made by different manufacturers. It is proposed to designate the screens by number, and a No. 30 screen, for example, will have the same opening, no matter by whom made or where found. A number will be much easier to remember than the fractional opening to which it corresponds. The basic screen in the series will have an opening of 1 mm., and, as it will ordinarily have about 18 meshes to the inch, will be called No. 18, leaving 17 screens coarser than 1 mm. and 13 sieves finer than 1 mm., there being 31 in all. The successive screen openings will vary by the square root of 2, as in the Tyler system, but intermediate screens corresponding to the fourth root of 2 will also be provided for those manufacturers who require closer sizing.

The essentials of the new screen scale are shown in the following table, together with a list of the Tyler screens for comparison.

DATA RELATING TO THE NEW STANDARD SCREEN SCALE AND THE TYLER SCALE

Standard Sieves		Tyler Sieves	
No.	Opening, mm.	Mesh	Opening, mm.
24	0 80	3	6 68
30	6 72	4	4 70
36	5 66	5	3 33
42	4 76	6	2 36
5	4 00	7	2 83
6	3 36	8	2 38
7	2 83	10	2 00
8	2 38	12	1 68
10	2 00	14	1 41
12	1 68	16	1 19
14	1 41	18	1 03
16	1 19	20	0 84
18	1 03	25	0 71
20	0 84	30	0 59
25	0 71	35	0 50
30	0 59	40	0 42
35	0 50	45	0 35
40	0 42	50	0 30
45	0 35	60	0 25
50	0 30	70	0 21
60	0 25	80	0 177
70	0 21	100	0 149
80	0 177	120	0 125
100	0 149	140	0 105
120	0 125	170	0 088
140	0 105	200	0 074
170	0 088	230	0 062
200	0 074	270	0 053
230	0 062	325	0 044

It will be seen that there is practically no difference in the opening of a screen made according to the Tyler standard and a screen made according to the Bureau

of Standards plan. Until all of the present screen cloth is used up, slight discrepancies will be tolerated, and in fact will not be noticed. In many cases the screen number is the same as the mesh commonly used. The proper diameters for the wires to be used, the mesh, and other pertinent factors are also given by the Bureau, but these are of interest only to the screen manufacturers and merely tend to complicate the system for the millman.

It will be observed that provision is made for anyone who has laid in a supply of screens made according to the 1916 requirements of the Bureau of Standards. Screens Nos. 2½, 5, 10, 18, 35, 60, 120, and 230 correspond to this scale. Also those who have clung to the English system, with openings of ¼ in., ½ in., ⅜ in. and proportional sizes, are provided for in screens Nos. 3, 6, 12, and the other dimensions of the scale, which have openings of approximately the same size.

Complete data on the subject can be obtained in mimeograph form from the Bureau of Standards, Washington, D. C., and those interested are urged to write for a copy. The tentative scale has the enthusiastic approval of C. D. Demond, of the Anaconda Copper Mining Co., and other leading testing engineers of the country. Those who have not already done so are asked to make known to the Bureau their wishes on the subject, as soon as possible, so that action on the definite adoption of the scale can be taken.

The Portland Cement Industry Of the La Salle District

Processes of Cement Manufacture Are Fundamentally
Similar in Three Plants Which Have a Com-
bined Daily Output of 14,000 Bbl.

PORTLAND CEMENT is manufactured extensively in La Salle County, Ill., where the La Salle limestone and the shale immediately underlying it are the sources of raw material. The three mills manufacturing portland cement in the district use essentially the

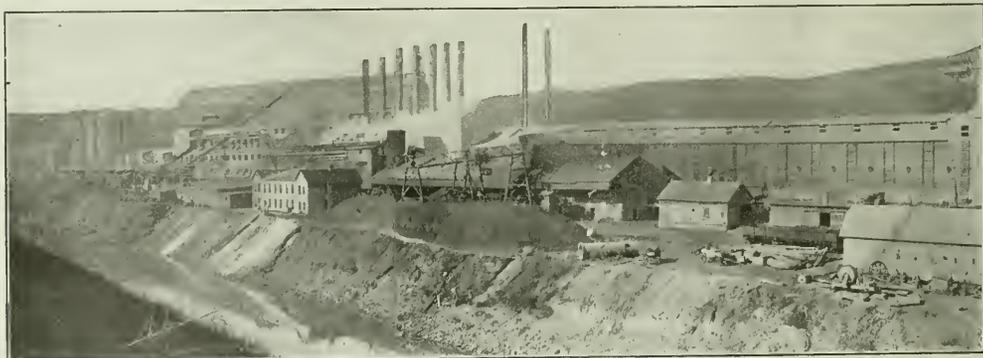

same process of manufacture. The limestone and shale are quarried (in one case mined), mixed in correct chemical proportions, and ground until 78 to 80 per cent of the product will pass a 200-mesh sieve. The powder is then burned to incipient clinker in rotary kilns, pulverized coal being used as fuel. The clinker is ground to cement, 78 per cent or more passing a 200-mesh sieve, and then stored in suitable warehouses preparatory to packing and loading. Packing is done mechanically throughout the district.

The plant of the La Salle Cement Co. is situated at La Salle, and has a daily capacity of 3,500 bbl. The quarry is supplied with modern equipment, and a system of stripping, together with back filling, is used. Steam shovels load both the limestone and shale. A 36x60-in. Fairmount roll crusher performs the preliminary reduction, and No. 5 gyratory crushers are used in secondary reduction. Williams mills and tube mills complete the crushing of the raw material, which is then treated in three 10x164-ft. rotary kilns. Sturtevant mills, comminuters, and tube mills are used in the final grinding of the cement.

The mill of the Lehigh Portland Cement Co. is situated at Oglesby, and has a daily capacity of 4,500 bbl. Steam-shovel loading of the limestone and shale is performed in an open quarry. A 42-in. McCully gyratory crusher is used in the primary reduction and Jeffrey hammer mills in the secondary reduction. An aerial tramway extends from the crushing plant to the mill, where Hercules mills and tube mills are used for fine grinding of the raw material, which is then roasted in seven 8x140-ft. rotary kilns. Kent mills and tube mills complete the clinker grinding.

MARQUETTE COMPANY USES UNDERGROUND MINING

The mill of the Marquette Cement Manufacturing Co., shown in an accompanying cut, is situated at Oglesby, and has a daily capacity of 6,000 bbl. Limestone and shale are secured from mining operations conducted on a room-and-rib system. Compressed-air operated shovels are used for loading, with gasoline and electric motor haulage. In crushing, a 36x60-in. jaw crusher is used for primary and a No. 8 K Gates crusher for secondary reduction. Ball mills and Fuller mills are used for fine grinding the raw material, which is afterward sent to seven 9x100-ft. rotary kilns. Kent mills and tube mills complete the clinker grinding.

MILL OF MARQUETTE PORTLAND CEMENT CO., OGLESBY, ILL.

same process of manufacture. The limestone and shale are quarried (in one case mined), mixed in correct chemical proportions, and ground until 78 to 80 per cent of the product will pass a 200-mesh sieve. The powder is then burned to incipient clinker in rotary

Returned Soldiers, particularly those who saw service overseas, are going back into civil pursuits better fitted for work. One of the largest employers in the United States found that, of 600 returned soldiers who have been employed by his corporation, 43 per cent have proved more efficient than they were before military service.

HERBERT CLARK HOOVER

Underwood and Underwood.

Herbert C. Hoover Returns

HERBERT CLARK HOOVER has completed his war work, the offices of the American Relief Administration in Paris have been closed, and the Food Administration remains in only technical existence. This announcement, made within the last few weeks, brings to a close one great chapter of Hoover's public services, which began with the invasion of Belgium in 1914, when he came to the rescue of thousands of stranded Americans, and grew until they assumed the highest international importance after the signing of the armistice, when he was named Director General of Inter-Allied Relief. Mr. Hoover, although severing his connections with the Food Administration, will always be remembered as the man who fed the starving people of Europe during the Great War.

Through the days of the war, the food supply of the Allies was a problem of the utmost importance, and the outcome a matter of doubt which hung in the balance during the greater part of the war period. Not only was the question of transportation, attended by the submarine peril, a cause for anxiety, but of still greater danger was the possible insufficiency of production in the United States, a source to which all the Allies looked as their only salvation.

The problem was a grave one, and all turned to Hoover to bring order out of disorder, to co-ordinate the efforts of individual agencies, and to accomplish the production and distribution of the necessary supplies to carry on the war. How well this was done and how efficiently the organization created by Hoover functioned have been told repeatedly in the columns of the press.

The romance of the administration of millions—even billions—of dollars' worth of food supplies has stirred popular imagination, and the name of Hoover has, in fact, come to suggest the miraculous in production and in administrative achievements.

Prior to the war, Herbert Clark Hoover was practically unknown outside of the circles of finance and the profession of engineering. But since 1914, so intimately did his work, his judgment and decisions, affect the lives of millions of men, women, and children, that he has become within five years an international figure familiar to the peoples of many countries.

The results achieved by various war organizations of Hoover's creation, and operating under his direction, are of wide public appreciation. The activities of the Commission for Relief in Belgium, Hoover's services in various capacities—as Food Director of America, Director General of Inter-Allied Relief, named by the commission sitting in Paris, and as Director General of the American Relief Administration, with full authority to supervise the expenditure of \$100,000,000, voted by Congress for European famine relief—present a record of executive ability rarely equaled, even in the days of a war which created imperative demands for qualities of the highest order.

On the morning of Aug. 4, 1914, the American Consul in London called Hoover on the telephone and

asked his help for American citizens in London, who had swamped the consular office with requests to change letters of credit, bank drafts, and express orders, for British gold. Hoover enlisted the aid of his friends and raised \$200,000, the Government lending the same amount. And during the war period 45,000 Americans were sent home. When Hoover came to the aid of his fellow Americans on this occasion, he probably had no idea that this was only the beginning of labors which would burden him for the next five years.

Meanwhile, the situation in Belgium had become desperate, and Hoover was requested to handle the work of relief in Belgium and northern France. Associating with him several able engineers, within three weeks an office had been established in New York, another in Rotterdam, and another in Belgium, and Hoover had perfected a system of shipping, checking and distribution which was a model of its kind. The rapid accomplishment of huge undertakings has long been recognized as a dominant characteristic of Americans. Men of other races could have built such a system, but only an American, with the assistance of Americans, could have done it in so short a time.

The Commission for Relief in Belgium handled, until near the close of 1916, supplies worth \$227,000,000, keeping alive a population of 9,000,000 and operated with an overhead expense of only three-quarters of 1 per cent of gross cost. Such is engineering efficiency in business, organized in an emergency and administered under constant stress and unprecedented difficulty. What might such ability accomplish under normal conditions of business and with ample time for planning and execution?

As Director General of the Inter-Allied Relief and head of the American Relief Administration, Hoover directed the distribution of 3,219,896 tons of food-stuffs, valued at \$777,795,000 and comprising over 600 complete steamer loads.

The American Institute of Mining and Metallurgical Engineers will hold a dinner and reception in honor of Hoover on Sept. 16 at the Waldorf-Astoria Hotel, New York, soon after his arrival, and this function will mark his retirement after five years of public service, given without salary and in which time he paid his own expenses. Mr. Hoover's war work has been completed, and there remains only the writing of the story of the gigantic task that he carried through with such conspicuous success.

It is reported that Mr. Hoover will leave New York without delay for a long-deferred rest at his home in Palo Alto, in California. Surely, he well deserves a long vacation, and the best wishes of a host of friends and the prayers of the multitudes whose suffering he relieved will accompany him. Although Mr. Hoover may have expressed his intention to retire from public service, he may not be permitted to do so. An insistent public wish that he continue in its service may make retirement most difficult. The desire to obtain rest and relaxation may pass away, a common occurrence among men of his type. Moreover, the sentiment persists that such men as Hoover do not possess a social right wholly to direct their own activities or destinies.

Harris & Ewing, Washington, D. C.

JOSIAH EDWARD SPURR

The "Journal's" New Editor

AS ANNOUNCED in the issue of Aug. 16, Josiah Edward Spurr will assume the post of Editor-in-Chief of the *Engineering and Mining Journal* on Oct. 1.

Mr. Spurr was born in Gloucester, Mass., on Oct. 1, 1870, son of Alfred Sears Spurr and Oratia Snow Spurr. He came from early Puritan and Pilgrim stock, being descended on his father's side from John Spurr, Boston, 1638, and on his mother's side from Nicholas Snow, Plymouth, 1623, who married Constance Hopkins, Mayflower, 1620.

Mr. Spurr attended public schools in Gloucester, and thereafter studied at Harvard University. On graduation, in 1893, he entered the employment of the Minnesota Geological Survey, and made the first geologic map of the Mesabi Range, then newly discovered. In the spring of 1894 he had prepared a bulletin on the subject, which the State Geologist accepted and published. In this bulletin Mr. Spurr announced his discovery of the origin of the Mesabi iron ores in a green iron silicate, a derivation which had not before been detected for any of the Lake Superior iron ores. This discovery was afterward confirmed by the work of Messrs. Leith and Van Hise, of the U. S. Geological Survey.

The bulletin on iron ores attracted the attention of S. F. Emmons, of the U. S. Geological Survey, who engaged Mr. Spurr as assistant in the study of the ore deposits of Leadville, Col., during the summer of 1894. Following a short period of investigation in the Leadville district, Mr. Spurr was assigned independent work in the study of the Mercur district, Utah, upon which he published a report issued by the U. S. Geological Survey. In this report he assigned the origin of the ore deposits to the after-effects of igneous intrusion, and he was probably the first American geologist to offer this explanation. In 1895, Mr. Spurr, with G. W. Tower, Jr., as assistant, made a geological survey of the Aspen mining district, in Colorado, with its complicated faulting, and as a result of this survey published Monograph XXXI of the Geological Survey.

Mr. Spurr was selected in 1896 to conduct the first Geological Survey expedition into the interior of Alaska. He was accompanied by H. B. Goodrich and F. C. Schrader as assistants. They made the trip over Chilkoot Pass on foot in June, 1896, and inspected practically all of the gold diggings then known in the region. While the party was at Circle City gold was discovered on the Klondike. Before the closing of winter Mr. Spurr and his associates returned to Washington, and a report was at once published on the "Geology of the Yukon District." Mr. Spurr also outlined further plans for Alaskan explorations, which were adopted.

In 1897, Mr. Spurr went to Berlin as a graduate special student in the university, but became dissatisfied with Prussian methods and proceeded to Paris to study under Lacroix. From this most pleasant association he was recalled to the United States for further Alaskan exploration. In 1898, he took charge of a Geological Survey party, which entered from Cook Inlet and ascended the Susitna River to the Alaskan Range. After crossing the range the party traveled 800 miles down the main east fork of the Kuskokwim River to its mouth, thence southward and through a series of hith-

erto unmapped rivers and lakes to Nushagak, on Bristol Bay. From Nushagak the trip was made across Bristol Bay in Eskimo skin-canoes, and on foot across the Alaskan peninsula to Katmai. Much of the route had not before been traversed by white men, and aside from the geological studies, rough maps were made of the general geography. The results of this expedition were published in a report of the Geological Survey, entitled "Geology of Southwestern Alaska."

Through his study of the Yukon gold fields Mr. Spurr reached the conclusion that the auriferous quartz veins were the end product of siliceous magmatic differentiation, and he was the first geologist to discover this vital association. In connection with these studies Mr. Spurr pointed out in subsequent papers, before the American Institute of Mining Engineers and elsewhere, the worldwide relation of siliceous igneous rocks to gold deposits. He also defined an important class of rocks more siliceous than granites, which he called alaskites. These definitions and conceptions have long been commonly accepted.

In 1899, Mr. Spurr was commissioned to make a reconnaissance of Nevada and adjacent California, to fill a gap in the geologic map of the United States. In addition to completing the geologic map, the result of this work was a bulletin entitled "A Reconnaissance of Nevada and Adjacent California South of the Fortieth Parallel."

In 1900, the Turkish Government applied to the State Department in Washington for a geologist and mining engineer, and Mr. Spurr was recommended. He went to Constantinople in the capacity of mining engineer to the Sultan, and made several examinations in Asia Minor and Macedonia. Mr. Spurr was appointed by the Sultan as a member of a commission to revise the mining laws, the other members being the Minister of Mines and the Grand Vizier.

Upon his return to the Geological Survey in Washington, Mr. Spurr undertook to examine the newly discovered camp of Tonopah, Nev., which he visited repeatedly, and on which he wrote several reports and papers. Subsequently, assisted by Sydney H. Ball and George H. Garrey, he made a survey of the geology and ore deposits of the Georgetown quadrangle in Colorado.

In 1906, Mr. Spurr left the Government employment to become chief geologist for the American Smelting and Refining Co., the American Smelters Securities Co., and allied organizations. He retained his connection with these companies until he left New York in 1912, having the title of consulting engineer.

About 1907, Mr. Spurr announced a theory of ore-deposition which involved the origin by siliceous magmatic differentiation, not only for auriferous quartz veins but of most metalliferous veins, and, further, that veins containing different minerals, such as copper, lead, zinc, gold, and silver, were deposited from the same solutions under varying conditions of temperature and pressure. These principles have met widespread acceptance.

In 1908, the consulting firm of Spurr & Cox, Inc., was organized, with offices in New York, Denver, El Paso, and Mexico City, specializing in mine examinations, geological surveys, mine operation, mill construction, and other forms of mining engineering.

In 1912, Mr. Spurr removed to Philadelphia and became vice-president in charge of mining operations of the Tonopah Mining Co., of Nevada, and continued in this capacity until Sept. 1, 1917. During this period he examined gold deposits in the Hudson Bay country of northern Manitoba, and became manager of the Mandy copper mine, which was the first producing mine in Manitoba.

Mr. Spurr was engaged later in mining in Nicaragua, where he developed the Eden mine, one of the most important mining enterprises in the country. He also developed the nearby Rosita mine and blocked out a large reserve of 5 per cent copper ore.

At the outbreak of the war Mr. Spurr went to Washington, and soon after was connected with the Shipping Board on a dollar-a-year rating. Here he became associated with Professor C. K. Leith, of the University of Wisconsin, on a Committee on Mineral Imports, representing both the Shipping and War Trade boards, and charged with formulating a program for reducing mineral imports, this being the time of the most acute ship shortage. Later Pope Yeatman, of the War Industries Board, became the third member of this committee.

On the termination of the work of the Committee on Mineral Imports, Mr. Spurr accepted the position of executive of War-Minerals Investigation for the Bureau of Mines, under a special fund of \$150,000 appropriated by Congress.

While on the Shipping Board and the Bureau of Mines, Mr. Spurr perceived the patriotic necessity of studies as to the control, both political and commercial, of the world's mineral resources, and outlined a comprehensive plan of treatment of the problem whereby he secured the voluntary co-operation of many geologists, mining engineers, and chemists. On the termination of the war Mr. Spurr resigned from this activity, and on the passage of the War-Minerals Relief Act, undertook to organize the force of field investigators, including engineers and auditors, with the title of Chief Engineer. Having organized this work, he accepted the invitation of the *Engineering and Mining Journal* to become its Editor-in-Chief.

In addition to the many publications of the U. S. Geological Survey which have been written by Mr. Spurr, he is the author of numerous papers published in the Transactions of different societies. In 1902, Mr. Spurr published "Geology Applied to Mining," which has had a wide popular circulation and acceptance as a textbook. In 1905 he was the leading spirit in founding *Economic Geology*, which became the principal journal in its field and worldwide in its circulation.

Chronology of Mining, August, 1919

Aug. 1—Workmen struck for higher wages on C. & N. W. ore docks at Ashland, Wis.—Arizona Hercules tailings dam at Kelvin, Ariz., destroyed by cloudburst.

Aug. 2—House passed bill imposing tariff on laboratory glassware, optical glass, scientific instruments, and similar apparatus.

Aug. 4—Proceedings begun in Elm Orlu Mining Co.'s supplemental suit against Butte & Superior at Butte, Mont.—Shopmen struck on ore-carrying railroads following dockworkers' strike at Ashland, Wis.—State Corporation Department of California issued list of oil companies that have violated the California "blue-sky"

law.—Duluth Engineers' Club held annual meeting at Duluth, Minn.

Aug. 7—Senate passed bill providing for suspension of assessment work. Bill signed later in month.

Aug. 10—I. W. W. strike at Oatman, Ariz., work being resumed two weeks later.

Aug. 13—Cerro de Pasco Copper Corporation's directors decided to build new smelter at Oroya, Peru.

Aug. 15—International Union of Mine, Mill & Smelter Workers struck in Coeur d'Alene district, Idaho.—Van. H. Manning addressed local oil men at Engineers' Club, San Francisco.

Aug. 17—Miners struck for higher wages at Divide and Tonopah camps, Nevada.

Aug. 21—Tungsten tariff bill passed House.—Winnipeg Mining Association organized.

Aug. 23—Dockworkers' strike settled at Ashland, Wis., and iron mines resume shipping.

Aug. 25—Elm Orlu supplemental suit settled by compromise.

Aug. 28—Strike of Nevada Consolidated Copper Co.'s employees ended.

Motion Pictures at National Exposition Of Chemical Industries

Operations in Coal Mining and in the Treatment of Metals in Furnaces—Formation of Coal, To Be Shown Graphically, a Novel Feature

THE motion picture is to play an important part in the coming Fifth National Exposition of the Chemical Industries, to be held at the Coliseum and First Regiment Armory, Chicago, during the week of Sept. 22-27. Vivid representation of chemical processes are to be shown, which will include all the steps, from the removal of the crude product from the ground to its ultimate presentation to the consumer.

Coal processes and coal mining will be shown by a series of pictures. On the evening of Sept. 23, M. F. Leopold, of the U. S. Bureau of Mines, will show three such pictures, illustrating the "History and Utilization of Coal." These will be "The Story of Coal," in four reels; "The Manufacture of Beehive Coke," in one reel; and "Byproduct Coking With Koppers Ovens," in three reels. These will be used to illustrate the discussion of these topics by Mr. Leopold.

Furnace treatment of metals will also be illustrated in pictures on the evening of Sept. 24, at the Coliseum auditorium. The films are supplied by several manufacturing concerns, as follows: The Electric Furnace Co., Detroit Electric Furnace Co., Shawinigan Water & Power Co., and Community Motion Picture Bureau.

Jam Handy, vice-president of the Bray Studios, will show some pictures on Sept. 25, these being the "Formation of Coal Made Visible" and the "Chemistry of Gas Engines Made Visible." These pictures will graphically illustrate the manner in which coal is formed and power extracted from the oil by gas engines.

On the evening of Sept. 26, Mr. Handy will show several other pictures, illustrating the "Invisible in Chemistry" as shown by art and as applied to munitions manufacture, the chemical processes of photography, the chemical processes of the electric battery, and also of crystallization. On the following evening, Sept. 27, the last night of the exposition, Mr. Leopold will show a number of elaborate pictures, all illustrating the safety work being done by the U. S. Bureau of Mines.

A. I. M. E. Program At Chicago

Exceptional Facilities Provided for Technical Investigations—Diverse Social Features—Many Prominent Men Will Attend Annual Banquet

SEPTEMBER 22 to 26 the American Institute of Mining and Metallurgical Engineers holds its autumn meeting in Chicago. The Congress Hotel is designated as the convention headquarters and most of the meetings and technical sessions will be held there. For the gratification of the technical appetites, a feast of over a hundred and fifty papers has been prepared for discussion at this meeting.

The first of the social activities during the session will be the smoker at the Congress Hotel, on Monday evening, and for this a lively program has been prepared. The committee in charge guarantees that at this smoker—in spite of the restrictions against 2.75 per cent—any existing trace of coolness or strangeness between members will be absolutely annihilated. An inviting series of excursions has been arranged for the members and their wives. These include a boat trip to the Gary steel mills, one day in the La Salle district, with its zinc smelteries, coal mines, and cement plants; the East Chicago lead refineries, the oil refineries at Whiting, the tungsten and molybdenum plant of the Fansteel Products Co., the Milwaukee mining machinery manufacturing and the coal mines in Franklin and Macoupin counties. Also, arrangements have been made for the members to visit the various industrial plants of interest in and about Chicago.

The general program of the meeting will be:

Monday, Sept. 22, 1919:

- 10 a.m.—Registration, Congress Hotel.
- 11 a.m.—Technical sessions, Congress Hotel.
 - a—Nonferrous Metallurgy.
 - b—Mine Taxation.
 - c—Coal and Gas.
- 2 p.m.—Technical sessions, Congress Hotel.
 - a—Coal and Gas.
 - b—Geology.
 - c—Milling.
 - d—Industrial Organization.
- 8 p.m.—Smoker, Congress Hotel.

Tuesday, Sept. 23:

- All-day excursion by steamer to the Gary steel mills, with technical session on Iron and Steel on the boat.
- 8 p.m.—Technical session on Oil, Congress Hotel.

Wednesday, Sept. 24:

- 10 a.m.—Technical sessions, Congress Hotel.
 - a—Iron and Steel.
 - b—Sulphur in Coal.
 - c—Mining and Local Resources.
- 2 p.m.—Technical sessions:
 - a—Nonferrous Metallurgy, Coliseum, in conjunction with Chemical Industries Exposition.
 - b—Sulphur in Coal, Congress Hotel.
 - c—Pyrometry in Iron and Steel Metallurgy, Congress Hotel.
- 6 p.m.—President's Reception, Congress Hotel.
- 7 p.m.—Banquet, Congress Hotel.

Thursday, Sept. 25:

- a—All-day excursion to the La Salle district.
 - Trips of inspection of zinc smelteries, coal mines, cement plant, permanganate plant, and scenic trips by automobile.
- b—Technical sessions, morning and afternoon, on Pyrometry, Congress Hotel.

Friday, Sept. 26: Optional excursions.

- a—Lead refineries, East Chicago, and oil plants at Whiting.
- b—Milwaukee mining-machinery plants and tungsten-molybdenum reduction works at North Chicago.
- c—Coal fields, Franklin and Macoupin counties.
- d—Local industries, Chicago.

The National Exposition of Chemical Industries will be held at the Coliseum and First Regiment Armory, Chicago, in the same week. A cordial invitation has been extended to members of the Institute to visit the exposition. The Wednesday afternoon session on non-ferrous metallurgy will be in conjunction with the exposition at the Coliseum.

It is thought that by having the banquet in the middle of the week, a maximum attendance can be obtained. Members who come to Chicago for only a portion of the session will then be able to be present at the banquet, whether they come for the first or the latter half of the week. The speakers at the banquet will include Charles M. Schwab, General Leonard Wood and Horace V. Winchell, President of the Institute; Captain Robert W. Hunt will be toastmaster.

The wives and daughters of all members are most cordially invited to attend the Chicago meeting. The banquet and the various excursions are being planned with a special view to their enjoyment by the ladies in the party. Also, a special ladies' committee has been appointed, of wives of members of the Chicago Section, which is arranging an attractive program for the entertainment of the women guests.

A special naval maneuver at the Great Lakes Naval Training Station will be arranged purposely for the ladies' entertainment.

27th Engineers Service Medals

During July, most of the service medals presented by the Association of the 27th Engineers to the men enrolled with the regiment were sent out. In those cases in which the addressees were known to be imperfect, the medals were not mailed. The number of medals issued was 1,397, of which sixty-four have been returned by the Post Office with the note "that the person addressed could not be found." A blank receipt was enclosed with each medal, with the request that the recipient fill it out and return to the undersigned. Up to Sept. 5, 944 receipts had been returned.

Members of the regiment who have received the medal but have not yet mailed the receipt are asked to do so without delay. Those who have not yet received it will please communicate with the undersigned. Those in the regiment who may read this notice are asked to inform other members whom they may meet.

W. R. INGALLS,

115 Broadway, New York.

Vanadium Company Under New Control

Control of the American Vanadium Co., with its mines in Peru and mills in Pittsburgh, Pa., was recently acquired by J. Leonard Replogle and Charles M. Schwab, through Allan A. Ryan & Co., bankers. The assets of the old company, which was controlled by the Flannery interests, in Pittsburgh, and was sold to a new company, which is expected to be known as the Vanadium Co. of America, will be liquidated. The new company, it is said, will issue 280,000 shares of stock.

Judge Gary Prominent in Development Of the Middle West

Influence of the United States Steel Corporation in Promoting Industrial Expansion of the Northern Iron-Ore Regions

AMONG the men prominently identified with the development of the mining and other industries in the Middle West none has had a greater part than Judge Elbert H. Gary.

Judge Gary was born in Illinois in 1846, and was admitted to the bar in 1865. His natural abilities soon attracted a number of important clients, and it was through his connection with one of these that he eventually devoted his energies exclusively to the steel trade, in which he has since risen to be the most commanding figure. In 1898, as general counsel for and a director of the Illinois Steel Co., he was called upon to take charge of the organization of the Federal Steel

JUDGE ELEERT H. GARY

Co., and for the first time was brought into close touch with the late J. P. Morgan. From then on the achievements of Judge Gary have been coincident with the growth and prosperity of the United States Steel Corporation, of which he is the chief executive officer, chairman of the Board of Directors, and chairman of the Finance Committee.

The most important iron-ore deposits in the United States lie in the Lake Superior district. The first of the Lake ore deposits to be opened was on the Marquette Range, but of all the ranges the largest, richest, and most easily worked was the Mesabi. The ore properties in the Lake Superior region, along with the Alabama properties, are the sources from which the Steel Corporation obtains its iron supply.

The activities of the Steel Corporation in the northern iron-ore region began with the purchase by the Corporation in 1901 of the Bessemer Steamship Co., a Rockefeller company, the purchase being made about one month after the organization of the Steel Corporation. This company had a fleet of fifty-six vessels engaged in

traffic on the Great Lakes. The Steel Corporation paid \$8,500,000 for the stock of the company, or about \$150,000 for each vessel of the fleet.

In 1901 the Corporation also purchased by exchange of stock one-sixth interest in the Oliver Iron Mining Co. and the Pittsburgh Steamship Co. The Carnegie Steel Co. already owned the other five-sixths of the securities of both of these firms, and this purchase gave the Corporation complete ownership.

In December, 1902, an important deal for the absorption of the Union Steel Co. was consummated. By this transaction the Corporation acquired, along with furnaces, mills, and tube works situated in various parts of the country, the ownership of two mines, and leases on two others in the Mesabi Range, with an estimated ore deposit of forty million tons.

From this period on, the history of the United States Steel Corporation, besides the achievement of greatly increased economic efficiency, is a continuing narrative of expansion, the construction of plants, and the acquisition of other companies. At the close of 1918 the Corporation had developed seventy-two mines on the Mesabi Range four on the Vermilion Range, seven on the Menominee Range, twelve on the Marquette Range, and thirteen on the Gogebic Range.

At Colerane a concentrator, the largest in the world, has been erected, and ore as low as 37 per cent in iron is treated, producing a product which averages 56 per cent iron.

Two well-equipped railroads, both owned by the Steel Corporation, carry the ore from the mines north of Lake Superior to tidewater on that lake. The Duluth, Missabe, & Northern transports the Mesabi ores to the port of Duluth, and the Duluth & Iron Range runs between points in the Vermilion Range on the eastern part of the Mesabi Range to Two Harbors. The mines of the other Lake ranges are served by independent roads, the ports being Marquette and Ashland, on Lake Superior, and Escanaba, on Lake Michigan. From these ports the ore is taken on the vessels of the Pittsburgh Steamship Co. to Gary, South Chicago, Cleveland, Ashtabula, Conneaut, Fairport, and other Lake Erie points, for distribution to the furnaces. The boats are loaded from the Corporation's docks. At Two Harbors, where there are four docks, 8,723,944 gross tons was handled in 1918, and at Duluth, 20,569,958 gross tons.

Judge Gary has with the passing of the years assumed in great degree the responsibility for determining the courses of action of the Steel Corporation, and to his influence is largely due the progress it has made, and the popular goodwill and esteem in which it is so generally held.

August Pig-Iron Production

August pig-iron production amounted to 2,743,388 gross tons, or 88,496 tons daily, as compared with 2,428,541 tons, or 78,340 tons daily, in July, or an increase of nearly 13 per cent, according to *Iron Age*. On Sept. 1 there were 266 active furnaces, with an estimated capacity of 93,360 gross tons daily, as compared with 239 furnaces, able to produce 85,635 tons a day, on Aug. 1. The number of active stacks showed a net gain of 27 during the month, 37 being blown in and 10 blown out. The production of ferroalloys amounted to 17,419 gross tons, as compared with 14,805 tons in July, or an increase of over 17 per cent.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

The War-Minerals Relief Commission

After conducting hearings in twelve cities, and listening to testimony in 500 cases, the War-Minerals Relief Commission has returned to Washington, and expects to make rapid progress in the disposal of pending claims. Senator Shafroth, the chairman of the commission, has come back impressed anew with the frankness and truthfulness of miners. Though many of the claims which were filed asked for larger amounts than were justified, it was found that as a rule this was due to misunderstanding on the part of the claimant. On the stand, where the limitations of the War-Minerals Relief Act could be explained, the claimants made no effort to misrepresent or to hedge around the "request or demand" feature of the law, Senator Shafroth said. In many cases claims were withdrawn outright when the exact provisions of the law were made plain.

Had the commission been in the position to make cash settlements on its trip, a large number of claims could have been paid off in full with a small percentage of the total amount asked. In one case a claimant while on the stand offered to take \$5,000 for his \$55,000 claim. In other cases claimants were willing to settle on a fifty-fifty basis. Others were anxious to settle on a basis of the actual cash which they paid out, though others were sticklers for the entire amount claimed. It is admitted, however, that little evidence was found by the commission indicating that the claimants regarded the Government as a partner when they began their operations. A stenographic record was made at each hearing, and the transcript of the testimony is being forwarded to Washington as rapidly as it is finished, where it will be available as a public record.

The second award made under the act is that in favor of the National Pyrites & Copper Co., a Georgia concern. In this case the original claim was for \$189,723.43. The commission recommended a payment of \$25,000 in full settlement of the claim. The award, however, was for \$37,000, the Secretary of the Interior having added \$7,000 to cover a technical error and \$5,000 to cover a salary account which the commission had not allowed.

The claim of J. N. Lotspeich, of Morristown, Tenn., was not allowed. In that case the claimant had requested reimbursement for his efforts made to interest capital in a certain manganese property.

From one of the awards it may be deduced that the commission will not interest itself in protecting the award for the claimant. In one case the claimant had purchased his mining property at a high price during the war, and on it only a part of the payment was made. He now stands to lose the entire award to the owners of the property. Some are of the opinion that the commission should do something to safeguard the claimant in a case of this kind, where the patriotic

effort was entirely that of the claimant. It was argued that the return of the property to the owners and a forfeiture of the payments already made on the property should satisfy the owners. It was pointed out that the discussion in Congress indicated that it was not intended to provide money for the payment for properties. If an award would simply become an additional asset against which the owners could proceed, it was claimed that it would in effect be awarding money to pay for the property. It is apparent, however, that the commission regarded this reasoning as illogical.

After having been in such close touch with those interested in mining, it is apparent that the commissioners now are in a position to suggest amendments to the War-Minerals Relief Act which will do away with some of the evidence of inequities, and it is probable that efforts to liberalize the act will await suggestions of amendments by the commissioners.

Senate Passes Leasing Bill

Leasing of oil, coal, gas, phosphate, and sodium land was assured when the Senate on Sept. 3, at a night session, passed the general leasing bill. Senator La Follette, of Wisconsin, who has been able to delay and prevent the passage of the bill on previous occasions, fought the measure stubbornly to the last. He had the support of nine other Senators in his efforts to pass certain of his amendments.

The amendment giving authority to the President to control the prices of coal, oil, and other products derived from the lands leased was rejected by the Senate, 48 to 10. The Senators voting with Mr. La Follette were Cummings, Iowa; Gronna, North Dakota; Harris, Georgia; Kenyon, Iowa; Norris, Nebraska; Nugent, Oregon; Sheppard, Texas; Trammell, Florida; and Walsh, Massachusetts. The main objection to the La Follette amendment was that price-fixing legislation should be undertaken as a separate measure, if at all. It was pointed out, however, that the amendment would give the Government power to fix the price on one-tenth of the oil of the country and allow the other nine-tenths to be unregulated. The same condition would apply to coal and the other commodities.

On his amendment to strike out Section 18 of the bill, only seven Senators voted with Mr. La Follette. Senator Lenroot called attention to the fact that there is nothing in the bill to prevent the President from creating as many naval reserves as he sees fit out of the 3,000,000 acres of land that will be subject to disposition under the bill. The only condition is that existing wells within any naval reserve he may create may, under certain conditions, be leased.

The bill, which will be administered by the Secretary of the Interior, allows a royalty of not less than 5c. nor more than 20c. on coal lands. The oil-land

royalties are not to be less than 12½ per cent or more than 25 per cent of oil produced. In the case of phosphates, the royalty is to be 2 per cent of the gross value of production, and with sodium the royalty is to be one-eighth of the production.

The bill now goes to the House, where it has been referred to the Committee on Public Lands. It is not expected that it will be reported out of this committee and passed by the House without further amendments, as some of the amendments adopted in the Senate are likely to be opposed in the House.

Investigation of the Oil-Shale Industry

Development of the oil-shale industry faces many technical difficulties and also involves an extensive manufacturing operation. For these reasons the Secretary of the Interior is especially desirous that Congress give favorable consideration to Senator Henderson's bill (S. 2671) which provides an appropriation of \$140,000 to carry on experimentation in the handling of oil shale. It is estimated that a supplemental appropriation of \$70,000 will be required each year thereafter.

At the request of the Senate Committee on Mines and Mining, the Secretary of the Interior has submitted to the committee an exhaustive report. Extracts from the report are as follows:

Experimental and investigative work should start in order to determine the most economical methods for the recovery of oil from shale. By proper guidance the shale-oil industry can ultimately be developed so that it is of commercial importance to this country.

The destructive distillation of shale to produce oil has been practiced on a commercial scale in Scotland, France, and New South Wales. The amount of oil produced is, however, small in comparison with the oil output of this country. The U. S. Geological Survey has estimated that we have stored in the mountains of the Rocky Mountain district billions of barrels of oil in the form of oil shale; more than can be mined in the next hundred years. A comparison can be drawn with the coal situation. There are more unmined tons of lignite in North Dakota than all of the rest of the United States, just as the oil held in the shales is vastly greater than that in the oil fields, but the actual recovery in both the lignite and oil shale is dependent upon such factors as location, labor, the number of mines, and the state of their development.

With all of these vast reserves, very little work has been done actually to determine the most economical methods for recovery. There are no oil-shale plants operating in the United States on a commercial basis. Perhaps one hundred companies have been organized for the purpose of developing or selling stock in oil-shale enterprises. Some of them have spent considerable time and money on experimental work with the aim of developing retorting processes other than Scotch, which will be satisfactory for American shale. About thirty processes, in various stages of development, have come to the attention of the Bureau of Mines.

Various engineers estimate that the cost of a complete retorting plant handling one thousand tons of shale per day will be from \$1,000,000 to \$5,000,000, and if this plant treated a shale averaging one barrel of oil to the ton of shale, it would take an initial investment of from \$1,000,000 to \$5,000,000 to produce one thousand barrels of oil per day. You can readily see, therefore, with such a heavy expenditure, the investor should have some reliable data for his investment.

Experimental work must necessarily precede such a large undertaking as the development of the oil-shale industry, and I recommend that such work start now, so that at the time when the supply of petroleum from our wells does not meet the essential demands the oil from shale will be ready to partly alleviate this shortage.

Potash From Searles Lake

Certain of the potash marketed from Searles Lake contained a sufficient amount of borax to injure crops. An official statement to this effect has been issued from the Department of Agriculture, which is of particular significance at this time because of its bearing on the matter of tariff protection for the domestic potash industry. The complete statement is as follows:

During the last few weeks the U. S. Department of Agriculture has received many complaints regarding injury to crops apparently resulting from the use of potash from Searles Lake, California. The natural brine of this lake from which the potash salts are prepared contains a considerable amount of borax. Apparently one, at least, of the companies operating in the locality did not exercise sufficient care in the operation of the potash, and let out a considerable amount of potash salts in 1918 with a high percentage of borax, averaging probably 10 per cent, and in some samples going as high as 23 per cent.

The department has been conducting careful investigations of the matter in the field, and these investigations indicate the substantial correctness of many of the complaints. In some of the special fertilizer tests of the department in the use of Searles Lake potash, injury, which apparently was the direct result of the high percentage of borax, was clearly shown, whereas potash from some other sources showed beneficial effects upon the crops tested.

Zinc Tariff Bill Passed by the House

Without a record vote, the House of Representatives on Sept. 2 passed the bill providing a new tariff schedule for zinc. The duties provided in the bill as amended are as follows:

Zinc-bearing ore of all kinds, including calamine, containing less than 10 per cent of zinc, shall be admitted free of duty; containing 10 per cent or more of zinc and less than 20 per cent, the duty is to be ¼c. per lb. on the zinc contained therein; containing 20 per cent or more of zinc and less than 25 per cent, ½c. per lb. on the zinc contained therein; containing 25 per cent or more of zinc, 1c. per lb. on the zinc contained therein. Zinc in blocks or pigs, and zinc dust, 1½c. per lb.; in sheets, 1½c. per lb.; in sheets coated or plated with nickel or other metal or solutions, 1¾c. per lb.; old and worn-out zinc, fit only to be remanufactured, 1c. per lb.

Investigation of about fifty complaints of the sale of wild-cat oil stocks in the Texas oil fields is under way by the Federal Trade Commission. The commission has sent two of its investigators into the region with instructions to make a searching inquiry into the cases. The complaints were lodged with the commission by competing concerns selling stocks or others interested in the legitimate development of the fields.

The incorporation of the United States Platinum Corporation by the Federal Government is proposed in a bill introduced by Representative O'Connell, of New York. The bill authorizes L. R. Beckley and associates to locate claims and enjoy leases which they may take up on platinum sands controlled by the United States in Alaska.

Trade between Hungary and the United States has been authorized, effective Sept. 2. Exports from the United States will be controlled by individual export licenses, but such licenses will be issued freely, except for commodities restricted for military reasons.

BY THE WAY

All Right If You Have the Car

Prohibition being a somewhat new experiment for some of the states, it is likely that complete and practicable plans for eluding the law have not yet been thoroughly contrived. In Ontario, where surreptitious practices have been necessary for some time, numerous clever schemes for spiriting the spirits away have been developed. The latest dodge is reported from Sudbury, where, according to our informant, the main wires of the city's lighting system were cut one night, after which two large drays, coming up out of the blackness of the night, were quickly loaded from a carefully spotted freight car, and silently stole away. Whether this supply will last the nickel district until another workable scheme is devised remains to be demonstrated.

A Question of Rights

"Ere pardner," said Cap'n Dick, "seems to me they do be 'avin' a 'eap o' trouble daown there in Mexico. Firs' they 'ave one o' these 'ere revolutions an' can't seem to h'agree among theysel's, an' finally, w'en they do seem to settle daown, some o' these 'ere fire-cracker ones don't care to stay daown. These 'ere bandit chaps we're readin' bout—w'y, m'son, one would think we wuz livin' back in tha h'olden h'ages, with h'all this 'ere talk about 'oldin' for ransom an' such. May be h'all right if these chaps want to carry h'on in that there fashion themself's but, dam-me, don't seem as 'ow they 'as much bloody right to h'interfere with them's as is mindin' their h'own business. 'Ere they be, a-blawin' h'up mines, destroyin' property an' h'eaven to tha killin' o' some o' they chaps 'oo be tryin' to do tha country a good turn. An' w'ot does tha Mexican government do? 'Ere I wuz readin' h'only tha h'other day about 'ow they say Mexican rights mus' be up'eld. Considerin' h'all that's 'appened, m'son, w'ot's think on un? Reminds me o' tha story about 'Arry Penglase. 'Arry come on shif' one mornin', lookin' daown in tha mouth, an' sez shif'boss to 'e, 'Wot's tha matter, 'Arry?' 'Oh, dam-me,' sez 'Arry, 'Las' night I lef' tha door to tha 'en-'ouse h'open, an' this moornin' tha chickens is h'all gone.' 'Well, m'son,' sez shif'boss, 'Don't see thee needs to worry bout that. Leave tha door h'open an' they'll come 'ome.' 'That's tha 'ell of it,' sez 'Arry, 'tha've gone 'ome.' But, dam-me, m'son, 'Arry h'admitted 'e'd no rights." D. E. A. C.

A Wicked Calling

Anyone who believes that Government reports are dull and uninteresting as the desert wastes may find here and there an oasis as fascinating as the report of the exploration of the valley of the Amazon, by Lieutenant William Lewis Herndon, in Senate Executive Document No. 36 of the Second Session of the Thirty-Second Congress. In speaking of the town of Cerro de Pasco, Herndon says: "The population varies from six to fifteen thousand souls, according to the greater or less yield of the mines. Most of the adult part of this population is, of course, engaged in mining. This seems to be a calling that greatly distorts the moral perception,

and engenders very confused ideas of right and wrong. The lust for money-making seems to have swallowed up all the finer feelings of the heart, and cut off all the amenities of society. There are no ladies—at least I saw none in society; and the men meet to discuss the mines, the probable price of quicksilver, and to slander and abuse each other. . . . I do not say that men here are individually bad; but only speak of the philosophical fact that mining, as an occupation, has a tendency to debase men's characters, and destroy those sensibilities and affections that smooth and soften the rugged path of life."

Engineerless Railroad Construction

A glib promoter, in the early days of iron-ore mining on the Vermilion Range of Minnesota, succeeded in interesting the residents of Tower in a proposition to build a narrow-gage steam railroad line between that village and the Soudan mine. He finally induced them to offer a \$10,000 subsidy, organized his company and began construction of the line. Such a simple matter as building a railroad, according to his ideas, hardly required the services of an engineer, and in due time tracks were laid and the line was ready for a tryout. A general holiday was declared, the little engine was steamed up, all the nabobs of the town were out in their finery to enjoy the free ride which had been offered, and everything went lovely until they came to a hill. The grade, lacking the kindly ministrations of an engineer, was more than the poor little engine could negotiate, but this did not daunt the holiday party. They all got out, pushed, and succeeded in getting the locomotive over the bad spots. Everything was lovely until they came to a curve, which had been laid out mostly by guess and was a little sharper than anything on wheels could go around. This proved to be the final straw. The party walked back home silently, and the next day the whole outfit was put on the market for scrap. Thus ended Tower's dream of empire.

Try This on Your Stomach

The members of the American Zinc Institute, at their recent annual meeting in St. Louis, devoted most of their time to a discussion of how best to boom the zinc trade. Almost every conceivable application was brought out, but the use of zinc as a foodstuff was unfortunately overlooked. According to the *Journal of Biological Chemistry* for June, 1919, an examination of the ash has disclosed the presence of appreciable quantities of zinc in many food products. Bakers' yeast, wheat, oats, corn, barley, rye, and rice contained from 15 to 415 mg. of zinc per 1,000 g. of fresh substances. In ordinary cows' milk, about 4.2 mg. of zinc was found per 1,000 g., and in human milk from 6 to 14 mg. Appreciable amounts were also found in hens' eggs. From its constant occurrence in the yolks of eggs as well as in cows' and human milk, it is inferred that the element zinc exerts an important nutritive function, the nature of which is not at present understood. Here is a wide field for zinc propaganda. Perhaps a splattered, or, we should say, zincated, Mellin's food can be compounded. Zinc flakes of a proper degree of thinness and crispness would be a change—we were going to say, a pleasant change—in our breakfast menu. And the profitable patent medicine field is as yet untouched. Imagine the opportunity for Nuxated Zinc.

PERSONALS

WILLIAM L. SAUNDERS

William L. Saunders is the chairman of both the general and executive committees, appointed by President Winchell of the American Institute of Mining and Metallurgical Engineers, to complete the arrangements for the banquet to be given to Herbert C. Hoover on Sept. 16, at the Waldorf Astoria Hotel, New York, in honor of Mr. Hoover's services in international affairs. Charles F. Rand and E. P. Mathewson are vice-chairmen of the general committee. Mr. Hoover sailed for the United States on Sept. 6 on board the "Aquitania."

Charles H. Repath is at the Calumet & Hecla works at Lake Linden, Michigan, in a consulting capacity.

Amil A. Anderson has been discharged from the Army and is now at Rapid City, S. D.

R. C. Allen, Michigan State Geologist, has resigned his office to take a position as secretary of the Lake Superior Iron Ore Association, with offices at Cleveland.

Harold Rabling has returned to the St. Joseph Lead Co. at Bonne Terre, Mo. Mr. Rabling left this company during the war to serve with the Field Engineers, Australian Imperial Forces.

T. L. Walker, director of the Royal Ontario Museum of Mineralogy, and mineralogist of Toronto University, is visiting British Columbia for the purpose of obtaining specimens for the Ontario mineral collection.

Major H. Whittingham, lately of the Royal Artillery, British Forces in France, has received his discharge and has returned to Sardinia as superintendent of the Gennamaru mines. His address is Ingurtosu, Arbus, Sardinia, Italy.

H. A. Megraw recently visited the Lake Superior iron district on professional business.

Jules Cousin, recently at 42 Broadway, New York, has returned to Belgium, his address being 78 Rue de l'Ermitage, Brussels.

Edwin B. Nagle, recently superintendent of El Cobre Mines, at Santiago, Cuba, is now at Saranac Lake, N. Y. Mr. Nagle expects to remain in this country for several months.

Walter K. Mallette has been selected to head the engineering department of the Copper Queen branch of the Phelps Dodge Corporation. Mr. Mallette left San Francisco recently for Douglas, Ariz.

J. Parke Channing, as president of the Engineering Council, recently addressed a communication to President Wilson urging the appointment of a member of the engineering profession to the vacancy existing on the Interstate Commerce Commission. Mr. Chan-

J. PARKE CHANNING

ning emphasized the fact that the transportation systems of the country are largely the creations of its professional engineers, and that from the early stage of preliminary exploration to the final one of upkeep and operation, and in adjusting the relations of transportation to the public, the genius and knowledge of the engineer are essential.

A. G. Burrows and P. E. Hopkins, of the Ontario Bureau of Mines, have been recalled from work elsewhere and sent to investigate the districts of Matachewan and West Shining Tree, respectively.

Carl Zapffe, geologist for the Northern Pacific Railway Co., has returned to Brainerd, Minn., after spending August in Pierce County, Wash., investigating the coal deposits and mining operations for purposes of taxation. Mr. Zapffe directs the company's iron-mining operations in the Mesabi and Cuyuna districts in Minnesota.

J. T. Shimmin has been appointed mill manager of the Arizona Hercules company's plant at Hercules, Ariz.

E. S. Boalich, mining engineer for the California State Mining Bureau, returned to San Francisco after spending a month at the Los Angeles office of the bureau.

Johannes Cornelissen, formerly with the Anaconda Copper Mining Co., at Butte, has gone to South America, where he has accepted a position with the Columbia Copper Mining & Exploration Co. at Santa Marta, Colombia.

George F. Kunz, chairman of the committee on non-metallic minerals of the American Institute of Mining and Metallurgical Engineers, has recently increased the personnel of his committee by the appointment of Raymond B. Ladoo, of the U. S. Bureau of Mines, and Eugene P. McCrorken, of *Engineering and Mining Journal*. The committee will endeavor to make a special feature of the 1920 meeting of the Institute by the presentation of a series of papers regarding the common uses and possibilities of non-metallic minerals and their value, so that material frequently not mined or disposed of as waste may be recovered.

Colonel William Boyce Thompson is president of the Roosevelt Memorial Association, No. 1 Madison Ave., New York, organized for the purpose of raising ten million dollars, the object of such fund being "To provide memorials in accordance with the plans of the national committee, which will include the erection of a suitable and adequate monumental memorial in Washington, acquisition, development and maintenance of a park in the town of Oyster Bay, which may ultimately, perhaps, include Sagamore Hill, to be preserved

WILLIAM BOYCE THOMPSON

like Mount Vernon and Lincoln's home at Springfield." Colonel Thompson has also proposed that the anniversary of the birth of Colonel Roosevelt be celebrated with memorial meetings.

John Cartmel, who has been overseas, has resumed his office as gold commissioner at Nelson, B. C.

J. L. Parker has resumed his consulting engineering practice in Vancouver, B. C.

C. A. Week, of the Bunker Hill & Sullivan company, has been inspecting properties in the Slocan district of British Columbia.

E. W. Widdowson, of Nelson, B. C., has been appointed Provincial Analyst for British Columbia.

A. G. Larson, receiver for the Lucky Jim mine, has been on a visit in southern British Columbia recently, and intends leaving on a trip to Alaska.

F. J. Crossland, formerly secretary of the Vancouver Chamber of Mines, who enlisted in the British Army in March, 1915, has returned to Vancouver, B. C.

General T. Coleman du Pont and Henry Payne Whitney have been elected to positions on the board of directors of the Vanadium Co. of America.

Charles Camsell, of the Canadian Geological Survey, has returned to Vancouver from a trip to Prince Rupert, Alice Arm, and Anyox, where he was planning the work for members of his staff.

William Meyers, recently released from service, has been named as assistant to Max H. Barber, general superintendent for the Cleveland Cliffs Iron Co., on the Mesabi Range. Prior to entering the Engineering Corps he was in charge of the Spies mine, in the Iron River district of Michigan, for the same company. This property is now idle.

George H. Ashley, of the U. S. Geological Survey, has been appointed

Harris & Ewing
G. H. ASHLEY

state geologist of Pennsylvania. Mr. Ashley will have at his disposal an appropriation of \$100,000 for the current fiscal year and it is hoped that the appropriation next year will be \$250,000.

Hon. William Sloan, Minister of Mines of British Columbia, was recently in the Portland Canal, Omineca, and Cariboo districts.

H. G. Haldane was in New York this week on professional business. Mr. Haldane has been identified with the potash interests in Nebraska.

Adolf Knopf, of the U. S. Geological Survey, has returned to San Francisco after an extended trip to Nevada, during which he visited Tonopah, Divide, Goldfield, Round Mountain, Manhattan, and Rochester.

J. H. Winchell, Jr., of the U. S. Geological Survey, has been transferred from the Washington office to Denver, where he is assistant to C. W. Henderson, chief of the Mineral Resources Division at the Denver office.

L. C. Graton, formerly professor of mining geology in Harvard University, and at present in charge of the copper division of the industrial unit of the U. S. Bureau of Internal Revenue, will

L. C. GRATON

make an address on "Mine Taxation" on Sept. 22 at the Chicago meeting of the American Institute of Mining and Metallurgical Engineers.

Robert Elder has returned to America from the Chiksan Mines, Unsan-kinko, Korea.

Jesse F. Boyd is now manager of the Cashin Mines Co., in the Paradox Valley, Montrose County, Col.

Max W. Ball is manager of the Rocky Mountain division, Roxanna Petroleum Co., of Oklahoma, with offices in Cheyenne, Wyo.

Alfred R. Flinn has been transferred from the Denver office of the Empire Zinc Co. to the Hanover mine, at Hanover, N. M.

J. B. Brown has accepted a position with the Cia Exploradora de Hidalgo, a subsidiary of the United States Smelting, Refining & Mining Co., necessitating his departure for Pachuca Hidalgo, Mexico.

George S. Rice will make an address at the smoker of the American Institute of Mining and Metallurgical Engineers to be held on Sept. 22 in Chicago. Mr. Rice will talk on coal and

GEORGE S. RICE

other features in the north of France, in the Cologne district, southern France, Westphalia, Belgium and Great Britain, and will also include the subject of liquid oxygen as he observed it in Germany.

OBITUARY

Elisha Hampton, prominent for many years in the mining industry, was killed on Aug. 20, 1919, in an automobile accident. Mr. Hampton was born at Mount Hawk, Cornwall, England, on Feb. 24, 1851. He worked in the Cornish mines from the age of eleven until twenty, when he came to California, where he engaged in placer mining in both Alpine and Nevada counties until he left for Alaska, where he had charge of one of the mines of the Alaska-Treadwell group. From Alaska he returned to California to take charge of the Oneida property, one of the larger Mother Lode mines. He remained here for four years and then assumed charge of the Central Eureka, after which he went to Goldfield, Nev. From there he went to the Bunker Hill mine, in Amador County, Cal.

SOCIETIES

American Society of Civil Engineers held a meeting on Sept. 3 at which a paper entitled, "Contracts—a Comparison of 'Cost Plus' with Other Forms," by Ernest Wilder Clarke, was presented.

Association of Iron and Steel Electrical Engineers will meet in convention in St. Louis, Sept. 22 to 26.

American Malleable Castings Association, 1900 Euclid Building, Cleveland, Ohio, has issued a circular describing the work of the organization in grading the products manufactured by members after tests, and analysis of the daily output of each, has been made at the association laboratories at Albany. When a member's product has daily met the requirements of the prescribed standard for three months, a "certificate of quality" will be issued. A pamphlet has been issued on "Malleable Iron," which can be obtained without cost by writing to the association.

Iron and Steel Institute will hold a meeting in London on Sept. 18 and 19, at which the following papers, among others, will be presented: "Nickel-Chrome Forgings," by J. H. Andrew, J. N. Greenwood and G. W. Green; "Report on Fuel Economy in Steel Works," by W. A. Bone, R. A. Hadfield and A. Hutchinson, with a supplementary report by H. J. Yates on "Fuel Economy in Foundry Practice"; "Decarburization of Steel," by E. D. Campbell; "Fuel Economy in German Iron and Steel Works," by Cosmo Johns and L. Ennis; "Experiments with Nickel Steels," by N. Hudson.

INDUSTRIAL NEWS

The Calkins Co. of Los Angeles, Cal., assayers supplies and laboratory equipment, formerly situated at 348 North Main St. has moved into larger quarters at 34 South Main St.

The Chicago Pneumatic Tool Co. announces the removal of its Cincinnati office from the Mercantile Building to the Walsh Building, Pearl and Vine Sts., where a service station with a complete stock will be maintained.

The Lakewood Engineering Co. announces the appointment of Harry W. Benkart as its representative in Buffalo, N. Y. with offices in the Ellicott Square Building. Mr. Benkart will devote his efforts to the general construction field.

William H. Baker has resigned from the Atlas Portland Cement Co. to accept a position with the Hardinge Conical Mill Co. as vice-president. Mr. Baker intends to introduce the Hardinge mill into the cement industry for grinding cement clinker.

Edison Storage Battery Co. announces the appointment of John Kelly as general sales manager, with headquarters at Orange, N. J. Mr. Kelly was promoted on July 1 of this year to the position of assistant general sales manager.

United Iron Works, Kansas City, Mo., has recently issued the August-September bulletin, containing a list

of rebuilt machinery which has been completely overhauled in the company's shops. The list includes steam and oil engines, pumps, electric motors, power plant equipment, drills, crushers, and compressors.

The Rateau Battu Smoot Co. has recently sold to the Famatina Mining Corporation, of Argentina, whose representative in this country is Bancroft Gore, a steam-driven turbo-blower for copper converter work. This blower will deliver 7000 cu.ft. of air at a pressure of 14 lb. The speed of this unit is 22,000 r.p.m. The turbine operates from boiler pressure of 150 lb. to a vacuum of 28 in.

New Jersey Zinc Co.'s exhibit at the National Chemical Exposition in Chicago will show the zinc in the form of ore as it comes from the mine, and the various products of zinc which are of every day use. Zinc oxide as used in paints, slab zinc, which this company produces in various grades, including the "Horse Head" brand and rolled zinc, which is being introduced for new uses, will be among the important exhibits. Among the other products and their applications to be displayed are lithopone, zinc chloride, sulphuric acid, muriatic acid, salt cake, spiegeleisen, and zinc dust. F. C. Ryan, sales engineer, will be in charge of the display, which will occupy booths 65 and 66, on the main floor of the Coliseum.

General Electric Co. will exhibit an interesting model of a precipitation outfit illustrating the Cottrell process, at the Chemical Exposition, Chicago, Sept. 22 to 26. The model is the property of N. H. Gellert, of the Gellert Engineering Co., which holds the precipitation patents as applies to blast furnaces. It was made by the General Electric Co., being an exact miniature of the apparatus and is completely operative. Other apparatus exhibited by the company includes a 100,000-volt Kenetrom, with a filament-heating transformer, which will be shown in operation. Of special interest will be an exhibit board, showing welded terminals for flexible cables used on blast furnaces. The booth occupied by the above exhibits will be numbers 84 and 117.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Crusher—Roll Crusher. Paul C. Van Zandt, assignor to Allis-Chalmers Manufacturing Co. (1,309,827; July 15, 1919.)

Drilling—Fullering Block for Rock-Drill Bits. Orrin B. Camp. (1,312,233; Aug. 5, 1919.)

Drilling Apparatus. George H. Gilman, assignor to Sullivan Machinery Co. (1,313,859; Aug. 19, 1919.)

Electrolytic Process and Anode. Frank L. Antisell. (1,313,246; Aug. 19, 1919.)

Flotation—Apparatus for Separating Ore by Flotation. Lewis G. Rowand, assignor to New Jersey Zinc Co. (1,312,754; Aug. 12, 1919.)

Flue Dust—Briquetting Flue Dust. Felix A. Vogel, assignor to General Briquetting Co. (1,312,218; Aug. 5, 1919.)

Haulage—Means for Operating Switches for Tram Roads in Mines, Quarries, or the Like. Thomas Dixon. (1,313,586; Aug. 19, 1919.)

Ingots—Method of Casting Ingots. R. A. Hadfield. (1,310,072; July 15, 1919.)

Magnesite Refractories, Method of Manufacturing. Robert D. Pike. (1,312,871; Aug. 12, 1919.)

Mine-Door-Operating Means. Joseph J. Body, Lee Long, Mason L. Johnson, Charles F. Kilgore and Alonzo Blevins. (1,311,488; July 29, 1919.)

Mine Water—Method of Treating Mine Water. Elgie C. Auld and James R. Campbell. (1,310,382; 1,310,383; and 1,310,384; July 15, 1919.)

Mining Bit. Isaac Hubbell. (1,312,732; Aug. 12, 1919.)

Mining Car. John C. H. Lubken. (1,311,659; July 29, 1919.)

Oil Shale—Apparatus for Distilling Shale and the Like. Harold H. Godfrey. (1,309,890; July 15, 1919.)

Oil Shale—Art for Separating the Petroleum Contents from Petroleum-Bearing Sands or Shale. Frank Navin. (1,312,266; Aug. 5, 1919.)

Ore Classifier. Charles Alfred Randall. (1,313,734; Aug. 19, 1919.)

Petroleum Residues, Etc., Process of Treating. Charles S. Palmer. (1,313,009; Aug. 12, 1919.)

Potash—Process of Decomposing Natural Silicates. Benjamin A. Peacock, assignor, by mesne assignments, to Robert Gilchrist. (1,310,770; July 22, 1919.)

Potash—Process of Decomposing Potassium Silicates. Samuel R. Scholes, assignor to H. C. Fry Glass Co. (1,312,053; Aug. 5, 1919.)

Potash and Cement, Manufacture of. Arthur C. Spencer. (1,312,592; Aug. 12, 1919.)

Potassium and Aluminum, Process of Treating Silicates Containing. Louis A. Eberhardt. (1,310,413; July 22, 1919.)

Pump. Herbert Alfred Humphrey and William Joseph Rusdell, assignors to Humphrey Gas Pump Co. (1,311,166; July 29, 1919.)

Reduction—Means for Reducing Ores. Diogo Dias de Barros. (1,313,274; Aug. 19, 1919.)

Zirconium—Manufacture of a New Compound of Zirconium and Its Application in the Production of Pure Zirconia. Walter Rosenbain and Ernest Harry Rodd. (1,307,881; June 24, 1919.)

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief of Interest to Engineers and Operators

SAN FRANCISCO, CAL.—Sept. 4

Homer Wilson, of San Francisco, who opened up the Keene Wonder mine, in the Death Valley Region of California, has taken over the mining property at Lodi, Nev., forty miles northeast of Luning, and will resume operations under the name of the United Lodi Mines Co. The mining camp is an old one, the principal mine being opened to a depth of 1,000 ft. on a vein occurring in limestone close to a contact of the limestone with granite. Considerable tonnage of good grade ore was developed, but attempts made in 1908 to smelt this ore locally in a lead blast furnace were unsuccessful. The property remained in a dormant state until the price of silver reached such a figure as to make the ore values attractive.

Wilson experimented with a concentrating plant, and soon demonstrated that a simple scheme of treatment would produce a high-grade concentrate and that the tailings which contained silver could be readily cyanided. The experimental mill consisted of rock breaker, ball mill, 20- and 40-mesh screens, and two Overstrom and a Senn concentrating table. From the results of the experimental mill, a 100-ton mill along similar lines is to be erected. The crushing arrangement will comprise rock breakers, rolls, and ball mill, closing into four sizes, with the treatment of the coarser sizes on Overstrom tables and the finer sizes on Senn tables. The ore contains 5 per cent of concentrate material. A 40-hp. oil engine will be used for driving ball mill and rolls, and a 25-hp. oil engine for the tables.

The mining plant consists of a steam-driven hoist and a steam-driven compressor. At the 500 level of the mine there is a 400-gal. horizontal steam-driven station pump. A sinking pump drains the lower levels. Oil-fires are used for power, an oil-storage space equivalent to two cars of fuel oil being available at the mine and a one-car storage tank at Luning. A drill sharpener and oil-fired forge, together with power drills and jackhammers, complete this part of the equipment. Transportation is effected by 24-ton auto trucks from Luning, forty miles distant. Water is pumped through a three-inch, five-mile pipe line.

RENO, NEV.—Sept. 4

At Tonopah and Divide there has been no settlement as yet of the strike, though Joseph Lord, the Federal mediator, is said to be confident that there soon will be. The latter is handling the matter with skill and has made a very favorable impression.

The Miners at Copper Basin in Lander County, Nev., are on strike following a refusal of the management to increase wages 50c a day, with a 10c raise in the present. The management agreed to the increase in wages, but raised bond 25c per day. The strike followed.

A Strike of the Comstock Miners, which lasted but a day, was declared off at a meeting of the union held on Sept. 1. The terms of settlement had not been given out, but the men asked the management to start a store or take some steps to secure a reduction in the cost of living. It will be several days before work will be operating again, according to Whitman Synnnes, the manager, but he says that now the company will go ahead with plans to enlarge the Mexican mill and to push development work.

The Strike at Fly, Nev., was settled amicably on Aug. 28 by miners returning to work at the 75c increase offered per day by the Nevada Consolidated Copper Co. with the understanding that the company would establish a commissary and sell goods to the employees at a price in an effort to reduce the high cost of living. This increase of 75c is what the company offered the men on July 27. Mill and mines started up on Aug. 29 and the smeltery on Sept. 3. The company is short of men in all departments, on account of so many leaving during the shutdown.

OUTMAN, ARIZ.—Sept. 3

The Recent Strike at Outman, Ariz., was called on Aug. 10 by I. W. W., the demands being \$6 a day for six-hour day, two men on machine drills, and abolition of contract and bonus systems. The company ignored these demands. The Western Federation of Miners had previously asked for a wage increase of 50c per day, which request was under consideration when the strike was called. The Western Federation men voted to continue work despite the I. W. W. strike but only a few came to work. A complete shutdown was therefore announced on Aug. 15. The local of the Western Federation of Miners then opened negotiations, desiring resumption of work. The terms announced at that work would be resumed with 50c advance in wages, providing enough satisfactory men presented themselves to warrant reopening the mines. Work was resumed on Aug. 24. The present wages of machine men are \$6, and of muckers \$5.50. There has been no strike by the Western Federation of Miners, and these men are all at work. No I. W. W. strike has been reported. Employment can now be given to over 100 additional miners. The mild winter climate and high wages will doubtless attract miners from the north.

WALLACE, IDAHO—Sept. 4

The Strike of Miners in the Coeur d'Alene district is now in its third week with no indication whatever that a settlement is near. Immediately following its declaration, most of the single men left the district, and this outward movement has continued until it is estimated that less than 50 per cent of the strikers remain, most of whom are married men. Most of these, it is believed, would be glad to return to work and would probably do so if it were not for the radicals in control of the union, enough of whom remain to intimidate the conservative element. A report having gained currency recently that the men were going back to work under former conditions, the executive committee of the union circulated handbills throughout the district which stated that the strike would not be called off until the operators conceded "the eight-hour day from portal to portal, a minimum wage scale of \$5.25 per day (no bonus), grievance committee privileges, an agreement covering these points with the operators." Despite this official announcement, there is no doubt that if the mining companies would concede the "portal-to-portal" proposition, the strike would be speedily ended. It is believed that the companies would waive this construction of the law and at least split the time going and coming if there was any assurance that the men would actually work to the best advantage while underground.

The Bunker Hill & Sullivan mine and smeltery continue in operation, though all other mines of the district are shut down. The smeltery is completely unionized, but in the mine the percentage of union men is less than in other mines of the district. The men go in on company time and come out on their own time, also eat lunch on their own time. This system was adopted over a year ago on account of the long distance to be traveled underground to the places of work. Against this, however, muckers in the Bunker Hill mine receive 25c per day less than in other local mines. Thus the split in time going in and out at the Bunker Hill is offset by 25c more per day paid to muckers at other mines. In all other respects working conditions are practically the same. The employees of the Bunker Hill voted down, by an overwhelming majority, the proposition to strike.

BUTTE, MONT.—Sept 8

The Labor Situation in the Butte district shows that change in the metal crafts is still remaining out, with apparently little appreciable effect on the operations of the mining companies. Leaders of the strikers declare they will be able to tie up the mines in consequence of shut bosses and others doing the work formerly done by the metal crafts. None of the other unions have supported the strikers, however, the miners

refusing to join them. Conservatively inclined labor leaders express the opinion that the strike is slowly disintegrating and that unless the metal crafts are able to bring about complications, the force of the walk-out has spent itself. More miners are seeking employment than the mines can take care of at present, and the Anaconda company is considering reopening the Mountain Consolidated, one of its larger properties. Several days ago the East Gray Rock property resumed.

North Butte, Butte & Superior, Davis Daly and other companies report labor conditions to be satisfactory. It is stated that leaders of the metal crafts had made overtures unofficially for reopening the conferences but no attention has been paid to them, their strike, it is charged, having been called in bad faith after the companies had agreed to the demands made.

DENVER, COL.—Sept. 4

In the Hardscrabble District of Custer County much activity is apparent as the result of the high price of silver. Recently the Herman property was sold to the Pabst brewing interests, and the Empire Zinc Co. has also acquired a large acreage. The old Bessick is again being operated. Other operating properties are the Buffalo Hunter and the Bull Domingo.

A Marked Exodus of European Laborers from the mining camps of Colorado is underway. These men are returning to their homes abroad. The reason that they give, for the most part, is that they no longer like the United States, where they cannot get their liquor. This may not be the only reason for their leaving, because many of them are undoubtedly returning to their homes to settle up estates, but it is nevertheless an important reason from the point of view of the foreigner.

The American Petroleum Institute adjourned Aug. 8 at Colorado Springs after a three-day session. The next meeting will be held in New York City three months hence. During this session two most important actions endorsed were the plan of Dr. Van H. Manning for the establishment of a million-dollar research bureau to make investigations relative to all phases of the oil and oil-shale industries, and also to fight any opposition which may be made against any of the state oil inspection bureaus. At the conclusion of the session, Spencer Penrose took the entire party for an automobile trip up to the summit of Pike's Peak. The following day a few of the members left, as the guests of Henry L. Blackmer, president of the Midwest Oil Co., on a tour of inspection of the Wyoming oil fields.

AUSTIN, TEX.—Sept. 4

Elliott Jones Co. has secured from District Judge Calhoun a temporary injunction restraining the Texas Railway Commission from instituting penalty suits against it, and the State Engineering Commission the authority to regulate pipe line companies. Suit attacks the constitutionality of the statute, and denies authority of the Commission over its tank cars and pipe lines from producing wells to settling tanks.

Action of Mineral Rights on submerged state lands in Harris and Matagorda counties will take place Oct. 16-19, 1919, according to Land Commissioner G. W. Addison. The first tract is adjacent to the Goose Creek oil field, and on San Jacinto Bay. It consists of 579.8 acres, divided into lots from 4.7 to 128 acres each. In Matagorda County, 440 acres on Matagorda Bay, adjacent to Big Hill, have been divided into twenty-acre lots. Both of these tracts are submerged, but the water is only a few feet deep, so that derricks can be readily built and drilling for oil prosecuted. The mineral rights only will be sold in the form of twenty-five-year leases to the highest bidders. Each subdivision must be bid on separately, but any one subdivision or corporation may bid on any number. Certain regulations as to work on these lots will also be put in force, because the State expects to gain considerable royalty from these

leases, especially those at Goose Creek. Keen competition for the Goose Creek land is expected, for it is immediately adjacent to a large producing field.

COTTER, ARK.—Sept. 4

Dixie Power Co. is making the final survey for a hydro-electric plant to be installed on the White River about a mile and a half above Cotter, Ark. The proposed site for the dam is at a point in the river where a solid rock ledge reaches across the river, with high bluffs on both sides, and where it is possible to build a dam 125 ft. high. The engineer in charge states that the dam will be 75-125 ft. high and 1,500 ft. long, and that it will be possible to generate 60,000-100,000 hp. The present survey will cover about 50 miles of the White River above Cotter. The power will be sold in the state.

HOUGHTON, MICH.—Sept. 6

The Winona Mine has one shaft open, and a second is about to start. Work is being done on the shaft. Working forces numbers 105 men. Men are coming in every day, and within ten days it is hoped that the total force will be doubled. With a force of 200 men it will be possible to operate the property with fair economy.

Mayflower-Old Colony Company has cut the Mayflower lode. The shaft is down 1,459 ft. and has been in copper, ore and iron for the last 60 ft. A few days ago the blasts opened up some copper rock which has every physical characteristic of the Mayflower lode, including copper in quantities which warrant production. At this level there is five feet of this copper opened. However, the management of the property is not prepared to state officially that the Mayflower lode has been cut. At 1,402 ft. the shaft went out of trap into amygdaloid. The dip of the vein is so flat that continuation of exploration by shaft sinking is uncertain. There is much interest in the exploration work at this shaft, partly because of the copper shown in the drill cores and partly because the formation upon which work is being done is entirely out of the horizon of the known mineralized formations of commercial merit. If this Mayflower-Old Colony work should result successfully, it offers opportunity for extensive exploration in many other properties along lines hitherto considered without merit.

The Isle Royale Company started mining work at No. 1 shaft this week, making four shafts again in operation, Nos. 4, 5 and 6, having been opened during the depression. Production for September will show probably substantial increase over output for July and August. The mill is now being handled entirely by output from mine, and regular tonnages are going across Portage Lake to Point Mills subsidiary stamp mill. Isle Royale lode has best physical characteristics at Shafts 4 and 5. Number 4 is sinking to 20th level, 2,600 ft. from surface. Number 5 shaft is sinking below 18th level, and No. 6 shaft is sinking below 16th level. The lode in No. 6 differs in actual mining qualities from any other lode in the Lake Superior copper-producing district. The average width of the lode is from 8 to 12 ft. Sometimes it widens to 16 ft., but that is rare. Copper contents cling to the foot wall, a distinction of this formation. In opening new ground the foot wall is always cut first, and drilling is done from the foot wall across the formation. Barren trap is left standing for pillars. There never was a time in the history of mining on Isle Royale when the underground openings showed faces carrying any better copper averages than they now are showing. This is particularly true in the lower levels of No. 4 and No. 5. The increase in No. 6 is by no means discouraging, although only 60 per cent of the ground in this shaft is tried for stopping. The average in No. 7, the shaft which shows 50 per cent for stopping. No work is being done in No. 7 now, nor in No. 2.

ISHPEMING, MICH.—Sept. 6

The Workers on the Iron Ore Docks who left their places have returned to work, the Railroad Administration announcing that claims for higher wages and shorter hours will not be considered while the men were out on strike. Ore is again being transported down the Lakes from Lake Superior and Lake Michigan ports, but the strike caused a large increase in the August shipment. There was a falling off of about 4,000,000 tons as compared with the movement for the same month of 1918. The coal-dock workers have refused to accede to the wishes of the operators and the Government, and the men who unload the coal at Portage Lake docks left their places this week, following the lead of the

Duluth workers. A coal shortage developed at the mines on the Mesabi Range, and it was necessary for some of the mining companies to send steam shovels and crews from the mines of Duluth and Superior to load coal to keep the mines in operation. It is believed, however, that this strike will be as short-lived as the one instigated by the ore-dock workers, and that no further delays will result. The sales of ore continue light, and operators do not care to lose the opportunity of shipping what little they have sold. Many of the Lake carriers will soon be assigned to the grain trade and there will be fewer vessels available for transporting ore, although at present there is no scarcity of ships. It was hoped that the furnaces would start to contract for their winter needs before this time, but many of them have not done so, and the sales of ore are far below expectations. It is certain that some of the mines will have to close this winter, either because of lack of sales, insufficient stocking to know, or of care to predict, what the winter holds in store for the mining business in the district.

Western Federation of Miners is not recognized by the companies. On Sept. 4 the companies issued a statement of their position following conferences with the local workers' committee. The statement offered a raise of 50c. per shift in the base wage, with a bonus based on 80-c. silver instead of 60-c. silver, as at present. There is thus no raise in wages, but the workers are protected more against a drop in the silver market. The managers said they do not consider eight hours more than a day's work underground, and that they themselves suffered much from inefficiency underground since the war. There is no good reason, they declared, to change the nine-hour day for surface men. Sunday labor is necessary in some instances, but men to engineers will be given a day off during the week on application, and the work will be eliminated where possible. If Sunday work was paid at an increased rate, the workers, the managers said the tendency would be to do repair work during the week, with consequent loss of employment. Collective bargaining with local committees and a central council will be put into operation.

MELBOURNE, AUSTRALIA—July 21

An Interstate Copper Conference of representatives of the state governments (except Tasmania) was held in Melbourne about the middle of last month to discuss the present position of the copper-producing companies. It is understood that the proposal submitted by Mr. Groom in behalf of the commonwealth government was in the nature of co-operation between the commonwealth and state governments in making advances against the copper produced. The higher prices now ruling, coupled with the recent sale of six or seven thousand tons of Australian copper to Japan, will probably result in the opening of at least the larger mines, apart from any question of government assistance.

The Gold Producers' Association, Ltd., early in the present year, was formed by Australian copper companies. The commonwealth government was approached with a view to the removal of the embargo on the export of gold. This concession was secured, and the association has now made known the result of its activities for the five months ended June 30. During that time it exported and sold 158,311 oz. of standard gold on behalf of its members at an average price of £4 15s. 4d. per standard oz. These sales represent little more than one-third of the total production of the associated companies, so that the net premium obtained was equal to 58.7 per cent of members' total production. Prices are expected to be lower in the immediate future, owing to the removal of the export embargo on American gold. However, the Gold Producers' Association hopes to minimize the effect of reduced rates by exporting a larger proportion of its gold.

The Most Destructive Fire ever experienced at Broken Hill, N. S. W., occurred on July 30 at 1:30 in the morning. It broke out in the crushing section of the mill and did damage amounting to £100,000 before it was under control. (Details of losses incurred have been given in an earlier issue.) This was the fourth outbreak of fire on the South Mine within three weeks, and there can be no doubt that it was fully caused by the advocates of "direct action." Special steps were being taken to guard against fire, but despite this, the flames had secured a firm hold before they were detected. About 1,000 men will be kept out of work (they have been out on strike for 10 weeks) as a result of this outbreak, and it will be many months before the copper company can resume its normal operations. In view of this fact, a sinister picture is suggested by the general manager's statement that when he appealed to some men standing in the street (one of the men of the mine) for assistance to fight the fire, "no one answered my appeal except two Maltese."

The Broken Hill mines have now (Aug. 1) been idle for ten weeks, and the Associated Smelters, at Port Pirie, South Australia, where large quantities of Broken Hill concentrates are smelted, which has been feeling the effect for some time, have now closed down altogether. As there are 2,500 men employed at the works in normal times, this stop will cause a deal of suffering, and it is rendered more regrettable that it would otherwise have been by the fact that the employees at Port Pirie established such a splendid war record, by insisting repeatedly on their rights in industrial disputes which would have interfered with the supply of lead to the allies. The capacity of the works is 160,000 tons of iron ore, 8,000,000 lbs. and 6,000 tons of zinc products per annum.

MOVING DIAMOND DRILL OVER GLACIER IN BRITISH COLUMBIA From Bulletin B. C. Department of Mines.

VICTORIA, B. C.—Sept. 4

British Columbia Iron Co., Ltd. has been formed to develop forty claims situated about three miles west of Kitchener, B. C., and extending in a belt north and south which crosses the Canadian Pacific line at Thompson Creek. It is stated that this is one of the largest deposits of hematite in the province. Considerable work was done last fall in opening it up. W. C. Wragge, of Nelson, B. C., is interested. Diamond drilling will be required to determine whether this is a commercial proposition.

The Railway to the Dolly Varden Mine from tidewater at Alice Arm being practically complete, the operators of other mines in the district are giving evidence of some concern as to the policy of the Taylor Engineering Co. toward handling on this road the ore from properties other than the Dolly Varden. The Alice Arm Commercial Club has taken the matter up with the Minister of Mines and the Minister of Railways. It is stated that the company has not committed itself on this point, and that as a result work on a number of properties at the head of Kitsault River is being delayed. The management of the Taylor Engineering Co., however, has given assurance that everything will be done in its power to assist in the development of the mineral resources of the district.

SUBURRY, ONTARIO—Sept. 6

Active Mining Operations have been resumed at the Creighton mine of the International Nickel Co., in order to supply sufficient ore to the smelter for the present monthly production of 2,500 tons of bessemer matte. Most of the Creighton ore will be roasted in open heaps at O'Donnell's as heretofore.

TORONTO, ONTARIO—Sept. 6

The Strike at Cobalt has been settled, the miners returning to work Sept. 8. The

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ALASKA

ALASKA GOLD (Juneau)—In August milled 202,268 tons of ore, averaging 87.8c. per ton. Percent extraction 80.64; tailings loss 17c. per ton. Tonnage milled in July, 153,000.

ARIZONA

Cochise County

ARIZONA SMELTING & POWER (Benson)—Reported company will blow in new 200-ton smelter in thirty days. Expects to handle ores from Johnson camp and surroundings. Has contract to furnish light and power to Benson. Martin Fishback, general manager.

SHANNON COPPER (Gleason)—Expect to start mining operations soon. Shipping high-grade ores to Arizona Copper smelter at Clifton, Ariz. John E. Penberthy, superintendent.

Gila County

ARIZONA COMMERCIAL (Globe)—No. 2 shaft sinking progressing, with three shifts working. Shaft down to 5th level.

IRON CAP (Globe)—New hoist, skips, and crushing plant running smoothly, giving 75 per cent increase in capacity. New equipment electrically operated with current from Inspiration company. Shipments to Inspiration mill expected to begin soon.

OLD DOMINION (Globe)—One blast furnace and one converter stand put in operation. Plant running at about one-third capacity and handling 400 tons per day. Mill handling 800 tons. Copper production for August, 1,937,000 lb.; July, 1,629,000; August, 1918, 2,064,500.

PORPHYRY CONSOLIDATED (Globe)—Repair work at station completed, and crosscutting resumed from bottom of winze on 800 level.

MIAMI COPPER (Miami)—Work on foundations of new equipment to be installed at No. 5 shaft progressing satisfactorily. Construction of new transmission line from power house to mine will soon be completed.

VAN DYKE COPPER (Miami)—Cross-cut and dump completed on 300 level. Sinking resumed, and shaft now 112 ft. deep. Air-vented pump installed at 300 level to handle water above this point.

Santa Cruz County

AMERICAN BOY (Patagonia)—Work recently interrupted by rain. Installing new machinery. Property under bond and lease to A. F. Gross, of Duluth, Minn.

EL PASO (Patagonia)—Cutting station on 300 level. Will increase force. Property at Mowry. W. J. Mitchell, superintendent.

FLUX (Patagonia)—Will resume operations. Owned by R. R. Richardson and leased to Flux company, of which F. B. Kolberg is president.

HARDSELL (Patagonia)—Shaft down 300 ft., with 500 as objective. Three shifts on sinking, which is being done on contract.

MORNING GLOBY (Patagonia)—Since opening on June 1, 275 ft. of development work done.

ARKANSAS

Marion County

EDITH (Rush)—Mining started last week with a small force.

MCCARGAR (Rush)—D. J. McCargar in charge of development work on two leases owned by himself, W. F. Hartsion, and Sam Kelsall, of Fall River, Mass., is installing air drills and compressor. Expects to have enough ground opened for mill by end of year.

CALIFORNIA

Amador County

BUNKER HILL (Amador City)—During last half year all operations confined to territory north of shaft. Twenty stamps ran 103 days, clean-up being approximately \$2,000 in bullion; \$12,000 in concentrates shipped.

CENTRAL EUREKA (Jackson)—Station at 3700 level and ore pockets practically complete. North drift from station cross-cut advanced 32 ft., showing good ore in face. South drift also shows 4 ft. of good

ore in face. South drift on 3,500 level in good ground, face being 193 ft. from cross-cut.

Eldorado County

LADY EMMA COPPER (Placerville)—Day Brothers getting out, under contract, carload of copper ore for test run. Mine twelve miles northwest of Placerville, on southeast side of Mount Ararat. Ore will be shipped to reduction plant on San Francisco Bay. Claim patented, and owned by W. E. Deiert, of San Francisco.

ROCKY BAR RIVER GRAVEL (Placerville)—Operations to start immediately. Will install machinery. Property on middle fork of Cosumnes River, fourteen miles from Placerville. Five 60-ft. Keystone drill holes drilled last winter, with results said to be promising.

Nevada County

AT SPENCEVILLE discovery of asbestos reported on ranch of Ray Hutchinson.

PLANT OF KELVIN SULTANA COPPER CO., KELVIN, ARIZ., RECENTLY TAKEN OVER BY NEWLY ORGANIZED RAY BOSTON COPPER CO. A. L. FLAGG, OF KELVIN, ARIZ., WAS RECEIVER FOR OLD COMPANY

GOLDEN CENTER (Grass Valley)—Shut down Sept. 1 to install more powerful pumping plant to handle increased flow.

KENOSHIA (Grass Valley)—Work of unwatering mine nearly completed. Grouped with other claims under new name of Alcade mines.

CALIFORNIA (Nevada City)—A. W. Hoge, superintendent, building 15-stamp mill expecting to find channel in about 200 ft. Company has run long tunnel in hard ground and has large holdings of virgin ground.

GASTON (Washington)—Closed until spring owing to uncertain labor conditions. During summer thirty to forty employed rehabilitating property.

Plumas County

PHILADELPHIA EXPLORATION (Crescent Mills)—Secured option on Crescent and Green Mountain gold mines, and development work will be started soon.

Tuolumne County

SOULSBY (Soulsbyville)—Operations to be resumed. South shaft to be deepened to ascertain value.

DELHI (Columbia)—Property with adjacent claims advertised for sale by sheriff to satisfy \$40,000 judgment obtained by Louis Nonnenmann, of San Francisco. Sale set for Sept. 12. Property now under bond to company headed by A. A. Codd.

COLORADO

Clear Creek

GEORGETOWN TUNNEL CO. recently held annual stockholders and directors' meeting. Following officers and directors elected: C. G. Breitenback, president and treasurer; F. H. Pratt, vice-president; C. A. Basse, secretary, and L. F. Shane, J. H. Robeson, C. G. Earnest and M. B. Dittenhoefer, directors. Newly elected directors have planned extensive improvements, in addition to vigorous development campaign that has been going on for some time. Foundations almost completed for new compressor and for flotation plant and 20-ton stamp-mill. Main tunnel now in over 2,000 ft.

Eagle County

EMPIRE ZINC (Gilman)—Working about seventy-five men on development. Electro-magnetic concentrator idle. Two

million tons of zinc-lead-iron ore developed averaging 15 per cent zinc. Large body of manganese-iron ore also developed. Wilkesbarre shaft almost completed, and will connect all upper workings of mine at Gilman with lowest tunnel level and Newhouse tunnel. With completion of this connection all surface activity will be around collar of Wilkesbarre shaft, and all ore will be lowered to lowest tunnel level and trammed out to the mill, or shipping station at Belden, on Denver & Rio Grande. Will materially reduce mining costs.

Ouray County

GUADALOUPE (Fronton)—Has cut old vein at greater depth and found that ore changed from chalcoprite to bornite. Vein contains high silver values. First car shipped recently netted almost \$6,000. Work proceeding on 3,300-ft. tramway from mine to wagon road 1,500 ft. below.

SUMMIT COPPER (Ouray)—Plans completed for construction of 100-ton flotation plant and concentrator. Charles McMillan, builder of Camp Bird and Sunnyside mills, engaged to handle this work. Mill will be on railroad. Planned to handle custom ores.

Park County

LOUISIANA-COLORADO (Alma)—Employing about forty men. Mill handling 150 tons of ore daily, producing concen-

trates running about 200 oz. in silver and about 40 per cent lead.

RUSSIA MINE (Alma)—Substantial payment of purchase price recently made by K. C. Houston, who represents Eastern syndicate which recently took over properties. Rich silver ore opened up by new owners and also large tonnage of low-grade silver ores. Both mine workings and stamps samples show large tonnage of low-grade ore available for milling. Syndicate considering installation of mill.

Summit County

EVANS-WINN SYNDICATE (Breckenridge)—Syndicate formed by Mark G. Evans, of Denver, to develop low-zinc sulphide veins encountered in dredging operations, is actively engaged in sinking prospecting shaft on Emille placer claim.

IDAHO

Boise County

GOLDEN AGE, JR. (Pioneerville)—Reconcentrating 1,400 tons concentrates for shipment. Considering reworking tailings dump carrying \$8 per ton. Company seeking funds to develop and erect 300-ton mill employing concentration and cyaniding. Property now equipped with 15-stamp mill.

Bonner County

LAWRENCE (Clarksfork)—Working five men and extending long crosscut tunnel to No. 2 vein, which shows surface outcrop, 15 to 20 ft. wide, of spathic iron gangue and galena and constitutes main vein of series of five parallel fissures in pre-Cambrian formation. Smallest of these already penetrating 300 ft. deep and stopped to considerable extent, having yielded several hundred tons of clean galena concentrates averaging over 70 per cent lead and 17 to 20 per cent silver. Ore of this grade accumulated for shipment by intermittent operation of small concentrator working on ore from No. 1 vein. No. 2 vein believed to be within 100 ft. of main tunnel face. Small cross dike which was recently encountered in crosscut tunnel, matching similar dike croppings intersecting vein at surface, is guiding operators in further development.

ARMSTEAD (Talaché)—Robert N. Bell, state mine inspector, reports rich milling ore to 1,400-ft. depth on dip practically demonstrated. Vein varies in width up to 7 ft. in length. In addition to rich main vein, deep crosscut tunnel, 3,800 ft. long, has passed through series of promising fissures.

Idaho County

HOMESTAKE (Orogrande)—Several officers inspecting property to determine equipment needed. Company owns Homestake, four miles south of Orogrande, and American Eagle and Fish Hawk, seven miles southeast of Elk City.

UNA (Orogrande)—Vein cut in tunnel at 1,050 ft. point and crosscut started. Good mineral values found in vein above.

Shoshone County

NABOB (Beeler)—New 150-ton mill completed and in operation. Has much lead-silver-zinc ore available. Company controlled by Stewart Mining Co. and machinery from old Stewart mill used in building new mill.

HERCULES (Burke)—Fire started Sept. 2 at end of long No. 5 tunnel in abandoned stopes. No harm expected unless fire spreads.

NATIONAL (Mullan)—Directors' statement issued covering company's operations, which shows all ore below main tunnel exhausted and that part of mine abandoned. Efforts to locate vein unsuccessful, and mine closed indefinitely. Company has upward \$50,000 in treasury and no debts; also well equipped mill of 500-ton capacity. Ore copper, 10 to 15 per cent, and about 3 oz. silver. Believed further exploration will be undertaken.

BIG CREEK (Wallace)—Plans for 75-ton mill in hands of company, and preliminary construction started. Expect to have mill completed within ninety days. Ore chiefly lead with high silver content; also gray copper.

MICHIGAN

Marquette Range

BREITUNG (Negaunee)—All ore in stock at Breitung Hematite and Mary Charlotte mines to be shipped this year. Shipments total 1,500 tons daily.

SOUTH JACKSON (Negaunee)—Ore now being loaded by shovel. Several large blasts recently put off. One of few open pits on Marquette Range.

REPUBLIC (Republic)—New change house to be erected. Will be modern structure with all latest conveniences.

Menominee Range

CASPIAN (Iron River)—New six-ton electric locomotive received. Similar to two purchased by Pickands-Mather & Co. for one of company's Mesabi Range mines.

MONTANA

Beaverhead County

BOSTON & MONTANA (Wise River)—Raise from 1,000 level Idanha "holed" through into upper Idanha tunnel, 640 ft. above, showing continuous ore of good grade. Crosscutting from tunnel level near-joint Central and Elkhorn veins, with ground becoming well mineralized.

Mineral County

TARBOX (Saltece)—Another assessment of 1C per share called. Surveys under way for mill construction.

Missoula County

POTOMAC COPPER (Potomac)—Driving main development tunnel. Ground soft with large areas of altered and mineralized ground in evidence. Breast in more than 500 ft. Will open Copper Cliff property at 800-ft. depth and Leonard mines at 1,500 ft. Ore showing extensive.

Silver Bow County

ANACONDA (Butte)—Development of silver orebodies in Walkerville section of Butte district being pushed. Labor troubles appear to be clearing, with more miners seeking work and copper production being increased slightly.

AT NORMAN SILVER MINES CO. PROPERTY, MINA, NEV.

BUTTE & RAMSDELL (Butte)—Ore shipments ranging over 10 per cent in copper. Four-car lot returning \$8,850 net from smelters, carrying 11.96 per cent copper on average. This coming from Lizzie vein, under lease from Davis-Daly.

BUTTE & SUPERIOR (Butte)—Ore development on lower levels of Black Rock and easterly in Four Johns claim, adjoining the former, reported encouraging with considerable tonnage indicated. Produced 10,750,000 lb. of zinc in concentrates and 200,000 oz. of silver. July production was 7,800,000 lb. zinc in concentrates and 150,000 oz. silver.

CRYSTAL COPPER (Butte)—"B" vein opened on 600 level shows high-grade orebody two to three feet wide. "A" and "C" veins on upper levels showing encouraging ground, and these fissures will be crosscut early on 600 level.

DAVIS-DALY (Butte)—Sinking of Colorado shaft nearly completed. Sump now being sunk for 2,700 level and crosscutting on this level for half dozen high-grade fissures in evidence on 2,500 level will start with 200 ft. of zinc earnings for July reported more than \$92,000 and for August approximately \$140,000. Ore shipments approaching 400 tons daily and further increase expected with installation of skips, steel for which is looked for this week.

EAST BUTTE (Butte)—Increasing production. Copper output for August, 2,054,760 lb. and silver 70,841 oz., largest of all months this year. Ore reserves being enlarged.

TUOLUMNE COPPER (Butte)—Cutting of Spread Delight fissure on 1,000 level looked for daily. Three-foot oreshoot of silver-copper ore opened on this level about 145 ft. from Spread Delight vein. Fissure also cut in Sinbad shaft at 1,140 ft., showing good mineralization. Shaft being sunk to 1,200 level, which will be reached in

about three weeks, and Spread Delight will be crosscut also on this level.

NEVADA

Esmeralda County

GOLDFIELD DEVELOPMENT (Goldfield)—Mill of 1,200-ton capacity expected to start operations early this month. Mine and mill have about 25 men employed.

MAYFLOWER CONSOLIDATED (Pioneer)—First unit of five stamps on Mayflower started Sept. 5.

Humboldt County

MINERVA TUNGSTEN (Winnemucca)—Has resumed operations, employing twenty men. Under present contract fair profit made.

Lander County

CHILDRESS & FARETTI (Battle Mountain)—Sufficient tonnage of ore having been developed, retorts will soon be turning out quicksilver.

Lincoln County

PICOCHE SHIPMENTS for the week ended Aug. 28 totalled 1,900 tons as follows: Prince Cons., 1,350; Virginia Louise, 350; Black Metals, 200.

Pershing County

MAJUBA (Imlay)—Majuba Silver Tin Copper Mines Co. has taken over Majuba Hill group of 79 claims being developed under direction of Jack Welch, field man for Mason Valley Mines Co. Two thousand tons shipped from development, and William Koerner, engineer, figures 50,000 tons sulphide ore in sight. George S. Brown, of Reno, president.

ROCHESTER NEVADA SILVER (Lower Rochester)—Drift on 900 level 200 ft. long, and in ore picked up beyond fault, and drift on 1,000 level advanced 60 ft., with raise being put up to connect. All workings in good ore. Mines of Rochester shut down as result of electric current being shut off, owing to water shortage at Government dam at Lahontan. Hoped to resume when irrigation ceases in about two weeks.

Storey County

COMSTOCK (Virginia City)—For week ended Aug. 30 report shows Consolidated Virginia shipped 382 tons, averaging \$21.74 per ton, valued at \$8,312.39; and Ophir 165 tons of \$19.01 ore, valued at \$3,139.11.

White Pine County

CHAMPION (Cherry Creek)—Brown and Harrison have let contract for driving tunnel 300 ft.

NEW JERSEY

UNITED STATES SMELTING (Chrome)—Employees struck for higher wages.

NEW MEXICO

Grant County

REPUBLIC M. & M. (Hanover)—Plans being drawn for 100-ton mill. Tests show crude extraction can be made by flotation. Crude zinc sulphide being shipped at rate of 300 tons per month. O. Wiser president and general manager.

BONNEY CONSOLIDATED COPPER (Lordsburg)—Has taken over Bonney mine in consolidation with El Dorado group. Property of Torrey & Sons, of Santa Fe, Manila group and other claims, about 700 acres in all, making third largest group of copper holdings in Grant County. Will install new power machinery and 100-ton mill; 40,000 tons ore ready for mill. D. L. Hill, Lordsburg, president.

CO-OPERATIVE (Lordsburg)—Received card of machinery for new concentration and flotation mill. Working twenty-five men. B. Tabor superintendent.

85 MINE (Lordsburg)—Most machinery for steam equipment on hand. Construction progressing. Operation expected in sixty days.

START CHANCE (Lordsburg)—Pipe line completed to Aberdeen shaft, insuring water supply for mill. B. Prescott, superintendent.

MEXARKO (Pinos Altos)—Two shifts being worked in Laneston mine. Ore being stored for treatment in mill of Calumet New Mexico Mining Co.

GRANT COUNTY COPPER (Santa Rita)—Body of zinc ore developed. Mill for treating same being built. Will be ready to start about Oct. 1. H. E. Link, manager.

BLACK HAWK M. & M. (Silver City)—Taking over Lucky Bill group, east of Bayard station. Development of 200 and 300 levels of Lucky Bill shaft will be pushed. Property good producer of lead carbonate

ores for several years. E. D. Lidstone president and general manager.

TEXAS

Brazoria County.

GULF PRODUCTION (West Columbia) —Ayers No. 1 well, brought in at 3,700 ft., making large production of clear oil. No. 1 McMeans well abandoned. Rigging up to start drilling No. 2 McMeans well.

TEXAS CO. (West Columbia) —No. 9 Arnold well completed and making good production of oil by flowing. No. 1 Brown well abandoned.

Galveston County

SULPHUR CARGO of 7,735 tons loaded out of Galveston on Swedish steamer "Skagern," one of largest sulphur cargoes ever shipped from this port.

SAN LEON OIL (Galveston) —No. 1 San Leon well abandoned. Tested salt water at 2,000 ft.

Gonzales County

BELL OIL & REFINING, of Houston, has purchased all holdings of Quality Realty Co. in Slayden oil field. Drilling will begin at once on W. H. Baldrige farm between Gonzales and Walden. Work in charge of H. Gibson.

Hardin County

WELDON OIL (Saratoza) —No. 2 Hooks well completed at 2,000 ft. Pump will be installed.

MINOR OIL (Sour Lake) —No. 66 well completed, and pumping from 2,550 ft.

TEXAS CO. (Sour Lake) —No. 298 Fee bailing at 825 ft.

Harris County

COMPLETIONS AT GOOSE CREEK: Crown Oil & Refining testing No. 6 Gilt; Atlantic Oil Producing bailing No. 1 Goose Lake; Humble Oil & Refining bailing No. 4 Dannenbaum at 2,620 ft.; Gulf Production arranging to pump No. 17 State-land and testing No. 3 Rosenthal.

DEEP WATER OIL (Houston) —Application made for permit to erect storage tanks. Building of oil refinery to begin at once. Lubricating oils will be manufactured.

Orange County

HUMBLE OIL (Orange) —Closed option on lease on 300 acres of land in Dyon survey of oil field in Orange County. Drilling will start soon.

Wichita County

CORDELL PETROLEUM CO. vs. **KIMMELL & DILLARD** (Wichita Falls) —Judge Betts, of Federal Circuit Court, has ordered oil from well recently drilled by Kimmell & Dillard, on Lucinda Moore survey, to be impounded and profits from production placed in bank at Wichita Falls. Five-acre tract upon which well is drilled is claimed by Cordell Petroleum Co. Making large production. Application for receivership by latter company transferred by Judge Betts to northern district of Texas, and will be heard in Wichita Falls.

UTAH

Beaver County

CAPITOL (Milford) —Shaft being sunk; crosscutting of vein started at 260 ft. Conditions promising.

GOLD CROWN (Milford) —Ore being mined from vein followed 400 ft. by inclined shaft.

Juab County

A **NEW WAGON ROAD** into the East Tintic district is the object of efforts now being made.

CHIEF CONSOLIDATED (Eureka) —Ground owned by company in eastern end of Tintic district being prospected by diamond drills. Equipment at main property recently electrified and working satisfactorily.

EUREKA BULLION (Eureka) —Ore being followed both in winze and raise, water supplied from Chief Consolidated. Improvement in value of ore on 800 level.

LEHI TINTIC (Eureka) —Ore being sacked for shipment. Machinery and material to be used in shaft sinking being hauled to property.

NORTH STANDARD (Eureka) —Shaft down 350 ft. and to be continued another 100 ft., where drifting will be started.

PINION QUEEN (Eureka) —Shaft being sunk.

TINTIC STANDARD (Eureka) —Railroad (Goshen Valley) to this property will not be completed before middle of October. Mine producing about 100 tons of ore daily. South shaft retimbered and enlarged

to depth of 1,000 ft. Blowers to be installed, one at surface and one on 1,000 level.

Idaho County

DEER TRAIL (Marysvale) —Operating with small force. Gold-silver-lead ore, owned by Salisbury Brothers, of Salt Lake City.

WEDGE (Marysvale) —Limited tonnage of high-grade gold-silver ore being mined. Recently 200 lb. of ore mined carrying coarse gold valued at \$6,000 per ton.

Salt Lake County

ALTA DIVIDE (Alta) —Operations to be resumed at this property, situated on divide between Big and Little Cottonwood canyons. Tunnel to be driven several hundred feet below old workings, showing promising mineralization. W. H. Evans interested.

EMMA SILVER (Alta) —Unwatering in progress, and expected to be completed by middle of September.

WOODLAWN (Salt Lake City) —Ore opened along No. 2 fissure from Gardner tunnel increasing in extent both laterally and with depth as development continues. Property adjoins Prince of Wales, now part of Michigan-Utah.

Summit County

PARK CITY SHIPMENTS during August amounted to 6,445 tons, compared to 4,391 tons in July, showing output to be returning to normal, after slow-down caused by strike earlier in summer. Shippers were Iowa copper, 44 tons; Judge M. & S. ore, 17 tons; zinc, 32 tons; Barb West, ore 471; Silver King Coalition, 2,309; Silver King Consolidated, 110; Ontario, 1,018; and Naidriver, 440 tons.

Toole County

OPHIR METALS (Ophir) —Operations to be started soon at this property, taken over by Boston men. Includes 13 patented claims, comprising 146 acres, and 27 miles of lode claims and fractions. Tunnel to be driven at 500-ft. depth below old workings, productive of silver ore in past, and new work undertaken to prospect Euckhorn and Cliff limestones. Stated \$50,000 spent on work planned. W. B. Farmer, of Boston, interested.

WASHINGTON

Ferry County

FIRST THOUGHT (Orient) —Spokane men and others have formed First Thought Gold Mining Co. and taken over this property from P. Burns, of Calgary. Dr. M. B. Grieve, of Spokane, president of new company.

LONE PINE-SURPRISE (Republic) —Shipping gold-bearing ore at rate of fifty tons daily.

Okanogan County

TIP TOP (Spokane) —Has acquired Tip a fractional Lynx, could Curry and Top, two 100-acre areas, on bond from Kankakee Mining Co., at Nespelem, Wash. W. A. Startzman, and Andy O'Neil Mining Co. Properties adjoin and embrace two veins upon one of which 2,000 ft. of development work has been done and \$26,000 expended.

Pend Oreille County

BEAD LAKE (Newport) —Company expects to settle question of title to mill site in few days and begin construction of plant to be finished before end of year.

Stevens County

GLADSTONE MOUNTAIN (Boundary) Work resumed. Recent find of new ore chimney in Electric Point mine only about 250 ft. from Gladstone line. D. D. Dodd, in charge.

NORTHPORT SMELTING (Northport) —One hundred fifty men laid off in smeltery, and plant almost at standstill due to closing of Hercules and Tamarack & Custer mines in Coeur d'Alenes by strike of miners.

CANADA

Alberta

CHARLES E. TAYLOR, chief geologist for Imperial Oil Co., announced drilling for oil will start at once south of Lethbridge.

British Columbia

ASPEN GROVE, Aberdeen, and Donohoe properties, in Merritt district, recently inspected for various interests. Many unworked properties in Stump Lake district, under development by R. R. Hedley.

BRITANNIA M. & S. (Howe Sound) —Mill working at capacity, treating 2,500

tons per day and producing about 2,000,000 lb. monthly. Development in last year 24,595 ft. and diamond drilling 26,682 ft. Drilling raises from 4,100 or mill level to 2,700 level to deliver ore by gravity to mill level.

CALIFORNIA (Kaslo) —Road completed to mine. Athabasca mill expected to run on ore from this mine within two months.

NORTH STAR (Kimberley) —Mines and surface equipment, destroyed by fire, being reconstructed. O. C. Thompson and J. L. McKinney owners.

BEATRICE (Lardeau) —Men sent from Vancouver to work this property which closed down four years ago. Ore galena and tetrahedrite.

BULLOCK (Lardeau) —Bullock Mining Co., organized by Graves Bros. to work Bullock property on which silver strike was recently reported.

SILVER CREEK (Revelstoke) —W. H. Aldridge has taken bond on this and made substantial payment.

IVANHOE (Slocan) —Car and half of ore shipped daily to mill at Rosebery, owned by Rosebery-Surprise Mining Co.

WHITEWATER (Slocan) —R. II. Stewart, mining engineer, has made thorough inspection of this and Corkin Province properties.

CONSOLIDATED M. & S. (Trail) —Offers scholarship to employee's son making highest marks in 1919 entrance examination at any Canadian university. Award consists of allowance of \$50 a year toward application course. Company received 5,492 tons ore from Aug. 14-21; total for year 222,987.

SECHART MERCURY (Victoria) —Property on Vancouver Island, idle for some time, purchased by E. H. Mansfield, who plans to build furnace. Property on island Barclay Sound. Ore runs 2.5 per cent mercury.

Manitoba

MANDY (Schist Lake) —Transportation of copper ore interfered with by low water, preventing shipment by barge to railway. About 10,000 tons remain at end of hauling road awaiting shipment of water, and it is not likely that more than half of this amount can be brought out this year.

Ontario

ORE SHIPMENTS over T. & N. O. Ry. in July totaled 1,321 tons of 2,000 lb. from following shippers: Beaver, 32; Buffalo, 387; Cobalt Provincial, 30; Coniagas, 77; Dominion Reduction, 30; Hudson Bay, 32; La Rose, 81; McKinley Darragh, 166; Mining Corporation, 328; Northern Customs, 43; O'Brien, 32; Penn Canadian, 31; Casey Cobalt, 28. This was shipped as follows: Deloro S. & R., 599 tons; Coniagas Reduction, 196; A. S. & R., Pueblo, 459; Pennsylvania Smelting, 31; Balbach S. & R., Newark, N. J., 2.

MCINTYRE (Porcupine) —Body of ore at 1,100 level over 800 ft. long by about 30 ft. wide being developed on No. 5 vein. Stated to carry higher gold contents than ore now being milled, which runs about \$11 to ton. Stations being cut at 1,250 and 1,375 levels. Main shaft down 1,400 ft.

HERRICK (West Shining Tree) —Outcropping vein sampled for over 1,000 ft. and reported to be of commercial grade for width of 5 ft., with sections carrying very high grade. Shaft down 50 ft., with encouraging results.

MEXICO

Hidalgo

REAL DEL MONTE Y PACHUCA (Pachuca) —Recently added 300 acres including Santa Ana property, of 200 acres, to holdings of 4,000 acres. Now has 43 miles on outcrop of Viscaine vein.

Sinaloa

EL ARCO MINES CO. erecting 60-ton mill, which will be enlarged later to 100 tons. Olaf Zetterlund, manager.

Sonora

EL PROGRESO (Batuc) —Has completed 35-mile wagon road from mine to join Motezuma-Lampasas road, by which company can reach railroad at Nacoziari, 110 miles away. Tables in operation in new mill. Expect to complete cyanide department this autumn. Jackson Elliott, mill superintendent.

PERU

CERRO DE PASCO (La Fundicion) —August production of copper, 5,726,000 lb.; July, 3,984,000.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—Sept. 9, 1919

The dullness in the metal markets continued this week, lead being the only one of the principal metals to show any signs of encouragement. This is not surprising in view of the well-known fact that the statistical position of this metal is strongest.

According to European advices, the industrial situation in Great Britain is distinctly better, more common sense being exhibited in all quarters than a little while ago. However, the whole European situation continues very grave.

Few people appear to recognize how serious are the necessities of Germany. She wants copper, without any doubt, but she wants other things more urgently. Consequently, Germany has even been a seller of copper in Great Britain.

Transatlantic freight rates are quoted as follows: To British ports, \$15 to \$18; to Rotterdam, \$12 to \$15; to Havre, \$20; to Hamburg, \$18. Transpacific rates to Hongkong and Kobe remain at \$14.

Wednesday, Sept. 10, was made a municipal holiday in New York, and although the banks were open, scarcely any business in the metals was transacted, and we record it as a holiday.

The cables for electrolytic copper in London have been coming over with different figures, represented as "spot" and "future." Thus, this week up to Sept. 9, spot was given at £110 and futures £120. In computing our averages, we have used the spot figure. We have been informed that these different figures, instead of representing different prices for spot and futures, actually represent the different prices for ingot bars and wire bars, the lower

figures being for the former and higher for the latter.

The average price for electrolytic copper in London in August is computed from the figures that we received and published. It is uncertain whether the blanks were holidays or whether the dispatches failed to come through. If the latter proves to be the case, the computation of the average will have to be revised. This matter is under investigation.

Copper

Another week passed without producers making any sales. The business continued to be done by second-hands, and instead of such supplies of copper having been cleaned up, considerable quantities of it continued to be offered. Much concern is expressed as to whence all of this copper originates. The aggregate of sales by second-hands during August undoubtedly amounted to a large figure, as did the sales during this week also. This information is confirmed by large consumers who have bought. The market may be generalized at 22 to 22c. right through the week for prompt and nearby copper, with somewhat higher prices for futures. A noteworthy feature is the development of what is in effect a differential between ingot bars and wire bars. Wire-drawers who bought the latter this week paid 22c. for round lots, but ingot bars were offered at 22c. and transactions occurred at that price. Another interesting feature of the week was the renewal of offerings of British ingot bars, which were to be had at 22c. c.i.f. New York, and possibly for less.

American wire-drawers report great activity in filling previous orders, and they expect a continuance of good business, but for the present their copper requirements are covered well ahead. The brass business does not show so good promise. British copper manufacturers are reported to be heavily booked with orders and well covered with metal, but the industrial situation delays the execution of orders and therefore retards consumption. Germany has sold copper to England, apparently for the purpose of getting credit for things needed more urgently.

Copper Sheets—The base price of copper sheets is 33c. per lb. Demand steady. Copper wire is quoted at 26@26 1/2c. in carload lots, f.o.b. mill. Market is dull.

Tin

There was a little shortage in tin of 99 per cent grade for prompt delivery in this market, and with the acceptance of a fair demand price stiffened a little, closing at 55c. Straits tin for

August-September shipment was quoted at 53½c. at the close. In general there was a firm tone to the tin market.

Singapore quoted £273 c.i.f. London on Sept. 4; £273½ on Sept. 5; £277½ on Sept. 8, and £279 on Sept. 9.

Lead

Some substantial business was done during the week at the full price asked by producers. At the same time there continued to be offerings at low figures by second-hands, and some lots were picked up from them. On Monday and Tuesday, however, such offerings diminished, and lead was no longer to be had from anybody at such low prices as in the early part of the week. On Tuesday, the market became quite strong, as high as 7.85c. being bid for lead in St. Louis. Such cheap lots of lead as were offered from speculative hands in the New York market were rapidly being absorbed.

Zinc

Some small business was done in high-grade and special zinc, but the market for Prime Western was extremely dull. In the early part of the week some transactions occurred at 7.35 to 7.40c. St. Louis, but on Monday and Tuesday zinc was easily to be had at 7.30 to 7.35c., and on Tuesday afternoon a round lot was offered at 7.30c.

The London market apparently conforms to German selling, declining upon German offers and rallying upon their withdrawal. According to late advices, Germany is still a seller of zinc.

The Belgian zinc smelters are slowly getting to work. During August, most of the Rhenish smelters were idle, and a good many of the works in Upper Silesia were closed.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet.

Antimony—The market was very quiet, although a little more business was reported than in the previous week. We quote spot at 8½c. and futures at 9@9½c.

Bismuth—We quote at \$2.96.

Cadmium—Unchanged at \$1.40.

Nickel—Ingot, 42c.; shot, 43c.; electrolytic, 45c. per pound.

Quicksilver—The market was very quiet and unchanged at \$95. San Francisco telegraphs \$95, firm.

Silver and Platinum

Silver—Silver market really steady the last week at 61d. in London, with limited demand for the Continent. New York market has been fluctuating in accordance with the rates for sterling exchange, and closes steady at 112½c. China demand has been only moderate, as the need of silver shipments has been greatly diminished by the large shipments of gold to the Far East.

Mexican dollars at New York: Sept. 4, 86½; Sept. 5, 86½; Sept. 6, 85½; Sept. 8, 86½; Sept. 9, 86½; Sept. 10, holiday.

Platinum—This metal continues in strong demand. We quote refined ingot unchanged at \$110 to \$115.

Palladium—Unchanged at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., Sept. 6—Zinc blende, per ton, high, \$50; basis 60 per cent zinc, premium, \$46; Prime Western, \$45; fines and slimes, \$42.50@40; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$45.94; calamine, \$29.66; all zinc ores, \$45.28.

Lead, high, \$70.15; basis 80 per cent lead, \$70@65; average settling prices, all grades of lead, \$66 per ton.

Shipments the week: Blende 5,677, calamine 240, lead 1,047 tons. Value, all ores the week, \$337,030.

The railroads are reported hauling empty cars here and hauling them away again, leaving full ones on sidetracks all over the district. The shipment is very low from lack of cars. Every smelter has hundreds to thousands of tons purchased, with no cars to move it. Lack of shipping facilities creates shortage of storage capacity for ore, and it is being reflected in a reduced production, at a time when outputting should be at its best.

Platteville, Wis., Sept. 6—Blende, basis 60 per cent zinc, \$46 base both for premium grade and high lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$65 per ton. Shipments reported for the week are 1,539 tons blende, 277 tons galena, and 358 tons sulphur ore. For the year to date the totals are 68,107 tons blende, 4,364 tons galena, and 11,110 tons sulphur ore. During the week, 3,411 tons blende were shipped to separating plants.

Other Ores and Minerals

Chrome Ore—Quoted at 75c. per unit, delivered in the East, with considerable business done. Indian chrome ore of 48 per cent grade and upward is offered at \$45 per long ton, c.i.f. New York.

Manganese Ore—This is now offered more freely from South America. Our direct advices from the Caucasus are to the effect that the mining industry there is now paralyzed. However, there is about one million tons of manganese ore mined, but scarcely any is being exported, inasmuch as the freight rates to European and American consuming points absorb practically all that can be realized for the ore. For the American market the latest quotation is 55c. per unit, c.i.f. Baltimore.

Molybdenum Ore—Some foreign inquiry was reported. The present nominal quotation is 75c. per lb. of 90 per cent concentrate, but probably that price could be shaded.

