But it is to the kind of feed with which the cages are provisioned that I attribute my wonderful success in sending queens during the last year; the loss being only one queen out of 400. The queens have been sent to nearly every State and Territory in the Union, including California, Utah, Texas, Georgia and Maine; also to Canada. This feed in simply granulated sugar moistened with honey to the consistency of a stiff paste. I wet the sugar with honey pretty thoroughly, then allow it to stand a day or two, when the sugar will settle to the bottom (it does not dissolve), the honey can then be scraped from the top, and the sugar will be of the proper consistency for putting into the cages. Mr. I. R. Good, of Nappanee, Ind., who is the discoverer of this feed, prepares it by putting in plenty of honey, and, after allowing it to stand a few days, pours it into a dish or box having a wire cloth bottom, which allows the excess of honey to drain out. Mr. Good has shipped hundreds of queens this season, sending them all over the country, and has lost only two. He says that this kind of feed is better than anything else when sending bees by the pound.

During the warm weather I send about ten bees with a queen; but, as the weather gets cooler, it is, I think, better to use a larger cage, and put in more bees and more feed. I do not put in old bees with jagged wings, neither those that have just hatched, but bees that are, as nearly as I can determine, about a week old.

In order that you may see exactly how the cage is made, and then, perhaps, be enabled to give your readers a better description of it than I have done, and also that you may see the condition in which its bees and queen arrive, I will send you a cage containing an untested queen and eight or ten bees.

Rogersville, Mich., Aug. 15, 1882.

[The cage and bees have been received. We cannot improve upon Mr. Hutchinson's description of the cage. There were 10 bees accompanying the queen, and all were as bright and lively in the cage, four days after their arrival, as they were when put in. With this cage and description of feed, we are convinced a queen with her retinue will endure a fortnight's journey with perfect safety. We have seen many of Mr. Good's shipments this season, and in no instance was there even a dead bee in the cage. A great mistake is frequently made in giving the queen and bees too much air in shipping long distances, or for continued confinement, as they quite easily chill, and changes in climate, or

from the heat of day to the cooling air of night, are quite as wearing as continual worrying. There can be nothing better, as a feed, than a combination of pure sugar and honey. The queen has been introduced to a queenless colony, as a recompense for her imprisonment.—ED.]

For the American Bee Journal.

The Yellow Races of Bees.

J. P. MOORE.

I send an article which I think has never been published in the BEE JOURNAL, entitled "The Principles of Bee-Breeding," by Frederick William Vogel, of Schmanshafel, Brandenburg, Prussia, translated from the German by the late Samuel Wagner, as follows:

If we carefully consider the topics embraced in No. 1 of our programme, we shall recognize, as the substance of them, this query, "Is it possible to produce an improved breed of bees? And if so, what are the principles of breeding which we must adopt?"

I do not deny that on this question I shall speak with a certain degree of complacency, for that which I have to communicate is not derived from the indulgence of an idle fancy, but is based on observations made at the hive—the only sure, living and pure source of apistical science.

In a discourse on the production of an improved breed of bees, we have to fix clearly in our minds the distinction between variety and race, for the two ideas are not unfrequently confounded, or used in a very arbitrary sense. The idea of variety includes a certain amount of constitutional properties. In bees there are, among others, good or bad temperaments, swarming propensity or the want of it, disposition to build drone comb, etc., etc. Allow me to include all such constitutional properties under the general term "characteristics." Variety, accordingly, is based on the characteristics. Corporeal markings, size and color, do not come into consideration in determining the idea of "variety." If the bees of any particular district are distinguished by a marked propensity for swarming, or by any other special characteristics we are warranted in designating them as a "variety." Thus, in my estimation, the heath bees of Luneberg, those of Lower Austria, etc., etc., are simply new varieties of our well-known black bee. The peculiar constitutional properties which characterize varieties are rooted in the psychical or spiritual nature of the insect, and are elicited by the kind or quality of the pasturage, by particular modes of management, by diversity of climate, or some other dominating peculiarity of the district. Accordingly, these constitutional properties disappear or are lost by lapse of time, by removal to a different locality, and thus subjecting the insect to other climatic influences and other conditions of management or pasturage.

Hence, it is obvious for the production of an improved breed, mere varieties are of very subordinate account. At the same time, however, I contend that the production of an improved breed of general value—that is, one equally suited to all parts of an extensive country—is an impossibility. On the other hand, I am clearly of opinion that, for each particular district, possessing marked peculiarity of climate and pasturage, an improved breed specially suited to those conditions, may be produced. And in this aspect, the existing varieties of the honey bee are of high significance and value.

The meaning and extent of the idea expressed by the term race have long since been settled by science. The term embraces a certain amount of external corporeal markings, among which are size and color. When the bees of any extensive region, or even of a limited district, are found to be strikingly distinguished by their large or small size, by the color and quality of their pubescence, or of the tint of their dorsal bands, from the common type of the honey bee—assuming as such, for the present, our common black bee, we are warranted in designating them as a distinct variety or race; and that each variety or race has its own distinguishing constitutional characteristics is generally known.

I am not of opinion, however, that in order to produce or improve breed, recourse must necessarily be had to the foreign races which have been introduced among us, though it is often alleged that we should, from the start, have availed ourselves of them, and have endeavored thus to originate an improved breed. But had that course been adopted we should hardly ever have reached a satisfactory result. The pure races would have disappeared under our hands long before we could have succeeded in substituting an improved breed for them. It was much wiser to labor primarily to secure an ample stock of pure races, while at the same time the peculiar characteristics of each were assiduously studied. And now that both these points have been attained, we are placed in a position favoring and furnishing means and facilities, for the origination and production of an improved breed.

Permit me now to communicate the results of a series of experiments all of which had for their object to ascertain the principles which should guide and govern us in the endeavor to produce and establish an improved breed of bees. The experiments instituted were so numerous, that they might be told by fifties or hundreds.

1. CROSSING THE BLACK BEE WITH THE ITALIAN.—When the Italian bee was introduced by Dzierzon, it was supposed that the workers produced by the Italian queen, fertilized by a black drone, would show an intermingling of the external markings of the parents. But this was soon found to be a mistake. In the second generation already, degeneration became apparent—the hybrids divided numerically, one portion resembling the

Italian, and the other the black bees. For the purpose of experiment, I continued breeding in these two directions, and in the fourth or fifth generation reached again on the one hand the pure Italian bee; and on the other in the fourth degree, the pure black bee. The hybridism of the bee was thus again resolved into its atavical elements. The facts thus experimentally ascertained are, however, of very subordinate significance, elucidating only the coloration of the hybrids. Of higher and much greater practical value, on the other hand, is the solution of the inquiry, "Do the constitutional characteristics of the two become commingled in the black-Italian hybrids? Or are those of the one variety or race simply transmitted to the other?" It is well known that very different answers have been given to these questions. Some breeders state that the hybrids of the black and Italian bees possess the constitutional properties of the Italians; while others allege the direct contrary. Some assert that the hybrids are more irascible than the black bees; others again say they are less so. Some declare that they will store more honey, while others say they will store less, etc. The truth is, the constitutional properties of the two are of an exceedingly subtle nature, which makes it extremely difficult to base a reply on the results of a cross between them. It is only by crossing the black bee with the Egyptian that we can obtain any clear light on the point under consideration.

2. CROSSING THE BLACK BEE AND THE EGYPTIAN.—When the Egyptian bee was consigned to me by the Berlin Acclimatization Society, I was of opinion that this bee was of little or at most of only slight importance in a scientific point of view, for I supposed then that whatever was to be learned of the proposed mysteries of the bee had already been revealed by means of the Italians. Now, however, I feel assured that the future of apistical theory pertains to the Egyptian bee.

Very soon some of the Egyptian queens became fertilized by drones. The workers produced by these queens were not perceptibly larger than the pure Egyptian workers, and in other respects still resembled the Egyptian type very much. The drones produced by these queens—since impregnation exerts no direct influence on them—were still pure Egyptian. I now raised some young queens from these impurely fertilized mothers, and employed the Kohler process to secure their fertilization by black drones. According to the experience derived from crossing the black bee and the Italian, the workers produced by such queens should have been numerically one-half black bees, and the other half Egyptian. But when the hybrid workers made their appearance, our anticipations were not realized. The hybrids diverged in two directions indeed, but the parental markings showed themselves mingled or melted into each other, in a portion of the progeny. A portion of the workers resembled the Italian workers so per-

fectly, in color, size and characteristics, that no expert could distinguish them from pure Italians. Another portion of them still resembled the Egyptian bees, showing a black body covered with a grayish pubescence, and manifesting the constitutional characteristics of the Egyptians. These observations led me to suppose that, probably ages ago, the Italian bee may have originated from a cross of the black bee with the Egyptian. I communicated this conjecture to Dr. Gerstaker of Berlin and other friends. The latter received the suggestion with great disfavor, regarding it as derogatory and dishonoring the Italian bee, and it required no inconsiderable labor to convince them that the conjecture had no reference whatever to any supposed value or want of value of any variety of the honey bee, but was of a purely scientific nature; and that one variety might, in economic value still rank high above another, though it be clearly demonstrated to be of hybrid origin. Dr. Gerstaker informed me that he was unable to distinguish the workers produced by a cross of the black bee with the Egyptian, from the pure Italian workers; but that I had assigned no reason for my hypothesis, and that the geographical distribution of the honey bee militated against it. I then again carefully studied the excellent little treatise by Dr. Gerstaker, on "The Geographical Distribution of the Honey Bee," and found that the geographical distribution of the races furnished no conclusive arguments either for or against my views. Here the idea occurred to me that the conjecture would attain to the highest degree of probability, if a hybrid queen of the second or third generation should be found to produce drones which could not be distinguished from Italians. Impatiently did I await the return of spring. The drones finally made their appearance and diverged likewise in two directions; one portion could not be distinguished from Italian drones, while another portion resembled the Egyptian drones in size, but having black bodies with grayish pubescence. I then raised young queens from an Egyptian hybrid queen of the second degree of degeneration, and arranged to have them fertilized by drones derived from the same mother, but bearing Italian markings. The workers produced by these queens resembled the Italians, while the drones diverged in the two directions adverted to. I now proceeded to breed in and in from the hybrids thus obtained, and in the third and fourth generations all the drones bore the Italian markings. It might here be objected that, on atavistic principles, these hybrids must revert to their distinct parental or primal races, as is the case with hybrids of the black bee and the Italians. But I have now before me black Egyptian hybrids of the nineteenth generation, and these still retain their characteristic markings unchanged alike in queens and drones and workers, though rather intensified in degree and permanence. Firmly established, therefore, do I regard this fact—from

a cross of the black bee with the Egyptian, a hybrid is produced which no man can distinguish from the Italian bee.

Now what do these observations teach? For brevity's sake I will express the question thus: Did Divine Omnipotence, when placing the animal creation upon the earth provide in each case only one primitive pair; or did He create each race at once in larger groups? And if the latter, were all the animals of the same class perfectly alike as regards size and color? Or did God create directly the different races of the honey bee? When we reflect that no mortal eye witnessed the grand act of creation, and further consider that no reply can be deduced from any known laws of nature, they may be regarded as highly presumptuous. But the arrogance apparently involved in them vanishes at once, when I state that I have not deduced the reply from my own mental cogitations, but from facts with which I became acquainted when crossing the common black bee with the Egyptian. My observations constrained me to accept two primitive races for the honey bee. A portion of each of these races certainly existed since the dawn of history, and these I denominate original or primary races. In the course of time others arose from the crossing or intermixture of the primary races, and these I call derivative or secondary races, or varieties. The black bee and the Egyptian I regard as primary races. The Italians, Cæropians, Syrians, Chinese, etc., etc.—"who can count the peoples? who name their names?" all these are nothing more than the hybridous product springing from the two original races—mere derivative or secondary races. I venture to say that if all these mixed products be entirely removed, leaving me only the pure black bee and the pure Egyptian, I could speedily reproduce any desired secondary race, by crossing those two primaries. Possibly, the strikingly black honey bee of Madagascar may yet prove to be another primary race.

3. CROSSING THE ITALIAN BEE AND THE EGYPTIAN.—What has hitherto been said is of subordinate importance, so far as regards the production of an improved breed; because it refers only to the color or markings, which it may be thought desirable to give to the improved breed. But of higher and more practical importance is the solution of the questions, is the constitutional temperament of one race transmissible to another? And if so, is this to be effected by means of the queen or drone? or, again, do the constitutional properties of the two races or varieties become so commingled or melted into each other by the cross, that new and special constitutional properties are the result? In breeding we have hitherto relied mainly on the queen. We said—"this is a choice, populous colony, with a fine prolific queen, therefore, we must use some of its blood for raising queens." But I do not believe that in the endeavor to procure an improved breed, it is sufficient to have

regard only for the qualities of the queen. According to my observations, those of the drone, too, must be taken into account.

In order to accumulate facts, it became necessary to cross the Italian bee with the Egyptian, because these two are the exact counterparts of each other, as regards constitutional characteristics—the Egyptians having a fiery temperament, while the Italian is of a placid and gentle disposition. The first inquiry was: Does the temperament reside in the seminal filament, or in the egg? In other words, is the seminal filament the germ of the young bee, or is the egg?

When first the seminal filaments were discovered in the generative fluid, it was thought that each was the incipient germ of a nascent creature, and that the young animal is nothing more than a fully developed seminal filament. Accordingly, it was assumed that the egg only contained the requisite nutriment for the sustenance and development of the seminal filament. Now, if this were in reality the germ of the nascent creature, the constitutional properties must be inherent in the drone. But every bee breeder is aware of the fact that an unimpregnated queen lays eggs which produce drones exclusively; and he further knows that worker bees occasionally lay eggs from which living creatures are developed, and that these are invariably drones. From these facts it is evident that the egg contains the germ of the young bee. Let us now inquire what observations and experiments further teach. I crossed pure Egyptian queens with Italian drones. In the hybrid progeny, the constitutional properties—the temperament—of the Egyptian seemed completely obliterated, as it were, and those of the Italian substituted. I next crossed the Italian queens with Egyptian drones, and the progeny displayed the Egyptian characteristics wholly. Hence, it was manifest that the temperament of the bee resides in the seminal filament. Accordingly, in our endeavors to provide an improved breed, our attention must be pre-eminently directed to the drones by which the selected queen is to be fertilized. We come now to the question whether drones possess diversities of temperament, but the elucidation of this branch of our topics would occupy too much time at present. I may perhaps have occasion hereafter to discuss it.

Some may dissent from the views I have here expressed, but we cannot disagree in our object, namely, by steadfast endeavor and close scrutiny to attain to the knowledge of the truth which the Omniscient has embodied in this very diminutive member of animated nature—the honey-bee.

Now, as Vogel has proved beyond a doubt that the yellow race of bees is not a primary race, but has been produced in all its varieties by crosses between the Egyptian and black bees, it makes it easy to see why the Italian is so gentle and so prone to run out into the black bee. The Egyptian bee was probably brought into Europe

some thousands of years ago. Virgil tells in his pastorals, that there were two distinct races of bees there in his time (that was in the time of Julius Cæsar), and that the yellow race was the best thought of; but as the black bee is a native of Europe, it results that the black blood in the Italian bee preponderates—there is more of it than there is of the Egyptian blood, hence, they are gentle, and the addition of a little more black blood makes them all black, as we have many times learned to our cost. I judge that the Syrian, Holy Land and Cyprian bee were originally produced by a cross between the black bee of Europe and the Egyptian, but in their case, I take it, that the Egyptian blood predominates; the queens are small, they are very light in color, and their disposition, in many cases, resembles the Egyptian more than any other race. In fact, I am perfectly satisfied that is just where they obtained it.

Binghamton, N. Y.

For the American Bee Journal.

Caledonian Apiarian Society.

This Society held its ninth exhibition in connection with the Highland Agricultural Society's Show, in the King's Park, Glasgow Green. It occupied two large marquees in the south-west corner of the yard.

Every exhibition seems to be advancing always on the preceding one, both as regards the number of entries and the quality and quantity of the hives, bee furniture, etc. The entries numbered upward of 100, exactly double that of last year, when the show was held in Stirling. Not only did the entries show an excess in number, but the quality of the exhibits were of such a character as to denote the distinct advances being made in the science of apiculture. A few of the sections and supers on exhibition were under the prescribed weight, which suggested the fact that the season has not been favorable for the production of honey.

Passing into the largest marquee, we find the centre of attraction to be in the observatory hives, which were placed along the north side of the tent. As the greatest interest was manifested in this class, I shall give a brief account of it:

In this department there was a keen competition, the first prize falling deservedly to Mr. D. Wood, Benmore via Greenock, whose hive was noticeable both for its ingenuity and beauty. It consisted of four frames double-hinged, folded together and set at proper distances, so that there is no possibility of bee-crushing. When folded together it occupies 11x17x24 inches in height; when expanded it is 2 ft. 7 inches, into the shape of a W, so that the eye sees everything that is

going on. All the necessary operations can be done by drawing the ends and top. The glass doors and top at each side are made to fold, when open to form the sides and top. The frames attached to the end, which when drawn out exposed them fully 14 inches. It is made to revolve on a foundation which is so arranged that no single bee can be crushed. It will at once be seen, when closed, the bees are in a perfectly natural condition for all the operations of bee life, without loss of heat or inconvenience.

In addition to the above, it is so arranged that a crate of sections can be put on the top, in which the bees enter most readily. The excluder zinc is so arranged that the queen cannot ascend the super, which presents a very pleasing appearance. In short, this is a hive which meets the conditions laid down by the Society, being a perfect hive for both summer and winter use, and having all combs visible on both sides.

Mr. James Johnstone, of Touch via Stirling, came second with a very nice hive, which has seven bars in number. These were of the Woodbury size, arranged in a row, and standing parallel to each other. These, working on a pivot, opened out like the leaves of a book, while the bees found their way to the main channel down the centre of the pivot.

Mr. Wood also exhibited another two leaved hive, which had six frames. It was well stocked, and also a great source of attraction.

Mr. Johnstone gained the first prize for the best colony of British bees, which he exhibited in a six-bar Woodbury hive, which was well stocked. In it the frames were arranged in two perpendicular rows, showing artificial comb foundation in the various stages of extension up to the complete cell.

Mr. Young, of Perth, came second, with one almost exactly the same, which was also well stocked.

Mr. Sword, of Falkirk, came third, which were exhibited in a single leaved hive, and contained four frames. This was also well stocked.

These were entries for the best colony of foreign bees, but as none of them were perfectly pure, the judges made no awards.

In the class for hives, the competition was very keen; they were all of a superior kind, both as to workmanship and design, the bar-frames making a splendid display by themselves. For the best collection of hives, bee furniture, etc., Mr. Young gained first prize, Mr. Steele, of Dundee, coming second. Both exhibited very interesting collections of everything connected with apiculture, even from a needle to an anchor. There was also a good display of various sized supers, comb foundation and samples of wax. In the honey classes the quality shown was of high merit. For the best super above 20 lbs., Mr. Anderson, of Stevenson, carried off the first prize, while Mr. Crawford, of Arran, came second. Both looked remarkably well, so much so, that both were bought immediately after the judging.

All the other classes, which were glasses and small supers, were well

competed for. Mr. Sword gained the first prize for the best exhibition of extracted honey in two pound glasses, while Mr. Templeton took first prize for the best comb honey in small sections.

Mr. Sword was awarded first prize, and Mr. Scott second prize for the best honey cakes, which were "very tasty."

Mr. Young was awarded 3 prizes of merit for various honey extractors which he exhibited, proving a good source of attraction.

Mr. Wood gained first prize for his fine display of honey producing plants, exhibited in a dried state.

Passing out of this tent we find ourselves enclosed in a smaller canvas, one (which has been several times illustrated in the BEE JOURNAL), and which was the scene of great interest during the show. Manipulating was carried on daily, while the public were protected by a gauze-screen. Driving bees from a straw skep and transferring their combs and bees to a bar-frame hive, were performed at intervals during the day and never failed to astonish the many visitors, who seemed amazed at the easy manner in which the bee master could handle them, like flies.

The following gentlemen acted as judges: Mr. Cowan, Horsham near London; Mr. Wilkie Gourcock, Mr. Patterson Struan, and Mr. Garvie Bridge, of Earnwhile. Bailie Laughland, of Kilmarnock, acted as Umpire.

The weather throughout was very wet with the exception of the last day (Friday), otherwise the show was a great success.

JOHN D. HUTCHISON, Sec.

The National Convention.

The North American Bee-Keepers' Society will hold their 13th annual meeting at Washington Park Hall, Cincinnati, O., across Washington Park from the Exposition building. Time, Oct. 3rd to 5th, 1882. First session Tuesday, 10 a. m., Oct. 3. We are encouraged to hope that this will be a very profitable meeting, as we are promised papers from, and the presence of, a large number of our most prominent bee-keepers both in the United States and Canada, and essays and implements of the apiary are expected from abroad to add to the knowledge imparted by the research and inventive skill and methods of our countrymen.

ENRICK PARMLY, Sec.
New York, July 12, 1882.

The Central Michigan Bee-Keepers' Association will meet Sept. 19th, at Lansing, in the Capitol Building. We call the meeting two weeks before the Annual Fair of the Central Michigan Agricultural Society meets, for the purpose of making the final arrangements for a large exhibit of bees, honey and apiarian supplies. A cordial invitation is extended to bee-keepers everywhere. The meeting will be of especial interest, and a large attendance is expected.

E. N. WOOD, Sec.

To all Bee-Keepers in Iowa.—At the next annual meeting of the North American Bee-Keepers' Society, to be held Oct. 3d, in Cincinnati, Vice Presidents are expected to report the status of the industry in their respective States. This can only be done by the help of bee-keepers in different parts of the State, and I wish that every person interested in bees would, as soon as they see this notice, send me by postal or letter a report of the condition of bee culture in their section, from the close of last year's honey season until the present time. I hope all who see this will respond, as I will not even attempt to make the report expected of me, unless I have sufficient information so as to make a reasonably correct one.

O. O. POPPLETON,

Vice P. for Iowa.

Williamstown, Iowa, Aug. 25, 1882.

The Kentucky State Bee-Keepers' Convention will meet in Louisville, Ky., at the Exposition Building Press Rooms, on Tuesday and Wednesday, Sept. 26th and 27th. All beekeepers are invited to attend, and send essays, papers, implements, or anything of interest to the fraternity. The Exposition will be in full blast and cheap. Railroad rates from all points. W. WILLIAMSON, Sec.

The Ohio State Bee-Keepers' Association will meet in convention in Columbus, on the Fair Grounds, during the week of the State Fair; meetings to be held on Thursday and Friday, Aug. 31 and Sept. 1, 1882. Rooms have been provided in the Fair Grounds for the use of the Association. A full attendance is requested of all who are interested.

DANIEL SPEAR, Sec.

Cardington, O.

Local Convention Directory.

1882.	Time and Place of Meeting.
Aug. 31—Ohio State, at Columbus, O.	Daniel Spear, Sec., Cardington, O.
Sept. 5—N. W. Ill. and S. W. Wis., at Rockton, Ill.	Jonathan Stewart, Sec.
19—Michigan Central, at Lansing, Mich.	E. N. Wood, Sec.
26, 27—Kentucky State, at Louisville, Ky.	W. Williamson, Sec., Lexington, Ky.
28—Norfolk, Ont., at Waterford, Ont.	Elias Clouse, Sec.
Oct. 3-6—North American, at Cincinnati, O.	Dr. Ehrick Parinly, Sec., New York City.
5—Kentucky Union, at Shelbyville, Ky.	G. W. Demaree, Sec., Christiansburg, Ky.
Tuscarawas Valley, at Newcomerstown, O.	J. A. Bucklew, Sec., Clariks, O.
Nov. 1—New Jersey & Eastern, at New Brunswick, N. J.	J. Hasbronck, Sec., Bound Brook, N. J.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$5 per 100.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

SELECTIONS FROM OUR LETTER BOX

Clipping Queens.—1. In handling brood frames, does it hinder the bees or disturb them to place the frames back prominently? 2. What is the safest way to clip queens' wings? I notice the usual way is to clip one wing only. 3. Why not clip both? 4. Is there any danger of injuring the queen by too close clipping? **QUIZ.**
St. Paul, Minn., Aug. 21, 1882.

[1. It may cause momentary confusion, but no harm if they are placed back with the brood in the center.

2. Lift the frame with the queen and stand it down or hang it, so as to leave both hands free; with the thumb and fore-finger of the left hand deliberately catch hold the end of one primary wing, and lifting out gently, with a sharp pocket knife cut off about one-third.

3. Because she can make a better attempt at flying with the ends of both wings clipped, than if a third of only one is taken off.

4. Yes, where both wings are cut close, as she is more helpless. If she is jostled off the comb by the bees, as is sometimes the case, she has more difficulty in regaining her position.—**ED.]**

Preference for Catnip.—Bees were on the verge of starvation here till about June 1st, and then it was too wet, so that the nectar was too thin. July showed the "silver lining," however, and August has turned the silver to gold. My first swarm came June 30th; now, from 17 in the spring, I have 54, but the increase came from 13 colonies, and two wild swarms caught. From one Syrian colony I have now 11, and all doing well. Increased mainly by natural swarming, but also divided and formed several nuclei, that have now grown into full colonies. A Cyprian colony I divided, and 5 days afterward, the new colony swarmed, and they have continued to swarm nearly every day this week. I let the last swarm hang in a tree till I tore out all the cells, but found the colony was still so strong that I hived the swarm by itself. The cells were in bunches and the children took from them half a dozen fine looking and lively queens. I filled all frames half way down with foundation, and sometimes they were all drawn out and contained honey, pollen and eggs in less than 24 hours. I have one queen with 19 frames of brood, and nearly every upper story has been badly brooded. Have only taken about 150 lbs. of extracted, and have about 100 lbs. of comb honey nearly ready, but white clover, red clover, alsike, melilot, catnip, smartweed and buckwheat are yet in profusion, and

will be till frost. If there is any plant that I feel sure it will pay to plant for honey alone, whether the season be wet or dry, it is catnip. I cultivated it this year, and shall plant all I can another season.

WM. CAMM.

Murrayville, Ill., Aug. 19, 1882.

Bees and Amber Syrup.—After an absence of about 2 years, I will again ask space in the BEE JOURNAL to inform its numerous readers what the prospects are in this part of Missouri. I began the season with 100 strong colonies, besides some 20 nuclei that I brought through the winter. I left my bees on the summer stands, and they all came through without any loss. I have now over 200 strong colonies, mostly Italians and Cyprians. This has been the finest honey season I have ever seen—one continual flow from March up the present, and the prospects are very fine for fall honey. I have taken off 1,500 lbs. of box honey, in 1 and 2 lb. boxes, and about the same of extracted, and expect as much more. I am putting up an apparatus for manufacturing syrup and sugar from early amber cane, do you think the bees will trouble any; I have heard that they will, but I would like to hear from you? I consult the Weekly BEE JOURNAL with interest, and hope it may continue its weekly visits for many years yet to come.

J. L. SMITH.

Lawson, Mo., Aug. 15, 1882.

[We are afraid you will experience considerable annoyance from and with the bees on account of your amber sugar works, especially if there should be any interruption in the honey flow.—**ED.]**

Bees Booming.—We have had no surplus honey from our bees for three years. But about a week ago they commenced "booming," and I now look for a good fall crop. I have 60 colonies in excellent condition, mostly with upper stories full of comb.

J. W. GREEN.

Chillicothe, Mo., Aug. 19, 1882.

Less than an Average.—The peculiar honey season is still continuing. On the 18th or 19th of July a heavy flow of honey suddenly commenced, and continued without interruption until the 30th, when it just as suddenly terminated. I obtained a surplus of about 50 lbs. of honey per colony during that short flow. Since July 30th, honey has been coming in so slowly that robber bees have troubled us very much about our work. Fall flowers are just commencing to bloom, and if we should be fortunate enough to have a month of fair weather yet, may make a medium crop; but I do not think it at all probable that we can get what I call an average crop, viz.: 100 lbs. per colony. Please send us a portion of that "cloud with a silver lining." We would give it a most hearty welcome. I assure you.

O. O. POPPLETON.

Williamstown, Iowa, Aug. 15, 1882.

Seeding an Orchard.—I have an orchard of three acres of trees, 12 years old, set 22x26 feet apart, now seeded to mammoth red clover, the heavy growth of which is likely to injure the trees. I wish to make a bee pasture of the orchard, how shall I proceed? The clover is now ripe and full of seed, besides the ground has seed in it from last year. Soil is common black loam, and quite level. We are three miles from any timber, and five from town. Land is worth \$75 to \$80 per acre. About one-half of the fences are Osage hedge, and this is full of catnip. A. H. HOLCOMB.

Pecatonica, Ill., Aug. 20, 1882.

[Cut the red clover and plow the stubble under as usual, then in early spring seed the orchard down with white clover. This will make excellent sheep, hog and calf pasture, and a very good range for bees. We would advise seeding down to sweet clover, but its rank growth on good loam would make it quite as objectionable to the orchard as the mammoth red clover, as it would attain a height of six feet or more.—ED.]

Excessive Swarming.—This season has been one of the most favorable of all seasons for breeding in this locality I ever experienced. Larger swarms I never saw; hives full and running over continually. Notwithstanding all the precaution taken to prevent them from issuing, they would come forth pell-mell, with mated or virgin queens. I have given room with surplus and breeding capacity to no avail. I have practiced destroying queen cells: in short, have done everything I ever read of or knew to prevent them from swarming and failed. Do you know what is the matter? With the exception of two days since the latter part of June, until to-day, I have hived from 1 to 9 swarms. I am using the Langstroth hive, an eight frame hive as modified by James Heddon, with his surplus arrangement, which I like. I must give you my experience with a large swarm. Five issued at one time and clustered together. I have one-third of one of the primary wings of every queen clipped, consequently, I captured four of those queens and returned them to their respective hives. The other one could fly enough to accompany the bees. They were directly over my bee garden or apiary, comprising 100 colonies of bees. I attempted to ascend twice to take them, but was nervous about it, in consequence of their becoming very much irritated on account of the uproar produced by the swarming, and gave it up to contrive some other means to get them, as I did not want to lose 5 Italian swarms in 1, with a good queen. The size of the cluster being about 4 feet long and 16 inches in diameter. As it was about 30 feet high, I concluded to try what virtue there was in powder and shot. I requested a young man in my employ on the farm to get the gun and shoot through them. He did so the third

time. You may guess there was a dislodgement of the bees to my satisfaction. With the exception of what were killed (perhaps enough for one swarm), the balance with the queen settled on an apple tree about 6 feet from the ground, and I saved and hived them in their original homes with their mothers.

DANIEL WHITMER.

South Bend, Ind., Aug. 17, 1882.

[This season has been a peculiar one regarding swarming, some bee-keepers reporting it without a precedent. We have known several cases of swarming from 3-story Langstroth hives, wherein were 30 brood-frames, and the majority containing more or less brood. Your trouble has been augmented somewhat by using only eight frames in the lower story; but we doubt if double that number would altogether have repressed their swarming proclivities. A bee-keeper of our acquaintance, in this city, who has long entertained the opinion that a long-idea hive could be constructed which would prove a non-swarm, having occasion to absent himself from the city for several weeks, constructed some of that class, and was so sanguine of success that he disregarded our advice to clip a wing of each queen. Now he mourns the loss of several of his best queens, which were accompanied by rousing swarms. In no instance were even all the foundation frames drawn out when the bees absconded, and he doubts the correctness of his theories.—ED.]

Cyprians Beat all the Rest.—Two years ago this fall I obtained 2 Cyprians and 1 Italian queen. I lost one of the Cyprians the first winter. The other beats all the rest of the bees combined. The first year they cast 7 good swarms. This year one colony has cast 6 swarms. I doubled up four and made two, so as to have them strong. They are the best workers I have. As there is some inquiry about them, I will say they have done well for me. I have taken from three colonies about 65 lbs of honey each, and will get 40 lbs. more from each this season, of box honey. From one colony of my old strain of bees, I will get about 160 lbs. of box honey. I have now 105 lbs., and they are good for 55 or 60 lbs. more. Out of my 45 colonies, 26 have done all the swarming this year. I have sold two, doubled up some, and some swarms went together. I now have 78 colonies, all doing well. Bees in this section are doing very well, although the spring was wet and cold, which made them rather late in swarming; but when white clover came they went into it with a rush. I put off swarming as long as I can, so as to get large swarms, when I can get honey in abundance.

THOMAS LASHBROOK.

Waverly, Iowa, Aug. 22, 1882.

Never saw a Better Honey Harvest.—The "silver linings of the clouds" reached here July 10th, and I never saw a better honey harvest in this country than it has been since that time. I inclose two honey plants, please give name and value. The small red flower grows in the timber land, and the bees work on it all day. Even where there is but one plant, I find it covered with bees. The yellow flower grows on the bottom land, and is a great favorite with the bees.

E. DOTY.

Macksburg, Iowa, Aug. 15, 1882.

[The small red flower is figwort or Simpson honey plant; the yellow flower is a solidago, to which class the goldenrod also belongs. It is needless, after giving the names, to say more in commendation of them as honey plants.—ED.]

Recapping a Queen Cell.—On the 10th inst. I had a swarm of bees come off. I went to the old hive and took out all the queen cells but one, laying them in a box which I put in the shop. On the 14th I came across them, and commenced to open them with my knife. I found a large one which I cut open, but seeing a grub-looking thing which moved a little, I put it in a queenless colony, grafting it in a comb, then awaited results. The next day at noon the cell was built out again and capped over, and to-day a fine, lively queen came forth. We are getting up quite an interest in bee-culture around Bushnell this season. All bee-keepers here appear to be doing well, and are taking off lots of honey.

NATHAN M. WOODMAN.

Bushnell, Ill., Aug. 22, 1882.

Best Honey Flow of the Season.—We are having the largest and longest honey flow of the season. With 10 days more of this weather, it will exceed in bulk all the rest of the season's crop. Bees are swarming daily; I had three swarms yesterday, but put them all back, thinking that the best course to pursue.

Geo. E. HILTON.

Fremont Center, Mich., Aug. 23.

Swarming Perplexities.—We have had a singular season so far, with but few days at a time that bees could get honey, on account of rains. We have had plenty of flowers, but the rain washes the honey out in a day or two; but more flowers come again. I have had a singular experience with swarms this season. Heretofore they have waited for each other—not so this time, for I have had as many as four out all at once, before I could get the first one hived. I attempted to divide, but sometimes some would get no queen, and so would go back. A second swarm came out before I had the first one half in; they went in with the first one without settling anywhere. I have lost over \$50 worth of swarms by absconding. All were Italians but one, and that rose high in the air and bid me good-bye. I

have sold 3 colonies for \$23.50, and have 9 left. I have not taken over 200 lbs. of honey. It may be we will have a good fall season.

JOEL BREWER.

Lincolnton, Ind., Aug. 15, 1882.

Honey-Dew.—We are having the sweetest time ever known in this county. No honey-dew before this has ever furnished a parallel. The bees are swarming, very rich, and stinging everything within fifty yards. I have been intending to call on you during this month, but will not be able to do so until next month. Please give us the philosophy of honey-dew.

WM. T. STURGILL.

Pickering, Mo., Aug. 19, 1882.

[The cause or origin of honey-dew has been a matter of much discussion and diversity of opinion among scientists as well as apiarists, one class holding that honey-dew is a juice or liquid which oozes from the leaves of trees and plants under certain atmospheric influences; opponents maintaining that it is an excretion deposited by small insects (*aphis*, or vine-fretter). Both parties are undoubtedly correct—*i. e.* there are probably two qualities of liquid, both termed honey-dew, and each having its origin as given above. It would require much more space than we can devote, to attempt to discuss the "philosophy of honey-dew."—ED.]

Eleven Colonies from One.—Starting in with one colony of blacks and hybrids last season late, I divided them this spring, and by swarming and dividing since, I now have 11 strong colonies doing splendidly. I have taken off some surplus, and the honey is superior to any I have ever seen west of the Mississippi. I never knew bees to increase so rapidly as they have the past few weeks. My experience in making the test satisfies me that this is a most excellent locality for bee culture, and if the winter proves as encouraging as the past season, I shall devote my whole time to apiculture in future.

WM. W. EASTMAN.

Yankton, Dak., Aug. 19, 1882.

Corn Tassel Honey.—I mail you sample of honey—what is it gathered from? I think it is corn, or is it buckwheat, or what? Bees are very busy, but I do not know what they are gathering from.

R. S. PLOPPER.

Bartlett, Ill., Aug. 23, 1882.

[It is as pure a sample of corn tassel honey as we ever saw, but is rather thin.—ED.]

Not Doing Well.—Bees are not doing well in this section, too wet, cold and a scarcity of flowers. White clover seems to be abundant in the Mississippi bottoms, but too far off for my bees.

J. SMITH HEAD.

Benton, Mo., Aug. 19, 1882.

Cellar for Winter.—I wish to get your advice about wintering bees in my cellar, which I had intended for that purpose. The cellar is 32 feet square: the part intended for bees is partitioned off 14 feet on the north-side with flooring; there are two windows, one in the north and one in the east. It is ventilated with a pipe running into the chimney. Would this be a good place for wintering bees, and how should they be prepared? I have 34 colonies. Last week, in examining my bees, I found a strong colony queenless, with no brood except that which was capped. They had several queen cells, some capped and others not. I caged a young laying queen and put her between the frames. The next day I drew the slide, and on the following morning the young queen was lying at the entrance. I opened the hive and found fresh laid eggs; on looking further, I found an inferior queen. I pinched her head and introduced another, and now all is lovely. Where did the queen come from?

Hebron, Neb. F. E. ROPER.

[The cellar you describe ought to be satisfactory for wintering bees in, if you entirely darken the two windows, and if free from jarring. When you put the bees away for winter, lift the covers entirely off, spread thin blankets loosely over the top, put one-inch square sticks crosswise, and stack the hives up as high as you can reach conveniently. It is a good plan to alternate the entrances—that is, face one hive one way, and the next face opposite alternately through the stack.

The inferior queen was undoubtedly in the hive when you first looked it through, and the bees nursed the cells with a view to swarming.—ED.]

A Slight Mistake.—On page 524 you made a slight mistake in the thickness of the worm I sent you. It should have been $\frac{1}{4}$ instead of $\frac{1}{2}$ of an inch.

S. C. FREDERICK.

Coal Vale, Kan.

Not so Bad.—Hearing so many poor reports from this State, this season, in regard to the honey crop, I thought I would give you my report up to date. From one colony I have already taken 130 pounds of choice white clover, all finished complete, besides 12 lbs. more unfinished, and several others have given me over 100 lbs. to the colony. I ran 28 colonies for comb honey, two of which superseded their queens, thereby giving me but little surplus. I have obtained in all, from this number, 2,000 lbs. of what I call choice honey.

G. H. ADAMS.

North Nassau, N. Y., Aug. 16, 1882.

Oregon for Bees.—Bees in this locality are very rich with stores in brood chambers, but few colonies have gathered a surplus in supers. Should fall harvest be good, a surplus in sections will be finished, and some ex-

perienced bee men will extract. Bees, generally, are in fine condition. I am looking forward to run an apiary near Portland, Oregon. What is your opinion of that country?

C. S. NEWSOM.

Athens, O., Aug. 20, 1882.

[We have been informed Portland, Oregon, is an excellent locality for bees, but know nothing of it personally.—ED.]

Sweet Clover.—How many acres of sweet clover will be a fair estimate for 50 colonies of bees?

H. J. NORTHRUP.

Lansingburgh, N. Y.

[We have no means of knowing with any degree of accuracy, as the growth with us is spontaneous and scattering; but think ten acres would be ample. This, then, could be partly mowed in July, so as to have one-half in bloom while the remainder went into its first seeding, which usually takes place in August.—ED.]

Crossing Stock.—Should an Italian queen meet an Italian drone for fecundation? Would it make any difference in stock if she should meet a black drone?

F. F. GRAVES.

Waterville, Me.

[If an Italian queen meets a black drone, her worker and queen progeny will be hybrids, and hence impure and unfit to breed from. If Italian bees are wanted, she must meet an Italian drone.—ED.]

Cleome.—I inclose sample of bloom that our bees have been working on very industriously for over three weeks. By giving its name and value as a honey plant, you will greatly oblige.

A SUBSCRIBER.

St. Joseph, Mo., Aug. 23, 1882.

[It is Rocky Mountain bee plant (*Cleome integrifolia*). As a honey plant, in our judgment, it ranks second only to sweet clover.—ED.]

Sowing for Honey.—1. Will it pay to sow good, high, well-drained grain land for bee pasturage? 2. How much of such land should one sow to keep a hundred colonies? It is a very poor season for bees in this vicinity, and they are not likely to have enough to winter on without feeding. We find the BEE JOURNAL a great assistance.

IRA ORVIS.

Pickering, Ont., Aug. 20, 1882.

[1. Yes; we decidedly think it would, as most of the season it would be valuable for stock pasturage, especially if sweet clover, which would give 3 to 4 weeks of green grazing after everything else is winter-killed, and spring grazing would be a benefit to it rather than damaging.

2. Ten to twenty acres.—ED.]

ESTABLISHED IN 1862
THE AMERICAN BEE JOURNAL
 ESTABLISHED IN 1862

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about **eight words**; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published **WEEKLY** as follows, if the whole is paid in advance:

For 4 weeks.....	10	per cent. discount.
" 8 ".....	20	" " " "
" 13 " (3 months)....	30	" " " "
" 20 " (6 months)....	40	" " " "
" 30 " (9 months)....	50	" " " "
" 52 " (1 year).....	60	" " " "

Discount, for 1 year, in the **MONTHLY** alone, 25 per cent., 6 months, 10 per cent., 3 months, 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the **SEMI-MONTHLY** alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

Always forward us money either by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

- For a Club of 2,—a copy of "Bees and Honey."
- " " 3,—an Emerson Binder for 1882.
- " " 4,—Apiary Register for 50 Colonies, or Cook's (Bee) Manual, paper, cloth.
- " " 5,— " " "
- " " 6,—Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Or they may deduct 10 per cent in cash for their labor in getting up the club.

Binders cannot be sent to Canada by mail—the International law will not permit anything but samples of merchandise weighing less than 8 oz.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Emerson Binders.—We have had a lot of Emerson binders made especially for the BEE JOURNAL for 1882. They are lettered in gold on the back, and make a nice and convenient way to preserve the JOURNAL as fast as received. They will be sent post paid by mail for 75 cents.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey. A new pamphlet of 32 pages. At the last meeting of the North American Bee-Keepers' Society, we were appointed on a committee to prepare instructions on the Exhibition of Bees and Honey at Fairs; this is also added to the above. Price, 10 cents.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference

When you meet with an accident, get a sprained ankle, or otherwise injured, don't go to the expense of sending for a doctor, but apply Kendall's Spavin Cure, and you will experience instant relief. 32w4t

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

- For 50 colonies (120 pages).....\$1 00
- " 100 colonies (220 pages)..... 1 50
- " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones to procure at the start.

Bingham's Smoker Corner.

Cyprians Conquered.—All summer it has been "which and t'other" with me and the Cyprian colony of bees I have; but at last I am "boss"—Bingham's Conqueror Smoker did it. If you want lots of smoke, just at the right time, get a Conqueror Smoker of Bingham. G. M. DOOLITTLE. Borodino, N. Y., Aug. 15, 1882.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

HEADQUARTERS FOR

SWEET CLOVER SEED.

King of Honey-Producing Plants.

Sown early in the fall will bloom some the next season; blooms from June 10th until killed by frost (at least four months). Every bee-keeper needs sweet clover. See what James Heddon and H. W. Garrett say about sweet clover in the Bee Journal of Aug. 16, 1882. Have no old seeds—all this year's crop. It will grow on any soil, wet or dry. Will sell in bulk, or in small lots. Send for prices. A. SAYDER, Clarksville, Albany Co., N. Y.

FOR SALE—An Apiary of 120 colonies, suitable for Extracted Honey. For further information apply to J. MCINTYRE, Strathroy, Ont. 35w2tp

Italian Bees for Sale.

One to Forty Colonies of Italian Bees for sale cheap. Address, **OTTO KLEINOW,** Detroit, Mich. 35w2t

HENRY ALLEY, WENHAM, MASS.

Queens Worth \$2.00 for \$1.25.

Large, handsome and beautiful. Every one warranted as good in all respects as tested queens. No loss of queens by mail in my new cages—all go safely. Safe arrival and purity guaranteed. Italian, Cyprian and Holy Land Queens by return mail. No money required until queen is received. 33w3t

HONEY

For the past few years I have made this excellent food my leading article. Having the best established reputation in this city as a dealer in PURE HONEY direct from the Apiaries, enables me to obtain the highest market prices. Your consignments and correspondence respectfully solicited.

R. A. BURNETT, Commission Merchant, Successor to Conner, Burnett & Co., 25w13t 161 So. Water Street, Chicago, Ill.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., August 28, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour :

Quotations of Cash Buyers.

CHICAGO.

HONEY—I am paying 7c. for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17@22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for honey is quiet. Extracted brings 7@10c. on arrival. No comb honey on the market worth mentioning, prices nominal.
BEESWAX—Scarce, and brings 20@25c. on arrival.
C. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The crop of 1882 is beginning to come forward, and so far very nice goods have been offered. Sales range at 18@20c. per lb.; one pound sections selling at the highest range, when well filled and white. Extracted, few offerings and demand light at 8@9c.
BEESWAX—25c. for prime yellow; dark 18@22c.
R. A. BURNETT, 165 South Water St.

CLEVELAND.

HONEY—There is no change in honey in our market the past week; 1-lb, white honey sells at 22c., 2-lb. at 20c.; second grade, 20c. for 1-lb. and 18c. for 2-lb. Extracted has not moved yet; nominally held at 12@14c.
BEESWAX—Scarce at 25@28c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—The market is firm for extracted and choice comb. Offerings and demand are light.
We quote white comb, 17@18c.; dark to good, 8@13c. Extracted, choice to extra white, 9@9½c.; dark and candied, 7@7½c. BEESWAX—28@30c.; STEARNS & SMITH, 423 Front Street.

BOSTON.

HONEY—Trade quiet. We quote at 20@22c., according to quality.
BEESWAX—Prime quality, 25c.
CROCKER & BLAKE, 57 Chatham Street.

ST. LOUIS.

HONEY—A fair movement in strained at 7¼@8s.—one lot of 25 blvs. reported sold at 8c. Some new comb (choice white clover offered), but little sold—held at 18@20c. per lb.; extracted quiet at 8@10c.
BEESWAX—Easier at 20@27c. for prime.
R. C. GREER & Co., 117 N. Main Street.

NEW YORK.

HONEY—No quotations reported.—ED.
BEESWAX—The market is quiet, with transactions limited to small lots, but prime wax is held firmly, with some Southern not offering below 28¼c. Western, pure, 29½@27½c.; Southern, pure, 27½@28½c.
D. W. QUINBY, 165 Park Place

Rev. A. SALISBURY

A NEW BEE BOOK!

Bees & Honey

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN,

Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturing a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper cover, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Earle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

Florida Land--640 Acres

CHEAP FOR CASH.

DESCRIPTION.—Sec. 4, township 7, south range 7 west, Franklin County, Florida, situated about 50 miles south of the Georgia line, 25 miles west of the city of Tallahassee, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a seaport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loam, covered with timber.

It was conveyed on Dec. 31st, 1875, by Col. Alexander McDonald, who owned 6 sections, including the above, to J. M. Murphy, for \$3,200, and on Sept. 5th, 1877, by him conveyed to the undersigned for \$3,000. The title is perfect, and it is unincumbered, as shown by an abstract from the Records of the county, duly attested by the County Clerk; the taxes are all paid and the receipts are in my possession.

I will sell the above at a bargain for cash, or trade for a small farm, or other desirable property. An offer for it is respectfully solicited. Address,

THOMAS G. NEWMAN,

925 West Madison Street, CHICAGO, ILL.

The Bee-Keeper's Guide,

OR,

MANUAL OF THE APIARY,

By **A. J. COOK,**

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

—:—

320 Pages; 133 Fine Illustrations.

—:—

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

—:—

Read the following opinions of the Book:

All agree that it is the work of a master and of real value.—*L'Apiculture*, Paris.

I think Cook's Manual is the best of our American works.—**LEWIS T. COLBY.**

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—**J. P. WEST.**

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—**E. H. WYNKOOP.**

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—**A. E. WENZEL.**

My success has been so great as to almost astonish myself, and much of it is due to the clear, detailed information contained in Cook's Manual.—**WM. VAN ANTWERP, M. D.**

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record*.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—**L'ABBE DU BOIS**, editor of the *Bulletin D' Apiculture*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Pulaski, N. Y.

We have perused with great pleasure this *mode mecum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor*.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$5.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches	\$8 00
For 2 Langstroth " 10x18 "	8 00
For 3 " 10x18 "	10 00
For 4 " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " 12 1/2 x 20 "	12 00
For 4 " 13x20 "	16 00

EARS FOR THE MILLION!

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from an peculiar species of small White Shark, caught in the Yellow Sea, fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Send charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better.

I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WITNESSES PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Day Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by **THOMAS G. NEWMAN,** 925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Manual of the Apary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.— The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.— This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.— This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee— This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.— A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apary for Pleasure and Profit, by Thomas G. Newman.— Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Hienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Bzierzon Theory;— presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine, by Thomas G. Newman.— This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.— This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price, 10c.

The Hive I Use— Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.— A 24-page pamphlet, by Chas. F. Muth, giving in detail the methods and management adopted in their apary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman. Giving advanced views on this important subject, with suggestions what to plant, and when and how: 25 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages.— It gives Mr. Muth's views on the management of bees. Price, 10c.

Food Adulteration; What we eat and should not eat. Ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Kendall's Horse Book.— No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Chicken Cholera, by A. J. Hill.— A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 Items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Black and Smiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gilders, Metal and Wood Workers of every kind. The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

An Important Circular.

On page 529, of the BEE JOURNAL for Aug. 23d, in an article entitled "Statistics on Bees and Honey," we made the following suggestion: "If the President of the North American Bee-Keepers' Society was to issue a circular to the several State Vice-Presidents, urging the importance and necessity for brief tabulated statements to be submitted to the Convention, and by their Secretary to be massed in a general statement, it would afford a useful and fruitful theme for discussion and legislation by the Society. These Vice Presidents could urge the matter upon the bee-keepers in their respective States through the bee papers and agricultural publications, and by means of public and private methods, and thus could be accomplished much more than can be done by any single enterprise. A correct and reliable report of this character would be a matter of national importance, and we believe can be accomplished only through the National Society." We are pleased to publish the following circular from Prof. Cook, giving the fullest indorsement to our suggestion, and officially calling upon them individually and collectively to render him most valuable assistance in making the National Society a means of benefitting the whole bee-keeping fraternity of the entire continent:

Vice Presidents National Association:

GENTLEMEN.—It is to be hoped that each Vice President will send a full report to the Cincinnati meeting from his State. Let this give the best possible estimate, founded on wide correspondence, of the crop for 1882, also

the general condition of apiculture in your State. Give particulars of climate for the year, whether cold or hot, wet or dry, and the relation, so far as noticed, of weather to honey secretion.

Give any further notes as to items of interest or value that may occur to you.
A. J. Cook, Pres.

Lansing, Mich., Aug. 30, 1882.

Recognizing Bee Men at Fairs.—We all know how pleasant it is for bee men to recognize one another and have a pleasant chat. At the coming fairs let every one who has a badge wear it, and they will be surprised at the amount of enjoyment it will give them—introducing them to many they have wished to meet and have a pleasant interview, but with whom they have, perhaps, had no personal acquaintance. Just try it, for once, and surprise yourselves. If you have no badge, get one.

The Weather in England.—The *Mark Lane Express*, in its review for the past week, says:

The weather has been autumnal. A heavy rainfall was general Tuesday, but it was not sufficient to damage the crops materially. The outstanding crops, however, are endangered.

☞ We will send sample copies of the BEE JOURNAL to any one who will distribute them to bee men at Fairs. We will also send some large colored posters to enable them to get up clubs. Write to us and say how many copies you wish and we will send them post paid. See our premiums for clubs on another page.

☞ The Chesaning, Mich., *Argus*, of Aug. 18, mentions the receipt, from Henry Jones, of one of the finest sections of honey they ever saw. They say his bees are mostly Italians, and from one colony he obtained 100 pounds of honey in 24 days exactly.

Sweet Clover—Its Culture.

Again do we have occasion to thank James Heddon for giving us a text on which to write an article devoted to sweet clover (*Melilotus alba*), and its virtues as a honey plant. Aug. 27th he writes :

Please tell us in next number all about spring *versus* fall planting of melilot, and the best way and time to do it in both seasons; how wet land it will do well on, etc.

We will preface the reply with the remark that our facilities for testing the various methods of cultivation, diversities of soil to which it is best adapted, manner of planting, quantity of seed per acre, and other minutiae, have personally, been somewhat limited and we are obliged to rely upon casual observations combined with information derived in answer to thousands of inquiries which we have propounded to reliable men of experience in different localities, where soils, climate and other characteristics would be as varied as possible. Of course, residing in a city like Chicago, we have not had an opportunity to carry our experiments with it to the extent we would like to have done were we differently situated; and yet we feel perfectly convinced of the correctness of all the conclusions we have arrived at.

Several years ago our attention was drawn to the sweet clover by observing myriads of bees working on it immediately succeeding a rainstorm, when not one was at work upon the white clover, owing to the storm having washed out the nectar, or, perhaps, the excess of water remaining in the clover heads. From that period until the present we have closely observed it, and never has it failed in its nectar secretion after the flow first commenced, nor has the abundance of the crops been retarded by atmospheric influences. Last season, which was one of unusual drouth following a remarkably severe winter, the sweet clover was very abundant, very rich in nectar, and very heavy with seed; but owing to the short spring and premature summer, it shed its ample growth of bloom in the first of August, unloaded its crop of seed, and came out in second bloom about the 10th of September, remaining in bloom till the advent of winter, and in some instances we shook the snow covering from standing brush and gathered the still fragrant flowers.

As is the case with all biennials, the later summer or fall is the natural

period of seeding; but the natural requirements of the seed are to some extent, or nearly wholly met by planting in late winter or very early spring, when the nights are still frosty and an occasional severe freeze assists to rot and burst the hull, allowing moisture to swell and germinate the kernel.

In November, 1880, we assisted the birds to scatter the seeds along the roadways and in the gutters of the less frequented avenues, and a fine crop of blossoms have since rewarded us for the little trouble. In February, 1881, we scattered the seed upon the snow, and it has grown finely. Seeds which we scattered in August of the same year, and others which fell from

Sweet Clover.

[These stalks, of which there are from 5 to 20 to a single crown, often attain a height of six feet, and are very dense in branches, foliage and blossoms, from the roots to the top.]

the plants during the same summer and fall, are now covering the ground with a dense, vigorous mass of green, with some promise of a crop of blossoms this fall. In April of this year we again scattered and raked in some of the seed, and it is now growing finely. To the contrary of this, we have conversed with two parties who themselves gathered seeds last summer and sowed them, but not a kernel has grown. It is possible they failed to cover them, and the birds devoured the seeds; or the weather may have been unfavorable at the time of planting. We would advise, whether planted in fall or spring, if possible, that they be harrowed in; or, still better, planted in drills three feet apart, with several inches of space between plants. Then, one year thereafter, put in an alternate drill, and the seeding and cultivation is completed for a lifetime. If planting is deferred till spring, the seeds should be covered, else the birds will be likely to gather them from the ground.

As regards soil, we do not think any choice can be made. In portions of Ohio, we are informed, it grows luxuriantly and spontaneously on the sand-hills and ridges, and we have seen it quite thrifty in this State where white drift or wash sand prevailed, bearing before a bountiful crop of sand-burrs and beggar-lice. Around Chicago, where we have had most experience with it, the soil is low, wet and cold, composed of blue-clay, and just above the water surface for fully half the year. We are informed by parties cultivating it in Indiana, along the Wabash, that they grow it to great advantage in the river valley, where it is subject to frequent overflow, with a sand-bed soil; along the Mississippi Valley it does well in the American Bottom, and is frequently submerged for weeks.

We have no doubt it will thrive well in any soil where any vegetation can be made to grow, whether wet or dry, sand or loam, forest or prairie, north or south, rich or sterile; and we do not believe it ever fails in its honey secretion, except, perhaps, for a very few days. During its first going to seed, which generally occurs in August, there is no bloom for two or three weeks, but this can be obviated by mowing a portion of the field in the latter part of June or first of July, or grazing it till late.

Statistics.—Mr. R. McKnight, the efficient Secretary of the Ontario Bee-Keepers' Association, has addressed a circular to every member of that Society with important questions to be answered. This is worthy of being copied by every bee-keepers' society in America. Only in some such way can we ever hope to obtain correct statistics of the bee-keeping industry. The questions are as follows :

How many colonies of bees did you put away in the fall? How many did you take out in the spring? How many did you lose by spring dwindling? How many did you lose from other causes? How many did you sell? How many have you at present? How much surplus honey did you take? How much of this was extracted, and how much comb? What hive do you use? Do you use comb foundation? How do you increase—by natural or artificial swarming? How did white clover yield? How did basswood yield? What is the yield this year compared with last?

When changing a postoffice address, mention the *old* as well as the new address.

The Northwestern Convention.

It will be seen, by reference to our Convention notices and Directory, that the Northwestern will meet in Chicago on the 17th and 18th of October, 1882, in compliance with a resolution adopted at the last annual meeting, to meet during the last week of the Exposition, and give all an opportunity to take the fullest advantage of cheap railroad rates. The President, Dr. C. C. Miller, accepted the invitation extended by the editor of this paper, to meet in the AMERICAN BEE JOURNAL office. Should it be found, however, that more room is required, but a few minutes' delay will ensue to obtain a public hall. All bee-keepers of the Northwest, comprising the States of Minnesota, Iowa, Wisconsin, Illinois, Michigan, Indiana and Missouri, should make an effort to attend this Convention, and each contribute of his or her experience to make its sessions as interesting as possible. The last meeting was one of the most interesting and profitable we ever attended, and we look forward to much good being accomplished by the Northwestern Bee-Keepers' Society. The President, in a postal card dated Aug. 24th, says: "I am now taking off my thirteenth thousand of white sections," and he will, undoubtedly, tell the Convention how he done it. The Northwestern inaugurated the system of dispensing with long-winded essays, adopting, in lieu thereof, the experience feature—with a view of combining science and practice, and the comparative results. Do not forget the 17th and 18th of October.

The Weather this Fall.

Prof. Vennor was quite correct about the weather for August. He said that shortly after the middle of the month, we should have one or two "cold dips." The papers report that fires were kept up in the passenger coaches of the Chicago and Northwestern railway while passing through Iowa on the 17th, so cold was the temperature. He says as follows of the month of September:

First week (1st to 7th). Foggy weather will be experienced along the North Atlantic coast and Gulf of St. Lawrence, with thunder storms and probably sultry weather over the North Atlantic. Sultry and showery up to the sixth day. Cooler change night of 6th or on the 7th, with possibly frosts in New York State and Province of Quebec, Canada.

Second week (7th to 14th). Cooler and pleasant weather. Days varying from warm to sultry; evenings and nights generally cool. A favorable week in the majority of sections. Cold in mountainous regions. Probably a good deal of rain in Province of Quebec and Lower Provinces. Stormy on Newfoundland coast.

Third week (14th to 21st). A rather stormy and unsettled week, with frequent rain-falls. Windy weather probable in Gulf of St. Lawrence and North Atlantic. Fair, seasonable weather in the majority of sections. Wet in northern sections about 20th and 21st. Stormy and cold weather in England and Scotland.

Fourth week (21st to 28th). Temperature probably fall-like. Windy with very cool evenings and nights (probably frosty) in Northern and Western sections. A good deal of rain in Northwest and Western States. Stormy and wet in Gulf of St. Lawrence and along North Atlantic coast.

Closing days (28th to 30th). In all probability wet and stormy in the majority of sections. Crop reports less favorable than expected. Wretched weather in Maritime ports and Newfoundland.—*Vennor's Weather Bulletin.*

His further prognostications are as follows:

October will be very similar to August, but of course colder. September is likely to be the counter-balancing month of this most unpropitious season, and during this month everything should be done that can be, to house things safely against further wet and storm. In the Northwest early cold and advanced snow-falls are likely to be the conditions, while in December the cold may be intense.

Bee men should take notice, and prepare early for a cold winter.

Fairs and Apiarian Exhibits.

About the middle of May last we forwarded, to the managers of the great St. Louis Fair Association, a list of apiarian articles worthy of competitive entry for premiums, and detailed at some length the benefit to be derived by the country, from a proper encouragement of the bee-keeping industry in the Mississippi Valley, as elsewhere. Those gentlemen have taken hold of the matter with an appreciative determination to work it up to its proper place, if they meet with support from bee-keepers themselves in the way of placing exhibits on the grounds worthy of encouragement. The initiative has been taken by them for the coming Fair, and, although the premiums are not as large as we had hoped they would be, still it is a great and most important advance in the right direction. We earnestly hope all bee-keepers, who

can possibly make it convenient, will send in a full and complete outfit for competition, both of bees, honey and apiarian implements—everything that will awaken the curiosity and rivet the attention of the hundreds of thousands of visitors who attend that Fair, and in a few years, at most, we will see bee-keeping ranking with stock-raising, grain-growing, tobacco-producing, and other great pursuits in the West, and acknowledged as such by the Fair Association and the public.

Messrs. R. C. Greer & Co., who rank among the most prominent of the commission merchants of the West, have written us under date of Aug. 30, as follows, regarding this matter:

Our St. Louis Fair Association, for the first time, offers premiums on bees and bee products. While the premiums are not large, they imply a commendable effort on the part of the Association to assist in furthering bee-culture. We forward you, by mail, the annual catalogue of the Association, and call your attention to Class E, Department of Jellies, Butter, etc., in which your readers may take interest.

Best display of Italian bees, \$20.
 Best display native black bees, \$20.
 Best imported queen, \$10.
 Best display of comb honey, 25 lbs., diploma and \$20.
 Best crate of honey in comb, large silver medal and diploma.
 Best display of apiarian implements, diploma and \$10.
 Best bee hive for all purposes, dip.
 Best honey extractor, diploma.
 Best wax extractor, diploma.
 Best bee smoker, diploma.
 Best honey knife, diploma.
 Best bee veil or face protector, diploma.

Instincts of Bees.—Mr. J. M. Hicks in the *Grange Bulletin* argues thus on the above subject:

It is not easy to draw a line of distinction between the marvelous instincts of bees (as so-called by man) and the reasoning faculty of the human family. Reaumur, the great French naturalist, once observed a bee consultation over a large snail which had crawled into their hive. They went to work, and with propolis, a gum gathered from certain trees, and invaluable in their housekeeping, the bees first glued the snail shell to the glass pane of the hive, and then covered the whole mouth of the shell with a thick coating of the substance, hermetically sealing up their enemy and burying it alive. We ask, is this an act of instinct or of perfect judgment, emanating as it naturally does with man, if brought into contact with a loathsome object which he could not otherwise manage?

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Controlling Swarms.—The *Grange Bulletin* says:

It requires the patience of Job and a large amount of perseverance as well as hard work to manage a large apiary during the month of August, unless you use a good honey extractor, which will greatly assist in controlling late swarming.

We often find it a difficult matter to control the swarming fever of bees, if the buckwheat blooms and secretes honey plentifully during the latter part of August.

Profits of Bee-Keeping.—The *Toronto Mail* collates the following from D. A. Jones' correspondence:

There may be saved \$10,000 a year in every township from the keeping of bees. He would undertake to make more money than any farmer in the world out of the same capital, and it would appear that this is no unwarrantable assertion. His expenses are: The cost of hire of the acre of land for each bee yard, equal to about \$50 down to \$4 a year; the cost of a cottage, \$500 at the outside; annual interest on the two, \$65; of interest on the capital represented by 620 colonies of bees at \$10 each, \$6,200, interest \$620; interest on cost of extractor, foundation machine, tools, barrels, tins, etc., total cost say \$1,000, interest, \$100; wages and board of four skilled assistants for six months, say \$1,200; extra help at extracting time, \$100; giving a total outlay of about \$2,100, nearly half of which is in the form of interest on capital which has grown up along with the business.

Of course it will not do for everybody to rush into bee-keeping with an idea that he can make a fortune every year by it. Mr. Jones' success is the result of a lifetime of close and laborious investigation, of the most patient studying of the ways of insects, and a readiness to adopt and utilize the experience of others which very few men possess. An essential quality for a large apiarist is that he be an excellent judge of men.

While it would be the most hopeless thing in the world for any person without experience to go into bee-keeping on a large scale, there is every inducement for embarking in the business in a small way. Fifty colonies of bees could be made to yield 150 to 300 pounds of honey each, value \$1,125 to \$2,250. Colonies to the value of \$50 a year could be sold, and still the number on hand would be nearly doubled. All this can be done at a very small expenditure of money. A cottage and an acre of land must be rented where there is good range. Black bees and Italian queens can be bought according to the means of the new bee-keeper. An extractor must be purchased and also the tools and lumber for making the hives and frames; or he can buy

these. The foundation-machine is too costly an implement for a small bee-keeper to purchase, and he would therefore have to purchase his comb foundation already made. This can be done at a cost about double the value of the wax. Then the new hand must be willing to accept, as proven, certain traits of bees which older heads have proved. He must not go over grounds on which the lifetime of many trained observers has been passed. He must study closely the bee literature of the age.

By patient study, aided by the personal superintendence of one or two colonies, the operator will in time be able to go into bee-keeping as a business, and he or she, for there is no business so especially adapted to women as bee-keeping, will possess a certain means of livelihood of which nothing can dispossess him. His income will fluctuate with the seasons, but no more so than the income of every farmer. If he is not above peddling around his honey he can get a much higher price for it than if he sends it to a commission merchant, and, moreover, his customers will then be sure of getting the unadulterated, and will become regular customers of stated quantities.

Local Convention Directory.

1882. *Time and Place of Meeting.*
- Sept. 5—N. W. Ill. and S. W. Wis., at Rockton, Ill. Jonathan Stewart, Sec.
- 19—Michigan Central, at Lansing, Mich. E. N. Wood, Sec.
- 26, 27—Kentucky State, at Louisville, Ky. W. Williamson, Sec., Lexington, Ky.
- 28—Norfolk, Ont., at Waterford, Ont. Elias Clouse, Sec.
- Oct. 3-6—North American, at Cincinnati, O. Dr. Ehrick Parmlly, Sec., New York City.
- 5—Kentucky Union, at Shelbyville, Ky. G. W. Demaree, Sec., Christiansburg, Ky.
- 10, 11—Northern Michigan, at Pawamo, Mich. O. R. Goodno, Sec., Carson City, Mich.
- 17, 18—Northwestern, at Chicago, Ill. C. C. Coffinberry, Sec., Chicago, Ill. Tuscarawas Valley, at Newcomerstown, O. J. A. Bucklew, Sec., Clarks, O.
- Nov. 1—New Jersey & Eastern, at New Brunswick, N. J. Hasbrouck, Sec., Bonnd Brook, N. J.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The second annual general meeting of the Ontario Bee-Keepers' Association, will be held in the City Hall, Toronto, on the 13th of Sept., at 7 o'clock p. m. If any change is made in the time of the meeting due notice will be given. R. MCKNIGHT, Sec.

The Kentucky State Bee-Keepers' Convention will meet in Louisville, Ky., at the Exposition Building Press Rooms, on Tuesday and Wednesday, Sept. 26th and 27th. All beekeepers are invited to attend, and send essays, papers, implements, or anything of interest to the fraternity. The Exposition will be in full blast and cheap. Railroad rates from all points. W. WILLIAMSON, Sec.

The National Convention.

The North American Bee-Keepers' Society will hold their 13th annual meeting at Washington Park Hall, Cincinnati, O., across Washington Park from the Exposition building. Time, Oct. 3rd to 5th, 1882. First session Tuesday, 10 a. m., Oct. 3. We are encouraged to hope that this will be a very profitable meeting, as we are promised papers from, and the presence of, a large number of our most prominent bee-keepers both in the United States and Canada, and essays and implements of the apiary are expected from abroad to add to the knowledge imparted by the research and inventive skill and methods of our countrymen.

EHRICK PARMLY, Sec.
New York, July 12, 1882.

The Northwestern Bee-Keepers' Convention will meet at Chicago, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1882. The office of the American Bee Journal has been kindly tendered as a place of meeting. A cordial invitation is extended to all beekeepers, and especially those of the Northwestern States, to be present. The meeting takes place during the last week of the Inter-State Industrial Exposition, to enable all to obtain reduced railroad rates. First session at 10 a. m. C. C. MILLER, Pres.

C. C. COFFINBERRY, Sec.

The Union Bee-Keepers' Association of Maryland, Virginia and West Virginia, will meet at Hagers-town, in the room of the County Commissioners, at the Court House, on Wednesday, Oct. 18, 1882, at 1 o'clock, p. m., the session to last two days. The Washington County Fair will then be in progress, which will give persons an opportunity to attend the exhibition. All persons intending to go will please drop me a card, so that I may secure for them half-fare rates.

J. LUTHER BOWERS, Sec.
Berryville, Va.

The fifth annual meeting of the Northern Michigan Bee-Keepers' Convention will be held at Pawamo, Ionia County, Mich., on the second Tuesday and Wednesday (10th and 11th) of October, 1882. Pawamo being on the D. & M. and H. & M. R. R., it will be accessible by rail. The members will do all in their power to make the meeting interesting.

H. M. ROOP, Pres.
O. R. GOODNO, Sec.

The Central Michigan Bee-Keepers' Association will meet Sept. 19th, at Lansing, in the Capitol Building. We call the meeting two weeks before the Annual Fair of the Central Michigan Agricultural Society meets, for the purpose of making the final arrangements for a large exhibit of bees, honey and apianian supplies. A cordial invitation is extended to beekeepers everywhere. The meeting will be of especial interest, and a large attendance is expected.

E. N. WOOD, Sec.

CORRESPONDENCE

For the American Bee Journal.

The Width of Sections, etc.

C. H. DEANE.

I must say that I agree with Messrs. Heddon and Townsend on the width of sections without separators, for I have experimented with some only 1½ inches wide this season, and with honey flowing very slowly, when it did come, they averaged ¾ of a lb. to the section, and they are not well filled out either. I therefore conclude that 1½ inches is about the right width. We may get a little more than a lb. in this width, at times, but then it will help to ease our conscience when we sell it for 25c. per lb., as I did my nice white section honey taken by the Deane system this season.

It may be that the Deane system was not the cause of the honey being nice and white, but it is a fact, that the sections came off easily, white, dry and smooth, and without separators. I have never been a comb honey producer to any extent, for I have had a great deal of trouble in getting the bees to go to work in those 2 story arrangements so extensively used, also no little annoyance in prying the sections out of the propolis after they were tilted; but the "solid" cash brought in by those few little sections, together with ease of manipulation of the Deane system, has quite won me over.

But to the etc. of this article, I want to say to Mr. Heddon, and others who may wish to try the Deane system, that I have greatly improved it this season, and that there is now no danger of its ever shrinking away from the ends of cases; no danger of the bottom bar sagging. Why? Because—1st. I now clamp the cases together with 3-16 iron rods having a screw and thumb nut on one end, and bent at right-angles at the other. By this method you can make the cases as tight as you can make a keg with hoops. 2d. I now make the clamps of 4 pieces, with a 1½x14 inch observing glass in the center, and they cannot warp. The clamps are made about ⅜ longer than they were formerly, with a notch in each end for the rod to drop into. One little turn of the nut loosens the rods, and in a second's time all is open before you. 3d. The bottom-bars will not sag, because the clamps hold the weight, and not the bottom-bars. 4th. We must have cases to send the honey to market, and instead of the brown paper and strips, as formerly spoken of, we will use the following, as the cost is about the same, and it is much more serviceable.

After taking the honey from the hives, remove the cases and clamp the sections together with the rods, 24 in number; but before clamping them tight, put 4 strips ½x1x1½ inches be-

tween two rows of sections, so the grocer can pull them out when they get to market, and thus loosen the sections; now while all is moderately tight, so the sections cannot shake about in transit, screw on the top ¾x11½x18½ inches, rabbeted ¾x½ inch on the edges, so the ¾ will come down close to the tops of the sections; now turn the case over and nail in the ends ½x4½x10½ inches; and the case with observing glass on the sides is ready to be given away with the honey, as it is cheap, solid and neat. I believe something has been said about the Deane system surpassing anything of the kind, for section storing, in the Langstroth hive, either in the top story or in the body of the hive. Mr. Bingham, I think, being one of the testifiers. I cannot say why Quinby's and Bingham's style of frame does not supersede the Langstroth, unless it is that the bee-keepers think the Langstroth frame the best, or that, like Mr. Heddon, they take a great deal of "solid comfort" in their own "fixin's." Mortonville, Ky.

For the American Bee Journal.

Sale of Comb Honey—No. 2.

G. M. DOOLITTLE.

Having tried to sell our honey at home and failed, or having a larger crop than could be disposed of to advantage in our neighboring towns, our next step is to find a market for it in some of our large cities. As selling outright is preferred by all to selling on commission, let us see what can be done in that direction first, leaving the shipping on commission as a *dernier resort*. In selling to parties in distant cities, the first thing presenting itself is the getting of the address of responsible persons who are dealing in honey, or who might be interested enough to buy our production. As a rule, nearly all wholesale grocers buy and sell more or less honey, and to these we apply. "Yes," says one, "but how shall we get their names and know their standing, whether responsible or not?" Well, I will tell you how an enterprising friend did last year and made a very successful sale of his honey, his crop being about 5,000 lbs. Through my suggestion as to how I got the names of commission merchants in large cities, he went to an acquaintance of his who had access to Bradstreet's Commercial Reporter, this friend securing the same for him to look at for an hour or two. Dunn & Co. publish a similar report to Bradstreet's, and all large business firms have one or the other of these commercial reporters, so as to enable them to transact business with reliable parties. By this means my friend secured the address of several wholesale grocers in Boston, New York, and elsewhere, who were quoted as being worth \$100,000 and upwards, with unlimited credit. To these he applied, enclosing a stamp for their reply, telling them what he had and desiring to send them samples of his honey if they thought they could handle it at the price named, which he believed to

be the true value thereof. The result was that after sending samples he sold his whole crop to one house in Boston at the prices named, and all parties were well pleased. He now says he feels easy about the disposition of his crop for future years.

Next we come to selling through commission merchants, which has been my practice for several years, as I could not make a satisfactory sale of my honey outright. At first I consigned my whole crop to one house, next to two houses, and finally to three, finding that the more I divided my product the sooner sales were made, and at a more remunerative figure. Last year I thought to divide my product still more, and so sent it in from 300 to 500 lb. lots to ten different commission merchants, whose names and standing I obtained as above. Prompt returns was the result, at a satisfactory price, and in some cases exceeding market quotations two cents per lb., thus proving to me that if we ship on commission, the scattering of our product into several cities, and among several commission houses, will, as a rule, bring the best results.

Now, there is another way of selling on commission often overlooked by the large producer, which is practical for one who produces a small amount, say from 100 up to 1,000 lbs. In most all of our small towns more or less honey is consumed, yet not enough to establish a market for the same, and in all such towns, if the right amount is left (not enough to over-stock the market), remunerative prices may be obtained. In a small town about 4 miles distant from where I write, lives a bee-keeper who produces from 200 to 400 lbs. of honey annually. This honey he takes to the two stores selling general merchandise in said town, and leaves it to be sold on commission, placing the selling price high enough to give him the real value of his honey after deducting the storekeepers' commissions, and in this way his whole crop is usually disposed of at the true value thereof, in accordance with the prices it would bring if shipped to a distant city. Thus I have given five practical ways of disposing of our crop, all of which have come under my observation, if not actually practiced by me.

All that is necessary is to try fill you find the one most adapted to your wants. In all cases the putting up of your crop in a tidy, attractive shape, and having a knowledge of the value thereof, will be the method by which we can get the true value of our production according to the markets of the world.

Sometimes it happens that the market quotations at the time we wish to prepare for selling our crop will be only nominal. In such cases I find it a good plan to write to some of those parties handling honey, for their opinion as to prices in the near future, and this, coupled together with what we know regarding the production of honey in the country, will help us to arrive at about what the real value of our product is. One thing I have noticed, however, and that is that generally prices rule higher for honey

in October, than any other month in the year; and unless the crop in the country is very short, the holding of it after that date results as a rule in our being obliged to accept of a less price.

Thus I have fulfilled my promise as to giving you a series of articles on the production, care and sale of comb honey, and if they have been of any benefit to any *one* reader of the *good, old, AMERICAN BEE JOURNAL*, I shall not have written in vain.

Borodino, N. Y.

Translated by Alfred Neighbour.

Effects of Cold—Pollen Gathering, etc.

DR. DZIERZON.

The milder the winter is, the more complete will be the repose of the bees, and the lower will they be able to allow the temperature to become even when they have their winter quarters, while increasing cold stimulates them to breathe more frequently and to consume more food; in other words, it stimulates their vital powers to greater activity in order to be able to offer the necessary resistance to the cold. It will be seen from this whether it is advisable to keep bees exposed to the cold in winter. Theory and experience, as well as the last mild winter, demonstrate to us practically the fallacy of this opinion. Exposure of the bees to extreme cold certainly causes them to crowd together into as thick a cluster as possible, but it does not send them into a sleep-like state of repose. On the contrary, it startles them out of their rest, compelling them to hum more loudly, while previously they were in perfectly silent repose. Nor does severe cold prevent premature breeding. There is generally more brood to be found in the hive in January and February, when the weather is very cold or after the temperature has been very low, than during a continuance of mild weather. Dr. Krasiecke acknowledges this fact, but explains it in a peculiar manner by saying that because bees consume more food when the temperature is low, the production of chyle would also be greater. But it is a known fact, that in order to create a higher degree of temperature, bees consume a large quantity of honey only. The latter, however, only supplies an increased quantity of excrementitious matter as secondary product, but no chyle. The presence of much excrementitious matter in their bodies, on the contrary, renders the bees more incapable of producing chyle. It is the disturbance of their rest and incitement to activity in order to raise the temperature, which also directly affects the queen, inducing her to deposit eggs sooner than she would have done if the weather had continued mild. The principal cause of early breeding, however, is the presence of much moisture, which forms inside the hive when the temperature outside is lower; water, as is well known, forming by far the largest constituent of the food of the brood, and want of water prevents or restricts breeding.

During mild weather, when the difference in the temperature of the air inside and outside the hive is but insignificant, little or no moisture is precipitated, just as the windows of our rooms condense no moisture then. At such a time the bees may be suffering from want of moisture, but as long as the suffering does not become acute it does no harm. It has rather the advantage that it keeps the bees back from breeding until they are able to fetch in sufficient quantity, the water which is indispensable in the preparation of chyle. It is best that breeding should be delayed till such a time when the bees are able to gather fresh pollen in considerable quantity, as many colonies, especially young ones, possess but a small stock or none at all of this material, which cannot be dispensed with when food is to be prepared for the brood. This is generally the case at the time of flowering of the alder tree, so that bagfuls might be collected from many trees, especially from those in isolated positions, and the bees might supply themselves from this source with pollen for the whole year. If favored by the weather, they could take full advantage of the alder flowers, which mostly make their appearance in March. Unfortunately, however, on account of the uncertainty of the weather at that time of the year, the pollen is frequently a complete failure; and should the weather happen to be favorable, the flowering time of the alder passes too quickly to be fully utilized. The flowering season of the alder might be artificially prolonged if branches with plenty of flower-buds were cut off and kept in a cool and shady place until the flowering time was coming to an end, when they might be put into the ground in a sunny spot near the apiary. But on account of the uncertainty of the bees being able to fully utilize these flowers, even if in the neighborhood of the apiary, we might render them a far greater service if we took the trouble at the time of falling of the alder flowers to collect the pollen which Nature offers in such abundance in order to supply the bees with it. We might perhaps moisten it with honey and squeeze it into the cells.

I have taken this trouble in former years, but found it rather a tedious and troublesome labor, and I have often asked myself the question whether it would not be possible to obtain the valuable substances which pollen contains—viz., the nitrogen, the essential oils, the ferments and salts from the entire buds, if these were collected before the pollen became scattered abroad by the wind, either by a process of drying or roasting, by pulverization, or dissolved as a kind of tea, and to make them palatable to the bees by mixing them with honey. The solution of this question would be a worthy and most commendable task for bee-masters who at the same time are thorough chemists.

It would certainly be better if the various artificial contrivances to keep our bees supplied with the substances their economy requires were not

needed. The weather late in last summer and in the autumn was most unpropitious for the impregnation of queens, and in this district at least rendered it altogether impossible. In former years it was a rare exception in my apiary to find queens remaining unfertilized even if reared late in the season. Even about Michaelmas, when one would naturally expect all drones to have disappeared, my queens still became fertile if only a few really fine days intervened to allow them to fly out again and again, and often far away from their hive. In the year 1867 the weather during the whole month of September was inclement and cheerless, and not one young queen became fertile, but on the 8th of October a calm, warm and sunny day followed. After the bees had been playing joyfully I examined several hives with young queens in the afternoon, and found that eight of them exhibited the sign of impregnation; in fact, all my queens for impregnation became fertile, although the number of drones in my apiary scarcely amounted to a hundred.

All the young queens which had not become impregnated at the time of our meeting at Erfurt last year remained unfertile, and had finally to be thrown away as worthless. Warned by this experience, I examined afterward five parent hives, in which I certainly did not expect a change of queen to have taken place, and discovered either no queen at all or a virgin queen, and was obliged to unite these colonies with smaller colonies, as I had no longer any spare queens at my disposal. In this respect the mild weather which prevailed late in the autumn, and even this winter, was also very welcome, as it enabled operations to be performed which in colder weather could not very well have been attended to.

That Bee Poisoning, Etc.

JAMES HEDDON.

Mr. Moore's article on bee-poisoning is "company" to my misery. I am surprised that I should have forgotten to mention the swelling about the lids of my eyes, though the under lids swell most, but not as much as Mr. Moore's. They itch and burn first. They get their immediate affection from poison thrown into the air, but I have often wondered if I should have any such sensations if I never got stung. I handle bees rapidly, and get nearly all my stings upon the hands, from pinching the bees accidentally.

How strange that Mr. Demaree and myself should each write an article containing arguments and proofs upon the same subject, for the same page of the same issue of the same paper at the same time. And what a contrast between our opinions; also between the results of our operations based upon these opinions. Now, honor bright, I think that if Mr. Demaree would only get out of that big "Blue-Grass region" (all flesh is grass, but

all grass does not yield honey), get the horse and cow-breeding theories out of his head, and go to raising honey to sell to support his family, his practice would soon reverse his theories, which tell him that traits of character which fully, yes, even more than duplicate themselves at the first cross, do not all run out at the second and third. There is no reason in such a theory, and if practice with thorough-bred cattle says such is a fact, it says right the reverse with bees. This I know from six years' experience. I have theory, reason and facts on my side of the problem as regards bees, and feel able to maintain them by reasoning as well as by demonstration to all those who visit my apiary.

Thanks to Mr. Hutchinson for his frank acknowledgment of the correctness of my plan of transferring. That sort of a man is generally correct in most things.

Dowagiac, Mich.

Iowa Homestead.

How to Manage Robber Bees.

J. J. KIZER.

Next to starvation robbing is the worst trouble with the bee-keeper. Many a colony of bees has been destroyed by others carrying off every particle of their stores, leaving them either to follow the robbers home, or starve in the hive, in either case causing the loss of a colony of bees to the owner. Even then the trouble does not stop, the robbing colony becomes very strong, either by accession of the robbed bees, or by an increase of brood-rearing, or both. When so strengthened, no ordinary colony can withstand their attack. They also become very cross, sometimes stinging and fighting apparently just for the fun of the thing, which is always a symptom of something wrong, but not invariably a sign of robbing, but an effect.

Signs.—*First stage.*—Great commotion in front of hive; bees fighting and some trying to effect an entrance to inside of hive. *Second stage.*—Bees rushing out of hive, running to edge of alighting-board, arising from there with difficulty, caused by being heavily loaded. If you do not recognize robbing by these symptoms to a certainty, catch one of those heavy fellows leaving the hive, pull him apart and see if his honey sack is filled; if so, set it down as a case of robbing in its second stage.

Preventions.—As usual with nearly all our troubles, an ounce of prevention is better than pounds of cure. First contract the entrance of each colony according to its strength; very weak colonies just so that what few bees fly from the hive can pass. See that the size of the entrance is regulated on the inside of the hive by a stick that will pass under the whole thickness of the hive, so the point of attack which is on the inside shall be narrowed down to the minimum, but see that they do not become stopped.

Under no circumstances let any bee get a taste of honey outside of its hive, either by leaving honey about

the house, or by leaving frames exposed while working with the bees, or by access to hive in which the bees have died, leaving honey. This is important any time in the season.

Remedy.—There are many ways to stop robbing, sometimes one way is best, sometimes another. Some recommend carrying the attacked colony into the cellar. I do not like this plan for reasons too tedious to state. Some prefer to put straw, hay or grass over the entrance, and throw water into the entrances of the robbing hives, also giving the robbers a shower at the attacked colony, this will generally have a good effect. I prefer to tack a wire screen two inches wide and as long as the width of the hive over the length of the entrance, leaving only a very small hole for the bees to pass. This screen will admit air, so the bees will not come out and cluster on the outside of the hive, giving the robbers full sway. If this arrangement does not answer, stop even the small hole in the wire screens until dusk, then let out robbers, stop the small hole again, and leave it so two or three days, when you may consider the colonies reasonably safe. It may be necessary to say that smoke will have to be used in these manipulations.

For the American Bee Journal.

Golden Honey Plant.

DR. G. L. TINKER.

The bees did not get down to business upon the golden honey plant until about the 20th. They are now storing in the sections rapidly, and work fully as well, and are carrying in as much honey as they did when the white clover was at its best. So far this season it has been wet and unfavorable for a large yield of nectar in any plant. The fact that the bees are now getting honey in large amount from it, as they did last season when it was extremely dry, will remove all doubt as to its reliability in this section. I find that the bees get very little pollen from it. For five miles down the river there are scattering plants along the roadside. In passing along I have not failed to see bees upon nearly every plant. There is no other plant here in bloom at this time that the bees get honey from to amount to anything.

I am receiving many inquiries in regard to the golden honey plant, and desire to say to those living in northern sections that it is perfectly hardy here at 30 degrees below zero. Its natural habitation is on moist soils, and it is spread to other locations mostly by high water in the river every spring. Owing to the seeds being broadly winged, they readily float and are carried away. I have often seen it growing upon high ground, and think it would spread everywhere if there was a natural way, except by water, of scattering the seed.

It will grow in low thickets, among large trees in deep shade, and in most any location. It often also grows very thick upon the ground, when it crowds

out all other kinds of weeds and grass; yet it is not a very troublesome weed here, nor is it likely to be anywhere. It will grow upon any kind of moist soil, clay, sand or loam, and upon uplands if sown in the fall upon plowed land and brushed or dragged in. As the plant yields a large amount of seed, a small plat will furnish enough the first year to go a long way in further seeding.

The plants from the seed bloom from one to two weeks later than those coming up from old roots.

The compound flowers are yellow, the rays extending about 2 inches, the head being about $\frac{1}{4}$ inch in diameter. The period of bloom extends from the 1st of August to the middle of September.

No kind of stock feed upon it or injure it in any way, except to make paths through it in pastures. It is a weed of no known value except to the honey bee. The honey made from it is somewhat balsamic, and will, undoubtedly, prove to be a superior medicinal remedy for some affections of the lungs. The flavor is aromatic, rich, very sweet, and is preferred by many to that of the white clover; it is also less apt to derange the stomach. The color is a fine amber, and section boxes soiled with it are stained yellow.

New Philadelphia, O., Aug. 24, 1882.

Prairie Farmer.

Selling Honey to Advantage.

MRS. L. HARRISON.

There is nothing a bee-keeper enjoys more than plenty of "clear cash" at the close of the season. This is what he has been aiming for, working and toiling early and late during the year, and the jingle of it is pleasant.

Some apiarists are good producers, but have poor faculty in disposing of the product; others, again, are natural born peddlers—you may push them out of the house, tell them to take their traps and be gone, while they, not abashed, will return and sell you the identical articles you refused to as much as look at, at a good price. Last year we purchased, a few miles from home, beautiful white clover honey, as white as the whitest, for 10 cents per lb., while at the same time, if that honey had belonged to other parties, they would have charged 25 cents per lb. and obtained it. Recently a lady called and inquired how we sold honey. We told her that we had no white clover honey this year, but yellow fall honey, which we were selling at 20 cents per lb. With a toss of her head, she replied, "Mrs. Bragg bought 20 pounds of a farmer lately for 10 cents per lb."

The farmer who keeps a few bees, obtaining them, most likely, by catching a runaway swarm, gives them no attention except living them at swarming time, and putting on surplus boxes, considers that what honey they make is clear gain, as "they work for nothing and board themselves." When he takes off his honey,

if he has more than his own family needs he takes it to the nearest town and offers it, either at a grocery, or to a friend, for sale. When the question is asked, "How much do you want for your honey?" he replies, in a careless way, "I don't know anything about the price of honey; give me whatever you think it is worth! Is 10 cents per lb. too much? Suit yourself about the price; I'm not at all particular." So the bargain closes.

Persons who depend entirely upon the product of bees for a living, have reason to dislike this class of bee-keepers. If a farmer has an animal for sale, a fat steer or pig, he will demand the highest price, even to the fraction of a mill, and the same way if it is hay, corn, or oats; but if these lords of the soil have honey, butter, or a chicken for sale, feel that they are in little business, hurry through it as quickly as possible, and get out of sight.

We have known bee-keepers to come to this city with a wagon load of honey, try to sell it at one grocery, telling, by the way, that they were in a great hurry to be back at home. After trying several groceries they came to the conclusion that honey was poor sale. These grocerymen understand their business. They make their living, as the Dutchman says, "by buying *sheep* and selling *dear*." In a short time, with the help of the telephone, all the dealers are informed that there is a big load of honey in town, and that by holding off, it can be purchased at a low figure. We once inquired of a groceryman how much he paid for his honey. He said, "O, there was a fellow who came to town with a big wagon load, and some more of us bought him all out, at 6 cents per pound all round." If these persons had come to town and stored their honey in a safe place the first thing, and then taken samples of it—white, yellow, dark, and extracted, as the case may have been—and dropped in at different places, where they wished to purchase their own supplies, looking at the goods, inquiring the prices, and remarking, "I must purchase before I go home, but I have something to sell," they would have realized double for their honey. If it was at a harness shop, and he needed a new whip, bridle, or anything in that line, the dealer, who is always anxious to trade, will probably say to his hands, "Boys, how many of you want some of this honey; this man wants to exchange for our goods." The trade is soon completed, and he leaves, perhaps, for a shoe store, and buys, in the same way, all his supplies, sometimes paying out some money, and again have some paid to him. While buying his supplies he will meet with cash customers, and when his honey is disposed of he will return home, laden with comforts for his family, and with more money than he would have had had it been sold for cash only.

Peoria, Ill.

[A liberal distribution of "Honey as Food and Medicine," will also help in establishing a home market.—Ed.]

SELECTIONS FROM OUR LETTER BOX

Wild Camomile Honey.—We have had a splendid season for increase and for honey. I increased from 18 colonies to 50 by natural swarming, but now the bitter honey comes again to ruin the fall crop. In 1878 I attributed it to horehound, but now I know it comes from wild camomile. I can do nothing with it except for feed in case it is needed, and bring my bees out in the spring strong and fine. It is beautiful, thick, golden honey, and I would like to have your idea, and the suggestions of bee-keepers generally, as to what to do with it.

E. P. MASSEY.

Waco, Tex., Aug. 25, 1882.

[We have never seen a sample of the honey, and hardly know what it is like. It might possibly be used in some branches of manufacture, especially by brewers, but we fear it would be impossible to neutralize its bitterness, so as to make it an article of general commerce.—Ed.]

Gathering a Surplus Every Week.—My bees are "just booming," having had less than a week at a time since fruit blossoms in which they were not gathering a surplus. My last swarm was Aug. 24th, but should have had more each day had not the rain for the past three days kept them back. Sweet clover has been in blossom since June, and gets more plentiful as the season advances, and the same stalks now have ripened seed and blossoms, and lots more to come. Goldenrod is just beginning to blossom. On page 538 of the BEE JOURNAL, the printer makes me say, "93 rather weak colonies." I think I said 9, at any rate, I should have so said.

A. B. MASON.

Wagon Works, O., Aug. 28, 1882.

Bee Matters in Kansas.—Bees are nearly a failure this season too. In May they started off as though they were going to do well, but the cold wave put a stop to their work, and they gathered no surplus until about the 20th of July, and then the weather became dry and hot, and honey came in sparingly. Up to date some of my best colonies have stored 25 to 35 lbs. of comb honey, and others 45 to 50 lbs. of extracted; at the present the flow continues, and will, I think, last until we have rain. I visited Leavenworth city and vicinity on the 10th to the 13th of August, and found most of the bee-keepers disheartened, but their bees had done rather better than ours here, for I helped to take the honey from some of them and found the brood chambers nearly full and very little brood. They are trying to keep up by the times by using the 4x4 $\frac{1}{2}$ sections and Langstroth hives. Please answer the following questions through the BEE JOURNAL and oblige:

1. In sowing Bokhara clover for pasturage with timothy, will it hurt the honey flow to cut it when the timothy is ready to cut for hay? 2. Will it yield honey the coming season if sown this fall? The questions may have been answered before in the JOURNAL, but if so, I failed to see them. We can readily see that we will have to plant for honey. I have 3 kinds of hives—Langstroth, Quinby and American—but I have made the American hive longer, and it now resembles the Quinby, only it is longer than that, and takes 14 frames 12x14. 3. Can I have one-piece sections made to fit these for next season? I am using smaller ones now, filling up the spaces with blocks of wood.

H. J. WARD.

Farmington, Kan., Aug. 22, 1882.

[1. It will retard the blooming a little, but make it more profuse.

2. But very little.

3. Yes; you can have one-piece sections made any size you wish, but you will have to give in advance the exact dimensions of the sections you wish, when they will be made just to your order.—Ed.]

After Honey-Dew.—The honey season here has been very peculiar. White clover was abundant, but it did not yield half a crop of honey. Bees have been very thick on the maples in the forest for several days—are they after honey-dew? I never saw the like here before. There will not be half a crop of honey here in this section, and not half the usual increase. Our bees are working on buckwheat now with a rush. I have heard it said that sweet clover (*Melilotus alba*) does not yield any honey. I have a small quantity in the yard, and the bees have covered it ever since it blossomed. I have watched sweet clover for the last five years, and, taking the seasons all through, after white clover has gone, nothing excels it; any barren land will grow it, if it is seeded. I notice with much regret the death of my old friend, A. F. Moon, with whom I was personally acquainted for several years previous to his going to Georgia. He was one of our noble souls. F. H. FINCH.

Sharon, O., Aug. 21, 1882.

[The bees are undoubtedly gathering honey-dew, not only from the maples, but perhaps from other forest trees. Several references to the abundance of honey-dew this season will be found in the BEE JOURNAL this week.—Ed.]

Encouraging in Kentucky.—I will be able to make a very good report from my apiary, notwithstanding the poor commencement this spring. Bees are doing extremely well now on buckberry, red clover, teasel and smartweed. The goldenrod has made a rank growth, and will bloom profusely. Altogether the outlook is encouraging.

JOHN T. CONNLEY.

Walnut Lick, Ky., Aug. 23, 1882.

Preparing for the Fair.—This has been a good season for honey with me. The spring was very late and wet during fruit bloom, and bees got but little honey, but white clover and basswood were good, and my bees have given me a good surplus. We have had a lull in the honey harvest for a few days, but the fall flowers are just coming into bloom, and if we do not have too dry weather we anticipate a good fall harvest. I find a ready market for all my honey at home. Honey is bringing 18 to 20 cents for comb in sections, and 10 to 12 cents for extracted. The quality of honey never was better; I intend to make an exhibit of bees and honey at our County Fair, also apianian implements. Will it answer to close the entrance of the hive with wire-cloth, or will it be better to make a kind of porch of wire cloth, and attach to the front of the hive, and will it need any ventilation at the top? There has not been much interest taken in honey exhibits by the managers of our Fair, but I am in hopes of working up an interest this fall that will induce them to offer liberal premiums in the future.

A. D. STOCKING.

Ligonier, Ind., Aug. 21, 1882.

[Better bore holes in the sides and ends, over which tack wire-cloth from the inside; then cover the tops entirely with wire-cloth, over which you can place the cover, so that should the bees become quite warm or excited, you can immediately cause the heat to escape from the top. The entrance should be closed with blocks which can be easily removed, to give the bees a flight, if desirable.—ED.]

Method of Dividing.—My queens' wings are clipped. When a swarm issues I watch for the approach of the queen, and catch and put her in a cage. I then open the hive and destroy all the queen cells. Usually, the bees will settle for half an hour or more, then return; soon as they return I move the old hive and put an empty one in its place; I then put one-half of the combs and bees in the new hive, filling up each with frames of foundation, and closing the old hive in good shape, put it where it is to remain. Now daub the queen with honey, raise the blanket or honey-boxes, give a few puffs of smoke, drop the queen in, and slant a board in front of the entrance; I then take a laying queen from a nucleus, clip her wing, and introduce her in the new hive on the old stand in the same way as the first. I rear my own queens this season. I have increased 18 strong and 5 nucleus colonies, making in all 35 colonies and 5 nuclei, in splendid condition. Some swarming nearly every day. I took 22 capped queen cells from one Syrian colony the other day. I can handle my Italians all the time without gloves; but I cannot say that of the Syrians. They are very watchful and frisky, and will defend their stores, of which they will have a good share if any are

to be found. My experience is that they will gather enough more than the Italians to balance their stinging and biting accounts. The honey season here has been good at times. At this date my bees are gathering honey very fast from white and Alsike clovers, corn tassels, catnip, buckwheat and scores of wild flowers. Hearts-ease, figwort and Spanishneedles are very promising, and I am still in good hopes. I have only taken about 200 lbs. of comb honey and 100 lbs. of extracted. The golden honey plant and cleome seed I sowed last winter and spring have not grown; the sweet clover I sowed last fall came up this spring, and some of it is over 3 feet high. I thought it might bloom yet this fall. The days are hot and nights cool. What is the name of inclosed twig and bloom, and what its merits as a honey plant? Bees are on it from early morning till night.

R. M. OSBORN.

Kane, Ill., Aug. 19, 1882.

[The twig and blossoms are a ver-vain, which ranks as a very good honey plant.—ED.]

Wiring Frames.—No more piercing for wiring frames; have some hooks like this 1, $\frac{1}{4}$ inch long under the angle, drive them in top and bottom bars, fasten the bottom-bar in a vise, drive tack in center of bottom-bar, wrap wire around and go to upper right hand hook, then back to next upper hook and down to next and so on, finishing at the point of starting. Let no man stand up and say, "I have been using this for a year," for if he has and not told the public about it he ought to—to—well, he ought to keep still now, at least. No patent.

C. H. DEANE.

Mortonsville, Ky., Aug. 21, 1882.

Shipping Cages.—Mr. E. A. Thomas wishes to know who has had "better success with shipping cages than he has?" Had Mr. Thomas stated the number of queens he has mailed, as well as the number he has lost, it would then be an easy matter to decide who has had better success. I have mailed over 500 queens, and only one reported dead, and 2 others injured. Have sent queens into every State (California the farthest, also to Canada). The report comes back, bright, lively and in fine condition. I heretofore made my cages too small, and the loss has been heavy. I now make them twice as large as I did last year. I found it very discouraging business last year, but now all is changed, and no queens are reported dead or not received. I put 4 parts honey and one part water to fill the sponges with. Thus the bees are supplied with water as well as honey. I do not think water necessary to keep the bees alive, but use it, as all honey soon dries on the outside the sponge and the honey will not come to the surface, as it will when water is mixed with it. My cages are only a block of wood sawed out of plank $1\frac{1}{2}$ inches thick; they are sawed $\frac{3}{4}$ inch thick; after the holes are made I nail a cover

$\frac{1}{2}$ an inch thick on one side, after the sponge is put in; I then nail a piece of wire-cloth over the other side, and when only one queen is to be shipped, the wire-cloth side is covered with a piece of wood exactly like the one nailed on the bottom side, excepting it has a $\frac{3}{8}$ inch hole made in it for ventilation. Any one having bad luck in shipping queens had better try my cage. Will mail one free to any one applying for them.

HENRY ALLEY.

Wenham, Mass.

Speed of Bee's Flight.—Please name the accompanying flowers. They grow on a bush from 2 to 7 or 8 feet high; are very plenty in this vicinity in moist and swampy lands. In 1880 bees stored more honey from this than from everything else combined. Bee hunters call it white blowens and also pepper bush. I saw in a piece written by Mr. Heddon for the BEE JOURNAL, "We are told bees fly from 1 to 4 miles in a minute." I would ask, who tells it, and how do they prove it? I never knew any to fly at any such rate, and I have timed thousands.

C. E. CHACE.

East Freetown, Mass.

[The sprig of blossoms sent are what in the Western and Central States are called yellow-weed or yellow-bush. The time of a bee's flight, we think, is pretty much a matter of guess-work; some have accredited them, too, with visiting honey pastures as far as seven miles away from the hives.—ED.]

Honey-Dew in Iowa.—That honey wave I spoke of July 17, still hangs over us in Iowa. I never saw anything to excel it, every weed seeming to secrete honey. Smartweed takes the lead, then honey-dew beats anything I ever heard of. For the last 20 days I have seen the leaves on the oak, hickory, elm, cottonwood, ash, walnut, sumac, and in fact, most every kind of timber in this section, dripping with honey-dew. A bush three inches thick, with a common sized top, has the appearance of having had a gallon of honey spread over the leaves. I have spent a part of 3 days trying to find from whence it comes. From the best of my experience, I must think that it is produced by insects. On close examination, I find a small, light-green insect under all the leaves that I have examined—the smallest hardly visible, while the largest is larger than a large gnat, with silver-colored wings. I will not attempt to give the amount, but will only say that I have taken a barrel full of honey-dew honey, and wish it would be the last, especially if we have other honey flowers. This honey is very dark and strong. I sold some before I knew what it was, for buckwheat honey, and am afraid it will injure my honey sales. I am introducing extracted honey in our market, and find some trouble, not much. Some say that people have recipes for making honey. I had more trouble

with linden honey. 1. What occasions honey-dew? 2. What color is the honey? 3. Is it wholesome for winter? Bees are swarming every day, from 1 to 4 swarms. I have 53 colonies and 1,035 lbs. of honey from 19 colonies in the spring, and sometimes almost wish for the honey flow to stop till I can catch up.

WM. MALONE.

Oakley, Iowa, Aug. 26, 1882.

[1. In your case, you have pretty well answered "what occasions honey-dew." On page 556 we answered the question for Mr. Wm. Sturgill.

2. Sometimes quite dark; at other times amber-colored.

3. We would not wish to risk it for wintering on.—ED.]

Manum's Hive.—I wish to correct what is probably a mistake of the compositor in giving the dimensions of A. E. Manum's frame, which reads "22 inches long and 9½ deep." It should read 12x9½ inches inside. It is on page 539, Aug. 23d. According to my limited experience, Mr. Manum's hive is of very simple construction, and very easy to handle bees in. All you have to do, is to turn back the cap and remove the cloth from the brood chamber, and raise the frames with as much convenience as though it was a simplicity Langstroth. I am much pleased with your answers to my questions in regard to swarming, etc. Twenty years ago there were hundreds of swarms of bees kept where there is now hardly one, in this section. In many instances those who kept bees then have never seen a frame hive, and know comparatively nothing of the modern improvements. They are afraid to expend a dollar or two for a book or paper to learn from.

A. P. FLETCHER.

Ludlow, Vt., Aug. 27, 1882.

An Error.—I notice in the BEE JOURNAL of Aug. 23d, page 539, you have made an error in giving the size of my frame, in answering Mr. A. P. Fletcher. You say my frame is 22 inches long; to be correct it should have read 12 inches long by 9½ deep, inside measure. This has been the poorest honey season I have ever experienced.

A. E. MANUM.

Bristol, Vt., Aug. 26, 1882.

[It was a typographical error, such as are easily committed, but sometimes lead to prejudicial impressions.—ED.]

A Suggestion.—Bees have not done well in our part of the country. I think it would be a very interesting feature in the National Convention to have some of the different makes of mills at work manufacturing foundation at some time during the meeting. It would greatly help those desiring to buy to decide which kind they would like best. It is my intention to be there, and I hope to see some machines working.

JOHN CRAWFORD.

Pleasant, Ind., Aug. 28, 1882.

Honey-Dew.—I send you specimens of honey-dew on the leaves of the paw-paw, that I picked in the woods this morning. It is very abundant, and is mostly under the maples—is general through the woods. Bees are gathering it industriously, and building out foundation in a most satisfactory manner. It is not confined to any particular leaves.

H. R. BOARDMAN.

East Townsend, O., Aug. 30, 1882.

[The honey-dew was nearly absorbed from the leaves into the paper inclosing them; on a very few there was a glistening spot which showed its presence, but even these had evaporated and entirely disappeared after 12 hours' exposure to the atmosphere, from which we conclude there is very little saccharine matter about the honey dew.—ED.]

Botanical.—I send plants for name. No. 1 grows 6 feet; No. 2 grows 5 to 6 feet; No. 3, 2 to 4 feet; No. 4, 3 to 4 feet; No. 5, 5 feet; No. 6, 5 to 6 feet. All these plants grow on dry soil except No. 3, which grows on rather moist soil.

J. W. PIGE.

Riverside, Iowa.

[No. 1 is figwort or Simpson honey plant; No. 2 is a stranger to us; No. 3, blue vervain; No. 4, motherwort; No. 5, yellow-weed; No. 6 is a vervain.—ED.]

On the Wing.—I took a drive through the woods this morning, and honey dew was abundant on the leaves of hickory and oak trees. As I sit and write I look across the divide, and see the leaves shining with nectar, so plentiful that a clear drop forms at the terminal of the leaves. Many fields are yellow with the bloom of Spanishneedles, and white clover is rank and blooming. Bees are swarming, and from present appearances, this locality will be favored with a large honey flow this autumn. On the wing.

MRS. L. HARRISON.

Downing, Mo., Aug. 25, 1882.

Large Increase.—The bees are now booming. We have had, the last two weeks past, the best honey weather we ever had. This has been a very good season for increase, and bees are now storing honey very fast. I have increased from 56 to 230 colonies, and will not look for so large a crop of honey as if I had increased less. My bees have, however, enough honey to winter on, and should the weather hold favorable a reasonable time, I will expect a fair average crop.

H. S. HACKMAN.

Peru, Ill., Aug. 28, 1882.

Too Much Swarming.—My bees are doing well. They swarmed too much the 1st of August, but have got down to business now, and I expect a good crop of honey.

JOHN ERWIN.

Louisville, Ill., Aug. 25, 1882.

Bees and Crops.—Surely Providence has smiled upon our Lone Star State this year. Wheat, oats, corn, cotton, and all kinds of fruit in abundance. Sugar cane is doing finely. I have lived here for 25 years, and have never seen a more bountiful crop of everything. A fine yield of honey has been gathered in all parts of the State, except a few of our Southern counties. The linden crop was a failure. My bees gathered enough to keep them breeding up well, and now they are gathering rapidly from what we call milkweed and boneset. Next month goldenrod will commence blooming, and from appearances now we will have a good fall crop. I have had several swarms this month, and am now rearing queens and superseding old ones. We can rear them here until November. I sell most of my honey in Houston and Galveston. In 2 pound glass jars, I get \$3.60 per dozen wholesale, and 6 pound buckets, \$9 per dozen; 1 pound sections, \$15 per 100, and find ready sale for it. Pure extracted honey is fast taking the place of adulterated syrups. I get a great many letters from bee-men in the older States, and take pleasure in answering them all, and will continue to give all the information I can regarding the resources of our State.

J. W. ECKMAN.

Richmond, Tex., Aug. 24, 1882.

Still Swarming.—I have been in hopes, from day to day, that the bees would quit swarming, but they do not. We have had from 1 to 4 swarms every day for the last 3 or 4 weeks, and young swarms will fill a full hive, with little foundation starters, in from 8 to 10 days; and in from 25 to 30 days I have taken out 25 lbs. of surplus honey. Since spring, from 24 colonies, I have increased my stock to 85; all natural swarms. I often put 2 swarms in one hive, on account of being short of hives.

I. W. KOCH, M. D.

Quincy, Ill., Aug. 30, 1882.

One Steady Flow of Honey.—Here in Southwestern Iowa, in the fore part of the season up to linden bloom, about the first of July, we had to feed to keep the bees from starving, and from that time till the present we have had one continual flow of honey, and our bees our now swarming at the rate of from 3 to 6 per day, which is unprecedented here. We put them back as fast as they come out, as there is more profit in the honey than in bees at this time of the year. If it should continue as it is now up till frost, we will be able to send in a large report at the end of the season. We now have 500 two-pound sections about ready, in addition to 200 already taken off from our 27 colonies. I inclose a branch from a small bush that grows here in the woods and fence corners, on which the bees work from daylight till dark. What is it?

S. C. SMITH.

Wheeler's Grove, Ia., Aug. 27, 1882.

[It is Indian currant or coral berry.—ED.]

Notion Store.—Will you please inform me through the BEE JOURNAL of a house in Chicago that wholesales articles suitable for a counter-store—that is, sort of trinkets and notions; or perhaps there is a wholesale store that has a 5c., 10c., 15c., etc., counter; one with a good reputation.

FRANK JUERGENS.

Hutchinson, Minn.

[Yes; Messrs. Butler Bros., 169 Adams street, can perhaps supply you with a catalogue of their goods, prices, etc. We believe their reputation stands very fair.—ED.]

Seeding Basswood.—This spring our bees commenced gathering pollen March 2d, from the elm, after which came fruit bloom, but bees paid very little attention to this on account of the buckeye (*Esculus flava*), one of our forest trees, which was in bloom then. The honey from it is clear and very thin when first gathered. The pollen is dark red. It was in bloom about 3 weeks, but on account of cold and wet weather, bees were unable to work on it more than 4 or 5 days, during which they filled their hives and we obtained some surplus by using the extractor. Our surplus was taken from the white clover, which commenced blooming about the middle of June, and is still in bloom to some extent, but bees do not pay much attention to it, as they are at work on buckwheat bloom. Basswood was almost a failure this season. At what time should basswood seed be planted, and what is the best method to procure young plants from the seed?

FRANK R. ROE.

Jordan, Ind., Aug 28, 1882.

[Plant the seeds in drills as soon as ripe, covering very lightly with sand loam and leaves. Transplant when about one year old.—ED.]

All Right for a Fall Crop.—This has been the poorest season for honey in this section for 10 years. Clover was almost a failure; last year's drouth and the March-like winter killed nearly all of it, and even red clover failed to bloom. Swarms that came off about the 1st of June, and put in empty hives, have to the present only about half filled them. My best colonies that did not swarm, have only gathered about 30 lbs. in sections filled with last year's comb, and I feared very much that my bees would not get enough for winter. We are having a splendid rain now, which will make it all right for a fall crop.

R. B. OLDT.

New Berlin, Pa., Aug. 27, 1882.

Plenty of "Strong" Honey.—Our bees at the present time are doing finely on fall bloom and buckwheat. Our white honey was all gathered from basswood in about 6 days, but if the weather remains as now for 15 days, we will have, as the Dutchman says, plenty of "strong" honey.

O. R. GOODNO.

Carson City, Mich., Aug. 28, 1882.

Bees are Boiling Over.—Bees are now "doing a land office business." They done poorly in spring, but when basswood came in bloom they began breeding faster than I ever knew them to do before. The hives are now boiling over with bees, and swarming is the order of the day, but the old queens do not seem to be so ready to go along. They are also getting honey very fast. Mine are mostly hybrids, and have become so vicious that I have come to the conclusion to either Italianize or quit. I have now 25 colonies.

PETER BILLING.

Pawnee City, Neb., Aug. 28, 1882.

Anticipates a Cold Winter.—My bees have not done well this season—too much rain and cold weather; but they have increased by natural swarming from 8 to 14 colonies, and a little box honey. I look forward to a more than ordinary season next year. I base my calculations upon a good honey season following a cold winter, and if all signs prove true we will get a severe winter the coming one. I have never received any particular benefit from keeping bees yet, except the pleasure the little fellows afford me, but I am going to try it another year and see what I can do.

S. G. REED.

Kent, O., Aug. 23, 1882.

Prospects for a Good Crop.—Bees done better here during this month than at any time this season. We had a number of swarms in August, which is something unusual. It is getting rather dry now, but have prospects for a good crop of goldenrod, asters, etc., a little later, while at present buckwheat and second crop red clover are yielding fairly. Will have some surplus and enough for winter stores. We had very few early swarms, consequently very little increase.

W. H. STOUT.

Pine Grove, Pa., Aug. 22, 1882.

Mammoth White Clover.—I send you a few heads of that wonderful clover. This is the second time it has blossomed this season. It does not grow like any other clover. Bees work on it remarkably. It is of a beautiful pyramidal form, and every head seems perfect, and a beautiful white in nearly every case. I will give a more extended description of it in future.

F. H. FINCH.

Sharon, O., Aug. 28, 1882.

Quite Satisfied.—Hearing of so many failures in New York State we feel quite satisfied with what little our 125 colonies have done this season. We have taken 1,500 lbs. of extracted, and think we will have over 2,000 lbs. of comb honey.

GREINER BROTHERS.
Naples, N. Y., Aug. 28, 1882.

Kept on the Jump.—Bees are just booming. I never saw them work as they have this summer. It has been one continual flow of honey since June 20th. My bees have kept me on the jump since that time.

D. S. BURBANK.

Grundy Center, Iowa, Aug. 25, 1882.

Fertile Workers.—Inclosed find piece of comb taken from a young colony hived about 2 weeks. I find no queen. All fresh comb is as full of eggs as this. Why is this? Did you ever see so many eggs? One laying worker could not deposit so many. Please report on this in the BEE JOURNAL.

P. P. COLLIER.

Rush Hill, Mo.

[The comb is very full of eggs, with, in some instances, quite a dozen in a single cell. We have observed the past season, in a small colony of Syrians, nearly a score of workers depositing eggs at one time, and have expressed the opinion that the conditions necessary to develop one fertile worker, would, if aggravated, develop hundreds.—ED.]

Done Well this Summer.—My bees have done well this summer so far. I started in the spring with 7 colonies, increased to 18, and obtained 420 lbs. of extracted honey. The bees are still gathering honey very rapidly from buckwheat and ironweeds.

DAVID K. KNOLL.

Salamonia, Ind., Aug. 18, 1882.

The Best Honey Harvest.—The honey harvest, since July 10th, has been the best I ever saw.

E. DOTY.

Macksburg, Iowa, Aug. 26, 1882.

Gathering Sweet Clover Seed.—Please state in the BEE JOURNAL how to gather and save sweet clover seed? I have a quantity of it, but do not know how I can save it profitably.

BEN. CLENDENON.

Grinnell, Iowa.

[Mow, thresh and screen it as you would other grain.—ED.]

Make a Home Market.—Since the first of June there has never been a more favorable season for bees, but up till June the bees had a hard struggle to get through. When white clover commenced to open they made up for lost time. Basswood was good. Almost all who take care of their bees obtained 100 lbs. per colony, from the basswood bloom. For the last 2 weeks bees have been working almost as hard as any time this year. I will extract from 1,800 to 2,000 lbs. from 65 colonies this week, all gathered in the last 10 or 12 days. The honey is of first-class quality—thick and nice. I wish every bee-keeper in Iowa would try and dispose of their crop in the State, and encourage the consumption of extracted honey. Put it up in attractive packages, and my word for it, there will be no drag in its sale. Ask what it cost you to produce it, and in proportion with other sweets that are as good as honey. Let every bee-keeper bear in mind James Heddon's article on page 374 of the BEE JOURNAL, entitled "The Coming Market." There is no reason why we should not have good prices for our products, as well as the farmer and mechanic.

H. O. McELHANY.

Brandon, Iowa, Aug. 31, 1882.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about **eight words**; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published **WEEKLY** as follows, if the whole is paid in advance:

For 4 weeks.....	10	per cent. discount.
" 8 ".....	20	" " "
" 13 " (3 months)....	30	" " "
" 26 " (6 months)....	40	" " "
" 39 " (9 months)....	50	" " "
" 52 " (1 year).....	60	" " "

Discount, for 1 year, in the **MONTHLY** alone, **25 per cent.**, **6 months**, **10 per cent.**, **3 months**, **5 per cent.**, if wholly paid in advance.

Discount, for 1 year, in the **SEMI-MONTHLY** alone, **40 per cent.**, **6 months**, **20 per cent.**, **3 months**, **10 per cent.**, if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

Always forward us money either by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Premiums.—Those who get up clubs for the **Weekly BEE JOURNAL** for one year, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,—a copy of "Bees and Honey."
" " 3,—an Emerson Binder for 1882.
" " 4,—Apiary Register for 50 Colonies, or Cook's (Bee) Manual, paper.
" " 5,—" " " cloth.
" " 6,—Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Or they may deduct 10 per cent in cash for their labor in getting up the club.

Binders cannot be sent to Canada by mail—the International law will not permit anything but samples of merchandise weighing less than 8oz.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the **BEE JOURNAL**.

Advertisements intended for the **BEE JOURNAL** must reach this office by Saturday of the previous week.

Emerson Binders.—We have had a lot of Emerson binders made especially for the **BEE JOURNAL** for 1882. They are lettered in gold on the back, and make a nice and convenient way to preserve the **JOURNAL** as fast as received. They will be sent post paid by mail for 75 cents.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey. A new pamphlet of 32 pages. At the last meeting of the North American Bee-Keepers' Society, we were appointed on a committee to prepare instructions on the Exhibition of Bees and Honey at Fairs; this is also added to the above. Price, 10 cents.

Do not let your numbers of the **BEE JOURNAL** for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and **Weekly BEE JOURNAL** for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., September 4, 1882.

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—1 am paying 7c. for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17@22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for honey is quiet. Extracted brings 7@10c. on arrival. No comb honey on the market worth mentioning, prices nominal.
BEESWAX—Scarce, and brings 20@25c. on arrival.
C. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—Choice white comb honey is steady at 18@20c. Some extra nice 1 lb. packages have sold at 22c. No demand for dark combs. Extracted honey in kegs, barrels and casks, 9@10c. Demand better than for months past.
BEESWAX—25c. for prime yellow; dark 18@22c.
R. A. BURNETT, 165 South Water St.

CLEVELAND.

HONEY—There is no change in honey in our market the past week; 1-lb. white honey sells at 22c., 2-lb. at 20c.; second grade, 20c. for 1-lb. and 18c. for 2-lb. Extracted has not moved yet; nominal held at 12@14c.
BEESWAX—Scarce at 25@28c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—We note sales of dark extracted at 7c. and medium quality at 8c. Inquiry has been fairly active. Offerings are small.
We quote white comb, 18@20c.; dark to good, 12@15c. Extracted, choice to extra white, 9@9½c.; dark and candied, 7@7½c. **BEESWAX**—28@30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—We quote at 7@7½c. for strained in bbls. and half bbls., 8@9c. for extracted in cans and kegs; comb, 18@20c. per lb. Larger values of strained and extracted apply to the lesser pkgs.
BEESWAX—27@28c. per lb.
R. C. GREER & CO., 117 N. Main Street.

NEW YORK.

HONEY—No quotations reported.—ED.
BEESWAX—The supply is moderate and prices held about steady, though very little doing. Western, pure, 27@27½c.; Southern, pure, 28@28½c.
D. W. QUINBY, 105 Park Place

BOSTON.

HONEY—Trade quiet. We quote at 20@22c., according to quality.
BEESWAX—Prime quality, 25c.
CROCKER & BLAKE, 57 Chatham Street.

Only a Crape on the Door.—We have just received a copy of a new motto song and chorus, called "Only a Crape on the Door," composed by Edward J. Abraham. This is one of the most touching and affective songs that ever came to our notice. It is very easy, and can be played on piano or organ. It is published at 40 cents, by F. W. Helmick, 180 Elm street, Cincinnati, Ohio.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Articles for publication must be written on a separate piece of paper from items of business.

Advertisements.

New Kegs

FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore prepared kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being pained.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well scalded, the pine will not flavor the honey.

Capacity, 175 pounds. Price, 80c. each.

The first car load of these kegs will arrive about Sept. 14th, and all orders will receive my prompt attention.

The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

923 West Madison Street, CHICAGO, ILL.

Bright Italian Queens.
200 NUCLEI.

Having filled all my orders, I can now send Queens by return mail. My customers say I send the nicest they get.

J. T. WILSON,

36wtf Mortonville, Woodford Co., Ky.

200 COLONIES
FOR SALE.

Tested Queens only in full colonies. Write for prices, and be sure to state if you have or have not over-received my circulars.

I am overwhelmed with letters containing orders for Tested Queens, and inclosing \$2, \$3 and often \$5 each, saying, "Send me one of your best Tested Queens, no matter about color or cost; I want one Tested for business; saw your advertisement in the American Bee Journal." Now, you do not know how happy I feel to thus substantially realize the splendid confidence my fellow bee-keepers put in me, and my new departure in breeding the best bees, regardless of color or number of bands, the more so, that among those ordering are old and experienced apiarists, whose judgment we have learned to look up to; and I feel that here is the proper place to say to them that I cannot possibly supply any more queens of any sort. Tested or Dollar, unless the bees are bought with them by the pound, or the whole colony is taken. I cannot spare any more Tested Queens alone and keep up the standing of my apiary for the rearing of a large number of queens next season. I now have more orders for Dollar Queens than I can fill. I fear. Next year I will try to satisfy all, and will notify you in the advertising columns accordingly.

I consider it now getting pretty late to rear the best Queens to fill the place of those sold out, and think that purchasers had better omit queen-rearing at so late a date. I have found that the best time for the bee-master to rear the best stock is about the time the bees do the best business.

JAMES HEDDON,

Dowagiac, Mich., Sept. 1, 1882.

QUEEN APIARY.

Italian and Cyprian Queens—large and beautiful—sent by mail, with purity, safe arrival, and satisfaction guaranteed. Only \$5.00 per half dozen. Address REV. J. E. KEARNS, Morning Sun, Iowa. 36w1tp

FOR SALE—An Apiary of 1200 colonies, suitable for Extracted Honey. For further information apply to J. MCINTYRE, Stratbrov, Ont. 35w2tp

PLYMOUTH ROCKS.—Exhibition Birds and Bussies. Mated Trios a Specialty. Correspondence cheerfully answered. WM. H. BUSSBY, 131 Lake street, Chicago, Ill. 35m9t

THIS PAPER may be found on file in the Co's Newspaper Advertising Bureau (10 Spruce St.), where advertising contracts may be made for it in NEW YORK.

AT LULING, TEXAS.

I breed PURE ITALIAN BEES AND QUEENS for sale; manufacture Hives of any style and Comb Foundation. Dealer in Novice Honey Extractors, Bingham Smokers, and everything used by modern bee-keepers. Write for prices. Bees-wax wanted. 14w39t

J. S. TADLOCK.

FLAT-BOTTOM

COMB FOUNDATION.

high side-walls, 4 to 16 square feet to the pound. Circular and samples free.

J. VAN DEUSEN & SONS,
Sole Manufacturers,
Sprout Brook, Mont. Co., N. Y.

BEESWAX.

I wish to buy a quantity of good yellow Beeswax. I am paying 25c. per pound delivered here, Cash on arrival. Shipments solicited.

To avoid mistakes, the name of the shipper should always be on each package.

Dunham and Root Foundation a specialty.
Italian Queens and Bees from March to November.
Send for my Illustrated Catalogue.
5mtf **PAUL L. VIALLO**, Bayou Goula, La.

Italian Bees, Queens and Sections.

Untested Queens, in May, \$1.50 each; in June,
\$1.25; July and after, \$1; per dozen, after July 1,
\$10. Sent by mail, with directions for introducing.
Italian bees by the half pound, same price as un-
tested queens. One 2 comb nucleus, without
queen (Gallup frames), in May \$3, June \$2.50, July
and after \$2; 2-comb nuclei, with the standard
Langstroth frames, 25 per cent. more. Sections—
Planned dovetailed sections, 4 1/2 x 4 1/2 x 1 1/2, \$4.50 per
1,000; 5 1/2 x 5 1/2 x 1 1/2, \$5 per 1,000. Sections of this
thickness do not need tins between them to insure
straight combs, and the bees can ripen up and seal
honey faster than in combs with deeper cells. See
testimonials in March number of *Gleanings*. Please
remit by P. O. money order, by registered letter, or
by draft on New York or Chicago. Address,
O. H. TOWNSEND,
19mtf Kalamazoo, Kalamazoo Co., Mich.

**A NEW BEE BOOK!
Bees & Honey**

OR THE
Management of an Apiary for Pleasure
and Profit; by

THOMAS C. NEWMAN,
Editor of the *Weekly Bee Journal*.