Tungsten Ore—Chinese ore for spot delivery was offered at \$7.25 to \$7.50; Bolivian ore is held at \$12, and Western scheelite at \$15 per unit f.o.b. mines. All business now is done with the proviso, "duty, if any, for buyers' account."

Pyrites—Spanish pyrites is quoted at 17½c. per unit for furnace size ore, free from fines, c.i.f. New York or other

Atlantic port. Sales of ore containing fines were made at 16c. Market slow and unsettled. Very little ore coming in. Price will decrease with ocean freights.

Iron Trade Review

New York—Sept. 9

Another increase in the unfilled tonnage figures of the United States Steel Corporation was reported today, according to the *New York Times*, the gain for the month of August amounting to 530,442 tons. The gain is slightly less than that which was reported for July, as compared with the June figures, but the difference, it is believed, is due to the fact that the Steel Corporation during August was operating at a much higher capacity than in the preceding month, and the greater deliveries consequently cut into unfilled orders more heavily. The total of unfilled tonnage now amounts to 6,100,103 tons.

Pittsburgh—Sept. 9

The American Iron and Steel Institute reports that 2,746,081 gross tons of steel ingots were produced during August by thirty companies which in 1918 made 84.03 per cent of the total ingot output. This indicates a rate of production in August by the entire industry of 39,100,000 tons per annum, against a 35,700,000 ton rate in July, or an increase of nearly 10 per cent. The August output was quite unsatisfactory in proportion to the plants in operation, as there was little actual idleness, yet the production was only 80 per cent of actual capacity, based on the efficiency shown in 1916. The difficulty seems to be that labor is inefficient.

The Steel Corporation's unfilled obligations, reported today on account of tomorrow being a Stock Exchange holiday, increased 530,442 tons in August, making the total at the end of August 6,100,103 tons. The August increase represented over 40 per cent of capacity, and as shipments were fully 80 per cent of capacity, the bookings must have exceeded capacity by more than 20 per cent. Three successive months have now shown increases averaging over 600,000 tons a month, whereas for six months preceding there were decreases averaging more than 600,000 tons a month.

The labor situation in the iron and steel industry has improved farther. The strike committee of the American Federation of Labor has made a pretense of urging President Wilson to endeavor to arrange a conference between the Steel Corporation and the committee, something President Wilson obviously would not undertake. The committee pretends that it is with difficulty restraining the men from striking, whereas the steel manufacturers believe that even with its utmost efforts the committee could not produce a real strike.

Demand for steel products is on a moderate scale, but appears insistent in some lines because in those lines the mills are already well sold up. The American Sheet & Tin Plate Co. is out

Number 12

Market Report for Sept. 20 Will Appear in Issue Of Sept. 27

INDUSTRIAL conditions in New York have made it expedient to close the forms of the *Journal* in advance of the routine schedule date. The usual market quotations are therefore necessarily omitted from this number. The market pages which would have appeared normally in the Sept. 20 issue will be published in the *Journal* of Sept. 27.

Present Status of Deep Mining in California

IN COMMENTING upon the present unsatisfactory condition of deep mining in California, Charles G. Yale, of the U. S. Geological Survey, assigned the following causes: Low prices of metals produced (and this applies to gold, on account of its low purchasing power); strikes and scarcity of labor generally; high taxes and other war conditions; surcharge on electric power allowed the power companies. His statement applies to gold, copper, lead, and zinc mines in California.

With the first three causes the mining industry in all of our metal-mining states has had to contend. As far as prices are concerned, the individual mine must sell its products at the ruling quotations, which are determined by economic conditions. This ruling price and the weight of metals produced determine the gross income of the mining company. Out of this gross income, needless to say, must come wages, taxes, salaries, supply and material costs, power cost, and overhead expenses, as well as any gain to the stockholders of the enterprise.

Gross incomes of mines have been greatly diminished, both from the lower prices of metals and also on account of curtailed production. Many gold and copper mines have closed down in California as a consequence of their inability to conduct operations under the existing conditions, except at a serious financial loss. Other mines are operating without profit. Whatever mines show an operating profit are indeed fortunate.

Under the circumstances labor strikes are particularly to be regretted. Their continuance will not better the status of labor nor improve the position of any individual mine. There are loss in time, deterioration in underground workings, failure to make necessary repairs in equipment, disorganization of the working force, and discouragement of the operating staff, not to mention the inevitable ill-feeling that accompanies the fighting of such questions to a settlement. A mine working on a narrow margin becomes a losing venture after a few such experiences.

Large low-grade properties do not attain low operating costs at once, but must pass through a period during which there is co-ordination of effort and a develop-

ment of plant and labor efficiency that require great skill on the part of a managerial staff. As this is attained, a margin between income and expenditure appears, and the enterprise becomes profitable. It takes a surprisingly small thing to throw the machinery out of order. It requires great patience and hard work to bring it back. If the men who go out on strike with apparently so slight concern would assume the responsibility which is rightly theirs by reason of their participation in the mining industry they would exhaust every reasonable expedient before striking. How many of the striking miners have sought to join forces with the communities in which they live in an endeavor to reduce living costs? Yet this is an eminently practicable way of increasing the "ruling wage." We know of mining companies that have kept down food and living prices in mining communities. It would be the part of wisdom for the mine workers to join forces with the mine management in a campaign to reduce living costs rather than to throw the burden upon the mine to pay increased wages.

In respect to high taxes, mining enterprises must pay their full share not only of the local and state taxes but also of the Federal taxes. The future does not hold forth the prospect of speedy reduction in the amount of the tax. It is not probable that the cost of mining supplies will be reduced materially. In the case of California mines, increases in the cost of power which is served to the mines by public-utility corporations have been made, and have had their influence in making profit margins smaller.

The big mine has played the part in the past of lending stability to the mining industry by providing steady employment to large numbers of mine workers. It will continue to do this if it has a reasonable chance to make expenditure less than income. The product of the mine must be sold in competition in the metal markets of the world. Unlike a public-utility corporation, the mine cannot pass on increased labor and supply costs to the metal consumer. Such increases almost always decrease the margin of profit, and the danger point is apparently being approached.

Both large and small mines need the active co-operation of the mine worker with the mine management, if the mining industry is to prosper.

Scientific Information In the Daily Press

THE quality of the technical information supplied by the general press is such as to provoke amusement among the comparatively small proportion of newspaper readers who have had scientific training. In some cases the reporter, or rewrite man, or whoever prepares such articles, apparently knows nothing whatever about the subject on which he writes, and statements are made which have no foundation in fact. In other instances—and here we find the most amuse-

ment—he has absorbed the gist of some feature of applied science, and in an effort properly to describe it in technical language he unconsciously wanders far afield. He means well, but his manner of expression is as unfortunate as that of the young man who passionately declared to his sweetheart, "If beauty is only skin deep, then you have a hide like a rhinoceros"!

Many scientific societies and Government bureaus furnish press bulletins on technical subjects, and the more careful newspapers look to such sources for material, rather than trust writers of limited familiarity with the subjects discussed. As an example we might cite an article on the "Deepest Well in the World," recently prepared by the U. S. Geological Survey, and contained in their Press Bulletin for August, an excellent article, which was reprinted by the *New York Times* and other lesser papers.

Information on technical subjects is often valuable and interesting to the layman, but it should come from an authority. The source also should be shown whenever possible, if for no other reason than to establish the status of the article in question.

As Others

See the Engineer

A FEW weeks ago M. O. Leighton, chairman of the Engineers, Architects and Constructors' Conference on National Public Works, reported the opinion of a statesman and politician of the better class upon the effort to establish the National Department of Public Works. The opinion contains an interesting estimate of the engineer and is quoted below:

"Your task is appalling. You have been elected to lead engineers into a political reform. They are the most unresponsive citizens we have. Your organization has a praiseworthy purpose, but if it were sponsored by almost any other group of reputable men than engineers there would be more promise of success. If your organization succeeds I believe you will find that it will not be the engineers who have carried it through. Their aloofness and indifference in all matters outside of their own professional sphere are among the unexplainable things in our political life."

The engineer as a representative of a class has of late been the recipient of a considerable amount of advice, the burden of which has been that he ought, for the welfare of the community, as well as for his own, to give more attention to public affairs and in more direct ways associate himself with politics and even political office. To see himself as others see him and to learn that he is unresponsive, aloof, and indifferent, according to our statement quoted, is not exactly pleasing. A more flattering account would be pleasanter. The results of the statesman's essay will be accepted by some, but many, among whom we place ourselves, will be inclined to take issue with the statesman on the ground that he has not taken an accurate sample, but rather has grabbed a "specimen" from the pile which cannot give the result that would have been obtained from a sample.

That engineers as a class are unresponsive is disproved by the attitude of engineers toward the war. They were among the first to volunteer their services, and from the illustrious Herbert C. Hoover to the engineer in the ranks of the American Expeditionary Force there was a hearty response to the needs of the situation. That engineers hold themselves aloof is in

a measure true, for most engineers thoroughly dislike to mix into the mire of politics.

Engineers are not indifferent to public affairs. In many instances it is the observation and the initiative of the engineer that are responsible for improvements in public service. It goes almost without saying that the idea of a National Department of Public Works comes from the engineers, and, through their organization, the Engineering Council, a strong effort is being made to put the idea over.

The opinion of our statesman-politician is worth examining further. Is it not a clever way of side-stepping a responsibility for a condition in the Federal departments for which the politician has primarily been responsible and for which he has been called to time by the engineers? It is begging the question to say that the task is appalling when viewed from the standpoint of the engineers getting back of the movement for a political reform. Would it be less appalling if the politicians were to actively interest themselves in the question? Is there anywhere a proffer of assistance from our statesman-politician to the engineers? No. All that there is, is a shrug of the shoulder and "Your task is appalling because engineers are unresponsive, aloof, and indifferent."

On the other hand, are politicians responsive, in touch with the public weal and attentive? They are, but as far as we are informed most of them are responsive and attentive to only two things—votes and a strong desire to remain in office. They are in touch more with the public pocketbook than the public weal.

We are glad to see that the engineer is interesting himself in public questions. We know that the task will not be appalling to him, for he has faced many a problem in bridge building, tunneling, construction, and management, and the brain power which he has brought to this work will, we believe, prove equally effective when applied to public questions.

Technical Graduates

And Plant Management

TECHNICAL graduates sometimes manage a plant as if it were an experimental laboratory. Part of their training has been in the laboratory, and it is natural that they should acquire the laboratory habit. There is a fascination about experimentation from which it is frequently hard to get away. We do not take issue with this, but we do desire to point out that there is necessity for discrimination. In the operation of a plant it is essential to decide upon a general plan and to carry this out until every detail has become a part of the plan and the working force has been so thoroughly drilled and broken in that a high degree of efficiency is the rule, and everyone in the plant knows exactly what is expected of him. Individual dexterity and skill are the outgrowth of repeated performance which finally reaches a stage under skilled direction when everyone fits into the system easily. Commercial results require plant operation of this order. There is always the breaking-in period of a new plant. During this period unit costs are high and efficiency is low. The more quickly this is passed the sooner will unit costs begin to decrease.

Experimental work properly belongs at the beginning of operations, and at this time the limitations of ore treatment should be worked out in the laboratory by systematic experiments. A knowledge of the type of

ore deposit will convey some indications of the changes to be expected in the constitution of the ore with deeper mine development. Provision can be made at the beginning for radical changes in ore constitution. Flow sheets can be devised from the experimental data.

During the operation of a plant, experimentation may be necessary, but a sharp line should be drawn between the operating force and the men who are conducting such experimental work. Only in rare instances should the line be crossed and interference with regular operation allowed. It is easy to disorganize, and hard, as well as expensive, to return to established routine. Where radical changes are necessary they should be effected promptly, and the working force brought to the new operating routine as rapidly as possible. The technical graduate who recognizes these principles and puts them into practice will earn money for his employer and win recognition as an able manager.

For the Freshman in Our Mining Schools

WITHIN a month the numerous schools of mining scattered throughout the country will be open, and another year's supply of mining and metallurgical engineers will be in the making. Most of these students will come from mining districts or from families one or more members of which have been interested in mining.

Secretly, most men feel that some other calling presents much greater opportunities than their own—the miner envies the commission merchant, with his attractive city or suburban home and nothing to do but buy goods and sell at an advance. And the latter thinks it would be ideal to get away from his confined environment; to ramble about in the open where riches lie buried in the ground and can be had for the digging. Desire for the other fellow's job is a human frailty, but the fact remains that most men, in selecting a profession, are inclined to embark in one with which they are already fairly well conversant. So, as we said, most mining engineers become such from environment. The embryo engineer will go to a mining school and take the course there offered; then he will begin or resume his practical work, and he will know little else than mining.

The profession would be benefited in many ways if more mining engineers were graduates of literary, law, or even medical schools. At least, the mining-school student should endeavor to secure as broad a course as possible. He will find that 95 per cent of the problems he will have to solve depend on plain common sense and experience applied to the elements of mathematics, physics, and chemistry, principally plain common sense. So he should go to a school that offers something besides strictly mining courses, and he should make the most of his opportunities. When it comes time to write for a job, the plum will go to the man who writes the best letter and the gooseberry to the one who drew "A plus" in the science of ore concentration.

One of the principal things a mining engineer is called upon to do today is to handle labor; and to do this he must understand psychology and social problems. He must also be a business man; which means he must have a good working knowledge of economics. And, in general, the higher a man gets in his profession, the more varied his education must have been.

So we say to the prospective student: Do not specialize too closely, and do not scoff at the "arts" student. He may be a wise engineer.

Wildcat Advertising

IN THESE DAYS, when so much is being said of "blue-sky" legislation, and stringent laws have been passed, and in some cases are actually being enforced, it is apparent that something is being done to discourage picking the public's pockets. But the millennium is still a long way off. Audacious advertising of oil promotions and other schemes frequently comes to hand. Attention has been called from time to time in these pages to advertisements that were so impudent as to be actually funny. Indeed, so lurid and barefaced have some of them been, that it seems that even the most credulous would pass them by with a laugh. This advertising has not been limited to any particular section, the most flagrant cases noticed having come from Utah, Connecticut, and Texas.

The Ontario government recently instituted prosecutions under the Ontario Companies Act against four promoters dealing in oil shares of companies of doubtful standing, and one of them has already been convicted. The action taken by the California State Corporation Department on Aug. 4 in issuing a list of companies which have failed to comply with the California Securities Act has been discussed in a previous editorial.

It is not enough, however, to punish the guilty promoter. The agency that prepares the advertisement of a promotion that is bogus on its face, and the newspaper that gives it space, are to a considerable extent partners in the crime. Business it may be, but it is dirty business.

Engineers throughout the country can do much to make the going more difficult for fake promoters. Most of the cases brought to our attention, in fact, have been exposed by members of the profession in the various sections. The crook who wants publicity should have publicity, but it should be of the sort he deserves. Fake promotions injure the mining industry and the engineer himself.

Daylight Saving In Mining Communities

THE advantages of the "Daylight-Saving" Law have been discussed extensively. We believe that practically all mining communities are sorry to see the law repealed; in fact the farmers seem to be the only class which has been made happy. It was a case of determined opposition of a minority overthrowing the half-hearted support of a majority.

To the men working on shift there was probably no particular advantage in the scheme, but to others it threw the work one hour further into the cooler portion of the day, and gave an extra hour for outdoor activity and recreation. Most mining communities are self-contained, and local "daylight saving" can easily be continued next year if the residents of a district wish it. To avoid confusion with railroad time, it might be advisable for the various mining companies merely to ask men working always in the daytime to report one hour earlier. Then there would be no need to change the clocks. Local communities may secure all the advantages of "daylight saving" by adjusting the hours of employment.

The Diesel Engine in the Southwest

The Economy of Power Secured From This Source Compared With That From Steam—Principal Troubles Encountered in Oil-Engine Operation—Necessity Of Employing Trained Operators

By B. V. E. NORDBERG

IN THE southwestern mining country, the Diesel engine may be employed under conditions to which it is particularly well adapted, as little fuel is available other than fuel oil, the bulk of which is shipped from the Californian fields. The two principal kinds which are used are a light grade about 25 Bé. and a heavier variety of from 19 to 14 Bé. The same grade of fuel is used for both steam and Diesel plants, so that a direct comparison can readily be made between economical installations of both types. East or west from the southwestern mining district, there are oil fields, and, with the lessened price of fuel, the cost of operating large steam installations more nearly approaches that of maintaining the Diesel plant. In small units, however, the steam plant is not economical, and small oil engines may find considerable application in the oil districts, as there is little difference in fuel economy between oil engines of different sizes. However, where the climate is cold and heating must be considered, the Diesel engine is of limited applicability.

A properly designed and well-constructed Diesel engine is economical not only in fuel consumption but also in maintenance. Still, no engine, however well built it may be, can deliver cheap power if the attendants are not capable, careful, and trained in the handling of such units. In this age of slight experience with oil engines, good construction is essential, and even more so in the mining field, where continuous operation is necessary. The wheels in a mining camp do not stand still for months at a time, and the problem involves a spare unit, without which no mining power plant should be designed. The larger mining companies understand this well, but the smaller ones usually believe they cannot afford a spare unit.

The electrification of all branches of mining is responsible for making the use of the Diesel engine a big factor in the reduction of cost of power. With an electric hoist installed and a mill driven by motors, the problem is simple, and the engine is usually direct-connected to a generator. With several engines running in parallel, no difficulty whatever is experienced, so that any number of units can be put into the same power house. The only limit is the economical number of units. The smaller the unit for a given type, the greater will be the cost of foundation, building, generator, and accessories. A multiple unit system is a logical method of installation, as it makes a more flexible plant and cuts down the size of the spare unit.

500 B.H.P. PER CYLINDER THE SIZE LIMIT

The question of how large a Diesel engine can be built is still undecided; for marine work the general belief is that the larger the engine the better. A limitation may be set, however, on the size that may be of economic value to the mining industry today. Those central power houses distributing to large mills and hoisting plants would demand as a maximum an oil engine capable of delivering about 500 b.h.p. per cylinder.

Such units can be built with from three to six cylinders. A larger number of cylinders than six is of questionable advantage, owing to the added complication and attention required by the adjustments. More than six cylinders may be suitable to certain types of engines, but, considered purely in the light of a large number of cylinders compared with a few cylinders, the engine with the smaller number possesses the advantage.

POWER INCREASED BY USE OF SCAVENGING PUMP IN HIGH ALTITUDES

Diesel engines in mining districts are usually installed in high elevations, and the maker must proportion his engine sufficiently large to meet the low atmospheric pressure. The amount of fuel that the engine can burn per stroke is less in high elevations than under pressure conditions present at sea level. In the two-cycle type of engine illustrated in Fig. 1, the reduction in power caused by high altitude can be less-

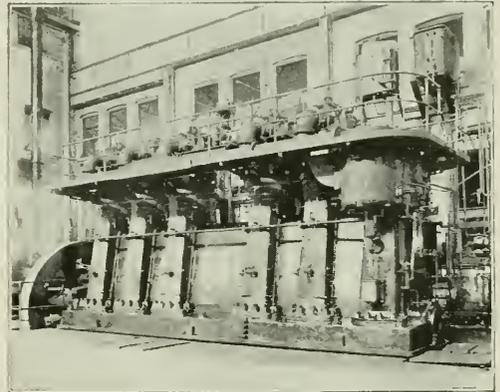

FIG. 1. A FIVE-CYLINDER TWO-CYCLE ENGINE RATED AT 1,250 B.H.P.

ened to a considerable extent by supercharging the cylinder with clean air from the scavenging pump, the position of which is shown in Fig. 2. The pump merely compresses air to a pressure of about 4 lb. per sq.in., which, in this type of engine, is led to the cylinder head through a header and blown through the cylinder when the four valves in the cylinder head are simultaneously opened.

The scavenging air is evenly distributed, flowing downward in an almost solid sheet, and expelling before it the burned gases. This blowing continues until the exhaust ports are covered by the piston. The scavenging valves are so timed that they remain open after the ports are covered, so that an additional amount of clean air is admitted to make the pressure equal to sea-level conditions. With this arrangement the same quantity of fuel per stroke can be burned, regardless of elevation.

the only loss being the additional power required to compress the increased amount of scavenging air. This amounts to the same thing as an additional friction load on the engine, and its rating is reduced by just that amount.

The high-pressure compressor furnishing blast air requires a little less power when compressing air at high elevations, even though the pressure range is greater. The fact that the power of the engine is not greatly reduced is a point of considerable advantage. An engine such as is shown in Fig. 1 is rated at 1,250 b.h.p. at sea level. It has five working cylinders of 250 b.h.p. each, the sixth illustrated being the scavenging air pump.

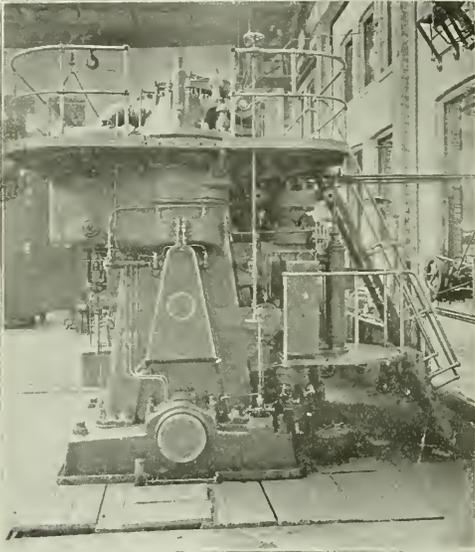

FIG. 2. END VIEW OF DIESEL ENGINE, SHOWING
SCAVENGING PUMP

At an elevation of 5,950 ft. the unit has pulled peak loads of 900 kw. lasting several minutes, easily holding its speed and without the slightest amount of smoke being visible in the exhaust.

Despite the fact that a two-cycle engine has the advantage of being able to develop more power, it is good policy to overtax it as little as possible. In mining work, the loads as a usual thing are comparatively constant. A load factor of between 60 and 70 per cent is not unusual, and it often remains at that figure for weeks at a time.

With several units, a plant may be operated with a load factor of 90 per cent or better. In fact, if given a conservative rating all of the engines illustrated in Fig. 1 operated at above 95 per cent. The unit under any consideration must be able to hold its load easily, and it must be borne in mind that the Diesel engine is a maximum-rated machine in the strictest sense of the word. The maximum rating has been determined only after long experience, and is not the maximum load which the engine can pull, as is sometimes mistakenly supposed. It is such a rating as will cause no trouble due to either excessive heat or diminution of load ca-

capacity in time, other conditions being good. It has finally come to be considered as a mean effective pressure referred to a b.h.p. that is safe. If a mean effective pressure is selected not so low as to impair the fuel economy, nor so high that there is danger of trouble from excessive heat, there should be no trouble in pulling 25 per cent overload at sea level for short periods. If the engine is rated too high, it is more susceptible to factors which may affect its power output. Some of these conditions are:

1. Variable quality of fuel.
2. Load unequally divided among the cylinders.
3. Failure to keep atomizers, fuel pumps, and parts in good running order.
4. Worn piston rings.
5. Cooling-water difficulties.
6. Improper adjustments.

GOOD GRADE OF FUEL OIL ESSENTIAL

As good a grade of fuel oil as it is possible to get should be used in any Diesel engine. This does not necessarily mean a light oil, as heavier grades are more economical; it has reference mainly to the objectionable impurities, which may attack the metal with which the oil comes in contact, impair the lubrication, or cause deposits within the cylinder. In all of these cases it is assumed that the oil is sufficiently atomized to produce complete combustion in the presence of a sufficient supply of clean air. Coarse sand and water can be extracted by a filter. Such impurities as sulphur, ash, coke, and asphaltum can be handled in moderate quantities, but if a fuel is allowed to stand unagitated, strata of various grades of fuel will form, which will not act uniformly in the engine. If a stratum is used that is difficult to burn and causes late combustion, the power of the engine will be reduced. The heat units supplied to the engine will not be entirely converted into work, and more heat will be developed within the engine, resulting in a condition analogous to overload.

UNEQUAL DISTRIBUTION OF LOAD COMMON CAUSE OF TROUBLE

Probably the most common difficulty encountered is caused by the unequal distribution of load among the several cylinders. This is purely an operating difficulty, but as an engine may run for long periods with abnormal loads on some of the cylinders, it is very serious if the rating is too high.

A well-constructed atomizer needs little attention, but even with good care there is a possibility of a leaky valve or trouble with the flame plate. In either case, combustion will be rendered less perfect, and a consequent drop in the governor will throw a greater load on the remaining cylinders. Similarly, a fuel pump that does not function properly causes the load to be shifted from the cylinder which it serves to the others, and loads them abnormally. Worn piston rings are another common defect, but these can be detected from the outside.

BAD COOLING WATER SHOULD BE PURIFIED

In mining districts, untreated mine water, high in scale-forming matter, is commonly used for cooling Diesel engine jackets. Such water would not be considered for use in a boiler. Although no similar water temperatures are reached as exist there, the surfaces with which the water comes in contact are extremely

hot. Along the upper part of the liner or cylinder head, local boiling may be going on, and there scale may be deposited. Such scale accumulation, especially in the piston water space, causes carbonization of the lubricating oil, followed either by piston-ring leakage or friction, which results in an added load on the engine.

Improper adjustments are not as unusual as they should be, and ratings of the engine should be liberal enough to guard against trouble arising from this source. This can be done only in a measure, to be sure. No formula takes into account the human element, so that even if the rating of the engine is liberal, compensation cannot always be made for this fault.

SKILLED OPERATORS REQUIRED

Any or all of the above causes may create sufficient difficulty to give the impression that the Diesel engine is troublesome and unsatisfactory. Conservative rating will exclude all trouble arising from the causes as given. Such minor difficulties would, however, not cause serious results even where units are rated high, provided a skilled operator were in charge. It is unfortunate that more such operators are not available, for all that a well-designed unit needs (and this means an engine built by a concern with a long Diesel experience), is the attention of a careful and intelligent operator, systematic inspection, and immediate attention to parts that show weakness.

DIRECT-CONNECTED COMPRESSORS ADAPTED TO MINING WORK

Fig. 3 shows a plant in which four 1,250-hp. units are running. At the farther end of the power plant, and hidden behind the last unit, is a compressor direct-connected to a Diesel engine, which is interesting, as it is a development growing directly out of the mining

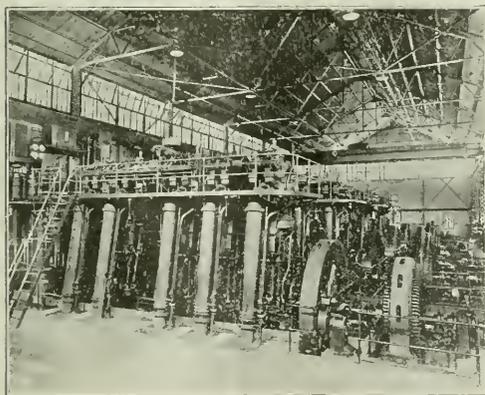

FIG. 3. A 5,000-HP. DIESEL ENGINE INSTALLATION

industry. The capacity of the compressor is entirely dependent upon the speed of the engine, as no variable-capacity devices are employed. In mining work, it is seldom that no air at all is required.

Stopping or starting even a large Diesel engine is not nearly as difficult as in the case of a steam plant, and can be done in much less time, so that if periods are encountered, even several times a day, where no air at all is necessary, the unit can be shut down. Such units are now built to vary between 70 and 180 r.p.m.,

which seems to be sufficient speed variation to suit the demand for air. The Diesel engine of this type, as should be remembered, must accomplish the same amount of work per stroke, whether running full speed or one-third speed, the requirements differing materially from those of the marine types, where the torque varies approximately as the square of the speed. The importance of uniformity of torque is immediately apparent, and the reason for the adoption of the two-cycle engine for this class of work is also clear.

The higher speed of 180 r.p.m. excludes the use of eccentric-driven valve gear on the compressor, so that a special feather valve was constructed, which has been entirely satisfactory. The capacity of the blast air compressor, which is direct-connected to the engine as shown in Fig. 2, determines the minimum speed of the unit. By supplying an additional amount of blast air the speed has been reduced to 56 r.p.m., when the exhaust just began to be visible. Inasmuch as the quantity of blast air varies with the speed, a special governor was designed which makes the engine entirely automatic.

The dimensions of the scavenging pump are the same as for a constant-speed engine, no changes whatever being made in the setting of the scavenging valves. The scavenging pressure varies from about 4 lb. per sq. in. at full speed to about 2 lb. per sq. in. at 70 r.p.m. The pressure of the compressed air also varies as the speed, dropping to a minimum of 330 lb. per sq. in. at 60 r.p.m., at which time the exhaust is invisible, and as even and regular as at full speed. These observations were made on a three-cylinder engine direct-connected to a 4,000-cu.ft. compressor.

CONSTRUCTION OF THE GOVERNOR

The governor employed for the regulation of the unit is a combination of an extremely static governor and an air plunger in communication with the receiver in the discharge line. The air plunger is frictionless, and is loaded by means of weights. In addition, a light spring is used to give a continually increasing load as the plunger is pushed out of its cylinder. This plunger is connected to the fuel-pump mechanism, so that, as it emerges, it decreases the fuel supply to the cylinder of the engine. As the static governor rises, it produces the same result.

In a well-designed Diesel engine driven compressor, the amount of fuel consumed is the same per stroke whether running at high or low speed, so that the mechanism controlling the fuel supply remains in practically a fixed position for all speeds. If the air pressure should drop, the air plunger will descend, giving more fuel to the engine, which immediately picks up speed. The speed governor then rises and cuts down the fuel until the speed is adjusted to correspond to the original fuel consumption. A constant pressure can be maintained with this type of governor with all variations in the rate of air consumption.

ONE POUND OF FUEL REQUIRED TO COMPRESS 1,000 CU.FT. OF AIR

A fuel consumption of slightly less than 1 lb. per 1,000 cu.ft. of free air compressed to 80 lb. per sq. in. has been realized during a test made on the 4,000-cu.ft. compressor described. This unit, as mentioned, is running at an elevation of 5,950 ft. It is interesting to note that the work of compressing 4,000 cu.ft. of air

is less at this elevation than at sea level. The fuel consumption is, however, slightly increased, so that the net result is an approximately constant fuel consumption of 1 lb. per 1,000 cu.ft. of free air. A commercial run covering thirty consecutive days of sixteen hours a day showed a consumption of 1,095 lb. per 1,000 cu.ft. compressed to 80 lb. per sq.in., which includes all the fuel oil used for starting, filling tanks, and leakage.

The compressor has a valve attached to the discharge pipe, which is open during the starting of the engine so that no air is compressed, and closed as soon as the engine is up to speed. The air compressed is determined from the counter reading. An elaborate test was made to determine the volumetric efficiency of the compressor, the weight of air being calculated both from indicator cards and from the flow through a fixed nozzle. In this way a factor was determined, which, if multiplied by the number of revolutions, would give the actual quantity of free air compressed.

COMPARISON OF DIESEL ENGINE WITH STEAM PLANT

In a comparison of the efficiency of a Diesel engine with that of a well-designed steam plant, probably no better illustration can be found than the results from two compressor plants, one operating with steam and the other with a Diesel engine. A very economical steam compressor plant built for the Champion Copper Co. was tested by Professor O. P. Hood, and the work described in the Transactions of the American Society of Mechanical Engineers, Vol. 28, p. 221. The Champion Copper Co.'s compressor has held the world's record for economy, despite the fact that conditions at the plant were unfavorable, as it was impossible to carry any superheat or the specified boiler pressure. The test showed an extremely good thermal efficiency. The steam pressure at the throttle valve was 243 lb. per sq.in., which was the basis for the determination of the number of B.t.u. delivered to the engine. The steam was very wet. The work delivered per million B.t.u. supplied was 194,930,000 ft.-lb.

Herewith are presented data taken from a test made on the air compressor plant built for the Phelps Dodge Corporation at the Burro Mountain Copper Co., Tyrone, N. M.:

AIR COMPRESSOR TEST

3 EG Diesel engine.
750 h.p.p. sea-level rating, direct-connected to a compressor.
Size of air cylinders, 19 and 33½ x 24.
Duration of test, 5 hours.
Total fuel consumed, 924 lb.
Total number of revolutions, 41,520.
M.B.F. referred to L.P. cylinder, 29 lb. per sq.in.
Average r.p.m., 138.6.
Maximum rated r.p.m., 180.
Work per revolution, 101,500 ft.-lb.
Fuel, per revolution, 0.022 lb.
Fuel temperature, 130°F.
Average air pressure, 88 lb. per sq.in.
Quality of fuel used, 19 EG.
B.t.u. content per lb., 19,100.
Duty for every million B.t.u. supplied, engine delivered
238,500,000 ft.-lb. of work, based on i.h.p. of air cylinder.

In the steam plant it must be remembered that the heat units are measured at the throttle, and the boiler-room and steam-pipe losses are not taken into account. Assuming these to be 20 per cent, the 195,000,000 ft.-lb. of work per million B.t.u. supplied dwindles down to about 156,000,000. In the Diesel plant, the duty given is based on the actual fuel delivered to the engine and the amount of work measured in the cylinders. The relative over-all efficiency can easily be seen from these figures.

To such an installation the Diesel engine is particularly well adapted. With a constant load to pull at all

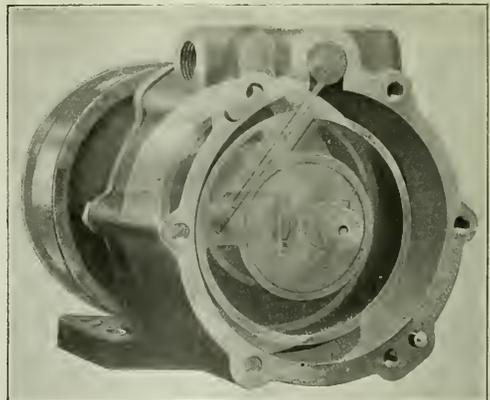

times, its rating can be made such as to be perfectly safe. No means of overloading it are available, so the factors mentioned earlier in this paper which affect the load-carrying capacity of the engine are not likely to cause trouble.

The speed of the compressor continually varies to suit the demand, which makes the average speed low, an advantage which cannot be overestimated. The amount of fuel burned per stroke is a constant and allows an adjustment of the supply of cooling water to be made which need not be changed and which reduces the possibility of overheating the jackets. Little attention need be given to the unit, as the necessity of supplying automatic devices to hold the blast-air pressure constant obviates part of the care necessary in ordinary Diesel plants.

A similar compressor is now being installed in the plant mentioned, the capacity of which is 6,400 cu.ft. of free air per minute, direct-connected to a five-cylinder engine. Further tests on this compressor will soon be made, and though it may not be possible to reduce the fuel consumption, there are other features which may be of interest and which can be discussed at some later time.

A New Pump With a Rolling Impeller

The construction of a new pump placed on the market by the Michigan Machine Co., of Detroit, Mich., under the name of the "Rollway" pump is shown in the accompanying photograph. Its principal working parts consist of two rollers which rotate eccentrically in the pump chamber. A spring is placed in the rectangular slot in the inner roller, which bears against the squared shaft.

INTERIOR CONSTRUCTION OF THE "ROLLWAY" PUMP

and which operates only when the pressure on the pump is as great as the pressure required to compress the spring. When this pressure is reached, the compression of the spring allows the rollers to come to the center of the pump, where they continue to revolve in the liquid without doing any pumping.

The "Rollway" pump is a positive one, but is also self-priming, and may be used within 10 ft. of the level of the liquid to be handled. Foreign matter will not clog it. The pump may be economically operated at speeds ranging from 100 to 600 r.p.m.

Geology of the Gogebic Range and Its Relation To Recent Mining Developments—Part II*

Contact Between the Two General Subdivisions of the Iron-Bearing Formation Is Well Defined—Members Composing Main Divisions Possess Distinguishing Characteristics and Can Usually Be Recognized, Although Contacts Are Gradual

By W. O. HOTCHKISS

State Geologist and Consulting Engineer, Madison, Wis.

WHEREVER exposed, either in mine workings or in drilling, the Ironwood formation is found to be made up of two major subdivisions. The contact between the two is always a sharp transition from a wavy-bedded ferruginous chert formation to an even-bedded, more or less heavily ferruginous slate. This contact differs from many of the other contacts between the chert and slate formations in that it is abrupt. In many cases the other contacts between the ferruginous slates and ferruginous cherts are marked by a gradual change, in which material of one character increases through a thickness of a few inches to several feet, whereas the other material decreases. The relations of these two major parts of the Ironwood formation are given in detail in the discussion of the Norrie member. For convenience of reference to these two portions of the formation the name Lower Ironwood is suggested for the basal part and Upper Ironwood for the upper part. These two portions of the iron formation correspond to what in the past have been called tentatively "South Belt" and "North Belt" in some of the work on the western end of the range.

Each of the main subdivisions of the Ironwood formation is made up of distinct members which can be recognized throughout the range wherever exposed in mine workings. The subdivisions of the Ironwood formation and the base of the overlying Tyler are as follows:

Tyler Formation.....	{	Graywacke slates. Iron carbonate slates. Pabst member, cherty and fragmental and ferruginous slate beds.
Upper Ironwood Formation..	{	Anvil ferruginous chert member. Pence ferruginous slate member.
Lower Ironwood Formation	{	Norrie ferruginous chert member. Yale member—interbedded ferruginous cherts and ferruginous slates. Plymouth ferruginous chert member.

Names have been given to the various members of the iron formation and the basal member of the Tyler to facilitate easy reference in discussing them. It is believed that the use of the names of prominent mines of the district for this purpose will be the most acceptable that could be suggested. The names used were selected with the purpose of showing mines where the particular member is well developed, but this was not always feasible, because the names of many of the mines are already in use as formation names in other localities.

The various members are distinguished by the characteristics described in the discussion of the difference between the beds. Three members—the Plymouth, Nor-

rie, and Anvil—are dominantly wavy-bedded granular or fine-grained ferruginous cherts; the Yale and Pence, which separate these three, are dominantly even-bedded ferruginous slates. In distinguishing these members in the mines it is not always easy to determine with engineering accuracy where the contact should be drawn. Many of the contacts are gradational zones, and any bed in these zones can be taken as the contact. Usually, however, there is little difficulty in identifying the contact within a few feet.

A reference to Fig. 17 will indicate the thickness of these members in various parts of the range. The numbered lines represent cross-sections along which the thicknesses of the various members have been measured horizontally, regardless of the inclination of the beds. In denoting the measurements it was thought best to depart from the usual custom of giving actual thickness of beds, and to adopt a method which is more convenient for the mining engineer, because of the fact that mine workings are on horizontal planes. The straight line from which the numbered cross-section lines extend is used to represent the base of the iron formation. Most of the sections measured were in crosscuts extending north from the foot wall. Such of them as are based on diamond-drill data have been reduced to the same system of measurement.

As the change in dip in the various parts of the range is comparatively slight, the sections shown in Fig. 17 will give comparative ideas of thickness of the beds. If actual thickness is desired, the distance given in the figure can be multiplied by the proper factor, assuming that the dip averages 60 degrees.

These various sections were taken as follows: (1) West side of Penokee Gap; (2) Tyler's Fork; (3) Atlantic mine approximately at No. 3 shaft, based on diamond-drill data; (4) Plumer shaft, 5 level crosscut; (5) Pence No. 2 shaft and diamond-drill hole; (6) Montreal No. 29 crosscut, 23 level; (7) Montreal No. 4 shaft, crosscut, 20 level; (8) Montreal No. 4 shaft, 8 level diamond-drill hole; (9) Ottawa 10 level, shaft crosscut; (10) Ottawa 14 level, crosscut near east end of mine; (11) Cary 19 level, No. 16 crosscut; (12) Windsor 8 level, No. 1 crosscut; (13) Ashland mine, 13 level, No. 9 shaft crosscut; (14) Norrie, combined from 14 and 17 levels, "A" shaft crosscuts; (15) Aurora 13 level, "E" shaft crosscut; (17) Davis 4 level, shaft crosscut; (18) Geneva 17 level, crosscut 350 ft. east of shaft; (19) Puritan 14 level, shaft crosscut; (20) Ironton crosscut 500 ft. east, on 17 level; (21) Ironton crosscut 1,860 ft. east, on 17 level; (22) Yale No. 1 shaft crosscut, 11 level; (23) Colby 9 level, No. 2 shaft crosscut; (24) Tilden 9 level, No. 6 shaft crosscut; (25) Tilden 23 level, No. 10 shaft, crosscut 1,250 ft. west of shaft; (26) Tilden 14 level No. 10 shaft, crosscut 180

*Part I was published in the *Journal* of Sept. 13, 1919.

ft. east of shaft; (28) Eureka 15 level, No. 2 shaft crosscut, and (29) Mikado, mostly from diamond-drill foot wall.

The Plymouth member of the iron formation is of particular interest because it is the one from which has come most of the iron ore mined on the Gogebic Range. In character it is predominantly a granular ferruginous chert, with some fine-grained chert beds. It is made up of a number of different beds, which

bed of the Ironwood formation. Its contact with the quartzite below is abrupt, and is noticeably irregular in such a manner as to indicate conclusively that an erosion period intervened between the deposition of the quartzite which forms the foot wall and the deposition of the Ironwood formation. The character of this thin introductory bed varies from quartzite in which the chert is present only as the filling of the spaces between the sand grains to a clear fine-grained chert in which there are only a few quartz grains. In mine maps this

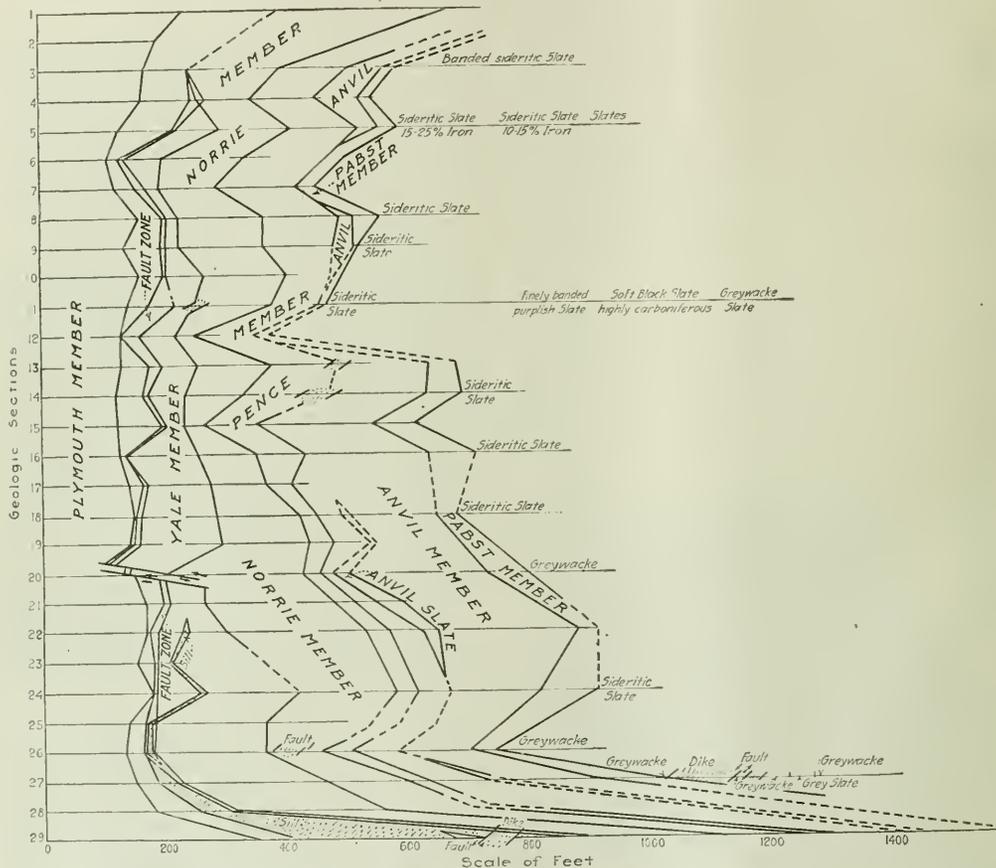

FIG. 17. TWENTY-NINE MEASURED GEOLOGIC SECTIONS ILLUSTRATING THE CORRELATION AND CHANGES IN THICKNESS OF THE VARIOUS MEMBERS OF THE IRONWOOD FORMATION

The line at the left represents the base of the formation. The top section is the westernmost, at Penokee Gap, and the lowest one in the figure is farthest east, in the Mikado mine.

could doubtless be mapped if sufficient time were given to the study.

The lowest part of the member is a thin cherty quartzite, which is sometimes present at the base. It is occasionally as thick as five feet, and rarely reaches a thickness of ten feet. Like the true foot-wall quartzite, it is chiefly composed of rounded sand grains, but it differs in being cemented with chert, rather than with the crystalline silica, which is the characteristic cement in the true Palms quartzite foot wall. Wherever it is present, this cherty quartzite makes the southernmost

bed, where present, is always included with the main quartzite as a part of the foot wall.

Succeeding this cherty quartzite bed, or, in the absence of the cherty quartzite, lying directly upon the Palms quartzite, is a gnarled concretionary jasper and jasper conglomerate. This bed is present in all places where the foot wall of the formation is seen. In some cases the conglomerate nature is strongly evident and in other places almost lacking. Sometimes the red color, a characteristic of jasper, is lacking, and the bed is light gray, or greenish gray in color. Frequently in the

mines, and particularly in the vicinity of orebodies, its distinctive characters are almost wholly lost because of the extensive alteration. This bed is from one to four or five feet in thickness throughout the central portion of the range from the Plumer mine to the Eureka. At Penokee Gap it becomes eight or ten feet in thickness, and at the Mikado mine its thickness increases to forty feet. What is believed by some to be the equivalent of this same jasper in the mines to the east of the great Sunday Lake fault attains a thickness of over 100 ft. Other observers believe this 100 ft. of ferruginous chert to be the equivalent of the whole Plymouth member. I am inclined to agree with the latter, but I should hesitate to state my views positively, because of my meager acquaintance with the formation east of the great Sunday Lake fault.

"FOOT-WALL SLATE" SHOWS CONSIDERABLE OXIDATION

Succeeding the gnarled conglomerate jasper above described there is present almost everywhere in the lower part of the Plymouth member what is known as the "foot-wall slate." This is a heavily ferruginous slate in most places, and usually, where seen in the mines, is thoroughly oxidized so that it is red in color and soft in character. In common with the jasper below it, this slate increases in thickness in the east and west sections shown in Fig. 17. At Tyler's Fork there are ten feet of this slate, with nearly twenty feet of a gradational zone between it and the granular chert beds above. In the Mikado mine it is nearly thirty feet in thickness. On the 23 level of the Brotherton shaft there are two feet of slate about twenty feet north of the quartzite which may be correlated with the "foot-wall slate" in the mines west of the Sunday Lake fault. In most of the mines the slate has a maximum thickness of only two or three feet, and in some cases it becomes so thin that it practically disappears. In almost all cases, however, a thin soft seam is present, which can be correlated with the foot-wall slate.

Above the foot-wall slate appears the main granular ferruginous chert of the Plymouth member. These granular chert beds are excellently shown at Tyler's Fork and at Penokee Gap, in natural exposures, and at the Plymouth and Wakefield open pits, where the mine excavations give an opportunity to view this member. The individual beds vary in thickness from a small fraction of an inch to three or four feet. Alternating with the chert beds are beds of iron oxide of varying thickness, seldom more than an inch, but in a few cases reaching a foot. The iron content of these chert beds is largely in the hematite beds just mentioned. In the chert beds themselves, granules of hematite and minute crystals of magnetite are sometimes so abundant as to make up the major portion of the bed. However, much of the iron is present in the thin layers or beds between the beds of granular ferruginous chert. From this statement it is to be observed that where the bedding is thick, and these bedding planes are far apart, the iron content is likely to be considerably lower than in those where the bedding planes are close together and beds are thin.

Certain rather consistent general tendencies as to thickness of bedding characterize various parts of this granular chert portion of the Plymouth member. The lower part of it, for distances varying from twenty to sixty feet from the foot-wall slates, is frequently characterized by beds one to five or six inches in thickness,

with rather heavy beds of iron oxide separating them. North of this in many sections there is observed a tendency on the part of the chert beds to become much thicker and more massive, and the separating beds of iron oxide to become thinner. This massive phase of the chert is frequently also fine-grained chert, rather than the distinctly granular variety. The thickness of this massive chert is exceedingly variable. In some cases the chert is entirely lacking, and again it has a thickness of fifty or sixty feet. Above it to the north usually occurs the thinnest bedded portion of the wavy-bedded cherts of the Plymouth member. In this portion the chert bands are seldom more than an inch, and oftentimes less than a quarter of an inch, in thickness, and the beds of iron oxide separating the chert beds are approximately of the same general thickness. This thin-bedded portion usually constitutes the uppermost part of the Plymouth member, but in some cases toward the top the chert beds again become thicker.

Near the top of the Plymouth member from the Davis mine west, either just at the top or within ten or twenty feet of it, there is a rather striking bed of yellow flinty chert which is more or less conglomeratic.

East of the Davis mine in approximately the same part of the Plymouth member there is found a thin horizon containing thin beds of brilliant red jasper, which also is somewhat conglomeratic. This yellow flint bed at the west end and the jasper bed at the east end are probably equivalent beds. In no places were the two found together. This striking distinction of color and flinty character in a member which contains practically no other flinty chert beds makes them particularly valuable as horizon markers.

In the Penokee Gap and Tyler's Fork exposures a short distance above the foot-wall slates some thin beds of granular red jasper are found, usually two or three inches in thickness, but occasionally reaching a thickness of a foot or more. West of the Davis mine these red jasper beds and the bed below the foot-wall slate are the only occurrences of red jasper seen in the Plymouth member. East of the Davis mine, however, the granular ferruginous chert of this member shows a fairly large amount of red granular jasper. The red granular jasper differs from the granular chert in character only in the fact that the individual grains are in large part jasper grains. This increase of granular red jasper toward the eastern end of the range is characteristic of all members of the Ironwood formation.

The transition to the Yale member is marked by a rather abrupt gradation from the fine-grained chert (which often succeeds the yellow flinty chert) to a ferruginous slate. The gradation beds are usually less than one foot in thickness.

THE YALE MEMBER

In the Yale member are grouped a number of beds of even-bedded ferruginous slate and wavy-bedded ferruginous chert, each of which is distinct from the adjacent beds, and which occupy the middle part of the Lower Ironwood formation. The base of the Yale is taken as the base of the first ferruginous slate, lying from 100 to 350 ft. north of the foot wall, as shown in Fig. 17. The top is less definite, but is taken as the top of the slate bed 60 to 150 ft. north of the base of the member in the western and central parts of the district, but at a much greater distance north at the eastern end of the range.

Closer study would almost certainly result in dividing the Yale member into several separate members. The best that could be done in the short time available for study of the Michigan end of the range was to group and name as a single member these slates and the included chert beds which lie between the Norrie and Plymouth members. In Wisconsin, where a more detailed study has been made, three slate beds can be traced definitely throughout the various mines and the various levels of each mine, with no considerable difficulty excepting where the great bedding fault has pinched one of them out. These separate slate beds are relatively thin, and vary individually from only three or four feet to thirty or forty feet in thickness. It is entirely possible that they represent discontinuous lenses which cannot be followed throughout the whole range, but it is believed most probable that some of the thicker ferruginous slates represent general conditions sufficiently that a careful study would show them to be continuous from one end of the range to the other. This, however, remains for more extended work to prove or disprove. Whether continuous beds or discontinuous lenses, they are sufficiently abundant to make the Yale member dominantly a ferruginous slate.

By referring to Fig. 17, it will be noted that the great bedding fault lies almost entirely within the Yale member. In some cases, as in Sections 3 and 4, the bedding fault lies in the extreme top of the Yale member and extends even into the cherty Norrie member above it. In Sections 12, 18, 19, 22, and 24, it will be noted that the great bedding fault lies along the lower side of the Yale member. For the major portion of the length of the range, however, this fault follows one of the thickest and best-developed of the ferruginous slate beds in the Yale member, the middle one of the three ferruginous slates of the Yale in Wisconsin. This is a finely laminated ferruginous slate, which, in its less altered form, is a black, slaty iron carbonate, containing so much fine, disseminated, black carbon as to have a graphitic appearance in many places. In its altered form this black slate is no longer black, but is stained red by the iron oxide, exactly as are the other ferruginous slates in this member. Usually, however, its more finely laminated character offers a fairly satisfactory means for distinguishing it.

ABSENCE OF CARBON IN SLATE BEDS

In no case were the other slate beds in the Yale member observed to contain carbon or to have a black appearance similar to the slate previously described. In their original form they are likely to be rather pure; gray, slaty iron carbonate, either free from or having moderate amounts of thin-bedded flinty chert. The oxidized phases are soft and red and not so thinly bedded as the black slate above described.

West of Section 17 in Fig. 17 the upper slate bed of the Yale member is generally free from chert. In the Davis mine and eastward the top of the Yale member is taken as the north side of a thinly and evenly bedded part of the formation which is marked by $\frac{1}{2}$ -in. to $\frac{1}{4}$ -in. flinty chert bands, separated by about equal thicknesses of hematite. This part of the formation is described as "platy" in character, because of the thin, even, continuous beds of flinty chert. My observations have not gone far enough to make sure as to whether these platy beds really belong with the slates of the Yale member, or whether, because of their great chert content, they

should be included with the Norrie ferruginous chert. On account of their even-bedded character, which is in marked contrast with the decidedly wavy beds of the Norrie, it has seemed best to include them in the Yale member.

The ferruginous chert beds which lie between the ferruginous slates in the Yale member are diverse in character. Throughout most of the district they are largely of the fine-grained wavy-bedded type, and either dull brown or a pale greenish gray in color. East of the Davis mine these ferruginous chert beds, like all the rest, begin to show increased amounts of red granular jasper, sometimes in scattered grains in ordinary granular chert and sometimes making up the whole of an individual layer.

In some parts of the ferruginous slates of the Yale member flinty cherts are found. These are particularly characteristic of the transition stages from the ferruginous slates to the ferruginous cherts. The transition zone at the top of the black slate is frequently characterized by a number of one-half-inch to two-inch beds of clear, glassy black flint. Most of the ferruginous chert beds in the Yale member are characteristically low in iron content, and the individual beds are likely to be rather thick. Some of them have a thickness of as much as four or five feet. This is mostly the case with the brown and green fine-grained cherts.

The transition from the southernmost slate of the Yale member to the Plymouth member is usually somewhat abrupt. In some cases, however, it is apparently gradational in character. The transition from the upper slate in the west and the platy flint in the east to the Norrie member is almost always gradational. The possibility is suggested that the Yale member may be separated from the Plymouth member by an interval of moderate erosion. On this possibility, however, little evidence has been accumulated. The relation of the Yale member to the Norrie member is such as to suggest continuous deposition and an entirely conformable relation.

The thickness of the Yale member measured horizontally varies from about 65 ft. in the Ottawa mine, as shown in Section 8 of Fig. 17, to 370 ft. in the Eureka mine, as shown in Section 28 of the same figure. To a large extent this increase in thickness is due to increased thickness of the platy flint beds.

THE NORRIE MEMBER

The Norrie member is made up almost wholly of wavy-bedded granular and fine-grained ferruginous chert, with hematite in beds and grains exactly as in the Plymouth member. The thickness of the individual beds varies considerably from place to place in this member, but there is in general in the lower part of the Norrie a heavily ferruginous, moderately thin-bedded part, succeeded by rather massive, thick-bedded, fine-grained chert, which has low iron content. In most places where it is known, the upper part of the Norrie member is thin, wavy-bedded, heavily ferruginous chert. In places where the Norrie member is thicker than usual there is oftentimes found at the very top a massive, thick-bedded, fine-grained, green chert, which alters in spotted fashion, giving an appearance which has been described as "worm-eaten chert." These leached spots are usually a quarter to an eighth of an inch in diameter.

East of the Davis mine the thin-bedded upper part of

the Norrie contains numerous thin beds of ferruginous slate, which vary from a few inches to one foot or two feet in thickness. The thickness of the Norrie member is as little as 30 ft. in the Windsor mine and becomes as great as 230 ft. in the Yale mine. Fig. 17 shows that the Norrie member varies greatly in thickness in short distances. In some of the crosscuts across the formation the Pence member apparently cuts out the upper beds of the Norrie member, leaving only a few feet of the lower portion.

Marking the top of the Norrie member in a pronounced fashion in the western end of the district, but somewhat less noticeable in the eastern part, is a thin conglomerate made up of flat pebbles of a considerable variety of phases of the iron-formation material. Associated with this conglomerate bed is often found several inches of granular red jasper having a decidedly fragmental appearance. This granular jasper, rather than conglomerate, is the usual phase found east of the Ashland mine.

The considerable variation in thickness of the Norrie, the difference in the character of its uppermost beds, where it is thick, from those which make the top, where it is thin; the abrupt transition in character of beds from Norrie to Pence, and the occurrence of a conglomerate or of a fragmental appearing granular jasper, are all facts which indicate an erosion interval succeeding the deposition of the Norrie and preceding the deposition of the Pence. Though little can be said of the duration of this period, it was probably relatively short compared to the erosion period between the granite and the Palms, or that between the Anvil and the Pabst members.

THE PENCE MEMBER

The Pence member is an even-bedded, thin-bedded ferruginous slate. Practically wherever seen the transition is abrupt from the wavy-bedded ferruginous cherts of the Norrie member, with its beds oftentimes as much as three or four inches in thickness, to the strikingly even-bedded, very thin-bedded Pence member. The conglomerate which marks this transition has been discussed under the Norrie member. West of the state line, where the Pence member is thickest, at the top of the Pence there is a gradation upward into a massive, brown, fine-grained, ferruginous chert, which is sometimes twenty or thirty feet in thickness, but, even though this brown chert is rather thick bedded, the bedding planes show a striking parallelism.

In some parts of the range, more particularly the eastern, the Pence member was apparently, in its original condition, a fairly pure iron carbonate rock with comparatively little magnetite or hematite present excepting in a few localities. In the Wisconsin part of the range, however, are numerous localities where this slate, as seen in its unaltered condition, is to a large extent made up of grains of hard blue hematite with a fair proportion of magnetite.

The chert present in the Pence member seems to vary considerably in moderately short distances. In some parts of a single mine this member is comparatively free from chert, and in other parts certain portions of the member will show an abundance of thin, continuous, flinty chert plates an eighth to a quarter of an inch in thickness. These flinty chert plates or bands are usually of a clear greenish gray or light yellowish gray in color. Where the formation is altered to any

extent, these clear flint bands easily disintegrate into a white chalky chert, which can be crumbled in the fingers like a soft blackboard crayon. Certain beds of this chalky chert make excellent markers for identifying horizons and are especially useful when working out a faulted condition. In the mines on the Wisconsin end of the range, where this member is thickest, about 60 to 80 ft. from the base of the member there is a horizon frequently marked by a number of thin bands of red jasper, which also serve to identify this part of the formation.

Fig. 17 shows that on the western end of the range, the base of the Pence member is found at distances from the quartzite varying from 260 to 400 ft. In the Norrie, Aurora, and Pabst mines it is 300 to 400 ft. from the foot wall, and is known as the "350-ft. slate." In the Yale mine, Section 22 of Fig. 17, it lies 550 ft. from the quartzite, and is called the "550-ft. slate." By tracing the Pence member between these two points it is found that the "350-ft. slate" of the Norrie is the same as the "550-ft. slate" of the Yale, and the "550-ft. slate" of the Norrie is the same as that which lies nearly 900 ft. north of the quartzite foot wall in the Yale.

On the Wisconsin end of the range, the Pence member varies from 80 to 130 ft. in thickness. This thickness continues fairly uniform eastward to the Davis mine, where there is a rather sharp decrease to a thickness of twenty-five to forty feet. All through the eastern end of the range the member will average close to thirty feet in thickness. The top of this member grades with a comparatively small thickness of beds into the granular jasper and granular chert of the lower part of the Anvil member. The Pence member in many localities contains sufficient magnetite to give a magnetic line when tested with the dip needle.

THE ANVIL MEMBER

The lower part of the Anvil member is everywhere composed of wavy-bedded granular chert and granular jasper, with frequent conglomeratic beds. The upper part of the Anvil is much less granular and conglomeratic, and contains more wavy-bedded flinty and fine-grained chert. This member is like the other chert members of the Ironwood formation in that granular jasper is more abundant toward the eastern end of the range. Toward the western end of the range the proportion of granular chert increases and the jasper is relatively insignificant in amount. On referring to Fig. 17 it will be noted that this formation is present in Sections 3, 4, and 5 and is missing in Section 7; is again present in Sections 8 and 9, and then does not appear again until Section 13 is reached, from which point it is continuous to the Mikado mine and probably beyond that to the great Sunday Lake fault, which offsets the formation east of the Wakefield and Mikado mines.

In the western end of the district the maximum thickness shown is in Section 4, where it attains seventy feet. It reaches a maximum thickness of about 300 ft. in the eastern portion of the district around Sections 20 to 22. Farther east, in the Mikado mine, its total thickness was not penetrated in the drill hole from which the section was made. In Sections 18 to 22, 27, and 29 there appears a lens of slate (called the Anvil slate in Fig. 17), which is exactly similar in character to the Pence member in the same sections. Above this slate the formation is almost invariably possessed of a high iron content and of a porous character which makes it a favorable place for that extreme alteration

of the formation which results in orebodies. It is in this member that many of the large "hanging-wall" orebodies have been found in the last few years.

THE PABST MEMBER OF THE TYLER FORMATION

The transition of the Anvil member to the overlying Pabst member is almost invariably an abrupt one. In the eastern end of the range, where the Anvil member is thickest, it is usually followed by a thin carbonate slate, but in the western portion, where the formation has nearly all been eroded away, the transition is usually marked by the beginning of conglomerate and the granular jasper associated with it.

The Pabst member can hardly be defined with accuracy, because of the scarcity of information concerning it. It is known in few places except in diamond-drill holes, and whether it should include the whole of the heavily ferruginous basal portion of the Tyler formation, or be limited to the dominantly cherty portions of this, it is difficult to determine. As drawn in the sections of Fig. 17, it includes only the dominantly cherty parts of the lower portion of the Tyler formation. The slates above this, in some cases for 300 ft., carry considerable percentages of iron in the form of iron carbonate, and probably when sufficient information becomes available should be given a definite name.

The relations of the Pabst member to the formations below are unconformable, and indicate an erosion interval between the deposition of the Anvil member and the beginning of the deposition of the Pabst member that probably was of considerable duration. This is shown by the fact that the Pabst member cuts across and covers at least two relatively small residual areas of the Anvil formation which are entirely separated from the main portion of this formation on the east—indicating that the Anvil member was entirely eroded in places—and also by the universal presence of conglomerates and coarse fragmental deposits in the Pabst member.

From the Norrie mine east the introductory bed of the Pabst member is a thin-bedded, somewhat slaty iron carbonate, which varies from a few feet in thickness up to thirty feet or more. Succeeding this there is usually a bed varying from a few feet up to thirty or forty feet in thickness, which is obviously conglomeratic and fragmental in its nature. This bed varies decidedly in character. In some places it is made up almost entirely of irregular and rounded fragments of iron oxide and is rich enough to be mined for ore. This is called the "fragmental ore horizon" in many of the mines. In other occurrences it is made up almost entirely of fragments of chert and slate, and in still other places it is chiefly fragmental granular jasper. In all its occurrences it is highly variable in character and likely to be interspersed with thin, slaty, flinty, iron carbonate lenses or even impure quartzite lenses. In some places these impure quartzite lenses attain a thickness of thirty or forty feet. One section of the Pabst member, measured in the Tilden mine, is given in detail as follows, beginning at the base and measuring northward:

0 to 22 ft., dense hard ferruginous slate, thinly bedded and evenly banded, and showing much magnetite in tiny crystals scattered throughout the rock.

22 to 37 ft., conglomeratic red granular jasper, with a matrix of hard, red and blue hematite.

37 to 41 ft., granular jasper and red, coarsely crystalline iron carbonate.

41 to 46 ft., mixture of alternating thin bands of impure quartzite, fine-grained massive iron carbonate and granular jasper.

46 to 51 ft., dense, hard, amorphous, greenish-gray iron carbonate.

51 to 52 ft., conglomerate of flat flint pebbles in a matrix of chert and hematite.

52 to 63 ft., dense brown flint, evenly and thickly banded, and amorphous unoxidized iron carbonate. Top of Pabst member.

63 to 67 ft., black iron carbonate slate, very evenly and thinly bedded, and moderately hard.

The foregoing section gives a good picture of the rapidly alternating conditions under which the Pabst beds were deposited. The only places on the west end of the range where the introductory slaty iron carbonate bed of the Pabst has been found are in a drill hole a short distance west of the Pence shaft and in one cross-cut in the Plumer mine. The section from the Tilden mine described above shows an assorted condition of the materials which is much better than is characteristic farther to the west. In the west the Pabst beds are usually a mixture of all of the materials which have been separated into more or less distinct beds in the Tilden section. The Pabst member usually contains enough magnetite to be followed readily with a dip needle.

THE IRON CARBONATE SLATES

North of the Pabst member the iron carbonate slates of the Tyler formation are known for varying thicknesses up to 300 ft. in a few drill holes and in outcrops along Black River. They are very thin, even-bedded carbonate slates similar to the ferruginous slates in the Yale and Pence members. In the region of the Montreal and Plumer mines these sideritic slates contain 20 to 25 per cent of iron, with an occasional analysis as low as 15 per cent for about 150 ft. north of the Pabst member. North of this there is a rather abrupt change to an iron content of about 12 to 15 per cent, with some analyses down to 10 per cent. This continues for another 150 ft., and then there appears the soft gray slate, with only about 5 per cent of iron. Section 11 of Fig. 17 shows to the north of these carbonate slates finely banded, somewhat purplish gray slates, which, in turn, are succeeded about 150 ft. farther north by soft, black, highly carbonaceous slates. These slates seem to be fairly persistent and continuous farther to the west, and their soft character is frequently indicated in the topography by a depression. To the east of this section little is known of the character of the slates this far north of the Pabst member.

UNCONFORMITIES

There are unconformities marked by conglomerates and fragmental deposits at the base of the Plymouth, the base of the Pence, and separating the Anvil from the Pabst member of the Tyler graywacke slate formation. Similar unconformities have been described in other iron ranges of the Lake Superior district, but too little detailed work has been done upon them to make it possible to make proper correlations.

The unconformity between the foot-wall quartzite and the iron formation is not marked by a large amount of erosion, so far as facts are available at present. The quartzite phase of the Palms is everywhere present, and its thickness does not vary over 75 ft., a variation that may be due to original deposition or to erosion.

The unconformity between the Norrie and Pence members possibly represents the erosion of 150 ft. of beds—not a large thickness and probably indicative of a brief erosion interval. Part of this variation in thickness may be due to differences in original thickness, but not all of it. This also represents a brief period of erosion.

The longest period of erosion is that between the deposition of the Anvil member and the beginning of the deposition of the Pabst. The Anvil member is known to vary from nothing to 375 ft. in thickness, and it is probable that this whole variation is due to erosion. This fact and the invariable conglomerate at the base of the Pabst mark this also as probably the longest erosion interval; in other words, the greatest unconformity at present known between the base of the Palms and the base of the Keweenawan.

The conglomerate near the top of the Plymouth member, or at the base of the Yale, is not known to represent any appreciable period of erosion, but it is possible that it may, and evidence on this point should be sought in future work.

There is little doubt that other minor unconformities such as those described would be found in the Tyler graywacke slate if exposures or drilling were sufficiently abundant to show them up.

More detailed work must be done on the Gogebic Range and on all other Lake Superior iron ranges before it can be stated whether or not any of these apparently minor unconformities will necessitate a revision of the present correlation of the Lake Superior Huronian formations.

(To be continued)

Ray Consolidated Copper Co.

The thirty-second quarterly report of the Ray Consolidated Copper Co., covering the second quarter of 1919, states that the gross production of copper in concentrates for the quarter is as follows:

RAY CONSOLIDATED COPPER CO. COPPER OUTPUT, SECOND QUARTER, 1919	
	Pounds
April	3,756,371
May	3,807,538
June	3,742,209
Total	11,306,118
Average monthly production	3,768,706

In addition to the copper derived from the concentrating ores, 361,583 lb. of copper was contained in ores sent direct to the smelter, making the total gross production from both sources for the quarter 11,667,701 lb., as compared with 12,471,729 lb. for the previous quarter.

During the period under view there were milled 391,500 dry tons, averaging 1.827 per cent copper. This tonnage corresponds to a daily average of 4,302 tons, as compared with 4,891 tons for the first quarter. The mill extraction was 79.06 per cent of the total copper contained in concentrating ores, as compared with 77.88 per cent for the previous quarter. The underground development was 3,437 ft., making the total development to date 692,065 feet.

The milling cost was \$1.23 per ton, as compared with \$1.20 for the previous quarter, both exclusive of Federal income and excess-profit tax. The average mining cost of ore milled for the quarter was \$1.63 per ton, of which 4.96c. was the cost of coarse crushing, leaving the net mining cost \$1.58 per ton, as compared with \$1.64 for the previous quarter, both exclusive of income and excess-profit tax.

The average cost per pound of all net copper produced for the quarter was 14.64c. This figure does not take into account credits for the value of the gold or silver, nor for miscellaneous income, and compares with a cost of 15.15c. similarly calculated for the previous quarter. These costs include a charge of 15c. per ton of ore milled for the retirement of mine development expenses, but are exclusive of estimates for Federal income and excess-profit taxes. Miscellaneous income for the quarter, including net receipts from gold and silver produced, amounted to 2.72c. per lb. The financial results of operation for the quarter are:

FINANCIAL STATEMENT, RAY CONSOLIDATED COPPER CO., SECOND QUARTER, 1919	
Net operating profits	\$18,275.04
Miscellaneous income	298,090.34
Total	\$316,365.38
Disbursement to stockholders	788,589.50
Net deficit for the quarter	\$472,224.12

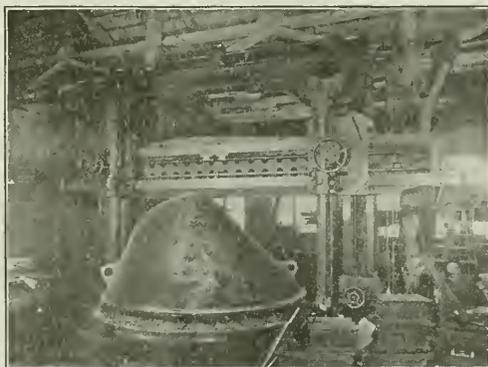

This statement compares favorably with that of the previous quarter, for which the net deficit was \$940,887.55.

The average carrying price of copper for the quarter was 14.80c., as compared with 13.13c. for the previous quarter. A quarterly distribution to stockholders of 50c. per share was paid June 30, and amounted to \$788,589.50. Total of such distributions from the beginning of the company's operations to the end of the second quarter of 1919 amounted to \$22,258,262.67.

The output for the quarter was approximately 50 per cent of normal. Operating conditions have become adjusted to the lesser production, accounting for the decrease in the cost per pound as compared with the previous quarter. During this period, the plants have been kept in readiness to return, upon short notice, to full capacity.

A Large Boring Mill

The photograph shows a large boring mill in the Worthington Pump & Machinery Corporation plant at Cudahy, Ill., turning out a top for a 12-ft. diameter copper converter. This top has a maximum diameter of

A 12-FT. DIAMETER COPPER CONVERTER IN COURSE OF COMPLETION

13 ft. 6 in. and weighs approximately 18,000 lb. The casting is of steel and is arranged to be lined with brick when placed in use. The boring mill is capable of handling work up to 24 ft. in diameter.

Notes on Troubles From Colloids in Flotation

Review of the Opinions of Flotation Experimenters on the Subject—Advantage of the Presence of Granular Sand—Physical and Chemical Theories—Effect Of Metallic Iron in the Ore Pulp

SOME notable papers dealing with the effects of colloids on flotation have recently been published. The phenomenon is well known to every operator of the flotation process. It consists in the fact that otherwise good flotation ores cease to be amenable to treatment by the process when they contain more than a certain amount of matter of a colloidal character.

The term "colloidal" may require defining. A. Schwarz¹ calls attention to the formation of colloids from the flotation oils, tars, and like substances, and objects to the term "colloid" applied to ore slime. Though the dispersion of such slime may not be fine enough to fall strictly into the "colloid" class, the word is used here in a broader sense, as it has been employed by many others without implying any assumption about the fineness and the degree of dispersion.

The action of the colloidal material, which exists in all ores to a varying extent and which is produced by the natural decomposition of the ore deposits, has so far received the greatest attention. The phenomenon has occasionally been described as an influence of the primary slime on flotation.² Although slime formed by the crushing of the ore in the milling process (secondary slime) generally shows the characteristic action of the primary slime to a much smaller extent, it has recently been definitely established, through work on molybdenum ore carried out by Will H. Coghill for the U. S. Bureau of Mines, that it may also be decidedly harmful.

How much the flotation qualities of an ore vary with the presence or absence of primary slime is shown in a table given by Rudolf Gahl, representing the flotation qualities of the different screen-sizes of an ore:

SCREEN-ANALYSIS OF ORE DRAWN FROM MILL BINS AND FLOTATION TESTS OF DIFFERENT SCREEN-SIZE:

Screen Size	Per Cent by Weight	Cumulative Per Cent	Per Cent Total Copper	Copper Contents	Per Cent Oxidized Copper	Contents Oxide Copper	Flotation Results Per Cent Total Copper	Tails	Mids. + Conc	Recovery Per Cent
+ 1 inch.....	8	8	0.05	0.324	0.13	0.40	0.22	12.8		70.5
+ 4 inch.....	17.1	47.9	1.34	0.229	0.11	0.19	0.22	17.4		64.7
+ 4 mesh.....	23.0	70.9	1.44	0.332	0.12	0.23	0.17	17.1		89.0
+ 8 mesh.....	4.3	75.2	1.42	0.061	0.12	0.05	0.17	16.3		88.8
+ 14 mesh.....	5.1	80.3	1.77	0.068	0.13	0.07	0.26	16.8		86.7
+ 28 mesh.....	4.1	84.4	2.14	0.080	0.14	0.06	0.61	16.3		74.3
+ 48 mesh.....	3.1	87.5	2.62	0.081	0.19	0.06	0.72	11.3		77.5
+ 100 m. sh.....	2.4	89.9	3.29	0.079	0.24	0.06	0.63	22.5		83.1
+ 200 mesh.....	2.0	91.9	3.16	0.063	0.27	0.05	0.60	20.1		83.5
- 200 mesh.....	8.1	100.0	1.53	0.124	0.43	0.35	1.57	1.48		
Average			1.44	1.441	0.16	0.157				

The various screen products were reduced to a fineness permitting their treatment by flotation and then tested in laboratory flotation machines. The inference may be drawn from the table that none of the sizes from which the primary slime had been removed offered difficulties in flotation, though the screen-size in which it collected did not yield to flotation at all.

In a paper issued by the Bureau of Mines³, Frederick G. Moses explains the phenomenon by pointing out that

the relations between gangue and economic mineral on the one side, and water and oil on the other side, are materially changed by the introduction of colloids, and that, therefore, the flotation qualities of the pulp which depend on these forces are changed also. Similar effects on the molecular surface forces are traceable to physical sources like heat, or to osmotic and electrical influences resulting from the addition of electrolytes. The benefit derived from heat and the addition of salts may therefore, it is reasoned, be ascribed to their action on the surface forces. This explanation, if used as a working hypothesis in experimental work, may well be the means of securing a clearer insight into the basic principles of the flotation process.

GRANULAR SAND AS A REMEDY FOR SLIME TROUBLES

The deleterious influence of primary slime on flotation is too well established to be doubted; it is a fact that many flotation operators know only too well. A question exists, perhaps, regarding the relative damage which it does. Moses mentions that when such slime is diluted by sand its effect is masked. This may be construed to mean that the slime is just as bad after the mixing as before, but it does not appear that Mr. Moses intends to state this, because in another place in his paper he mentions the possibility of mixing the refractory slime with granular ore as a remedy. "Masking" the effect of a harmful ingredient by mixing it with normal ore would certainly be the last thing the metallurgist should do, unless the mixing had other advantages.

PEARCE'S WORK ON THE RETARDATION OF SAND

Questions along similar lines are discussed in another article written by Jackson A. Pearce.⁴ Mr. Pearce, like others, has tried to utilize the known facts regarding colloids, and describes a flotation machine which he built with the object of retarding the passage of sand through it, thereby increasing the proportion of sand to slime which exists in the machine. This proportion, it is needless to say, may be quite different from the proportion that exists in the ore fed to the machine or leaving it. He seems to feel reasonably sure that the success of his machine, which made it possible to treat ores that were refractory in other machines, is due to the application of this principle.

QUESTION OF FLOW SHEET

The combined treatment of sand and slime in a flotation machine, although it seems to be the correct method for the treatment of some ores, cannot claim to serve for all ores, for though it apparently presents advantages for the recovery of refractory fines, it offers the drawback that it introduces coarse grains, which are naturally difficult to lift, into a medium which itself may be quite refractory. In cases where emphasis has to be placed on the best recovery of the coarse mineral grains, it seems to be the best course to treat such granular

¹Chem. & Met. Eng., Vol. 19, 1918; p. 701.
²Rudolf Gahl, "History of Flotation at Inspiration," Trans., A. M. E., Vol. 55, 1917; p. 576.
³Technical Paper No. 200, U. S. Bureau of Mines, "Colloids and Flotation."

⁴Min. & Sci. Press, Vol. 117, No. 15; Oct. 12, 1918; p. 491.

material separately and to avoid all contamination with colloidal matter. This procedure, previously recommended by Rudolf Gahl for certain cases, is also advocated by Mr. Pearce, and apparently practiced by him.

As far as the selection of the proper flow sheet for a certain ore is concerned, it seems to be preferable to treat the combined sand and slime, if no serious difficulties are encountered in the recovery of the coarse mineral, and to provide separate treatment if the flotation of the coarse grains is difficult, provided that the slime by itself is not refractory. In other cases a combination treatment would seem to be the logical solution.

ARE THE PHYSICAL OR THE CHEMICAL QUALITIES OF PRIMARY SLIME RESPONSIBLE FOR ITS ACTION IN FLOTATION?

Although there does not seem to be any doubt that the colloidal primary slime is decidedly harmful in flotation operations, it is not absolutely established that the colloidal properties are what causes the trouble. For it is a fact that that portion of the ore also differs in other qualities from normal ores. The ore freed from slime, for instance, when brought into contact with the mill solution, may give up hardly any soluble constituents to the water, but the primary slime, when treated with water by itself, often sets free noticeable quantities of such salts. Although no analysis of such solutions is available, it seems reasonable to suppose that in the case of copper ores they contain iron and copper salts and probably organic matter also.

To decide what characteristic of the slime causes the harmful effect would seem to be an easy matter. Segregating one part from another should give the answer. This has been tried by thoroughly and repeatedly washing the slime with water. The flotation treatment of the washed slime gave better results than that of the natural slime, but it was still far from being satisfactory. One might, therefore, feel tempted to conclude that the action of the primary slime was due to a combination of its physical and chemical qualities, if certain that all the chemical ingredients that might cause the action had been removed by washing. However, this conclusion may not be safely drawn, as it might well be that the adsorption of the salts to the colloidal slime particles is of such a magnitude as to prevent thorough elimination of the harmful ingredients by simple washing. A possibility seems to remain, therefore, that the colloidal fraction of the ore is not harmful by itself, but that all the harm is done by the chemical products of the natural decomposition.

The fact that small additions of chemicals sometimes are decidedly helpful would perhaps better agree with a chemical theory than a physical one, although the addition of small amounts of chemicals also influences the physical characteristics of ores, for instance, by causing coagulation, which is said to be of prime importance. A comparison of the settling qualities of slime to which various chemicals are added, with the flotation qualities of such mixtures, would help to clear this question. So far, apparently, no such relation has been established.

A reference should be cited here that might be investigated, because it could have a bearing on these questions. It is contained in a British patent granted to A. A. Lockwood⁵ and points out the advantage of

agitating slime with granular, preferably siliceous, sand previous to subjecting it to the gravity-concentration process. The inventor claims that, by doing this, gangue materials that have a tendency to float, like mica, are by the preliminary treatment kept from doing it. The similarity with the case under consideration, where the admixture of sand is regarded as beneficial, because it prevents an excessive amount of gangue material from floating, is apparent, and points perhaps to a relation between the two phenomena.

INFLUENCE OF IRON ON REFRACTORY ORES

In his paper quoted above Rudolf Gahl stated that the presence of metallic iron in ore pulp, refractory because of the presence of primary slime, has a decidedly beneficial influence. This statement has been commented on by various investigators.

Coghill⁶ mentions that in laboratory tests of some Oregon copper ore he found it decidedly harmful to reduce the ore in a disk pulverizer, because this introduces some metallic iron into the ore pulp. This does not, of course, contradict the statement about the beneficial influence of iron in other cases, but it might be interpreted to raise a doubt.

Zachert⁷ offers an explanation of the effect of metallic iron. He ascribes the improvement resulting from the substitution of steel balls for pebbles in a ball mill to magnetic forces which are absent when the grinding is done with an unmagnetizable medium like pebbles.

Mcses⁸ calls attention to the fact that although in his opinion a beneficial influence of the metallic iron in all probability exists, it should not be forgotten that the improvement which has been noticed to result from the substitution of a Marcy ball mill for a pebble mill with center discharge might also be due partly to the substitution of the open-end discharge which the Marcy mill possesses for the center discharge.

The action of the metallic iron offers an interesting problem. The most natural explanation might be that the improvement results from the neutralization of acid in the pulp. The fact that the same action does not result from the addition of iron oxides, or from the addition of other metals, does not necessarily contradict this assumption. Another explanation might be based on the fact that metallic iron must destroy the copper sulphate. Still, the percentage of copper sulphate in a very refractory primary slime may be exceedingly small.

One may be tempted to connect this phenomenon with that of over-voltage met in the electrolysis of aqueous solutions. It is well known that certain metals, when used as electrodes in electrolytic processes in which gases are set free, facilitate the development of the gas and others impede it. To develop gas on the latter requires a higher expenditure of power than the development of gas on the former. The difference in the voltage required, which is a measure of the power, is called over-voltage. The gas also seems to form in much smaller bubbles on metals requiring little over-voltage and in large bubbles on metals that require a high over-voltage. What is required in the flotation process are small gas-bubbles, and the assumption that the presence of small quantities of metallic iron facilitates their formation would not seem preposterous. Most mill men are aware of the fact that when air is blown through a thickened pulp of colloidal slime enormous bubbles of air

⁵*Min. & Sci. Press*, Vol. 116, 1918; p. 194.

⁶*Min. & Sci. Press*, Vol. 114, 1917; p. 663.

⁷*Min. & Sci. Press*, Vol. 114, 1917; pp. 19, 20.

⁸British Patent No. 174; 1915.

will form, which might at once be taken for an indication that such pulp is not suitable for flotation treatment. Thinning the pulp permits the formation of smaller bubbles, and it may well be that thinning pulp of such character brings about changes similar to the addition of iron.

In connection with what has been said on the influence of iron, attention might also be called to an expedient resorted to by chemists, when liquids are to be boiled which have a tendency to bump, that is, liquids which do not boil smoothly but which form a few big bubbles that burst explosively and are likely to break the porcelain or glass vessel in which the boiling is being done. It is the practice of chemists in such cases to add small glass beads or something of such character to the liquid for the purpose of conducting the operation with greater smoothness. May not the addition of sand to colloidal suspensions represent something similar, and therefore facilitate the flotation process?

In conclusion, it may be well to point out that what has been said is not so much meant to establish facts as to formulate questions. Others may find it easier on that account to contribute to their final solution.

Graphical Methods of Presenting Metallurgical Data

Suggestions for Plotting Mine and Mill Statistics To Show Periodical Variations.—System Used

By the Chino Copper Co.

H. M. MERRY, metallurgical statistician of the Chino Copper Co., will present a paper at the Chicago meeting of the A. I. M. E. on "Graphic Metallurgical Control." Construction of charts to show periodical variations in mine, mill, or smeltery operations is commonly done to a greater or less extent in most works, as metallurgical results, their causes and effects, can be much better comprehended when presented in graphic form. Mr. Merry has made a study of the subject, and gives some of the principles which should be followed in the preparation of such charts, well illustrated by numerous examples.

Two kinds of co-ordinate papers are employed. In the semi-logarithmic method, logarithmic horizontal ruling and arithmetical vertical ruling are used. Time is laid off on the vertical lines and values are assigned to the horizontal logarithmic scale. In the other method, called the special arithmetical method, millimetric-ruled cross-section paper, available in 50-yd. continuous rolls 22 in. wide, has been found most satisfactory. Sheets 4 ft. in length, of full width, are recommended for the charts.

The notation of the scale should be so arranged as to display the various factors with due prominence. Assay values of heading and tailing, which are the minimum and also the governing factors, should be exaggerated. Beyond the maximum range of heading assays of valuable metal, the scale may be reduced, the concentrate assay values, dilutions, and extraction falling principally in this range. The tonnage scale should be devised to meet the maximum and minimum variation and may include concentrate production. It is permissible to overlap the tonnage and percentage scales, preferably in multiples of ten, employing lines of different weight or color to distinguish them in conflicting areas. Abnormally high or low points that fall outside the limits of the particular scale should be plotted on the

projection of the scale in which they originate, as breaking scale destroys the proportion of the relationship with other lines.

A record of departmental milling costs and general statistics may be kept on separate similar sheets, changing the scale from logarithmic notation to direct arithmetic, covering the necessary range of magnitudes.

Upon sheets of the same size, a monthly graphic record of tonnage of ore mined and yardage of waste stripped is kept by the Chino company, with incidental costs of various operations. Corresponding deep-mining data can be added or substituted with facility.

Half-Year Pig-Iron Output Decreases*

Pig-iron production in the United States for the first six months of 1919, compared with both the first half of 1918 and the last half of 1918, shows a material loss. If production for the last six months of this year is continued at the same rate as during the first half, the 1919 total will fall 6,495,641 tons below that of 1918. The slump in blast-furnace activity from January to June is responsible for the low production figure. Judging from the improved production of July and the number of idle stacks blown in during the month, the last six months' total will be considerably larger, with the result that the 1919 output may compare favorably with the 1918 output.

According to the statistics compiled by the American Iron and Steel Institute, the production for the six months ended June, 1919, was 16,278,175 tons, 1,949,555 tons less than for the same period last year and 4,546,086 tons less than for the six months ending Dec. 31, 1918. Of the 16,278,175 tons produced, 16,036,218 tons was made with coke, compared with 17,933,932 tons for the first half of 1918 and with 20,488,243 tons the last half of 1918. Anthracite iron, with 67,592 tons, fell from 120,404 tons and 163,188 tons, respectively. Charcoal iron, with 174,365 tons, was about an average of the two six-month periods last year.

Production of pig iron by grade shows the following: Basic, 7,910,295 tons; bessemer and low-phosphorus, 5,181,621 tons; foundry, including ferrosilicon, 2,436,023 tons; malleable, 465,823 tons; forge or mill, 104,874 tons; ferromanganese, 106,056 tons, and spiegel, 38,136 tons. Merchant iron or iron made for the market totaled 4,499,133 tons, and iron made for the maker's use 11,779,042 tons.

Total Value of the Minerals produced in the U. S. during 1918, according to the U. S. Geological Survey, was about \$5,526,000,000, more than half a billion dollars in excess of the value recorded for 1917, but the total quantity produced was less. The value of the metals produced was about 3 per cent greater in 1918 than in 1917. The figures show that less iron ore and steel were produced, but here, again, values were higher. A little more pig iron was made, though the quantity shipped was less. Copper and zinc, not only in themselves but as the components of brass, are perhaps next in importance to iron in the world's industry; and in 1918 they stood high on the list of war metals. A little more copper but less zinc was produced, and the values of both were lower, that of zinc falling about 25 per cent. The output of the war metals manganese and chromite, used in hardening steel, was greater than in any preceding year. Chromite increased 88 per cent in quantity and 275 per cent in value over 1917, and the increases in manganese ore were 136 and 100 per cent, respectively. Less gold and silver were mined than for many years.

*Extracted from *Iron Trade Review*, Sept. 4, 1919.

Sinking the "H" Shaft at the Pabst Mine

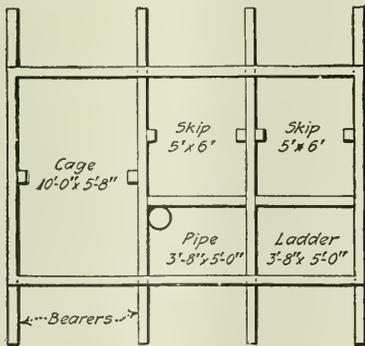

High Drilling Efficiency and Low Maintenance Cost Obtained by Careful Inspection and Overhauling of Drilling Machinery—Well-Planned Sequence of Operations and Arrangement of Equipment Assured Excellent Progress

By A. J. WAGNER

GROUND was broken on June 20, 1917, at the "H" shaft of the Pabst mine of the Oliver Iron Mining Co., Ironwood, Mich., and in March, 1919, the shaft, having a depth of 1,830 ft., was completed. During this period all steel sets, bearers, dividers, concrete lath, and skip runners were placed, and, in addition, all stations were cut, pockets built, and cages and buckets put into operation. When the work was started it was decided to make each part of the job as complete as possible while sinking proceeded, for it was believed that in the long run time would be saved by so doing, rather than to push the sinking and then complete the steel work and equipment later.

It is questionable whether the progress made on the sinking and equipment of this shaft has been equaled in this district. No serious accident occurred from start to finish.

The shaft is vertical, with outside dimensions of 18 ft. 4 in. x 11 ft. 4 in., and is divided into one cage compartment, 10 ft. x 5 ft. 8 in.; two skip compartments, each 5 ft. x 6 ft.; one pipe compartment, 3 ft. 8 in. x 5 ft., and one ladder compartment, 3 ft. 8 in. x 5 ft.

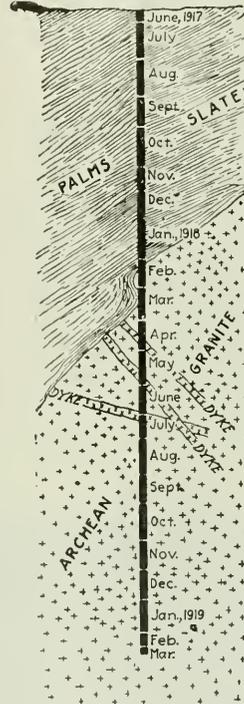

PLAN OF PABST "H" SHAFT

The long axis of the shaft was placed perpendicularly to the strike of the formation, taking the natural ground slippage on the end of the shaft. This is the first shaft so situated on the Gogebic Range. In sinking, the first nine feet was overburden, and this was followed by slate that continued to a depth of 725 ft. At this point granite was cut, and granite with dikes continues to the bottom of the shaft 1,830 ft. from surface. The vertical section in an accompanying cut shows the history, geological conditions, and monthly progress.

The sinking crew consisted of eight miners and one shift boss on each of three eight-hour shifts, making a total of 27 men. These men performed all the work in the shaft, such as drilling, charging, blasting, mucking, and timbering.

The drill equipment at the beginning consisted of twelve Butterfly Jackhammers, Type BCR430, equipped with 7-in. hollow hexagon steel and four-point bits. These were used in the slates to a depth of 589 ft., at which point harder ground required a stronger and heavier drill. Twelve Jackhammer sinkers, Type DDRW13, then replaced the Butterfly machines. The

SECTION SHOWING PROGRESS AND MATERIAL CUT IN SINKING THE PABST "H" SHAFT

factor of primary importance in speed of sinking is to break the ground, and the remarkable accomplishment of the drilling machines used in the "H" shaft made possible the fast record. As will be detailed later, a nine-foot sink the full size of the shaft was drilled, charged, and blasted in eight hours, the actual drilling of the full round, totaling 442 ft., requiring from five to six hours. The drilling time from start to finish of a nine-foot hole in granite averaged thirty minutes.

When material was removed from the shaft at the end of each drilling period the eight used drill machines were sent to the shop with the drill steel, and each machine was opened, inspected, cleaned, and lubricated before it was returned to the shaft. The result was an

extremely low maintenance cost and a uniformly high drilling efficiency. The warehouse record shows a maintenance cost for the year 1918 to have been only \$2.51 per month per machine. As each machine drilled 6,000 lineal ft. in hard ground, the cost of maintenance was \$.005 per foot drilled. As convincing proof of the value of high-grade inspection and careful lubrication it may be stated that, upon completion of the shaft, the drills were mounted and placed in service on the main level drift and on sinking work at other mines.

As 3/4-in. hollow hexagon steel was in stock, this size was used in the sinkers, although they were designed to use 1-in. steel. The drill steel was made up with two-foot starters, and the last drill was eleven feet long. The bits were standard four-point with a 90° cutting edge and 5° and 14° taper. The gage of starters was 2 3/4 in., with 1/2-in. change in gage and 18-in. change in length. The steel was machine sharpened at the collar of the shaft in a No. 5 Leyner sharpener. No difficulty was encountered with steel breakage or inability to make the drills "follow."

Air for the machines was supplied by a 6-in. air pipe provided with a standard manifold. A specially designed header was discarded early in the work, as its use was found to be troublesome.

The cut was drilled so as to remove, when blasted, a "V" at the center of the shaft, and consisted of five rows of five holes each, in each half of the shaft, with three extra holes drilled straight down across the center of the shaft. An accompanying diagram shows a plan and section of the distribution of the holes.

In the diagram fifty-three holes are shown. In slate; fifty holes were drilled, the three center holes marked "B" being omitted. The numbers on the holes refer to the order of blasting. The three holes marked "D" were shot by means of a battery to relieve the cut. The holes numbered 1 were fired first; 2, second, and the others in rotation, and the row numbered 1 was fired first; row 2, second, and succeeding rows in like order, the rows up to 6 being shot and then this part mucked out. Rows 7, 8, 9, and 10 were next fired in sequence.

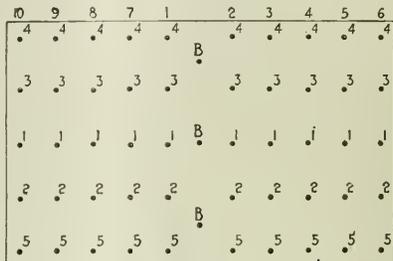

SHAFT-SINKING CREW AT PABST MINE, IRONWOOD, MICHIGAN

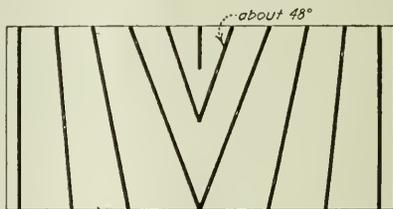

completing the cut. By firing in this order a wiggle, or staggered, effect was obtained, throwing the dirt from side to side, breaking any big blocks loosened, saving the shaft timber from damage, and putting the entire charge off as it was timed to go, without prematurely exploding other holes. Delayed fuses were used and the holes charged with eight sticks of 80 per cent Red Cross gelatine, the detonator being placed in the fourth stick from the bottom. This arrangement is contrary to the rule for placing the detonator, but owing

to the fact that the holes are close together, the collar often breaks prematurely and tears out the detonators that have not been exploded. When this happens some of the holes do not explode and too much burden is placed on other holes.

No cut failed to be pulled clean, and not one steel shaft set was bent, although the sets were kept within fifteen to twenty feet of the bottom. The blasts were timed so close together that the effect was to blend the concussion in one slow, rattling blast.

Plan (Drilling and Blasting)

Vertical Section

ORDER FOLLOWED IN BLASTING MACHINE-DRILLED ROUNDS AT PABST "H" SHAFT

After blasting, the muck was hoisted in two 20-cu-ft. sinking buckets, provided with special guides. At the trestle landing the buckets were dumped while hanging straight on the cable, the rock falling on an inclined shaft cover. This sloping cover was hinged, provided with high sides that formed a chute, and was swung in and out of position by means of air-operated cylinders. The complete cycle of work in sinking was as follows:

TIME REQUIRED PER CYCLE OF WORK IN SINKING PABST "H" SHAFT

Operation	Time, Hours
Take down material and drill entire cut	6.0
Charge holes (first blast)	1.0
Remove material and blast	1.0
Blow smoke	1.5
Muck first blast	8.0
Charge second blast and fire	0.5
Blow smoke	1.5
Muck second blast	6.0
Hoisting water with bucket, per day	1.5
Timbering, per set	5.5
Cutting and blasting hitches	8.0
Installing bearers	3.0

The shaft sets extending through the encountered slates are made of 8-in., 34-lb., "H"-section steel and 6-in., 22.8-lb., "H"-section throughout the remainder of the shaft. They were spaced at 5-ft. centers. Dividers were of steel. Bearers were placed every 100 ft. in depth, four bearers to a set, one under each end plate and one under each cross divider. The bearers are 12-in., 31.5-lb. I-beams, 17 ft. long, cut in the middle for purpose of installing and spliced after being placed.

Hitches 3½ ft. deep were cut to fit the steel, and this was done by drilling one side and the bottom of each hitch, the holes being placed side by side, each hitch requiring nine holes. Iron wedges secure the bearers.

The lath or lining consisted of pre-cast concrete slabs 8 in., 10 in., and 12 in. wide by 4 ft. 10 in. long and 3 in. thick in the slates and 2 in. thick in the granite. The slabs were designed with one vertical edge on each face, beveled to permit easy installation, and held in place by angles riveted to the "H" sections. The lath was wedged from the rear with cedar blocking. Men and material were handled on a cage, and dirt was

HOIST COMPARTMENTS, COLLAR OF PAEST "H" SHAFT

hoisted by buckets, the three hoisting compartments being used.

The equipment on surface was temporary, buildings and headframe as well as machinery. The machinery used was as follows:

Cage Hoist—One herringbone-gear drum, 48 in. x 36 in. Lake Shore Engine Works electric hoist driven by 112-hp. 440-v., slip-ring, General Electric induction motor.

Rock Hoist—One of two drum, 48 in. x 36 in. herringbone-gear, Lake Shore Engine Works electric hoist driven by 150-hp., 440-v., slip-ring, General Electric induction motor.

Surface Haulage—One Armstrong haulage plant, rawhide pinion and iron cut spur gear, geared to handle cars at 900 ft. per min., driven by 220-v., 50-hp., Westinghouse induction motor.

Air Compressors—Two 12-in. and 7½ in. x 12 in. Imperial, compound, short-belt drive, Ingersoll-Rand air compressors, each of 327 cu.ft. displacement at 210 r.p.m. and driven by 440-v., 50 hp., General Electric slip-ring, induction motors running at 1,200 r.p.m.; one 14 in. x 12 in. N. S. B. E., Chicago Pneumatic Tool Co. air compressor, of 487 cu.ft. capacity at 230 r.p.m., driven by 100 h.p. Burks, 220-v., slip-ring, induction motor running at 900 r.p.m., and one No. 5 Leyner drill sharpener.

The work of sinking this shaft was in charge of Gustaf Erickson, mining captain, and under the direction of A. G. Hedlin, head mining captain. A. J. Wagner was in charge of drills and responsible for their performance.

Crude Barytes produced and marketed in the United States in 1918 amounted to 155,241 short tons, one-fourth less than the quantity marketed in 1917, and one-third less than that marketed in 1916, according to statistics collected by the U. S. Geological Survey. The average price per ton was \$6.73, as against \$5.66 in 1917 and \$4.56 in 1916.

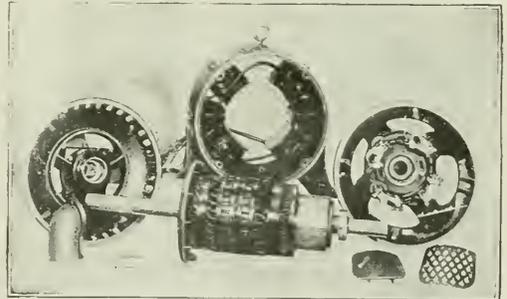

New Type of Direct-Current Motors

In the new type of commutating-pole, direct-current motors and generators which have recently been introduced by a large electrical machinery manufacturer, the following are included: Continuous rated (50° C. rise) motors, for application where the power requirements are definitely known; normal rated (40° C. rise) general-purpose motors; adjustable speed motors for continuous or intermittent service; generators and exciters.

For constant-speed motors, the ratings and speeds are the same as those of 60-cycle induction motors, and they can thus be used interchangeably with induction motors for direct-connected applications without changing the method of drive or the ratio of gearing. Adjustable speed motors, intended particularly for machine tool and similar applications, are provided for 2:1, 3:1 or 4:1 speed range. Generator speeds also correspond to those of induction motors, thus permitting the direct coupling of the machines to form motor-generator sets in various combinations.

The line of ratings now complete covers motors from one-half to 50 hp. and generators from one-half to 40 kw., and larger sizes are under development.

Box-type brush holders are adjustable for tension and suitable for either direction of rotation. Each holder can be removed independently with a screwdriver or wrench. At least two brushes per stud are used. The field coils are wound on metal spools, which prevent movement of the coils, and are protected by an outside layer of enameled wire. The armature core has the laminations riveted together, permitting the removal of the shaft without dismantling the core or commutator, and in the ratings of 20 hp., 850 r.p.m., and larger, the core and commutator are built on a sleeve, so that the shaft can be pressed out of the finished armature without disturbing the windings.

NEW TYPE OF DIRECT-CURRENT MOTOR DISASSEMBLED

An important feature of the machine is the ventilating system. The air being drawn out by the fan mounted on the rear armature head, fresh cool air flows in through the ventilating ducts and takes up the heat. This heated air is forced out through openings in the periphery of the rear bearing brackets. With this ventilation, it is claimed, the internal temperatures are kept low, thus prolonging the life of the insulation.

This type, which is designated as the Allis-Chalmers Type "E," is completely new throughout. The motors are designed for belted as well as direct-connected applications and are particularly suited to machine-tool service.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Magnesite and Other Tariff Bills

Despite the desire of Chairman Fordney of the Ways and Means Committee to have the House consider the bill providing duties on imports of magnesite, the parliamentary situation up to the time that this is written had not permitted him to get the bill before the House. It is expected that the magnesite bill will meet more opposition in the House than any of the other emergency tariff bills. This will be based largely on the claim that the bill will benefit only a few in this country and at the same time will strike a blow at large investments of American capital abroad, as well as increase the price of an important commodity which would be passed on to a very large number of ultimate consumers.

No steps have been taken as yet by the Senate Committee of Finance of which Senator Penrose, of Pennsylvania, is chairman, to take up the emergency bills. The committee is to meet at a date yet unfixed to decide on the action which is to be taken. There is no great amount of sympathetic interest in the bills, however, which are referred to in the Senate Committee as "pop-gun" measures. Many are of the opinion that they must await general tariff legislation. Heretofore, it has been assumed that the general revision of tariff would be undertaken immediately upon the convening of the regular session. It is the general belief now, however, that no such legislation may be expected until after the Presidential campaign.

Leasing Bill in the House

Prompt consideration of the general leasing bill by the House was assured when the Public Lands Committee took up the measure on Sept. 15 and decided to expedite its passage.

It is probable that the House Committee will not look with favor upon an amendment to the bill which would make available to the mining industry a certain percentage of the receipts obtained from licenses. Many members of the House are of the opinion that a portion of the receipts from licenses should be devoted to research which would be of general benefit to the mining industry. As 45 per cent of these receipts goes into the reclamation fund, and 45 per cent to the states, it is felt that at least the remaining 10 per cent should be devoted to the interest of mining, which is materially affected by the leasing bill.

Such an amendment to the bill was prepared by Senator Henderson, which would allow the 10 per cent going to the Treasury to be expended for such investigations by the Bureau of Mines as may be authorized by Congress. He refrained from pushing this amendment only when Senator Smoot, one of the Republican leaders and a member of the Appropriations Committee, went on record favoring special appropriations for various phases of mining research. Mr. Smoot's words in that connection were:

"While I am in sympathy with the object of the amendment, I think the leasing bill is not the proper

place to bring it about. I will join with the Senator from Nevada in securing a direct appropriation for this purpose, and I will say that I have no doubt, as a member of the Appropriation Committee, that there will be an appropriation made for this very purpose."

It is Senator Smoot's idea that at least 10 per cent of all royalty which will accrue under the Leasing Act should be turned into the Treasury to pay the expense of administering the act.

Encouraged by the attitude of Senator Smoot, Senator Henderson expects to push for immediate consideration his bill providing \$140,000 for an investigation of oil shale. In addition, he will introduce soon a bill providing for an investigation looking to the more economical production of slate. Owing to the increased prices of steel, lumber, and other building materials, there is an increased demand for the use of slate wherever it can be substituted for other materials in building and other constructional operations. At present only 5 per cent of the slate quarried is suitable for final preparation. An improvement in mining methods, he believes, will result in eliminating an important portion of the present loss. He has in mind, also, other investigations of interest to the mining industry.

Technical Men Needed as Consuls

A consular examination will be held in the late autumn or early winter. It is the hope of officials at the State Department that a considerable number of technical men will take that examination. The department recognizes that the interest of the United States will be served best if technical men are available to fill vacancies in the consular service at points where their training will be of special value.

For instance, a mining engineer, having passed the examination, would be considered especially for any vacancy at a foreign mining center and likewise a chemist would be considered for a center of the chemical industry.

The scale of pay in the consular service is so low that it is often difficult for a candidate without other source of income to maintain himself at the post to which he might be sent. For this reason many young men well suited for consular work find such a career unattractive. For that reason, as well as others, the department would welcome as consular candidates technical men of means who would be willing to accept such service.

Duty on Talc and Soapstone

Talc, steatite, soapstone and French chalk will be charged duty at the rate of 1 c. per lb. when imported into the United States if a bill introduced by Representative Fordney should become a law. If the product should be sawed or be in the form of crayons or cubes, the duty is to be 2 c. per lb., and manufactures of those articles, if not decorated, are to be subject to duty at the rate of 50 per cent ad valorem. If decorated, the duty is to be 60 per cent ad valorem.

F. J. Bailey on Present Mining Conditions

After a visit to all of the Western stations and branches of the Bureau of Mines, F. J. Bailey, the assistant to the director, who is in charge of the operating division of the Bureau, returns to Washington convinced that the mining industry is entering a new period of activity. Though the change from a war to a peace basis has put an end to some classes of mining, this will be more than offset by activities in other branches, he believes. He is especially gratified with the evidences of increased activities in the gold-mining industry.

One of the striking conditions which came to Mr. Bailey's attention during the trip is the immense amount of improvements which have been made on mining properties during the war period. The betterments which have been established are making for cheaper production and are making possible many of the activities now in evidence. He found that in most of the mining sections the transition from a war to a peace basis had been completed.

That the Bureau of Mines enjoys a considerable prestige among men engaged in the industry became more evident to Mr. Bailey, as a result of his visit to practically all of the important mining centers. He believes that the war gave the Bureau of Mines, as well as other Government agencies, an opportunity to display its worth to the industry. There is a unanimous demand, Mr. Bailey reports, for additional mining research and united effort looking to the solving of the industry's problems.

Exports of Mining Machinery

The exports of mining machinery from the United States during July, 1919, according to the figures of the Bureau of Foreign and Domestic Commerce, are as follows:

Countries:	Oil Well	All Other
Belgium		\$5,188
Italy		3,526
Netherlands		1,102
Norway		16,765
Roumania	\$158,641	
Spain	757	17,345
England	2,156	135,317
Canada	17,535	51,151
Honduras	76	1,000
Nicaragua		5,781
Salvador		901
Mexico	25,675	74,038
Madagascar, Langley, etc.		26
Newfoundland and Labrador		142
Trinidad and Tobago	3,266	
Cuba	724	10,282
Argentina	14,951	980
Bolivia		9,929
Brazil		10,764
Chile		100,144
Colombia		11,173
Ecuador		740
Peru		22,891
Venezuela	13,003	
China		97,093
British India	2,889	4,970
Dutch East Indies	51,496	10,220
Japan		5,130
Russia in Asia		37,346
Australia		1,251
New Zealand		493
French Oceania		2,000
Philippine Islands	640	780
British West Africa		4,102
British South Africa	495	10,689
French Africa	1,850	
Portuguese Africa		27
Totals	\$299,674	\$653,286

Foreign Trade in Metals and Ores

Imports and exports of the more important metals and ores, as reported by the Department of Commerce for July, 1919, and the figures for July, 1918, as finally revised, are as follows:

IMPORTS, JULY, 1918, AND 1919

(In pounds, unless otherwise stated)

	July, 1918	July, 1919
Antimony ore, contents	1,119,077	226,246
Antimony matte, regulus or metal	1,400,030	1,219,458
Copper:		
Ore, contents	6,179,353	4,756,444
Concentrates, contents	5,185,245	2,902,900
Matte, regulus, etc., contents	1,533,838	5,758,470
Imported from (in part):		
Mexico	2,104,426	3,610,480
Cuba	3,397,685	4,029,810
Chile	2,120,720	856,000
Peru	3,417,904	3,186,163
Unrefined black blister, etc.	350,175	123,112
Refined in ingots, plates, etc.	19,543,854	18,033,812
Old, etc., for remanufacture	5,389,000	3,116,315
Composition metal, copper chief value	111,891	281,983
Lead	14,145	12,177
Lead:		
Ore, contents	3,597,906	2,711,964
Bullion, contents	2,134,609	12,575,262
Imported from (in part):		
Canada	2,209,572	1,376,588
Mexico	3,495,546	12,758,243
Chile	26,309	383,878
Pigs, bars and old	54,921	561,055
Pyrites, long tons	46,908	63,088
Imported from (in part):		
Spain, long tons	11,905	36,099
Canada, long tons	34,503	24,889
Tin ore, long tons	3,499	1,975
Tin bars, blocks, pigs, etc.	15,567,667	113,120
Imported from (in part):		
United Kingdom	1,467,386	Nil
Strait Settlements	7,653,459	113,120
Dutch East Indies	2,653,136	Nil
Hong Kong	2,733,774	1,896,909
Zinc:		
Ore contents	1,193,916	4,225,489
Imported from (in part):		
Canada	829,327	196,515
Mexico	364,589	2,160,540
Blocks, or pigs, and old	Nil	Nil
Manganese ore, long tons	30,886	15,585
Imported from (in part):		
Cuba	9,702	307
British India	2,700	Nil
Brazil	15,925	9,750
Tungsten ore, long tons	858	452

EXPORTS OF COPPER, LEAD AND ZINC

(In pounds)

	July, 1918	July, 1919
Copper:		
Ore, contents	326,352	3,000
Concentrates, contents	127,000	Nil
Unrefined black blister, etc.	672,000	3,600
Refined in ingots, bars, etc.	64,513,910	42,373,791
Exported to (in part):		
France	30,738,418	13,917,000
Italy	11,311,323	Nil
United Kingdom	199,595,996	7,676,212
Canada	2,766,126	1,406,066
Composition metal, copper chief value	7,690	25,409
Old and scrap	Nil	Nil
Pipes and tubes	173,557	334,563
Plates and sheets	377,148	436,843
Wire, except insulated	1,905,418	5,527,682
Lead:		
Pigs, bars, etc., produced from domestic ore	13,711,872	637,855
Produced from foreign ore	3,046,069	4,664,547
Exported to (in part):		
United Kingdom	7,430,468	3,472,560
Canada	5,880,469	119,650
Brazil	66,249	3,309
Japan	2,658,855	672,000
Zinc:		
Dross	2,023,402	72,000
Spelter:		
Produced from domestic ore	8,859,975	18,715,545
Produced from foreign ore	361,243	1,103,124
Exported to (in part):		
France	6,290,460	5,683,424
Italy	356,000	112,000
United Kingdom	2,186,547	11,442,341
Canada	373,891	340,694
Mexico	2,020	None
Japan	None	2,016,147
In sheets, strips, etc.	1,461,441	2,008,580

Sale of Government Brass

Sealed bids have been asked by the Director of Sales for the entire surplus stock of brass held by the War Department. Fully 150,000,000 pounds will be covered by the sale. It consists principally of sheets, strips, bars, and rods. Full specifications and particulars of the sale may be had on inquiry to the Chief of Ordnance, Washington, D. C.

Dedication of U. S. Bureau of Mines Experiment Station at Pittsburgh

Program of Events Beginning on Sept. 29 Includes a Nation-Wide First-Aid and Mine Rescue Contest—Large Attendance Expected

THE dedication of the U. S. Bureau of Mines station at Pittsburgh will be held on Sept. 29 to Oct. 1. The Pittsburgh Chamber of Commerce will co-operate, and it is expected that a considerable number of members of the American Institute of Mining and Metallurgical Engineers will visit Pittsburgh after the conclusion of the Chicago meeting on Sept. 26. One of the features of the program of events scheduled for the three days will be a first-aid and mine rescue contest on Sept. 30, in which there will be nation-wide participation. The complete program is as follows:

SEPT. 29

- 8:30 a.m., Bureau building open for inspection.
- 10:30 a.m., dedicatory ceremonies in rear of main building, 4,800 Forbes St.
- 2 p.m., special train and automobiles to experimental mine near Bruce-ton, Pa.
- 3 to 6 p.m., mine explosion and inspection of experimental mine and explosives testing plant near Bruce-ton, Pa.
- 6 p.m., return by special train and automobiles to B. & O. station, Pittsburgh.
- 8 p.m., informal reception and organ recital Carnegie Music Hall. Arranged by Carnegie Institute of Technology.

SEPT. 30

- Nation-wide First-Aid and Mine Rescue Contest, Forbes Field, Pittsburgh.
- 9 to 12 a.m., elimination mine rescue contests.
- 2 to 5 p.m., elimination first-aid contests.
- 5 p.m., coal-dust explosion.
- 8 p.m., pageant glorifying the mining industry, Forbes Field.

OCT. 1

- 9 to 12 a.m., final mine rescue contest.
- 2 to 5 p.m., final first-aid contest.
- 5 p.m., coal-dust explosion.
- 8 p.m., smoker, with award of prizes to winning teams.

Henry Clay Callahan

Henry Clay Callahan, prominently identified with the development of the mining industry in the West, died on Aug. 29 in San Francisco. Mr. Callahan was born at Callahans, Siskiyou County, Cal., on Oct. 6, 1852. His father, M. B. Callahan, one of the pioneers of 1849, who came to California in search of fortune, eventually became a prosperous merchant, conducting a business in mine supplies and similar products. The connections of his father, through his business interests with mining men of that time in California, Nevada, and Utah, enabled young Callahan to place himself advantageously. He began his experience underground in Virginia City, Nev., where he obtained employment in the Ophir mine as a carman and miner.

In 1875, at the age of twenty-three, Mr. Callahan went to Utah as superintendent of the South Star

and Titus mines, on Emma Hill. He soon had other interests at Bingham Canyon, Utah, and in Tuscarora, and other mining camps in Nevada. In 1877 he went to Bodie, Cal., to take charge of several properties there.

Mr. Callahan finally established himself in New York as a mining engineer. During the Leadville, Col., excitement he took charge of the Bull Domingo mine, in Custer County. About the year 1880, he was on George Hearst's staff in Arizona and New Mexico. In 1883, Mr. Callahan returned to California and managed the Bonanza King mine, in San Bernardino County, for Thomas Ewing and Daniel Gillett, of New York. About this time he also went to examine the La Union mine, in Costa Rica, for Daniel Gillett, who represented the London Exploration Co.

HENRY CLAY CALLAHAN

In association with Henry Bratnobar and Alfred Wartenweiler, Mr. Callahan went to Australia in 1893 to represent an English investment company there. In Australia he was prominently identified with the development of the Kalgoorlie gold fields, becoming superintendent and manager of the Lake View Consols and several other mines in that district. He was also manager for the London & Globe Exploration Co. In 1900 he was appointed one of the Queen's Commissioners from Western Australia to the Paris Exposition.

As a mining engineer, Mr. Callahan belonged to a conspicuous group of engineers who made mining history in the '80s and '90s by their ability to discover and develop orebodies and by their practical sense in management.

On account of ill health, Mr. Callahan practically retired from active participation in mining affairs in 1906.

Steel Production in Austria-Hungary, according to the *Ironmonger*, amounted to 1,763,745 tons in 1918, compared with 2,920,789 tons in 1917. Of this Austria produced 1,323,800 tons, compared with 2,204,139 tons in 1917; Hungary 426,476 tons, as against 692,429 tons in the previous year, and Bosnia 13,469 tons, as compared with 24,221 tons in 1917.

The Situation at Cobalt

Operators Win, But Victory Is Costly—Practically All Mines Flooded—Resumption of Work Will Require ' Time—Kirkland Lake Miners Still Out

TORONTO CORRESPONDENCE

THE Cobalt strike is over, and the men have gone back to work at the same pay and hours as before. The efforts of the Miners' Union to control the labor of the camp have been definitely broken, and no further trouble from this source need be expected, for a long time at least. Though it was a victory for the mine managers, this kind of victory is as usual a costly one. It is doubtful if the Cobalt camp will ever be as active as before the strike, or that there will ever be as many men employed again.

As far as can be learned the decision of the union executive to call off the strike was due in part to the firm attitude taken by the mine managers and also to the fact that the president of the American Federation of Labor, realizing the hopelessness of the situation, advised the union to throw up its hands. No strike pay was given, and the only assistance from the union was in the form of orders on the stores to those who were in actual want. As the applicant practically had to bare his soul before he got assistance, not much money was paid out.

Practically all the mines are flooded to a certain extent, so that it will be some time before operations are in full swing. It is believed that the resumption of work in Cobalt will have a beneficial effect upon the situation in Kirkland Lake and that the strike will be called off there also.

Minnesota Iron Country Statistics

The mine inspector of St. Louis County, Minn., in his annual report states that there was removed from the county during the fiscal year ended June 30, 1919, a total of 31,828,809 tons of iron ore, of which 9,575,514 tons was produced by underground methods and 22,252,295 tons by open-pit method. There was removed 14,124,832 cu.yd. of stripping. The number of men employed in all operations was 14,212. Fatal accidents for the year were thirty-three, as compared with sixty for the preceding year, which, after deducting the eighteen fatalities of the Sliver disaster, recorded last year, shows an improvement of more than 25 per cent for 1919 in this respect. There were twenty-one serious non-fatal accidents. One hundred and seventeen mines were active and forty-nine idle. Average wages throughout the industry were \$5.55, as compared with \$4.75 for the preceding year, an increase of 17 per cent.

The mine inspector of Itasca County reports that from this county was shipped 6,762,598 tons of ore in the year ended June 30, 1919, and 9,813,319 cu.yd. of stripping was removed. The season was marked by a large increase in the number of washing plants. There were twenty-four operating mines in the county and eighteen idle ones, and in all lines of mining endeavor 4,485 men were employed, at an average wage of \$5.27. Seven fatal accidents occurred during the year, all in open-pit work. Both reports make pleased and long comment on the degree of co-operation afforded by the operator, and one of them frankly admits that the operators have in some instances outstripped the inspector in the effort to reduce injuries and suffering.

Monthly Copper Production in 1919

The table which appears herewith is compiled from reports received from the respective companies (except in the cases noted as estimated), together with the reports of the U. S. Department of Commerce as to imported material, and in the main represents the crude-copper content of blister copper, in pounds.

MONTHLY CRUDE-COPPER PRODUCTION, 1919

	May	June	July	August
Alaska shipments (c)	1,134,272	2,374,843	3,021,912	4,333,009
Arizona:				
Arizona Copper	2,400,000	2,400,000	2,400,000	2,900,000
Calumet & Arizona	4,308,600	4,872,000	4,800,000	4,814,000
Cons. Ariz. Smelting	690,000	625,000	630,000	630,000
Inspiration	6,200,000	6,300,000	6,000,000	6,500,000
Magma	730,548	956,117	903,179
Miami	4,989,580	4,385,865	4,113,452	3,999,120
New Cornelia (d)	1,408,000	2,708,000	2,736,000	3,066,000
Old Dominion	2,564,000	2,015,500	1,629,000	1,937,000
Phelps Dodge	6,783,900	6,680,335	7,239,075	7,150,731
Ray	3,975,000	3,890,000	3,865,000	3,895,000
Shattuck Arizona	Nil	Nil	Nil	Nil
United Verde	1,250,000	3,525,000	4,040,000
United Verde Extension	Nil	2,806,849	4,582,372	3,275,452
California:				
Mammoth	620,000	Nil	Nil	Nil
Michigan:				
Calumet & Hecla	6,796,819	5,439,761	6,208,517	7,586,601
Other Lake Superior (b)	6,500,000	5,750,000	5,750,000	5,750,000
Montana:				
Anaconda	13,500,000	10,530,000	11,122,000	12,600,000
East Butte	1,414,460	1,513,360	1,458,420	2,054,760
Nevada:				
New Mexico:				
Chino	3,583,396	3,615,458	3,626,354	3,321,857
Utah:				
Utah Copper	9,125,000	9,528,000	8,405,863	8,640,000
Eastern smelters (b)	1,400,000	1,400,000	1,400,000	1,400,000
Total reported	83,072,975	85,011,570	87,659,247
Others, estimated	9,580,000	10,845,000	12,710,000
Total United States	92,652,975	95,856,570	100,369,247
Imports: Ore and concentrates etc.	7,946,560	7,732,950	13,417,814
Imports in blister, etc.	15,997,164	19,842,478	18,033,812
Grand total	116,596,699	123,431,998	131,820,873
British Columbia:				
Granby Cons.	1,848,802	2,072,964	2,050,000
Mexico:				
Boleo	1,322,720	1,256,640	1,256,640
Cananea	3,000,000	3,000,000	3,200,000	4,200,000
Phelps Dodge, Mexican properties	1,532,000	1,735,000	2,516,000	3,422,000
Other foreign:				
Cerro de Pasco	4,034,000	4,026,000	3,984,000	5,726,000
Chile	5,066,000	5,003,430	7,161,444
Katanga	2,094,370	4,519,430	4,442,270
Baculus & Johnston	1,970,064	2,100,000	2,174,000

(c) Only electrolytic cathodes are entered. New Cornelia also produces some copper from ores sent to Calumet & Arizona smeltery. (d) Estimated. (e) Official figures of the U. S. Department of Commerce; includes Kennecott production from its Alaska mines.

Production of the United States by months since the beginning of the year and the corresponding figures for 1918 were as follows:

	1918	1919
January	165,431,568	135,733,511
February	160,011,364	111,649,512
Mar. h	185,325,168	102,040,460
Apr. l	163,207,096	98,808,998
May	181,070,350	92,652,975
June	166,723,509	93,836,370
July	159,329,031	100,369,247

The grand total includes, under "Imports in ore and blister copper," the production of such companies as Granby, Cananea, Braden, Cerro de Pasco, and Chile. As a matter of record, however, the individual figures are given after the total. We also report the copper output of the Boleo and Katanga companies, which does not come to the United States.

The Shipments of Tungsten through the port of Bangkok, Siam, to the United States in the fiscal year ended March 31, 1917, amounted to 131,040 lb., and to 44,800 lb. in the fiscal year 1917-18, according to the U. S. Geological Survey. The production of tungsten practically ceased with the beginning of the current year, but Bangkok dealers in the ore are keen on securing new markets for stocks already on hand, and are ready to guarantee almost unlimited supplies for future shipments.

BY THE WAY

The Largest Oil Reservoir

What is said to be the largest oil reservoir in Great Britain, if not in the world, was built at Rosyth during the war for the oil supply of British war vessels, according to a recent issue of *Ironmonger*. The reservoir is made of reinforced concrete, although it is founded on rock. Its size may be gathered from the fact that its roof area is $7\frac{1}{2}$ acres or 35,493 sq.yd., the area covered by the reservoir and its associated works being $11\frac{1}{2}$ acres. Its walls are 35 ft. high; the amount of rock excavated was 300,000 cu.yd., and the amount of concrete poured, 98,500 cu.yd. The reservoirs capacity is 60,000,000 gallons. To ensure tightness a number of novel devices have been introduced, though when first tested these did not prove adequate, as the floor leaked considerably, and a complete new floor was laid. The reservoir is easily the largest oil reservoir in that country, and probably in the world.

The Fault of Overconfidence

"Some o' these 'ere chaps 'oo is braggin' tha 'ol bloody time," said Cap'n Dick, "is boun' to slip h'up naow an' again. Funny it be, too, m'son, 'ow there be them 'oo've 'eard a thing once or twice an', dam-me, soon they be tellin' un jus' as though it 'appened to they, whether or no. An', min' you m'son, perfectly h'innocent they be as they gaws h'on an' h'on, an' talks bout this an' that. A man 'asn't tha 'eart to call them liars, an' yet 'e naws they be far from 'ittin' tha truth. W'ot beats me is 'ow some o' these 'ere newspaper chaps 'as tha nerve to come h'out with a lot o' tha statements in the daily press that they do—an' tha next day they 'as to take un h'all back; but, min' you, m'son, tha tale is fixed h'up so h'artful that no one naws they wuz wrong at all. An' h'after that they believe they wuz right an' brags bout it, jus' like Billy Trevathan. Billy, 'e'd been to one o' these 'ere circuses with some o' tha boys, an' comin' 'ome they wuz talkin' bout one o' tha dwarfs that they'd seen in tha side-show. 'Dam-me,' sez one o' tha boys, 'e isn't very big, is un?' 'No,' says Billy, 'No. An' I tell e, m'son, h'over in h'ol country I've seen dwarfs twice as big as 'e.'"

D. E. A. C.

Treating 'Em Rough

In the Canadian Mining Institute Bulletin for July, "R. G.," referring to the widespread labor trouble in Canada, says: "It would be difficult, if not impossible . . . to prescribe a single remedy for its adjustment." On another page of the same journal, however, a single remedy used in England in the Fourteenth Century is cited. It was a statute passed in the reign of Edward III, which fixed the rate of wages, and compelled all, except artisans, merchants, or owners of farms, to work, when called on, at this rate of wages, or to go to prison. Another statute provided that if laborers or artificers left their work and went to another county they were to be arrested and brought back. A later law provided that a loafer should be tied to the end of a cart, naked, and beaten with whips throughout the town, "till his body be bloody by reason of such whipping." He was then required to take an oath to return home, "and put

himself to labour, as a true man ought to do." If he made default, the whipping was to be repeated. If he persisted in not working, the upper part of the gristle of his "right ear was to be clean cut off." If still persistent, he was to be tried and executed.

The Gila Monster Not Monstrous

Visitors to the mining camps of Arizona have always been interested in seeing specimens of the Gila monster and hearing the natives tell of the marvelous characteristics of the reptile. One of the most common tales was that the deadly poison which the lizard was supposed to secrete came from food which was assumed to be in an advanced state of decomposition in the creature's stomach. The idea was that the alimentary tract was elemental in form, and partook of the characteristics of many of the desert rivers—that is, it just petered out without ever getting anywhere. Any food getting as far as the stomach was *spurlös versenkt*.

One story was to the effect that a cowboy fastened one of the reptiles on behind his saddle, and later, reaching around behind him, was bitten in the hand. He was rushed to Tucson, but the poison had permeated his system, and he died.

Now along comes Science to prove that, ugly looking as he is, the Gila monster has been grossly maligned. There is nothing unusual in his internal arrangements, and no authentic case of a death from his bite has been found. The cowboy story was true in every word—only said cowboy died several years after the bite. The Gila monster is, however, capable of secreting a poisonous saliva, the degree of toxicity varying in different specimens. The bite is often painful and causes swelling, but investigation shows that it is not in itself deadly.

Early Life in Nevada City

Glimpses of life in Nevada County, Cal., in the '50s, are caught as one reads the account that recently appeared in the *San Francisco Chronicle* of the visit paid by James M. Feeley, of Stockton, Cal., to Nevada City, where he worked a claim sixty years ago. Feeley, who is eighty-four years old, witnessed the great fire of 1856, which virtually wiped out the young town of Nevada City, and was also an eye-witness to the horse-whipping of Henry Shipley, an early-day editor, by Lola Montez at Grass Valley in the early '50s. He visited the site of his claim and cabin on Shady Creek, near Nevada City, the old scenes recalling an incident which he related as follows:

"One day when I returned to my cabin for dinner I found a man sitting at the table helping himself to my pot of beans. I was mad, of course, but restrained my anger when I recognized the intruder as the noted bandit, Tom Bell. I told him very politely to take anything he wanted, as I was not looking for an argument with Tom Bell. Tom ate his fill, thanked me and went away. A few days later I came to Nevada City and sold my gold dust for \$500. While I was going back to Shady Creek I ran across the notorious Tom Bell just as he was in the act of robbing a couple of miners, and I decided at once that my \$500 was lost. But Tom recognized me, and told me to pass quietly on and keep still. That I did, and my money was saved. Thus that pot of beans netted me \$500. Tom was the terror of the boys in the mines for months, robbing right and left and always eluding capture."

PERSONALS

H. D. MacCaskey, who has been one of the prominent members of the staff of the U. S. Geological Survey for many years, has purchased a ranch near Medford, Ore., and will make his residence there. Mr. MacCaskey will continue to represent the Survey in certain matters pertaining to that section.

Donald M. Liddell is in Texas for ten days on professional business.

Reginald E. Hore, of Toronto, has gone to the Wasapika gold area, where he will examine properties.

Eliot Blackwelder, formerly professor of geology at the University of Illinois, has removed to Denver, Col.

G. B. Richardson has been placed in direct charge of the oil and gas section of the U. S. Geological Survey.

Ray J. Barber is now consulting engineer for the Roxbury Gold Mines, Inc., and is situated in New York City.

George G. Fleming has accepted a position in the testing department of the New Jersey Zinc Co., at Palmerton, Pa.

J. M. Armstrong, of the Caribbean Petroleum Co., has been transferred to Maracaibo, Venezuela, from Philadelphia, Pa.

Bailey C. Clark, consulting engineer for the Atolia Mining Co., was at Loring, Nev., recently in the interest of the company.

H. C. Cook, of the Canadian Geological Survey, is making an investigation of the Larder Lake gold field of Northern Ontario.

Walter Harvey Weed, made a professional examination of the Loring district, Nevada, early in September, for New York clients.

Harry Harper, mining engineer, of Santiago, Chile, has removed to La Paz, Bolivia, where he is connected with W. R. Grace & Co.

Fred Sherman Baker, who has been with the Oriental Consolidated Mining Co., at Unsankinko, Chosen (Korea) is now at Columbia City, Ind.

L. E. Booth, formerly with Anaconda Copper Mining Co., has accepted a position with the Inspiration Consolidated Copper Co., at Inspiration, Ariz.

Frank E. Lathé, of the Chile Copper Co., at Chuquicamata, Chile, has been appointed chief chemist for the British America Nickel Corporation at Sudbury, Ont.

W. O. Hotchkiss, State Geologist of Wisconsin, and E. R. Butcher of the Republic Iron & Steel Co., visited the Gogebic Range during the early part of September.

W. H. Gardner, formerly superintendent of the Cyprus mine, at Hibbing, has been appointed superintendent

of the McComber mine, on the Vermilion Range.

E. J. Longyear, J. M. Longyear, R. M. Bennett, and O. B. Warren have completed the annual inspection of the Bennett-Longyear and Meriden Iron interests on the Mesabi Range.

John D. Ryan and J. Leonard Replegle were members of committee of thirteen named by the Secretary of War to meet General Pershing upon his arrival in New York.

Jacob A. Davidson, who made important discoveries in the Matchewan gold area, has been engaged by the Montreal River Gold Mining Co. to examine and report on its holdings.

James F. Rose, of Hibbing, has returned from a reconnaissance survey 250 miles into the wilderness northwest of Ottawa. He was in charge of the work for the Canadian Pacific Ry.

Harris & Ewing

H. D. MACCASKHY

E. J. Lambert and A. J. Carlson, professors of the University of Minnesota, have completed an examination of the Mesabi and Vermilion ranges in the interest of the Minnesota Tax Commission.

W. C. Phalen, of the Bureau of Mines, left Washington on Sept. 6 for Canada where he will study magnesite deposits around Quebec. Mr. Phalen expects to be back in Washington within three weeks.

John G. Bartram, who is with the Petroleum Co. of Oklahoma, has been transferred from Cheyenne, Wyo., to Tulsa, Okla., to take charge of the geological work of the company in southern Oklahoma.

D. Dale Condit, oil geologist, who has been in the service of the U. S. Geological Survey for several years, has resigned to accept a position with S. Pearson & Sons, Ltd., of London, and has been assigned to work in China and India.

Ernest E. Thum, formerly Western Editor of *Chemical and Metallurgical Engineering*, has been appointed associate editor and is now connected with the New York office. L. W. Chapman succeeds Mr. Thum, with offices in San Francisco, Cal.

John W. Allen has resigned as general manager of the mining and transportation department of the Brier Hill Steel Co., Youngstown, Ohio, effective Sept. 6, to accept a position with the National Trading Co., Cleveland. J. Roscoe Stroh has succeeded to Mr. Allen's position, the designation of which has been changed to manager of the mining department.

OBITUARY

A. H. Brown, formerly manager of the Hudson Bay mine, Cobalt, and the Dome Lake, at Porcupine, and more lately mining inspector, died recently at Sudbury, Ont., from pneumonia contracted during a visit to the West Shining Tree gold area.

SOCIETIES

Engineers' Club, Houston, Tex., met on Sept. 4, and a paper on the use of lubricating oils at aviation fields was read by W. M. Davis, supervising engineer of the lubricating department of the Texas Co.

Lake Superior Industrial Bureau.—At the annual meeting, the following officers were re-elected: Francis J. Webb, president; W. P. Chinn, vice-president; E. J. Maney, treasurer; and A. F. Ferguson, secretary. Executive committee is composed of F. J. Webb, E. J. Maney, and George D. Swift.

American Society of Civil Engineers announced a meeting to be held on Wednesday, Sept. 17, to be devoted to a discussion on the need for a National Department of Public Works. Among the speakers who were expected to be present were George W. Fuller, Walter D. Blair, M. O. Leighton, and F. J. MacIsaac.

INDUSTRIAL NEWS

The Mine and Smelter Supply Co., Denver, Co., has become agent for the Gardner horizontal and the Gardner-Rix vertical types of air compressors, single and duplex.

The Chicago Pneumatic Tool Co. announces the appointment of Fred Gehbauer, as special navy yard representative, with headquarters at the Philadelphia office, 1740 Market St.

The Inter-State Machinery Corporation, 538 Commercial Trust Building, Philadelphia, Pa., succeeding the Ralph R. Lewis Co., announces it is retaining the same offices and working under the same management as heretofore.

Krogh Pump & Machinery Co., of San Francisco, advises that it has just made a shipment of sand pumps and spare parts to the United Alkali Co., Liverpool, England, and is receiving a considerable number of foreign inquiries.

The Bucyrus Co., South Milwaukee, Wis., announces that it has opened a Cleveland office at 808 American Trust Building. This office will be in charge of E. G. Lewis, formerly with the New York office of the company, and more recently president of the New Jersey Slag Products Co., Dover, N. J.

The Driver-Harris Co., Harrison, N. J., is now selling its wire-rope products direct to the trade instead of through its former selling agents. The company has increased its facilities to include all grades of rope in 6 x 7, 6 x 12 and 6 x 19 construction, such as drilling cable, elevator and haulage rope, sand lines and similar products in all sizes up to 3 in.

Williamsport Wire Rope Co., Williamsport, Pa., has established an office and warehouse at Chicago under the direction of C. M. Ballard, formerly connected with the Williamsport organization at Cleveland, Ohio. The Chicago office is at 122 South Michigan Ave., and the warehouse at 755 West Quincy St. The company can now make shipments from Chicago to customers in the territory served from that point.

Worthington Pump & Machinery Corporation announces its purchase of the plant, patterns, accounts, patents, and other assets of the Epping-Carpenter Pump Co., situated at Pittsburgh, Pa. The plant will be operated as the "Epping-Carpenter Works." Orders and contracts now in hand will be completed by the Worthington Pump & Machinery Corporation, and all further business will be for its account. Remittances should be made to and all correspondence should be addressed to the Worthington Pump & Machinery Corporation, No. 10 43rd St., Pittsburgh, Pa.

TRADE CATALOGS

Walter A. Zelnicker Supply Co., has issued Bulletin No. 266 containing stock list of supplies in St. Louis, Mo.

Duplex Truck Co., Lansing, Mich., has issued a circular devoted to the interest of motor truck users. Several performances of the company's four-wheel-drive truck are included.

Davis-Bournonville Co., Jersey City, N. J., has issued an illustrated bulletin descriptive of the pyrograph, a boiler-shop cutting machine for trimming and beveling boiler sheets to the correct flange height and calking angle in one operation with oxy-acetylene torch.

Colonial Steel Co., Pittsburgh, Pa., has issued a 25 pp. tool-steel-treating book containing directions for hardening and tempering steel to be used for various purposes. In tabular form are listed various steel products, grade of steel which should be used in their manufacture and drawing color or temperature.

Fireproof Construction, Using Expanded Metal Lath. Northwestern Expanded Metal Co., Old Colony Building, Chicago, Ill.; 6 x 9; 72 pp.; illustrated. Descriptive of the uses of metal lath in construction of partitions and plastering of walls. Stock sizes, weights, and finishes are given in tabular form. Details of construction work with description of lath accessories, viz., channels, corner heads, saddle clips, and others, are included.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Alloy of Copper, Nickel, Zinc, Iron, and Manganese. Foster Milliken. (1,314,417, Aug. 26, 1919).

Converter and Smelter. Theodore Miller. (1,314,348, Aug. 26, 1919).

Drill—Rock Drill. Omar E. Clark, assignor to the Denver Rock Drill Manufacturing Co. (1,314,246, Aug. 26, 1919).

Electric Melting Furnace. James D. Shipton. (1,313,746, Aug. 19, 1919).

Flotation—Apparatus for Separating Ore Materials From Each Other. Frederick B. Flinn, assignor, by mesne assignments, to Pneumatic Process Flotation Co. (1,314,316, Aug. 26, 1919).

Flotation Processes, oil and feeding device for. William W. Wolcott. (1,314,296, Aug. 23, 1919).

Granulator. Edward N. Greenleaf and George T. Hansen, assignors to Allis-Chalmers Manufacturing Co. (1,309,800, July 15, 1919).

Hose Coupling. N. B. Braly. (1,310,559, July 22, 1919).

Leaching—Apparatus for Extracting Metals From Their Ores. Edmund S. Leaver, assignor of one-half to Charles E. Van Barneveld. (1,312,488, July 5, 1919).

Ore-Concentrating Apparatus. Jacob David Wolf. (1,310,492, July 22, 1919).

Ore-Concentrating Machine. Frederick E. Small. (1,314,370 and 1,314,371, Aug. 26, 1919).

Ore Concentrator. John F. Kellogg. (1,314,335, Aug. 26, 1919).

Phosphoric Acid—Method of and apparatus for producing phosphoric acid and compounds of the same. Frank S. Washburn, assignor to American Cyanamid Co. (1,314,229, Aug. 26, 1919).

Pipe—Corrosion-Resisting Conduit Pipe. Charles Albert Rose and Gustave Monrath, assignors to Chile Exploration Co. (1,310,715, July 22, 1919).

Pumps—Drainage Valve for Deep-Well Pumps. William H. McKissick. (1,314,070, Aug. 26, 1919).

Reduction—Ore-Reducing Process. Benjamin Q. P. Foss, assignor to The Foss International Ore Reduction Co. (1,311,645; July 29, 1919).

Roasting—Method of Roasting Zinc Ores or Concentrates. Urlyn C. Tainton. (1,310,455; July 22, 1919).

Slag Remover. John H. Abel. (1,303,225; May 13, 1919).

Smelting and Refining Ore, Process of. Leopold Mambourg, assignor to the Mambourg Continuous Iron and Steel Furnace Co. (1,313,309; Aug. 19, 1919).

Steel, Art of Manufacturing. George Hillard Benjamin. (1,314,384; Aug. 26, 1919).

Steel, Carbon-Chrome-Nickel. James Ramsey Speer. (1,314,022; Aug. 26, 1919).

Steel—Production of Refined Basic Steel. William R. Walker. (1,309,162; July 8, 1919).

Sulphides—Method of Making Soluble Sulphides. Raymond F. Bacon, assignor to Metals Research Co. (1,310,151; July 15, 1919).

Sulphur—Method of and Apparatus for Sulphur Mining. Robert E. Carmichael. (1,308,929; July 8, 1919).

Sulphur, Process of Recovery of. Rasik Lal Datta. (1,313,370; Aug. 19, 1919).

Sulphuric Acid, Contact Process for Making. Herbert Henry Meyers, assignor to Armour Fertilizer Works. (1,314,280; Aug. 26, 1919).

Tin—Utilization of Tin Scrap. Daniel A. Wilcox and Disney H. Wilcox. (1,310,381; July 15, 1919).

Washing—Portable Washing Plant. James P. Dovel. (1,309,754; July 15, 1919).

Welding—Electrode for Electric Arc Welding, Emile Languepin. (1,314,273; Aug. 26, 1919).

Zinc—Condenser for Zinc Vapors. Sven Hultd, assignor to Norsk Elektrisk Metalindustri Aktieselskap. (1,311,604; July 29, 1919).

Zinc—Method of Refining Zinc. Sven Hultd, assignor to Norsk Elektrisk Metalindustri Aktieselskap. (1,312,480; Aug. 5, 1919).

Zinc—Process of Alloying Zinc with Iron or Steel. Benjamin F. Dimm. (1,307,853; June 24, 1919).

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief of Interest to Engineers and Operators

NEW YORK, N. Y.—Sept. 12

South American Gold & Platinum Co. has been unable to develop its properties in Colombia as rapidly as it had desired, owing to the failure to settle the dispute over the Panama Canal. The properties comprise 10,000 acres along the San Juan River and about fifty miles of river bed extending up two tributaries of the San Juan, owned by the Pacific Metals Co. The company's mines can be reached in river vessels via the San Juan. The land blocked out, according to the company's estimate, represents about \$27,000,000 in platinum and gold. One wooden dredge, with a capacity of 40,000 tons per month, has been working and a new steel dredge will be in operation about Oct. 1. Recently the daily production of the wooden dredge was about \$7,000 to \$8,000. The company is a holding company for the Anglo-Colombian Mining Co., a British corporation, and the Pacific Metals Co.

BOSTON, MASS.—Sept. 12

The Nevada Consolidated Copper Co. is defendant in a suit brought against it by Minerals Separation North American Corp. and Minerals Separation, Ltd., (British) in the U. S. District Court at Portland, Me. The plaintiffs allege infringement of patents in the concentration of ores, claiming damages and seeking an injunction to prevent further infringement. By bringing suit against Nevada Consolidated, a Maine corporation, Minerals Separation has involved another Federal circuit, the first, as any appeal on the part of Nevada Consolidated would come to Boston for hearing on the adjudication. The Miami company's case went before the third circuit on appeal in Philadelphia. Butte & Superior appeals have been made in the ninth circuit at San Francisco. Prior to this litigation, three suits have been brought by Minerals Separation for patent infringement, two of them against Butte & Superior, which must now make an accounting. In the third case, that against Miami Copper Co., accounting has been taking place for several months.

GRASS VALLEY, CAL.—Sept. 11

Mine Workers' Protective League at a recent meeting in Grass Valley, Cal., decided to enforce rules of the league throughout the district. It was the sense of the meeting that force is to be used, if persuasion fails, to compel workmen who are non-members to join the league. Membership is now between 900 and 1,000. The mines in the

district are all running except the Golden Center.

ISHPEMING, MICH.—Sept. 13

The Chemical Plant and ore stock house of the Manistique, Mich., furnace of the Charcoal Iron Co. of America was recently destroyed by fire. The loss is estimated at \$150,000. It will be several months before the manufacture of pig iron and chemicals can be resumed there. A few weeks previous one of the buildings of the company's Newberry furnace was burned.

What Effect a Steel Strike will have on the mines of the Lake Superior district it is difficult to predict. The U. S. Steel Corporation has been making heavy shipments of ore throughout the season, evidently anticipating labor troubles. It is believed that some mines will be compelled to close if the furnaces are idle, but the idea of striking is not being taken very seriously in the mining districts. The miners are well satisfied with the wages which they are receiving, and there is no talk of labor troubles on any of the ranges. There is plenty of work, and a miner has no difficulty in getting a place. The sales continue light, although there have been a few inquiries for 1920 delivery.

IRONWOOD, MICH.—Sept. 13

Mine Operators are greatly interested in the impending strike of the steel workers' unions. On the Gogebic Range the unions are not strong, and may not attempt to strike. If steel plants should be forced to close, mines will probably have to do so also, as they already have a surplus stock of ore on hand.

HOUGHTON, MICH.—Sept. 12

Copper has not been moving with any noticeable rapidity from the Michigan ports within the last thirty days. Although there is no large accumulation of stocks on any of the docks, at the same time it is apparent that there has been no insistent demand. Rail shipments are rare.

CLEVELAND, OHIO—Sept. 9

Iron-Ore Shipments from upper Lake ports during August amounted to 4,423,133 gross tons, according to *Iron Age*. This sharp falling off was due to the strike of the dockmen at upper Lake ports, which caused an almost total suspension of the movement for three weeks. The movement during July was 9,173,429 tons, and shipments during August would probably have been about the same had it not been for the strike. The August movement shows a decrease of 5,302,198 tons, as

compared with the same month a year ago. The total shipments for the season up to Sept. 1 fell off nearly 10,000,000 tons, as compared with last year, being 29,804,981 tons, as compared with 39,334,264 tons during the same period a year ago. Shipments are now moving forward in fair volume. The amount of ore on the lower Lake docks showed a decrease on Sept. 1, as compared with a month ago. The amount of ore on docks Sept. 1 was 6,705,062 tons, as against 7,069,893 tons Aug. 1. The amount on docks Sept. 1 a year ago was 8,152,214 tons.

TORONTO, ONT.—Sept. 11

John T. Stirling, of the Alberta Department of Mines, states that a force of men in charge of William Pickles, mining engineer, has been sent to Fort McMurray to start drilling for salt, a deposit of which underlies that town. Previous exploration by drilling disclosed a bed 180 ft. deep lying 480 ft. below the surface. It has not been decided whether the government will mine salt or turn the work over to a company. There is an estimated market for about 45,000 tons of salt in Alberta and the adjacent provinces.

Prospectors' Development Co., Ltd., has been incorporated, and plans the organized development of promising mining properties in Northern Ontario. The company is capitalized at \$2,000,000, divided into \$1 shares. No promotion stock has been issued, the entire stock remaining in the treasury. The following men are identified with the enterprise: John B. Holden, of Toronto; Harry Oakes, president of the Lake Shore mine; H. H. Johnson, of the Tough-Oakes; William Wright, original owner of the Wright-Hargreaves mine; Mr. Bain, of Bicknell, Bain, McDonald & Gordon, and others.

LONDON, ENGLAND—Aug. 23

Organization of the Mexican Corporation has recently been effected by the Camp Bird and Santa Gertrudis companies. Capitalization is \$1,000,000. The majority interest is controlled by these two companies, the balance being taken up by the Consolidated Gold Fields, the Consolidated Mines Selection, the Exploration, the Imperial & Foreign Corporation, the Central Mining Corporation, the Lake View group, and the Lena Goldfields companies. The directorate of the new corporation consists of F. W. Baker, chairman of the Camp Bird and Santa Gertrudis companies; R. T. Bayliss, chairman and managing director of the Exploration Company; Lord Brabourne, director of

Consolidated Gold Fields; W. McDermott, chairman of Consolidated Mines Selection Co.; F. A. Govett, chairman of Lake View & Oroya, and Lake View & Star companies; J. A. Agnew, A. S. Elmore, director of Camp Bird and Santa Gertrudis companies; and H. Guedalla, managing director of Imperial & Foreign Corporation and director of Burma Corporation. The company, it is said, has been formed to acquire certain interests in Mexico recommended by the Santa Gertrudis company.

MELBOURNE, AUSTRALIA—July 21

The Moore Filter Co., of the United States, has been granted leave to appeal to the Privy Council, with regard to its unsuccessful action against the Great Boulder Proprietary Gold Mining Co., for an alleged infringement of patent rights.

Hampden-Cloncurry Copper Mines, Ltd., North Queensland, during the half-year ended Feb. 28, operated with a loss of £53,973, to which must be

added £12,610, written off for depreciation, making a total debit of £66,583. Curtailed production, consequent upon the stoppage of smelting operations in November last, increased wages and decreased efficiency of labor, and high railway freights were contributing factors to this deficiency. Negotiations for the disposal of the copper unsold are still proceeding. The ore reserves are estimated at 218,000 tons, containing 13,020 tons of copper.

In the Westonia Gold Field, in Western Australia, the local mining warden before whom the drainage action between the Edna May and the Edna May Consolidated was heard, decided in favor of the former. The verdict provided that the Edna May Co. be paid £4,747 for drainage charges up to Apr. 1, and £100 per month afterward, with costs. The Edna May Consolidated Co. has also agreed to pay the Edna May Central Co. £400 for past pumping and £50 per month. In the course of a few months the Edna May company will have exhausted its reserves of payable ore and the other companies in the

field will have to face the question of fresh arrangements for drainage. Speaking at a recent meeting of the Edna May company, the chairman of directors said that, after negotiation, it had been agreed upon between the two companies to accept the warden's decision as to damages and costs, but payment would be made as follows: £947 to be paid at once (this had been done), on Aug. 1 £100, on Sept. 1 £1,000, the balance, £3,200, to be paid in ten equal monthly installments on the seventh of each consecutive month, in addition to the contribution of £100 per month for current drainage. Costs to be paid when fixed. He also added that the company had decided it would be better expeditiously to extract the profitable ore developed than to operate a portion of the adjoining mine—the Edna Central. For the half year ended Apr. 30 the Edna May company, which is the principal mine on the Westonia field, produced 13,498 tons, averaging £2 9s. 1d. and the recovery by amalgamation was £36,356. Sands and slimes treated yielded £2,819.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ARIZONA

Cochise County

Calumet and Arizona (Bisbee)—Smeltery produced 4,814,000 lb. of copper in August, of which 3,438,000 lb. was available for company.

Shattuck Arizona (Bisbee)—Operations (and production) will probably be resumed this month, when pumping will be started. Water, which had filled shaft almost to 700 level, has receded about one-half, or about 55 ft.

Gila County

Old Dominion (Globe)—August production of copper 1,937,000 lb.; July, 1,629,000; August, 1918, 2,064,500.

Inspiration Consolidated (Inspiration)—August production of copper 6,500,000 lb.; July, 6,000,000; August, 1918, 9,000,000.

Miami Copper (Miami)—August production of copper 3,999,120 lb.; July 4,113,452; August, 1918, 5,374,198.

Greenlee County

Arizona Copper (Clifton)—August production of copper 2,900,000 lb.; July 2,400,000; August, 1918, 4,300,000.

Maricopa County

Montezuma (Morristown)—Lessees have taken out about three cars of high-grade lead ore. Property idle for nearly fifteen years. Before that time several cars of rich ore shipped from big gloryhole.

Pima County

New Cornelia (Ajo)—Copper produced in August was 3,066,000 lb. cathodes, 320,000 lb. smelting ore, and 166,000 cement copper.

Pinal County

Red Hills (Price)—Shipping carbonate ores from recent development. Plan to resume drilling at early date.

Ray Consolidated (Ray)—Production of copper in August, 3,895,000 lb.; July, 3,865,000.

Potts Canyon (Superior)—Development resumed, having been suspended during war. Sinking new shaft. Ores carry silver, lead, and vanadium. W. E. Deffy in charge.

Yavapai County

U. V. Extension (Jerome)—August production of copper 3,275,452 lb., or over 300,000 lb. less than in July. Reduction caused by changing from blast furnace to reverberatory and also to labor shortage.

Sheldon Mining (Walker)—Company planning extensive development work under direction of Mark Bradley. New compressor and other equipment will be installed.

CALIFORNIA

Amador County

Bunker Hill Cons. (Amador City)—Leveled assessment of 5c. per share to continue development below 2,800 level.

Eldorado County

Melton (Placerville)—J. Q. Wrenn, of Placerville, bought half interest in Eagle King gold quartz mine, better known as Melton mine, situated fifteen miles east of Placerville.

Nevada County

At Bullard's Bar, forty men working under George F. Taylor placing concrete foundation for restraining dam in Yuba River. Work being rushed.

Empire (Grass Valley)—Continuous pumping in this and North Star mines has reduced flow to normal. Work resumed in latter on 6,300 level.

Golden Center (Grass Valley)—Pulled pumps Sept. 5 and will shut down as soon as mill treats ore on hand, owing to high costs and uncertain labor market. Stockholders authorized sale of 187,000 shares of treasury stock at \$1 per share to provide fund for possible future operation.

Tulare County

Blue Mountain (Porterville)—Reported purchased by directors of Golden Center mine, of Grass Valley.

Tuolumne County

Black Oak (Soulsbyville)—Development begun on 1,800 level. North drift will be driven 300 ft.

COLORADO

Garfield County

Champion Oil Shale & Refining (Grand Valley)—Orders placed in Denver for shale plant. N. W. Bansill and M. Mulling, of Las Vegas, N. M., chief

stockholders and directors, recently in Grand Valley to confer with J. L. Herick, manager.

La Plata County

Cumberland (Durango)—Shaft being sunk, to be about 500 ft. deep, to develop Cumberland vein below Red Bed formations. E. B. Miller consulting engineer.

Mineral County

Melissa (Creede)—Leary, Campbell & Co., lessees of Melissa claim on Bachelor Mountain, have opened up oreshoot on "Top Blanket Vein." Plans completed for building mill and aerial tramway.

Pitkin County

Oakland (Aspen)—Alexander and Martin Scott, operating Oakland mine on south side of Queen's Gulch, four miles south of Aspen, discovered high-grade silver-bearing ore in vein 9 ft. wide. Said to include streak few inches wide of solid polybasite. Oakland developed in early days by tunnel several hundred feet long. Several small "feeders" cut in driving this tunnel, but were not prospected. Much activity has resulted in Aspen district.

San Juan County

Silver Lake (Silverton)—Leased to John Giomp, of Silverton. Several groups of lessees and sub-lessees already at work. Shipping to Iowa Tiger mill.

Summit County

Molly B (Breckenridge)—Will resume operations at copper-bismuth-silver mine in Yuba Dam Flats section. H. F. Sandy will be in charge.

Wellington Mines (Breckenridge)—Resumed operations Sept. 2. Is heaviest producer of zinc lead ores in district.

MICHIGAN

Copper District

Allouez (Allouez)—Operating two shafts and will reach normal production within month. Using ten electric motors.

Calumet & Hecla (Calumet)—Have added 500 men to force in last three months.

Seneca (Calumet)—Total of 325 ft. opened in lode both sides from shaft. North side in good copper from start. South side ran into fissure characteristic of Kearsarge amygdaloid but good ground found again. Stockpiling rock from first level to be milled to prevent accumulation as soon as there is enough to keep one head running two shifts. Three sites considered for proposed mill.

Winona (Houghton) — Increasing working force, which now totals 140 men. Former employees returning from manufacturing centers. Stamp mill running. Mining from one shaft. Second shaft expected to be in operation in thirty days.

Copper Range (Painesdale)—Baltic mine producing rock running 34 lb. per ton and Trimountain 30-31 lb. per ton. Continuing to select rock underground.

Gogebic Range

Aurora (Ironwood)—Change house about completed. Will accommodate 400 men. Built of concrete blocks, one story, 138 x 40 ft. Roof of concrete on hy-rib with air space and plaster inside. Steel lockers, 20 x 15 in., in central portion, with wash sinks along side walls, and six showers and toilet room at each end of building. Small basement at one end contains coal bin and two boilers, one for steam heat, other for heating water. Similar change houses are under construction at Norrie and Pabst mines.

Pabst (Ironwood)—At H shaft, engine-house foundations built, and foundation for one hoist ready. Next week work will begin on conduit transmission line from there to G power house. Cables will be in fibre conduits laid in concrete.

MINNESOTA

Mesabi Range

Hobart (Gilbert)—Will start shipping again this fall. Originally opened in 1907, but abandoned after small shipment. Fee owned by Murphy-Dorr-Flinn interests. Recently leased to M. A. Hanna & Co., which has overcome many obstacles in getting property in condition. Large volume of water in development and swampy nature of surface of particular annoyance.

Wade-Helmer (Kinney)—Stripping of portion of Wade, adjoining old pit of Helmer, has progressed to clean-up stage. Sixty-ton shovel engaged in clean-up; revolving shovel in bottom loading dump cars, which are hoisted on skipway and transferred to railroad cars. Wade is North Star lease, Helmer fee owned by state. Cleveland-Cliffs Iron Co. operators.

MONTANA

Deer Lodge County

Southern Cross (Anaconda)—Sinking under way, with heavy volume of water.

Missoula County

Potomac Copper (Potomac)—Arrangements concluded for power line from C. M. & St. P. road, eleven miles away, to property. Installation of air compressor plant to be completed soon.

Powell County

Monarch (Elliston)—Tramway over 1,700 ft. long being constructed to carry ore down mountain side.

Silver Bow County

Anaconda (Butte)—Copper production for August, 12,600,000 lb.; July, 11,122,000 and June, 10,530,000.

Butte & Ramsdell (Butte)—First dividend expected this month.

Butte Bullwhacker (Butte)—Shipments begun to Anaconda leaching plant at Washoe works.

Butte New England (Butte)—Operations suspended, and negotiations under way with Hayden-Stone interests for acquiring property, which adjoins Davis-Daly.

Davis-Daly (Butte)—Tonnage for Colorado mine in August, 144 cars; July, 90. Net earnings for August over \$140,000, against \$92,000 in July. Tonnage being increased.

Elm Orlu (Butte)—Proving-up in connection with controversy with Anaconda company, which is mining ore in portion of Emily vein in Pilot-Butte mine. Elm Orlu claims title because vein uniting with Emily apex inside Elm Orlu, a prior location over Emily or Pilot-Butte claims.

Tuolumne (Butte)—Crosscut on 1,000 level of Main Range mine has cut ore in Spread Delight fissure. Sinking continuing to 1,200 level, where Spread Delight will be crosscut again.

NEVADA

Clark County

Boss Gold (Goodsprings)—Semi-annual report shows net amount received from two cars of platinum-palladium ore was \$15,038.70. Two cars of copper ore also shipped during half year.

Lincoln County

Hamburg (Pioche)—Work soon to be resumed on company account. No leases to be let, though several applications received.

Black Metals (Pioche)—New machinery recently installed working smoothly, according to George Snyder, manager. Increased production assured.

Mineral County

Simon Fagan (Mina)—Shaft still in good ore, with gold and lead increasing and silver decreasing. E. S. Chafey manager.

Nye County

White Caps (Manhattan)—Gross production for August about \$26,000. Ore recently discovered beyond fault on 600 level.

Cons. Spanish Belt (Manhattan)—East heading on Ernst vein on main tunnel level advanced 22 ft. Face shows 5 ft. of good ore.

Pershing County

Nevada Valleys Power (Lower Rochester)—Again able to furnish mines and mills of Rochester district with abundance of power owing to lessened use of water by ranchers. Companies at Lower Rochester and Packard preparing to resume operations with full force.

White Pine County

Nevada Consolidated (McGill)—No copper production reported for August on account of strike.

NEW MEXICO

Grant County

Chino Copper (Santa Rita)—Copper production in August, 3,321,857 lb.; July, 3,626,354.

OREGON

Baker County

Ben Harrison (Baker)—Plans to enlarge mining plant in Greenhorn district and install flotation system. W. C. Fellows, general manager.

UTAH

Juab County

Tintic Drain Tunnel (Eureka)—Power line being strung, and work to be started on air shaft as soon as line completed. Good progress made in driving tunnel. Henry Barney in charge.

Tintic Standard (Eureka)—Railroad to mine expected to be completed middle October.

Salt Lake County

Alta Tunnel & Transportation (Alta)—Has found mineralization at 1,400 ft. depth below old Prince of Wales workings. New find thought to be in Prince of Wales fissure.

Montana Bingham (Bingham Canyon)—During August, fourteen cars shipped bringing net returns of \$20,921. Drifting from tunnel on Fortuna and Mayflower veins, latter furnishing most of ore for present shipments. Old Highland Boy ore bins in D. & R. G. yards at Bingham purchased, and to be moved to portal of Montana-Bingham tunnel, to give additional bin capacity of 250 to 300 tons.

Utah Copper (Salt Lake City)—Copper production in August, 8,640,000 lb.; July, 8,405,863.

Summit County

Park City Shipments week ended Sept. 6 were 3,623,480 lb. ore and concentrates. Shippers: Silver King Coalition, 1,200,000 lb., Ontario Silver, 1,009,000; Judge M. & S., 1,005,000; Daly West, 408,110.

Keystone Mining (Park City)—Proposed to increase capitalization from 700,000 shares to 1,000,000 shares, par value \$1, with view to procuring funds for further development.

Naildriver (Park City)—Compressor to be installed soon. Developing with view to opening more ore before making further shipments.

Park-Utah (Park City)—Work resumed with twenty men. Developing new territory in eastern section of camp, working from Ontario drain tunnel.

WASHINGTON

Stevens County

United Silver-Copper (Chewelah)—Shipped eleven cars of ore in August, also seven cars flotation concentrates, one car table concentrates carrying 20 per cent copper and 80 oz. of silver, and 3 cars of high-grade crude ore. Raise from 1,000 level driven 165 ft. and connection made, which enables removal of large block of milling ore. Ten-foot orebody disclosed 600 ft. north of main drift on 1,200-ft. level. Mill tonnage increased to 175 daily. Eighty-seven men are employed in mine and mill.

Northport S. & R. (Northport)—Suspension of smelting operations on account of labor strike in Coeur d'Alene district has permitted plant improvements. Furnaces being re-lined. About fifty men employed.

Okanogan County

Copper World Extension (Night-hawk)—Property located on Palmer Mountain. Have completed installation of Riblet tramway and are carrying on development work while awaiting favorable smelting conditions for heavy sulphide ore.

Pyrargyrite (Oroville)—Property well developed. Clearing ground for erection of 50-ton mill to treat silver ore. Tables and flotation will be used. Monroe Harmon, manager.

CANADA

British Columbia

Dolly Varden (Alice Arm)—Taylor Engineering Co. will extend railroad four miles next year to aid other properties, according to Dr. King, Minister of Public Works. Dolly Varden producing 100 tons ore daily and shipping regularly to Anyox.

British Columbia Manganese (Duncan)—Shipped two cars of ore from properties at Hill 60. Will ship regularly.

Rock Candy (Grand Forks)—Consolidated M. & S. Co. installing three additional decrepitating furnaces and rotary kilns at fluorspar property near Lynch Creek, near Grand Forks. Furnace and kiln already installed satisfactory. Four units when complete will handle 100 tons daily. A. A. Robertson in charge.

Hedley Gold (Hedley)—Will close mill this fall, on account of high wages and cost of supplies. Present surplus will be used for continuing mine development instead of paying dividends.

Mountain Chief (Renata)—Shipping 200 tons, of which much is bornite.

Noble Five (Slocan)—Syndicate composed of James Dunsmuir, of Victoria, and associates is building concentrator at Cody.

Panama (Slocan)—H. Giegerich, now sole owner, has resumed work. Tunnel in 370 ft.

Ruth (Slocan)—Eight-foot vein cut 600 ft. from portal of tunnel.

Ontario

Peerless (Boston Creek)—Shaft down 150 ft. Lateral work will be undertaken when 200 level is reached.

Bourkes (Bourkes Station)—Shaft being sunk 200 ft. below level. New 12-drill air compressor ready for operation.

Tucker-Welsh Claims (Larder Lake)—Nipissing sampling this property.

Clifton Porcupine (Porcupine)—Boulder vein opened up for 160 ft. on first level. Crosscut being driven to connect with No. 7 vein. Installation of electrical equipment nearing completion.

Dome Extension (Porcupine)—Now completing fourth crosscut into orebody on 600 level. In one crosscut thought to be at widest part of orebody 99 ft. was cut. Stopping under way.

Dome Lake (Porcupine)—Share-

holders ratified by-law for \$100,000 bond issue.

Keora (Porcupine)—Diamond drilling completed. Planned to sink to high-grade orebody indicated by drilling.

Porcupine Crown (Porcupine)—All underground workings dewatered and operations under way to 1,000 level.

McIntyre (Timmins)—About 800 ft. of No. 5 vein opened up on 1,100 level; showing higher gold content than on upper levels. Below 1,000 ft. formation changes, quartz decreasing and being replaced by sulphides, which necessitates finer grinding. Tube mill being installed. On Plenaurum heavy flow of water struck on 1,000 level, rendering deep mining difficult.

MEXICO

Jalisco

Numerous Sales of Properties reported as follows: Cuale mines to Esperanza Mines Co. of El Oro; Lupita mines to Mexico Mines of El Oro; Satorno mines to Dos Estrellas Mining Co. of El Oro; San Pedro Analco mine to San Rafael y Anexas Co.; Guachinango mine to American Metals Co.; Mazata mine to Carlos Romero and a French company which is installing 150-ton cyanide plant; Noce Bueno and Virrey mines to Cia. Real del Monte at Pachuca.

AUSTRALIA

Broken Hill Prop. (Broken Hill)—Head office in Melbourne has announced shipping strike has ended.

BRAZIL

St. John del Rey (Morro Velho)—Gold production first half August £16,500; yield per ton 47s. 2d.

KOREA

Oriental Consolidated (Unsan)—August clean-up \$62,500. Taracol operations suspended seventeen days, owing to scarcity of water. Now in full operation. Completion of Suribong power project delayed by failure of Pelton turbines to arrive.

TRANSVAAL

Rand Gold Output in August 706,000 oz.; July 725,000.

Market Report for Sept. 20 Will Appear In Issue Of Sept. 27

Industrial conditions in New York have made it expedient to close the forms of the *Journal* in advance of the routine schedule date. The usual market quotations are therefore necessarily omitted from this number. The market pages which would have appeared normally in the Sept. 20 issue will be published in the *Journal* of Sept. 27.

CURRENT PRICES—MATERIALS AND SUPPLIES

IRON AND STEEL

SHEETS—Quotations are in cents per pound in various cities from warehouse also the base quotations from mill:

* 200-lb. barrels. † Per 100-lb. bbl. ‡ Per ton.
Note—Refund of 10c. per barrel.

LINSEED OIL—These prices are per gallon:

	New York		Cleveland		Chicago	
	Current	One Year Ago	Current	One Year Ago	Current	One Year Ago
Raw per barrel (5 1/2 bbl. lots)	\$2.15	\$2.50	\$2.10	\$2.37	\$2.37	\$2.50
5-gal. cans	2.30	2.00	2.75	2.25	2.57	2.25

WHITE AND RED LEADS—In 500-lb. lots sell as follows in cents per pound:

	Red		White	
	Current	1 Year Ago	Current	1 Yr. Ago
100-lb. keg	Dry 13.00	10.50	Dry 14.00	10.50
25- and 50-lb. kegs	13.25	14.75	14.25	14.75
12 1/2-lb. keg	15.00	14.50	15.00	15.50
5-lb. cans	15.00	16.50	15.00	16.00
1-lb. cans	16.00	17.50	16.00	17.00

MINING AND MILLING SUPPLIES

	Fire		50-Ft. Lengths	
	Underwriters' 2 1/2-in.	Common, 2 1/2-in.	7 1/2c. per ft.	40%
1-in. per ft.	First Grade \$0.50	Second Grade \$0.33	Third Grade \$0.22	

STEAM—Discounts from List
 First grade, 30%; Second grade, 40%; Third grade, 45%
LEATHER BELTING—Present discounts from list in the following cities are as follows.

	Medium Grade	Heavy Grade
New York	45%	35%
St. Louis	40%	35%
Chicago	45%	40%
Birmingham	35%	30%
Denver	35-50%	30%
Cincinnati	30-52 1/2%	40-23 1/2%

RAWHIDE LACING—30% off for cut; 6c. per sq. ft. for side lacing.

MANILA ROPE—For rope smaller than 3 in. the price is 1 to 2c. extra; while for quantities amounting to less than 600 ft. there is an extra charge of 1c. The number of feet per pound for the various sizes is as follows: 1-in., 8 ft.; 1 1/2-in., 6 ft.; 2-in., 4 ft.; 2 1/2-in., 3 ft.; 3-in., 2 ft. 10 in. Following is price per pound for 3 in. and larger, in 120-ft. coils.

	Denver	Kansas City	New Orleans	Seattle	St. Louis	Atlanta
Boston	\$0.25					
New York	27	27	27	27	27	27
Cincinnati	29	29	29	29	29	29
Chicago	28	28	28	28	28	28

San Francisco	24	24	24	24	24	24

PACKING—Prices per pound:

Rubber and duck for low-pressure steam	\$0.90
Asbestos for high-pressure steam	1.50
Duck and rubber for piston packing	1.00
Flax, regular	1.20
Flax, waterproofed	1.60
Compressed asbestos sheet	0.90
Wire insertion asbestos sheet	1.10
Rubber sheet	1.50
Rubber sheet, wire insertion	1.70
Rubber sheet, duck insertion	1.50
Rubber sheet, cloth insertion	1.30
Asbestos packing, twisted or braided and graphited, for valve stems and stuffing boxes	1.20
Asbestos wick, 3- and 1 1/2-in. balls	0.85

REFRACTORIES—Following prices are f. o. b. works:

Chrome brick	net ton \$90-100	at Chester, Penn.
Chrome cement	net ton 45-50	at Chester, Penn.
Clay brick, 1st quality fireclay	net ton 35-45	at Clearfield, Penn.
Clay brick, 2nd quality	net ton 30-35	at Clearfield, Penn.
Magnesite, dead burned	net ton 32.50	at Chester, Penn.
Magnesite brick, 9 x 4 1/2 x 2 1/2 in.	net ton 80-90	at Chester, Penn.
Silica brick	net ton 41-45	at Mt. Union, Penn.

Standard size fire brick, 9 x 4 1/2 x 2 1/2 in. The second quality is \$4 to \$5 cheaper per 1000.
 St. Louis—Fire Clay, \$30 to \$40
 Birmingham—Fire clay, \$41-\$44; silica, \$46.50-\$54.50; magnesite, \$80-\$85 chrome, \$80 to \$90.
 Chicago—Second quality, \$25 per ton.
 Denver—Silica is \$35 per 1000.

RAILWAY TIES—For fair size orders, the following prices per tie hold:

Chicago	Material		7 In. x 9 In.		6 In. x 8 In.	
	Plain	by 8 Ft. 6 in.	by 8 Ft.	by 8 Ft.	by 8 Ft.	by 8 Ft.

Number 13

Present Industrial Crisis Must Be Met by

Dividing Profits with Labor

UNREST and discontent are world-wide. Dissatisfaction with the existing social and industrial order is practically universal.

In Russia, Bolshevism is virtually a strike against the former and now extinct government; but every other country—every nation in which men think and feel and read—is seething with the spirit of revolt and desire for change, which finds expression in strikes where there is even the semblance of organization to give form to concerted demands. And amid the epidemic of strikes and threats of strikes, unorganized labor—unnumbered artisans and workers, professional and other—must accept such poor solace and hope as may be afforded by protest from soap box, from platform, and in reams of letters to the press and to legislative bodies. The trades unionists, with, in general, a living wage, are demanding further recognition. The vast body of the unorganized, squeezed into semi-starvation by the weight of opposed industrial forces, are in a desperate and dangerous plight.

So deep-seated is the determination to alter present conditions, so vehement is the voice of protest, so all-embracing is its character, as to compel the conclusion that it has a common origin and springs from a common cause. And before a corrective can be administered, that cause must be identified, and a remedy must be sought, found, and applied. First, the facts must be determined; second, the source from which they spring must be established, and, third, a means for resolving the industrial problem must be erected.

Strikes—en masse, or by the individual as he quits his job—and the impulse that inspires and fosters them, are produced by, first, suffering, privation, and want; second, by discontent, arising from (a) insufficient pay; (b) too long hours; (c) oppressive and humiliating conditions of employment; (d) high prices (decreased purchasing power of circulating money medium).

Labor wants, and is incessantly demanding, a share of the profits of industry—and to a marked extent a part, also, in the management. It has been the habit of Labor to insist upon, and of just employers to accord, a *living wage*. Labor is no longer satisfied with a *living wage*. It is demanding a profit from the turnover. And it has learned that lesson from Capital—from Management.

Industry must readjust its practice so as to pay a profit on Labor as well as on Capital. A *living wage* is no better for Labor than for Capital. Capital—Management—demands and takes security, wage, and profit. Labor now demands a *living wage*, security, and

profit. Both Labor and Capital produce *all profit*. Profit should be equitably divided.

It is begging the issue to maintain that Labor will not accept its share of business loss. It does. If a business does not prosper, it fails. Work ceases. The worker must get a new job. If it prospers, he, with Capital and Management, has achieved the result. He must and will share in the profits—plus a *living wage*. The most astute and far-seeing bankers and publicists have been proclaiming this for years. And the managers of Industry, with noteworthy exceptions, immune from the prevailing pestilence, have steadfastly refused to grow in wisdom with the world, and have been sitting tight on the safety valve. And now the machine is showing unmistakable signs of excessive heat. Who permits and encourages the impending explosion must go up with it. Apportioning the blame—fixing the guilt—will not refabricate the destruction.

It is the great privilege of the mining industry to be able to point the way to justice in this acute crisis. The managements and men—twin factors in production—have agreed, in many camps, plants, and communities, upon a plan of operation so fair, so reasonable, so just, that even a child can understand and approve it. Wages of metal miners, under extensively prevailing scales, depend on the market price of the joint production of Capital and Labor. Profiteering in the necessities of life is curbed by approved control of retail distribution. Not in a day has all dissension been dissipated, but the way seems light, and the principle to which adherence has been pledged is on its face acceptable in good faith.

Not all industries sell their product by the pound at periodically determined fixed market prices. But all business men worthy of the designation know how to find the costs of production—and how to apportion them. And the time has come that Labor knows, also, how to find the costs—and the income; and even the rank and file are convinced that Capital is appropriating all, or nearly all, of the profits.

Evolution has made another turn of the wheel. Autocracy—political, social, ecclesiastical, and industrial—lies buried in the soil of France. Accommodation to the new order, readjustment on the new and more equitable basis, is the only alternative to a forced and violent ultimate acceptance of the conditions of the New Era. The sun of industrial feudalism is setting.

Strikes are an abomination. They are costing the world millions every day, and wasting the substance and strength of the race. The imperative need of the hour is machinery for the peaceful and orderly adjustment of industrial issues.

Americans and patriots all—proved and tried—management and men must gather at the counsel table, and with mutual patience, sympathy, forbearance, and determination to do justice, erect an industrial program that all can accept with honor and with self-respect.

Hoover

OF THE triumvirate of heroic figures that emerge from the Great War, Herbert Hoover stands forth with a distinction new to the annals of the race. Destiny accords to few men so overflowing a measure of successful and notable achievement, or such fervent appreciation of public service well performed.

New York has received perhaps two million Americans that served "over there," and the Grand Ballroom of the Waldorf has served as a setting for many important and historic episodes, but on no previous occasion has it assembled a more distinguished or representative American gathering than that which welcomed Hoover, engineer, general, master executive, and man, back to his home and to his own people.

Hoover is now at the very peak of his power—spiritual, intellectual, moral, physical. No other man embodies to such superlative degree the technical equipment, world experience, and tested and proved ability as an organizer of industrial resources. The world's best-loved man, Hoover makes at this hour an impelling appeal to all constructive elements of American citizenship. Tied to no party, owing no faction or class allegiance, he would win to his support all elements of American life that are disgusted and weary of the incessant and futile playing at the 1900 brand of politics that has discredited and disgraced Congress for the last five years. Mention, at the reception in his honor, of his conspicuous availability as the country's next Chief Executive, brought that notable assemblage to its feet as one man, with a roar of cheers as spontaneous as it was sincere.

Hoover has richly earned a rest. He must have it. But he may not, with the consent of the people of America, retire.

That part of Hoover's address, delivered on the occasion of his reception on Sept. 16, dealing with the future of America, constitutes a veritable charter of the coming industrial dispensation. It is his platform. It is just.

The *Journal* presents for nomination for President of the United States of America at the election of 1920, Herbert Clark Hoover, Servant of Humanity.

The Steel Strike

IN HIS refusal to treat with the labor unions in regard to the adjustment of certain alleged conditions in the iron and steel industry, Judge Gary gives two reasons: First, he does not believe that the committee appointed by the unions represents the bulk of the workers, and, second, he maintains that a conference with this committee will be regarded by them as a recognition of the "closed shop."

To this interpretation of the situation, John Fitzpatrick, chairman of the committee of the American Federation of Labor for organizing the iron and steel industries, takes exception, stating that if these are the real reasons they are not sufficient "to plunge the industry into a great labor conflict." According to Mr. Fitzpatrick, employees are therefore compelled to resort to a strike; to quit work in order to prove to Judge Gary that he is wrong in his first surmise. The second reason given by Judge Gary in his refusal is pooh-poohed as having "absolutely no basis whatsoever in the present controversy."

It would be interesting to know, of course, just how many employees of the Steel Corporation are unionists, and, to go a little further, just what number of these desire representation in this instance. Approximate

figures state that the number of those employed by the Corporation totals 240,000. Of these the greater proportion, it may be assumed, are eligible to become affiliated with the unions, the remainder being employed in professional or supervising capacities, and therefore undesirable as union members. Be this proportion what it may—and it seems highly improbable that the Corporation is wholly in the dark as to its employees' affiliations—the word has gone forth that it is essential that Judge Gary must be "shown" the desires of the steel workers, and the manner of demonstrating their position is to take the form of an immense tie-up.

Consideration of the second principle involved brings more or less confusion to the unprejudiced observer. Judge Gary takes the stand that in holding a conference with the representatives he would commit his company to recognition of the closed shop. The union, on the other hand, says that this statement dodges the real issue. To those who have followed earlier controversies between the labor unions and the Steel Corporation, it is a well-known fact that the objection to the closed shop dates back to the very inception of the organization. Apparently, then, the latter is only maintaining a consistent policy. Mr. Fitzpatrick's exception, in light of the above statement, seems paradoxical.

Regardless of circumstances and the arguments presented by both sides of the controversy, the issue seems to be one in which opposing wills clash against each other, both with a firm resolve to see the matter to a finish. Until a settlement is agreed upon, the public must suffer the consequences. And the public is getting tired of strikes. As stated in a recent editorial of the *New York Sun*, "the people are tired of being threatened and coerced, of bleeding through the nose eternally for the benefit of a minority. They think the time has come for a moratorium of trouble until conditions in a broad sense adjust themselves."

An issue of such magnitude as the threatened steel strike is not a matter to be dealt with lightly. It is an intensely serious issue, and one in which there can be permitted no personal aggrandizement.

Certainly the movement will meet with little sympathy from the public if such a motive is suspected. It would not take kindly to the idea that the strike was a possible result of another labor leader's desire to fill Mr. Gompers' shoes.

Mexico

THE Senate Foreign Relations Committee is attempting to ascertain the true conditions in Mexico. Inman's book, "Intervention in Mexico," has been the subject of searching inquiry. Members of the committee have questioned Mr. Inman closely in order to determine whether there was any basis for his accusation that certain interests were spreading false, or greatly exaggerated, reports for the purpose of bringing about intervention. Cross-questioning developed nothing to support Mr. Inman's insinuation.

The *New York Times* suggests that it is unfortunate that the sub-committee having charge of the inquiry is composed of an avowed interventionist, a man reflecting border sentiment, and an opponent of the administration. Perhaps this is not an ideal committee for a judicial investigation of the subject, but it appears from the questions that are being asked that every effort is being made to learn the truth. The fact seems to have been brought out that if a fair and impartial investigation is being circulated in the United States that it will be considered

propaganda in connection with the Mexican situation, its object is to place before the American people an accurate picture of conditions in Mexico, with the belief that the public, when once informed, may be depended upon to insist that evil conditions be corrected.

American mining interests are so extensive in Mexico, and so many American miners are looking forward to the time when they can again resume their peaceful vocation in that country, that we await with interest any constructive suggestions that may result from the present investigation.

Postal Zone Law Should Be Repealed

OUR United States postal service reaches every home and every citizen. It is such an instrument of information and education and unification that to restrict it in any way is to hurt the country. The postage rate should not be determined on the basis of cost. Cheap postage on periodicals and newspapers has made the American nation a nation of readers. This is a national benefit. To raise the postage on publications means that the publishers must add this charge to the price of their periodicals, and thus lessen reading. This is a bad thing. Compare the achievements of those nations wherein magazine reading is universal, with the backward conditions in those nations which have never encouraged widespread reading nor the extensive distribution of periodicals and newspapers.

In discussing the dangers of the postal zone law, Senator Arthur Capper, of Kansas, said: "So clearly and firmly has the American postal principle been held, that postage cost must not determine postage rate, that our postoffice has delivered letters and publications to Yankee whaling ships at Point Barrow Circle for two cents that cost over \$5.60 to deliver. I would ask any thinking citizen if it is not just as important that a Yankee skipper home from a whaling cruise shall be able to understand and vote intelligently upon the great public questions of the day as it is for the citizen who has stayed at home? This principle is sound. Shall not California, Kansas, and Maine have equal postage on all information as an American right?"

"It has been alleged—and maybe some have fallen victims to its un-American and illogical absurdity—that cheap postage on magazines and newspapers is a subsidy to the publishers. It is not a subsidy to the publishers. It is, if you want to use the term 'subsidy,' a subsidy to American readers. You can determine this for yourself. Who receives the benefit or subsidy when the Yankee skipper of a whaling ship off Point Barrow, in the Arctic Circle, receives news from home which costs \$5.60 to deliver? Is that a subsidy to his home newspaper, his periodical or magazine, or is the benefit of that to the ship captain himself and his citizenship and our united and national standards of intelligence?"

In every case of cheap postage the primary and chief benefit is to the receiver. Why should San Francisco pay higher postage than New York merely because certain information happened to be printed in New York? Why discriminate against San Francisco?

Congress is being flooded with editorials from the country newspapers demanding that the postal-zone law be retained. At present they have their field of readers unchallenged. Congress depends largely upon public sentiment. These country newspapers are supplying their readers as well as Congress with misinformation and misstatements of fact as to the Post Office Depart-

ment and postal functions. After peace legislative measures are out of the way, Congress will be ready to consider national legislation which has been impressed upon it as of paramount importance. If you believe that the postal-zone legislation is of importance to you as a citizen, and to the unified national consciousness of this country, then we urge you to write or telegraph to your Congressman to oppose the vicious postal-zone system, and use his influence to secure its repeal.

Promoting Safety

THE prevention of accidents in the mining industry is a subject which has been studied intensively only within the last ten years, but in that time wonderful progress has been made. That accident prevention is not only a humanitarian measure, but a business one as well, has been definitely proved. Practically all of the larger companies have safety engineers who devote all of their time to improving the conditions in mine, mill, or smeltery from the standpoint of the manual worker.

Next week, beginning on Oct. 4, as we state elsewhere in this issue, the Eighth Annual Safety Congress will be held in Cleveland. The Congress deserves and will have a large attendance, for it will serve as a clearing house for new ideas. It is sponsored by the National Safety Council of Chicago, well known as the central organization for the promotion of safety in American industrial plants.

The work of the safety engineer nowadays leads him into varied fields. In addition to putting up a guard rail at the proper place, he must know something of medicine and sanitation; he must know the best form of light and where to put it; he must often be an editor of the works paper; he must be an educator and know how best to teach the workers and inculcate the safety germ into their lives; and lastly, he must be a good mixer, an agreeable fellow who will secure co-operation and whose good ideas will be enthusiastically accepted by the managers as well as by the manual workers.

The men who have studied safety problems will get much good from the Cleveland convention, but it is the class who have never given the subject much thought that will reap the greatest benefit. It is regrettable that more of these men—men who do not even know that there is to be a convention—cannot be present.

There is a general idea among the layman that the one who steps into a mine cage takes his life in his hands. This is due chiefly to three reasons—general unfamiliarity with mines (we fear what we do not understand), the occasional holocausts in coal mines, and the frequency of minor accidents incident to the nature of the work. Such meetings as the Safety Congress provides will help to prevent the last two, and the first reason is something about which we do not need to worry.

Market Report for Sept. 27 Will Appear in Issue Of Oct. 4

INDUSTRIAL conditions in New York have made it expedient to close the forms of the *Journal* in advance of the routine schedule date. The usual market quotations are therefore necessarily omitted from this number. The market pages which would have appeared normally in the Sept. 27 issue will be published in the *Journal* of Oct. 4. The Sept. 20 report appears in this issue.

BAILY ELECTRIC BRASS FURNACES PREVIOUS TO SHIPMENT ON A MEXICAN CONTRACT

Furnaces are of the tilting type, and are rated at 105-kw. electrical capacity, 1,500-25. hearth capacity, and a melting rate of 600 lb. per hour

Development of Reciprocating Air Compressors

Machines of Small Capacity Were Formerly Not Expected To Be Efficient—Change From Steam to Electric Drive Resulted in Many Makeshift Devices—Modern Machines Highly Developed

BY S. T. NELSON

IN CONSIDERING recent developments in air compressors, it is advisable to go back at least ten or twelve years, as at that time the development of the present modern compressors began to evolve from what was then considered to be the acme of perfection in compressor building. Prior to the panic of 1907, which might be referred to as one of the country's cyclic readjustment periods, industry was so busy for a number of years that there was little either of time or incentive to bring about changes in engineering and industrial development. As long as industry travels along in a regular and undisturbed channel, the need of improvement is not usually forced by economic factors, as conditions have automatically so adjusted themselves that the necessary means are forthcoming to keep business going from day to day. Eventually, however, a readjustment period arrives, and compels the realization that a reduction must be made in the cost of production, and that old, stereotyped methods must be revised and new conditions met.

Before the year mentioned, air compressors of about 1,000-cu.ft. capacity piston displacement and up were expected by purchasers to be high-grade, efficient machines. Purchasers of compressors of less than 1,000-cu.ft. piston displacement did not usually insist very strongly on high efficiency, as there was a prevailing notion that a compressor having a capacity of less than 1,000-cu.ft. piston displacement was so small, and therefore so unimportant, that economy in its operation was not considered of vital importance.

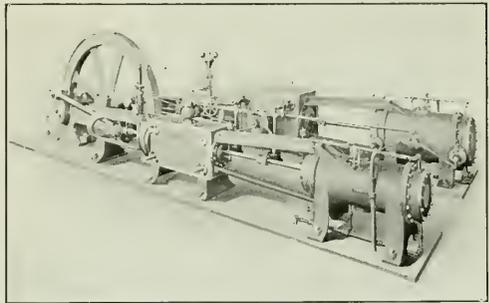

SMALL COMPRESSORS NOT ECONOMICAL

Purchasers were usually told by compressor manufacturers (and it is practically true today) that, under varied operating conditions, the Corliss engine was the most economical prime mover in existence, and, inasmuch as a Corliss engine had to be used in order to secure good economy, it was impracticable to make a smaller compressor than 1,000 cu.ft. of an economical type, as Corliss engines smaller than this size would not show a sufficiently high steam economy to warrant the price. So manufacturers furnished to the trade compressors of the slide-valve type of the most antiquated engineering. In many instances patterns and designs were used that were over twenty years old. This was true not only of the steam end, but of the air end of the compressor as well.

Small mines and factories, often with limited means, were compelled to use these extravagant profit destroyers, there being no economical machines of that size on the market, leaving the large economical machines to the large and profitable mines and industries, and wellnigh in a literal sense exemplifying the old axiom, "Unto every one that hath shall be given; but from him that hath not shall be taken away even that which he hath."

As the readjustment period of 1907 proceeded, en-

gineering thought had to busy itself with the problems "What shall we do to be saved?" and, "What can we do and what must we do to save others?" as those are questions that are forced upon engineers of all kinds, more especially during readjustment periods. So engineers were confronted with the necessity of producing air compressors of greater capacity for less money than the old-fashioned makeshift compressors that had been in use up to that time. The word "makeshift" does full justice to the system then prevailing. Up to that time nearly all builders of the large and economical type of compressors would first select a cross compound engine of a size nearest their requirements. Behind,

OLD TYPE OF COMPOUND STEAM-DRIVEN TWO-STAGE COMPRESSOR, WITH AIR CYLINDERS COUPLED TO REAR END OF STEAM ENGINE

and sometimes in front of the steam cylinders a pair of air cylinders would be placed of a size which could be operated by the steam engine that happened to be on hand or that could be furnished with the least cost of changes to patterns and drawings. Frequently, if the compressor manufacturer did not happen to have a sufficiently cheap Corliss engine of his own, he would fish around among other engine manufacturers until he found one. The compressor builder in that case furnished the air cylinder only, and if ever anything deserved the name "makeshift" the large Corliss compressors of that period certainly did.

If five specifications were furnished for a cross compound two-stage compressor there would be cylinders of as many different sizes as there were bidders. For compressors of 4,000- or 5,000-cu.ft. piston displacement there would be four or five inches difference in the high-pressure cylinder and twice that difference in the low-pressure cylinder, with strokes ranging all the way from thirty-six to forty-eight inches and even up to sixty inches. After the compressor manufacturer had listened to all of the weighty reasons why each bidder had figured on a machine particularly suited for his needs and why there was such a difference in cylinder dimensions between his and the others, the

would-be purchaser found himself in such hopeless confusion that he often had to submit the proposition to a consulting engineer. The latter would decide, at least in most cases, on a size and design such that none of the bidders had either drawings or patterns that would fit, so the result was a new design carrying with it so great a change in drawings and patterns that the cost of the installation was out of all reason. Then it was handed over to the purchasing agent, and the price per pound figured out. Often the contract was secured by the one who poured such a large quantity of pig iron into the sole plates that his price per pound was the lowest, every one being satisfied that he had secured the greatest bargain when he had secured the greatest tonnage. In most cases more vital points were left out of consideration.

ADAPTION OF STEAM MACHINES TO ELECTRIC DRIVE

When inquiry was made for electrically driven compressors, which began to come into use ten or twelve years ago, all builders of large compressors, without exception, would take these makeshift steam-driven compressors, remove the steam cylinders, and place the air cylinders nearest to the frames. Then the electrical companies would furnish motors developed and made especially for these clumsy, heavy, slow-moving affairs, and another makeshift was added to all the others, each one built up by itself and hardly ever any two alike. In many instances the motor alone for one of these slow-running electrically driven steam machines would cost more than a modern electrically driven compressor, including motor.

The conditions outlined had to be corrected if efficiency was to be improved, first cost and building space reduced, and also size of foundations. The only practical solution of the problem was to design compressors of standard types that could be manufactured in quantities. It also became necessary to eliminate the old-fashioned mill and factory engine from the compressor field and design an engine suitable for compressor service and for the particular machine with which it was used. Compressor builders had to cut loose from the hindrance that the factory or mill engine had imposed upon them.

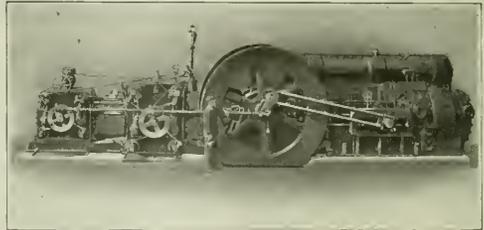

SPEED INCREASED AND WEIGHT DECREASED ABOUT ONE-THIRD

One of the principal compressor manufacturers developed a self-contained, two-stage, tandem, Corliss, compound compressor in five sizes, the capacities in cubic feet of piston displacement ranging as follows: 1,000, 1,500, 2,000, 2,500, 3,000. The fact that these engines were so designed that they could not be used for any other purpose than for driving the compressor with which they were designed to work enabled the designers to use the material of which they were made very advantageously. When consideration is given to the increased speed which was possible owing to changes in design, the weights of these units, for a given quantity of air, were from one-third to one-half of the weight of the old-style, slow-running, cross compound compressor. As a result of the self-contained design, the floor space was reduced to one-third of that occupied by a cross compound compressor of the same capacity. Inasmuch as the strains and stresses were contained within the machine itself, and would not have to be transferred from side to side, as in a cross

compound compressor, which, by the way, depends upon its foundation as a sort of backbone to hold it together, the foundation cost was reduced to about one-third, for all that was needed was a bed to rest upon, the working stresses being taken up in the machine itself. Thus, at one stroke, more was accomplished in the reduction of cost of material and floor space, and first cost of the compressor and compressor foundations as well, than had been accomplished in the line of compressor engineering for over twenty years previously. These machines were made up in quantities of from three to twelve of each size at a time.

MULTIPLE UNITS AFFORDED MORE FLEXIBILITY

If more air was needed than one compressor could supply, two units were installed, which would provide a load flexibility that could not be obtained with the old-style, cross compound machine without seriously affecting its economy. For instance, a 5,000-cu.ft. cross compound compressor could work economically only when running at from two-thirds to full load and speed; so when, as often occurred, only one-fourth of its capacity was required, the air loss became great on account of leakage, and steam loss became excessive on account of cylinder condensation, owing to its slow speed. When two units of the tandem compound type are used, say one of 2,000 cu.ft. and one of 3,000 cu.ft.

MODERN TYPE OF TANDEM COMPOUND CORLISS TWO-STAGE STEAM-DRIVEN COMPRESSOR

capacity, making 5,000 cu.ft. total capacity, either one can be operated at its most economical volume at all times.

Another important advantage attained was in the time required for delivery. In normal times these machines can be delivered immediately, and can be installed as soon as the foundation is built, eliminating the necessity of waiting five to ten months or longer for a machine to be made up to order.

To sum up, the advantages accomplished by this re-designing of the Corliss compressor were: saving of from one-third to one-half of the material; reduction of building space and foundation cost by one-half to one-third; a considerable reduction in the first cost of the machine itself; immediate delivery in normal times, and improved operating efficiency due to the load flexibility.

THE FIRST CRUDE ELECTRICALLY DRIVEN COMPRESSORS

The development and improvement of electrically driven compressors from the crude machines existing previous to the period mentioned is equally interesting. Many electric power plants were being developed, or under consideration. Propositions were under way, so that when electric power became available it would take the place of steam in a great many places. In anticipa-

tion of this event, a large number of the old-fashioned, slow-moving, cross compound Corliss compressors were equipped with pulleys for rope-drive, or belt pulleys, of sufficient weight to act as flywheels as long as steam was used. When electrical energy became available a belt or rope drive was to transmit the power from the motor to the combination rope-belt pulleys and flywheels, the steam cylinders would be disconnected, and by this apparently easy process the transformation from steam to electric drive was to be accomplished.

I will relate one instance that will prove, in the light of recent developments in electrically driven compressors, the impracticability of this scheme. In this case the flywheel that was to act as a pulley for the rope drive was 22 ft. in diameter, and weighed between 60,000 and 70,000 lb. The capacity of the compressor was 5,000-cu.ft. piston displacement. The weight and size of this pulley were in themselves sufficient to condemn this scheme, to say nothing of the first cost of an 800 hp. motor with its rope drive, the addition to the building that would be necessary to house the motor and the rope drive, and the upkeep of the rope transmission. It therefore was decided that it would not pay to change from one to the other, as a modern, up-to-date compressor could be bought for less money, including motor, than the changes would cost, and the newly purchased machine would be more efficient. This case is only one of many.

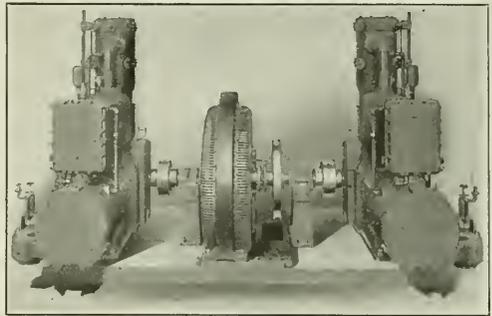

SHORT AND LARGE DIAMETER CYLINDERS THE NEXT STEP

When it was discovered that a compressor so designed that it could be driven with either steam or electricity was an uneconomical, impracticable, and wasteful machine, the development of the purely electrically driven compressor began in earnest. A line of compressors of the cross compound, two-stage type having shorter cylinders and larger diameters than those hitherto used was developed by various manufacturers. This change was made for the purpose of increasing the rotative speed so as to keep the size of the motor, and consequently its price, at the lowest point possible, though a number of compressor builders still wanted to cling to certain details in design and construction that had become standard practice in connection with the slow-speed compressors.

The mechanically moved intake and discharge valves, with their heavy reciprocating valve gears and compressors designed with mechanically moved intake valves and spring-closed poppet discharge valves, were persistently favored. To meet competition, the speeds of these machines were constantly increased beyond the point at which these reciprocating valves and valve gears could be depended on for uninterrupted service, and in consequence breakages and shutdowns were numerous. A number of manufacturers had to recede from the high speeds to slower speeds, which, of course, was a step in the wrong direction, for the reason that it involved the use of an old design of valve gear that was unsuitable for electrically driven machines. These valve gears were not only troublesome at the start, but they became more so because of the difficulty of lubrication, as, even with the best oils procurable for the air cylinders, carbon deposits on the outside of the rolling valves and on the guide plugs of the poppet discharge valves necessitated frequent cleaning and delay in operation.

But when everyone was busy wondering what to do next to overcome this difficulty, the steel makers in this country, unknown to themselves, came to the rescue. Steel plate was then being manufactured from some of the new alloys for saw blades, clock springs, vibratory diaphragms, and like articles, that was much stronger and tougher than the ordinary carbon steel that had been made up to that time. Some manufacturers conceived the idea that a piece of that strong and flexible alloy steel could be used for the intake and discharge valves of compressors in much the same manner as the leather valves used in the blast furnace blowing engines of thirty-five or forty years ago.

The experiment was tried, and it was a success from the start, and the discovery marked the real starting point in the modern electrically driven compressor. The reciprocating valve gears, with their eccentric rods, eccentrics, bonnets, rolling valves, adjustable keyheads, and many other contraptions that had been carried over from the steam-driven compressor, were immediately discarded. So were valve guides, bored-out seats, springs, cushioning devices, and other parts, for the poppet discharge valves. In many cases from 1,500 to 2,000 lb. of reciprocating parts were discarded and

MODERN TWIN ANGLE COMPOUND COMPRESSOR, CONSISTING OF TWO COMPLETE COMPOUND COMPRESSORS, EACH CAPABLE OF BEING OPERATED AS A SEPARATE UNIT

from 10 to 12 lb. of steel plate valves took their place. Because of these easily moved valves, made up of steel plate from .022 to .044 in. in thickness, an additional increase in speed became possible, and lubrication trouble, which had been very annoying up to that time, was practically overcome, as the only parts of the cylinders in a modern compressor that need lubrication are the cylinders themselves and the pistons.

A lubricator having ten or twelve oil plungers was necessary for the operation of the two air cylinders and valve gears of the former type of mechanically moved valves. Under improved conditions it was possible to use two plungers instead of ten. With the increased speed due to the lighter valves came another reduction in the price of the motor.

HEAVY FLYWHEEL STILL A DEFECT

Two objectionable features were still left—the throwing effect of the reciprocating pistons and connecting rods, especially when the compressor was running unloaded, and the heavy combination belt pulley and flywheel in the belt-driven compressor. They also remained the necessity for a heavy flywheel in addition

to the rotor, on the type of compressor that carried the motor on its shaft. These objections have now been met by some makers.

A WELL-BALANCED MACHINE FINALLY DEVELOPED

The angle type of compressor, built on the same lines as the Ball & Wood compound engine, and the large 10,000 hp. angle compound Corliss engines that were built for the Manhattan Street Railway Co. in New York City, solved both the annoyances due to the reciprocating masses and to the flywheel. Placing the two air cylinders at right angles to each other, and fastening the connecting rods of the two pistons to the same crank-pin, placed the reciprocating masses in such a position relative to one another that, by designing the crank so as to contain within itself the weight necessary to balance pistons, piston rods and connecting rods, a machine was secured that would run without vibration. In other words, the shocks and jars due to the reciprocating masses were eliminated by this arrangement, and a perfectly balanced machine was the result. Placing two angle compound machines side by side and connecting them to the same shaft in precisely the same manner as the 10,000 hp. Manhattan Street Railway engines, above referred to, and putting the electric motor on the compressor shaft between the two machines, produced such a uniform working cycle, with eight points of resistance per revolution, that a flywheel became an unnecessary adjunct. So at last the two objectionable features, shocks and jars due to unbalanced reciprocating parts, and the flywheel, were eliminated. The result was one of the most efficient, durable and economical compressors that have been invented up to this time.

Now the users of compressed air may have the same economical operating cost below 1,000-cu.ft. capacity that formerly could be enjoyed only by those whose operations were sufficiently large to warrant compressors of 4,000-, 5,000-, or 6,000-cu.ft. capacity.

Butte & Superior Mining Co.

The twenty-second quarterly report of the Butte & Superior Mining Co., covering the second quarter of 1919, was issued on Aug. 8, 1919. The following statement shows the principal operating features for the quarter, as compared with those for the first quarter of 1919:

OPERATING DETAILS BUTTE & SUPERIOR MINING CO., FIRST AND SECOND QUARTERS, 1919

	Second Quarter	First Quarter
Dry tons of ore milled.....	99,562	71,298
Average zinc content (per cent).....	14.439	15.436
Average silver content (oz. per ton).....	6.475	6.710
Zinc concentrates produced.....	25,905	19,307
Average zinc in concentrates (per cent).....	54.064	54.50
Total zinc in concentrates (lb.).....	28,010,363	21,044,540
Average silver in zinc concentrates (oz. per ton).....	22.113	22.012
Mill recovery (per cent zinc recovered in concentrates).....	97.287	95.606
Direct mining cost (per ton).....	\$5.9774	\$6.4003
Direct milling cost (per ton).....	\$2.7851	\$2.9967
Total direct cost mining and milling (per ton).....	\$8.7625	\$9.3970
Indirect, or general costs (per ton), exclusive of freight.....	\$0.7080	\$1.3760
Total costs (per ton).....	\$9.4705	\$10.7730

Exploration work during the quarter was confined principally to diamond drilling, there having been 626 ft. of drilling completed. Development work done consisted of 3,341 ft. of drifting, 1,674 ft. of crosscutting, 548 ft. of raises and winzes, and 144 ft. of shaft raises. The tonnage of ore developed during the period was somewhat greater than the tonnage extracted, so

that the ore reserves show a slight increase as compared with the previous period.

The amount of ore mined was considerably greater than during the first quarter, but was markedly below normal production, as a consequence both of the low zinc prices prevailing and of the shortage of labor. The cost of mining was \$5.98 per ton of ore, as compared with \$6.40 per ton for the previous period.

The end of the quarter showed a marked increase in the tonnage of ore milled, and there was a continued slight decrease in milling costs. There was milled during the quarter 99,562 tons of ore, at an average cost of \$2.785 per ton, as compared with an average cost per ton of \$2.996 for the first quarter. Mill operations showed a recovery of 97.29 per cent of zinc in concentrates, averaging 54.06 per cent zinc and 22.11 oz. of silver.

In the month of June, as a result of the decision of the United States Supreme Court in the flotation case, the amount of oil was increased to more than 1 per cent, with a resultant slight increase in the cost of milling, due to the additional oil contained therein, but with particularly satisfactory metallurgical results, which clearly demonstrate that no serious obstacle will be encountered in the altered practice.

Financial results of operations for the second quarter, as compared with the previous period, are as follows:

FINANCIAL STATEMENT BUTTE & SUPERIOR MINING CO., FIRST AND SECOND QUARTERS, 1919

	Second Quarter	First Quarter
Net value zinc concentrates at mill.....	\$608,741.45	\$382,156.11
Net value lead concentrates at mill, and residues.....	368,664.01	250,336.85
Metal inventory and quotations.....	150,000.00	0
Miscellaneous.....	25,727.13	19,193.61
Total.....	\$1,153,132.59	\$651,686.57
Operating costs, taxes, etc.....	942,906.51	768,065.42
Profit.....	\$210,226.08	
Loss.....		\$116,378.85

The above statement includes charges for depreciation, taxes, etc., but no allowances have been made for depletion. The average price of zinc used for estimating the profits for the quarter was 6.38c.

On June 2, 1919, the Supreme Court of the United States rendered its decision in the case of Minerals Separation, Ltd., et al. vs. Butte & Superior Mining Co. The decision of the Supreme Court reversed and modified the decisions of the Circuit Court of Appeals for the Ninth Circuit and the United States District Court for the District of Montana. The substance of the decision of the Supreme Court of the United States is that when the Butte & Superior Mining Co. was using a fraction of 1 per cent of oil on the weight of the ore it was infringing the patent of Minerals Separation, Ltd., and that when it was using 1 per cent or more of oil on the weight of the ore it was not infringing the patent of Minerals Separation, Ltd.

As Butte & Superior has clearly demonstrated that satisfactory results will be obtained by the use of 1 per cent or more of oil on the weight of the ore, the injunction enjoining it for using less than 1 per cent will not disturb or materially affect the operations conducted at the Butte & Superior plant.

Manganese Ore Exports From India for the fiscal year ended March 31, 1919, were 385,361 gross tons, as compared with 433,331 tons in the previous year, according to *Iron Age*. Of the former exports Great Britain took 295,230 tons, and France, 57,400 tons, with smaller amounts to Belgium, Italy, Japan, and the United States.

Geology of the Gogebic Range and Its Relation To Recent Mining Development—Part III*

Influence of Faults on the Forming of Orebodies Such That Careful Study Is Necessary in Planning Development Work—Four Types of Faults Evident, Each Bearing a Definite Relation to the Iron Formation

BY W. O. HOTCHKISS

State Geologist and Consulting Engineer, Madison, Wis.

THE strike of the Ironwood formation is shown in Fig. 1¹. The dip in the mines varies little from 60 degrees to the north, excepting where folds or faults have caused local changes. Toward the extreme east and west ends of the range, variations are more common, and the dip varies from a steep northward overturn (in minor instances only) through horizontal to an occasional steep southward inclination.

Folding.—Folds of a minor character are occasionally found in the productive mines, but they are only small drag folds a few feet across. The west end of the range, from a few miles east of Mellen to Lake Namakagon, has been folded on a much larger scale. Fig. 18 shows a section of the fold in Section 9, T.45N., R.2W.,

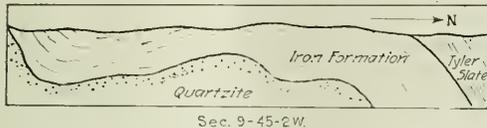

FIG. 18. CROSS-SECTION OF THE FOLD IN THE IRONWOOD FORMATION IN SEC. 9, T. 45N., R.2W., SHOWING THE QUARTZITE, THE IRON FORMATION AND THE TYLER SLATE

about three miles east of Mellen. The fold in Section 18, T.44, R.3W, Wisconsin, is shown in Fig. 19. Just East of Mineral Lake, in Sections 13 and 24, T.44, R.4W., notable crumpling and faulting of the formation on a large scale occur, and this is shown by the small outcrop map, Fig. 20. Farther west the formation has been much folded, but its general northward dip is preserved. At the extreme east end of the range, similar folding has taken place.

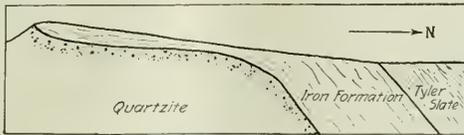

FIG. 19. CROSS-SECTION OF FOLD IN SEC. 18, T. 44N., R.3W., SIMILAR TO FIG. 18

In general it may be said that the minor folding is not known to have played any part in localizing ore deposits. The one important item in the attitude of the beds, from the point of view of the effect on origin of ore, is the 60 degree northward dip.

Faulting.—Throughout the whole extent of the iron formation and the rocks associated with it, faulting is

very common. Many of the faults have been identified in recent mining developments, in drilling, and in geological work, but many more undoubtedly remain to be worked out by more careful and extended observation. Many can be discovered by careful dip-needle work on the magnetic lines marking the Pabst and Pence members. More careful observations on faults will undoubtedly be made, as they are an important element in the formation of orebodies, and therefore a knowledge of the details of faulting is necessary for the proper planning of exploration and development operations.

That faulting occurred at widely different periods is definitely known, as faults of one kind cut across and displace earlier faults. As faulting has not been

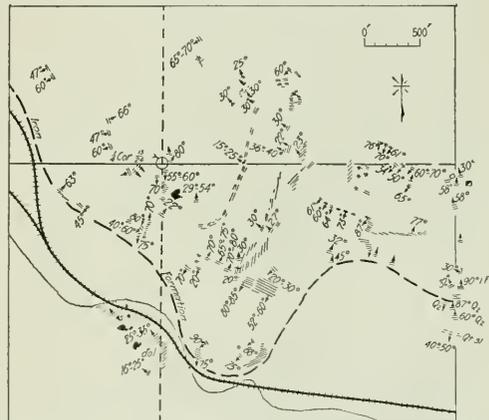

FIG. 20. OUTCROP MAP OF FOLDED AND FAULTED AREA IN SECTIONS 13 AND 24, T. 44N., R.4W.

studied thoroughly in many of the mines, it is impossible to make final statements with regard to the relative ages of all the faults. Few determinations have been made that definitely fix the relative ages. Whether all other faults of the same general types will be found in agreement with the facts thus far observed, only more detailed work will show.

Faults are "planes of weakness" in a formation, and at any time after the first break has occurred further movements may take place. It is not at all unlikely that slight movement is going on along some of the faults in this range. If such movement has occurred, it is obvious that older faults may now appear to displace younger ones. Complications of this sort may possibly be discovered by future observation.

On the basis of the present only partly conclusive data, there are four types of faults of relative age,

*Parts I and II were published in issues of the *Journal* of Sept. 13 and Sept. 20, 1919, respectively.

¹"Geology of the Gogebic Range and Its Relation to Recent Mining Development—Part I," *Eng. and Min. Journ.*, Sept. 13, 1919.

the most recent being given first and the earliest given last, as follows:

1. Faults striking nearly perpendicular to the formation and nearly vertical in dip. These are called transverse faults.

2. Faults striking nearly parallel to the strike of the formation or parallel to eastward-pitching dikes, and nearly perpendicular to the beds. These are called Eureka type faults, from one of the best-known faults of this kind.

3. The great Sunday Lake fault, the only one of its type.

4. Faults parallel to the beds of the iron formation. These are called bedding faults.

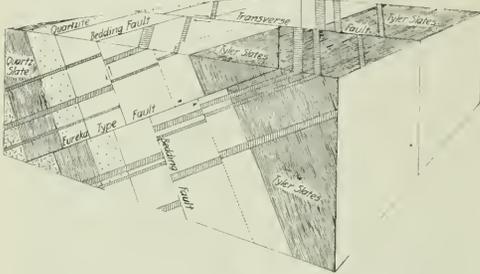

FIG. 21. BLOCK DIAGRAM SHOWING RELATION OF TRANSVERSE FAULTS, EUREKA TYPE FAULTS, AND BEDDING FAULTS

The first two and the last types of faulting and their relation to each other, so far as known at present, are shown in the block diagram in Fig. 21.

The latest faults to be formed are those which cut approximately perpendicular to the beds and are nearly vertical in attitude. These transverse faults may vary rarely as much as 45 degrees from the direction stated. They are the only faults definitely known to have affected the Keweenaw volcanic rocks, but it is probable that faults of the Eureka type may later be found to cut through the Keweenaw. The greatest known fault of this type is that at Penokee Gap. Here the formation on the west side of the fault is set north about 900 ft. relatively to that on the east side. No facts are known that determine the actual direction of throw here, but it is probable that the movement on the fault plane took place in a direction nearly at right angles to the plane of the beds.

Another pronounced fault of this type is that at Potato River Gap. Van Hise described this² as having a horizontal displacement of 280 ft., the west side of the fault moving to the northward.

The two faults mentioned are the only large ones of this type known in the Ironwood formation. Displacements of moderate throw are found at short intervals all along the range. Where the iron formation occupies the crest of the ridge west of Penokee Gap, small notches in the ridge are found every few hundred paces, where the offset of the formation is as much as twenty feet. The notches mark the places where broken fault material has been eroded. In the mines small transverse faults with an offset of only a few feet are common, and some with a horizontal offset of nearly 100 ft. are known.

The direction of relative movement in these trans-

verse faults varies. West of Penokee Gap a number of adjacent small faults show the formation on the west side of the fault offset to the north. Elsewhere, there seems to be little regularity, but too little is known to warrant the conclusion that no regularity exists. The movement between the fault blocks has been slight, and the blocks have probably tilted more or less during the faulting, so that in a single fault it may be found that though one side is offset to the north at surface, in depth the other side may be set north.

Faults of the transverse type have been observed by Gordon³ in the Keweenaw lavas making the ridge north of the Tyler slate formation. Horizontal offsets of as much as 1,500 ft., and many of lesser magnitude, were noted by him. He states, further, that the offset seems to decrease greatly as the faults are followed south. These faults cut the trap range into blocks with high vertical fault-plane cliffs which are very striking when viewed from the mines. In the iron formation the largest of these faults produces an offset which is only a small fraction of the offset in the lavas.

This same effect—of smaller offsets as the fault is followed to the south—is observed in the iron formation itself. Transverse faults, which have offset the beds nearly a hundred feet at the north side of the formation, have produced only twenty or thirty feet of offset at the south side. It has long been accepted that all faults die out with depth. Here is an instance where apparent lateral dying out is due to the fact that the faults were probably formed when the iron formation was nearly horizontal in position. The subsequent tilting has resulted in eroding away the formation, so that there now appears in cross-section at the surface what formerly, at the time when faulting occurred, represented miles of depth from what was at that time the surface of the earth. The transverse faults are known to offset all intrusives in the iron formation and

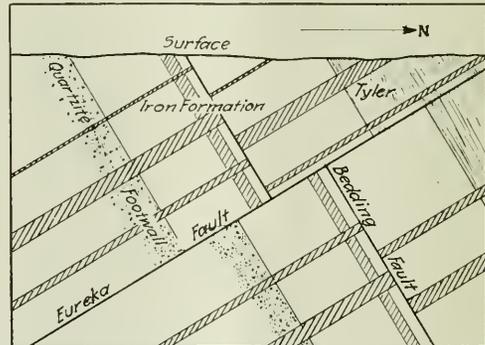

FIG. 22. DIAGRAM SHOWING MOVEMENT OF THE EUREKA FAULT IN THE EUREKA MINE IN CROSS-SECTION

all other types of fault excepting the Sunday Lake thrust. Other evidence, however, is conclusive that the transverse faults occurred long after the Sunday Lake fault.

Extending from the Tilden mine through the Eureka mine, and for unknown distances farther east and west, there is a fault which dips toward the foot wall and strikes nearly parallel to it. In the Eureka mine this fault offsets the iron formation, as shown in Fig. 22. In the Tilden mine this offset is reversed, and the offset

²Monograph XIX, U. S. Geological Survey.

³1906 Annual Report Michigan Geological Survey, p. 464.

is as shown in Fig. 23. These figures are not actual cross-sections of the mines named, but only diagrams to show the offset due to the fault. This fault acted after the manner of a pair of monster millstones. Looking down upon it from the south, the upper block turned as though it were driven by a shaft turning in the

The Eureka fault is offset by the transverse faults, and so must have existed when the transverse faulting occurred. It in turn offsets the bedding fault and the sill, so that these must be older.

THE SUNDAY LAKE FAULT

The Sunday Lake fault is probably the greatest fault on the Gogebic iron range. It has been studied for a number of years by Dr. C. K. Leith and some of his students. A number of the latter have written theses on the structures in this Wakefield area, and one of them, M. C. Lake, geologist for the M. A. Hanna Co., wrote an article which appeared in Crowell and Murray's "Iron Ores of Lake Superior," 1917. A map of this faulted region is shown in Fig. 24, and is adapted from Mr. Lake's map. The base of the iron formation on the east side of the fault is nearly a mile and a half northwest along the fault from the base of the iron formation on the west side of the fault, but whether this is the actual direction of throw of the fault or not is somewhat doubtful. The throw is probably at right angles to the dip of the formation. From all the information at present available, the fault is approximately vertical in its dip, and the strike, as shown in Fig. 24, is approximately northwest. The main movement along this fault plane occurred when the beds of the iron formation series were horizontal, before any appreciable tilting had taken place. The beds on the east side of the fault were then over-thrust upward in a westwardly direction. Associated with this thrust fault there was folding and crumpling of the beds, as shown in the hill of Palms quartz slate at Wakefield. After this fault occurred, there followed a period which resulted in the complete erosion in some places of the Tyler slates on the eastern side of the fault, so that when the Keweenaw lava flows began to pour out, they, or Keweenaw conglomerates, rested in many places directly upon the iron formation.

So far as is indicated by information at present avail-

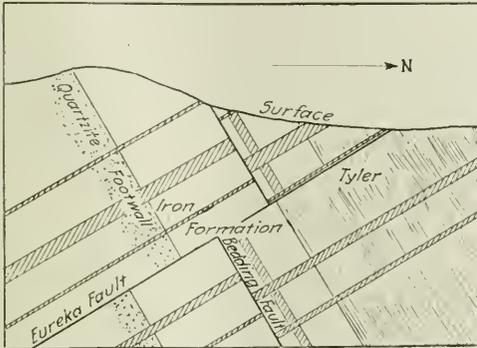

FIG. 23. DIAGRAM SHOWING MOVEMENT OF THE EUREKA FAULT IN THE TILDEN MINE IN CROSS-SECTION

direction of the hands of the clock, the part west of the pivot moved north and that east moved south. The point where there is no offset, the pivot of these millstones, is situated in the Palms mine. The greatest offset known in the Tilden is about 225 ft.; that in the Eureka is about 300 ft.

Other faults of the Eureka type are known in the Asteroid and Mikado mines, to the east, and in the Plymouth and Wakefield mines. Most probably, the faults which set down to the south the great block of formation in which the latter two mines lie are of the Eureka type. Much must be learned about these faults before this can be stated as a certainty. It is entirely

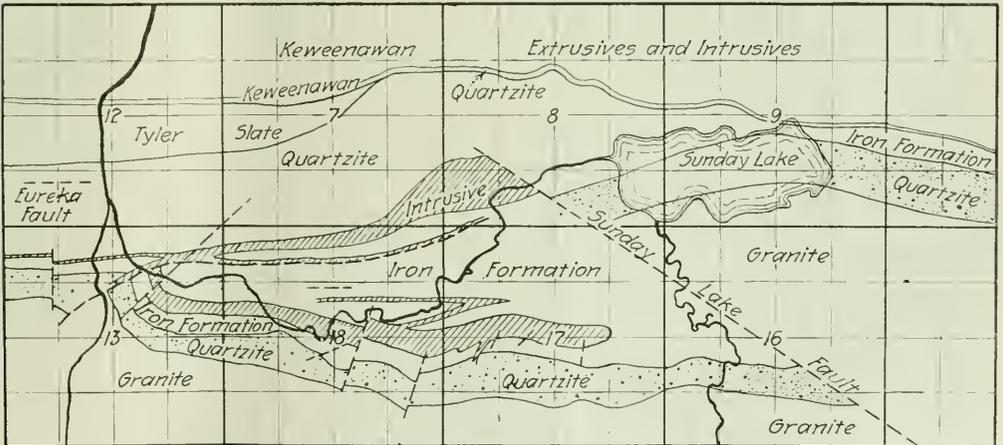

FIG. 24. MAP OF REGION OF SUNDAY LAKE FAULT After M. C. Lake in "Iron Ores of Lake Superior," Crowell and Murray.

possible that they represent a fifth type of fault. Faulting of the Eureka type has been definitely recognized though there may have been a later movement along this west of the Tilden mine only in a few cases of slight fault that has displaced the traps, there is no question displacement, but it is not at all unlikely that larger that the major movement occurred before Keweenaw time. There is no evidence that the bedding fault

cuts through the Sunday Lake fault, and, on the other hand, bedding faults are known in the iron formation east of the Sunday Lake fault. Though it is impossible to say that these bedding faults correspond to the great bedding fault movement west of the Sunday Lake fault, it is not at all improbable that they do. If so, the Sunday Lake fault must have displaced the bedding fault. Furthermore, the bedding fault, in its strong eastward movement of the beds north of the fault, would have produced a notable offset in the Sunday Lake fault if it were the younger of the two.

BEDDING FAULTS

Faulting in the Ironwood formation along planes parallel to the bedding is found near the base of the Plymouth member, in the Yale member, and in the Pence member, and also in the Pabst member of the Tyler formation. So far as my observations have gone, the amount of movement on any of these fault planes is comparatively little, except in the Yale. The great bedding fault is found, for the most part, in or near the black ferruginous slate of the Yale member. This fault does not follow a single bed, but in some places is found at the very top of the Yale member, or even in the lower part of the Norrie, and at other places is found at the very base of the Yale.

The movement occurred sometimes along a single shear plane, but more often along two or three planes—usually all in the Yale member. The main direction of movement along this fault can be best described by stating that the beds above or north of the fault plane have moved to the east. As is the case in many faults, the amount of movement has been greater in some parts of the plane than in others, and the amount of eastward shove of the beds north of the fault apparently increases as investigations proceed west. In addition to this eastward movement of the upper beds, there has been in most places a movement up or down the dip of the beds. In the Tilden mine the beds north of the fault have gone downward. In the Geneva mine, and everywhere to the west, there is an upward movement of the beds north of the fault, and this upward movement increases in amount the farther west the fault is followed.

As mine workings seldom touch the exact spots which make it possible to identify the same portion of a dike on the north and south sides of the fault, it is impossible in most parts of the range to give exact figures as to the movement. The eastward component in the Norrie mine is indicated by the fact stated to me by Mr. Olson, the chief engineer on this range for the Oliver Iron Mining Co., that a vertical dike was offset 650 ft. to the east on the north side of the fault.

In the Montreal mine it has been possible to identify with reasonable certainty the intersection of a westward-pitching dike and an eastward-pitching dike, both on the foot wall and at a point about 300 ft. north of the foot wall, so that the total amount and direction of movement at this point can be estimated closely. In the vertical longitudinal projection of the mine, the intersection of the two dikes 300 ft. from the foot wall is 840 ft. east and 375 ft. upward in vertical projection from the same intersection on the foot wall. Translating this into terms of movement on the actual fault plane would mean that the beds to the north of the fault moved a total distance of approximately 950 ft. eastward and upward, or approximately 800 ft. along the strike of the beds and 200 ft. up the dip of the beds.

The easiest method of measuring this fault is in the mine cross-sections, where the actual offset of the dike in each section can be scaled in places where the same dike can be identified both north and south of the fault. The offset measured in a section like this will, of course, vary with the pitch of the dikes, and does not give any actual measure of faulting, but it does give the approximate distance that would have to be raised in the mine workings from a dike in the foot side of the fault in order to get the same dike north of the fault. Measuring in this fashion, the measurements given in the following table indicate the distance which the two parts of a dike on opposite sides of the fault are displaced in the vertical cross-section. The first measurement is in the easternmost mine where information is available, and the succeeding measurements are progressively farther westward:

Tilden Mine—North side down about 100 ft.

Davis-Geneva—North side up 60 to 100 ft.

Aurora—North side up 150 ft.

Ashland—North side up 200 to 250 ft.

Montreal—North side up 425 to 500 ft.

The bedding fault is displaced by the transverse faults and by faults of the Eureka type. These facts indicate that the bedding fault was present when the other two types of faulting occurred. In its turn, the main bedding fault displaces the intrusives in the iron formation so far as relationships are known at present. Therefore, the bedding fault must have occurred after the intrusives had entered the iron formation. Apparently, also, this bedding fault is offset by the Sunday Lake fault, so that the latter apparently occurred after the bedding fault took place.

INTRUSIVES

Both in the productive as well as in the non-productive parts of the range the intrusives consist of numerous dikes and a sill which is known to extend from the Mikado mine on the east to the Yale mine on the west. The intrusives are much more complicated and much less known in the extreme eastern and western ends of the range, but no attempt is made to discuss these at this time. All of this discussion applies only to the dikes in the productive part of the range and to the sill.

The intrusives in the iron formation are much alike in character, such variations as are noted being chiefly size of grain or difference in color. They are diabase or diorite of medium to fine crystalline character. The sill is parallel to the beds, and, so far as observed, seems to be intruded into the black slate bed of the Yale member. The dikes are nearly perpendicular to the bedding of the iron formation, but usually are somewhat steeper in dip toward the foot wall than this statement would indicate.

The larger number of dikes have an eastward pitch, so that in following eastward along the foot wall a dike will drop from 20 to 35 ft. in going 100 ft. of horizontal distance. Some dikes have less pitch than this and a few are steeper, a very few being known to be nearly vertical in dip and striking directly across the iron formation. In addition to these eastward-pitching dikes there are those which have a westward pitch. In general these westward-pitching dikes seem to be much less constant in direction. In the Cary mine, a west-pitching dike cuts through an east-pitching dike, but it is not known if other westward-pitching dikes are younger than those with an east pitch.

Little is known of the relationships of the dikes to the sill. In the Yale mine a single instance was found where a small dike cut through the sill, proving the dike to be the later of the two to be injected into the iron formation. This is shown in Fig. 25. Whether all of the dikes are of later age than the sill, cannot be stated. It is probable that there are dikes of considerably different ages in the iron formation, but on this little evidence is at hand. There are dikes cutting the Keweenaw trap rocks which are thought to be the same as the dikes in the iron formation, indicating that some of the dikes are Keweenawan or later in age. Other dikes and the sill are offset

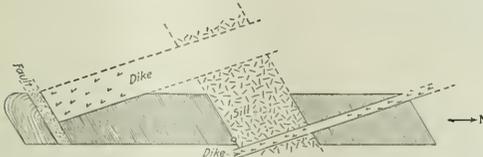

FIG. 25. SKETCH OF WEST SIDE OF CROSSCUT IN YALE MINE, SHOWING SILL CUT BY SMALL DIKE

by those faults which are definitely known to be earlier than Keweenawan, and so must be pre-Keweenawan in age. Further study of the relative ages of dikes is most likely to show that dikes intruded the iron formation at various periods during, and preceding, the volcanic activity of Keweenawan time.

It has been the opinion of some geologists that the openings filled by the dikes were the channels through which the Keweenawan lavas reached the surface, but it seems to me rather improbable that these could have been the main feeders for the lava flows, because of the fact that the iron formation adjacent to the dikes is seldom altered for a distance as great as a foot. Only adjacent to the largest dikes, 50 or 100 ft. in thickness, has the effect of the dikes on the iron formation extended as much as six or eight feet. If these dikes had served as the main channels for the hundreds of cubic miles of lava composing the Keweenawan, it is almost beyond question that they would have altered the iron formation, more particularly the chemically unstable carbonate phases, to a far greater extent than they do. This fact, and the strong evidence that most of the dikes were of an age earlier than the bedding fault, seem to me to indicate strongly that most of the dikes are pre-Keweenawan in age.

SUMMARY OF STRUCTURAL EVENTS

It may be well to summarize at this point the history of the structural incidents in the iron formation and state briefly the evidence which has been given. (1) After the deposition of the iron formation the first event of importance was its intrusion by the great sill. The intrusion of many of the dikes was probably almost contemporaneous with this, and possibly somewhat later, a single instance having been found where a dike cut through the sill. (2) While the beds were still in a horizontal position the bedding fault occurred, cutting the dikes and the sill and shoving the upper beds in an easterly direction. Numerous cases have been found in which the sill and the dikes have been cut by this fault, which, so far as is known at present, is the oldest one on the range. (3) The next event of importance was the development of the great Sunday Lake thrust and the associated crumpling

of the beds, which occurred while the formation was still in a horizontal position. After this fault occurred a great erosion interval, during which the whole of the Tyler slate formation was eroded in places east of the Sunday Lake fault. (4) The next event of importance was the development of faults of the Eureka type. This may have occurred either before or after the outpouring of the Keweenawan lavas which make the trap rock range, but it is my belief that these faults probably occurred after the Keweenawan lavas had been extruded. Most probably the iron formation was still in a horizontal or nearly horizontal position at the time this faulting occurred. (5) The next important structural event in the history of the iron formation was the development of the transverse faults. (6) The last structural event was the tilting of the iron formation downward to the north.

These events have been stated in categorical style to point out the trend of the evidence available at present. It must be kept in mind that this simple statement cannot be complete and that events given here as successive may have been almost contemporaneous.

CHRONOLOGY OF STRUCTURAL EVENTS

Of these structural events, the greater part of the intrusion of the iron formation, the development of the bedding fault and of the Sunday Lake fault, occurred before the Keweenawan lavas were present. The Eureka type faults may have occurred either before or after. The transverse faults occurred after development of the lava flows, and probably before but possibly during the tilting which tipped them to their present steeply inclined attitude.

It is probable that still another structural event occurred in another intrusion by dikes, and that these dikes are the ones which in a few instances have been found to cut into the Keweenawan lava flows. If such dikes exist in the iron formation, however, they should be found to cut through the great bedding fault without being materially displaced, unless later movements along the bedding fault cut them off. No cases of this kind have been identified with certainty so far as the facts are known to me.

(To be concluded)

French Technical Journals

A list of French technical journals, with addresses and terms of subscription, is given below, with the belief that it may be of value to readers of the *Journal*. Many engineers who have served overseas desire to keep up their French, and, at the same time, to keep in touch with engineering matters abroad during the reconstruction period:

L'Echo des Mines et de la Metallurgie, 7, Rue d'Offement, Paris. Subscription (foreign), 55 fr.

La Metallurgie et la Construction Mecanique, 20, Rue Turgot, Paris. Subscription, 25 fr.

La Revue de Metallurgie, 49, Quai des Grands Augustins, Paris. Subscription, 40 fr.

Revue Universelle des Mines, 174, Bould. St. Germain, Paris. Subscription, 40 fr.

Revue Industrielle de l'Est, 40, Rue Gambetta, Nancy. Subscription, 22 fr.

La Technique Moderne, 49, Quai des Grands Augustins, Paris. Subscription, 42 fr.

Le Genie Civil, 6, Rue de la Chaussée d'Antin, Paris. Subscription, 45 fr.

L'Usine, 145, Faubourg St. Denis, Paris. Subscription, 36 fr.

A Precedent for Engineers

W. L. Saunders, Speaking at Dinner to Herbert C. Hoover, Eulogizes Masterly Executive
And Engineering Accomplishments of the Food Administrator in
Serving the Cause of Humanity During the War

AN ASSEMBLAGE that crowded the Grand Ballroom of the Waldorf, and that overflowed into the foyer and reception rooms, on Tuesday night, Sept. 16, welcomed Herbert C. Hoover back to the United States. The reception and dinner in his honor were given by the American Institute of Mining and Metallurgical Engineers, who had as guests for the evening many prominent and distinguished citizens.

The dinner and reception were attended by more than 1,200 members and guests of the Institute. Among those invited were A. C. Bedford, J. Parke Channing, Norman H. Davis, Henry S. Drinker, Arthur S. Dwight, John H. Finley, E. H. Gary, George W. Goethals, John Hays Hammond, A. J. Hemphill, Myron T. Herrick, Alexander C. Humphreys, H. H. Knox, Thomas W. Lamont, Pierre Mali, Key Pittman, O. B. Perry, Charles F. Rand, Mark L. Requa, Edgar Rickard, John D. Ryan, Charles M. Schwab, Waldo J. Smith, Henry L. Stimson, Melville E. Stone, Oscar S. Straus, Albert Straus, George Otis Smith, and Robert H. Treman. William L. Saunders, past president of the A. I. M. E., was the toastmaster.

The members of the Institute, their friends and guests greeted with long-continued applause, delivered standing, and amid cheers and "Tigers!" the toastmaster's declaration concerning Herbert Hoover: "Such captains of industry are by education and experience best fitted to steer the ship of state."

Horace V. Winchell, president of the Institute, presided, and before presenting the toastmaster read a score or more of cable dispatches and messages from foreign engineering and civic bodies.

Mr. Saunders' address follows:

This dinner is a simple tribute paid by the family of engineers to one of its masters. He is indeed a master, who, after rising to leadership in his profession, elects to be a servant in the cause of human welfare during a period of great calamity. If there is one reason larger than others for this meeting, it is that we might grasp the hand of our guest and say from our hearts, God bless you, old man. You have done well. We are proud to know you.

As this is a familiar audience to me, suggesting (except that it is bigger) our old Mining Institute dinner days, I am reminded of an incident that occurred up in the iron district of Michigan: A speaker, looking over a familiar audience, began by saying, "Now you know what I am going to say." A large part of the audience cried out "Yes." Whereupon he said, "Well, as you know what I am going to say, I shall not take your time by saying it." He then sat down. Called to his feet again, he repeated the statement, "You know what I am going to say." There were loud cries of "No." He then said, "Will those people in the audience who know what I am going to say please tell those who do not know, and save time for the next speaker?"

Now, as the next speaker is our guest of honor, the logical and popular thing for me to do is to follow the course of my Michigan friend. But in this I am beset with difficulties. The committee in charge of this dinner has overruled its chairman, declining to listen to my argument that a toastmaster at a dinner does not make a speech, but should feature the speakers and not himself. To this they have cruelly replied that everybody knows that toastmasters become so inebriated by the exuberance of their own verbosity that they feature themselves to such an extent that it is hard to even see the features of other speakers, let alone hear their voices.