It contains 160 profusely illustrated pages, is
"fully up with the times" in all the various im-
provements and inventions in this rapidly devel-
oping pursuit, and presents the apiarist with
everything that can aid in the successful manage-
ment of the honey bee, and at the same time pro-
duce the most honey in its best and most attrac-
tive condition. Chief among the new chapters are
"Bee Pasturage a Necessity," "Management of
Bees and Honey at Fairs," "Marketing Honey,"
etc. Price, bound in cloth, **75 cents**; in paper
covers, **50 cents**, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

- Carefully prepared for beginners.—Farmers
Cabinet, Amherst, N. H.
- A very valuable work to those engaged in bee-
raising.—News, Prairie City, Iowa.
- We advise all who keep bees to send for this ex-
cellent work.—Journal, Louisiana, Mo.
- Its chapter on marketing honey is worth many
times its cost.—Citizen, Pulaski, Tenn.
- Carefully prepared, and of vast importance to
bee-raisers.—Indianian, Clinton, Ind.
- A neat and abundantly illustrated hand-book of
apiculture.—American Agriculturist, N. Y.
- New and valuable, and embellished with 169
beautiful engravings.—Democrat, Salem, Ind.
- Much practical useful information, in a cheap
form.—Daily Standard, New Bedford, Mass.
- Contains all the information needed to make
bee-culture successful.—Eagle, Union City, Ind.
- Just such a work as should be in the hands of
every beginner with bees.—News, Keitsburg, Ill.
- A valuable work for all who are interested in the
care and management of bees.—Democrat, Alle-
gan, Mich.
- The most perfect work for the price ever yet pro-
duced on the subject of bee-culture.—Anti-Monop-
olist, Lebanon, Mo.
- The engravings are fine. It is gotten up in the
very best style, and is cheap at the price.—Farmer,
Cleveland, O.
- It comprises all that is necessary for successful
bee-culture, save experience and good judgment.
—Daily Republican, Utica, N. Y.
- A manual, containing all the newest discoveries
in the management of these little workers.—Plain
Dealer, St. Lawrence, N. Y.
- Full of practical instruction, that no one who
contemplates keeping bees can do without.—Farmers'
Journal, Louisville, Ky.
- Gives minute details for the management and
manipulations necessary to make bee-keeping a
success.—Col. Valley and Farm.
- It embraces every subject that can interest the
beginner in bee-culture. The engravings perfectly
illustrate the text.—Farm and Fireside, Spring-
field, O.
- Embraces every subject of interest in the apiary,
giving very thorough details of the management
and manipulations necessary to make bee-keeping
a success.—Farm, Longmont, Colo.
- Written in an interesting and attractive manner,
and contains valuable information for all readers,
even though they be not directly interested in the
care of bees.—Sentinel, Rome, N. Y.
- It is a valuable and practical book, and contains
a complete resume of the natural history of the
little busy bee, as well as of all that one needs to
know in their care and management.—Chicago
Herald.
- Describes all the newest discoveries in the art,
by which the production of delicious and health-
giving honey is obtained, as well as how to prepare
it for the market in the most attractive shape.—
Signal, Napoleon, O.
- Contains a vast fund of information in regard to
bee-culture. He who would keep abreast of the
times must keep posted in all the improvements in
his line. We advise all interested to get a copy of
this book.—Daily Times, San Bernardino, Cal.
- It embraces every subject that will interest the
beginner. It describes all the newest discoveries in
the art by which the production of delicious and
health-giving honey is obtained, as well as how to
prepare it for the market in the most attractive
form. It is embellished with beautiful engravings,
and is the most perfect work of the kind, for the
price, that has ever come under our notice.—Farmer,
Lancaster, Pa.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal stand for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$8 00
For 2 Langstroth " 10x18 "	8 00
For 3 " " 10x18 "	10 00
For 4 " " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " " 12x20 "	12 00
For 4 " " 13x20 "	16 00

The Bee-Keeper's Guide; OR, MANUAL OF THE APIARY, By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

—:o:—
320 Pages; 133 Fine Illustrations.
—:o:—

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

—:o:—
Read the following opinions of the Book:

All agree that it is the work of a master and of real value.—*L'Apiculture*, Paris.

I think Cook's Manual is the best of our American works.—**LEWIS T. COLBY.**

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—**J. P. WEST.**

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—**E. H. WYNKOOP.**

This book is just what everyone interested in bees ought to have, and which, if one does not own it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—**A. E. WENZEL.**

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—**Wm. VAN ANTWERP, M. D.**

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record*.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—**L'ABBE DU BOIS**, editor of the *Bulletin D'Apiculture*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Pulaski, N. Y.

We have perused with great pleasure this *vade mecum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor*.

EARS FOR THE MILLION!

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carclarodon Rondelleti*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many an seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CHARACTER ABSOLUTE. AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by THOMAS G. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide or, Cook's Manual of the Apiary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quoby's New Bee-Keeping. by L. C. Root.— The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture. by A. I. Root.— This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book. by A. J. King.— This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee— This is a standard scientific work. Price, \$2.

Blessed Bees. by John Allen.— A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit. by Thomas G. Newman.— Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Hienen Kolthur. by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Bzierzo Theory.— presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine. by Thomas G. Newman.— This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.— This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price, 10c.

The Hive I Use.— Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.— A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity. by Thomas G. Newman.— Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers. by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Kendall's Horse Book.— No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Chicken Cholera. by A. J. Hill.— A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc. of vast utility to every Mechanic, Farmer and Business Man. British Bee-Keepers' Association.

At the 8th annual exhibition of this society, held at the Royal Horticultural Society's Gardens, at South Kensington, Aug. 2-8, the attendance was large and enthusiastic. Entries for premiums were made in 42 classes, there was a spirited and creditable competition among exhibitors, and the number of premiums awarded averaged between 3 and 4 for each class, embracing almost everything useful and ornamental about an apiary. We have only space to enumerate the names of the successful contestants for premiums in some of the leading classes: Best colony of Ligurian (Italian) bees, Messrs. Neighbour & Son; best colony of English bees, T. B. Blow; best colony of any other variety, T. B. Blow, for Carniolans; best observatory hive, stocked with bees and queen, Messrs. Neighbour; best movable-comb hive, complete, for summer and winter, F. Search; best frame hive for general use, Messrs. Dines; best and cheapest frame hive, for cottagers' use, Messrs. Dines; best straw hive, T. Sells; neatest and best rack, Messrs. Abbott Brothers; best rack for use on a straw skep, T. B. Blow. Nine classes were devoted to surplus, the first premiums in which were taken respectively by J. H. Brown, H. S. Heath, W. Woodley, J. H. Brown, A. Rusbridge, Miss Gayton, J. W. Measures, K. Allen, and Miss Gayton, Messrs. Abbott Bros. took all the prizes offered for foundation, in three classes. For the best mead, metheglin, etc., T. W. Cowan took 1st and 2d prizes. Best collection of bee furniture, etc., Messrs. Neighbour & Son. In the driving contest, the

first prize was awarded to J. K. Filber; second, J. Walton; third, W. Martin.

Professional Apiculture.

The Prairie Farmer, in a late issue, indorses the whole ground recently taken by the BEE JOURNAL in favor of the establishment of an Apicultural Department in the Illinois Industrial University. The Farmer closes its able article by remarking that "if apiculture is taken up at the Champaign University, the professor, whoever may be selected, should know something practically about the business, and not work upon mere theory, as is too often the case with those who think themselves scientists, but who in reality are mere followers of scientific theories." In our opinion, Prof. Burrill is just the man to organize and conduct this Department successfully. At all events, we know of not another in whose ability we have the confidence that Prof. Burrill's name inspires.

We sincerely regret to learn of the indisposition of Mr. Heddon. In a note from him, he says his advertising in the BEE JOURNAL has deluged him with a flood of letters and business correspondence which he finds impossible to answer personally, and that his supply of queens has been exhausted, except where accompanied by the full colony or bees by the pound. His advertisement in this number pretty clearly explains his embarrassment.

Persons desiring excursion rates to attend the Bee-Keepers' National Convention can, upon application to Mr. C. F. Muth, Cincinnati, O., obtain a circular giving the names of the different roads and reductions in fare during the great Exposition.

Evils Correcting Themselves.

A recent exchange says "the glucose factories are slowly but surely succumbing to the inevitable, and closing up. The Des Moines factory ran two or three years, and has gone to wreck or after using up \$90,000 of cash capital."

"History is but repeating itself." As "murder will out," so will great wrongs correct themselves, and vile and dishonest corporations become so arrogant and burdensome as to hasten their own destruction, and the public good. When glucose, as a commercial product, was first brought to the public notice, much was expected from it as a cheaper substitute for cane and other sugars, in many uses where it could be made to answer without prejudicing public health and corrupting the morals of society; and perhaps at that time it was honestly made and wholesome, but competition was soon stimulated, unscrupulous men became engaged in its manufacture, greed usurped the place of conscience, deception and fraud were resorted to in its use, plausible stories and pious cant were employed to popularize it with the public, poisonous acids and deadly chemicals helped to cheapen its manufacture, and it was forced upon the consumers by "fair means and foul," till its use became a matter of necessity, as nothing could be purchased that was free from its taint. New and dangerous diseases were traced directly to its use. Complications arose which baffled the skill of physicians—they could surmise the cause, but could not prescribe the remedy. Strong men and women became afflicted with chronic complaints, but no cure was inaugurated; children were poisoned with it, but there was no law to punish the murderers; and everywhere the papers teemed with cases of cheese poisoning, etc., but nothing could be done to punish the manufacturers of the poisonous, vile stuff, and the merchant continued to vend the spurious goods under an honest name, because a genuine article could not be obtained.

And in all these dishonest practices the consumer is not the only person who has suffered, although perhaps the principal sufferer, because he has suffered pecuniarily as well as physically—his health has suffered with his pocket. The honest producer has often been driven from his occupation, and forced to quit business, or himself become dishonest. Sugar refiners who would have been above de-

ception, have themselves gone largely into the adulteration business rather than suffer financial ruin; dealers in syrups and honey have sold tons of poisonous compounds as silver drips, golden syrup, rock candy drips, maple honey, strained honey, maple syrup, etc. Dairymen have used the poisonous meal to feed their cows, and supply dealers have sold the glucose to feed to bees. In each case its use has incurred a penalty, and generally the penalty has been paid by somebody.

Thank heaven, the people are becoming educated to a realization of the wrongs which have been perpetrated upon them. Farmers are making their own syrups, and using less sugars; families are buying honey from those they know to be honest; parents are denying their children the poisoned confectionery which has so often entailed a doctor's visit and bill; and the consumption of glucose under various respectable names is so greatly on the decrease as to threaten the majority of the manufacturers with bankruptcy.

We are assured by a person in this city who uses honey largely in manufacturing, that he purchased several barrels of what was guaranteed to be *chemically pure* (whatever that means) honey. One of his employees, by some oversight, one evening left a portion of a barrel of it uncovered, and during the night an unfortunate mouse in quest of plunder accidentally became submerged in the stuff. In the morning the workmen found the poor mouse floating around in the liquid, still alive but quite exhausted; they lifted it out, but found the hair completely eaten away from its legs, body and neck. On the head and ears the hair still remained, presenting a very laughable, as well as instructive sight. If poisonous glucose will cause cheese to "rot down in thirty days," and skin a mouse alive in twelve hours, what will it not do with the human stomach if its use is persisted in?

We can sympathize with those who meet with financial reverses, if engaged in honest, commendable business enterprises, but greatly fear we feel an inward chuckle of delight whenever we read of disaster overtaking these traffickers in the "unclean things."

When changing a postoffice address, mention the *old* as well as the new address.

The Market Seeking the Producer.

Less than one year ago, the BEE JOURNAL advised its readers that in the near future the market would as eagerly seek their product as then did the general market seek the producers of butter, cheese, etc., and that with a choice article to dispose of, cash could easily be realized, at paying figures. The prediction has been verified even sooner than we had dared to hope. Several weeks ago California was eagerly visited by agents of several extensive European houses, anxious to buy up almost fabulous amounts, and at handsomely paying prices; but they met with disappointment, as the season has not been so good in that State as was earlier anticipated. Honey in San Francisco now brings as high a price as in the principal markets of the Atlantic States, and offerings are very small at any price.

On Tuesday, Sept. 4th, we were pleased with a call from Mr. F. L. Ripley, a member of the old and reputable house of Crocker & Blake, 57 Chatham street, Boston, Mass., who is making an extended tour of the West, buying up full crops of honey from first hands—producers. He reports the honey crop in New York is not altogether a failure, and gave the names of several extensive beekeepers who had realized very satisfactory yields of choice white honey, and for which they were expecting high prices.

With but occasional exceptions, the crop is quite large throughout the country, the grade generally extra good, and the movement lively, but the season for rapid sales is yet quite early. October is usually the best month for effecting sales and realizing prices, as till that time more or less of doubt prevails in the minds of both seller and buyer regarding the extent of the crop and what should constitute a fair valuation. Producers should feel no anxious doubts, and above all, make no sacrificial sales; but fairly determine upon a remunerative price for their honey, and insist upon receiving that amount. From all the principal cities our commercial correspondents report choice A 1 honey fairly active, and prices good, though not exorbitant.

We regret to state that Mr. Frank Benton has lost his little girl, Thekla. She was born in Cyprus, and died in Beyrout on July 5, 1882.

Preserving Late Swarms.

Jas. N. Tucker, East Killingly, Ct., writes Sept. 4th :

Aug. 26 I had a medium swarm issue from a previous swarm of the present season. This last swarm I know contains the laying queen and as she is a young queen reared the present season, very prolific, a purely mated Italian, and her progeny are good workers and gentle, I would like very much to save the colony; but as they came out unexpectedly, I was not well prepared with foundation, etc., and, as at this rather late period in the season I disliked to weaken any of my other colonies to strengthen this one, I hived them in a Langstroth hive containing 9 frames, one only of which was a frame of brood, the remaining 8 containing only one inch starters of worker foundation. Thus far, as considerable late buckwheat has been in bloom, and as my bees have worked considerably on red clover and upon fall flowers, I have only fed about $\frac{3}{4}$ lb. of granulated sugar syrup each night; but from date I intend to feed $1\frac{1}{2}$ lbs. each night. 1. With this treatment, what ought to be their condition October 1st? 2. What further feeding will they be likely to need after that date to insure wintering? 3. Will they need to be fed any substitute for pollen, and if so, what and how? 4. Ought I to have done differently in any particular from what I have done? 5. Would you suggest any change in the programme? Perhaps by advising me, through the columns of the BEE JOURNAL, you will also advise many others somewhat similarly situated, and will provide us for like emergencies in future years.

1. Had you given the frame of brood and 5 frames with starters, then, as fast as the combs were built down given a frame each third or fourth day, we think their condition would perhaps be better Oct. 1st.

2. They will need feeding till there will be at least a store of 30 pounds for winter. It is probable the queen will keep up breeding till very late, and there will be much larvæ in the combs at above date, all of which, together with young bees emerging from the cells, will require more food than old bees.

3. No; bees will find plenty of pollen, or a substitute more acceptable than any you can give them.

4. You might have given the swarm, when well established in the new hive, at least 5 combs well built out, and supplied the frames with starters to the colonies from which you took the combs.

5. Only the above. Aug. 26 is quite late, very late, to hive a swarm and expect to build it up strong enough for wintering. Everything

must be the most favorable, with not one adverse circumstance, to insure success, and every help which experience or judgment may suggest, should be employed.

Indiana State Fair.

We have received a complimentary ticket to the Indiana State Fair, to be held at Indianapolis, Sept. 25 to 30. We shall not be able to attend, but hope the Fair, with its bee and honey show will be a grand success. The managers remark as follows :

The managers of the coming State Fair, commencing Sept. 25, express great encouragement from the bright prospects for success by the early opening up of the business connected therewith; the anxiety of old exhibitors to secure more space and the several applications to erect special buildings on the grounds for exhibition purposes at private cost.

The indications are such that in order to meet the requirements, 150 new horse stalls are being made. The stables and pens for other stock remodeled and put in complete order that exhibitors and visitors may realize comfort and pleasure. The gradual growth and increased interest manifested in the State Fairs, and the kindly expressions from exhibitors who represent large manufacturing establishments at the principal Fairs, the bountiful harvest now gathered, and a season of abundance in prospective, gives every reason to hope for an improvement on any former year, and the assurance that the Indiana State Fair can be made to rank first on the list of Fairs, as the State is now first in the production of wheat, and second to no other State in all the requisites of human prosperity.

Arrangements are pending for special attractions during the Fair in addition to the large premiums on speed.

All the State Institutions at the Capital City will be prepared to receive visitors during the Fair week, and this will be a rare opportunity, at reduced railroad rates, to visit the new State House, in process of construction.

Mr. C. F. Muth, writes to the BEE JOURNAL from Cincinnati, Sept. 6. "Please tell all bee-keepers that I will receive any and all goods destined for the National Convention, to be held Oct. 3-5, in our city, free of all charges. No expense for drayage to or from the depots—no charges for storage. All I ask is that the goods be prepaid to our city. The prospects for a good meeting are flattering to the best of my judgment." We anticipate there will be a good display of bees, honey and implements at the National Convention.

MISCELLANEOUS.

Old Fogy Bee-Keeping in California.—The Semi-Tropic California gives the following account of some of it :

In Los Angeles county there is a stretch of foot-hills four or five miles in length with a large variety of "bee feed" where there are live or six separate apiaries, varying in elevation from 1,200 to 2,500 feet, and there is ample range for all. These apiaries have been established from five to ten years, and so far as I can learn there has not been one-half dozen queens bought and introduced in all these apiaries in all these years, and little or no effort made to rear queens to replace old, worn out queens or to supply queenless colonies. In fact the bees seem mostly left to "run" themselves. To save trouble and combs from moths, the top boxes are left in all winter and if the swarm is weak they have a slim chance to rear brood with all that space to warm during the cool days and nights of early spring, and the brood may be chilled, die and be mistaken for foul brood.

In the apiaries referred to there has been but little swarming since 1878, and of course most of the queens are three to four years old which accounts in part for the five to twenty per cent. loss last spring, and the loss from this cause will probably be greater next spring than last as a queen is not supposed to live more than three to four years, and to be generally quite unprofitable after the third year. In some of these colonies the bees have or will supersede their queens, while the very large majority probably will not. Even supposing they were all superseded the queens would not be nearly as prolific as though reared from young prolific queens of no relations to the apiary, besides had there been early introductions of one or more good Italian queens the yearly yield of honey ought to have been much greater, to say nothing of the increased present value of the apiaries. The majority of these bee-keepers don't believe in "fussing" with bees. After breeding commences in spring they "go through" the bees, look at the brood chambers, double up the weak ones and they are done with the "bottom boxes" for that season, and if the queen, as is often the case, makes a brood-chamber of the top box they take what honey they can get from said upper story because it will not do to disturb the bottom box. They will tell you that Eastern bee papers are of no use here and will generally say that bee-keeping will not pay in California. If such men would subscribe to two or three good bee papers, they would be surprised to see how much a little good bee literature will assist to make the busi-

ness profitable. These men, it seems, generally affect to ignore written or printed experience or suggestions; they have "no use" for book bee-keeping and then wonder why the bee business don't pay. J. H. B.

Care of Comb Honey.—J. L. Bowers writes to the *Maryland Farmer* the following on the care of comb honey:

Do not on any account store honey in a cellar, the dampness causes it to sweat and then the cappings will break and you have a lot of ruined honey. Our honey room is in the second story of our house and will hold two tons. It is 6x10 feet and 9 feet high, with two doors, one on each side; one opening from the hall, the other opening into a room over a porch. This room has one window. Here we put our honey first to let it harden, keeping this room light, after exposing to the light about two weeks, we place it in the honey room. Never on any account place more than two boxes on top of one another, but place shelves above each other on the order of a library. If little red ants bother honey, place the honey on a bench and put each leg or foot in a pan of water, and my word for it, if you keep water in the pans, no ants will bother the honey. Our honey room is as dark as anything can be made to be.

Honey Ants Employ Slaves.—The *Scientific American* contains the following concerning some curious habits of honey ants:

Sir John Lubbock's extraordinary book on "Ants, Bees and Wasps," will amaze readers. Fancy ants having slaves! Fancy these proverbial examples to the sluggard keeping certain insects as we keep cows, and building sheds over them, and keeping others as pets! The aristocracy of ants seem to have all the vices which brought antique monarchies to destruction. Sir John writes soberly, as a philosopher should, and weighs his words no doubt, which makes his conclusions the more astonishing. The author quotes some of Huber's experiments, the value of which he has himself tested. The bloated ant aristocrats, it is said, "have lost the greater part of their instincts; their art, that is, the power of building; their domestic habits, for they show no care for their young, all this being done by the slaves; their industry, for they take no part in providing the daily supplies; if the colony changes the situation of its nest, the masters are all carried by the slaves on their backs to the new one; nay, they have even lost the habit of feeding. Huber placed thirty of them with some larvæ and pupæ and a supply of honey in a box. At first," he says, "they appeared to pay some little attention to the larvæ; they carried them here and there, but presently replaced them. More than one-half of the Amazons died of hunger in less than two days. They had not even traced out a dwelling; and the few ants still

in existence were languid and without strength. I commiserated their condition, and gave them one of their black companions. This individual, unassisted, established order, formed a chamber in the earth, gathered together the larvæ, extricated several young ants that were ready to quit the condition of pupæ, and preserved the life of the remaining Amazons." This observation has been fully confirmed by other naturalists. However small the prison, however large the quantity of food, these stupid creatures will starve in the midst of plenty rather than feed themselves. . . . I have, however, kept isolated specimens for three months by giving them a slave for an hour or two a day to clean and feed them; under these circumstances they remained in perfect health, while, but for the slaves, they would have perished in two or three days."

Superiority of Italian Bees.—Mr. J. B. Mitchell, in the *Hawkinsville (Ga.) Dispatch*, gives the following brief but comprehensive summary of the superior qualities of the Italian bees:

Their good qualities are now conceded by all who have tried both varieties under similar circumstances, and they are rapidly taking the place of the blacks in all parts of the country.

They are more active than other bees, making three flights in the time that the black bees make two; they are more hardy, working earlier and later, and in cooler weather; they gather honey from flowers that are not frequented by black bees; their queens are more prolific, so that they may be increased much faster with safety; they gather more honey and give more swarms in the same length of time, and are more gentle and easily handled than the black bees.

Their chief point of excellence, and one that is worth everything to beekeepers in the south is, that they readily and successfully defend their hive against the depredations of the bee moth. A strong colony of Italians is worth more as a protection against this pest than all the moth-proof hives and moth traps that were ever invented.

Congress and Adulteration.—The *Grange Bulletin* remarks thus on the subject of adulteration of food and the necessity of Congressional legislation on the matter:

We see a step taken in the right direction, and as it should be, when the courts maintain the dignity of the people in carrying out the prevailing sentiment in putting down the adulteration of food. Good-bye to glucose, oleomargarine and other dirty frauds now being practiced on the people in almost every conceivable form, much of which is of a dangerous character as well as poisonous, and should be stamped out of exist-

ence. We think the day not far distant when it will be done. When such a grand State as Missouri takes hold of the matter in her courts, as they have done, and pronounces it wrong, let all the States follow suit. Our National Congress should be up and doing something to protect her citizens from such outrages as have been practiced on them. We ask, what is Indiana doing to put down such dangerous articles as artificial honey so often made from chemicals, and butter of grease, and that, too, of the dirtiest kinds, and sold for a genuine article; and many other articles we could mention? Let the people be in earnest about this matter.

Healthfulness of Honey.—An Exchange makes the following remarks on this subject:

Americans are lovers of sweets and consume an average of 40 pounds or more of sugar for every man woman and child of our population. To meet this demand, millions of dollars' worth of sugar are imported annually, and millions of dollars' worth of honey are allowed to go to waste for the want of bees to collect and put in proper shape for the use of man. It is not as generally known as it should be that honey may be employed for sweetening purposes instead of sugar, for most of the purposes for which the latter is used. But could we supply it to the extent of diminishing our imports of sugar to one-half their present proportions, and millions of dollars would be saved for the purposes of business in our own country. But far above all money considerations would be the use of a pure sweet upon the health of the people instead of the vile compounds now sold as sugar and syrups. The healthfulness of honey as food has been admitted from the earliest writers down through the centuries to the present time. Hence we have nothing to fear from the free use of honey, while recent developments show we have much to fear as to health in the use of adulterated sugars and syrups. But the price of honey in the past has had much to do in the keeping it from the tables of men of limited means, who did not possess the workers to collect and store it for them. Honey is a vegetable production, appearing in greater or less quantities in every flower that nods to the breeze or kisses the bright sunlight in all this heaven-favored land of ours. It is secreted in the flower for the purpose of attracting insects, thus securing the complete fertilization, of the female blossoms. Hence it follows that all the honey we can secure in the hour of its presence in the nectaries of the flowers, is clear gain from the domain of nature.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Local Convention Directory.

1882. *Time and Place of Meetings.*
- Sept. 19—Michigan Central, at Lansing, Mich.
E. N. Wood, Sec.
- 26—Eastern Mich., at Detroit, Mich.
A. B. Weed, Sec., Detroit, Mich.
- 26, 27—Kentucky State, at Louisville, Ky.
W. Williamson, Sec., Lexington, Ky.
- 28—Norfolk, Ont., at Waterford, Ont.
Elias Clouse, Sec.
- Oct. 3-6—North American, at Cincinnati, O.
Dr. Ehrick Parmlly, Sec., New York City.
- 5—Kentucky Union, at Shelbyville, Ky.
G. W. Demaree, Sec., Christiansburg, Ky.
- 10, 11—Northern Michigan, at Pawamo, Mich.

- 17, 18—Northwestern, at Chicago, Ill.
C. C. Coffinberry, Sec., Chicago, Ill.
- Tuscarawas Valley, at Newcomerstown, O.
J. A. Bucklew, Sec., Clarks, O.
- Nov. 1—New Jersey & Eastern, at New Brunswick.
J. Husbrouck, Sec., Bound Brook, N. J.
- In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Ohio Bee-Keepers' Association.

The Ohio Bee-Keepers' Association met at Grange Hall, on the State Fair grounds, Sept. 1, 1882.

Dr. Besse, of Delaware, was called to the Chair.

The question under discussion was: "Can bees be successfully wintered without pollen?"

Mr. Benedict said yes, but pollen was not the sole cause of dysentery; but one cause was impure honey, and being gorged and confined to hive.

Mr. S. D. Riegel, of Ross county, thought it would be a mistake to take all the pollen from the colony; there were other conditions necessary; thinks in some winters bees would winter without pollen.

A vote was taken on the question: "Is an excess of pollen one cause of dysentery?" Decided in the negative.

Question: "How shall we manage our bees so as to be sure of wintering, and to get the best results next season?"

Mr. Brigham, of New London, gave his experience of two years ago. Had in his care six colonies; lost six; did not lose any of his own; thinks 20 pounds of honey necessary for each colony; he put burlap on top of the frames, and then straw; sometimes straw immediately on top of the frames, without burlap; he has an inch augur-hole in each end of his hive, with wire-cloth over the holes, in each end of the upper story, for ventilation.

Mr. Newton thought the thermometer should stand at 45° for cellar wintering; he can winter with less honey if proper temperature and conditions outside, than with inside wintering; he believes there are other causes of dysentery than continued cold weather.

Dr. Besse thought the hard winter of 1881, and the mortality has left us with the survival of the fittest, *i. e.*, the hardiest of bees.

Mr. Reigel said some of the proper conditions for successful wintering

are a good queen, plenty of good, pure honey (not too much), sufficient quantity of mature bees, thorough ventilation and dryness.

Mr. Powell, of Pataskala, wants plenty of mature bees in the fall. He winters on summer stands; only lost $\frac{1}{2}$ of bees during the severe winter of 1880-81. He would not stimulate too early in the spring.

Mr. Benedict would rather have 30 than 20 pounds of honey to winter on. He did not think small colonies profitable to winter. They are more likely to get dysentery than the larger ones. Has had all the experience in in-door wintering that he wants. His beehive was too warm. He gave a neighbor his experience in in-door wintering, who tried it, lost his bees, and then blamed him.

The general opinion of members present on temperature for successful wintering was, that it should be between 32° and 45°.

A discussion on organization followed, and an election of officers. President, Dr. H. Besse, Delaware, O.; Vice Pres't., Aaron Benedict, Bennington, O.; Secretary, Daniel Spear, Covington, O.; Treasurer, S. D. Riegel, Adelphi, O.

The next meeting will be held some time next December, in Columbus, at some date to be fixed by Secretary and Treasurer. D. SPEAR, Sec.

The National Convention.

The North American Bee-Keepers' Society will hold their 13th annual meeting at Washington Park Hall, Cincinnati, O., across Washington Park from the Exposition building. Time, Oct. 3rd to 5th, 1882. First session Tuesday, 10 a. m., Oct. 3. We are encouraged to hope that this will be a very profitable meeting, as we are promised papers from, and the presence of, a large number of our most prominent bee-keepers both in the United States and Canada, and essays and implements of the apiary are expected from abroad to add to the knowledge imparted by the research and inventive skill and methods of our countrymen.

EHRICK PARMLY, Sec.

New York, July 12, 1882.

The Northwestern Bee-Keepers' Convention will meet at Chicago, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1882. The office of the American Bee Journal has been kindly tendered as a place of meeting. A cordial invitation is extended to all bee-keepers, and especially those of the Northwestern States, to be present. The meeting takes place during the last week of the Inter-State Industrial Exposition, to enable all to obtain reduced railroad rates. First session at 10 a. m. C. C. MILLER, Pres.

C. C. COFFINBERRY, Sec.

The Eastern Michigan Bee-Keepers' Association will hold its fall meeting Sept. 26, commencing at 10 a. m., in room 10 Merrill's Building, Detroit, Mich. A. B. WEED, Sec.

The Union Bee-Keepers' Association of Maryland, Virginia and West Virginia, will meet at Hagers-town, in the room of the County Commissioners, at the Court House, on Wednesday, Oct. 18, 1882, at 1 o'clock, p. m., the session to last two days. The Washington County Fair will then be in progress, which will give persons an opportunity to attend the exhibition. All persons intending to go will please drop me a card, so that I may secure for them half-fare rates.

J. LUTHER BOWERS, Sec.

Berryville, Va.

The fifth annual meeting of the Northern Michigan Bee-Keepers' Convention will be held at Pawamo, Ionia County, Mich., on the second Tuesday and Wednesday (10th and 11th) of October, 1882. Pawamo being on the D. & M. and H. & M. R. R., it will be accessible by rail. The members will do all in their power to make the meeting interesting.

H. M. ROOP, Pres.

O. R. GOODNO, Sec.

The Central Michigan Bee-Keepers' Association will meet Sept. 19th, at Lansing, in the Capitol Building. We call the meeting two weeks before the Annual Fair of the Central Michigan Agricultural Society meets, for the purpose of making the final arrangements for a large exhibit of bees, honey and apiarian supplies. A cordial invitation is extended to bee-keepers everywhere. The meeting will be of especial interest, and a large attendance is expected.

E. N. WOOD, Sec.

The Kentucky State Bee-Keepers' Convention will meet in Louisville, Ky., at the Exposition Building Press Rooms, on Tuesday and Wednesday, Sept. 26th and 27th. All bee-keepers are invited to attend, and send essays, papers, implements, or anything of interest to the fraternity. The Exposition will be in full blast and cheap. Railroad rates from all points. W. WILLIAMSON, Sec.

The bee-keepers of Boone Co., Ind., are cordially invited to meet at the office of Barton Higgins, in Lebanon, Oct. 9, at 9 o'clock, a. m., to complete the organization of the auxiliary County Bee-Keepers' Society. The bee-keepers of Hendricks county, Ind., are invited to be present. By request of the Committee.

To Southern Bee-Keepers.—I would like to have announced in the Weekly BEE JOURNAL, for the benefit of those bee-keepers who desire to attend the Convention at Cincinnati from this portion of the South, that round trip tickets from Atlanta, good for 10 days, will be \$19. Round trip tickets from Augusta, good for 15 days, \$27.55. At these reduced rates, it is hoped that many will shake off their cares for a few days and go to meet their distant brethren in Convention. J. P. H. BROWN.

Augusta, Ga., Aug. 30, 1882.

High Elevation for Bee Hives.

EDWARD MOORE.

Some advise to place the hive 2 to 4 inches from the surface of the ground, in order that the bees coming home with their heavy load may not rise to the hive, as they would if it was set higher. It is not at all likely that bees in general will fly so low, no matter how they are loaded. When I watch my bees coming in, or going out (as I often do), I think they fly more like 8 or 9 feet from the ground than anything less, rising to it and falling from it, only a few yards from the hive. Compare this with the top of stores, as stated in Cook's Manual. My hives are at least 16 inches above the surface, and I think I have seen others about the same height; besides, when they are so low they are in the most impure air, composed, as it is, of carbonic acid gas. What height is considered sufficient to keep them clear of that impure air? or, as the atmosphere in so low a position is poisonous, how are creeping insects and other small animals able to thrive in it? as they are generally unable to be in any other atmosphere. Are they differently constituted? Is that which is poisonous to us, good for them? Decomposition is constantly going on, and, of course, as that goes on in the same proportion is the poisonous gas created. It is reasonable to suppose that where the gas is confined, it is most injurious, and I suppose is accounted for to some extent in that way.

Will some of our scientific men please give the less favored some light on this subject, especially with respect to bees, and I shall be glad if it is extended as much as may be considered advisable, to other objects.

Another thought. How often we hear of bees who have gone off to the bush, and I don't remember hearing of any that were not at least several feet up, and may I say this has been their choice. It may have been, in some cases, that they could not find a home nearer terra firma. I speak of bees that are likely to be of service to man. Of course, there are bees that have their nests in the ground, but they are of no value.

I have a paper before me that tells us that in Britain alone there are more than 250 different species of bees, besides a variety of domesticated kinds, also the adding of fresh introductions. Whether these 250 species build in the earth, or in walls, or attach their nests to ceilings I do not know. Their habits may be, and most likely are, very much varied, as we know there are some wasps' nests in the ground, some build a kind of nest attached to a spar, and some who are called by the name of mason wasp, because they excavate a hole in

the wall. I need not try to enlarge on this, as it is likely most intelligent people at least know all I have written on the subject, and more. I see in the number of the BEE JOURNAL dated August 30, which I have received to-day (Sept. 2), something about toads preying upon bees. I have had them at my hives in that praying (preying) attitude, and with all the devotional appearance. After driving them away a few times, the little patience I had has been exhausted, and I have sent them to Davy Jones', although I never could approve of their setting themselves so near my hives, so long as they kept about the garden I would not hurt them. I consider that for reasons of this kind it is better to raise hives at least sufficiently to prevent toads, or any such visitors coming in too close proximity, as I don't think they can climb up the upright leg of the beehive.

Barrie, Ont., Sept. 2, 1882.

From the Century.

The Bee-Pastures of California.

JOHN MUIR.

The bee pastures of the coast-ranges last longer and are far more varied than those of the great plain, on account of difference of soil and climate, moisture and shade, etc. Some of the mountains are upward of four thousand feet in height, and small streams and springs, oozy bogs, etc., occur in great abundance and variety in the wooded regions, while open parks flooded with sunshine, and hill-girt valleys lying at different elevations, each with its own peculiar climate and exposure, possess the required conditions for the development of species and families of plants widely varied.

Next the plain there is, first, a series of smooth hills, planted with a rich and showy vegetation that differs but little from the plain itself—as if the edge of the plain had been lifted and bent into flowing folds with all its flowers in place, only toned down a little as to their luxuriance, and a few new species introduced such as the hill lupines, mints and gillias. The colors show finely when thus held to view on the slopes—patches of red, purple, blue, yellow and white blending around the edges, the whole appearing at a little distance like a map colored in sections.

Above this lies the park and chaparral region, with evergreen oaks planted wide apart, and blooming shrubs from three to ten feet high—manzanita and ceanothus of several species, mixed with rhamnus, cercis, pickeringia, cheary, amelanchier, and adenostoma, in shaggy, inter-locking thickets, with many species of ho-sackia, clover, monardella, castilleja, etc., in the openings.

The main ranges send out long spurs somewhat parallel to their axes, inclosing level valleys, many of them quite extensive, and containing a great profusion of sun-loving bee-flowers in their wild state; but these

are in great part, already lost to the bees by cultivation.

Nearer the coast are the giant forests of the redwoods, extending from near the Oregon line to Santa Cruz. Beneath the cool, deep shade of these majestic trees the ground is occupied by ferns, chiefly woodwardia and aspidiums, with only a few flowering plants—oxalis, tridentalis, erythronium, fritillaria, smilax and other shade-lovers. But all along the redwood belt there are sunny openings on hill-slopes looking to the south, where the giant trees stand back and give the ground to the small sun-flowers and the bees. Around the lofty redwood walls of these little bee-acres there is usually a fringe of chesnut, oak, laurel and madrona, the last of which is a surpassingly beautiful tree, and a great favorite with the bees. The trunks of the largest specimens are seven or eight feet thick and about fifty feet high, the bark crimson and chocolate, the leaves plain, large and glossy, like those of *Magnolia grandiflora*, while the flowers are white and unshaped, in well proportioned panicles from five to ten inches long. When in full bloom, a single tree seems to be visited at times by a whole hive of bees at once, and the grand hum of such a multitude of wings makes the listener guess that more than the ordinary work of honey-winning is going on.

How perfectly enchanting and care obliterating are these withdrawn gardens of the woods—long vistas opening to the sea—sunshine sifting and pouring upon the flowery ground in a tremulous, shifting mosaic, as the light-ways in the leafy wall open and close with the swaying breeze—shining leaves and flowers, birds and bees, mingling together in springtime harmony, and nectarous fragrance exhaling from a thousand thousand fountains! In these balmy, dissolving days, when the deep heart-beats of nature are felt thrilling rocks and trees and everything alike, common business and friends, children and wives, are happily forgotten and even the natural honey-work of bees, and the care of birds for their young, seem slightly out of place.

To the northward, in Humboldt and the adjacent counties, whole hill-sides are covered with rhododendron, making a glorious melody of bee-bloom in the spring. And the western azelea, hardly less flowery, grows in massy thickets three to eight feet high around the edge of groves and woods as far south as San Luis Obispo, usually accompanied by manzanita, while the valleys, with their varying moisture and shade, yield a rich variety of the smaller honey-flowers, such as mentha, lycopus, micromeria, audibertia, trichostema, and other mints, with vaccinium, wild strawberry, geranium, callas and golden-rod; and in the cool glens along the stream-banks, where the shade of trees is not too deep spirea, dogwood, photinia, and calycanthus, and many species of rubus, form interlacing tangles, some portion of which continues in bloom for months.

Though the coast region was the

first to be invaded and settled by white men, it has suffered less from a bee point of view than either of the other main divisions—chiefly, no doubt, because of the unevenness of the surface, and because it is owned by individuals, instead of lying exposed to the flocks of the “sheepman.” These remarks apply more particularly to the north half of the coast. Further south there is less moisture, less forest shade, and the honey flora is less varied.

The sierra region is the largest of the three main divisions of the bee-lands of the state, and the most regularly varied in its subdivisions, owing to their gradual rise from the level of the Central Plain to the alpine summits. The foot-hill region is about as dry and sunful from the end of May until the setting in of the winter rains, as the plains. There are no shady forests, no damp glens, at all like those lying at the same elevations in the coast mountains. The social composite of the plain, with a few added species, form the bulk of the herbaceous portion of the vegetation up to a height of fifteen hundred feet or more, shaded lightly here and there with oaks and sabine pines, and interrupted by patches of ceanothus and buckeye. Above this, and just below the forest region, there is a dark, heath-like belt of chaparral, composed almost exclusively of *Adenos. toma fasciculata*, a bush belonging to the rose family, from five to eight feet high, with small, round leaves in fascicles, and bearing a multitude of small white flowers in panicles on the ends of the upper branches. When it occurs at all, it usually covers all the ground with a close impenetrable growth, scarcely broken for miles.

Up through the forest region, to a height of nine thousand feet above sea level, there are ragged patches of manzanita, and five or six species of ceanothus, called deer brush or California lilac. These are the most important of all the honey-bearing brushes of the sierra. *Chamæbatia foliolosa*, a little shrub about a foot high, with flowers like the strawberry, makes handsome carpets beneath the yellow pines, and seems to be a favorite with the bees; while the pines themselves furnish unlimited quantities of pollen and honey-dew. The product of a single tree, ripening its pollen at the right time of year, would be sufficient for the wants of a whole hive. Along the streams, there is a rich growth of lilies, larkspurs, pedicularis, castilleias and clover. The alpine region contains the flowery glacier meadows, and countless small gardens in all sorts of places full of potentilla of several species, spraguea, ivesia, epilobium, and goldenrod, with beds of bryanthus and the charming cassiope covered with sweet bells. Even the tops of the mountains are blessed with flowers—dwarf phlox, polemonium, ribes, bulsea, etc. I have seen wild bees and butterflies feeding at a height of 13,000 feet above the sea. Many, however, that go up these dangerous heights never come down again. Some, undoubtedly, perish in storms, and I have found thous-

ands lying dead or benumbed on the surface of the glaciers, to which they had perhaps been attracted by the white glare. From swarms that escaped their owners in the lowlands, the honey-bee is now generally distributed throughout the whole length of the sierra, up to an elevation of 8,000 feet above sea-level. At this height, where the snow falls to a depth of 15 or 20 feet, they flourish without care. Even higher than this several bee-trees have been cut, which contained over 200 pounds of honey.

The destructive action of sheep has not been nearly so universal on the mountain pastures as on those of the great plain, but in many places it has been more complete, owing to the more friable character of the soil, and its sloping position. The slant digging and down raking action of hoofs on the steeper slopes of moraines has uprooted and buried many of the tender plants from year to year, without allowing them time to mature their seeds. The shrubs, too, are badly bitten, especially the various species of ceanothus. Fortunately, neither sheep nor cattle care to feed on the manzanita, spiræa, or adenostoma; and these fine honey bushes are too stiff and tall, or grow in places too rough and inaccessible, to be trodden under foot. Also the canon walls and gorges, which form so considerable a part of the area of the range, while inaccessible to domestic sheep, are well fringed with honey shrubs, and contain thousands of lovely bee-gardens, lying hid in narrow side-canons and recesses fenced with avalanche taluses, and on the top of flat, projecting head-lands, where only the bees would think to look for them.

But, on the other hand, a great portion of the woody plants that escape the feet and teeth of the sheep are destroyed by the shepherds by means of running fires, which are set everywhere during the dry autumn for the purpose of burning off the old fallen trunks and underbrush, with a view to improving the pastures, and making more open ways for the flocks. These destructive sheep-fires sweep through nearly the entire forest belt of the range, from one extremity to the other, consuming not only the underbrush, but the young trees and seedlings on which the permanence of the forests depends; thus setting in motion a long train of evils which will certainly reach far beyond bees and bee-keepers.

The plow has not yet invaded the forest region to any appreciable extent, neither has it accomplished much in the foot hills. Thousands of bee-ranches might be established along the margin of the plain, and up to a height of four thousand feet, wherever water could be obtained. The climate at this elevation admits of the making of permanent homes, and by moving the hives to higher pastures, as the lower pass out of bloom, the annual yield of honey would be nearly doubled. The foot-hill pastures, as we have seen, fail about the end of May, those of the chaparral belts and lower forests are in full bloom in June, those of the upper and

alpine region in July, August and September. In Scotland, after the best of the Lowland bloom is past, the bees are carried in carts to the Highlands, and set free on the heather hills. In France, too, and in Poland, they are carried from pasture to pasture among orchards and fields in the same way, and along the rivers in barges, to collect the honey of the delightful vegetation of the banks. In Egypt, they are taken far up the Nile, and floated slowly home again, gathering the honey-harvest of the various fields on the way, timing their movements in accord with the seasons. Were similar methods pursued in California, the productive season would extend nearly all the year.

The average elevation of the north half of the sierra is considerably less than that of the south half, and small streams, with the bank and meadow gardens dependent upon them, are less abundant. Around the headwaters of the Yuba, Feather and Pitt rivers, there are extensive table-lands of lava, sparsely planted with pines, through which the sunshine reaches the ground with little interruption, and here flourishes a scattered, tufted growth of golden applopappus, lino-syris, bahia, wythebeia, arnica, artemisia, and similar plants; with manzanita, cherry, plum, and thorn in ragged patches on the cooler hillslopes. At the extremities of the Great Plain, the sierra and coast ranges curve around and lock together in a labyrinth of mountains and valleys, throughout which the coast and sierra floras are mingled, making at the north, with its temperate climate and copious rain-fall, a perfect paradise for bees—though, strange to say, scarce a single regular bee-ranch has yet been established in it. Cultivation, however, is making rapid headway over all the State, and before long, the wild honey-bloom of the mountains will vanish as completely as that of the fertile lowlands.

For the American Bee Journal.

Scorpions in Bee Hives.

ARTHUR TODD.

Have any of your numerous readers ever come across these insects living in the hive with the bees? I shall be glad to know, for I had an experience I will briefly relate, and have never seen anything in print on the subject. Having purchased a lot of Arab hives when in Algeria, next thing to do was to go and take them, for the Arab never “delivers.”

The adventures of that night will not be forgotten in a hurry. There were 30 hives, all on the ground, buried in weeds; some rotten, some good, and all with communities that knew exactly how to apply the “business end” to advantage, if you only looked at them.

Well, we got to work; first some rats scared us, next a few tarantulas, as we called those immense centipedes. Suddenly my assistant Arabs called out to beware of scorpions, as I was about to disturb the stones support-

ing a hive composed of a long box with a tremendous population.

The job of transportation concluded, next thing was to get to work and transfer to bar-frame hives. When I came to transfer that long box the sight was splendid, as on getting a side off, combs 39 inches long and as straight as an arrow were disclosed. The bees dislodged, and the comb required cut out and inserted in the frames, I proceeded to cut out the remainder. As I reached the floor board and laid it bare, my attention was drawn to a number of little moving things, yellow, and just like crabs. Of these I killed 18, and many escaped. I was informed that these were young scorpions; and that I had had a lucky escape the night previous in not getting stung. I watched other Arab hives after that, and found them again and again, so I could come to no other conclusion, than that scorpions do frequent bee hives if allowed. In no case had these small scorpions the tail, and I would much like to know if the young of the scorpion is always minus a tail, and at what period that interesting appendage shows itself. The adult scorpion is no stranger in the neighborhood of hives, as was amply proven by my own observation.

Grange Bulletin.

The Development of the Honey Bee.

J. M. HICKS.

The digestive organs are the most prominent, but even these consist chiefly of a large intestine and they do their work so efficiently that an immense quantity of fat is stored up in the body of the little larvæ as raw material of which the more complicated organs of the imago are built up.

The worm usually lies curled up in a half circle in its cell, and the only symptom of life that it exhibits is by scratching with its mandibles against the cell wall, as an intimation that it requires nourishment. It, however, becomes the tenderest object of solicitude on the part of the workers, they clean and rub it, endeavor by their sonorous hum to cheer it in its solitary confinement, and constantly supply it with infant food (bee bread), which they manufacture from honey and pollen, and offer to the little nursing at the point of their ligula or tongue. The whole arrangement of the attendance resembles that in the founding hospital; the watchful nurses wander from crib to crib, from cell to cell, offering food to the little inmates, striking them with their antennæ, and fondling them with their delicate organs of nutrition. After they have been thus treated for a few days, the nurses discontinue the supply of food, and close up the orifice of the cell with wax. This operation they perform by applying a series of concentric rings of gradually decreasing circumference, one within another until there is nothing left but a small hole in the center, which is then

blocked up with a particle of wax. As soon as the cell is closed the inmate sets to work and spins a cocoon of silk (which the queen larvæ accomplishes in about 24 hours, the worker in thirty-six), and then rests for two or three days. At the end of this time it assumes the pupa form, undergoing the metamorphosis from the worm structure to the insect already described; and when this is complete the imago, or fully developed insect first frees itself from its silken envelope, and then, forcing open the lid of its prison house by means of its head and mandibles, makes its escape a perfect bee.

The time occupied from the depositing of the egg in the cell to the final appearance of the insect is, for the queen sixteen days, for the worker about twenty-one, and for the drone twenty-four days.

But the labors of the worker in regard to the working of the brood, do not end here. After the young insect, be it worker, drone, or queen, has effected its escape, a number of busy nurses at once set to work and prepare the vacated cells for the reception of another egg. First one enters, and searching for the pupa-case drags it forth and carries it away to the entrance of the hive; a second follows and brings away the exuvial from the larva; and then other succeeding bees clear off the refuse, leaving only a portion of the silken cocoon, which gives additional strength to the cell.

Returning now to the history of the queen: we are told that, during her progress from cell to cell for the purpose of oviposition, she is accompanied by from four to twelve workers, who provide her with honey, and, watching all her movements, take care that she lays only one egg in each cell, or in cases she should deposit more, as sometimes happens, they remove all but one, and place them elsewhere. She usually lays from two to six eggs in succession, and then rests awhile; and according to Reaumur she will thus deposit about two thousand eggs in one day. The total number laid by a single queen in one season is variously estimated at from 50,000 to 100,000 eggs.

Let us now suppose the season to be somewhat advanced, and that in the month of May the queen has deposited about 10,000 to 11,000 worker and drone eggs. At this time the workers construct half a dozen royal cells, already described, and her majesty proceeds forthwith to deposit in them the necessary eggs. The usual term of sixteen days having now expired, the guardians of one of the royal cells receive intimation, by the movement within, that a new queen is about to make her appearance, and immediately the intelligence flies from bee to bee, and they crowd around the cell in order to welcome the stranger. The queen-mother approaches also, accompanied by her body guard.

"Dear me! how interesting!" we can almost hear you exclaim, reader; "to welcome the little stranger, no doubt?" No, not to welcome her offspring, but, *incredible dictu!* with the murderous intention of attacking and

slaughtering her as a rival. In this design, however, she is foiled by the workers that have gathered around the royal cell. These cover its entrance and keep the young queen a close prisoner; if necessary, blocking up the opening of the cell with wax until the old queen shall have disappeared, and feeding the young one with honey during her imprisonment. In the hive of bees, as in the hives of men, Cæsars, or rather, in the former case, two Cæsars, cannot exist at one time; and when the old queen finds that her hateful rival is beyond her reach, she ceases to oviposit, and wandering about the hive in a state of great excitement, she at length takes her departure in search of a fresh habitation, accompanied in a full hive by about 1,000 drones, (who are said to lead the way) and ten times that number of workers.

This new colony, well known to us as the "swarm," is received by beekeepers in an empty hive, where the workers at once proceed to construct waxen cells and perform their ordinary avocations, whilst the queen at once resumes the work of oviposition.

But let us now return to the old hive, where the young queen holds undisputed possession, and this she renders doubly sure by at once proceeding to the cells that contain her younger sisters, and with her sting mercilessly destroying them before they arrive at maturity.

Sometimes, however, it happens that two young queens make their exit simultaneously from their respective cells, and by a curious instinct the old queen is then diverted from her purpose of infanticide, and at once takes her departure with her attendant swarm.

For the sequel, we must once more refer to Voigt, for we are sure you will agree with us that the account is graphic, interesting and morally instructive: "The bees that remain after the swarm has taken its departure divide into two parties, which marshal themselves around their respective queens, and then march against one another within the hive itself." Presently the armies approach one another from either side; they meet face to face; and what follows? Will the onslaught at once begin? This would indeed be the case if they were human beings, of whom thousands would rush to their fate, and streams of blood would be shed for the sake of one ruler. But no! the bees are wiser; what care they with their constitutional *regime*, whether the reins of power be held by a member of the house of Hapsburg or of Hohenzollern! let the ambitious aspirants decide the struggle for supremacy by a single combat! so say the bees, and they look on quietly whilst the duel is being fought, quite content to tender their allegiance to the survivor. The fight for the throne is merely a combat between the pretenders. Would that the human race, which conceives itself to be so wise and perfect, had, under similar circumstances, adopted this principle of action, how much less blood would have been spilt upon this fair earth

whose surface has been so often fertilized by the bodies of human beings slain in battle.

Battle Ground, Ind.

National Farmer.

Colorado as a Locality for Bees.

J. S. FLORY.

When I made my first visit to Colorado I considered the propriety of engaging in the bee business here, but must say that the apparently desert plains and absence of honey producing forests made quite an unfavorable impression on my mind in the direction of apiarian science. Like the stockman on his first visit to our arid plains who declared that there was not enough grass to the acre to give a goose a decent living, I could not see otherwise that a colony of bees would soon starve here, and from the observation of others engaged in the business, I am prepared to say Colorado is well adapted to successful bee culture—at least a good portion of the State is so adapted. As it is true "full many a rose is born to blush unseen," so that there are many a thousand pounds of delicious honey in Colorado left to waste its sweetness on desert air, all for the want of bees to gather it. A man once said he lost \$10,000 in one season, simply because he did not have cattle to eat up the grass on the prairies around him; in a like manner our losses in the State are great by not having the bee at hand to gather the sweets that are in nature's storehouse all around us.

Every person of experience in the Eastern States knows that warm weather, with occasional showers, are accessory to a good honey season, and that a continued drouth was fatal to the bee's harvest. Looking at the matter from this standpoint, we had our doubts in regard to our arid climate being favorable for bee culture. Our conclusions, however, now are that hot days followed by cool nights facilitate the secretion of honey in flowers better than any other state of weather. In the East the drought days usually followed by warm night, was fatal to the honey prospects; occasional showers cooled the air, and this was favorable, therefore, the temperature was of more importance than dampness. Again, continual rains destroy the honey crop, and deprive the bees the opportunity to go on the wing. Now, taking these things into consideration, and reasoning from the above alluded to hypothesis, we arrived at the solution of what seemed to be to us a puzzle: Why bees did so well in our dry climate. Our hot days followed by cool nights give to nature her sweets in abundance, and having no prolonged rains, bees have the best opportunity to improve each shining hour, and that you know, in Colorado, means from sun-up to sun down, one day after another, week in and week out. Thus we see instead of Colorado being a poor country for bee-culture it is just the reverse.

Of the many honey producing plants that abound in our State, the despised

and much abused cactus, probably stands first; then in their season, we have goldenrod, aster and thousands of others. All we need to make honey an important item of wealth added to Colorado's prosperity, is an awakened interest in the matter and bees to gather the honey. Nature makes the honey, we want the bees to gather it.

To secure success, in the first place, we want the Italian bee, it being more prolific, more hardy, and a climate more akin to ours, we think them far superior to the common black bee. Second, a movable hive. Third, colonies should be kept strong in numbers and rich in stores in order to stimulate to early breeding. Fourth, enough apiar science to give one the knowledge the queen bee is not a king, but the mother of the whole colony; that an abundance of drones are a nuisance, being a class of tramps that live off the industry of others, but few should be allowed to be reared. Fifth, common sense enough to know how and when to make artificial swarms, and when to leave these alone; too many colonies are killed by kindness—too much attention. The fatal mistake with many, is wanting to get along too fast.

For the American Bee Journal.

The Best Comb Foundation.

J. V. CALDWELL.

I have been taken to task by Mr. Heddon for presuming to say the Dunham foundation is a "first-class" article. Well, the meaning of this, as I infer, is when the article fulfills, in a perfect manner, the purpose for which it was made, then I say it is a first-class article, and when I say the foundation I make does fulfill its purpose, I do not wish Mr. Heddon to doubt my word, as I certainly shall not doubt any assertion he may make in this discussion.

Mr. Heddon thinks my foundation has been found fault with; well, I desire to say that any of my customers of this season have the liberty to make any statement they wish to, either in public or private. Because I have succeeded in making the Dunham machine a success (which Mr. Heddon has not), he infers I must be a better mechanic than he is. The fact is, I have never had the advantage of a mechanical trade. Mr. Heddon gets the impression I am of a conservative turn of mind, and do not want the best bees, etc. Well, I must admit I have not yet gone so far as to claim, with Mr. Heddon, "that all intelligent and unprejudiced men admit evolution to be a fact;" but I do like the best of everything I can get, Dunham foundation included. I have had at least one customer who tried the Given foundation, and did not want any more. I have never tried it myself, as, so far, the Dunham has answered all purposes in the brood chamber, and this is all I use it for making, and using as I do the thin Vandervort in the sections. Mr. Heddon infers when I say I have my combs drawn out in a "perfect" man-

ner that I must have compared them with one that had dropped from the frame, which is something that does not happen in my apiary. The Given foundation has not always given satisfaction, as Mr. Heddon well knows. The editor of the BEE JOURNAL tried them together, and was satisfied the Dunham was superior. The Dunham machine is considered a good one by bee-keepers all over the country (excepting, of course, those who do not know how to use it properly). I have no doubt the Given foundation is a good article. Any foundation would be when backed up with a wire factory. What we need is a good foundation without the necessity and extra expense of hardware to make it acceptable to the bees. I claim: First, that the Dunham machine is the best made; and, second, that I can print more good sheets of foundation on it than can be made on any press machine yet made, and I stand ready to make the claim good in any fair and honorable manner.

Cambridge, Ill., Aug. 29, 1882.

[At the time we tested the two makes of foundation together, we found the Dunham much superior, or, rather, much preferred by the bees, and soonest worked; but since that time, as we are informed, there have been great improvements made in the Given dies, and we presume it may now be equal, in every respect, to the Dunham; and should it be this, surely it is good enough for all practical purposes, in the brood chamber. The wash used on the Given foundation when our experiments were conducted, undoubtedly had much to do with its failure.—ED.]

For the American Bee Journal.

The Common Sense Hive.

WM. CANM.

In a late number of the JOURNAL, Mr. Demaree, of Ky., condemns the Common Sense bee hive as a swindle. I think he is too severe. About one year ago an elderly gentleman, by the name of Barnes, called and stayed all night with me. He was a thoroughly posted and practical apiarist and believed in his hive. Upon leaving, he insisted upon my taking a hive for trial, and left one, which I did not fill till this summer. It is a good hive, but would not suit me. It is very convenient, as you can slide the cover either way to examine brood frames or brood nest without disturbing the other. The bottom is hinged to the body and has a hook in front, so as to make it fast or loose as you wish. The frames are deeper than wide, so that it is a good winter hive. My objections are, that it is too small; that it has no cap and hence the space immediately over the brood nest is lost; then, I prefer a frame that is wider than it is deep—the reverse of this. It is, however, exceedingly simple

and easy to manipulate, which makes it a good hive for farmers and those who are not accustomed to handling frame hives, hence it will serve a very useful purpose in the way of introducing intelligent bee-culture. Mr. Barnes was associated with his son, a wounded and disabled officer of Indiana volunteers, during the war. I afterwards visited them at Jacksonville, Ill., and was both pleased and instructed, though I openly objected to the hive. Mr. H. W. Hitt, of Merritt, Ill., bought the right to make and vend it in this (Scott) county, and though I see nothing about it to patent, yet Mr. Hitt has done well in using it himself this year, and many to whom he has sold are much pleased after trial. I have no interest in the matter except a desire to see fair play. As I have said, I do not want the hive for my own use, but believe it will do good by leading people to use frames, and hence better hives. With a mixture of Syrian blood in my queens, I shall be forced to adopt a larger hive than any I have now, though one, No. 19, takes 25 frames, 10x12 inches, and forty-two 2-lb. sections. Bees are booming.

Murrayville, Ill., Aug. 30, 1882.

SELECTIONS FROM OUR LETTER BOX

Drone Brood.—I commenced this spring with one colony of black bees, in a box-hive; transferred them to a Simplicity hive on the 24th of May; divided them on the 10th of July, giving the new colony one frame of larvæ from 2 to 3 days old; had 6 queen-cells started next day; 3 queens were hatched on the 24th of July and upon examining the hive I could only find one queen, the others I presume, must have been destroyed, as well as the remaining cells. On the 28th of July I found my new queen on the ground in front of the hive, with a quantity of bees around her. I picked her up and put her in the hive. The next day was very chilly and damp. Since then, for about 2 or 3 weeks, we had very unfavorable weather. Now, this new colony has about half a frame of capped brood in worker cells with the caps raised considerably higher than in the old hive; 5 cells, which to me, from their shape, look like queen-cells, as well as cells with 2 to 4 eggs in each. Will you please let me know, through the Weekly BEE JOURNAL, the cause of the trouble, and how I can remedy it.

ROLLAND MACDONALD.

Montreal, Can., Sept. 1, 1882.

[The first queen hatched destroyed the others and the remaining cells; or it was done at her instigation. The brood capped over is drone larvæ, and the cells which have the appearance of being queen-cells are undoubtedly filled with drone larvæ. The queen, if there is one in the hive, is probably

the one picked up; she failed to meet a drone and through injury or other cause has been unable to go out again, and has become a drone-laying queen, while the bees, realizing the situation, have attempted to rear a successor for her from the best resources they had—drone larvæ. You had better give them two or three frames of capped worker brood and one with eggs or newly hatched worker larvæ, to give an opportunity to rear a good queen. Should the weather prove favorable, and she become mated, you will yet save that colony. It is the only chance, unless you introduce a good, prolific queen.—Ed.]

New Courage Added.—The cloud with the silver lining has at last hove in sight, bringing with it an atmosphere freighted with the scent of fragrant autumn flowers. The heretofore despairing hopes of many beekeepers in this part of the country have changed to those of rejoicing; the unfolding of each additional species of flowers, seems to add new courage to many whose hopes seemed blasted but a few weeks ago. For the past few days the honey flow has been very great; many colonies that were scarce in stores but a short time ago are now full in both brood and surplus departments; new boxes are frequently added, which are filled in a short time. A fair crop is now almost ready to harvest; if this cloud with silver lining should be so broad as to be a month in passing over, what would we poor fellows do? Bees swarming and honey running to waste, for want of storage! The weather is fine, bees are booming, honey rising, glucose on the decline, fixtures in good demand; let the good work continue.

V. H. ORMSBY.

Pierpont, O., Sept. 4, 1882.

Harvest about Ended.—Our harvest is about ended for this year. We have had a fine crop considering what our bees had to contend with; the basswood and plum blossoms failing; white clover was rich with honey, and we have had several honey-dews, one occurring yesterday. The bees work lively on the leaves while the dew is on them. Bee men in this county are scarce. A good many lost heavily, and concluding it did not pay, quit the business.

C. FOLLETT.

Osage, Iowa, Sept. 4, 1882.

Ready for the Fair.—Our bees are booming here now. I took from one colony, last Saturday, 77 pounds of comb honey, and had before taken 46 pounds from the same colony. The honey was in sections with foundation. I have extracted from another colony 116 pounds, and taken 10 one-pound sections. Both of the above colonies were divided in June. I have just finished extracting, and am ready for the fair.