But you do not know what I am going to say, for this is no ordinary occasion. Never before have men gathered to pay a just tribute of admiration to one who has done the things that this man has done. His work was not built upon precedent; there was no experience, no guide. It was, in fact, a creation. In the words of the Prime Minister of England, his work in Belgium was nothing less than a miracle. Yet it is a fact that those who have been in close touch with the situation say that his greatest work has been done since the armistice was signed.

Truly, this is a period of new things, new changes, new times; a period of agitation which brings to the front new men of true worth. You who are mining engineers know what a good thing the flotation process is, how by violent stirring up of things the metallic values are separated from the gangue and float off at the top. This process has been in action all over the world during the past five years and it has revealed out of the chaos an engineer of the value of pure gold—one

"Of manners gentle, of affections mild,
In wit a man, simplicity a child."

A rugged personality, strong of conviction, modest; thinking never of self; practical, far-seeing, wise, human, brave; with a mind clear in action, a conscience that always functions; one who has saved lives while all others were engaged in destroying them; a rare combination of physical, mental, and moral courage; a real American is this Herbert Hoover.

Who's Hoover, any way, and what is a mining engineer, are questions asked by the man on the street. It is easier to answer the first question than the second. Some of you may remember my saying at one of our Institute dinners: If a man goes digging for clams is he mining or is he fishing? Professor Kemp answered it by saying that his professional experience had taught him that the mining engineer is the clam. There is some truth in this just when we realize that engineers are always digging in scientific fields, giving little thought or time to civic affairs or to human welfare. Huxley has called this a mental twist and he compares it to a ship out of trim because listed by an excess of cargo on one side. Here at last we have the example of an engineer who typifies the modern defini-

tion of engineering which is thus written in large letters on the wall of the engineers' library in New York: "Engineering, the art of organizing and directing men, and controlling forces and materials of nature for the benefit of the human race." How well this modest mining engineer has shown that he has the art of "organizing and directing men"! Of the many thousands working for him, here and abroad, it is said that not only have they given him loyal support, not only are they glad to work for him, but every man of them would take off his coat and fight for him. How well he has shown his capacity for "controlling forces and materials of nature for the benefit of the human race."

This definition of engineering would have been amazing forty years ago. The civil engineer was then a surveyor, a mathematician and a bridge designer; the mechanical engineer an educated mechanic, a designer and draughtsman; the electrical engineer was unknown outside of the school and the laboratory; while the mining engineer was a combination of the geologist and that kind of a chemist who could tell how much phosphorus there was in a steel rail. I make this statement with apologies to Alexander Holley, who in his day was the one and only mining engineer known beyond the fence of the work-shop or mine.

But the engineer is at last coming into his own. We see the dawn of a new day; truly there is a new order of things: The great centers of the world are now industrial centers. The prosperity and strength of nations in peace and war rest now upon the factory system, the shops, the railways and steamships, the mines, the smelters and the public works. And who is responsible for this? Who plans and executes these things? It is the engineer, civil, mining, electrical, mechanical, chemical, and automotive. Such captains of industry are by education and experience best fitted to steer the ship of state. The place for the engineer is not in the dark confines of the hold below, but on the upper deck—yes, on the bridge.

We are told that practically all the executive heads of the organization for the relief of Belgium were engineers. Who but an engineer is as well trained by education and experience to meet emergencies? He must be prepared for extraordinary conditions. He must foresee these conditions and be ready to act quickly. A mine manager—usually a mining engineer—when told that a pump has broken down in the mine, cannot wait for the common remedies, but must provide in advance for experts and appliances to be on the spot at once and cure the trouble promptly. Is not this the one thing above all others which enabled America to play so important a part in the war? Was it not the spirit of the engineer, his capacity to do things and do them quickly?

Surely the war was not won by money, for the enemy was never financially embarrassed. I think we shall all agree that the basic strength of the Allies throughout the war was in the never-dying morale of all the people, including the armies, arraigned against Germany. But what would this strength have availed us but for the resources behind the lines? Modern war resources are mainly coal and iron and the capacity to put these things to practical use on a large scale. The mines would avail little but for the works, and the works might avail little but for the men—the engineers who direct them on modern, scientific lines of high ef-

iciency. Mr. Hoover during the war gave me the first insight into the Battle of the Marne, when he told me that even the Germans underestimated by twenty per cent the volume of munitions required in a modern battle. They drew away too fast from adequate supplies.

And so America, through its engineering and industrial strength, helped to save the world from calamity. Now what individual best exemplifies this? Food played an important part in the war. We have heard the cry that food will win the war. Surely without food no war could be won. It was Mr. Hoover who took care that there should be no food shortage. He did more—he taught thrift to millions of people in all walks of life and in all parts of the world. He preached the gospel of the clean plate. But it is not only in food that our guest stands as an example of achievement; he typifies the engineer, the executive, the man behind the gun. It is easy to see things that lie directly before us, but the best executive is one who builds his fences around the future, who anticipates trouble before it comes.

Little has been said of Mr. Hoover's capacity to think straight in advance, but this is really one of his strongest characteristics. It was first shown when he took charge of the work of sending Americans over when the Great War broke out. His plans were made and negotiations completed with shippers before the organization was made up and before he had any knowledge of how many persons were to go or where the money was to come from. While forming the Commission for the Relief of Belgium, and before he knew who was to pay the bills, he had ordered millions of dollars' worth of food and had chartered ships. When asked why he took such chances he said that it was impossible to believe that the people of the world would not stand behind so wholesome a measure in the interest of humanity, and they did stand behind it nobly and to the end. While Congress was hesitating and amending the Food Act Bill, Hoover was busy organizing every state and territory, even going into counties of each state, so that when the bill was finally passed the machine had been completed and was ready to function. His abiding faith in public opinion is based upon the belief that the people will always support an unselfish effort to do that which is right.

I have said that there was no precedent for the work done by Mr. Hoover. He has established a precedent for engineers, and for us this is one of his greatest acts. I shall not attempt to tell you all that he has done during the past five years. I am incapable of doing so. The things are so big that one stands agast in studying them. We have long known him as an able and successful mining engineer. He is an honorary member of the Institute. He was the first choice of the nominating committee for president of the Institute in 1914, but asked to be permitted to forego the honor because he felt that it was his duty to help feed the Belgians.

Herbert Hoover is a graduate of Stanford University. He first served with the United States Geological Survey, then went to West Australia and China, in mining activities. His work in London up to the beginning of the world war was notable in that he departed from the usual share-promotion schemes of the mining market, developing the properties in which he was inter-

ested purely on technical lines. He would not countenance any inflation of shares which was not represented in the intrinsic value of the properties. When the war broke out he gave up his management and directorships and steadfastly refused to give any attention to his private affairs during the whole period of the war. He began work the morning after England declared war on Germany, taking charge of the relief of American refugees, advancing funds out of his own pocket, and through his friends, furnishing forty-five thousand people with money and steamer tickets to get home. In October, 1914, he organized the Commission for the Relief of Belgium. Through this source nine million people were continually supplied with food, nearly half of them being entirely dependent upon this relief. There were thirty-five thousand Belgians and French engaged with him in this work. He provided seventy steamers in regular service, delivering 4,500,000 metric tons of foodstuffs. The losses in foodstuffs from all causes from the ship to the Belgian warehouse were less than two-tenths of one per cent. There were 200 American volunteers in this work, serving without salary, most of them paying their own expenses. Eighty per cent of them were university graduates. The total overhead expenses of this commission were less than one-half of one per cent. He was responsible for the expenditure of six hundred and fifty million dollars.

Shortly after America entered the war Mr. Hoover was summoned to Washington to take charge of the food situation here. The problem was a large one, as food demands from Europe were centered upon the United States. His organization in every state and county comprised 8,500 men and women, giving their whole time to the Food Administration. In addition to this there were half a million persons registered and ready to be called upon for emergency work. Twelve million families were pledged to support the work. Of the active workers about one-half were volunteers, the others receiving moderate salaries from the Government. It has been estimated that if these volunteers had received the ordinary Government remuneration of \$2,000 per annum the salary bill alone would have been nine million dollars. Most of these volunteers paid their own expenses. Of the paid employees only thirty-four received remuneration of \$3,600 per annum or more. It has been estimated that this administration carried out its functions ninety-two per cent by voluntary effort, seven per cent by persuasion and one per cent by legal authority. A conservative estimate of the advertising voluntarily contributed in this work approximates the sum of eighteen million dollars. A voluntary conservation campaign among hotels and public eating places resulted in the first six months in saving the equivalent of about two and a half million bushels of wheat.

During eight and one-half months in the year 1918 more than sixteen and one-half million bushels of wheat were saved by conservation at the mills. It is impossible to enumerate all of the activities of the Food Administration. One of the minor activities was the Grain Threshing Division, organized for the purpose of helping to eliminate wasteful practices. The expenses of this division amounted to fifty-five thousand dollars, and it has been estimated that the amount of wheat saved was forty-four million dollars.

Immediately after the armistice was signed Mr. Hoover was directed to proceed to Europe to investigate the part that America could play in the relief of the civilian population. Though he had but four days before sailing, he arranged for the purchase and shipment of 250,000 tons of food. It was not until February of the following year that Congress appropriated one hundred million dollars for European relief. At that time several hundred thousand tons of foodstuffs had been actually distributed. Up to a recent date over three million tons of foodstuffs, valued at over seven hundred and seventy million dollars, have been distributed.

This is a brief and altogether inadequate statement of a wonderful record of achievement. Certain things stand out with striking prominence. Mr. Hoover was more than a food administrator. He was a general, an organizer in action. He got men to do things. His faith in the moral support of the people was sublime yet practical. He seemed to know the right methods to follow and the psychological moment to act in order to secure the full measure of support.

And so, dear friend, we welcome you home! We rejoice that your five years of labor have produced so wholesome a harvest. We are glad that you are returning to the practice of your profession. We know that we cannot honor you as you have honored us; but in this inadequate tribute of our love may you find some measure of cheer as you journey to the Sierras and your California home. On behalf of this audience, on behalf of all engineers, on behalf of a war-stricken people, who did not pray in vain, "Give us this day our daily bread"—on behalf of all America, let me say to you in the words of John Milton, Servant of God, well done, well done!

Testimonial to Hoover

AN ILLUMINATED TESTIMONIAL, bearing the Autograph of each person attending the dinner given by the American Institute of Mining and Metallurgical Engineers, on Sept. 16, 1919, at the Waldorf-Astoria Hotel, to welcome the return of Herbert Hoover, was delivered to the guest of honor during the dinner. The text of this testimonial was as follows:

"To HERBERT HOOVER the members and guests of the American Institute of Mining and Metallurgical Engineers, assembled to commemorate his return home, extend the *welcome* due an eminent American citizen, a successful Engineer, a Genius of Constructive Administration, a practical Economist, a Statesman of World Vision.

"In him they honor an Idealist who was able to vitalize the Altruism of America and save from Hunger and Anarchy vast areas of Europe where millions of men, women and children in a score of languages lift their voices to call him blessed.

"He is loved and honored for his gift of leadership and inspiration which called many thousands of volunteers to his aid in the great tasks he undertook and accomplished.

"Realizing that no gift of gold or precious stones could convey the deep feeling of appreciation we wish to express, we simply subscribe our names as fellow engineers, co-workers and admiring friends.

"NEW YORK CITY, Sept. 16, 1919."

Herbert Hoover's Address at the A. I. M. E. Reception in His Honor

FOLLOWING the toastmaster's tribute, at the reception and dinner in his honor, to Herbert Hoover's great services for America and for the world in the last five years, Mr. Hoover delivered an address, which is here presented in full:

I have been asked to speak to you on some of the impressions that I have gained during my service in Europe since the armistice. Two convictions are dominant in my mind. The first comes from contact with stupendous social ferment and revolution in which Europe is attempting to find solution for all its social ills by practical experiments in Socialism. My conviction is that this whole philosophy is bankrupting itself from a startling quarter in the extraordinary lowering of productivity of industrial commodities to a point that, until the recent realization of this bankruptcy, was below the necessity for continued existence of their millions of people. My second conviction is older but has been greatly hardened, and that is a greater appreciation of the enormous distance that we of America have grown away from Europe in the century and a half of our national existence, in our outlook on life, our relations toward our neighbors, and our social and political ideals. The supreme importance of this Americanism neither permits us to allow the use of this community for experiment in social diseases, nor does it permit us to abandon the moral leadership we have undertaken of restoring order in the world.

During the last ten months I and my colleagues have occupied a unique position in intimate witness of the social currents that have surged back and forward across Europe. The enemy collapsed not only from military and naval defeat but from total economic exhaustion. In this race to economic chaos the European Allies were not far behind. By this exhaustion the whole of Europe stood facing a famine, the like of which has not been seen since the Thirty Years' War, when a third of the population died of starvation. In the midst of all this was the struggle of a score of new democracies to establish themselves, with friction along every frontier, and with the destruction of governmental institutions, without financial resources to buy supplies, with the miseries of their people offering fertile soil for every economic patent medicine and for all the forces of disorder, and Bolshevism and anarchy overhanging all, there could be no hope of restoring normal economic life until the completion of peace. In all this situation, with its desperation, greed, century-old animosities, its idealistic and proper aspirations, there was only one hope. That hope, expressed by every city and state, was that the American people, being the one disinterested and uncrippled economic and political force still existing in the world, should again intervene. It was in response to this call that the President, comprehending the real heart of the American people, intervened in Europe a second time and took those steps which resulted in a practical economic organization of Europe, pending the con-

summation of peace and the arrival of the forthcoming harvest.

This second intervention was not a relief problem in the ordinary acceptance. It was not a problem alone of finding foodstuffs for starving populations of the ravaged regions. It was the problem of finding a large margin of foodstuffs and other supplies for the whole of Europe—Allies, liberated peoples, neutrals, and enemies; and in a mass of at least 200 millions of these people formerly under enemy domination it was a problem of finding absolute economic rehabilitation. Further than this, it was a problem of warding off Bolshevism on one side and reaction on the other, in order that the new-born democracies could have an opportunity of growth. Its practical consummation was a problem of the organization of the economic strength of the United States and its co-ordination with the remaining economic strength of Europe, and, in large areas, the imposition of absolute dictatorship over economic forces.

Thus, the shipping of the world required sufficient co-ordination to transport thirty millions of tons of supplies from all quarters of the globe to Europe. It required the provision of credits to those countries whose total exhaustion abolished all hope of normal payment. It required the insistence upon payment from those who had gold or commodities. It required sufficient co-ordination of purchase in this vast quantity of supplies that the markets of the world should be affected in the least possible degree. With the dissolution of the organization of the old channels of communication, river craft and railway rolling stock was hoarded by each state; telegraph and postal communications were broken down; every frontier was the scene of more or less military friction, until at one moment there were twenty-five little wars in progress. Many of these new governments were without experience or even without the existence of departments for the conduct of either the transportation or distribution of supplies.

Thus, it was necessary to secure the erection within their governments of actual departments, to furnish them advisors, to take over the actual operation of thousands of miles of disintegrated railway systems, to open rivers and canals for traffic, to stimulate the production of coal and other primary commodities, to control their distribution through large areas, to find a basis for exchange of surplus commodities from one state to another, to exercise the strongest political pressure to obtain the disgorgement of surpluses into areas of famine, to resort to barter on a national scale where currencies had broken down, to stimulate peoples discouraged and disheartened to efforts in their own salvation, and, finally, but not least, to intervene a charitable hand in the saving of their children and the stamping out of contagious diseases, and through all of this economic disorganization to inspire the maintenance of order on one hand and the defeat of reaction on the other. Beyond this again, the necessity of constant friendly intervention in frontier quarrels to prevent the starting of more wars.

These things have not been solved by the service or direction of any one man. They have been accomplished through co-ordination of the men of good will in twenty governments of Europe and throughout by creation of a thread of American personnel, directed from a single center. On our side it has required the co-operation of Congress, the Grain Corporation, the Treasury, the Shipping Board, the Army, and the Navy. A thousand Americans were sent into those communities with but little authority beyond their own assurance and the confidence on all sides that they were disinterested, that their only desire was to solve a great and human emergency for no political and no commercial advantage. It was our desire to do this from the background, without ostentation; to act at all times through established institutions, to build up their strength for the time they must rely upon their own resources. I cannot pay enough tribute to all these thousand Americans, many of them engineers, men taken from the common life of the United States, thrust into the face of staggering political, economic problems, the solution of which must affect the well-being not of hundreds but of millions. The proof of their performance lay in the fact that Europe has come through the most terrible period of its history with no loss of life from economic causes, with a stronger democracy and a glow in its heart for the United States.

This service of the American people has been accomplished at no mean national sacrifice. From the armistice to this year's harvest there has been furnished over two and a quarter billion dollars' worth of supplies, the majority of which has been given freely upon the undertaking of the assisted governments of repayment at some future date. There has been no demand of special security; no political or economic privileges have been sought. It may be years before we receive any return from these loans, but if that period should never come the American people, by this second intervention in Europe, have saved civilization, and have done so with no thought to the burden or cost to themselves. These matters have been brought to a successful close with the arrival of the harvest and the prospect of peace. What the future has a right to demand from us in further economic support is not yet clear, but it is at least certain that if the world cannot quickly secure the settlement of peace and safeguards for the future through the League the whole of our two great interventions will have gone for nothing, and the menace of reaction will again return against us upon the winds of chaos.

As the executive head of this Allied effort in economic control, I have thus had an intimate contact with the common people and their officials. I have witnessed their improving physical condition, the constant change of currents of social, political and economic forces, their revolutions, and I have had to deal ultimately with the results of all these phenomena. During this period since the armistice, we have witnessed social and political revolution among one-third of the civilized world, and we see the remainder in great social tribulation. No contemporary can properly judge or balance the relative volume of great currents of social agitation. They are matters of mind and not of matter. Yet practical statesmanship requires that within our abilities a constant accounting should be taken of the tangible results of these forces abroad, if the development of our liberal institutions and progress of orderly

government is to be maintained and revolution avoided.

This cataclysm of social change in Europe is the result of the long culmination of social as well as political wrongs; it is no sudden afterthought of war. These forces were projected into actual realization by the collapse of the war, the breakdown in the political institutions that had preceded it, and the misery that has flowed from it. Our soil is not so fertile as that of Europe to many of these growths, because we have a larger social conscience. We have not the vivid class and economic distinctions of Europe, nor have we the depth of misery out of which these matters can crystallize. Nevertheless, in these days of intimate communication, social forces are rapid in their penetration and social diseases are quick in universal infection.

The general revolution of Europe of the last century, starting with the French Revolution, profoundly changed the whole social order of the world, and, while in that revolution the spiritual impulse was the demand for political liberty, there was also a great economic impulse. That economic impulse was primarily the division of the land, and one of the fruits of that revolution was the better distribution of wealth among the agricultural population. Since that time an enormous expansion of mechanical industrialism has been superimposed upon all agricultural states, with a large increase in urban populations. The economic impulse of the revolution to-day is the demand for a better division of the wealth from this industrialism, and this time the agitation arises mainly from the urban population.

These vast masses of humanity in Europe have long been groping for the method of nearer equality of opportunity and better distribution of the results of industrial production. These gropings and these attempts have in recent years been dominated by Marxian Socialism, developed in different degrees of intensity. Broadly, these revolutions have taken two forms: the Bolshevik form, through which there has been overnight communization of all property, and second, the milder form of legislative nationalization of industry. I believe we are now in position to take some stock of and to form some judgment as to the adequacy of these solutions for what I believe every liberal-minded man believes is a necessity—the better division of industrial production.

We require only a superficial survey to see that the outstanding and startling economic phenomenon of Europe today is its demoralized industrial production. Of the 450 million people in Europe, a rough estimate would indicate that they are at least 100 million greater than could be supported on the basis of production, which has never before reached so low an ebb. Prior to the war, this population managed to produce from year to year but a trifling margin of commodities over the necessary consumption and to exchange for supplies from abroad. It is true that in pre-war times Europe managed to maintain armies and navies, together with a numerically small class of non-producers, and to gain slowly in physical improvements and investments abroad, but these luxuries and accumulations were only at the cost of a dangerously low standard of living to a very large number. The productivity of Europe in pre-war times had behind it the intensive stimulus of a high state of economic discipline, the density of populations at all times responded closely to the resulting volume of production. During the war, the inten-

sive organization of economy and consumption, the patriotic stimulus to greater exertion and the addition of women to productive labor, partially balanced the diversion of man-power to war and munitions. Both the pre-war and the war impulses have now been lost, and the productivity of Europe has steadily decreased since the armistice.

It is true that some of this diminution in production has been contributed to by the other factors, but in the larger degree the cause of this steady decrease of productivity, with its shortage of necessary supplies and its rising cost of living, must be sought in the social ferment, with its continuous imposition of Socialist ideas. In this ferment the advocates of Socialism or Communism have claimed to alone speak for the downtrodden, to alone bespeak human sympathy, and to alone present remedies, to be the single voice of Liberalism.

We may examine these phenomena a little more closely. In Russia we have a great country in which the population, with the exception of a small minority, were comparatively well fed, warmly clothed, and warmly housed. They were subject to the worst of political tyranny, were deliberately steeped in ignorance and superstition, yet their productivity was sufficient to enable them to provide these primary comforts and to export more foodstuffs than the United States. Socialism was brought in overnight at the hands of a small minority of intellectual dilettantes and criminals, and this tyranny of minority, more terrible even than the old, has now had nearly two years in which to effect the conversion of the wicked competitive system into the Elysium of Communism. Today two-thirds of the railroads and three-fourths of the rolling stock that they control are out of operation. The whole population is without any normal comforts of life and plunged into the most grievous famine of centuries. Its people are dying at the rate of hundreds of thousands monthly from starvation and disease. Its capital city has diminished in population from nearly two million to less than 600,000. Prices have risen to fantastic levels. The streets of every city and village have run with the blood of executions, nor have these executions been confined to the so-called middle and upper classes, for latterly the opposition of the workmen and farmers to this regime has brought them also to the fring squad in appalling numbers.

If we examine the recent proclamations of this group of mixed idealists and murderers, we find a radical change in their economic and social ideas. They have abandoned the socialization of the land, for they find the farmer will not produce for payment in high-flown and altruistic phrases. They have re-established a differential wage in an attempt to stimulate the exertion and ambition of skilled labor. They have established a State Savings Bank, in order to stimulate production through making provision for family and old age. They are offering fabulous salaries for men capable of directing the large agencies of production. In fact, while in the midst of flowery verbal endeavor to maintain that they are still Socialists, they are endeavoring to restore individual ownership of property and of the results of labor. The very High Priest of Socialism is today vainly endeavoring to save his people from their total destruction by summoning back the forces of production. The apologists of this debacle are telling us that it is due to the Allied blockade, and to

various other oppositions, but any one with a rudimentary knowledge of Russia knows that they did have within their borders ample supplies of food, coal, oil, wool, flax, cotton, and metals and the factories with which to work them in abundance, and that their sole deficiency is human effort.

We could take another example of Bolshevism in the efforts of Bela Kun and his colleagues in Budapest. The distinction between this situation and Russia is that they were dealing with a population of much higher intelligence, of much higher average education, and it required but three months for the working people of Budapest to realize the fearful abyss into which they had been plunged. It was solely due to the efforts of the trade unions in Budapest that the Bolsheviks were thrown out of Hungary.

These are the extreme points where Socialism has had its opportunity for immediate and wholesale application, according to all of the precepts of its advocates. Elsewhere in Europe Socialism has proceeded through established institutions, and we may shortly examine the results here also.

During the war large measures were taken on both sides of the front to secure the mobilization of production and distribution to its maximum use in the struggle. There was effective socialization of vast sections of industry. These measures are being continued and extended today in many places by governments anxious to maintain the stability of institutions, even at the sacrifice of economic safety, but under the threat of minorities of revolutionary action. Yet here again the same prime weakness has proved itself. The only partial success of these measures in war was due to the great patriotic impulse of war. Those who conducted these large operations were men whose initiative and capacity had been selected by the competitive system. These war impulses have been lost, and these organizations with constantly decreasing efficiency even in war now face disaster from further reduced productivity. All these decreases have immediate results in a rising cost of living or the necessity of governments to subsidize commodities—such as bread. There is no better example of this than the coal industry of Europe, and even omitting Russia, this production has fallen from a rate of 600 million tons per annum at the armistice to a rate of 450 million tons recently.

The coal industry is in modern life the very life-blood of the state, and it has proved itself the most susceptible among all the industries to these influences, and its production today is at such an ebb as to jeopardize the entire social fabric. I am convinced that the greatest proportion of European leaders of Socialism today to some extent realize this bankruptcy, and are today endeavoring to cover a retreat with loud complaints as to the failure from other causes. Nevertheless, the realization itself is a great step and is bringing the turn of the tide, and through it Europe is on the road to economic recovery—if she gets peace.

The whole of these various sorts of Socialism are based on one primary conception, and that is that the productivity of the human being can be maintained under the impulse of altruism and that the selection of the particular human for his most productive performance can be made by some superimposed bureaucracy. Their weakness is the disregard of the normal day-to-day primary impulse of the human animal, that is,

self-interest for himself or for his family and home, with a certain addition of altruism varying with his racial instinct and his degree of intelligence. They fail to take into account, also, that there is but one sufficiently selective agent for human abilities in that infinite specialization of mind and body necessary to maintain the output of the intricate machinery of production, and that is the primary school of competition.

My emphatic conclusion is, therefore, that Socialism as a philosophy of possible human application is bankrupt.

Although Socialism has now proved itself with rivers of blood and suffering to be an economic and spiritual fallacy and to have wrecked itself on the rock of production, I believe it was necessary for the world to have had this demonstration. Great theoretic and emotional ideas have arisen before in the world's history and have, in their bankruptcy, deluged the world with fearful loss of human life. A purely philosophical view might be that these experiences are necessary to humanity, groping for something better. It is not necessary, however, that we of the United States, now that we have witnessed these results, plunge our own population into these miseries and into a laboratory for experiment in foreign social diseases.

Bankruptcy of the Socialistic idea, however, does not relieve us from the necessity of finding a solution to the primary question which underlies all this discontent. That primary question is the better division of the products of industry and the steady development of higher productivity. This bankruptcy of the Socialist idea should, if reaction is to be prevented, return the guardianship of this problem from the radical world to the liberal world of moderate men, working upon the safe foundations of experience.

The paramount business of every American today is this business of finding a solution to these issues, but this solution must be found by Americans, in a practical American way, based upon American ideas, on American philosophy of life. A definite American substitute is needed for these disintegrating theories of Europe. It must be founded on our national instincts and upon the normal development of our national institutions. It must be founded, too, upon the fundamental fact that every section of this nation, the farmer, the industrial worker, the professional man, the employer, are all absolutely interdependent upon each other in this task of maximum production and the better distribution of its results. It must be founded upon the maximum exertion of every individual within his physical ability and upon the reduction of waste both nationally and individually. We can well see a vivid confirmation in Europe of the fundamental economic principle that the standard of living and the cost of living is the direct quotient of the amount of commodities produced; that we must secure a maximum production of the industrial machine if we wish to keep our population alive or if we wish to see an increase in the standard of living of our people. From this only can arise the very foundations of the higher activities of life. The application of this proposition must, however, stand several tests. A maximum production can only be obtained under conditions that protect and stimulate the physical and intellectual well-being of the producer. We shall never remedy justifiable discontent until we eradicate the misery which the ruthless-

ness of individualism has imposed upon a minority.

If I were thinking aloud I would say at once that this maximum production cannot be obtained without giving a voice in the administration of production to all sections of the community concerned in the specific problem; that it cannot be obtained by the domination of any one element. I would say that the human race had increased its standards of productivity and therefore of living through the growth of extraordinarily intricate organization of production and distribution based upon stimulation of the individual by the reward it offers. I would also say that it cannot be obtained from the destruction or sudden disturbance of this delicate and intricate organization of production and distribution or extravagance in its products. I would say the road lies along the better division of the more exorbitant profits that arise from these processes and that have accumulated from them. By better division of profits, I do not refer particularly to profit-sharing schemes but to the broad issue of the whole social product. Some are comparatively overpaid, and many comparatively underpaid, for the service they render to the community. Our organization in many aspects is not all that we could desire, but it is the best we have been able to evolve over thousands of years, and the destruction of these processes or of the organization which conducts them has been demonstrated to be the sure road to destitution and fearful loss of life.

It is not that we today have suddenly awakened to this necessity for better distribution of profits. The social conscience of this country has been manifesting itself continuously concerning this matter for years. We have in the United States today a better division of wealth and a greater equality of opportunity than any other nation in the world, and we have thus better foundation upon which to build. We have reason for discontent in the fact that our industrial development has outrun our social progress, and we have reason to hasten those measures that lead to larger justice in distribution of these profits, larger representation of all elements of the community in the control of these agencies to further strengthen our measures for the restraint of economic domination by the few and for the liquidation into the hands of the many of the larger industrial accumulations in the hands of the few that our rapid development has made possible.

Again I wish to repeat, the observation of these forces in Europe has reinforced my Americanism during these last ten months of intimate contact with them; it has revealed to me the distance of our departure from the political, social, and economic ideals of Europe. There has grown in this United States a higher sense of justice, of neighborly service, of self-sacrifice, and, above all, a willingness to abide by the will of the majority in every section of this community. This Americanism is the guarantee of the ability of our people to solve this most momentous internal problem confronting our generation. But these very ideals, this very sense of justice and service for our own people, gives us still further opportunities.

Our sister civilization in Europe is today recovering from a great illness. The many new democracies that we have inspired are striving for our ideals. We alone have the economic and moral reserve with which to carry our neighbor back to strength. To do this is also true Americanism.

CORRESPONDENCE AND DISCUSSION

Letters From the Mining and Metallurgical
Industry Dealing With Pertinent
Subjects of Interest

Engineering, Latin and Greek

In the *Journal* of May 17 an editorial entitled "Engineering, Latin and Greek," caught my eye because I have always held some decided views as to the study of the dead languages, and have been on the lookout to find someone who can persuade me that the years devoted to these subjects were not so badly spent as they seem. The only encouragement which I am able to gather from this editorial is that my knowledge of these languages should make me better able to converse with other men who have acquired the same. Of course, this might be said about the study of any other topic, or about any experience, particularly of travel. As I have never noticed myself taking advantage of this prerogative, probably I have thrown away a valuable opportunity.

As the editorial asks for expressions of opinion, I venture to offer such an expression. To acquire my training in Latin, which was no more than what all of us took to pass the college entrance examinations in advanced Latin, necessitated spending an average of ten hours a week, counting home work and class-room recitation, for forty weeks a year for six years, or 2,400 hours. This is equivalent to a modern workingman's year of forty-eight hours a week for fifty weeks, so here is a solid year sacrificed on the shrine of one dead language. Still I am trying to discover any benefit which may be considered worth a fraction of the cost, or which can be compared with the benefit which might have been derived from the same amount of time spent doing innumerable other things which I would have liked to do, but could not do because of lack of time.

The only language to which I can point as an undoubtedly good investment was the eleven weeks' course in Spanish, of one lesson a week. No credit was allowed, because Spanish is not one of the classical languages, but it was the most valuable course for the time spent which I ever took, and was far more practical than any of the other languages, all of which required many times the work. My Greek is of value in that it is handy to be able to pronounce the Greek letters we meet in mathematical equations and in astronomy, but this could be learned in a couple of hours. Also, all the Latin suffixes and prefixes could be learned in a similar time, and that is about the extent of the use of Latin.

If anyone should ask you why hundreds of thousands of youths of the country are forced to spend millions of hours annually wearing out their brains and loading them with stuff that is only to be forgotten, you may tell them, if you want, that this is culture, and we must all be cultured. But if you want to get to the bottom of the truth you should say that the real reason is that some of our most aristocratic universities require it for entrance. Therefore other colleges, not wanting to be outdone by these, also require it, and so preparatory schools must teach it. You may ask why these more

aristocratic universities require it, if it is not worth while. The answer is that the "powers that be" at these colleges grew up in an age remote from these times. They despise modern "break-neck" tendencies and practices; in fact, they personally never took much to sciences, but preferred literature. They value much more the qualities which their own professors admired. They can point out that all the great men of former times studied Latin, and therefore so long as they are on the board of directors they will fight to keep Latin and Greek in their honored places.

Harvard, 1906, and M. I. T., 1908.
Franklin, N. J., August 8, 1919.

Estimating Screen Efficiency

The article "Estimating Screen Efficiency," by W. O. Borchardt, in your issue of April 12, interests me strongly, because the points raised are similar to those affecting the problem of estimating the efficiency of ore dressing in general, which I have been studying.

Problems of this kind are half solved when they are correctly stated, and their difficulty is due to want of clarity in this respect more than to anything else. For instance, Mr. Borchardt continually refers to the efficiency of a screen, when what he is really writing about is the efficiency of an operation of screening. The efficiency of a screen per se is always 100 per cent; it will pass the whole of its undersize if you shake it long enough. But in practice perfection must be sacrificed to other and generally sordid considerations. Usually, the actual result obtained depends on the physical nature of the material screened. That with a high percentage of oversize is less easy to screen than material containing a low percentage, and the most difficult is that with a high percentage just a little larger than the mesh aperture. So it is with ore dressing: some ores are easier to dress than others, though, in theory at least, perfect separation of valuable content and waste could be made by an infinite series of repetitions, and only then.

I do not wish here to enlarge upon the derivation and use of the formulas I have devised for arriving at the absolute percentage efficiency of an ore-dressing result; anyone interested in the matter can look it up in the September, 1918, issue of the *Mining Magazine*. The point I want to make now is that both problems are similar, in that they are concerned with an attempt to express the efficiency of an operation aimed to separate, more or less completely, two different entities, waste and valuable matter in the one case, and undersize and oversize in the other.

I consider that my method of solving the ore-dressing problem is applicable also to screening. As a matter of fact it is unnecessary to use it in this way, for a simpler method is possible, but I want to do so here as a check.

Let the true percentage of undersize in the material

treated be 40 per cent, and of oversize 60 per cent, of the total weight. Let the percentage of undersize obtained in a particular operation of screening be 30 per cent (of the total weight of the feed, be it understood) and of oversize 70 per cent.

Then,

- $a = \text{per cent oversize in feed} = 60.0 \text{ per cent.}$
- $b = \text{per cent undersize in undersize} = 100.0 \text{ per cent.}$
- $c = \text{per cent of undersize in oversize} = 14.3 \text{ per cent.}$
- $A = \text{weight of feed} = 100.0.$
- $B = \text{weight of undersize} = 30.0.$
- $C = \text{weight of oversize} = 70.0.$

and the percentage efficiency of the operation equals

$$100 \times \frac{\left(\frac{b}{a} - 1\right) \frac{100(a-c)}{b-c}}{100-a} = 100 \times \frac{\left(\frac{100}{40} - 1\right) \frac{100(40-14.3)}{100-14.3}}{100-40}$$

$$= 75 \text{ per cent}$$

This is a very involved way of arriving at the same result as that given by

$$\text{Per cent efficiency} = \frac{100 \times \text{undersize obtained in operation}}{\text{true undersize}}$$

One difficulty which has prevented the solution of the ore-dressing problem is the general failure to recognize that though ore dressing is usually thought of as an attempt to obtain as large a percentage of the valuable matter as possible in a condition as free as possible from waste, it may equally as well be considered an attempt to obtain as large a percentage of the waste as possible in a condition as free as possible from valuable matter. The mathematical treatment from either standpoint should arrive at the same result.

So, with screening, the efficiency of the operation is the same whether considered from the point of view of undersize or oversize, and here I take issue with Mr. Borcherd. t.

Considering the oversize as equivalent to the valuable mineral in the ore-dressing formula, one can state, from the same data as before,

- $a = \text{per cent oversize in feed} = 60.0 \text{ per cent}$
- $b = \text{per cent oversize in oversize} = 85.7 \text{ per cent.}$
- $c = \text{per cent oversize in undersize} = 0.0 \text{ per cent.}$
- $A = \text{weight of feed} = 100.0.$
- $B = \text{weight of oversize} = 70.0.$
- $C = \text{weight of undersize} = 30.0.$

Per cent efficiency =

$$100 \times \frac{\left(\frac{b}{a} - 1\right) \frac{100(a-c)}{b-c}}{100-a} = 100 \times \frac{\left(\frac{85.7}{60} - 1\right) \frac{100(60-0)}{85.7-0}}{100-60}$$

$$= 75 \text{ per cent}$$

the same result as before, and not the same result as would be given by the formula

$$\text{Per cent efficiency} = \frac{100 \times \text{true oversize}}{\text{actual oversize}}$$

for which formula I can see no justification whatever.

So that, having subjected the above form of mathematical treatment of a kindred problem to searching analysis, I am satisfied that the absolute percentage efficiency of an operation of screening is given by the formula

$$\text{Per cent efficiency} = \frac{100 \times \text{undersize obtained}}{\text{true undersize}}$$

W. O. Borcherd states that he does not believe it possible to make comparisons of two screens operating on different feeds or on the same feed at different rates. This is equivalent to saying that it is not possible to

make comparisons between the results of two different processes of ore dressing on different ores, or on the same ore where rates of feed, or point of division between concentrate and tailing, or some other variable differs in the two cases. But this is just what the type of formula I have introduced does make possible. But, mark, it is only the results actually obtained which are thus rated. One is better than another by a definite degree, but this is not to say that the relation would be preserved with the same ore and the same process in each case, if the rate of feed or some other variable was altered. The reason this limitation exists is because it is impossible to equate a curve from a knowledge of only one point on it. If the general equation of the curve is known, then the knowledge of the co-ordinates of one point enables those of any other to be calculated, but the characteristic curve of an ore-dressing or screening operation is not known, and probably never will be.

R. T. HANCOCK.

Jos, Northern Nigeria, June 15, 1919.

Recent Metallurgical Progress

American engineers, especially those of us who have followed the various phases of the flotation litigation, have read with particular interest the references to flotation in Mr. Picard's recent presidential address before the Institution of Mining and Metallurgy of London, excerpt of which was published in the *Journal* of July 12, 1919. Mr. Picard has condensed so large an amount of metallurgical information into the space at his disposition that one should commend rather than criticise his accomplishment in this respect. There is, however, one sentence of about six lines which, in respect to its degree of condensation, challenges one's attention. This sentence says: "With later discoveries as to the partial solubility of essential oils, of the beneficial effect of certain insoluble oils in 'stabilizing' the froths and of sub-aeration procedure, the elimination of any need for pulp-heating, or in many cases for acidification, together with the use of alkaline circuits, etc., modern flotation has made remarkable advances."

It is to be wondered how many of Mr. Picard's hearers recognized in the casual references contained in this short sentence the description of three additional Minerals Separation patents! They are the so-called "soluble frothing agent" patent, the "in-the-cold and without-acid" patent, and the "sub-aeration."

One may rightly question whether the writer of the above condensed sentence may not have subconsciously concluded that the features so casually referred to in this sentence were, as in reality they actually are, merely those factors which are "So varied," yet factors of one and the same process. The U. S. Supreme Court, in its *Butte & Superior* decision, declared Minerals Separation patent 835,120 to be an improvement upon the Cattermole process. It would appear, therefore, that the reagents of the Cattermole process would be also the reagents of 835,120. In this connection, Mr. Picard's statement as to the "dual part" played by certain oils, as well as his allusion to the solubility of oleic acid, becomes of particular interest, and one wonders if these patents, so casually here referred to, can ever be sufficiently differentiated from 835,120, and therefore, also, from the Cattermole, to meet the standard of invention which would be applied to them, should they eventually come before the Supreme Court.

Philadelphia, Aug. 15, 1919.

Suggestions From Practice for the
Superintendent, Foreman,
and Miner

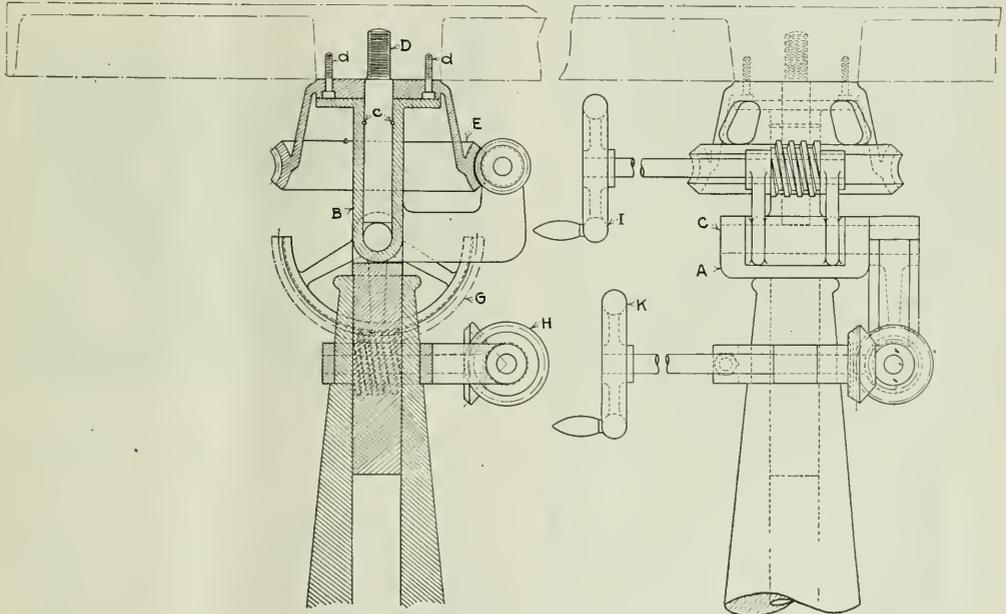

Improved Tipping Device for Oxy-Acetylene Welding Table

By J. T. SMOODY

The utilization of oxy-acetylene welding machines in shop practice is increasing, and during the last few years their adoption at mines has been fairly general. The many repairs necessary to pumps, mine cars, hoisting machinery, and other mine equipment make the oxy-acetylene torch an invaluable asset to the mine shop equipment, and it is believed that a description of the following tipping device for use in connection with an oxy-acetylene welding table will be of interest.

operator to move the table in any plane. When the break in a casting is such that it cannot be welded when placed in a horizontal plane, the broken pieces may be clamped to the table, which is adjusted to the proper plane, thus eliminating the blocking of the casting, which always consumes valuable time. When the desired plane has been found, and while one or two men hold the table, the third tightens the set-screws tapped in the socket to hold the table firmly while the casting is being welded.

The fact that it takes more than one man to operate the table makes its use objectionable where time is an important consideration. Another objection is that

DETAIL OF TIPPING FOR OXY-ACETYLENE WELDING TABLE

The type of table commonly used for welding small and medium weight castings was designed by the Auto-geneous Welding Equipment Co., and was described in *American Machinist*, July 8, 1909. The device consists of a cast-iron base, having a 2½-in. diameter cored hole in its center. The base supports a ball-and-socket joint, to which the table is fastened by means of four cap bolts. The socket is made with a small base on the side and hollowed out at the top, providing a bearing in which the ball-and-flange connecting neck rests when the table is in a vertical plane. This description is sufficient to show that the idea is to enable the

the ball-and-socket joint, when worn and slightly spread, cannot be held in place securely. The accompanying sketch shows a device that I have developed to overcome the above objections and save time in the adjustment of a welding table.

The yoke casting A is placed in the cored hole of the table base and the yoke in turn supports a three-way socket B, which has a vertical and horizontal pin running through it. The horizontal pin C is driven in tight and pinned on, whereas the vertical pin D is loose, and is held in place by two small pins c. The top end of the socket B has a flange on which the

Institute Meeting Opens at Chicago

Engineers in Large Numbers Register at Convention Headquarters at Congress Hotel—
 Proceedings During First Three Days Marked by Spirited Discussions—
 Question of Mine Taxation Receives Consideration

WITH the opening of the semi-annual convention of the American Institute of Mining and Metallurgical Engineers in Chicago on Sept. 22 another chapter in the history of the Institute was begun. When the A. I. M. E. meeting was held in New York last February, the signing of the armistice was so recent an event that it was not possible for the engineers to enter into the proceedings as wholeheartedly as they are doing at Chicago. The questions before the present meeting are of vital importance to the country's industrial progress. About 1,000 persons, coming from every American mining center, are expected to register during the five-day session.

MINE TAXATION

How to tax the country's mines and at the same time make a fair allowance for the wasting assets of the industry, was the subject of a spirited discussion on the opening day between Government agents and mining men qualified to talk on the question. The result of the mine-taxation meeting was a decision to secure close co-operation between the Government and the taxpayer, with the mine owner and mining engineer assisting the former in determining the basis of taxation. Dr. L. C. Graton heads the Government representatives.

A. S. Learoyd, of the U. S. Fuel Administration, in his paper presented at the first session, said that in case of future rationing of anthracite coal, the same system will probably be used as was employed last winter. E. C. Harder and D. F. Hewitt, of the U. S. Geological Survey, in another paper, outlined the extent of the country's newly developed manganese resources. The advantages of physical examination of employees and of certain methods of curtailing forces without destabilizing labor or business conditions in the community were pointed out by Charles F. Willis, of the Phelps Dodge Corporation.

There were also numerous business sessions on the opening day. In the evening the delegates met for a smoker at the Chicago University Club. Dr. F. G. Cottrell, George S. Rice, and Frank H. Probert, of the U. S. Bureau of Mines, recounted their observations on their recent trip through the devastated regions of France and displayed pictures showing present conditions in the various mining and metallurgical districts.

IRON AND STEEL SESSION OPENS ON SECOND DAY

Sessions on "Iron and Steel" were scheduled for the second day of the convention. Among the papers presented were the following: "Blast-Furnace Refractories," by Raymond M. Howe; "Effervescing Steel," by Henry D. Hibbard; "Aircraft Steels," by Albert Sauvour; "Determining Gases in Steel and the Deoxidation of Steel," by J. R. Cain; and "Effect of Time and Low Temperature on Physical Properties of Medium-Carbon Steel," by G. A. Reinhardt and H. L. Cutler.

Moving pictures of the largest plate-rolling mill in the world were shown the members in connection with a business session that lasted throughout the evening. The rolling mill shown is capable of turning out a 240-in. plate.

At the session on "Oil" at the Congress Hotel on the same day, a paper by Dr. Charles Baskerville on "The Value of American Oil Shales" was presented, in the course of which was reiterated the statement that petroleum production in the United States is lagging behind consumption. Dr. Baskerville also said, "The annual production of crude petroleum of 300 million barrels will require a material addition to keep the 477 refineries in operation up to their capacity of 490 million barrels annually. Hence, new oil fields or new sources of crude oil, or both, must be developed. In view of the recent variety of flamboyant advertisements in connection with the shale-oil industry, I hope the Institute will take adequate steps to safeguard, as well as foster, a promising industry. It is no business for an individual who expects quick returns."

THIRD DAY MARKED BY NUMEROUS TECHNICAL SESSIONS

Sessions on "Iron and Steel," "Sulphur in Coal," and on "Mining and Local Resources" were held in the forenoon on Sept. 24, at the Congress Hotel, which was the convention headquarters. At the session on "Coal" attention was focused on the need of improving coal production by better utilization of the supply, and of providing more coal of low sulphur content. E. A. Holbrook, acting chief mining engineer of the U. S. Bureau of Mines, said in his paper that a few years ago 40 per cent of the coal mined was wasted by rejection in the mine or in the setting aside of smaller sizes. Research and greater knowledge are needed regarding costs, rates, and markets, according to Mr. Holbrook.

A warning to the gas industry that low sulphur coals will become scarcer year by year, and that in time the industry will be compelled to use coals that are now considered of no commercial value, was issued by W. W. Odell and W. A. Dunkley, the latter of the Illinois Geological Survey. At another session E. F. Boericke and T. H. Garrett, of the Mineral Point Zinc Co., predicted a growth in importance and output for the Wisconsin zinc district, which they said has in recent years increased its output about 1,300 per cent.

There were also business sessions on Sept. 24 in addition to an extended symposium on non-ferrous metallurgy that was held in the Coliseum in conjunction with the Chemical Industries Exposition. In all 145 subjects are being presented during the week's meeting, the largest number in the history of the Institute.

Charles M. Schwab, General Leonard Wood, and Horace V. Winchell, president of the Institute, were the principal speakers on the program for the banquet on the evening of Sept. 24. The president's reception preceded the banquet. The latter event was followed by dancing in the ballroom of the Congress Hotel.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

War-Minerals Relief

The investigatory work in connection with the War-Minerals Relief Act which has been conducted under the direction of J. E. Spurr is far in advance of the decisions by the War-Minerals Relief Commission. Engineers' reports to the number of 150, and 144 auditors' reports, have been turned over to the commission. Seventy-four claims have been analyzed by the chief auditor and chief engineer and reviewed by Mr. Spurr and placed before the commission. In every case where a "request or demand" on the part of one of the Government agencies named in the act is alleged, it has been made the subject of a special inquiry by the investigations division. This work has been carried on by twelve engineers and nine auditors in the field, in addition to the force in the offices at Washington.

Now that the methods of examination have been reduced to a clearly understood system, and with the experience which the force of engineers and auditors has had, it would be possible to carry the work on more rapidly should that become necessary. It is probable, however, that only the present rate will be maintained, so as not to be too far ahead of the decisions by the commission. Under Mr. Spurr, J. A. Battle, Jr., has had charge of the engineers, and C. B. Holmes has been in direct charge of the accountants.

After a more careful consideration of the effect of the Attorney General's opinion, it is believed that slightly more than one-half of the claims filed with the War-Minerals Relief Commission will be eliminated. The Attorney General's opinion¹ was to the effect that claimants must show that an appeal was made to them by one of the five bodies mentioned in the statute. With the claims thus eliminated, there no longer is doubt that the \$8,500,000 appropriated will be sufficient to settle all claims which fall within the statute.

Some claims are being eliminated by the discovery that the claimant may have profited in another operation. The commission declines to pay the loss on one property when others held by the same claimant have been profitable. In one case the claimant established without difficulty a loss of \$2,700, but from another source the commission learned that the claimant had received profit of about \$30,000 in a similar operation.

Economic Conditions in Norway

A feature of recent economic developments in Norway, writes Nels A. Bengtson, trade commissioner for the Bureau of Foreign and Domestic Commerce, is the almost complete shutdown of ten of the largest carbide, aluminum, and cyanide plants in that country. These plants, when running at full capacity, employed more than 6,000 men, but during the last few months they have employed only about half that number. In the early part of August, it is reported, labor troubles developed, which seriously affected the output of the plants.

The mining industries at present are also in a stagnant condition, some of the largest pyrite and copper mines having reported that they can no longer produce in competition with other countries, on account of the difficulty of mining conditions. Many of the older mines report a scarcity of ore, and indicate that they will have to find virgin areas in order to produce according to the pre-war scale.

The electrochemical and electrometallurgical industries, it is said, are also passing through a depressing transition period, from war conditions to a peace basis. It is predicted that some plants will find it difficult to maintain operations when the keen demand and inflated prices prevalent during the war period give way to normal demands and open competition. This, it is thought, will be especially true for such plants as use relatively large quantities of raw materials in proportion to the values of finished products. Norway is, on the whole, it is reported, deficient in raw materials for these industries and has a limited market for their products.

Offsetting these disadvantages, Norway has cheap hydroelectric power available at factory and harbor sites. The well-developed shipping lines, added to the preceding factors, combine to favor the industry, it is said, in which electrical energy is a factor of maximum importance, and consequently are of advantage to those which use relatively small quantities of raw materials in proportion to the value of finished products. It is believed that developments along these lines will characterize future Norwegian industrial progress.

Mining Laws of Nova Scotia

A digest of the mining laws of Nova Scotia was recently received by the Bureau of Foreign and Domestic Commerce from the American Consul General at Halifax. The Minister of Public Works and Mines, he reports, states that no restrictions, either legislative or administrative, which are not placed on British subjects, are placed on aliens, in the granting of mining rights or concessions for the operating of mines, or the distribution of mineral products. There are not at present in the province of Nova Scotia, the consul says, any extensively large mining grants which because of their size cannot be developed by the concessionaires in the immediate future. All ores and minerals, however, are subject to royalties to the Crown.

The right to mine minerals or to prospect for minerals must be obtained from the Mining Department. Licenses are issued for gold and silver prospecting, and for all other minerals, exclusive of gold and silver. Applications for prospecting may be filed by anyone with the Mines Department. The license to prospect, when issued, is valid for eighteen months, and leases run for twenty years, at a yearly rental per area. Practically all leases, it is stated, are renewable for a further period of twenty years, and may be renewed as many as three times thus making the original lease and renewals operative through the period of eighty years.

¹Eng. and Min. Journ., July 19, 1919, p. 107.

American Electrochemical Society Meets at Chicago

Electrochemists Gather in Joint Sessions With Mining
and Metallurgical Engineers—Important
Present-Day Problems Discussed

CONCURRENTLY with the convention of the mining and metallurgical engineers at Chicago, as well as the Exposition of Chemical Industries and other events, the American Electrochemical Society held its thirty-sixth general meeting in that city on Sept. 23 to 26. Headquarters were maintained at the Congress Hotel. Registration of members and their guests began at the hotel early Monday morning, but was later continued at the society's booths on the balcony of the exposition at the Coliseum.

The program of the meeting really began on the following day. During the afternoon a joint technical session on "Iron and Steel" was held, the list of papers presented and discussed being given in the A. I. M. E. program. A further session on the same subject took place in the evening at the hotel.

"Ferrous and Non-Ferrous Metallurgy" was the general subject of the afternoon session on Sept. 24, F. A. J. Fitzgerald presenting a paper on the "Radiant Resistor Furnace," and A. M. Clark one on "Electric Heat in the Typewriter Industry." Other papers discussing the electric furnace were presented by Mr. Fitzgerald and H. G. Weidenthal.

In the evening electric-furnace exhibits in the exposition auditorium were inspected by the members, following which motion pictures showing electric furnaces in operation were displayed. The subjects included "Resistance Type Furnaces for Melting Non-Ferrous Metals"; Detroit Rocking Electric Melting Furnace in Operation; and "Electric Furnaces in the Heat Treatment of Essential War Materials."

The joint session on "Pyrometry" occupied morning and afternoon sessions at the Congress Hotel on the third day. In the evening the members were entertained at a smoker as guests of the local committee.

"Catalysis" was the subject of the symposium in the forenoon of the last day. Prof. H. S. Taylor, of Princeton University, presided over this session. Those who took part included W. D. Bancroft, H. S. Taylor, and W. J. Huff. In the afternoon a demonstration of the manufacture of fluorine was given by Prof. F. C. Mathers and Burr Humiston, and various technical papers were presented. The evening was spent in visiting the exposition.

Safety Congress Convenes

Eighth Annual Meeting of National Safety Council
To Be Held in Cleveland Oct. 1 to 4—Many
Interesting Papers and Exhibits Planned

THE Eighth Annual Safety Congress, under the direction of the National Safety Council, will be held at the Hotel Statler, Cleveland, during the four days beginning Wednesday, Oct. 1. The sessions on the first day will be general in character, the last three days being devoted to special meetings of particular interest to various groups, including the automotive, cement, chemical, construction, electric railway, metals, mining, packing, paper and pulp, steam railroad, textile, wood-working, rubber, and marine industries.

The week of Sept. 28 to Oct. 4 will be observed in Cleveland as "Safety Week," and a special effort will be made to avoid all industrial accidents. During Safety Week in St. Louis, where the annual meeting was held last year, the only death from accident was that of an intoxicated man falling from a wagon, and with the laws now in force it is hoped that Cleveland will, during this week, set a new record in community safety.

In addition to the meetings on Wednesday in which all will be interested, the following papers which will be of special interest to the mining profession, will be read, each to be followed by discussion.

Thursday morning, Oct. 2, Room 341.

9.30—"Mine Accidents, English Speaking vs. non-English Speaking Employees." By A. H. Fay, mining engineer, U. S. Bureau of Mines.

10.15—"Training and Handling of Men." By M. W. Gidley, safety inspector, Copper Queen Co.

11.00—"Labor Turnover and Its Relation to Mine Accidents." By E. E. Bach, chief Americanization Bureau, State of Pennsylvania.

11.30—"Industrial Relations in the Mining Industry." By Charles F. Willis, of the Phelps Dodge Corporation.

Friday morning, Oct. 3, Room 341.

9.30—"Fire Prevention in Anthracite Coal Mines and Necessary Equipment for Fighting Mine Fires." By M. W. Price, efficiency engineer, G. B. Markle Co.

10.15—"Effective Use of Rescue Apparatus in the Fighting of Mine Fires." By T. Ryan, Mine Safety Appliance Co.

11.00—"The Desirability of Standardizing Mine Rescue Training and a Plan for Standardization." By D. J. Parker, mine safety engineer, U. S. Bureau of Mines.

Saturday morning, Oct. 4, Room 341.

9.30—"A Compilation of Chute Types for Loading Ore Into Tram Cars in Metal Mines." By C. A. Mitke, mining engineer, Phelps Dodge Corporation.

10.15—"The Importance of Safety Measures to the Miner." By Major Arthur S. Dwight, chairman, Industrial Organization Committee, A. I. M. E.

11.00—"Need for a Definite Technical Service in the Mining Section of the National Safety Council." By E. F. Tillson, assistant superintendent, New Jersey Zinc Co.

Many mine safety engineers will also be interested in an Employees' Publications Luncheon Round-Table to be held on Thursday, Oct. 2, at 12.30 p.m., at which such topics as the following will be discussed: How to interest the management to appropriate funds for a plant organ. What benefits should a corporation expect to derive from an employees' publication? What can employees' publications do to promote industrial good-will? What kind of material is needed to make the plant periodical a success? How to obtain news items for a plant publication.

On Thursday afternoon a general session will be held on Americanization and the immigrant problem; on Friday noon a luncheon round-table to discuss the safety bulletins and posters; on Friday afternoon a general session on health; and on Saturday afternoon, a general session on safety education.

The entertainment of those attending the Congress has also been given considerable attention. There will be a reception and informal dance in the Statler ball-

room on Wednesday evening; an informal dinner and smoker at the Hotel Winton on Thursday evening, and the annual banquet (informal) on Friday.

One of the principal features of the congress will be the Safety Exhibit which will occupy 14,000 sq.ft. of floor space in Grays' Armory. This will be the most pretentious and elaborate exhibition of its kind ever made, practically all of the leading manufacturers of safety devices being represented. Those who attend this exhibit will learn of all the latest and best ideas in guards, sanitation, and lighting, many features of a practical nature having been recently developed.

International Exposition of Mining Industries

The opening date of the International Exposition of Mining Industries at New York has been changed from Oct. 15 to Dec. 1, owing to the delay of the Government in vacating Grand Central Palace. This decision was made when it was found that the time was not sufficient to prepare the building and exhibits.

The International Exhibition of Mining Industries, as mentioned in the *Journal* of Aug. 2, forms a part of the project that contemplates a permanent exposition of various industries, the scheme being fathered by the Nemours Trading Corporation, of which Alfred I. Du Pont is president. Howard R. Ward, who is manager of the mining industries section, recently returned from an extended trip through the West, and reports that there is widespread interest on the part of manufacturers and engineers in regard to the exhibit. Comprising the advisory committee are the following: H. C. Parmelee, H. R. Ward, S. A. Taylor, Frederick G. Clapp, Ralph Arnold, Kenneth Seaver, H. H. Stoek, and Charles W. Merrill.

Petroleum in Cartagena District, Colombia

The American Consul at Cartagena, Colombia, in a report recently received by the Bureau of Foreign and Domestic Commerce, declares there is a lack of activity in the development of the oil fields in that consular district.

So far as is known, he reports, only two American companies have acquired concessions to explore and exploit lands for petroleum in the Cartagena district. Nothing but preliminary explorations have been made by these companies, although other American companies are making investigations in the same department.

It is understood that three groups of British geologists, representing British capital, are making investigations in the same region, a former member of the U. S. Geological Survey being one of the number.

At present, the American consul reports, exploitation of petroleum wells is at a standstill, awaiting the result of the suspension of the recent decree regarding subsoil rights.

Michigan Copper Output in August

The production of ingot copper from the mines of the Michigan district for the month of August was 13,302,886 lb., a decided increase over the output for July but only 70 per cent of normal production. The outstanding features were the increase in the production of the Calumet & Hecla of nearly a million pounds, the decided increase in the Ahmeek and Osceola mines, and the ex-

ceptionally high-grade yield shown in the Champion mine of the Copper Range, as well as the increase in copper total. La Salle drops out entirely and Superior's output is practically nothing. Winona entered the list of producers for August, but had not operated long enough to get any mineral to the smelter.

The following is a carefully prepared tabulated statement giving the approximate results in actual copper produced at all of the mines in the Michigan copper district. In some of the mines the figures are official smelters' and mine records; in others they are estimates; but the approximations are conservative in each instance.

COPPER OUTPUT OF MICHIGAN MINES IN AUGUST

Mine	Rock Tonnage	—Lb. per Ton—		Refined, August	Refined, July
		Aug.	July		
Ahmeek	55,890	22.2	20.8	1,245,300	958,500
Altoz	13,600	18	14.5	245,800	150,100
Baltic	70,000	34	35	2,800,000	634,500
Calumet & Hecla	165,472	25	22.4	4,136,818	3,292,821
Centennial	5,075	13.9	15	70,500	76,002
Champion	45,000	40	35	1,800,000	1,350,000
Isle Royale	58,865	18	18	1,059,583	935,150
Mass Consolidated	7,143	14	14	100,000	92,321
Michigan	5,000	32.2	20	161,254	184,175
Mohawk	43,157	21.36	23.4	922,209	1,012,575
Osceola Cons.	96,700	14.4	13	817,600	651,000
Quincy	80,000	18	18	1,620,000	1,500,000
Superior	650	17	20	11,000	35,025
Victoria	10,000	12.5	16.5	130,000	108,900
Wolverine	77,493	14.65	13.8	402,822	331,736

Davis-Daly Copper Co.

The report of the Davis-Daly Copper Co. for the quarter ended June 30, 1919, states that much underground development was performed during the period reviewed, and some excellent orebodies were opened, which added materially to the ore reserves.

The Belmont crosscut, which was started in December, 1917, for the purpose of ventilating the mine, has been completed, and has accomplished the cooling of the underground workings materially. The temperature has been reduced from 110 degrees to 85 degrees, permitting full eight-hour shifts, and increasing the efficiency of the men. Surface improvements are under way, and the new skip and steel ore bins will be installed soon, thus facilitating hoisting and increased production. The wage question is approaching settlement, and there is little or no difficulty in securing good and efficient men.

On June 22, shaft sinking at the Colorado mine was begun from the 2,500-ft. level to the 2,700-ft. level. It is planned to connect by crosscut with the downward extension of the orebody found on the 2,500-, 2,300-, and 2,100-ft. levels. Total development for the quarter was 1,938 ft., comprising 801 ft. of drifts, 263 ft. of crosscuts and 874 ft. of raises.

Shipments for the quarter amounted to 10,700 tons, producing 1,859,747 lb. of copper and 72,784 oz. of silver. The average assay of the ore shipped for the period was 8.98 per cent copper.

Total receipts for the quarter amounted to \$257,736.11, and total disbursements were \$185,735.24. The disbursements included \$81,869.71 for development, \$72,758.94 for mining cost, and \$14,950.26 for equipment.

Iron Bacteria are actively engaged in the deposition of compounds of iron not only in surface iron-bearing waters but in mine waters to depths of several hundred feet. A special paper on the subject, "Iron Depositing Bacteria and Their Geologic Relations," has recently been issued by the U. S. Geological Survey. E. C. Harder, of the Survey, who has examined deposits of iron ore in many countries for the special purpose of determining their mode of origin, has recently made close studies of the action of bacteria in forming iron ores, and has made laboratory cultures of various iron-depositing bacteria.

BY THE WAY

Naturally

"Naturalization of Mines Now Being Proposed by Miners" runs a headline in a paper of the Middle West. It is perfectly logical, of course, that this should precede any attempt to Americanize the miners.

Bacteria and the Steel Strike

At a time when the down-trodden steel workers are striking it is interesting to read of the industry of the iron-depositing bacteria and their geologic relations. Among them everybody works, including father, as E. C. Harder shows in his paper on this subject just issued by the U. S. Geological Survey. Mr. Harder gives the results of his laboratory experiments in bacterial iron deposition, considers the probable extent of influence of bacterial action in forming deposits of iron ore, and gives a bibliography containing titles of the papers on work of bacteria in rock and ore deposition. All this reminds us of the saying "from shirt sleeves to shirt sleeves in three generations." What the lowly bacteria has perhaps painfully accumulated, the profligate steel worker squanders, directly or indirectly as you choose, and then impudently asks for more. Go to the iron-depositing bacteria, thou steel worker, learn of their ways, and be wise.

An Impending Calamity

A cloud no bigger than a man's hand has arisen above our horizon, and the barometer is rapidly falling. The wind is rising, and the birds have hushed their voices. Obviously a storm threatens. It does, indeed! Woolsey McAlpine Johnson, of the Potash Patents Corporation, objects to our calling his advertising "bunk." The criticism to which he takes exception appeared in the issue of July 26 under the caption "Potash and Wooden Nutmegs." But the half was never told—lack of space prevented. Many a gem was perforce omitted. For instance, the funds that Mr. Johnson would raise by the bond issue advertised are to be used, among other purposes, to enable him to develop his "Bacchus Barlicawn Bar-none Raspberry Juice," though what this has to do with potash products it is hard to see. Mr. Johnson, however, is to be given credit for having rung all the bells at once. He appeals in one ad. to nearly every trait that ever makes a "sucker" part with his cash. But the postoffice inspectors may get him if he doesn't watch out. What more horrible fate than to fall into Mr. Burleson's hands!

Other Peoples' Worries

The importance of engaging in welfare work, or "industrial relationship work," as one large mining corporation prefers to call it, is now well recognized by mining companies, and thereby a new qualification is added to those that the ideal manager must possess. But the same ideal manager, if by any chance he exists, may be glad if his lot is cast without the Dark Continent. As one reads the account of Dr. Orenstein's testimony before a government commission in South Africa, dealing with the methods of combating pneumonia among the natives, he can almost picture the

executive on the Rand as playing nurse to a lot of black boys. The recipe given for caring properly for the tropical native is that he should be housed in the cubicle type of compound room, given his government ration without stint, plenty of good blankets for his bed and one to put on coming up from the mine, a hot ration before going down, a dry ration at half-shift, and main ration as soon as possible after quitting work. For the rest, he is to be protected from cranks, both medical and lay.

The Clarity of Language

"Every naow an' again, m'son," said Cap'n Dick, "some chap starts h'agitatin' for this 'ere h'Esperanto or universal language. Tha h'only trouble is, m'son, that there is so much h'agitatin' these days that h'unless man belongs to some union of h'other 'e's liable not to be 'eard. But that's neither 'ere or there. Tha point to be h'understood is that there should be some way by means o' w'ich a man could make 'is meanin' clear to tha chap 'oo 'e's talkin' to. There's too much confusion an' babel basut some things that could be made simple if people h'only 'ad proper understandin' an' a fair means o' talkin' to h'each h'other. I am reminded, m'son, o' tha time Tom Trewella bloody near come to blows with 'is butcher for lack o' h'understandin' h'each h'other. Tom gaws daown taown one moornin' to buy a bit o' steak for 'is missus. In 'e gaws to tha butcher shop, an' firs' thing e' sees, standin' h'up on top o' tha counter, is a stuffed bird, tha like o' w'ich e'd never seen. 'Ere, Billy,' sez 'e to the butcher, 'Wot's thee want for tha broad-faced chick?' 'Tha's no broad-faced chick you, 'e's a h'owl,' sez tha butcher. 'Gos' along,' h'answered Tommy. 'W'y, dam-me, 'e's never too h'old for boilin.' Wot's tha matter with thee?"

D. E. A. C.

In Telluride

Rare is the mining camp that does not boast the good old days when it was young and history was lurid in the making. But Deadwood, Cripple Creek and Leadville, Butte, Virginia City and Globe have gone and got religion—or else the movie habit. The heroes of other days now stalk boldly across the screen instead of through the city streets, and in the audience that beholds them the tenderfoot is not to be distinguished from his neighbors.

It is in Telluride that one catches occasionally a glimpse of other days. Some say that no one ever dies a natural death in Telluride. What a twist in the scheme of things that this place, set in its wonderful mountain scenery, should have been and should still so often be the scene of unfortunate events. Man has rivaled nature in taking life. The history of the camp is replete with accounts of robberies, murders, death by snowslides and other causes, and many mysteries are still unsolved. The latest crime occurred on Sept. 10, when four contractors were shot to death on the upper level of the Tomboy company's Montana mine just as the shifts were changing. The gunmen, who were masked, made their escape, and no motive for the crime has been deduced. Level No. 1 of the Montana mine is up in the Middle Basin, within a thousand feet of the top of the range and several miles from the outside workings of any other property worked by the Tomboy company. The writer of fiction who is tired of war subjects may find what he is looking for in Telluride.

PERSONALS

J. B. UMPLEBY, who has been a member of the staff of the U. S. Geological Survey for many years, has resigned to become the director of the school of geological engineering at Norman, Okla. One-half of his services is to be devoted to the school and the remainder to work as a consulting geologist.

Clarke Sullivan, of San Francisco, is in Ely, Nev., on professional work.

F. G. Stevens, of Toronto, has returned from examining mines in Central America.

G. L. Sheldon, formerly of Ely, Nev., recently visited Chaffee County, Col., on examination work.

C. Schuette, formerly on the staff of the Bureau of Mines, has left San Francisco for Nevada.

R. A. Bryce, of Toronto, is opening up a gold property in the Cariboo District, British Columbia.

William F. Ward is engineer for an hydroelectric power project in the district of Ocana, Colombia, South America.

D. L. Cleaves, of St. Louis, has accepted an appointment with the Balbach Smelting & Refining Co. of Newark, N. J.

Major L. A. Barton has returned from overseas service and will resume his practice as soon as he receives his discharge.

Harvey B. Small, manager of the Liberated mine, in the district of Guamoco, Colombia, South America, is in New York.

G. C. Bateman, of Cobalt, has returned from Port Arthur, where he has been examining some of the old silver mines in that district.

J. R. Stroh, assistant manager mining department Brier Hill Steel Co., has been named manager, succeeding **John N. Allen**, resigned.

Benedict Crowell, Assistant Secretary of War, has returned from France, where he had been for six weeks attending to the settlement of Army affairs.

Oscar H. Reinholt, recently returned to San Diego from a professional trip to Sierrro County, Cal., and expects to proceed soon to San Angelo, Texas.

James L. Bruce, manager of Butte & Superior Mining Co., has resigned to become manager of the Davis-Daly Copper Co. He will take up his new duties on Jan. 1, 1920.

Karl C. Parrish, who has been engaged in mining in Colombia for several years, is at present engaged in engineering and developing an addition to the City of Barranquilla.

J. J. Becker, formerly manager of the blast furnace of E. J. Lavino & Co., at Lynchburg, Va., will become manager of a furnace operated by associated interests at Sheridan, Pa. His successor at the Lynchburg plant will be **M. D. Langhorne**.

M. Y. Williams, of the Canadian Geological Survey, who is an authority on the geology of oil areas, and **Joseph Keele**, of the Mines Branch, a specialist in clays, are making examinations along the proposed T. & N. O. railway extension north of Cochrane.

Dr. Charles L. Parsons has resigned his position as Chief Mineral Technologist of the Bureau of Mines to take effect Nov. 1. He expects to open offices in Washington on that date, and in addition to conducting the Washington office of the American Chemical Society, will engage in private work.

Harris & Ewing

J. B. UMPLEBY

OBITUARY

Angus McDonald, one of the pioneers of the Cobalt district and afterwards engaged in mining in Nevada and Colorado, was accidentally shot recently while on a hunting expedition. Mr. McDonald was thirty-three years old.

Nathaniel Stone Simpkins, prominent in the development of the Calumet & Hecla and other copper mines, died recently in Connecticut. Mr. Simpkins is survived by his wife, three sons, and one daughter. He was graduated from Columbia University, New York, with the class of 1882.

John Daggett, former superintendent of the San Francisco Mint and Lieutenant-Governor of California, died on Aug. 30 at Black Bear, Siskiyou County, Cal. Mr. Daggett went to California from New York in 1852 and was among the well-known early Californians. Early in 1853 he entered California state politics and was nominated

for Lieutenant-Governor at the Democratic convention in 1882. In 1893 he was appointed superintendent of the San Francisco Mint. After his retirement from the Mint, Mr. Daggett returned to his mine at Black Bear, Siskiyou County. He led a secluded life up to his death.

SOCIETIES

American Society of Mechanical Engineers held a meeting in New York on Sept. 17. **Dr. William M. Leiserson**, of the U. S. Department of Labor, spoke on "Industrial Unrest."

Mining and Metallurgical Society of America. The New York Section held a meeting at the Columbia University Club, New York, on Sept. 23. **W. R. Ingalls** presiding. The subject "Occupational Training" was discussed by **Prof. Robert Peelle** and other speakers.

INDUSTRIAL NEWS

Pacific Tank & Pipe Co. is to offer \$750,000 ten-year first mortgage bonds, the amount realized to be applied as working capital. The increase in the company's business has rendered this step necessary.

Charles Hardy, metal and ore broker of New York, has acquired a warehouse at Hoboken, N. J., which he states combines unusually good structural features and handling facilities. The building will be devoted entirely to the storage, inspection and sampling of metals, including iron and steel, tin plates, and minerals.

The **Western Electric Co.** recently added a lighting department to its general sales organization for the purpose of fostering the propaganda for better lighting in factories, offices, hotels, clubs, and residences. **E. Cantelo White**, who has had almost fifteen years' experience in the electric-lighting field, will be in charge.

Traylor Engineering and Manufacturing Co. announces that it has booked the following recent orders for mining and crushing machinery: **New Jersey Zinc Co.**, two sets 30 x 16-in. Traylor rolls, with automatic lateral adjustment; **Thomas L. Barrell**, Louisville, Ky., one No. 3 gyratory and one 30 x 12 ft. trommel screen; **Great Western Portland Cement Co.**, one 48 x 60-in. "Bulldog" jaw crusher; **Choctaw Portland Cement Co.**, one 42 x 48-in. "Bulldog" jaw crusher; **W. R. Grace & Co.**, four 36 ft. by 72 in. revolving trommel screens; **Sociedad Minera y Metalurgica de Penarroya**, one 3 x 6 ft. Sheridan shaking grizzly; **Amparo Mining Co.**, one 5 x 20-ft. tube mill; **Chicago Gravel Co.**, one 4 x 12-ft. "Bulldog" grizzly feeder and one 8-in. "Bulldog" gyratory crusher.

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief
of Interest to Engineers
and Operators

SAN FRANCISCO, CAL.—Sept. 17

John D. Hoff has begun suit through his attorneys, Clarke and Clarke, for infringement of his patent for calcining magnesite ore. The defendants are the Magnesite Production Corporation and Moore, Morrison, et al., owners of the Sampson magnesite properties in San Benito County, Cal. The patent is said to consist in a new and improved method of calcining magnesite ore in vertical kilns, by which the by-path process insures a continuous operation of the kiln and a more perfect calcination of the ore for plastic purposes. Mr. Hoff and associates have also begun action to recover the property, which they have under lease and on which they claim to have expended within the last two years more than \$100,000. Operations have been suspended for several months because of the tariff situation and the scarcity of market demands.

RENO, NEV.—Sept. 17

The Silver Peak Chemical Co. is mining what is said to be the only known deposit of water-soluble potash alum in commercial quantity, seven miles southeast of Blair Junction, on the T. & G. R.R., in Esmeralda County, Nev. According to W. B. Roberts, manager of the company, tests made by E. E. Free, of the U. S. Geological Survey, and others, show that the ore now opened up will average 20 per cent pure potash alum. The deposit has been developed by eight shafts, with numerous drifts and crosscuts, for a length of 1,000 ft., depth of 75 ft., and width of 70 ft. The process of extraction will be simple, according to chemists who have made numerous analyses and crystallization tests. The company announces that it has ordered a 100-ton plant and expects to have it in operation within ninety days.

A Vote To Call Off the Strike at Tonopah and Divide, taken recently at a meeting of conservative miners of the district, resulted in 279 votes in favor of the motion and 51 against Governor Boyle and operators expected, therefore, that work would be resumed Sept. 15. At a meeting of the more radical held afterward, a motion was likewise made to call off the strike. An amendment was also offered that Tonopah be declared a scab town, but the meeting adjourned without action on the motion or the amendment. Speakers at this meeting declared the strike had only just begun. The expected resumption did not take place, therefore, on Sept. 15, and the future is uncertain. There were 1,500

miners and mill men in the district before the strike, and it is estimated that of these 500 have already departed.

SPOKANE, WASH.—Sept. 17

Northwest Mining Association, at its meeting held in Spokane on Sept. 12, endorsed the Jones-Reavis bill, now before Congress, providing for the creation of a Department of Public Works, with an engineer at its head, who shall be a member of the President's Cabinet. The association in its resolution urged that Congressmen from the Northwest support the bill. A copy of the resolution was sent to each Senator and Representative in Washington.

WALLACE, IDAHO—Sept. 16

The Strike at the Coeur d'Alene mines has been without disorder thus far. Picketing at the Hecla mine be-

BUTTE, MONT.—Sept. 19

First Break in Metal Crafts Strike in Butte district took place Sept. 18, when the machinists at the Anaconda smeltery at Great Falls, Mont., voted to return to work, accepting the old offer of the company. The Metal Crafts is an independent union consisting of machinists, engineers, and electrical workers. The men in the organization refused to accept the wage offer made by the Butte mining companies at the time of the strike in February of this year. Metal Crafts consist of only 6½ per cent of the total mining labor of the district.

HOUGHTON, MICH.—Sept. 17

Calumet & Hecla's longest underground level will be completed Jan. 1, notwithstanding the fact that operations at the south end are suspended.

DEPOSIT OF POTASH ALUM NEAR BLAIR JUNCTION, ESMERALDA COUNTY, NEV., BEING WORKED BY SILVER PEAK CHEMICAL CO.

came rather offensive at the start, but a warning from the sheriff's office had immediate effect. The force at the Hecla has increased, now totaling about seventy-five men, who are engaged in repairs on pumps and in similar work. No men are employed at any of the other mines except watchmen and those necessary to keep pumps running. There is a fixed determination on the part of the companies to give no recognition to the union. The impression prevails in the district that the Hercules and Tamarack mines, controlled by the Days, will not attempt to resume operations until spring. The Northport smeltery, which handles the ores from these mines and is also controlled by the Days, is closed down.

The drifting to the north continues at full speed. This underground project will be 8,000 ft. long when completed and will connect lower levels of the Red Jacket perpendicular shaft with the lower levels of the conglomerate angle shafts and ultimately will provide a tramway for the lowest level. When this work is completed five shafts of the South Hecla, Nos. 6, 7, 8, 9, and 10, will be operated through subshafts and the rock trammed over to the Red Jacket shaft. Once this work is well under way all pillars can be removed from the South Hecla shafts from a point 8,000 ft. from surface, and the shafts permitted to cave. New miners are being added to the crew of the Calumet & Hecla and subsidiaries at the rate of fifty a day.

Mohawk Mining Co., in the Michigan copper country, is concluding an interesting construction job at the stamp mill at Gay. The drift out under the waters of Lake Superior, through the sandstone, has now attained a lateral distance of 2,100 ft. and has 700 ft. more to go before the raise is cut through to let the water in. When completed, this system will bring water from a point 2,800 ft. out in the lake and 28 ft. under the surface for use in the mill. Long experiments have proved that the spot selected for this intake is practically clear of stamp sand and float ice, owing to the prevailing wind and the topography of the lake. The shaft was sunk 125 ft. from the pump house, and 110 ft. below the level of the lake. At 90 ft. depth below the lake level a pump station was cut. The tunnel work has been under way since last winter. Two weeks ago a cylinder was sunk, with the aid of divers, in the lake bottom, at the point where the upraise is due to hole through. From this cylinder a steel rod has been sunk to the point where it will connect with the tunnel, and the raise will follow the line thus given. The present intake for water used at the mill is near the mouth of the Tobacco River. The work of the pumps has been seriously hampered every winter by floating chunks of ice and by foreign matter that washes up close to the shore.

AUSTIN, TEX.—Sept. 16

Oil Companies operating in Texas to the number of 1,400 have failed to file with the Texas Railroad Commission the information regarding their operations required by recent act. Another call will be made, and action will probably be taken against those not complying.

Suit for Oil Land valued at \$8,000,000 has been entered in the district court of Travis County by the State of Texas. The land in question is 160 acres in Stephens County, and the defendants are Gulf Production Co.; Shamrock Oil Co., of Waxahachie; John F. Lewis, of Dublin; C. M. Caldwell and wife, and B. S. Walker, of Stephens County; N. N. Rosenquest, of Taylor County; and J. L. Mayfield, of Wichita County. Title is in question because the original owner forfeited his rights, and was later reinstated under conditions claimed by the state to be illegal. Defendants are claiming title under original purchase. In addition to the land, the state is suing for \$300,000 damages for oil and gas removed.

Sinclair Oil Corporation will build a model industrial city to accommodate 6,000 population at its projected \$1,000,000 refinery. The site includes 700 acres, fronting on the Houston ship channel. The first unit of the town will consist of fifty bungalows, with others to be built as needed. In addition to the dwelling houses, there will be built a community settlement house, hospital, schools, library, stores, swimming pool, and other community

buildings. The hospital will be planned after that at Gary, Ind.; the schools will give trade and domestic science courses, in addition to the usual studies; the stores will be municipally managed. The larger buildings will be of fireproof construction. C. K. Birdwell, of Houston, is architect, and W. W. Mellin is resident engineer.

BIRMINGHAM, ALA.—Sept. 12

The Sloss-Sheffield Steel & Iron Co. is again in the market with some offerings of iron, and with further business in sight its prospects are bright for the coming quarter. This company is planning to build fifteen or twenty new cottages at its mines as well as a new church for negroes. It is said that more men are employed now at the company's mines than ever before.

Business in the Birmingham iron industry is becoming better as the last quarter draws near. No orders have been accepted for 1920 delivery

NEW YORK, N. Y.—Sept. 18

Adolph Lewisohn & Sons, Inc., was chartered at Albany, N. Y., with \$6,000,000 capitalization and Adolph and Samuel Lewisohn directors. The company is authorized to conduct a general real-estate business and engage in mining and refining of metals.

BOSTON, MASS.—Sept. 17

Balaklala Consolidated Copper Co.'s lawsuit against the United States Smelting Co. for recovering approximately \$34,000 claimed to be due in settlement for copper has been shifted from the California state court to the Federal court. The litigation resulted largely from the cessation of quotations published by the *Engineering & Mining Journal* closely following the armistice last November. A smelting contract between the two companies was based on these quotations. One difference between the contestants has to do with whether the next published quotation of the *Journal* constituted

AT CAMP OF BIG MISSOURI GROUP, SALMON RIVER DISTRICT, BRITISH COLUMBIA. WILLIAM SLOAN, PROVINCIAL MINISTER OF MINES, IN FOREGROUND. SNOW IS ON THE GROUND, THOUGH PICTURE WAS TAKEN IN MID-SUMMER

so far, though it is known that consumers are urging the acceptance of orders totaling close to 100,000 tons.

Much concern is noticeable in the iron and steel circles of the district over the expected strike of iron and steel workers set for the last part of this month. Just what is the strength of the unions in the Birmingham district is not known, but it is said in some quarters that about 40 per cent of the district is organized. The strike, should it last for any length of time, will seriously affect all industries. It is particularly to be regretted at this time, when so many concerns are just beginning to rally from the setback of the first half of the year. Some of the companies are planning to push construction work in case all other operations are stopped.

An electric haulage system costing \$100,000 was completed about Sept. 1 at the Virginia mines. The work was begun Mar. 1. This will effect a lowering of tramping costs.

the basis for settlement of whether a market for the metal existed in the period between the dates of published quotations.

Louis Ross is entitled to recover only \$100,000 from Albert C. Burrage, instead of a percentage of profits, which Ross alleged to be about \$25,000,000, made by Burrage in the sale of mining properties in Chile to the Guggenheim interests, of New York. This is the decision given by the Supreme Court in Boston on Sept. 10. The court ruled that Ross was bound by the agreement made with Burrage in 1912, under which Burrage had the option of paying Ross \$100,000 or transferring to him 5 per cent of the securities coming to Burrage as profit from the exchange of the options on the mining properties brought to his attention by Ross. Burrage elected to make the cash payment. The court declared the plaintiff entitled to a decree directing the defendant to pay the \$100,000 forthwith.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
for Easy Reference

ALASKA

August Shipments of domestic copper matte, etc., from Alaska to United States totaled 7,816 gross tons; copper contents, 4,333,009 lb., valued at \$793,650.

Kennecott (Kennecott)—August production of copper, 8,224,000 lb., including output of Braden Copper Co., against 5,873,560 lb. in July. Increase 40 per cent, due to improved market.

Salt Chuck (Ketchikan)—Recent car shipment returned 36.96 per cent copper, 6.1 oz. silver, 1.27 oz. gold, 0.10 oz. platinum, and 2.93 oz. palladium. Andrew G. Larson, of Spokane, engineer in charge, says some shipments are higher and some lower in value than this. Property on Prince of Wales Island.

ARIZONA

Cochise County

Shattuck Arizona (Bisbee)—Produced in August 386,027 lb. copper, 708,526 lb. lead, 33,383 oz. silver, and 51 oz. gold. This came from ore taken out in development work in June, July and August, which was smelted in August.

Phelps Dodge (Douglas)—Smeltery copper production for August was as follows: Copper Queen branch, 5,264,000 lb.; Moctezuma Copper Co., 3,422,000; Burro Mountain branch, 234,000; custom ore, 337,000; total Douglas smeltery, 9,257,000; Detroit branch (Morenci), 1,315,731; total, 10,572,731.

Gila County

Arizona Commercial (Globe)—August production about 600,000 lb. copper from 6,000 tons ore. Average copper content of ore produced in first eight months of 1919 was 5.66 per cent. New No. 2 shaft expected to reach 12th level early in 1920. Large tonnage commercial ore cut in two crosscuts on 10th level; also in 7th level crosscut.

Old Dominion (Globe)—Good ore showing continues in virgin ground on 16th and 18th levels east. Production at 60 per cent capacity.

Greenlee County

Arizona Copper (Clifton)—August production of copper, 2,900,000 lb.

Pinal County

Grand Pacific (Superior)—Over 300 ft. of development done in August. Extracting ore from two intermediate levels. Ore in upper levels running high in copper.

CALIFORNIA

Calaveras County

Carson Hill Gold (Carson Hill)—Milled 2,500 tons first ten days of September, averaging \$17 per ton. Push-

ing development work on 875 level, where good ore was opened. Will make further payment on American Zinc Co. loan on Sept. 20.

El Dorado County

Lyman (Placerville)—L. A. Bender developing property. Shaft down 50 ft.; cutting tunnel at 40-ft. depth, providing ventilation.

Ohio (Placerville)—Under development since July 23 by W. G. Rossi and Boro Soderhjelm, of Placerville. Barrel gravel mill, bins, and gas engine installed. Drift run to connect with tunnel in adjoining mine for ventilation. Blocking out breast of average gravel. Will start mill soon.

Ralston (Placerville)—High-grade cemented gravel reported found in old Ralston deep-gravel gold mine twenty miles northeast of Placerville. Property worked by W. H. Duffy, with small crew; formerly owned by William C. Ralston.

Rising Hope (Placerville)—Blocking out good tonnage of hard cemented gravel with view to installing ten-stamp quartz mill. Gravel too hard for pres-

tral tunnel leased to Carl Gunnison, W. Thompson, and Emmet Tuck, who are raising to known orebody above. Freeman lease showing up well in heading being driven east from tunnel.

Community Sampler (Idaho Springs)—Has erected new 35-ft. mixing floor and expects to build ore bins on ground west of sampler recently bought from L. A. Hafer.

Golden Edge (Idaho Springs)—Under lease to A. Weinberger, who has small force cleaning up preparatory to starting development.

Lamartine (Idaho Springs)—Operated by C. H. Speiser, who is concentrating ore at Oneida mill.

Lake County

In St. Kelvin District a leasing company has secured control of the Griffen property. The Colorado Power company is extending its line to the portal of the old Griffen tunnel. This tunnel is over 1,000 ft. long, with a good showing of low-grade gold ore. Further development work will be done on the vein when new surface plant and equipment are installed.

SMUGGLER UNION MINING CO.'S MILLS, TELLURIDE, COL., LOOKING NORTH UP MARSHALL CREEK

ent barrel gravel mill. George W. Engelhardt, general manager; Charles M. Henson, superintendent.

COLORADO

Clear Creek County

Big Five (Idaho Springs)—Block of ground on Edgar vein 800 ft. from Cen-

Montrose County

Cashin (Paradox)—Preparing for production. Erecting buildings and adding to equipment. Contract let for 100-ft. shaft. Property has good body of high-grade copper and silver.

Radium Ore Sampler (Montrose)—

Has installed motor-truck system and is hauling ore by night.

Pueblo County

Colorado Thrift Oil & Gas (Fountain)—Has purchased heavy drilling machine for drilling well near Fountain.

San Miguel County

Shipments from Telluride district in August were: Tomboy, 51 cars of concentrates; Smuggler, Humboldt, and Black Bear, 46; and Cimarron, 3.

IDAHO

Shoshone County

Amazon-Dixie (Wallace)—Mine recently examined by A. W. Ellenberger, capitalist, of Cleveland, who, with other Cleveland associates, has financed company. Will provide \$150,000 and more, if necessary, to install electric power and electric hoist, and to sink 400 ft. from present 1,100 level, making total depth from surface 1,500 ft., or 800 ft. below main working tunnel, from which shaft is sunk. Ore on 1,100 level improved as compared with showing above. Mine situated in Montana near Idaho line at Sildix Station, on Northern Pacific.

Bullion (Wallace)—Diamond drill cut 14 ft. copper ore, carrying gold and silver. Same shoot located in upper tunnel and in shaft 400 ft. above. Strike taken to prove large body commercial ore. Mine on St. Joe side of divide, six miles from C. M. & St. P. road. Old grade of logging railroad, within three miles, which may be utilized.

Success (Wallace)—Working two sets of lessees, shipping lead-silver ore only. Operations otherwise discontinued, on account of strike.

MICHIGAN

Copper District

Lake Superior Copper again going out by rail in small lots to domestic manufacturers.

Quincy (Hancock)—Remodeling of smeltery on Portage Lake begun; will take five months. Enlarging main furnace building, in which will be installed two furnaces of capacity of 100-tons fine copper per day. Will equip plant with gasoline locomotives, new boiler plant with economizers, and new cranes. Plant handles custom ore as well as Quincy ore. Preparing to ship by rail lot of 750,000 lb. sold within fortnight.

Oseola Con (Houghton)—North Kearsarge has two laterals toward Ahmeek boundary in better copper than previously opened in this low-grade property.

Victoria (Houghton)—Adding to force and planning to put mine on two shafts.

Winona (Houghton)—Working Nos. 1 and 4 shafts. Underground force, 100. More men needed.

Mohawk (Mohawk)—Has full crew below and on top for first time in two years. Three shafts working, Nos. 4, 5, and 6, the first yielding best rock.

MINNESOTA

Mesabi Range

Tioga (Chisholm)—Fee owners and operator conducting joint drilling campaign to determine whether or not any ore lies below present main level.

MONTANA

Silver Bow County

Anaconda (Butte)—Rolling mill at Great Falls, Mont., in August converted 6,000,000 lb. refined copper into finished rods and wire. Plant running at capacity. Great Falls copper refinery at two-thirds capacity. Zinc plant still down.

North Butte (Butte)—August production of copper 1,450,122 lb.; July, 1,005,810; August, 1918, 1,931,837.

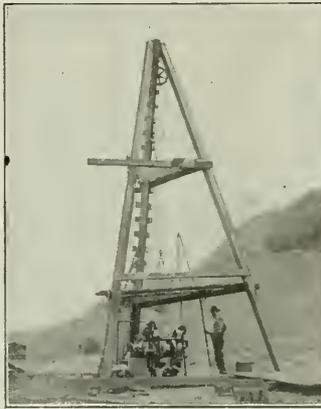

NEVADA

Lyon County

Douglass (Dayton)—Douglass tailings dump below Dayton again being reworked. Tailings from Comstock ores. Last effort to rework unsuccessful.

Nye County

Tonopah Belmont (Tonopah)—Dividend declared Sept. 15 a reduction of 10 per cent, owing to recent strike of miners at Tonopah.

DIAMOND DRILLING IN TONOPAH DISTRICT, NEVADA, BY TONOPAH EXTENSION MINING CO.

Pershing County

Jose-Davis M. & M. (Loring)—Has ordered 30-ton mill now on road. In Shepherd workings ore developed on tunnel level for 100 ft. in length and 60 ft. deep; 200 tons broken, which management figures runs \$200 per ton. W. I. Beauchamp manager and E. E. Roberts, former Congressman, president.

Loring Treasure Hill Mines (Loring)—East vein of Loring Treasure Hill can be traced for 1,500 ft., with high-grade streak on foot wall, many specimens showing visible gold.

Mayday Group (Loring)—On main vein a barren-looking black quartz assayed high in gold and is being developed to see if commercial body can be found. On southwest end of claim a

silver-copper ore was found from which specimen assay went \$102.50.

Nevada Honey Bee (Loring)—Under J. H. Bell, superintendent, twenty men are sinking Malley shaft and driving Benedetti tunnel. Former down 110 ft. First shipment from Honey Bee went \$34.06 per ton. Company is financed by New York interests.

NEW MEXICO

Sierra County

Silver Monument (Chloride)—Taken over by Jack McCuthin and associates.

Lady Franklin (Lake Valley)—Running mill tests on silver ores preliminary to deciding process for new mill.

SOUTH DAKOTA

Custer County

Climax (Custer)—Shaft retimbered, and development of mica deposits begun. Shipments of mica will be made soon.

Lawrence County

Deadwood Lead & Zinc (Deadwood)—Concentrator in operation for only a short time. Scarcity of water given as reason for suspension.

Eagle Bird (Deadwood)—Incorporated with Fred Pennington, president, and Burt Rogers, secretary and treasurer. Securities being sold, and probable that work on ground on Squaw Creek will be started this year.

Custer Peak (Englewood)—Concentrator and mine closed down.

Pennington County

National Tin (Hill City)—Cowboy shaft enlarged to three compartments. Timbering of new compartment nearly completed. Drift being driven on 300 level. Machinery installation being made at mill, and plant should be ready for operation during October.

Egyptian (Keystone)—No work being done at property. Understood that company will be formed to finance further development.

TEXAS

Fort Bend County

Development at Blue Ridge Field giving encouraging results. Circle Oil Co.'s No. 1 Scott well 2,700 ft. deep, and good showing of oil made in bailing. West Production Co.'s No. 1 Luscher well also about 2,700 ft. deep, with oil showing. Both wells at considerable distance from original discovery, making possible extension of field.

Hardin County

Saratoga Field Completions: Regna Oil Co., No. 5 Ogden, set screen at 1,300 ft.; Peerless Oil Co., No. 6 Kirby, making small production by pumping; Sun Oil Co., testing No. 133 McShane well; Weldon Oil Co. also testing well.

Harris County

Macks Oil & Water Well Screen Co. has just let contract to W. C. Hendrick Construction Co. for two reinforced-concrete buildings. Entire plant when completed will consist of eight buildings. Main office 821 Kress Building, Houston.

Jackson County

At Edna, Texas Co. will drill on large ranch of L. Ward. Other drilling near Edna will be done by F. Seliner & Co., of Houston, on Kroop farm, near Vanderbilt; Coast Line Oil Corporation, on Calhoun farm, three miles southeast of Edna; and S. G. Drusher and associates, on Drusher land, northwest of town.

Jefferson County.

Texas Steel Co. (Beaumont)—At meeting of stockholders Sept. 3, four new directors elected: B. A. Steinhager, W. F. Graham, E. L. Boydkin, and R. S. Collins, all of Beaumont. Pig-iron plant at Rusk, Cherokee County, closed temporarily, owing to Railroad Administration raising freight rates. Suit filed for overcharges and \$50,000 damages.

Lampasas County

Nineteen Locations made in county and derricks built. Wells being drilled are: Howell No. 1, on White Ranch; Key well, on Baxter ranch; Smith well, on Smith ranch; Groves No. 2 well at 600 ft.; St. Mary, on Le Compte ranch, at 700 ft., narrow oil-bearing strata being penetrated at 600 ft.; New York syndicate, drilling two wells on line between Lampasas and Coryell counties.

Liberty County

Recent Completions in Hull Field: Gulf Production Co., No. 1 Thomas installing pump; Big Four Oil Co., No. 5 Hannicker bailing at 2,500 ft.; Republican Production Co., No. 18 Dolbear abandoned; will drill another well. Field production about 8,000 bbl. daily.

Nueces County

Corpus Christi O. & G. (Corpus Christi)—White Point gas well, flowing wild for three years, successfully capped. Pipe line will be laid to supply Corpus Christi, and possibly Taft, with gas. Heavy concrete block laid around well to prevent it from breaking loose when valves closed.

UTAH**Salt Lake County**

Garfield Smelting (Garfield)—Cloudburst on Sept. 18, falling directly on A. S. & R. smeltery, put plant out of operation for several days.

Utah County

Pacific Gold M. & M. (American Fork)—Property taken over by owners. Has been under lease.

WASHINGTON**Okanogan County**

Arlington (Concunully)—Most consistent shipper of silver ores in district. Property well equipped and credited with good production. Two carloads good-grade silver ore in bins awaiting shipment. Property ten miles from Concunully.

Carl Frederick (Concunully)—Silver property nineteen miles southwest of

Concunully; starting 120-ft. raise to explore high-grade ore showing in surface cut. C. Bernhard, manager.

Kankakee (Nespelem)—Lessees have struck native gold ore in ledge and have penetrated 11 ft.

Trinidad (Tonasket)—Silver property nine miles southwest of Tonasket has shaft down 35 ft. in mineralized zone carrying silver and lead. Starting a drift to get under favorable showings uncovered above.

Snohomish County

Boston American (Monte Cristo)—Preparing to start up after shutdown during war. Home office, Everett, Wash.

Good Hope (Monte Cristo)—Working small crew and trying to have state open road to Index to make shipping possible.

CANADA**British Columbia**

F. J. Albo, of Rossland public schools, has won this year's scholarship for the Kootenays, offered annually by Consolidated Mining & Smelting Co. of Canada.

Carmi (Carmi)—W. H. Sawyer, superintendent, installing 75-ton concentrator.

North Star (Kimberley)—Has shipped first car since tramway and buildings were burned by forest fires this summer.

Beatrice (Lardeau District)—New Era Mines, Ltd., bondholders, plan to drain workings, ship dumps, and develop orebody further. Fourteen hundred feet of tunnel already driven, bunk houses built, and 1,500-ft. aerial tramway installed. Property ten miles from Beaton, B. C., and comprises three Crown-granted claims above timber line. Reached by four-mile motor road and six-mile pack trail.

Eureka (Nelson)—H. H. Vincent, president of Vincent Development Co., which is developing Eureka-Granite-Poorman property for Inland Mining Co., states survey of proposed 6,000-ft. extension to tramway is complete and contract for construction will be awarded immediately. Car of concentrates ready for shipment to Trail.

Cork Province (Slocan) — Recent shipment flotation concentrates returned 51.5 oz. in silver, 65.8 per cent lead, 5.2 per cent zinc. In same car were bull-jig concentrates that returned 29.2 oz. silver, 43.6 per cent lead, and 8.9 per cent zinc. Company will ship no more bull-jig concentrates. Publication of report of R. H. Stewart expected soon.

Lucky Jim (Slocan) — Spokane stockholders trying to work out plan to reorganize and secure 1½c. a share from each of 6,000,000 shares outstanding. This would give \$90,000, of which about \$70,000 would be used to pay all obligations.

Black Prince (Slocan)—First car shipped for year. Ore silver-lead.

Utica (Slocan)—Ore being taken out by Poyntz, McLellan, and MacDougall, lessees.

Belmont Surf Inlet (Surf Inlet)—August earnings \$25,457, compared with \$11,999 in July and \$24,888 in August, 1918. Labor situation, which has been hampering operations, now improving.

Consolidated M. & S. (Trail)—Ore receipts from Aug. 21 to 31 inclusive were 11,551 gross tons. Largest custom shipment was 1,023 tons, from Mandy mine, The Pas, Manitoba. Company's Sullivan and Kimberley mines contributed 7,467 tons and Centre Star, of Rossland, B. C., 1,084 tons.

Nova Scotia

Nova Scotia S. & C. (Sydney)—Planning to erect new byproduct plant at Sydney mines, to cost over \$2,000,000. Will necessitate enlarging present plant and erection of new blast furnace.

Ontario

Kerr Lake (Cobalt)—Will reduce capital from \$3,000,000 to \$2,400,000 by payment of part of capital to shareholders of record Sept. 22.

Waldman (Cobalt)—Leased to F. B. Mosure.

Miller Lake O'Brien (Gowganda)—Operations curtailed owing to low water for power purposes.

Kirkland Porphyry (Kirkland Lake)—Kirkland Porphyry having gone into voluntary liquidation, Orr property, held under option, will return to original owners. Option price \$523,000.

Dome (Porcupine)—Output for August shows increase, tonnage treated being 25,000 tons, or 3,000 over July.

MEXICO**Sonora**

Greene Cananea (La Cananea)—August production 4,200,000 lb. copper; 179,470 oz. silver; 880 oz. gold.

Market Report for Sept. 27 Will Appear In Issue Of Oct. 4

Industrial conditions in New York have made it expedient to close the forms of the *Journal* in advance of the routine schedule date. The usual market quotations are therefore necessarily omitted from this number. The market pages which would have appeared normally in the Sept. 27 issue will be published in the *Journal* of Oct. 4.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, Sept. 17, 1919

Copper and zinc continued very dull, with some exhibition of weakness in zinc. On the other hand, lead turned very strong, and the market advanced, as was foreseen last week.

The stocks of metals in the hands of the British government on Sept. 1, with the comparative figures for August stated in parentheses, were as follows: Copper, 31,415 tons (41,697); lead, 94,138 tons (120,971); zinc, 34,724 tons (39,540); aluminum, 22,919,680 lb. (23,520,000 lb.); nickel 5,328,760 lb. (5,491,480 lb.); antimony, 7,584,640 lb. (9,880,640).

Reports from London continue to be to the effect that industrial affairs in Great Britain are becoming distinctly better. Port congestion, however, is a bar to some trades. It takes longer to

get lead out of a government store than to bring it from Australia.

Transatlantic freight rates declined sharply this week, reflecting the increasing easiness in shipping conditions. Rates to British ports were quoted at \$15; to Hamburg at \$16; to Dutch ports and Antwerp at \$12. Freight rates to French ports were booked at \$15, with indications that even lower might be done. From San Francisco to Hong-kong the rate advanced to \$15, while to Kobe it declined to \$12.

Copper

The dullness in copper continued. No business was done by the principal producers. Some business was done by agencies. The major part of the business, however, continued to be done by brokers reselling for consumers and speculators. The volume of this business was less than in the previous week,

and the hope was again expressed that such accounts were about cleared up. However, Japanese houses, upon advices that copper had declined in Japan, became sellers on Sept. 12, and at about the same time British houses renewed offerings of ingot bars. They intimated a price of £113 to £113¹/₂, c.i.f. New York, which would be about 21c. delivered here.

In this market the differential between ingot bars and wire bars continued to prevail, and, indeed, became rather wider than previously, for the former were offered at 21¹/₂c. New York, while business was done in wire bars at 22¹/₂c. Toward the close the market seemed to exhibit an easier tone, and there is no doubt that wire bars could be obtained from some quarters at 22¹/₂c. delivered, which would be 22.10c. New York.

Copper Sheets.—The base price of copper sheets is 33¹/₂c. per lb. Market steady. Demand strong. Copper wire is quoted at 26@26¹/₂c. in carload lots, f.o.b. mill. Market dull.

Tin

A fair business was done at slightly higher prices, tin of 99 per cent grade closing at 55¹/₂c. American producers are now making about 1,250 tons per month. Straits tin in this market was quoted at 56c. on Sept. 11-13, 56¹/₂c. on Sept. 15-16, and at 56¹/₂c.@56³/₄c. on Sept. 17.

Singapore quoted c.i.f. London £280 on Sept. 11, £281¹/₂ on the 12th, and £286 on the 15th.

The statistical position of tin is thought to be improving. London is bullish.

Lead

The labor troubles in Idaho and the threat of trouble at one of the important smelteries near St. Louis increased the tightness of a statistical position that was already strong. The largest producers have their books full of orders for a month ahead, and there are only a few producers who are able to offer any lead for prompt or early shipment. Shortage of railway cars makes shipment difficult even by them. In view of these circumstances, it was not surprising that an active demand for lead should develop. Following this, the A. S. & R. Co. advanced its price to 6¹/₂c. on Sept. 15. Orders were taken at that price for October shipment. The aggregate of business during the week came to a fair total.

About the end of this month, or early next month, the St. Joseph Lead Co. will resume smelting at its plant at Herculaneum which has been idle since Feb. 14.

Zinc

The demand continued sluggish. Some producers became tired of waiting and made up their minds to sell. This resulted in a further decline in price. However, there were always bids somewhat under the market, which checked any tendency toward rapid movement downward. The market closed at 7.10c. to 7.20c., with nobody appearing desirous of buying and nobody seeming to be very anxious to sell.

The Eagle-Picher Lead Co. has bought the plant of the Robert Lanyon Zinc & Acid Co. at Hillsboro, Ill.

Zinc Sheets—The quoted price of zinc sheets is \$10 per 100 pounds.

Other Metals

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet.

Antimony—The market was quiet. We quote spot at 8½@8¾c. and futures at 9@9¼c.

Bismuth—We quote \$2.96.

Cadmium—Unchanged at \$1.40.

Nickel—Ingot, 42c.; shot, 43c.; electrolytic, 45c.

Quicksilver—Upon renewed buying the market advanced to \$105. San Francisco telegraphs \$100@105 firm.

Silver and Platinum

Silver has advanced to 61½d. on the information that the government of India has fixed the exchange value of the rupee at 2s., a rise of 2d. Market steady; China buying limited offerings.

Mexican dollars at New York: Sept. 11, 87; Sept. 12, 64½; Sept. 13, 86½; Sept. 15, 87½; Sept. 16, 87½; Sept. 17, 87½.

Platinum—The Government stock is reported all sold. Knowledge of this and the development of a strong demand caused the market to become very excited. We quote refined ingot at \$130 to \$140. It is possible that some sales were made at even higher prices.

Palladium—Unchanged at \$120.

Zinc and Lead Ore Markets

Joplin, Mo., Sept. 13—Zinc blende, per ton, high, \$49.70; basis 60 per cent zinc, premium, \$46; Prime Western, \$45; fines and slimes, \$42.50@40; calamine, basis 40 per cent zinc, \$30. Average settling prices: Blende, \$44.38; calamine, \$30.70; all zinc ores, \$43.55.

Lead, high, \$70.35; basis 80 per cent lead, \$70@65; average settling price, all grades of lead, \$66.36 per ton.

Shipments the week: Blende, 4,573; calamine, 291; lead, 1,037 tons. Value, all ores the week, \$280,860.

The car situation has reached a point where further loading must await emptying some cars. Over 20,000 tons are now in transit, about 575 cars. Filled cars have moved away more rapidly, but, with heavy wheat shipments in transit, no empty cars are to be had. Some shipping is being done to nearby points in coal cars. Two smelters are idle at Henryetta on account of labor trouble and lack of ore.

Platteville, Wis., Sept. 13—Blende, basis 60 per cent zinc, \$45@46 base for premium grade and \$45 base for high lead or Prime Western grade. Lead ore, basis 80 per cent lead, \$66 per ton. The zinc market was dull, and buyers of the high grades were not inclined to bid for ore at the week end. Shipments reported for the week are 1,934 tons blende, 125 tons galena, and 528 tons sulphur ore. For the year to date the totals are 70,041 tons blende, 4,489 tons galena, and 11,638 tons sulphur ore. During the week 2,909 tons blende was shipped to separating plants.

Other Ores and Minerals

Chrome Ore—Offered at \$32 per ton, delivered in the East, without finding buyers.

Molybdenum Ore—Quoted nominally at 75c. per lb.

Tungsten Ore—The market is quite disorganized, owing to the uncertainty of tariff legislation. Chinese ore was offered at \$7.40.

Pyrites—Spanish pyrites is quoted at 17½c. per unit for furnace-size ore, free from fines, c.i.f. New York or other Atlantic port. Sulphur companies reported to be selling at prices as low as \$14@15. Market unsettled.

New York—Sept. 17, 1919

Although it is probable that conservative influence in the labor world will prevail and that there will not be a general strike of iron and steel workers, the threatened suspension of work has been a disturbing factor in the market during the past week and still causes apprehension, says *The Iron Age*.

The net result of the agitation is that little buying has been done. The desire of consumers and distributors to secure material has been more pronounced than in the earlier talks of strike, but so has been the hesitancy of the producers to add to their commitments.

The demand for pig iron is not now active, and an Illinois foundry inquiry for about 10,000 tons for delivery in the first half of next year thus gains prominence. Persistent reports of weakness of basic continue, and there is a limited demand for all steel-making irons. Stove manufacturers in the Central West are having difficulty in maintaining full operation on account of scarcity of molders. The demand for stoves is greater there than the supply.

On ship material the Government has again obtained base quotations of 2.50c., Pittsburgh, for plates and 2.40c. for shapes. The former price is widely possible on attractive lots, but 2.45c. is the general market for structural material.

Buyers for oil-well developments have been pressing to get covered owing to the imminent stoppage of steel plants. Demand for oil pipe promises to last over at least two years.

Tin plate makers, with stocks in consumers' hands now well exhausted, look to having a banner year in 1920. Black sheets have sold in the Central West for \$3 above regular prices.

Pittsburgh—Sept. 16

Wednesday night, Sept. 10, the special committee of six of the general committee constituted by twenty-four unions to organize the iron and steel industry announced that it was calling a strike for the industry to begin Monday, Sept. 22. The news created some surprise, both because it was thought the organization was not strong enough to produce a strike and because it was believed that in any case such a move would be deferred in deference to President Wilson's desires until the results of the White House conference on labor on Oct. 6 could be measured. The common view seemed to be that the chances of a strike of any magnitude following the strike call were relatively small.

When the report appeared yesterday morning that the strike call was to be rescinded there was scarcely a ripple in the trade. The original order was issued only after a prolonged debate among the labor organizers, and it is generally believed that Mr. Gompers personally is opposed to a strike being called at this time, particularly as the President has urged that there be a labor truce until after the White House conference on labor Oct. 6. It appears that Mr. Gompers has no direct authority in the matter, which is subject to the decision of the unions involved; but it is understood he has urged the union heads to recall the order and that at their meeting to be held in Pittsburgh tomorrow they will probably do so.

Though the claim repeatedly made by the labor agitators that the iron and steel producers wish to precipitate a strike is wholly unfounded, it is true that the manufacturers would prefer a strike and a settlement of the whole matter rather than an indefinite prolongation of the agitation. The manufacturers believe that the great majority of their employees are satisfied and do not want to strike, but it is clear that the agitation of the last few months has considerably lowered the efficiency of the men. It is reasonably certain that no large part of the men are actually organized, but there is a possibility that if a strike were once started it would grow. The policy of the manufacturers is well defined. They would simply close the works that would be affected and let them stay closed.

The steel market has been quiet, the mills being well filled with business for several months to come, based on the present rate of production, which is below capacity, chiefly because men are not working at normal efficiency. In oil-country goods there is a definite scarcity, due to the large amount of oil development planned, and inability to secure as much material as is desired in the Texas oil field will result in a condition that will involve the expiration of many leases without the prescribed drilling being done. In other lines there is no definite scarcity.

Fabricated steel-lettings in August represented 78½ per cent of fabricating

shop capacity, but large building projects involving the use of structural steel are not coming out at the pace of a few weeks ago, and there is no railroad demand except for a limited volume of material for car repairs. Nevertheless, the current make, representing 80 to 85 per cent of the entire productive capacity, is readily absorbed, and it does not appear that buyers are accumulating any stocks, although, on account of prospects of traffic difficulties later in the year, they would like to fortify themselves. Box cars are scarce, even at the present time, causing considerable tonnage of sheets to accumulate at mills. Tin plate is moving freely and wire products are moving fairly well.

Steel prices steady, and it is practically the universal feeling among producers that price advances should not be made. Of course, there is no possibility of any decline. Plates, which were set at 2.65c. by the March 21 schedule, have sold at 2.50c. more often than at the full price, and the 2.50c. price is now more often regarded as the real market price for desirable orders.

Pig Iron—Although it was the declared policy of furnacemen not to sell for next year, news is now coming out of a considerable volume of transactions, at current prices, through consumers giving their regular sources of supply the option of taking the business or seeing it placed elsewhere. An occasional sale of foundry iron for this year's delivery is made at \$1 advance, but this is not general. Bessemer and basic are quiet in the open market, but requirements under contracts are heavy. We quote prices unchanged: Bessemer, \$27.95; basic, \$25.75; malleable, \$26.25 @ \$27.25; foundry, \$26.75; forge, \$25.75, f.o.b. Valley furnaces, freight to Pittsburgh being \$1.40.

Steel

Steel—Mills are having difficulty in meeting requirements under sheet bar contracts, but are generally succeeding, and there is hardly any open-market inquiry. Billets are quiet. We quote: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; rods, \$52.

Ferromangalys

Ferromanganeses—Representatives of British ferromanganese producers are not quoting openly, as the complaint was made before the Federal Trade Commission charging them with "dumping." Their last quotation was \$95, c.i.f. Domestic producers continue their asking price of \$110, delivered, but it is understood this price could be shaded. Consumers are showing no interest in the market.

Coke

Coke—The furnace coke market presents an easier tone, but producers are still asking \$4.75 for spot or prompt. Foundry coke shows better demand, with light offerings, and \$6.25 to \$6.50 is generally secured, depending on brand. The minimum has advanced \$1 a ton within three or four weeks.

Number 14

Strikes

AS ONE picks up the morning paper today one unconsciously glances over the headlines for the latest news regarding strikes and to learn who is the next to announce that he will join the procession. To many it is merely a matter of curiosity, and they think little of the principles involved, unless they chance to come in personal contact with the results of the strike.

What difference does it make to the average reader in Kansas City whether the steel-works men strike or stay at work? It may be a long time before he feels any of the effects of such a strike, but he will feel them sooner or later, and learn that he has a vital interest in this and every other strike. In the same way, the miner may not at first see much connection between a strike in Pittsburgh and his work in the Anaconda copper mine, but there is, nevertheless, a very close connection.

A strike that calls out 2,000,000 men, or only a fraction of that number, from such an important industry as the manufacture of steel, is sure to affect that industry seriously, but the disorganization cannot stop within the plants that convert iron into steel. The closing of steel mills means less demand for pig iron, fuel, fluxes, and ore. It means the tying up of ships and the sidetracking of empty freight trains. It means the slowing down of iron-ore production and less money coming into the producing communities. A cessation of steel production means that the brakes must be set upon those industries into which steel enters as a principal or important element. What building or manufacturing industry is there which does not require steel in some form? The dynamo, the motor, and the trolley all call for iron and steel. The slowing up of such industries hits the copper market, and the Anaconda miner will then realize how a serious strike at Pittsburgh may touch his peace and happiness.

The miner is not in a class that is independent of other industries. He is more or less dependent upon every industry that influences the life of the community. He is more dependent upon the orderly progress of industry than is any capitalist, and he has more power than any capitalist to put a curb on strikes, although he has seldom used it. Some workmen realize the interdependence of industries: that some cannot go on while others stand still. With the realization of this fact the sentiment against strikes will grow.

For example, when a steel strike is proposed, there may be expressions of sympathy for the object of the strike, but there will be also a protest from those whose labor is to transport and use the steel. There will be a protest from miners of ore, fuel, and flux. The protest will come from so many directions and from so many labor organizations that leaders will hear and heed those protests. We have faith in the belief that the miners will not be the last to raise their voices in the discouragement of all industrial strikes.

The Dawn of Sanity

THE age of lunacy that had its inception when Germany invaded Belgium has revealed how many there are of our fellow men that ought at least to be sent to the psychopathic ward of the nearest hospital for prolonged observation. The question of sanity is perhaps after all, a relative one. In the case of Germany it seemed as if the entire nation had lost the function of reasoning. There is no doubt that the Bolsheviks are either criminal or crazy.

But as the wave of unreason has swelled higher and higher, first in one country and then in another, at last sweeping over even our own country, the dawn of sanity seems at last breaking—and in the country where society first ran amuck. This is the case if a recent dispatch in the *New York Times* is to be believed. The German workman is undergoing a great change of attitude toward economic questions. Many now favor a reduction in the cost of living rather than higher wages and are advocating a ten-hour day, as against one of eight hours, as the only means of increasing production and easing the present hard conditions of living. Surely this is cheering news to us—to some of us at least. Even as socialism and perhaps bolshevism came out of Germany, let us hope that this new-old thought will overwhelm the world.

Mexico

THE *Journal* has been accused of following the lead of "the yellow daily press and agitating for intervention by the United States in Mexico," and it is further suggested that we would do better to cling to technical matters and leave politics alone.

As to "following the lead" of any press, yellow or otherwise, we plead not guilty. We have our own sources of information and endeavor to make accurate statements relative to conditions on the other side of the Rio Grande, whether that information leads to the conclusion that Mexico is capable of solving her own problems, or to the conclusion that it would be better for Mexicans and all other peoples that some one should lend her a helping hand. Many of our readers have concluded that we advocate military intervention because the elimination of conditions to which we have called attention seems possible in no other way.

As to eschewing politics and clinging to technical matters, it is quite difficult to draw the line as to what are and what are not political questions. It has been said that anything in which a large number of people are interested, or in which a small group of the public is interested, is a political matter.

If we should eliminate from our columns matter in which many are interested and devote them entirely to a discussion of technical subjects in which only specialists are concerned, we should fail in the fulfillment of

our objective. This is our excuse for frequent reference to Mexico—if, indeed, such is needed.

We have no enmity toward Mexico or the vast majority of Mexicans. We do not covet her riches or her undeveloped resources. We have but one desire—peace and happiness for the Mexican people. When this is an accomplished fact there will be no question of protecting the lives and property of foreigners. The latter will be as secure as the former, and no one can ask for more. If political and industrial conditions in Mexico are adjusted in the interest of her own citizens, her difficulties with respect to foreigners will begin to take care of themselves.

Mexico is potentially one of the richest countries in the world. It has every climate, from tropical to north temperate. The fertility of its soil is unsurpassed, and its backbone is a range of mountains stored with base and precious metals. We desire to see the potential become actual.

In recent years no ruler of Mexico has taken the presidential chair who has had the resources or following that would enable him to establish a government giving ample guarantee of law and order. For this reason only those industries that can stand a heavy tax have been able to do business at all. Among these the mining of gold and silver has continued at some points and the production of oil has increased. Other industries have led a precarious existence or have been entirely stifled.

The present incumbent is by no means lacking in ability, and he knows full well that present conditions cannot continue indefinitely. He also knows that the amount of taxes now collected is very large, but that it does not go toward the liquidation of indebtedness. By far the greater part goes to the support of a military organization upon which he cannot depend. It costs him more to maintain this organization than it does to fight.

Perhaps at times we have taken too gloomy a view of the Mexican situation. We would be glad to see some bright spots in it, and if those who are living on the further side of the Rio Grande will only call our attention to those things that go to make the high lights, we will be glad to give them prominence in the pictures we draw of Mexican conditions.

Wanted: Steel,

Copper, and Coal

FOOD is not the only thing for which Europe is calling; her need for the product of our mines is as great as that for the products of our soil. Her demands for the output of the mines may not be as great as the latter, but the need is there, and the only reason she is not insisting upon their more extensive shipment is the fact that she has but limited means of paying for them. There is no need for the cultivation of a foreign market. It already exists. It is a seller's market, and there will be no haggling over prices, if only some means of paying can be found. This matter is primarily a banker's problem, but producers and operators are vitally interested in seeing that it is solved intelligently and quickly.

Though the United States is pre-eminently fitted to supply foreign markets with steel, copper, and coal there are many other products of mines and smelters equally favored with an unsatisfied demand from abroad.

Although the market exists, ships will not carry our products to it unless they can return with one of three things: products of those countries, coin, or promises to pay. Except to a limited extent, the countries needing our metals are not yet producing; they cannot pay in produce. They have some gold, but they need that at home more than we need it here. The main thing they have with which to barter are their promises to pay, and the immediate question is, What shall be the form of these promises? What form shall they take to be serviceable to those who can furnish the desired products, but must have cash with which to conduct business?

It is not a matter of short-time credits such as Germany and England have used in the past to encourage foreign commerce; these our banks could furnish. The promises to pay that must now be given may mature years hence. Our producers and their bankers cannot carry such a load.

These credits must be established by the American people as a whole—not the Government of the United States but the people themselves—those who bought Liberty bonds, savings banks, life-insurance companies, the miner, the laborer, the banker, the poor and the rich. Savings from all sources must go into foreign loans just as they went into Liberty bonds.

While the war was in progress a fifth of our people loaned money to the Government, which promptly turned \$10,000,000,000 over to our allies, that they might spend it in this country. The money was spent, and it was in this way that we managed to keep ships passing to the other side loaded with millions of dollars' worth of material, the fleets returning in ballast or only lightly laden.

Our post-war financial problem has changed but little. The demand for goods is not quite so urgent. The Government must pass over to its people the risks and opportunities of peaceful trading. We must take the bonds or promises of foreign countries or foreign firms without the guarantee of our own Government coming in between, and we must do this not for the benefit of foreigners but for our own good and convenience.

We have the means; we are the wealthiest people in the world—not boastfully, but in fact—but we need to be educated to the necessity and opportunity that lies before us; otherwise this potential market will not become a reality. This is not a political problem; it is not a moral obligation that should be fulfilled. It is purely a commercial proposition, but one in which we are all interested, whether we have nothing or have much to do with commerce.

The task that lies before us is hard, but not too great for a nation that has done what we have done during the last two years. The marketing and purchase of foreign securities in the United States is something new to our people, and yet it can be done. In the \$10,000,000,000 that we have loaned Europe we have done this very thing, only that the United States guarantees payment of interest and principle. Now it is the part of investment bankers and those directly interested in production and export to show the investing public the advantage of foreign investments and virtually to guarantee their safety.

Already substantial loans have been made abroad, but they are small as compared with the needs of the various Allied powers, and our public has not yet been asked to participate in the purchase of the securities

corresponding to these loans. The investment trust seems to be the most practical agent for handling this business. Such a trust may investigate and loan to many branches of industry in large or small amounts, issuing its own securities with credit based upon all of the promises to pay. In this way the risk to the purchaser is reduced to a minimum and the premium paid by the borrower is as low as possible.

If at times the inquiries from abroad for the product of our mines seem light, it may be well for the producer or trader to ask himself a question: What am I doing to stimulate the market in the United States for foreign securities? As that market varies, so will foreign trade, and as foreign trade varies, so will domestic mineral production.

Sad Plight of the College Instructor

THE successful practice of the engineering profession in all its various branches rests upon the technical education of its members. Administrators may be born, and reach eminence in the management of engineering enterprises without the aid of college diplomas, but the engineering details are worked out only by those who have passed through schools of both theory and practice. Schools of theory have for years depended for their success upon the untiring devotion of a class of men who seldom attain eminence outside of their particular sphere of teaching.

If the world owes every man a living, as socialistic doctrine claims, it certainly owes it to the educators who have the responsibility of training our youth. It is an unpleasant truth that no class of workers receives less public attention, less credit, and less compensation for services rendered to humanity than college instructors and professors. This has been serious in the past, and lack of adequate compensation has forced many an able instructor to abandon that work for which he was temperamentally fitted, and has compelled him to enter the field of professional practice in order that he might support a growing family. Bad as this state of affairs has been in the past, it is far worse now, and the plight of many of our most efficient college men is serious.

The importance of engineering education to public welfare is so fundamental and far reaching that its neglect is more than serious—it is a calamity; and yet our thoughtless and unappreciative public is guilty of this very neglect today. Though the public, the mass of the people, receives the benefit from the practice of the engineering profession, few have a clear conception of the extent to which life and happiness depend upon its practice, and fewer realize the necessity of adequately supporting the source from which an engineer's usefulness is derived.

Within the last few months the American people have shown that they have some appreciation of the work of the public-school teachers, and have generously come to their support, but the instructors in the institutions of higher learning have been overlooked. This is not the fault of the boards of control, for the men composing these bodies know the conditions and would rectify them if they could. The colleges simply lack funds. They cannot pay their instructors the wages of longshoremen. Instructors must suffer or abandon their professions.

Although every college in the country appreciates the disadvantages under which its staff labors, Harvard, one of the richest institutions of learning, has been among the first to undertake a campaign to rectify the evil of an underpaid faculty. During the first week in October Harvard graduates will undertake an intensive drive for \$11,000,000 or more, for an unrestricted endowment fund for the university. Harvard is only one of many institutions where the instructors in engineering have received only about one-third of the compensation of competent locomotive engineers. We would not belittle the responsibility of the latter, but we would like to see the material appreciation of the former magnified to its proper proportions.

All engineers know the importance of keeping in our colleges able teachers of those subjects in which they have specialized, and it is now clearly the engineer's duty to put his shoulders to the wheel, and assist in every possible way in maintaining the standards of education that have been established. It will be a labor without compensation other than the knowledge of having done something worth while. We have faith that they will respond.

The Need for Propaganda Among the Uneducated

THAT education is one of the best solutions of the present industrial unrest is nowhere better proved than in the strike of the steel workers. Reports indicate that most of the native-born Americans were inclined to stick to their jobs and that the groups of strikers and trouble-makers were almost 100 per cent foreign. Although the American laborer has not enjoyed a liberal education by any means, he has had many more opportunities in this direction than the immigrant. The agitator finds his most fertile field to sow the seeds of industrial discontent in the uneducated masses from southeastern Europe, and the Bolsheviks thrive in darkest Russia. These people cannot see beyond their own noses, and fall easy victims to any one who will make the most extravagant promises regarding wages and hours of work. Under the present conditions, labor cannot harm itself more than to cut down production, and thus raise the cost of living, by striking. There are signs that the labor unions are waking up to this fact.

It is unfortunate for the country that more propaganda is not being circulated among the uneducated classes in an effort to bring before them some of the elementary principles on which the social order is founded. To say that the mill worker reads and hears one hundred reasons why he should try to get more pay or work shorter hours to one argument that he should produce as much as possible for the good of himself and the nation is hardly an exaggeration. Why cannot we have a little more Federal and state educational propaganda among the men who are now obliged to listen to the agitator or nobody? The speakers required must not be of the "high-brow" type; they must be taken from the ranks of the better class of workers, and their messages must be delivered in the halls which are frequented by the classes they wish to reach. Their bulletins must be printed in languages which can be read. How much progressive Americanism and sound economics are being printed in our country in the Slavic languages today?

Possibilities of the Oil-Shale Industry

Probable Extent of the Business Shown—Differences Between American and Foreign Practice—
Relative Value of Oils and Byproducts—Commercial Methods of Retorting
Already Developed—Refining Not Difficult

BY H. M. ROESCHLAUB
Petroleum Engineer, Denver, Col.

THAT the manufacture of oil from oil shale is destined to become one of the greatest industries in the United States is now a matter beyond dispute. The dominant position of oil in the industrial world today is a matter of common knowledge. The economic life of the country demands that this production be not only maintained, but actually greatly increased; also, considerable apprehension is now being felt in high sources as to the outlook from drilling operations.

In the latter part of May, 1919, an exceedingly pessimistic report by the U. S. Bureau of Mines was

passing almost entirely into the political and economic control of foreign governments; that the United States is thus likely to pass from the position of dominance into a position of dependence, and that in 1918 the United States imported 39,000,000 bbl. of oil, in addition to using from our reserve stock about 27,000,000 barrels.

It is estimated that the demand on the oil industry will reach about 800,000,000 bbl. per annum by 1927 and that all known and probably all underground reserves will become entirely exhausted by 1928. It is therefore apparent that some other source of oil must

LEDGE OF PAPER SHALES LYING NEAR TOP OF MOUNTAIN

transmitted to the House Committee on Appropriations through Secretary Glass of the Treasury Department. This report states, in part, the actual conditions which cause the present apprehension pertaining to the oil situation, and sets forth the facts that the underground reserves of the United States are 40 per cent exhausted, and that domestic production from drilling is probably near the peak stage; that the consumption of petroleum is increasing far more rapidly than the domestic production; that the oil contained in the vast reserves of oil shale is not yet available; that petroleum has become the fundamental basis of the industrial and military life of the nation; that gasoline has become the motive power for approximately 6,000,000 automobiles and trucks, for airplanes, farm tractors, motor boats, and numerous other industrial purposes; that fuel oil has become necessary for our navy, our merchant marine, and larger industrial plants; that the potential supplies of crude oil outside of the United States are rapidly

be found and that immediate preparations must be made for its development in order to supplement the present source. That the oil shales in the several Western states will constitute this new source is recognized by both Government officials and petroleum experts; in fact, these shales are considered of such potential value that the Government has reserved a total of over 132,000 acres, of which 45,440 acres are in Colorado and 86,584 acres are in Utah, as a naval oil reserve.

SCOTCH SHALES

Considerable publicity has been given the oil-shale industry, during the last year, setting forth operations abroad and the enormous industrial possibilities in the United States. Scotland appears to be the foremost country in this industry at this time. There, oil and several valuable byproducts have been obtained from shales for over seventy years, during which time the industry has been paying enticing dividends, in spite of

the comparatively high mining costs and slow processes of eduction. Scotch shales produce an average of around 25 gal. of oil per ton, together with a considerable quantity of ammonium sulphate, 50 to 60 lb. per ton, by far the greater portion of which is exported, principally to the United States and Japan, where it is used in commercial fertilizer.

UNITED STATES SHALES

In Colorado, Utah, Wyoming and Nevada there are enormous bodies of oil-producing shales, which will give, upon distillation, from two to three times the oil per ton that is obtained from Scotch or other shales abroad, together with a marketable amount of ammonium sulphate. They will not, however, produce as much ammonium as do the foreign shales; but it is estimated that the commercial shales in these four states will produce many times the oil that has been and will be obtained from oil sands within the United States.

OIL CONTENTS AND VALUE

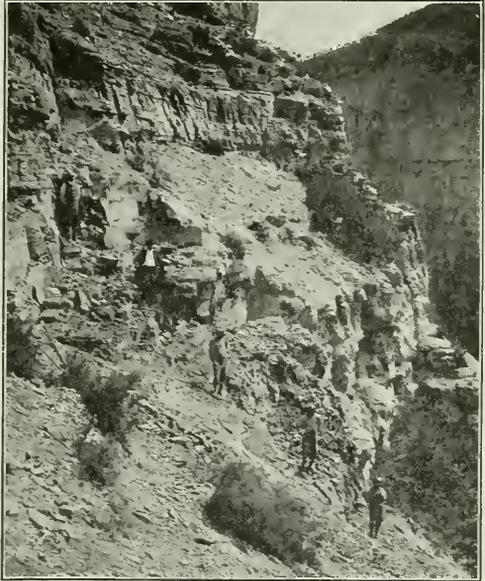

Though the U. S. Geological Survey states that the oil-bearing stratum in Colorado averages 1,500 ft. thick, it is not reasonable to assume, of course, that this entire area is commercial shale. The strata of commercial shales—that is, shales capable of producing around one barrel of oil per ton—have been variously estimated to range from thirty feet up to several hundred feet in thickness, but a safe estimate would be fifty feet. This would mean that each acre contains 110,000 tons of commercial shales, capable of producing that many barrels of oil upon proper distillation.

PHYSICAL CONDITIONS

These shales lie in high mountains rising for many hundreds of feet above the surrounding country. A considerable shale area is accessible by well-built roads, and the country contains, readily available, all the necessary timber and water for operating purposes. It must be taken into consideration, however, that by far the larger portion of this vast area is not now accessible. This section contains numerous deep canyons, from the sides of which the shale can be readily distinguished, but many of these canyons have no outlet by which a shipping point can be reasonably reached, and the shales cannot, therefore, be considered of commercial value at this time. There are, however, several main streams well back into the shale area which make available for immediate operation sufficient commercial shale to meet all operating requirements for some years. The same conditions exist in Utah, Wyoming, and Nevada, so that it can be readily understood that no apprehension need be felt regarding the insufficiency of commercial shale. Practically all of the accessible shale lands, however, have been acquired by right of location and are now held by individuals and companies as vested rights. No shale land of commercial value is now available for further location in so far as my investigations have disclosed.

The location of the shales above the valleys will make the mining and transportation to the retorting plants economical and workable on a large scale, with a smaller outlay for equipment than is required abroad. Another advantage is that, the shale beds being exposed, the tonnage and oil content of any given area can readily and quickly be ascertained at a nominal cost, something after the manner of computing the contents of a large timber tract, which condition permits the placing of the reduction plants at the most advantageous points.

Though Utah has a larger area than Colorado, it appears that the strata in Colorado are larger (they lie in blanket or flat formations), and carry a better average oil content. Wyoming also has a larger area than either Colorado or Utah, but the strata there are much smaller and carry less oil content than either Colorado or Utah. Nevada also has commercial shales, in a more limited area than either of the states mentioned, but they are rich in places and in good workable veins. The Nevada shales also carry some phosphates, which is not a commercial content of the Colorado or Utah shales. In both Colorado and Utah gilsonite is also found in the shale fields, together with a brown formation much like gilsonite, which should be of considerable commercial value. There are at a number of points small veins of elaterite, but in most instances too small to receive attention from a commercial standpoint.

TYPICAL FORMATION OF COLORADO OIL SHALES

These shales, known as the Green River Formation, contain no liquid oil, and are, therefore, not susceptible to evaporation, nor is the oil capable of being educed by the use of solvents. What they do contain is an unfinished hydrocarbon, which requires the application of heat in a manner permitting the eduction process to be carried out. This is chemically termed destructive distillation, and is not a complicated process, but is one that can be accomplished in a number of different ways.

DESTRUCTIVE DISTILLATION

The fundamental principles to be taken into consideration in successful distillation (retorting) of oil shales are that when the hydrocarbon shales are heated, the oil is expelled from them as a boiling liquid; that the heat must be maintained at the proper temperature to vaporize this liquid for removal from the retort; that the normal temperature of these oil vapors is 305 deg. to 310 deg. F., and if they are allowed to remain in the retorting chamber after volatilization, and their tempera-

ture be raised in an appreciable degree, they will be converted into a permanent or fixed gas which could not be condensed and therefore would cause a loss of oil. The amount of the oil vapors thus converted into a permanent or fixed gas will be governed almost entirely by the style of retort used and the length of time required for the removal, at their normal temperature, of these oil vapors into a cooler atmosphere. At all times the distillation should be carried on at the lowest temperature consistent with the complete eduction of the oil and its conversion into vapor, and in this manner the maximum amount of oil will be obtained and the minimum amount of permanent gas. Though a certain amount of permanent gas will inevitably be produced, any excess over the minimum will necessarily be at the expense of oil recovery.

There is no question that the oil from some shales can be educed at a lower temperature than others, though some of the shales may require a longer exposure to the heat. These factors must be carefully taken into consideration and determined regarding the specific shales to be handled. The first eduction stages will be reached at a temperature of around 150 deg. F., and this should be gradually increased until a maximum temperature of approximately 700 deg. F. is attained, at which point practically all of the oil will have been educed, with the possible exception of a small part of the heavier and less valuable constituents, which may require a higher temperature for vaporization to remove from the retort. Their value, however, hardly justifies the time and extra heat necessary for their recovery. The lower the temperature at which the oils can be educed and vaporized, the better the grade of crude that will be obtained, and a consequent larger proportional recovery of gasoline will result.

The operating conditions abroad and in this country will differ in several material ways. Abroad there is a nearby market for all the permanent gas produced, it being used for domestic purposes, a condition which will not exist in American shale areas. There, a fuel is used for retorting purposes which is entirely foreign to the shale; and mining is done mostly by hand-drilling, and a considerable per-ton expense is entailed in bringing the shales from the beds underground to the retorting plants. Scotch and other foreign shales are in comparatively small strata and irregular in formation, which creates a high operating expense chargeable to each ton of shale retorted.

In this country practically the reverse of the conditions noted will prevail. The gas produced will probably be in excess of the amount required for retorting purposes, with no available market. The mining will be done with machine drills, either electric or compressed air. American shale beds lie well up in the mountains, permitting the use of gravity in delivering the shale to the retorting plants; and the shales here are found in much larger strata, permitting a cheaper breakage of the shale. And though the wages in this country are undoubtedly more than they are abroad, the conditions here will probably result in a cheaper per-ton cost.

In Scotland and elsewhere abroad the primary objects of operations differ from those which will prevail in this country. The industry has been carried on there primarily for the recovery of the ammonium sulphate, with the permanent gas the secondary objective, and the oil recovery has always been merely of subordinate consideration.

It is apparent that a retort in which the shales enter at their normal temperature in a continuous stream, and while being passed along are continually stirred (to prevent fusing) and are from time to time brought in direct contact with the heated walls of the retort, with gradually increasing heat until they have reached the final eduction temperature desired, when they are ejected, would constitute the most economical method of distillation. A matter which must be taken into consideration is the fact that if the shales of the United States are allowed to lie dormant in the retort during the eduction period, they have a tendency to become fused or matted, and are therefore difficult to remove. In several experiments along this line it has become necessary to blast the spent shales from the retort. They must be kept moving at all stages of the eduction period to achieve satisfactory results.

What is required in this country is a simple retort which can be economically and easily constructed, giving a reasonable tonnage per day, designed primarily for the recovery of the oil and embodying none of the complications, either in construction or operation, of a retort of which the principal function is the recovery of byproducts. Such a retort will obtain a certain percentage of the attendant byproducts, but not the maximum, and will undoubtedly be found to be the most profitable system of operation on American shales. If it should be desirable to obtain the maximum of ammonium sulphate, it would be more feasible to construct a retorting plant along special lines to handle the shales primarily for this purpose, but such a retort would be much more complicated, both in construction and operation, and also more costly than one built for oil recovery as its principal objective.

PERMANENT GAS

Western American shales, when heated to a temperature ranging up to 700 deg. F., will ordinarily produce from 2,500 to 3,500 cu.ft. of permanent or fixed gas per ton, in addition to the oil vapors. This could be materially increased by raising the temperature of the vapors, but at the expense of oil. This gas contains approximately 450 B.t.u. per cu.ft. It will require from 350,000 to 500,000 B.t.u. to retort one ton of shale under ordinary conditions, depending to a large extent on the style of retort and efficiency of the heating arrangement. If only 50 per cent efficiency is obtained, it will require from 1,400 to 2,200 cu.ft. of gas per ton of shale to produce the requisite heat for eduction purposes for the recovery of the oil, assuming the maximum temperature at 700 deg. F., and it would, therefore, appear that there will be ample gas for retorting requirements, with a sufficient excess to generate the necessary steam power for all operating purposes. Should the production of permanent gas be found not sufficient, however, the shale itself can be readily used for heat generation, and will be found a cheap fuel, although special arrangements will be required for its use.

One of the peculiar features of the permanent gas production is the fact that the lower-grade shales, those producing from 10 to 20 gal. of oil per ton, will produce appreciably more gas than is obtained from the richer shales, although it does not appear that the very rich shales, those producing around 100 gal. of oil per ton, vary to any great extent in the amount of permanent gas produced from those shales yielding around 40 to 50 gal. of oil per ton. The lower-grade shales also appear to burn as readily, and apparently produce as

much heat, if not more, than the higher-grade shales, when burned under proper conditions.

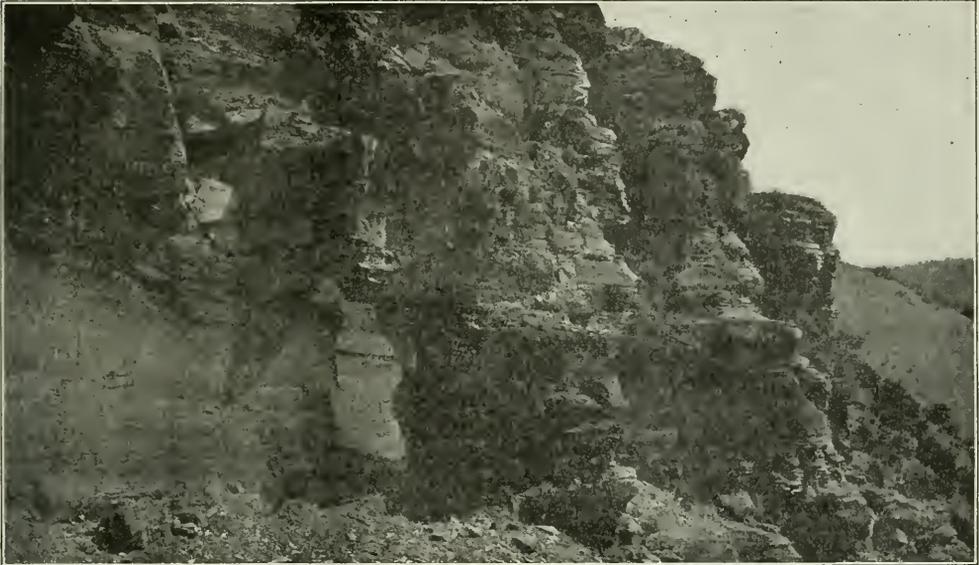

Mining will not be found to be a complex problem. It has been suggested many times that oil shales can be mined by steam shovel or open-cut methods, but though there may be a few isolated localities in which these methods would prove practicable, the principal processes of obtaining the shales for retorting purposes will be somewhat in the manner of coal mining with the room and panel systems, or by stoping, as is done in metal mining. The shales will be found in wider strata than is customary either in coal or metal mining, and the mining can therefore probably be done more cheaply.

Western American shales lie in flat or blanket formation, and where compressed air or electric drills are

slow for practical work, that ball mills would not do at all, and that there are a number of other crushing machines which are not adaptable to oil shales. There are, however, several mills which give the desired results. These are embraced in the rotary-hammer type, or the pan mills, of which there are a number of types from which to make a selection. It may be necessary, in order to increase the capacity of the crusher proper, to first pass the shales through a jaw crusher, thereby reducing the pieces from man-size to several inches before passing to the fine crusher.

BYPRODUCTS

The question of byproducts to be obtained from the oil recovered from the shales, as well as the spent shales themselves, is a much mooted subject. A number

MASSIVE SHALES IN COLORADO

used, some difficulty may be encountered with seams if straight drifting on the veins is undertaken, more especially on what are termed the paper shales. It will, therefore, be found more advantageous to drill the veins at an angle, which will also give a better breaking effect from the powder.

At almost any point in the shale area, veins of from six to twenty feet in thickness, carrying a commercial oil content, can be found. These can be economically worked by running in either on the bottom or immediately below the vein and removing the vein matter by means of inclined stopes. The drilling can be done at an angle across the vein, and the shale can be broken into a loading chute, from which it can be drawn into cars for tramping to the crushers, without hand shoveling, thereby greatly reducing the cost of this operation.

CRUSHING

During the early stages of the investigations, the question of crushing caused considerable apprehension, on account of the pliability and lack of fracturing qualities of the shales. It was found that rolls were too

of statements have been made as to the great number of byproducts to be obtained. Probably most of them came direct from an encyclopedia. Although there appears to be no question as to the practicability of obtaining several valuable byproducts, such as ammonium sulphate and fertilizer, the facts must be taken into consideration that different temperatures and methods of conducting the shales through the retorts will not only produce varied byproducts, but varied characters of the same byproducts, and it would therefore be folly to attempt to make any statement even approximating accuracy with respect to them. There is no question that a number of byproducts can be and have been found, in laboratory work, but the industry has not progressed sufficiently to justify the assumption that any number of them can be obtained commercially.

Though the more valuable oils are recovered from the shales at temperatures ranging up to 700 deg. F. and as rapidly as this temperature can be reached and maintained, ammonium sulphate, probably about 10 lb. per ton, will also be recovered. However, to obtain the maximum amount of this product, it will not only be

necessary to construct an entirely different style retort than one primarily for oil recovery, but the temperature must be carried to a minimum of 1,300 deg. F., and possibly as high as 1,600 or 1,800 deg. F., together with the injection into the retort of super-heated steam, to convert all the nitrates into ammonium sulphate. In order to accomplish this it is necessary to free the shale of all carbon, which requires an intense heat. The process is, therefore, much more complicated than the simple recovery of oil. It is questionable whether the price and marketability of this product would justify the necessary expenditure for the special retorts and additional operating costs necessary for its recovery in maximum amounts. The life of a retort used for this purpose would also be materially shortened.

FLOTATION

The matter of using the residue shale oil, i. e., that remaining after removal of the gasoline and lighter lubricants, has been seriously considered, and the fact that several well-known engineers give it their unqualified endorsement as a flotation oil speaks well for its future use in this field. It must be remembered, however, that the demand is limited, only about 500,000 bbl. now being used per year. When many companies are producing shale oil, and trying to dispose of their residue oil for flotation purposes, the market will probably be flooded. Undoubtedly, however, the entire supply could be used for this purpose for several years, during which time other industrial uses can probably be discovered.

FERTILIZER

One of the promising fields for byproducts at present appears to be the utilization of the spent shales for fertilization purposes, as they contain from 0.5 to 6 per cent of nitrates and small amounts of potash and phosphoric acid. If this can be worked out on a commercial scale, considerable additional revenue should be derived from this source.

PRECIOUS METALS

Analyses of the spent shales from the Colorado area are said to have shown recoverable gold, silver, and platinum, but these mineral values undoubtedly came from a very small area, as the general formation and nature of the shale bedding would not indicate that these metals could be found in commercial quantities, and they should not at this time be given serious consideration.

REFINING

Though crude shale oil may differ somewhat from the crude produced from oil sands, and probably will require a slight deviation from present refining methods, the refining should not be a complex problem. When the methods are once determined, the refining of shale oil will be as readily accomplished as that of ordinary crude oil.

The expenditure necessary for refining shale crude and the construction of refineries for that purpose will not differ materially from ordinary refining, and such expenditure will be based entirely upon the finished products into which the crude oil will be manufactured. Should it be found practicable to work the residue oil into a flotation oil by merely removing the gasoline and lighter lubricating oils, both construction and operating expenses will be comparatively small, but if it be desired to obtain the paraffin and heavy oils and

greases, a larger expenditure, both for construction and operation, will be required.

Shale-oil gasoline and lubricants are at least equal in every way to those products obtained from the oil sands. The shale oil should, and in most instances probably will, crack into around 50 per cent gasoline, of a quality equal to that of the commercial gasoline now obtainable.

AMERICAN METHODS

As already stated, the process of treating the shale is simple destructive distillation, and the efforts of American engineers so far have been devoted for the most part to mechanical efficiency. This involves the handling of the shales through the retort in a continuous and automatic manner; keeping them moving at all times to prevent fusing; bringing them intermittently into contact with the walls of the retort for the required heating; immediate removal of the oil vapors from the interior of the retort without raising their temperature; reasonable running capacity commensurate with installation costs; as nearly perfect heat efficiency and control as possible; the continuous and automatic ejection of the spent shales from the retort, and, finally, a reasonable installation cost and minimum operating expense.

Several purely American methods are now available which incorporate these mechanical requirements to such a degree as to justify the installation of retorting plants. Several of them have been tested on a sufficiently large scale to prove their efficiency for commercial operation.

I wish, however, to put forth a word of caution, as several of the American methods which have been tested have been found inadequate or imperfect. Great care should govern the selection of the method to be used, as an error in this particular will cause considerable delay and additional expense.

The recovery of contained products from American shales is purely a mining and manufacturing industry, with vast quantities of raw material readily available at a cost only of taking it, which will be comparatively small. The new shale should yield about one barrel (42 gal.) of crude oil per ton. A favorable feature is the fact that the necessary plants, both retorting and refining, can be constructed with no danger of an exhaustion of the supply of shale. When once these plants are installed, their production should be without material fluctuation for many years, possibly for several generations, and though it will require a reasonable amount of capital to embark in this industry, it is by no means such an enormous amount as to be prohibitive, nor will it be as great as many industrials require the earnings from which are much less and more speculative than the oil-shale industry.

The certainty of the production of oil on a commercial scale with an unquestionable market for the product should appeal to capital and relieve to a considerable extent the speculative features. That the time and conditions are now right for the exploitation of the Western oil shales on a large scale is a matter which appears to be beyond question.

One of the Richest Gold Pockets which has been found on the continent occurred in the Croesus Mine, in northern Ontario, where a yield of about \$85,000 per ton was obtained. Six samples of this ore, valued at \$10,000, were purchased by the Ontario government.

Geology of the Gogebic Range and Its Relation To Recent Mining Development—Part IV*

Deeper Mining Shows Greater Extension of Orebodies—Conservative Estimates State Ore Depth To Be 4,000 Ft., and Dependent on Extent of Water Circulation, Which Is Effective Agent in Altering Iron Formation to Ore

BY W. O. HOTCHKISS

State Geologist and Consulting Engineer, Madison, Wis.

THE ore deposits of the Gogebic Range may be classified either according to the mode of origin or according to their form. Based on mode of origin they are divided into (1) those originating chiefly by the leaching of silica from some part of the

form with the two greater dimensions parallel to the beds and the least dimension across the beds; and (2) those having a very long axis—sometimes two or three miles—parallel to the foot wall and dike trough in which they lie, and relatively short dimensions at right angles to the long axis. The flat tabular orebodies include the fragmental ore deposits in the Pabst member and also numerous small orebodies in the Ironwood formation.

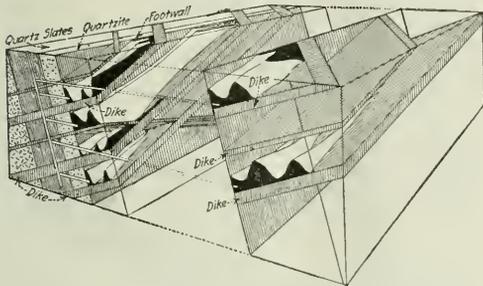

FIG. 26. BLOCK DIAGRAM SHOWING RELATION OF OREBODIES TO DIKES AND THE GREAT BEDDING FAULT

oxidized iron formation, and (2) those which owe their existence chiefly to the erosion of iron formation and the segregation of the iron oxide by this process. This last class is not important and includes only certain rich beds in the Pabst member—the so-called “fragmental ore zone”—and similar bodies found east of the Sunday Lake fault, where pre-Keweenaw erosion cut into the iron formation and worked it over, washing out much of the decomposed chert and leaving local deposits rich in iron oxide. The only case of this Keweenaw ore which I have seen is in the Sunday Lake mine.

The orebodies in the Pabst fragmental zone are usually thin and of limited extent. They give way on all sides to less well-assorted material, which makes the main mass of this member. Orebodies of this class are influenced little, if any, by dikes or faults, and are likely to be found just as wide and rich below a dike as above it.

In the first class, those derived from oxidized-iron formation by the leaching out of silica, belong all the main productive orebodies of the range. These may be derived from any part of the iron formation, as any of it may alter to ore under favorable conditions. Usually, however, these orebodies are confined to five horizons in the Ironwood formation. This is discussed in detail later under “Influence of Various Beds on Localization and Form of Ore Deposits.”

Classified according to form, the orebodies again fall into two divisions; (1) those having a flat tabular

The form and mode of occurrence of the orebodies which occur in dike and foot-wall troughs is evident from Fig. 26. For the sake of clearness, this has been drawn as though that part of the formation north of the great bedding fault were bodily shoved north to permit seeing behind it. From this figure it is apparent that the orebodies follow down the pitching troughs, and that an orebody found at the surface in one place may be found at great depth in an adjacent property. These orebodies may be described as great inclined spindles. In many cases they taper off at each end and are largest in the middle. Some of them extend from the surface to the greatest depths that mining has penetrated them. Others are entirely underground and do not appear at the surface. One of these last is a Puritan orebody shown in Fig. 27. A general idea of the vertical cross-section and vertical longitudinal projection of such an orebody is given in Figs. 28 and 29. From these figures it is seen that

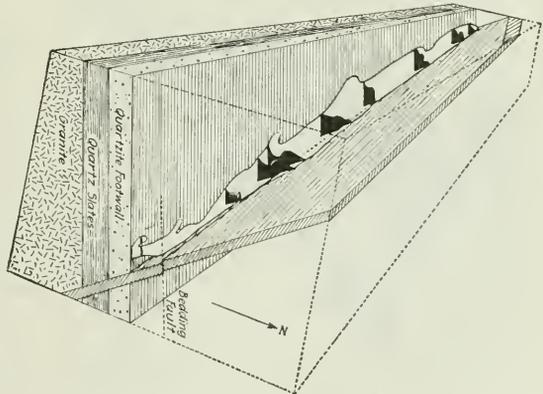

FIG. 27. BLOCK DIAGRAM SHOWING FORM AND MODE OF OCCURRENCE OF AN OREBODY IN THE PURITAN MINE. The top of this diagram is deep below the surface. The orebody pinches out at both ends

the longest dimension in the cross-section is usually parallel to the foot wall.

The depth to which these orebodies go is not known. Mining has extended to a depth 2,500 ft. vertically

*Parts I, II, and III were published in issues of the *Journal* of Sept. 13, Sept. 20, and Sept. 27, 1919, respectively.

from the surface, and nothing has been found to indicate the stoppage of conditions favorable to the development of orebodies. In fact, it is the general history of the range that the deeper that mining has gone the larger have been the orebodies. Predictions as to the ultimate depth at which ore will be found are worth little. It is conservative, however, to estimate that ore will extend at least to a depth of 4,000 ft.,

Fig. 28

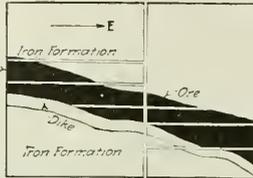

Fig. 29

FIG. 28. CROSS-SECTION SHOWING RELATION OF A TROUGH OREBODY TO FOOT WALL AND DIKE

FIG. 29. LONGITUDINAL SECTION OF PART OF A TROUGH OREBODY, SHOWING RELATION TO DIKE

and it will be surprising if it does not go considerably deeper.

The form of the orebodies and the depth to which they extend depend upon the depth to which vigorous water circulation has extended. The structural factors controlling water circulation were discussed under "Alteration of the Iron Formation," and there listed as foot walls, dikes, faults, physical condition of beds—porosity—and folds.

One additional factor enters to control the depth to which the formation has been altered to ore, that of the slowing up of the water circulation by depth.

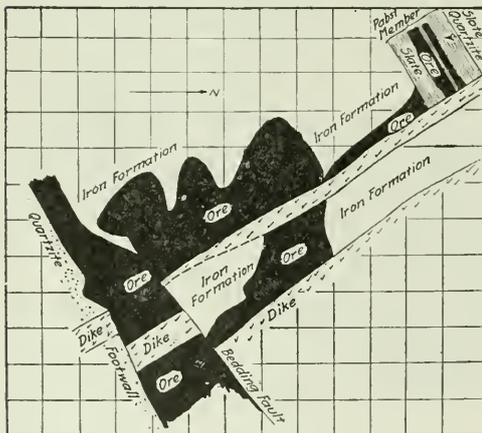

FIG. 30. CROSS-SECTION OF AN OREBODY EXTENDING FROM FOOT TO HANGING IN THE AURORA MINE

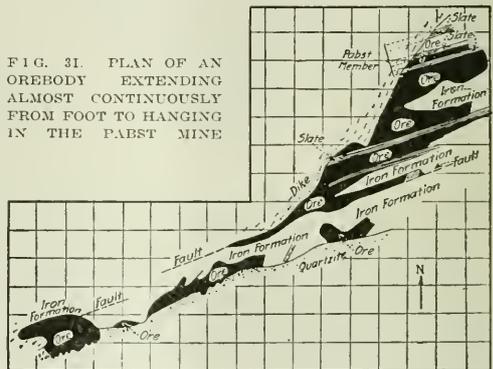

The first five factors undoubtedly continue to vastly greater depths than profitable mining can go. The effect of the last can be told only as deeper exploration discloses the facts. The slowing up of the water circulation should not be considered on the basis of present relief of the surface and present climate, but rather on the relief and climate of the geologic times,

just after the beds were tilted to their present positions. Then the relief was greater and the water circulation more vigorous, on account of the greater hydrostatic head. The climate of those times was also much more arid than at present, and the water table consequently relatively lower, so that more of the formation was doubtless above the permanent level of the ground water and subject to the action of an abundance of oxygen.

INFLUENCE OF VARIOUS BEDS ON LOCALIZATION AND FORM OF ORE DEPOSITS

The porous or impervious nature of the iron formation, and the amount of the iron oxide originally present, are facts which relate themselves to particular beds and structural conditions. Some beds are relatively very porous and permit ready circulation of water. Others are tight and impervious, and the circulation of water is relatively impeded. Some beds contained much iron originally, and some little. Some are porous and had much iron in them. Others are porous and contained little iron. Some are tight and

FIG. 31. PLAN OF AN OREBODY EXTENDING ALMOST CONTINUOUSLY FROM FOOT TO HANGING IN THE PABST MINE

had much iron, and others are tight and had little iron. These characteristics of the beds may be tabulated as follows:

1. Porous with high original iron content.
2. Porous with low original iron content.
3. Impervious with high original iron content.
4. Impervious with low original iron content.

In similar structural situations beds of these types are altered to ore in the order given. It must be borne in mind that any part of the iron formation is capable of alteration to ore, but it is obvious that a tight, lean bed will be the last to be so completely altered.

In the most favorable situations the whole formation from foot to hanging is altered to ore on a dike. Such an orebody is shown in Fig. 30, which shows a vertical cross-section in the Aurora mine. In plan an orebody of this sort has the appearance shown in Fig. 31, which shows part of one level in the Pabst mine. It will be noted that the "capping" of slightly leached iron formation is irregular in form. Certain beds project down between tongues of ore. From the discussion that has preceded it is obvious that the reason for this irregular form of the orebodies lies in the differing character of the beds. Those beds that are leanest and tightest project farthest

into the ore; those that are richest and most porous have altered to ore to the greatest distance above the dike.

The orebodies shown in Figs. 30 and 31 are characteristic of the largest bodies, in which the alteration of the formation has been most extensive. If one go to the opposite extreme and select the smallest orebodies that have been mined one finds that they are subject to the same conditions. Looking at Fig. 30 and imagining the pendant tongues of "capping" extended downward till they reach the dike, and so cutting the large orebody into several small isolated bodies, will give a correct picture of the way in which the smaller orebodies occur.

Alteration of the iron formation began first in the most porous beds where they were just above dikes large enough to control the water circulation. The porous beds that contained the largest percentage of iron, and so the smallest percentage of silica, were leached soonest of their silica, and were the first to be altered to ore. As this process continued, the

In the Wisconsin end of the range, where it has been most closely studied, there are four chief ore-producing beds or horizons. In the order of their past record of production, these would rank as follows in Wisconsin:

1. The basal part of the Plymouth undoubtedly has produced more ore than any other horizon. This is shown at A, Fig. 32.
2. The upper part of the Plymouth has probably produced the next largest amount of ore, as large foot-wall orebodies have always included this horizon when they became thicker. This is shown at B, Fig. 32.
3. The horizon of the great bedding fault has probably been the third most productive in Wisconsin, as practically the whole production of the Atlantic and Iron Belt mines came from this horizon. This is shown at C, Fig. 32.
4. The horizon of the top of the Norrie and base of the Pence has to date probably produced least, but it bids fair to take third if not second place in importance, as the Montreal hanging orebody lies in this horizon. This is shown at D, Fig. 32.

In Michigan, another member of the iron formation becomes of great importance, the Anvil member. It contains the new large hanging-wall orebodies of the Colby, Yale, Ironton, Anvil, and others. This is shown at E, Fig. 32. As it is a thick member, relatively porous and high in original iron content, it is practically a certainty that many other large orebodies will be discovered in it.

Further north than the orebodies of the Anvil member come those of the Pabst member of the Tyler formation. There are thus six different principal horizons at which separate orebodies are found:

1. In the lower part of the Plymouth member.
2. In the upper part of the Plymouth member.
3. In the bedding fault horizon—either in the Yale member or basal part of the Norrie.
4. Near the contact of the Norrie and Pence members.
5. In the Anvil member.
6. In the Pabst member.

Small orebodies have been found in other horizons, and as exploration extends some of these may prove to have considerable importance locally.

Unfortunately, time has not permitted sufficiently thorough study of the Michigan end of the range to identify with equal certainty the stratigraphic position of the orebodies there, but from the observations made it is clearly apparent that the orebodies occur in nearly, if not exactly, the same horizons as in Wisconsin. It is to be expected that their relative importance is not the same, and each mine should be studied carefully in relation to its own history and in relation to neighboring properties to see which horizons north of the foot wall have given the greatest amount of ore in the past and which offer the most promise for the future.

INFLUENCE OF FAULTS ON LOCALIZATION AND FORM OF ORE DEPOSITS

In the immediately preceding part, the influence of porosity and original iron content of various beds of the formation on the form and occurrence of orebodies was explained. It was illustrated with cross-sections, as these show the chief effect of these factors; and as these factors are characteristic of various

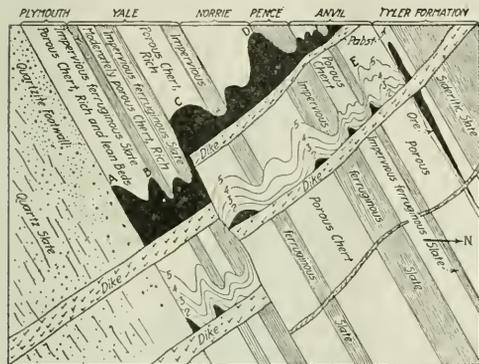

FIG. 32. CROSS-SECTION SHOWING FINAL FORM (ON UPPER DIKE) AND VARIOUS EARLIER STAGES (ON SECOND DIKE) OF AN OREBODY EXTENDING FROM FOOT TO HANGING

Black is ore

amount of material altered to ore increased, so that the orebodies grew larger and larger, until, in the most favorable situations, the leaner and tighter parts of the formation which at first separated the orebodies were finally altered to ore, and the orebody extended from foot wall to hanging, as shown in Figs. 30 and 31.

A series of cross-sections might be drawn showing this progressive enlargement of the orebodies, or it could be shown on a single section, as in Fig. 32. In this the whole thickness of the iron formation is indicated. The small black areas on the second dike down indicate the first parts of the formation to be altered to ore. The numbered lines outside this indicate outlines of the orebody in the successive stages of its development. The black area on the upper dike shows a cross-section of the final stage, that represented by line No. 5 on the second dike.

Fig. 32 shows also the various members into which the iron formation is divided. This section is not an actual section from any mine, but is a composite to illustrate the principles governing the form and occurrence of the orebodies as seen in cross-section. In any actual section the relative thickness of the various members would vary from that shown.

beds it might be expected that ore would be continuous along these favorable beds, but it is found that the ore-bodies are not continuous. They bulge and then pinch out gradually, or they come to an abrupt end against rock. Certain parts of the formation seem to be barren and entirely unleached, and even almost wholly unoxidized. In mine workings the formation above a certain dike is often found to be altered to ore, though between that dike and the next one below, possibly 200 or 300 ft., the formation may be slightly oxidized. Between the second dike and the third, still farther down, the formation may again be oxidized and leached, and contain ore. Not only are there alternate barren and productive parts in depth, but along the strike of the formation some parts are productive and some are barren.

These facts are due to the general conditions, before stated, which control the water circulation. They are not attributable to original differences in the beds, but, in large measure, result from the effects which the faults have produced in the circulation of the underground water.

Owing to the slight throw in the foot wall which many of the transverse faults show, they have not been regarded as important, and most of them have doubtless not been recognized at all. Only within the last ten years or so has the great bedding fault been generally accepted as an important factor in localizing ore deposits. These two types, the bedding fault and the transverse faults, are present everywhere along the productive part of the range, and so have been of greatest influence.

Both types of faults cut across all dikes and displace them, more or less, so that the impervious troughs made by the dikes and the foot wall are broken, and the water finds its way down the faults to deeper parts of the formation.

The transverse faults have permitted water to have ready access to certain thin, unusually porous and rich beds of the formation almost regardless of dikes, and in this way have been responsible for some if not all of the thin blanket type of orebodies along the foot wall. They also are frequent causes of "bulges" in the long "trough" orebodies. The increase in water circulation which reaches the trough where such a fault crosses it, particularly when the throw is not sufficiently great to completely separate the ends of the dike, causes greater activity in leaching of the silica. This results in an enlargement of the orebody. Cases are not uncommon where a transverse fault is followed up or down for long distances by a chimney of ore in the broken material of the shear zone.

The longitudinal fault has broken up the formation and permitted ready channels of flow for water. Where this water comes to a dike and flows along it, leaching of silica occurs, and if the process goes far enough an orebody results. The water in some instances spills over the edge of a large dike into the fault and is caught on the dike below on the foot-wall side. Orebodies of the form shown in cross-section in Fig. 33 are developed in this manner.

In addition to the effect on specific orebodies, of which the above statements are instances rather than a complete discussion, the faulting has had the more general effect of shaking up some blocks of the formation, and so making them more porous. Possibly, also, it has compressed other blocks, and so decreased their original porosity. In the movements that have taken

place in the formation, those blocks of formation lying between dikes and between transverse faults have most probably acted as units. They can be regarded as the individual gigantic stones making up a great piece of masonry. As this "masonry" was tilted and settled and sheared, the resulting stresses on the individual units would break some of them and possibly compress others; some would be made more porous and some less so. The effect of this action cannot be observed; it can only be deduced from a mechanical consideration of what must have happened when the formation was faulted. However, it serves to explain why certain blocks of the formation contain ore and others do not; why between one pair of dikes there is good ore and between the next pair there is none, and why an orebody extends a certain distance along the strike, and the same beds which carried the ore are utterly unleached a few hundred feet farther along the strike. This mechanical effect on the various blocks of the formation cannot be foretold at present. It simply

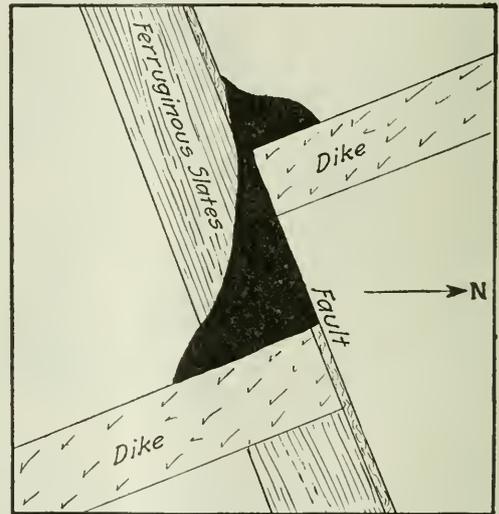

FIG. 33. CROSS-SECTION SHOWING AN OREBODY DEVELOPED ALONG THE GREAT BEDDING FAULT

aids in understanding the facts after they are discovered.

In concluding the discussion of the origin and occurrence of the ore deposits, it may be well to summarize the matter briefly. In form the orebodies are long, spindle-shaped bodies, or flat tabular bodies. They are found chiefly in six different horizons, but any part of the iron formation may alter to ore. The principal factors controlling form and localization are: First, the character of individual beds, porosity and original richness in iron; second, the structural factors, dikes, foot wall, and faults; and, third, the topography and climate of the geologic time just after the formation was tilted to its present conditions. All these controlled the water circulation, which has been the effective agent in altering the iron formation to ore.

Most of the exploration on the Gogebic Range is done by underground work, the driving of drifts and

crosscuts. Though this is the most expensive method, it is much more satisfactory than drilling, for the reason that it gives thoroughly dependable samples. Drilling is both difficult and expensive, owing to the much leached, vuggy character of the formation in the productive part of the range. The most satisfactory method of exploration is a combination of drilling and underground work.

From the preceding discussion of the occurrence and origin of ore deposits it is obvious that properly planned exploration should aim to test the best of the promising ore horizons on dikes of sufficient size to control the water circulation effectively. If the posi-

up to the dike from below or running an inclined raise parallel to the dike. It is evident from Fig. 35 that if a crosscut were run along the dike every orebody shown would be found. Furthermore, every foot of such a crosscut would be valuable exploration. It would disclose whether other horizons, in addition to those already known, were ore bearing, and it would exhibit the effect on the formation of the ore-forming, silica-leaching water, in the most favorable situation possible—where it has been concentrated on a dike. If each dike of ore-bearing size were tested by two or three such crosscuts, few orebodies of minable size would be missed.

It will be noted that in the foregoing discussion it was assumed that the position of the dike was known. If the positions of the dikes are not known—the usual case in exploration—the first problem is to locate them. For this purpose the drill is entirely satisfactory and cheapest. Holes inclined northward parallel to the formation, and drilled in pairs so that one is north of the fault and one south, are best for this purpose. Once the dikes are located it is relatively easy to plan underground work or surface drilling to crosscut the formation and explore the larger dikes at points where they intersect the horizons most favorable for finding ore. In later exploration for orebodies a single vertical or cross-cutting hole can sometimes be planned to test favorable horizons on several successive dikes.

It may seem at first thought to be an unwise expenditure to “explore for dikes,” but when it is recalled that the ore is found lying on these dikes and at six or more different horizons in the iron formation the importance of knowing just where the dikes lie is obvious. It is the first essential to successful exploration.

DIFFICULTIES OF SATISFACTORY DIAMOND DRILLING ON THE GOGEBIC

Diamond drilling for ore is likely to be very unsatisfactory on the Gogebic Range. The formation is not uniform. It is vuggy, and soft in spots, and

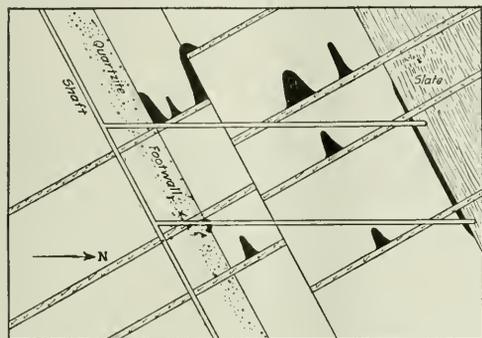

FIG. 34. CROSS-SECTION SHOWING TWO EXPLORATORY CROSSCUTS AND THE EASE WITH WHICH OREBODIES CAN BE MISSED BY PROMISCUOUS EXPLORATION EVEN WHERE OREBODIES ARE UNUSUALLY NUMEROUS

Black is ore

tions of transverse faults are known, it is best to explore in their vicinity. If the positions of dikes are known, crosscuts can be started to reach them at the desirable horizons. The usual method has been to run a crosscut straight across the formation, more or less blindly, in the hope of intersecting an orebody. If such a crosscut finds an orebody, it is purely a matter of luck. It may miss an orebody with great ease. Furthermore, it may never approach anywhere near a dike, and so be wholly wasted as effective exploration.

The way in which such a crosscut can miss ore is indicated in cross-section in Fig. 34. This figure is drawn to show orebodies in all six of the best horizons and yet show how two crosscuts can miss practically all of them. As such crosscuts are expensive, and little has heretofore been known as to real objectives for them, relatively few have been driven. The obviously necessary percentage of failure has been such as to discourage effective exploration away from the foot wall.

Fig. 35 shows the plan of the orebodies on one level with a straight crosscut, which does not explore the dike except for a small part of its extent, and that in an unproductive part of the formation. This figure also has been drawn to show orebodies in all six horizons on this one level, a case that would rarely occur, and yet it is evident that it is easy to miss all the ore north of the foot wall.

The best direction to run an exploratory crosscut is parallel to the dike. If any ore exists, it will be found. If the dike is not pitching, it can be tested by raising

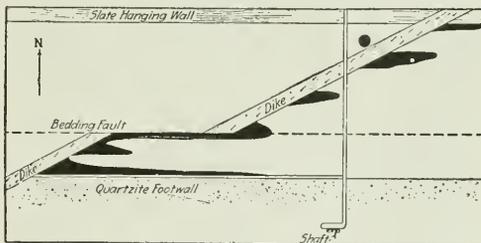

FIG. 35. PLAN SHOWING AN EXPLORATORY CROSSCUT AND THE EASE WITH WHICH OREBODIES CAN BE MISSED, EVEN WHERE UNUSUALLY NUMEROUS

Black is ore

hard and dense in others. Faults, and the broken ground associated with them, are abundant; and even though in many cases they displace the formation but a few feet, they have broken the ground. In formation of this character it is exceeding difficult to get reliable samples. The water and sample may be entirely lost in vugs or in open ground. If the hole is drilling in ore after having penetrated a soft, leached ferruginous chert, the drill rods will

wear off the decomposed chert from the sides of the hole and contaminate the sample. In more than one case that has come to my attention this contamination has been sufficient to take away any impression that an orebody had been penetrated. These are some of the difficulties of diamond drilling. There are many others, such as the necessity for carefully casing close to the bit, trouble with caving ground, reaming, cementing, and all the obstacles that occur in connection with the mechanical operation of drilling.

Notwithstanding all these difficulties, drilling is an absolutely essential method of exploration on the range. Some of them have been mentioned to bring out the difficulty of interpreting the results. Extreme care is necessary, and a full record of every fact in connection with the drilling of the hole, i. e., how many feet per day, amount of sample recovered per foot in each run, loss of water, caving, sticking bits, hardness or ease of drilling—in short, all that the drill runners learn of the nature of the ground, and all that can be obtained from careful study of the samples recovered—should be recorded. In this way often it can be correctly estimated that a 48 per cent assay from the sludge will be minable ore when a drift gets into it. In general, it may be stated that the results of drilling are likely to represent the iron content of the material penetrated as somewhat lower than it really is.

The most satisfactory method of exploration is to use the diamond drill to locate the most promising parts of the formation and then get into these by underground workings.

MANY FUTURE DISCOVERIES PROBABLE

The foot wall may be said to be fairly well explored, as deep as mining has gone in almost every property on the range in so far as these workings have extended. There are large areas, both east and west of the productive portion, that offer excellent promise for the future. Another element of great promise for the future consists of the possibility of further discoveries, (1) along the foot wall between areas that have been mined; (2) away from the foot wall; (3) in greater depth. It is my belief that exploration of the formation well away from the foot wall has only fairly started. Many large orebodies doubtless remain to be discovered north of present foot-wall workings. The success of several mines in finding in the hanging as large or larger orebodies than they ever had on the foot will lead ultimately to a thorough exploration of the whole thickness of the formation.

With unexplored foot-wall areas, greater depth, and the unexplored "hanging" part of the formation to develop, this range is reasonably sure to produce several times as much as it has in the past before final exhaustion of its high-grade ores.

The Troublesome Ruble

"I finally got through Siberia, but it was some stunt, and I certainly was glad I had no Government expense account to worry over, even with the Bureau of Mines auditor to help me," wrote H. Foster Bain, of the U. S. Bureau of Mines, from Shanghai last August. "How would I ever have made a motor car at 800 rubles for the afternoon look reasonable? But if I had not had the car, one of us never would have found a place to sleep the first night. Also, the rubles varied in

value from day to day, and there were three different kinds to worry over aside from the counterfeit. The latter was so common that no one took account of it for bills of less than 100 rubles. I bought my first rubles with yen, having bought the latter with pounds credit in London, and having no idea what the pound will be worth in New York, say in three months from now when the draft turns up. I got ninety rubles for ten yen. These proved to be Romanoff rubles, and while in the stores, restaurants, and shops they pass only at par, after spending part of them I discovered that speculators would pay 150, or 50 per cent premium, for them in exchange for Omsk rubles, which are as good as any at the eats places, so I sold what I had left. Then I bought more Omsk rubles at twenty and at eighteen per yen. Then I got more from the bank at 165 per pound—about thirty-three per dollar—(the street rate was forty-six per dollar). They paid me mainly in 500-ruble notes, and nobody would take them because of lack of change. The cashier could not or would not make change, and I narrowly escaped having to adopt the native custom, and go swimming without a bathing suit. In that case, by taking up a collection of the change in the party, including the ladies, disaster was averted. Mainly we bought change, bargaining for it like potatoes and paying from 10 to 30 per cent premium. Meanwhile, rubles continued to fall until the last day my assistant was in Harbin, when he could have obtained 140 for a real honest-to-God dollar.

"Now, with this as a background, ask the auditor how a man should charge up a meal that cost sixty rubles? Oh, yes, there is one more complication. Occasionally, we could work off a United Cigar Store coupon as part payment at some variable sum. There was an explosion, though, one night in a restaurant when Kinney had landed one on a waiter. He reasoned it must be American money, and gave it in change to an American Captain. The Captain was no sport, but went right up in the air. The waiter was firm that whatever it might be "Amerikansky," it was "ten rubles our money," and we snook before the row ended.

"There are some compensations even for trouble with rubles. Yours for peace and sound money."

Increase in Steel Corporation Orders

Unfilled orders on the books of the United States Steel Corporation, Aug 31, were 6,109,103 tons, compared with 5,578,661 tons on July 31, according to *Iron Age*. This is an increase of 530,442 tons, against an increase for July of 685,806 tons, and an increase for June of 610,545 tons. The unfilled orders a year ago were 8,750,042, or 2,649,939 tons more. The table below gives the unfilled tonnage for the Steel Corporation at the close of each month beginning with January, 1916:

UNFILLED TONNAGE OF U. S. STEEL CORPORATION

	1919	1918	1917	1916
January	6,684,268	9,477,853	11,474,054	7,922,768
February	6,010,787	9,288,453	11,376,697	8,568,96
March	5,430,572	9,056,404	11,711,644	9,331,001
April	4,800,685	8,741,882	12,185,083	9,829,558
May	4,282,310	8,337,623	11,886,591	9,937,791
June	4,892,855	8,918,866	11,383,287	9,640,450
July	5,578,661	8,883,801	10,844,164	9,593,592
August	6,109,103	8,759,042	10,407,049	9,660,537
September		8,297,905	9,833,477	9,522,584
October		8,353,293	9,009,675	10,015,260
November		8,124,663	8,892,106	11,058,542
December		7,379,152	9,381,718	11,547,286

The largest total of unfilled orders was on April 30, 1917, when it was 12,183,083 tons. The lowest was on Dec. 31, 1910, when the total was 2,605,747 tons.

CORRESPONDENCE AND DISCUSSION

Letters From the Mining and Metallurgical
Industry Dealing With Pertinent
Subjects of Interest

Pulverized Coal at the Tennessee Copper Co.

The article on pulverized coal in the blast furnace, published in the *Journal* of Aug. 16, is interesting, and a discussion of it may prove much more so if some of those who have tried coal will tell their previous and probably unsuccessful efforts to use it as a blast-furnace fuel.

In 1910 or 1911 one of the many Japanese engineers and metallurgists who visited the Tennessee Copper Co. at that time asked if any attempts had been made to substitute coal for coke at the company's plant. He told of its use at one of the larger copper-smelting plants in Japan, the one with which he was connected, and described the method used there. After leaving Copperhill he wrote a short description giving a sketch of the apparatus that had been developed, and stated the percentage of coal that was required, which, as I remember, was less than 4 per cent. His results were so interesting that it was decided to make a simple trial in one of the blast furnaces at Copperhill. This was done, but the coal interfered with the color of the acid made from the furnace gases, and it was decided to postpone the work at least until the production of acid had been brought up to a reasonable quantity and the consumption of niter brought down.

It is probable that the experiments were not taken up by the new management, but, no doubt, the extreme prices of coke current in 1916 or earlier induced new experiments resulting in the success since achieved.

The method practiced at the Japanese furnaces, and which was tried first at Copperhill, was not to use powdered coal but fine coal up to pieces about 1 in. in diameter. The powdered coal was screened out, as I remember, and the coarser pieces were charged through the tuyère. This meant that the coal, on being blown into the furnace, did not burn completely as soon as it reached the hot interior of the furnace, but lodged in the interstices and burned slowly. A small amount of coal was charged intermittently, but on account of its slow burning gave no chance for back-firing or explosions. Eighty-pound air was used, as that was the only air easily available for the experiment. The tuyères soon brightened up, instead of being dark and cold, and the results seemed satisfactory. It was tried only on one or two tuyères and was used on different tuyères with the idea of doing away with the great amount of tuyère punching that had been found necessary to insure the fast running of the furnaces and the high grade of gas that was desired at the acid plant.

It was not practicable to continue the hand screening and charging of these small amounts, and so the tests were again postponed to some future time when operations should become normal, after completion of the bedding plant and additions to the acid plant then under construction.

This reminiscence is given, not with any idea of detracting from the excellent work carried through by Mr. Cavers, but to show that once in a while even Americans get valuable ideas or suggestions from the Japanese.

It was recognized that the blast furnace was not an economical apparatus for smelting, because the heat balance showed that there was sufficient heat from the reactions to do the smelting without any fuel, such as coke or coal. The trouble was that the heat was generated too high up in the furnace and the tuyère zone was too cold. Much of the heat from the coke and the sulphur is generated so high up in the furnace that it is almost valueless for the smelting operation and simply superheats the gases, which have to be cooled before going to the acid plant. By the introduction of and the burning of the fuel lower down in the furnace, the heat is obtained at the point most needed, which is the reason why a smaller amount of fuel will do the work.

It is particularly interesting to note that a charge as low as 12 per cent sulphur has been smelted with coal replacing part if not all of the coke, as this indicates a much greater field of endeavor than the semi-pyritic work at Copperhill.

It is also particularly gratifying to me to feel that another important advance in the art of metallurgy owes at least part of its beginning to the boys at Copperhill.

N. H. EMMONS, 2D.

Camp Wabasso, Laconia, N. H., Aug. 19, 1919.

The Engineer in Politics

Again engineers are reminded editorially in the Aug. 16 issue of the *Journal* of their political and civic shortcomings. Granted that the criticism of the profession as a class is warranted, individually (as this editorial must be interpreted) is it?

Let us follow the engineer from his inception in the business until he attains some measure of success. At college he is taught that his is the career which depends for its success upon individuality, force of character, and constant application to his work. His curriculum is technical. His instructors are technical. The whole atmosphere created in his particular department of training is technical. If his nature is one which absorbs this techno-culture, he spends his evenings at home alone, loading up on all the theory that his textbook provides, so that in class and laboratory he can make application of the principles he has acquired. He has not the time to take part in athletics that his classmate in liberal arts has; his course requires more hours to graduate from the four short years of training allotted for the groundwork of his calling. He gets a "corking" good course in mathematics because he needs that in his mechanics.

Chemistry is important, for it is so essential to get

the right combinations in the metallurgical laboratory and to pass examinations involving calculation of blast-furnace charges. Mineralogy must become second nature with him if the undergraduate engineer wants to be a geologist. He must be accurate. He must be exact and exacting (especially with respect to himself). His English ought to be correct, for otherwise it *might* spoil some future report; but he is supposed to have learned that subject at high school, and it would be unwise to neglect the technical subjects in college for history and literature, except, of course, to read the "technical journals" in idle moments. Sometimes he is counseled to take a "year" in Spanish, because there is a possibility he may be called to a job in Latin America, but that is not absolutely essential, as he can "acquire Spanish in the field."

Political economy and sociology the student recalls in some vague sort of way, perhaps because of the economy part. He has to practice it as well as hear it so much that it becomes the one great principle he gleaned from college life. Theatres, dances, social clubs are all right in their place, but during the college semester, nay-nay! They take time from study and make him sleepy during the lecture on the Dikelocephalus Period of the Lower Paleozoic (or is it the Upper?). Debating societies are good, in fact, fine in their way, especially if the discussions are on technical subjects. But then, the liberal art students get the most out of them, for they usually argue current topics, which don't help a fellow much when it comes to sampling a mine. Anyway, those fellows are studying to be lawyers and need to cultivate talking.

Again, does our embryo engineer ever hear a lecture on the benefit a workman derives from his union or that it is a good idea for the boys in the class to organize and hang together or deal collectively on such matters as might affect their welfare? Under such conditions our young engineer completes his college work and enters the profession to be put in full charge of a No. 2 shovel in a narrow stope by an ambitious and plodding superintendent who received his first practical experience in the same way.

Now the engineer discovers that there are other things to be learned than the subjects he thought he had mastered in college. Besides the practical knowledge which he acquires by time only, there is the business side, which somehow the "profs" overlooked. After shift he has to turn in and study accounting and system. The camp in which he launches his career is perhaps isolated. There is not much social life, and he has become more or less of a recluse anyway. If he was not studious at college he must work now to make up for the time he lost there. During the next fifteen years, if he has force and good judgment, he rapidly progresses along these lines (shifting to numerous places) until he is mine or mill foreman, or perhaps in exceptional cases he may have attained the superintendency of some prospective mine in Podunk or another equally well-known location. He at last has time to take a long breath, to sit down and reflect and to investigate the other fellows around him.

It is probable that the engineer now finds that Bill, who took liberal arts, is U. S. District Attorney in some lively city, where he settled after leaving college. He has acquired a large circle of influential friends and a comfortable home. Tom, who was always a good fellow and just got by with his general-science studies,

also scraped through "medical," joined several of the prominent clubs in the city of a half million people; stayed there; became generally liked for his happy personality and charitable deeds, and is now favorably endorsed for Congress, with the solid backing of his medical associates, who seek much needed reform in laws affecting health and social welfare. So with the other fellows who entered their various lines of work at the same time he did. They settled down to a business, settled on a ranch or settled in some professional capacity in growing or populous communities. At any rate they *settled*. Then he inventories his own qualifications for public office. He finds in himself, as compared with the average 100 per cent public official, the following:

	Per Cent
Age	100
Mentality	150
Judgment	200
Executive ability	300
Morality	100
Popularity with public	30
Popularity with corporations who know him	100
Popularity with corporations not knowing him	0
Oratory	10
Soberity	60
Tra-ability under party domination	2
Willingness to admit defeat	0
Influential friends	5
Support from his colleagues	7
Average	75 to 82

If he is ambitious to do something for his community, his profession, or his country, he knows from long experience with the cold-blooded figures of fact that he cannot be elected over the professionally political Bill or the naturally political Tom; so he stretches the friendship of the old college days to get what he wants through them.

As an individual he is not responsible for these conditions. His college training, his environment, his professional training and his business as a whole are against him. His success as a mining engineer depends upon his experience in various fields. He does not remain in one community long enough to establish a sphere of permanent influence. The people with whom he comes in contact, like himself, are nomadic; a few years finds them scattered to all parts of the globe. The mining engineer is essentially a pioneer, and as such he does not want to settle down. He thinks at times he would like the quiet, steady life of his business brother, but when he tries it he does not stay. He must be conquering Nature and solving Nature's problems. If he were not so he would not be an engineer.

But more particularly the engineer knows, when he aspires to political honors, he is not going to be backed up by his profession. It has not been organized on that basis. Its principles and its precepts in the past have been "each individual for himself." There has been no collective thought or action to further his interests or his business. While miners and muckers, hoistmen and mechanics, even the unskilled laborers, organized for collective bargaining with organized capital, our engineers, our technical societies, and our technical press derided the idea of keeping pace. It was not included in the ethics and was beneath the dignity of engineers to organize in anything resembling a union, as engineers are the direct representatives of Capital, and as such cannot place ourselves on a par with Labor. We must not limit the amount a skillful engineer might earn by adopting a minimum scale of fees or salaries, regardless of how little compensation the struggling youngster of our profession was getting.

The result has been that many of the younger members have dropped from mining and taken up more lucrative lines of endeavor. Some of these men have gone into politics, but naturally they have entered in their new roles and not as engineers. Yet withal, the outlook is not hopeless. The war brought the mining engineer into prominence for his efficiency and executive abilities and gave him some encouragement. Some of the profession who did not stay with mining too long are notable exceptions to the rule. The Governor of Nevada is a mining engineer. Several of the important commissions of this and other states have engineers at their heads or as members. It would be interesting if the *Journal* could inform us as to the number of engineers acting as city managers.

This last medium of dragging the engineer into the limelight is the greatest opportunity we have for ultimately producing the "engineer-politician." As city manager he has full and unrestricted outlet for his technical ability, and, with his usual inborn desire to get to the bottom of things, generally will assimilate the qualifications necessary for election to public office.

These individual instances, the more liberal tendency of the technical journals so noticeable of late, and, most important of all, the consolidation of the Engineering Societies to gain recognition of the engineer as a *human being*, are great strides in the right direction. Now let us start propaganda in our technical schools for more liberal training in sociology, literature and general culture, and the engineer will lead the world.

F. DEAN BRADLEY.

Goldfield, Nev., Aug. 26, 1919.

"Wildcat" Oil Wells

To those not familiar with the terminology of the oil industry the expression "wildcat" oil well carries with it, but not justly, a suggestion of opprobrium. In mining, a "wildcat" proposition usually is more than an unreliable or an unsafe speculation; an insinuation of dishonesty is more often than not intended in the use of the expression. This is generally not the case with oil wells. The New Standard Dictionary (Funk & Wagnalls) gives as one meaning of the term "wildcatter," "one who drills for oil where it is not known to exist." By deduction one obtains the definition of a wildcat well as one that is drilled, or being drilled, where oil is *not known* to exist. This is vastly different from drilling where it is *known not* to exist. Therein lies the difference between a speculation, or gamble if you will, and the obtaining of money under false pretenses. In general, the wildcat oil well is merely one drilled in territory where no oil has been found, whether there are any indications of success or not.

Gulf, Tex., Aug. 17, 1919.

ALBERT G. WOLF.

Further Tests With Coke and Powdered Coal at Copper Cliff

In the *Journal* of Sept. 13, reference is made to the experiments on the application of pulverized coal in the blast furnaces at the smeltery of the International Nickel Co., of Canada, Ltd. The text you published has, unfortunately, given many interested parties the impression that the company's experiments have been unsuccessful, particularly as you state "it is probable that the work connected with same will soon be terminated." I have just returned from a

visit to Canada, and wish to correct impressions that have been made. It is true that in the experiments recently carried out in an effort to smelt copper-nickel ores without coke the results have not been encouraging. However, it has been demonstrated that a combination of the use of coke and powdered coal is practicable, and the following comparative results obtained from two furnaces of the same size, with the same furnace charge and blast pressure, over a period of six days, will show the possibilities from an economic point of view:

	No. 7 Furnace Coal and Coke	No. 8 Furnace Coke Only
Ore, tons	2,802	3,023
Charge, tons	3,043	3,188
Coke, tons	225	411
Coal, tons	192	
Total fuel, tons	417-13 80'	411-12 90'
Fuel cost	\$4,869	\$6,370
Fuel cost, per ton ore	\$1 74	\$2 11

The cost of grinding the coal and the extra labor connected with the coal feeders would be about \$0.07 per ton of ore, which would make the fuel cost per ton of ore for No. 7 furnace, operated with the fuel combination, \$1.81.

The data at present at hand do not offer much encouragement that the furnaces at this smeltery may be operated on coal alone, but it is possible that a means may be found to overcome the difficulties encountered. The smelting of Copper Cliff ores has always been a difficult problem, and it is gratifying that the combination coal and coke method has accomplished so much, and will undoubtedly be considered by all engineers and metallurgists interested in the subject as being distinctly encouraging.

I might state that though it is true that experiments have been terminated at this time on the basis of replacing all the coke, it is intended, after constructional changes in the furnaces have been effected, to resume experimental work, with a view to obtaining the best results possible on a combination of fuels.

W. L. WOTHERSPOON,

General Manager, Garred-Cavers Corporation.

43 Exchange Place, New York, Sept. 20, 1919.

Can a Geologist Explain?

There are twenty-two creeks and gulches in the Barkerville area of British Columbia that are, or were, rich placers. They flow in every direction except south, even southeast and southwest. In other words, not one rich south-flowing creek has been found in that area in fifty-eight years, although every well-situated, south-flowing creek has been prospected. Cariboo schists, striking approximately northwest and southeast, underlie all of the creeks mentioned, no matter what their direction of flow.

There is no simple and easy explanation, such as gradient too steep or too flat, or course of the creek along the strike of the rock, or mushy bedrock. Apparently, the south-flowing creeks should be as rich as the others, but the gold, in quantity, is not there. In the area mentioned, this is the rule without exception. I would like to know why. Also, does the rule hold good in other northern districts? Who can tell us about the Klondike, Alaska, and Siberia? Does any particular direction of flow indicate a poor placer creek in Australia or South America? If so, why? If not, we come back to the original problem: why are the south-flowing creeks of Cariboo so ornery?

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

War-Minerals Act Does Not Cover Ferromanganese

Producers of ferromanganese do not come within the purview of the War-Minerals Relief Act, according to an opinion just handed down by the Attorney General. The opinion was asked in connection with the claim of \$561,346.62 by the Anaconda Copper Mining Co. for losses sustained in producing and preparing to produce ferromanganese. In his opinion the Attorney General said in part:

The sole question for determination is whether Congress intended to pay for losses not only incurred in mining manganese but also in manufacturing manganese into an article of commerce known as ferromanganese.

The only uncertainty that could possibly exist as to the meaning of the statute appears to arise out of the word "produce," which is applicable to both mining and manufacture, and mine owners as well as manufacturers are referred to in the statutes as producers. There are, however, certain provisions of the act which definitely limit the application of the word to mining operations.

The claim of the Anaconda Copper Mining Co. evidently is based upon the contention that ferromanganese is an intermediate metallurgical product of manganese and is embraced within the provision for payment of losses to producers by reason of the specific mention of intermediate metallurgical products in the act of Oct. 5, 1918, and the adoption of the minerals enumerated in the law of Oct. 5 in the first paragraph of Section 5 of the act of Mar. 2, 1919. There is, however, no basis for this contention, as the intermediate metallurgical products, metals, alloys, and chemical compounds covered by the act are all specifically named, and, as there is no reference to ferromanganese, the rule of law *expressio unius exclusio alterius* applies.

The Attorney General upholds his conclusions by a careful review of the discussion while the measure was the subject of legislative consideration and of the conference reports.

The Tariff Situation

In the opinion of Senator Penrose, of Pennsylvania, the chairman of the Committee on Finance, the proper time to consider tariff revision would be after the Presidential election. He further declares that he is opposed to piecemeal tariff legislation, such as is being conducted by the House of Representatives, as it is certain not to deal fairly with all interests concerned.

Senator Penrose expects to call his committee together in the near future, with the purpose of reaching a decision as to the action which the committee will take toward the emergency tariff bills which have been passed by the House and are now before it. It is expected that the committee will support Senator Penrose in his stand, which seals the fate of the tungsten, zinc, and chemical glassware bills, so far as separate legislation is concerned. Those bills have been before the Senate committee for some time, and their friends have made every effort to move the Senate committee to action.

The matter of a general revision in the tariff is not regarded with enthusiasm by any of the Republican

leaders. They feel that world conditions are in a state of change and must reach a more stable status before intelligent action can be taken. Many are of the opinion that the enactment of a general anti-dumping bill would protect American interests until it is possible to form a better conception of international trade relationships.

Any specification of all scientific instruments in one group, with a single rate of duty applying to all articles in the group, should be avoided, in the opinion of the U. S. Tariff Commission, which has reported on the subject at the request of the Committee on Ways and Means. These instruments are of such extremely varied character that the most widely divergent competitive conditions exist. To attempt to group them together would result in conspicuous inequities. In the case of certain instruments not now manufactured nor likely to be manufactured hereafter in this country, the Tariff Commission declares, a tax on consumers without stimulation of domestic production would result.

The study made of the situation by the Tariff Commission develops that in many cases articles now are being produced in the United States which are superior to those formerly imported.

Gold and Silver Production

Gold production during the calendar year 1918 shows a decrease of \$15,104,000 as compared with the production of 1917. Silver output during 1918 was less than that of 1917 by 3,930,223 ounces. Final figures for the 1918 production, by states, have been issued in a joint statement by the Bureau of the Mint and the U. S. Geological Survey. The statement is as follows:

GOLD AND SILVER PRODUCTION OF THE UNITED STATES
(Gold, Value; Silver, Fine Ounces)

	Gold		Silver	
	1917	1918	1917	1918
Alabama	\$2,200	\$700		2
Alaska	14,671,400	9,424,700	1,207,164	802,743
Arizona	5,180,600	5,583,000	6,962,257	6,831,465
California	20,929,400	16,784,400	2,107,107	1,432,812
Colorado	15,974,500	12,724,700	7,291,495	6,900,266
Georgia	6,500	4,500		45
Idaho	754,800	701,400	11,402,542	9,396,009
Illinois			7,116	8,218
Maine		700		6,338
Maryland			538	164
Michigan			684,225	516,294
Missouri	300	60	63,344	42,314
Montana	3,673,200	3,280,700	14,555,034	16,378,263
Nevada	6,932,500	6,700,440	11,217,654	9,931,969
New Hampshire				691
New Mexico	1,085,400	687,080	1,535,807	773,662
North Carolina	10,800	4,400	590	100
Oregon	1,687,300	1,265,700	172,152	129,150
South Carolina	1,700			
South Dakota	7,372,900	6,699,400	190,382	161,232
Tennessee	5,500	5,600	106,975	105,829
Texas	100	20	587,945	579,158
Utah	3,522,100	3,153,000	13,360,905	13,492,555
Vermont	100	1,000	403	4,891
Virginia	1,300	400	4,500	1,814
Washington	488,200	333,800	266,112	300,000
Wyoming	3,700	900	3,400	1,255
Continental U. S.	\$82,304,500	\$67,356,600	71,727,6476	7,797,139
Philippines	1,446,100	1,290,000	12,715	13,000
Porto Rico	100	100		
Total	\$83,750,700	\$68,646,700	71,740,362	67,810,139

Gold production in fine ounces in 1918 was 3,320,784, compared with 4,051,440 in 1917.

The Institute Session on Mine Taxation

CHAIRMAN ALLEN opened the session on Monday at 11 a.m. He introduced the subject of mine taxation by giving two definitions of a mine, namely, the commonly accepted designation, "A mine is a wasting resource," and a new definition which demands careful consideration, "A mine is a manner of wasting resource." The underlying thought in the latter is of special interest in the consideration of the subject of mine taxation, particularly in connection with the principles of depreciation and depletion. It is found that the allowance for depletion is not a simple problem that can be solved by assuming a fixed annual reduction in the value of the ore reserve, because of constantly varying conditions, both as to the changing economic operating problems and the irregular changes in the present value of the reserve as a result of current development of new orebodies.

The chairman introduced L. C. Graton, of the Internal Revenue Commission, who addressed the meeting and presented the results of the commission's study of over 35,000 mines which had been valued for taxation purposes by the Bureau of Internal Revenue. Mr. Graton requested co-operation and suggestions from mining men, and the discussion which followed served to indicate some important features of taxation which had not been fully covered by the work of the commission.

R. V. Norris discussed the question from the coal-mining company's point of view and expressed the belief that all coal operators would co-operate with the Government in every possible way to help solve the mine-taxation problem and that they regarded Mr. Graton's works as highly illuminating. He insisted that the commission should recognize a distinction between metal mining and coal mining, in that the latter was more like manufacturing, and should be so regarded.

W. O. Hotchkiss, of the Wisconsin Geological Survey, pointed out the importance of a carefully selected personnel on the commission and expressed the hope that the Government would provide adequate compensation, so that able students and investigators of the mine-taxation problem could be retained until their important work was completed.

Paul Armitage, of New York, discussed the problem from the lawyer's standpoint and offered examples to show that the depletion method, as contemplated by the law to be consistent, must take into account the his meaning by considering the elements of time and value as co-ordinates and pointing out that be a curve falling either above or below a straight line. He believed that the Treasury rule must be changed.

Dedication of Pittsburgh Experiment Station of Bureau of Mines

PITTSBURGH CORRESPONDENCE

DEDICATORY ceremonies of the U. S. Bureau of Mines Experiment Station at Pittsburgh began Monday, Sept. 29, with Van. H. Manning presiding. The attendance at the ceremonies was large and representative. The invocation was delivered by S. B. McCormick, Chancellor of the University of Pittsburgh, and was followed by an address of welcome by Mayor E. V. Babcock. Response to the latter was made by First Assistant Secretary Vogelsang, who represented Frank K. Lane,

Secretary of the Interior. Governor William C. Sproul, in his speech, promised co-operation between state and Federal organizations and employees, and announced his intention of introducing radical proposals, during the next legislative session, which would tend to make mining communities more inviting. J. Parke Channing, representing H. V. Winchell, president of the American Institute of Mining and Metallurgical Engineers, discussed the present unrest in metal mines.

Other speakers emphasized the work being done by the Bureau for the conservation of life and natural resources. A number of references were made by speakers to the late Dr. J. A. Holmes, who was the first director and originator of the Bureau of Mines.

After luncheon a special train was provided, and visitors were taken to the experimental mine at Bruceton, where a mine explosion was shown and other experimental work was demonstrated by members of the Bureau.

September Mining Dividends

Dividends paid by 28 United States mining and metallurgical companies in September, 1919, amounted to \$11,080,134, compared with \$23,553,456 paid by 36 companies in the corresponding month last year. Canadian, Mexican and South American companies paid \$1,760,664.

Yukon Alaska Trust, a holding company, made its usual disbursement of \$1 per share (\$203,433).

Interesting features this month were the resumption of dividends by Calumet & Hecla, which had not paid since December, 1918, and by Ahmeek, Isle Royale, and Osceola, which passed their last quarterly payments. Calumet & Arizona increased its payment from 50c. to

United States Mining and Metallurgical Companies		Situation	Per Share	Total
Ahmeek, e.	Mich.		\$1.00	\$200,000
Am. Sm. and Ref., com.	U. S.-Mex.		1.00	609,930
Am. Sm. and Ref., pld.	U. S.-Mex.		1.75	875,500
Argonaut, g.	Calif.		.05	10,000
Bingham Mines, com.	Utah		.25	37,500
Caledonia, l. s.	Ida.		.01	26,050
Calumet & Ariz., e.	Ariz.		1.00	612,520
Calumet & Hecla, com.	Mich.		5.00	900,000
Chino, e.	N. M.		.75	652,485
Copper Range, e.	Mich.		.50	197,500
Creson Cons., g.	Calif.		.01	122,000
Eagle & Blue Bell, l. s.	Utah		.05	44,580
Fairview Round Mountain, g.	Nev.		.02	19,048
Federal Min. & Sm., pld.	U. S.		.50	60,005
Golden Cycle, g.	Ariz.		.03	45,000
Hecla, l. s.	Ida.		.15	150,000
Homestake, g.	S. D.		.50	125,580
Isle Royale, e.	Mich.		.50	75,000
Kentecott, e.	Nev.		.50	1,393,053
Nevada Con., e.	Nev.		.37 1/2	744,790
Orville Dredg., g.	Calif.		.12	82,380
Osceola, e.	Mich.		1.00	96,157
Quincy, e.	Mich.		.50	110,000
Ray Con., e.	Mo.		.50	788,580
St. Joseph Lead., com.	Mo.		.25	352,369
So. Hecla, l. s.	Utah		.15	39,457
Tintic Standard, l. s.	Utah		.08	93,400
United Eastern, g.	Ariz.		.07	93,410
United Verde, e.	Ariz.		1.50	450,000
Utah Copper, com.	Utah		1.50	2,436,735
Canadian, Mexican and South American Mines				
Cerro de Pasco, e.	So. Am.		\$1.00	\$898,224
Kerr Lake, s.	Ont.		1.00	600,000
Mexico Mines of El Oro, g.	Mex.		1.44	262,440

\$1 per share, and Federal Mining & Smelting, preferred, reduced from \$1 to 50c. Among the Canadian companies, Hedley passed its dividend, and Kerr Lake, though it did not pay its regular dividend, made a capital distribution of \$1 per share, as a result of reducing its capital stock from \$3,000,000 to \$2,400,000.

The totals for the first nine months of the year are as follows, the 1918 figures being given in parentheses: United States mining and metallurgical companies, \$72,547,069 (\$129,402,031); holding companies, \$1,113,438 (\$1,718,438); Canadian, Mexican, Central and South American companies, \$12,163,034 (\$14,070,925).

Chicago A. I. M. E. Meeting

Session on "Milling and Industrial Organization" Held At Congress Hotel, Sept. 22—Reduction of Labor Forces, Physical Examinations and General Welfare Authoritatively Discussed

CHICAGO CORRESPONDENCE

THE A. I. M. E. session on "Milling and Industrial Organization" opened on Monday, Sept. 22, at 2 p.m., with F. K. Copeland presiding. The paper on "Chilean-Mill Practice at the Portland Mill," by Luther W. Lennox, was introduced by George M. Taylor, general manager of the Portland mine and mills, at Victor, Col. Mr. Taylor reviewed briefly the investigations made by Mr. Lennox, and pointed out the increased efficiency resulting from a readjustment of the crushing practice at the Portland mills. The paper was discussed by R. B. T. Kiliani, of Denver, Col., who referred to Miami practice, and by C. H. Benedict, of the Calumet & Hecla Mining Co., who commented on methods of crushing employed in the Michigan copper district.

The papers on "Graphic Metallurgical Control," by H. M. Merry; "Mill Operations at the United Eastern During 1917-1918," by Wheeler O. North, and "Crushing Practice at New Cornelia Copper Co.," by W. L. Du Moulin, were read by title, and discussion was postponed. The three papers by Charles F. Willis, namely "Methods of Curtailing Forces at the Copper Queen," "Educational Methods at the Copper Queen," and "Physical Examinations Previous to Employment," were introduced and read by J. W. Reid, who pointed out that the Phelps Dodge Corporation had given careful study to the problem of curtailing forces, and that the salient principle of its present practice was to lay off first those employees who would have the least to lose by such action.

C. H. Benedict discussed the problem of reducing labor forces, and outlined methods employed at Calumet & Hecla properties, where the men are divided into three classes: (a) men with dependents, (b) single men, and (c) returned soldiers. He said that returned soldiers were offered their old jobs in every case, but that in some instances, where the job was filled by a man with a dependent family, the soldier refused to accept the offer and sought employment elsewhere.

The subject of educational methods was discussed by George M. Taylor, who thought that the scheme outlined by Mr. Willis would not be successful in a mining camp like Cripple Creek, Col., where most of the mining operations were carried on by lessees who were more often employers than employees, who were frequently well-educated men, and whose general intelligence was in any event well above that of the average miner.

The paper on physical examinations was elucidated by Mr. Reid, who said that the practice was sometimes resented by labor unions because it was not fully understood. It was pointed out that many miners did not realize that the physical examination was for their own protection, as well as for the purpose of safeguarding the company against liability on account of accidents to men who were physically incompetent to perform the tasks assigned to them. Large mining companies have learned by experience that a man who is physically unfit is almost sure to be hurt sooner or later and is a great liability to the company.

The three papers by Mr. Willis led to a general discussion of the various methods employed by mining companies toward labor uplift and efficiency. A. M. Plum described the "bonus" and "dividend" systems employed in the Platteville, Wis., zinc district for the purpose of increasing tonnage production. Robert Ammon, of Mascot, Tenn., outlined the operation of the "Industrial Democracy Plan" which has been installed in his district, and explained some of the problems involving negro labor wherein it was necessary to limit the individual's earnings in order to maintain efficiency at a maximum. Charles W. Goodale spoke of the "Brawley" system used at Butte, Mont., and stated that a wage of \$5.75 per day was sometimes augmented by a bonus as high as \$1.25 per day. C. H. Benedict distinguished between "bonus systems" and "profit sharing."

A. I. M. E. Smoker

Program of Entertainment for Visiting Engineers Replete With Novel and Interesting Features—
Chu Chin Chow (?) Achieves Sudden
And Unexpected Eminence

CHICAGO CORRESPONDENCE

ON MONDAY evening, Sept. 22, 1919, the American Institute of Mining and Metallurgical Engineers held an interesting and entertaining smoker, in the Gold Room of the Congress Hotel, Chicago. Through the untiring energies of Bradley Stoughton, the members of the Institute had the rare privilege of hearing an address delivered by Mr. Chu Chin Chow, an eminent Chinese mining engineer and metallurgist, who, according to his interpreter, spoke of the vast undeveloped mineral resources of China, and the financial and political assistance his country hoped to receive from the United States.

Sidney Smith, cartoonist for the *Chicago Tribune*, supplied mirth in the form of caricatures of members present, and some of their acquaintances.

George S. Rice delivered an illustrated lecture on the present status of the mining industry in the war zones of France and Belgium. Many of the pictures of famous mining plants, before and after the German fiends of destruction had demonstrated their efficiency, served to impress upon the minds of the audience not only the utter lack of sportsmanship of degenerate kultur, but also the herculean labors which confront the French mining engineers who must and will revive their wrecked industries.

Dr. F. G. Cottrell exhibited many interesting war-zone pictures, and described numerous power and industrial projects in Belgium, France, Germany and Italy, not the least interesting of which was a plant in Northern Italy where power was developed by utilizing low-pressure steam of volcanic origin.

One of the features of the evening's entertainment was a one-act comedy which served as a happy vehicle for character sketches of such well-known personages in the mining world as Hoover, Jackling, Rickard, and Hammond. The evening held not a dull moment, for all intervals between main features on the program were appropriated by a male quartet or an orchestra. The members who were present felt truly sorry for those who were not.

BY THE WAY

American Auspices

A bit of British humor may be found in a recent issue of *The Capitalist*, where an officer of the Baku Russian Petroleum Co., (1909) Ltd., is quoted as stating at a company meeting that, "Under the so-called Peace Treaty, just concluded in Paris under American auspices, the new Republic of Azerbaijan—which embraces Baku—was apparently to be recognized by the Great Powers, and the importance of the oil industry as a national asset should eventually ensure its proper treatment at the hands of the new authorities."

A Fuelless Engine

The millennium in engine design has again been achieved, this time in a fuelless engine designed by one C. C. Thorn, of a company that styles itself "The United Powers Co. (when organized), San Francisco." The company purposes renting automatic power of all kinds, including mechanical power, inertia power, leverage power, gravity power, compound power, and hydraulic power. The engine "gets its power from its own energy, developed by its own mechanism without fuel." Three million horsepower on a 40 x 40-ft. tract is possible, it is claimed. The engines work automatically and are always under perfect control. United Powers Co.'s shares are \$100 each. "You cannot get too much for a good investment."

Not the Proper Education

A few years ago in a mining town of California it happened that a Cornish mining captain was elected as a member of the local school board. Just before the end of the school term the physics teacher in the high school resigned, and the school board met to elect a successor. As it was so near the end of the term, the board experienced some difficulty in finding a good instructor. Finally, a member of the board suggested the name of a young mining engineer who was employed as assayer at one of the local mines. The qualifications of the young man were discussed at some length, and during the greater part of the conversation Cap'n Frank sat with a look of disgust on his face. When he could hold in no longer he gave vent to his feelings as follows: "Wot! 'E teach physics for we? Wot do 'e naw 'bout un? Why, dam-me, I wouldn't 'ave 'e to doctor a bloody dog for me."

A Grave Situation

An unusual protest against mining operations has recently been made by the people of Oronogo, Mo., against the Oronogo Mutual Mining Co. The latter, it is charged, is mining under the town cemetery. The citizens have held a mass meeting and appointed a committee to investigate. One miner stopped work when he claimed to have discovered that he was mining under his daughter's grave, and others with relatives buried in the cemetery have also threatened to quit. The company admits that it probably will work under the cemetery, although this is not being done at present. It is operating at a depth of 180 ft., and the management points out that no possible damage can be done

by mining at this depth. The work is sheet-ground mining, and much powder is being used. The company has a lease from the city council, the members of which argue that the town is poor and the royalty will help in keeping the cemetery in good condition.

Murdered Truth

Hill City, S. D., has a ghost. The manager of the Cowboy mine, Alexander Roy, says so. According to Mr. Roy, the spook manifests itself by giving forth in the mine workings wild screams such as ladies give when they are being choked to death, although at times when it gets tired it growls like a buzzsaw. Mr. Roy has come to the conclusion that the sounds are due to a magnetic vortex caused by a concentration of the earth's magnetism by the metal in the ore. This vortex, according to Mr. Roy, has a form like a smoke ring, or a doughnut, perhaps, and by its whirling gets the air all stirred up, so that it just naturally whirrs, too, and makes the sounds described. Study of this phenomenon, according to Mr. Roy, is as valuable as Newton's study of the law of gravitation. If tin can thus centralize magnetic waves, he says, it can be used to overcome the power of gravitation, so that the airship of the future can be built of tin. Mr. Roy evidently has a tin lizzie in mind. It seems, offhand, that the tin market does not require stimulation by ghost stories. As far as the affairs of the Cowboy mine are concerned, a ghost is hardly a live asset.

Leave the Gun at Home

"Speaking of horrors," drawled Britton, as he and the doctor left the change house, "I recall an experience at the Lazarus mine, shortly after graduating. Like many a tenderfoot, I wore a six-shooter. After taking a few samples above the main tunnel level I put my sacks into a larger sack and sealed it, rolling the bundle in my coat and tucking it up on a timber above the winze platform. Descending an old rickety ladder, I was chipping off bits of ore here and there when I was startled by a loud report. Almost instantly came a scream from the level above, followed by the fall of a heavy body that shook the ladder above me. Both candle and hammer dropped from my grasp, and I clung to the ladder to keep from falling. Instinctively I reached to my holster and found it empty. Later it transpired that a drill boy, who had just brought in the lunch of a miner, was attempting to pick the pockets of my coat. As it dawned upon me that it was my own gun that had been fired, I also realized that but a moment before a living person had stood above me. Huskily, I halloood; but no response came. Lighting matches and holding them over my head, I could make out a huddled bulk sagging over a ladder rung near the top. Calling again to know if help was needed, I could not even see the body move. Bending down to see if anyone below had witnessed the tragedy, I felt a drop of warm liquid strike my neck; and then quite a succession of larger drops. The terrible thought struck me that literally someone's blood was upon my head. A wild notion of flight seized me, but the only outlet was up that single ladder. Mustering my courage as well as I could, I crept tremblingly up. When near the top of the ladder I gently grasped my coat and samples. On the platform I found a perforated dinner bucket, from which the last drops of coffee were dripping. I never inquired about the gun, as I had no further use for it."

PERSONALS

S. K. Dahl has gone to Venice, Cal.

Carl J. Trauerman, well-known mining engineer of Butte, Mont., is visiting in Boston and New York.

Edward Mosehauer, of the United Metals Selling Co., has gone abroad to represent the Copper Export Association with headquarters in Geneva.

Frank A. Kennedy and Edward Collins, of Duluth, Minn., are making several mine examinations in the Seven Devils District in Idaho.

Louis D. Huntoon has resigned as secretary of the Mining and Metallurgical Society of America and is succeeded by F. F. Sharpless.

Preston Locke, of Spokane, Wash., representing the American Smelting & Refining Co., recently visited the Portland Canal and Salmon River districts of British Columbia.

R. H. Crozier, who until recently was mill superintendent of the Hampden-Cloncurry mines, Kuridala, Queensland, has been appointed manager of the ironstone quarry of Burma Mines, Ltd., Namtu, Burma.

Forrest B. Smith, general field representative of the American Mining Congress, spent part of September in San Francisco in the interest of the annual convention of that body to be held at St. Louis, Mo., in November.

Harry S. Denny has been appointed Deputy Civil Service Commissioner for the occupied area of Cologne. Mr. Denny was for a number of years assistant consulting engineer for the General Mining and Finance Corporation.

Adolph Knopf, of the U. S. Geological Survey, has returned to Rochester to complete a survey of the district which he began two years ago, but which was interrupted that he might devote attention to the search for minerals used in the manufacture of munitions.

C. F. Kelley, president of the Anaconda Copper Mining Co., accompanied by John Gillie, manager of mines, and Frederick Laist, general manager of smelters for the Anaconda, inspected the company's properties at the Boston & Montana reduction works at Great Falls, Mont., recently.

A. H. Lawry, formerly superintendent of the Goldfield Consolidated Mines Co., in Nevada, is now consulting engineer in charge of the Tonopah Divide and other properties controlled by George Wingfield in Divide. Mr. Lawry succeeds William Sharp, who was appointed temporarily after A. I. D'Arcy resigned.

James L. Bruce, general manager of the Butte & Superior, has resigned, effective Jan. 1, 1920, to accept the general management of the Davis-Daly Copper Co., taking charge of the latter

Sept. 15. Mr. Bruce will attend to the affairs of the Butte & Superior up to the first of the year, in addition to his duties at the Davis-Daly.

Captain C. E. Grunsky, Jr., has resumed his engineering work in San Francisco with the C. E. Grunsky Co., a reorganization of the American Engineering Corporation. Captain Grunsky had been with the U. S. Army for two years, during which time he saw active service at the front and supervised the valuation of war losses in French mines.

George W. Metcalfe, general manager of the mines and smeltery at Kennett, Cal., is leaving to take up other work for the United States Smelting, Refining & Mining Co. He will be succeeded by O. J. Egleston, who has been chief engineer for the same company in its Western field. L. D. Anderson, at present manager of smelters at Salt Lake City for the company, will succeed O. J. Egleston as chief engineer. K. H. Kervin formerly superintendent of the smeltery at Kennett, has gone to the copper refinery at Chrome. Frederick Lyon, managing director, has retired owing to ill health. George W. Heintz, for years local manager at the Salt Lake offices, will be transferred to the Eastern office and his place taken by Clarence E. Allen, who has been manager of mines and is in turn succeeded by D. D. Muir, Jr., formerly local manager of the exploration department and later in charge of the zinc plant at Baxter Springs, Kan.

SOCIETIES

American Iron and Steel Institute will hold its sixteenth general meeting at the Hotel Commodore, New York, Oct. 24 and 25.

American Foundrymen's Association held its twenty-fourth annual meeting in Philadelphia, Sept. 29 to Oct. 3. The various sessions were at the Bellevue-Stratford Hotel, and the exhibition at the Commercial Museums.

Institute of Metals.—At the meeting at Sheffield, England, on Sept. 24 and 25 an additional paper to the original program was presented by Zay Jeffries, of Cleveland, Ohio, on "The Micro-Mechanism of the Ageing of Duralumin." Dr. Jeffries went to England to present his communication in person.

Electric Furnace Association held a meeting in Chicago at the Congress Hotel on Monday, Sept. 22, the day before the meeting of the American Electrochemical Society. There was a business session in the morning, for formal reorganization, election of officers and other important business. Following a luncheon, a general session for the afternoon was arranged, to which were invited all who are interested in the electric furnace and its products.

Engineers' Club of Northern Minnesota resumed the regular monthly meetings at the public library in Hibbing on Sept. 20. The members were entertained by a film of the General Electric Co. showing the electrification of the Chicago, Milwaukee & Puget Sound Ry. A committee was appointed to investigate the merits of the electric shovel as applied to Mesabi Range operations, and also to study the practicability of changing the present steam shovels to fuel-oil burners.

INDUSTRIAL NEWS

The Western Electric Co. has recently opened a branch, consisting of a sales office and warehouse, at 334 East Bay St., Jacksonville, Fla. The house is in charge of A. H. Ashford. Electrical supplies and specialties will be carried in stock.

New Jersey Zinc Co. has sent out a statement on the use of rolled zinc for making stencils, and detailing its advantages over other materials. Negotiations are being carried on to supply Japanese producers with zinc stencils for stamping silk designs to replace the hand methods now practiced.

International Exposition of Mining Industries will open in the Grand Central Palace, New York, on Dec. 1, instead of on Oct. 15, as originally planned. Howard R. Ward, manager, has returned from an extended tour through mining centers, to prepare for the opening. Failure to have the quarters ready for occupancy by the exposition is the reason for delay, the building having been used by the Government.

Colburn Flotation and Engineering Co., Denver, Col., has issued an illustrated circular describing the Colburn vacuum flotation machine. A number of advantages are claimed for the machine, which, it is stated, uses both mechanical and air agitation without the cost and complication involved in compression of air outside the machine. Also, it is said that the vacuum may be varied according to the ore. One valve regulating the sand discharge from the last spitzkasten is the only regulating valve used.

American Ore Reclamation Co., 71 Broadway, New York, has issued a 24-p. pamphlet describing the operations of the company, which is engaged in the licensing and engineering of plants for the sintering and desulphurizing of iron-bearing material, and acts as consulting engineer in operations involving the treatment of iron-ore material that can be beneficiated by sintering. The company operates principally under the Dwight & Lloyd patents for continuous down-draft sintering and is also licensed to use the intermittent process with separate tilting pans, the Heberlein, the up-draft process, and the rotary kiln.

EDITORIAL CORRESPONDENCE

Current Events and Topics in Brief Of Interest to Engineers And Operators

GLOBE, ARIZ.—Sept. 25

The American Association of Engineers has just organized a Globe-Miami Chapter with fifty-one members. C. P. Griffith is temporary chairman and R. L. Russell is temporary secretary.

"Safety-First Week," will be observed Oct. 19 to 25 under the auspices of the Globe-Miami District Mine Rescue and First-Aid Association, which will aid in extension of its work to cover civic features outside of the mines. This will include household and street accidents, fire, industrial accidents and school education along safety lines.

The Salt River Valley Water Users' Association is to build a steam-power plant near Phoenix, to equalize the service from its hydro-electric plants at Roosevelt and valley points. The Inspiration Consolidated Copper Co. has been getting an irregular power supply from the Roosevelt dam works and has had to rely to a large degree on its own steam-power service, supplemented from the reverberatory furnaces of the International smeltery. Now it is understood there is to be guaranteed a steady power supply from the Roosevelt system. In addition, there is to be connection at Phoenix, with the same system by the Arizona Power Co., from its hydro-electric works on Fossil Creek, Yavapai County.

SALT LAKE CITY, Utah—Sept. 17

Mine Rescue Car No. 11, of the U. S. Bureau of Mines, which has been visiting mining camps of Utah, has been in Salt Lake City at the Oregon Short Line station since Sept. 22, and will remain for two weeks. Classes in first-aid work are being held by the crew of the car.

Commercial Club of Salt Lake City has organized a mining division, so that there may be a group within the club to look after matters of especial interest to the mining industry. A committee of thirty-five mining men has been formed, with John N. Hayes, of the Utah Copper Co., chairman, and Frank Pingree, of the National City Bank, vice-chairman. A. G. Mackenzie was made secretary. At a meeting on Sept. 12, a resolution in favor of lowering freight rates on ores and concentrates from Salt Lake Valley to Eastern refineries was adopted.

The Campaign for Americanization of Foreign Workers in the various mining camps of the state, as provided

ance at school on the part of all persons between the ages of sixteen and forty-five, who are unable to read and write the English language, is meeting with success, and those affected are showing themselves anxious to comply with the regulations. At Bingham, a committee of fifty was organized among the foreigners, on which every mine as well as each of the nine nationalities in the camp was represented. This committee has made it a point to reach every person affected by the law, furnishing information as to the requirements, the date of opening classes, and other pertinent facts in connection with the law. School opened Monday, Sept. 22.

JOPLIN, MO.—Sept. 27

Shipping Conditions have greatly improved in the Joplin-Miami district in the last week, following the appointment of Ross A. Blanchard, assistant traffic manager for the American Zinc, Lead & Smelting Co., as representative of operators, smelters, and the U. S. Railroad Administration, with headquarters at Joplin and Miami, in an attempt to relieve the situation. Regional Director B. L. Bush, at St. Louis, promised cars up to 65 per cent of the district's demands, and all the coal cars that could be used, and although Blanchard did not reach the district until Sept. 22, much relief already has been received.

DULUTH, MINN.—Sept. 22

The Bendixen Bill, levying a 5 per cent tax on iron ore, was vetoed by the Governor on Sept. 19 after passing both Senate and House. The vote in the former was 38 to 28. The bill was expected to raise about \$6,500,000 a year in taxes.

HOUGHTON, MICH.—Sept. 29

Labor is becoming more plentiful in the Michigan copper district. Many Finnish miners are returning to the mines from the farms, desirous of having underground employment for the winter. Mines are constantly adding to their forces, but putting practically all new employees at work underground, and none on surface. Additions now are made at the rate of 100 a week. This will not increase the output of copper as much as might appear at first glance, because all new underground men are put at development operations, getting the mines ready to better the total output when demand requires it.

The steel strike has no effect on the

indirect reflection in the demand for metal. The strike of boatmen also is without effect here, as all mines of this district have their coal supplies on hand to run on full time until July 1, 1920.

The metal situation in the Houghton district is not clearing up. There is 50,000,000 lb. of copper on hand. The Lake Superior smelting plant, a subsidiary of the Calumet & Hecla, at Dollar Bay, closed last June, and still has 15,000,000 lb. on the dock, unsold. No new mines reopened this week.

A gift of a life insurance policy to every employee was announced on Sept. 29 by Calumet & Hecla, Osceola Consolidated, Ahmeek, Allquez, La Salle, Lake Milling, Smelting & Refining, Superior, Isle Royale and Whitepine companies, employing eleven thousand men. The policies range from \$1,000 to \$1,500, payable to any named beneficiary, dating Oct. 1, 1919, without medical examination and without cost to the recipient. The miners, who have always had to pay high rates for life insurance, are jubilant.

ISHPEMING, MICH.—Sept. 27

Drilling for Iron Ore Near Escanaba will be undertaken by a company recently organized at that city. Some exploration work was done there years ago. The contract has been awarded to E. J. Longyear Co. Escanaba is not considered to be on any of the Michigan iron ranges, but is the shipping port for the Menominee Range. If ore is found it will be considered to be an extension of the eastern Menominee Range.

Titles of Lands of the Ayer Estate, of Boston, are being searched by attorneys representing the Chicago Title & Trust Co., and it is reported that the lands are to be sold en bloc. The Ayer estate has large holdings in Houghton, Ontonagon, Iron, and Gogebic counties, in northern Michigan, some of which are in the mineralized belts. If the deal goes through it will be the largest transfer of lands to take place in the Lake Superior district in several years.

The Steel Workers' Strike is having its effect in the Lake Superior district, but it is difficult to state at this time what the extent of the curtailment in the district will be. Some of the train and shovel crews were laid off during the first week, operators not caring to load boats that they fear may not be unloaded when they reach lower Lake ports. If the seamen decide to

region will be seriously handicapped, although a strike at this season would not result as disastrously as one earlier in the year. The time is fast approaching when Lake shipments stop for the year, and the seamen have little to gain if they do decide to go out in sympathy with the steel workers. No mines have been closed as yet, although the managers of two Mesabi Range operations have been advised from the East that they may have to suspend operations on short notice. However, all of the open-pit mines will be closing for the year within a month or six weeks. The Minnesota Steel Co. is operating its plant at West Duluth, the men having decided to remain at work. There are no strikes anywhere in the entire Lake Superior district, the ore-dock and coal-dock workers, who were idle for a few weeks, having gone back to work. The United States Steel Corporation has been preparing for labor troubles for several months. Though the independents have been slow in getting ore down to Lake Erie, the Corporation has been stocking ore at its furnaces.

HOUSTON, TEX.—Sept. 25

Crown Oil & Refining Co., at annual meeting of stockholders, held Sept. 15, elected the following officers: George E. Colvin, president; J. W. Colvin, vice-president; H. F. Montgomery, secretary; and C. F. Robinson, treasurer. Directors are: R. L. Young, J. C. Stribling, George E. Colvin, J. W. Colvin, all of Houston, and J. W. Dubould, W. D. Ahern, and F. S. O'Reilly, of New York. Reported that refinery now under construction at Pasadena will be completed by Jan. 1, 1920, with capacity of 5,000 bbl. daily, and that, contrary to reports, this refinery will not be sold.

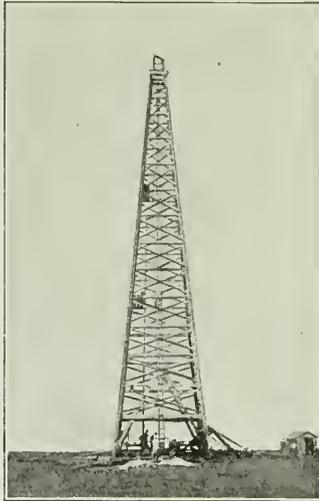

Eagle Petroleum Co., of Houston, has been recently organized. Officers are J. A. Reynolds, president, C. E. Morgan, vice-president and general manager; C. E. Gates, secretary and treasurer. Company has purchased Swastika lease of fifteen acres in Markham field, Matagorda County, upon which are three producing wells; Swonger & Vicar lease, at Batson, Hardin County, where two wells are producing and a third will be drilled at once; and leases at Stratton Ridge, Brazoria County; High Island, Galveston County, and in the Homer field of Louisiana. Company is a close corporation, with no stock for sale.

BIRMINGHAM, ALA.—Sept. 25

The Opening Day of the Steel-Workers' Strike found the plants of the Birmingham district practically untouched. Approximately 500 men in the entire state responded to the walk-out orders. The Steel Corporation's subsidiary, the Tennessee Coal, Iron & Ry. Co., lost about 70 men at its big Fairfield plant, 30 or 40 at the By-Products, and fewer than 150 at the steel plants in Ensley. Fewer than 150 men are said to have left the American Steel & Wire Co.'s mills.

All plants in Bessemer are running, and few strikers are to be seen on the streets. The opening of the strike found all mines along the southern end of Red Mountain operating with their normal Monday crews. In some places the force was below normal, but this was later found due more to the "Monday-after-payday" effect than to the strike. It is understood the Muscoda mines, one of the principal mining properties of the Tennessee Coal, Iron & Ry. Co., has more than doubled its force of deputies and watchmen. The plant of the Anniston Steel Co. at Anniston, Ala., which employs more than 300 men, and that of the Gulf States Steel Co. at Gadsden, were not affected at all by the strike.

It is expected that the union leaders in the Birmingham district will call for a sympathetic strike. It is to be noted that some of the companies are putting men back to work who struck but have asked for reinstatement. The independent companies expect to be drawn into the struggle soon. The employees of the Woodward Iron Co. have

DERRICK 112-FT. HIGH AND ROTARY DRILLING RIG AT 3,000-FT. OIL WELL MATAGORDA COUNTY, TEXAS

already been ordered out, but have made no response.

In the face of severe criticism, Governor Kilby, of Alabama, and his followers succeeded in passing the bill providing for a tax on coal and iron ore. The companies in the Birmingham district and elsewhere in the state made every effort to prevent its passage, but without success.

Rail is being rolled at the steel mill of the Tennessee Coal, Iron & Ry. Co., at Ensley, Ala., for shipment to Japan, and a dozen or more flat cars were spotted on Sept. 22 to be loaded. The order, it is understood, calls for a large tonnage.

NEW YORK—Sept. 26

Phelps Dodge Corporation intends to launch a campaign of intensive underground development work at its Mornci property, and, at a later date, will probably erect a modern concentrator which can treat to advantage low-grade copper ores. Various new installations and equipment will be necessary in connection with the mining of these ores and their beneficiation, but, it is stated officially, absolutely no definite plans have been made as yet. Such plans will be developed in the course of the next six months.

BOSTON—Sept. 27

Arizona Commercial Mining Co., of Globe, Ariz., again brought same suits, under Massachusetts laws, against Iron Cap Copper Co., also of Globe, immediately after the Massachusetts Supreme Court in equity session had handed down a decision that the two suits were beyond its jurisdiction. These last actions, however, were suits at law and disregarded the finding of the court in equity session. In brief this means that the cases will be now tried by a court and jury and a decision finding for either the plaintiff, with damages, or for the defendant will be handed down.

WASHINGTON, D. C.—Sept. 25

The Anglo-Persian Oil Co. is negotiating to effect a complete absorption of five Scotch mineral-oil companies, according to a consular report from London to the Bureau of Foreign and Domestic Commerce. The Scotch companies which will be affected by this transaction are the Pumpherton, Broxburn, Oakbank, Young's Paraffin Light & Mineral Oil Co., and James Ross & Co., having an aggregate capital of approximately £2,860,000. The Anglo-Persian company will undertake to supply the Scotch companies, it is stated, with enough crude oil for refining, so that they can return an ample dividend to their shareholders, and the directors of these concerns are urging the stockholders to accept the proposal of the Anglo-Persian company.

TORONTO, ONT.—Sept. 27

The Mines of Cobalt are gradually getting back to normal, following the cessation of the strike. In the majority of cases, however, the lower workings are still flooded, but within the next week or so all the properties should be working at capacity. Owing, no doubt, to the fact that a considerable number of men are rustling, there is a decided increase in the efficiency of the men.

About a week ago the miners of the Kirkland Lake district took a vote as to whether or not the strike in that camp should be called off. So far, the result of the vote has not been announced, but it is probably that the strike will cease, and work be resumed. If work is not started soon, the probabilities are that all the properties will remain closed until next spring.

THE MINING NEWS

Progress of Mining Operations
Condensed and Classified
For Easy Reference

ARIZONA

Cochise County

Central (Dos Cabezas) — Development begun on sixteen copper claims. Group adjoins Mascot. E. A. Ely in charge.

Centurion (Dragoon)—Cleaning up drifts, and shaft preparing to operate after two-year shutdown.

Middlemarch Copper (Gleason)—Closed for several weeks on account of miners' strike for higher wages. Will start work with new force soon.

Arizona United (Johnson)—Voluntarily raised wages 10 per cent Sept. 1.

Greenlee County

New Year's Gift (Duncan)—Compressor being installed.

Maricopa County

Eyrich (Phoenix)—Free-milling ore sampling over \$12 developed to extent of 9,000 tons in 300-ft. shaft and 300 ft. of drifting. Main exploration will be on 500 level. Property in Winifred district, eighteen miles north of Phoenix. John F. White manager.