J. L. STRONG.

Clarinda, Iowa, Sept. 5, 1882.

Late Swarm.—I send you a couple of weeds for name; they grow plentiful in low places, and my bees are on them a good deal. Please let me know what they get from them. I had a large swarm of Italians to-day. It is so late I am afraid they will be too weak to winter. I gave them 4 frames of honey, which left 5 empty frames with no foundation. 2. Did I do wrong in giving them full frames? 3. Give me the best plan to do with them? They are gathering honey fast now; the buckwheat will be out of bloom in a day or two. It has been a poor year in this section for bees. I had 9 colonies in the spring and have only had 4 swarms. I have only one colony that is working in the top boxes, and they all came out strong in the spring. 4. Is it a common occurrence for bees to swarm before the young queen is out of the cell? I examined the parent colony after it swarmed, and found the queen-cell capped. 5. Do you think the young queen will meet a drone this fall? There is only one drone flying, but there are some drones just hatching in the parent colony. GEO. KEMP.

Navan, Ont., Aug. 31, 1882.

[1. The yellow flower is a solidago, of which the goldedrods are also species. The bunch of pink flowers are *P. hydro-piper*, for which there are almost a score of common names, among which are smartweed, hearts-ease, blackheart, etc. Both are good honey plants and late bloomers.

2. You done right.

3. With plenty of bloom of which you sent specimens, and your empty frames full of foundation, we think you will have no trouble in wintering, especially with the four frames of honey you gave them.

4. Yes; they do so as a rule—perhaps always.

5. Yes; if the weather is favorable. Bees never swarm naturally, under favorable circumstances, without making ample provision for a perpetuation of the parent colony, hence they are as scrupulous to provide forthcoming drones as queens.—Ed.]

Honey from Celandine.—Bees are booming now and I have just been to ascertain what source they are gathering from. A large tract of low land covered with trees and bushes, near here, was burned over at the time of the drouth last fall, and this season is covered with celandine in full bloom, which is just swarming with bees to the exclusion of nearly everything else. I have extracted 527 lbs. from 37 colonies—all that they gathered from clover and basswood, and increased from 44 to 66, with a good prospect of getting enough for winter from celandine. Nearly all of the bees have their backs covered with white pollen, which adheres to them in crawling into the peculiar shaped flower. Have any of the

readers of the BEE JOURNAL had a like experience? There seems to be occasionally an oasis in this State, but here the season for surplus has been the poorest in 10 years. If my hopes are realized, I shall consider that bee-keeping pays even in such a season as this, with all its contrary weather.

W. H. S. GROUT.

Kennedy, N. Y., Sept. 4, 1882.

Preparing to Feed.—The long drouth has been very hard on my bees—no rain to speak of since July 18. I have several colonies that will not get honey enough to winter on. 1. When shall I commence to feed? 2. Are there any sweets that I can make a good syrup from, that will cost me less than A sugar. W. A. SMALL.

Waltham, Mass., Sept. 5, 1882.

[1. Commence feeding soon as satisfied they will need it.

2. There is nothing cheaper than A sugar that we would recommend.—Ed.]

Why is It?—I have one colony of bees that has been carrying out brood for about 4 weeks. The brood is in all stages, from larvæ to full grown. They were transferred June 12. The colony is an old one, from which no swarms have issued either this or last year. Please give the cause of this destruction of brood, and, if possible, a remedy?

WM. GLENNON.

Williamstown, Mo., Sept. 2, 1882.

[The queen in that hive, or the strain of bees, are good for nothing as workers, and they are probably in a starving condition. The only remedy we can suggest, is to supersede the queen and give plenty of feed.—Ed.]

Quite Cheering.—My bees, since the last of June, have done well. My crop this far is 9,000 pounds of very nice extracted honey. The weather is now fine, and honey is coming in fast. If the good weather holds, I shall get several thousand pounds more.

O. CLUTE.

Iowa City, Iowa, Sept. 4, 1882.

Bees on a Spree.—Old Sol has scarcely shown us his blushing face this summer. Great black clouds have hidden it completely; but whether or not these clouds are lined with silver I cannot say, still, this I know, they are brimfull of rain, and they have copiously sprinkled the country with that cooling beverage, and that they, or something else, have filled the flowers with honey. Everything that grows, from a skunk-cabbage to a rose, seems to bubble over with nectar. The bees are on a spree for the first time in three years. One would think that they swarmed for mere recreation. They come without end, and, like riches, "betake to themselves wings and fly away." From 5 colonies in the spring I have lost 7 or 8 swarms, and yet have a decent increase. One swarm I hived three

times, and the last time I gave them a frame of brood, but they evidently thought very little of babies, for they filed out again and sought some "leafy bower among the wooded dell," and oh, such tempers as they have, too. Nothing seems to give them more pleasure than to jab five minutes of profanity and physical activity into the unsophisticated looker on. Is the Swiss wax extractor patented; if so, by whom is it held?

F. L. DRESSER.

Hillsdale, Mich., Sept. 4, 1882.

[It is not patented.—Ed.]

Solidago.—Please give name of plant enclosed, and its value as a honey plant; bees work on it very much. It grows 5 to 6 feet high in waste places, and there is a splendid flow of honey from it when the weather permits the bees to fly.

FRANK A. EATON.

Bluffton, Ohio, Sept. 2, 1882.

[It is a solidago, to which family the goldenrod also belongs. The solidagos are all good honey plants.—Ed.]

A Few Good Days Needed.—My honey crop will be short this season unless we have favorable weather from this time until the last of the month or later. I have a great deal of nice honey which a few days would get capped so I can crate it.

H. W. ANDERSON.

Gibson's, Ind., Sept. 6, 1882.

No Let Up.—We are having the largest and longest honey flow I ever knew in Illinois; there has been no let up here since it commenced, the first week in June. Bees continue to swarm, notwithstanding some have divided them and taken other plans to prevent it; but swarm they will, and some are the largest swarms I ever saw. I divided a colony (No. 6) and left the queen in the old hive, and in about 3 weeks afterwards the parent hive cast 2 swarms on the same day, one about 9 a.m., and the other at 2 p.m.; both swarms had queens, and are now making surplus honey. This is something new in my experience, and I write to know if it is a common occurrence among bee-men. I have a garden near my bees, sown to buckwheat, and it has been in bloom over a week, but I have never seen a bee work on it. Can you tell me the reason, and what is the best kind of buckwheat for honey?

A. W. FISK.

Bushnell, Ill., Aug. 1, 1882.

[It is not unusual for two swarms to be cast almost simultaneously; and in the case cited, the queen was superseded or lost in the division. As to the bees not working on the buckwheat, it was because the bees found a better flow in something else. We doubt if there is much in buckwheat as regards honey flow, although it is claimed by some that the silverhull is much the best.—Ed.]

Crooked Combs.—I am a beginner in bee-culture and wish to grow into it as fast as I can with my limited means. I have a lot of 1.59 acres in town, but there is considerable vacant land about me. I bought one colony of bees in a Langstroth hive in July, put a second story on in August, took two frames of brood and honey from the lower and put in the upper story, had no foundation, so I filled it up with empty frames. Aug. 30, having received foundation, I opened the hive and found that the bees had been building crooked, crosswise, etc.; also there was a queen-cell on one of the old combs which I had taken from the lower part, capped over. I took out the empty frames and some of the worst of those that had comb and honey, and inserted frames with foundation. I wish soon to introduce a new queen, but the lower frames are so badly stuck together by comb built between, that I do not know what to do. Will you please inform me through the JOURNAL? Also whether you think I can make it a success here in town?

J. M. FOOTE.

Creston, Iowa, Sept. 1, 1882.

[You had better let them remain as they are till apple bloom, then transfer them to hives with foundation. Adopt Mr. Heddon's system of transferring. You can make a success of bee-culture in town, if you do not aim to keep more than 100 to 200 colonies; by planting waste places with sweet clover, catnip, motherwort, etc. By planting a little each year, your bee pasture will increase with your bees, and you will scarcely realize the expense.—Ed.]

The Swarming Fever.—There are many things in the bee papers that I do not swallow quite. I have tested the anti-swarming plans this year, and for several years, but I have no sure way yet. The new swarm on the old stand has answered about a third of the time this year. Cutting out queen-cells does not amount to much with Italians; giving room is of small account; changing and room, and cutting out will work tolerably. Result—no sure way, when the honey flow is good. Change, with room, and you will succeed nearly every time. Just a little living amount of honey, and the Italians will swarm and nothing can stop them. Bees have done well, but honey is rather scarce. Too much rain. Amount for July 5.65, Aug. 6 inches; nice drizzling showers and often, good weather for crops but poor for honey. White clover extra bloom, but honey washed out by the frequent rains. Basswood the same. Prospect for fall flowers is extra good, and if frost holds off, may pile up the honey. I do not think the market will be glutted with honey this fall. I sell all of mine at home and could sell much more if I had it. I think I never had nicer honey than I have had this year. But no great rush. Hives filled with bees and working well but honey

comes in slow. Guess the crowds of brood take extra food. Did you ever know a colony to hunt out old hive and go back after 55 days—I had one this year. I changed them but they found the old hive and went there to my loss of one colony. I saved the hive of comb and honey as I put them on a hive that looked like swarming. I like the JOURNAL and like to read the various opinions therein. Heddon's head I guess is level, but a little, just a little crooked maybe. Bless you, what do I care for notions? I have mine too. Now, Mrs. Dunham's foundation suits me. If other makes are better, it is very good indeed. I have used it and know it is good. Maybe there are better makes, but the Dunham is good enough for me. It has never failed, never sagged, and is worked out speedily, that's good enough I think.

J. R. BREED.

Embarrass, Wis., Aug. 31, 1882.

A Second Queen.—I would like your opinion in regard to the conduct of a queen which has lately come to my notice. A friend has a colony which I divided in June, and which I have been endeavoring to get a laying queen into since without accomplishing my purpose, till about two weeks ago. Having failed in the endeavor to introduce a laying queen, I allowed them to rear one from brood given. I looked at the colony, when, from the appearance of the cells, I judged that the queens would hatch the next day and on the ninth day afterward I found eggs and larvæ; so that the queen must have begun to lay when five days old. Five days after I looked into the the hive, my friend says that while sitting by the hive he saw the queen emerge amid some confusion of the bees, and take wing. He took out his watch, and in just five minutes she returned and entered the hive. She remained ten minutes, when out she came a second time, amid the same confusion of bees, ran up the side of the hive, took wing and was gone fifteen minutes, when she again entered the hive, and the commotion among the bees ceased. Do you think she was taking a second wedding flight?

JAMES MCNEILL.

Hudson, N. Y., Sept. 4, 1882.

[The cells were not all destroyed by the first queen hatched and a second one was hatched, which either destroyed the first queen, or she was driven from the hive.—ED.]

Never Knew a Better Year.—When I put my bees on their summer stand they were heavy with honey and strong in numbers; the weather was favorable until the 10th of April, when it set in wet and cold; then there was the fruit bloom, box elder, dandelion and the golden willows. There was scarcely a day that the bees could fly. On the 26th of May, while walking through my bee yard I noticed young bees crawling about the hives and alighting on the grass. Wondering what that meant I opened

the hive and found all the honey gone. I at once gave them 3 lbs. of honey and 5 lbs. of sugar, as clover was just coming into bloom. On the first of July the lindens began to open their buds to the busy bees, and continued to bloom on the low lands until the last days of July. In my 15 years' of bee-keeping I never knew a better year than this for surplus honey. I do not know the exact number of pounds I have taken, but I have a fine lot of comb and extracted honey. At this date the bees are carrying in honey quite fast, and swarming most every day, until I think I am safe to say that I have returned 50 good swarms to the parent colonies since they commenced to swarm in May. As I am a farmer and stock-raiser, I do not follow bee-keeping as a business. My 60 colonies have paid me better than any thing I have this year.

HIBERT CLARK.

Palmyra, Iowa, Sept. 1, 1882.

Extraordinary Work.—Perhaps we have the best day's work extracting on record—four men and a boy extracted 1,700 pounds in 7 hours. This work was done with a four-frame Excelsior extractor, the boy running that, while the four men manipulated the hives and done the uncapping. Our crop will exceed 25,000 pounds.

CHAS. DADANT & SON.

Hamilton, Ill., Sept. 7, 1882.

Not so Bad.—Honey harvest in Canada is not so bad on the whole. It was very slack in July, but has been fair in August, and even yet there is a good deal coming in. I have 7 strong colonies from 2 in the spring—part by dividing and part by natural swarms. Will sweet clover yield honey next year if planted now?

C. W. YOUNG.

Stratford, Ont., Sept. 2, 1882.

[It will yield a little late in the season.—ED.]

Outlook is Good.—Bees have done nothing in the way of surplus honey till within the past two weeks, since which time they have been working in the sections very rapidly. The outlook is good for a fair yield at this time.

H. S. SEE.

Geneva, Pa., Aug. 31, 1882.

Goldenrod in Bloom.—My bees are doing very fairly now. Goldenrod has just begun to bloom. S. S. KARN.

North Manchester, Ind., Aug. 30.

Nothing Like It.—Bees are booming. I have never seen any thing to compare with the present run of honey.

JOHN A. WILLIAMSON.

Lodge, Ill., Sept. 7, 1882.

Excessive Swarming.—We have had a fair season for honey in this part of Ohio, since the middle of June. My colonies have increased from 17 to 43, and will give at least 700 lbs. of comb honey, and are in good condition. Dr. H. S. Conklin's apiary has suffered from excessive swarming. His

bees began to swarm early in June, and are still swarming. One or two others here are having trouble in the same way. The market for comb honey here is fair; the demand, I think, will exceed the supply at 25c. per lb. We are using Mr. J. S. Hill's Langstroth double-walled hive, which has been a success with us this far.

W. B. SPENCE.

Sidney, O., Aug. 31, 1882.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones to procure at the start.

☞ We will send sample copies of the BEE JOURNAL to any one who will distribute them to bee men at Fairs. We will also send some large colored posters to enable them to get up clubs. Write to us and say how many copies you wish and we will send them post paid. See our premiums for clubs on another page.

☞ The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

Paid orders are filed in the Treasurer's office, and always accessible for reference, and the remitter gets a receipt for money sent.

For safety, when sending money to this office, all should get either a post office or express money order.

☞ Articles for publication must be written on a separate piece of paper from items of business.

☞ The *Prairie Farmer*, one of our old and valuable exchanges, comes to us with sixteen pages of reduced size, and change of name to the *People's Illustrated Weekly and Prairie Farmer*. The illustrations are fine, paper excellent, and print and appearance artistic. Price remains as heretofore, \$2 a year.

ESTABLISHED 1862
THE AMERICAN BEE JOURNAL
 ESTABLISHED 1862

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about eight words; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole is sent in advance:

For 4 weeks.....	10	per cent. discount.
" 8 ".....	20	" "
" 12 " (3 months)....	30	" "
" 24 " (6 months)....	40	" "
" 36 " (9 months)....	50	" "
" 52 " (1 year).....	60	" "

Discount, for 1 year, in the MONTHLY alone, 25 per cent., 6 months, 10 per cent., 3 months, 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

Always forward us money either by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

- or a Club of 2,—a copy of "Bees and Honey."
- " " 3,—an Emerson Binder for 1882.
- " " 4,—Apiary Register for 50 Colonies, or Cook's (Bee) Manual, paper.
- " " 5,—" " cloth.
- " " 6,—Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Or they may deduct 10 per cent in cash for their labor in getting up the club.

Binders cannot be sent to Canada by mail—the International law will not permit anything but samples of merchandise weighing less than 8 oz.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to new Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey. A new pamphlet of 32 pages. At the last meeting of the North American Bee-Keepers' Society, we were appointed on a committee to prepare instructions on the Exhibition of Bees and Honey at Fairs; this is also added to the above. Price, 10 cents.

Hundreds of clergymen, doctors and others have used Kendall's Spavin Cure with the best success. 37w4.

According to Edwin Alden & Bro.'s American Newspaper Catalogue, just issued, there are 12,158 newspapers published in the United States and the Canadas. Total in the United States, 11,522; Canadas, 636. Published as follows: Dailies, 1,152; Tri-Weeklies, 80; Semi-Weeklies, 150; Weeklies, 9,078; Bi-Weeklies, 23; Semi-Monthlies, 202; Monthlies, 1,290; Bi-Monthlies, 12.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
 Monday, 10 a. m., September 11, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—1 am paying 7c. for dark and 9c. for light extracted.
 BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17@22c.
 A. L. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@20c. on arrival; extracted, 7@10c. BEESWAX—Firm at 20@25c. per lb.
 CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—Choice white comb honey is steady at 18@20c. Some extra nice 1 lb. packages have sold at 22c. No demand for dark combs. Extracted honey in kegs, barrels and casks, 9@10c. Demand better than for months past.
 BEESWAX—25c. for prime yellow; dark 18@22c.
 R. A. BURNETT, 165 South Water St.

CLEVELAND.

HONEY—Still selling at 21@22c. per lb. for best white 1 lb. sections; 2 lb. sections, 20c.; second grade, 18@19c. Extracted has taken a little start, and 40 lb. cans as well as 5 lb. tin pails sold at 14c. Sales of honey have been quite light the past week or two, owing to the good supply of the home-grown peaches.
 BEESWAX—Scarce at 25@28c.
 A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—There is abundant inquiry, but the majority of buyers are not disposed to pay full prices. Offerings are light, and no large receipts are anticipated.
 We quote white comb, 18@20c.; dark to good, 12@15c. Extracted, choice to extra white, 9@9½c.; dark and candied, 7@7½c. BEESWAX—28@30c.
 STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—We quote at 7@7½c. for strained in bbls. and half bbls., 8@9c. for extracted in cans and kegs; comb, 18@20c. per lb. Larger values of strained and extracted apply to the lesser pkgs.
 BEESWAX—27@28c. per lb.

Bees---127 Colonies for Sale.

I will sell my Park Ridge, Ill., Apiary very cheap. Locality good, market convenient, everything complete. I have more bees than I want. Address COFFINBERRY, 925 W. Madison st., CHICAGO.

Sweet Clover SEED.

I have received a shipment of new crop Sweet Clover Seed, and can now fill orders at 30c. per pound, \$1.00 per peck, or \$15.00 per bushel.

ALFRED H. NEWMAN,

37w1f 925 West Madison Street, Chicago,

New Kegs

FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore procured kegs intended for syrup, Bsh, lard, etc., and in view of this growing trade, I now feel justified in having made to order a Special Keg

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well scalded, the pine will not flavor the honey.

Capacity, 175 pounds.....Price, 80c. each.

The first car load of these kegs will arrive about Sept. 10th, and all orders will receive my prompt attention.

The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

923 West Madison Street, CHICAGO, ILL.

200 COLONIES

FOR SALE.

Tested Queens only in full colonies. Write for prices, and be sure to state if you have or have not ever received my circulars.

I am overwhelmed with letters containing orders for Tested Queens, and inclosing \$2, \$3 and often \$5 each, saying, "Send me one of your best Tested Queens, no matter about color or cost; I want one Tested for business; saw your advertisement in the American Bee Journal." Now, you do not know how happy I feel to thus substantially realize the splendid confidence my fellow bee-keepers put in me, and my new departure in breeding the best bees, regardless of color or number of bands, the more so, that among those ordering are old and experienced apiarists, whose judgment we have learned to look up to. I feel that here is the proper place to say to them that I cannot possibly supply any more queens of any sort, Tested or Dollar, unless the bees are bought with them by the pound, or the whole colony is taken. I cannot spare any more Tested Queens alone and keep up the standing of my apiary for the rearing of a large number of queens next season. I now have more orders for Dollar Queens than I can fill, I fear. Next year I will try to satisfy all, and will notify you in the advertising columns accordingly.

I consider it now getting pretty late to rear the best Queens to fill the place of those sold out, and think that purchasers had better omit queen-rearing at so late a date. I have found that the best time for the bee-master to rear the best stock is about the time the bees do the best business.

JAMES HEDDON.

Downiac, Mich., Sept. 1, 1882.

HONEY

For the past few years I have made this excellent food my leading article. Having the best established reputation in this city as a dealer in PURE HONEY direct from the Apiaries, enables me to obtain the highest market prices. Your consignments and correspondence respectfully solicited.

A NEW BEE BOOK!

Bees & Honey

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN,

Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper cover, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Carefully prepared, and of vast importance to bee raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keittsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebascon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

Florida Land--640 Acres

CHEAP FOR CASH.

DESCRIPTION.—Sec. 4, township 7, south range 7 west, Franklin county, Florida, situated about 50 miles south of the Georgia line, 25 miles west of the city of Tallahassee, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a seaport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loam, covered with timber.

It was conveyed on Dec. 31st, 1875, by Col. Alexander McDonald, who owned 6 sections, including the above, to J. M. Murphy, for \$3,200, and on Sept. 5th, 1877, by him conveyed to the undersigned for \$3,000. The title is perfect, and is unincumbered, as shown by an abstract from the Records of the county, duly attested by the County Clerk; the taxes are all paid and the receipts are in my possession.

I will sell the above at a bargain for cash, or trade for a small farm, or other desirable property. An offer for it is respectfully solicited. Address,

THOMAS G. NEWMAN,

925 West Madison Street, CHICAGO, ILL.

The Bee-Keeper's Guide;

OR,

MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—*L'Apiculture*, Paris.

I think Cook's Manual is the best of our American works.—LEWIS T. COLBY.

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage 'n bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

My success has been no greater as almost astonishing myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—W. J. VAN ANTWERP, M. D.

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record*.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—L'ABBE DU BOIS, editor of the *Bulletin D' Apiculture*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Pulaski, N. Y.

We have perused with great pleasure this *mode mecum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor*.

ALFRED H. NEWMAN, 923 W. Madison, CHICAGO, ILL.

EARS FOR THE MILLION! Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small **White Shark**, caught in the Yellow Sea, known as **Carcharodon Rondeletii**. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **300 years no Deafness has existed among the Chinese people.** Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Day Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by **THOMAS C. NEWMAN,** 925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide to Cook's Manual of the Apiary.—Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 120 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Heren Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40c., or \$3 per dozen, postpaid.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discuses upon the history of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price, 10c.

The Hive I Use.—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how; 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's view on the management of bees. Price, 10c.

Food Adulteration! What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Chicken Cholera, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gliders, Meters and Wood Workers of every kind. "The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED EXCLUSIVELY TO PROGRESSIVE BEE CULTURE.

Vol. XVIII. Chicago, Ill., September 20, 1882. No. 38.

THE AMERICAN BEE JOURNAL

Published every Wednesday by
THOMAS C. NEWMAN,
 EDITOR AND PROPRIETOR,
 925 WEST MADISON ST., CHICAGO, ILL.
 At \$2.00 a Year, in Advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

Bee and Honey Show at Toledo, Ohio.

Such a grand success was this new feature of the Tri-State Fair, that the managers have already promised the Bee-Keepers' Society all the space they may desire at the Fair for next year.

The small corner set apart for the Bee and Honey Show was so crowded all the time, that it was with great difficulty any one could get through the crowd, and utterly impossible for one-quarter of those who desired to examine the exhibits, to even get within a stone's throw of them. The exhibits covered all kinds of supplies used in the apiary, besides comb and extracted honey put up in all the most desirable ways, and a lot of beeswax. There were also full colonies of Italian bees; nuclei containing Cyprian, Syrian and Italian queens, and queens in separate cages. These goods were all on sale, and the receipts from sales paid the exhibitors very well without taking into consideration the premiums awarded.

The bee-keepers present formed an Association, of which Dr. E. B. Southwick was elected President, and Dr. A. B. Mason, Secretary. As a report of the proceedings may be expected from the Secretary, we shall not particularize, except to say that the Association appointed a committee to confer with the Managers of the Tri-State Fair in reference to the details for a very large Bee and Honey Show there next season. So well did the present one succeed, that the bee-keepers, with one accord, agreed to give the next Show of Bees and Honey their most hearty co-operation.

The popularity of the bee and honey exhibit at the Tri-State Fair is but a repetition of the experience of the managers of the Inter-State Fair at St. Joseph, Mo., last season, and the great Toronto Exposition of last year, and but confirms the impressions we entertained when we first urged upon Fair Executive Committees to give apiculture the liberal recognition it deserves. It is still more gratifying to know that the bee-keepers themselves so soon realize a benefit from these public aids to their enterprise.

The *Rural New Yorker*, which is very reliable authority on all matters, says: "The honey crop will be a good one this year, notwithstanding the discouraging prospects early in the season. The yield will be light in Europe, and California will probably not have much for export. Good honey, put up in proper shape and carefully graded, will find ready sales. It should be marketed in no other way. Neat packages are attractive."

By reason of poor health, Mr. James Heddon was not able to attend the bee and honey show at Toledo, O., last week, but he intends, if well enough, to attend the Northwestern Convention at Chicago, October 17th.

A call has been issued for a meeting of bee-keepers to take place at the office of J. D. Chaplin, Esq., in North Manchester, Ind., on the 30th of September, 1882, at 1 o'clock p.m. There are many bee-keepers in that vicinity, and all are invited to be present and assist in organizing an association.

The Rev. W. F. Clarke passed through Chicago last week on his return from Manitoba. He also spent a day with Mr. James Heddon, en route.

Sending Queens by Mail or Express.

On the 25th ult. we received from Mr. I. R. Good, Nappanee, Ind., a cage containing 10 worker bees, accompanied with the following explanation: "I wish to call your attention to the cage I use, and the food placed in it for the bees and queen. I do not lose one queen out of 100, sent in these cages, with this kind of food. If you wish to try the shipping qualities of the cage, mail it to some person in Texas, or at any other distant point, and have him return it to you. The bees will stand a journey of two weeks, and be none the worse for wear and tear."

The cage, with the bees bright and lively, was immediately mailed to Dr. W. R. Howard, Kingston, Texas, where they arrived Aug. 30th, and by him remailed to us on the 31st. Dr. Howard wrote us: "The bees arrived in good condition to-day—not one dead—all lively, and not in the least restless; not more than $\frac{1}{2}$ of food consumed; the food seemed to be in a good, moist condition. With the amount of food, and in their present condition, I should think they were good for a journey of 1,000 miles more."

The cage reached us the second time on September 4th, with the bees still in good condition, except with one dead and one debilitated; but the food had become quite dry and powdered, being scattered throughout the apartment occupied by the bees. We moistened some granulated sugar with liquid honey and placed it in the food cavity, and on the following day again mailed it to Dr. Howard, where it arrived Sept. 8th.

The Doctor acknowledged its receipt in the following language: "Bees came to hand yesterday; 5 bees were alive when received, but this morning only 1 remains alive. The feed appears to have been too damp, and daubed the bees somewhat. I will send the cage with some bees on a new food I have been experimenting with of late; will give you formula at some future time if it proves worthy. Please return, if alive, or send to Dr. J. P. H. Brown, Augusta, Ga., with request to forward to me if alive. It is almost too late in the season to experiment much with bees in transit except in the South. In the event you send to Dr. Brown, have him write to me, as well as yourself, the condition of the bees on arrival." Dr. Howard's remittance of bees were received at the BEE JOURNAL office

Sept. 12th, all alive and apparently in the best condition.

We are inclined to the opinion, had Mr. Good's experiments been instituted in mid-summer, when the weather was sufficiently warm that the bees could readily clean each other, and be free from chilling while in an exhausted condition, or had the food we gave them been in a less moist condition, the period of survival would have been lengthened from 16 days to perhaps double that length of time—or in other words, that it might be possible to mail queens in these cages, with this article of food, from accessible points in the United States and Canada, to Italy with perfect safety.

Mr. Good's cage is made from a block $3\frac{1}{2}$ inches long, 1 inch thick, and $1\frac{1}{2}$ wide, in which are bored two 1 inch auger holes, connecting, and $\frac{3}{4}$ inch deep, which are mortised into one, to serve as an apartment for the bees, at one end; a second hole is bored at the other end of the block, disconnected from the bees, except by a $\frac{1}{4}$ inch hole, for the bees to pass through to the feed, which is placed in the 1 inch cavity. A piece of wire-cloth covers the whole cage, and over this is tacked a thin piece of wood, with a hole cut in, to furnish air to the bees. A $\frac{1}{4}$ inch hole is also bored in the side of the cage, through which the queen and workers are put inside, and this also is covered with wire-cloth, to furnish air, in case the top of the cage should become covered while in the mail pouch.

For food, Mr. Good uses granulated sugar, which is prepared by putting in plenty of liquid extracted honey, and after allowing it to stand a few days, pouring it into a dish or box having a wire-cloth bottom, which allows the excess of honey to drain out,

Here is a most powerful illustration of the efficacy of pure food for consumption in long confinement, and the combination of the cane sugar with the liquid of the pure honey seems to meet all the natural requirements of the bees. There is a hallowed proverb which reads, "He builded better than he knew." Can it not be possible that Mr. Good has exemplified it in his experiments for a transit-food, by discovering and proving the solution of the great wintering problem. Certainly, the results possible are worthy of the most diligent experiments and observation. Should it prove successful, the response from thousands of bee-keepers would resound throughout America—"Good! Good! Good!"

The Honey Crop and the Market.

Mr. J. M. McCaul, with Thurber & Co., of New York, gives the following review of the honey crop for 1882, in a recent number of the *Bee-Keepers' Exchange*:

The outlook for the honey crop of 1882 is but little better than that of 1881.

After returning from the Golden State, and placing California's crop of honey in 1878 at 720,000 pounds, about a quarter crop may be looked for there this season, some 180,000 lbs. of this amount (about 90 tons), according to the best available reports, will constitute the excess of honey produced in 1882 over that in the previous year. New York state, a leading honey producing center, will run short of its general good average, but this deficiency will be offset by gains in Illinois, Michigan and other western states, which produced less than usual in 1881. California promises a quarter crop this year, against a total failure in 1881. This will constitute the surplus over the quantity of honey marketed in 1881. The heavy honey year in California was 1878, the crop has not equalled the output of the bee since that date. The taking up of alternate sections of land for grazing and allowing sheep to range across the intermediate plots, tend to destroy the blossoms on which the industrious bee has depended. A fire swept across a county or two in Southern California two years ago, and all verdure was destroyed, this discouraged the bee-keepers, as well as the bees. Although by next season the present prospect is that honey blossoms will be fairly plenty once more. This explains the failure of the honey crop in that state last year. But the probability of recurrences of fires, together with the grazing trouble, point to the steady reduction of the honey product in California from now on, unless measures are taken to cultivate bee food in the canyons and elsewhere, which plan is meeting with serious consideration with California bee-keepers.

Mr. McCaul's estimate is quite up to, or a little over the amount for California, but for the country at large he is, perhaps, a little under. The *Exchange* intimates, editorially, that Messrs. Thurber & Co. may be over-estimating the crop "in order to bear down the prices," as they are this season buying as dealers, instead of selling on commission as last year. We do not believe, however, that the estimate is excessive, but, rather, under the actual yield, and while we express this opinion candidly we do so with an honest conviction of its truth, and accompanied with the advice to producers that honey is worth as much and should realize as high figures, or higher, than last year, for several reasons, first of which is that

the whole crop, even if one-third larger, is not as great as the consumption will be. Secondly, the quality is much above an average, and should command more for its intrinsic value. Third, the demand from abroad will be much larger than ever before, and will pay an advance on former prices if the product cannot be bought at a less rate.

That the home consumption will be much larger than ever before we feel convinced, as bee-keepers are awakening to the necessity of educating our people to use it more freely, and are adopting more readily every facility for familiarizing the public with a genuine article, and its desirableness as a pure and wholesome article of food. In this connection the Expositions and Fairs are doing more good, remunerative work, than could be accomplished by years of patient individual effort, and it is refreshing to witness the alacrity with which bee-keepers are availing themselves of these popular methods of public instruction; and it is safe to say that the domestic consumption will be rapidly increased to double its former extent, and thus on almost without limit.

In view of the partial failure of the limited honey crop in Europe, and the heretofore popular demand for a pure article of American honey, no one can for a moment doubt that later on the foreign demand will be very heavy, especially when it is remembered that their fruit crop this season is very limited, and honey is, perhaps, its most natural substitute. In our own markets the demand, though healthy and substantial, is not so eager yet as it will be later on, owing to the plentiful and superior small fruit crop; but when this is entirely cut off by frost or expiration of season, the retail demand for honey will likely brighten up, and with a more eager retail market, jobbers' prices will advance, and the demand from first hands or producers become more competitive.

In this connection it is interesting to note the general favor with which smaller—very small—packages are being received. In the Boston market last week, as will be observed by reference to the market column in the BEE JOURNAL, Messrs. Crocker & Blake report the market active, with honey in ½ pound sections selling at 30c. per pound; in 1 pound sections at 22 to 25c., and 2 pound sections at 20 to 22c. Mr. Kendel reported a demand in Cleveland for extracted honey in

packages ranging down from 60 to 5 pounds, at 14c., and 1 pound sections at 1 to 2c. higher than 2 pound sections. Messrs. Greer & Co. reported extracted honey in kegs and cans at 2c. higher than in barrels and half barrels; and in our own market (Chicago) Mr. R. A. Burnett quotes white comb steady at 18 to 20c., with some extra nice 1 pound sections selling at 22c. per pound. Thus it will be seen that the public demand and ready prices, are singularly corroborative of the BEE JOURNAL's oft-reiterated advice, to carefully grade all honey, put it up in small packages most convenient for consumers' use, and make its appearance as attractive as possible. Although the grade may possibly be the same, a more attractive small package will find the quickest sale at a much higher price. Above all, do not by any means use second-hand packages of any kind, more especially kegs or barrels. Anything wooden which has once contained liquid, will be found impregnated with a flavor that will prove detrimental to a fine quality of honey, and either depreciate its value in market, or entirely ruin its sale. It will be found lavish economy.

Foundation Making.—Prof. Cook, President of the North American Bee-keepers' Society, has issued the following circular:

To the Manufacturers of Foundation Machines:

Many have expressed a desire that all of the foundation machines of the country may be at the National Convention, and that foundation may be made so that all may see how they work. While visiting that Goliath of American bee-keepers, D. A. Jones, of Beeton, Canada, last week, he showed me how beautifully the Dunham machine worked, and the fine foundation that it would produce, and said that if Mr. Heddon could do better with the plates, he wished to see it done at the National Convention. I could not help uttering a vehement amen. I remarked that we should also wish to see the one who has done so much for foundation, and foundation machines, A. I. Root, there, with his roller machine, and with the great praise that has been given to the Vandervort foundation, which as we all know that have used it, is well earned, we want as much to see that machine work. Now I wish to suggest that Mr. A. I. Root bring a cistern and wax reservoir, that C. F. Muth furnish wax, and that every manufacturer bring his machine, and we all see them tried. We all know that Messrs. Muth and Root, so full of generous purposes are they, will not refuse to do as suggested above. Such an exhibition would be not only

very interesting, but would prove a wonderful educator. I hope that all of you, Mrs. Dunham, and Messrs. Vandervort, Given, and Root will at once express a willingness to comply with the above request, which is the wish of a host of bee-keepers that intend to be at Cincinnati.

Lansing, Mich., Sept. 7, 1882.

MISCELLANEOUS.

Adulteration of Food.—Hon. W. I. Chamberlain, Secretary of the Ohio State Board of Agriculture, in the last number of the *Country Gentleman*, gives a mental analysis of a breakfast table which he failed to enjoy, and which he characterizes as follows:

I hastily made a mental analysis of the coffee, and it would be about thus for a pound package:

	Per cent.	Per pound.	Value in a pound.
Rio coffee.....	20	0.20 lbs. at 20c.	\$0.04
Peas.....	40	0.40 " 2c.	0.008
Chicory.....	20	0.20 " 4c.	0.008
Lord knows what.....	20	0.20 " (?)	0.000(?)
			\$0.056

Or the value per pound would be about five and one-half cents; or, as pure green Rio, by the quantity, is only ten and one-half cents per pound it would make the prepared coffee cost the manufacturer or adulterator about three cents per pound, and he sells it at fifteen cents or more—a reasonable compensation for grinding and mixing.

A similar analysis of the other articles was about as satisfactory. The sugar was part glucose. The milk was perhaps watered; perhaps from cows fed on glucose meal or sour slops. The buckwheat cakes were 20 per cent. buckwheat, 20 sorghum seed meal and 60 wheat middlings. The butter to put on the cakes was made not of cows' cream, but of cows' tallow, doctored chemically and churned with skimmed milk, on the principle of letting the chicken wade through the broth to make it chicken broth. The syrup to put on the cakes was thick and salvy—20 per cent. cane syrup, 75 per cent. glucose, and about 1 per cent. sulphuric acid!

"O, isn't that a dainty dish to set before a king!"

Disgusted with the coffee, I called for tea, but it never saw the populous shores of China or Japan. The vinegar was not from cider, and the pepper and spices used in cooking had lost a part of their essential oils in some great factory. The canned fruit and preserves had glucose syrup, thick, and of fine "body," but with little sweetness. My stomach said no to such a breakfast, and I hastily withdrew into the open air to let it utter its protest. I served that breakfast just as the whale did Jonah, and with far better reason, for such a

breakfast was not more than half so digestible!

Is it too much to hope that when our Solons have sufficiently protected our crops from adulterated food, they will also protect our stomachs?

A Phenomenon.—Wm. C. Casson, of Addison, N. Y., sends an extract from the Addison *Advertiser*, giving the following account of a curiosity in that city. Mr. Casson says: "What a pressing invitation for the Doctor to commence an apiary":

Dr. John Mitchell, of this village has a curiosity on his premises, on Front St. In the back part of his lot stands a small apple tree, and in that tree is one of the largest swarms of bees that we ever saw, that have hived themselves in the open air, they have already got comb hanging down from a limb larger than a half bushel nearly filled with honey, and they are working away filling the comb and preparing to enlarge.

Characteristics of the "Coming Bee."—The following suggestions are by the editor of the *Bee-Keepers' Guide*:

What shall be the standard physical characteristics of the coming bee?

That advancement may be made toward producing *Apis Americana*, it is important that an impression of its physical characteristics be given, and that this impression or representation of the coming bee should be the effect of causes and conditions that will produce those qualities which are to bring forth the best honey gatherers and hardiest race. Breeders of bees, in the same manner as poultry and stock breeders, should have a standard of excellence and make an effort in the line indicated. While it is true that we select queens that are yellow nearly their entire length for breeding purposes, and charge the highest price for them, we have come to believe from experience that such queens are not always the best.

For reasons we will presently give we are inclined to favor the queen that resembles a fine worker bee. She should have three distinct yellow bands and the remainder of the abdomen should be proportionately like a worker. Yellow queens are produced during very warm weather in strong colonies, and we regard the conditions as not being favorable to produce energetic, hardy and long-lived queens. Because of the fact that much heat is necessary to produce the yellow queen we believe the color to indicate weakness. When colonies increase naturally, at the capping of the first queen-cell the bees swarm and leave the old colony quite weak for the following eight days, while the young queens are maturing, and the queens produced in this manner show more black or dark rings than they would, had only the queen been removed and all the bees allowed to continue the high temperature while the

queens were being developed. We find that a large number of queens perish before they become fertile during extremely warm weather, and we believe heat to be the cause.

Some of the largest and finest yellow queens are short lived, and especially the very large ones. A certain amount of heat is required to produce vigorous animals and plants; a little more heat may promote a more rapid growth, but produce weaker animals and vegetation. We believe that extreme heat should be avoided as much as a temperature so cool as to produce dark and inferior queens. We mean that while the queen breeder keeps his breeding colonies strong and comfortable during the early spring, he should be equally careful to keep them cool and comfortable during the heat of summer, by reducing their strength and supplying shade. In other words, we advise a mean temperature for breeding colonies in order to secure queens, that are uniform in color, can resist cold, endure heat, and to insure longevity.

Negro Bee-Keepers.—Referring to Mr. E. C. Jordan's query, "Why do negroes not keep bees?" on page 378 of the BEE JOURNAL, the editor of *Southern Industries* remarks as follows:

Perhaps as the editor of that valuable journal never said or heard of negroes who were successful bee-keepers, we offer to suggest that the negroes in this portion of the South prefer leaving the management of these busy, honey-making *stingers* to their white brethren, they taking only the trouble of lifting the contents from the hives after nightfall, or during the absence of the industrious apiarists. When bees are not domesticated, and beautiful clear honey produced by them, "Sambo" as a *pis aller* will content himself with that made by the hard-working wild bee. It is safe therefore to conclude that the negro has a great fondness for honey, fears not the sting of the producer, but simply does not care to deprive the white man of the exclusive privilege of experimenting, raising fine colonies, and wearing the title of "Apiarist."

Song of Rejoicing.—The *Nebraska Farmer*, of this month, gives vent to its exultation, over the bountiful harvests, including honey, obtained in Nebraska during the present season, in the following language:

As our state is blessed with a bountiful harvest in nearly all the rural products, it is well that we should rejoice, and that each specialist should make known the results in his department. Bees have been no exception to the general rule. The early season was too cold and damp, but as it advanced, if brought flowers laden with honey, which incited the bees to rapid breeding, and in June swarms began to come out freely, and have continued to ever since; yet August has been their gala day. Swarm after

swarm have issued, until the increase has been from 300 to 400 per cent. and the flow of honey has been so great that they quickly fill the hive, and then the boxes with honey, and gladden the apiarist's heart. Reports from most parts of the state give like results.

The State Board of Agriculture have given us great inducements to make a display at the coming fair. With the means at hand it is no more than right that we should do our best in appreciation of their efforts in our behalf. Therefore, let everyone turn out who can, and exhibit honey, bees and apiarian supplies. There is nothing that will advance our interests better than lively competition. It will incite us to greater effort, and make better bee-keepers of us. It will attract the eye of the consumer, and increase the demand. It will induce others to branch out in the business, and much of the sweetness that is now wasted could be utilized by the bees.

H. W. Lee's Apiary.—A correspondent of a Rockford, Ill., paper, gives the following description of a visit to the apiary of H. W. Lee, at Seward, Ill.:

His farm is in the township of Rock Run, Irish Grove, and about three and one-half miles north of Peca-tonica. As a bee farm, its location could not be very easily improved, for these industrious honey-gathering insects are enabled not only to gather the sweets from clover, buckwheat, etc., but also from wild flowers and basswood blossoms, which abound in those quiet "sylvan shades." Mr. Lee has been an apiarist for twenty years, and has been a diligent student of bee life, in all its varying phases, consequently he is thoroughly informed on the subject. He had 120 colonies last spring, but now has 200 colonies, or in the neighborhood of 7,000,000 bees. This apiarian metropolis covers two acres of ground, has six rows of hives, and is laid out as regularly as the city of Philadelphia.

The present prospect is that he will have not far from three tons of honey to put upon the market this fall. The largest yield he ever had in one year was four tons. He has a machine for extracting honey from the comb, and also another for making foundation. Besides his bees, Mr. Lee has also a fine lot of grapes and blackberries.

☞ We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

CORRESPONDENCE

For the American Bee Journal.

Bee-Keeping in the Great Northwest.

WM. F. CLARKE.

Having just taken a trip into and partially through the region above-named, I propose, while the subject is fresh, to jot down for the AMERICAN BEE JOURNAL a few impressions of the country, apiculturally considered. My tour extended from St. Paul to Winnipeg, Manitoba, thence westward, 409 miles to the last rail of the Canada Pacific Railway, returning to Winnipeg, thence east to Hawk Lake, about half way to Thunder Bay on Lake Superior; again returning to Winnipeg, thence, via Minneapolis to the Jim River Valley, Dakota, and from there to Chicago, where I now write. The Great Northwest I take to comprise the vast tracts of land north and west of St. Paul.

At present, and if properly farmed for all time, this region, taken as a whole, may, without impropriety, be considered the world's largest and grandest wheat-field; beginning with the famous Red River Valley in Northern Minnesota, and stretching northward to the limit of cereal culture, and westward to the Rocky Mountains; it may, almost without exaggeration, be said to be one mammoth wheat field, the like of which is not to be found on the earth's surface. The only part of this field that can be said to be fully worked, is the before-mentioned Red River Valley. There I saw a sight that made me open my eyes wider than they were ever stretched before. Wheat on either side of the railway track, from thence apparently to the horizon; much of it standing, more of it reaped or in course of reaping by the wonderful self-binders that convert standing grain into sheaves as if by magic; miles of it in shock; teams busy hauling dry sheaves to the steam threshers that were puffing and buzzing on every hand; men bagging the threshed grain; and, again, more teams hauling to the nearest elevators.

Here are the big Bonanza farms, of which we have read and heard so much. All through my westward journey, and more than as far again, there is a strip of at least 500 or 600 miles wide, capable of presenting just such a spectacle as I saw in the Red River Valley, and in the course of a very short time it will present a similar spectacle. These immense wheat areas are fast filling up with a population that will speedily become comfortable, if not rich. I don't think this mammoth wheat field will ever be much of a bee country. The summers are too short; the winters too long, and the thermometer gets too far below zero. Fancy wintering bees where the mercury sometimes dips down to 60° below zero! But these thrifty wheat farmers will all have

parlors, or at any rate kitchens, where their queens and princesses will sit "eating bread and honey," that is, if they can get the honey, as they will be able to do, if bee-keeping spreads itself in those more genial regions where it can be practicably and profitably carried on. These are not very far to the south of this mammoth wheat field of the world.

I do not know what is the limit of paying apiculture in Minnesota, but there is a limit, a line of north latitude beyond which bee-keeping, as a business, cannot be carried on. Beyond that limit, there will soon be a market for honey, which bee-keepers had better keep an eye on; a market in which all other products that are not native bring high prices, and a market, too, in which the luxuries, as well as the necessaries of life, are in brisk demand, for this remarkable region is not being peopled with a poor, economical and struggling class, but mainly with those who have come from the Eastern States and Provinces, with more or less means. Their aim is to be able to boast in the shortest time possible that they possess all the delicacies they left behind them, and they will not leave honey out of their catalogue.

I do not pretend to have made a thorough apicultural exploration; my trip was too hasty for that, and I am only jotting down impressions. But let me now advert to a region which, I believe, presents large scope for bee-keeping. I refer to the far-famed Jim River Valley in Dakota. Before seeing this highly-favored spot of earth, I thought it had been overpraised. Now that I have been there, I am ready to say with the Queen of Sheba, "the half was not told me." I have seen much of the earth's surface in general, and of the continent of America in particular, but this, to my mind, judged from an agricultural standpoint, is the gem and crown of it all.

The climate and soil must have some peculiar qualities, for here, from four to six degrees farther south than the Manitoba wheat areas, "A No. 1 hard" can be, and is, grown in all its prime excellence. At the same time, the Indian corn is as good as in Illinois; water and musk melons grown on the open prairie, without hot-bed forcing, were ripe, luscious and abundant when I was there, Sept. 6 and 7. But bees don't suck nectar from melons, though boys and "children of a larger growth" are wont to do so. Let me say, then, that asters, boneset, goldenrod, and innumerable flowers were in a blaze of glory at the dates named, all over the untouched prairie. Such a magnificence of floral beauty, I never saw on this broad continent before in the month of September. This means an abundant fall honey harvest, the great desideratum for successful and profitable bee-keeping.

I have often regretted that I am not more of an apicultural botanist, and never did so more sincerely than as I gazed upon those gorgeous Dakota prairies a few days ago, for I would like to be able to name well-known honey plants, which I am sure

luxuriate there. It is the same all the season through. From early spring to nipping frost, those prairies are one vast flower-garden. There are no wild bees, so far as I could learn. Trees are conspicuous by their absence, except along the river banks and bottoms, and there the growth is not large enough to allow of a hollow trunk sufficient to accommodate a colony of bees. If there were natural hives, I question if "wintering on their summer stands" would work, for even in the Jim River Valley the mercury sometimes falls pretty low. But no country was ever better adapted for cellar or clamp wintering. That peculiar soil of which I have spoken, requires no walls of wood or masonry when a cellar is dug in it. Cover an excavation with a shed or building, and the walls remain as intact as when they were first shaved down with a sharp spade. I saw cellars of this kind that have been in use for three or four winters, and there is no crumbling of the walls, while such a thing as a dump cellar is unknown, except so far as the dryest earth has a trace of dampness in it. No rotting boards to mar the sweetness of the air; no solid walls of stone or brick to stop the pores and forbid capillary circulation. Surely, this is the paradise of cellar or clamp wintering for the bee-keeper.

My visit to this charming valley answers the question I have often asked, viz.: is there not a region somewhere on this continent suitable for isolated queen-breeding, where the season is of sufficient length to make the business profitable? Mr. Jones' islands are too bleak and inhospitable to make it other than a costly business to breed absolutely pure queens there. When I was at his place early in June, operations on the islands had not yet begun. In the Jim River Valley spring opens as early as in New York, Southern Ontario, Northern Illinois, or Central Michigan, and the season is as long. Here, then, is an opening for some enterprising man who wants to raise dollar queens that have only to be mated to be infallibly all right. I have no doubt this fine valley will, ere long, swarm with bees and bee-keepers. I met with one man, a carpenter, who was working at house building "on the distant prairie" several miles from his own house, who took a few colonies to the Jim River Valley this spring, and regretted his inability to look after them, for they both swarmed and gathered honey to an extent he never saw equaled in all his life before.

Does the Bee Injure Grapes?

T. T. ROBERTSON, M. D.

It has long been believed, and is now almost universally accepted as a fact, that the bee destroys grapes and other fruits. I have watched the little workers for years, and have been loth to believe it. I observed long ago that they never attacked sound grapes.

But when defective, or split as the result of a rainy spell, they would then suck out the juices. Being unable to convince others of the harmlessness of the insect in any other way, I devised for that purpose the following experiment, which any one may try for himself.

I placed at the mouth of the hives bunches of several varieties of thin-skinned grapes, and for days, although the bees were constantly crawling over them, not a berry was injured. I then punctured half of the berries on each bunch, and instantly the bees went to work on all so punctured, in a short time sucking them dry. The remainder of the berries were untouched and remained so until punctured by me, when they in turn were attacked as promptly as the former.

This experiment demonstrates that it is necessary for the grape to have been previously injured so as to allow exudation of juice; otherwise the bee will not molest it. I have not observed so carefully in the case of other fruits, but it is my belief that this is the *modus operandi* in all cases.

Rot, splitting of the grape, injury by insects and birds (in this latitude a small yellowish bird is conspicuous), are the causes that render grapes liable to attack by bees. And when we reflect that the berries thus injured would decay, it will be seen that the bee actually saves to us what would otherwise be lost, by storing it up as honey.

I have been hurried into this communication, by observing that in some quarters legislative action is about to be taken against an insect which I believe closer observation will demonstrate to be not only innocent of harm, but productive of good.

Winnsborough, S. C.

Bee-Keepers' Magazine.

Understanding a Locality.

G. M. DOOLITTLE.

One of the important factors of successful bee-keeping is a thorough knowledge of the locality in which we reside. Many bee-keepers do not seem to realize the importance of this, as their actions show, for if they did they would not be asking "if the basswood had blossomed yet," as did a bee-keeper a few days ago.

All work with the bees to be successfully done, should be done with an eye open to the probable time of the blossoming of the main honey plants in our locality. For instance, if white clover is our main honey crop we must commence operations with the bees at least six weeks previous to its blossoming in order to insure a good yield from it, for it takes at least six weeks to build up a colony so it will be able to do the best work on a given field of blossoms. Hence as white clover blossoms in this latitude about June 15th, we must commence to get our bees ready for it as early as the first of May. Now, by so doing we get the bees in time for the harvest which means success. But supposing basswood, which opens July 10th

to 15th to be our main harvest, we having but little white clover, not more than enough to keep the bees breeding, then the commencing to stimulate the bees for this harvest as early as the first of May would be labor thrown away, as well as a useless expenditure of honey used in producing bees to loaf around waiting for the harvest.

What man is there having a field of wheat requiring the labor of 20 men to harvest the same, who hires these men two weeks previous to the time the wheat is ripe? When shall we learn to use common sense in regard to bees as we do in other things? For a man to talk of getting his bees strong and ready to swarm in April by means of artificial heat in this latitude, as some have, shows a lack of good common sense on this point.

Again, if our bees are weak in the spring and we do not get them ready for that harvest until after the harvest is over, they become merely consumers instead of producers, or worse than useless. It would be like the man hiring his twenty men to harvest his wheat after it had become ripe and spoiled in the ground.

Thus it will be seen that to be the most successful we must have a full force of bees just in the right time to take advantage of the harvest. In order to do this we must study our locality and know the time our honey producing flowers open, and thus we shall gain a knowledge that will enable us to reap a rich harvest of honey when honey is secreted in the flowers.

Borodino, N. Y.

For the American Bee Journal.

How I Shall Winter My Bees.

J. A. BUCKLEW.

I submit for your criticism my plan of wintering my bees the coming winter. I ask all who have had experience in wintering bees by burying them in clamps, or in the ground, to tell me what they think of the following plan: I will have 40 good colonies and 10 nuclei, all Italians, with about 20 lbs. of sealed honey to the colony, and the nuclei about 10 lbs. each; all in Simplicity hives.

I shall dig a trench two feet deep and three feet wide, in dry sandy soil, sloping to the south; in the bottom will put one foot of dry straw; one foot from the top I will put two rows of scantling on which to set the hives; will place hives about six or eight inches apart, leaving them on their bottom-boards with caps off, and a sheet of burlap over the frames; between, around and over the hives I will put dry straw, but not pack tight. Around this I will build a rail pen commencing one foot from the hives on each side, and by drawing in, bring it to a point over the center of the hives; over this pen I will put straw six inches thick, and cover all at least one foot thick with earth. At each end of this pit I will have a four-inch pipe to enter the ground at least ten feet from each end hive; these pipes will extend

under the bees and terminate about half way to the center.

At the center of this pit I will have another pipe to start just below the hives and extend through and above the pit about six feet; the ends of these tubes will be made to keep out mice, snow and rain, and still give ventilation. In this shape I propose to leave my bees until they can gather pollen next spring.

This has been a very fair honey season with us. After bees commenced work on white clover there was no gap in the honey flow, as is generally the case. White clover lasted at least two weeks longer than general, and the golden honey plant and goldenrod were in bloom before white clover was done. Bees are gathering honey yet, working on red and Alsike clover, buckwheat, Spanish needle and asters; also, on the excrement of aphides or plant lice, and this last means dysentery, if they have any of it left to winter on. I believe the coming winter will be almost as destructive to bees as that of 1880-81. Bee-keepers should be prepared for it at any rate.

Forty acres of Dr. Tinker's golden honey plant this year would have given me more honey than the thousands of acres of white clover on which my bees worked. It is the best honey plant, in my opinion that I have ever seen; it has grown wild here for many years, but I am sorry to say it is migrating or going down stream, the older plants up stream die out; the seed is carried down stream by high water, and come up farther down every year. Success to the Weekly BEE JOURNAL.

Clark's, O., Sept. 11, 1882.

Gleanings in Bee-Culture.

Holy-Land Bees.

E. R. ROOT.

It may seem strange to some, that I, occupying so favorable surroundings, should hold aloof from the general contribution in common with our many bee friends; but deeming it better to "go slow," and give our older and wiser heads the field, I have thus far stood back, thereby correcting a few of my hasty conclusions and immature opinions.

Lately my attention has been so greatly drawn toward the Holy-Land bees that I cannot refrain from saying a few things in their favor, although they are surrounded by some prejudices. That they are very prolific, all, who have handled them will admit; from whence it would naturally follow that their generative qualities would tend especially toward raising cells; this, in our experience, has been decidedly the case.

I will mention one or two instances, not because they are remarkable in themselves, but to show that this is one of the characteristics of the race. On the 5th of July we were somewhat short of cells, and in taking my usual rounds through the apiary, I came to a Holy-Land colony from which the queen had been sold. The state indicated that the bees had killed a dol-

lar queen caged there, and had served two just hatched in the same manner. In consequence of this determination to build cells, the colony had been queenless about ten or twelve days. On picking up one of the frames I found a young hatched queen; and on another, I counted upward of 25 cells. As we were at this date short, and the queen a fine tested Holy-Land, I determined to avail myself of this fine lot of cells. After cutting out perhaps half a dozen, and laying them on the side of the hive, I was about to proceed further, when, looking down, I discovered that three of the six had hatched. I immediately set back the frame, and disposed of my young queens wherever most needed. I again commenced at the cells, and after having cut out three or four, found two more queens hatched, and another fast gnawing out. I placed my ear near the comb containing the cells, and could distinctly hear the nibbling of the queens within. This indicated very plainly that they would soon all be out. I therefore hastened to put the remaining cells along with the two hatched queens, into the nursery; soon after, another lot was in turn brought there, as I feared they, too, would hatch on my hands, as did the others. Nor was I mistaken in this.

After resuming my work, John told me that the queens were running loose in the lamp nursery in every direction. I hastily cut out the cells yet remaining in the hive, and once more started for the nursery. Sure enough, on arriving there my eyes were greeted with a sight that really made me feel quite happy, as they were just in time to supply the demand of the colonies. These queens, with a single exception, all hatched within thirty minutes; and were so remarkably strong and healthy that some attempted to fly, and one did succeed partially. No time was lost in giving them to queenless colonies; but, unfortunately, we were not as successful in rearing them all. This date (5th of July) in our locality was about the intermission of the flow of honey between clover and basswood; in consequence of which, the bees, not having much else to do but mischief, killed a part of them.

Out of the number that were accepted, a few could be introduced only by vigorously smoking their colonies at the entrance. The queens are now laying, and are so exceedingly large and fertile that my honored *patron* pronounced them to be some of the finest queens he ever saw.

At another time, John and I counted in four Holy-Land colonies, 82 cells: this number is only their fair average yield. Whenever we are in need of a "raft of cells," as we term it, the brood of a Holy-Land colony is exchanged for that of an imported stock. By that means we can obtain as many cells as we need; whereas the imported stock, left to itself, probably would not raise over 6 or 8 cells, and it is not uncommon for them to have only three or four.

Now, in summing up a few of the good features of the Holy-Lands, we

find, from the above facts, first, they raise a great abundance of cells at one rearing; secondly, the cells are started so that they hatch at or nearly the same time; lastly, if the cells are not too much disturbed, the queen will hatch out strong and healthy.

Now, a word in regard to the Holy-Lands as honey-gatherers: My experience has led me to think that they are equally as good as the Italians, and some say a little superior. Being originally reared in a hot, dry country, they have necessarily been obliged to gather honey at every opportunity available, or the race could never have existed. In this country, they of course manifest the same energetic disposition; and hence, as far as my observation goes, gather some honey after the basswood flow, even when the other bees are apparently inactive.

After what has been said, I would not have it understood that I have any the less regard for the Italians than before; but, on the contrary, all things considered, I think they possess many qualities far superior to other races of bees, and will probably always retain the front rank.

My object in writing this is not to give the Holy-Lands undue praise, but to bring forth a few of the good qualities which are justly their due. I do not deny, that the Holy-Lands have a few bad features; but these, I think, have been fully discussed before.

Medina, O.

Home Farm.

Progress of Apiculture in 30 Years.

L. F. ABBOTT.

During the last thirty years great discoveries have been made in the natural history and general management of bees. And while the habits and instincts of the honey bee are the same to-day as thousands of years ago, the methods employed to develop and utilize their value and enable the bee-keeper to prosecute his business with intelligent oversight have been numerous and very valuable, because mainly practical in their application to the end sought, namely, the improvement of the stock; to acquire a knowledge of the habits of the bee; better to utilize their labor, hence greater profits; the latter mainly the greater desideratum of the Yankee mind.

The invention of the movable-comb frame hive introduced by Mr. Langstroth about 1850, opened up a wide field of study; in fact it was the invention of the age as regards intelligent bee-keeping, and upon it has hinged most of the progress that has been made since. By its use we were enabled to go inside the hive and prove those things at which naturalists had hinted. It enabled us to practice artificial multiplication of swarms, or prevent natural swarming when desirable. That bees, deprived in any way of their queen, had the means to rear another one, had long been known, but till now the knowledge

was of but little practical value. Now we are enabled to rear queens at will; to become acquainted with their good or bad qualities and to breed and perpetuate the one or discard the other; and also if another race of bees is thought to be superior to the ones we are breeding, the movable-frame enables us to introduce foreign stock without loss.

Science has also demonstrated that to elaborate and build comb causes bees much labor, and that it is at the expense of a large quantity of honey. Take an ordinary bee-hive of 2,000 cubic inches capacity and to fill it with nice new combs requires labor sufficient to bring in thirty pounds of honey, and the elaboration of wax to form material for the building of the combs requires thirty pounds more. We find that sixty pounds at least of honey has been the cost of filling each hive. Enterprising bee-keepers sought to obviate in some measure this outlay, and the result has been the honey extractor whereby the newly closed cells are uncapped and the frames with combs attached are taken from the hive, the bees brushed off and then placed in the machine and rapidly revolved, emptying the honey from the cells and then the combs replaced in the hive to be refilled and the process repeated when advisable.

Twenty years ago, had some timid apiarist ventured to suggest the possibility of making artificial comb which the bees would readily accept and utilize the same as their own, he would have been a fit subject for a lunatic asylum; but nearly as long ago as that the embryonic idea took root in the brain of the late Samuel Wagner, and the result has been the production of foundation comb that can be attached to the frame and placed within the hive and as readily used by the bees for all purposes as their own.

These are some of the wonderful results that have accrued by the application of certain principles in accordance with the no less wonderful instincts and habits of the honey-bee.

But while the results of the new light that has dawned upon the bee-keeper's pathway has been to lead to grand achievements in summer management of the apiary, the successful wintering of bees has not yet come to be demonstrated by any set rules however carefully observed. Comparatively speaking, it is easy to successfully manage the apiary during the warm months, for success hinges very much upon whether the season is auspicious for honey gathering; but during the winter and spring the bee-keeper often finds all his wisdom at fault. There are a few rules it is well to observe, and these when put in practical use are as near right as any we have tried. To be brief, for this article has already exceeded its proper limits, let us observe:

1. Bees in the movable-frame hive are not in their normal condition; hence, some means should be adopted to prevent a low temperature within the hive. Such condition is best afforded by wintering in a dry cellar.

2. The larger the mass of bees con-

solidated together the less susceptible are they to a low temperature; hence by the first of November remove a frame and put the remaining ones farther apart, also cut passage ways through the combs to enable the bees to communicate freely through each sheet of comb.

3. Quietness is essential to their prosperity, hence the hives need to be placed in a dark cellar, and if the cellar is used for other purposes put a partition across the room so the light may not disturb them.

4. A current of air continually passing from beneath up through the hive is detrimental to the health of the bees; then contract the entrances and leave small spaces between the combs and bottom board; place quilts upon the top of frames, remove the caps from the hives and keep at a temperature of 40° Fahr., higher than this will cause uneasiness, lower will do no harm.