Abe Lincoln (Wickenburg)—Work resumed with three shifts after several weeks' shutdown. Shipments being made.

Dragon (Wickenburg) — Fifty-ton mill to be started soon on gold-silver-vanadium ore. Shaft to be deepened from 260 ft. to 1,000 ft. About 2,000 ft. of underground development already done. Operated by Los Angeles company, headed by James G. Scarborough.

Pima County

Vulcan (Tucson)—Sold to William Kemp and associates, of New York. Property, in San Xavier district, has been held by W. R. Ramsdell, Epes Randolph, Charles Walker and James N. Pemberton.

Yavapai County

Gadsden (Jerome)—Closed down for repairs.

United Arizona (Jerome)—Completed timbering of main shaft to 875 level and installing new hoist. Property in Black Creek district, thirty miles from Jerome. Operated by Phoenix company, headed by C. H. Dunlap.

Verde Squaw (Jerome)—Second diamond-drill hole caved at 330 ft., after passing through 15 ft. of well-mineralized schist.

Hidden Treasure (Prescott)—Property in Groom Creek section, under development by Jerome company, headed by C. H. Bennett, of Clarkdale. J. H. Morrison, mine manager.

Tuscumbia (Prescott)—Old silver bonanza in Bradshaw Mountains be-

ing put in condition by Jerome company, headed by George Kingdon, manager, of United Verde Extension. New surface equipment being installed.

Yuma County

Ranier (Salome)—Two-compartment shaft down 80 ft. New hoist and compressor equipment being installed. William T. Gnash in charge.

New King of Arizona (Yuma)—Lower-grade ores to be worked in new mill. Operation made possible by development of water, impounded near mine, in Castle Dome mountains.

ARKANSAS

Marion County

Beulah (Rush)—Under lease to Arkansas Zinc Co. Sinking shaft to 51-ft. level, where zinc ore has been proved by drilling. Now down 14 ft.

Mattie May (Rush)—Small force of miners at work on property. Mill completed.

LA GRANG HYDRAULIC MINE, TRINITY COUNTY, CAL., NOW CLOSED DOWN

North Star (Yellville)—Will start active mining and milling operations at once.

Independence County

Polk-Southard (Batesville) — Independence Mining Co. operating Polk-Southard manganese mine, has produced since May 31 800 tons of high-grade boulder ore, averaging 50½ per cent metallic content. Shipments of this made on last year's contract.

CALIFORNIA

Amador County

Keystone (Amador City)—Preparations nearly completed for operation on large scale. Wooden timbers in upper part of shaft being replaced by concrete, which is expected to eliminate expense caused by settling ground around shaft. Hoisting equipment being overhauled.

Central Eureka (Sutter Creek)—Twenty-five stamps of forty-stamp mill now in operation. Development work confined principally to 3,700 south drift, which is 81 ft. from shaft and contains 5 ft. of quartz averaging about \$17 per ton. Restraining dam for impounding tailings being enlarged and strengthened.

Calaveras County

Triple Lode Gold (Angels Camp)—Old Blair gold-quartz mine, idle for sixteen years, to be operated by new California company, headed by T. L. Brophey. Hoist installed at old shaft, and former workings being unwatered.

Finnigan (Carson Hill)—Bonded by James R. Keith Co., of San Francisco. Old mill dismantled and site selected for new mill. Property adjoins Morgan mine.

Kern County

Rand Silver Con. (Randsburg)—Persistence of high-grade contents proved to 75-ft. depth by uncovering of third rich streak at this depth. Width of new shoot 5 ft. Crosscutting begun at 50-ft. level, where second high-grade pocket was found. Lessees working in six different places. Deep-est shaft 80 ft.

Modoc County

High Grade (Alturas)—Acquired by Lester Reynolds, who will operate during winter.

Nevada County

Alta Hill (Grass Valley)—Roy King has taken option on fifteen parcels of land noted in past for yielding placer gold, but which show no quartz outcrops. Undertaking based on geological study of district. Development planned by tunnels.

Idaho Maryland (Grass Valley)—Deed of conveyance recorded transferring holdings of Union Hill mines to Idaho-Maryland Mines Co. Sale includes all claims and machinery.

Placer County

Rising Sun Con. (Colfax)—Electric power line under construction from sub-station at Colfax. Pumps and hoists installed, and unwatering of shaft has reached point between second and third levels.

Plumas County

Walker Copper (Portola)—Hauling concentrates to railroad in four 5-ton trucks. Mill capacity increased to about 200 tons per day. Concentrates run from \$8 to \$12 per ton in gold and silver, in addition to copper contents. Right of way secured for aerial tramway, to reduce shipping expense.

Walker Consolidated (Portola) — Property adjoining Walker Copper mine and including Alta-Alice group of claims to be prospected by two diamond-drilling outfits.

Sierra County

York Finney (Downieville)—Bonded by James F. Hunt, former district attorney, who plans to unwater shaft and drift north and south on gold-quartz vein.

Hilo (Sierra City)—Bernhardt Brothers waiting for rain to wash large amount of gravel stored on dumps.

COLORADO

Hinsdale County

Golden Fleece (Lake City)—Mill being overhauled and re-equipped for flotation. Dump will be re-treated. Concentrates to be shipped to Salida.

Sulphuret M. & R. (Lake City)—Extending tunnel to connect with old shaft to improve ventilation. When completed will develop on larger scale. At present shipping small tonnage of \$50 silver-lead ore.

Ouray County

Revenue Tunnel (Ouray)—A. S. & R. Co., lessee, has let four development contracts and ordered 10,000 ft. of timbers. J. Gordon Hardy, consulting engineer.

Yankee Girl (Ouray)—Hoisting silver copper ore from famous old chimney. Acid water on lower levels hindering reopening.

Saguache County

Rawley (Bonanza)—Owners will operate mine, which has been idle since 1912. Property has large amount of \$20 ore blocked out.

Summit County

Laurium (Breckenridge)—Blue Flag Gold Mining Co., of Cripple Creek district, cleaning out old workings of Laurium group, in Illinois Gulch. Property recently visited by J. F. Erisman, president.

Warrior's Mark (Breckenridge)—To be operated after long idleness by Warrior's Mark Mining Co., recently incorporated by Samuel Klous, of Boston, County Treasurer George Robinson, and County Assessor William Keogh.

Teller County

Acacia Gold (Cripple Creek)—Has resumed sinking South Burns shaft on Bull Hill from 1,450 level to 1,550 level. Will crosscut at latter depth to Shurtloff vein.

Caley mill (Cripple Creek)—Property on Iron Clad Hill being dismantled by Morse Machinery Co., of Denver.

KANSAS

Joplin-Miami District

Miami Zinc & Royalty Co. will build mill on Wauchessette lease west of Treece, Kan. Property good producer with hand jigs. Company operating Oko mine, south of Picher. W. H. Tylee, of Boston, president, and T. F. Lennan, of Joplin, vice-president and general manager.

Silver Fox (Baxter)—New mill, replacing one destroyed few months ago by fire, almost completed.

Oberman (Jefferson City, Mo.)—Sinking shaft on ground leased from Wright estate, recently purchased from A. E. Bendelari and others. Tract has been well drilled.

Andrew Bros. (Joplin)—Empire tailings mill purchased and being moved to Wyandotte lease, at Galena.

High Five (Joplin)—Has completed sinking of new field shaft and connected it with mill by tramway.

Union Metals (Joplin)—Sinking of No. 8 shaft begun at Waco property. No. 7 shaft virtually completed.

MICHIGAN

Copper District

Calumet & Hecla (Calumet)—Operating two shafts two shifts daily on Osceola lode and all shafts two shifts daily on Calumet conglomerate. Building new railway from Ahmeek direct to stamp mill is being discussed. Experimenting with electric smelting, but not successfully. Survey of smeltery situation under way, but no decision as to extent of rebuilding operations at Hubbell plant.

Wolverine (Kearsarge) — Working two shafts, Nos. 3 and 4. Eight lower levels producing good copper. Operations back of foot wall in upper levels satisfactory.

Lake (Lake Mine)—Michigan shareholders favor resumption of operations. Sixteen facings in copper rock when work was suspended. Sufficient men for basis of new crew residing at property.

White Pine (White Pine)—Two shafts now working, and crew increasing steadily.

Gogebic Range

Mines on Gogebic Range made record shipments recently when 200,000 tons of ore was forwarded to Ashland docks in three days.

Village of Wakefield will soon vote on proposition to incorporate as a city. Limits would be established so as to include Wakefield Iron Co. and Plymouth open pits, as well as several underground mines. May mean increased taxes for mines concerned.

Newport (Ironwood)—"K" shaft sunk and station cut on 26th level, where development work will soon begin.

Oliver (Ironwood)—Mines began to stock again Sept. 25. Condition probably temporary and owing to lack of boats at Ashland docks rather than to steel workers' strike.

Pabst (Ironwood)—Hoar loading

machine ordered for power plant for loading coal from dock into cars. Cars trammed to elevator at boiler house, raised to top of coal bins, run over automatic weighing machine, and dumped. Seven 150-hp. return-tubular and three 400-hp. water-tube boilers in two batteries, former supplying hoists and compressor, latter turbo-generators.

Plymouth (Wakefield)—Drifting continued at 125-ft. depth in drainage shaft sunk from bottom of pit. Only two shovels working in ore.

Marquette Range

Cliffs Shaft (Ishpeming)—Good progress being made with new concrete shafthouses. Expected to be completed before cold weather. Will be first of this type on range. Quarter million tons of ore in stock will be carried over.

Mary Charlotte (Negaunee)—Half of crew of 150 miners of Breitung Hematite mine transferred here. Over 350 now working at Mary Charlotte. All ore in stock to be shipped.

MONTANA

Silver Bow County

Anaconda (Butte)—August copper output of Washoe and Boston & Montana smelteries 12,600,000 lb., compared with 11,122,000 lb. in July and 10,530,000 lb. in June. Scarcity of experienced miners reported. Company speeding up on development work.

NEVADA

Clark County

Yellow Pine (Goodsprings)—On Sept. 1 management voluntarily raised wages of muckers, trammers and laborers 25c. per day to \$4.75. Miners, machine men, timbermen and millmen received 50c. per day advance.

Esmeralda County

Atlanta (Goldfield)—Deep workings being abandoned and pumps pulled from main Atlanta winze from 1,750 level. Winze and 1,750 level will be allowed to fill. Future work in Atlanta will be done from 1,465 level of Grizzly Bear.

Mineral County

Candelaria (Mina)—An eight-drill Chicago pneumatic compressor shipped to Candelaria, and accommodations for force will be built at once.

Nye County

Louisiana Con. (Tybo)—Contract for surveying and installing transmission line from Manhattan to Tybo, to furnish power for mine and smeltery, let by Nevada-California Power Co. F. W. Draper manager of the Louisiana Consolidated.

White Pine County

Boston & Ely Con. (Ely)—Stockholders on Sept. 10 voted to sell property and assets of Ely Northern Copper Co. to Boston and Ely Consolidated Mining Co. for \$77,445. Transaction completes merging of Boston Ely, Smoky Development Co., and Ely Northern Copper.

McEllin (Hamilton)—Fifty-ton concentrator, being built by Sayers and Tilford, lessees, to treat dump, almost completed. Estimated dumps contain 80,000 tons which will run \$12 per ton.

NEW MEXICO

Grant County

Hanover-Bessemer (Fierro) — Shut down on account of steel strike; 300 men affected.

OKLAHOMA

Joplin-Miami District

American Z. L. & S. (Joplin)—Has taken working option on forty-acre lease south of St. Louis, Okla., and has several drills at work.

Rialto (Miami)—Purchased by E. S. Warner, of Buffalo, Mo. Will be operated after year's idleness. Situated south of Picher camp.

Niangua (Picher)—Followed recent purchase of Hare mine on adjoining lease with purchase of Diamond Joe mine, northwest of Quapaw. Building underground hopper at latter plant, which will be known at Niangua No. 3. Henry Medlin, of Miami, manager.

Vantage (Picher)—Annual election of officers resulted in naming Dr. C. D. Clapp, of Moberly, Mo., president; W. C. Cole, Bethany, Mo., vice-president; W. W. Innis, Miami, Okla., secretary-treasurer; R. P. Sharpe, Miami, director and general manager.

TEXAS

Brazoria County

West Columbia Field Production for second week in September reported approximately 36,000 bbl. daily.

Hurricane at West Columbia destroyed eleven derricks and did considerable other damage on Sept. 14.

Eastland County

Gulf Production (Pleasant Grove)—Oil well brought in unexpectedly night of Sept. 13 was ignited. Difficulty expected in smothering fire.

Harris County

Operations at Humble Field: Syrian-American Oil Co., No. 4 McDonald, abandoned; Texas Co., testing 178 Herman at 1,250 ft., and abandoned No. 28 Koehler 2,420 ft.; Brazos Oil & Refining Co., abandoned No. 5 Fuller well.

Jefferson County

Deep Wells at Spindletop now drilling are Texas Co., No. 1 Fee, 2,400 ft. deep, and No. 2 Fee, 2,200 ft.; Wilson & Broachi, No. 1 Green, 2,100 ft.; Crown Oil & Refining Co., No. 1 McFadden, starting to drill.

Liberty County

Big Four Oil (Hull)—Brought in No. 5 Hannicker well at 2,570 ft., flowing 25 bbl. daily by heads.

Hull Field Production second week in September about 2,600 bbl. daily. Recent completions: Big Four, No. 5 Hannicker well; Humble Oil & Refining Co., No. 1 Palmer; and Gulf Production Co., No. 1 Thomas.

Matagorda County

Texas Co. (Markham)—No. 6 Meyers well making heavy gas pressure from 3,100 ft.

Texas Gulf Sulphur (Gulf)—Hurricane Sept. 14 destroyed three derricks. Allen Texas (Matagorda)—Derrick on No. 1 Baer well at Big Hill destroyed by hurricane Sept. 14. Drilling may not be resumed.

UTAH

Juab County

Lehi Tintic (Eureka)—Board of directors elected: George Nicholls, president; W. H. Trask, vice-president; C. D. Anson, G. B. Doyle, J. A. Barclay, and Charles Zabriskie, manager.

Sioux Con. (Silver City)—At meeting of Knight mining companies held in Provo, Sept. 10, taking over of this property announced.

Salt Lake County

Little Cottonwood Transportation (Alta)—Has increased rates, beginning Sept. 15, with permission of Public Utilities Commission, all increases

Utah Copper (Salt Lake City)—Company has invited employees to select representative committee of three to consult with management on subjects of mutual interest.

CANADA

British Columbia

Cork-Province (Slocan) — R. H. Stewart, mining engineer, has recommended expenditure of \$100,000 as necessary to insure continuous ore supply, also that shaft be deepened and equipped, that more power be developed, that drifts and raises be driven on new level, and possibly additions be made to mill.

Boston-McCrea (Boston Creek)—Electrically driven mining plant will be installed.

Coniagas (Cobalt)—Now treating 225 tons of ore and 250 tons of tailings daily.

La Rose (Cobalt)—Has found high-grade ore in vein at No. 3 shaft of University. Workings now being dewatered.

Mining Corporation (Cobalt)—Developing gold property in Caribou district, British Columbia.

Nipissing Extension (Cobalt)—Has taken over old Farrar property. Company capitalized at \$3,000,000. A. J. Young, of Northern Customs Concentrators, president.

Green-Kirkland (Kirkland Lake)—Camp buildings erected and twelve men engaged in prospect work.

Murray-Mowgridge (Larder Lake)—Shareholders have ratified deal to reorganize by selling assets to new company called Murray-Mowgridge Mines, Ltd., in consideration of 1,928,870 shares of new company. New York interests have agreed to underwrite 200,000 shares of stock, with which to wipe off existing obligations, completing purchase price on certain properties, and furnishing funds for development. Property being developed on 200 level, and shaft will be continued to 300 level.

MEXICO

Baja California

Boleo (Santa Rosalia)—August production of copper, 1,597,040 lb.

Sonora

Nacozari Con. Copper (Douglas, Ariz.)—Deep development and drainage tunnel advanced approximately 200 ft. monthly during last three months, with formation showing almost continuous network of small seams of chalcopryite, with bornite streaks at intervals. General formation now showing monzonite and rhyolite porphyry. Main breast now 3,900 ft. from portal and within 300 ft. from oxidized outcrop. Moderate tonnage of \$300–\$400 silver ore coming from San Pablo mine. San Pablo drift will soon connect with San Pablo working shaft, thus providing drainage and ventilation. Company's wagon road to Nacozari now in good condition for auto truck.

BELGIAN CONGO

Katanga (Elisabethville) — August production of copper, 5,026,488 pounds.

MOUNT NELSON FROM SITTING BULL CABIN, WINDMERE MINING DIVISION, BRITISH COLUMBIA

asked by company having been granted except in case of low-grade ores, for which increase of 30c. per ton allowed, instead of \$1, as proposed.

Monetaire Mining (Alta)—Suit filed by N. V. Jones against board of directors—D. J. Williams, president, M. H. Kriebel, Paul Platt and Mrs. M. A. Williams—and Monetaire Mining Co., to declare void alleged action of board in appropriating \$14,000 as president's salary for seven years back and in levying assessment of 1c. a share. Conspiracy to defraud alleged.

Bingham & Garfield (Bingham Canyon)—Restraining order asked by Col. E. A. Wall, to prevent company from constructing tracks across Klondike, Starless, Keystone, St. Patrick, and Sarsfield claims, owned by him, interference with extraction of ore deposits from claims being alleged as ground for suit.

THE MARKET REPORT

Silver and Sterling Exchange

Sept.	Sterling Exchange	Silver		Sept.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
18	414½	1137	61½	22	414½	114½	62½
19	415½	114	62	23	415½	115½	62½
20	415	114½	62	24	417	116½	63

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

Sept.	Copper		Tin		Lead		Zinc
	Electrolytic	Spot	Spot	N. Y.	St. L.	St. L.	St. L.
18	21½@22½	55	54½	6.25	5.95	7.10@7.15	7.10
19	21½@22½	54½	54	6.15@6.25	5.95	7.10	7.10
20	21½@22	55½	54	6.15@6.25	5.95	7.05@7.10	7.05@7.10
22	21½@22	54	54	6.15@6.25	5.95@6.00	7.05@7.10	7.05@7.10
23	21@21½	53½	53	6.15@6.25	5.95@6.00	7.00	7.00
24	20½@21	53½	53½	6.25	5.95@6.00	6.95@7.00	6.95@7.00

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.12c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

Sept.	Copper			Tin		Lead		Zinc	
	Spot	3 M.	Electrolytic	Spot	3 M.	Spot	3 M.	Spot	3 M.
19	100½	101½	110	281	275½	25½	26½	41½	42½
20	100	100	110	278½	273½	25½	26	41½	42
22	100½	100½	110	278½	273½	25½	26	40½	41½
23	100	100½	110	276½	273½	25½	26	41½	42½
24	99½	100½	110	277	274½	25½	26½	41½	42½

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York—Sept. 24, 1919

The predominant feature in all of the metal markets this week was the steel strike, the coming of which was clearly foreseen for several days before the event. Under this influence, there were further recessions in the price for copper, spelter, and tin.

Copper

About the same conditions prevailed as in the previous week, except that prices were lower. There was the same differential of about 3c. per lb. between wire bars and ingot bars. Big producers did no business. They received some inquiries from consumers, with intimations that the latter would not pay the producers' price, but would pay something above the market price established by the smaller agencies and brokers. The principal producers, however, refused to entertain such overtures.

A small tonnage of copper was sold for export to Germany.

Copper Sheets—The base price of copper sheets is 33½c. per lb. Demand strong. Copper wire is quoted at 26@26½c. in carload lots, f.o.b. mill. Market is dull.

Tin

The approach of the steel strike inspired tinsplate manufacturers to refrain from buying, and in some cases to offer tin for resale. This precipitated a sharp decline. At the beginning of the week Straits was quoted at 56½@56½c. At the close, business was done at 54c.

Lead

Some pretty good business was done by those producers who had prompt lead available, and in general they realized the full price for it. However, some rather large business was done at a sharp concession by one manufacturer who had a good buyer. There is still a considerable quantity, estimated at about 2,500 tons of lead, for sale by second-hands, but to a considerable extent this is in out-of-the-way markets. For example, a considerable tonnage of lead in Boston was offered at 6c., and relatively low offers were made on lead at Baltimore and Cleveland. Though the quantity of second-hand lead in this market appeared to be small, if it existed at all, producers selling from the refineries in the New York district had to meet the competition of second-hand lead from places like Hartford.

Zinc

A small business was done from day to day at declining prices, but the aggregate was small. The steel companies requested postponement of deliveries, and brass manufacturers had no interest in buying. The demand for high-grade zinc was as dull as for Prime Western.

Zinc Sheets—The quoted price of zinc sheets is \$10.50 per 100 pounds.

Aluminum—Virgin metal quoted at 33c. per lb. No change. Market quiet.

Antimony—The market continued quiet and unchanged at 8½ and 8¾c. for spot. Futures were quoted lower, 8½ and 9c. being mentioned.

Bismuth—Unchanged at \$2.96.

Cadmium—Unchanged at \$1.40.

Nickel—Ingot, 42c.; shot, 43c.; electrolytic, 45c.

Quicksilver—The advance continued, and \$109 was reached and maintained for a day or two, the market then receding to \$105. This probably occurred under the influence of the expected arrival of 500 flasks of Italian quicksilver from Genoa. San Francisco telegraphed \$102, steady.

Silver—Owing to the large and incessant demand on China account, silver has advanced rapidly, during the last week about 3c. per ounce, and closes firm at the highest price prevalent in a long time.

Mexican dollars at New York: Sept. 18, 87½; Sept. 19, 88½; Sept. 20, 88½; Sept. 22, 88½; Sept. 23, 89½; Sept. 24, 90½.

Platinum—This market continued to be excited. The metal is in strong demand and the supply is scarce. We quote refined ingot at \$130 and \$140.

Palladium—Unchanged at \$120.

Chromium Ore—No business reported.

Manganese Ore—No business reported. The ideas of the buyers and sellers are far apart.

Molybdenum Ore—No business reported.

Tungsten Ore—There was no change in the situation.

Joplin, Mo., Sept. 20.—Zinc blende, high, \$47.20; basis 60 per cent zinc, premium, \$43.50; Prime Western, \$42.50; fines and slimes, \$40@37.50; calamine, basis 40 per cent zinc, \$30@26. Average settling prices, blende, \$43.09; calamine, \$28.22; all zinc ores, \$42.76. Lead, high, \$71.15; basis 80 per cent lead, \$70@65; average selling price, all grades of lead, \$66.84 per ton.

Platteville, Wis., Sept. 20.—Blende, basis 60 per cent zinc, \$43.50 for premium grade and \$42.50 for Prime Western grade. Lead ore, basis 80 per cent lead, \$70 per ton.

Pig Iron—Prices unchanged.

Steel—No market. Prices are quotable unchanged.

THE MARKET REPORT

Daily and Weekly Metal and Mineral Prices
Metal Market Conditions, Average
Monthly Prices, Stock Quotations

Silver and Sterling Exchange

Sept.	Sterling Exchange	Silver		Sept.	Sterling Exchange	Silver	
		New York, Cents	London, Pence			New York, Cents	London, Pence
25	420	118 3/4	63 1/2	29	423	117	62 1/2

27	426	118 3/4	62 1/2	Oct. 1	418	119	64

New York quotations are as reported by Handy & Harman and are in cents per troy ounce of bar silver, 999 fine. London quotations are in pence per troy-ounce of sterling silver, 925 fine.

Daily Prices of Metals in New York

Sept. Oct.	Copper		Tin		Lead		Zinc	
	Electrolytic	Spot	N. Y.	St. L.	St. L.	St. L.	St. L.	
25	21 @ 21 1/4	53 1/2 @ 53 3/4	6 1/2	5.95 @ 6.00	6.95 @ 7.00			
26	21 1/2 @ 21 3/4	53 1/2 @ 53 3/4	6 1/2	5.95 " 6.00	6.95 " 7.00			
27	21 @ 21 1/4	53 1/2 @ 53 3/4	6 1/2	5.95 " 6.00	6.95 " 7.00			
29	20 3/4 @ 21 1/4	53 1/2 @ 54	6 1/2	5.95 " 6.00	6.95 " 7.00			
30	21 @ 21 1/4	53 1/2 @ 54	6 1/2	5.95 " 6.00	6.85 " 6.90			
1	21 @ 21 1/4	53 1/2 @ 53 3/4	6 1/2	5.95 " 6.00	6.85 " 6.90			

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

London

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

NEW YORK, Oct. 1, 1919.

The market this week was dull and uninteresting. However, it began to appear as if there might be some of the skies in the copper situation. Transatlantic freights were again easier without there being any change in quotations. Freight to Hamburg could be arranged at \$13, and to French and Dutch ports at \$10. To British ports \$15 was asked, but probably \$12.50 could be done. An embargo on shipments to England by American boats was put into effect Monday noon, but British boats continued to sail. The rates from

San Francisco to Hongkong and Kobe remain at \$20.

Lucien Nachmann has joined the copper sales department of the American Smelting & Refining Co. Mr. Nachmann is a thorough expert in the metal selling business. He was in New York from 1890 to 1905 as representative of Brandeis, Goldschmidt & Co., and from 1905 to 1915 was in London as a partner in the same house.

The War Department reported on hand, as of Sept. 10, the following stocks of Metals: Brass (70-30), 79,207 tons; Brass (60-40), 28,636 tons; total brass, 108,311 tons; copper, 363 tons; pig lead, 1,000 tons; zinc, 10,820 tons.

COPPER.

Another week passed without the big producers doing any business, but the smaller agencies did a little. Copper continued to be offered from second-hands, but the supplies seemed to be greatly reduced, and ingot bars were no longer offered at such relatively low prices as previously. One small sale to Germany was reported, and one domestic consumer placed a million-pound order. All of the big producers received more inquiries from domestic consumers, and that fact in itself was regarded as encouraging.

TIN

Business was dull during the early part of the week, but was better on Monday and Tuesday of this week. However, the market went off today on some lower offers from London. This was rather surprising, in view of the opinion entertained in some quarters that the strike in Great Britain would check the shipment of tin from there.

In the early part of this week spot Straits was quoted in this market at 55c., but at the close it was offered at 54 1/2c., with the intimation that 54 3/4c. might be done on a fifty-ton order.

Singapore quoted £276 1/2, c. i. f., London, on Sept. 26; £279 1/2 on Sept. 29; and £280 on Sept. 30.

LEAD.

The market was rather dull, although some fair business was done on certain days. Every producer was firm in demanding 6 1/2c., New York. Some business was done around 6c., this representing the cleaning up of some speculative holdings. Cheap lead is still offered at points outside of New York, including Boston, but a good deal of this is strategically misplaced. A consumer buying at those prices and paying the freight to where he wants to use the lead is apt to find it rather costly, after all. Such experiences have been reported. On the other hand, speculative transactions might have different results.

The mines of the Coeur d'Alene continue closed, with the exception of the Bunker Hill and Sullivan.

The St. Joseph Lead Co. has not yet resumed smelting at Hercules, but expects to do so within a few days. The Doe Run brand of refined lead will be produced again, and will be offered at a premium of \$4 per ton over ordinary lead.

ZINC.

There was scarcely any buying by consumers. On the contrary, producers in general were in receipt of requests to defer shipments. This

was but natural, in view of the steel strike. On the part of the brass manufacturers the liquidation of the immense stock of brass held by the Government is going to throw a shadow over the markets, including that for spelter. Such buying of spelter as there was this week was mainly of speculative character.

Antimony—The market was quiet. We quote spot at 8½¢, and futures at 9@9½¢. The Chinese and Japanese houses are not at all keen about selling, their expectations being for higher prices.

Quicksilver—The market was quiet at \$105, with a fair demand and an absence of selling pressure. San Francisco telegraphed \$99.

Platinum—The market was more quiet, with quotations unchanged at \$130@140 for refined ingot.

Palladium—Unchanged at \$120.

Chrome Ore—Quoted at 80¢ per unit, delivered at Eastern works.

Manganese Ore—Quoted nominally at 50¢ per unit, c.i.f., Baltimore.

Molybdenum Ore—Quoted nominally at 75¢ per lb. of molybdenum sulphide.

Tungsten Ore—The situation remains unchanged. No business was reported and no quotations were mentioned. One buyer offered \$7 per unit, which price was regarded as too low.

CONDENSED FORM:

Copper Sheets—33½¢ per lb. Demand strong. Wire, 25½@26½¢. Market weak.

Zinc Sheets—\$10.50 per 100 lbs.

Aluminum—33¢ per lb.

Bismuth—Unchanged at \$2.96.

Cadmium—Unchanged at \$1.40.

Nickel—Ingot, 42¢; shot, 43¢; electrolytic, 45¢.

Pyrites—Spanish pyrites is quoted at 17½¢ per unit for furnace size ore, free from fines, c.i.f. New York or other Atlantic ports. Sulphur companies reported to be selling at prices as low as 14@15¢. Market unsettled.

Silver—The silver market continues firm. China continues to be the main support to the market. Shipments from San Francisco during August are reported as 9,900,000 oz.

Mexican dollars at New York: Sept. 25, 91¾; Sept. 26, 91¾; Sept. 27, 91½; Sept. 29, 89¾; Sept. 30, 91¾; Oct. 1, 91¾.

PITTSBURGH—Sept. 30.

The iron and steel strike started yesterday week, Sept. 22, and candid iron and steel manufacturers now admit they expected a somewhat larger one than occurred. Taking the industry as a whole, about 35 per cent of the men struck at the outset, and then there were various rearrangements. Where any large number of men at a plant or in a district struck, they intimidated the rest and got them out; where only a few struck they went back to work. For two days the decreases in employment exceeded the increases, and then for two days more there was an even

balance. By Friday morning more men were going back than were going out. Districts closed tightly were the Mahoning Valley, Cleveland (not including Lorain), and the Wheeling district, the Calumet district (Chicago and Gary) going down more than half, the South and East being scarcely affected, Johnstown and Buffalo, however, closing almost entirely.

Municipal Pittsburgh was little affected; the Monongahela Valley, an important part of the Pittsburgh district, developed 25 to 35 per cent unemployment, and the Shenango Valley 40 to 50 per cent. The Monongahela and Shenango Valleys at once became pivotal points, and developments there were watched narrowly, it being regarded from the outset as certain that if these districts would hold for the manufacturers Youngstown and other districts would eventually yield. After three or four days, conditions in the two valleys began to improve, and the improvement has continued to date. It is almost positively assured that the strike is a failure, but, taking the industry as a whole, the increase in employment from the low point is a small percentage and the increases in tonnage production is small, and Cleveland, the Mahoning Valley and the Wheeling district are closed as tightly as at any time, and resumption there may possibly be a matter of many weeks. There is no trustworthy information available here as to late developments in the Calumet district.

Pig iron and steel production, on the whole, is at a lower proportion to capacity than is employment. The strike is of course considered from the point of view of employment, not that of tonnage output. It is of minor consequence to the manufacturers how much they produce, and as to consumers, they have shown a remarkable spirit of co-operation, and, much as they would like to have deliveries, they are making no complaints. Producers are endeavoring to distribute their output in such manner as to give the widest employment among their customers. Shipments are no greater than production, if at great.

Pig Iron—As the strike is one of common labor almost exclusively, the blast furnaces are harder hit than the steel producing and steel rolling mills, and some steel mills have had production curtailed by shortage of pig iron as well as strike within the mill. As so many merchant furnaces are situated far from the centers where the strike is strongest, the total merchant furnace output makes a good showing, and pig iron is not likely to be made especially scarce. This analysis is confirmed by the continued good demand for foundry coke; furnace coke has gone begging. The Mahoning Valley furnaces are all down, but in the Shenango Valley four of the six at Sharpville, all down at one time, are now operating; two at West Middlesex were not closed, and the scattered western Pennsylvania furnaces are in most cases operating. Market quotations are unchanged: Bessemer, \$27.95; basic, \$25.75; malleable, \$26.25@27.25;

foundry, \$26.75; forge, \$25.75, f.o.b. Valley furnaces, with \$1.40 freight to Pittsburgh.

Steel—There is approximately an even balance between closing of mills that produce and that consume billets and sheet bars. Prices remain: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; rods, \$52.

Ferromanganese—One or two English producers are quoting \$95, c.i.f., for 80 per cent ferromanganese, the majority being out of the market. It is thought in trade circles that one or two will always be in the market. Before the complaint of "dumping" made before the Federal Trade Commission, nearly all the English producers were quoting. Hearings on the complaint thus far have not been public. Domestic producers continue their quotation of \$110, delivered. There is no demand.

Coke—Shipments of furnace coke on many contracts have been suspended on account of the strike. Operators endeavored to meet the situation by drawing ovens less frequently, but coke accumulated and has been offered at \$4 or less without finding takers. One buyer bid \$3.25. Foundry coke has been in excellent demand, and prices are if anything stiffer, fairly good grades commanding \$6.25 in open top cars and \$6.50 in box cars, per net ton at ovens, Connellsville region.

NEW YORK—Oct. 1, 1919.

Buying has been checked but not suspended by the iron and steel strike, according to Iron Age. Bookings are chiefly with the furnaces and mills not seriously affected.

The continued favorable progress of the strike is all that the producers expected. Where protection is sufficient to prevent intimidation workers are returning. Much encouragement is taken from the refusal of the Bethlehem employees to go out and from the conditions in the pivotal Monongahela Valley. The continued absence of marked rioting, usually a sign of a collapse, points to a drawn-out issue.

Following the 30,000 tons of basic iron reported last week, the American Bridge Co. has closed on 15,000 tons more. The basic market is now stronger at \$1 per ton above the basis of these sales. Fresh inquiries for about 10,000 tons of foundry iron for next year have appeared in New England. The Middle West is taking iron from western Pennsylvania, involving an added freight cost.

Plate mills willing to take on further commitments have no difficulty in getting 2.65¢, Pittsburgh, though 2.55¢ was quoted on 4,800 tons for Japan.

The scarcity of steel bars, for months in demand, is putting activity in bar iron, and advances for prompt shipment are not unlikely.

Producers remain firm in their determination to shut down mills if it is not safe to run them, and consumers are expressing an unqualified support. It remains that without relief in thirty days the automobile industry will begin to feel the pinch.

Prompt blast-furnace coke is lower, due to an accumulation at ovens.

THE MINING INDEX

Listing Special Articles of Interest
And Value to the Miner
And Metallurgist

This index is a convenient reference to the current literature of mining and metallurgy published in all the important periodicals of the world. We will furnish a copy of any article (if in print) in the original language for the price quoted. Where no price is quoted the cost is unknown. Inasmuch as the papers are not ordered from the publishers, there will be some delay for the foreign papers. Remittance must be sent with order. Coupons are furnished at the following prices: 20c. each, six for \$1, 33 for \$5, and 100 for \$15. When remittances are made in even dollars, we will return the excess over an order in coupons, if so requested.

Salutatory

THE accession to office of the new editor, and his assumption of the editorial "we," came at a singularly inauspicious time, being signalized by a presumably purely coincidental printers' strike and the suspension of the Engineering and Mining Journal for the first time in its history. The assumption of the coincidental nature of the strike is strengthened by the fact that about two hundred other New York periodicals similarly suspended.

The strike which caused this hiatus is of unusual interest in that it represents a contest between organized labor, as commonly so understood and represented by the American Federation of Labor, and certain local unions, which are characterized as "out-law" unions, and whose demands for shorter hours and larger pay at this time have been denounced by the American Federation as springing from a radical, un-American, and Bolshevik program.

Whatever may be the ultimate explanation of the particular disturbance which has upset the periodical publishing industry of New York, there may well be more coherence and significance in the present widespread strike disease than is proclaimed from the housetops, and in the signs that strikes emanate from propaganda foreign and opposed to the more intelligent policy of organized American labor, which proved its patriotism and its enmity to revolutionary doctrines during the war. The existence of such propaganda indicates a guiding central organization, concerning which we have no adequate information, and which, therefore, is secret. The existence in the United States of such an organization, devoted to the overthrow of existing society and government, is known in a general way from various evidence and bits of testimony; as is also the fact that the real headquarters of this movement are not in the United States but in Europe. Russia is the source whence the missionaries of these subversive doctrines and the funds for its anti-American campaign are most commonly reported to have come. On the other hand, a magazine correspondent asserts positively that the real head of the movement is a Prussian, whose headquarters are in Switzerland, of whom Lenine and Trotzky are emissaries and subordinates, and that from these Swiss headquarters campaigns of strikes and other movements for the sapping of government are directed in various parts of the world.

In this connection, one recalls with curiosity the statement of the chairman of an investigating committee of the New York Senate the other day to the effect that the present industrial strike epidemic is

due to a German plot to control the world's commerce. Whether such is the basis of our present difficulty, or whether some of these unintelligent strikes are in part or in whole due to the hilarious joy-riding of the wage-earner trying to find out how far his luck will carry him, we have no means of estimating; but our judgment is that the organized radical movement will be found strongly underlying.

The Mining Engineer And the State.

IN HIS presidential address at the Chicago meeting of the American Institute of Mining and Metallurgical Engineers, Horace V. Winchell touched a high note in appealing to mining engineers not to neglect public duties in their absorption in their chosen profession. We shall publish this address soon. Meantime, we wish to second the appeal of Mr. Winchell in this regard. No body of men is more qualified to be of public service than mining engineers. Contrary, perhaps, to the common impression in the East, they are a class of men holding to an unusually rigid ethical code; they are seasoned and resourceful, and they have conspicuously the advantage of being on easy and equal terms with all classes and castes. Therefore, they are Americans in the highest sense and are qualified to serve their fellow citizens and the common weal better than most other classes of men.

It is in a way unfortunate that the conservatism of the engineer, which is a natural accompaniment of his experience and insight, should have kept him so largely aloof from public affairs and from active interest in public questions. The war tended to call the mining engineer from this seclusion and brought him to the fore, where he served with success, not only in the Army but in many other responsible emergency positions, where his special training and acquired initiative were of value.

The present days are hardly less grave and important. The violent and vociferous minority which is campaigning to smash the Constitution and substitute for the ideals of democracy the oligarchic yoke of the bigot, can only be successfully subordinated and relegated to its proper proportions by a live interest and activity in public affairs and all questions of the day by such men as the mining engineers and others of like type.

It is a duty no less imperative at the present day than that which the mining engineer owes to his family, to serve the democratic state actively and sternly, and not contribute by impassivity to the rule of an ignorant minority.

The cultivation of honest politics as a national sport would solve most of our problems. We have a larger fund of intelligence and common sense than other nations, and the problem is to get it into action.

The Neglect of the

Non-Metallic Minerals

THE non-metallic minerals have been considered as of minor importance in the mining industry. With the exception of such substances as phosphate rock, limestone, dolomite, and recently magnesite, attention has been concentrated largely upon the metallic minerals.

In recent times we have seen the development of the alloy steels, with the resulting benefit to the structural engineer, in the manufacture of the high-speed engine and tool steels. Tungsten in illumination, radium in medicine, Monel metal where tensile strength and non-corrosive qualities are required, antimony in type metal and shrapnel lead, arsenic in agriculture, the copper-tin-lead-antimony alloys for anti-friction metal, alloys of nickel and chromium as resistance substances in electrical work all have been developed by the persistent effort of technologists, mostly within the last two decades. The use of zinc as roofing material and for electrical fixtures, as well as for many other purposes, is being advocated by the American Zinc Institute. Recent efforts have been made to introduce the use of lead in galvanizing as a substitute for zinc.

The utilization of products of non-metallic minerals has not kept apace with their associates in the mining field. This may be because the latter have offered a greater promise of success to the investigator and inventor.

Just what possibilities lie within the realm of the non-metallic mineral industry, no one would be justified in attempting to predict. As there is comparatively little present use for many minerals of this class, deposits remain undeveloped, and where these occur with other minerals, at present more valuable, they are usually rejected as waste. Imports of pottery are being made in large quantities into this country when it is entirely probable that some domestic clay deposits could be further utilized.

About 20,000 tons of strontium hydrate manufactured from celestite was reported to have been used in Germany for the extraction of sugar in the beet-sugar industry in one year, and barium compounds have also been put to a like use. The manufacture of barium salts was almost entirely confined to Germany before the war. Since the German-owned patents have become available to enterprising American manufacturers, there has resulted the development of the extensive American deposits on what promises to be a large scale. Our sulphur production under normal operations far exceeds the demand. Is it certain that none other than the present uses can be found for this important mineral?

Sufficient research work should be conducted by Government agencies, scientific bodies and by private enterprise to discover further the utility of the non-metallic minerals. The committee on Non-

Metallic Minerals of the American Institute of Mining and Metallurgical Engineers has undertaken to further this purpose by the collection and dissemination of information among possible producers and consumers. State geologists and individuals with opportunities of knowing the resources of certain localities can co-operate by contributions to the general literature on this subject.

Do You Appreciate the

Value of the Scrap Heap?

DURING the war, mining and metallurgical managers operated their plants for the most part at maximum capacity. Considerable new equipment was installed, but in many cases repairs were deferred. To shut down a machine for the time which would be required for repairs was thought inadvisable, and then, too, the idea was current that prices were very high only temporarily, and that work not absolutely necessary could better be postponed until supplies were more plentiful.

The time of stress is passed. Most mining works are now operating at a fraction of their capacity, so that needed repairs and replacements can easily be made without sacrificing production. Economists believe that a new price level has been established, which will not be materially reduced for several years; in fact, in many cases, prices are still advancing, so that purchases should not be deferred in the belief that more advantageous terms may be made in the near future.

Soon, we hope, the treaty of peace will be signed, and credits will be established between nations. Mining, one of the most basic of all industries, may be expected to be one of the first to be called upon to rebuild Europe. The mining industry should be ready with its machinery in the most efficient condition. Too often, when business is good, the tendency is to say "We have no time for changes," and when business is bad, "Times are hard, and we cannot afford to spend the money."

The economy of labor, at its present high price, is something to which we must all give attention. Nothing is so wasteful in this respect as a decrepit machine, and it belongs on the scrap pile. Former well-reasoned decisions must be revised, for a machine which was economical five years ago may not be so today, though, in itself, it may be just as efficient.

Some years ago, when mottoes were more popular as an office decoration than they are today, the writer had one on his desk reading somewhat as follows: "The principal reason for the success of the American business man is that he appreciates the value of the scrap heap." The manager of the plant, which was in none too prosperous a condition, was a parsimonious individual, and, spying the motto one day, said "Yes, that is very true; lots of material is thrown on the scrap heap which might be made to serve a little longer." Thus we have the other point of view. But it is not the big way to look at things—what we like to think of as part of the American Idea. Pennies saved do not always grow to be dollars in the bank.

Too Much Regulation

SENATE Bill No. 2896, introduced by Senator Nelson on August 23, 1919, provides for Federal regulation of the manufacture, sale, purchase and use of explosives. It follows closely the line of the U. S. Explosives Act, the salient features of which were published in the Journal of February 22, 1918, p. 378. The Explosives Act was designed to cover the conditions growing out of the war. The proposed Federal regulation is objected to by mining and other interests in California for the following reasons:

First, it places an additional unnecessary burden upon mine operators.

Second, it will supersede an already workable and practicable State statute now in force in California, which, together with certain rules and regulations adopted by the Industrial Accident Commission of the State of California, provides for the manufacture, sale, use, and storage of explosives.

Third, the revenue provided for therein would be entirely inadequate to meet the cost of enforcement.

In an editorial appearing in the Journal on June 21, p. 1098, there was pointed out the need of close control upon the distribution and use of explosives, and the question was raised as to whether it would not be good public policy to have uniform state or Federal laws to cover this need. Under our system of government, the control of explosives used within a state is vested in the state government. It is a part of the state police powers, as well as a part of the activities of State Industrial Accident Commissions or other state organizations concerned with the safe operation of mines.

There are already adequate Federal laws regulative of the interstate transportation of explosives. We believe that a general Federal enactment of the kind proposed, however desirable it may appear to be from the standpoint of public safety, would lead to confusion, and that if it were not efficiently carried out it would be ineffective. Placing such an act in the hands of the Commissioner of Internal Revenue and his department does not denote a comprehensive understanding of the mining industry and the peculiar conditions which prevail in different states.

It is to the interests of the mining industry of the separate states to secure legislation through their respective state legislatures to cover the need for close control, without imposing excessive and irksome restrictions. It is probable that there are already state laws, as in the case of California, which meet the situation.

Wasting Heat on the Slag Dump

IN THESE days of conservation, the sight of hundreds of tons of red-hot slag being poured out on smeltery dumps arouses in the thoughtful observer a feeling of regret, the extent of which depends, to a considerable extent, on the amount of his domestic fuel bill. Great advances have been made in metallurgy, but too little attention appears to have been devoted to the heat balance of metallurgical furnaces, more particularly in the utilization of the heat

in the molten products. The heat in the gaseous products is in many cases partially turned to profitable account.

A ton of slag from a copper smelting-furnace contains roughly 1,400,000 B.t.u., which might be utilized. In coke at \$10 a ton one can buy 25,000 B.t.u. for one cent; or with coal at \$5 a ton, 50,000; or with oil at \$2.50 a barrel, 20,000. Each ton of slag poured on the dump thus represents a loss of 30 to 70 cents in its heat content alone; in a plant where 3,000 tons of slag is poured every day, the yearly loss is in the neighborhood of half a million dollars. The magnitude of the loss is appalling.

Metallurgists are inclined to confine research to those problems which apparently offer the greatest probabilities for a successful solution. Yet the work may result in a saving of only \$100 a day, whereas twice as much work on a harder problem may mean a reward of \$500 a day. Saving the heat from molten furnace products is one of those problems which we are likely to postpone until some less visionary ideas have been developed. Yet, we do not wish to give the impression that schemes have not been devised for this purpose. The proposal has been made to run the slag into molds placed on trucks, which are drawn through a tunnel. Air passing through the tunnel in the opposite direction becomes heated and may be used for various purposes, such as under boiler fireboxes, for heating blast, and similar operations. A patent has been used on a method of running the molten slag into vertical tubes, surrounded by water, the lower part being made larger to facilitate the removal of the solidified pillar of slag. Or the molten slag might be run into a closed vessel of water, the steam removed at atmospheric pressure and used in a low-pressure turbine, the granulated slag being removed from the bottom of the vessel by suitable means.

Sometime in this generation, we venture to predict, the current wasteful practice will become obsolete. With so many of our smelting plants working at reduced capacity, the time is ripe for doing some practical experimenting on the subject.

The enforcement of the Federal Explosive Act, repealed since the armistice, imposed restrictions which, though irksome, were faithfully observed by the mining industry. An important and perhaps unlooked-for result of these regulations was to diminish the liability to accident by carelessness in leaving powder lying loose along walls or upon timbers or by capped fuse left hanging on nails or on timbers. Surplus powder and supplies were returned to magazines, with the further result that a distinct economy in the use of explosives followed. Mine managers and superintendents should continue the close control of explosives in their mining operations, for, once a good practice has been started, it can be continued; but slackness and carelessness, if allowed to follow at the heels of a strict regime, inevitably result in danger to all underground men, as well as waste, both of which conditions add to the cost of operations.

Ore Deposits of Utah*—Part I.

Principal Mining Districts of the State Are Associated With Occurrences of Intrusive Rocks, The Orebodies Occurring as Replacement Deposits in Fissures—Metal Production Shows Increasing Output From Lode Mines Since 1870

BY B. S. BUTLER

U. S. Geological Survey, Washington, D. C.

THE object sought in this paper is the presentation in a summary form of some of the features of the ore deposits of Utah that are discussed in greater detail in a report now in press on the "Ore Deposits of Utah," U. S. Geological Survey Professional Paper 111, by B. S. Butler, G. F. Loughlin, V. C. Heikes, and others. For a more complete account of the geology, description of individual districts, for references to the extensive literature and other features, and for detailed evidence for the conclusions here advanced, those who are especially interested are referred to that report.

there was a general elevation of the entire region, and this was greatest along certain east-west belts forming the Uinta and Raft River ranges. Although other uplifts, such as those of Tintic-Deep Creek and of Beaver County, as shown in Fig. 1, are less prominent physiographically, they are equally important structurally.

Possibly the uplifts of the Plateau region, the Henry, Abajo, and La Salle mountains uplifts, the San Rafael Swell, and others (also shown in Fig. 1), were formed during the same post-Cretaceous period. Contemporaneous with or soon after the general uplift there was a great outpouring of lava and accompanying intrusion of igneous material over much of the Great Basin and part of the Plateau provinces, and this volcanic activity was followed by the subsidence of the Basin region below the Plateau region. At that time and later the Basin region was broken into blocks of general north-south trend, which were tilted at different angles and which form the Basin ranges. The effect of the same movement in the Plateau region was to throw the more pliable Mesozoic sediments into folds. Since these events occurred (if, indeed, they have entirely ceased), the processes most active in the Plateau provinces have been those of denudation and erosion, which have lowered the general surface and produced great canyons. As the Basin province has no outlet through which materials can be removed, debris resulting from a wearing down of the higher areas accumulates in the lower areas, and is gradually filling the intermountain lowlands. Lowering of the highlands and filling of the lowlands are both working to level the Basin area.

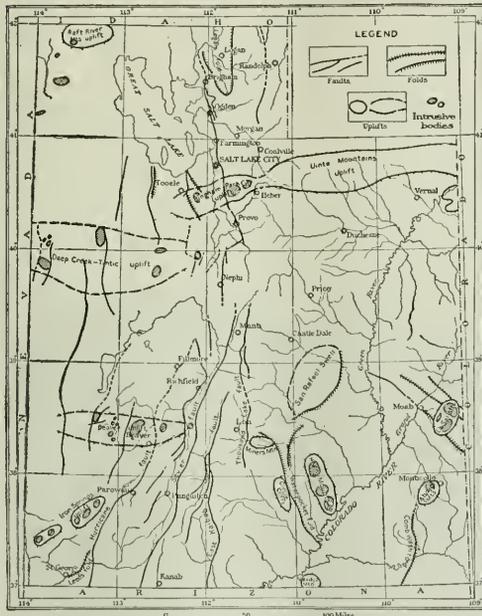

FIG. 1. OUTLINE OF THE LARGER STRUCTURAL FEATURES OF UTAH

The western part of Utah is in the Great Basin province; the southeastern part is in the Plateau province; and the northeastern part includes the Uinta Mountains. The Great Basin province is separated from areas to the east by a zone that may be designated the Wasatch belt. A large part of the Basin province in Utah was above sea level and was undergoing erosion throughout the Mesozoic era, the material removed being deposited in the area now occupied by the Plateau and Uinta provinces. In post-Cretaceous time

RELATIVE POSITION OF SEDIMENTARY ROCKS

The sedimentary rocks of Utah range in age from pre-Cambrian to Recent. Pre-Cambrian rocks, mainly schist, shale, and quartzite, are exposed along the great east-west uplifts—the Uinta Mountains, Raft River Mountains, the Tintic-Deep Creek uplift, and adjacent to the great northward-trending Wasatch fault. (See Fig. 1). Resting unconformably on the pre-Cambrian rocks is a great series of Paleozoic quartzites, shales, and limestones, ranging in age from Lower Cambrian to Permian. Within the Paleozoic system there are no marked angular unconformities, but there is abundant evidence of periods of non-deposition and of erosion. The Paleozoic rocks form most of the Basin ranges and much of the Wasatch belt, but they pass eastward beneath Mesozoic formations. Near the Colorado boundary, south of the Denver & Rio Grande R.R., where the pre-Cambrian rocks are exposed, the Paleozoic formations are absent, apparently having wedged out toward the east.

Upon the Paleozoic formations lies a thick series of Mesozoic rocks, consisting mainly of shales and sandstones but including some beds of limestone. These strata are exposed principally in the eastern part of the state, but they are found also at a few places in the

*Publication sanctioned by the Director of the U. S. Geological Survey.

Great Basin. They rest with little or no angular unconformity on the Paleozoic rocks; and within the Mesozoic strata there are no pronounced angular unconformities, though in the Mesozoic era, as in the Paleozoic, there were periods of non-deposition and of erosion.

Overlying the Mesozoic rocks in large areas south of the Uinta Mountains and in the Plateau region are

important being the Park City-Little Cottonwood-Bingham belt, the Tintic-Deep Creek belt, Beaver County belt, and the Iron Springs belt. In addition to these there are intrusions in the Grouse Creek, Raft River, and Pilot ranges and three centers of intrusion, the Henry, Abajo, and La Sal mountains, in the southeastern part of the state. (See Fig. 1.) The large intrusive bodies in the western part of Utah are charac-

MINE OF UTAH COPPER CO., BINGHAM CANYON, OQUIRRH RANGE

Tertiary formations which consist largely of sandstone and shale but include some limestone. At a few places in the Great Basin, Tertiary sediments lying unconformably on the older rocks are exposed. Quaternary sediments occupy large areas in the Great Basin between the ranges.

Extrusive rocks are of interest because of their extent, and intrusive rocks, which are not relatively abun-

teristically stocks; those exposed by erosion in the southeastern part are laccoliths.

The composition of the intrusive rocks, like that of the extrusives, is prevailing intermediate, approaching quartz monzonite and quartz diorite. In the stocks in the western part of the state the deeper exposed portions are the more siliceous, probably because of differentiation produced by the sinking of the ferro-magne-

LITTLE COTTONWOOD DISTRICT, SOUTH SIDE OF CANYON, SHOWING ALTA OVERTHRUST ZONE IN WHICH OCCUR OREBODIES OF THE WASATCH, COLUMBUS-REXALL, AND CARDIFF MINES

dant, because the ore deposits are commonly associated with them. Extrusive rocks are most abundant in southern Utah, where they form a broad belt extending from the Nevada line eastward to the High Plateau. They also occupy large areas farther north in the Great Basin. A large part of the lava is of intermediate composition, approaching latite, though rhyolites occur, and the latest flows are of basalt.

The intrusive rocks are confined largely to rather definite belts in the western part of the state, the more

sian minerals, which were the earliest to form, to still greater depth. In the laccoliths of the Plateau region there has been little differentiation.

The age of many of the igneous bodies is not known from direct evidence. Those that have been determined are of post-Cretaceous age. Probably most of them are of Tertiary age, though some may be earlier. Several, at least, of the intrusive bodies are later than the associated extrusive rocks.

The oldest large structural feature in the rocks is

(c) Commercial value used for metals produced in each calendar year. (d) This yearly production of silver, between 1871 and 1881, was estimated to be 46,000 ounces. (See U. S. Geol. Survey Statistical Ann. Rept., pt. 2, p. 355, 1895). See also that period the gold was mined and very little silver, and only 2,760 ounces were reported by producers whose ore yielded a total of 920,741.10 ounces of gold from 1890 to 1913, inclusive. (e) No records were kept by producers of certain lots of lead ore shipped from the Black Warrior and Dixie mines in the Tussequito district. (f) Dividends paid by operators in the Silver Reef section are known to be incomplete. A fair estimate is given by competent authorities. (g) Between 1904 and 1911 the production was 44,244 pounds of copper and 134,361 pounds of lead, as reported by producers. Prior to this period no record of production was found.

folding. The age of much of the folding in the western part of the state has not been determined, and the folding may have occurred in two or more periods. The most pronounced folding, which was accompanied by overthrust faulting, took place in the Wasatch belt, near the boundary of the Basin and Plateau provinces. This folding occurred in post-Cretaceous time.

After the folding there were east-west uplifts, some of which were accompanied by intrusions. (See Fig. 1.) The Uinta and Raft River ranges represent such uplifts, and such structural features are associated with the intrusive belts farther south, as the Tintic-Deep Creek and the Beaver County uplifts. The domes or swells and the broad uplifts that characterize the

in 1865. Since 1870, as may be seen in Fig. 2, there has been a steady and increasing output from lode mines, which to the close of 1918 have yielded a total of over \$900,000,000, and the operating companies had paid dividends of more than \$170,000,000. An accompanying table shows the metal production and its value for the several districts of the state.

Placer Deposits—The largest placer deposits in Utah are those of Bingham Canyon, which have yielded about \$1,000,000 in gold, and there has been a small production of gold from the placers of Colorado, Green, Grand, and San Juan rivers.

Lode Deposits—The lode deposits, considered from the point of view of origin, may be separated into two

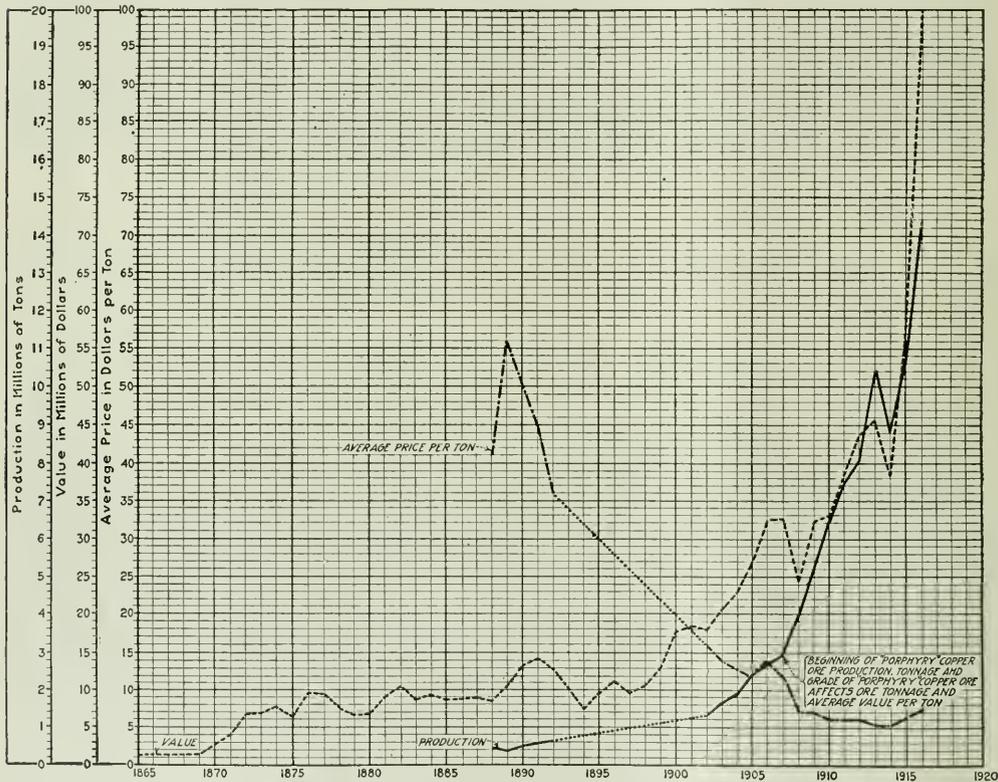

FIG. 2. CURVE SHOWING BY YEARS PRODUCTION OF ORE, VALUE OF ORE, AND AVERAGE VALUE OF ORE PER TON, 1865 TO 1916

Plateau region may have been formed at the same time. The youngest large structural features are north-south faults that outline the Basin ranges and that also occur in the Plateau area. (See Fig. 1).

INCREASE IN ORE OUTPUT FROM LODE MINES

The presence of metallic deposits in the mountains of Utah was known in the '50s of the last century, and a little lead ore was reduced to metal in a crude way by the Mormon settlers. Active prospecting began with the arrival of General Connor's California volunteers, in 1862, and the first claim was located in Bingham Canyon in 1863. The production of placer gold began

groups: (1) those that show no close relation to igneous rocks, and (2) those that are closely associated with igneous rocks and are believed to be genetically related to igneous intrusion.

Deposits Not Obviously Associated With Igneous Rocks—Of the deposits not obviously associated with igneous rocks, the Mesozoic "red bed" or sandstone deposits of silver, copper, and uranium-vanadium are the most abundant. The study of certain of these deposits has led to the belief that they were formed later, than most of the folds and faults which were important factors in controlling the movement of the solutions that deposited the ores. Most of the deposits are closely as-

sociated with fossil vegetation, which appears to have been a factor in precipitating the metals from solution.

The Silver Reef deposit of southern Utah, which has yielded more than \$8,000,000 in silver, is the most im-

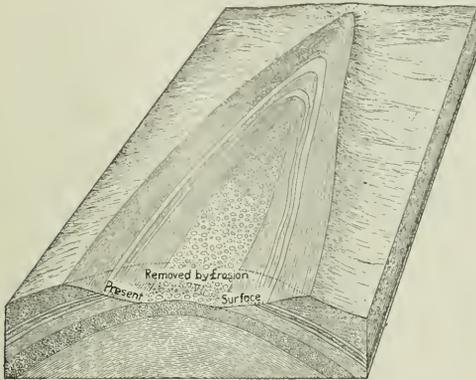

FIG. 3. GENERALIZED STEREOGRAM, SHOWING THE RELATION OF ORE DEPOSITS TO STRUCTURE IN THE SILVER REEF DISTRICT

Ores are principally in the sandstone strata

portant of this type. The orebodies are near the crest of an anticline, as shown in Fig. 3, which appears to have been a controlling factor in the circulation of solutions. The larger copper deposits of the Plateau

The Mesozoic rocks of the Plateau region contain small amounts of metals that seem to have been deposited with the sediments, and it is believed that the workable deposits have resulted from a concentration of this disseminated metal by circulating waters after the region was elevated, folded, and faulted.

Deposits Associated With Igneous Rocks—Most of the ore deposits are associated with the belts of intrusive rocks that coincide with the Park City-Little Cottonwood-Bingham, Tintic-Deep Creek, Beaver County, and Iron Springs uplifts in the western part of the state. The deposits occur in all classes of rock—intrusive, extrusive, and sedimentary. A comparison of the different deposits in any one of the three classes of rock, and of the deposits in one class of rock with those of the others, leads to the belief that the metals contained in the ore deposits came from the same general source as the material that forms the intrusive stocks.

DEPOSITS IN INTRUSIVE ROCKS

The deposits in the intrusive rocks consist of the following: Pegmatitic gold quartz veins, represented in the Deep Creek Mountains and in the Raft River Mountains; pegmatitic quartz tourmaline-scheelite veins of the Clifton district; quartz-tourmaline iron-copper veins of the Clifton and San Francisco district; quartz-copper veins and stockworks of the Bingham and Beaver Lake districts; quartz lead-silver-copper veins of the Bingham and Tintic districts; quartz-gold veins of the Clifton district; and magnetite-hematite veins of the Iron Springs district. The pegmatitic types are

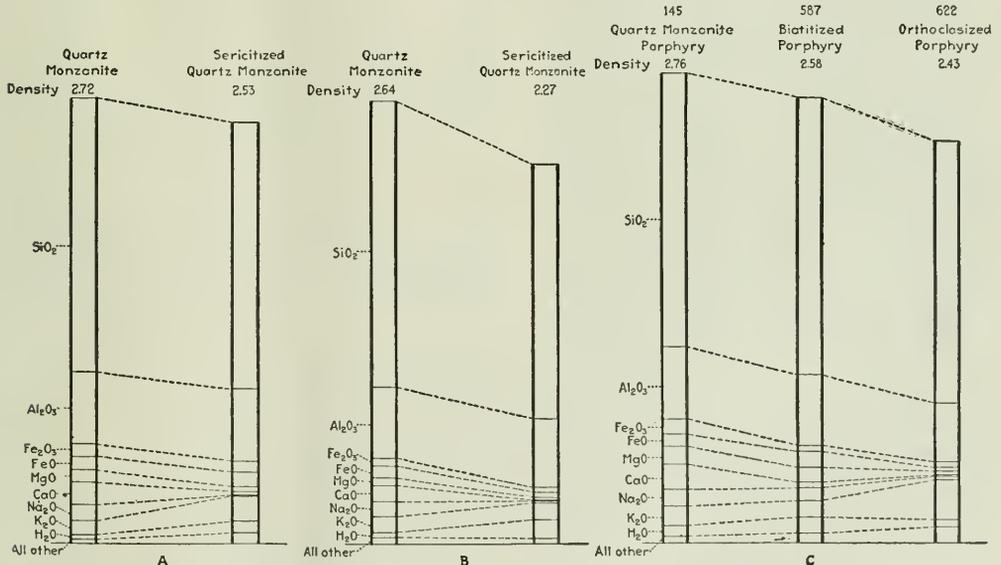

FIG. 4. DIAGRAMS SHOWING CHANGE FROM FRESH TO ALTERED QUARTZ MONZONITE, PRODUCED BY THE ACTION OF THE ORE SOLUTIONS IN THE WALL ROCK ADJACENT TO VEINS

regions are clearly associated with folds, faults, and fissures. The relation of the vanadium-uranium deposits to structural features is not as clearly apparent, but their location near the domes and folds of the Plateau region seems more than accidental, and a detailed study may reveal a casual relation to these structures.

unmistakably differentiation products of a magma, and the other types show such an intergradation as to lead to the belief that they are all directly related to igneous activity.

The deposits in sedimentary rocks may be subdivided into contact deposits and replacement deposits as-

sociated with fissures. The contact deposits include copper deposits, which are present in many districts, but are particularly well developed in the Rocky, San Francisco, Little Cottonwood, and Clifton areas.

Several of the copper deposits are notably high in iron. Contact gold deposits have been worked in the Clifton district, and contact tungsten deposits are present in the Clifton region and in the Grouse Creek range. Iron deposits are important in the Iron Springs district, and many of the other deposits contain a large amount of iron. The contact deposits are characteristically replacements of limestone at or near the contact with intrusive rocks by silicates, oxides, and sulphides. All the deposits show large additions of silica and variable amounts of iron, sulphur, copper, boron, and some other metals.

REPLACEMENT DEPOSITS IN IMPORTANT DISTRICTS

The replacement deposits associated with fissures include copper deposits such as those of the Bingham, Star, Little Cottonwood, Lucin, and other districts;

of the replacement deposits in limestone, which are important in the Park City, Tintic, Bingham, and other districts. The deposits of the Cottonwood districts associated with thrust faults constitute a special type allied to the bed deposits.

The origin of the deposits in the sedimentary rocks can best be approached by considering their relation to the deposits in adjacent igneous rocks of the origin of which there seems little doubt. There is strong evidence that these classes of deposits were formed by similar solutions. The character of the solutions can be judged only by their action on the rocks, and it, of course, must be recognized that the same solution would act quite differently on rocks of different composition as monzonite and limestone. The similarity may be indicated by the change effected by the more abundant constituents, or it may be more strikingly evident by the presence of some of the rarer elements, but the agency of similar solutions is indicated when the proportion of the more abundant constituents is similarly shown by the action on igneous and sedimentary coun-

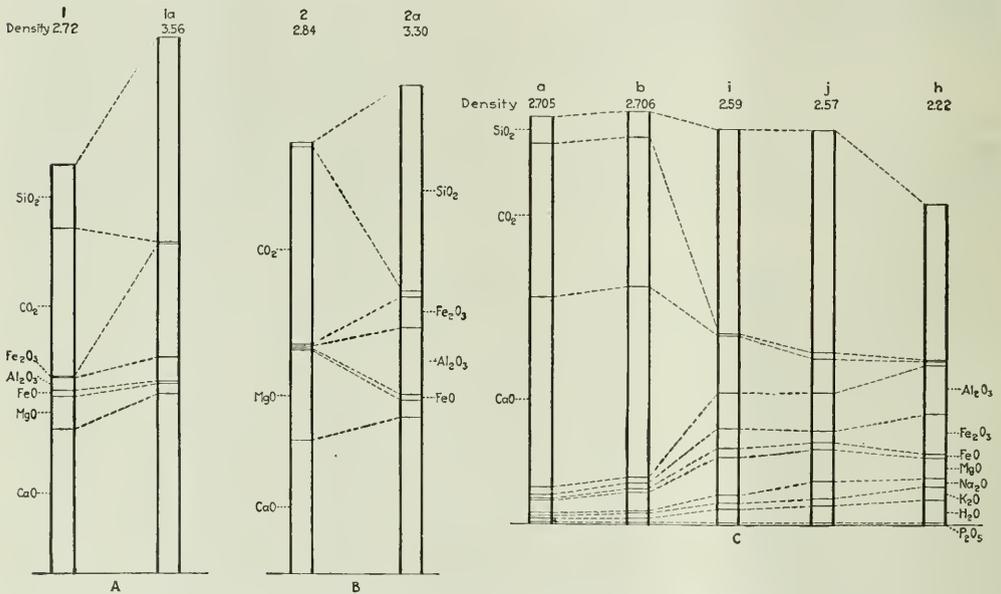

FIG. 5. CHANGES OF LIMESTONE IN CONTACT ALTERATION

A and B, San Francisco district; 1 and 2, fresh rock; 1a and 2a, altered rock; C, Iron Springs district; a and b, fresh rock; i, j, and h, altered rock

lead-silver and lead-silver-copper-zinc deposits in many areas, most productive in the Park City, Tintic, Bingham, Cottonwood, Ophir, and Stockton districts; silver deposits of the Park City, Ophir, and Mercur districts; gold deposits of the Mercur district; and quicksilver deposits of the Mercur and Marysvale districts.

The important deposits of this type may be separated into fissure replacement deposits in which the replacement has extended only a short distance from the fissure, and bed deposits in which the replacement is confined largely to certain beds or zones and may extend into them for a considerable distance from the fissure. The more important deposits of the former occupy fissures in quartzite, as in the Ontario fissure of the Park City district. The bed deposits include most

of the replacement deposits in limestone, which are important in the Park City, Tintic, Bingham, and other districts. The deposits of the Cottonwood districts associated with thrust faults constitute a special type allied to the bed deposits.

The origin of the deposits in the sedimentary rocks can best be approached by considering their relation to the deposits in adjacent igneous rocks of the origin of which there seems little doubt. There is strong evidence that these classes of deposits were formed by similar solutions. The character of the solutions can be judged only by their action on the rocks, and it, of course, must be recognized that the same solution would act quite differently on rocks of different composition as monzonite and limestone. The similarity may be indicated by the change effected by the more abundant constituents, or it may be more strikingly evident by the presence of some of the rarer elements, but the agency of similar solutions is indicated when the proportion of the more abundant constituents is similarly shown by the action on igneous and sedimentary coun-

The similarity of solutions is perhaps more strikingly

brought out where both types of deposits in the same district contain some of the rarer elements. Boron minerals abound, and tungsten minerals are also present in both types in the Clifton district. Abundant barite occurs in the deposits in both the intrusive and lution rich in barium, and the iron deposits of the Iron sedimentary rocks in the Tintic district, indicating so-Springs district occur both as veins in the intrusive rock and as replacement of the adjacent limestone. The location of the deposits and the composition of the solutions that formed them both point to a common origin for the deposits in the intrusive rocks and the contact deposits. Deposits in sedimentary rocks associated with fissures show all stages of mineralogical gradation from typical contact deposits, and there can be no reasonable doubt of their common origin.

DEPOSITS IN EXTRUSIVE ROCKS

The occurrences of mineralization in extrusive rocks consist of silver-lead-copper-zinc deposits of the San Francisco district; gold-silver deposits of the Gold Springs-Stateline districts and the Marysvale region; and the alunite deposits of the Marysvale region. The deposits occur as filling of fissures and replacement of the adjacent rock. The situation and character of the deposits and the alteration of the adjacent rocks indicate that the origin of the deposits is the same as that of those in the igneous and sedimentary rocks, but the mineralogy shows them to have formed near the surface. The alunite deposits perhaps may have reached to the original surface.

(To be Concluded)

The Larder Lake Gold Area

Recent Developments Show More Promise Than Early Results Indicated.—Electric Power Available Will Permit Systematic Sampling Over Large Area

TORONTO CORRESPONDENCE

THE twenty-eighth annual report of the Ontario Bureau of Mines, 1919, Part II, contains a paper by P. E. Hopkins on the Larder Lake gold area, situated fifty miles due north of the Cobalt silver district, near the Ontario-Quebec boundary. It is connected by a wagon road seventeen miles long to Dane station, on the Temiskaming & Northern Ontario Ry.

The finding of gold in August, 1906, was followed by a rush of prospectors during the ensuing winter, when a few thousand claims were staked. Development resulted in much disappointment, and most of the claims were abandoned. Desultory mining has since been carried on at two or three properties, the total gold production being about \$20,000, coming from the Associated Goldfields (Harris Maxwell) La Mine d'Or Huronia, and the Reddick property. In parts of the area, recent development work has made certain properties more promising than they formerly appeared.

The geology of the area is similar to the pre-Cambrian in many other parts of Ontario. The oldest rocks are dominantly volcanic, comprising greenstones and green schists. Associated with them are bands of ferruginous carbonate, iron formation, slate and conglomerate, which strike nearly east and west and dip vertically. The sediments have their greatest development along the north shore of Larder Lake, portions of which are traceable westerly to Kirkland Lake.

The rusty weathering carbonate is intersected by quartz and calcite stringers, which carry most of the gold. Cutting the above rocks are dikes of porphyry and aplite, and superimposed on them are erosion remnants of conglomerate, greywacke, and arkose of the Cobalt series. The diabase and gabbro dikes represent the latest igneous activity.

Rusty carbonate rocks are found in or near many of the Northern Ontario gold areas, but this type of material has been prospected to a considerable extent in various parts of the province without yielding any producing gold mines. These rocks are more widely distributed in the Larder Lake district than elsewhere, and are important, as they appear to contain a greater quantity of gold than the other rocks of the area. Gold occurs, however, in the aplite on the Gold King and in the porphyry and green schists of La Mine d'Or Huronia. It is believed that the gold is related to these aplite-porphyry intrusions and therefore indirectly to granite.

The rusty-weathering carbonates are dolomites in places which occur in bands up to 300 ft. or more in width; usually brown in color, but often large parts of them have been altered to green fuchsite or mariposite, serpentine, and talc. They are intersected by a network of quartz and calcite stringers, which carry low assays in gold over considerable widths, and frequently contain small oreshoots or spectacular gold showings. Although this association of rocks and mineral solutions is not known to form ore in many parts of the world, there is resemblance to the orebodies on the Rawhide mine, southeast of Angels Camp, Cal. Small, medium-grade oreshoots do occur, as on the 83-ft. level of the Reddick and 500-ft. level of the Associated Gold Fields, but they are isolated, with little to indicate where they will be found and what will be their extent.

The passing from ore into material altogether or nearly barren is indicated only by the disappearance of visible gold, or by low assays, and not by any change in the character of the deposit. As the known richer shoots are small and scattered, the success of mining will depend upon the working of extremely large bodies of low-grade ore, which will necessitate much capital and detailed mining. Electric power being available, a careful, systematic surface sampling of large areas of mineralized dolomite can be made at a reasonably small cost, with the purpose of finding low-grade ore over a considerable area.

The properties of the Associated Goldfields known as Block "B" and Block "D," formerly known as the Harris Maxwell and Reddick mines, respectively, are operated with electric power supplied from the company's own plant at Raven Falls, from which a transmission line was also constructed to La Mine d'Or Huronia. Mining operations have been of an intermittent character. Other gold prospects worthy of mention on which some work has been done are the Gold King, Chesterville, Kerr-Addison, and Larder Lake Proprietary. A promising pyrite prospect, which Mr. Hopkins regards as worthy of further development, occurs on Claim H. S. 904, half a mile from the southwest bay of Larder Lake, in Hearst Township. An 8-lb. sample yielded on analysis 43 per cent sulphur and 40c. of gold to the ton. Massive iron pyrites several feet wide was also seen on Claim H. S. 913, which is in the southeast part of Hearst Township.

What Mexico Needs

With Order, Fair Laws, and Honest Administration, the Latent Resources of the Country Would Be Developed Without Exploitation—A Properly Enforced Mandatory Under a League of Nations Is Proposed as a Possible Solution of Present Difficulties

BY AN AMERICAN CITIZEN RESIDING IN MEXICO*

THE editorial which appeared in the *Journal* of July 26, 1919, under the caption "Article 27" is far from accurate, and in the interest of fairness and accuracy should be corrected.

The new Mexican Constitution was signed in Queretaro, Jan. 31, 1917, and promulgated Feb. 5, 1917. Chapter I, including Articles 1 to 29, inclusive, is the Mexican Bill of Rights or, as they call it, Individual Guarantees.

"Article 14.—No law may be made retroactive to the prejudice of any person. No one may be deprived of life, liberty, property, possessions or rights, except by trial before courts, previously established, in which the essential formalities of legal procedure are complied with, in conformity with laws enacted prior to the act....."

The above is an accurate translation of part of Article 14 of the Constitution, which clearly makes any law or decree that tends to be retroactive, or any deprivation of acquired property, possessions or rights except after trial by a competent court, unconstitutional, and would undoubtedly be so construed by any just court or honest executive.

"Article 27.—Property to the lands and waters situated within the national territorial limits, corresponds originally to the Nation (has its origin in the Nation) which has had and has the right to transfer dominion to individuals, constituting (thereby) private property. This (private property) cannot be expropriated except for reasons of public utility and under indemnization.

"The Nation will have the right, at all times, to impose the regulations upon the use of private property which the public interest demands, such as regulating the use of the natural elements that may be produced; to make an equitable distribution of the public riches; and to guard their conservation. With this object the necessary measures will be taken for the division of the great estates; for the development of small properties; for the creation of new agricultural communities with the indispensable waters and lands; for the development of agriculture generally and to prevent destruction of the natural elements and the damages which property might suffer, to the prejudice of the public.

"Towns, villages and communities lacking lands and waters, or who do not have sufficient quantities to provide the necessities of the population, have the right that they be granted them, from the surrounding properties, always respecting the small property.

"In view of this, the grants of lands which have been made to date in conformity with the Decree of Jan. 6, 1915, are hereby confirmed.

"The acquirement of private properties necessary to carry out the objects expressed in the foregoing will be considered as of public utility.

"The Nation has direct dominion over the minerals and substances which in veins, masses or orebodies form deposits of a nature distinct from the earth itself, such as the minerals from which industrial metals and metalloids are extracted; deposits of precious stones; rock salt and the deposits of salt formed directly from sea waters; the products derived from the decomposition of rocks when

their exploitation requires underground workings; phosphates which can be utilized as fertilizers; solid mineral combustibles (coal); petroleum and all the solid, liquid or gaseous hydrocarbons.

"The Nation is also proprietor of the waters of the seas within the limits and terms fixed by International Law; of the waters of the lagoons and estuaries; or those of the interior natural lakes which are connected directly with constant flowing streams; those of the principal rivers and streams from their sources to their mouths, if they flow into the sea or cross two or more states; those of intermittent streams which cross two or more states; those of rivers, streams or canyons which form national or state boundary lines; the waters which are extracted from mines; and the beds and margins of the foregoing lakes, rivers and streams to the extent fixed by the law. Any other stream not included in the foregoing will be considered as an integral part of the private property it crosses; but the use of the waters, when such stream passes from one property to another, will be considered a public utility, and will be subject to the regulations which the States may dictate.

"In the cases to which the two preceding paragraphs refer, the dominion of the Nation is inalienable and imprescriptible, and the Federal government may only grant concessions to individuals or to civil or commercial companies organized in conformity with Mexican laws, under condition that regular works be established for the exploitation of the respective elements, and that all the requisites provided by law be complied with.

"The acquiring of dominion over lands and waters of the Nation will be governed by the following provisions:

"I.—Only Mexicans by birth or by naturalization, or Mexican corporations, have the right to acquire dominion over lands, waters and their dependencies, or to obtain concessions for the exploitation of mines, water power or mineral combustible (coal) in the Republic of Mexico. The State may concede the same right to foreigners, providing they agree before the Department of Foreign Affairs to consider themselves as Mexicans in matters relating to the property rights, and not to invoke for the same, or for that which relates to them, the protection of their Governments, under the penalty that in case they fail to keep the agreement they will lose their rights in the property acquired by virtue of the agreement, to the benefit of the Nation. Foreigners may not under any conditions acquire direct dominion over lands and waters within 100 kilometers (62.14 miles) of the frontiers nor within 50 kilometers (31.07 miles) of the coast."

"II.—Religious Societies" and "III.—Charitable Institutions" do not concern us here, and I omit the translation, as well as "V.—Bank." "VI.—Common Holdings" as of tribes, communities, etc., will also for the same reason be omitted, as well as "VII.—Other Civil Corporations."

"IV.—Commercial corporations, with stocks (or shares), may not acquire, possess or administer rural lands. Corporations of this class formed to exploit any industrial factory, mines, petroleum wells or for any other purpose not agricultural, may acquire, possess and administer lands, only to the extent that may be strictly necessary for the indicated objects of the establishments or services, which the Executive of the Union or of the States will fix in each case.

"All contracts and concessions granted by former governments since 1876 which have tended to segregate in the

*Neither the name nor the address of the writer of this article is published, for reasons which will be appreciated upon reading the translation of Art. 33.—Editor.

hands of any single individual or company lands, waters and natural riches are declared revisable and the Executive of the Nation is authorized to declare them null and void, if they imply serious detriment to the public interests.

"Chapter III., Article 33.—Foreigners are those who do not possess the qualities named in Article 30 (i.e. Mexicans by birth or naturalization). They have the same rights which the first section of Chapter I of the Constitution grants; but the Executive of the Union will have the exclusive power to force any foreigner whose presence he judges inconvenient to leave the national territory immediately and without the necessity of previous judgment.

"Foreigners may not mix in any manner in the political affairs of the country."

In making the foregoing translations, the chief concern has been to give the true meaning of the text rather than to make smooth English, and it is believed to be accurate.

It will be noted that there are direct clashes between Article 14 and Article 27, the last paragraph of the latter giving powers to the Executive which in the former are specifically delegated to competent courts.

Under the old laws gold, silver, platinum, copper, iron, cobalt, nickel, manganese, lead, mercury, tin, chromium, antimony, zinc, bismuth, sulphur, arsenic, tellurium, rock-salt and precious stones in ore veins or deposits are specifically mentioned and declared to be the property and under direct dominion of the Nation, as well as placers of gold and platinum.

The following were declared to be the exclusive property of the owner of the soil under the old law:

I.—Veins or deposits of mineral combustibles (coal) in all of their forms and varieties.

II.—Veins and deposits of bituminous matter.

III.—Veins and deposits of salts that appear on the surface.

IV.—Springs or underground flows of water, except that waters extracted from mines became the property of the mines.

V.—Surface rocks and materials of the soil and the earths, sands and clays.

VI.—Bog iron and iron float, stream tin and the ochres.

All of these, except surface rocks and the earths, sands and clays, would now appear to have been declared to be the property of or under the dominion of the Nation; and in addition the following materials that were not specifically mentioned in the law of 1909, although some of them were well known to exist in great quantities: petroleum; hydrocarbons, solid, liquid and gaseous; phosphates and salt deposited by the sea.

It appeared that while certain valuable minerals had been considered the property of or under the direct dominion of the Nation for many years and had paid extraordinary taxes both on the lands under which they lay, without acquiring any manner of title to the surface of the lands, and upon their products, other very valuable minerals of an organic base were treated in an entirely different manner. In fact, silver and gold in ores are paying nearly double the tax on their gross value that petroleum is paying at this date, according to the statements of Sub-Secretary of Industry and Commerce, Mr. Salinas; and if the miner has over 100 hectares of claims in one mining agency he pays just 3 and $\frac{6}{10}$ times as much property tax per hectare on the area in excess of one hundred hectares.

The translation of Article 27 shows that the editorial under that heading was inaccurate in the following particulars:

(a) A renouncing of citizenship is not required—

only an agreement to consider oneself as a Mexican in all that relates to the special property and only to that property, and the further agreement not to invoke the protection of one's government for that property; which is not a serious thing to agree to when it is remembered that we have had no protection from our Government nor any results from any complaints we have made to it for the last eight years.

(b) The statement regarding foreign or domestic corporation ownership of lands is fairly correct as stated, and probably a good and desirable thing to do if they can find the means to do it honestly and honorably.

(c) Leaving out the word "immediate" from the sentence regarding the holding of excess land requirements, the clause is correct and should work no hardship on any legitimate enterprise.

(d) Adding the word "direct" before "ownership" and changing the latter to "dominion" the clause would state the matter correctly, except for a slight error in the distance. Under the old law there was a zone of 80 kilometers on the frontiers in which foreigners could not take up or acquire mining properties without special permission from the Executive of the Nation and renouncing their rights as foreigners.

(e) If the writer of this clause had put a period after "nation" he would have been exact; but Article 14 of the Constitution, and possibly the indemnification clause in Article 27, cover the situation.

(f) "If they imply serious detriment to the public interest" added to the clause will make it fairly well in accord with the text of the Constitution; and again Article 14 may be called into play.

Really, there is nothing seriously wrong, radical or unusual in Article 27, except that for a legal document it is in some instances rather loosely worded and subject thereby to different interpretations. When carefully written Congressional laws are passed to regulate and enforce it, and an honest and conscientious judiciary and Executive carry the laws into effect, there should be no room for cavil.

In the United States foreigners are not allowed to take up mining claims, nor homesteads, nor pre-emptions, nor any public lands until they have declared their intentions of becoming American citizens, although they can acquire private lands by purchase. Our mining and petroleum laws are generally recognized as particularly bad, but they have been in effect so long and such immense rights have been acquired under them that it is most difficult if not quite impossible to change them to a more rational basis. The tendency of our own Government to recognize Government ownership of petroleum and coal as distinct from the soil is shown in the withdrawal of great tracts of potential oil and coal lands as naval reserves and of great tracts of oil shale from entry, by department order, although possibly under color of law, and the recent proposal to lease oil lands at not less than 5 per cent royalty, which strangely is the Mexican rate.

The taxes on oil lands, according to an interview with Mr. Salinas, sub-secretary of Industry and Commerce, published in the *Universal* of Aug. 6, 1919, is five pesos (\$2.50, U. S. currency) per pertenencia (2.47 acres) per annum. The tax on petroleum is 5 per cent of its value, as stated in the same interview.

The taxes on silver, gold, copper and lead in ores

there is no question that the latent resources of the country would be developed without exploitation, work for its idle hands would result, and it would take its proper place in the sun.

That there is no man, faction nor party within the country capable of rejuvenating it, is patent to any impartial observer.

The only salvation of the country is the establishment of a properly enforced mandatory under the League of Nations to give them order, fair laws and honest administration until such time as they learn the basic principles of democracy. Personal contact with the people, from the richest haciendas to the poorest and most ragged peon, leads me to believe that the great majority of the people, outside of the officials and military, would gladly welcome such a solution to their difficulties.

Chemical Compounds for the Detection of Overheated Machinery*

Their Use as a Varnish-Paint Serves as a Heat Detector For Distorted or Dirty Bearings, Giving Warnings Before Serious Damage Occurs

BY H. T. PINNOCK

INVESTIGATIONS have been made into the use of chemical compounds as a means of indicating the overheating of bearings and other parts of machinery. Double iodides of mercury with other metals possess the property of undergoing a reversible transition involving change of color when heated and subsequently cooled.

Two of these compounds showed superior qualities over a number of others which were comparatively slow to change and spread over so large a range of temperature as to be unsuitable for the purposes required, or the range of color was too slight to be of any practical value. The first of these was the double iodide of silver and mercury, Ag_2HgI_4 , which is a pale lemon yellow powder at ordinary temperatures, and changes to a vivid carmine color at about $90^\circ\text{--}100^\circ\text{C}$, the change in both directions being fairly sharp. The other was the copper mercuric iodide, $\text{Cu}_2\text{I}_2\text{HgI}_4$, which Tonner had previously described. This substance is a vivid scarlet vermillion at ordinary temperatures and at $60^\circ\text{--}70^\circ\text{C}$. it changes to a chocolate brown. Both these compounds are adapted for use under suitable conditions, but it was found that a mixture of the two, consisting of 85 per cent of the copper salt and 15 per cent of the silver salt, was more sensitive and gave a greater color range from vermillion to almost black, the transition being exceedingly sharp. (Other mixtures were prepared for special conditions, but the above was more generally applicable.)

The compounds may be prepared in a variety of ways; for instance, a simple method of preparing the copper salt is by well triturating in a mortar 380 grams of cuprous iodide with 910 grams of mercuric iodide, sufficient water being added to form a paste. When thoroughly mixed, the mass is dried in the water oven, and the dried mass ground to an impalpable powder. Another method is to dissolve the mercuric iodide in excess of potassium iodide solution and precipitate the

double salt by the addition of copper sulphate solution. The silver salt can be prepared in a similar manner by double precipitation. Whichever method is adopted, the product should be well washed to eliminate soluble impurities, as these appear to retard the color change, as well as to affect its character.

It has been found convenient to convert them into a varnish-paint or enamel, by incorporating the powder with a colorless varnish medium that will stand moderately high temperatures without softening. A good white shellac spirit varnish such as is used on electrical machinery has been found suitable for most occasions, as this will stand a low stoving temperature, but for more elevated temperatures, a medium such as is used in the high temperature aluminum paints used for steam pipes, and which will resist temperatures up to 200°C ., is excellent. About 100 grams of compound to 70 c.c. of medium will be found a mixture of suitable consistency.

A convenient method of applying this heat detector is first to paint a white circle or ring on the bearing or other place which it is desired to keep under observation, using a zinc white paint. This white circle is applied to the journal or housing of the bearing, and the detector paint is applied as a vivid red bull's-eye in the middle of this, thus forming a striking object which is visible from considerable distances. It must of course be applied to the block of metal as near as possible to the point at which the heat is likely to be generated. It is sometimes desirable to apply the paint to the shaft itself, just where it extends beyond the bearing metal, and in this case a convenient method is to apply a broad band of white paint with a narrower band of the red detector paint in the center. This red band in the center of the white one is then easily seen as the shaft rotates. In any case, after the paint is dry, it should be protected with a coat of colorless oilproof varnish, so that the surface may be occasionally wiped free from dust and dirt.

This detector has also been successfully used on a gas engine, one of the main bearings of which was frequently heating up, owing to a slightly distorted shaft, and it was possible to place good big bull's-eyes upon it, which on many occasions gave warning of impending trouble, enabling the load to be reduced before damage was done. It was also found of service on the water-jackets of large internal combustion engines to give warning of insufficient circulation of cooling water.

Many other instances occur in which this property of the double mercuric iodide compounds may be utilized to advantage; for instance, it may be used in the reverse way on air-heating towers and the like. A case in point is that of a producer-gas plant where the air supply is saturated with water vapor at about $70^\circ\text{--}75^\circ\text{C}$. If the outside of the tower has a white circle about 3 feet in diameter painted on it, with a center about 1 foot in diameter of the detector paint, the appearance of a red color, visible all over the plant, is a sign that the saturation temperature has fallen too low and requires attention. The same applies to feed-water heaters for boiler feed water.

Western Australia Gold Production continues to decline. According to a consular report, during the six months ended June 30, 1919, the total Australian production amounted to 573,279 fine oz., of which Western Australia furnished 410,428 oz. For the corresponding period of 1918 the Australian production was 641,911 oz., Western Australia furnishing 443,983 oz.

The Boarding House—an Institution

Contentment and Length of Service Often Depend
More on Good Food, Well Served, Than
on the Rate of Wage

BY RAY W. ARMS

SECRETARY BAKER of the War Department is quoted as saying that a five-cent street railway fare in cities is a psychological necessity. I wish respectfully to submit that within this category also falls the dollar-a-day board at mining-camp boarding houses. No matter what difficulty the cook may encounter in securing foodstuffs, or what prices he has to pay for them, their arrangement into three meals a day must be accomplished for a dollar, or trouble is inevitable. In these days of high costs it is becoming increasingly difficult to set a table with sufficiently wholesome and palatable food at that figure, and the price asked in a great many places exceeds it, but, in spite of this, the men will always feel that a dollar is "par," and that any more than a dollar is overcharge.

Of greater importance, perhaps, than the price is the quality of the food. In mining camps, competition is not especially keen, and the workman is forced to depend upon a few places at the most. He is at the mercy of individuals who, though they are not always profiteers, are frequently careless and seek to accomplish their task in the easiest way, instead of making some effort to procure the best available. This carelessness is always a prolific source of discontent among the men, and much of the roving tendency so evident among miners, especially in the West, can be attributed directly to a desire to change boarding places.

Men in authority whose duties include the establishment of eating places for the men all too often have the mistaken idea that those accustomed to rough work can eat and enjoy anything. Nothing could be farther from the truth. The prevalence and persistence of this erroneous opinion is the cause of much grumbling among the men.

Often there are separate boarding houses for the officials, technical men, and those in the so-called "white-collar" jobs, which receive special attention and enjoy the choice eatables, the culls being sent over to the men, to their intense disgust if they are aware of the practice.

In a few instances no provision whatever is made for the men. Even though their number may be sufficient to justify the establishment of some sort of an eating place, they are left to shift for themselves, violating their digestions with canned and cold foods.

To be wholly successful in pleasing its patrons, a boarding house must serve good, clean, wholesome, palatable foods. Fancy dishes are neither necessary nor desired, but a little care and skill in the preparation of the plain dishes make an enormous difference in the results. Cleanliness is always appreciated, even among men whose work is grimy. Linen is superfluous, but a clean oil cloth or a well-scrubbed table top will serve the purpose. Also, no matter how hardened a man may become to all kinds of fare, his aesthetic sense is always offended at the sight and the feel of a greasy plate. And, besides being clean, the food must be plentiful and varied, so that differing tastes may be satisfied.

In mining camps, where pleasures are always few, the boarding house is an institution. Beyond its

threshold occur a large proportion of the events which serve to break the monotony of the miner's humdrum, off-duty existence. During working hours a man's thoughts are frequently occupied with conjectures concerning the coming meal. If he is fortunate enough to have an excellent eating place his anticipation will be pleasant, and he will be serene in the thought that, however far off from the truth his guess may be, the forthcoming meal will be palatable and satisfying. If he is ill-fated in his boarding house, his guess as to the approaching meal will probably be more nearly correct, but his anticipations much less keen.

The transient miner is said by some to be the most efficient type. In his roving from Alaska to Mexico he has picked up tricks of the trade that are unknown to the locally trained. I have never seen estimates concerning the length of his stay in any one camp, but from personal experience would judge that it is about eight weeks. He may come to a certain place attracted by a minor feature of the camp life which appeals to his fancy at the time. He stays until some adverse detail, equally minute, begins to pall upon him, and finally becomes intolerable. A great many times the feature which sends him on his journey to new fields is the boarding house. He gets along fairly well for a while, but after a time the pleasure of eating is gone. Why? Well because there is too much sameness to the menu; because everything is too salty; because the cook serves prunes three times a day; because the beef is always tough; because the flies are allowed too many privileges; because of a thousand other reasons, either imagined or actually existing. In other words, carelessness with the boarding house will never hold this type of men over their allotted time.

The word luxury is purely comparative. In New York real cream in coffee is for many a necessity. In the hills it is a luxury. On the other hand, broiled lobster is considered by some New Yorkers to be a rather luxurious repast. To the miner in camp it would be a curiosity. All of which is introductory to the statement that a little care and effort on the part of the cook will enable the men to have dishes which they will consider luxuries and will relish as such. A good tender cut of meat, some fresh vegetables, even the old stuff prepared in a slightly different way, might easily take on the aspect of a banquet to the simple tastes of the boarder.

It is therefore suggested that for several reasons it would be good policy on the part of the management to improve this often neglected department and furnish the best food obtainable. This course will be a large factor in inducing men to stay longer, and it is common knowledge that good food will render a man more efficient. It is even conceivable that where men are hired by the day or hour this increased efficiency might constitute an appreciable, though subtle, item in the cost accounts.

I have in mind a certain camp where daily wages run consistently lower than elsewhere in the district, but where the board is excellent and reasonable in price. The company runs the boarding house and hires a competent cook, who is given instructions to feed the men with the best of everything. As a consequence the company sustains a slight loss at the boarding house, but this is more than balanced by the difference in wages between this particular camp and the rest of the district. The men feel they are getting the best of the bargain, and, as a rule, are content to stay.

The United Eastern Mill, at Oatman, Ariz.*

A Modern Plant for Treating Gold Ores by the Cyanide Process—Single-Stage Crushing, Followed by Two-Stage Grinding With Short Ball Mills in Cyanide Solution—Straight Counter-Current Decantation Used

BY WHEELER O. NORTH

THE United Eastern Mining Co.'s property is situated in the Oatman Gold Road mining district of Mohave County, Ariz. The mine and mill are about twenty-six miles southwest of Kingman, the nearest railway connection. The ore consists of a mixture of calcite and quartz, with some andesite. The mineral values, which are mainly gold, alloyed with approximately 34 per cent, by weight, of silver, are extremely fine, so that fine grinding is a most important factor in extraction. The milling process, briefly, consists of single-stage coarse crushing, two-stage ball milling in cyanide solution, followed by combined mechanical and air agitation, and by straight counter-current decantation. The Merrill zinc-dust precipitation method is used to recover the valuable constituents of the ore, and is preceded by the Crowe vacuum treatment of the solution.

The most notable features of the plant are the absence of filters, and the use of short ball mills for fine grinding. As originally designed, the capacity of the mill was to be 200 tons per day, although the grinding facilities were to be capable of handling double that amount. By adding extra agitators and thickeners and by some alterations to the grinding equipment, the daily capacity has been raised to 285 tons. This, it was hoped, might be increased to 300 tons during the warm months of the present year.

As this paper deals primarily with plant operations, those interested in the mechanical description are referred to the article by Otto Wartenweiler,¹ the designing engineer, which gives the details and costs of design and construction. The following changes have been made since that article was published:

Two special simplex Dorr classifiers have been substituted for the two duplex Callow screens and bucket elevators, which classified the Marcy discharge and returned the oversize for regrinding. Three Dorr agitators 14x24 ft. diameter, and two Dorr thickeners, one 40x12 ft. and one 30x8 ft., have been added to the cyanide plant. A 4-in. Krogh centrifugal solution pump and a second Ingersoll-Rand compressor, 9x8 in., were also necessary additions.

FACTORS IN OPERATING COSTS

Water.—Water costs 52c. per 1,000 gal., and 210 gal., at a cost of 11c., are used per ton of ore milled.

Power.—Power costs about 2½c. per kw.-hr., and 1.25 hp. is required per ton of ore milled, costing 52c., or 24 per cent of the total cost.

Labor.—Labor, which is 26 per cent of the total cost, is entirely American, the wage scale being \$5 for helpers, \$5.50 for millmen, and \$6 for solution shift foremen. The repair crew receive \$4.50 and up. The total mill crew (exclusive of repair gang) of three shifts is normally fifteen men. The total labor cost, including superintendence, operation, and repairs, amounts to 56c.

per ton; the average wage is \$5.17 per shift; the tons milled per man on shift, 14.27; per man on repairs, 22.79; average, 8.76.

Supplies.—Supplies, which are 48.3 per cent of the milling costs, amount to \$1.06 per ton milled. All supplies are hauled from Kingman over a good mountain road, at a cost of \$8.50 per ton.

Table II shows the operating costs per ton of ore milled for the last two years:

TABLE II. COST OF OPERATIONS

	Operating Labor	Repair Labor	Supplies	Power	Miscellaneous	Total
1917.....	\$0.4738	\$0.0902	\$1.0675	\$0.4751	\$0.0448	\$2.1514
1918.....
Average.....

In the mine, all ore passes through grizzlies set at 10 in. The 2½-ton skips dump automatically into the 250-ton flat-bottomed coarse-ore bin, which will deliver by gravity about 180 tons. The feed is taken by a 42-in. maple-lined, link-belt pan conveyor, using 2 kw. average load, and operating at a speed of 3 ft. per min. Two per cent of waste is here picked out at a cost of 85c. per ton.

The coarse crusher, a Telsmith No. 6 primary breaker, delivers 35 tons per hour of a 2-in. product, using 10 kw. Lately, the crusher has been preceded by 1½-in. grizzlies, thus relieving the load and materially reducing crusher repairs.

The Telsmith product is delivered by an 18-in. belt set at 20° incline, over a Merrick weightometer, to the fine-ore bin. This belt, operating at a speed of 250 ft. per min., handles up to 50 tons per hour, taking 7.6 kw. The weightometer results have proved entirely satisfactory.

TABLE III. COARSE-CRUSHING COSTS PER TON OF ORE

1917.....	\$0.0211	\$0.0092	\$0.0170	\$0.0112	\$0.0585
1918.....
Average.....

In the analysis of crushing costs in Table III, the increase in the second year is due largely to repair or replacement items.

Two-stage crushing would be desirable to secure finer ball-mill feed and doubtless could be affected at an equal, or even lower, cost than here obtained.

*Excerpted from an article that was presented at the Chicago meeting of the A. I. M. E., Sept. 22-26, 1919.
¹Bull. A. I. M. E., November, 1917.

A nice point of design is the relation of ore storage, particularly mine run, to the daily output. A storage of several days' ore should be provided for, as it is an important factor in the continuous and even operation of both mine and mill. This point is too often overlooked in otherwise well-designed plants for smaller-sized mines.

The fine-ore bin is a 24x24 ft. flat-bottom wood tank furnished by the Pacific Tank Co., and made of 4-in. merchantable Oregon pine. Its capacity is 500 tons. A rack-and-pinion gate feeding an 18-in. link-belt pan conveyor running at 33 in. per min., using 2 kw., delivers up to 15 tons per hour to the ball mill. The amount of feed is controlled by the opening of the bin gate. A record is kept of this opening, as measured by the number of teeth or notches on the bin-gate operating rack shown above a stationary marker at one side. These notches multiplied by the time give notch-hours, from which a known factor gives a fairly accurate estimate of the tonnage milled for each shift or for any desired period.

COARSE GRINDING

The ore, with the addition of lime, is fed to a No. 64 1/2 Marcy mill, working in closed circuit with a simplex Dorr classifier, set on a 3-in. slope and making thirty-four strokes per minute. This mill operates at 26 r.p.m. and carries a load of 9,000 lb. of 5-in. forged chrome balls. It reduces 260 tons of -2-in. ore to -20 mesh, using 67 kw. The grinding is carried on in a 1.6-lb. per ton KCN solution containing 1 lb. per ton of protective alkali (lime). The accompanying tables IV and V give the details of the mill operations and supplies.

Control of the coarse grinding is maintained by varying the specific gravity of the pulp in the Dorr classifier, and by the bin gate.

TABLE IV. BALL-MILL DATA

No. 64 1/2 Marcy mill	Peri- pheral Speed of Mill, Ft. R.p.m.	Tons per Hour Original Feed	Average Power Kw.-Hr. Gr.-Hr.	Kw.-Hr. Per Ton, Gr.-Hr.	Ball Load, Lb.	
2-in. feed ground to pass 20 mesh.	26	490	11.00	67	6.09	9,000
Allis-Chalmers 5 x 6 peb. mills 20-mesh feed ground 82 per cent -200.	28	440	3.75	48	12.80	8,000

TABLE V. TOTAL STEEL CONSUMPTION

No. 64 1/2 Marcy Mill	Lb. per Hour, Including Scrap	Lb. per Ton, Including Scrap	Per cent of Metal Lost as Scrap	Cost per Ton, Milled Ore
5-in. chrome-steel balls.	10.58	0.925	None	\$0.554
Feed-end liners, manganese steel.	0.717	0.072	32.2	0.110
Shell liners, manganese steel, step type.	1.650	0.163	45.5	0.268
Discharge grates, chrome steel.	0.566	0.055	48.4	0.137
Bolts, clamp bars, center liners	0.214	0.022	63.8	0.068
Total liner consumption.	3.147	0.312	43.0	0.583

The discharge of the mill is maintained at about 30 per cent moisture. The normal return circuit from the classifier is about two to one of original feed.

TABLE VI. COARSE-GROUNDING COSTS PER TON OF ORE

	Operating Labor	Repair Labor	Supplies	Power	Miscel- laneous	Total
1917	\$0.0429	\$0.0140	\$0.1097	\$0.1183	\$0.0001	\$0.2850
1918	0.0387	0.1165	1.424	1.465	0.021	3.462
Average.	0.0407	0.153	1.267	1.550	0.014	3.171

Table VI shows the Marcy mill costs. As in coarse crushing, the second year's costs are increased by renewals and replacements not occurring in proportionate amount in the first year's operation. Other factors tending to increase the 1918 costs were increases in

wages of 28 per cent, power 15 per cent, and supplies in some cases over 100 per cent.

Fine grinding is done in two 5x6 ft. Allis-Chalmers ball granulators. These mills carry a ball load of 8,000 lb. of 2-in. chrome steel pebs and consume 48 kw. They grind about ninety tons each from -20 mesh to 82 per cent -200 mesh, working in closed circuit with standard Model C, duplex, 54-in. Dorr classifiers, set at 2 1/2-in. pitch and operating at eighteen strokes per rake per minute. As this size classifier was found to be greatly overloaded for such fine separation, an 8-ft. Callow cone was installed to take the overflow of each classifier. The spigot product is returned by a Frenier pump to the classifier feed boxes. The slime overflow of the classifier was raised 4 in., which also helped materially in the classification.

The moisture content of the mill discharge is maintained at about 30 per cent, and, as in the coarse grinding, the main control is by the specific gravity of the classifier overflow.

The cones are equipped with a 1 1/2-in. discharge pipe, 30 in. below the overflow of the cone. After considerable experimentation, this size of outlet and head for the discharge proved to be the most satisfactory. This arrangement also acts as a trap for any coarse gold, so that a considerable increase in value of mill heads can be accommodated without the necessity of cutting tonnage. The spigot product is returned to the Dorr classifier by No. 3 Abbe Frenier spiral sand pumps.

TABLE VII. FINE-GROUNDING COSTS PER TON OF ORE

	Operating Labor	Repair Labor	Supplies	Power	Total
1917	\$0.0553	\$0.0328	\$0.1862	\$0.1899	\$0.4642
1918	0.0678	0.171	2.393	2.055	5.297
Average.	0.0618	0.246	2.140	1.981	4.985

It is of interest to note that comparative data in the district show that two-stage ball milling is about 15 per cent cheaper than the same work accomplished with stamps and tube mills. At the same time, indications are that single-stage ball milling shows the same supply and labor costs, but about 20 per cent greater power consumption.

TABLE VIII. TOTAL STEEL CONSUMPTION, INCLUDING SCRAP

Total liner consumption.					

AGITATION

From the fine-grinding department, the pulp flows by gravity to No. 1 Dorr thickener, arriving with a gravity of 1.12 and a dilution of 1 part of ore to 4.5 parts of solution. The thickened underflow is pumped by a duplex, Campbell & Kelly No. 4 diaphragm pump to the first of a series of seven 14x24 ft. diameter Dorr agitators, which are arranged to handle the continuous flow of pulp by gravity. The flow of pulp is 280 tons per day with a specific gravity of 1.40. The period of agitation is about sixty-two hours, after which dissolving of values is almost negligible. Agitation is effected by air, compressed to 30 lb. by two belt-driven Ingersoll-Rand compressors, Class E. R. I., size 9x8 in., using 15 kw. for each.

From the agitators the pulp flows through five 40-ft. Dorr thickeners arranged for straight counter-current work. The barren solution, 3.76 tons per ton of ore, is introduced in No. 4 thickener, and the wash water, about 0.82 tons per ton of ore, is introduced in No. 6 thickener. The flow at No. 6 thickener is split, and about one-third is sent to No. 7 thickener, a 30x8-ft. tank. The discharges of No. 6 and No. 7 thickeners flow together to the tailing pond with a moisture content of 0.82 ton of solution to 1 ton of ore.

The seven agitators, seven thickeners, and six duplex diaphragm pumps are all driven by one line shaft and consume an average of 6 kw., or just over 8 hp. The solutions are handled by direct-connected centrifugal pumps controlled by automatic float switches.

The primary thickener taking the dilute overflow of the cones, 280 tons of ore to 1,768 tons of solution, has a settling area of 4.37 sq. ft. per ton of ore, and a settling ratio of 38 cu. ft. per ton of ore. It is necessary, however, to operate this thickener with a low mud line to prevent colloidal material being drawn over into the gold tanks. About 870 tons of solution are precipitated daily, and the remainder, about 600 tons, is returned to the mill storage.

The regulation of all thickeners is maintained by varying the speed or the length of stroke of the diaphragm pumps. The mud line is determined by use of a weighted bottle, which will sink in solution but float on the mud. The maximum gravity is obtained with the highest mud line consistent with a clear overflow, other factors of alkalinity, temperature, and density of feed remaining constant. All additions of cyanide are made to No. 1 agitator, where the cyanide is built up to 2.7 lb. KCN per ton of ore.

The cyaniding costs are given in Table IX. The reduction in price of cyanide during 1918 more than offsets the adverse factors of power and labor.

TABLE IX. CYANIDING COSTS PER TON OF ORE

	Operating Labor	Repair Labor	Supplies	Power	Miscellaneous	Total
1917.....	\$0.0972	\$0.0237	\$0.4575	\$0.0884	\$0.6668
1918.....	0.0867	0.0257	3553	1153	0.0018	5848
Average.....	0.917	0.248	4042	1025	0.010	6242

PRECIPITATION

The pregnant solution from the primary thickener flows by gravity to the No. 1 gold tank, from which it is pumped by a 2½-in. Krogh centrifugal pump through a Merrill central-slucing clarifying filter consisting of 28 frames 3½ ft. square. This filter delivers the clear solution to the No. 2 gold tank, or steady-head tank of the Crowe vacuum-treatment system. Zinc dust is added to the solution as it leaves the vacuum-treatment system. Control of precipitation is largely mechanical and is based on experience. The shift foreman checks the rate of zinc feed by weighing a 5-min. run, which is normally about 110 gm. When a new press is cut in, 20 lb. of zinc dust is added at once and the rate of feed is increased for six hours to 220 gm. per 5 min. The solution discharged from the press during the first 15-min. run is returned to the gold tank. This is with a precipitation rate of about thirty-six tons of solution per hour.

TABLE X. PRECIPITATION COST PER TON OF ORE

	Operating Labor	Repair Labor	Supplies	Power	Total
917.....	\$0.0003	\$0.0032	\$0.1274	\$0.0243	\$0.1552
1918.....	0.002	0.024	0946	0178	1150
Average.....	0.002	0.028	1103	0209	1342

The cost of precipitation as given in Table X showed

a decided reduction in 1918, due partly to the lower price of zinc dust but mainly to the use of the Crowe vacuum treatment, which effected a saving of nearly 50 per cent in the amount of dust used.

Vacuum treatment is carried out in a 4x10 ft. vacuum receiver or drum set on end, the 6-in. inlet of which is in the center of the top and 23.4 ft. above the solution level in the steady-head tank. The solution is poured down over a series of perforated trays. During this process, the occluded air is liberated and removed by the vacuum pump. The solution level in the vacuum receiver is maintained at a height of about 30 in. by a float operating a butterfly valve in the intake pipe. This float rod is fitted with an electric contact, which sounds a "Klaxon" alarm if for any reason the solution level gets dangerously low. The discharge of the vacuum receiver is from the center of the bottom. It feeds by gravity to a 7x8-in. triplex pump set so that the pump glands are 32.8 ft. below the solution level in the receiver. This keeps a slight pressure on the pump glands and prevents intake of air at that point. The zinc dust is fed to this pump, where it is mixed with vacuum-treated solution. It is then pumped to the refinery and the 32-frame, 36-in., Merrill presses. The barren solution from the presses is returned to the No. 4 thickener, part of it being used as cooling water for the air compressors on the way back.

CLARIFICATION

The clarifying filter is dressed with No. 10 duck. One set of cloths lasts about six weeks. The feed pressure on this filter varies from 8 lb. with a clean press, up to 33 lb. just before sluicing. The press is normally sluiced every six hours, using barren solution under 50 lb. pressure. It is very essential that the sluicing bar and nozzles be maintained at a high state of efficiency; a spare bar is always kept in readiness. The cloths become coated with a lime and alumina deposit, so that acid treatment is necessary every three days.

A hot solution of 0.9 per cent HCl is used with a contact of 60 min., the acid being circulated through the press by a 1½-in. centrifugal pump. After treatment, the press and acid-circulating system are drained and washed out, and the acid solution is stored, for future use, in a redwood sump tank.

The sludge from the ordinary sluicing of the filter is returned to No. 3 thickener, as it always contains gold and cyanide. Ordinary sluicing takes 10 min. and the acid treatment about 90 min., so that the filter normally operates 96 per cent of the day. Redressing requires nearly five hours. This filter can clarify 1,000 tons of solution per day under these working conditions.

TABLE XI. CLARIFICATION COST PER TON OF ORE

	Operating Labor	Repair Labor	Supplies	Power	Total
1917.....	\$0.0010	\$0.0017	\$0.0197	\$0.0073	\$0.0297
1918.....	0.004	0.020	0337	0100	0461
Average.....	0.007	0.018	0270	0087	0382

In both precipitation and clarifying costs, the only operating labor charged is that of changing cloths.

CLEAN-UP

The precipitation presses are dressed with four thicknesses of sheeting. The outside cloth is removed at each clean-up and a new cloth is added on the bottom. By this method no duck or canvas is required and the condition of the cloths as regards "liming up" is maintained nearly constant. When it is desired to clean a

press, the solution is cut off and the press is drained and blown with compressed air from 60 to 90 min.; this dries the precipitate to about 45 per cent moisture. The press is then opened and the precipitate is scraped into the precipitate wagon. The outside cloths, with some adhering precipitate, are removed and burned in a special furnace, and the resulting ashes are returned to the undried precipitate.

After determining the moisture content, the undried raw precipitate is fluxed with 11 per cent borax glass, 11½ per cent sodium bicarbonate, 6 per cent manganese dioxide, 3.3 per cent ground bottle glass, and at least 10 per cent of old slag shells from former melts, the percentage being in terms of the calculated weight of the dry precipitate.

A precipitate press ordinarily runs from five to six days, and yields about 130 lb. dry precipitate. In re-summing precipitation after a final clean-up, one press is given the entire flow. When this builds up a pressure of 35 to 40 lb., the second press is opened just enough to maintain the pressure of the first press below 45 lb. When the second press reaches 20-lb. pressure, the entire flow is turned into it and the first press is cleaned. This method is carried on until the end of the month, when a final clean-up is made. The solution is metered by a revolution counter on the triplex pump, which is calibrated at intervals with a known tonnage of solution.

MELTING

The fluxed wet precipitate is placed in No. 5 paper bags and fed to an oil-fired No. 150 Case tilting furnace, using a No. 100 long-lipped, graphite crucible. When ready for pouring, the crucible contains fifteen sacks of precipitate and yields a 600- or 700-oz. button and from 40 to 50 lb. of slag. This charge is poured into a conical mold and allowed to set for a few minutes. The slag is then tapped through a hole about 2 in. above the gold button, and run into cold water for granulation. The granulated slag, which carries about 25 oz. of gold per ton and as much silver, is ground in a small mill and concentrated with a laboratory-size Deister table. The bullion buttons are remelted and cast into bars weighing about 150 lb. each.

TABLE XII. REFINING COST PER TON OF ORE

	Operating Labor	Repair Labor	Supplies	Power	Miscellaneous	Total
1917.....	\$0.0437	\$0.0051	\$0.0710	\$0.0004		\$0.1202
1918.....	.0444	.0026	.0366	.0008	\$0.0017	.0861
Average.....	.0441	.0038	.0530	.0006	.0009	.1024

For convenience of comparison, the costs of clarifying, precipitating and refining for 1918 are also given per oz. of gold and per ton of solution precipitated:

TABLE XIII. 1918 COSTS PER TON OF SOLUTION PRECIPITATED

TABLE XIV. 1918 COSTS PER OUNCE FINE GOLD RECOVERED

	Operating Labor	Repair Labor	Supplies	Power	Miscellaneous	Total
Clarification.....	\$0.0003	\$0.0019	\$0.0318	\$0.0095		\$0.0435
Pre-precipitating.....	.0002	.0023	.0892	.0168		.1085
Refining.....	.0419	.0025	.0345	.0007	\$0.0016	.0812

REFINING COSTS

The costs of clean-up and refinery, as is the case with those of precipitation, were materially reduced in 1918 by the use of the vacuum process. The zinc content of the crude precipitate was reduced from 30 to 35 per

cent to 6 or 7 per cent, and the bullion content was raised from 54½ to 71 per cent. This increase in metal content allowed the substitution of the No. 100 crucible for the No. 150, as the smaller size easily yielded a button from 600 to 700 oz., which is about as large as can be conveniently charged into a red-hot furnace without danger of cracking the crucible.

The cost of refining, averaging a little over 10c, is only about 4½ per cent of the total cost of operations.

The Metallurgy of Wulfenite*

Probably 90 per cent of the molybdenum produced in the United States during the war period was derived from molybdenite, according to J. P. Bonardi, of the U. S. Bureau of Mines, in spite of the fact that prior to 1915 the wulfenite ores of Arizona supplied the larger part of the molybdenum. This is attributable to the successful application of flotation to molybdenite and because the deposits of the latter are larger. The wet concentration of wulfenite ore offers little difficulty, but a number of associated minerals—vanadinite, cerussite, anglesite, galena, pyromorphite and mimetite—come out in the concentrate, rendering its subsequent treatment somewhat difficult. Usually, a concentrate of 15 to 20 per cent MoO₃ is the best that can be obtained, and buyers of concentrate frequently set the latter figure as their minimum content. Wulfenite has the advantage over molybdenite that it frequently has gold in association, and both this and the lead are recovered in the treatment of the concentrate.

Any of three methods of treatment may be used: (1) an acid leach; (2) an alkaline leach; (3) fusing with something that will reduce the lead to the metallic form and take the molybdenum into the slag. The first has so many disadvantages compared with the other two as not to merit much consideration. Of the various alkalies, sodium sulphide is, perhaps, the most satisfactory, as the molybdenum goes into solution as sodium molybdate, the lead and precious metals remaining in the residues. This process is used by at least one company in the United States at present. The high-grade calcium molybdate thus produced can be used for the production of ammonium molybdate, ferromolybdenum, or added directly to the steel in the manufacture of alloy steels. By fusing with soda ash, caustic soda, and coal, the lead is recovered in the form of bullion. The sodium molybdate thus formed can be leached from the slag and the metal precipitated in the form of calcium molybdate, which can be utilized as stated above.

In one of the experiments a recovery of 96.7 per cent was made on the molybdenum and of 98.5 per cent on the lead, and it is estimated that a 90 per cent extraction of both would represent commercial practice. At present prices there is a difference of \$270 between the value of the products and the cost of the chemicals in treating a ton of typical concentrate, so that the process would seem commercially feasible.

The Gold Mines of Ontario, chiefly in the Porcupine district, have so far yielded \$51,000,000 worth of the metal. The Cobalt camp has produced \$185,000,000 in silver, and the copper-nickel mines of the Sudbury district have produced \$138,000,000.

DETAILS OF PRACTICAL MINING

Suggestions From Practice for the
Superintendent, Foreman,
and Miner

Rock Grizzly at the Franklin Mine

BY A. O. CHRISTENSEN

A grizzly used at Franklin, N. J., for handling rock filling for the mine is illustrated in the accompanying sketch. The rock arrives through mill-holes as broken by the blasting, with little or no blockholing. The object of the grizzly is to act as a screen and separate

The critical feature of the arrangement is the brow marked B. Most of the work of running the rock through the chute is done by means of a bar operated just below the brow. If the brow is higher than a man's shoulder, the work is hard, tiresome, and dangerous, and it has been found that the distance of 5 ft. above the grizzly is the best height for B. Directly in front of the grizzly, and rising from a level with it, is a pile of material which is never disturbed and slopes up at its angle of repose. If the brow is situated over this pile, a part of the opening available trouble free running of the rock is lost and considerable trouble is caused by hang-ups and the entrance of chunks that are too large to pass through the opening. If the brow is placed back from the front edge of the grizzly, no purpose is served by the latter and it is subjected to harder use, because the chunks drop directly on the front edge from above, instead of rolling on it.

The length of the grizzly as measured from below the brow depends on the height of B and the angle of repose of the rock. Assuming this angle as 45°, and the height of B as 5 ft., the grizzly should be 6 or 7 ft. long. To make it greater than this would involve needless expense and is dangerous for the men when the run of rock begins after having been hung up.

Practice with various forms of grizzlies, and the study of their operation, show that, for this type, the following dimensions and arrangements have been

found satisfactory: The grizzly itself is made of horizontal 9-in. x 12-in. timbers, fitted into hitches, strengthened, and protected from wear by angle irons and spaced 2 ft. between centers. Across these are laid heavy railroad rails, spaced 15 in. between centers, inverted, and overlaid with strips of 1-in. flat iron to take the wear. These may be bolted to the timbers in different ways, but provision should be made for effecting easy renewal.

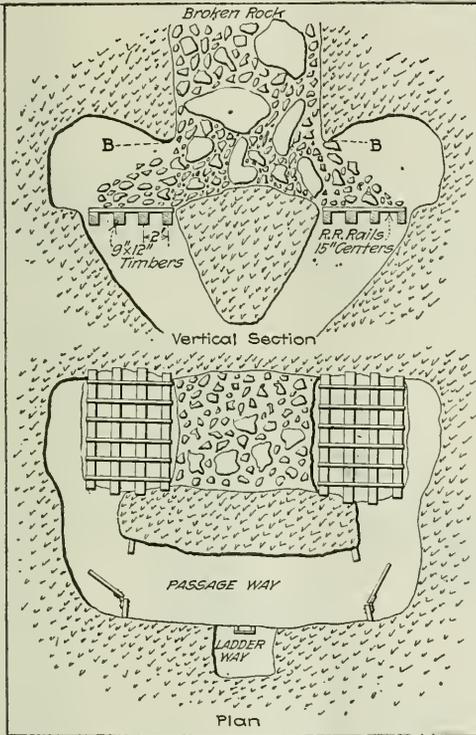

Two men can work on each grizzly, but it has been found more economical to have one helper on each grizzly and one man in charge. Chunks that are too large to pass the grizzly or to be broken with a hammer are rolled to one side and blockholed until so many have accumulated that they interfere with the work. In blasting, both sides are fired at the same time, the doors in the passageway are closed, and the men enter the ladder-way and close the door above, to protect themselves from the concussion.

Safety Device for Dumping Ore Into Skips

BY A. C. BIGLEY

Butte, Montana.

Station tenders dumping loaded ore cars directly into the skip from the station are in constant danger of being struck by rock falling down the shaft, and there is the possibility that the engineer may move the skip during the dumping operation and this often results in slight, serious, or fatal accidents. As a means of

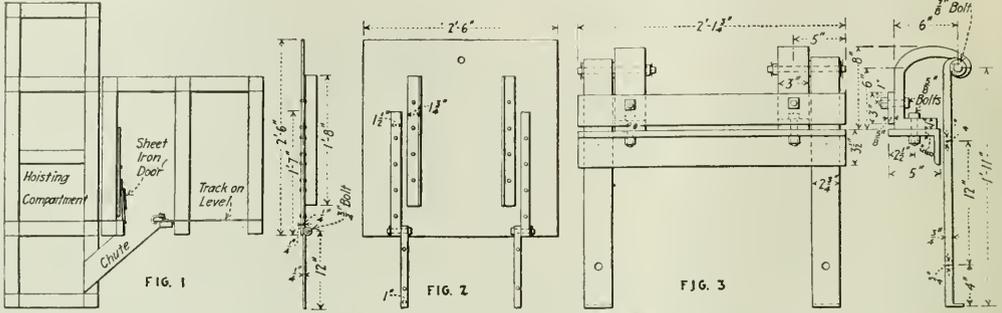

GRIZZLY FOR HANDLING ROCK FILLING

or classify the rock so that the proportion passing through will be of a size that may be delivered conveniently into tram cars by means of chutes.

The rough rock reaches the grizzly through the mill-hole, which is about 12 ft. in diameter. The capacity of the chute below the grizzly and above the haulage level is sufficient to hold whatever rock is produced during several shifts' work, so that failure to remove the rock from the chute may not immediately interfere with the running of the rock through the grizzly. Two separate grizzlies are employed, the capacity thus being doubled, one grizzly complementing the other in case of hang-up.

overcoming injury from these sources and at the same time increasing the efficiency in dumping directly into skips (in the absence of skip chutes or ore pockets) a scheme was devised at the Berkeley mine of the Anaconda Copper Mining Co., of Butte, Montana.

The ground in front of each hoisting compartment of the shaft was removed as shown in Fig. 1 and is lined on the sides and bottom with sheet iron, making a slide or chute with an opening into the shaft 20 in.

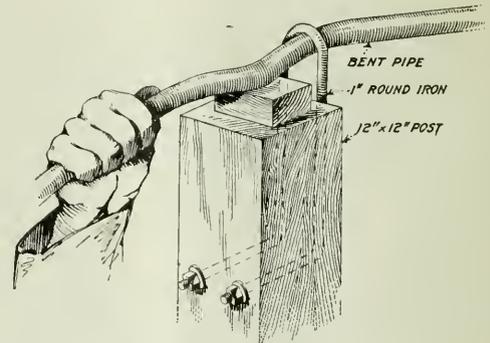

PLAN AND ARRANGEMENT OF SAFETY DEVICE FOR DUMPING ORE INTO SKIPS

deep and 19 in. wide. Sheet-iron doors, as shown in Fig. 2, cover the openings on the station floor when not in use. The doors when closed will not interfere with the caging of waste or handling of supplies on the station. In order to provide a dump or stop for the cars as they are being emptied, the device shown in Fig. 3 was made, and this prevents the car from pushing ahead and holds it stationary while it is being dumped. After the skip has been filled, the stop is turned over and folded into the slide or chute, a part of it serving as a support for the door when it is closed. This method protects the station tenders from danger, as their work is done at a safe distance from the shaft, and all station doors are closed. By the use of the old method it was necessary to "re-spot" the skip after three cars were dumped, on account of the stretching of the rope. The skip can now be filled without "re-spotting," and an easier method of dumping and handling of the cars is provided.

A Straightener or Bent Pipe

Pipes that have been laid through crooked drifts and up crooked raises are usually badly bent, and their much of the equipment is recovered from parts of the mine that have been worked out, an assortment of pipe removal requires further bending, and to this is added the falls of ground and shooting on the pipes. At most mines where development is progressing rapidly and

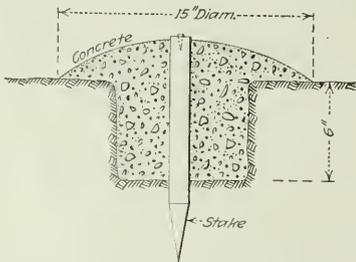

accumulates. The major part of this will be of 1-in. size, bent and twistest. Pipe of small diameter is readily straightened sufficiently to be used again. This straightening should be accomplished by rebending, and not by pounding, and, to do this, some means of holding the pipe is necessary.

DETAIL OF BENT-PIPE STRAIGHTENER

Concrete Collar for Survey Station

The sketch illustrates a method that may be used for the purpose of preserving reference stations in survey

METHOD OF CONCRETING SURVEY STATION

work, especially in the vicinity of an industrial plant or where construction operations are in progress.

The accompanying illustration shows a simple device which enables one man to straighten a large number of pieces of 1-in. pipe in a short time. It consists of a good-sized post, 8 x 8 in. to 12 x 12 in., set firmly in the ground, and about 4 ft. high. A piece of 1-in. round iron is bent into an elongated U-bolt, about 3 in. across the two arms, and the two ends are bent at right angle to the U-part, passed through the post, and fastened securely in place by nuts. In straightening a pipe, it is passed through the U and over a small block on top of the post. The post is at such a height that the pipe is easily manipulated, and the length of pipe offers sufficient leverage to enable the workman to bend it with little exertion.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

War Minerals Relief

An important ruling, having to do with net losses, has been made by the War Materials Relief Board in connection with a claim by two partners, one of whom had a two-thirds interest in the property, and also had interest in other properties with the same product. His profits on the other properties more than covered his loss in the one covered by the claim. His partner, having no profits from similar operations, was awarded one-third of the amount allowed on the claim, it being specified that the other partner was not to share in the award. The exact wording of the ruling is: "Net losses must be individual and must reckon with all operations of any claimant for the production of the minerals specified in the act. No claimant can be permitted to ask for an award for net losses from unsuccessful enterprises alone. The term 'net losses' must be construed as such; that is, when the result of all operations of the claimant in the named minerals is unprofitable."

About 154 claims have been thrown out by the commission, as it was clearly shown no request or demand was made by the Government agencies named in the bill. Many protests are being received, but the commission is unable to act otherwise in view of the Attorney General's interpretation.

National Conference of Labor

National Industrial Conference was called to order on October 6 by Hon. William B. Wilson, Secretary of Labor, temporary chairman; Rowland B. Mahany acting as temporary secretary. John Barrett, Director General of the Pan-American Union, extended a cordial welcome to the conference on behalf of the governing board, and concluded a graceful and felicitous address by expressing the belief that all present were working for good will, particularly co-operation, and permanent peace in American industry.

Temporary Secretary Mahany read President Wilson's letter of September 3, 1919, calling the conference. A roll-call showed that all save three or four invited by the President were present. Secretary Wilson delivered an address, wherein he referred to the fundamental causes of industrial unrest, and called attention to the fact that permanent industrial peace must be based on industrial justice, and that it is not sufficient that either side to an industrial controversy should be the sole judge of what constitutes justice.

It was resolved that each of three groups of conferees, representing Employers, the Public and Labor, should appoint three members of a committee of nine on permanent organization of the conference;

and that, in like manner, a committee be appointed on rules and procedure. The conference, which promises to be of historical importance and great public service, opened auspiciously, an atmosphere of good feeling, public spirit, and desire to co-operate and to be mutually helpful, prevailing.

Exports of Mining Machinery

The exports of mining machinery from the United States during August, 1919, according to the figures of the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Oil Well	All Other
France	\$ 2,100	\$ 69,562
Italy		205
Netherlands		28,113
Norway		6,223
Roumania	41,331	
Spain		17,267
England		84
Canada	9,752	44,288
Costa Rica		263
Guatemala		1,150
Honduras		1,227
Nicaragua	1,304	3,323
Panama	1,268	
Mexico	106,565	53,090
Miquelon, Langley		2,165
Newfoundland and Labrador	200	
Barbados	866	
Trinidad and Tobago	4,428	
Cuba	4,421	9,098
Dominican Republic	153	
Argentina	33,933	
Bolivia		2,532
Brazil	1,742	4,000
Chile	230	87,597
Colombia		20,765

Tariff on Potash

Germany is boasting that she will continue to control the potash output of Alsace, according to Representative Kinkaid, of Nebraska. Mr. Kinkaid urged that the bill providing duties on imported potash be reported promptly to the House and passed, and also called attention to the potash resources of the United States, urging their development. He cited the fact that the American producers proposed that the maximum price for next year shall not exceed \$2.50 per unit for their potash, in attempting to refute the claims that the potash bill will cause fertilizer prices to go to prohibitive levels.

Mine Taxation Discussed at Washington

Chicago Meeting Showed Need of Further Conference—
Many Prominent Mining Men Take Part—Committees Formed to Consider Interests of Special Mining Industry

AT THE meeting of the American Institute of Mining and Metallurgical Engineers in Chicago, the subject of mine taxation under the income-tax and excess-profit tax laws was discussed by L. C. Graton, of the Bureau of Internal Revenue, who is in charge of copper in the division of Natural Resources of the Income Tax Unit. Mr. Graton read a paper on the subject of administrating the tax, which was discussed with great interest at several sessions, under the chairmanship of R. C. Allen. The Chief of the Division of Natural Resources, Mr. Darnell, was also present at the meeting, and requested further assistance and co-operation by the Institute. Owing to the feeling that further conferences were necessary, H. V. Winchell, president of the Institute, appointed a committee of the Institute to meet in Washington in co-operation with the Internal Revenue Bureau. This committee assembled on October 6 at the Treasury Building and was welcomed in a cordial speech by Commissioner Daniel C. Roper, and in brief speeches by Mr. Darnell and Mr. Graton. The personnel of the executive committee selected by President Winchell is as follows: C. F. Kelley, chairman, S. J. Jennings, James R. Finlay, R. V. Norris, J. E. Spurr, W. G. Swart, and Paul Armitage, secretary.

The fact was emphasized by Mr. Kelley, in addressing the committee, that the function of the body was to formulate principles of taxation and interpret the law, rather than to criticize the existing legislation and its administration. He made it plain that, if the committee did not point out improvements and formulate correct and satisfactory principles, the metal industry would not be in a position to criticize Congress or the Revenue Bureau for any alleged shortcomings. For further action, it was decided to divide the committee into three sub-committees as follows: (1) Committee on invested capital—F. S. Peabody, chairman; Walter Douglas, Mr. Peterson, Mr. Schofield, J. F. Callbreath, C. F. Kelley, and W. G. Mather; (2) committee on valuation methods—J. P. Channing, chairman; R. C. Allen, J. R. Finlay, R. V. Norris, Arthur Thacher, J. E. Spurr, John P. Gray, and George F. Wolff; (3) committee on depreciation and depletion—W. G. Swart, chairman; R. M. Bennett, Paul Armitage, H. A. Guess, F. L. Garrison, W. A. Williams, J. L. Bruce, Walter Fitch, and Mr. Schree.

These three subcommittees held frequent meetings, and when the main committee of the whole was convened on the afternoon of October 9, each of the subcommittees presented resolutions and recommendations, which they had drawn up, and which were submitted to the committee of the whole for such action as was thought desirable. The matter was referred by this committee to the executive committee, which decided to go over these recommendations at

Atlantic City on October 20, and then formulate them definitely, so that they could be presented to the officials of the Bureau of Internal Revenue. The executive committee was enlarged so as to include W. G. Mather, Walter Fitch, John P. Gray, Arthur Thacher and Walter Douglas, Mr. Darnell was made an associate member.

In the meantime it was arranged that the resolutions decided upon should be considered by specially constituted committees representing the principal mining industries, which committees would be formed by the various members of the executive committee, who would act as chairmen. These committees are as follows: Copper, Walter Douglas; coal, R. V. Norris; metal, W. G. Swart; lead and zinc, J. R. Finlay, and precious metals, J. E. Spurr.

As seen from the list of members of the Institute, who make up the general committee, this series of meetings was successful in bringing together men of wide experience, and in affording opportunity for intensive discussion of the vital problems connected with the administration of the income-tax law and the excess-profits tax law in regard to mines. Moreover, the spirit of co-operation shown by Commissioner Roper and his staff promises well for the future.

Organization of the mining unit of the subdivision of natural resources in the Internal Revenue Bureau is relatively new, the present staff of mining engineers having but recently entered upon their duties. It is owing to the efforts of Mr. Darnell and Ralph Arnold that such an organization has come into existence.

Chronology of Mining, September, 1919

Sept. 1—Strike of miners ended at Virginia City, Nev.—Yellow Pine Mining Co., Goodsprings, Nev., voluntarily raised wages 25-50 cents.

Sept. 2—House passed zinc tariff bill.—Fire broke out in abandoned stopes of Hercules mine, Burke, Idaho.—Wellington Mines, Breckenridge, Col., resumed operations.

Sept. 3—Senate passed oil-land leasing bill.

Sept. 4—Mining companies at Colbalt, Ont., issued statement of their position as to labor strike existing.

Sept. 8—Strike at Cobalt, Ont., ended.

Sept. 9—Suit for infringement of flotation patents filed against Nevada Consolidated Copper Co. by Minerals Separation North American Corporation and Minerals Separation, Ltd.

Sept. 10—U. S. Supreme Court, at Boston, handed down decision in suit of Louis Ross against Albert C. Burrage to obtain part of profits from sale of mining properties in Chile to Guggenheims; court ruled Burrage was entitled to only \$100,000.

Sept. 14—Hurricane did much damage in various Texas oil fields.

Sept. 15—Public Lands Committee of House decided to expedite passage of general leasing bill.

Sept. 16—Herbert Hoover given dinner by A. I. M. E. in New York, upon arrival from Europe.

Sept. 18—Cloudburst put American Smelting and Refining Company's smeltery at Garfield, Utah, out of operation for several days.—First break occurred in Metal Crafts strike at Butte, Mont., when machinists voted to return to work.

Sept. 19—Governor of Minnesota vetoed Bendixen bill levying 5 per cent tax on iron ore.

Sept. 22—General strike of steel workers began.—School opened for teaching English to aliens in Utah mining camps, as required by state law.—Chicago meeting of A. I. M. E. and other societies opened.

Sept. 25—Fire broke out on 800 level of Homestake Mining Co., Lead, S. D., shutting down all mills.

Sept. 26—Arizona Commercial Mining Co. again filed suit against Iron Cap Mining Co., after former suits had been thrown out by Massachusetts court for lack of jurisdiction.

Sept. 27—Strike, which began August 19, settled at Chrome, N. J., plant of United States Metals Refining Co.

Sept. 29—Calumet & Hecla Mining Co. announced gift of life insurance policy to each of 10,000 employees.—New building dedicated at Pittsburgh, Pa., the U. S. Bureau of Mines experiment station.

New Process for Removing Sulphur Dioxide from Smeltery Smoke

A method for treating gases containing small amounts of sulphur dioxide, such as from 1 to 2 per cent, has been patented by E. V. Espenhahn, of the Broken Hill works, at Port Pirie, South Australia (U. S. Patent No. 1,315,183, Sept. 2, 1919). The gas is passed through a spray of sodium thiosulphate solution in washing towers or scrubbers, forming a solution of the polythionates. Part of this liquid is then heated to about 100 degree c., when decomposition takes place with the formation of sodium sulphate, sulphur dioxide, and free sulphur; the latter agglomerates into porous masses and is easily recovered.

The sodium sulphate solution is cooled, the salt precipitated out, filtered, mixed with coal or coke and heated to about 1,000 degree c., to form sodium sulphide. This is leached out of the fused mass and clarified. It is then brought into contact with a part of the polythionate solution, with which it reacts to form free sulphur and thiosulphate. The thiosulphate so formed is used to wash the incoming gases, making the process a cyclic one. Modifications of the process may be employed to produce concentrated sulphur dioxide, sulphuric acid, or thiosulphate.

September Pig-Iron Production

Pig-iron production in September, 2,441,554 tons, though 301,834 tons less than that of the 31-day month of August, was larger than July's output of 2,428,541 tons, according to Iron Age. The daily averages for September, August and July were 81,385, 88,496, and 78,340 tons respectively. The effect of the strike is shown in a net loss of 103 furnaces on the active list. Most of them were banked as October came in, but many are now in operation. Against a rated capacity of 93,360 tons daily for 265 furnaces active September 1, the rate of production

of the 162 furnaces in blast October 1 was only 50,-100 tons, indicating to how large an extent the larger furnaces were crippled.

Foreign Trade in Metals and Ores

Imports and exports of the more important metals and ores, as reported by the Department of Commerce for August, 1919, and the figures for August, 1918, as finally revised, are as follows:

IMPORTS, AUGUST, 1918 AND 1919		
(In pounds, unless otherwise stated)		
	August, 1918	August, 1919
Metals and ore:		
Antimony ore, contents	18,951	78,400
Antimony ore, contents	2,886,926	741,550
Antimony matte, regulus or metal.....		
Copper:		
Ore, contents	5,581,878	4,172,049
Concentrates, contents	5,629,619	3,262,921
Imported from (in part):		
Canada	3,981,670	2,870,938
Mexico	8,935,251	3,204,371
Cuba	2,127,800	2,143,507
Chile	1,213,378	169,385
Peru	2,288,016	54,633
Venezuela		720
Unrefined, black, blister, etc.	11,708,671	15,954,504
Refined, in bars, plates, etc.	168,027	439,151
Old, etc., for remanufacture	111,196	98,400
Composition metal, copper chief value.....		
Lead:		
Ore, contents	2,802,856	860,654
Billion, contents	12,397,866	4,959,021
Imported from (in part):		
Canada	2,678,977	300,765
Mexico	12,398,506	5,508,058
Pigs, bars and old		1,120,089
Pyrites, long tons	69,730	30,705
Imported from (in part):		
Spain, long tons	17,674	21,275
Canada, long tons	41,469	9,430
Tin ore, long tons	825	728
Tin bars, blocks, pigs, etc.	16,619,837	9,872,459
Imported from (in part):		
Straits Settlements	6,877,092	2,746,259
Dutch East Indies	5,481,194	
United Kingdom	1,901,348	
Australia	780,640	224,000
Hongkong	1,103,546	
Zinc:		
Ore, contents	3,412,338	1,606,497
Imported from:		
Canada	1,247,740	195,646
Mexico	2,164,598	1,402,151
Blocks or pigs, and old		11,545
Manganese ore, long tons	33,976	3,240
Imported from (in part):		
Cuba, long tons	972	193
Brazil, long tons	25,520	3,600
British India, long tons	1,650	
Tungsten ore, long tons	583	653

EXPORTS OF COPPER, LEAD AND ZINC		
(In pounds)		
	August, 1918	August, 1919
Copper:		
Ore, contents	107,120	
Concentrates, contents	34,000	10,500
Unrefined, black, blister, etc.	50,247	1,176,330
Refined, in ingots, bars, etc.	45,876,440	47,385,901
Exported to (in part):		
France	12,378,446	8,901,736
Italy	3,981,546	4,490,261
United Kingdom	22,393,051	11,355,619
Canada	4,688,948	1,211,643
Composition metal, copper chief value	29,477	
Old and scrap	5,531	20,223
Pipes and tubes	303,601	295,856
Plates and sheets	762,052	591,784
Wire, except insulated	1,837,989	3,203,901
Lead:		
Pigs, bars, etc., produced from domestic ore.....	15,194,602	2,653,083
Pigs, bars, etc., produced from foreign ore.....	3,141,888	6,602,822
Exported to (in part):		
Canada	3,061,859	230,023
United Kingdom	12,711,666	
Argentina	1,600	1,272,282
Japan	2,174,018	3,304,086
France		2,264,189
Brazil	268,987	768,719
Zinc:		
Dross	4,463,275

Produced from domestic ore	5,665,452	23,204,987
Produced from foreign ore	2,748,397	1,619,872
Exported to (in part):		
France	5,911,693	6,914,357
Italy	1,746,618	2,076,780
United Kingdom	156,718	11,390,236
Canada	487,273	230,642
Mexico	5,602	120
Japan		4,048,994
In sheets, strips, etc.	2,545,289	3,964,278

BY THE WAY

A Rare Find

"A new metal in the mining world of northern Ontario," says the Sudbury Star, "is to be developed by a syndicate of individual members of a well known firm of Sudbury, Ont., who have purchased a body of barytes north of the town along the line of the Canadian National Railways. The metal is high in chemical properties and is used extensively in the sugar, paint and rubber industries."—From a private source we are informed that this metal runs as high as 100 per cent in chemical properties, and is not considered unusual at that.

A Short Course in Timbering

Back in the days of the war, which is now so fortunately finished, it was the custom among some of the officer schools in France to send their young hopefuls out among the various engineer outfits for practical experience in technical work. A sergeant of the good old 27th relates one of his experiences with this type, showing vividly the importance usually attached to the intricacies of mining. It happened on one of the many cold, wet mornings that the sergeant had a detail busily at work timbering a dugout, when a natty young prospective shavetail breezed in with, "What's on today, sergeant, what are we doing?" "Timbering," "Timbering?" "Yup." "But I don't understand; there must be some mistake, I shouldn't have been sent here." "Why not?" "Why I took timbering yesterday."

Zinc in the Movies

Having seen several of the Ford Educational Weekly moving pictures during the summer, the secretary of the American Zinc Institute visited Detroit recently and called to the attention of the Ford Motor Company the educational possibilities of a film depicting the zinc industry, at the same time submitting a skeleton scenario, and that company at once agreed to make and distribute in connection with its Ford Educational Weekly service a moving picture showing the manufacture and uses of zinc. The photographs are now being taken, and when this work has been completed a committee from the Institute will assist in the editing of the film. The picture will be entitled "The Story of Zinc—the Everlasting Metal," and its sub-title, "An Exposition of Zinc from the Mine to the Roof of the American Home," indicates that it will include—beginning with the Missouri-Kansas-Oklahoma field—the mining, milling, loading, transporting, roasting and smelting of the ore, the casting and rolling of the metal, and the manufacture of sulphuric acid, zinc dust, zinc oxide and lithopone. Old and new uses of zinc will be particularly featured. It is planned to release the zinc film early in 1920.

Evils of Competition

The rivalry between shifts in getting out tonnage, though always encouraged by the superintendent, is nevertheless a frequent source of trouble to the latter. This is especially true on the iron ranges during the stock piling season, when tonnages are necessarily estimated and it is not easy to tell whether the various tricks resorted to are honest or otherwise. One of these subterfuges was accidentally brought to light by old Pierre, the stockpile roustabout at the Lake Angeline mine, in Michigan, back in the days when mines were operated on the unit system. Under this system a mine car filled a skip and a skip filled a stock-pile car.

The tally boy was also the skip tender, besides being related to anywhere from one to half a dozen of the men in the gangs at work. Old Pierre's understanding of the complexities of life was limited to the knowledge required to push the little car out on the pile and back to the skipway. Likewise he knew it was cold out on the dump. It was not in his mind either to hurt the plotters or help his employer when he hailed the captain one frosty morning and said: "Meestir captain, please to have de carpentair to put de leetle board on de side of de car. Now I can take two skip to one car; if I have de leetle board, I can take tree to one tam—and Cras, she's cold on de h'end of de dump."

The Popular Diamond

Some interesting facts about the market for diamonds were disclosed recently by an American importer just back from a diamond-buying visit to Europe, states the Financial Times, of London. Diamond sales in Amsterdam are cosmopolitan gatherings, for in the crowd one sees Japanese, Chinese, Hindus, Mexicans, Turks, Persians, Australians, South Americans, and men from every country in Europe. According to the expert, there was never such a demand for diamonds as there is today. Japan has become an enormous purchaser. There were many Hindus and Brazilians among the buyers, but of the South American countries Argentina is the heaviest purchaser. India was once the world's sole source of diamond supply, and when the Indian mines failed Brazil held that position. The Indian mines are exhausted, and the Brazilian mines are either nearly exhausted or inadequately worked, and are no longer an important factor in the world's diamond output. Germans, Austrians, and Russians at Amsterdam, apparently with plenty of money, are buying all the diamonds they can get. All the neutral countries were heavy diamond buyers during the war, and their market demands are still immense. But it is surprising to find that Germany, Austria, and Russia, which are supposed to be down and out financially, should now be cutting such an important figure in the world's diamond markets. It is more than probable that the present instability of less concrete forms of property is responsible for the popularity of the diamond. *Multum in parvo* is certainly a sound motto for the modern millionaire who wishes to hold on to his riches.

PERSONALS

J. M. Hill, the geologist of the U. S. Geological Survey, who is in charge of matters pertaining to platinum, has returned from a visit to the Colombian platinum deposits.

William W. Mein was recently in San Francisco, leaving on September 26.

C. G. Dainpre, manager of the Associated Gold Fields, Larder Lake, Ontario, has resigned.

J. B. Tyrrell, of Toronto, is examining properties in the Rice Lake district, in Eastern Manitoba.

R. H. Stewart has gone to Texas in the interests of the Gunn-Thompson syndicate, of New York.

Robert A. Kinzie, in charge of operations of the Engels Copper Co., was recently in San Francisco.

Edward Mosehauer, of the United Metals Selling Co., will go abroad to represent the Copper Export Association in Germany.

Sidney L. Shouts, of Wallace, Idaho, has gone to California, being engaged by the Government in the adjustment of war claims of chrome producers.

D. G. Kerr, vice-president of the United States Steel Corporation, and a party of friends spent several weeks' vacation in the woods near Watersmeet, Mich.

Willet G. Miller, who has been in England as Canadian representative of the Imperial Mineral Resources Bureau, is expected to return to Toronto in October.

Harry W. Darling, field engineer for the Crown Reserve Mining Co., Ltd., was in San Francisco during September and expected to leave for Porcupine, Ontario.

Carl A. Allen, Utah Inspector of Mines, attended the dedication of the Pittsburgh laboratory of the Bureau of Mines, and visited several Eastern cities before returning West.

M. D. Foster, formerly chairman of the House Committee on Mines and Mining, now a member of the War-Minerals Relief Commission, is seriously ill at his home at Olney, Ill.

John F. Bethune has been appointed secretary of the U. S. Tariff Commission. The position is of particular importance at this time, owing to forthcoming revision of tariff laws.

A. R. Montagu has been visiting **W. S. Boyd**, in Ray, Ariz., after two years spent in investigation of the mineral resources of the State of Bahia, Brazil, especially in connection with gems.

Frederick Burbidge, of Wallace, Idaho, manager of the Federal Mining & Smelting Co., was in New York, and will return by way of Oklahoma, where the company operates several zinc mines.

Major Julius M. Cohen returned from France in command of the 319th Engineers. Major Cohen was Chief Engineer of Construction during the last year at Camp Pontanezen, Brest, France.

Carl Tombo, of Philadelphia, Pa., was in Placerville, Cal., Sept. 8 and 9, examining, with **Burr Evans**, consulting engineer of Placerville, a free-gold mining property in El Dorado County, near Placerville.

L. Keith Ward has been appointed secretary to the South Australian Department of Mines, succeeding **F. C. Ward**. **L. Keith Ward** will still continue in his position of government geologist and director of mines.

Harris & Ewing
JAMES M. HILL

John A. Percival, of New York, president of the Consolidated Interstate-Callahan Mining Co., recently inspected the property near Wallace, Idaho. Mr. Percival is also interested in other mining operations in the Coeur d'Alene district.

Warren C. Prosser, who has been superintendent of the Red Mountain Mines Co. for the last two years, has resigned that position to return to professional work in mineral and oil-land investigation, with headquarters in Denver.

Rudolph A. McGovern, general manager of the Caloric Co., Brazil, a subsidiary of the Mexican Petroleum Co., sailed from New York on Oct. 2, on a business trip to England, Belgium, France, and Italy. After the tour Mr. McGovern expects to return to Brazil.

Frank N. Skeels, of Wallace, Idaho, mining engineer, is engaged in investigating the clay deposits of Idaho for the State Bureau of Mines and Geology, and in co-operation with the Federal Bureau of Mines. A bulletin will be issued covering the results of his work.

J. W. Bennie has transferred his headquarters to Gleeson, Cochise County, Ariz., in order to superintend the operation of one of the mining groups retained by the Shannon Copper Co., after the sale of its Clifton interests to the Arizona Copper Company, Ltd.

L. C. Graton has been employed by the Calumet and Hecla Mining Co. to make a complete geological survey of the entire territory owned, controlled, or managed by the interests in Northern Michigan, comprising 23,000 acres. It is expected the work will require two years.

J. Burns Read has been appointed assistant professor of mining engineering at the University of Illinois. Professor Read served as captain of ordnance in the Inspection Division of the U. S. Army during the war, and was in charge of the non-ferrous group of the metallurgical branch at Washington.

OBITUARY

H. P. Flint, superintendent of the Tom Reed mill, at Oatman, Ariz., was drowned recently while bathing in the Colorado River.

Frank Cochrane, chairman of the Canadian Government Railway Board and a former member of the Canadian Cabinet, died at Ottawa on September 22, after a protracted illness, at the age of 67. Mr. Cochrane was for some years Minister of Lands, Forests and Mines for Ontario.

John Trevarrow, Sr., aged seventy-six, died at his home at Mohawk, Mich., on September 21. He came from England in 1861, and worked at the old Central mine, and when the Mohawk mine opened he became head mining captain and directed the opening of this property, retiring in 1913.

Charles O'Connell, a prominent mining engineer of Northern Ontario, died at Haileybury, on September 20, from heart disease. Mr. O'Connell came from California, and was a pioneer of the Cobalt camp, being connected with the development of many valuable mines. He was several years manager of the Tough Oaks mine at Kirkland Lake, and until a short time before his death was manager of the Patricia property at Boston Creek.

Samuel Brady, agent of the Michigan Copper Mining Co. property, Ontonagon County, Mich., died on September 30, following an illness of two years, from cancer. Mr. Brady had been in charge of this property for thirty years, taking it over when it was known as the Minnesota. He was graduated from the Rensselaer Polytechnic Institute, of Troy, studied in Germany and England, and was experienced in gold mining in the Black Hills and in copper exploration on Isle Royale before his connection with the Michigan company.

Robert Neil Dickman, a mining engineer of Chicago, died at La Jolla, Cal., on September 14, following an operation. Mr. Dickman was formerly of the mining engineering firm of Dickman & MacKenzie. Mr. MacKenzie was killed in 1905 by Yaqui Indians while on business in Mexico. Mr. Dickman, at the time of his death, was on the staff of Robert W. Hunt & Co. He was born in Cleveland, Ohio, his father being Franklin Dickman, justice of the Supreme Court of the State. Mr. Dickman was graduated at the University of Michigan in 1886. He leaves a widow and one son, Franklin.

Henry B. Underhill, Jr., president of the Selby Smelting and Lead Co., and a resident of San Francisco, died on September 14. In 1866 Mr. Underhill went into the employ of Thomas Selby, who built the shot tower which was destroyed by the fire of 1906. The Selby Smelting Works was first established at North Beach, in San Francisco, and was subsequently moved to Vallejo Junction. In 1905 the business was sold to the American Smelters Securities Co., a subsidiary of the American Smelting and Refining Co. For over fifty-two years Mr. Underhill was associated with the smelting plant in the business and financial end, making a specialty of selling the silver produced by the plant. He finally became the president of the company, which position he held when he died.

SOCIETIES

American Society of Civil Engineers held a meeting on October 1 at which A. L. Sonderegger presented a paper on "Physiography of Watersheds and Channels, and Analysis of Stream Action of Southern California Rivers, With Reference to the Problems of Flood Control." The paper appeared in "Proceedings" for August, 1919.

The Institute of Metals held the Sheffield meeting on September 24 and 25, the program of which included a kine-

matograph film display of brass melting in an electric furnace, and a souvenir pamphlet containing a list of the members attending and illustrated descriptions of the University of Sheffield, works to be visited, and a specially drawn map of Sheffield.

Natural Gas and Petroleum Association of Canada held its first annual meeting at Hamilton, Ont., on September 19. C. E. Steel, president, was chairman. The following papers were presented: "Petroleum in Ontario, Reminiscence and Forecast," by A. M. McQueen; "Oxy-Acetylene Welding in an Isolated Plant," by J. H. Stoliker; "History of Natural Gas in Ontario," by D. A. Coste. M. Y. Williams, of the Geological Survey of Canada, outlined the findings of his recent survey trip to the prospective oil areas in the James Bay district, and G. R. Mickle, provincial mine assessor for Ontario, presented an interesting paper on some phases of the natural gas industry in the province.

American Institute of Mining and Metallurgical Engineers, Denver Chapter, held a banquet on September 19, at the Savoy Hotel. The institute met for the purpose of taking action to bring about the repeal of the Colorado Engineers' Licensing Act. J. R. Grant, chairman of the meeting, was empowered to select a committee of three to take action in the matter. Robert Hursh, manager of the Empire Zinc Co.; George Collins, manager of the Mary Murphy Mining Co., and J. C. Roberts, of the Colorado School of Mines, were appointed. Horace V. Winchell, of Minneapolis, Minn., president of the A. I. M. E., was the guest of the Golden Chapter at a banquet held on October 15.

INDUSTRIAL NEWS

International Trade Conference, called by the Chamber of Commerce of the United States at Atlantic City, N. J., has been postponed from the week of September 29 to the week of October 30, owing to delays incident to the departure of delegates from Italy, France and Belgium.

The Bucyrus Co. has removed the southern sales office from New Orleans, La., to room 2, 212 Jefferson County Bank Building, Birmingham, Ala. C. N. Ballentine will remain southern sales manager, and will be assisted by E. J. Wilkie, who has been connected with the sales department at South Milwaukee, Wis.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Alloying—Admixture of Metals or Substances for Alloying. Edmund Godfrey Burr. (1,315,208; Sept. 9, 1919.)

Barium—Process for Preparing Barium Hydroxide from Barium Sulfide. Edward A. Barnes. (1,316,133; Sept. 16, 1919.)

Blast - Furnace-Stack Reinforcement. James P. Dovel. (1,316,085; Sept. 16, 1919.)

Blast Furnaces—Heat-Recuperating Process and Apparatus for Blast Furnaces. James P. Dovel. (1,316,086; Sept. 16, 1919.)

Briquetting Finely-Pulverized Iron Ore, Method Of—A. Lammerhirt. (1,315,315; Sept. 9, 1919.)

Casting Machine. Edward Harker Acton, Frank Evans Dickie and Thomas Pratt, assignors to Aluminum Co. of America. (1,316,471; Sept. 16, 1919.)

Classifier (Mechanical)—Frank E. Marcy. (1,316,911; Sept. 23, 1919.)

Crushing—Ball or Tube Mill. Newton L. Hall. (1,315,770; Sept. 9, 1919.)

Crushing—Centralized Ball Mill. Morrisson J. Barnett. (1,316,670; Sept. 23, 1919.)

Crushing—Hammer Mechanism for Rock-Crushing and Other Purposes. John R. Abbott. (1,316,406; Sept. 16, 1919.)

Crushing—Reducing Mill. Edward B. Campbell, assignor to Williams Patent Crusher and Pulverizer Co. (1,315,281; Sept. 9, 1919.)

Drill. Charles Erb Wuensch. (1,316,609; Sept. 23, 1919.)

Drill—Rotary Boring-Mill. Howard R. Hughes. (1,316,094; Sept. 16, 1919.)

Drill-Puller. William M. Williams. (1,316,753; Sept. 23, 1919.)

Electric Furnaces—Electric Transformer Especially Suitable for Use in Connection with Electric Furnaces. James Bibby. (1,315,359; Sept. 9, 1919.)

Electrical Treatment—Apparatus for Treating Ores. Carl Cornwell. (1,316,769; Sept. 23, 1919.)

Electrode for Electric Furnaces. Paul Sejourner, assignor to Societe Electro Metallurgique Francaise. (1,315,992; Sept. 16, 1919.)

Flotation—Process of Treating Copper Ores by Sulphatization and Flotation. Niels C. Christensen, assignor to Metallurgical Improvement Corporation. (1,316,352; Sept. 16, 1919.)

Furnace Roofs—Art of Repairing. Benjamin Gold. (1,316,297; Sept. 16, 1919.)

THE MINING NEWS

New York, October 11, 1919

Fire Breaks Out in Homestake Mine at Lead, S. D.

Company Preparing to Flood Workings—
No Men Laid Off—Mine Rescue

Fire broke out in a timbered stope between the 700 and 800 levels of the Homestake Mine at Lead, S. D., on September 25. Miners driving a drift for water lines on the 700 level ran into burning timbers on October 2. Efforts are being put forth to confine the fire to this area. Preparations have been made for flooding the mine, and during the interval the mills will be idle. All employees will be used on the surface until the fire is extinguished. In all probability the mine will be flooded to the 600 level within a month. During the fire of 1907 the workings were flooded to the 300 level in forty-seven days. The United States Bureau of Mines rescue car is on the ground from Livingston, Mont.

earnest effort is being made by these organizations to save the road from being taken up. The cost of the road was considerably over a million dollars. Permission has been given the owners by the Public Utilities Commission of Colorado to dismantle the road.

Texas Oil Companies Must Report to State Commission

New Law Imposes Fine For Failure, But Many Companies Have Not Complied

Under the new statute, passed last month, the Texas Railroad Commission has been given certain authority over the oil companies operating in the State. Carrying out the terms of this statute, the Commission called for reports from every oil company doing business in Texas, these to contain among other information the capitalization, amount of stock sold, price obtained, commission paid for selling, promotion costs, production, situation of

Assessed Valuations Lowered on Cuyuna Range Orebodies

The State Tax Commission, following hearings held in St. Paul, Minn., on August 8 and September 24, and which were generally attended by Cuyuna Range operators and fee-owners, and at which the past and present condition of the manganiferous ore situation was thoroughly gone into, ordered on Oct. 2 a substantial reduction in the 1917 and 1918 assessed valuations of the Clark and Cuyuna-Sultana orebodies. The Commission reduced the 1918 assessed valuation of the Clark from \$176,856 to \$21,737, and that of the Sultana from \$151,799 to \$33,309. Similar reductions in the assessed valuations of other manganiferous or low-grade bodies of the Cuyuna are expected to follow as a result of this ruling. The experimental nature of the manganifer-

Boulder Railroad in Colorado May Be Scrapped

The Denver, Boulder & Western Railroad has been purchased by the Morse Bros. Machinery & Supply Company, of Denver. This road, 49 miles in length, in Boulder County, connects Ward and Eldora with Boulder, and is the outlet for practically all the mining towns and districts of Boulder County. It is a narrow-gauge line, laid with 56-lb. rail, and is completely equipped with eight locomotives, ninety freight cars and passenger coaches. The Morse Bros. company have offered this road to the mining men and commercial organizations of Boulder County, in order that the road may remain of service to the community. An

wells, amount of oil sold, to whom, and price obtained. Due publicity was given to the requirements of this statute through the press, and so far 1,080 reports of oil companies have been received properly executed. Blank forms for reports have been prepared, and are forwarded on request. Judging from letters of inquiry about various oil companies, directed to the Commission, it is believed there must be as many more companies operating that have not filed reports as there are that have reported. Because the law is a new one, the Commission has not yet taken action to penalize these companies, but may proceed to do so after October 1. The penalty for failure to make a report may be a fine of \$500.

ous ore market is given by the Commission as a reason for their ruling, Ruskard Hurd, secretary of the Commission, stating that "There never has been a normal demand, normal market, normal value or normal price for the manganiferous ores of the Cuyuna Range."

Insurance Gift Pleases Employees of Calumet & Hecla

The most important subject of discussion among mining men of the Michigan copper district during the last week was the blanket life-insurance policy put into operation by the Calumet & Hecla company for its 10,000 employees. The plan generally caused favorable comment among the workers. The insurance costs them nothing. No medical examination is to be required.

underground mining men have always found it difficult to secure life insurance owing to the hazard of their work. The Calumet & Hecla company is generally credited with the same forward-looking policy as it has showed in putting into effect the same compensation regulation that the State now requires of all corporations two years before there was agitation for such a compulsory regulation. The value of these policies ranges from \$1,000 to \$1,500.

standpoint will continue to be recorded. The only question is how long the Commonwealth Government will allow the permit to export gold to remain in force.

Birmingham Situation Improving Strikers Gradually Seeking Re-instatement and Conditions Approaching Normal

On Sept. 26 the Woodward Iron Co. blew in its No. 1 furnace which has been idle for several months, undergoing repairs. This was done in face

Scholarships at Sudbury

The International Nickel Co. of Canada has founded three scholarships to be awarded by competition to apprentices and minor sons of its employees. The scholarships cover the regular four years course at Queens', Toronto, or McGill Universities and are of sufficient value to meet entire cost of the course. First examinations for scholarships were held at Sudbury High School.

Hurricane Hits Somerset Oil Fields in Texas

Somerset Field, near San Antonio, Tex., was hard hit by the hurricane that swept the Gulf Coast country Sept. 14. The largest losses were sustained by the Gulf Production Co., ten of whose derricks were blown down, and Grayberg Oil Co., which lost eight derricks. Several other derricks were also destroyed. Nearly all wild cat derricks near San Antonio were blown down. Strangely, this territory was more damaged than other fields closer to the coast.

Kirkland Lake Strike Failing

Lake Shore and Teck-Hughes Companies Resume—Labor Scarce in Gold Camps

A short time ago a vote was taken in Kirkland Lake and the outlying camps to see whether or not the strike, which has stopped all production in Kirkland Lake for several months, should be called off. Although the majority voted against calling off the strike, the men at Kirkland Lake camp itself, which is the only one of importance, were in favor of returning to work. Several mines have therefore decided to resume operations. The Lake Shore has taken on a small force of men, as has also the Teck-Hughes. The forces will be gradually augmented as the different companies get into better positions. Apparently there is no attempt on the part of the union to prevent the men working. The men persisted in striking, despite orders from headquarters, and now after several months' idleness, are going back to work at practically the old scale of wages, some of the lower paid men receiving a small increase.

The gold mines of northern Ontario, and particularly Porcupine, are suffering from a shortage of labor. It is stated that the Hollinger could use another thousand men, while the Dome would be able to take from one to two hundred men. With the ending of the strike in Cobalt and the return of a large number of men to their old positions, the situation in Porcupine is still further aggravated. During the winter months numbers of men usually go into the bush to cut pulpwood, and were it not for the fact that there is likely to be a large number of unemployed in Canada during the coming winter, the situation in the mines might be serious.

GATES CRUSHER SECTION OF BROKEN HILL SOUTH MILL WAS DESTROYED TOGETHER WITH OTHER PARTS OF THE PLANT

Australian Gold Exports Bring High Premium

In Australia the Gold Producers' Association recently made a distribution of approximately £120,000, which had been realized on the disposal of gold in the East at a premium. That represented transactions by the organization to June last. Since then largely increased sales of the precious metal have been effected. Prices received in the early part of July were much lower than those obtained formerly, owing to the advent of the Americans as heavy sellers. This condition, however, was corrected subsequently as a result of the variation in the rate of exchange, and as a consequence gold, which is now being sold in the East, is again commanding fairly high premiums, as the demand is very extensive. Australia produces annually something like £3,500,000 to £4,000,000 in gold on the average in normal times. The premiums obtained by the Gold Producers' Association on sales effected down to the end of June last was 5s. 7d. per oz., and even if future negotiations should not yield quite as high a figure, it is hoped that by augmentation of production and consequently of sales, very satisfactory business from the sellers'

of the union threats to cripple the Woodward company by extending the strike in this district to include all plants of the company. No record is given of the actual number of men who went out on the strike order which followed the union threat but from unofficial sources it develops that a considerable number of skilled men walked out. The company succeeded in replacing these for the most part and by shifting from various plants kept going on full schedule. It is now reported that the majority of the strikers have returned to work.

At the various plants of the Tennessee Coal Iron & Ry. Co., men who struck are being rapidly reinstated or are asking for reinstatement. This company has put on a night shift of about 200 men at its No. 6 mine at Muscoda, the night shift having been abandoned several months ago. It is said that this night work will be permanent. The Bessemer Rolling Mills (Tennessee Coal Iron & Ry. Co.) apparently is not affected yet by the strike as practically all of the skilled men have remained at work and the plant continues to roll its regular output. Nos. 1 and 2 furnaces are running with full crews and Nos. 3 and 4 are idle but have been so for some time.

PROGRESS OF MINING OPERATIONS

Important Events of Interest
Condensed and Classified
for Easy Reference

ALASKA

Alaska Gold (Juneau)—Milled 176,870 tons ore in September, averaging 83.9c per ton; per cent extraction, 81.88; and tailings loss 15.2c.

ARIZONA

Cochise County

Blackhawk (Bisbee)—Full face of high-grade copper ore developed in drift on 650 level. Same ore body was cut at 450 ft. Nighthawk Leasing Co., operator; James Z. McKenna, superintendent.

Calumet & Arizona (Bisbee)—September production of copper was 4,494,000 lb., of which 3,318,000 lb. was available for company.

Shattuck-Arizona (Bisbee)—September production was 70,412 lb. copper, 690,222 lb. lead, 4,919 oz. silver, and 10.61 oz. gold.

Courtland District is renewing activity, with 60 men working on the Great Western and other properties.

Mascot (Dos Cabezas)—Test of new 150-ton mill reported satisfactory. Milling ore in sight and on dumps estimated at 1,000,000 tons. John W. Prout, Jr., in charge.

Tombstone lessees on the old bonanza mines now owned by Phelps-Dodge Co., are shipping 80 carloads of ore a month.

Gila County

Arizona Globe (Globe)—Ores will be treated in mill of Gibson company pending construction of own mill.

Castle Dome Development (Globe)—Drilling on 700 acres 12 miles from Globe. Reported to have cut 130 ft. of copper ore.

Iron Cap (Globe)—Concentrator to be constructed. David Cole, consulting engineer.

Graham County

Stargo (Morenci)—Shipments have begun from property, compressed air being furnished by Phelps-Dodge power plant quarter-mile away. Present shipments being made from old workings on 75-ft. level, but development is in progress at 185 level. David Fennesy, of El Paso, designing mill based on recent ore tests made by General Engineering Co., of Salt Lake City. Property owned and controlled by Stargo Syndicate composed of Arizona people and is not incorporated.

Greenlee County

Arizona Copper (Clifton)—September production of copper 2,900,000 lb.

CALIFORNIA

Amador County

Argonaut (Jackson)—Concrete foundations are being placed for new hoist. Stamp mill is operating to capacity.

Calaveras County

Lee Mine (Altaville)—Recent developments include unwatering of shaft, construction of gallows frame, and installation of hoist. Plans for near future consider sinking shaft 200 ft. below present depth.

Carson Hill Gold (Carson Hill)—Company has sold \$450,000 7 per cent 4-year convertible notes to private syndicate. Proceeds used to pay off the \$450,000 balance of \$600,000 loan from American Zinc, Lead & Smelting Co. Net profits earned in September, about \$75,000; total net since Jan. 1, when operation began, nearly \$500,000. Broad development campaign will begin soon.

Morgan Hill (Carson Hill)—Being operated by W. J. Loring. August cleanup, \$104,000.

Sierra County

Tightner (Alleghany)—Directors, on Sept. 29, gave bond and option over number of years to Fred Searles, Jr.; active operations to begin in 30 days and preparations about complete. Includes Tightner placer, Eclipse, Red Star, Arlene and West Extension.

COLORADO

Boulder County

Emmett (Jamestown)—Mining flusspar and delivering to Lehman mill at Jamestown and Pitchblende mill at Springdale. Green Transportation Co. has contract to deliver 300-500 tons per month to shipping bins at Boulder. Argo, Brownspar, Blue Jay and other properties (not Emmett Co.'s) to be reopened.

Interstate Metals (Salina)—New flotation plant almost ready. Arthur Buckbee, manager. Will do custom business though built primarily as experimental plant.

Victoria Group (Salina)—Owners will develop lower ore horizons by long tunnel. Mine has been steady though small producer of high-grade silver ore.

Ouray County

Guadalupe Group (Ironton)—Being worked by two lessees, namely, Guadalupe Leasing Co. and A. E. Ackerson. Former has built large boarding house and installed small gasoline power

plant; also driving 300-ft. drift and 90-ft. raise; 17 men employed. Ackerson lease building bunk house and working four men.

Camp Bird (Ouray)—Has completed transportation tunnel which connects with old mine workings. Work in progress several years. To complete work required 11,000 ft. of cross-cutting, 1,700 ft. of drifting, and 500 ft. of raising. Tunnel cut 15 new veins.

IDAHO

Boise County

Golden Age, Jr. (Pioneerville)—Preparing to drive development tunnel, and to install ball mill for regrinding concentrates tailings. Carload will be shipped early in October.

Bonner County

Idaho Continental (Port Hill)—Snow motors building in Spokane; will be used to haul ore to Port Hill, 26 miles distant from mines.

Shoshone County

Nabob (Beeler)—After completing 150-ton mill, financial troubles overtook company through inability to pay employees. Numerous liens filed and all operations suspended. Major Griggs now in New York to confer with officers of Stewart Mining Co., which controls Nabob. Understood to have much lead-silver and zinc ore available for mill.

Idaho-Carbonate Hill (Mullan)—Ore shoot averaging five ft. wide has been developed on 400 shaft level with drift still in ore. Work suspended temporarily while diamond-drill tests are being made to prove ore at further depth. Striking this ore is important on account of situation of property in section of district heretofore without proved mineral merit. Ore is lead-silver with a little zinc. Property controlled by W. D. Greenough.

Midnight (Mullan)—Lead-silver and zinc ore varying from a few inches to three feet developed for 250 ft. on north vein, reached by crosscut from Fanny Gremm tunnel level. Controlled by Jones & Baker, of New York.

Linfor (Wallace)—Linfor Copper Mining Co., successor to Empire Copper Mining Co., preparing to resume operations on Little North Fork. Property developed by 350-ft. shaft, with large block of medium-grade copper ore on lowest level. Has 150-ton mill. Under management of William Beaudry, formerly manager of Stewart.

MICHIGAN

Copper District

Calumet & Hecla (Calumet)—Continues to secure good results in reworking old sands which are now coming from depth of 100 ft. in lake and are running 18-lb. copper per ton. Cost under 8c. Production from sands this year will total 11,000,000 lbs., which will make total of 36,315,000 lbs. from lake. Estimated life of sandpile 35 years. Pebble importations from Denmark and France continue.

Seneca (Calumet)—Second level laterals opened this week, following suspension of hoisting for baling. Concreting in shaft and laying of rails necessary before sinking is resumed. No mill plans announced as yet.

INCENDIARY FIRE AT PLANT OF BROKEN HILL SOUTH SILVER MINING CO., BROKEN HILL, NEW SOUTH WALES, ON JULY 20, CAUSED \$500,000 LOSS.

Mayflower (Houghton)—Shaft down 1,520 ft. in trap. Identity of formation still undetermined. For 100 ft. there has been mixture of amygdaloidal matter (which alone carries some copper) and trap.

Victoria (Rockland)—Eight-ton skips will replace buckets for efficiency. Shaft at 2,700 ft. in mass copper and barrel rock. Four-ton mass taken out this week.

TEXAS

Brazoria County

Gulf Production (West Columbia)—Hogg No. 3 well pumping 150 barrels daily.

Statex Oil (West Columbia)—No. 1 Curson well came in September 23 at 3,000 ft., shooting oil over derrick, and gushing at rate estimated 5,000 barrels daily, with heavy gas pressure. Well is 1,100 ft. west of main field. New well, No. 1 Elman, started on adjoining lot.

Texas Co. (West Columbia)—Brought in Hogg No. 15 well September 18 at 3,100 ft., making 1,500 barrels daily at start. No. 19 Hogg well being tested below 3,000 ft.

Fort Bend County

Gulf Co. (Blue Ridge)—Derrick destroyed in recent hurricane being rebuilt, and work will be continued.

West Production (Blue Ridge)—Slight blowout occurred in setting screen in new well, and second and smaller screen must be set before well can be tested. Conditions good for producing well.

UTAH

Juab County

Tintic shipments week ended September 27 were 120 cars.

Chief Consolidated (Eureka)—New shaft down 735 ft., being drained by drift which is being driven toward shaft at 1,000-ft. depth. Pumps lifting 900 gallons per minute. Good produc-

Salt Lake County

Ohio Copper (Lark)—Experimental work at new flotation plant completed and mill shut down pending final report as to results. Several hundred tons of ore handled daily in making tests. West end of mill and part of crushing plant destroyed by fire in 1918 have been repaired. Bond issue and increase in capitalization ratified by stockholders. Plans for financing under way.

CANADA

Ontario

Cross Lake (Cobalt)—Shaft down 225 ft. Crosscutting on 210 level.

La Rose Consolidated (Cobalt)—Discovery of high-grade ore made at 100-ft. level. Will also drill on rich vein found on University property just before recent labor strike.

Paragon-Hitchcock (Elk Lake)—Shaft down 200 ft. Drifting on 24-ft. vein of calcite and aplite with some native silver.

Castle (Gowganda)—Good ore discovered on surface.

Teck-Hughes (Kirkland Lake)—Miners being engaged following recent shutdown owing to strike.

Wasapika (West Shining Tree)—Orebody reported to be 50 ft. wide. Crosscut at 100 level.

Murray-Mowgridge (Wolfe Lake)—Shareholders have ratified reorganization plan involving sale of assets to new company, known as Murray-Mowgridge Mines, Ltd.

Quebec

Bishop Claims (Lake Du Parquet)—Timmins interests of Hollinger Consolidated Gold Mines have secured option on this property, situated close to Quebec-Ontario boundary near Lake Abitibi. Geological conditions reported to resemble those of Porcupine field. Small rush to this section last year, but up to present nothing further has been done.

MEXICO

Chihuahua

American S. & R. (Chihuahua)—Erecting big machine shop at Avalos smelter, costing over 50,000 pesos.

Las Liones G. & S. (Ojo Caliente)—Operations are expected to be resumed at once. Ore shipped to smelter at El Paso, Tex., via Mexico Central R. R.

CHILE

Chile Copper (Chuquicamata)—August production of copper, 8,994,210 lb.; July, 7,161,444 lb.

PERU

Cerro de Pasco (La Fundicion)—September production, 5,266,000 lb. copper; August, 5,726,000.

tion coming from workings below water level. Shipments limited owing to present metal prices.

Godiva (Eureka)—Work suspended owing to price of lead. Winze sunk to 1,350 level to be continued to 1,500 or 1,600 level.

Iron King (Eureka)—Large blower installed and about 1,000 ft. of ventilating pipe now in place in 1,545-ft. shaft. Will continue sinking for short distance and then start drifting.

Pinion Queen (Eureka)—Power connections being made by Utah Power & Light Co. New connections being installed and building constructed. Knights interested.

Tintic Standard (Eureka)—Company experimenting on low-grade ores with view to building mill. Shipping good tonnage of high-grade ore.

Summit County

Silver King Cons. (Park City)—Has made first shipment of 106 tons from new strike on Electric Light claim. Net returns, \$61.15 per ton. Two lots ready for shipment.

The above quotations are our appraisal of the average of the major markets based generally on sales as made and reported by producers and agencies, and represent to the best of our judgment the prevailing values of the metals for the deliveries constituting the major markets, reduced to basis of New York, cash, except where St. Louis is the normal basing point.

Quotations for copper are for ordinary forms of wire bars, ingot bars and cakes. For ingots an extra of 0.05c. per lb. is charged and there are other extras for other special shapes. Cathodes are sold at a discount of 0.125c. per lb.

Quotations for zinc are for ordinary Prime Western brands. We quote New York price at 35c. per 100 lb. above St. Louis. Tin is quoted on the basis of American tin, 99 per cent grade.

The above table gives the closing quotations on the London Metal Exchange. All prices are in pounds sterling per ton of 2,240 lb.

Metal Markets

New York, Oct. 8.

There was better sentiment in all of the markets this week, which was reflected by slightly higher quotations for copper, lead and zinc.

Our advices from Europe are to the effect that the stocks of metals, especially of lead and spelter, are being reduced both in Great Britain and on the Continent, and it is expected that before long Europe may be a buyer of zinc and lead.

Transatlantic freights are about the same. To British ports, \$15; to Havre, \$12; to Rotterdam, \$10; and to Hamburg, \$13. Transpacific freights, San Francisco to Hongkong and Kobe, declined to \$18.

Copper

A fair volume of business was done by agencies and by brokers, but the principal producers did nothing worth mentioning except through the Export Association. The latter did some business with several quarters, including Germany, and there were also some export sales made outside of the Association. Domestic consumers evinced some interest in buying copper, and it is not unreasonable to expect that some business with them will ensue ere long. In the meantime, it appears that the copper for sale by brokers has been cleaned up, and the smaller producers who have been selling have raised their prices a little.

Our latest advices from Japan, by mail, are to the effect that the copper

market there is very dull, with very little being done at present. It is generally believed that no recovery in the market can be expected until Japan has digested the larger part of the purchases that she made in America earlier in the year.

Tin

There was a better sentiment in the tin market, and prices were a little firmer until Oct. 7, when very heavy arrivals of Straits tin resulted in a general easing of prices.

Straits tin was quoted at 55c right through the week.

Singapore quoted £274 $\frac{1}{2}$, c. i. f., London, on Oct. 2; £276 on Oct. 3; £281 on Oct. 6; £284 on Oct. 7 and 8.

Lead

The statistical position is very strong. Only a few producers have any lead to offer. This week they realized an advance over the price asked by the A. S. & R. Co. At the same time there was still some business in small lots of lead done by second-hands at low prices, under conditions similar to what we reported last week.

The situation in the Coeur d'Alene remains unchanged. The St. Joseph Lead Co. started work at Herculanum on Oct. 4, but blast furnaces will not go into operation until Oct. 9. Labor troubles are now reported from Alton.

There were some sales of lead for export. For bonded lead, 5 $\frac{1}{2}$ c is asked.

Zinc

Zinc advanced sharply on rather large buying, which appeared to be mainly of speculative character.

High grade zinc was sold at 8c. Ordinary prolong zinc dust at 9 $\frac{1}{2}$ c.

Antimony—The market was unchanged at 8 $\frac{1}{2}$ c for spot. Futures were quoted at 9c.

Quicksilver—The price declined sharply, and the market closed unsettled at \$95. San Francisco telegraphed \$98, barely steady.

Silver—Silver is working on the level of 63d. to 64d. in London, but owing to the demand for the East, direct shipment from San Francisco commands a premium of 1c per oz., more or less. Otherwise, there are no developments in the silver situation.

Mexican dollars at New York; Oct. 2, 92 $\frac{1}{2}$; Oct. 3, 91; Oct. 4, 92; Oct. 6, 92 $\frac{1}{2}$; Oct. 7, 91 $\frac{1}{2}$; Oct. 8, 91 $\frac{1}{2}$.

Platinum—We quote refined ingot at \$130@135.

Palladium—Unchanged at \$120.

Monthly Average Prices for
September

Lead, New York	6.108c
Lead, St. Louis	5.853c
Lead, London	£25.330
Zinc, New York	7.510c
Zinc, St. Louis	7.160c
Zinc, London	£40.955
Silver, New York	114.540c
Silver, London	61.668d
Copper, electrolytic, N. Y.	21.755c
Copper, standard, London.....	£100.767
Tin, New York	54.482c
Tin, London	£280.102
Bessemer pig iron, Pittsburgh.....	\$29.35
Basic pig iron, Pittsburgh	27.15
No. 2 foundry, Pittsburgh	28.15
Copper Sheets—33½c per lb. Demand strong. Wire, 25½@26½c. Market weak.	

Zinc Sheets—\$10.50 per 100 lb.

Aluminum—33c per lb.

Bismuth—Unchanged at \$2.96.

Cadmium—Unchanged at \$1.40.

Nickel—Ingot, 42c; shot, 43c; electrolytic, 45c.

Pyrites—Spanish pyrites is quoted at 17½c per unit for furnace size ore, free from fines, c.i.f. New York or other Atlantic ports. Sulphur companies reported to be selling at prices as low as 14@15c. Market unsettled.

Tungsten Ore—A little business in Chinese ore was done at \$7. For high-grade wolframite, \$10.50 was still asked.

Molybdenum Ore—Considerable tonnage of molybdenite was sold at 75c per lb. of molybdenum sulphide.

Chrome Ore—Considerable business was done in ore for both the chemical trade and for metallurgical purposes. Ore of 40 to 45 per cent grade was quoted at 65c per unit, delivered in the East.

Manganese Ore—Market dull and no business reported.

Zinc and Lead Ore Markets.

Platteville, Wis., Oct. 4.—Blende, basis 60 per cent zinc, \$43.50 for premium grade and \$42.50 for Prime Western Grade. Lead ore, basis 80 per cent lead, \$72 per ton.

Joplin, Mo., Oct. 4.—Zinc blende, per ton, high, \$46.60; basis, 60 per cent zinc; premium, \$43.50; prime Western, \$45@43; fines and slimes, \$42@38; calamine, basis 40 per cent zinc, \$32@28. Average settling prices: Blende, \$43.48; calamine, \$33.28; all zinc ores, \$43.35.

Lead, high, \$76.50; basis 80 per cent lead, \$75; average settling price, all grades of lead, \$73.78 per ton.

Shipments the week: Blende, 8,721; calamine, 118; lead, 1,554 tons. Value, all ores the week, \$497,860.

The blende market was reported unchanged from last week until late this evening, when it was ascertained the higher prices above were being paid.

Receipt of more box cars and shipments by coal cars are helping move the ore stock toward the smelters. Buying continues around 8,000 to 9,000 tons per week, a little ahead of the shipments.

Added competition advanced calamine prices, and producers set a price at \$32 basis.

Iron Trade Review.

Pittsburgh—Oct. 7.

Though the outcome of the strike in the iron and steel industry was settled positively before the first week was out, even now, in the third week, the strike is receding slowly, and, indeed, it is receding at all only in districts or at plants where operations were already fairly heavy. Western Pennsylvania as a whole now shows about 85 per cent employment and 80 per cent production, or a few per cent more than a week ago. Eastern Pennsylvania and the South are running practically full. There remains a belt that is down tight, this beginning with the Wheeling district, extending north through the entire Mahoning Valley, and then running along the Lake front through Cleveland and on through Buffalo. Though Cleveland is down tight, Lorain, just a few miles west, is running practically normal. At Buffalo, Lackawanna and Donner are down tight, though Wickwire, farther to the east, is running in part.

The next chapter will open with breaks in the totally closed region, Youngstown being picked as the most likely place for a beginning. Wheeling, for years a hotbed of labor discontent, will probably be the last. Martial law has been declared in that part of the Calumet district that is in Indiana, and there will be martial law in the steel towns on the Illinois side the moment occasion arises. Thus the strikers in the closed belt are confronted with the spectacle of two-thirds of the men being out in the Calumet district without being able to do mischief to workers and the men in the Shenango Valley and western Pennsylvania generally being almost all at work, with the small minority unable to make trouble. Nevertheless, the manufacturers have no definite views as to when a break will occur, though it is considered improbable that it will be more than a few weeks. The strike is almost wholly

of common labor, chiefly unlettered foreigners, to whom idleness is necessarily very irksome; and, furthermore, the matter of money is important. Those who have no savings will find it difficult to live, and those who have saved will not want to dissipate their hoardings. The strike continues to show little real management by the leaders, who apparently had nothing in mind but to start trouble which would either cause the authorities to take a hand and bring about a compromise or would develop into some sort of revolution. Public opinion is wholly against the strikers, and the efforts of the strike leaders to bring about sympathetic strikes have been altogether futile.

Employment in the iron and steel industry as a whole is now at about 60 per cent of normal, and production, in tonnage, is at 50 per cent, or a trifle more of capacity. There are practically no market transactions, as the mills that are running are already sold up. Jobbers are under heavy demand, but are selling sparingly.

Pig Iron—Production by merchant furnaces is fairly large, but, as iron foundries are not affected by the strike, the requirements exceed the supply, and pig iron is scarce. As consumers were well covered when the strike started, there is little buying. The market is firm at former quotations: Bessemer, \$27.95; basic, \$25.75; malleable, \$26.25@27.25; foundry, \$26.75; forge, \$25.75, f.o.b. Valley furnaces, freight to Pittsburgh being \$1.40.

Steel—A shortage of billets and sheet bars is likely to develop through the strike affecting steel-producing units more than steel-finishing units, but prices are unlikely to be affected, as we continue to quote: Billets, \$38.50; sheet bars and small billets, \$42; slabs, \$41; rods, \$52.

Ferromanganese—A quotation of \$95 c.i.f., could probably be obtained at any time on English. Domestic producers state their asking price is \$110, delivered, but consumers show no interest whatever in the market.

Coke—With sharp decreases in coke production in the Connellsville region since the strike started, and with the resumption of a few furnaces closed in the early days of the strike, there is a better balance between supplies and requirements, but coke is still plentiful, and furnace might be picked up at \$3.75, though some operators quote \$4.25 and do not expect to sell. Some of the byproduct ovens at Youngstown are operating slow, to keep warm, and the product is being sold at low prices. Foundry coke is little affected, good grades of Connellsville bringing \$6@6.25 per net ton at ovens.

Asbestos asphalt-saturated felt (14 lb. per roll) costs \$156 per ton. Slate-surfaced roofing (red and green) in rolls of 108 sq. ft. costs \$2.25 per roll in carload lots and \$2.50 for smaller quantities. Shingles, red and green slate finish, cost \$6.00 per square in carloads, \$6.25 in smaller quantities, in Philadelphia.

HOLLOW TILE—

Table with columns for city (St. Paul, Seattle, Los Angeles, New Orleans, Cincinnati, St. Louis) and tile sizes (4x12x12, 8x12x12, 12x12x12) with prices.

*F. o. b. factory, 4, 8 and 10 inch.

LUMBER—Price per M in carload lots:

Table with columns for city (Boston, Kansas City, Seattle, New Orleans, St. Paul, Atlanta) and lumber types (Fir, Hemlock, Spruce, Fir, Hemlock, Spruce) with prices.

Table for NAILS—The following quotations are per keg from warehouse: Wire, Cut, with columns for Mill, Pittsburgh, Dallas, Chicago, San Francisco.

PORTLAND CEMENT—These prices are for barrels in carload lots, without bags.

Table with columns for city (New York, Jersey City, Boston, Chicago, Pittsburgh, Cleveland, Denver) and cement types (Current, One Month Ago, One Year Ago) with prices.

Note—Charge for bags is generally 15c. each, 60c. per barrel.

LIME—Warehouse prices:

Table with columns for city (New York, Kansas City, Chicago, St. Louis, Boston, Dallas, San Francisco, St. Paul, New Orleans, Atlanta, Denver) and lime types (Hydrated per Ton, Lump per 300-Lb. Barrel) with prices.

*200-lb. barrels. †Per 180-lb. bbl. Note—Refund of 10c. per barrel.

LINSEED OIL—These prices are per gallon:

Table with columns for city (New York, Chicago) and oil types (Current, One Year Ago) with prices.

WHITE AND RED LEADS—In 500-lb. lots sell as follows in cents per pound:

Table with columns for city (New York, Chicago) and lead types (Current, One Year Ago) with prices.

MINING AND MILLING SUPPLIES

Table for HOSE—Underwriters' 2 1/2-in., 3-in. per ft. with columns for Fire, Air, 50-Ft. Lengths and discounts.

Table for LEATHER BELTING—Present discounts from list in the following cities are as follows: New York, St. Louis, Chicago, Birmingham, Denver, Cincinnati.

RAWHIDE LACING—30% off for cut; 62c. per sq. ft. for side lacing.

Table for MANILA ROPE—For rope smaller than 3/4 in. the price is 1/2 to 2c. extra, while for quantities amounting to less than 600 ft. there is an extra charge of 1c.

PACKING—Prices per pound:

Table with columns for material (Rubber and duck for low-pressure steam, Asbestos for high-pressure steam, Duck and rubber for piston packing, Flax, regular, Flax, waterproofed, Compressed asbestos sheet, Wire insertion asbestos sheet, Rubber sheet, Rubber sheet, wire insertion, Rubber sheet, duck insertion, Rubber sheet, cloth insertion, Asbestos packing, twisted or braided and graphited, for valve stems and stuffing boxes, Asbestos wax, 1/2- and 1-lb. balls) and prices.

REFRACTORIES—Following prices are f. o. b. works:

Table with columns for material (Chrome brick, Chrome cement, Clay brick, 1st quality fire clay, Clay brick, 2d quality, Magnesite, dead burned, Magnesite brick, Silica brick) and prices.

RAILWAY TIES—For fair size orders, the following prices per tie hold:

Table with columns for city (Chicago, San Francisco, St. Louis) and tie types (Plain, Douglas Fir—Green, Douglas Fir—Creosoted, Untreated A Grade Red Oak, Untreated B Grade Red Oak) with prices.

FLOTATION OILS—Prices of oils for flotation, in cents per gallon, in barrels

Table with columns for city (New York, Chicago, Denver) and oil types (Pure steam-distilled pine oil, Pure destructively distilled pine oil, Pine tar oil, Crude turpentine, Hardwood creosote, 0.96-0.99) with prices.

COTTON WASTE—The following prices are in cents per pound:

Table with columns for city (New York, Cleveland, Chicago) and waste types (White, Colored mixed) with prices.

WIPING CLOTHS—Jobbers' price per 1000 is as follows:

Table with columns for city (Cleveland, Chicago) and cloth types (13 1/2 x 13 1/2, 13 1/2 x 20 1/2) with prices.

EXPLOSIVES—Price per pound of dynamite in small lots and price per 25 lb. keg for black powder.

Table with columns for city (New York, Boston, Cincinnati, Kansas City, Seattle, Chicago, St. Paul, St. Louis, Denver, Dallas) and explosive types (Low Freezing, Gelatin, Black Powder) with prices.

CHEMICALS

SODIUM CYANIDE—New York price is 31c. per lb.; Denver, 37c.; Chicago 31 1/2c.; St. Louis, 31c.

SODIUM SULPHIDE—In New York the price per pound is 5c. for concentrated, 3c. for crystals. The St. Louis price is 2c. for concentrated. The Denver price is 7 1/2c. for crystals. The Chicago price is 5c. for concentrated, 3c. for crystals. Concentrated comes in 500-lb. drums, the crystals in 440-lb. bbl.

ZINC DUST—For 350 mesh the New York price is 10c. per lb.; Chicago, 13c., Denver, 22c., St. Louis, 15c.

ALUMINUM DUST—Chicago price is 1.10 per lb.

Table for MINERS' LAMP CARBIDE—Prices net f. o. b. cars at warehouse points. Columns for Union, Cameo, Union and prices per 100-lb. Drums, 100-lb. Drums, 25-lb. Drums.

Number 16

The Steel Strike—and Others

THE strike in the steel industry shows no signs of terminating; but at Gary, the nerve center of the situation, the theoretical passivity of the striker has threatened to turn into violence, and destruction has been held back only by Federal troops, machine guns, and artillery. The contest is a gigantic one, involving the most essential single industry of the country or the world—the United States iron and steel industry. It is not directed against any particular organization, the great corporations like the United States Steel Corporation and the Bethlehem Company standing on no better or worse a footing than smaller producers. It is a strategic campaign on the part of certain obscurely known organizations to control the steel industry.

That is the issue, plainly enough stated on both sides—the open shop: whether the employer shall employ whom he finds capable and desirable, and the employee shall work when he so elects and wherever he finds the best opportunity and conditions, or whether both capitulate to a subterranean and external control; whether a great technical and scientific industry shall be controlled by its stockholders, its engineers, its experts, its organizers and its skilled and unskilled workmen in a due and agreed proportion, or whether all shall become absolutely subject to orders issued from nowhere in particular and emanating from nobody knows whom.

It is clear that in many cases at least, the employees had no wish to strike and had nothing to gain thereby, but were coerced into so doing. It is equally clear that the willing forces of the strikers are mainly illiterate aliens, as stated by both sides at the Senate inquiry; and we have the testimony of the Mayor of Gary and General Leonard Wood that the dangerous element lies in anarchistic propaganda.

Signs are not wanting here as elsewhere that the American Federation of Labor is not heartily sympathetic with this particular campaign of domination, and that it is only withheld from active participation in the opposition by the fear of being classed as on the side of the "capitalist" and losing control of the labor situation.

Lesser strikes are in progress all over the country. The strike has become the holiday of the workman, his assertion of freedom, his magical Aladdin's lamp to rub and command. Originally a means to escape from distressing conditions, it is by no means always so at present; indeed, the opposite is sometimes the case—the striker goes out because he is

making so much money that he can afford to "lay off," and the sky is the limit of the game of poker he plays.

What of the ethics of this popular game? Undoubtedly, in most cases, a man has the right to quit work, as the labor leaders point out. This right is naturally paired off against the right of the employer to hire whom he pleases, which employers point out. Certain reservations, however, must be made to both these rights. The rights of an individual terminate when his freedom of action injures another individual or limits his liberty. There is the actual case of the newly arrived alien who killed his wife and was shocked and surprised at being arrested; he had understood that he had come to a free country. A watchman at a bank has not the right to quit work without notice—he can quit only when he has personally seen to it that his work is being carried on; nor can the keeper of the lighthouse, the hostman at the mine, nor many others. And the fundamental right of the employer to employ and to discharge has similar well-understood limitations.

Granted, in general, the individual right of the workmen to quit, however, what of the organized quitting called the strike? Quitting then becomes not an assertion of individual freedom but a force in strategic conflict; even if done quietly it is not passive but an active economic blockade of capital's ports, to obtain terms which theoretically cannot be obtained by peaceful negotiations. When employed as a counter-move against a similar economic blockade put down by the employers, singly or organized, it is the natural rejoinder of labor; it is indisputable that measures more active than talk have to be taken in the affairs of the world every now and then. When such a conflict begins to injure the public in general or an appreciable part of it outside the conflicting parties, one or both are overstepping their rights; and therefore widely organized labor and capital alike must be careful in their moves.

As an absolute rule, then, the right to strike cannot be granted. Could the American army have struck for \$50 per month and no trench work on the morning of Chateau Thierry? Lest you think this far-fetched, let it be added that we know a college graduate who claims that the army has the right to strike. Have the Federal troops at Gary the right to take the opportunity to strike? The policemen of Gary? The policemen of Boston? of New York? Have the postmen of the nation the right to strike? The telegraphers? The railroad men? The steel workers? The coal miners? Have

the doctors of the nation the right to organize and strike for double pay, cash or no service, time and a half for overtime and no night work? Have the Government clerks at Washington that right? The keepers of lighthouses? The judges?

Why not? Many of these things have happened; and the rest may happen. The Washington Government clerks and scientists are organized as a branch of the American Federation of Labor; the actors' strike shows the possibility of the professions; and the extreme advocates of labor organization are jubilantly looking forward to the time when all men receiving wages or salaries shall have been organized into one grand union.

The spectacle results of classes representing small minorities pressing alternately their advantage against all other classes by a system of force, passive or active, not consistent with the principles of equal justice toward all and the great balanced theory of the greatest good to the greatest number as the best possible condition. It is the system of the gentleman who boards a train at the opportune moment, and with the strategic advantage of being at the right end of a six-shooter, relieves the unwilling passengers of their cash. Organized capital is equipped also for just such undemocratic moves.

The ultimate objects of the steel strikers may be divined to be akin to the ingenuous Plumb plan for the railroads, whereby these arteries of the country are to be turned over to the engineers, firemen and conductors for the exploitation of the public. Soon, if the movement proceeds happily, we shall have the steel workers controlling the mines, furnaces and mills, the coal miners the fuel supply, the bank clerks the banking system, the counter-jumpers, floorwalkers and drivers of delivery wagons the department and chain stores, while to the policemen will fall the tribute or plunder of the cities.

This is sober truth, and not jest. The bituminous coal miners of the country are due to strike on Nov. 1, at the beginning of winter, to enforce by the freezing out of an unprepared people their plan for the nationalizing of the coal industry. The idea of the will of the majority and the test of the ballot is obsolete or not yet heard of by these ignorant and violent aliens.

What will be the result of all this state of destructive economic civil war which is upon us? As Hoover has pointed out, Bolshevism has succeeded in Europe in proportion to the illiteracy. In illiterate and ignorant Russia it has endured many months. In relatively well-educated Hungary it did not last many weeks. How long will America, foremost in education and intelligence of all nations, stand for the undemocratic domination by force of alien minorities; of cliques and conspiracies formed by the scum of the most backward European countries? In view of the principle above stated, the answer is reassuring.

Everywhere the strike situation has got beyond the control of organized American labor, as witness the open stand which the American Federation has found itself compelled to take against the printers' and longshoremen's strikes in New York, and others.

On Oct. 13, out of seventy recorded existing major strikes, only eight had the sanction of American Federation. The present crisis threatens organized labor as direfully as any other group.

When, then, are strikes justifiable and permissible, and when do they cease to be so? When the economic blockade or embargo which is thereby laid down is directed against the public or it is the public which primarily suffers under it, rather than the antagonized employers; when the strike organizers count on victory through the surrender, through starvation, cold, danger, hardship, or discomfort, of multitudes of men, women and children not parties to the specific differences between employer and employee which led to the strike, and through the inability of employers to withstand the pressure of such a defenseless multitude calling on the only responsible party to the strike to make peace at any price to them, then a strike becomes a conspiracy against the people, an act of civil war carried on by one of the best recognized and most efficient methods of modern warfare, and should be dealt with promptly by those civil and military organizations which the people has provided for its own protection, that it might go about unarmed and unafraid of foreign or domestic aggression.

We suggest the appointment of a Federal Strike Commission, composed of representatives of the Public, Labor and Capital, such a commission to license a strike of more than a certain number of employees before it would be legal; and strikes without the nation's approval to be punishable by the Federal authorities.

Institute Mine Taxation Committee in Washington

THE meeting of the specially appointed mine taxation committee of the American Institute of Mining and Metallurgical Engineers, at Washington on Oct. 6 and 7, in co-operation with the Bureau of Internal Revenue, was a most notable and significant event. The subject is not a minor one but of the greatest importance to the industry and to the nation, as mining is its second largest industry. Therefore the men summoned by President Winchell came from many States and formed an impressive gathering of what is best in mining engineering.

Delegations to Washington, representing special interests and seeking to obtain just recognition, or more, for the industries or groups they represent, are extremely common; but this visit did not partake of that character. Coming at the special request of the Internal Revenue Bureau, and representing the mining engineering profession, and not any special interests, there was no hint of any attempt or desire to "put something over," or to obtain any more favorable interpretation or application of the law than that desired in all fairness by those Government officials charged with its administration; nor were there clashes of interests intent on securing representation. Instead of "the discordant grinding of many axes," there was the quiet and impressiveness of a common practical and elevated purpose.

The engineers presented themselves as expert advisers, familiar with the facts and the equities of the income-tax and excess-profit laws as applied to the mining industry, and seeking intelligently the means for securing to the Government the payment of the necessarily heavy tax, without killing or even breaking the legs of the goose which lays the egg of gold, copper or steel. An unintelligent and arbitrary interpretation or administration of the situation would have exactly this suicidal or destructive effect, and the future of the mining industry, in so many branches of which the United States dominates the world, depends to a considerable extent upon the handling of this delicate situation.

The recommendations of the committee are not yet maturely formulated, although entirely satisfactory progress has been made, and the final presentation will probably be possible in a few weeks.

The first adventure of the Institute into public affairs under its new charter should be followed by others, wherever good may be accomplished. The precedent is an excellent one.

The Importance of Telling The Whole Story

IN GIVING treatment and operating costs, technical writers should be extremely careful to explain as completely as possible not only the prices and conditions obtaining at the time the given costs were entailed, but also exactly what the stated figures embrace. For example, some one might state the cost of reverberatory smelting to be \$2 a ton at a Tennessee smeltery, and the careful foreman in British Columbia might think that he was behind the times when his monthly reports averaged \$3.25. Yet if he thoroughly understood how each figure was determined he would possibly decide that a trip north would be of economic benefit to the Tennessee managers. He might find that labor and fuel were much cheaper at the other plant and that his own figure included interest and depreciation and half the superintendent's salary! (There being no reverberatory smelting in Tennessee, our readers must not enter these figures in their notebooks.)

Cost comparisons are even more odious than other kinds. They rarely mean anything without a complete study of the work covered. The more embracing they are, the less they can be understood. In the case mentioned it would be almost impossible completely to explain the \$2 figure, but a statement that the repair cost of a disk crusher was 5c. per ton of ore crushed would be fairly intelligible if accompanied by a description of the ore, size of feed and product, tonnage per day, size of crusher, facilities for repair work, cost of new steel and babbitt, character of the necessary repairs, price of labor, and a few minor enlightening details, such as the Bolshevistic tendencies of the repair crew.

Possibly the foregoing remarks may give a clue to the reason why some companies do not care to make public their costs. They may also explain, on the other hand, why other companies offer them freely to the metallurgical world.

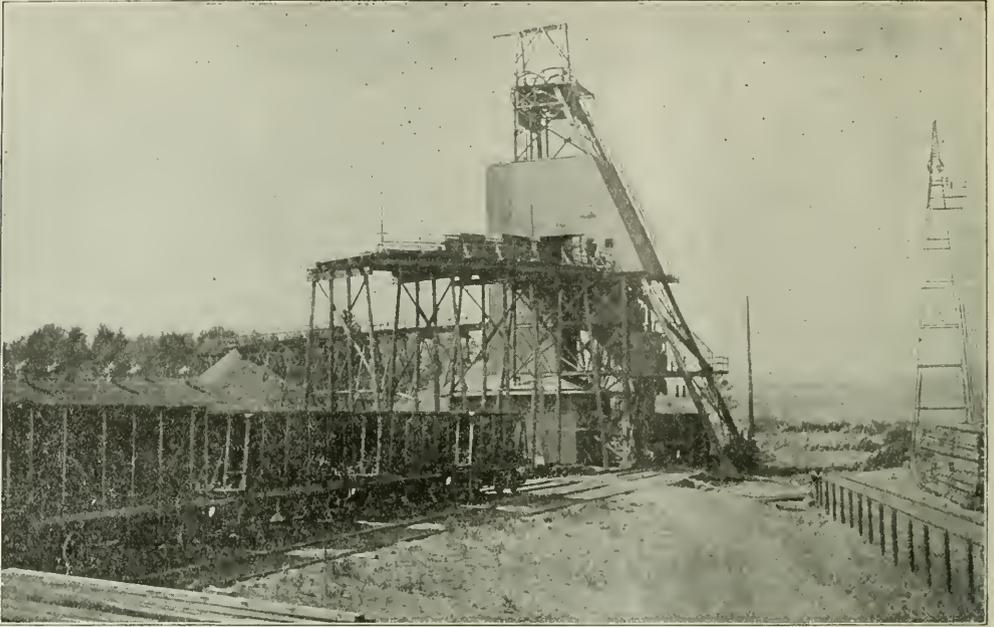

The Natural Trend

ANOTHER prominent mining company has joined the ranks of the oil producers. The United States Smelting, Refining & Mining Co. is reported to have secured a 50-per cent interest in the Wrightsman oil properties in the Bull Bayou oil field, in Louisiana. Except for a substantial interest in Ventura Consolidated, this is the first entrance into the oil business on an important scale by this company. Nipissing Mines Co., Helvetia Copper Co., Southwestern Miami Development Co., South Butte Mining Co. and East Butte Copper Mining Co. have all been reported as engaging in this popular activity. Many other and diverse interests, far removed from the environment which surrounds the development of oil lands, have made their advent in the field. Prominent among them have been railroads and the Cities Service Co. belonging to the Doherty interests, which organization has achieved a noteworthy success.

The transition from the development of mining claims to that of oil lands is a natural and logical one. The problems are quite similar. The science of geology has always been associated in the popular mind with mining, and so have the mechanical skill, and the hazard of prospecting, which constitute the two requisites in the bringing in of an oil well. The development of oil lands, however, is a comparatively simple operation and requires the solution of none of the intricate engineering problems involved in mining. Wealth flows to the surface in the form of oil much more easily than it is won from copper metal deep in the earth; and with the passing of the peak of opportunity for metal mining in the United States, the natural trend is for metal mining companies to invest a part of their accumulated surplus in the mineral industry of the hour.

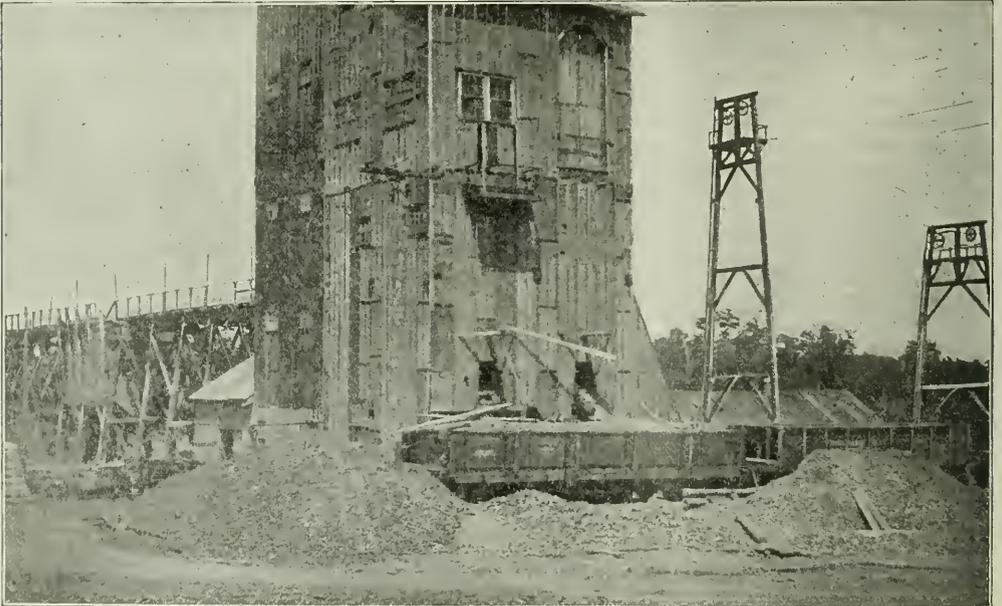

A New Department The Petroleum Section

The Journal has published in times past a number of articles dealing with the petroleum industry as well as with the subject of petroleum engineering. So important, however, has the industry become that we are starting in this issue a new department—The Petroleum Section. In this we will publish short articles on practical details, statistical material from various sources and information useful to engineers and others interested. Subjects of broader scope will be published as before among the leading articles of the various issues of the Journal. The establishment of the new department is another direction in which the Journal will increase its field of usefulness to its readers. It is hoped that engineers will not only contribute to this section but will also lend their aid to us in bringing the many important developments which are taking place in the comparatively new field of petroleum engineering to mining engineers, as well as to the industry. We feel that there has not been sufficient attention paid it but the Journal will now do its share.

Ore Deposits of Utah*—Part II

Evidences Show the Formations of the Large Orebodies of Utah Were Influenced by a Relation Existing Between the Exterior and the Surface at the Period of Solidification—Brecciation of Rocks Favorable to Ore Deposition

BY B. S. BUTLER

U. S. Geological Survey, Washington, D. C.

IT HAS been pointed out that the exposed intrusive bodies in the eastern part of Utah are characteristically laccoliths, and that those in the western part are stocks. The present erosion surface has truncated the stocks at different distances below their tops, and, in

conditions of nearly uniform pressure, may have been a factor in preventing the segregation of such liquid and gaseous differentiates with their dissolved contents as they were formed. If the material forming a laccolith or sill was intruded into hot deep-seated rocks, and

FRONT OF WASATCH RANGE AT THE MOUTH OF LITTLE COTTONWOOD CANYON

fact, there is reason to believe that some stocks have not yet been exposed. Stocks that are truncated near their apices are designated apically truncated stocks; those that have been more deeply eroded are termed medially truncated stocks.

In studying the relation of ore deposits to the different types of intrusive bodies it was a matter of some surprise to find that more than 99 per cent of the metal production of the state derived from deposits associated with igneous rocks had been from those associated with apically truncated stocks. Prospecting of deposits associated with laccoliths and medially truncated stocks, though it has been carried on intermittently for more than forty years, has not developed a single mine of first- or second-class importance.

The scarcity and small size of ore deposits in association with the laccoliths of Utah is thought to be related to the slight degree of differentiation that is observed in these intrusive bodies. The material forming the laccoliths enters the chamber which it occupies through a comparatively small opening (see Fig. 6), and the material in the opening solidifies soon after active movement ceases, thus effectively shutting off connection with the deeper-seated source of supply.

The individual bodies of igneous materials in the laccoliths of Utah are relatively so small, and solidified so rapidly, that conditions for differentiation were not favorable. A large accumulation of differentiation products of which the ore solutions were one is therefore not to be expected. The fact that the laccoliths had no connection with the surface, and solidified under

solidified slowly, the conditions might be favorable to gravity differentiation such as has been called upon to explain deposits like those of Sudbury, Ont.

In the stocks differentiation was least active near the tops and on the margins where the solidification

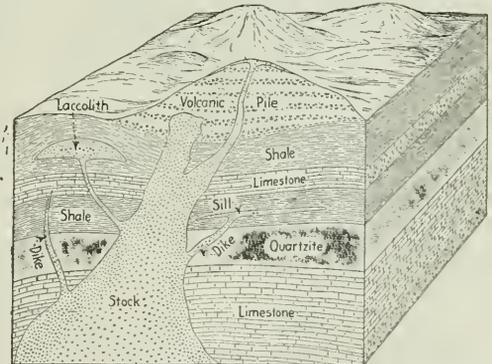

FIG. 6. GENERALIZED STEREOGRAM SHOWING DIFFERENT TYPES OF INTRUSIVE BODIES

was most rapid, and most active in the interior. The heavy products of differentiation, as the iron-magnesian silicate crystals that formed early, tended to settle, whereas the volatile constituents carrying metals in solution evinced a proclivity to rise. This differentiation by settling of crystals is believed to explain the more siliceous composition of the medially truncated stocks.

*Publication sanctioned by the Director of the U. S. Geological Survey.

As rapidly as a crust of solidified rock formed over and around the stocks it was fissured by the movements due to solidification and other causes, and the volatile materials rising through the still fluid mass, on reaching the fissured zone, were guided along these openings till physical and chemical conditions favorable to precipitation were reached in the solidified igneous rock or the adjacent sedimentary or eruptive rocks where minerals were deposited. (See Fig. 7.) The effect of this process was to concentrate the mineral constituents resulting from differentiation in and around the tops of the stocks. Where the stocks have been deeply eroded, this zone, and with it most of the valuable ore deposits, have been removed. (See Fig. 7.)

It is possible that the concentration of metals near the apex of a stock is influenced by the relation of the magma at the time of intrusion to the surface or to the zone of fracture. If a magma containing gases held

the stocks of Utah were so connected, notably those of the Tintic and Marysvale districts. Proof that an intrusive body now exposed had no connection with the surface before solidification is more difficult to demonstrate. There are, perhaps, criteria that would aid in such a determination, and their recognition will be valuable.

The deep-seated intrusive body of the Park Valley district contains abundant aplite and pegmatite, as does the Granite Mountain intrusive. Possibly the retention of these differentiation products means a lack of surface connection. Large ore deposits have not been found associated with these bodies. Whether aplites and pegmatites are significant or not, it may be noted that the intrusive rocks of all the districts containing large ore deposits are similar in character to those that are believed to have had a surface connection before solidification.

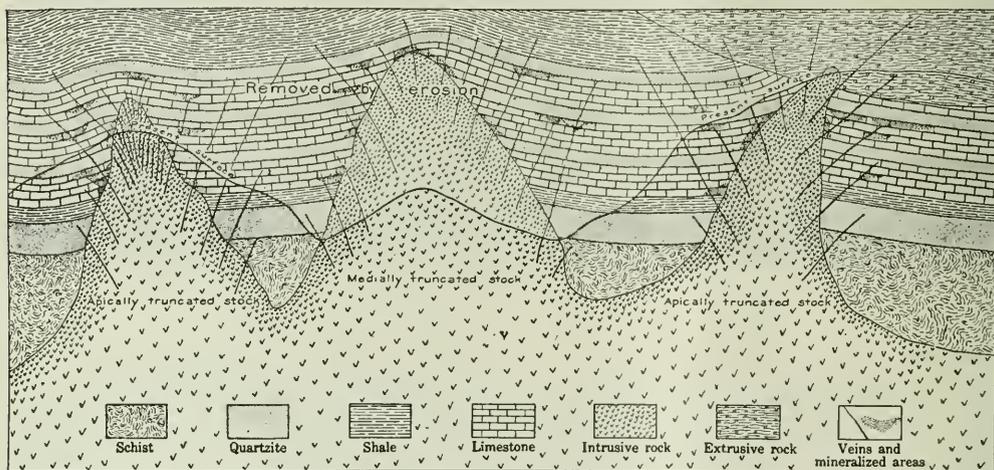

FIG. 7. GENERALIZED STEOGRAM SHOWING THE RELATION OF OREBODIES TO STOCKS.
The lighter portions of the stocks are more siliceous.

in solution under pressure is forced through the overlying rock until it connects with the surface or with the zone of fracture it is possible to imagine a condition similar to that produced by removing a cork from a bottle of champagne, when the dissolved gases move toward the region of lower pressure. In this manner there might be relatively rapid movement of previously dissolved gases into a restricted area from a large volume of magma.

The expansion of gases under decreased pressure and chemical reactions would effect temperature changes that may be factors in precipitating metallic and other substances. If the magma did not reach the surface, the influence of difference in pressure would not be effective or would be less effective. This may account for the conditions in the Park Valley district and in the Grouse Creek range where the tops of intrusive bodies (whether laccoliths or stocks is not apparent) are exposed by deep erosion, and do not appear to contain large deposits of ore.

It is not always possible to determine whether an intrusive body was connected with the surface before solidifying. There is, however, evidence that some of

Primary sulphates in igneous rocks and in ore deposits formed at high temperature are confined to a few complex silicate minerals containing the sulphate radical. In igneous rocks these minerals are characteristic of effusive rocks and dikes as constructed with deep-seated intrusive rocks. In deposits formed at intermediate temperature barite is common, and anhydrite is abundant in some deposits. Under favorable conditions, and probably at comparatively low temperature, alunite forms abundantly. It is believed that in many deposits the sulphate of the minerals has been derived from deep-seated solutions.

The study of volcanic emanations has shown that there is a change in their composition with change of temperature. At high temperature, sulphur or sulphur dioxide may be present, but no sulphuric compounds; whereas at moderate temperature, sulphurous and sulphuric compounds may be present. Sulphur trioxide is unstable at high temperatures (at atmospheric pressure it is practically dissociated at 1,000 deg.), and the temperature range in which it forms rapidly by combination of sulphur dioxide and oxygen is stable and narrow (approximately 250 to 600 deg. C. under at-

mospheric pressure). If free oxygen and sulphur or sulphur dioxide are present in igneous emanations, it would be expected that, in cooling, sulphur trioxide would form and that at suitable temperature the sulphates would also form.

Sulphuric acid can also be formed readily by the reduction of ferric solutions and sulphur dioxide. If emanations contain no free oxygen, that element may, combined with the metals or with hydrogen at high temperature, together with sulphur, form the oxides of sulphur and sulphuric compounds at lower temperatures.

HEAD OF LITTLE COTTONWOOD CANYON ALTA DISTRICT, WASATCH RANGE

That this reduction of metallic oxide and oxidation of sulphur compounds can take place is indicated not only by experimental data but by the abundance of ferric compounds in igneous rocks and mineral deposits formed at high temperature, though those ferric compounds are not only commonly absent in veins formed at moderate temperature, but in the adjacent wall rocks have been largely reduced. In contrast to this, sulphuric compounds are only sparsely represented in igneous rocks and mineral deposits formed at high temperature, but are frequently abundant in deposits formed at intermediate and low temperatures, and in many deposits are associated with abundant ferrous and manganous compounds. Such changes may be observed in a single deposit that has continued to form over a wide range of temperature, as that of the Cactus mine of the San Francisco district.

The alunite veins at Marysvale appear to have been deposited from deep-seated (hypogene) solutions, and it seems probable that in their formation the sulphur in the solutions was oxidized to sulphuric acid, which acted on the felspathic rocks adjacent to the fissures and formed the potassium and aluminum sulphates that entered into the alunite.

The interchange of oxygen between certain elements and sulphur, with varying physical conditions, is believed to be an important factor not only in the formation of sulphates in solutions of deep-seated origin but also in the precipitation of other primary (hypogene) ore minerals.

Before the main period of ore deposition, parts of the region had been deeply eroded, and rocks ranging from pre-Cambrian to Cretaceous age were exposed at the surface, so that the age of the rock is no trustworthy indication of its depth below the surface at the time

ores were deposited. Replacement deposits occur in rocks ranging in age from pre-Cambrian to Jurassic, and their relative importance seems to depend on chemical composition and physical character, and the relation to intrusive rocks rather than upon age.

The limestones were generally more readily replaced than the siliceous rocks, as is plainly evident in the Bingham, Park City, Tintic and other districts. In a series of limestone beds those composed essentially of calcium and magnesium carbonates were more readily replaced than the siliceous or shaly beds. This relation is illustrated in many of the districts of the state. Some particular feature may control in certain deposits; carbonaceous shale, for example, appears to have been most potent in precipitating gold from the solutions that traversed the rocks of the Mercur district.

IMPORTANCE OF PHYSICAL CONDITION OF ROCK

The importance of the physical condition of rocks as a factor in determining their susceptibility to replacement can hardly be overestimated. In many instances it appears to more than counterbalance unfavorable chemical composition, and where favorable chemical composition and physical character are combined in the same rock, bonanza deposits have resulted. Highly jointed brecciated or crushed rocks, where impervious gouge does not prevent access of metalliferous solutions, have uniformly proved favorable to ore deposition. Among the important deposits in such material are the great disseminated copper ores of the Bingham district, in highly jointed monzonite; the copper deposits of the San Francisco district, in brecciated quartz monzonite; the lead-silver-zinc-copper deposits of the same district, in brecciated latite; the deposits in crushed quartzite, in and adjacent to fissures in the Park City, Bingham, and other districts, and the deposits in brecciated limestone in the Cottonwood and other districts. In numerous instances a close inspec-

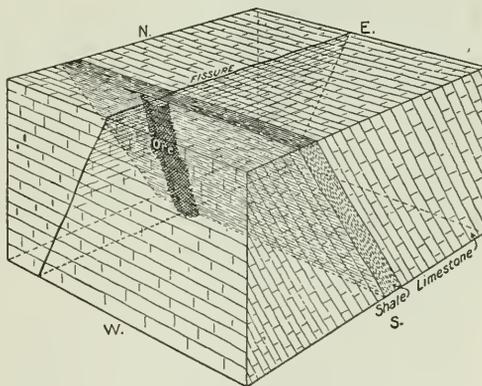

FIG 8. STEOGRAM ILLUSTRATING THE RELATION OF ORE SHOOT TO IMPERVIOUS ROCK

tion of an ore bed has shown that the selective replacement has been in part at least due to the fact that the replaced bed has experienced greater shattering adjacent to the fissure than the overlying or underlying beds.

The presence of impervious rocks may exert an important influence on the location of oreshoots. This is shown in the replacement of beds underlying shale, as in the Star district (see Fig. 8), or underlying a dike

or sill, as is shown in the Fish Springs, Ophir, and other districts.

The basin character of part of the area which has resulted in a greatly varying position of the water

however, affects very differently the various metals in the ores.

Under the conditions that have prevailed in the regions, gold has moved little during the process of

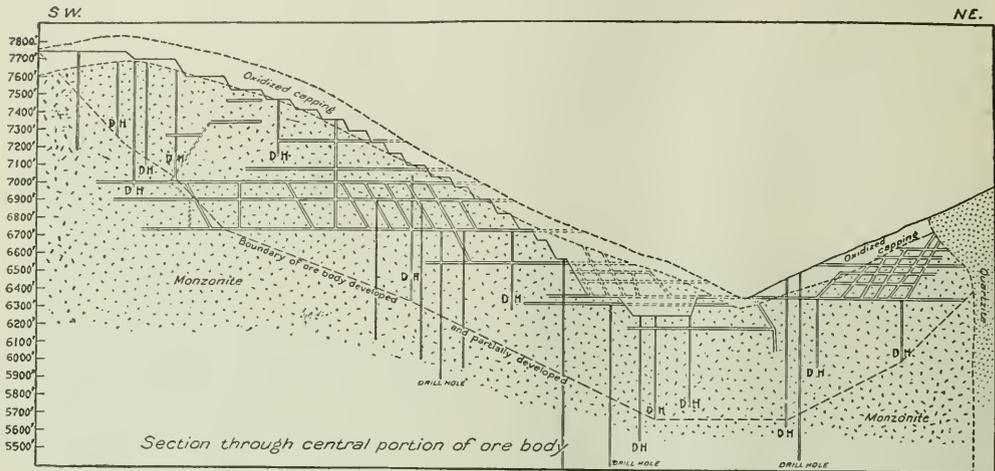

FIG. 9. SECTION THROUGH DISSEMINATED DEPOSITS OF BINGHAM DISTRICT SHOWING OXIDIZED CAPPING AND ENRICHED SULPHIDE ZONE
From Utah Copper Co. annual report

table has caused an unusual complex cycle of alteration by surface agencies in some of the deposits. Nearly all types of deposits have been both enriched and made

oxidation, but has undergone residual concentration in the gossans, as in the Bingham district, and the gold of the gossan may have been later concentrated in places. Moreover, the natural process of oxidation has eliminated one step in the metallurgical process. In the Mercur district the unoxidized ores required roasting before cyanidation, whereas the oxidized ores could be treated without roasting.

Silver, like gold, has apparently moved little under the prevailing conditions. This is probably due to the fact that chlorides are abundant in the region, and enough are present in the waters to convert all soluble silver salts that form to the slightly soluble silver chloride. As in the case of gold, there has been some residual enrichment, and the metallurgical treatment of the ores was much simplified.

Lead, upon oxidation, forms slightly soluble salts, mainly the sulphate or carbonate, and has migrated little. As with the metals previously mentioned, there has been residual enrichment, and the oxidized ores were amenable to the simple metallurgy that was possible in the early days of mining.

Copper, which forms readily soluble and also slightly soluble salts, shows much variation in movement. Where abundant limestone or calcite is present in the deposits, the copper resulting from the oxidation of the original minerals forms the slightly soluble carbonate, and there is comparatively little migration. Where the gangue is mainly silicate, the soluble salts migrate downward and are re-precipitated, forming a zone of sulphide enrichment, as in the disseminated deposits of the Bingham district and in the Horn Silver mine, as shown in Figs. 9 and 10 respectively. Much of the copper ore of the state has resulted from the enrichment of material originally too low in copper to be mined profitably.

Zinc, like copper, forms both soluble and insoluble

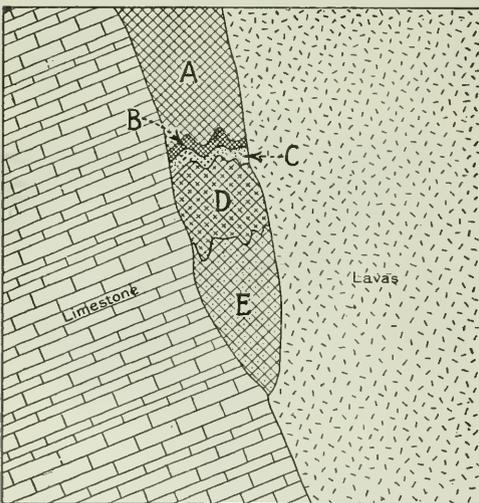

FIG. 10. GENERALIZED SECTION, SHOWING TYPES OF ORE IN THE HORN SILVER MINE

A. oxidized lead-silver ore; B. oxidized copper ore; C. secondary copper sulphide ore; D. Secondary zinc sulphide ore; E. primary sulphide ore

more amenable to metallurgical treatment by the natural process of concentration.

In nature, as in smelting, starting with a sulphide ore, the process is essentially one of oxidation. This,

salts. Under favorable conditions the zinc content of complex sulphide bodies has been concentrated into valuable deposits, but under unfavorable conditions it has apparently been disseminated and lost. The most favorable conditions appear to exist where the soluble

of tropical ulcers, which reduced the labor supply; to shortage of cars, and to the urgent Imperial demands at Beira for bunkering; also to the constantly increasing demand for coke for the Katanga copper mines and the need of the Rhodesian railways. Rhodesian mines de-

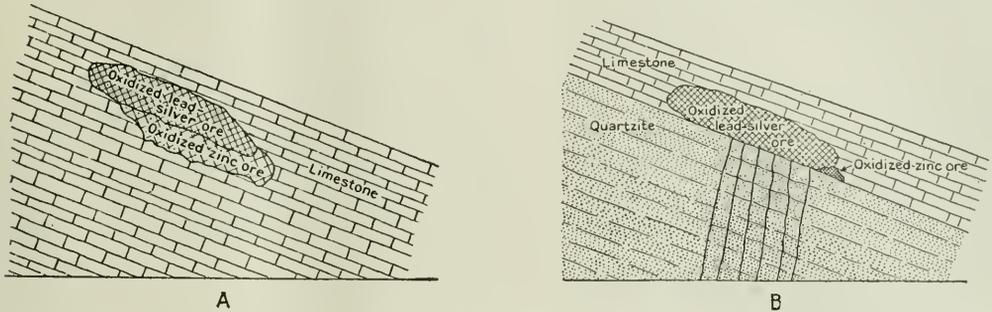

FIG. 11. A, CONDITIONS FAVORABLE TO THE FORMATION OF SECONDARY ZINC ORES; B, CONDITIONS UNFAVORABLE TO THE FORMATION OF A SECONDARY ZINC ORES

salts, in their migration, pass into readily replaceable limestone, by which the zinc is precipitated mainly as carbonate, as shown in Fig. 11-A. Where the solutions carrying the zinc pass into siliceous rocks (see Fig. 11-B) the zinc is too much disseminated to form ore. Under rather exceptional conditions, as in the Horn Silver mine, zinc is precipitated in the sulphide zone, as wurtzite, and thus forms a zone of enriched zinc-sulphide ore.

Mining in Rhodesia in 1918

Output and Dividends Decreased, Owing to War Conditions—Wankee Colliery Unable To Meet Demand for Coal—Influenza Made Heavy Inroads

THE mineral production of southern Rhodesia in 1918 was as follows, according to the report of the Secretary of Mines: Gold, 631,358 oz.; silver, 175,722 oz.; copper, 3,254 lb.; coal, 491,268 tons raised, 285,312 sold, 119,701 coked; chrome ore, 31,286 tons; asbestos, 8,574; ironstone, 6,355; wolframite, 11; scheelite, 26; arsenic, 114; antimony, 15; barytes, 54 tons, and diamonds, 449 carats. The value of the total mineral production in 1918 was £3,456,321, or £1,183,014 less than in 1917.

Ten mines produced over 10,000 oz. of gold in 1918, Shamva yielding 89,780; Globe & Phoenix, 82,283; Lonely, 49,561; Cam & Motor, 39,640; Falcon, 33,282; Rezende, 29,690; Eldorado, 29,348; Antelope, 18,405; Gaika, 15,645, and Fred, 14,129. Gold quartz crushed was 1,966,974 tons. Two large gold mines closed down late in 1917. Rising prices for stores and supplies and the absence of many claim-holders on active service also caused the closing down of many small mines.

A very rich shoot of gold ore was opened in the Rezende mine, at Umtali. The Globe & Phoenix mine continued its prosperous career, and the Lonely mine, at Bemberi, disclosed rich ore in the lower levels between 1,500 and 2,000 ft. vertical depth. It is rather amusing to note that not so very long ago this mine was cited as an example of "impoverishment in depth"!

The Wankee Colliery was seriously short in its coal output during most of the year, owing to an outbreak

pending on coal for fuel had often to go short and hang up stamps. "The strain on this colliery to meet increasing demands seems to be too great," runs the report. "The coal measures at Wankee are practically unlimited, and the coal is of excellent quality; but the necessity of opening up another colliery at Wankee with adequate equipment becomes more and more apparent."

The supply of wood and timber in the mining districts is causing anxiety, as no reforestation methods are practiced. During the last quarter of the year Spanish influenza paralyzed the industry. Natives died or deserted, and would not re-engage until they had visited their kraals to see how their relatives had suffered. In October and November, 1918, deaths in the mines amounted to 3,000 and desertions totaled 7,300. The loss to the mineral industry was about £400,000. The average number of native laborers employed was 32,766, and the death rate, which was greatly increased by influenza, was 110.76 per 1,000! The monthly average number of Europeans employed was 1,452.

The Odzi River bridge on the line to Beira, the shipping port, was carried away by flood, stopping exports of base metals for several months. Prospecting was at a standstill, and organized prospecting is required. A valuable area, however, containing vast deposits of chrome ore and some high-grade asbestos, was discovered in Lomagundi district forty miles from the railway. Scheelite was discovered in large quantities in and around the Golden Valley mine, in the Gatooma district, and also near Umtali.

The main copper producer was the Falcon mine, with 3,033 tons. The Lomagundi area shows promise as a copper producer. The Selukwe mines produced tin-chrome ore. Arsenic is now produced from a mine near Bulawayo and another near Umtali. The bulk of the production was sold in the Transvaal to the B. S. A. Explosives Co. which makes cattle dip. Platinum was discovered in the precious-stones wash of the Somebula district.

Dividends declared by mining companies in 1918 totaled £615,640, compared with £691,260 in 1917. These figures do not include profits made by small workers.

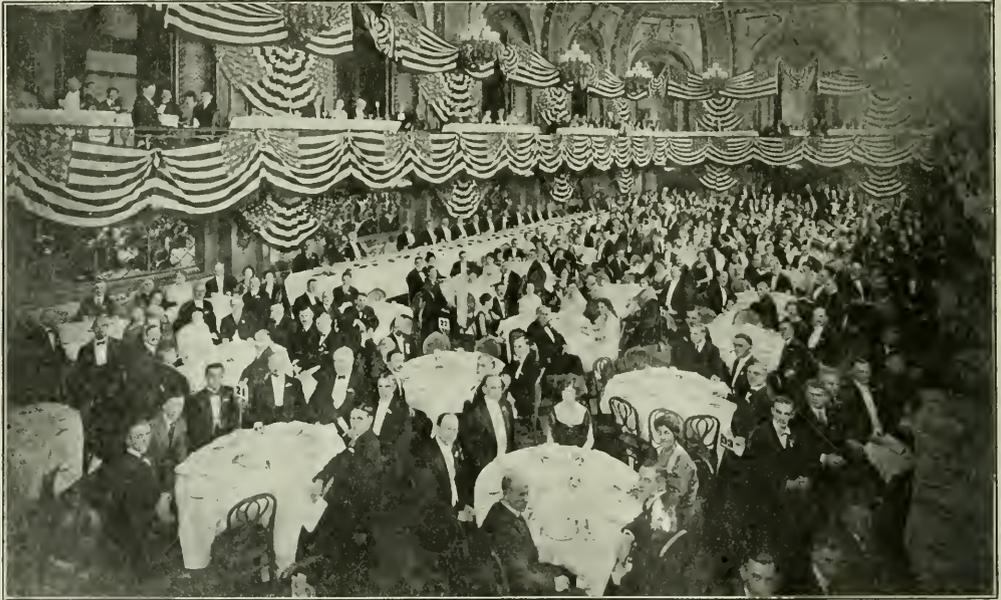

A. I. M. E. Banquet

THE banquet which is an annual feature of the meetings of the American Institute of Mining and Metallurgical Engineers was held this year in the Gold Room of the Congress Hotel, Chicago, on Sept. 24, 1919, and was attended by more than six hundred members and guests. Captain R. W. Hunt officiated as toastmaster, and introduced President Horace V. Winchell, who urged engineers to exert their influence toward the proper solution of public problems, and admonished them not to neglect their duties as citizens while engrossed in their professional activities. Mr. Winchell's address is published in full elsewhere in the Journal.