5. Be sure that each hive contains at least 15 pounds of honey; disturb as little as possible until spring. These rules followed your losses will be less than in any other way.

Augusta, Me.

London Journal of Horticulture.

Effect of Cold and Consumption of Food.

A. PETTIGREW.

On page 566 of the AMERICAN BEE JOURNAL we have, through the kindness of Mr. Alfred Neighbour, the opinions of Dr. Dzierzon on other questions of importance. He says, "The milder the winter the more complete will be the repose of the bees, and the lower will they be able to allow the temperature to become even when they have their winter quarters, while increasing cold stimulates them to breathe more frequently and to consume more food; in other words, it stimulates their vital powers to greater activity in order to be able to offer the necessary resistance to cold in winter."

Theory and experience, as well as the last mild winter, demonstrate to me practically the fallacy of this opinion. Exposure of the bees to extreme cold certainly causes them to crowd together into as thick a cluster as possible, but it does not send them into a sleep-like state of repose; on the contrary, it startles them out of their rest, compelling them to hum more loudly, while previously they were in perfectly silent repose. Nor does severe cold prevent premature breeding. There is generally more brood to be found in the hive in January and February, when the weather is very cold or after the temperature has been very low, than during a continuance of mild weather. Dr. Krasieck acknowledges this fact, but explains it in a peculiar manner by saying, "that because bees consume more food when temperature is low the production of chyle would also be greater." All this and more than this seems to be no more than theory and speculation, and not supported by facts or experience.

My own experience, extending over a period of fifty years, and the experience of many practical and observing bee-keepers, go quite in an opposite direction, and prove that the colder the winter or weather is, the less honey is consumed by bees, and this stands to reason as well as experience. In cold winters bees sit closely together for weeks and hardly move. There is in such seasons little waste and wear, and little food is required to make good the waste. In warm winters there may be heard a hum night and day in good hives—the bees set loosely together, move about among one another, and often take outdoor exercise. The waste of body is greater, and a greater quantity of food is required and eaten to make good the waste.

The last warm winter is referred to by Dr. Dzierzon in support of his new theory. English bee-keepers know that during the last open winter the consumption of food was great—unusually great, and hives were unusually light in the spring months of this year. That bees consume much more food in warm winters than they do in cold ones is a fact well known long ago, and every year's experience confirms it. This theory of Dr. Dzierzon reminds me of the strange notion of a Swiss clergyman, who boldly stated that two swarms of bees united do not eat more in winter than each of the swarms would do if kept separate. This was received as the truth by a large circle of apiarists, some of whom tried to explain it on scientific principles. Of course they failed, and when told years afterward that 10,000 bees required twice as much food as 5,000, they believed this and said no more about the discovery of the Swiss clergyman.

If bees eat more food and breed sooner in a cold house and in a cold winter than they do in a warm house and winter, the system of contracting space in bar-framed hives cannot be too soon abandoned and condemned, and hives with cavity walls are quite a mistake if Dzierzon's views are correct.

Bowdon, England.

West Texas Bee-Keepers' Association.

In consideration of the great interest that is now being taken in scientific bee-keeping in Western Texas, a number of bee-keepers met at the office of T. C. Greenwood, in Luling, on the 2d inst., for the purpose of effecting a temporary organization to be known as the West Texas Bee-Keepers' Association. Although with only a few days' notice, there were 420 colonies of bees represented, with a product up to date of about 32,000 lbs. of honey. After some spirited discussion, it was deemed advisable to postpone the organizing of the per-

manent Association until the 1st of November, 1882, so that those living at a distance may have an opportunity to come and take part in said organization.

The following gentlemen were elected officers of the temporary organization: J. S. Tadlock, President; T. C. Greenwood, Vice President; Thos. Balcomb, Secretary; P. H. Calahan, Treasurer.

We respectfully invite all the readers of the BEE JOURNAL living in West Texas, or any part of the State, to try and make it convenient to be present, that we may permanently organize and discuss the many interesting topics in connection with the best management of bees for our Southern climate. THOS. BALCOMB, Sec.

To all Bee-Keepers in Wisconsin.—At the next annual meeting of the North American Bee-Keepers' Society to be held Oct. 3d, in Cincinnati, Ohio, Vice Presidents of each State are expected to report the condition and industry of bees in their respective States. This can only be done by the help of bee-keepers living in different parts of the State, and I wish that every bee-keeper interested would, as soon as possible, send me a report of the condition of bee-culture in their section, to wit: How many colonies had you in the spring? How many on the 1st day of May? How many did you sell after the 1st day of May? How many have you now, and have they enough honey to winter without feeding? How much surplus honey did you take? How much of this was extracted, and how much comb? How much wax did you get? What hive do you use? How do you increase—by natural or artificial swarming? How was the weather in the spring, summer and fall—wet or dry, cold or hot? I hope all bee-keepers in this State will respond and give me an answer to the above stated questions, so I will be able to make a correct report from this State.

CHRISTOPHER GRIMM,
Vice Pres., for Wisconsin.

Jefferson, Wis., Sept. 14, 1882.

The Northwestern Bee-Keepers' Convention will meet at Chicago, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1882. The office of the American Bee Journal has been kindly tendered as a place of meeting. A cordial invitation is extended to all bee-keepers, and especially those of the Northwestern States, to be present. The meeting takes place during the last week of the Inter-State Industrial Exposition, to enable all to obtain reduced railroad rates. First session at 10 a. m. C. C. MILLER, Pres.

C. C. COFFINBERRY, Sec.

The bee-keepers of Boone Co., Ind., are cordially invited to meet at the office of Barton Higgins, in Lebanon, Oct. 9, at 9 o'clock, a. m., to complete the organization of the auxiliary County Bee-Keepers' Society. The bee-keepers of Hendricks county, Ind., are invited to be present. By request of the Committee.

The National Convention.

The North American Bee-Keepers' Society will hold their 13th annual meeting at Washington Park Hall, Cincinnati, O., across Washington Park from the Exposition building. Time, Oct. 3rd to 5th, 1882. First session Tuesday, 10 a. m., Oct. 3. We are encouraged to hope that this will be a very profitable meeting, as we are promised papers from, and the presence of, a large number of our most prominent bee-keepers both in the United States and Canada, and essays and implements of the apiary are expected from abroad to add to the knowledge imparted by the research and inventive skill and methods of our countrymen.

ERRICK PARMLY, Sec.
New York, July 12, 1882.

The Union Bee-Keepers' Association of Maryland, Virginia and West Virginia, will meet at Hagers-town, in the room of the County Commissioners, at the Court House, on Wednesday, Oct. 18, 1882, at 1 o'clock, p. m., the session to last two days. The Washington County Fair will then be in progress, which will give persons an opportunity to attend the exhibition. All persons intending to go will please drop me a card, so that I may secure for them half-fare rates.

J. LUTHER BOWERS, Sec.
Berryville, Va.

The fifth annual meeting of the Northern Michigan Bee-Keepers' Convention will be held at Pewamo, Ionia County, Mich., on the second Tuesday and Wednesday (10th and 11th) of October, 1882. Pewamo being on the D. & M. and H. & M. R. R., it will be accessible by rail. The members will do all in their power to make the meeting interesting.

H. M. ROOF, Pres.
O. R. GOODNO, Sec.

Local Convention Directory.

1882. *Time and Place of Meeting.*
Sept. 26—Eastern Mich., at Detroit, Mich.
A. B. Weed, Sec., Detroit, Mich.
26, 27—Kentucky State, at Louisville, Ky.
W. Williamson, Sec., Lexington, Ky.
28—Norfolk, Ont., at Waterford, Ont.
Elias Clouse, Sec.
Oct. 3-6—North American, at Cincinnati, O.
Dr. Ehrick Parmly, Sec., New York City.
5—Kentucky Union, at Shelbyville, Ky.
G. W. Demaree, Sec., Christiansburg, Ky.
10, 11—Northern Michigan, at Pewamo, Mich.
O. R. Goodno, Sec., Carson City, Mich.
17, 18—Northwestern, at Chicago, Ill.
C. C. Coffinberry, Sec., Chicago, Ill.
Tuscarawas Valley, at Newcomerstown, O.
J. A. Bucklew, Sec., Clarks, O.
Nov. 1—New Jersey & Eastern, at New Brunswick.
J. Hasbruck, Sec., Bound Brook, N. J.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

SELECTIONS FROM
OUR LETTER BOX

Moving Bees.—It has been a very poor summer for bees, they came through the winter in good shape, but the weather we had in May and June left them in bad shape for the honey harvest. I had to feed every week up to July 5th, to keep them from starving. No box honey until August. I run my bees for increase this summer, and have Italianized all of them. I increased by the nucleus plan; had 12 colonies to begin with, and have now 32, good and strong, which have honey enough for winter; had 4 colonies make 200 lbs. of box honey. I live about ½ mile from where I am going to winter my bees—shall I leave them where they are now until I put them in the cellar, or shall I move them a week or two before they are to be put in the cellar, so as to give them a chance to fly? If I should move them would they come back to the old stand and die; or if I should wait and move them on a wagon or sleigh, and put them in the cellar without having a flight, would it not cause them to have the dysentery?

CHARLIE W. BRADISH.
Glendale, N. Y., Sept. 11, 1882.

[Move them before it is too late for a flight, then slant a board in front of each hive, so as to partially obstruct the ingress and egress; this will cause the bees to mark their location anew, and your loss will be very trifling. It would be hazardous to move them, any distance, or at all, and place them at once in winter quarters.—ED.]

Building Up.—I have a strong 2-frame nucleus—can I safely winter them, or can I build up by giving comb foundation? WM. ROBERTS.
Vaughansville, O.

[It is now too late to think of building them up much. With a strong two-frame nucleus, the most you could safely count upon would be to have one sheet of foundation drawn out into perfect comb. If you have other colonies, better give a frame of brood from each of those till you have about seven frames of brood and honey. If you cannot do this, then prepare your nucleus and put it in the cellar soon as cool weather comes. It may possibly winter safely, but the probabilities are against it.—ED.]

Still Gathering Honey.—Our bees have abundant supplies for winter, and are still gathering honey. We have removed most of the boxes and given them combs to fill for spring feeding. I hope to be able to attend the Northwestern Convention.

A. J. HATFIELD.
New Carlisle, Ind., Sept. 13, 1882.

Much More to Learn.—I commenced this year as an amateur apiculturist, with 3 colonies in box hives. I now have 8, and 4 swarms I failed to hive. I have read Quinby's and Prof. Cook's works some 3 or 4 times, also the BEE JOURNAL, and still find that what I do not know about bees would make a volume of 600 or 800 pages largely illustrated. I have only the box hive. My bees are gathering honey moderately—some largely, about half of them have filled surplus boxes once, and one colony, a June swarm of this year, has yielded 3 crops, about 45 lbs. Others have given no surplus, but they hang outside, and have more or less for months, in some instances with room inside. They have made comb outside and under the stand. Why is this? Again, Prof. Cook and Quinby lead us to suppose that the bees will make straight comb on the frames, in the frame hives; yet, in your paper to-day, J. M. Foote, of Creston, Iowa, complains of crooked combs in a Langstroth hive. I fear there is much to be learned not down in the books. THOS. MARTIN.

Coal Valley, Ill., Sept. 13, 1882.

[The idling and building comb outside was most likely the result of being honey-bound in the hive; it is possible, however, they were infested with moths, which sometimes cause a repugnance to inside work. Had you been using movable frame hives, you could easily have determined the trouble, and applied the remedy. We do not think Prof. Cook or Quinby intended to convey the impression that movable frames were a guarantee of straight combs; but with the V shaped top-bars for the movable frames, there is a great probability of straight combs, much more so than with flat top-bars, and greatly more so than with no frames to guide them, and only a couple of sticks crossed to give them a start in building. Try a movable frame hive next season, and give yourself an opportunity to be converted to their use, also to reduce the number of pages and illustrations in the large book which you could get up with your box hive experience.—ED.]

An Amateur's Success.—For the encouragement of beginners in the bee business, I make a statement of what I have done with 3 colonies this summer, and have only given them but a very little of my time on account of my practice; didn't do anything with them until late in the spring, and did not feed a single ounce of anything. I used comb foundation; the 3 colonies were in plain hives, with only 8 frames about the size of the American, with room for 16 frames if needed. By dividing and saving queen cells I have increased to 24, only one of them being a natural swarm and very large, which left for parts unknown. I might have increased a half dozen

more, as I have plenty of honey, most of the hives containing 10 and 12 frames that are well filled. There was no honey here to work on until the 8th of July, and we have had all we could eat on the table, and there is a fair prospect for quite a surplus of fall crop. This I think is quite good for the little time they received. Of course some will say I am an old hand at the business; yes, I am, and, like James Heddon, I have the leather-colored Italians. I expect to increase to 100 next year, if I do not lose any this winter. I like to pack with chaff for winter, with as little upward ventilation as possible, with frames about 1 foot inside measure. I prefer my frames the longest way up and down. I think it the best for extracting or for boxes at the sides and top if I wish. There are nothing but Italians in this vicinity.

Dr. J. S. McALLISTER.
Columbus, Neb., Sept. 13, 1882.

Robbing.—Will bees continue to work while being robbed? Please answer in BEE JOURNAL.

II. J. NORTHROP.
Lauringburgh, N. Y.

[No; unless the colony is strong enough to guard itself against the intruders, and gather honey at the same time.—ED.]

Harmless Moth.—I send you by today's mail a large miller, which I wish you would describe in the BEE JOURNAL, if not too much trouble. It was found on the alighting board of one of my bee hives. What was it there after?
J. W. GILBERT.

Palmyra, N. Y., Aug. 11, 1882.

[This moth is one of our most common and beautiful sphinx moths. *Deilaphila lineata*. It is a fine brown moth, beautifully lined with white, black, yellow and red. The larvæ is also handsome, and feeds on the purslane. I do not know what it was about the hives for, without it was guided by curiosity—surely it had no sinister purpose, as it is very common here, and never, so far as I have noticed, has it ever peeped into a beehive. These moths, as are all of the Sphingidæ, are lovers of sweets, and possibly might have a honey tooth; yet their size would debar them from gratifying any such taste, as they could not enter a hive.—A. J. COOK.]

On the Jump.—I was taken sick the 16th of June, and was very ill for 8 weeks, so now that I have regained my health, I am very busy. I have the care of 150 colonies, divided into 7 apiaries from 9 to 20 miles distant from my home, and it keeps me on the jump. The honey crop is about one-third of what it should be. No basswood and very little sumac, from the effects of dry weather.

H. L. JEFEREY.
Woodbury, Conn., Sept. 13, 1882.

Feeding for Winter.—I commenced to keep bees this spring, having purchased 4 colonies of Italians. I have attended to them as well as I could, having had no experience and being guided solely by Cook's Manual, and the information contained in the BEE JOURNAL. The bees have increased very well, so that I have 9 colonies, and they are all full of bees and brood; but what puzzles me is, that there is no honey in any of the combs. I cannot see a single frame with capped honey and I have taken none from them. I am afraid that there will not be enough to keep them over winter, as the season is now pretty well advanced. Should I commence feeding now, or wait till later? There seems to be plenty of food for them, as the flowers are blooming and everything looks favorable for gathering honey. I am afraid that if I defer feeding till cold weather, they will not take it.

Ilanover, Ont. NOVICE.

[Better commence feeding soon, and give them sufficient that two or three days will enable you, when cool weather comes, to give all they will still need. In a northern latitude frost is liable to come with the first clear weather; besides, the food will be much better, and the bees much more contented if they can get most of their winter stores properly ripened and capped before cold nights are permanently on.—ED.]

Doing Well on Fall Bloom.—I like to hear, through the BEE JOURNAL, from those keeping bees, and will give my experience with them; I am but a beginner. I bought an Italian queen and introduced her into a colony of black bees in June, 1880; increased to 4 colonies by natural swarming in 1881, and obtained 75 pounds of box honey. My bees were strong and hives full of honey for winter. I wintered on the summer stands, and all came out in good condition last spring. I have increased by natural swarming to 11 colonies, all in fine condition. One fine swarm absconded to the woods, and I returned 6 or 8 to the hives they issued from, as I was working for honey and not increase. The 11 colonies have given me about 500 pounds of comb honey. I do not extract, as I want honey for house use only, and prefer it in the comb. I use a side opening, movable frame hive, 14x13½ inches, and 12½ inches deep, 9 frames, with upper story for surplus honey. Can use either boxes or frames for surplus. I have never used sections, as I do not expect to sell honey. Locust was a failure with us, the bloom being killed by late frosts; white clover did not give a good yield on account of too much rain in the fore part of the season; basswood was almost a failure, but the 1st of August we had some good rains that gave us an abundance of honey bloom, and as bees had bred up well on white clover, they have given us a good surplus. If the weather continues favorable, we will get a good yield for the

season. This season has been better than the last for honey. My bees are good workers, but are inclined to swarm too much, which gives me some trouble.

JOHN ERWIN.
Louisville, Ill., Sept. 13, 1882.

Floral Specimens.—I send you today two specimens of honey plants, for names, on which bees are working now. No. 1, the large yellow flower, is found in great quantities along the mountain streams and valleys where soil is wet; it grows about 5 feet high, bears 6 to 20 flowers on each plant; stands very thick on the ground, making the valley look yellow, when in bloom, begins blooming about Aug. 1st, just as the cranesbill begins to shed its blossoms, and continues to bloom till frost. Bees, insects and bumble bees cover these flowers from morning till night in great quantities, and in the evening after 4 p.m. hundreds of bumble bees may be seen sticking to them, in a stupefied condition unable to fly, and consequently perish of cold, the elevation here being 8,000 feet above the sea. No. 2, the pink flower, begins blooming about August 20th, and blooms till frost. The plant attains a height of 3 feet, and the flowers are found along about one foot of the stem; grows anywhere in moist soil, and is very abundant. Bees are just beginning to work on it here. Both these plants, like the cranesbill, are found anywhere from the foothills to the snow, thus spreading over territory whose elevation is from 5,000 to 11,000 feet, which accounts for the long season of bloom.

PHIL. REARDEN.
Jamestown, Col., Aug. 28, 1882.

[No. 1 is known as *Rudbeckia laciniata* by botanists, and is sometimes included in the somewhat large list of sunflowers by the unscientific. It is a vigorous species, preferring damp or wet soils, and occurs throughout Canada, and the Northern States. The "compound" flower is large and conspicuous, its yellow rays often two inches long, spreading horizontally or drooping. These marginal flowers of the head produce neither stamens nor pistils, hence no seed; their whole duty is to perform the function of an advertisement or sign; but the numerous inconspicuous florets of the central part of the head are perfect in their parts, and when properly fertilized set an abundance of seed. These, too, are rich in pollen and nectar, readily accessible to bees. Curiously enough, insect aid is almost imperative in the process of fertilization, or more properly pollenization, for though each little, tubular flower sends up its pistil through a close ring of the five united anthers (pollen-sacks) when the latter are bursting and exposing the pollen in profusion, not a grain of this reaches the stigma

at the time. When the pistil has pushed itself through the dusty mass, more or less of which adheres to its sides, it, rising well above, separates into two lobes each of which curls outward so that the surfaces previously applied closely to each other become exposed. It is only on these latter surfaces that the pollen can germinate, and thus fertilize the flower; but they are the very parts not smeared with pollen as the pistil pushes up through the mass. Probably by swinging with the wind and brushing against other objects, many flowers might be fertilized without insects, but the pollen-grains are too rough to be easily blown away from their place of contact or scattered by the wind. Certainly, nectar-loving insects do good service to the plant, and for these the flaming signs are hung out.

No. 2. *Epilobium angustifolium*. This splendid, violet-purple flower is of a noble race, to which belongs the evening primrose, and those glories of the green-house, the fuchsias. In them all the ovary is situated below the showy part of the flower, and in this case the latter seems perched on the upper end of a pod which rapidly develops, and ultimately gains a length of five or more inches, filled with very numerous seeds and a quantity of silky fibers (coma) like the milkweeds. The plant is found throughout the Northern States, and reaches into Arctic America, but is at home only on certain soils and under certain conditions, hence the distribution is far from uniform. I cannot state what value the species has for honey producing. Medicinally, it has latterly gained some repute.—T. J. BURRILL.]

Hooks for Tops of Frames.—Last winter I brought safely through 37 out of 39 colonies; united down to 30 strong ones to begin the season's work. Took over 1,000 lbs. nice honey, about half comb and half extracted; increased to 46, and will winter a dozen nuclei, besides requeening most of my apiary. I wish to say to Mr. C. H. Deane, that I am using a much better substitute for the holes for wires in the frame, than his hooks, and cheaper by far. It is simply the tin tack used for tacking in window glass, similar to tin points used for glassing sections. Drive nearly down and then bend it over to form the head of the tack, and being broadest at the top, the wires will not slip off; or, better still, have a steel tool made to cut the tin triangular and cut your own tacks long enough to go through the top and bottom-bars and clinch on the other side. If any one has a bet-

ter substitute for pierced frames let us have it. I object to Mr. Deane's hook, because its peculiar construction must make it expensive.

Barnesville, O. J. G. STEER.

Still Swarming.—And yet they come; another swarm to-day, and two on August 29th; 16 now from 6 in the spring. I am getting more bees than honey this season; but they seem to be doing well now, as fall bloom is very plenty. There is a yellow flower growing here very plenty along Eel river, that bees are working on from morning until night. It seems to be the favorite flower. From the description that Dr. Tinker gives of the golden honey plant I think it the same. I send you a sample.

H. C. WHITLOW.

North Manchester, Ind., Sept. 8.

[It is undoubtedly the same.—ED.]

Botanical.—Please name accompanying flowers. No. 1 grows upon low land, and has yellow blossoms; Nos. 2 and 3 grow upon medium low and high land, the first with violet tinted, and the last with white blossom.

DANIEL WHITMER.

South Bend, Ind.

[No. 1 is a solidago; No. 2, motherwort; No. 3, white aster.—ED.]

Late Clover Bloom.—Our bees are yet hard at work. White clover is still in abundant bloom, as well as all kinds of fall flowers. I began in the spring with 4 colonies, and none of them very heavy, I have increased them to 10 strong colonies, and have taken 224 lbs. of extracted and 134 lbs. of comb honey, in 2-lb. sections, and will still have several pounds of comb to take off, which will make over 90 lbs. per colony. My increase has been entirely by division, by taking from one to three frames from a hive at a time, and putting empty combs or frames in their place. I believe this portion of Iowa is going to be hard to beat for a bee country, for we have a good white clover district that is generally in bloom for weeks, besides other bloom in the fall.

J. W. SANDERS.

Le Grand, Iowa, Sept. 8, 1882.

Done Well.—My bees have done well this summer. I started with 3 colonies, increased to 12, have taken 300 lbs. of extracted and 50 lbs. of comb honey in sections. Sold all my extracted honey for 15c. per pound at home, and could sell lots more if I had it.

E. L. FREDENBERG.

Fentonville, Mich., Sept. 9, 1882.

To Clean Moth out of Combs.—Take all the web out of the comb in the frames, then place the comb in a tub of water, filling each cell with water and leaving the comb in the water about four hours. In two days after placing the frame in the hive, they will commence to fill the comb with honey again.

WINFIELD ROMMEL.

Metuchen, N. J.

Value of "Bees and Honey."—Father bought a colony of bees last winter in a Simplicity hive. The spring and summer has been so wet that the bees did not do much. The first swarm came out Aug. 10th, the second Aug. 12th and the third the 13th. I returned the third swarm, but they came out again the next day, so I put them in a new hive. They are all doing well and getting in good condition for winter. We now have hot days and cool nights. 1. Will it pay to buy a honey extractor for 4 colonies? 2. Do you think it a good plan to clip the queen's wing? 3. What is the color of a pure Italian queen? I learned what little I know out of "Bees and Honey." I think it worth twice its cost. HERBERT H. FISH.

Spencer, Iowa, Sept. 11, 1882.

[I. It will not, unless you expect to increase next season.

2. Yes; as it does not injure the queen if properly done, and it is a great safe-guard against losing swarms.

3. They vary. Some are a very pretty gold yellow, with only the tip of the abdomen black, while others are a leather-colored yellow, and the segments of the abdomen are black, with a black tip to the abdomen.—ED.]

When Shall I Feed.—I have taken from my bees a very nice surplus of extracted honey, but they have stored none in the brood-chamber. I will be compelled to feed during the winter. Would you advise feeding now, or wait until later in the season? The brood-chambers are full of capped brood, larvae and eggs, and if I feed now, the food will become scattered in all parts of the hive. How would it do to wait until about the 1st of Oct., then remove a few of the brood combs, close up with division boards, and feed all at once? W. T. CLARY.

Clarysville, Ky., Sept. 7, 1882.

[Take off the upper or surplus story, if not already done, and feed now; a change in the weather is liable to take place at any moment. Even though scattered in the hive, the bees will bring it together as the young bees emerge from the cells.—ED.]

Inferior Honey.—This has been a very bad season so far. All of the earlier honey is dark and of an inferior quality. The later honey is good, and sells readily at 15 cts. per lb. for extracted, and 20 cts. for comb honey, and can be retailed for higher figures.

N. H. ROWLAND.

Troy, Ky., Sept. 13, 1882.

Toads and Bees.—Nothing can be truer and more to the point, than the extract from the *Canadian Farmer*, given on page 547 of your invaluable Weekly. Some years ago, my bee-house being in a locality where toads abounded, my attention was drawn to the "preying" attitude described,

and taken up by the creatures every night. To test the matter, I put a bullet through several, and immediately cut them open. The average number of undigested bees found in each one's stomach was 36 to 40. I took special note of quantity, and never after allowed a hive to set right on the ground. **ARTHUR TODD.**
Philadelphia, Pa.

Nuclei Storing Surplus.—In passing from Lasalle to Mendota, Ill., I observed bees kept on but one farm, and those were kept on the old plan. The country is an ocean of flowers, and tons of honey were going to waste for want of bees to gather it. My bees are bringing in honey very fast, and are still swarming now and then. The weather is most promising for an immense fall crop. Small nuclei, which I did not expect would gather enough for winter stores, are now working in surplus boxes and sections. **H. S. HACKMAN.**
Peru, Ill., Sept. 10, 1882.

About an Average Season.—The season here for bees has been about an average one. Spring was backward, but when it did open the white clover held on remarkably well; and linden lasted well, but did not blossom very full. Have 100 colonies in fine shape for winter. **C. A. GRAVES.**
Birmingham, O., Sept. 12, 1882.

Good Fall Honey Crop.—My bees done well this summer. White clover came out on the 20th of June, which month was cold and wet. Three weeks in July were very good, with plenty of clover honey. There were 10 or 12 days of rain in August; the rest of the time up to this date has been very good, with sweet clover, buckwheat and goldenrod, and honey in plenty of them. **JOS. LEE.**
Farmers', Mich., Sept. 11, 1882.

Bees Booming Yet.—Bees are booming yet. If the present honey flow continues till October 1st, I shall harvest about 10,000 lbs. of comb and extracted honey. **E. T. FLANAGAN.**
Belleville, Ill., Sept. 13, 1882.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
" 100 colonies (220 pages)..... 1 50
" 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones to procure at the start.

We will supply sample copies of the BEE JOURNAL and large colored posters to any who may make a display at the coming fairs, to aid in getting up clubs.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about **eight words**; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole is paid in advance:

For 4 weeks.....	10	per cent. discount.
" 8 " (3 months)....	20	" "
" 12 " (6 months)....	30	" "
" 16 " (9 months)....	40	" "
" 20 " (1 year).....	50	" "
" 24 " (1 year).....	60	" "

Discount, for 1 year, in the MONTHLY alone, 25 per cent., 6 months, 10 per cent., 3 months, 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

Always forward us money either by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

or a Club of 2,—	a copy of "Bees and Honey."
" " 3,—	an Emerson Binder for 1882.
" " 4,—	Apiary Register for 50 Colonies, or Cook's (Bee) Manual, paper.
" " 5,—	" " cloth.
" " 6,—	Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Or they may deduct 10 per cent in cash for their labor in getting up the club.

Binders cannot be sent to Canada by mail—the International law will not permit anything but samples of merchandise weighing less than 8 oz.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL. }
Monday, 10 a. m., September 18, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—I am paying 7c. for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17c/22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some cull for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16c/20c. on arrival; extracted, 7c/10c. **BEESWAX**—Firm at 20c/25c. per lb.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—Choice white comb honey is steady at 18c/20c. Some extra nice 1 lb. packages have sold at 22c. No demand for dark comb. Extracted honey in kegs, barrels and casks, 9c/10c. Demand better than for months past.
BEESWAX—25c. for prime yellow; dark 18c/22c.
R. A. BURNETT, 165 South Water St.

CLEVELAND.

HONEY—Still selling at 21c/22c. per lb. for best white 1 lb. sections; 2 lb. sections, 20c.; second grade, 18c/19c. Extracted has taken a little start, and 60 lb. cans as well as 5 lb. tin pails sold at 14c. Sales of honey have been quite light the past week or two, owing to the good supply of the home-grown peaches.
BEESWAX—Scarce at 25c/28c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—About 3,000 lbs. (52 cases) Hale's extra white comb was placed this week at 20c. There is no better honey in the State, and the brand enjoys an enviable reputation. Medium quality extracted in cases is firm at 8c/9c. The inquiry is good. In a retail way 10c. is asked for some extra white extracted.
BEESWAX—28c/30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Sold more freely, but at lower prices: Comb at 18c/20c., strained at 7c/7½c., and extracted (in cans) at 8c/9c.; choice in smaller quantities brings higher figures.
BEESWAX—Sold fairly at 27c. for prime.
R. C. GREER & Co., 117 N. Main Street.

NEW YORK.

HONEY—No quotations reported.—**ED.**
BEESWAX—The supply is moderate and prices held about steady, though very little doing. Western, pure, 27c/27½c.; Southern, pure, 28c/29c.
D. W. QUINBY, 105 Park Place

BOSTON.

HONEY—Market active. We quote ½ lb. combs 30c. per lb.; 1 lb. combs 22c/25c.; 2 lb. combs 20c/22c. Extracted, in half bbls., 12c/14c.
BEESWAX—Prime quality, 25c.
CHOCKER & BLAKE, 57 Chatham Street.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey. A new pamphlet of 32 pages. At the last meeting of the North American Bee-Keepers' Society, we were appointed on a committee to prepare instructions on the Exhibition of Bees and Honey at Fairs; this is also added to the above. Price, 10 cents.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and with any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

We will send sample copies of the BEE JOURNAL to any one who will distribute them to bee men at Fairs. We will also send some large colored posters to enable them to get up clubs. Write to us and say how many copies you wish and we will send them post paid. See our premiums for clubs on another page.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

Paid orders are filed in the Treasurer's office, and always accessible for reference, and the remitter gets a receipt for money sent.

For safety, when sending money to this office, all should get either a post office or express money order.

Emerson Binders.—We have had a lot of Emerson binders made especially for the BEE JOURNAL for 1882. They are lettered in gold on the back, and make a nice and convenient way to preserve the JOURNAL as fast as received. They will be sent post paid by mail for 75 cents.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

CLUBBING LIST.

We supply the Weekly *American Bee Journal* and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	Publishers' Price.	Club
The Weekly Bee Journal	\$2 00..
and Gleanings in Bee-Culture (A.J. Root)	3 00..	2 75
Bee-Keepers' Magazine (A.J. King)	3 00..	2 60
Bee-Keepers' Instructor (W. Thomas)	2 50..	2 35
The 4 above-named papers	4 50.. 4 00
Bee-Keepers' Exchange (Houk & Peet)	3 00..	2 50

New Kegs

FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore produced kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine boops on each end.

I have tested a sample keg by filling it DEY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well scalded, the pine will not flavor the honey.

Capacity, 175 pounds. Price, 80c. each.

The first car load of these kegs will arrive about Sept. 10th, and all orders will receive my prompt attention.

The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

923 West Madison Street, CHICAGO, ILL.

HONEY

For the past few years I have made this excellent food my leading article. Having the best established reputation in this city as a dealer in PURE HONEY direct from the Apiaries, enables me to obtain the highest market prices. Your consignments and correspondence respectfully solicited.

A NEW BEE BOOK!

Bees & Honey

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN,

Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is “fully up with the times” in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are “Bee Pasturage a Necessity,” “Management of Bees and Honey at Fairs,” “Marketing Honey,” etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keltsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price that has ever come under our notice.—Farmer, Lancaster, Pa.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$10.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$8 00
For 2 Langstroth " " 10x18 " "	8 00
For 3 " " 10x18 " "	10 00
For 4 " " 10x18 " "	14 00
For 2 frames of any size, 13x20 " "	12 00
For 3 " " 12 1/2x20 " "	12 00
For 4 " " 13x20 " "	16 00

A. SNYDER,

Clarksville, Albany Co., N. Y.

THIS PAPER may be found on file at Gen. P. Rowell & Co.'s Newspaper Advertising Bureau (10 Spruce St.), where advertising contracts may be made for it in **NEW YORK.**

The Bee-Keeper's Guide; OR, MANUAL OF THE APIARY,

By **A. J. COOK,**

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book:

All agree that it is the work of a master and of real value.—*L'Apiculture*, Paris.

I think Cook's Manual is the best of our American works.—**LEWIS T. COLBY.**

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—**J. P. WEST.**

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—**E. H. WYNKOOP.**

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage 'n bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—**A. E. WENZEL.**

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—**WM. VAN ANTWERP, M. D.**

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record*.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—**L'ABBE DU BOIS**, editor of the *Bulletin D'Apiculture*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Pulaski, N. Y.

We have perused with great pleasure this *volume* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor*.

EARS FOR THE MILLION!
Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carcharodon Rondeletii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became an universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, and the WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

To avoid loss in the mails, please send money by REGISTERED LETTER.

Sent by mail, postpaid, on receipt of price, by THOMAS C. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject. \$1.50.

Novice's ABC of Bee-Culture, by A. I. Root—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c; in paper covers, 50c, postpaid.

Bienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon's Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey; the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price, 10c.

The Hive I Use.—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees, Price, 10c.

Fond Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Chicken Cholera, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind. The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED EXCLUSIVELY TO PROGRESSIVE BEE CULTURE.

Vol. XVIII. Chicago, Ill., September 27, 1882. No. 39.

ESTABLISHED 1861

THE AMERICAN BEE JOURNAL

ESTABLISHED 1861

Published every Wednesday by

THOMAS C. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

At \$2.00 a Year, in Advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

EDITORIAL

The National Convention.

Before our next issue, the National Convention will convene. We hope all who can do so will attend, and trust that the meeting will be very interesting, and, as heretofore, entirely harmonious. We regret not being able to be present, but shall have a representative of the BEE JOURNAL there, to take a report of the proceedings for publication.

Those who have found fault with the former meetings of this Society, should by all means attend this one, and by their counsel and assistance, aid in making it as near perfection as possible. Those who do not attend have no reason to find fault with what is done—let them go, and see to it that no stone is left unturned which could make it more interesting and useful to the bee-keeping fraternity of the whole country.

As to the next place of meeting—the Northwestern Bee-Keepers' Association at its last session in Chicago invited the National to meet with it in joint assembly, and this we think would be hailed with delight by hundreds, but some may think otherwise. New York, Indianapolis, St. Louis, Toronto, Cleveland, Peoria, and other cities have been suggested. Let the matter be well canvassed, and the most suitable place selected—so that all may be satisfied, and the bee-keeping industry be best subserved.

The BEE JOURNAL does not desire to make any suggestion as to the location of the next Convention. It will be well satisfied with any that may be selected—feeling assured that the united wisdom of those in attend-

ance will be sure to make a good selection. No matter where it may be held, the BEE JOURNAL will do all in its power to advance its interest, and we shall attend if it be held at any other time than the first week in October.

In our next issue we shall give such of the essays to be read at the Convention as we can procure, and copies of them will be distributed there, so as to overcome some of the objections heretofore urged against their use. By this means those present will be able to read them over in advance, or note points as they are being read, for further discussion, and thus add largely to their usefulness.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly in this form and size, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

A Test for Honey.

Prof. T. Maher, of this city, sent us the following letter:

In the pamphlet on "Food Adulteration," page 53, Prof. Kedzie observes very truly: "Not only will sugar thus combine with lime, oxide of lead, oxide of iron, etc., but it will associate with itself sulphuric acid, and form a compound acid which comports itself very differently from simple sulphuric acid. This sacro-sulphuric acid forms a pretty large class of salts which are soluble in water, but especially soluble in solutions of sugar. Re-agents which will readily precipitate sulphuric acid and sulphates, *e. g.*, chloride of barium, will not precipitate the sacro-sulphates.

"Glucose has the same power as an acid substance as sacrose, forming a class of soluble glucosates. It will also associate with itself sulphuric acid, and form a class of gluco-sulphates. Undoubtedly a large part of the lime found in these starch-sugar syrups exists in the form of gluco-sulphate of lime."

I would only take exception to the sentence "chloride of barium will not precipitate the sacro-sulphates." For, with a white solution of chloride of barium added to and stirred with a diluted solution of (glucose) clear syrup at 16c. a quart, obtained this morning from the corner grocery, I have just obtained a white precipitate of sulphate of barium which sufficiently accounts for the cheapness of this syrup, when I had to pay 18c. for a quart of dark New Orleans molasses, a dilute solution of which gave no precipitate when similarly tried with a dilute solution of chloride of barium, but remained perfectly clear, as did, on another trial, a solution of extracted honey from a 3-lb. can which I bought at 161 S. Water St., and thus branded on the outside: "Pure Honey from the apiary of H. D. Burrill, Bangor, Mich."

I made a fourth trial with coffee sugar from the same grocery store, but the solution remained clear and no precipitate took place. My wife declares that she will keep this small bottle of chloride of barium solution and will not fail to try all the molasses, sugar and honey which may come into our house; let alone the syrups which will of course be severely kept out; and why cannot every well regulated family thus be provided with such a small bottle?

Chicago, Ill., Sept., 1882.

As the determination of a simple and practicable detective for adulteration in sweets is a matter of the greatest importance to bee-keepers, grocers and families, we invited Prof. Maher to conduct a few experiments at the BEE JOURNAL office, which took place on the 20th inst.

The Professor produced a phial containing about 4 ounces of chloride of barium. "This," he remarked, "is a good article. It is necessary in all

experiments of this nature that the agent used as a detective be a pure article, else the result will often be unsatisfactory; therefore, in purchasing, we must visit the druggist or chemist whose reputation is above reproach."

The first experiment was upon a so-called pure article of "golden syrup," about one ounce of which was poured in a glass, to which was added about two ounces of water. This was thoroughly mixed by stirring, after which nearly two tablespoonfuls of the liquid barium were poured in. At first a small cloud or opaque discoloration occurred, after which it resumed its original color, while the Professor remarked that it was a very good article of syrup he was testing. He said, however, that the impurities (glucose) in the syrup would be precipitated to the bottom of the glass, and would be visible when the liquid had become quiet, which proved to be the case.

Test No. 2 consisted of a tablespoonful of Davenport "grape sugar" (glucose), dissolved in four ounces of water. Into this the liquid barium was poured, when the whole mass immediately assumed a clouded appearance, and upon becoming quiet a sediment settled in the bottom of the glass, apparently as much in volume as there was originally of the glucose, and which would indicate that the majority of the glucose was insoluble in simple water.

For test No. 3 a sample of honey was used that was sent to the BEE JOURNAL Museum by Mr. Wm. Hoge, about two years ago, which he claimed would not granulate, owing to some peculiar process by which it was treated. In this a slight effervescence took place, as though there was an acid in its composition being acted upon by soda.

Prof. Mahler was quite positive as to the efficacy of his test, and thinks chloride of barium will prove the simplest, cheapest and most delicate detective that can be used, and perfectly within the province of every man or family for all practicable purposes. Should it so prove, the Professor has well earned the gratitude of every honey producer in the country, and his experiments will result in much good.

A couple of years ago our attention was called to tincture of iron, as a ready agent for detecting adulterations in syrups and honey; but we

found its use impracticable, for, while it would discolor and sometimes blacken liquid honey, it could not be relied on to give a positive indication of the presence of glucose, nor, indeed, could the proportion of honey used in a mixture of any kind be determined. Hence, we have failed to appreciate any advantage to be derived from its use, but rather misapprehension and uncertainty.

Bee and Honey Show in Florida.

Mr. W. S. Hart, New Smyrna, Fla., wrote to the State Park Association, in reference to offering Premiums for a display of honey at the State Fair, and secured an offer of a premium of \$25.00 for the best display of honey in all departments of its production, and \$10.00 for the second best, together with a diploma for the first prize. The following extract from Mr. Hart's letter shows his line of argument:

Our industry is well worth fostering. Here in this little hamlet of New Smyrna, we have produced over forty thousand pounds of honey of the best quality this year. Most of it produced in three apiaries. I think this amount will be nearly or quite doubled next year. This amount collected, where a few years ago all this delicious sweet was allowed to waste, shows plainly that the summer breezes sweeping over our fair State, bear away thousands of dollars' worth daily of the purest and healthiest sweet known to man. By offering liberal premiums at our State Fair, for the products of the apiary, your Association will exert an immense influence toward saving this wealth to the State and at the same time help to bring within its border an intelligent and industrious class of people.

Wintering Bees.—The *Canadian Farmer* offers a prize of \$10 for the best essay on "Wintering Bees in Canada. The Canadian Bee-Keepers' Association awarded it to Mr. H. Clouse, of Beeton, Ont. We shall give it in the BEE JOURNAL soon.

The committee appointed to award the prize remarked as follows: "Regarding the essay we do not think it went sufficiently into details, but as far as it goes it shows evident care in preparing, and that the writer is a practical man."

The *Rural Canadian* adds: "It is a prize hard to award, for only the test of time can show who is the successful competitor. Many individual bee-keepers would gladly give \$10 each for a sure method of wintering bees."

Yellow Melilot or Sweet Clover.

We observe on page 616 of this issue, that Mr. Ed. Bertrand, editor of the Swiss *Bulletin d'Apiculteur*, proposes to cultivate the yellow sweet clover as well as the white. It may be that in Switzerland the bees can obtain nectar from this variety, but we have never heard of its affording bee pasturage in this country. In portions of California, Texas and New York we have been informed it grows spontaneously, but the bees do not work on it. We have seen a few specimens of it growing in our locality, but always deserted by the bees. With us it blooms some two weeks sooner than *melilotus alba*, and would be quite desirable if a honey-producer.

**MISCELLANEOUS.**

Food for Queen Cages.—Speaking of the food used by Mr. I. R. Good and others in queen shipping cages, consisting of honey and sugar, the *Indiana Farmer* remarks as follows:

We have been using this kind of candy for several years with the very best results, and have called attention to the matter several times through the *Farmer*. In the fall of 1880, in answer to some inquiries we said: "Many of our friends seem to have difficulty in making a candy for queen cages which will carry them safely for any length of time without water. We make ours as follows and have not had a single loss during the season, from this cause. We have part of a barrel of granulated honey, by digging down in the center of which, that around the sides of the barrel becomes very dry. To some of this we add sufficient of 'C' sugar to make a very stiff paste or candy. We add sugar so long as it will hold together. 'A' sugar will not do so well as the grain seems too hard and dry, and seems more inclined to run, and daub the bees."

Does the Queen Lead the Swarm?—The *British Bee Journal* says:

There is an impression prevailing among the uninitiated that the queen of a hive leads off the swarm, but this is by no means the case with first issues, for, as a rule, the queen does not come forth from the hive until the greater part of the bees are on the wing. Another erroneous idea in existence is that the queen bee is the first to alight upon a branch or a bush, and that the bees congregate

about her, but the reverse is a fact. When a swarm begins to issue, if the bee-keeper will place himself on the shady side of the hive and watch the stream of bees which pour forth like an army through a gateway, he may see the queen come out, and if inclined to prove our assertions he may capture and cage her, and put her in his pocket while he watches the proceedings of the bees. When the throng is circling in the air he may imagine that the bees are searching for her, and will, perhaps, conclude that as they cannot find her they will return at once to the hive; but no, they will first congregate near a convenient tree or bush and make a great noise sufficient to attract the attention of her majesty if she were abroad, and then they will alight and form a cluster and wait for some minutes, to give her an opportunity of joining them. If now she be taken to them, she will join the mass and all will be well; if not, the bees, after a short time, will disperse and return to the hive. Now this kind of experiment has been so often proved that it may be taken for granted when a swarm of bees has alighted and afterward returned to the hive that the queen was not able to join them, or she would assuredly have done so.

Glucose from Rags.—The *Revue Industrielle* states that a German manufactory is turning out over a ton a day of glucose made from old linen rags.

These rags, which are composed of hard vegetable fibers, are treated with sulphuric acid which converts them into dextrine. The latter product thus obtained undergoes a washing with milk of lime, and is then treated with a fresh supply of acid stronger than the former, when the mass is at once transformed and crystallizes into glucose, of which confections, honey and jelly may be made. The process is said to be a very cheap one, and the glucose chemically identical with grape sugar.

The Harvest of the World.—From the *London Times* we clip the following summary of the harvest of the World:

As regards French wheat, the result is already known. Maize is good in 25 departments, and very good in two, as against good in seven departments only last year. Rye shows a similarly favorable contrast. Barley shows a slighter improvement. In Great Britain 414 inquiries have been sent to farmers, asking their opinion on the growing crops. The replies, taking 100 as representing an average crop, show the following result: Wheat, 92.2; barley, 95.4; oats, 105.1; roots, 107.1; potatoes, 96.4. This may be compared with last year's figures, which were as follows: Wheat, 90; barley, 110; oats, 60; roots, 80, and potatoes, 98. The wheat crop will probably be 10,000,000 quarters for consumption, leaving 14,000,000 quarters for which we shall be dependent on

foreign supply. Spain is the only country from which the reports are unfavorable.

In summarizing the result, the *Times*, says: "Never, during the time since these reports were collected has the harvest in the northern hemisphere been so good all round. We usually have had to report a deficiency either in Europe or America. This year there is absolutely none. The world has an over average harvest, the year is likely to be one of cheap abundance."

Preparing Bees for Winter.—The *Indiana Farmer* gives the following:

We should not lose sight of the fact that the most essential point in safe wintering is plenty of young bees. More can be done in the month of September to aid bees in preparing for successful wintering than can subsequently be done. The queen should be kept breeding all of this month if possible. Bees bred after this time are perhaps the only ones that survive the winter, therefore, it is of the highest importance that the queen should have plenty of room, to the end that the colony will be strong in young bees. When the season for honey gathering is over and the weather becomes cooler, bees will not rear brood, or but very little. If you have not already done so, examine each hive carefully and learn the exact condition in which it is, and if any are deficient in stores feed at once and in sufficient quantity to last them through the winter.

Peculiarities of Bees.—The *Gazette des Animaux* publishes the following about the sciology of bees:

It appears that the monarchies of bees, well-governed as they seem to be, are afflicted nevertheless by organized criminal classes—sneak-thief and highway robbers. Some of these robber bees go in strong bands to pilage and are able to storm and sack a hive. After the slaughter they carry all the provisions home. Some colonies of bees never work; they live entirely by robbery and murder. There are also sneak-thieves who creep unperceived into strange hives to steal honey. If successful they return afterward, with hordes of burglar bees, break open the honey-safes, and carry away the contents.

The Honey Harvest in Switzerland.—The *Bulletin d'Apiculture*, remarks as follows on the subject:

The season of 1882 will probably be counted as a bad one by our bee-keepers. The first crop was pretty good in some of the valleys, small in others and almost nothing in the cantons of Fribourg and Soleure, as well as in the Alpen Vaudoises. They write to us from Lausanne that their gathering is very poor, and that the swarms have been very few. We greatly fear the second crop, where they generally have one, will still be worse than that of July.

CORRESPONDENCE

For the American Bee Journal.

Wintering, the Season in England, etc.

SAMUEL SIMMINS.

While there is yet time, before the bees are prepared for their long confinement, allow me to suggest what appears to me to be the principal cause of the frequent heavy losses, which occur during the severe and protracted cold, to which some of your States are subject.

The all important and life-giving element, "fresh air," seems to have been lost sight of, and I believe that hives judiciously ventilated, without direct draught, will stand any weather, even should they have an excess of pollen, which some writers suppose to be the grand cause of wintering troubles.

Dysentery rarely occurs among my bees. Our winters are never so severe but what the bees can occasionally renew the air by their usual method of fanning; but with you the case is different, and it stands to reason that when the cold is so severe that they are unable to leave the cluster for many days in succession, the atmosphere must become foul, and, consequently, the health of the bees is materially affected, and then follows dysentery and generally the loss of the colony.

I do not mean to say that dysentery is always caused by the want of oxygen, but that its absence is the principal source of winter mortality with colonies well stored.

My idea is to give a gentle, continuous supply of fresh air, without permitting direct draught, and those intending to experiment in this direction will, of course, adopt the means most suited to their own style of hive. The season with us has been generally unfavorable; the only honey-flow occurring during the second week in August, when colonies in fair condition stored more than sufficient for winter. Previous to this the bees obtained just enough to keep the queens breeding, enabling me to increase to twice the number I had at the beginning of the year. I should have done better than this, but the weather was too windy and cool for the mating of queens; hardly one in five succeeded in meeting a drone, although I had a large number of the latter in my apiary.

I have come to the conclusion that drones are useless except for the one purpose of fertilizing queens. They consume a large quantity of honey. This year two of my strongest colonies contained not only their own drones, but, toward autumn, others from hives where they were being turned out, and when at last a few days of honey weather set in, these two made but little show, while others having no drones, were enabled to

store and cap sufficient for their winter consumption. During June and July, those having an average number of drones could not seal a single cell of honey, while even weaker colonies with none, managed to keep 2 or 3 lbs. capped over.

Drones that are not required for breeding are almost a triple loss to the bee-keeper. The same space of comb which produced these idle consumers would have given a larger number of working bees, who not only get their own living, but add to the wealth of the hive.

I do not think the drones are at all instrumental in ripening the honey. What can do this more effectually than the constant circulation of air created by the peculiar fanning motion kept up by the bees? Neither do I see how it can be supposed that drones are necessary to help keep the brood warm. We know that when there is sufficient honey in the fields to entice nearly the whole working force of the hive, the brood is partially deserted only during the hottest part of the day, when no danger will occur by its being so left. It cannot be said that the presence of the drones will liberate a larger number of workers, for it must always be borne in mind that they are produced only at the expense of a much larger number of actual laborers.

Rottingdean, near Brighton, Eng.

Bee-Keepers' Exchange.

Jottings on California Bee Topics.

W. A. PRYAL.

The honey season has closed and now the wise bee-keeper is working to get his bees to fill their hives with honey for the winter requirements. No matter how good the yield may have been at the regular season, the bees will, as soon as it is over and the short drouth is lasting, empty the greater part of the cells of the sweet liquid. This spell of no honey and indoor boarding commences as a general rule toward the middle of July and continues perhaps for some weeks. During its continuance all the drones are banished from the hives, never to be replenished till the following March. In this short time too the large force of workers that remained at the close of the last honey consume fully one-half of the supplies; and as there are but few flowers of any consequence, after July the wise apiarist has to manage his bees carefully to keep them from consuming the remainder of their stores. It is true that there are some flowers to be found at all seasons of the year in this climate, but where many bees are kept no one colony can manage to lay in anything like an adequate supply of winter provisions from these flowers, unless the bloom is abundant and the flow of nectar free and plentiful as it is some years. At this time, too, the queen ceases to lay eggs except in two or three frames; the bees gradually begin to grow less. So it is important for the apiarist to be attentive to the needs of the apiary at this season.

Just a little judgment will save him perhaps many a valuable colony of bees.

From five to fifteen pounds of honey will suffice to winter a colony in this climate, if the bee-keeper is only careful and watches them. A few ounces of honey fed to them at the proper time may take them through the worst part of the season, and from thence on they will be able to earn their own living.

My bees have gone through the "hard times" with the aid of a few pounds of honey, that was fed to them. The eucalyptus will soon be in bloom, and this feed with the juice they will "steal" from peach and apricot orchards, will provision them for the winter. In the middle part of February they may require a little more feeding, in fact, if they do not really require it, it is always a good plan to give them a few ounces every evening to stimulate the queen to greater exertions towards filling the combs with eggs so that a large force of bees will be ready for the first honey flow.

Orchardists in this vicinity do not complain of the bees as do their brethren in the lower part of the state. Their great annoyance is caused by birds, especially the linnets. When a fruit is once pecked by a bird, it is no longer of any account and the neighborly fruit grower would sooner have the bees get the rest of it than his arch enemy the bird.

The latest reports from the honey section of the state say that the crop will be about a fourth of a crop. Still, though the crop is light it is of good quality, and the bee-keepers have made such material advances in knowledge, etc., during the last year, that they are demanding higher prices for their honey. No more do they intend to let speculators grow fat at their expense, and we hope they will succeed in their demands.

This county (Alameda) is not noted for its bee-keeping interests; it being more of a manufacturing, commercial, agricultural and horticultural county. As far as I know I am the only individual in it who has made any success of apiculture, and then only to a limited extent. No other person has an apiary "equipped" with the modern appliances like myself. In the adjoining county, Santa Clara, on the south, there are several successful bee-keepers.

I have, during this unfavorable year, taken 46 pounds of extracted honey from my hives; this is nearly half a crop. The honey is of three grades, corresponding to the season in which it was gathered. The first is of a dark amber, and of a fine flavor, being what we call eucalyptus honey; the second lot, which was taken during the principal honey flow, is of a pale amber, and is a fine article; and the last is a little darker than the second and nearly as good. There are none of the honey sages in the woods hereabouts that they have in the south, and consequently we do not obtain any of the peculiar honey they get down there; but still our honey sells as readily as does theirs. We get five or six cents per pound more for ours than

they do; not that we claim that ours is superior, but we are near a pretty thickly settled community, only a few miles from Oakland, the second city in the state, and only nine or ten miles from San Francisco. We can get a fair crop of honey any year, while lower down they cannot. We believe that just across the coast range of hills from us, in Contra Costa county, many a fine spot for an apiary may be found, and that during a season like the last, from 60 to 100 pounds of extracted honey per colony could be taken, and that 150 to 200 pounds could be obtained during a good year. When the craze for white or perfectly clear honey has somewhat died away, we will see the day when there will be as much honey raised in the northern portions of the state as there is now produced in the south. Take Shasta and adjoining counties where they have the "small" amount of 9 feet of rain every year—the lower counties hardly had 6 inches, we believe this year, say a foot anyway—(here we had only 17 inches)—the flowers grow in remarkable profusion and we have heard that bees do remarkably well there.

People in the east may begin to think that California bee-keeping is played out, but they are sadly mistaken, for it is only in its infancy. It is now only confined to a small section of the state while in a few years it will extend all over its vast surface—from Del Norte on the north to San Diego on the south and from the Sierras on the east to the sea on the west. Then when there will be a sure crop every year, the immensity of which was never known before, will the world look for its regular supply of the heavenly distilled sweetness from these shores; then will our apiarists have overcome the middlemen, and then will the industry be only second to our wine crop; and peace and happiness be the lot of every ardent keeper of God's grandest insect gift to man.

Modern Breeding and Longevity.

EUGENE SECOR.

When I came to Northern Iowa, 20 years ago, a few of the early settlers kept a few "skeps" of bees. They had never heard of a Langstroth hive, nor of an Italian queen bee. The black bee was kept, either in a "log gum," as taken from the woods, or in a rough, unpainted box, made from native lumber. These men had never heard, probably, of putting bees in a cellar or cave, nor of covering them during the winter. At any rate, they did not practice it; yet they survived the rigors of those "old-fashioned winters." Not until the Italian bee, and the Langstroth hive were introduced, did we hear of such fatality among the bees. With the introduction of these came also the necessity, or at least the practice, of housing them in winter, until now, no modern beekeeper is fool-hardy enough to leave

the hives exposed to the elements while the thermometer is playing hide-and-seek among the twenties.

Many besides myself have undoubtedly asked themselves the cause of this apparent change. I say apparent change, because it may be that in those early times, when statistics relating to this industry were very meager, and bee papers almost unknown, that the losses were not noted, as they are now. And as old beekeepers used to "take up" all late swarms with new and tender combs, and never counted them as lost, that the per cent. of colonies taken through the winter may not have been greater than now. Yet we often hear old men say that "bees didn't use to die so;" and remembering, as we do, the terrible fatality of 1881, which nearly stripped the entire North of bees, it is worth considering whether or not our modern methods of rearing and keeping bees has anything to do with our losses.

It is clear to my mind that the Langstroth hive is too shallow for out-door wintering in a cold climate. That being true, and in-door wintering, or protection of some kind a necessity, do we comply with the needs of the case as to temperature, dryness, etc.; and if neglecting these, or other essentials, do we not weaken the constitution of the race and thereby invite disease and death?

Again, the old folks didn't start with one colony in the spring and expect to have ten in the fall. Their increase was by natural swarming. Are we not straining nature a little by our methods of artificial increase? It is so easy for the novice (and some who are not novices) to divide colonies, and thereby be able to make a big report, that ambition often gets the better of his judgment, and the consequence is that his colonies are constitutionally weak, his queens short-lived, and his real increase and profits small—unless he is in the supply business, and can make his customers believe that queens reared by the forcing process are just as desirable as those reared in full colonies, in the natural way, and in the proper season.

That high breeding—that is, breeding for certain characteristics not found in the native races—is opposed to longevity is proven by the history of our own race, and by the experience and observation of breeders of thoroughbreds and high grades among our domestic animals, and I see no reason that the rule will not hold good in insect life. If we breed for beauty of form or color, or for early maturity, or any other special trait and neglect to comply with certain laws tending to other and perhaps as important characteristics, such breeding will often be at the expense of the hardiness of the race and prove in the end disastrous.

Breed for color if you like, but do not neglect better traits. If it is beauty you want, remember "handsome is that handsome does." Breed for large bees if you wish—bees that have a proboscis like a rye straw—that can suck syrup from the bottom of a molasses barrel—but in so doing do

not make them so tender that we will have to raise the queen "on the bottle," nor take the workers to bed with us to nurse them through the winter.

If Vogel is correct in his theory, that the Italians are not a pure race, may not some of these losses be traced to that cause, for, if not pure, crossing with the black bee, instead of adding vigor to the latter would make them less hardy than either? For instance: my neighbors who were most unfortunate in losses in 1881, are men who have not infused any fresh blood into their apiaries for several years. My own, that stood the test better than any of them, had been improved every year by the addition of queens from abroad.

Now, the lesson which I wish to deduce from this is, that the cross of the Italians and black bees, to be beneficial, must be kept up, otherwise our bees degenerate to a condition worse than before the intermingling of the two.

The importance of thoroughbred drones is beginning to be appreciated. If a low grade bull is not fit to breed from, why is a hybrid drone, the tendency of whose offspring is to revert to the original type?

Forest City, Iowa.

Two Queens in One Hive.

JOHANN FELSWANN.

"Two queens in one hive is nothing new," says one; "it has happened with me, too." Certainly, such cases are not so very rare, and will be observed by every attentive bee-keeper, and if I essay to write about it, it is not so much on account of the two queens as on account of the accompanying circumstances, under which they were observed. No practical experienced apiarist will deny the existence of two queens in one hive occasionally, but the opinions as to the "why" of it, diverge very much. To enumerate all the different opinions of bee-keepers with reference to this subject would fill many pages, the study of which would lead to the conclusion that the occurrence of two fertile queens in one hive has not yet been sufficiently explained, and will remain so until by experiment the conditions are discovered under which an otherwise normal colony will suffer two queens in their hive.

Now, as to my case: It was on an afternoon in July, the day being very clear and bright; as it had rained the preceding night, everything was refreshed and the bees improved the opportunity to gather honey from the newly opened flowers. I had one very populous colony, which, in spite of all the chances there were, did not swarm; hence, on the day spoken of above I went to investigate the case. On removing the frames, I found in the first three newly-gathered honey, the fourth was one-third honey and the rest empty cells, cleaned and polished to receive eggs, which fact led me to suppose the queen near. Very carefully I removed the frame, and there

on the fifth frame, still hanging in the hive, I saw the queen in the act of laying. [In such hives the back is movable and frames are taken out one after the other from the back toward the front.—Remarks by translator]. Now, the fourth frame just removed I held still in my hands, and, as is my habit, I turned it to look at the side which had been toward the laying queen and behold, there was another queen and in the cells freshly-laid eggs. Two queens! Quite a surprise! Well, after examining the rest of the frames of brood and finding everything in the best of order, I put the frames back again in the same order they had been, with the two queens on their combs, for further observation.

The colony remained strong, had always much brood and furnished some honey, and went into winter quarters with the two queens. It wintered well; in the latter part of April I examined the colony again, but found only one queen.

The following remarkable points may be observed in this case:

1st. Both queens were in one and

FIG. 1.—Triungulin, or first larva, the one carried by the bee to the hive. Length, 2 m. m.

FIG. 2.—*Meloe*, female, showing short elytra, or wing-covers, and large abdomen.

the same space between two combs; both in the act of laying. In all or most all cases heretofore reported, they have had their quarters in different parts, generally in extreme ends or sides of the hive.

2d. Both queens seemed to work harmoniously together for the well-being of the colony, whilst the rule is, that if they meet in one hive they fight until one is dead.

3d. A change of queens could not have been contemplated by the bees, in which case they rear another queen, because the old queen was only in her second year, and in her very best age, as proven by the condition of the colony before and after.

4th. Even suppose the bees meant to rear a queen, to either supersede the old one or swarm, then why did the old queen not swarm with part of the colony?

5th. The conduct of the workers is also to be considered, which not only suffered two queens in their hive, but seemed to treat them both alike.—*From Illustrated Bienen Zeitung.*

Gleanings in Bee-Culture.

Blister-Beetle Larvæ Attacking Bees.

Inclosed I send a few insects that infest the bees about this time of the year. I have found as many as seven on one bee, but mostly not more than one. I have never found them on queens or drones, and have therefore concluded that they come from the flowers when the bees are at work, though I have never found any on the flowers, after diligent search. If you can inform me in regard to them, you will greatly oblige.

J. P. M. RAINBOW.

Fall Brook, Cal., May 1, 1882.

The insects (Fig. 1) from J. P. M. Rainbow, Fall Brook, Cal., are the larvæ of some species of blister beetle, possibly of *Meloe barbarus*, Lec., which is a common species in California. These blister beetles are quite curious and interesting. The famous Spanish fly, which is commercially of so much importance, and which, when dried, forms the cantharides of the shops, belongs to this family. We have several species of these blister beetles,

they escape from the eggs, thousands of which are deposited in the earth by each female, at once crawl up on some flowering plant, like the *compositæ*, and as these latter are visited by bees, the active larvæ crawl upon the legs and bodies of the bees, and so are borne off to the hives. Seven of these, as seen by Mr. R. on one bee, is a serious burden, and must often overcome the bees. But this is not all. The larvæ leave the bees in the hives, and take to an egg diet, which they vary by eating honey, jelly and pollen. In this way they become a serious injury to the bees. As neither the drones nor the queens visit the flowers, these vesicant larvæ will be found on the workers only.

The other curious feature of these insects is there anomalous transformations, which were styled by M. Fabre, hypermetamorphosis. In most insects the metamorphosis is like that of our bees. We first have the egg, then the larva, then the pupa, and last the imago, or winged insect. In these blister beetles, we have the egg, then a degraded form, the one carried by the bees from the flowers, which is known as the triungulin (Fig. 1), then the second larval form, which has nearly the same shape as before, but the legs are much shorter, and now it is feeding on eggs, and the other good things of the hive. The next larval form is called pseudopupa, as it looks some like a pupa as it rests in the mutilated skin of the previous stage. The next stage is much like the usual beetle larvæ, or grubs, and then we have the pupa, and last the imago. Surely such a long development is worthy of a long name, and why not hypermetamorphosis? Some of the larvæ feed on the eggs, etc., of some of the wild bees, and others, as shown by Prof. C. V. Riley, in a most excellent paper on these insects, feed on the eggs of the Rocky Mountain locust.

That any of the larvæ feed on the roots of grass, as stated by Harris Packard and many others, is very doubtful.

A. J. COOK.

Lansing, Mich., July, 1882.

For the American Bee Journal.

Checking the Swarming Fever.

M. C. STEVENS.

Jas. N. Tucker's queries in regard to his swarm of Aug. 26th, induce me to give my practice with late swarms: 1st. Destroy every queen-cell. 2d. Return the swarm. 3d. Put on the upper story filled with sections furnished with starters. If there is any honey to be found they will go to work "with a will," and soon fill every section. Thus, at present prices, will be worth more than a good colony of bees. If no honey is coming in, they will be in a condition to winter with but little trouble, and without much risk; but if they are put in an empty hive, and no honey is coming in, they will have to be fed a good deal, and then, after one has done his best, the chances are slim for wintering. Besides this, the

parent colony will be reduced in numbers, and in all probability the drones will all be killed off before the new queen goes forth on her bridal tour, and hence she will return to the hive a virgin and worthless. The fate of the colony is then inevitable—the bees will dwindle to nothing before spring. Bee-keepers should awake to the fact that, in most cases, it is more profitable to take proper care of a few colonies, than endeavor to get a large increase in bees, which is always at the expense of the honey product. My advice is, in no case to allow a colony to cast more than one swarm. If a second swarm comes out, put them back as directed above.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

Louisiana State Association.

The bee-keepers of St. Mary, Iberia, Vermillion, St. Landry, and St. Martin parishes met at Serrett's Hall, New Iberia, on Saturday, Sept. 2, 1882. W. R. Thompson, Esq., was elected President and J. D. Bedell, Secretary, *pro tem*.

W. R. Thompson stated the object of the meeting. Those present then proceeded to the election of officers with the following result: W. R. Thompson, President; Dr. Shaw, Vice President; Geo. E. Sonnemann, Secretary; Henry Steckler, Treasurer; E. Delmouly, Vice President for Lafayette Parish; J. D. Bedell, for St. Mary Parish; Louis Duchamp, for St. Martin's Parish; J. W. Jackson, for St. Landry Parish.

These Parishes embrace about 1,500 colonies, of which 905 are in frame hives, and the remainder are box hives and nuclei.

The next meeting will be held on Saturday, Oct. 7th, at Serrett's Hall, New Iberia, La.

W. R. THOMPSON, Pres.

G. E. SONNEMANN, Sec.

Bulletin d'apiculteur.

Swiss Bee-keepers' Convention.

The spring meeting of the "Societe Romande d'apiculture" was held at Fribourg, in Grenette hall on June 27th; 80 members were present; the President elect, M. A. de Dardel, congratulated the members on their having met this year in the rich center of Fribourg, already so far advanced in the culture of bees, that it has two more societies besides their own, one French and the other German, all three emulating each other in devising and adopting good methods; and, moreover, that among their own 268 members, 15 were foreigners, who showed, by joining them, the interest they feel by their work, not the least part of which is to regulate and facilitate the sale of honey; to find new markets, and throw all the light they can upon the frauds in the trade; he felt thankful with them that notwithstanding an unfavorable season of cold spells, northerly winds and rough weather of every kind, as many of them as had colonies on the plain, ready in time, had succeeded, during the few fine days at the last moment, the 11 days from the 27th of May to the 7th of June, in gathering at least an average crop; he also urged them so to co-operate with the promoters of the Swiss Exposition of apiculture at Zurich, that their own society should be well represented there in the two expositions, one of which would be permanent with "two empty specimens of each of the hives used by us, viz.: our summer hive for a colony in its highest development, and our winter hive for a colony in its most straightened condition, with all the instruments and tools used in both periods, and samples of honey and wax, classified by cartons, altitudes, times of gathering, and the plants on which the bees had fed. The other exposition, he continued, would be temporary, in September, and would receive colonies of bees of various races with hives, instruments, etc.

He was followed by Mr. L. S. Fusay, who, undaunted, as he said he was, by the ghost of the tax gatherer, proposed that the following questions should be printed and sent by mail to every one of their members and others engaged in bee-keeping, to be answered in September:

1. How many hives have you, movable or permanent?
2. How many kilogrammes of honey have you gathered?
3. What proportion of clover land do you cultivate, and what is your estimate of the proportion of same land is there in your country as compared with other cultures?
4. Same question for natural meadows?
5. What is the proportion in oak land?
6. Have you linden trees and chestnut trees?
7. Have you many fruit trees, and of what kind mostly?
8. What is the prevailing wind with you in the spring, and what kind of wind is it?

9. What is your altitude above sea level (in metres)?

10. What is your harvest time for honey?

11. Is your country flat, hilly or mountainous?

12. If mountainous, which way does it incline?

13. What is the character of the soil?

Information he said, thus collected, differed, and intelligently acted upon would not only increase the production of honey, but improve its quality, and so enlarge the sale of it that he would not be any more afraid of the tax gatherer than he is now of his competitors all around him. By teaching his neighbor he has added water and power to his own mill-race.

Mr. President Horner promised the co-operation of the Fribourg Society in answering these questions, and suggested the addition of a few other questions like these: To what cause do you attribute your success or your failure? What influence has the climate on your section of country?

After a prolonged discussion on the most efficient ways and means to have the questions reach their destination, be intelligently answered, and the answer conveyed safely, a committee was appointed to carry out the measure in full.

Mr. Ed. Bertrand, editor of the *Bulletin d'Apiculture* read a paper on the yield of honey. For a few years back he said, by means of hives permanently fastened upon scales, I have taken notes of the progress of my various crops in different locations, and I desire to communicate to you the results I have obtained, and the information to be derived from them. I have two of such colonies at some distance from my residence, and there I can take observations only when I go to visit them from time to time. At Nyon, my home, I frequently take notes every day. He said that almost invariably his crop of honey depends for weight upon the state of the weather during the 15 days preceeding May harvest. This year, at the end of March and beginning of April, the hive on the scales kept up its weight pretty evenly, the cherry trees were in blossom, then the plum trees, a few species of willows and the dandelion—after the 22d of April till the 10th of May, the weight decreased constantly, and yet the chestnut trees were blooming, the pear trees also, etc.; but the weather was rough, rainy, cold, from the north. The 11th, 12th and 13th of May show in my notes a daily increase of 350, 375 and 200 grammes corresponding to fine days and to the first flowering of the clover and the blue sage; our soil is gravelly and light. Again, from the 14th to the 20th of May, the diminution is constant, except on the 19th when the blow from the north gave place on the 20th to a southwest wind, the entire diminution from the 14th to the 20th in the evening was kilog. 1.775 (5½ pounds!) and thus on till the 16th of June when he ceased his observations to gather in his honey. I can tell that all my crop was the work of 11 days, during two of which nothing was

done. In these observations I have of course sought to take into account the influence of temperature, of the atmospheric pressure, of the direction of the wind, of the weather, and my table embraces all these records—the laws are known which rule over the secretion of nectar by the plants; but we do not know every thing, and there are anomalies, and cases which cannot be explained. A certain temperature is necessary, a certain heat also, a moderate atmospheric pressure, and a certain moisture in the air, these are the general laws. The dry winds from the north and northeast are very contrary, while the moist winds from the south and west are very favorable. The rays of the sun are not indispensable; for, in cloudy weather and even during the few hours preceeding a storm, I have seen the bees gathering enormous quantities of honey. During fine weather, the gathering may be abundant, very much so, but if the days continue hot and dry, the honey decreases. After a good rain, it is abundant but watery, owing doubtless to the nocturnal evaporation; a cooling of the temperature arrests the secretion of the nectar, and yet this secretion will take place when the temperature is relatively low, in the spring for instance. Cold nights have generally an unfavorable influence upon the days which follow, and even here we sometimes get good crops after cold nights not however, below 55 to 46° Fahr.

I know that the variations in the weight of a hive do not reveal all its inside working; the laying of larvæ increases or diminishes in importance; the bees also bring in water and pollen; they build their combs; working bees are lost. It is difficult to apportion its part to everyone of these factors; and yet, take it all in all, these observations on the scales are as amusing as useful for the conduct of the apiary—often the bees appear to be gathering and yet bring in nothing; and then an importance is given to bloom, which it does not everywhere deserve in the same degree. Thus, at Nyon, I rely no longer upon fruit trees, the acacia robinier, the linden, etc. I depend on my meadows, the trefoil, the sago, and they do not disappoint me; I know that, with them, my colonies will be ready by the middle of May.

I can only speak for my locality; but I believe that the condition of many more in valleys is the same as mine. I know also, that, after hay harvest, I have nothing more to expect at Nyon; from the white clover, linden and buckwheat the bees do well. But when I shall have succeeded in getting up a field of melilot, yellow (honey lotus) as well as white, on some very poor land, I will then consider myself as a bee-keeper, almost always sure to succeed.

Commenting upon this paper, Mr. J. Jeker added that the Germans give up all idea of getting honey from their fall beath after a storm, so great is the influence exerted by electricity upon the nectar. He had also hives fixed upon scales, and, weighing a colony which had lost its queen three

days after it had been hived, he found that, from that time its weight had continually decreased, while other colonies with queens were increasing in weight, the queenless one was getting lighter every day.

Another paper was read by Mr. B. de Vevey, advising beginners on their treatment of drones, not to kill them by wholesale, but to be sure to keep a few hundred for every colony, in order that the purity of the mother be well provided for, otherwise she would be very apt to get off from the hive and never return, leaving it queenless, an unproductive expense, even if a few pounds of honey are saved by an injudicious suppression of the drones which are also needed for the erection of the large cells without which bees cannot get along.

Mr. J. Jeker stated his method of dividing colonies in frame hives and recommended to beginners to make up a colony not from one hive, but from two, taking the queen and young bees from the first and the cells with larvæ from the second; experienced keepers however, he said, make up small nuclei which they furnish with cells built up in a good colony.

Mr. B. de Vevey, stated his method of dividing a colony, by choosing his strongest colony, taking out of it the cells and larvæ, without the bees, placing them in an empty hive which he carried off to fill the place of a colony that is also carried off somewhere else, and the working bees of the latter, coming back to their wonted place, find the larvæ which they care for at once to get a queen.

As he invited criticism upon his way Mr. Ed. Bertrand remarked that it was contrary to admitted theory for old working bees thus to rear a queen.

The Rev. Father Philippe, Superior of the Cordeliers, explained his method of keeping his Italian bees pure: He waits for the psychologic moment when the bees begin driving the drones before them, a sure indication that the days of these are numbered, and he divides his colonies making a choice of such as he wants to breed from; the colonies which have queens gradually exterminate their males, while those which are queenless keep theirs, and these males of choice colonies will fertilize the new queens; although it happens sometimes that the queen is badly mated and thus brings out a mongrel set of working bees, still the male progeny is pure; at the time he thus operates, the hive swarms with bees; and as he divides only after harvest, his yield of honey does not suffer. He also described the compartment box which he uses to raise and keep a certain number of queens for use when wanted. The compartments are all small hives which he can put together when not thus occupied by queens.

President Horner said that he had devised such a queens' box—a wired frame divided into 15 apartments, each holding 15 cells; but he doubts the possibility of these queens being kept after hatching.

Mr. Ed. Bertrand replied that he had no experience with such; but that in America such boxes are used,

although the queens are there set free as soon as hatched—not being accepted however, by a colony, or even by a small nucleus, unless brought in within the half hour following their birth; that after a very few days the young queens become possessed of an imperious desire to get out; and finally that it is not probable that the young queens are fed by the bees, nor know how to feed themselves.

Mr. Fusay, in trying to obtain fecundity in queens while captive, had once fitted up in the upper part of a frame cages containing royal cells; the queens, he said, could go out into a space arranged above the cage, and into this space males were introduced; but the results were null; the captive queens after 7 or 8 days, were thinned, faded, and not received if presented to nuclei.

Mr. Ed. Bertrand presented the solar wax extractor of Leandri, improved by Dr. A. Dubini, costing 10 francs; it had been sent to be examined and tried, and the wax extracted with it was declared to be very pure, not burned in the least; it could only be used for small quantities, but saved much labor. Mr. Bertrand presented also the Peet queen cage, an American device for carrying and introducing queens; now being manufactured by Mr. P. Von Siebenthal.

Mr. Marmier presented an American smoker improved by himself; between the guard and the fire place he has fitted up an old carpet to shield off the heat; within the fire-box, a spring fastened to a grate presses upon the fuel and keeps it kindled; lastly two handles fitted upon the bellows facilitates it being held more easily with one hand.

The meeting adjourned at 5:45 p.m.

ED. BERTRAND, Secy.

This day of June 27th was well filled up; at 7:30 in the morning a number of bee-keepers were already in attendance at Carpenters' hotel, Fribourg, Vand, Geneva, Neuchatel, the Bernese Jura were represented; the venerable Abbe Alois Ulrich, of Sion, always present at our meetings, represented the Valais; true to his promise, Mr. J. Jeker, of Lubingen, vice president of the Society of our confederate of the German tongue, was also present; the committee of the Fribourg Society was almost complete. After the introductions, hand shakings, and the exchange of news about the yield of honey, the entire company of pastors and curates, teachers and farmers, manufacturers and others, went in a body to the fine garden of the Cordeliers, situated upon a high terrace overlooking the Savine. The Rev. Father Philippe, Superior of the Convent, did the honors in a very pleasant manner. His colonies, mostly pure Italian, are located in three or four pavilions. Unfortunately the season has this year been very unfavorable in the Canton of Fribourg, and the hives contained but very little honey. A number of groups formed around the pavilions and a few competent members, among them the Father Philippe and Mr. Jeker, with a right good will, made

operations and demonstrations in response to inquiries addressed to them; after which discussions and the annual meeting was held at Greneth Hall.

The National Convention.

The North American Bee-Keepers' Society will hold their 13th annual meeting at Washington Park Hall, Cincinnati, O., across Washington Park from the Exposition building. Time, Oct. 3rd to 5th, 1882. First session Tuesday, 10 a. m., Oct. 3. We are encouraged to hope that this will be a very profitable meeting, as we are promised papers from, and the presence of, a large number of our most prominent bee-keepers both in the United States and Canada, and essays and implements of the apiary are expected from abroad to add to the knowledge imparted by the research and inventive skill and methods of our countrymen.

EHRICK PARMLEY, Sec.

New York, July 12, 1882.

The Northwestern Bee-Keepers' Convention will meet at Chicago, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1882. The office of the American Bee Journal has been kindly tendered as a place of meeting. A cordial invitation is extended to all bee-keepers, and especially those of the Northwestern States, to be present. The meeting takes place during the last week of the Inter-State Industrial Exposition, to enable all to obtain reduced railroad rates. First session at 10 a. m.

C. C. MILLER, Pres.

C. C. COFFINBERRY, Sec.

The Union Bee-Keepers' Association of Maryland, Virginia and West Virginia, will meet at Hagerstown, in the room of the County Commissioners, at the Court House, on Wednesday, Oct. 18, 1882, at 1 o'clock, p. m., the session to last two days. The Washington County Fair will then be in progress, which will give persons an opportunity to attend the exhibition. All persons intending to go will please drop me a card, so that I may secure for them half-fare rates.

J. LUTHER BOWERS, Sec.

The fifth annual meeting of the Northern Michigan Bee-Keepers' Convention will be held at Pewamo, Ionia County, Mich., on the second Tuesday and Wednesday (10th and 11th) of October, 1882. Pewamo being on the D. & M. and H. & M. R. R., it will be accessible by rail. The members will do all in their power to make the meeting interesting.

H. M. ROOP, Pres.

O. R. GOODNO, Sec.

The Tuscarawas Valley Bee-Keepers' Association will hold their next meeting in Wilgus Hall, Newcomerstown, O., on Tuesday, Oct. 10, instead of Oct. 5th. This change is made in order to allow members to visit the National Convention at Cincinnati.

J. A. BUCKLEW, Sec.

The bee-keepers of Boone Co., Ind., are cordially invited to meet at the office of Barton Higgins, in Lebanon, Oct. 9, at 9 o'clock, a. m., to complete the organization of the auxiliary County Bee-Keepers' Society. The bee-keepers of Hendricks county, Ind., are invited to be present. By request of the Committee.

The Marshall County, Iowa, Bee-Keepers' Association will hold its regular session at the Court House in Marshalltown on Saturday, Oct. 7, at 10 a. m. Subject for discussion, "How to prepare for wintering." We hope to have a good meeting.

J. W. SANDERS, Sec.

Vice President for Kansas.—Mr. D. P. Norton having peremptorily resigned, I hereby appoint Mr. S. J. Miller, of 314 Kansas avenue, Topeka, Kansas, as his successor to the Vice Presidency for Kansas of the N. A. B. K. Society.

A. J. COOK, President.

The Southern California District Bee-Keepers' Association will hold their annual Convention in Union Hall, Los Angeles City, Oct. 19, 20, 1882, during the week of the Agricultural Fair. The Convention promises to be of so much interest that no bee-keeper should miss it. Ladies are pressing invited to attend.

J. E. PLEASANTS, Pres.

The fall meeting of the Northern Ohio Bee-Keepers' Association will be held in Whittlesey Hall, Norwalk, O., Saturday, Oct. 21, commencing at 9 a. m. A full attendance is solicited, as it will be a meeting of more than usual interest. Principal subject for discussion: "How shall we winter our bees without loss?"

S. F. NEWMAN, Sec.

CLUBBING LIST.

We supply the Weekly American Bee Journal and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

Binder for Weekly for 1882.....	2 75.	2 50

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference

SELECTIONS FROM OUR LETTER BOX

Saving Combs.—Do bees make any comb after August? I have been advised to take from each hive all frames with comb that bees cannot cover. 1. Is it wise to do so? 2. If I do, how can I preserve this comb until spring? 3. Will it injure the comb to fumigate it with sulphur to destroy worms? This is my first year's experience with bees; am much interested, but have had great trouble with worms in my weak colonies. My experience will, I trust, enable me to do better next year.

JOHN H. BOSS.

Glenville, Ala., Sept. 13, 1882.

[1. It is better to remove all combs that the bees cannot cover, leaving those in the hive which are well filled with honey.

2. Put them in a cool, light room; or in a tight room where you can easily fumigate them with sulphur.

3. No; and for this purpose you can use empty hives, fitting the combs in nicely, closing all cracks, and with a good smoker charged with sulphur, fumigate them thoroughly from the entrance. If the bees do not cover all the combs, it will be no protection against moths to leave the extra combs in the hives, but rather destruction to the combs and the bees as well.—ED.]

Poisoned.—I have two August colonies of bees that have done splendid work, and two July colonies that are perfect failures. They have dwindled to a few handfuls. One colony I gave a comb with eggs and larvæ, but they failed to rear a queen. In the other I fear the queen is worthless. 1. What shall I do with both colonies to save what I have? 2. Would it be best to consolidate them both with my strong colonies? 3. What is the trouble with the bees, when a dozen at a time may be seen upon the ground reeling around as if drunken, and apparently in distress? Bees in this quarter have swarmed late, but done remarkably well. We have had no rain here since the 8th of August, and, in consequence, flowers are dried up. Please answer the above questions and oblige

A BEGINNER.

Malvern, Iowa, Sept. 18, 1882.

[1 and 2. Unite them with the stronger colonies, removing their queens first. By this process you will strengthen the already good colonies, and will sacrifice nothing in doing so, as the July colonies would probably die if left to themselves.

3. Most likely it is the result of some peculiar food which is a destructive poison, and the bees come out of the hive to suffer and die.—ED.]

Sweet Clover.—The middle of July I carefully prepared nearly two acres of land and planted buckwheat and Bokhara clover together on it. I used fully four pounds of the clover seed per acre. The buckwheat came up, but so far nothing is to be seen of the clover. The seed was sold to me by a trustworthy dealer. 1. Can you explain the cause of failure? 2. Will it likely come up yet? I am satisfied the pasturage is the great question for bee-keepers to solve, and am inclined to plant a good deal of sweet clover as well as some other plants, but this first attempt is discouraging. I had a novel experience with a young queen a few days since. I thought it time for her to begin laying and on taking out a frame, she being on it, I thought I detected in a cell near her one egg. I had to disturb the bees, they being clustered pretty thick over the spot. To my surprise she took flight. None of the bees were so much disturbed. Shortly afterwards I found her in the hive, and intending to build the nucleus into a colony, gave her another frame of bees and brood. Later in the day, wishing to be assured of her safety, I carefully examined the hive. When I first lifted out the frame on which I found her she seemed nervous and timid, but soon resumed her occupation of laying, although the noon sun was shining on her. The bees about her seemed to be quite as much interested in her work as I was. This conduct seemed singular in a timid young queen. GEO. E. BOGGS.
Clintonville, Ky., Sept. 19, 1882.

[1. We are yet in the experimental stage of cultivating sweet clover, and occasionally failure of germination is a problem we have not solved. Yours is the third case we have heard of, where the seeds failed to grow, and in the first two cases we knew the seeds to be fresh and sound. In one case, they were gathered in the vicinity of Chicago, and sowed at different times on the same kind of soil gathered from, and yet it did not grow. In both instances, however, they were sown broadcast during a spell of drouth, and, we believe, were not harrowed under. A gentleman of this city gathered some of the seed last season and sent to a friend in Nebraska, who planted it in March last and we are assured it has been in bloom for four weeks. We have planted sweet clover at almost all seasons, and in every method we could think of, and have never had it fail to grow; but had but one kind of soil to experiment upon—a low, blue clay.

2. Were the case ours, we would not despair of its growing, unless next spring fails to bring it up.

We have never had even a young Italian queen take flight from the comb; but it has been a very common

occurrence with young Syrians, even to the age of six weeks. They appear quite nervous and restless when the comb is disturbed.—Ed.]

Moving Bees.—1. Will it do any damage to bees and brood to move them 60 miles by rail about the first of November, and should I cover the frames with wire-cloth or honey-board while in transit? 2. Is honey from goldenrod good for wintering bees? It has been a very poor season here for bees. W. N. HOWARD.
Lyndon, Vt., Sept. 18, 1882.

[It will do to move bees at any time, provided the weather is mild enough afterward to allow of their having a flight. So late in the season as you propose to move them would be too cold to allow of wire-cloth covering the frames. Use a honey-board over them, or a blanket over the frames and the hive cover on. It would be well to bore one-inch holes in opposite sides of the brood-chamber, and cover them with wire-cloth from the inside; this would afford ventilation enough. Never put the wire-cloth outside, where ventilation is the object desired, as the bees, when excited, will crowd into the cavity, and those behind crowd against and kill them, and thus defeat the very purpose you wish to accomplish.

2. If ripened and capped over, it is excellent winter food.—Ed.]

September Swarm Doing Well.—Bees are doing well. My last swarm came out one week ago to-day. I gave them 3 frames of brood and honey, and 6 of foundation. At this date they are almost complete. From one pound of Dr. Tinker's golden honey plant seed, sowed Feb. 15th to April 15th, in best rich loam on lower foothills and bottom lands, not one stalk has appeared as yet. I have 59 good colonies of bees.

ASBURY MCKNIGHT.
Bible Grove, Ill., Sept. 16, 1882.

Cultivation of Sweet Clover.—About the culture of sweet clover you remark in the BEE JOURNAL of Sept. 6th, "the natural requirements of the seed are to some extent, or nearly wholly met by planting in late winter or very early spring when the nights are still frosty and an occasional severe freeze assists to rot and burst the hull," etc. I have been experimenting with sweet clover for three years, and the only success I have had in sowing was in spring, after all danger of hard freezing had passed. Early last spring there was a bountiful growth of young plants from seed dropped by the old ones, and a hard freeze killed every plant above ground. The young plants are quite tender. I sowed an acre in drills after all freezing was over, about time of corn planting, and judging from the result, I should say

that good new seed would grow as well as good seed corn, and if properly distributed, a pound is sufficient for an acre. It should be covered about an inch, and a plant to every square foot is ample. It is about the first green thing to be seen above ground in spring and is quite liable to be nipped by frosts. Its early and rank growth dwarfs and chokes out rival weeds, its rich and luxuriant foliage completely shading the ground. I have not tested it for pasture, but if stock like it and thrive upon it, it must be valuable for early pasture. Can you tell me how to save and separate catnip and hoarhound seed from the chaff to which it adheres "closer than a brother?" I consider them both excellent honey plants, especially as hoarhound blooms two to three weeks before sweet clover, and I never knew bees to desert it for something better. D. P. NORTON.
Council Grove, Kan.

[If sown in late winter, it will rarely ever sprout in time for the frost to kill it. We have sown it on the snow, and received good results. Again, were it necessary to sow in spring, it would not be so universally reproductive as it has always proven itself, growing and thriving for many years in succession if left to seed itself each summer and autumn, as has been the case in the vicinity of Chicago.

We have no information as regards saving and cleaning catnip and hoarhound seed, and quite agree with you in commending them.—Ed.]

Five Hundred Per Cent.—I have just returned from the Rocky Mountains, and after viewing the magnificent and varied flora, of mountain, foothill and plain, and seeing no honey nor apiarian supplies at the great Denver Exposition, I regarded it as an outrage upon the beautiful "Centennial" State of Colorado. Our bees here are piling in the honey at a wonderful rate and I find a ready market at home for all produced. My bees have made for me this season five hundred per cent. upon their last spring's valuation. Am beginning to feel quite well acquainted with some of your correspondents from their frequent letters—and Heddon—I just naturally like him. JOS. SAUNDERS.
Reynolds, Neb., Sept. 17, 1882.

Honey Bound.—My 75 colonies of bees are all full below—no room for the queens to lay. Had I better extract two or three frames in each, and put the empty combs in the center? Some colonies have 10 frames of solid honey. H. M. MORRIS.
Rantoul, Ill., Sept. 18, 1882.

[Yes; the first favorable weather that comes. It would be much better had it been done before; but even now there is time to mature a liberal amount of brood before winter sets in, if it is attended to at once.—Ed.]

Bee Lice.—I have seen such trouble as described by Wm. Glennon, on page 557 of the BEE JOURNAL, caused by a red spider-like louse, which affects the abdomens of pupa generally, but sometimes larvæ. Get a piece of pupa brood 5x6 and examine. Sometimes large patches are infested; at other times only a cell or two in a place.

H. L. JEFFREY.

Washington Depot, Conn.

[The louse to which our correspondent refers is probably *Branla cæca*, which will be found fully described in "Cook's Manual," page 268, or, perhaps, *Meloe barbarus*, a delineation of which is given in this number of the BEE JOURNAL, on page 614. We do not think anything of this kind was the trouble with Mr. Glennon's colony. The bees were, from some cause, unable to lay in ample stores, and destroyed the defenseless to save the vigorous. The queen may have been unprolific previous to honey flow, or the bees lacked energy and industry.—ED.]

Protracted Drouth.—I commenced the season with 20 colonies, most of them in fair condition, but 2 or 3 very light, these I soon brought up by giving them frames of capped brood from strong colonies. I always aim to get my colonies uniform as early as possible in the spring; bees did nothing in March and next to nothing in May. The season was cold, dry and backward, fruit trees blossomed the last of May and first of June, but they seemed to secrete very little honey; red raspberry and white clover yielded very little honey. I had to feed my bees with frames of honey kept over from last season, or I do not believe I should have had half a dozen colonies left alive. About the middle of July most of my colonies had not an ounce of sealed honey, and many of them it seemed had hardly enough to last them over night; but they were strong in bees and brood. The booming time finally came the last week in July and first in August. It was during sumach bloom, and lasted about ten days. Most of the time being favorable for the bees and they improved it, for during the time they filled all spare room in the brood frames, some of the outside frames they sealed solid to the bottom, and also filled 175 two-pound boxes, or 350 lbs. of box and 100 lbs. of extracted, all nice white honey, and all collected in about 10 days, besides what was stored in the brood frames, which must have been twice as much more. Since sumach has gone the bees have barely made a living, but they are at work some on goldenrod now, and bid fair to obtain ample stores for winter. I kept back swarming as much as possible by letting the swarms return when they came out. I clip all my queens' wings, and remove 2 or 3 frames of brood and replace with empty combs or foundation. These frames of brood from two or more hives I unite with bees and all, and

from other colonies. After a day or two I introduce a laying queen, and they very soon make good strong colonies. My increase was from 20 to 30, with a few nuclei for queen-rearing. I do not claim to be a scientific bee-keeper, as I make it only a secondary business, farming being my principal occupation. I get 25 cents a pound for nearly all of my honey, and a good share of it is sold right at my door. We have had one of the most severe drouths this season that I ever knew. From the 19th of July to the 10th of September we had less than half an inch of rainfall, and most of the time the weather was very warm, with drying winds. Nearly all vegetation has dried up except in low, swampy places. Many animals have suffered for want of food and water, and the poor honey bee with the rest. We had a fine, welcome rain last Monday, over 2 inches of water falling, for which we feel thankful.

R. DOWNS.

Naugatuck, Conn., Sept. 14, 1882.

Sugar Syrup for Wintering.—Some experienced bee-keepers say that white sugar syrup is equally as good as honey for wintering bees. If so, why is it not advisable to extract all the honey late in the fall, and insert empty combs in the brood department to be filled with sugar syrup by the bees for winter use? If this were done, there would not be likely to be enough pollen stored to harm the bees and the syrup would, I should think, be more economical than honey for bee feed. Has this mode been sufficiently tested to determine its feasibility?

J. MCKINSTRY.

Nelson, Ill.

[Many bee-keepers have advocated and adopted the practice of extracting closely in the fall, then feeding sugar syrup for winter stores, with very satisfactory results.—ED.]

Honey Mulberry.—Bees are doing very well here for the last few days, but are storing but little honey in boxes, their time being principally occupied in filling empty spaces in the brood chambers, where the brood has hatched out. This has been a poor year for honey in this section. May, June, July and August is the time when bees store nearly all their surplus honey here. From the 1st of May to the 10th of June was so cold and wet bees did nothing; then came a drouth which lasted till the 10th of July, during which time nearly all the surplus honey was stored that we have taken this season. Since that time it has been too wet until the 1st of this month, and it seemed to take a week or 10 days' dry weather to renew the secretion of honey in the blossoms which had been so long and repeatedly drenched with rain. Dry weather, if not protracted too long, is most propitious for the secretion of honey, more especially in the river bottoms. As there has been a good deal said about negro bee-keepers, I can say I am acquainted with 6 or 7 negroes who are keeping bees, and own from 2 to 100 colonies, some of whom are

realizing large yields of honey, and are making it quite as profitable as their white brethren who keep bees in the same style—that is, in old log and box hives. A young man who has 17 colonies at my apiary, and myself, are the only persons in all my acquaintance who keep bees in movable comb hives, but several speak of transferring next spring. I had a talk with an old bee man who lives near Longview, Tex., who told me he had the best honey plant extant. He calls it the honey mulberry, and says it grows to the usual size of the common mulberry. He promised me some sprouts from it. I would like to have your opinion of this plant as a honey producer. 1. Do you know any plant by this name? 2. Do you know of any other species of mulberry that is valuable as a honey plant? 3. Are hybrid bees more irascible than the blacks? Do virgin queens very often meet with drones whose hives are a mile away, or is it in exceptional cases?

B. L. CLEMENTS.

Queen City, Tex., Sept. 17, 1882.

[1. We do not know any such shrub or tree.

2. There are two or three species of mulberry, but none especially valuable for honey, though all yield more or less.

3. If Italian queens are mated with black drones, they are much more irascible than the pure blacks; if black queens mate with Italian drones, then the traits of disposition are most likely to be reversed.

4. They do so very frequently, unless they are very numerous surrounded with drones.—ED.]

A Partial Report.—So far I have obtained 990 lbs. from my 17 colonies spring count besides increasing to 38. They are hybrids. The season up to July 1st was cool and unfavorable but since that time there has been an abundance of bloom. I consider Alsike clover the best of honey plants.

F. A. BOHL.

Summum, Ill., Sept. 16, 1882.

Solidago.—Please say what the accompanying plant is? I have never seen bees on it, but I am told they do visit it.

W. P. TAYLOR.

Fitzroy Harbor, Ont.

[It is a solidago, to which family goldenrod also belongs. We have seen bees gathering honey from this species this fall.—ED.]

Amber Syrup for Wintering.—Will it be safe to feed bees syrup made from early amber sugar cane, for winter use?

JAMES F. JOHNSON.

Salem, Mo., Sept. 17, 1882.

[We have never known of its having been tried, but doubt its utility for that purpose; however, it is worthy of a trial with one or two colonies.—ED.]

Not So Bad.—Bees are doing very well so far this season. I have taken to date 9,191 lbs., mostly extracted; had 69 colonies in the spring. I have increased to 100. P. LOUCKS.

Kingsburgh, Cal., Sept. 9, 1882.

[Nearly 140 pounds per colony spring count, and 80 per cent. increase, is not such a disastrous failure as might have occurred. In former years anything like such a yield would have been reckoned first rate.—ED.]

Good Fall Honey Crop.—The fall honey crop is very good. Comb honey is selling readily to our grocery men at 25 cents per pound. A. J. COOK.

Lansing, Mich., Sept. 21, 1882.

Bees in Canada.—This has not been a good season for bees in Canada, the spring was so remarkably cold, they hardly got honey enough to keep themselves alive till basswood bloom. Since that time they have done well, but swarming was very late (the end of July and through August), which is very unusual. I lost some swarms, as I did not watch for them, thinking swarming time was past. I have increased my stock from 3 to 9. I am the only person in this township that I know of who keeps Italians, and only one of my young queens mated with a black drone, so that I have been fortunate in only having one colony hybridized.

HENRIETTA F. BUTLER.

Campbellford, Ont., Sept. 13, 1882.

The Jackson, Mich., Fair.—Yesterday I visited the Fair at Jackson. The apiarian exhibit was quite small, compared with the one at Toledo, and what there was had not been put up in a way to call attention. Some extracted honey in jelly cups and combs made in tumblers was about all besides the apiarian supplies. Bee-keepers have no reason to complain of not being able to sell their honey, when they make no effort to show it. Consumers of honey look at "supplies" with curiosity, but at honey with a desire to taste it. We should endeavor to attract the eye, gratify the desire for the beautiful, as well as to please the taste.

E. B. SOUTHWICK.

Mendon, Mich., Sept. 21, 1882.

Beaver County, Pa.—Such a season as the past has never visited this county. Heretofore we have almost always obtained more or less surplus honey. Bloom was plentiful, but appeared to secrete no nectar. The poor bees have been diligent, and on the wing from morn till night, but made no progress at all. I know of but few swarms, not over 20 besides my own; I had about 18 natural swarms, and for the life of me I cannot see what made them swarm, as they had no honey. I bought a black colony which cast a swarm; I then transferred them, and there was not a pound of honey in the hive. I cannot imagine why they swarmed. 1. What is the difference between a tested queen and

a dollar queen after her progeny appears, and they possess the requisite number of bands? 2. I send you a sample flower that the bees work on from morning till night; it is a fall flower, and grows from 7 to 8 feet high. What is it?

COL. R. WALTON, *Vice Pres.*
Industry. Beaver Co., Pa.

[1. As you propound the question, there is no difference. Fairly stated, there is just as much difference as exists between a doubt and a fact.

2. The plant specimen is from Dr. Tinker's famous golden honey plant.—ED.]

A Ton of Honey.—I commenced in the spring of 1882 with 26 colonies in movable frame hives; have increased mostly on the nuclei system to 85, all good colonies now; extracted over 300 lbs. of honey from clover and basswood; have worked since for increase and comb honey. I have over a ton of honey, and what I call a fair increase, over 3 from one. I have transferred 40 colonies for neighbors, all of which have done well—thanks to Mr. Heddon for progressive transferring in the BEE JOURNAL of July 12th. I have transferred 18 colonies on that plan—it is just immense. No more combs, brood and honey, nailed, clasped, tied and smashed in frames for me. My success in increase and honey (which means money) was through the aid of the welcome BEE JOURNAL, of which I hope to be a lifelong subscriber. S. McLEES.

May, Mich., Sept. 20th, 1882.

Satisfied.—My BEE JOURNAL comes every week, freighted with items new and spicy, adapted to bee-culture. It refreshes our memory on things old and wakes us up to modern ideas. Long may its editor live to publish the BEE JOURNAL, and tell us how to manage the "blessed bees."

HENRY TILLEY.

Castle Hill, Me., Sept. 18, 1882.

☞ The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning County, in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

LEONIDAS CARSON, *Pres.*

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about eight words; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance.

Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole is paid in advance:

For 4 weeks.....	10 per cent. discount.
" 8 ".....	20 " " "
" 13 " (3 months)....	30 " " "
" 26 " (6 months)....	40 " " "
" 39 " (9 months)....	50 " " "
" 52 " (1 year).....	60 " " "

Discount, for 1 year, in the MONTHLY alone, 25 per cent., 6 months, 10 per cent., 3 months, 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

☞ The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premium. Their own subscription may count in the club:

For a Club of 2,—	" Bees and Honey," in paper.
" " 3,—	an Emerson Binder, or "Bees and Honey," in cloth.
" " 4,—	Apiary Register for 50 Colonies, or Cook's Manual, paper.
" " 5,—	Cook's Manual, in cloth, or the Apiary Register for 100 Colonies
" " 6,—	Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Two subscribers for the Monthly will count the same as one for the Weekly, when getting up clubs for the above premiums.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., September 25, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour :

Quotations of Cash Buyers.

CHICAGO.

HONEY—1 am paying 7c. for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17@22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@20c. on arrival; extracted, 7@10c. BEESWAX—Firm at 20@25c. per lb.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—Choice white comb honey is steady at 18@20c. Some extra nice 1 lb. packages have sold at 22c. No demand for dark combs. Extracted honey in kegs, barrels and casks, 9@10c. Demand better than for months past.
BEESWAX—20c. for prime yellow; dark 18@22c.
R. A. BURNETT, 165 South Water St.

CLEVELAND.

HONEY—Sells very readily in 1 lb. sections at 21@22c. for best white, and 19@20c. for 2 lb. Second grade, 1 lb. 19@20c. Extracted is selling very slowly again, and some arrivals in bbls. we have been unable to place, asking 11@12c. Extracted in tin pails has sold slowly at 14c.
BEESWAX—25@26c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

Included in this week's receipts was one lot of 10 tons amber extracted, free from granulation, which was purchased prior to arrival. Half of it has since been resold at 8 1/2c., for shipment to Europe. The market is firm but rather quiet.
We quote white comb, 18@20c.; dark to good, 12@15c. Extracted, choice to extra white, 8 1/2@9 1/2c.; dark and candied, 7@8c. BEESWAX—28@30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and dull. Comb lower, at 16@18c.—latter for choice white clover in small packages; strained in round lots at 7c.; extracted in cans at 9@10c.
BEESWAX—Sold fairly at 27c. for prime.
R. C. GREER & Co., 117 N. Main Street.

NEW YORK.

HONEY—No quotations reported.—ED.
BEESWAX—The supply is moderate and prices held about steady, though very little doing. Western, pure, 27@27 1/2c.; Southern, pure, 28@28 1/2c.
D. W. QUINBY, 105 Park Place

BOSTON.

HONEY—Market active. We quote 1/4 lb. combs 30c. per lb.; 1 lb. combs 22@25c.; 2 lb. combs 20@22c. Extracted, in half bbls., 12@14c.
BEESWAX—P line quality, 25c.
CROCKER & BLAKE, 57 Chatham Street.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
" 100 colonies (220 pages)..... 1 50
" 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

We will send sample copies of the BEE JOURNAL to any one who will distribute them to bee men at Fairs. We will also send some large colored posters to enable them to get up clubs. Write to us and say how many copies you wish and we will send them post paid. See our premiums for clubs on another page.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

When changing a postoffice address, mention the old as well as the new address.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey. A new pamphlet of 32 pages. At the last meeting of the North American Bee-Keepers' Society, we were appointed on a committee to prepare instructions on the Exhibition of Bees and Honey at Fairs; this is also added to the above. Price, 10 cents.

Ribbob Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Hundreds of clergymen, doctors and others have used Kendall's Spavin Cure with the best success.

37w4.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

THE BRITISH BEE JOURNAL AND BEE-KEEPER'S ADVISER.

The BRITISH BEE JOURNAL is published monthly, and contains the best practical information for the time being, showing what to do, and when and how to do it. It is edited and published by C. N. ABBOTT, Bee-Master, School of Apiculture, Friarlaw, Southall, London. We send the Weekly AMERICAN BEE JOURNAL and the British Bee Journal, both for \$3.50 per annum.

5wly Nappanee, Elkhart Co., Ind.

W. Z. HUTCHINSON,

Rogersville, Genesee County, Mich., has no Queens for sale now, except Tested Italians at \$1.50 each. But he has plenty of these, and can send them by return mail. 39wtf

THIS PAPER may be found on file Co.'s Newspaper Advertising Bureau (10 Spruce St.), where advertising contracts may be made for it in NEW YORK.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the conical leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$8 00
For 2 Langstroth " 10x18 "	8 00
For 3 " " 10x18 "	10 00
For 4 " " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " " 12½x20 "	12 00
For 4 " " 13x20 "	16 00

A NEW BEE BOOK!

Bees & Honey

OR THE Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN,
 Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is fully up with the times, in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.
 A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.
 We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.
 Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.
 Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.
 A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.
 New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.
 Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.
 Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.
 Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.
 A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

"The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.
 The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.
 A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

New Kegs

FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore prepared kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well sealed, the pine will not flavor the honey.

Capacity, 175 pounds. Price, 80c. each.

The first car load of these kegs will arrive about Sept. 10th, and all orders will receive my prompt attention.

The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

923 West Madison Street, CHICAGO, ILL.

The Bee-Keeper's Guide; OR, MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—*L'apiculture*, Paris.

I think Cook's Manual is the best of our American works.—LEWIS T. COLBY.

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—WIL VAN ANTWERP, M. D.

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record*.

It is a credit to the author as well the publisher. I have never yet met with a work either French or foreign, which I like so much.—L'ABBE DU BOIS, editor of the *Bulletin D'Apiculture*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Pulaski, N. Y.

We have perused with great pleasure this *vide mecum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. Do not taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur to bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor*.

EARS FOR THE MILLION! Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea known as *Carcharodon Roudetii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthy noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by THOMAS C. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Manual of the Apary.—Entirely re-written, elegantly illustrated and fully up with the times "an every subject of bee-cult." It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author's master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apary for Pleasure and Profit, by Thomas G. Newman.—Third Edition "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Bienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon Theory—presents the fundamental principles of bee-culture, and trowishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc., and Honey as Medicine with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price, 10c.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadaat, giving in detail the methods and management adopted in their apary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and add when and how; 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Chicken Cholera, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 2000 Items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gliders, Metal and Wood Workers of every kind. The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postpaid, \$2.50.

THE AMERICAN

BEE JOURNAL

DEVOTED EXCLUSIVELY TO PROGRESSIVE BEE CULTURE.

Vol. XVIII.

Chicago, Ill., October 4, 1882.

No. 40.

Published every Wednesday by

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR,

925 WEST MADISON ST., CHICAGO, ILL.

At \$2.00 a Year, in Advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

The Road to Success.

In confirmation of the policy inaugurated by the BEE JOURNAL, and our persistent advice concerning the effect of apicultural societies and bee and honey shows on the bee-keeping industry, Prof. Cook, in a recent letter, says: "Local societies and big honey exhibitions are the ways to progress, now. Keep these ideas before the people." The following is the platform which we have been advocating for years, and the correctness of which is being indorsed by the most intelligent and progressive apiarists:

1st. Encourage planting bee-pasturage, that there may be, every season, a crop of honey to gather, and making apiculture a fixed occupation.

2d. Fostering District and Local Societies to afford mutual instruction, and strengthen fraternization.

3d. Instituting large and attractive honey and apiarian exhibits, to educate the community to the desirableness and economy of a superior product.

4th. Cultivating a discriminating domestic market, to encourage superiority and excellence.

5th. The sale at all times, and in all places, of an honest article under an honest name.

We expect to give the proceedings of the National Convention in next week's BEE JOURNAL, so that our readers may be fully informed concerning all that will have been done or discussed at this important gathering of the bee-keepers of America. We hope the future meetings will not be held so early in the month

of October; we think a week or so later would be a much better time, after the bees are all prepared for the coming winter.

The National Convention.—We give up a large portion of our space this week to some of the essays which will be read and discussed at the National Convention. As we present a number of copies to the Convention for the use of those in attendance, they will be enabled to read each essay in advance, and note points for discussion, or follow them, as they are being read, and mark portions for future inquiry. This method of proceeding will overcome many previous objections urged against essays at Conventions, and greatly add to their usefulness.

Carelessness in our correspondents often causes us much trouble. We have an order for books which contains neither the name of the writer, his postoffice, County or State. All we can do is to wait until he gets sufficiently vexed at not receiving them to write us again, and then, should he give us his name and address, we can fill the order; if he should still think we ought to know him without this formality, and neglect to give us any clue to his personality or residence, we must wait until he gets "mad" enough to do so. As the time for the usual winter rush of correspondence is nearing, let us try to impress on our correspondents the necessity of being careful in the matter. Also, if they live near one postoffice and get their mail at another, be sure to give the address we have on our list.

We have made arrangements whereby we can procure tickets for those desiring to attend the National Convention, and return, good for 30 days, for \$12.00.

THE NATIONAL CONVENTION.

President Cook's Address.

[This and the five following addresses will be read and discussed at the National Convention, to be held at Cincinnati, O., commencing Oct. 3, 1882.—ED.]

Experiments with Bees.

There are several points in the habits and economy of bees, concerning which scientists and practical bee-keepers are not all agreed. Some of these are not without practical importance. In the researches and experiments which I now describe, I have aimed to settle definitely some of these mooted questions.

Bees Voiding Dry Feces.

The late M. Quinby, who, as a practical bee-keeper, had few if any superiors in our country, taught during the latter part of his life, that bees to winter well required heat to evaporate the moisture from their feces, which in health would be passed in a dry state in the hive. Last winter in an article in the *Rural New Yorker*, I called this theory in question, stating that I had yet to find evidence that it was correct. Mr. N. N. Betsinger in an article before the N. E. Bee-Keeper's Association at its last meeting said: "The atmosphere outside the cluster should not fall much below 60°; and with these conditions the excrement will be discharged in a dry state." Mr. E. Gallup, in *Gleanings in Bee-Culture*, May, 1882, p. 233, says that he has "often seen bees discharge the contents of their abdomens, which was powdery-like," though this was not in the hive but as the bee flew forth on the snow, and was about to die. Mr. C. N. Abbott, editor of the *British Bee Journal*, says that he is "amused that there should be any uncertainty in this matter." He says that "if bees are sent some miles on the cars, where they have room to fly in the box, any one may see the dry excreta." He has "seen hundreds of cases where there have been thousands of grains of bee excreta, about the size and color of coarse gun powder."

Lastly I quote the noted agricultural editor of the Province of Ontario, Mr. W. F. Clarke, who is "quite certain that bees void dry feces." He says in the *AMERICAN BEE JOURNAL*, vol. 18 p. 374, "when we have discovered the conditions under which bees discharge dry feces only, we shall have solved the problem of successful wintering."

To ascertain the truth in this matter, I first examined the alimentary canals of scores of bees which were taken from the hives in the cellar, just before setting them out in the spring. These bees had wintered exceptionally well, and if Mr. Quinby was correct, were just the ones to show the dry feces. According to Messrs. Gallup and Betsinger, these bees should hold

in their intestines the dry excrement. In every case I found no sign of the dry powder, but the semi-liquid mass, containing grains, probably pollen, which I have ever found in such dissections. The intestinal excreta of bees I find to be very much the same at all times; the principal difference being in the number and size of granules and in some cases a more rank odor.

I next took all the material that was on the bottom board of a colony which had wintered so well that there were very few dead bees in the hive, to Dr. Kedzie, and asked him to report the character of the contents. The result of the analysis gave 75 per cent. wax, the remainder consisting of sand, and parts of dead bees. Prof. Beal and I gave the same material a careful microscopic examination, and though we found the powder-like grains, referred to by Mr. Abbott, their character was not such as the appearance of the feces would lead us to expect, in case they were fecal masses. I examined these very carefully, and in almost every one I found compound hairs, just such as are found on the bodies of bees, and which I have never found in the intestines of bees. In some cases I did find that there was considerable matter that did not melt as does wax, and which seemed to contain pollen, but the form of these masses, and the fact that hairs were embodied in them, leads me to conclude that they originated in the same way that the similarly formed wax pellets did, with which they were associated, and of which they often formed a part. Where the bees had wintered well, and there was no sign of dysentery, there was not the least fecal odor to this mass on the bottom board beneath the bees. After a full examination, I became so thoroughly convinced that this mass was not at all fecal in its origin, that I put large bunches of it into my mouth and chewed them, to find in every case a nearly tasteless, wax-like gritty substance, with no possible taste to hint of a fecal origin. The grit is easily accounted for as sand will blow into the entrance of the hives in the autumn. Prof. Beal and I saw these sand-grains with the microscope, and Dr. Kedzie met the same in his examination.

Summer Experiments.

During the months of June and July last, I experimented with three different colonies of bees, at three different times, as follows: I shut them in, so that they could not fly, and gave them clean hives, well ventilated with nothing in them but the empty frames, though in one case I added foundation. The bees were left in this condition for two or three weeks, and each colony fed daily from one to three pounds of the best granulated sugar, reduced to a syrup by adding 8 lbs. of water to 10 lbs. of the sugar. The hives were empty of combs, save as the bees built them, and so the bees had a chance to fly in the hive, and in the middle of the day, as the heat would become great, they would be irritated very much like they would if

carried on a journey. The hives were covered with wire gauze which was painted green. At the close of the experiment in each case the bottom-board was covered with the powder-like grains, which all of my large class of students pronounced at once to be the droppings of the bees. There is no wonder that the gentlemen above referred to have been deceived. To one acquainted with fly specks, there would be no doubt in regard to their nature, until he gave the subject close scientific examination. All of these masses contain wax, bee-hairs, and many of pieces of wood, quite large grains of green paint which they had cut from the wire gauze, some of which were semi-cylindrical; and in one case where there was a piece of cotton cloth in the hive, long cotton fibers. Some of the wood splinters were still attached to the hive, and yet surrounded with the pellets, the hairs winding around the wood. In all of these cases the entrances to the hives were closed with common wire gauze, and in every case there was a small windrow of these pellets just outside the gauze.

Now that these were any of them fecal pellets, notwithstanding their appearance, is entirely disproved. Careful dissection of scores of bees found the same semi-liquid mass referred to above, thick with pollen grains, which in one case Prof. Beal identified as pollen grains of the pine, with no sign of bee hairs, paint particles, or wood splinters. Secondly, many of these pellets had incorporated in them cotton fibers, wood splinters, and paint masses that could not have gone through the intestinal canal of the bees. Thirdly, the bees could not possibly have discharged their feces outside the entrance, through the wire gauze, as seen in the little windrows. Lastly, if the masses, which embraced the wood-splinters, passed through the bees, the splinters must have done so as well, but these were attached to the hive, by one end, and so if they passed through the alimentary canal of the bees the hive must have borne them company; which, notwithstanding the great achievements of bees, will hardly be credited even by the most credulous. I am much indebted to Prof. W. J. Beal and one of my students, Mr. W. M. Badcock, a very careful and painstaking young man, both of whom have given this subject careful investigation, and feel certain that the masses cannot be fecal.

I will further state that in a few cases I found real feces in the hive. These, consisting of dried pollen grains, were strung out in a row, and in every case there was a stain by the side of the mass, indicating their original semi-liquid condition in which the fresh feces are ever found. These masses were like the intestinal excrement, and not at all like the so-called fecal masses described above. There is no doubt but that bees, if long confined in their hives are irritated, either by too great cold or too great heat, or continual disturbance as by jarring, will have to void their feces, and, if they cannot fly out, they will

discharge these excreta in the hives; but they will never be dry, but always semi-liquid.

What, Then, Are the So-Called "Dry Feces."

Mr. Badcock suggested that they might be masses of refuse which the bees had packed in their pollen baskets, which gave rise to the peculiar form. But the fact that some of these were wound around attached splinters, makes this explanation untenable. It must be that bees knead together, by means of their jaws, the wax, the hairs that they collect in dragging dead bees, and other refuse, which they have occasion to cut away or remove. I cannot explain why they thus waste so much good wax, unless they find that their jaws, like the seamster's thread, work better if waxed.

Do Imago Bees Eat Pollen?

The question is often raised by writers on bees, whether the mature bees eat pollen. It is well known that bees will winter just as safely, and probably with more certainty, if they have no pollen. In fact bees do just as well if wintered solely on sugar syrup, which is a pure hydrocarbon and entirely destitute of nitrogenous material, which all honey contains, in the slight amount of pollen gathered with it. It has been suggested that as bees are very active, and so must expend considerable muscular energy, the albuminoids are indispensable in their food. The fact that we always find abundance of pollen in their alimentary canals proves that bees do eat it, and that all does not go to feed the young bees or brood. The fact that we find so much pollen in the rectum, would show that this pollen is not very well digested by the imago.

Pollen as a Winter Food.

Some of our ablest bee-keepers think that eating too much pollen during their confinement in winter, may give rise to dysentery, and cause the fatality so much dreaded by beekeepers. Careful experiments, which I have carried on for several years, give support to this view. No one can doubt but that dysentery comes from over-distended intestines. As we have seen, the excreta of bees consist largely of pollen grains. Reason would sustain the argument from experience, that bees without pollen in the hive might winter more safely. Surely if the bees were induced to eat much of the pollen it could but act disastrously, as we have seen that much is left undigested.

Do Bees Breed without Pollen?

It is often asserted that bees can rear brood without pollen. This is certainly a mistake. In all the cases tried this summer, and several similar ones previously tried, I have failed signally to secure any brood. If fed honey there might be some brood reared, as bees collect some pollen in the honey, but when I have fed pure sugar, I have signally failed to rear brood. By opening the hives just at night and inserting a comb containing pollen, I at once secured brood. I have for several years put a portion of

our bees in the cellar, each season, to winter, with the combs of pollen carefully excluded from the hives. Such never contain brood in the spring as I set them out, while the others often do. Some of our apiarists report differently, which I cannot understand.

Comb an Expensive Article.

Mr. Langstroth, the great Huber of America, states in his classic work on the Honey Bee, that it takes from 13 to 20 lbs. of honey to feed the bees while they secrete one pound of wax. My experiments, were it not that the bees were in a very abnormal condition, show that wax is even more expensive. The chemical composition of wax, which is much like that of fat, makes it easy to understand how bees can secrete it on a diet purely of the hydrocarbons.

Agricultural College, Lansing, Mich.

For the American Bee Journal.

Experiments in Comb Building.

PAUL L. VIALLO.

To ascertain the quantity of honey or sugar required to build 1 square foot of comb, and the quantity of honey required for 1 lb. of wax, the following were my experiments:

I took the bees from two colonies, putting them in two empty hives, and confined them in a room arranged for the purpose. I gave them nothing but water for 2 days, so that I would be certain they would have used all the honey taken during the shaking and brushing into the empty hives. In two cases during my experiments I had to feed after 12 hours, as they showed signs of starvation. Before feeding, I took care to cut out and scrape all the combs they had made. The hives were numbered 1 and 2, the bees weighed every time, so as to always have as much as possible the same amount of bees. No. 1 contained $5\frac{1}{4}$ lbs. and No. 2, $5\frac{1}{2}$ lbs. of bees.

Fed No. 1 with 2 lbs. of brown sugar made into syrup, and No. 2, with 2 lbs. of white sugar, also made into syrup. No. 1 gave 167 square inches of comb and No. 2, 68 square inches. I reversed the feeding, and No. 1 gave 77 inches, and No. 2, 148 inches. I fed both with 2 lbs. of honey, and got from No. 1, 55 inches, and from No. 2, 48 inches. The 55 inches of comb, including all scrapings, weighed $2\frac{1}{4}$ ounces, and its average thickness $1\frac{1}{8}$ inches. Judging from that, it would take 14 lbs. of honey (without pollen) to make 1 lb. of wax.

By taking the average, it would take about 2 lbs. of brown sugar, 4 lbs. of white sugar, and nearly 6 lbs. of honey to make 1 square foot of comb of an average thickness of $1\frac{1}{8}$ inches. But as the combs obtained were thicker than those generally built naturally, we may safely reduce the above quantities $\frac{1}{4}$ to $\frac{1}{5}$ per cent. Now, as we know from analysis that honey contains from 45 to 50 per cent. of grape sugar, we may account for the difference of results between sugar and honey, and I am certain that in a flow of nectar that more inches would be

built and more wax secreted from the same amount of saccharine matter, as nectar is composed of 55 to 60 per cent. of cane sugar and contains no grape sugar. Having no grape sugar, I could not experiment on it so as to see if bees would build combs with it only. I have repeated these experiments several times with but slight variations.

As the above experiments were made without pollen, I went over the same with pollen, and the result was a gain of about 15 per cent. in inches and quantity of wax. In each experiment I changed bees so as to always have old and young, and always had the queen with the bees. I would also state that it was not always the colony containing the most bees which gave the most wax, and on one occasion using a smaller hive, $3\frac{1}{2}$ lbs. of bees gave about the same result.

During the above experiments I had a chance to observe the eggs laid by the queens, which they would do moderately as the combs were built, and noticed that when fed with sugar the eggs were removed by the bees; in one instance a few remained in the cells and seemed to be dead, nearly as soon as hatched; with the honey a few eggs would hatch, but the young worm would be invariably removed in 2 or 3 days. This living of the worm was due, I suppose, to the small quantity of pollen contained in the honey, as, after diluting the honey and filtering it, the result was the same as with sugar. I went so far as to give them a frame containing eggs and larvæ one day old, taking care that there was not a grain of pollen, and continued the feeding with honey, and in 24 to 30 hours all the eggs and larvæ had been removed by the bees. After several other trials with negative results, I collected some pollen from some combs and gave it to them during the feeding, and in every case the eggs hatched and the worms went through all the ordinary phases and hatched perfect bees, and I came to the conclusion that without pollen or a substitute, no brood was reared. In all these operations, I always had some water in the hive.

As these experiments were made in confinement, I intend to repeat those in regard to the quantity of honey required to make 1 pound of wax in the open air, as soon as there is no flow of nectar from the field, though there is always a little; but I will place another hive with the same amount of bees on a scale and watch if there is any honey coming in during the experiment, and deduct the difference. If it was possible to obtain enough nectar, I am certain that the result would be the same as with brown sugar, and that not more than 5 or 6 lbs. of honey is required to make 1 lb. of wax. I believe that in the open air the bees will give more wax, as being at liberty they will work with courage.

In these experiments, you will see that some of the feed is stored in the cells, and the feeding must be pushed a little further, and when the combs are removed, they must be weighed with the little honey in them, these

washed and re-weighed after they are dried, and the amount of honey deducted, etc., from the amount fed.

You will excuse me if I do not enter into more minute details, but I think that you will fully understand how the experiments were made, and that you will be able to repeat them, and I hope your results will corroborate mine. Do not be afraid to ask for more details, as I am at your service, and will cheerfully give them.

Bayou Goula, La., Sept., 1882.

For the American Bee Journal.
Control of Fertilization.

G. W. DEMAREE.

Bee-keepers of America have just cause to feel proud of the progress already made in the science of breeding, and the manipulation of bees, yet they have cause to feel humiliated that one of the chief factors that go to make up the conditions of scientific breeding has, thus far, eluded the grasp of the most studious and careful of our apiarists. I refer to a more perfect control of the males or drones in the process of mating.

Every other important problem pertaining to the science has been solved by the combined wisdom of the fraternity, but before this dark mystery we stand as helpless as so many infants.

It is admitted by all intelligent breeders, no matter what may be the peculiar views of each as to the most profitable "strain" or breed of bees, that careful selection is essential to successful breeding. It is an easy matter to control the stock on the side of the mother bee, both as to the "strain" or type sought to be perfected, and the individual specimens best qualified to transmit the qualities sought for in breeding. But with our present knowledge no such control can be had over the males or drones. It is true that much may, and has been done by resorting to isolated localities where the queens can meet no other drones than such as the apiarist keeps in his own yard, but this can only give general control. It places the apiarist as a breeder but little above the shepherds of thousands of years ago whose flocks bred promiscuously, regardless of the weak and the strong.

It is claimed that the males can be controlled in breeding by the use of all worker combs, by which means such drones as are not desirable may be suppressed. All this looks feasible, but a philosophical question arises here as to what will be the tendency of such a course. All will admit that the instincts of bees leads them to rear more or less of drones even in worker combs, and these dwarfed specimens will go forth to propagate the race, and thus take the place of properly developed specimens. It is not hard to foresee the evil effects that must ultimately follow such a course.

These dangers, however, can be averted to a good degree by allowing each colony a few square inches of drone cells to satisfy their yearning

for drone progeny, and remove the necessity of rearing dwarfs for the want of full-sized cells.

The frame which contains the drone cells should be marked so that but little time need be lost when it is desirable to clip the heads of the drones with the honey knife.

The genuine "innocence" of some who write on the subject of "purely mated" queens is calculated to provoke a smile on the part of those who have given the subject careful attention. Those who expect to have their queens mated with the drones reared by a few select colonies in their own apiaries, when situated in a locality where there are other bees, simply deceive themselves and those who "bite" at their advertisements. Situated as I have been for years past I could give facts enough to show the utter unreliability of such a course in breeding.