Captain Hunt discussed conservation, and pointed out that the conservation of mineral resources was

Commander Taublet, of the French Navy, delivered an address wherein he compared interesting mineral statistics of the United States and France, and pointed out France's great need for coal, and her willingness to exchange iron for coal.

Mayor Theodore W. Robinson welcomed the Institute on behalf of the city, and delivered an interesting eulogy on "Chicago the City of Destiny," in which he called it the world's larder and granary, and the greatest railroad center because of its twenty-seven trunk lines. In referring to the duties of the engineer, he urged the preaching of the gospel of hard work, thrift and loyalty. He advocated the open shop, and called the steel strike "foreign radicalism transplanted."

BANQUET A. I. M. E., CONGRESS HOTEL, CHICAGO, SEPT. 24, 1919.

more important than the conservation of our forests, because the forests could be replaced within a measurable period of years, whereas the minerals, once removed from earth, or wasted, represented a permanent loss. He advocated the conservation of human life first, natural resources second, and capital third, and expressed the opinion that if laws were enacted to take care of the first two, capital would take care of itself. He thought that the nationalization of coal mines would be the greatest hardship ever put upon the people of the United States, and that the most effective way to conserve coal would be to tax the coal left in the form of pillars in the ground in the process of mining.

Secretary Bradley Stoughton expressed, on behalf of the Institute, hearty thanks to Chicago for its cordial hospitality, and said that the meeting broke all records in point of attendance.

Charles M. Schwab delivered an entertaining address, in which he urged engineers to give more attention to the science of human engineering. He extolled the efficiency of American industry during the war, and referred to the so-called German efficiency as a great fallacy. He said that one way to reduce the high cost of living was to practice economy and efficiency, and that the surest cure for our industrial unrest was "an honest day's work for an honest day's pay."

Address of Horace V. Winchell at A. I. M. E. Chicago Meeting

AT THE BANQUET held on the evening of Sept. 24, at the Chicago meeting of the Institute, President Horace V. Winchell delivered the following address, which is here presented in full:

Ladies and Gentlemen: On behalf of the members and directors of the American Institute of Mining and Metallurgical Engineers, I desire to express our appreciation of the diligent labors and many thoughtful courtesies of the Chicago members which have culminated in this splendid gathering here tonight. We have enjoyed the cordial atmosphere of welcome by which we have been surrounded; we have profited by the interesting discussions of the past three days, and we shall long remember with gratitude the manifestations of friendship which have attended our brief sojourn in Chicago.

We look upon these, our annual mid-year gatherings in different sections of the country, as one of the most effective agencies in the forming of acquaintance with many whom we might otherwise never meet. In this way are brought together men of common aims and similar lines of investigation, and through the interchange of ideas and the friction of personalities are often developed a warmth of interest and a fruition of conception which lead not only to lifelong friendships but to results of importance in our social and economic development. Those of us who were here in 1893 and listened to the reading and discussion of Posepny's paper on the genesis of ores received an inspiration and a stimulus which perhaps have played no small part in the vastly greater study and the clearer understanding of that subject which in the past quarter of a century have been marked by a progress greater than that of all antecedent time. Nor is this the only epoch-making monograph which has first been promulgated at our meetings. I have no doubt whatever that some of the ideas advanced in our technical sessions this week contain germs of thought susceptible of great future elaboration, and that these germs, if not already fully developed, will bear rare fruit in succeeding years. May we not therefore congratulate ourselves and thank our hosts in this great metropolis because of this record-breaking attendance here this evening? Truly a high mark has been set in the history of Institute events.

In glancing backward over the last twenty-five years we become conscious of many changes, not alone in the scale of production and in methods of operation but also in the more intangible but none the less important conception of the relation of the engineer to society in general and more especially to his own particular community. Although it is to be feared that there is some foundation for the statement recently made to the chairman of the National Service Committee of the Engineering

Council¹ by "an acknowledged statesman and keen observer of events," that "Engineers are the most unresponsive citizens that we have. . . . Their aloofness and indifference in all matters outside of their own professional sphere are among the unexplained things in our political life," yet there are signs of an awakening, and the future is not without promise.

Our Institute itself, an organization which was for many years forbidden by the organic law from exerting any influence on law-making bodies, or even presenting its views as an organized unit of professional men regarding any movement which affected the general community, has recently removed these restrictions and is now able legally and with perfect propriety to appoint its committees and representatives to lend professional advice and assistance to any and all public and governmental agencies which may in any way shape and control legislation and national activities.

Recent events have shown us that the fabric of human relationship is each year more closely interwoven. The strands are ever closer and more firmly drawn, and each separate thread is a sensitized nerve alive with electricity and communicating instant warning of danger and news of damage to every other vital part. The development and perfecting of means of communication and transportation, and the arrival of an industrial age, have made all the world neighbors; and just as a fire in your neighbor's house is always a matter of concern to you, so an incipient conflagration of social or economic unrest or disorder in any part of the civilized world has now come to have its effect upon every other part.

I have said before, and it cannot be too often repeated, that from the historic moment when Admiral Dewey sailed into Manila Bay and upset the coffee cups of the Spanish Navy, we, the United States of America, are by force of natural law, and whether we wish it or not, partners in the commonwealth of nations. We may legislate against it; we may make treaties with reservations, or no treaties at all; we may set up barriers and lock the doors against all foreigners, black, white or yellow; but if because of our acts, or for any other reason, these excluded and distant peoples engage in conflict among themselves, we shall again, in spite of our wishes, our barriers and our padlocks, be drawn into the fray.

Nor is it in time of war alone that we find ourselves indissolubly harnessed up with the rest of mankind. Each smallest fluctuation in the annual production of the farms of Europe or of Argentine is reflected in our markets. Each drouth or famine, each outburst of Bolshevism, each overthrow of a tyrannical government in any part of the globe, affects each and every one of us, down to the youngest babe in its cradle or the poorest-paid worker in a sweatshop. Social diseases of the body politic are like the influenza: they are pandemic,

¹Engineering and Mining Journal, Sept. 13, 1919, p. 459.

they are in the air, and are not excluded by bolts nor barred gateways, by statutes or standing armies.

Nor may we blind our eyes to the fact that at the present time, under the order of divine providence, the United States is the only great nation whose resources are not only unimpaired but incomparably greater than ever before; that the nations of Europe are exhausted and almost bankrupt; that it is our privilege and our duty to them as well as to ourselves to go to their rescue. This was made so clear by our illustrious member, Herbert Hoover, in his address at New York last week, that it requires no emphasis from me. I presume each of you will soon receive that address in printed form. I advise you to learn it by heart and to lend it to all your friends. I wish that it could be read by every intelligent person between the Atlantic and Pacific; that it could be used as a text by every minister, and as a reading lesson for a week in every highschool. It emanated from a heart wrung by the woes of suffering millions and from a brain clear enough and broad enough to analyze the causes for Europe's condition and to perceive clearly the only remedy.

It is a source of inspiration to us, and one of supreme gratification to all engineers, that in a time of crisis, in a period that tried men's souls, at a moment when the real man comes to the front and assumes that position of leadership to which, by his mental attributes and moral courage he is naturally entitled, it should have been a mining engineer to whom the world turned for relief, and that for his trusted and most effective coadjutors he chose many other engineers. Does this not suggest to us that engineers are needed in the settlement of the world's affairs? Do we not realize that there is prevalent, as an aftermath of war and the artificial conditions created by it, a widespread feeling of discontent? Are we not still, and more than ever, ready to apply to the solutions of post-war problems the mental poise and balanced judgment which are a part of the equipment of the trained engineer? Shall we be so modest and retiring or so engrossed in our technical duties as to forget or neglect our duties as citizens?

Just at this point my subliminal ear detects a murmur. What do you say? "We cannot all be Hoovers or presidents or Members of Congress"? No, of course not! But you can help to make or unmake them, to influence them, and to shape the policies of government and the destinies of nations. Why is President Wilson touring the country today? Is it not to shape public opinion? He knows that the world is ruled by ideas, and that there is no greater force than public opinion. Suppose all the engineers of this broad Republic should unite and devote all of their spare time and energy for six months in advocating some change in our statutes which clearly appealed to their sense of equity as promoting the public welfare: do you not suppose they could speedily overcome the apathy and selfish inertia of our chief law-making body? Of course, they could. Well, it would not be you or I, but all of us, who would have done it. It would be the result of co-operation and organized effort, in which

each individual pulled in the same direction and not at cross-purposes with the rest.

Now, this is all trite; and in one form or another has been said many times. You want perhaps to know just what particular move to make next, and just how and where to begin. And these questions I cannot answer; but I may, with your permission, make a few suggestions.

There are problems of public character constantly before us, and yet of direct and vital importance to each one of us engineers. Some of these problems are comparatively local in their sphere of bearing and application; some are nation-wide, and some of them are international in scope. We have, for example, in each state and county, local taxation questions. As applied to mines and quarries, to mills and smelters, and to many other industrial plants, the valuation of properties for taxation involves questions which require engineering ability of high order, and keen analysis by the best brains of the country. The same problems are now presented in connection with the Federal Income Tax Law. Indeed, there are few subjects of wider general bearing and importance, nor any which make more pressing demand upon the engineering talent of the land. That we were not consulted in the framing of the law is perhaps due largely to our lethargy and apparent indifference. We are now confronted with its interpretation and proper application, and should not fail to give to the governmental authorities the benefit of our most serious consideration and competent advice. We are glad to be called into conference, and must willingly embrace the opportunity to aid in placing all interests involved on the most nearly equitable basis.

Then there is the ever-present and just now unusually inflamed antagonistic struggle between the employee and the employer. I know of no more promising work for engineers, with their peculiar adaption for studying the elements of a complicated situation, for determining the relative importance of its factors, for picking out the particular operating defects, and for suggesting solutions to difficulties. Conflicts generally arise through lack of mutual understanding and consequent lack of confidence. Where there is perfect understanding among fair-minded men there will be confidence, and where there is confidence, difficulties can be adjusted without strife. It seems to me that engineers may be of inestimable service to all classes by exerting the influence, which they undoubtedly possess, toward the education of the hostile elements as to the real necessities and actuating motives of the other. We are consumers; we are a portion of the public which always suffers in these industrial conflicts. We are coming to believe that no element in the community should be permitted to throw our entire industrial machine out of operation; that some control should and must be exercised to prevent these recurring disasters to the peace and prosperity of the country. The subject is one which demands the attention of all thoughtful and intelligent citizens, and is to be settled, if at all, only by concerted effort.

In broader fields we see the need of engineering brains and attention in the world-wide control and distribution of mineral resources. Recent thoughtful discussions by Messrs. Leith and Spurr have shown us that the United States has important duties to its own people and to the people of other countries in connection with the commercial control of minerals. It will be generally admitted that, until very recently, our people have been so busy in developing our own resources that we have paid little attention to those of other countries. It is also a fact that our policy of insularity has tended to discourage investments abroad. The studies of world conditions which we have been forced to make within the past few years have made it clearly evident that we must wake up and protect ourselves and our industries in their relation to the raw materials for manufacture and world-wide distribution. Our resources must not be dominated by foreign capital, and we must acquire our necessary share of those which can be controlled by us abroad. As Spurr¹ wisely says:

"Such mineral wealth as we possess in an exportable surplus must be managed for our best advantage. Such minerals as we do not possess in quantities sufficient for our own needs, must be secured to us so far as possible by a definite and intelligent governmental policy."

Other governments have already passed laws debarring us from owning or operating oil-producing properties and mines of various sorts within their territories. We have done little or nothing along these important lines of security and protection for the future.

Finally, it is for us to remember that we are not only engineers but Americans; that "America is worth saving not only as a land in which men and women may be free and increasingly prosperous, but as a land and a government under which character can be built, individual capacity given opportunity for free exercise, and co-operation on the widest scale promoted not only for private advantage but for the public good."²

Let us not forget that "socialism is the twin brother of autocracy, and, like autocracy, it is the deadly enemy of republicanism and of individual liberty." Let us stand firmly for the principles of equal rights and justice for all, and have full confidence in the destiny of our country. Thus alone shall we come up to the full measure of the possibilities of our profession and our duties as American citizens.

Special Meeting of Denver Members of A. I. M. E. at Chicago

One of the pleasant features of the A. I. M. E. meeting in Chicago was the reunion luncheon of the Denver and ex-Denver members of the Institute at the Congress Hotel, on Sept. 23, attended by twenty-two engineers, many of whom are now active members of the Denver Section. The meeting was called by H. B. Lowden, of the Colorado Iron Works Co.,

Denver, and Secretary of the Teknik Club, of Denver. H. C. Parmelee, editor of Chemical and Metallurgical Engineering, and formerly secretary of the Teknik Club, presided. Other members in attendance were John V. N. Dorr, the Dorr Co., New York; Walter G. Swart, Duluth, Minn.; A. M. Plumb, manager Wisconsin Zinc Co., Patteville, Wis.; Chester H. Jones, Chicago editor Chemical and Metallurgical Engineering; E. R. Ramsey, The Dorr Co., Denver; R. B. Moore, U. S. Bureau of Mines, Golden, Col.; D. J. Roach, Great Western Sugar Co., Denver; L. F. Miller, University of Minnesota, Minneapolis, Minn.; Will H. Coghill, U. S. Bureau of Mines, Seattle, Wash.; S. J. Osborn, Great Western Sugar Co., Denver; S. C. Lind, U. S. Bureau of Mines, Denver; W. A. Mitchell, assistant chief engineer Great Western Sugar Co., Denver; P. M. McHugh, Western sales manager The Dorr Co., Denver; S. A. Ionides, Denver; Arthur G. Dwight, New York; H. N. Stronck, Chicago; and John L. Malm, W. E. Malm, R. A. Malm and Harry J. Wolf, the Malm-Wolf Co., Denver.

The chairman referred to the meeting as one of the numerous reunions of engineers that contribute toward the success of the A. I. M. E. meetings. A renewal of old friendships was followed by a discussion of industrial relations, in the course of which there was a general expression of progressive sentiment. It was agreed that every important industrial contract of the future would be drawn with due consideration for (a) labor, (b) capital, (c) management, and (d) the community.

Chile Copper Co.

The tenth quarterly report of the Chile Copper Co., covering the second quarter of 1919, states that on account of the condition of the copper market the company's operations remained curtailed to approximately a 50-per cent basis. The production of copper for the quarter averaged 5,030,951 lb. per month, as compared with 5,169,641 lb. per month during the first quarter of 1919.

During the quarter ended June 30 there was treated 511,502 tons of ore, averaging 1.69 per cent copper; in the preceding quarter there was treated 648,203 tons, averaging 1.57 per cent copper. During the quarter 10,533,846 lb. of copper was sold and delivered out of a production of 15,092,852 lb. In the preceding quarter the copper sold and delivered totaled 3,971,849 lb., out of a production of 15,508,924 lb.

The average price realized for copper during the quarter ended June 30 was 15.933c per lb., as compared with 13.724c per lb. for the preceding quarter. For the quarter ended June 30, the cost of copper produced, including depreciation and all general expense, but excluding delivery and selling expense, excess-profits tax, obsolescence and depletion, was 12.69c per lb., as compared with 15.25c per lb. for the first quarter of 1919. Including all excluded items except excess-profits tax and obsolescence, the cost figured on copper sold was 21.520c for this quarter, against 30.355c for the first quarter of 1919.

The Gold Situation*

Present Juncture of Financial Affairs Compared With Conditions Succeeding Civil War Period—
Importance of Stimulating and Encouraging Production of Gold—Effect
Of Present Expansion of Credits

BY JOHN CLAUSEN

A GREAT MAN once said, "Necessity opens our eyes to the advantage of fresh principles," and as I see it this is now the position in which we, as other nations, find ourselves. The greatest war the world has ever seen has so altered conditions that methods and customs different from those heretofore known or used must necessarily take the place of the old in order to keep abreast of the new order of things. In reality, a very important issue is presented as to whether the standard of value of the world will in future be gold or become a combination of silver and gold, and if so, what effect such changes would have on the trading powers of nations. It is obvious that if a bi-metallic standard were adopted as media, the question of the value between the metals themselves would become one of vital concern. Then again, for the actual needs of people there may be a scarcity of gold circulating as money for trading purposes, or as affecting the position of governments and banks and the availability of the precious metal in proportion to liabilities.

GREENBACK CURRENCY OF 1862

There are many interesting angles from which to view this important subject, but it may be of general benefit to here recount what happened in this country during and after our Civil War.

As an inevitable result of the Government policy which had placed upon the banks a burden too heavy for them to carry, the financial institutions in New York and other sections were, during the Civil War, forced to discontinue specie payments, which subsequently brought about the suspension of the National Treasury. At the beginning of 1862 a bill was introduced which had for its purpose the making of Government notes legal tender, and although that measure was considered unconstitutional it became law in February of the same year. The issue of greenbacks payable to bearer, after several amendments of the bill, was authorized up to a maximum of \$400,000,000. When the greenbacks were put out, it was expected that they would circulate at par with the gold dollar, containing 23.2 grains of pure metal, but a year after the first Legal Tender Act had been passed paper money had an exchange value equal to only 14.5 grains of gold. Its value rose in August, 1863, to 18.4 grains, but fell in July, 1864, to 9 grains, which appears to have been its lowest point. The premium on gold was then such that a dollar in paper money was not worth more than 36 cents in gold coin.

The most striking example of profiteering during that period was the Black Friday Conspiracy of September 24, 1869, when a group of speculators bought up large quantities of gold—creating an artificial scarcity—and as a result that commodity could be obtained only from this clique at ruinous terms. This brought

about many failures, and to check gambling in gold and reduce the premium on it, the Anti-Gold Law was passed; but as it did not materially bring the premium on gold to a lower level, it was very soon repealed.

In June, 1862, Congress authorized the use of "Postage and other stamps of the United States" as money because of the demand for small currency, notwithstanding the circulation of the so-called "shinplasters," which were issued in denominations of 5, 10, 20, 25, and 50 cents.

CALIFORNIA ALONE MAINTAINED SPECIE PAYMENTS IN CIVIL WAR

In some of the Western states attempts were made to maintain specie payments—after they had in the main been given up in the Eastern states—but California alone has the distinction of remaining on a sound metallic basis during the Civil War. In New York some of the banks felt confident of ability to continue paying cash, but none did—if the records are complete—with the exception of the Chemical National Bank. It was not until 1876 that gold again sold at par throughout the United States.

THE CRISIS OF 1893

Since that period the more notable event was the panic of 1893, which was followed by a depression throughout the nation, with the result that a large amount of gold was drained from this country to Europe. The Treasury's reserve became so low in November, 1894, that a sale of Government bonds was resorted to; in fact, the stock of coin was reduced to such an extent that there were outstanding more gold notes than coin, leaving a part of the certificates represented by bullion in the form of bars. Again, during February, 1895, and also in July of the following year, strong syndicates headed by leading bankers in New York accomplished the difficult task of bolstering up the finances of the United States Government, and it was largely due to their activities that the United States remained on a gold basis. The success of these combinations had a far-reaching influence on business, and as soon as it was seen that the gold obtained from abroad was not going to be lost at once, as in previous bond sales, confidence was again revived, and the financial position of the United States improved so favorably in the eyes of Europe that it was possible to float large holdings of American securities abroad.

THE GOLD POOL OF 1914

In August of 1914 foreign exchange became demoralized, and to remedy that situation a gold pool was created, when influential banks and bankers throughout the country joined in an agreement to provide mail and telegraphic transfers to Europe in lieu of gold for export, which proved a helpful factor in restoring order and confidence.

*From the *Chemical Bulletin* of the Chemical National Bank, Aug. 16, 1919.

For several years prior to the declaration of war in Europe, France, Russia, and Germany especially had been engaged in an eager competitive scramble for gold, which resulted in the holdings of their great state institutions increasing rapidly. On this account, at the outbreak of hostilities, we found them with what was up to that time the peak of their gold reserves.

The embargo which was universally adopted clearly demonstrated the desire of every commercial nation to control and retain its supply of gold. As far as the United States was concerned, other than the necessity of obtaining Government permission to export gold in coin or bars, its circulation in this country has not been restricted—although the efforts of banks and individuals alike have been directed toward harmoniously cooperating with the Government in concentrating the nation's supply with the Federal Reserve banks.

WHERE GOLD IS NOT ACCEPTABLE

One of the most curious economic features of the present situation is the strong light which it has thrown on the fact that it is possible to have too much of a good thing, even when that thing is gold. This is forcefully demonstrated if we glance at the financial position of the Scandinavian countries, where the law has been carried so far as to relieve the government banks of the statutory obligation to buy gold and coin from all those who bring it in. This naturally prevented other countries dealing with Scandinavia from paying for purchases in gold, and the barter of commodities was the only means open for concluding commercial transactions.

It has lately been said that the world is divided into two classes of countries: those which decline to accept gold and those which refuse to part with it. Sometimes it is asked how anyone can possibly refuse to take gold in payment, but this is explained by the statement that gold in bars or foreign coins is not legal tender anywhere. No person in Scandinavia, for example, could be made to take gold bars or American eagles in reimbursement for goods to meet a required payment in legal tender currency of Denmark, Norway, or Sweden.

THE PRESENT CREDIT INFLATION

The issue and circulation of paper credits throughout the leading nations of the world has been proportionately far greater than their holdings of gold, and this state of affairs has naturally resulted in inflation on an alarming scale. The thought, however, that European nations may possibly repudiate part of their war debts for the sake of reducing the amount of currency outstanding against government bonds or notes, is obviously superficial. Finance has become an international rather than a national question, and the monetary history of any country tends to become more and more merged with that of the whole civilized world.

International credit is firmly established on a gold basis, and no country has any interest in upsetting the present standard, although it is contended that, notwithstanding a great production of new gold, it may not necessarily assure universal gold standardism, as it would be a mere drop in the bucket of our future needs. If the world's credit, therefore, is to be carried on with gold, every ounce that can possibly be produced will be required as a basic foundation upon which international and national finance has been reared.

The production of gold is a vitally essential industry, which, for obvious reasons, should be promoted to the fullest extent. It is very apparent, however, that with a fixed value for the yellow metal, together with the rapidly increasing cost of material, labor and transportation, this particular industry as now developed is seriously affected, and it would seem inevitable that unless some form of Government relief is given to the producing mines, many of them will be compelled to discontinue operations.

In a letter addressed to Charles A. Sulser relating to the present conditions concerning the production of gold in Alaska, the Secretary of the Treasury clearly voiced the attitude of our Government when he stated: "I fully appreciate that with the rising cost of raw material and labor and with a fixed value for their output, the gold miners are facing difficult conditions. I should be sorry, however, if for this reason there were any relaxations in the effort to produce gold. At no time has this country so much required the largest possible production of gold as at present. . . . In order to place the the enormous amount of Government bonds required to finance our war expenditures, a large credit structure will inevitably be erected in our gold reserves, and it is necessary that these reserves—which are the foundation of the structure—shall be maintained on the broadest possible basis."

EFFECT OF INCREASING PRICE OF GOLD

There are people who argue that if the Government would agree upon a plan to increase the value of gold from \$20.67 to say, \$30 or \$40 a fine ounce, it would make a settlement of obligations possible with only half the metallic requirement otherwise necessary to redeem outstanding paper credits. This course, radical to say the least, would have a disastrous effect upon all credits and especially reflect upon the cost of living, which, in all probability, would climb to limits beyond the reach of the average citizen. Increasing the value of gold or giving it at premium does not necessarily give it a higher purchasing power, but, on the other hand, in the final adjustment seriously disrupts the basis of international credit.

When peace is finally restored all the world will be faced with a period of great financial and industrial uncertainty, and to pass through it successfully will be a task that will need all the statesmanship civilization can muster. To increase this uncertainty by tampering with the standard of international payment would be an extraordinary futile means of handling the situation, and only make the confusion worse confounded.

The principal nations of the world have adopted gold as the basis of their currency systems. The market price for it is everywhere the same and equally certain at the standard price of \$20.67 a fine ounce. It may be an anomaly that economic civilization should depend for means of payment on the supply of a particular metal, but it will take much ingenuity to find a practical substitute for gold and secure for it the popularity and confidence that this precious metal commands. The mere fact that it has been chosen by the most enlightened commercial nations is strong proof that it is the best single commodity for practical use as a standard.

The disproportionate distribution of gold among world nations attracts attention to the study of the part that this metal plays and is to play in future in the world's economic affairs. It is apparent to the careful observer that the pace at which the production of gold

increases is not as fast as the rise in value of the world's wealth.

The vast obligations piled up by nations, the huge issues of paper currency, the refunding of debts and resumption of specie payments are among the most urgent and difficult problems with which the world is now confronted. This makes it only too apparent that gold is a necessity for the credit and financial unity of nations, and it is essential that an adequate foundation of gold be created to uphold that system.

One of the first acts of the British government after England was plunged into war was to insure that the gold turned out of her mines should be safeguarded, and steps were taken for the deposit of new holdings in Canada, South Africa and Australia to the credit of the Bank of England. This arrangement had many advantages and tended greatly to facilitate the concentration of the metal where it was needed for the settlement of liabilities, and Great Britain has in this way used her gold unsparingly to meet immediate obligations.

The enormous increase in credits and paper money circulating in every country of the globe is reacting very materially on the present and prospective supply of gold, and it would seem timely to briefly review its relative influence on prices in general, which in normal times zig-zag to meet the demand for and the supply of credit and gold. If, for instance, prices and wages are increased, so far as they are paid in gold, it will require a proportionate amount of money to meet the higher costs. It follows as a matter of course that a larger circulation of money is required to meet the demand. While the quantity of gold available as money is seen to exert an influence in the direction of raising or lowering prices, it would seem equally certain that as international commerce progresses, and the system of credit expands, an increased world's supply of gold is a matter of vital importance.

It is true that, in practice, many transactions of buying and selling are set off one against another, but there can never be a system of finance carried on in any country, operating under a gold standard, without a basis of money somewhere.

HIGH PRICES LIKELY TO CONTINUE

The tendency to a further rise in prices is likely to continue for several years; the increase in the cost of living, and the importance of adjusting wages to prices; the increasing obligations of nations extending over long periods; the problem of a universal standard of value; the development of commerce and banking; the growth of population and wealth—these are questions which are becoming of increasing importance. With the falling off in the production of gold and a material rise in gold prices, a very serious state of affairs is presented, which is likely to affect the international economic position of all peoples.

We are at the dawn of a bigger financial and commercial tomorrow, and while the situation is fraught with a great many difficulties, we must face conditions as they exist and through frank and free discussion arrive at a practical and sound solution. Let us hope that our united efforts will crystallize into a practical plan for the alleviation of the present critical situation, and that in the process of correction we may establish those principles which lie at the base of national progress and human welfare.

Baffles Should Be Tight*

BY W. F. SCHAPHORST

One subject that is seldom touched upon in connection with boiler operation is the baffle wall. A baffle seems to be a simple part of a boiler setting, and therefore worthy of little thought, but that is not the case. Baffles should be correctly designed, correctly placed in the boiler tubes, and they should be leakless. Tests have proved that they cannot be placed haphazard, here and there. The volume of the hottest gases usually determines the position of the first baffle encountered. Then, as the gases reduce in volume, due to coming in contact with the tubes and giving off heat, it is clear that the second baffle must be so placed that there will be no reduction in gas velocity. And so on. As the gas moves from pass to pass the baffles are placed closer and closer together.

If the baffles leak because of loose or careless construction, the hot gases will "short-cut" through the baffle and escape up the chimney without giving off the full amount of heat. The chimney gases will be too hot. Holes in baffles should be stopped up with plastic fire brick. Or, when the baffle is in a badly damaged condition, it might be well to replace the entire baffle with a new leakless monolithic baffle of this plastic composition.

Determining the Amount of Dust in the Air of Miami Copper Mines

The U. S. Bureau of Mines, in co-operation with the U. S. Public Health Service, has begun a study of dusts from the Miami, Arizona, copper mines, according to the *Journal of the Franklin Institute*. To determine the dust content a volume of 19 cu.ft. of mine air is filtered through a glass tube containing 100 gm. of sugar, the tube being of such dimensions as to give a filtering column 1½ in. high. The sugar is then dissolved in water and the recovered dust screened through a 230-mesh screen, which removes all particles larger than 50 microns in diameter. These are rejected, as particles of wet dust larger than 10 microns in diameter are considered harmless, as they do not lodge in the lungs. The dust is then graded into two portions, a non-injurious, consisting of particles between 12 and 50 microns in diameter, and an injurious, made up of particles smaller than 10 microns. The total dust is determined in milligrams per cubic meter of air, the number of particles per cubic meter, the number of injurious particles per cubic meter, their weight in milligrams per cubic meter, and the weight of the dust over 10 microns diameter in milligrams per cubic meter. Photomicrographs are made of characteristic dusts.

Manganese Production Is Decreasing, according to the U. S. Geological Survey. Reports sent by operators of manganese mines to the Survey covering the first three months of 1919 show that the shipments of manganese ore during that quarter were much smaller than during any other quarter since 1917. The shipments of high-grade ore were 23,937 tons, against 75,465 tons during the last quarter of 1918 and 305,869 tons during the entire year. The number of shippers was only 24, against 247 during the year 1918. The shipments of low-grade ore, containing 10 to 35 per cent manganese, were 35,516 tons, against 320,455 tons during the last quarter of 1918 and 916,163 tons during the year.

Mexican Senate Introduces New Oil Bill Legislation Providing for Nationalization of Oil Lands Results in Sharp Conflict—Foreign Oil Com- panies Appeal to Supreme Court

ACCORDING to reports reaching New York from Mexico, the inactivity of the Chamber of Deputies, which has failed to take action on the nationalization of oil lands, has resulted in the Senate initiating new measures based on those of the President, but differing therefrom in that the retroactive feature is absent. Therefore, if these measures are enacted into law, the oil lands to which title was obtained before the present Constitution became operative, on May 21, 1917, would not be affected.

President Carranza's decrees, which were for the purpose of making Article 27 of the Mexican Constitution apply to foreign-owned oil lands, have been the subject of bitter attack by the foreign interests, which declare that the decrees as well as the article are confiscatory.

In the course of the debate, efforts were made to include in the measure a complete redrafting of the Article 27, which caused considerable discussion. The government's side, supporting the nationalization program, was presented by Luis Cabrera, Secretary of the Treasury, and Leon Salinas, Secretary of Industry and Commerce. Secretary Cabrera has been quoted to the effect that the foreign oil interests would not be satisfied with the decision of the Senate, and therefore it was only a waste of time to discuss the oil question.

The suits brought in the Mexican courts by the foreign oil companies have been appealed to the Supreme Court. Apparently, to delay any action of this court, Secretary Cabrera has opposed the action in order that the Executive Department of the Mexican government and the oil interests may reach an understanding. So far, no information is available as regards an understanding between the respective parties in interest.

Investigation of Oil Resources in Utah

Geologists of the U. S. Geological Survey are in the southern part of Utah, according to a report of Director George Otis Smith, to Congressman Meton H. Welling, making a reconnaissance investigation of the possibilities of finding oil in the Virgin River section. After making an examination of the geological conditions, Messrs. Reeside and Bassler, who have the work in charge, will move eastward and northward, extending the scope of the work as their judgment concludes that conditions warrant.

The proposed survey of a large area including much of the San Rafael Swell has been deferred through lack of funds. It has also been found necessary to eliminate field work on oil shales in Utah, although a general report on the oil shales of north-eastern Colorado and southwestern Wyoming is approaching completion.

In view of the threatened oil shortage, companies are prospecting for oil in portions of New Mexico and Arizona, and, in the judgment of the Federal geologists, Utah has better prospects than many other areas in which no commercial production of petroleum has yet been assured.

The study of the geology and ore deposits of the Cottonwood and American Fork districts—interrupted during the war—has been resumed. It is expected that the field examination will be completed this fall, and that Messrs. Calkin and Butler will submit their report before the field session of 1920. A similar report on the geology and deposits of the Oquirrh Range, that had been recommended and planned, was abandoned because of lack of funds. The general report by Mr. Butler on the ore deposits of Utah is now in preparation for publication.

World Petroleum Investigation

According to reports from Washington, an investigation of world petroleum conditions has been initiated by the Administration, particularly with regard to discrimination that may be exercised against American enterprise obtaining control of foreign properties. It is understood that this move was instigated by the Shipping Board and also through suggestion from Congress.

The remarkable statements made by Senator Phelan, of California, in a discussion in the Senate, to the effect that foreign capital was given free rein in the exploitation of oil land in the United States, whereas, with the exception of Mexico, Americans are almost entirely excluded from all foreign fields, lent an impetus to such an investigation. Realization of this condition is reported to have caused the Shipping Board to urge President Wilson to undertake such an inquiry for the purpose of developing a national policy to assure an adequate fuel-oil supply for the United States Navy and for merchant ships.

The first step, it is understood, has been to obtain reports from consuls in every country where oil is produced, which will cover the mining laws and any legal restrictions imposed on foreigners in obtaining concessions. When all the details have been obtained a complete report will be made, and used as a basis in determining whether domestic measures of exclusion are necessary.

Natural Gas in Elk Hills, Kern County, Cal.*

R. P. McLaughlin, State Oil and Gas Supervisor of California, Describes Recent Activities of His Department in New Oil and Gas District—Further Tests Necessary To Determine the Possibilities of the Field

AN IMPORTANT addition to the available supply of natural gas was the most striking oil-field development during the month of May. It is possible that one of the largest gas fields in California has been tapped by this work in the Elk Hills, in Kern County.

The discovery was made by the Standard Oil Co. at its well No. 5, Sec. 36, T. 30 S., R. 23 E., M. D. B. & M. Through its co-operative attitude, the company afforded the State Mining Bureau an opportunity to demonstrate the economic value of scientific and technical work in the exploitation of natural deposits of oil and gas. The discovery is the outcome of recommendations made by the engineering staff of the Bureau. Successful demonstration of the recommendations could not have taken place had the company not followed the policy of acting upon suggestions which to it at first appeared of doubtful value.

The recent development gives another clear demonstration of the fact that rotary tools may easily and effectually conceal valuable deposits of oil or gas. Such a condition must not be confused with the unsettled question of protection of deposits by mud fluid. An adequate test of the value and productiveness of certain strata requires that water be "shut off," and then the well must be bailed or pumped.

The first investigations and recommendations by the State Mining Bureau in the Elk Hills were made by Deputy Supervisor R. N. Ferguson. His account is as follows:

Prior to the development of oil by the Standard Oil Co. on its "Hay" property, in Section 36, T. 30 S., R. 23 E., M. D. B. & M., in the Elk Hills, the field had been inactive for several years. The only matter coming before the department concerning the field was the waste of gas from the Hillcrest well, on Section 28, T. 30 S., R. 23 E., M. D. B. & M. This waste is reported to have started when the casing was pulled from the well. It was not brought to the attention of the department until the escaping gas took fire early in 1918. At that time it was investigated, and from unofficial sources it was determined that the gas was coming from formations a little over 600 ft. below the surface. No log of the well was or is as yet available. At the time of the receipt of "Notice of Intention to Drill" Hay No. 1 (Sept. 20, 1918), in this field, the department was in possession of the above information relative to Hillcrest Well No. 1 and of logs of the following Associated Oil Co.'s wells:

Section 22, T. 30 S., R. 23 E., M. D. B. & M.—Well No. 3, which reported a 1,900-bbl. flow of hot salt water from 2,690 ft. to 2,710 ft. and gas, but no oil. Well No. 4, N.E. ¼, which reported showings of gas from 610 to 828 ft., but no oil. Well No. 4, S.E. ¼, which reported a depth of 1,185 ft., but no oil, gas or water.

Section 21, T. 30 S., R. 23 E., M. D. B. & M.—Well No. 2, which reported a depth of 1,291 ft., but no gas, oil or water. Well No. 2, which reported gas at 2,415 ft., showing of oil at 2,500 ft., gas between 2,800 and 2,900 ft. Well No. 4, which reported a depth of 1,187 ft., but no gas, oil or water.

Section 26, T. 30 S., R. 23 E., M. D. B. & M.—Well No. 1, which reported gas at 1,090 ft. oil of 35 degree gravity from 3,067 to 3,410 ft., heavy oil at 3,580 ft., and oil and gas at various points between depths of 3,724 and 4,030 ft.

Section 36, T. 30 S., R. 23 E., M. D. B. & M.—Well No. 1, which reported gas between depths of 410 and 520 ft., and oil and gas from 2,470 ft. to 3,058 ft. Logs of several other wells, less than 500 ft. in depth, were also available.

*Excerpt from advance chapter of Fourth Annual Report of the State Oil and Gas Supervisor, California State Mining Bureau, May, 1919.

From this information, and a general knowledge of the structure of the region, it was assumed that the following series of formation existed throughout the Elk Hills. This assumption was arrived at by roughly contouring the exposed formations as shown by geological maps, and comparing the well logs, using a correlation line based on the contour map:

First—500 to 1,000 ft. of formation likely to carry upper water.
Second—At least 1,000 ft. of formation likely to carry gas in commercial quantities. The upper portion of this gas zone to correspond stratigraphically with that found in Hillcrest well, section 28, T. 30 S., R. 23 E., M. D. B. & M., and in Associated Well No. 4, N.E. ¼, Section 22, T. 30 S., R. 23 E., M. D. B. & M., and Well No. 1, Section 26, T. 30 S., R. 23 E., M. D. B. & M., and Well No. 1, Section 30, T. 30 S., R. 24 E., M. D. B. & M.

Third—Either (A) or (B):
(A) The above gas zone to continue to a thickness of 2,000 ft., and to be underlain by the flowing salt water reported in the log of the Associated Oil Co.'s Well No. 3, Section 22, T. 30 S., R. 23 E., M. D. B. & M., at 2,690 ft., and this in turn to be underlain by a productive oil zone.

(B) The gas zone to give way to an upper oil zone, the two to have a thickness of about 2,400 ft., and to be underlain by the hot flowing salt water, and this in turn to be underlain by a second oil zone.

In starting Well No. 1, the company essayed "to drill until we encounter a productive oil or gas formation and then cement a string of casing above such formation, the size and weight of casing used to depend on the depth at which we encounter productive oil or gas." The reply to the proposal was so written as to specify a manner of drilling which would properly protect the gas and oil from damage in either of the above cases. It was recommended:

First—That conductor pipe be securely cemented in the first blue clay below the yellow surface gravel (not deeper than 500 ft.). This casing was specified to serve the double purpose of excluding possible upper water and of making it possible to hold pressure on the mud, with which underlying gas formations were to be sealed.

Second—It was recommended that in drilling ahead the size of the hole be reduced at a depth of 1,500 ft., so that, after determining the full thickness of the gas zone, the hole could later be reamed to a point below the gas, leaving a shoulder at that point. It was expected that this shoulder would be used as a landing point for the casing with which the gas was to be cased off. It was thought that one of two things would develop during this drilling to determine the point of landing: (a) Water sand would be encountered; and in this case it was expected that the company would be required to cement casing above the water and below the gas; or (b) oil would be encountered below the gas, in which case the company would desire to case off the gas before trying to produce the oil.

Third—The recommendation was so worded that in case water was encountered above the productive oil, or in case the company desired to drill to the deeper zone (below the water), a string of casing should be cemented below this water in such a manner that no oil- or gas-bearing formations would be cased off with the water behind this casing.

Well No. 1 was drilled to a depth of 2,532 ft., and produced oil in January, 1919. Neither the company proposal nor the department recommendations, as set forth in the letter quoted, were followed by the company. Eighteen-inch stovepipe casing was cemented at 495 ft. and 12½-in. casing at 2,480 ft. No test was made to determine the value of the upper gas zone. It was, therefore, necessary to devise plans which would not unduly hinder the company in its search for oil, but would still insure that valuable gas deposits were not being overlooked, with the attendant possibility of waste. This part of the work was carried on by Deputy supervisor R. D. Bush and the State Oil and Gas Supervisor.

Proposal to drill wells Nos. 2 and 3 followed soon after the demonstration that No. 1 was a satisfactory producer of oil. The proposals were that the wells should be drilled in about the same manner as No. 1 had been drilled; that is, in a manner which would not permit test for supposed upper gas. The Bureau was reluctant to see a further precedent established of passing through

the upper gas zones without testing their value and, if necessary, providing against waste by dissipation or flooding. The company, on the other hand, maintained that a single oil well in this locality did not adequately prove the value of the property and that its proposals should be followed. It was decided that wells Nos. 2 and 3 should be drilled approximately as proposed, with the added proviso that special attention should be given, during drilling operations, to observing gas indications in the upper formations. It was further agreed that, should these two wells fail to prove definitely the existence or non-existence of upper gas zones, another well would be drilled for that specific purpose. The company acceded to the proposed expenditure, notwithstanding its expressed doubt as to the commercial value of the gas zones. The test well was designated as No. 5.

In Well No. 2, at a depth of 1,537 ft., the driller in charge reported that mud in the circulating ditch showed considerable gas for about two hours. Owing to misunderstanding as to what was required in observing or testing this gas showing, the well was not "shut down" until it reached a depth of 1,630 ft. At the last-mentioned depth an inspection showed no evidence of gas. It was later reported that some gas was noted at a depth of 1,835 ft.

During the drilling of Well No. 3 a showing of gas was reported at a depth of 1,652 ft., and inspection showed only a few bubbles in the circulating mud. At a depth of 1,850 ft., gas was again reported, and inspection was made by a representative of the Bureau. Heavy mud was circulating, and where it discharged into the ditch the odor of gas was noticeable. The gas bubbles confined in the mud broke upon rising to its surface, and gave the appearance of boiling. Such an appearance extended throughout the length of the ditch and into the suction tank. The drilling foreman stated that he had seen much weaker showings at wells which had later developed into good gas producers. The showing also appeared to him similar to those observed at wells Nos. 1 and 2 at depths of 1,825 ft. and 1,865 ft., respectively.

Drilling continued, and 12- $\frac{1}{2}$ in. casing was cemented at a depth of 2,455 ft. Gas flowed from the well at the rate of over two million cubic feet per day through a two-inch "bean" under pressure of 26 lb. per square inch, when the well was open to a depth of 2,465 ft. The well was completed as an oil producer at a depth of 2,683 ft.

Notice of intention to drill Well No. 5 was filed on Mar. 28, 1919, proposing to cement 12 $\frac{1}{2}$ -in. 50-lb. casing at a depth of 1,800 ft., drill to 2,000 ft., and test out gas. The casing was cemented as proposed, and it is of particular interest to note that at the test of shut-off, on May 24 and 25, with five feet of open hole below the casing shoe, the well was bailed to a depth of 1,300 ft. and stood twenty-five hours with a rise of only five feet in the fluid level. This feature is of particular importance, as indicating that there is but slight danger of a well in the vicinity blowing out prematurely, although Well No. 4 did blow out from a deeper zone. Drilling continued, and 6 $\frac{3}{4}$ -in. casing, with 100 ft. of perforated pipe on the bottom, was landed at 1,895 ft. and the well bailed. Gas began to flow uncontrolled on May 28, at the rate of thirty-three million cubic feet per day. The flow was later placed under control, and, so far as pipe-line facilities permit, is being delivered to consumers

Well No. 4 was begun about the same time as No. 5, and was drilled in similar manner to wells Nos. 1, 2 and 3. It therefore does not necessarily appear in the chronological statement of events previously set forth. It is of interest to state that it encountered a large flow of gas lower than that in No. 5. The gas ignited, burned the rig, and at the time of writing the fire can be seen for many miles.

From the foregoing description it will be noted that the extent of gas resources of the Elk Hills has not yet been thoroughly tested. The necessity for a careful drilling program, insuring adequate protection, is self-evident.

August Production of California Oil Fields

August production of the California oil fields is given by the *Standard Oil Bulletin* in the following table:

Field	New Rigs	Drilling	Wells		Producing	Production per Day, Bbl.
			Completed During Month	Abandoned During Month		
Kern River	14	19	9		2,017	20,700
Mckittick	2	3			346	7,236
Midway-Sunco	16	83	18	2	2,301	86,516
Lost Hills-Beridge	3	19	5	1	552	12,247
Coalinga	5	38	7	3	1,197	44,715
Lonpoc and Santa Maria Ventura County and Newhall	6	21			369	15,265
	10	37	4		503	4,871
Los Angeles and Salt Lake		3			666	3,887
Whittier-Fullerton	22	121	8		850	83,090
Summerland					142	147
Watsonville					5	75
Totals	78	344	51	6	8,948	278,749

Total crude-oil stocks, Aug. 31, 1919, were 33,705,383 bbl. Total shipments from fields in August, 1919, 8,786,695 bbl.

The British-Mexican Petroleum Co.

Final arrangements are now being completed for the factors entering into such a change are the high the establishment of a working basis of a new oil company to be known as the British-Mexican Petroleum Co., Ltd., which will control the products of the Pan-American Petroleum & Transport Co. and its subsidiaries. Negotiations with this end in view were started in 1915, but were not concluded at that time, because of war conditions.

It is the intention of the new company, it is understood, to gradually replace coal-driven by oil-driven liners, and to build storage oil tanks in various parts of the world. The new organization has already agreed to purchase from the Mexican Petroleum Co., Ltd., a minimum quantity of 7,00,000 bbl. of oil annually for a period of years.

Herbert G. Wylie will be the active manager of the new company, with offices in London, according to information obtained at the Washington office of the Mexican Petroleum Co.

The British-Mexican Petroleum Co. is capitalized at \$9,733,000, equally divided between British and American interests. It is reported that Sir Thomas Royden, deputy chairman of the Cunard Steamship Co., is a director of the new company, which fact, it is believed, indicates that British steamship companies are probably taking definite steps to adopt oil as fuel instead of coal. Reports coming from England to the Bureau of Foreign and Domestic Commerce point out that two of the factors entering into such a change are the high price of coal and the ease and rapidity with which a vessel can be "oiled."

CORRESPONDENCE AND DISCUSSION

Letters From the Mining and Metallurgical
Industry Dealing With Pertinent
Subjects of Interest

Early Developments in Flotation at the Kylee Copper Mine, New South Wales

The Journal for July 5 contains a paragraph, on p. 21, concerning an improvement in flotation practice at Anaconda,¹ which is interesting to me because the improvement mentioned therein is one of several that were made at the Kylee Copper Mine, New South Wales, Australia, in 1910, in an M. S. machine, adapted from the existing zinc-lead practice at Broken Hill.

The Kylee plant is worthy of mention, as it was the first plant to make a commercial success of the froth-flotation of copper ores, and the one in which most of the present-day commonly accepted principles of copper froth-flotation were firmly established. Among them were: (1) the feasibility of using a cold non-acid circuit; (2) the practicability of treating ores containing a small amount of sulphide minerals (only 6 per cent instead of the 30 per cent or more contained in Broken Hill ores); (3) the production of high-grade concentrate by refloating low-grade froth; (4) the necessity for grinding finer than in zinc-lead practice where dense hot acid solutions were the order of the day; and (5) the importance of low and fairly constant pulp dilution in the machine. In fact, feeding reagents at the grinding plant instead of at the head of the flotation machine was the only important principle of present-day practice which was not developed at this plant.

Later, on the advice of A. R. Weigall, the consulting engineer, the Kylee system of copper flotation was adopted by the Seoul Mining Co. at its Suan plant in Korea, to treat tailings from the gold mill, containing as little as 2 per cent of sulphides, mostly in the form of chalcopyrite. The results were satisfactory until ore was encountered containing secondary bornite, which proved to be difficult to recover. The problem was investigated and solved, quite independently of the excellent work done in America about the same time by G. A. Chapman, by feeding a collecting oil to the tube mills.

At the Suan plant, not only are all middlings returned to the head of the machine by the suction of the stirrer in the first mixing box, but also the transference of the rougher concentrate to the cleaner cell is accomplished in the same manner.

By properly adjusting the mixing box and the stirrer a head of 5 ft. can be negotiated without difficulty, and there is no necessity for pumps or elevators around the plant, except in the case where the

cleaner tailing is returned to the regrinding circuit instead of directly back to the head of the rougher.

H. Hardy Smith,
Huchang Mining Co., Kokai, Heianhokudo, Chosen,
Aug. 20, 1919.

Foreign Trade and Government Protection

Although I am interested in an entirely different line from that of the manufacturers, would it be possible that a few remarks on foreign conditions might be of interest to them? One of the questions now confronting us as a nation is that of foreign trade. Our Government seems to be intensely interested in the building up of a merchant marine to further this trade, to be offering all sorts of advice, largely through the Department of Commerce, and to be urging the industries of the country to expand, particularly in Latin America.

Beautiful, is it not?

Take the case of one American who has seen considerable foreign experience. Our Government suggests "Go after the business and bring the money home." But if you get into any trouble outside of our boundaries, it also says, "Why did you leave the United States? You had no business out of the country, and as you went to further your own interests, you cannot expect any consideration from this Government, and you will have to stand your losses." (This may mean your life as well as your property.) "Bring home the money, but don't ask us to do anything for you except to receive your Income Tax."

What real American in Latin America does not send orders home for home-made goods? How many Americans in Latin America are not like the Chinese in this country, striving to make their pile and then get back home? And what a time some of us have had to get back, particularly if we left before passports were required?

Our Consular Service is 99 per cent inefficient. If you doubt this, go abroad and see some of our "representatives;" or, worse yet, try to get one to fulfill his obligations to you as an American citizen, and see what results you can obtain.

This is a part of my own personal experience:

After having been ordered out of Mexico by a paternal State Department, which stated that I had no business to be out of the States, and had no recourse to the department for losses incurred in a foreign country, I took another chance, and went to Australia. Armed with letters to both the Consul and the Vice-Consul (two out of three good men I have encountered in the service), I immediately became identified as an American. After the war broke out, I desired to return to the States, and I applied for

¹The feature at Anaconda to which Mr. Smith refers is the return of middling to a box in front of and slightly below the first M. S. cell, the middling pulp being drawn up into this cell by the suction created by the impeller.—Editor.]

passports for myself and family to the successors of the men to whom I had taken letters, one of which, by the way, was from a former Consul to South Africa, the third good man in the service.

Would the Consular Department look up my letters? "No. They were filed in the basement and were unavailable." I would "have to secure a birth certificate. American citizens in Sydney cannot identify you unless they were present at the time you were born."

I was therefore compelled to write to the Mayor of Canton, Ohio, which place I had left thirty years before, requiring a loss of three and a half months' time waiting for a reply, and upon the receipt of the necessary papers, duly certified by the Mayor and with a certificate from the State Board of Elections stating that he was the duly elected and qualified Mayor, was met by the true statement of the Consul, "You were never the Mayor of Canton."

Ye Gods! and ten thousand miles from home!

After getting photographs, and duly presenting my wife for identification, the next brilliant remark was, "Who is this woman?"

I got the passports, and the Consul got my personal opinion of his ancestry and his intellectual rating.

Now, after having been ordered out of Mexico by our State Department, and after having had such a hard time to get home from Australia, my advice would be to stay at home, all ye Americans. Let the foreigners come here to buy your goods, or hire an Englishman, a Frenchman, or even a German as a traveling man or agent to represent your firm and thereby avoid having a widow and perhaps some orphans on your hands should your agent be killed, for if you don't provide for her after her husband has been robbed and murdered, she will have to provide for herself.

The season is open for Americans the year round, and though our Government may protect—yes, does protect ducks and geese—it does not protect its citizens.

Some of us remember the Mafia. We many of us remember the Maine. We settled. We were settled with. How about the Cumbre Tunnel, Santa Ysabel, and even on our own territory, Columbus?

By all manner of means, get the trade. When you send out an agent, if he be an American, better send a death certificate and a coffin along, so as not to bother our Consular Service or our State Department with any such trifling matters as a murdered citizen.

G. L. Ashmun.

Bowling Green, Ky., Sept. 22, 1919.

Herbert Hoover's New York Address

The issue of the Journal of Sept. 27 is the most valuable publication that has ever come into my office, in that it contains the address in full of Herbert C. Hoover to the American Institute of Mining and Metallurgical Engineers. In common, I imagine, with the whole body of American engineers, I have been waiting for the calm, clear, dispassionate and

dependable statement of the only living man today who can define and set forth existing world issues from accurate personal knowledge.

Through all the mass of conflicting, political, and otherwise biased statements which have issued from time to time through the medium of the press since the war ended, none have previously seemed to bear the impress of absolute sincerity or of even scant knowledge of facts, saving only the public speeches of the President himself, which speeches, unfortunately, only a few people comparatively have personally heard or have read through the limited press reports.

I have read and studied Mr. Hoover's statement until I almost know it by heart. It is the masterly statement of America's greatest living engineer today, the only man who is capable of speaking with authority, from absolute and exhaustive personal knowledge, without bias, of the vital issues confronting this nation. As such it should receive worldwide publicity. It may well be studied in the public schools, because the issues involved are, and will be perforce, largely the heritage of the men and women of tomorrow.

Education, in these matters plainly differentiated, are clearly and forcefully separated from the biased statements and interested attitude of political influences, seeking to make these issues party capital, one way or another, is an absolute requisite for correct final judgment and action, which judgment and action will be continuously needed at least over the next decade and possibly longer. Yet, so far as I have observed, Mr. Hoover's masterly and official statement is not receiving any part of the publicity which it imperatively demands, and I am hopeful that in your wisdom and judgment, you may find it advisable and possible to issue this speech in pamphlet form for general distribution. I am convinced that American engineers at least will warmly welcome such a publication (which manifestly should be made by the United States Government itself), in the event it is not to be so officially published, which I surmise might be politically an impossibility.

Geo. H. Clark,

Consulting Engineer,

Member Yale Engineering Association.

Birmingham, Ala., Oct. 10, 1919.

The Diesel Engine in the Southwest

Referring to my article which appeared in your issue of Sept. 20, entitled "The Diesel Engine in the Southwest," please refer to a description of a compressor in connection with the Diesel engine where I made use of the expression "feather valve" in describing the valves of this compressor. I now learn that the word "Feather," in connection with a valve, is a registered trade name which was in this case misused, as the valves referred to in my article are of an entirely different construction than those to which the above mentioned trade name refers.

NEWS FROM WASHINGTON

By PAUL WOOTON
Special Correspondent

Magnesite Tariff Bill

By vote of 154 to 112 the House of Representatives on Oct. 7 passed the magnesite tariff bill (H. R. 5218). As passed, the bill provides a duty of $\frac{1}{2}c$ per lb. on magnesite ore; $\frac{3}{4}c$ per lb. on calcined, dead-burned and grain magnesite; and $\frac{3}{4}c$ per lb. and 10 per cent ad valorem on magnesite brick. The bill as originally introduced provided $\frac{3}{4}c$ per lb. on ore; $\frac{1}{4}c$ on calcined, dead-burned and grain magnesite, and 25 per cent ad valorem on magnesite brick.

A sharp difference of opinion as to the duty which should be imposed on imported magnesite developed during the discussion of the bill. Representative Moore of Pennsylvania, one of the high-protection leaders of the House, opposed the rates as too high and suggested their amendment. Mr. Moore insisted that a duty of $\frac{1}{2}c$ a lb. is the very highest rate which should be allowed on calcined, dead-burned and grain magnesite. Mr. Moore's contention was largely in the interest of American investors who, he said, prior to the knowledge that any important deposits of magnesite existed in this country, developed mines in Austria representing an investment of \$2,000,000 of American money, and in addition, invested a half million more in plants for the treatment of the imported ore, after its arrival here. Mr. Moore pointed out that no tariff duty would be needed so far as Western magnesite is concerned, if it were manufactured in the West, instead of in the East. As a result, under the proposed tariff, only one series of mines in one state would have to furnish the product for states three thousand miles away, who would be obliged to pay excessive freight charges and would be prohibited from getting their raw material in competition. Representative Hadley of Washington, who has been most prominent in urging the tariff on magnesite, in an extended speech pointed out that our deposits of magnesite are very extensive, there being 8,000,000 tons blocked out and in sight, according to the Geological Survey. He said that he had evidence from consumers that domestic magnesite is superior to the Austrian product, and that magnesite mining here has reached the point where all the requirements of the country can be filled. In connection with the claim that the bills would play into the hands of an American monopoly, Mr. Hadley pointed out that this was not true, inasmuch as the largest producer owns only one-eighth of the total known deposits in the country, and has never produced more than one-third of the country's output. He referred to the Geological Survey's report showing that magnesite was produced in ten counties in California in 1918, and that in 1917 there were 65 separate producing companies in that state.

Mr. Hadley reviewed the situation which confronted the steel industry of the United States when war was declared on Austria, and argued against allowing the country to drift back into the same position. Mr. Hadley had figures purporting to show that \$2,000,000 has been invested in the magnesite industry in the State of Washington and \$1,500,000 in California, which were contested by Representative Moore, who called attention to some estimates that such investments in the West do not exceed \$500,000.

It is evident, from the discussion on the rate of pay in Austrian mines, that no reliable information is at hand as to the wage rate there.

Figures submitted to the Ways and Means Committee show that the price of magnesite at Eastern ports, under the operation of the proposed tariff, would be \$50 a ton as compared with the pre-war price of \$16 laid down at Eastern ports. The freight rates from the State of Washington to Eastern ports is \$16 a ton.

Representative Kitchin, the ranking democratic member of the Committee on Ways and Means, attempted to amend the bill by proposing lower rates of duty in each case, but each of his amendments was defeated.

The sensation of the debate, however, came when Mr. Kitchin proposed to add the following provision to the bill: "That the duties provided for shall not apply unless it be shown to the satisfaction of the Secretary of the Treasury that the industry producing magnesite is paying for the labor, in the production of such magnesite, as much as \$12.50 a ton." After a long parliamentary wrangle, the proviso went out on a point of order. Mr. Kitchin forced a record vote which, with one exception, was along party lines.

The main arguments for the rates of duty as carried by the bill were that the tariff would add only $3\frac{3}{4}c$ a ton to the price of finished steel, and that it is necessary to maintain the war-born magnesite industry which produced 316,000 tons of magnesite in 1917 despite the non-existence of the industry prior to the war.

Civil Service Positions Open

The U. S. Civil Service Commission announces open competitive examinations for the following: Chief metallurgical chemist (male), \$3,000 per year; assistant chief metallurgical chemist (male), \$8.80 per day; metallurgical chemist (male and female), \$6.88 per day; assistant metallurgical chemist (male and female), \$5.12 per day. Applications must be filed with the commission on or before Nov. 25, 1919.

Also a position as transitman for men only at \$900 to \$1,200 a year, or at higher or lower entrance sal-

aries, depending upon the qualifications and duties of the appointee, who may be allowed the temporary increase of \$20 per month allowed by Congress. Applications will be received until further notice.

Applicants should apply for Form 1312 to the Civil Service Commission, Washington, D. C., stating the exact title of the examination desired.

Protective Tariff Legislation

A general anti-dumping bill, intended to protect American industry from the unloading of foreign products in American markets pending the passage of new protective tariff legislation, was introduced by Senator Smoot on Oct. 7. It is stated that this bill has the support of the Republican leaders and is designed to take the place of the pending bills for a protective tariff on dyestuffs and other "infant industries."

Canadian Reciprocity Bill

The House of Representatives on Oct. 9 voted to repeal the Canadian Reciprocity Act, without opposition. It was declared that there was no intention to act in hostile fashion toward Canada, but that all nations should be treated equally in such matters. Under the Reciprocity Act a number of products were duty free, including unmanufactured asbestos, gypsum, talc, mica, feldspar and fluorspar.

Iron Imports and Exports*

During August, 1919, there was imported to the United States 32,117 tons of iron ore, 21,991 tons of scrap iron, and 2,902 tons of pig iron; these commodities coming from Spain, Sweden, Canada, and Cuba. Pig-iron exports totaled 38,373 tons during July and 35,764 in August. Iron ore exported was 182,066 tons in July and 44,915 tons in August, the entire amounts going to Canada.

The decrease in the amount of exports during August from those in July may be attributed in part to abnormally high exchange rates now in force, which have advanced the export cost of foreign countries from 15 to 50 per cent.

Some Manganese Producers Are Still Active

The signing of the armistice resulted in a considerable decrease in the activity of manganese producers, but despite present conditions, several properties have been developed during 1919, according to W. R. Crane in a Bureau of Mines bulletin. The Superior Manganese Company reports an exceptionally promising discovery of high-grade ore at Neva, Tenn. A ten-ton electric furnace for treating this and a carbonate ore from the East Fork Mine, near Sevierville, Tenn, is being built by the Tennessee Manganese Co., of Knoxville.

Considerable activity in manganese development work is also reported in the Cuyuna range in Minnesota. Fairly large bodies of manganiferous iron ore have been developed in Eagle County, Col., and the Philipsburg district in Montana is still active.

American Mining Congress to Meet at St. Louis

Annual Convention To Be Held in November Will Consider Important Readjustment Problems—Nation-Wide Participation Desired

FOLLOWING close upon the Industrial Conference recently held in Washington, another event of national importance is approaching in the annual convention of the American Mining Congress, that is to be held at the Planter's Hotel, in St. Louis, Mo., Nov. 17-21. At this convention the officers of the congress hope to bring together all conflicting interests that enter into the nation's business, and by discussion of the various readjustment problems to determine what policies will best serve the country at this critical time.

Participation in the convention, it is announced, will be upon the following basis: The President of the United States may appoint ten delegates at large; governors of states and territories, ten delegates; state mining departments, five; county commissioners, two; mayors of cities, one for each 100,000 population, except that where the population is 100,000 or less two may be appointed; mayors and presidents of towns, two delegates; national bodies organized in behalf of commerce, mining, and oil, ten delegates, and similar state bodies, five. Presidents of state schools of mines or universities where mining is included in the curriculum may be members of the convention. Members of the American Mining Congress are likewise members of the convention. In addition to this representation, members of both houses of Congress have been invited to participate.

The subjects that are upon the general program for discussion include the proposed nationalization of industry, industrial relations, the international petroleum situation as relating to the United States and Mexico, and national "blue-sky" laws. Other subjects are those of public lands and water power, freight rates in relation to industry, and national co-operation among industries. The relation of mining to national finance, and to state and Federal governments, as well as to labor, will also be discussed. Conservation and protection of the wasting industries will be another topic to receive attention.

Problems directly relating to each division of mining will be given full discussion in divisional conferences. Separate meetings will be arranged, for which programs are being prepared, covering such subjects as pertain directly to metal mining, coal mining, petroleum, non-metalliferous substances, gold, silver, and precious metals, and oil shale. As to each of these subjects there will be discussions upon production, transportation, and exchange. The recommendations of each sectional meeting will be referred to the general committee on resolutions for final action by the whole convention.

Appointments of delegates and inquiry regarding convention plans and other matters may be addressed, it is stated, to John T. Burns, assistant secretary of American Mining Congress, Planter's

*Excerpted from "Monthly Reports on Minerals Investigations of the Bureau of Mines," September, 1919.

Hotel, St. Louis, Mo. The annual members' meeting of the congress will be held at the Planter's Hotel on Nov. 20, for the purpose of electing four directors and for transacting other business.

In conjunction with the convention will be a National Exposition of Mines and Mining, a feature of which will be an historical and educational exhibit by the U. S. Bureau of Mines, showing the history, development, and possibilities of mining in the United States. District and state exhibits will also be displayed.

American Mining Congress and the National Exposition of Mines and Mining

Sessions To Be Held in Conjunction With Machinery Exhibit in St. Louis, Nov. 15 — National Gold Conference and Meeting of War-Mineral Producers

THE National Exposition of Mines and Mining, embracing every phase of mining, including coal, metal, chemical, non-metalliferous and petroleum machinery and labor-saving appliances, will be held in the old Southern Hotel Building, St. Louis, Mo., during the week of Nov. 17, in conjunction with the American Mining Congress. The St. Louis Chamber of Commerce, the St. Louis Convention and Publicity Bureau, the Associated Industries of Missouri and the Mining Associations of Illinois and Missouri are co-operating to make the exposition one of the largest exhibits of the industry ever held in the United States. This will be the first time the American Mining Congress has attempted a comprehensive exposition in connection with the educational program of the annual convention.

Applications for exhibit space at the exposition have been received from numerous concerns situated in all parts of the country. The old Southern Hotel Building contains more than 50,000 ft. of floor space available on two floors. There will be no charge for space for actual exhibitors of any of the lines connected with the mining industry.

General sessions of the congress will be held in the Planter's Hotel. The program includes discussions by prominent statesmen and business men on the proposed nationalization of industry, industrial relations, the international petroleum situation as it relates to the United States and Mexico, national "blue-sky" laws, public lands and water power, relation of the mining industry to national finance and to labor, and other topics of interest to the industry.

Problems directly relating to each division of mining will be given full discussion in divisional conferences. Separate meetings will be held, for which programs covering such subjects as pertain to metal mining, coal mining, petroleum, non-metalliferous substances, gold, silver and precious metals and oil shale are being arranged. In the sections there will be discussions upon production, transportation and

exchange, and the recommendations of each sectional meeting will be referred to the general committee on resolutions for final action by the whole convention.

The National Gold Conference and National Conference of War-Minerals Producers will also be held during the same week.

A special program in charge of Dr. Harold N. Lawrie, gold economist of the American Mining Congress, is being arranged, but in addition to the selected speakers there will be an open forum for the presentation of all resolutions and practical suggestions which may be offered by those present.

The circular calling upon the representatives of the industry to attend the convention emphasizes the necessity of maintaining an adequate gold reserve and at the same time meeting the demands of the trade, which is apparent to both producers and financiers, but says that the impracticability of changing the present price of gold without overturning the present monetary system and affecting international relations is also apparent. The call states, further:

"The trade demands for gold in the United States during the present year, according to the best obtainable statistics, will exceed the total production of gold in this country by \$15,000,000, and next year, if the present ratio of decrease in production and increase in demand is maintained, the trade shortage will be \$20,000,000.

"The distress of the producers is reflected in all mining communities, and this unsatisfactory condition pertains not only to the United States but to all other gold-producing sections of the world."

Request for information regarding the appointment of delegates, inquiries regarding convention plans, and similar communications should be addressed to John T. Burns, assistant secretary, American Mining Congress, Planters' Hotel.

New Zinc Oxide Plant at Columbus, Ohio

The American Zinc, Lead & Smelting Co. will build this fall an extensive plant at Columbus, Ohio, for the manufacture of zinc oxide from lead-free ores shipped from the company's mines at Mascot, Tenn. Production will probably begin early in 1920. Zinc oxide is used largely in the rubber and paint industry, and the fact that Columbus is a center of these industries led to the decision to establish the plant there. Besides the mine at Mascot, the company has zinc mines at Joplin and Platteville; zinc smelters at Hillsboro and East St. Louis, Ill., and Caney, Kan., and a lead smeltery at Granby, Mo.

West African Gold Output

The gold output of Western Africa during the first six months of 1919, and for the corresponding period of 1918 and 1917, according to The Economist, was as follows:

	—Fine ounces—		
	1917	1918	1919
January	31,756	25,407	24,509
February	25,334	25,346	26,068
March	38,126	25,524	25,509
April	29,827	27,682	25,810
May	29,160	29,747	23,748
June	27,517	28,308	25,114

BY THE WAY

Lake County, Col., Wins Boundary Suit

Judge Henry J. Hersey, of the District Court of Denver, recently presided at a suit between Lake and Summit counties, Colorado, which was begun on September 23. The controversy, which was over the boundary line between the two counties, was finally decided in favor of Lake County. The Climax Molybdenum Co., owned by the American Metal Co., happens to be situated approximately on the boundary line in dispute. Lake County, by reason of the decision in its favor, is now entitled to the taxes accruing from this valuable molybdenum property.

Freedom in the Mountain Heights.

The principle of self determination has strong backing in some circles in Telluride. At least one gathers this impression as he reads the interesting columns of the San Miguel Examiner. A recent item reads: "Jack McEchern promised to beat it if he was let out of jail yesterday, so the authorities let him out, and the chances are that he will go." Another item hints that there may be some slight restriction on individual liberty at times when it says, "Kid McGovern drifted back here this week. He is under a six-months jail sentence and upon being told that it was either go back to jail or get out of town for him, he left for the Alta."—Such is life in the mining camps, or is it?

A Great Opal

If opals are unlucky, a certain one that is now being displayed in Washington must be good for a disaster. It weighs 16.95 ounces Troy, and was discovered during the war in a mine in a western state. It has been weighed by the Bureau of the Mint and displayed among other places in the private office of the Secretary of the Interior. The owners of the stone are keeping secret the place of its discovery, but advanced the opinion that the geological formation in which this gem was found occurs in Idaho, Montana and Nevada. The stone was found two years ago but has been kept in a safe deposit vault to await the return of peace and a better market for gems. Although the opal is uncut, the beauty and fire of the stone are striking. It is absolutely free from matrix and its weight expressed into carats is 2,572.

Look Before You Leap

In spite of safety-first precautions and the inculcation of principles that tend to prevent accidents, some individuals seem predestined to casualties of definite types. A group of college sophomores, putting in their first summer of actual underground experience, visited the old iron mines at Mount Hope, N. J. One task was to run a survey line through

some irregular stopes from a gloryhole to a shallow hoisting shaft. In their great zeal to display traditional sophomoric erudition some members of the party started in to cover a little extra territory. Investigation disclosed the existence of a winze, whereupon a learned discussion ensued as to the probable history and purpose of the working. Since an upward current of air persisted, it was conceded that there was a communication with some shaft or adit opening at a lower level. The Solomon of the squad offered to prove his contention that it connected with the Taylor mine by going down forthwith and meeting any or all doubters at the entrance to the Taylor. He actually had one foot poised to descend when a pessimist of Scotch ancestry restrained him by force, suggesting that some test be applied to the ladder.

A slight shaking of that relic demonstrated that dry rot may leave but little outward signs of decay, for the ladder at once crumbled to dust and was not. By all the rules of experience, the embryonic engineer had a lesson fit to last a lifetime. Either in spite of it, or through excessive caution, or else due to what a theologian might call the law of foreordination, the same engineer had his bad fall in an old mine shaft about twenty years later. Happily, though, the accident involved nothing worse than the loss of a leg.

Native Labor on the Rand

It is cheering to note that somewhere still on this globe of ours there are those that are proud to work and who by their daily toil gain social distinction. The attention of Mr. Gompers (and, incidentally, Mr. Vardaman, of Mississippi, may be interested) is directed to this Elysium. In darkest Africa these people live, as any paid agitator will tell you. For years, work on the Rand mines has been a tradition with the East Coast native, who obtains in the mines wages and conditions of employment far superior to those in his own country. A member of the Witwatersrand Native Labor Association, in testifying recently before a government commission, according to the correspondent of the Financial Times (London), said that the native is eager to come to the Rand, and the young native who has not worked on the Rand is rather looked down upon. It was, therefore, unnecessary for the association to do much toward actually inducing natives to come and work, and it rather concentrated its energies on transit facilities and good conditions of employment.

Details were given of the recruiting system by the member. Normally the association obtains 40,000 to 45,000 recruits yearly from East Coast territories, and the number employed in gold and coal mines was about 78,750. As only about 170,000 are available for work outside the territories, and the period of work is intermittent, about half the native's time being on the Rand and half at his kraal, there is little scope for appreciable increase in number of recruits. The Portuguese African, who usually works underground, constitutes 38 per cent of the underground native strength, thus forming the backbone of the industry's native labor force.

Western Canada Mining Directory and Year Book, 1919. Cloth, 6 x 9; pp. 114. Progress Publishing Co., Ltd., Vancouver, B. C., 1919.

This book is divided in sections as follows: Directory of Officials of the Canadian Department of Mines, etc.; Directory of Mines in British Columbia, Alberta (coal), Saskatchewan (coal), and Yukon, arranged alphabetically, giving names of owners, locations, etc.; Laws Affecting Mining in Western Canada; Statistics of Dividends and Stock Market; Statistics of Production; List of Mining Publications and Bibliography; Directory of Machinery and Mine-Supply Houses. The value of a directory is determined only by use; therefore, it is too early to say anything about the merits of this one, except that it appears to be well arranged, and is probably a valuable addition to the published information on western Canada.

ABSTRACTS

Oxidized Zinc Ores of Leadville, Col. By G. F. Loughlin. Pp. 91, pls. 8, figs. 7. Bull. 681, U. S. Geological Survey, Washington, D. C., 1918.

Although deposits of oxidized zinc ores at Leadville, Col., had been exposed in mine workings for many years previously, it was not until 1910 that their character and extent began to be realized. Since that year large quantities have been mined annually. Bulletin 681 begins with a review of early accounts of zinc carbonate and silicate and of the recent discovery of the orebodies. It then describes in detail the oxidized zinc ore minerals and minerals associated with them, the varieties of ore, their range in metal content, their distribution and extent, and their genesis. G. F. L.

Geology and Ore Deposits of the Yerington District, Nevada. By Adolph Knopf. Professional Paper 114. Pp. 68, pls. 5, figs. 12. U. S. Geological Survey, Washington, D. C., 1918.

The Yerington district in western Nevada is, next to Ely, the most productive copper district in the state. The oldest rocks of the district consist of andesites, keratophyres, and limestone, with subordinate shale, quartzite, and gypsum, all of Triassic age. They were intruded in post-Triassic time, probably early in the Cretaceous, by granodiorite, which was followed by quartz monzonite. These intrusions intensely metamorphosed the rocks they invaded and converted large areas into lime-silicate rock. After this metamorphism the region was cut by numerous dikes of quartz monzonite porphyry. Faulting then ensued, and along the faults ore-forming solutions arose and produced the copper deposits to which the district owes its economic importance. The Tertiary rocks, resting with marked unconformity on the Mesozoic group, are chiefly volcanic and are at least 7,000 ft. thick. They fall into three major groups, which are separated by two well-marked unconformities. The lowest subdivision consists of quartz latite, rhyolite, and andesite breccia; and it is probably the correlative of the Esmeralda formation of Upper Miocene age. The middle subdivision consists of andesite flows resting in places on the eroded edges of the rhyolites. The uppermost subdivision consists of subangular conglomerate overlain by basalt. The principal ore bodies consist of pyrite and chalcocypite in a gangue of pyroxene, garnet, and epidote. They are replacement deposits of limestone developed along fault zones and are of the contact-metamorphic type. The primary ore is essentially unenriched by later sulphides. The average tenor of the ore mined has ranged from 2.75 to 6 per cent of copper. A. K.

PERSONALS

Herbert C. Hoover is in California. Charles S. Haley is now at Farmingdale, N. J.

Jay A. Carpenter was recently in Randsburg, Cal., on mine examination work.

S. J. Speak, of Hooper, Speak & Co., London, has been in San Francisco and is now at Trail, B. C.

G. L. Sheldon is returning to Denver from a month's professional work in Nevada, California and Montana.

H. D. Budelman, superintendent of the West End Consolidated, has returned to Tonopah from a trip through Siskiyou County, California.

F. M. Van Tuyl of the Malm-Wolf Co., made an examination of oil properties near Douglas, Wyo., for Wyoming interests during October.

W. J. Johnson, of New York, is at the New King of Arizona mine, seventy miles northeast of Yuma, Ariz., where he is developing water for milling needs.

W. P. Harlow, of Boulder, Col., accompanied by George Teal, consulting engineer, was recently in Jerome, Ariz., where he is interested in a number of properties.

Lyman F. Barber, until recently mill superintendent for the Black Diamond Co., at Walker, Ariz., has taken charge of the mill of the Swansea Lease, Inc., at Swansea, Ariz.

Robert E. Vinson, of the University of Arizona, has been making an investigation of the effects of the smoke of the United Verde smeltery on the surrounding vegetation.

Major Paul B. Davis, of New York, formerly of Organ, N. M., lately in France with the engineers, will open offices in El Paso, Texas, for the practice of mining engineering.

Dudley Dean, secretary and treasurer of Keweenaw Association, spent several days during the week of October 13 on the Gogebic Range, inspecting the mines owned by the association.

Sydney H. Ball, of the firm of Rogers, Mayer & Ball, has been made a chevalier of the Belgian Order of the Lion, in recognition of his work in developing the mining industry of the Belgian Congo.

H. H. Bellamy, a representative of the Sandavol Zinc Co., of Chicago, has been in the North Arkansas zinc field for several days, investigating the ore deposits of the field and buying carbonate concentrates.

Edward W. Berry and Joseph T. Singlewald, Jr., of the Department of

Geology, Johns Hopkins University, have returned from a trip of six months to Peru, Bolivia and Chile, made through the George Huntington Williams Memorial fund.

Charles Eugene Schneider, head of Schneider & Co., Creuzot, France, is a member of the French economic mission, which, along with similar missions from Great Britain, Belgium and Italy, will visit New York to inform the American public of the economic situation of Europe and advocate financial co-operation between the powers during the period of reconstruction.

G. H. Clevenger, vice-chairman and acting officer of the Engineering Division of the National Research Council, with office in New York, has given up his active supervision of the work of the council and will leave soon to fulfill a professional engagement in Mexico. Upon his return, some months hence, he will open an office in New York as consulting engineer, specializing in metallurgical lines.

R. B. Moore has been designated to succeed Charles L. Parsons as chief chemist of the Bureau of Mines. For several years Mr. Moore has been in charge of the Mining Experiment Station of the Bureau at Golden, Col., and he also was in direct charge of the radium work done by the Bureau. Mr. Moore will be succeeded at Golden by S. C. Lind, who has been serving at that station as physical chemist.

OBITUARY

James H. Conrad died at his home in Oakland, Cal., in the early part of October. Mr. Conrad was at the head of the famous Malakoff property at North Bloomfield, where he made his home for many years. He came to California from Pennsylvania in 1858 and served in the army during the Civil War. Following the decline of hydraulic mining, he was employed by an English syndicate to direct hydraulic operations in various parts of the world, but returned at intervals to North Bloomfield.

MINING SCHOOLS

Camborne School of Metalliferous Mining has secured the services of J. G. Lawn as acting principal and to conduct the mining classes until the governors find an engineer who can accept a permanent position. H. W. Hutchin has been appointed lecturer on assay-

ing, taking the position formerly occupied by the late J. J. Beringer. Mr. Hutchin will continue some portion of his private practice, particularly his work for South Crofty.

INDUSTRIAL NEWS

Arthur M. Loeb & Co., Lima, Peru, desire to communicate with manufacturers of all kinds of mining and railroad equipment for the purpose of securing their exclusive agencies in Peru.

The Merchants' Association of New York has issued its year book for 1919, containing reports of the president and various bureaus, list of members and the rules and regulations governing the members' council.

Stewart & Holmes Drug Co., Seattle, Wash., will move about Jan. 1, 1920, to their new building, corner Occidental Ave. and King St. The assay and chemical supply department which has heretofore been in a separate building, will occupy the fourth floor.

E. V. Peters, general sales manager of the New Jersey Zinc Co., New York, left on October 10 for the West, to be gone a month on a business survey. Mr. Peters is accompanied by R. M. Neumann, manager of Western sales, with headquarters in Chicago. During their trip they will inspect various distributing warehouses which the company has established. Messrs. Peters and Neumann will visit, among other cities, Denver, San Francisco, Los Angeles, Portland, Ore., and Seattle.

National Foreign Trade Convention will be held at San Francisco, Cal., May 15-20, 1920. American firms represented at previous conventions have been requested to have their representatives, living or traveling abroad, time their visits to this country so as to take advantage of the opportunities afforded by this convention. Three special steamers, chartered for the accommodation of delegates from abroad, will be provided for the ports on the Pacific Ocean. Another steamer starting from New York, will go by way of the Panama Canal. Information regarding details of sailing and the program will be furnished by O. K. Davis, secretary, No. 1 Hanover Square, New York.

The Morse Bros. Machinery and Supply Co., of Denver, Col., is dismantling the Argentine and Grays Peak R. R. This road runs from Silver Plume, Col., to the summit of Mount McClellan, 14,000 feet elevation. It was equipped with 40-pound steel rails and

gasoline Shay locomotives. All of the material is being brought to Denver for resale. This company is also dismantling the Jerry Johnson 100-ton cyanide mill at Cripple Creek, erected in 1914. It was equipped with Dorr thickeners, agitators, classifiers and Olive filters. The material is also being shipped to Denver for resale. The 500-ton concentrator and 250-ton copper smeltery of the Penn-Wyoming Co. at Encampment, Wyo., is also being dismantled by the Morse Company. The 1½-mile Leschen tramway is also being prepared for shipment. This tramway was built in four sections of four miles each, and is available for immediate use. Over 96 miles of wire rope, 925 buckets, 196 towers, and tension stations, with complete terminal irons, make up the equipment. This was said to be the longest successful tramway in the world.

SOCIETIES

The Teknik Club, Denver, Col., held a dinner on October 13, which was followed by a program with addresses by Albert C. Crehore, on "Constants of the Ether," and Jay Lonergan on "Selling in China."

Canadian Mining Institute will hold the annual meeting in Vancouver on November 26, 27 and 28. E. T. Hodge, professor of geology at the British Columbia University, has been appointed general secretary.

Colorado Scientific Society held its regular meeting on Oct. 11, 1919, in Denver, Col. Captain Harry G. Burrows, Engineers Corps, addressed the meeting on "Engineering Construction in France During the War."

American Institute of Electrical Engineers and the American Physical Society held a meeting October 10 and 11, 1919, in Philadelphia. The present status of theories of atomic structure was one of the subjects discussed.

California Metal Producers' Association will change its name at the annual meeting of the Association, Oct. 22, 1919, to "California Metal and Mineral Producers' Association." The offices of this association are at 625 Market St., San Francisco, Cal.

American Welding Society, 33 West 39th St., will hold a meeting on Oct. 24 at the Engineering Societies Building. The program is as follows: Address, by C. A. Adams; "A Theory of Metallic Arc Welding," R. G. Hudson; "Repairing a Lighthouse," J. H. Deppler; "Gas Welding During the War," H. S. Smith; "Gas Cutting," F. E. Rogers; "Electric Resistance Welding,"

P. T. Van Bibber. A moving picture, "Repairing the Northern Pacific," will conclude the meeting. J. H. Deppler of the Metal & Thermit Corporation has been elected a vice president of the American Welding Society, and P. F. Willis, president of the Henderson-Willis Welding & Cutting Co., has been elected a director of the society.

TRADE CATALOGS

Electric Hoists. Victor R. Browning and Co., Cleveland, Ohio. Pamphlet; 8½x11; 8 pp.; illus. Describes electric hoists built for general purposes, with details of various parts.

Suspension Baffle Walls. Kefauver and Kenney, Baltimore, Md. Pamphlet, 8½x11; 4 pp.; illus. Describes the application of suspension baffle walls for steam locomotives, with advantages claimed for this type.

Lea-Courtenay Co. of Newark, N. J., has recently issued two bulletins, Nos. H 4 and S 5. The first is a treatise on centrifugal pumps as well as a catalog of the company's most complete line, and the other is a synopsis of typical centrifugal pumps installed in various industries.

The Stowe Stoker. Laclede-Christy, St. Louis. Catalog, 7x10; 16 pp.; illus. Describes the Stowe Stoker, a new automatic type, for which is claimed an increased capacity and economy. A discussion of combustion problems with the effects of various factors is included.

C-H Rectangular Magnets. The Cutler Hammer Manufacturing Co., Milwaukee and New York. Pamphlet; 8½x11; 8pp.; illus. Descriptive of magnets adapted for handling regular shapes in steel and iron, including billets, slabs, round and square bars, pipe, and steel plate.

Stamp Mills. Allis Chalmers Manufacturing Co., Milwaukee, Wis. Bulletin No. 1432 C; 8x10½; 52 pp.; illus. Describes stamp mills and accessory machinery for free-milling gold ores. A set of specifications for a ten-stamp mill with estimates of materials and supplies for one month's run, is included.

Material-Handling Machinery. The Osgood Co., Marion, Ohio; 8½x11; 32 pp.; illustrated. Describes steam shovels, cranes, clamshell outfits, and dredges manufactured by the company. The shovels are built in two types, the revolving, Nos. 18 and 29, carrying a ¾-yard and 1-yard dipper, respectively, and the Standard Railroad, Nos. 43 and 120, carrying a 1½-yard and a 6-yard dipper.

NEW PATENTS

U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 5c. each.

Gases—Treatment of Gases Containing Sulphur Dioxide. Edward Victor Espenhahn. (1,315,183; Sept. 2, 1919.)

Gold-Washing Apparatus. John H. Fellows. (1,316,835; Sept. 23, 1919.)

Grizzly—Roller Grizzly. Leo Finger. (1,313,011; Aug. 12, 1919.)

Ingot Molds, Antipinging, Means For. John Brunner. (1,315,944; Sept. 16, 1919.)

Jigging Apparatus and Process. William C. Prickett. (1,315,407; Sept. 9, 1919.)

Leaching—Process of Treating Copper Ores by Lixivation with an SO₂ Solution. Niels C. Christensen, assignor to Metallurgic Improvement Corporation. (1,316,351; Sept. 16, 1919.)

Lime—Method of Producing Lime. Arthur S. Dwight and Richard Lewis Lloyd, assignors to Dwight & Lloyd Metallurgical Co. (1,315,952; Sept. 16, 1919.)

Magnesium—Process of Producing Alkali-Earth Metals. Warren F. Bleecker and Walter L. Morrison, assignors to Electric Reduction Co. (1,311,378; 1,311,379; and 1,311,380; July 29, 1919.)

Melting Metals, Art Of. William H. Bristol, assignor to The Bristol Co. (1,315,206; Sept. 9, 1919.)

Mine Water—Process of Treating Mine Water and Product Thereof. Addison F. Hoffman. (1,315,836; Sept. 9, 1919.)

Nitrogen—Apparatus for Fixation of Atmospheric Nitrogen. James Simpson Island. (1,316,445; Sept. 16, 1919.)

Platinum Metals—Process of Recovering. William C. Furguson, assignor to Nichols Copper Co. (1,315,660; Sept. 9, 1919.)

Powdered Coal—Apparatus for Burning. Aubrey J. Grindle, assignor to Combustion Economy Corp. (1,315,719; Sept. 9, 1919.)

Pulverized Coal—Combustion Process and Apparatus for Practicing the Same. Ulisses A. Garred, assignor to Garred-Cavers Corporation. (1,311,807; July 29, 1919.)

Roasting—Method of and Apparatus for the Heat Treatment of Finely-Divided Materials. Francis O. Blackwell and Nathaniel H. Emmons, 2d. (1,315,460; Sept. 9, 1919.)

Screen. Frank E. Johnson, assignor to American Manganese Steel Co. (1,312,545; Aug. 12, 1919.)

THE MINING NEWS

New York, October 18, 1919

Comstock Lode to be Diamond Drilled

Diamond drilling is to be employed on the Comstock lode at Virginia City, Nev., to prospect the ground below the Sutro tunnel, which is 1,640 ft. below the surface. The work will be done by the Middle Mines Association, together with various Eastern interests. H. L. Slosson, Jr., president of the Association, is quoted as saying, "People in the East have taken control of the Savage, Chollar and Gould & Curry mines, which mines have produced above the Sutro tunnel (1,640 level) over \$55,000,000. The Best & Belcher is to co-operate with them in the plan and the Potosi company has agreed to exploration proposed. No work of any

of C. H. Hitchcock. The option on this tract has recently been extended and drilling will be continued. The work is said to have disclosed bodies of hematite ore. The Little Long Lake iron lands on the same range have recently been examined by J. C. Murray. These lands are owned principally by H. E. Knobel and John W. Wolvin, of Port Arthur.

Conditions Good in Grass Valley District, California

Labor disturbances in the Grass Valley district of California are believed to be over. The conservative element among the miners is in control and any further difficulty is confidently expected to be improbable or, if it arises, to per-

as low as \$35 per month and a single miner can save \$50 per month from his wage of from \$100 to \$120 per month. With this surplus they are inclined to lay-off when they have accumulated a small stake. The result of this tendency is to bring the requirement for the number of miners of this class up to double the normal number.

There is encouraging activity in the district. Both the Empire and the North Star mines are recovering rapidly from the effects of the unfortunate strike. At the Idaho-Maryland unwatering operations are proceeding rapidly and a second air compressor is being installed. Other properties are also operating. The Banner properties on Banner Mountain are reported to have been purchased and added to the holdings of the Central Consolidated Mining Co.

Gold Rush to Hampton Plains

Recent Discovery in Western Australia Drawing Many Present Indications Promising

The facts relating to important gold finds in Western Australia during the last summer are given by the following dispatch from the Premier at Perth, W. A., to J. D. Connolly, Agent General for Western Australia:

"In June this year party prospectors found large ore formation on Block 50, freehold property, held by Hampton Properties, Ltd., situated 22 miles south of Kalgoorlie. Shaft sinking disclosed lode formation 25 ft. wide and ore channel can be traced north and south for considerable distance. Country rock is similar to the Boulder belt. Formation is oxidized to depth of 60 ft., composed of ferruginous quartz and soft lode formation and assays high values. If developments continue as at present, it is one of the most important auriferous developments found for many years.

"About half-mile eastward another ore formation has been disclosed showing visible gold. Surface indications of ore are good, but developments are necessary before anything definite can be said. A considerable number of leases have been taken up."

During September the Hampton Properties issued 268 mining licenses and received application for 170 leases. Little is being done, it is said, pending completion of the survey.

VIEW SHOWING SURFACE PLANT OF THE UNION MINE, COMSTOCK LODGE, VIRGINIA CITY, NEVADA

character has been done between the Sutro tunnel level and the 2,300 level. The combination shaft controlled by these companies is now open to the Sutro tunnel level and for some distance below. We have during the last 90 days equipped it with electric hoist and air compressor, new cables, etc., and are now carrying down air pipe to operate the diamond drill at the tunnel level."

Drilling in Northern Ontario for Iron Ore

The Leitch iron ore lands east of Lake Nipigon in northern Ontario are being diamond drilled by Smith & Travers, of Sudbury, Ont., for American interests. This work is in charge

of settlement without a strike. A secret ballot has been inaugurated in the unions and as a consequence the vote on questions affecting the welfare of the men more adequately represents the thought of the workers. A careful observer familiar with the facts said that the strike would not have occurred if the secret ballot had been in use. More than half of the miners employed are men of family who have worked for the companies under favorable wage and living conditions for a long time. The unmarried miners and the drifters who are necessary to complete the complement of workers at the various properties constitute the real problem. The high cost of living has not affected them since board and lodging is

Strike Settled at Tonopah and Divide

After considerable delay and much uncertainty the labor difficulties of the Tonopah and Divide districts have been settled and work has been resumed at a number of properties. It will take some time before operations become normal, for many of the best miners and skilled mechanics have gone to other localities and some will remain away permanently. It is largely due to the efforts of Governor Boyle that the difficulty was finally adjusted. To prevent further interference with the workmen who are returning to their work an injunction has been issued by Judge Averill of the local Nevada court restraining certain persons connected with the I. W. W. and such other persons who may be associated with them from interfering with miners or from claiming that any authorized strike is in course at Tonopah and Divide. The order prevents any interference of whatever nature with the workmen.

Globe-Miami District to Have "Safety First Week"

The Mine Rescue and First Aid Association of the Globe-Miami district, in Arizona, has undertaken a crusade to promote the safety of the community. To this end the week of Oct. 19 to 25 has been set aside as "Safety First Week" and the aid of all civil and industrial departments in the district has been asked in making the thing a success. It is planned to carry out the Association's program by means of proclamations by the Mayors of Globe and Miami, by four-minute talks to school pupils by their teachers, and by similar talks in theatres and to men as they go on shift in the various plants. The district has been placarded with "safety-first" mottoes and the support of newspapers and local merchants obtained.

New Cornelia Plans Future Construction

The plans of the New Cornelia Copper Co. have been definitely outlined by J. C. Greenway, general manager. The 500-ton mill is working well, but the experimental work may have to be continued for about ten months, which is considered sufficiently long to determine the best methods to adopt for concentrating the local ore. A 5,000-ton concentrator will then be built and may be in operation within three years. It is estimated that with a daily demand for 5,000 tons of ore, the surface carbonates and oxides will last from six to eight years. They will be taken out by steam shovels and reduced in the leach-

ing pits. By the end of this period a second 5,000-ton flotation unit will probably be in operation, thus continuing a daily draft on the mines for 10,000 tons of ore. Much of the sulphide for the mill yet is to be uncovered by the shovels working on the carbonates, though even now a large sulphide supply is available through development in nearby ground acquired by the company. The sulphides are richer than the surface ores, so concentration will give much larger bullion returns.

It is planned also to establish a smeltery, probably of reverberatory type. It is possible that the bullion also will be

MAIN SHAFT, TONOPAH-BELMONT DEVELOPMENT CO., TONOPAH, NEV.

refined at Ajo, to save transportation costs. The necessary sulphuric acid can be obtained, as it is now, from the Calumet & Arizona acid works at Douglas.

Homestake Fire Still Burning

The fire in the Homestake mine, at Lead, S. D., which started on Sept. 25, as reported in the last issue, broke out when miners blasted down a timbered raise on the 800 level. Water was turned in from the 600 and 700 levels and for a week the blaze was confined to the stope where it began. Openings were driven on the upper levels for water lines. The fire could not be reached from the 800 level and all openings leading from the burning stope were bratticed off to confine the gas. On Oct. 2 the fire reached the 700 level and on Oct. 4 it was decided to flood the workings to the 600 level. All machinery from lower levels was hoisted and all mine work suspended. All mills were also shut down owing to the need of all available water. Flooding to the 600 level will probably take about five weeks. Suitable work will be found by the company for all

employees during the temporary shut down of mine and mills. The fire continues to burn between the 700 and 600 levels.

During the fire in the same mine in April, 1907, it required 47 days to fill from the 1,550 level to the 200 level, and took 622,257,232 gals. of water. Today the mine is over 2,000 ft. deep, but the lower levels have not been opened to any great extent. If the fire can be held below the 600 level it should not take as long to fill the mine as it did in 1907. The 600 level and those above are larger than those below. Another advantage of keeping the fire below the 600 is that work can be resumed immediately after the fire is extinguished.

Labor Quiet on Mesabi Range

Steel Strike Fails to Close Down Mines—Some Men Out at Ely From Other Causes

The steel strike has thus far been absolutely devoid of direct results in closing down even one iron ore mine on any of the Minnesota ranges. Because of vessel congestion at lower lake ports many operators have been forced to mark time for two or three shifts out of each week since the strike was called, while others have been able to revise their schedules and put excess steam shovels to work stripping and doing other dead work around the pits while awaiting the return to normal conditions. A small strike of purely local nature has interfered with the operation of Chandler mine at Ely on the Vermilion Range, two foreign elements disagreeing on the desirability of a certain boss and leaving the operator in the position of facing a strike regardless of the course he might choose. Though short handed the mine has continued to operate. The striking element have continued to strike in spite of efforts toward conciliation by townspeople and officials, and have now increased the demands to include those championed by the I. W. W. in 1916; namely, the abolition of the contract system with a minimum of \$6 per eight-hour day. The trouble has also spread and the Sibley, Zenith and Pioneer mines are now closed down. Radical agitators are infesting all mining camps on the Mesabi Range, but are making no headway.

New Baltic and New Arcadian Companies Consolidate

A merger of the New Baltic and New Arcadian Copper companies has been effected. Shareholders unanimously approved the plan at a meeting held in Houghton, Mich., on Oct. 7. The new company will be known as the Arcadian Consolidated. Assessment will be avoided by leaving 43,000 shares in

the treasury to be marketed. Exploration results in the Baltic shaft were said to be promising at the time operations were suspended.

Seneca Buys Mill Site

The Seneca Mining Co. has purchased a mill site from Calumet & Hecla on the shore of Lake Superior. The site consists of 340 acres just west of the town of Eagle River, in Keweenaw County, Mich. This road will be down grade practically all the way to the mill. Underground, the showing continues good. Shaft sinking has been resumed. The lateral work on the first level, comprising 450 ft., has been completed to the boundaries. Second level lateral work has been under way since Oct. 1.

Representatives of Arizona at St. Louis Convention

The following named have been appointed by Governor Campbell to represent Arizona at the session of the American Mining Congress at St. Louis Nov. 17 to 21: A. T. Thomson, Douglas; F. W. MacLennan, Globe; Norman Carmichael, Clifton; M. Curley, Ajo; J. Kruttschnitt, Jr., Tucson; W. C. Browning, Superior; G. M. Colvocoreses, Humboldt; J. A. Burgess, Oatman; Ezra W. Thayer, Phoenix, and W. B. Marvin, Yuma.

Boulder, Colo., Association Formed To Help Prospectors

Grubstaking of prospectors is the object of the Gold Mining & Improvement Association recently organized at

Boulder, Col. The officers of the Association are James M. Platt, president; C. M. Pruden, vice president; Moses Hoover, treasurer, and Delia Mulford, secretary. The other directors are W. G. Houston, Charles M. Keith, John H. Du Bois and Mary N. Morehouse.

Canadian Geological Research

Dominion Geological Survey Work In British Columbia Covers Extensive Territory

In the course of its work during the last summer the Dominion Geological Survey had several parties at work in various districts of British Columbia. One party, in charge of J. J. O'Neill, who was geologist with the Stefansson Arctic expedition, covered the Salmon River district at the head of Portland Canal. In this district is the Premier mine as well as the Big Missouri group and other prospects of promise. The Cariboo country was covered by the party of B. R. McKay, who is making a geological survey of the placer gold deposits. A party in charge of L. Reinecke worked the section lying along the Pacific Great Eastern Ry. between Clinton and Quesnel. The soda lakes of this area will be made the subject of a special examination by Mr. Reinecke. The Slocan district was covered by M. F. Bancroft, who is completing a geological survey of the district which was begun years ago and was almost completed by the late O. E. Le Roy.

V. Dolmage with his party was engaged in surveying the west coast of Vancouver Island. The Britannia area

along Howe Sound was covered by S. J. Scholfield, who is making a detailed examination of the district. In the Bridge River country, S. C. McCann is preparing a geological map and is comparing the geology of the district with that of the Grass Valley district of California. Charles Camsell, who is in general charge of the Survey's work in British Columbia, spent a few weeks in the Coquihalla River section examining the district.

Concentrator for Rossland, B. C.

Consolidated Company Decides to Erect Plant—May Also Build Mill At Kimberley

At a joint meeting between the officials of the Consolidated Mining & Smelting Co. of Canada and those of the city of Rossland, B. C., on Sept. 27, arrangements were practically concluded by which the company will build a 5,000-ton concentrator in Rossland city. Sufficient water has been assured, and the company has placed its engineering staff at the city's disposal in order to expedite the preliminary work. S. G. Blaylock, general manager of the company, announced that, now that a water supply was assured, he was anxious to get the building roofed before the snow came. Construction is to be of reinforced concrete, and the roof will be of sheet zinc supported on steel rafters. It is expected that the plant will be in operation within a year. There is also a persistent rumor that the same company will build a 10,000-ton concentrator at Kimberley, where the Sullivan mine, its largest producer, is situated.

PROGRESS OF MINING OPERATIONS

Important Events of Interest
Condensed and Classified
for Easy Reference

ARIZONA

Graham County

Arizona Leasing (Klondyke)—Company organized to take over Grand Reef and some other groups in Klondyke district. Active development soon will be under way on principal properties.

Mohave County

Cerbat Tunnel surveyed into mountain three miles. Geological and mineralogical survey of district now in progress.

Placer Ground near Colorado River to be handled by dry washing plant which is to be installed by H. L. Harris.

Chloride Queen (Chloride)—Working steadily on Silver Mountain and Sun-

day School groups. Double-compartment shaft sunk to 256 ft., with 320-ft. drift on 200 level. Ore generally is high-grade silver.

Golconda (Chloride)—New mechanical equipment being installed by Highland Mining Co.

Hidden Treasure (Chloride)—Chloride Mining Co. is clearing out old workings.

Memphis (Chloride)—Taken over by Dardanelles Mining Co. from Miss Anna Durkee, of New York.

Schenectady (Chloride)—Sold to J. McMillan and associates; will unwater and start development at once.

Steffy (Chloride)—Foreclosed to Thompson-Dudley Machinery Co. Machinery, including mill, will be sold.

Arizona Butte (Kingman)—Starting work on big tunnel at Stockton Hill, with full equipment necessary.

Bunker Hill (Kingman)—Property, east of Cerbat, taken over from John Mulligan by H. E. Smith. Vein, cropping for 700 ft., runs high in silver.

Cleopatra (Kingman)—Property near Bill Williams Fork reported to have developed 200,000 tons of copper ore of good grade. Inspection lately made by representative of Humboldt Smelter.

McKesson (Kingman)—Machinery from Tipperary mine at Oatman being transferred to its property near Wallapai.

Pawva (Kingman)—Purchased and will operate Last Chance mill on ore from 180 level. G. W. Gibson in charge.

Senate Silver (Hackberry)—Sinking inclined shaft and drifting from 200 level.

United American (Kingman)—Work resumed with full crew. Shaft to be sunk within 90 days to 500 ft., where drifting will be started. W. K. Ridenour, president, at the camp.

Pima County

New Cornelia (Ajo)—September production of copper 3,898,000 lb., comprising 3,092,000 lb. cathodes, 334,000 lb. smelting ore, and 472,000 lb. cement copper.

El Tiro (Silver Bell)—Fair grade copper ore shipped regularly to Hayden smeltery. Produced 500,000 lbs. since July 1, repaid all development and rehabilitation costs and has treasury balance. Has exceptional railway facilities and good electric equipment. Percy Williams, manager.

Arizona-Tucson (Tucson)—Sinking 2-compartment shaft on the property, in Amole district, 8 miles south of Tucson.

Dawson Metallurgical (Tucson)—Has completed 85-ton Dawson-type furnace near Narragansett mine, in Rosemont district, 42 miles southwest of Tucson. W. A. Doyle, president, in charge.

Mina Mexicana (Tucson)—Taken over by the Suffern Company, of New York, which has started development.

Yavapai County

Jerome Superior (Jerome)—Below 700 ft., shaft cut 4-in. streak of brown hematite, considered encouraging sign. Hoisting 140,000 gals. a day. George Mitchell, general manager.

Tuscumbia (Jerome)—Old Tuscumbia mine in northern slope of Bradshaws about 4 miles from famous Peck mine, taken over under lease and bond by George Kingdon and others. About one month was spent in sampling. Large force has been employed and new camp built. In early days Tuscumbia had remarkable record of production and its bullion output exceeded that of its neighbor, the Peck.

Copper Queen Gold (Mayer)—Will build 100-ton flotation mill; contract let to Kennard & Bierce, of Los Angeles.

Henrietta (Mayer)—Installing electric hoist for sinking from main tunnel.

Silver Belt (Prescott)—First carload shipped to El Paso from 250 level, netted \$5,000. Company will sink from old workings on 3-ft. vein of high-grade ore. Ben Rybon in charge.

CALIFORNIA

El Dorado County

Pacific Deep Gravel (Placerville)—Six hundred acres seventeen miles east on Lincoln Highway, sold by J. H. Zimmerman of Placerville, to J. E. Sexton, Eugene Davis and others, of Eureka and New York. Development includes old 400-ft. cross-cut tunnel and air-shaft; will drive new cross-cut at deeper level. Fifteen men at work. Will Christian in charge.

Placerville seriously threatened by encircling forest fires on Sept. 24. Buildings on Poverty Point and Baring Gould properties were burned down.

Kern County

California Rand Silver (Randsburg)—Dividend of \$96,000 declared. Former sheriff J. W. Kelly, president.

Nevada County

Allison Ranch (Grass Valley)—Mill being operated eight hours per day only, on account of scarcity of profitable ore. Consolidated Mines Co. driving development drifts east and west of shaft and hope to cut Hartery and Omaha ledges.

COLORADO

Boulder County

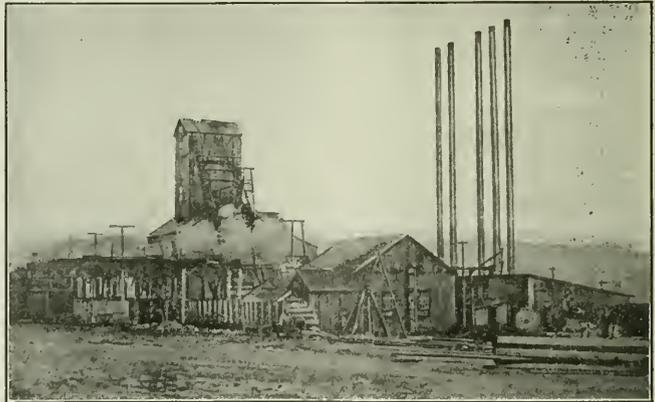

Golden Eagle (Boulder)—Property in Argo tunnel bonded to Eastern interests. Much work done in retimbering, catching up caved ground and driving raises and skipways. Large tonnage expected from tunnel and upper levels. Al Weinberger, general manager, and T. D. McGuire, superintendent.

Eagle County

Horse Mountain M. & M. (Eagle)—Company in Fulford Mining District, 70 miles from Eagle, operating Lady Bell group. About 175 cars of high-grade gold-silver ore was shipped, in removing of which a large body of low-grade ore was developed. Now planned to build mill. J. O. Kempf, president; John Welsh, vice president; S. A. Mock, secretary-treasurer.

Gilpin County

Ottawa Group (Alice)—Property 10 miles north of Idaho Springs, consisting of 8 lode claims and mill-site, purchased for \$50,000 from John F. Kaminky, by newly organized Roosevelt Mining & Milling Co., composed of five business men of Newark, N. J.

SURFACE PLANT OF WOLFTONE MINE, LEADVILLE, COL.

Idaho-Maryland (Grass Valley)—Test run made for unwatering 1,000-ft. vertical shaft. Pumping will be done with old electric-driven Cornish pump formerly used.

Cold Springs and Buckeye group of claims in Willow Valley sold by W. G. Motley of San Francisco to Mrs. L. M. Hoge of Nevada City. Buckeye hoisting plant and Cold Spring mill included. Hoge interests driving long tunnel to tap quartz veins and gravel, and erecting 15-stamp mill near tunnel mouth.

Plumas County

Engels Copper (Engelmine)—Company's Superior mine showing high-grade average ore.

Developed by 2,200-ft. tunnel; 20 men employed. Nathan Shapiro in charge.

Gunnison County

Ruby Consolidated Silver (Irwin)—Company with property two miles off Crested Butte Branch Railroad has set aside \$30,000 for development.

Pitkin County

Ethiopian (Quartz)—Operations suspended owing to poor market. Has 4-ft. vein of high-grade amorphous-graphite.

San Juan County

Valley View Leasing (Telluride)—Constructing mill to treat ores from San Bernardino group which it is operating under lease.

MICHIGAN Copper District

Champion (Painesdale)—Maintaining tonnage of ore running 40 lb. per ton refined copper. Baltic and Trimountain mines of same group making better than 32 lb. average.

Mass Cons. (Rockland)—Now shipping 500 tons daily and plans further increase in output. September ore shipments totaled 14,000 tons.

Gogebic Range

Norrie-Aurora (Ironwood)—New locomotive crane with long boom and clamshell in use on coal docks to spread coal away from dock. Former practice of Lake Superior mines of storing part of winter coal supply in railroad ore cars is no longer permitted by R. R. Administration.

Pabst (Ironwood)—"H" shaft crosscut on 24th level cut through footwall into ore 966 ft. north of shaft on Oct. 1. In last two months crosscut was driven 441 ft. in slates; 8x15-ft. heading, three shifts, six men each, with mucking machine and five drills. Considerable time lost because of powder gas, no ventilating system used.

Puritan (Puritan)—Miner buried and suffocated Oct. 11 on 70 ft. sub. of 14th level. Piece of capping rock fell in stope and caused run of ore.

Morgan (Wakefield)—Being developed with force of 25 or 30 men. Railroad not yet in, and all ore hoisted has to be stocked. Property farthest east of operating mines of the range. Ore-body tested by extensive drilling before development was begun. Operated by Thomas Furnace Co., of Milwaukee, who can handle siliceous ores found on this property.

Marquette Range

Barnes-Hecker (Ishpeming)—Armstrong loader installed underground; first on Marquette range.

South Jackson (Negaunee)—Pit loading suspended for season. Never operates during winter.

Menominee Range

Oliver Iron (Stambaugh)—Dober mine ceased shipping for season.

Pickands, Mather (Iron River)—Shipments stopped from James, Balkan, James, Caspian, Bengal, Fogarty and Baltic mines. Balkan only property to reduce force. Stocking room scarce at Balkan.

McKinney Steel (Crystal Falls)—Dunn, Tobin and Odgers mines are idle. Probably will not resume until spring.

Amasa-Porter (Amasa)—Ore now being hoisted and stocked.

MINNESOTA

Cuyuna Range

Northland (Cuyuna)—Developing and stockpiling manganiferous ore.

Mahnomen (Ironton)—Has been shipping special manganiferous ore all rail to an interior furnace. Ore assayed high 28 per cent manganese and 29 per cent iron, or a combined content of 57 per cent dried.

Thompson (Ironton)—Inland Steel Co. is relinquishing Haley-Keating lease, operated since 1913, as property is exhausted. Equipment and plant will be used in mining the SW. ¼ of SE. ¼ of Section 2-46-29, a State lease known as the North Thompson, which was stripped two years ago and has been operated as an open pit.

Whitmarsh Mining Co. (Ironton)—Closed down both its mines, Martin and Huntington. About 25,000 tons in stockpile at each property. Will allow mines to fill with water.

Sagamore (Riverton)—Stripping contract completed. Winston-Dear Co. loading ore in pit. Will ship 100,000 tons manganiferous ore this season. Experimental washing in Rowe washing plant is giving excellent results in eliminating excess fines and moisture.

Huntington (Sec. 9-46-29)—Reduces force temporarily awaiting more favorable turn of market. Whitmarsh Mining Co., operators.

Joan No. 4 (Trommald)—Shaft of this manganiferous property of Marcus L. Fay, which has been closed down since December, 1918, mysteriously caved and disappeared from view on night of September 30.

Omaha (Woodrow)—Miners' strike adjusted; underground operation resumed. Drying plant shut down for repairs. Eighteen gangs one shift in straight shipping ore. Installing auxiliary electric hoist. Omaha Iron Co., Chicago, operators.

Mesabi Range

Wisconsin Steel (Chisholm)—Subsidiary of International Harvester Co. has begun developing underground mine, including three forties in NW. ¼ of Section 27-58-20. Property leased from Great Northern, reported to contain 10,000,000 deposit. C. R. Emerson, local superintendent.

Jean (Eveleth)—Small underground mine of Kingston Mining Co. worked out. Total shipment, 109,139 tons since opening in 1916.

Oliver Iron (Eveleth)—Will build 100 residences and one modern flat building; at Hibbing, 19 residences and one flat building; Coleraine, 32 residences; Eveleth, 25 residences; Ely, 24 residences. Call for bids on 140-room hotel to be erected in new addition to Hibbing.

West Adams (Eveleth)—Fault Mining Co. operating small revolving shovel stripping old caves. Expect to recover large tonnage of high-grade lost through earlier careless methods.

MISSOURI

Newton County

Heaton-Hodges (Granby)—First of two shafts started in 1918 now 17 ft. into ore revealed at 230 to 250 ft. by diamond drilling of Trentland. Runs better in lead and zinc than drillings indicated. Charles O. Hodges, of Dallas, Tex., president. This will be the first producer in new district. Several other companies have started shafts.

MONTANA

Beaverhead County

Boston and Montana Development (Wise River)—Line of Montana Southern Ry., proposed as outlet for ores of Elkhorn mines, will be completed to these properties about the middle or latter part of this month, according to local office of Boston & Montana.

Silver Bow County

Butte-Bullwhacker (Butte)—Tonnage shipped to Anaconda's leaching plant being increased to more than 100 daily.

Butte-Duluth Copper (Butte)—Grade of about 2 per cent copper being maintained in shipments to the Washoe reduction works.

Butte and Superior (Butte)—Development program for Butte-New York territory adjoining Black Rock mine, controlled by Butte & Superior, includes crosscut from 1,800 of Black Rock. Butte-New York ground cut on 1,200 level said to be promising.

Crystal Copper (Butte)—Showing in "B" vein continues good, more than 2½ ft. of ore being in sight with grade high in silver and gold values.

East Butte Copper (Butte)—Showing on 1,800 level is reported to be improving. Tonnage grade running well.

North Butte (Butte)—Ore reserves of Granite Mountain and Speculator mines standing at high point in number of years, according to unofficial reports. Output being increased.

NEVADA

Mineral County

Simon Silver Lead (Mina)—Burch, Hershey & White appointed engineers.

Pershing County

Loring (Lovelock)—Excavating for 30-ton Gibson mill of Jose-Davis company finished and concrete foundation will be put in at once. Tunnel on company's lease on Sheepherder still shows full face of good ore.

Nevada Honey Bee (Lovelock)—William J. Loring, manager, has started systematic prospecting of service, without interfering with regular development. Malley shaft down 125 ft. and Benedetti tunnel in 262 ft.

Storey County

Consolidated Virginia (Virginia City)—For week ended September 26 Consolidated Virginia extracted 137 tons of good-grade ore from point 60 ft. east

in new vein on 2,150 level and 88 tons from point 30 ft. southwest in same vein.

Mexican Gold and Silver (Virginia City)—Opening new level at 1,900-ft. point of 2,000 raise and crosscutting east and west. Enlargement of cyanide plant continues.

Ophir Silver (Virginia City)—From 1,900 level there were extracted 41 tons of good-grade ore in week ended September 26. Prospecting continues on 1,465, 1,600, 1,800, 1,900 and 2,000 levels.

SOUTH DAKOTA

Custer County

At Fairburn, first rig to be used in drilling for oil in this new field has arrived, and will be set up at once. Structure said to be good, and all land within area leased. Although no oil has ever been developed in vicinity, oil men claim indications are satisfactory.

Lawrence County

Gold Stone (Deadwood)—Articles of incorporation filed. Capital \$125,000. Company has leased Rainbow mine in Maitland district, and will also work adjoining properties which they own. Incorporators—Solomon Burns and N. T. Mason, Deadwood, and Mark J. Little, Pittsburgh, Pa.

Echo (Maitland)—Sinking of shaft approaching 200 level. Good grade of lead-silver ore cut in sinking.

Mogul (Terry) — Operations suspended owing to labor shortage and increased cost of production. Mill in continuous operation since completion of new plant in 1914.

UTAH

Juab County

Tintic shipments week ended Oct. 4 totaled 120 cars.

Electric power has been installed recently by over 12 companies of East Tintic district.

Goshen Valley R. R. is rapidly completing a spur to Iron King and Tintic Standard properties.

Apex Standard (Eureka)—Small bunch of promising ore opened on 900 level 100 ft. from shaft. L. W. Merriam, president.

Lehi-Tintic (Eureka)—Developing ore opened on 900 level through lower tunnel. Shaft sinking deferred. Will build tramway. Working on surface plant.

North Standard (Eureka)—Sinking suspended while drifting for ore on 500 level.

Sioux Consolidated (Eureka)—Damages of \$7,500 for failure to buy and hold block of stock of this company awarded to James Morgan, of Nephi, against W. H. Child & Co., brokers of Salt Lake City. Suit was brought for

value of stock dividends paid while company was making payments and interest which amounted in all to \$17,000.

Tintic Standard (Eureka)—Producing 100 tons silver-lead ore daily from 1,000 level. Hauling by truck to Denver & Rio Grande main line.

WASHINGTON

Kittitas County

Great Western Silica (Roza)—Building 25-ton mill for pulverizing crude diatomaceous earth. Extensive deposits opened on Squaw Creek, nine miles from Roza.

F. M. Handy & Keller (Valley)—Hauling magnesite from Double Eagle quarry by motor truck.

Majestic Diatomaceous Earth (Wymer)—Producing about 10 tons of finished material daily.

Lincoln County

Drum Lummon (Miles)—Producing good grade of silver ore from property south of Crystal Buttes. Will truck to Davenport for shipment. M. H. O'Connell in charge.

Okanogan County

Copper World Gold (Loomis) — Leased for five years to E. Dempster, of New York, who expects to expend \$25,000 to \$30,000 in next year in equipment and development. Dempster also has lease with eight years to run on Copper World Extension adjoining, from which he shipped 4,000 tons last year and where 35,000 tons are said to be blocked out. Copper World, said to have mineral zone 100 ft. wide within which is 17 feet of sulphide ore. Tramway 2½ miles long has been built to Copper World Extension, at cost of \$45,000, and will be extended a few hundred feet to Copper World.

Kaaba Mines (Oroville)—Installing mine plant with 600-cu. ft. compressor 4,000-lb. hoist and electrical equipment. J. W. Douglas, president.

Stevens County