It requires concert of action on the part of those who keep bees in any locality to insure uniformity of mating even as to "stripes," as some interested breeders sneeringly put it. I wish to repeat here what I have said somewhere in my writing, viz.: That "an inferior specimen of a superior race is not necessarily better than a superior specimen of an inferior race." I think this is a fact that will hold good under all circumstances. Hence, if the honey bee is not an exception to all the rules known to the breeders of live stock, why, then, to have perfect control, the breeder must be able to select not only the race or "type" to breed from, but such specimens of the race or type as in his judgment are best qualified to transmit the qualities sought to be established in his ideal bee. By careful application of these rules our stock breeders have been able to surprise the world with their wonderful achievements. But I undertook to write this essay in order to relate some experiments which I have tried the past season in my researches for a method to control fertilization, and this I do with the hope that although they were failures as to the main object in view, they will not be altogether unprofitable and uninteresting. After trying many experiments to induce queens to mate in confinement with utter failures, it occurred to me that if some device could be invented which would allow the workers to pass out into the open air and at the same place permit the queen and drones to pass into an apartment prepared for them, and fly voluntarily, the conditions would conform so nearly to Nature's method that there would be hopes of success. To carry out this plan I made a box 18 inches square at the top by 18x2 inches at the bottom, and 12 inches deep, thus giving a box—when set on legs for a support—with three perpendicular and one sloping side, which last answered as a sloping bottom to the box. On top of this box was set a "tent" the same size of the top of the box and 12 inches deep, made like a square "show case." The sides of the tent were covered with paper cambric, and the top with the thinnest crepe I could get. A common nucleus

hive was fastened against the perpendicular side of the box opposite to the sloping side, and its entrance was made to connect with a "covered way" through the narrow part of the box at the bottom of the angle. At the termination of the "covered way" two saw cuts were made so as to admit a perforated tin plate to answer as a queen and drone excluder. The covered way was so arranged that the worker bees could pass out through the perforations in the tin plate, and when the covered way was uncovered on the inside of the tent, the queen and drones being excluded from passing out through the slots in the tin, could rise and fly in the tent. Having matters arranged in this way, I stocked the nucleus hive in the usual way, except I fitted a piece of drone larvæ just ready to hatch in one of the combs, and 24 hours afterward I gave the nucleus a matured queen cell. The drones were hatching continually, and I "sorted" them, carefully removing such as did not come up to my standard of "the best." There were about two dozen of them when culled.

When the drones were four or five days old they began to come to the entrance, and seeing the light above, they made no effort to pass out through the holes in the tin, but rose and flew lively in the tent. I watched them with much interest, fearing that they would not know how to return when their frolic was over, but in this there were no grounds for fears; they could pass from the entrance to the tent and back again as friskily as if under no restraint whatever. Thus far things looked flattering, and I waited for the queen's turn to try her skill. On the evening of the fifth day of her age she came out and flew with pomp and splendor in the tent, the soft walls and roof of the tent were but little in her way, and she seemed to enjoy life hugely. She was able to return without the least confusion. The first day she made six trials in the tent, all the while from a half dozen to a dozen drones were flying with her, and they waltzed around in the gayest fashion. Day after day the queen and drones sported in the tent together, as though they had not the remotest idea that they were males and female, and old enough to get married. She waltzed out two sets of drones, and kept up her flights till 20 days old and then gave it up. At 30 days old, she began to lay eggs and laid sparingly for two or three days and died.

The second experiment was much like the first as to the flights of the queen in the tent. She kept up her flights with the drones till she was 18 days old. On the evening of the eighteenth day of her age I opened a valve at the top of the tent and let her out; she was gone but a short time and returned, but in a few minutes she came out again and disappeared into space; the result was that in just 30 minutes from the time she was first let into the open air she returned with the evidence of having met a drone, and in a little over two days after she was laying. She lived only about a week after she commenced to

lay. Now let us see what the results of these experiments indicate. Both of the confined queens had sisters of the same age of themselves, and these were laying rapidly and had sealed brood, while the confined queens were flying day after day in the tent, surrounded by as gallant a band of drones as could be selected. The confined queens were on the wing from one to two hours each day for 12 or 14 days, without showing the slightest signs of excretion or substance adhering to the extremities of their abdomens, thus disproving Ulivi's theory. One of the confined queens flew 12 days in the tent right among the drones, without "mating," and when set at liberty found a mate in 30 minutes.

The experiments showed that the vitality and endurance of the queen exceeds that of the drone many times over.

They further show that retarded fertilization is injurious to the queen, and when long delayed proves fatal to her existence. The excessive rainy weather made it inconvenient to pursue the experiments further this season, but I hope to take them up in the future. By means of the invention above described, I hope to control, in a good measure, the mating of specimens to breed from. I discovered, and hope to take advantage of it, that the queens in confinement, when of the proper age to meet the drones, become exceedingly anxious and desperate to escape their imprisonment, and will fly quite late in the evening, after all the drones have retired. The drones confined with the queen will keep up their clamor for liberty long after the other drones have retired for the day. With this state of things under our control, it will be seen that by giving the imprisoned queen and selected drones liberty to fly after other drones have retired, will, as nearly as possible, insure select mating.

Chaff Hives in Winter.

O. O. POPPLETON.

As my idea of essays at a Convention, is that they are intended more as a basis for discussion than as an elaborate treatment of the subject, I will confine myself to what I consider the advantages and disadvantages of chaff-hive wintering, over other methods, and a few ideas suggested by my experience with them.

I want to say at the outset, and emphasize it, too, that I find a proper management during the honey season is just as necessary a factor in successful wintering, as is the mode of wintering itself; but this part of the subject I will not attempt to consider.

Chaff-hives have now been in quite general use for four or five years, and reports of their success or failure are conflicting. I have used them exclusively for seven winters, and the largest loss I have had any one of those winters has been about 5 per cent., while the average loss has been

less than 3 per cent. These losses are net ones, after both wintering and springing.

I find wintering in chaff-hives possesses the following advantages over other methods:

1st. They admit of being prepared for winter as soon as the honey season closes, before severe cold weather sets in.

2d. When once prepared for winter, they require little or no attention until spring. This is quite an advantage as it allows us to turn our entire attention elsewhere for four or five months of each year.

3d. It requires less labor to prepare bees for winter, than by any other mode.

4th. The sun cannot warm up the inside of hives so readily as it can single-walled hives, thus inciting the bees to flight when the air is too cold for them to do so safely. I think all can see the advantage of this, especially during the fall and spring.

5th. The inside of the hives are readily accessible at all times during the winter, when weather is warm enough to allow bees to be handled.

6th. They thoroughly protect bees from the effects of changeable weather during the spring months. This is by far the most important advantage of all, and, as I said at the National Convention last fall, "this one thing alone in my opinion amply pays for their extra cost." The spring of 1882 was a marked example of the truth of that opinion. Several of my neighbors, who winter their bees in cellars, have told me that they were troubled exceedingly during the spring and early summer with chilled brood, while I do not know of having lost a single cell of brood from that cause. I am so thoroughly satisfied of the value of this advantage, that I hazard the prediction that a score of years hence, the most successful wintering will be accomplished by the uniting or blending the use of chaff-hives and cellars, or by the use of more thoroughly arranged chaff hives than we now have.

7th. They prevent spring dwindling. This is also a marked and important advantage. I have no trouble in saving colonies that possess a good queen and a pint of bees at the commencement of pollen gathering.

8th. They are valuable helps in building up nuclei and weak colonies all through the season. I think all experienced bee-keepers will see the value of this, especially during such a season as the present one has been.

9th. They seem to prevent a too early commencement of brood-rearing, which is considered by some of our ablest apiarists to be one great cause of spring dwindling. My observations are that bees in chaff-hives do not commence rearing brood until they can fly quite freely in the spring; but after once commencing to breed, their more even temperature allows them to do so more rapidly than in single-walled hives.

Their disadvantages are:

1st. Their extra cost. This is quite an item, but not a serious one to those who make bee-keeping a regular busi-

ness. Such are forced to have the best hives and appliances they can procure.

2d. Their large size and weight makes them unhandy to move about in the apiary. This is a serious objection to those whose system of management requires the frequent moving of hives, and who have no extra help convenient. To me this has been a very small objection.

3d. The difficulty of getting into the hives in the spring, on account of having to remove loose chaff. This objection applies only where loose chaff is used for packing, and is entirely obviated by the use of chaff cushions.

I have long been of the opinion that, other things being equal, the manner of wintering that best prevents the accumulation of dampness in the hive, will be the most successful. I regard this as the prime object to be attained by any method. Those colonies which come through best, almost invariably come through with dry bees, dry combs and dry packing, and this is especially true with bees in chaff-hives. Almost any kind of chaff, properly prepared, makes an ample protection from the cold; but I find quite a difference in different kinds about their liability in holding dampness. I have used timothy, wheat, oats and buckwheat chaff, and prefer them in the order named. Am now using timothy chaff exclusively.

My experience leads me to give the following suggestions in regard to the use of chaff-hives:

1st. Pack as early in the fall as possible. I have noticed that colonies packed before severe weather sets in do the best.

2d. Leave packing on as late in the spring as possible. This is very important. I never take any packing off until the middle of May, and not then unless colonies get very strong.

3d. Use the finest, lightest chaff you can get, and have it freed as much as possible from straw, etc. As I said before, I use timothy chaff, and am very particular to free it from straw by sifting it.

4th. Use a thickness of at least 4 or 5 inches of chaff on the sides and top of hives. The chaff at sides of my hives is a little over 5 inches thick, and if I was to change the thickness of the chaff at all, I would increase instead of diminishing it.

5th. Thoroughly protect the bottom of the hive as well as the top and sides. I know that this advice is directly opposite to the practice adopted by some who winter very successfully, but my own careful observations lead me to advise as above.

6th. Wherever possible, use chaff cushions instead of loose chaff. If one has only a few colonies, this is not so important; but it is almost impossible to handle the bees in a large apiary when packed in loose chaff—at least I find it so on our windy prairies. I now construct my hives with double walls in front and rear, which are permanently filled with loose chaff, using cushions at each end and one on top. These cushions can all be removed in an instant of time when

desiring to perform any manipulation of the hive, and can be quickly replaced. It is a very tedious job packing and unpacking bees with loose chaff every fall and spring, and I do not think any large bee-keeper will attempt it more than once.

7th. Have as much empty space as possible inside the hive and outside the packing, and in no case allow the top of the hive to rest directly on the packing. I use very large hives with from 2 to 5 cubic feet of empty space, and have frequently noticed that those hives having the largest amount of this empty space, usually keep the driest.

8th. Crowd bees on as small a space as possible. I winter my strong colonies frequently on 7 combs, and never more than 8, my frames being of about the same capacity as the Langstroth frames.

9th. Crowd the packing as close up to the bees as possible. The less empty space there is inside the packing, the more equal can the bees keep the temperature.

10th. Have winter passages through all the combs. I consider this very important with any mode of out-door wintering.

In conclusion I want to say, that while I do not consider the method of wintering in chaff-hives to be the best one under all circumstances, and for all bee-keepers, I do think that the longer it is practiced, the more favorably will it be thought of. If my cellar was a suitable one, I should experiment with the putting of some thoroughly packed hives in it during the winter, thus combining the advantages of our two principal methods of wintering. I hope some of our wide-awake bee-keepers, who are more favorably situated than I am, will make some thorough experiments in this direction.

Williamstown, Iowa, Sept., 1882.

For the American Bee Journal.

Advancing the Science of Apiculture.

J. E. POND, JR.

The science of apiculture is still in its infancy—a healthy babe if you please; still its growth has been hardly commensurate with its years, but with careful nurture and right management it will eventually become a giant.

The advent of frame hives formed an era in this occupation, which before that time was considered of little account, except among a few specialists, causing it to be classed among the sciences, and to become a certain success in the hands of any one who will devote brains and labor to it. The old box-hive management was largely a matter of luck, even among those of the largest experience, but with frames, pecuniary profit is sure and certain with those who understand the business, and beginners, even, can, by their aid, manage an apiary without loss, and with a fair chance to realize a profit. All honor, then, to the Rev. L. L. Langstroth, for what he has done for apiculture in

giving us the movable frame. His works will follow him, and his memory be held dear in the hearts of bee-keepers long after his frail body lies moldering in its mother earth, and bee-keepers, generations hence, will bless his name for making the management of the hive so simple and so easy. But why has not that advancement been made in bee-keeping since the era of the frame, that its advent seemed to warrant? I do not wish to be understood as assuming that no advancement has been made since that time, but I do assert that such advancement has not been made as ought to have been, or might have been, had our bee-keepers been a little less selfish, and actuated with a desire to benefit humanity as a whole, rather than themselves individually. To be sure, there has been but little encouragement given to any one who earnestly desired to progress. Attempts in that direction have either been "damned with faint praise," or died for want of sustenance. New ideas have been frowned upon, and new theories, especially if they seemed to combat old fogy principles (which were the natural result of the box-hive and brimstone style of management) were either looked upon as innovations, and condemned without a trial, or else strangled at birth by the cord of self-sufficiency. Even the inventor of an acknowledged good thing was not allowed to receive the reward he so justly merited, but attempts were at once made either to decry the merits of the invention, or to avoid payment for the same, by adopting some device which, when used in connection with it, was supposed to dodge the claim of the inventor, even though admitted to be anything but an improvement.

In all ages such has been the case with improvements, and in apiculture no less than any other. No one is willing to accept a new thing at first, or drive his wheels out of the old ruts, no matter how clumsy the old or how rough the road, but when the new device has won its way to favor, a host of imitators at once arise, and while they are not willing even then to acknowledge the merits, they are ready to adopt the principles, claiming that the additions or changes they have made are the chief, if not the only causes, of its success. As in hives and other supplies, so in matters relating to the honey bee itself. It took years to learn the economy of the hive, the duties of queens and workers, and the use of the drones; and even these facts were not discovered till poor blind Huber set himself to the task. Parthenogenesis was scouted as being at variance with the laws of nature, and even now there are found those who still insist the Dzierzon theory is an impossibility.

The advent of the Italian bee was an immense advantage, for its coming and adoption was the means of settling forever many mooted questions, and of our learning many things that heretofore were hidden mysteries, and had our bee-keepers even then striven as hard to gain a knowledge of the bee itself as they did to make it a

pecuniary profit to themselves, we should have progressed much farther than we now have.

The invention of foundation and the extractor (both foreshadowed by Langstroth years ago) were long strides forward, and their tendency has been to make uncertainty certain, and a barely paying business largely remunerative. Why is it, then, with all our past and present advantages, that we have made no greater progress? Other occupations, which a few years ago possessed far less prospects and advantages, have outstripped us in the race, and have gained a world-wide reputation, and become a means, rather than an auxiliary, in gaining a competence. Why is it not so with apiculture? The questions do not seem hard to answer, and I propose to briefly give my views in regard to them.

Bee-keepers, as a rule, are not entomologists, and entomologists, as a rule, are not bee-keepers, and bee-keepers have not taken that pains they ought, to give enough study to entomology to enable them to know the general peculiarities of the bee. In days past, and largely even now, bee-culture was, and is used, simply as an auxiliary to agriculture, and while considered profitable, was only so because the bees boarded themselves and required (at least received) no care. If they gave a yield of surplus well and good, if not, their owners let them die out, saying, "I never did have luck with bees." Even those who adopted it as a business simply engaged in it for the profit to be derived from it without knowing aught or caring aught, save for the mechanical part of its management. No time was given to the study of the characteristics of the bees themselves, and no thought given to the business, except to reckon up the gain or loss at the close of the season. Occasionally some one better posted than his neighbors would attempt some experiments which seemed to him conducive of good results, and endeavor to get his neighbor to follow his lead, but he was only laughed at for his pains, and driven from his position by raillery and ridicule. If a scientist gave a view or opinion at variance with old-fashioned notions, it was at once said, "What does he know about it, he is only a book man? We have kept bees for 40 years in the good old way of our fathers, and he can't tell us anything about it." Prejudice and superstition have prevented progress in many directions, and in apiculture as much, if not more, than in any other, and until we divest ourselves entirely of such prejudice, learn that this is a progressive age, and that we, even well-informed though we are, have yet much to learn, we shall grope in the darkness of self-conceit, and never see the light of progress and improvement. No one need fear the results of experiments or discussions. Truth is immutable, and will live through countless ages. Although experiment and discussion may seem to disprove some of our pet ideas, upset some of our cherished fancies, and prove us in the wrong, the truth itself can never

be successfully assailed, and though falsehood and error may, for the moment, seem to be in the ascendant, "truth, though crushed to earth, will rise again," and triumphantly assert and maintain its position against all odds, and falsehood and error be buried so deep as never to be resurrected. From ages long gone by till now it has been easy to write, but it is too often the case that those who know the least of a given subject are the first to write upon it; so with apiculture. Many who are actuated by a desire simply perhaps to see themselves in print, write a plausible article, the only merits of which are its finely turned sentences, and fully rounded periods. Others with axes to grind, for the purpose of turning an honest (?) penny; others still, actuated it would seem with no motive other than to deceive, put themselves before the public. All of these would do no harm if the readers were beekeepers of experience; but, unfortunately, these articles are read by many who have just commenced keeping bees, and to a great extent look for information from the articles they read in their bee papers. They are taken, and taken in by them, and when they find out the falsity and incorrectness of them, they at once denounce all writers, and those who are striving to give correct information are looked upon as humbugs and swindlers as well as the other class mentioned, and the result is that apiculture receives a blow from which it takes a long time to recover.

There is a remedy, and one that will give the occupation a new impetus and tend to advance it to the position it ought to occupy. It remains with us, however, to adopt and apply the remedy, and no matter if it is somewhat caustic and burns our self-conceit, we must vigorously apply it till the sore is healed, and a cure effected. That remedy is, for us to study the business in all its bearings, and particularly the habits and peculiarities of the honey bee. State nothing as facts until fully proven; give theories as theories only, and the reasons for accepting them, but until fully backed up by carefully conducted experiments, state them as theories still. Write for your special journals and write often, but do not be guilty of writing unless you have something to write about; state results briefly and the causes which led to them, and always give a full account of unsuccessful as well as successful experiments. Be ready at all times to amicably discuss any matter in which your own opinion is not accepted by others as correct. Do not hastily adopt a new thing because it is new, and, above all things, do not hastily condemn a new thing before fully understanding it. Avoid personalities in discussion, whether written or spoken, and, as earnest thinking men, do all that in you lies to advance the cause in which you are engaged and which you so fondly love. Thus will the science of apiculture be made to advance and take its proper place among the legitimate means of support in the world, and become a

source of mental discipline and pecuniary profit. Consider the honey bee not simply as a means of gain, but as a wonderful instance of God's goodness and kindness to man, who created the world and all therein contained for this his own glory and man's comfort and pleasure. "Go to the bee (ant), consider her ways and be wise," remembering that he who gave the honey bee its wonderful instinct (almost allied to reason) is the Creator of us all, and that from him only can we obtain support and sustenance, and from what we learn of the wonders of the created, learn to look with love and reverence to him, the Creator. Attend the Conventions to which you are sent as delegates, not simply with the idea of having a good time and making pleasant and agreeable acquaintances, but go there as men who have a purpose to attain, a duty to perform, and in its attainment and performance be actuated solely by a desire to aid, assist and encourage all steps that may be taken to forward the interest of apiculture. Work with head and heart for the interest of the whole; frown upon error, and heartily cheer for the right; do not resolve the Convention into a scandal shop, or form it into a mutual admiration society, but give to all their just due, and encourage progress, no matter from whence it originates; respect the opinions of others, even when they clash with your own, and by argument instead of sarcasm, strive to carry your own points. Let your points be for the general good, and not for a selfish purpose only.

Thus shall we make apiculture a noble profession, and cause it to proudly hold up its head among other occupations, and become a power in the land.

Foxboro, Mass., August, 1882.

For the American Bee Journal.

Comb vs. Extracted Honey.

DR. C. C. MILLER.

Shall we work for comb honey, and how shall we get the most of it?

I don't believe much in essays for Conventions, but as the President of the National Convention has honored me by asking me to write on the above subject, I cheerfully make the effort, especially as the subject is one which is to me intensely interesting, and I hope something in the essay may provoke discussion. If there is discussion, I know I shall learn something from it.

Practically, I answer the first part of the question by saying that I have this season taken fifteen thousand pounds of honey, and my extractor has stood untouched the whole summer. This answer is, however, only for the present time; for changes are so constantly taking place that another year may make extracted honey the most profitable for me to raise. The answer is also only for myself. For many others I am satisfied it is better to extract all honey. Not 50 miles from where I live is a man who sells thousands of pounds of extracted honey at

the highest price which can be obtained for comb. That man would be foolish to raise comb honey in preference to extracted. Under the present condition of matters, probably each producer must decide for himself which kind will yield the most net profit. A few years ago I raised extracted honey exclusively, and I may be allowed to give some of the reasons why I now prefer to raise comb honey. So long as I had only enough honey to supply the home market, I could sell extracted for about the same as comb, but having now a larger apiary, I am obliged either to ship to the large cities, or spend a good deal of time in developing a larger field as my home market. I think this latter course would take a good deal of my time through the winter, and at that time of the year I want something of a vacation. Moreover, if I sell extracted to the best advantage in a home market, I must spend no little amount of time and labor constantly getting it ready in small packages for retailing. If I ship to the large cities I can ship in bulk the extracted, and be easily rid of it, but a glance at the quotations frightens me from such a course. Comb honey is quoted about double the price of extracted, and I do not believe I can raise twice as much extracted as comb. Possibly, if I had a smaller number of colonies I might. I think one person can take care of a larger number of colonies run for comb than for extracted honey. Then all my fixtures and arrangements are at present for comb honey, and without the prospect of decided gain, I should not want to change. On the whole, looking honestly at the whole ground, I do not think I have made out so strong a case but that I might be induced to change upon being better informed as to the best way of raising extracted honey, or upon a sufficient advance in the price of the same, and I expect to see the price constantly approximate toward that of comb honey. But just at present I hardly expect to use the extractor more than enough to supply my own table, for a good article of extracted I believe to be best for the consumer.

Coming now to the second part of the question, how shall we obtain the most comb honey? If some years of practice, together with lying awake nights studying over the question, may fit one to answer it, then I may certainly lay some claim to be the right man. But candidly, I don't know. If a trip to the Cincinnati Convention will give as full an answer to the question as I desire, I shall feel well repaid for the journey, even if I have to make it on foot. The question is a very general one, covering pretty much the whole field of bee-keeping, involving a large number of other questions, to some of which I may briefly allude. Among the first, comes the question as to the best bees; a question I do not feel competent to discuss, and one which has been much discussed already in our papers. I do not, however, believe that the best bees for business will be had by getting queens from the best strain, and then breeding from them indiscrimi-

nately from year to year. Each year I find some colonies that are slow about building up, and make poor work all through the season. Often I have waited for them, hoping each week they would do better, until the harvest was past, obtaining from them perhaps not half the average yield. A colony which lags behind and fails to fill up when all conditions are favorable, should have its queen promptly killed and replaced by a better. A colony which is much crosser than the others should have its queen replaced, for cross bees cannot be so rapidly handled, an important item toward securing the largest yield. This year my bees seemed unusually cross, in fact the crosser I ever had. In one instance a person was attacked with no apparent reason, who had not approached within 6 or 8 rods of the apiary, and followed to a distance of perhaps 15 rods more. I was sometimes stung when walking near the bees and not disturbing them at all. It seemed as if my whole apiary had become cross. I watched closely the deportment of each colony on being handled or approached, destroyed the queens of two that were especially vindictive, and in a short time the whole apiary seemed as gentle as ever.

The right hive, of course, has something to do with the yield, and each man knows what that is, for it is the one he has invented. I am one of the few unfortunates who have not invented a hive; I have not even laid our venerated friend Langstroth under everlasting obligations by improving his hive; therefore, I am no competent judge.

Then comes the question of side and top-storing, and leaving each one to his own favorite plan. I have tried to secure the advantage of both by putting a frame of brood into the super until the sections were well started. By shifting about this frame of brood, or by putting frames of empty sections between those well occupied, I try to get the bees well started early in the season on a large number of sections, and toward the close of the season limit them to as few as may do, by using division boards in the super.

Years ago, while blocking up the cover of a hive to allow a free circulation of air through the brood chamber, Adam Grimm said to me, in his earnest way, "I consider this very important." Since that time I have practiced shoving the super forward on the hive, leaving an open space of perhaps one-fourth inch for ventilation until all swarming was over.

It is hardly necessary to say that starters of some kind must be used, and I am strongly of the opinion that the largest yield requires the largest-sized starters. For 1 lb. sections I prefer starters at least $3\frac{1}{2} \times 3\frac{3}{8}$ inches in size. That which will be most rapidly used by the bees will of course be preferred. There have been such great improvements, that little seems to be desired in the way of foundation. Some beautiful thin Dunham, made by A. I. Root, delighted me this summer; but on the whole, I think I have never liked any foundation I have used quite so well as the Given,

made by Mr. Heddon. To get the largest yield, I imagine that the thinnest foundation must not be used, only so the base be thin.

I suppose swarming hinders the largest yield, and I do not know that I have any new thought as to the best plan to repress the swarming fever. I am especially unsettled as to what is the best disposal to make of swarms that do come. Will the combined wisdom of this Convention please inform me how I shall secure from a colony that swarms, as large a yield as if it had not taken into its head the notion to swarm at all?

Passing by other important items, I will only mention that of pasturage. With all the advantages of natural pasturage, I suspect that shortly beekeepers will wake up to the fact that their harvest may be extended by special planting to fill in the "gaps." The BEE JOURNAL will tell us to sow melilot, *Gleanings* will tell us figwort. Each one should try these and other good honey plants, gradually increasing the acreage as he finds what is most profitable in his particular locality. I have faith enough in this to believe that it will pay to devote some acres entirely to honey plants, and am anxious to learn the best way to get 5 acres in figwort, 5 in melilot, and to know if it will pay me to raise golden honey plant and spider plant.

This essay is quite too long, but our esteemed friend, the President, should have known to have chosen a smaller subject, or a larger man.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The bee-keepers of Boone Co., Ind., are cordially invited to meet at the office of Barton Higgins, in Lebanon, Oct. 9, at 9 o'clock, a.m., to complete the organization of the auxiliary County Bee-Keepers' Society. The bee-keepers of Hendricks county, Ind., are invited to be present. By request of the Committee.

For the American Bee Journal. Central Michigan.

The Central Michigan Bee-Keepers' Association held a meeting in the Capitol Building Sept. 19th, and was called to order by President Ashworth.

The first question discussed was the size and style of a building to exhibit bees, honey and apiarian supplies in. After a spirited discussion, a motion was carried by which a committee of three, consisting of Prof. Cook, President Ashworth and N. V. Goodno, all of Lansing, Mich., was appointed, to request the managers of the Agricultural Fair to erect a building suitable for the exhibition of bees, honey and apiarian supplies.

The President then called for an expression of opinion on the best methods of rearing queens. The topic was discussed by E. S. Vannetta, S. Hilbert, H. L. Denny and others. Mr. Denny said when rearing queens for his own use, he stimulated his best colonies to breeding early; so they would have drones flying before there were any other drones out.

A recess was taken until 2 p.m., when Pres. Ashworth being called away upon urgent business, Prof. Cook was called to the chair, and the meeting opened with a renewal of the discussion on the best methods of exhibiting bees, honey and apiarian supplies at the Fair.

Prof. Cook stated that he had this season a queen fertilized in the hive, he also stated that he had used foundation this season from nearly all the different makes of machines now in use, and his bees appeared to work equally well on it all, with no trouble from stretching or sagging except that made upon the Given press, and that he could do nothing with.

The next question was how many bees should be in a hive to winter well.

Mr. Wood, of Grand Ledge, wanted his hives full of bees when he put them in the cellar, and from 15 to 20 lbs. of honey. He usually fed some in the spring to stimulate early breeding.

Mr. Waldo, of Grand Ledge, and E. N. Wood, of North Lansing, preferred wintering out-of-doors on the summer stands.

S. D. Newbro exhibited a very ingenious device in the shape of tongs for lifting the brood frames from the hives, and to hold the combs while examining them; also a machine for fastening the foundation into the section boxes, and other articles.

Narmore & Wood exhibited their hives, section boxes, etc.

E. N. WOOD, Sec.

The fifth annual meeting of the Northern Michigan Bee-Keepers' Convention will be held at Pewamo, Ionia County, Mich., on the second Tuesday and Wednesday (10th and 11th) of October, 1882. Pewamo being on the D. & M. and H. & M. R. R., it will be accessible by rail. The members will do all in their power to make the meeting interesting.

H. M. ROOP, Pres.

O. R. GOODNO, Sec.

The National Convention.

The North American Bee-Keepers' Society will hold their 13th annual meeting at Washington Park Hall, Cincinnati, O., across Washington Park from the Exposition building. Time, Oct. 3rd to 5th, 1882. First session Tuesday, 10 a. m., Oct. 3. We are encouraged to hope that this will be a very profitable meeting, as we are promised papers from, and the presence of, a large number of our most prominent bee-keepers both in the United States and Canada, and essays and implements of the apiary are expected from abroad to add to the knowledge imparted by the research and inventive skill and methods of our countrymen.

EHRIK PARMLY, *Sec.*
New York, July 12, 1882.

The Northwestern Bee-Keepers' Convention will meet at Chicago, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1882. The office of the American Bee Journal has been kindly tendered as a place of meeting. A cordial invitation is extended to all bee-keepers, and especially those of the Northwestern States, to be present. The meeting takes place during the last week of the Inter-State Industrial Exposition, to enable all to obtain reduced railroad rates. First session at 10 a. m.

C. C. MILLER, *Pres.*
C. C. COFFINBERRY, *Sec.*

The Union Bee-Keepers' Association of Maryland, Virginia and West Virginia, will meet at Hagers-town, in the room of the County Commissioners, at the Court House, on Wednesday, Oct. 18, 1882, at 1 o'clock, p. m., the session to last two days. The Washington County Fair will then be in progress, which will give persons an opportunity to attend the exhibition. All persons intending to go will please drop me a card, so that I may secure for them half-fare rates.

J. LUTHER BOWERS, *Sec.*

The fall meeting of the Northern Ohio Bee-Keepers' Association will be held in Whittlesey Hall, Norwalk, O., Saturday, Oct. 21, commencing at 9 a. m. A full attendance is solicited, as it will be a meeting of more than usual interest. Principal subject for discussion: "How shall we winter our bees without loss?"

S. F. NEWMAN, *Sec.*

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning County, in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

LEONIDAS CARSON, *Pres.*

The Marshall County, Iowa, Bee-Keepers' Association will hold its regular session at the Court House in Marshalltown on Saturday, Oct. 7, at 10 a. m. Subject for discussion, "How to prepare for wintering." We hope to have a good meeting.

J. W. SANDERS, *Sec.*

Vice President for Kansas.—Mr. D. P. Norton having peremptorily resigned, I hereby appoint Mr. S. J. Miller, of 314 Kansas avenue, Topeka, Kansas, as his successor to the Vice Presidency for Kansas of the N. A. B. K. Society.

A. J. COOK, *President.*

The Southern California District Bee-Keepers' Association will hold their annual Convention in Union Hall, Los Angeles City, Oct. 19, 20, 1882, during the week of the Agricultural Fair. The Convention promises to be of so much interest that no bee-keeper should miss it. Ladies are pressing invited to attend.

J. E. PLEASANTS, *Pres.*

The Tuscarawas Valley Bee-Keepers' Association will hold their next meeting in Wilgus Hall, Newcomerstown, O., on Tuesday, Oct. 10, instead of Oct. 5th. This change is made in order to allow members to visit the National Convention at Cincinnati.

J. A. BUCKLEY, *Sec.*

The N. W. Bee-Keepers' Association of La Crosse, will meet in the City Hall in La Crosse on Friday, Oct. 13, 1882. All interested are invited to be present.

G. J. PAMMEL, *Sec.*

SELECTIONS FROM OUR LETTER BOX

Washington Bower.—I send you a small piece of vine called Washington bower, which blooms from early spring till late in the fall. The bees work on it from morning till night, and on the blossoms two or three days old as well as on the new ones. I would like to have your opinion about whether it is very good for the bees or not? It is an ornamental vine, and many people have it running on their porches. Good luck to the BEE JOURNAL.

MARVIN M. BINKLEY,
Sherman, Tex., Sept. 23, 1882.

[We do not think bees work on Washington bower to any extent in the North—at least we have never been able to discover them on it. It is possible that in some latitudes, and under certain atmospheric influences, it may afford a bountiful supply of good honey, while under others it would not. We know that this is true of buckwheat, and perhaps many other plants.—ED.]

Quizzical.—Will you be kind enough to answer me two questions: 1. Would you advise a beginner in bee-culture to make artificial swarms or divide his bees for increase in the time of apple bloom without any regard to the state of the weather or condition of the colony? 2. If not, then, how could you advise Mr. J. M. Foote, of Creston, Iowa, as you did on page 587 of the BEE JOURNAL of Sept. 13, 1882? I know by sad experience that that is "bad medicine" for a beginner. Mr. "Heddon's system" is very nice for one who is backed up by a comb foundation and wire factory, providing the weather is fine and the bees are "booming," otherwise it is not advisable. Please rise and explain.

OLEFOGY.

Allendale, Ill., Sept. 26, 1882.

[I. We supposed when that advice was given that there was but one man in the country (yourself) who would be foolish enough to divide during apple bloom, or any other time, if the weather was not favorable, or the bees strong enough to divide with safety, and he had probably learned better by "sad experience."

2. We never advised the use of wired foundation in transferring, nor for other purposes, but we did advise the "progressive method of transferring," as pursued by Mr. Heddon.

Our correspondent is inclined to be quizzical, and in order to force a point, seems to assume that it is impossible to get good transferring weather during apple bloom, or to adopt Mr. Heddon's method without using his or a similar material.—ED.]

Extraordinary.—That honey ware is gone, except some coming in from asters. I commenced the season with 19 colonies, which have increased to 56, and have obtained 2,000 lbs. of comb and extracted honey, with as much more to take off. O, how they fight when I open a hive! I have tried the Italian and Cyprian side by side this season, and, all things considered, the Cyprians are the best; at least the cross between the two races is good enough.

WM. MALONE,
Oakley, Iowa, Sept. 22, 1882.

[Over 200 lbs. per colony spring count, and more than 150 per cent. increase. Who can beat it, averaging the apiary through? We have no doubt it has been done, but would like for them to "rise and explain."—ED.]

Quantity and Quality Excellent.—Our honey crop has been very good in quantity, and excellent in quality this season, although the honey flow came very late. August was the busy month with willing workers. Our fall honey crop is never so great as in some localities, as we have not the abundance of goldenrod.

WM. WAKEFIELD,
St. Paul, Minn., Sept. 22, 1882.

Hanging Frames.—Why are not small hanging frames used for surplus honey, or, if they have been used, what was found to be the objection? It seems to me their advantages would be great. We could see just what combs would do to take out at a glance and could take them out without in any way disturbing those that were not capped, or had brood in them. They would be filled more readily, as hanging immediately over the brood frames they would seem to be but a continuation of them, and practically there would be not the least obstruction to the bees getting up to them. I mean to have them of the same width of the brood frames, *i. e.*, $\frac{3}{8}$ inch, and quite shallow, so that honey would naturally be stored there. Please answer in next issue of BEE JOURNAL.

G. M. ALVES.

Henderson, Ky., Sept. 21, 1882.

[The objection to their use would be the liability of the queen to make a brood-nest of the second story as well as the first. We have, the past summer, frequently seen three-story Langstroth hives, which were being manipulated for extracted honey, wherein several frames in the upper or third story contained brood, larvæ and eggs; and your device would be subject to the same annoyance. Of course this would depreciate the value of the comb honey produced in them if intended for a general market, as they would not only be more or less filled with pollen, but wherever young bees had been reared the combs would be discolored and unsightly.—ED.]

Meaning of Terms.—Will you please tell me the meaning of the terms "foul brood" and "nuclei"? I am a novice in bee-culture, but the more I learn, the deeper I become interested.

JOHN L. VREDENBURGH.

Austin, Texas, Sept. 18, 1882.

[Foul brood is a malignant, contagious disease, which destroys the brood of a colony of bees. Nuclei is the plural of nucleus, and is used to denote a miniature colony of bees.—ED.]

A Continuous Season.—The honey season is over with us. The drouth and frost have stopped the growth of all honey-producing plants. When I review the past 6 years, I am sure the present has been fully equal to the best. From about the 16th of June to the 15th of Sept., we have had one continuous flow of honey, with the exception of a day or two at a time. During this period we have had several honey-dews, which covered the leaves of the trees so thickly that it ran down and dropped from their points, besmearing one's clothing in passing through the timber. Frames of foundation placed in the middle of a colony with brood on each side would be drawn out and filled with honey before the queen could lay an

egg in them. On the 2d of Sept. I made two new colonies from 2 strong ones, giving each one frame of brood and one frame of honey, and filled out the hives with frames of foundation. On the 15th of Sept. I opened the hives and found that the foundation had been drawn out, filled with honey, and the most of it was sealed over. There was even less brood than when the colonies were made. Still, both queens were young and vigorous. The honey extracted during this time is very thick, and has a pleasant flavor. It is thought by some to be better than that taken while basswood was in bloom.

J. L. STRONG.

Clarinda, Iowa, Sept. 22, 1882.

Queen Overlooked.—I purchased a small lot of bees and added them to a colony; about 2 days afterward I found a queen on the ground near the hive. I looked at them, at intervals for about two weeks, finding no queen, but brood in various stages. I grafted in a queen cell, and next morning found a dead queen on the ground. 1. Why was this? From another colony I removed the queen. Eight or nine days after I caged an Italian queen on a frame having some brood, letting her remain 48 hours. Seven days after I could not find her, but later in the day noticed a cluster of bees on the outside of a screen to prevent robbing. I brushed the bees away, and there was my queen dead. 2. What was the matter? I have lost 6 fine queens in attempting to introduce them. H. J. NORTHRUP.

Lausburgh, N. Y., Sept. 18, 1882.

1. There was a queen in the small lot of bees you added, which was killed by the bees or queen in the hive, and which you overlooked afterward.

2. The robbing and confusion incident to the wire screen frightened the bees and queen, and in her efforts to abandon the hive, and their attempts to retain or protect her, she was killed.—ED.]

Do Bees Spread the "Yellows?"—There is considerable agitation among fruit men in this State in regard to whether bees spread the yellows in peaches. Would like to hear from Prof. Cook on the subject. Bees are doing well here, and very strong.

T. O. SHEARMAN.

New Richmond, Mich., Sept. 14.

Crop Reports.—To date I have taken off 23,100 lbs. of extracted and 500 lbs. of comb honey from a commencement of 256 colonies. I expect to extract about 300 lbs. more. Mr. G. C. Vaught to date has taken off 3,045 lbs. of comb and 1,270 lbs. of extracted honey, and expects to take off 1,000 lbs. more of comb honey, all from a commencement of 39 colonies. Mr. Wm. McLendon, of Lake Village, Ark., whom I visited Aug. 20th, had extracted 7,500 lbs., and taken 110 lbs. of comb honey from a commencement of 70 colonies. Mr. Robert Adams,

near Lake Port, Ark., at the same date, from 3 colonies to commence with, had extracted 588 lbs., and taken 72 lbs. of comb honey. What the expectations of my Arkansas friends are I cannot say, but they are sanguine of a heavy yield. I will send you a report in full in the winter of all the apiaries in my neighborhood. The North American Bee-Keepers' Society meets in convention too soon for a full report from Southern bee-keepers.

O. M. BLANTON.

Greenville, Miss., Sept. 21, 1882.

Removing Colonies.—It is necessary to remove my colonies before I pack for winter, to a yard 200 feet distant. They must be taken from one place to the other direct. 1. What is the best manner to remove them? 2. When is the best time? 3. A good deal of drone comb is in the frames the bees are to winter on. What should I have done, and what can I do?

JAMES GARDINER.

Paris, Ont.

1. Carry them on a hand-barrow.
2. Remove them at once, slanting boards in front of each to cause them to mark their location anew.
3. If filled with honey, let them remain; if not, remove them when packing, or before.—ED.]

Finishing Up.—On the morning of the 23d inst. we had a light frost, but at 2 o'clock p. m. the bees were working busy as ever. This morning a second and heavier frost occurred, which will stop bee-work to some extent. Bees have done well here this summer. I hope mild weather will prevail a few days to finish off unfinished combs. My crop will reach 4,000 lbs. from 48 colonies last spring.

T. N. MARQUIS.

Woodland, Ill., Sept. 24, 1882.

Swarming.—Seeing a statement written by Joel Brewer, and one from Daniel Whitmer, on page 555 of the BEE JOURNAL, moves me to write for their benefit, and others (if they wish to try it), my success for five years consecutively. When spring comes I commence to build up, and get large colonies to be ready for the honey season. If my colonies are not strong enough when that time comes, I double them until the desired strength is reached. Now comes the time to be on my guard. When one shows signs of crowding the queen, which will be when mock queen cells are being built rather plentiful, with here and there an egg placed in them, I procure another hive, and filling it with empty combs, place it under the colony. The vacant space being below, and heat always rising, the colony receives no injury from chilling. This method has never failed with me, and I can refer to 5 bee men besides myself who practice it with success. I use a hive 2 feet long and one foot wide, by 14 inches deep. The frame is 11x13 inches, outside measure, and I keep none but pure Italian bees. In five years' use of the above method, I have

never had a swarm issue, and I have had large colonies that filled three of these hives tiered one above another, always putting the empty one below. When extracting, I would take off the brood nest and extract the lower hive. I have procured hundreds of pounds from a single colony by this method. I never clip a queen's wing, and would as soon go visiting during the height of the honey and swarming season as any other time, for I feel that my bees are safe. I do not ask bee-keepers to take for granted what I say, but try one colony this way, being sure to prepare in time. W. S. BAIR.
Rollersville, O., Sept., 17, 1882.

Bitter Honey.—I observed in the BEE JOURNAL of Sept. 6, page 568, that E. P. Massey, of Waco, Tex., has some bitter honey from the wild camomile. I do not know whether it will act like the bitter honey from the tulip tree, or not. We often get that so bitter we cannot use it, but if kept 6 or 8 months the bitter taste has always left it. The sweet I suppose neutralizes the bitter. My bees are now and have been for some time doing well, for this country and time of year. They done well in the spring and fore part of the summer, then fell back and consumed nearly all of their stores and stopped breeding, until the plant I send you for name came into bloom, which was about 8 weeks ago, and some of which is yet in bloom. There was, I think, 1,000 acres of it within range of my apiary. My bees worked upon it until corn and other flowers came into bloom. I also send a second flower that grows here in great abundance, and blossoms in May and June. J. H. CHRISTIE.
Dyersburg, Tenn., Sept. 11, 1882.

[The first of the flowers is *Rudbeckia fulgida*, one of the purple cone flowers. This is a Southern species, scarcely reaching farther north than Kentucky. Grows on dry soil.

The second, *Penstemon digitalis*, is a beautiful plant, related to many of our showy cultivated flowers, among others the snapdragon. It is also southern in habitat, from Virginia and Southern Illinois downward. The whole group to which it belongs (*Scrophulariaceae*) are prominent honey plants.—T. J. BURRILL.]

Commdrums.—I had a swarm of black bees June 9th, and hived them in a hive full of empty combs, putting on 21 prize boxes, and have now taken from them 35 pounds of honey. They are now, however, changed to pure Italians without introducing any queen to them. How did it happen? I sent for 2 Italian queens and introduced them to black colonies, which are also changed to Italians. The first queen was introduced July 3d, and swarmed on the 14th, and that colony swarmed on Sept. 3d. It was a very large one, and was hived on one frame of empty comb and 9 frames of wired foundation. They are very strong and heavy; I think

the bees and honey will weigh 25 or 30 pounds. 2. Do you think they will winter safely? W. M. ROBERTS.
Vaughansville, O., Sept. 23, 1882.

[1. Either the swarm did not come from a black colony, or an Italian queen has by some means gained ingress to the hive, and destroyed the black queen.

2. If well supplied with matured young bees and 25 or 30 pounds of good honey, we do not know why they should not winter as safely as any. The weather since Sept. 3d has been excellent for breeding.—Ed.]

Working Nicely.—The weather is warm at this time, and bees are working nicely on goldenrod. If the weather continues warm a few days longer I shall have to extract to make room for the queens. R. DOWNS.
Naugatuck, Conn., Sept. 20, 1882.

Honey Dew.—Inclosed find some beech leaves, which I obtained from the woods near here, and of which there is a great abundance in the same condition. Is the sticky substance on these leaves the so-called honey-dew, or what is it? There were no bees on them at the time I found them, which was late in the afternoon.

S. P. NEWMAN.
Norwalk, O., Sept. 15, 1882.

[It is undoubtedly the same. There are times, and when gathered may have been one of them, when this substance does not possess the same sweetness as at others, and hence was not liable to attract the bees.—Ed.]

Most Remarkable in 30 Years.—The season in this section for bee-keeping has been the most remarkable I have known in my 30 years' experience. Bees came through the winter in fine condition, but when they went abroad for honey they found the flowers scarce, and what few there were secreted but little honey. Where large lots of bees were kept together, they had to be fed up to July 4th, and in some localities should have been fed later. Swarming was very light, as in the yard that I worked, containing 150 colonies, only about 40 swarms, and all were returned but 2. The small crop of honey that I obtained (3,000 or 4,000 lbs.) came from basswood, and was gathered in less than a week. All have a good supply for winter, which has been gathered from fall flowers. In some sections in this county bees are in a starving condition, and some large apiaries do not number one-half what they had in the spring. As the question of how to winter bees is one of the most perplexing in bee-keeping, I will at some future time give the readers of the BEE JOURNAL my method, which has never failed in 26 years with large lots, whether hot or cold. I have not time to give it now, but will say that all that is necessary is a warm cellar.

IRA BARBER.
DeKalb Junction, N. Y., Sept. 23.

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about **eight words**; fourteen lines will occupy 1 inch of space
Transient Advertisements payable in advance.
Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published **WEEKLY** as follows, if the whole paid in advance:

For 4 weeks.....	10 per cent. discount
" 8 ".....	20 " "
" 12 " (3 months)....	30 " "
" 24 " (6 months)....	40 " "
" 36 " (9 months)....	50 " "
" 52 " (1 year).....	60 " "

Discount, for 1 year, in the **MONTHLY** alone 25 per cent., 6 months, 10 per cent., 3 months, 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the **SEMI-MONTHLY** alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,
925 West Madison Street., Chicago, Ill.

Special Notices.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

- For a Club of 2,—“ Bees and Honey,” in paper.
- “ “ 3,—an Emerson Binder, or “ Bees and Honey,” in cloth.
- “ “ 4,—Apiary Register for 50 Colonies, or Cook's Manual, paper.
- “ “ 5,—Cook's Manual, in cloth, or the Apiary Register for 100 Colonies
- “ “ 6,—Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Two subscribers for the Monthly will count the same as one for the Weekly, when getting up clubs for the above premiums.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

CLUBBING LIST.

We supply the American Bee Journal and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	Publishers' Price.	Club
The Weekly Bee Journal	\$2 00..
and Gleanings in Bee-Culture (A. I. Root)	3 00..	2 75
Bee-Keepers' Magazine (A. J. King)	3 00..	2 60
Bee-Keepers' Instructor (W. Thomas)	2 50..	2 35
The 4 above-named papers	4 50.. 4 00
Bee-Keepers' Exchange (Honk & Peet)	3 00..	2 80
Bee-Keepers' Guide (A. G. Hill)	2 50.. 2 35
Kansas Bee-Keper	2 60.. 2 40
The 7 above-named papers	6 30.. 5 50
The Weekly Bee Journal one year and		
Prof. Cook's Manual (bound in cloth)	3 25..	3 00

Binder for Weekly, 1881	2 85.. 2 75
Binder for Weekly for 1882	2 75.. 2 50
The Monthly Bee Journal and any of the above,	\$1 less than the figures in the last column.	

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Articles for publication must be written on a separate piece of paper from items of business.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

When changing a postoffice address, mention the *old* as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Hundreds of clergymen, doctors and others have used Kendall's Spavin Cure with the best success.

37w4.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., October 2, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—1 am paying 7c. for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17@22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@20c. on arrival; extracted, 7@10c. BEESWAX—Firm at 20@25c. per lb.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand is good for choice white comb honey in 1 and 2 lb. sections, and prices are without material change, 18@20c. being the range of this week's sales. White extracted, in cans, 10 @11c., in kegs and casks, 10c.; dark, 9@9½c. Dark comb honey, 12½@16.
BEESWAX—Yellow, 26c.; dark, 18@22c.
R. A. BURNETT, 165 South Water St.

CLEVELAND.

HONEY—Sells very readily in 1 lb. sections at 21@22c. for best white, and 19@20c. for 2 lb. Second grade, 1 lb. 19@20c. Extracted is selling very slowly again, and some arrivals in bbls. we have been unable to place, asking 11@12c. Extracted in tin pails has sold slowly at 14c.
BEESWAX—25@28c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—Receipts were liberal this week, but the bulk of arrivals were in transit to other markets. There is a good inquiry, and prices are firm for fair to choice extracted, and for choice comb. Dark or otherwise inferior comb is not easily placed. We quote white comb, 18@20c.; dark to good, 12@15c. Extracted, choice to extra white, 8½@9½c.; dark and candied, 7½@8c. BEESWAX—24@30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and dull. Comb lower, at 16 @18c.—latter for choice white clover in small packages; strained in round lots at 7c.; extracted in cans at 9@10c.
BEESWAX—Sold fairly at 27c. for prime.
R. C. GREER & Co., 117 N. Main Street.

NEW YORK.

HONEY—No quotations reported.—ED.
BEESWAX—The stock continues light, and prime Southern held up to 30c. with little if any obtainable below 29c. Western, pure, 28@29c.; Southern, pure, 28@30c.
D. W. QUINBY, 105 Park Place

BOSTON.

HONEY—Market active. We quote ¼ lb. combs 30c. per lb.; 1 lb. combs 22@25c.; 2 lb. combs 20@22c. Extracted, in half pails, 12@14c.
BEESWAX—Prime quality, 25c.
CROCKER & BLAKE, 57 Chatham Street.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey. A new pamphlet of 32 pages. At the last meeting of the North American Bee-Keepers' Society, we were appointed on a committee to prepare instructions on the Exhibition of Bees and Honey at Fairs; this is also added to the above. Price, 10 cents.

Kendall's Spavin Cure is used from the Atlantic to the Pacific coast.
 40w4t

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

NOTICE.

As I do not sell honey on commission, and buy only such kinds as I need in my line of trade, I cannot accept any shipments without previous correspondence.
 I can sell Beeswax of any quality, and will pay the regular market price for it, in any quantity, or exchange for it comb foundation, without previous correspondence.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$3 00
For 2 Langstroth " 10x18 "	8 00
For 3 " " 10x18 "	10 00
For 4 " " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " " 12 1/2 x 20 "	12 00
For 4 " " 13x20 "	16 00

A NEW BEE BOOK!

Bees & Honey

OR THE Management of an Apiary for Pleasure and Profit; by **THOMAS G. NEWMAN,**
Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keltzsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Alleghen, Mich.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Duly Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

Queens and Bees

FOR SALE—200 Untested Italian Queens—single Queen, \$1; half dozen, \$5.50; per dozen, \$10.00.

100 Untested Italian Queens—single Queen, \$2.50; per half dozen, \$13.00; per dozen, \$24. **50 Colonies of Bees**, in Gallip frames, cheap. **200 Colonies of Bees**, in Langstroth frames in prime condition.

J. H. ROBERTSON,

3w5tf Pewamo, Ionia Co., Mich.

New Kegs

FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore procured kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well sealed, the pine will not flavor the honey.

Capacity, 175 pounds. Price, 80c. each.

The first car load of these kegs will arrive about Sept. 10th, and all orders will receive my prompt attention.

The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

923 West Madison Street, CHICAGO, ILL.

The Bee-Keeper's Guide;

OR,

MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book:

All agree that it is the work of a master and of real value.—*L'Apiculture*, Paris.

I think Cook's Manual is the best of our American works.—**LEWIS T. COLBY.**

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—**J. P. WEST.**

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—**E. H. WYNKOOP.**

This book is just what everyone interested in bee-culture has sought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—**A. E. WENZEL.**

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—**WM. VAN ANTWERP, M. D.**

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record*.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—**L'ABBE DE BOIS**, editor of the *Bulletin D'Apiculture*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Paluski, N. Y.

We have perused with great pleasure this *valde necum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular the most interesting of all occupations.—*American Inventor*.

PRICE—Bound in cloth, \$1.25; in paper cover, \$1.00.—by mail prepaid. Published by

Sweet Clover
AND OTHER SEEDS.

Having a large stock of the new crop of Alsike, White and Sweet Clover Seeds, I can fill orders at **30c.** per pound, **\$4** per peck, or **\$15** per bushel.

Also, all other SEEDS for HONEY PLANTS,
Send for my Catalogue.

ALFRED H. NEWMAN,
925 West Madison Street, Chicago, Ill.

PURE HOLY-LAND QUEENS.

I make a specialty of rearing pure Holy Land Queens, and have now more than 100 colonies in their purity. All Queens bred from D. A. Jones' Imported Queens. Dollar Queens, before June 20, \$1.25 each; after that date, single Queen, \$1.00; 6 for \$5.00; 12 or more, 75 cents each; Warranted Queens, 25 cents more each. Tested Queens, \$2.50 each; Italian Queens, same price.

I. R. GOOD,
5wly Nappanee, Elkhart County, Ind.

Bright Italian Queens.
200 NUCLEI.

Having filled all my orders, I can now send Queens by return mail. My customers say I send the nicest they get.

MENDELSSOHN
PIANO Co's.

PIANOS

\$850 Square Grand Piano for only \$245.
PIANO STYLE 31 Magnificent rosewood case elegantly finished.
3 strings, 7 1-3 Octaves, full patent cantante agraffes, our new patent overstrung scale, beautiful carved legs and lyre, heavy serpentine and large fancy moulding, full iron frame, French Grand Action, Grand Hammers, in fact, every improvement which can in any way tend to the perfection of the instrument, has been added.
Our price for this instrument, boxed and delivered on board cars at New York, with fine Piano Cover, Stool, \$245, and Book, only.....\$245.
Reduced from our late wholesale factory price, \$295, for 60 days only, to have this beautiful Piano introduced. This is now, by far, the greatest bargain ever offered the musical public. Unprecedented success! Tremendous demand for this style! Order at once.
This Piano will be sent on 15 days' test trial. Please send reference if you do not send money with order. Cash sent with order will be refunded and freight charges paid by us both ways if Piano is not just as represented. Several other special bargains: Pianos, \$100 up. Over 15,000 in use, and not one dissatisfied purchaser. Handsome Illustrated Catalogue mailed free, giving the highest testimonials ever awarded any manufacturer. Every Piano fully warranted for 5 years.
SHEET MUSIC 1/2 price. Catalogue of 3,000 choice pieces for sale, stamp.

EARS FOR THE MILLION!
Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Caracharodon Rondeletii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Day Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by
THOMAS C. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Manual of the Apilary.— Entirely rewritten, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apilary for Pleasure and Profit, by Thomas G. Newman.—Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Hienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This contains the Prize Essay on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and of honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling, and Marketing.—A 24-page pamphlet, by Charles D. Dudson, giving in detail the methods and management adopted in their apilary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman—giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth: 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Cholera Cholera, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED EXCLUSIVELY TO PROGRESSIVE BEE CULTURE.

Vol. XVIII.

Chicago, Ill., October 11, 1882.

No. 41.

THE AMERICAN BEE JOURNAL

Published every Wednesday by

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

325 WEST MADISON ST., CHICAGO, ILL.

At \$2.00 a Year, in Advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

Honey Show at Stratford, Ont.

A correspondent writes us as follows, concerning the recent honey show in connection with the Agricultural Fair, at Stratford, Ontario, Canada :

The efforts of the BEE JOURNAL are bearing fruit in the increased attention and interest taken in the gentle craft of bee-keeping. As a rule, the display of honey at the agricultural shows in Canada has been confined to a jar or two of thick looking stuff, and a couple of boxes of comb honey, which are sandwiched in between some dirty looking grape sugar, and three or four cakes of home made soap. The display made by Mr. Jones at Toronto, the past year or two, has enthused local apiarists all over the country, and if the directors of the County Fairs only act decently, the show of bee products may be made a prominent feature.

At the County of Perth Exhibition, held at Stratford, Ont., last week, Mr. D. Chalmers, of the Honey Grove Apiary at Musselburg, occupied quite a large display, his tempting goods being arranged in glass bottles, pound sections and Jones honey pails with gorgeous labels. He drove quite a thriving business, and carried off the first prize for section, and the second for extracted honey. He also displayed to wondering crowds a full supply of almost everything used in the honey business.

Dr. Shaver, of Stratford, an enthusiastic apiarist, devoted himself entirely to comb honey, having a pyramid of several hundred one-pound sections, graded according to the source of supply—the clover, thistle, basswood, goldenrod, etc., being clearly distinguishable from the color.

Mr. Young, an amateur of the first year, captured the first prize for extracted honey. The fall flow here has been immense, and the yield a large average.

At the recent Fair at Hamilton, Ont., there was a very good exhibit of hives, bees, honey and apiarian supplies. The first prize for bees was awarded to Mr. A. Robertson, of Carlisle; 2d. to Rennie Bros., of Hamilton; 1st for hive to Mr. McEvoy, Woodburn; 1st for comb honey to Mr. McEvoy; 2d to Mr. C. Marshall, Binbrook; 1st for extracted honey to Mr. McEvoy; 2d to C. Marshall. The bee-keepers on the ground met and formed themselves into the Wentworth, Ont., Bee-Keepers' Association, with the following officers for the first year: 1st Prest., J. M. Knowles, West Flambro; 2d Prest., J. H. Cornell, Lynden; Treas., A. Robertson, Carlisle; Sec'y, Geo. N. Henderson, Hamilton. The meeting adjourned to meet on the first Saturday in November at the Dominion Hotel, Hamilton; 20 members were enrolled.

At the Baltimore Fair there was an exhibition of bees, honey and apiarian equipments. Under the superintendency of Mr. Charles H. Lake, there was a special tent for the display and manipulation of bees, etc., and all bee-keepers were invited to join in making an effective and attractive display. We hope they did so, but as yet we are not informed on the subject.

The Rev. W. F. Clarke's address will hereafter be Winnipeg, Manitoba, to which place he has removed to take editorial charge of the Winnipeg *Sim*. The BEE JOURNAL extends congratulations.

A Test for Honey.—In Prof. Maher's article on this subject on page 610, an error was made, which needs correction. In the fourth line of the third paragraph read "weak" for *white*, thus: "with a weak solution," etc.

Healthfulness of Honey.

Pliny, the Roman historian, speaks of Rumilius Pollio, who possessed marvelous health and strength, at over 100 years of age. Upon being presented to the Emperor Augustus, who inquired the secret of his liveliness of spirits and strength of body at so great an age—he answered: "*Interus melle; exterus oleo*"—Internally through honey; externally through oil.

Pure honey should be used unsparingly by every family. It is no longer a luxury to be enjoyed only by few, but it is sufficiently cheap to be within the reach of all. It has properties which make it a valuable food. It differs from alcoholic stimulants, which dull the intellect—on the contrary it produces a bright intellect as well as a healthy body. Children are very fond of honey, and one pound of it goes further than a pound of butter. It has the peculiarity of keeping good, while butter often becomes rancid, and injurious to health.

The bees gather the honey from the juices of healthy plants, shrubs and trees, and the nectar so gathered is, therefore, the pure sweet, as it comes from the hand of the Creator. We therefore strongly advise every family in the land to place honey on the table for daily use; make cakes, cookies, ginger bread, pop-corn balls, etc., with it, and give it to the children, imparting to them health of body and strength of mind, instead of using the unhealthy, adulterated syrups which now so commonly deal out death to the "little ones," desolating almost every household and hanging the black pall of mourning over the world.

Feed no Glucose to Bees.—The Cincinnati *Grange Bulletin* in its last issue gives the following warning against feeding bees with glucose:

We have at all times condemned the use of glucose as a feed for bees, believing as we do, from a long experience, that its use is pernicious to the welfare of all bees that may be attempted to be wintered on it; hence we say do not try to feed your bees with the pernicious stuff (glucose).

☞ Candy pulls are in fashion, but they are now called "glucose tentions."

☞ Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

Wire Frame Holder.

We have received from E. H. Thurston, M. D., of Hagerstown, Ind., a very simple device for holding frames, which can be fastened to the side of the hive. It can be attached or detached in a moment, and will be found very convenient. It is placed in our museum, and the following description of it by Dr. Thurston is quite complete, and will give a good idea of it:

DEAR EDITOR—I send you, by mail, a wire frame holder. This arrangement is of my own getting up. While working with my bees, I often had to remove all the frames, and I was troubled to find places to put them, when I was looking for the queen. During one night I was wakeful and thinking of my bees, when the idea of a frame holder came to me; next morning I put my plans into execution and a wire holder something like the one I send you was the result. I tested it and on Tuesday I went to Cincinnati, Ohio, to attend the North American Bee-Keepers' Convention, and took my holder with me. It met the approval of Messrs. A. I. Root, I. R. Good and many others who examined it; all thought it good. On my return I improved it, as the one sent you to-day. The holder can be fastened to any hive. If there be no projection to fasten it to, you can screw two small blocks on the hive to receive the horizontal bars. This holder will hold 5 frames; they may be made to hold more. The cost of the holder will not be more than 10c; and any one can make them. I use two pieces of wire, 20 inches long, to make each bracket, and 2 pieces of wire 11 inches long to make the side hook braces. When the holder is put on and the sharp ends of the top bar pressed tightly into the wood and side hook bars well fastened you will find it will be very solid and will hold to its place. The holder might be made of wire about one or two sizes larger. There is no patent on it, nor shall there be. I wish to give a description of it in the JOURNAL so that every bee-keeper may have the advantage of it. Any one can make them, and I think all who use them will find them very convenient.

☞ As the time for the usual winter rush of correspondence is nearing, let us try to impress on our correspondents the necessity of being careful when writing to this office. If they live near one postoffice and get their mail at another, be sure to give the address we have on our list.

☞ The Detroit *Free Press* man must have been there. He says: "The sting of a bee is really only one-eighth of an inch long, imagination makes it seem as long as a hoe handle."—*Exchange*.

Bees still Working on Sweet Clover.—Mr. Julius Tomlinson of Allegan, Mich., writes us under date of Oct. 6, 1882, as follows: "The weather here is very warm and has been very dry, but Thursday we had a fine rain. My bees are working on sweet clover now." Bees are still working on it in Chicago, and will do so, for many weeks to come, if it is warm enough for them to fly.

☞ The California *Apiculturist* for September, referring to the remarks of the BEE JOURNAL concerning the uses of drones in the hive, and suggesting that they may nurse the young bees, increase the heat in the hive, etc., remarks as follows in a jocular way: "It is said by some naturalists that drone bees are a slandered race, that they are not idlers, but nurse and take care of the baby bees. Can as much be said of old bachelors?"

☞ The Northwestern Bee-Keepers' Convention will be held at Chicago, on Wednesday and Thursday, Oct. 18 and 19, 1882. By a notice on page 650 it will be seen that Dr. Miller, the president, has discovered an error in the date previously announced. Let all take particular notice, and be prepared to attend and partake of the "feast of reason and flow of soul," there to be enjoyed. The place of rendezvous will be at the office of the AMERICAN BEE JOURNAL, where the hotel arrangements and place of meeting will be made known.

Wintering Bees.—As this subject is now a very seasonable one we present the Prize Essay on wintering bees, by Mr. Clouse, in this issue. In our next we expect to give an illustrated article by Mr. James Heddon on the same subject.

☞ Just as we go to press, we are informed by the Secretary of the National Convention, Mr. A. I. Root, that he will furnish us the Official Report in time for the next number of the BEE JOURNAL.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

☞ Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

☛ In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

Ontario, Canada, Convention.

The Ontario Bee-Keepers' Association was held at Toronto on Sept. 13, 1882. Hon. Louis Wallbridge in the chair.

The Secretary's report was read and adopted. It showed 116 members, and balance in hand of Treasurer of \$27.25.

The President said that the committee, consisting of himself, the Secretary and Mr. D. A. Jones, had applied to the Government for incorporation and a money grant. The Government seemed favorable to an Act of incorporation, but hesitated on the point of a grant.

The President's address was then made, in which he said that he took a real pleasure in bee-keeping apart from the profit. The study of the habits and development of bees was most instructive and elevating. They were excellent instructors in mathematics, and set an excellent example in social economy. The honey display at the Exhibition this year was not quite up to the usual mark, owing to the very unfavorable season.

His method of wintering bees, he said, had been tested by him and found good. He used the Langstroth hive with nine frames. He never interfered with the brood nest in the spring, when he removed certain combs to insure breeding. He continued his honey raising operations to the filling of boxes; he did not remove frames. For wintering he removed all the boxes and honey boards, and stripped everything down to the comb-frames. With a coarse fabric he formed quilts and cushions, with which he carefully protected the hives. These he piled one above the other in his cellar, keeping them apart with small battens, and covering each separately with a piece of cloth so as to afford each colony space to walk up the sides of their own habitation. This separation secured proper ventilation and dryness, and was absolutely necessary in cellar wintering for the safe and healthy preservation of bees.

In reply to a question, he stated that he gave no top ventilation except through the quilt. The moisture passed through the quilt and

evaporated on the top. The great principle was to keep in the heat and let out the moisture.

D. A. Jones was of the opinion that the whole secret of wintering was to have plenty of young bees, plenty of stores, together with plenty of heat and ventilation. The great danger was the generation of carbonic acid gas. In one instance he had found a stratum of this gas in his cellar to the depth of six inches. As carbonic acid gas was heavier than the atmosphere, and consequently sunk, it was most important to elevate the hives a little and have proper bottom ventilation.

The PRESIDENT said that in his cellar the gas generated was carried away by a small stream of water. His hives were also raised slightly from the ground.

Mr. W. C. Wells explained how he had applied a stove to secure proper heat and ventilation. He let off the noxious gas through a tile, like water.

Dr. Shaver, of Stratford, thought the cushions or quilt should be filled with sawdust six inches deep. Proper ventilation would remove the carbonic acid gas. The opening of the doors and windows was sufficient. The colonies should be ventilated from either above or below. He agreed with the President about stacking the hives one above the other separated by small stakes. He never took out his bees until the first of May. Early moving in the spring caused the queen to begin laying before the weather was warm enough, and had consequences were sure to follow.

Mr. Jones found by weighing that during winter his colonies consumed about five or six pounds of honey. Soft maple blossoms were of great value to bees in spring, perhaps about the 1st. of April.

Thos. Forfar considered the bottom ventilation an absolute necessity, as the carbonic acid gas, being heavier than air, sunk to the bottom.

C. R. Trench, of New Market, was convinced that ventilation is required both at top and bottom. He had been very successful in wintering, and he adopted measures to secure this kind of ventilation. He considered dry sawdust packing of the greatest value both in summer and winter. In summer it kept out the heat, and in winter the cold. He considered feeding in the winter a very bad expedient. He did not think chaff as good as sawdust, especially on top, where it got all matted together. It might do at the sides. The sawdust packing prevented the deceitful warming up of a wintry sun, which sometimes lured bees outside to meet death from cold. He used sawdust to the depth of four inches and left his hives thus protected all winter. He had not been successful either in cellar or bee-house wintering, but had been quite successful when he left the hives on the summer stands.

Mr. McKnight said that it appeared that every one considered the way which he found successful, the right way. He proceeded to describe experiments he had made in bee-house,

cellar, and outside wintering. He had uniformly met with success by all methods, and therefore he concluded that there must be several right ways. He used different kinds of hives, but gave preference to the Thomas hive for wintering, owing to the depth of the frame. He had found for packing purposes ground cork better than sawdust, chaff, or any thing else. He thought a good transmitter rather than a good absorbent was what was required on the top of hives.

SECOND SESSION.

In the absence of the President, Mr. Corneil Lindsay was called to the chair.

Mr. Woodward asked what was the best method of introducing a new queen late in the season.

Mr. Corneil formed a cage of wire-cloth with an open side, which he placed on the combs. The queen, thus protected, took a deep draught of honey, and then set about her proper business. In a short time a young brood surrounded her, and she felt quite at home.

Mr. Jones took a piece of wire-cloth and formed it into a box without a lid. He cleared a piece of comb, placed the queen on it, and then covered her with the wire-cloth box. In a short time the bees gnawed through the comb and liberated the captive. The operation was then complete. He had also successfully introduced a queen with the assistance of chloroform. He believed the best way was to cage the queen on a comb. A gentleman of Cincinnati had successfully introduced queens by enclosing them first in a close wire-cloth cage and suspending it for a time in the hive. Subsequently he made an aperture at the bottom and covered it with wax. The bees then gnawed her out in a friendly way. It was a very unwise thing to disturb the hive after introducing the queen.

Mr. Chalmers wanted Mr. Jones to explain how he used chloroform. He thought it was another dangerous operation.

Mr. Jones said he confined his doctoring with chloroform entirely to his bees. After the application of chloroform the bees lay as if dead on the bottom of the hive, but when a little fresh air passed over them they revived. Care must be taken to give the whole hive a uniform dose. A sponge moistened with chloroform must not be introduced into the hive.

Mr. McKnight stated that his third gathering of honey had been very dark in color, resembling molasses. He had not discovered from what source the honey came. The flavor and consistency of it were satisfactory. The combs were also black.

Question. What can be done for a broken down colony of bees if discovered before the bees are smothered?

Mr. Jones explained that this occurred sometimes in shipping. He cooled the combs until they became stiff and then replaced them. The bees very soon repaired breaches.

Mr. Chalmers asked what could be done for bees smeared with honey.

Mr. Jones thought the best way was

to allow other bees to remove it. He would not wash them.

Mr. Forfar was of opinion that the best way was to wash off the honey with warm water.

Mr. McKnight said the bees shook their wings and used every effort to extricate themselves. If they could move round at all they would clean themselves.

Question. In moving bees for better pasturage how near may they be placed to their former position so that they will not return thither?

Mr. Corneil stated that he had moved some colonies three miles, and there had been no returning. He was, however, satisfied that he could move them a quarter of a mile without fear of their returning, provided he used precautions.

Mr. Jones had moved some of his a distance of less than two miles without any of them returning. If trees were present they could be removed a shorter distance. He did not believe in the practicability of moving them to different places in the same yard by setting up boards.

Mr. Corneil was of opinion that this could be done provided the bees were shaken up. The motion of a wagon would be sufficient.

Mr. Chalmers had found them to return two miles. This year he had moved a colony half a mile. He had shaken them up and set a board before them as a mark. Few returned.

Question. What are the advantages to be derived from reversible frames, and what is the simplest means of reversing them?

Mr. Rutherford, of Strathroy, said that by reversing the frames the combs were completed with feed and made perfect both above and below. When not reversed bees often left an open space below. By reversing, the four corners of the comb instead of two corners were filled with honey, and the center as usual with brood. He also described an improved form of feeder which he had invented. It enabled feeding to be regulated in speed and applied in any position.

Mr. Jones said he had tried most methods of bee feeding. During the last four years he had used about 120 barrels of sugar. In half an hour he had supplied as much as a thousand pounds by simply pouring the syrup upon the backboard of the hive. He fed at night and allowed them to consume it before morning. It was well to feed the whole yard at once to prevent robbing. He recommended nothing but the best sugar.

Mr. Corneil thought granulated or loaf sugar was better than crystalized sugar. In the former the water of crystalization was evaporated.

Mr. Rutherford preferred the Italians in some respects to the blacks. The Cyprians, according to his experience, were "terrors." Before handling them he required to smoke them above and below, and even then it was a hazardous matter to handle them. Last year his Cyprians had done admirably. This year they had also done well. He did not look upon his as pure Cyprians. He believed they were crossed with Italians.

Mr. Jones thought the Cyprians were too irritable, but when crossed with Italians they were excellent honey gatherers. He believed the Holy Land bees crossed with Italians were the best in his yard. He had had a sad experience with black bees. Six or seven of these colonies were starving, while the Cyprian and Holy Land bees were filling their hives with honey.

Mr. Woodward narrated a case of a queen that could not fly, being mated in her own hive, contrary to what was usually accepted as the rule.

Mr. Jones said this question had been discussed last year. No one at that time had been successful in obtaining fertilization in confinement. A committee, consisting of himself and Prof. Cook, of Michigan, had been appointed to make experiments. Prof. Cook had taken 5 young queens, cut their wings, and confined them by means of guards. Four of these never laid. One after fourteen days did lay, and the offspring was perfect. The queen of this hive had been examined, and was found incapable of flying. Prof. Cook came to the conclusion that she must have been mated in her own hive.

Mr. Corneil believed that dysentery was due to dampness of the atmosphere. Honey, he said, was a hydrocarbon, and when combined with oxygen water was formed. Comparative physiologists knew that honey in this condition produced dysentery among other bad results. The effect of damp weather on man was to prevent proper exhalation. Consequently the excreta that would have passed off by the skin was thrown into other channels and produced dysentery. It required dampness to produce fermentation, fermentation to produce bacteria, and bacteria to produce dysentery. The proper prevention was ventilation. When air was humid more ventilation was required than when the air was dry. Every 27° increase of temperature in the atmosphere doubled its capacity for absorbing moisture. He had made experiments to verify this. By making suitable arrangements of pipes in his cellar he entirely prevented dysentery among his bees. This was done by keeping the air dry and of proper temperature. He considered it as important to put a hygrometer as a thermometer in cellars, in order to test the humidity and temperature of the atmosphere. Experiments of a very careful character had been made in a hospital in Montreal to ascertain in what part of the rooms the air was purest and in what part foulest. These experiments showed that the purest air was in a layer on the floor and in a layer a little deeper close to the ceiling. The air midway between these layers was foulest. These experiments, the accuracy of which he did not doubt, exploded the old theory of the purest air being midway between the floor and the ceiling. Taking into consideration the law of the diffusion of gases, he could not see how a layer of carbonic acid gas could lie on the floor. If they enclosed two gases in any space both

would be found after a time equally distributed throughout it.

Mr. McKnight was elected President for the ensuing year; Dr. Shaver, First Vice President, and W. C. Wells Second Vice President; Secretary, Mr. R. F. Holterman; Executive Committee, Dr. Duncan, Messrs. J. B. Hall, Jones, Chalmers, Thorn, Ramer and Colcock.

The prize of \$10, given by Mr. Colcock, proprietor of the *Canadian Farmer* for the best essay on "bee wintering" had been awarded to Mr. H. Clouse, Beeton, and is as follows:

WINTERING BEES.

Preparations for winter should be commenced about September 1, when it is both necessary and desirable that all weak colonies should be doubled up and strengthened; care being taken that all are supplied with good laying queens of not more than three years of age—of course, younger queens, all other points being equal, are preferable. The colonies must be kept breeding as long as possible, in order that there may be a sufficiency of young bees with which to go into winter quarters.

If there is not sufficient honey in the hive to promote breeding, and the bees are not gathering, they should be fed once a day—in the evening when they are less apt to rob. To make the feed or syrup, take standard granulated sugar and water, in the proportion of two pounds of the former, to one pound of the latter; bring to a boil, and allow to cool, then feed.

Rather the best vessel, in my experience, is a common coffee-pot, with a lip-spout, and the most expeditious as well as the simplest mode of feeding, is to raise the entrance end of the hive about one inch above the level; lift the cover and displace a corner of the bee-quilt, pouring in the syrup in quantities of a tea-cupful or less, according to the strength of the colony. On this point considerable care should be exercised as in the case of weak colonies, where they are unable to take up before morning the quantity given them, there is a chance that the other and stronger colonies may begin robbing.

I would advance as another reason for feeding in the evening, that, should there be a chance of their gathering natural stores the following day, their hives would be clear and nothing need then prevent them from going to work, whereas, were they fed in the morning they would remain at work in the hive and would lose what natural stores they might otherwise have gathered. By this method the hives would of a necessity require tight bottom-boards, thus preventing the feed from running out, where bottoms are not so arranged, other means would have to be adopted—such as the use of the different feeders, etc., which are in existence. This, however, is by far the cheapest, simplest and quickest mode of feeding, as by proper management, one person can (with the assistance of a small boy to take off covers, etc.) feed from 200 to 300 colonies per hour.

This feeding should be continued until about the first of October, but

about the 15th of September, all colonies should be crowded to as small a space as possible (by the use of division boards), so that when clustered the bees will cover from 5 to 10 frames, according to their respective strengths, selecting always the oldest combs (as they retain the heat better) and those best filled with sealed and other honey and also containing a good supply of pollen, which latter will generally be found at either side of the brood-chamber, and more especially toward the entrance of the hive, taking care to place the combs containing the pollen in about the same position for winter, because in cold weather they are very apt to become chilled (if they have to go around the comb for food) before they can reach the cluster again.

If the bees are to be wintered in chaff or sawdust hives, the space behind the division board should be filled with sawdust, chaff, dry leaves or some other absorbant material—the former is preferable as the same thickness of it as of the others will keep the bees in a much better condition, besides being more easily obtained. Before filling in space behind the division board the colony should be examined to ascertain that they are all supplied with queens, and that there is enough space in the lower part of the combs, free from honey on which to cluster as it is not desirable that they should cluster on the honey since the heat is not so easily retained as by the empty combs. At this time any unsealed honey should be extracted, it becoming sour when left standing, and being apt to cause dysentery, care being taken to avoid breaking of the capping. After this has been done and the frames replaced, fasten the division boards securely; then pack and place over the top of frames, first, a bee-quilt which is free from propolis, and then the cushion or packing to absorb the moisture. By placing bee-quilt between frames and cushion you prevent the latter from receiving any propolis, or from being gnawed by the bees, thus enabling you to use the same cushion for years.

If the bees are to be packed in clamps they should be moved each day that they have been flying, from six to twelve inches until you have them in the place designed for them, which place should be sheltered from the north and west winds. Place the hives about 6 or 8 inches apart, with the entrances facing south and east—the former preferred. Then they should be raised up a foot from the ground to allow space for packing beneath, leaving the entrance of hive about one inch below the level to allow any water which might perchance have found its way into the hive, to escape. A channel should be formed the same height and breadth as entrance to hive, and long enough to appear through the packing in front, thus allowing the bees a passage from the outside. Before forming channel the hives should be examined and prepared in the same manner as are the sawdust or chaff hives, also packing behind the division board and using fresh quilt. Boxing should then be

constructed, sufficiently large to allow a space for packing of about 12 inches at backs of hive and ends of clamp, and 6 inches in the front. Some have wintered successfully with less. Proceed with the packing towards evening when the bees are not flying, as if done while they are, they will experience more difficulty in finding entrance, whereas when flying out after packing is completed, they will mark the location and have no trouble on their return. The channels must be securely fastened so they will not be easily displaced by the settling of packing or any other reason.

When filling, stamp in the packing until the top of the hive is reached; then remove the lid and cover the frames with sawdust to the depth of one foot. Cover the whole securely so that neither rain nor snow may penetrate. They will then require no attention until the first fine day during the approach of spring, while the bees are out for a fly, when the hive should be examined—the object being to see that they have sufficient food; if not they should be given a frame of sealed honey, or a cake of sugar or candy, placed over the frames, as at this time it would be too early to feed liquids. The candy is made by the same process as syrup, with the exception that the amount of water is diminished. In some cases bees have been fed during the entire winter on this candy and have thrived well; when placed on frames in the fall it is made in cakes six or eight inches square, and about 2 inches thick, while for spring feeding it need only be about 1 inch thick.

When bees are to be wintered in the bee house they should be prepared by the same process as in out-door wintering, and at about the same time, using the same precautions; they will not then require any more care until the time for removal to their winter quarters, which is generally from the first to the middle of November—in other words just before winter sets in. If, after they have had a good fly, and return with empty stomachs, the following day is cool, and if you are of the opinion that fine weather is past, they should then be housed. First close the entrance by adjusting blocks and slides for that purpose; then remove the cover and place on top of bee-quilt a cushion which may be made to cover the entire top of hive, and about four inches deep of dry sawdust packing.

You will then carry the hives in carefully, so that the bees may not be jarred or the comb misplaced. If the bee house is not supplied with shelves, place a platform all around, 6 inches from the floor, and the width of the hives. On this place a row of hives, with the entrances toward the centre of the room, and 2 inches between the hives. On narrow strips at each end of the hives, place another row, with the entrances over the space between the hives of the first row. Then place more strips and hives until all are in position, the strongest colonies at the bottom and the weakest at the top, to give the latter the benefit of the heat from those at the bottom. The upper rows should be not less than 6 inches

from the ceiling. If crowded for room two rows may be placed in the centre of the building, which should have double walls, with a space of 18 inches packed with dry saw dust, with the same thickness overhead. A pipe, 6 in. square inside, should pass from the centre of the ceiling of the house up through the roof; the full length of the pipe being about 10 feet.

The foundation must be frost-proof, and there should be an underground ventilator of about the same size as the upper one, running from the center of the floor, and having its outward mouth from 100 to 200 feet from the building, at a depth to which frost could not penetrate. By this means the temperature inside is not so liable to sudden changes. It should be kept between 40 and 45° during winter, with as little variation as possible. If it falls, the upper ventilator should be closed for a short time. This may be effected by means of a slide, either at the ceiling or in the garret.

In case the temperature is above the regulation, which often occurs near spring, the doors should be opened at nights; or ice should be placed in a position near the ceiling, with a vessel below to catch the drip, so that moisture may not be created. Entrances must all be removed after bees have been placed in winter quarters, and bees must be kept quiet and unexposed to the light. Excitement, light and uneven temperature will cause them to gorge themselves with honey, after which, being unable to have a cleansing flight, they may become affected with dysentery, which will soon be made manifest, by their soiling the entrance of hive. Immediately this is noticeable, they should be given a fly (when temperature is not below 45°), excepting in cases where the bees have been given a flight before the spring. It is not necessary to have them placed on their old stands, as after having remained in winter quarters for four or five months, they will have forgotten their former localities.

In putting the bees out in spring, some promising fine day should be chosen, when temperature is above 45° in the shade. Place them out in the forenoon so that they may have a good flight—covers to be placed on at once. Every entrance should be closed before commencing to carry out the bees, and may be slightly opened after being placed on the stands.

When inside wintering is adopted, a lamp might be introduced with which to examine hives, and care should be taken to scrape the dead bees, etc., from the entrances two or three times during winter, without disturbing the other bees. Be particular that entrances to hives packed outside do not get clogged up with dead bees, ice or snow—to prevent the latter, clamp roof should slant toward back of hives.

The method of wintering in bee house may also apply to cellar wintering. Believing that numbers of beekeepers may have to resort to feeding this season, I have particularized that part of my subject more than I might otherwise have done. Fulfill these conditions and be assured of success.

THE NATIONAL CONVENTION.

As our representative was unable to attend the National Convention and take a report of the discussions, as we intended, we must defer their publication until the official report is received from the secretary. We are informed that about 100 bee-keepers were there and that the meeting was interesting and harmonious. It was decided to hold the next annual session in Toronto, Canada. The following were elected as the officers for the ensuing year:

President—D. A. Jones, Beeton, Ont.
Secretary—A. I. Root, Medina, O.
Treas.—C. F. Muth, Cincinnati, O.

Vice Presidents:—W. S. Hart, New Smyrna, Florida. Dr. J. P. H. Brown, Augusta, Ga. Dr. C. C. Miller, Marengo, Ill. J. M. Hicks, Battle Ground, Ind. O. O. Poppleton, Williamstown, Iowa. Rev. L. Johnson, Walton, Ky. L. Sartoris, Maryland. J. T. Davis, Shelburn Falls, Mass. Prof. A. J. Cook, Lansing, Michigan. Dr. O. M. Blanton, Greenville, Miss. E. M. Hayhurst, Kansas City, Mo. G. M. Doolittle, Borodino, N. Y. Dr. H. Bessie, Delaware, O. H. Hammond, S. C. J. W. Wilson, Tenn. Bowers, Va. C. Grimm, Jefferson, Wis.

Mr. C. F. Muth gave the following address on "Our Honey Market:"

Every producer soon learns to appreciate a rise in the market, or an increase in the demand of his produce, and it appears to me that no class of producers deserves more this happy change in the rise of the honey market than the bee-keeper, after, comparatively, short crops for the last four years, in most parts of this country. Of a modest and industrious disposition, he has put in hard work, under adverse circumstances, with an energy and steadiness which should be crowned with success.

It is 12 or 15 years ago, when, principally by the aid of Mr. Langstroth, we commenced to comprehend the movable-frame system. The honey extractor came next, and the introduction of comb foundation followed it. All these improvements were taken up with a keen eye, and made use of without regard to labor and expense, especially so by our American brethren. The result was an overstocking of the market. There was an abundance of extracted honey, far in excess of the demand. Low prices had to be accepted in order to effect sales.

Some of our zealous brethren expected that the natural laws could be suspended in favor of honey. They formed combinations and adopted resolutions that no honey should be sold for less than a certain price, that all middle men or dealers, should be excluded, that the producer should sell direct to the consumer; these and a number of other nonsensical resolutions were passed. One of those combinations offered the sale of their honey to me, if I would refuse to handle the honey of all other parties and associations. I admired their

patriotism and liberality, but left them alone.

The combinations and so-called co-operative arrangements of the present day are only feeble remnants of institutions which never benefitted anybody in particular and which will soon be wiped out of existence by that natural friend of the producer, the best and only co-operator in existence—"demand."

When we first commenced to astonish the world with our immense yields of honey, in the course of a few weeks, from one source alone (*i.e.* from white clover or linden) 200 lbs. of honey or more per colony, we were looked upon with suspicion. We learned to keep separate the honey of plants blooming at different times, producing thereby the choicest qualities possible. This by no means, weakened the suspicion resting upon us. The baker for instance or any other manufacturer would not believe that this fine flavored article of a beautiful golden color was clover honey. We had to take it back and bring him buckwheat or some other common quality with which his taste was familiar. Even some of our best druggists, well versed in other matters, looked incredulously at our best honey because they were not used to so fine a flavor.

All these matters have changed. There is perhaps not now a respectable merchant or manufacturer in Cincinnati who suspects our machine-extracted honey, and there is hardly a store to be found which does not keep it, nor a manufacturer using sweets at all, who does not use honey. There is perhaps no city in America where more extracted honey is retailed than in Cincinnati, nor where there is more honey used for manufacturing purposes. Sweet honey is even used for making sour pickles. Being a Cincinnati, I can best speak of Cincinnati and if I am found to be exaggerating in any particular, I am willing to stand corrected. The growth of the demand for honey (I mean for extracted honey), is very encouraging. It is growing gradually and steadily. Its growth is a healthy one and will continue as long as consumers and manufacturers keep faith in the producer and dealer supplying them. If it was not for a few wicked adulterators the consumption of honey in this country would be immense by this time. However, there is no occupation without an unpleasant feature, and as bee-keepers we should ask no exception to this rule. But I feel safe in saying, that no overstocking of the market will take place any more, and the great and growing demand, at present, warrants that hereafter supply only will determine prices of extracted honey, like the rest of our great staples.

Time has brought on a great change even with the name of honey itself. Comb honey used to be the honey, and with a few old fogies that is still the honey, but it must be of a choice quality to find a ready sale and if it is a little unhandy to get it, or if the price is a little too high, it is a fact that parties do very readily without it. If comb honey is nice and cheap,

a good deal can be sold, but it will remain a fancy article only, and the demand for it will never grow.

President Cook's Address.

Ladies and Gentlemen of the National Bee-Keepers' Association, and Friends:—It is fortunate for me that bee-keepers are of a practical turn, and so are always better pleased with facts and matters of interest than with mere eloquence. Thus in calling attention to what immediately concerns us as apiculturists, I can hardly fail to secure your interest and attention.

Since our last meeting, we have had to mourn the loss of one of the most noted bee-keepers of our country. A. F. Moon was the one to inaugurate a movement that resulted in the establishment of the Michigan Bee-Keepers' Association. He was the first, also, to move publicly towards the founding of this Association. As a writer of articles to the bee papers, and as the editor of a successful journal for years, he is well known to all of you. As a bee-keeper, he was very enterprising, and gave to the craft many valuable improvements, both in the way of apparatus and methods of manipulation. In the apiary, Mr. Moon was peculiarly at home. Few men in the world could surpass him in the skill and rapidity with which he manipulated bees. As Secretary of the Michigan Association, when Mr. Moon was President, I early learned to appreciate his energy, enterprise and ability as a bee-keeper. Mr. Moon never tired in the work of aiding and advising those who were learners in the art to the prosecution of which he gave his best work. To-day we all mourn the loss of one whose work will long endure in the more intelligent labors of those left behind.

The last year has been one that has generally given joy and hope to the apiarist. In some localities in the north, and in Canada, the cold season has frozen up the nectar glands of the flowers, and the bees have merely gathered enough to support them. We thus learn that cold no less than severe drouth and wet, will destroy the yield of honey.

The present season has emphasised the importance of a varied pasturage for bees. Some of us who got no clover honey and very little basswood, are rejoicing in a full crop of fall honey. Surely, we as bee-keepers can do no wiser thing than to study to increase the number, variety and excellence of our honey plants.

Another lesson of the season, is the value that may come from moving bees to the vicinity of bloom. Mr. George Grimm thinks this so important, that he makes his hives so as to the better practice it. I know of bee-keepers that got all the sections full of fine honey this past summer, simply by spending one day in moving their bees, while their neighbors, who practiced the usual method of remaining at home, got almost no honey, and are now feeding for winter.

Another point that we do well to consider, is the quality of our bees. Mr. Jones finds that while his black bees have gathered none, and would

have starved had he not fed them, his Syrians have laid by considerable surplus. This Association can do no wiser thing than to encourage, in every possible way, the improvement of our strains of bees.

Owing largely to the stimulus given by your action last year, the exhibitions at our annual fairs have been better, more general, and better rewarded than ever before. Let us continue to urge separate buildings for the exhibition of bees, honey, etc., larger premiums, and then work to make them in the best degree successful.

Your committee on fertilization in confinement have all been at work to succeed in this important but difficult matter, yet in every case, if we except Prof. Hasbrouck, without any signal success. I have succeeded in having one queen mated in the hive, as she was clipped as soon as she left the cell, and there was perforated zinc at the entrance all the time, and upon trial we found that the queen could not crowd her thorax through the openings. She positively could not have been mated on the wing, as she never could fly. It seems as certain that she could never have been fertilized outside the hive. Several other experiments have all failed. Surely this matter is too important to be abandoned till we gain a method, if it is possible (and there is great reason to hope), that shall succeed in the hands of all.

During the year our attention has been called to several matters that are well worthy of mention here. The value of the perforated zinc in the apiary is assured. The desirability of an inclosure of wire gauze, and cloth to surround us and the bees as we are called to work with them when they are not gathering, is also established. This not only prevents the robbing mania, but we find that even Syrian hybrids will not sting in such a tent. We value ours very highly. Perhaps the greatest discovery that has been given widely to the public is the method discovered by I. R. Good, of Nappanee, Ind., to prepare food to be used in shipping queens. It is simply granulated sugar, moistened with honey just so the latter will not run, and yet so as to keep the sugar moist, and do away with the need of water in the shipping cages. Experience seems to have proven the value of this food beyond question. Is it not possible that this may give a hint to a first class food for winter?

With these preliminary remarks, I will conclude this address with the details of some investigations which I have made to determine the nature of the so called "dry feces."

[The investigations will be found in the BEE JOURNAL of last week, page 626.—Ed.]

Mr. C. F. Muth gave the following address on "Foul Brood."

Foul brood among bees, as the name denotes, is a disease of the bee while in the larva state. It does not effect the bee after it has attained its growth. The disease originates, in this coun-

try, from infection only, and spreads rapidly because of its very insidious character. Brood may die in the hives from chilling, smothering, starving, or other cause, decay and create an unbearable stench at a time when colonies are too weak to remove the dead bodies. It will never create the disease "Foul Brood." We may hang these combs containing decaying larvæ in strong colonies, where they will be "cleaned out" without the least bad result.

Among the hives of my country apiary I found, about the middle of last August, 2 colonies with fertile workers, which I broke up by removing the hives and giving the brood combs to a young swarm a short distance off. I went out to the farm again about 4 weeks afterward, accompanied by a bee-keeping friend. While I was otherwise engaged, my friend, who is a good bee-keeper, overhauled a number of colonies and found one with "foul brood." He had seen the disease at my home apiary, and knows chilled brood as well as any of us.

In this case, however, I doubted my friend's judgment. Not having salicylic acid at hand, we got brimstone ready and deferred looking at the colony until evening, after we had finished the balance of the bees. I was surprised at the sight; about 4 weeks previous I had put 6 combs full of drone and worker brood, from fertile colonies into the second story of this rather weak one, with all the bees adhering to the combs, and shaking all the bees of both hives in front of this one. The bees had all left to join their old hives; the brood was exposed thereby, and all had died.

It bore a striking resemblance to "foul brood," but the brood, although in an advanced state of decomposition, pulled out whole from every cell with the head of a pin. This is hardly ever the case with foul brood, where the skin appears to decay at the same time with the body, and the dead larvæ appears to be only a soft mass without any cohesion. In order to convince my doubting friend, I placed the combs in second stories of strong colonies, and buried only the most offensive ones. I am certain I made no mistake in the matter, and mention the above in order to bring more light on the subject of "foul brood," and to contradict and put on their guard those of our friends who still claim that chilling creates "foul brood," or that a good or bad season has something to do with it.

So many sample combs infected with the disease, sent me for examination last summer from different parts of the country, convinces me that the knowledge of foul brood is one of the most important subjects to bee-keepers. Many are aware that my home apiary has been troubled more or less with foul brood for a number of years. I never made it a secret, but showed the disease to every visiting friend for his own information, whenever it was in my power. Foul brood never made any headway with me, and, in no case, was it spread by me, although I sold hundreds of colo-

nies of bees, and a large number of queens. My apiary was free from the disease sometimes, for a year or more, with no sign of foul brood anywhere until the following fall or spring, I would discover again a cell of foul brood, or a number of them in one or more hives. Whenever I noticed those diseased cells in time, before they had thrown out their infectious spores, I made them harmless by means of an atomizer, and succeeded in the majority of cases. The hives with which I failed kept me in "hot water" for months, and sometimes for all summer, and then, when "patience had ceased to be a virtue," they were subjected to the radical cure as given in my pamphlet, "Practical Hints to Bee-Keepers."

It was a mystery to me what caused the occasional re-appearance of foul brood in my apiary. I know that spores of the disease may be hid for years in crevices in or about the hives, that a diseased larvæ pulled out and dropped anywhere may infect a bee accidentally alighting on it, but I was so particular to remove all such causes, aided by the peculiar location of my apiary, that I could not believe a friend correct, when he claimed that I infected my bees by the use of salicylic acid.

Light was thrown on the subject last spring and summer. A party about a mile from my house (bee line perhaps $\frac{1}{2}$ mile) kept 12 colonies or more of bees for several years, and lost the last one last spring. I was well acquainted with him, but his black bees and old foggy style of keeping them had never excited my curiosity. He came to me about the latter part of May and related that he had kept bees now for 10 years, that he got less bees every year, and that the last colony had died this spring, that a lively robbing had taken place when his last colony fizzled out, and that the robbers were my yellow bees; "and now," he concluded, "can't you buy my hives and combs," etc. I went out and found him in possession of about 600 combs; every one of his colonies had died of foul brood. The combs showed it satisfactorily, and my bees, no doubt, had "saved the pieces," whenever any one of the colonies had given out.

Three of my colonies apparently, had been participating in the last feast, during the beginning of that beautiful spell of pleasant weather in March. Two of them were put on foundation, and were cured in the same month, while the bees of the third were sold to a druggist (for medicine), and the combs burned. I did not know the source of my trouble until my neighbor saw me in the latter part of May.

If I here give my experience in detail, it is done because I think that in this manner it is more likely to "stick" with the majority of bee-keepers. I purchased the hives referred to above, with the proviso that they be scraped off nicely, and the combs and frames burned before the hives were delivered. This was done. The hives were placed against a dark wall in my stable, until I should have

time to disinfect them. No flowers were then (about June 1) yielding honey, and bees went anywhere to find sweets, in this neighborhood. A lot of honey was lying in the stable, and several barrels were leaking, and when I came into the stable one day I was surprised at the number of bees rising from the floor, alighting and resting on those bee hives and then making for some small windows under the ceiling. The thought struck me at once that the bees alighting on those hives would take home with them the spores of foul brood. I proceeded at once to disinfect those hives by cleaning them out and moistening every part thereof with the medicine by the means of paint brushes. It was, however, too late. Of my 36 colonies of Italian bees, only 5 or 6 were not infected, and these now remain uninfected. The mischief just being done and finding only a few, say from 1 to about 10 or 12 infected cells in a hive, I expected to cure the most, if not all, by a few good attempts at atomizing, and I succeeded with 7 or 8 colonies. I examined all the hives at least once or twice a week thoroughly, and when September commenced, and I still found from 1 to 4 cells diseased in every one of the balance, my patience was exhausted, and I immediately proceeded to the radical cure, I shall describe further on, what should have been adopted at once, and which is the only complete cure for foul brood known to me.

It was no small job, and I had accomplished but little; about 4 gallons of water was mixed with 10 gallons of honey and a lot of quart Mason's jars filled therewith; to every jar was added an ounce of foul brood medicine thoroughly mixed and a perforated cover put on. I use the Langstroth 10-frame hive. The first infected hive was put to one side and replaced by the lower story of another clean hive, provided with 10 sheets of foundation, covered, and a jar of medicated honey, inverted over a hole above it; a platform was now placed against the alighting board, and the bees of every comb of the infected hive were brushed on the same and made to enter together with all the rest. It will not take them long to empty these jars, which should be replaced by full ones as soon as empty until all the foundations are built out, and the bees have honey enough to winter on. The old combs can be extracted and rendered into wax, but great care should be taken that no bee alights on them nor on anything else pertaining to an infected hive.

It is stated by good authority that the spores of foul brood are made harmless through the boiling process, but I bury the remnants of combs, and render wax at night so that bees are excluded entirely. The hives and frames are disinfected thoroughly by means of a good atomizer, or the medicine is applied by a paint brush, not a part must be missed. After the first hive is disinfected, as described, it answers the purpose of a new one, and can be used for the next infected colony which is subjected to the same treatment as the first, and so on. My

atomizer is always ready, filled with the medicine, and my fingers and knife are disinfected at intervals, and when I leave an infected colony. This cure is complete and has been tried by me, perhaps a hundred times or more. No combs from an infected colony should be used again in a healthy one, because one of those spores smaller than a speck of dust, invisible to the naked eye, attached to the comb, is sure to breed mischief.

My foul brood medicine is the same as given at our last meeting and in "Practical Hints." It will do no harm to repeat it. The following is the formula: 16 grains salicylic acid, 16 grains soda borax, and 1 ounce of water. It is cheap, can be put up by every druggist, and every bee-keeper should have a bottle of it ready for an emergency.

As time is money in this country of ours, it may be best and cheapest for us to apply brimstone to every colony affected with foul brood. This, however, should be done at night, when all the bees are at home. The hive should be closed below, at the entrance, with a pan of brimstone ignited, on the top of the frames, and a tight cover placed over the whole. The fumes of sulphur being heavier than the air, descend, and kill most effectually all life inside of the bee hive. Bury or burn all its contents, and be sure to disinfect the hive before you leave it.

Too Late.—I wish to express my regret that the call made by Prof. Cook, requesting that the different foundation machines be at the National Convention, reached me too late. The arrival of the BEE JOURNAL to-day was the first knowledge of it I had. It would have been impossible for me to attend in person, but would gladly have sent a man with a press if I had known in time that other machines were expected there.

D. S. GIVEN.

Los Angeles, Cal., Sept. 29, 1882.

The Iowa Central Bee-Keepers' Association will hold its annual meeting at the office of Graham & Steel, Winterset, Iowa, on Friday Nov. 3, 1882, at 10 a. m. All interested in bee culture are invited.

HENRY WALLACE.

The fifth annual meeting of the Northern Michigan Bee-Keepers' Convention will be held at Pewamo, Ionia County, Mich., on the second Tuesday and Wednesday (10th and 11th) of October, 1882. Pewamo being on the D. & M. and H. & M. R., it will be accessible by rail. The members will do all in their power to make the meeting interesting.

H. M. ROOP, Pres.

O. R. GOODNO, Sec.

The N. W. Bee-Keepers' Association of La Crosse, will meet in the City Hall in La Crosse on Friday, Oct. 13, 1882. All interested are invited to be present.

G. J. PAMMEL, Sec.

The Northwestern Bee-Keepers' Convention will meet at Chicago, Ill., on Wednesday and Thursday, Oct. 18 and 19, 1882. The office of the American Bee Journal has been kindly tendered as a place of meeting. A cordial invitation is extended to all bee-keepers, and especially those of the Northwestern States, to be present. The meeting takes place during the last week of the Inter-State Industrial Exposition, to enable all to obtain reduced railroad rates. First session at 10 a. m.

C. C. MILLER, Pres.

C. C. COFFINBERRY, Sec.

The Union Bee-Keepers' Association of Maryland, Virginia and West Virginia, will meet at Hagerstown, in the room of the County Commissioners, at the Court House, on Wednesday, Oct. 18, 1882, at 1 o'clock, p. m., the session to last two days. The Washington County Fair will then be in progress, which will give persons an opportunity to attend the exhibition. All persons intending to go will please drop me a card, so that I may secure for them half-fare rates.

J. LUTHER BOWERS, Sec.

The fall meeting of the Northern Ohio Bee-Keepers' Association will be held in Whittlesley Hall, Norwalk, O., Saturday, Oct. 21, commencing at 9 a. m. A full attendance is solicited, as it will be a meeting of more than usual interest. Principal subject for discussion: "How shall we winter our bees without loss?"

S. F. NEWMAN, Sec.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning County, in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

LEONIDAS CARSON, Pres.

The Southern California District Bee-Keepers' Association will hold their annual Convention in Union Hall, Los Angeles City, Oct. 19, 20, 1882, during the week of the Agricultural Fair. The Convention promises to be of so much interest that no bee-keeper should miss it. Ladies are pressingly invited to attend.

J. E. PLEASANTS, Pres.

The Tuscarawas Valley Bee-keepers' Association will hold their next meeting in Wilgus Hall, Newcomerstown, O., on Tuesday, Oct. 10, instead of Oct. 5th. This change is made in order to allow members to visit the National Convention at Cincinnati.

J. A. BUCKLEW, Sec.

CORRESPONDENCE.

For the American Bee Journal.
Apirian Salmagundi.

A. B. MCLAVY.

Complying with Mr. Todd's request, I will say that in the early spring I frequently find scorpions in my hives over the mats. I have seen them of almost all ages, to judge by their size. I think their business end, or tail, is either born with them, or develops very soon after birth, for I have never seen one too young to have it appended. I suppose they seek the warmth above the cluster, as I have never been able to see any other object they sought.

Let me add a mite to the drone subject, seemingly in conflict with the generally accepted version of their usefulness, except for fecundating queens. Early in August I observed in all of my large colonies a great quantity of drone brood, often in the 1st and 2d stories. In the present month the drones seemed to me to be in the majority over the workers, but at the same time the combs were full of worker brood, and the drones were clustered thick over the brood. At this writing the colonies are full of workers, and they are killing off the drones, and that, too, when the honey flow from fall flowers is as fine as it can be. My bees are storing more honey now than in the spring.

Now, does not this argue some other use for drones? There are no cells, as in swarming season; the honey flow is fine and promises to be excellent, yet in the face of the glowing prospects, the poor drones seemingly having served their purpose, are being sacrificed.

I cannot fully accept the commonly-taught adaptation of the drones, and nothing more. The view I take is, that the prospects being bright, the bees bred the drones so as to take advantage of their copulency (animal heat) in breeding up; that being accomplished, they are useless now, as an examination of my colonies will show, for they are "busters."

What is the future of wax? Without an idea either to "bull" or "bear" the price of wax, I make this inquiry. To my mind, the price of wax now is too low, and for the same reason that applies to any other commodity—the same inexorable law of supply and demand. The same remark applies to any one else that it does to myself. I use ten pounds and produce two. As a support to my position, I am informed that in Mexico the demand exceeds the supply, and that, too, when 60 cents is paid for it.

I think a remedy can be found by some enterprising Yankee bee-keeper, and I suggest it. It occurs to me that paper can be rolled out upon foundation rollers, the paper being wetted and the rollers heated, leaving the side walls on the paper. Now dip the

paper in a hot bath of wax, so as to give us the foundation both stronger and lighter, and using perhaps 60 or 75 per cent. less wax than at present. This has reference to foundation for extracting only. If this is worth anything, I cheerfully offer it to the fraternity.

Your appended remarks upon a clipping in No. 37, do not present the facts fairly regarding negroes as bee-keepers. While but few of them are progressive bee-keepers, yet when they are property-holders, they are very apt to keep bees. I think that probably 150 or 200 colonies of bees in this country are owned by negroes, and I find quite a number of them are valuable assistants at swarming time, and at other times, too. "Don't you forget it," they keep bees; they get the honey; they get stung, but they keep them "alle samee." My man Jerry handles a swarm just as well as any one.

Bastrop, Tex., Sept. 25, 1882.

For the American Bee Journal.

Poisonous Gases around Bee Hives.

R. F. HOLTERMAN.

Upon my return from the Toronto Industrial Exhibition, I find the BEE JOURNAL, with an article on page 582, by Mr. Ed. Moore, in which he expresses a desire that some scientist enlighten him. Now I have no pretensions to so elevated a position, but I believe that I can throw a little light on the matter.

The freely circulating atmosphere has no such impure atmosphere next to the earth, provision for this has been made in the following manner: The animal world takes in oxygen and gives out water and carbonic acid gas, and to prevent too much of this being generated, it is taking up water, lime, and other substances; the plant life takes it up through these and other mediums, and gives off more or less pure oxygen. In this way the animal and plant kingdoms balance one another.

In the Valley of Death, in Java, where carbonic acid gas exudes from the caves in the earth, and the atmosphere is this gas in almost a pure state, no animal life exists, and on the other hand plant life is luxuriant. Scientists ascribe the great growth of vegetation (shown by coal-beds and other traces) in antediluvian times to the predominance of the carbonic acid gas. Then the winds and radiation from the earth's surface through the rising and setting of the sun, keeps the atmosphere in motion, thus keeping the gases of different weights constantly mixed. If it were not for this, the fish and all animal life would perish in the sea for want of oxygen, and cities would be visited by pestilence, but the gentle motion of the atmosphere, assisted by rain and windstorms keeps the whole in circulation.

I have tried different elevations for bee-hives, and prefer about three inches, with a board slanting from the entrance to the ground. If lower, the bottom board is too damp, causing bees to draw upon the combs more

easily; if higher, when loaded with honey they often drop to the ground before reaching the hive, especially in the spring of the year when cold. They are less exposed nearer the ground. They are better higher up as regards loads, but I have never found these latter very destructive. Fisherville, Ont., Sept. 21, 1882.

For the American Bee Journal.

Glucose Detective.

T. MAHER.

Allow me to correct a little the account of our trials at your office last week, by chloride of barium, to detect free sulphuric acid in the glucose used for mixing with sugar, syrups and honey.

The first experiment was upon a so-called pure article of "golden syrup," about one ounce of which was poured in a glass to which was added about 2 ounces of water, this was thoroughly mixed by stirring till a very clear solution was obtained; after it had rested awhile, a few drops of the chloride solution were added carefully; a small white cloud of sulphate of baryta immediately appeared, showing the presence of not a very large percentage of free sulphuric acid, but of a sufficient quantity to form a light deposit, after a few hours, of this sulphate of baryta.

Test No. 2 consisted of a very small quantity, about half a small teaspoonful of Davenport "grape sugar," scraped with a pocket knife from a sample lump as large as an English walnut; this small quantity was also dissolved by carefully stirring it in 4 or 5 ounces of water, till another clear solution was obtained; it was also rested awhile, after which a few more drops of the chloride were added, when another cloud appeared thicker this time than on the first trial, which, as you say, did produce, after a few hours, a perceptible precipitate, not, however, of insoluble glucose, but of sulphate of baryta.

As for test No. 3 of the carefully corked sample phial of honey sent to you about two years ago, and which showed some thick fluid above the granulated portion in the bottom, the clear solution of it in the glass did not show any cloud on the addition of the few drops of chloride, hence no precipitate did take place, there being no free sulphuric acid in it to decompose the soluble chloride into an insoluble sulphate.

Let me add that any one can purchase for a dime or a nickel, an ounce of chloride of barium in crystal from a respectable drug store, dissolve it in a tumbler in 6 ounces of pure water, stirring with a teaspoon till a clear solution is obtained, after which it should be set by to settle well in a small bottle for about 12 hours; some light earthy sediment may then appear in the bottom of the bottle, from which the clear solution above it may be separated by pouring it carefully into another clear bottle, to be thus kept for use, carefully corked.

Chicago, Sept. 29, 1882.

For the American Bee Journal.

Some Hints about Conventions.

C. C. MILLER.

Perhaps I ought to say "two hints" as that number comes prominently before my mind just now.

The first is that each member should before he leaves home, write down a list of the subjects he wants discussed and the questions he wants answered.

The second is that he should take his wife with him, or other members of his family.

The experience of the past meetings of the Northwestern Convention at Chicago confirms the opinion that in no way can a meeting of bee-keepers be made more interesting and profitable than by having the time mostly or wholly spent in live discussions of practical topics, and in asking and answering questions such as are constantly arising in the minds of those who make their living through the labors of the busy bee.

Do not most bee-keepers' wives have some interest in their husbands' calling? Would they not be interested in hearing and taking part in bee-keepers' discussions? I am much mistaken in my estimate of bee-keepers' wives if they are not, in the main, an intelligent set, possessing an unusual amount of good, practical common sense; women who do their full share of the work and to whom a couple of days rest would be a blessing and whose presence at a convention would largely increase its interests. My wife has worked side by side with me in the apiary this summer, has taken her full share of stings and work, and is entitled to attend the Convention as well as myself. I expect her to go with me and I don't want to see so few women there that she shall feel "like a cat in a strange garret."

Allow me to give a pressing invitation to all bee-keepers to be present at Chicago. The meeting occurs the last week of the Exposition when excursion tickets can be had from nearly all points. Perhaps the BEE JOURNAL will lay us under still greater obligations by telling us just how to reach the place of meeting, and by giving us some information as to convenient hotel accommodations.

Now just as soon as you have finished reading this, please sit down at once and commence writing a list of the questions and subjects you want discussed; even if there is only a single one, write it down that you may not forget it. Then talk over with your wife the matter of her accompanying you, and tell her it will do you good, and her good to have her along. Like as not she will object that she hasn't just the right clothes to put on, or that some "woman fixen" is out of repair about her bonnet or dress, but tell her that the latest style is not to dress up much for conventions, and that other bee-keepers as well as her husband are men of sense and value a woman for her qualities of head and heart and not for the clothes she wears. Please be on hand if possible at 10 a.m.

Wednesday, Oct. 18. All lady bee-keepers are urgently invited whether they have husbands present or not.

By an oversight of the president, the notices already given say that the Northwestern Convention meets Oct. 17-18. Instead of this it adjourned last year to meet Wednesday, so please note that it meets Wednesday and Thursday Oct. 18-19.

Marengo, Ill.

SELECTIONS FROM OUR LETTER BOX

Good Work in Extracting.—I inclose you the flower of a weed that grows all through the woods here. I wish you would give the name. It has been in bloom ever since the 1st of August, and my bees have never ceased to work on it since. Bees are still booming on goldenrod. At present the nights are a little too cool for the upper stories. I think Iowa can show up with most any other State this season on honey yield, and there cannot be any better quality than ours this season. I see by the BEE JOURNAL of Sept. 13th that Dadant & Son think they have the largest day's extracting on record. On Monday, Aug. 28, working from 9 a. m. to 5 p. m., and taking 1½ hours' nooning, I extracted 500 lbs.; I did all the work of carrying the honey in and everything else, and on Saturday afternoon, Sept. 9th, I extracted 280 lbs. from 2 p. m. to 6 p. m.; and this was capped ¾ of the way down each comb. I use a 2-frame extractor. Now if any one can beat this, let them speak out. H. O. McELHANEY.

Brandon, Iowa, Sept. 15, 1882.

[The plant is *Lophanthus scrophulariefolius* (giant hyssop), a plant occurring throughout a very wide region of the Northern States, not usually abundant, except in rich soils well protected from the tramping, etc., of cattle. No doubt a good honey plant, yet far inferior to many others of less vegetative vigor. T. J. BURRILL.]

My Third Annual Report.—The season just closed, although better than either of the two preceding, has not been altogether satisfactory to the bee-keeper in this section of Iowa. The spring and early summer were wet and cold. The little honey secreted by the flowers was washed out by the frequent rains. An unusually late frost, May 21st, killed many of the honey flowers; apples and plums were in bloom and completely destroyed; basswood buds were so frozen that no bloom was seen; the bees got just enough honey to keep up brood-rearing. Nearly all our surplus was stored after the middle of July. At that time, many of the colonies did not have 5 pounds of honey in the brood chamber, although they had commenced to store in the supers. With the blooming of sumac came our first extracted honey. That yielded

well, and was a profitable honey plant. The honey is thin, but of good flavor, and improves on acquaintance. After sumac, came what we call the yellow evening primrose. There happened to be a neglected field near our place, and there were acres of primrose in it, and the bees preferred it to any other flower. After the primrose came the thistle family, and they have been in bloom ever since. These three plants furnished about all the honey we obtained this year. No basswood nor white clover honey, and none from buckwheat. I heard one gentleman say that he thought there was some honey-dew in the timber, and also that he saw a great many bees on the corn tassels, but I did not notice either. Our honey is all light-colored, and that gathered after sumac disappeared is very thick, so thick that it will scarcely run through a common-sized funnel. Number of colonies last fall, 18; number this spring, say June 1st, 15; lost in wintering, 2; lost in "springing," 1; increased by natural swarming and by young queens given to nuclei, and built up, to 20. Tried to control swarming, but could not. Some colonies swarmed four times, which were returned to the old colony. I winter always in a cellar under the house with the temperature of cellar last winter 34° to 40° F. Kind of hive used similar to Langstroth in size, only the frames run across instead of lengthwise. Number of pounds surplus, extracted, 882½ lbs.; in 1½ lb. section boxes, 265½; total number pounds surplus, 1,148; average per old colonies, 76½ lbs.; largest from any one colony, 152 lbs. Some as fine honey as I ever saw was made after Sept. 1st. Quite a large amount was stored after that date. The whole family of fall yellow flowers, goldenrods, asters, artichokes, etc., were almost entirely neglected by the bees this fall. I watched in vain for a bee on them. EUGENE SECOR.

Forest City, Iowa, Sept. 22, 1882.

A Scotch Bee-Keeper in Texas.—As mentioned in my last letter to the BEE JOURNAL, on p. 507, I have continued my journey from Illinois to Texas. Through the kindness of the editor of the BEE JOURNAL, there is now another green spot in my memories of America. His letter of introduction gave me a cordial welcome at the home of Judge Andrews, and, truly, I did not journey in vain, for his apiary is a grand sight. He seems to be personally acquainted with his bees in each colony, and speaks of his queens as a good farmer does of his cattle. He has over 200 colonies of pure Italians, for which he claims two particular points of merit, beauty and docility, and I can vouchsafe for the latter, as I waded through a perfect forest of hives and never received a sting. He extracts honey with a machine of his own invention, and his harvest this year is immense. Mr. Andrews also has some of the finest cattle I ever saw. One calf, of the Jersey breed, he has been offered \$200 for. He keeps only the best and purest stock. JAMES ANDERSON.

Allen, Texas, Sept. 20, 1882.

Bee and Honey Show in London, Ontario.—We have just had our Western Fair, and the apiarian exhibit was good, showing quite plainly that bee-keepers are on the increase in Canada. We had more exhibitors and more exhibits. The honey show was very far in advance of all other years; the honey exhibited was in cans, jars, boxes, and sections of different sizes. Mr. Chalmers of Mussellburg, Ontario, had the largest exhibit, comprising honey, comb foundation, smokers, knives, etc.; also a cage of Italian and one of black bees, which attracted a great deal of attention, and were the admiration of all lovers of the little busy bee. We also had the different methods of wintering explained to our satisfaction. The bee men give a very poor report, as regards the honey crop of Canada, and a great many are talking of selling out, which some of the far-seeing bee men take advantage of, and are buying at low prices, hoping to realize a handsome profit next summer. Keeping in mind the old saying that "after a storm comes a calm."

W. H. WESTON.

London, Ont., Oct. 3, 1882.

That Champion Colony.—Since my unprecedented yield of honey from the horsemint, I have received many letters asking about the habits and growth of the great Texas honey plant. There are several species of the horsemint, and the best is *Monarda punctata*—stem erect, branched, glabrous, obtuse, angled, whitish; leaves oblong, lanceolate, remote and obscurely serrate, tapering at the base, smooth; flowers in whorls, and has from three to ten whorls to the flowerstalk; bracts lanceolate, colored, longer than the whorl; calyx long; corolla hairy, dotted with brown, the upper lip slightly arched, longer than the lower, and completely protects the nectar from rain, so it matters not, rain or shine, the bees never stop only when the rain is pouring down. It grows almost anywhere, in the swamps, on dry, loose, loamy soils, on the high prairies, and on the post-oak lands; grows from three to five feet high. It generally comes up about the last of December, and first of January, and begins to open its honey-laden flowers about the 20th of May, and, if seasonable, that is, if a good rainfall every 10 days, the flowers will last until the 1st of July, giving the wide-awake bee-keeper a chance for 200 lbs. and upwards of choice honey from each colony. It will grow in the fall, sown on the wheat and oat fields, and as soon as the grain is removed, about the first of May, the mint grows up rapidly and begins to bloom about the 1st of July; but very few years do we ever get any benefit from this late crop, on account of drouth. It grows well on pasture lands, as nothing will eat it. It dies out root and branch as soon as done blooming. It is not a pernicious weed, and is easily destroyed with the plow or hoe. The following is the report of the big colony: At date of last report, 700 lbs.; July 30, extracted 8½ lbs. and removed two upper stories; Aug. 23,

extracted 49 lbs.; Aug. 29, 22 lbs.; Sept. 8, 18 lbs.; I allow for waste and uncapping, 2½ lbs., which gives 800 lbs. from a single colony, the progeny of a single Cyprian queen—no increase—not an egg or particle of brood, or other help, from other colonies. My crop of spring honey is 6,000 lbs. from 36 colonies spring count. I will lose over 2,500 lbs. of fall honey, as it is not fit to use, so I have quit extracting, and my hives are full of sealed honey and some swarming. I now have 97 choice, full colonies, and 15 small colonies; lost 15 or 20 by swarming to the forest. Had I been prepared, my report would be triple this. Hope to do better another year. The fall honey is from the wild camomile, and is equal to quinine for sweetness.

B. F. CARROLL.

Dresden, Tex., Sept. 18, 1882.

A Good Profit.—My honey is not all sold, but I expect to realize \$15 per colony, spring count, from the honey, besides an increase of 100 per cent.

P. J. ENGLAND.

Fancy Prairie, Ill.

Bees have Done Finely.—Since the first of July the bees have done finely here. Mr. M. Bailey and Mr. Braught in this county have each obtained over a ton of honey. A. J. ADKINSON.

Winterset, Iowa, Sept. 30, 1882.

Position of Pure Air in Rooms.—At the Bee Convention in Toronto, Mr. Corneil tried to give some light on this subject (see page 644 of this Journal), and if true will be read with interest in connection with my remarks on page 582 of the BEE JOURNAL for Sept. 2d. Mr. Cornell's remarks are a puzzle. We have been taught that the foulest air is the heaviest; here we have it asserted that the purest is both heaviest and lightest, and that the foulest is between the two! It is lucky for small animals after all, also for the giraffe; they both get the advantage that we, poor midway creatures, are as a general thing deprived of. How is it that facts of such importance are so changeable? With statements of such importance, men must surely give opinions as facts. This impure air cannot be so very destructive to life, or it is not easy to tell how long any one may live if he walked upon stilts, with his head constantly up to the ceiling; then to overcome the difficulty of the different heights of ceilings would require several pairs of stilts. But what about the pure or impure air outside of a building, to correspond with that next the ceiling? what height would the pure air get, if the ceiling was not there? perhaps some one will inform us concerning that. We have been informed that the correct distance of the sun has not been given until lately; there is merely a few millions of miles of error, but that is not much. Are the two layers of most pure gas differently composed? One must be the *heaviest*, and the other the *lightest* to be as stated. EDWARD MOORE.

Barry, Ont., Oct. 2, 1882.

Botanical.—Again I send you some samples of flowers on which bees have been busy, in rotation. Would you be kind enough to furnish names and notes as to their value as honey-producing plants. No. 1, the yellow flower, with bowl full of milky, sticky matter, is found all over the mountains from the foothills to the timber line. No. 2, the smaller yellow one, is found about the same locality. Bees began on them about Sept. 1st. No. 3, the blue flowers, are now daily covered with bees. These flowers are found both on the mountain sides and on the streams. Nos. 1 and 2 grow about 1 foot high and in large bunches of 12 to 30 flowers on each bush. No. 3 has 4 to 8 stalks 2 feet high, with 50 to 60 flowers on each stalk. I also send you a specimen of white sage that covers the mountains here. Bees do not seem to notice it here. Is it the same as that of California? Answers to the above queries will be of interest to all Colorado bee-keepers. I think.

PHILIP REARDEN.

Jamestown, Col., Sept. 9, 1882.

[No. 1, *Grindelia squarrosa*. A peculiarly western plant not known east of the Mississippi river, but growing abundantly on the plains of Nebraska and Colorado, also in Mexico. The viscid characteristics of the heads and flowers is interesting and peculiar. Will this correspondent, who has the chance observe what this last has to do with inviting or preventing the visits of insects?

No. 2, *Chrysopsis villosus* (golden aster), resembles our common asters, except that the flowers are yellow instead of white or violet. Wisconsin to Kentucky and westward. Very common on plains in Colorado.

No. 3, *Aster laevis* (smooth aster). A beautiful plant in half shady places. Common in Northern States.—T. J. BURRILL.]

From Minnesota.—I started in spring with 13 colonies. I had them in my oats bin till the 1st of March. They were strong in bees and brood. The 1st of March was very fine, and they being restless, I set them out. About the fifth we had rain, then it became cold, and before I was aware the brood was chilled. The first of June one was left; but there were more bees starved to death last spring. April and May were so cold that there were only a few days in the two months that they could fly, and in May we had a frost that killed nearly all the fruit blossoms and the basswood. There was nothing for them to get honey from till in June. Some who were quite extensive bee men lost all and quit bee-keeping. Bee men in Brown county lost nearly all. One man, out of 45 had only 3 or 4 survive the cold spring. They are mostly the common brown bee, with some Italians and hybrids, they did not swarm till in July and August. There are more bees in the woods than usual. Bees

have done well. I had a swarm come out on the 16th of July and put them in a hive with 9 frames 10x15 inches in the clear, with more or less of old combs; in one week I put on 30 1½-lb. sections; they are all full. All that I have seen, say that their bees have done well this season. M. SIENER.
South Bend, Minn., Sept. 17, 1882.

A Good Report from Michigan.—We have had a very good season here. I began with 42 colonies in the spring, and now have 130, besides losing 7 or 8. I have about 2,000 lbs. of beautiful white section honey, and 2,000 more plain pine sections which will be filled in two weeks if this fine weather continues. I also have 500 lbs. of extracted honey, the quality of which cannot be surpassed. I made a mistake which I fear will prove fatal to me, in sending to a "middleman" for supplies, as his long delay in filling my order has been the cause of great loss in various channels. I am now entirely out of sections, and bees very strong. We have had a continuous honey flow throughout the season, and hence excessive swarming. We think our district is good for a big yield, for years to come.

THOS. H. SHEPHERD.
Uby, Mich., Sept. 8, 1882.

Bees Still Gathering Honey.—We have had several frosts but our bees are still gathering honey from red and white clover, asters and goldenrod. I am preparing the hives for winter as fast as possible. I will send you my report soon, and expect it will appear pretty big.
S. A. SHUCK.
Bryant, Ill., Sept. 28, 1882.

A Tremendous Report.—My season's report is as follows: Cold and wet in April, May and most of June; fed all colonies from May 1st till June 4th; first swarm June 23d. Spring count, 19 colonies; increased to 71; extracted honey 3,000 pounds; one-pound sections, 1,000; from one colony of Syrian bees, 235 pounds of extracted honey and 7 swarms. All are in good condition for wintering. Best colonies for honey are one dark Italian and one light Italian—each 350 pounds extracted honey, but no swarms.
S. H. MOSS.
Colchester, Ill., Sept. 27, 1882.

The Seed of the Golden Honey Plant.—I see that some who purchased the seed of the golden honey plant have failed to get it to germinate. All of the seed sent out was first class in quality. If it failed in any case, it was from some peculiarity of soil, or in the planting or sowing. Now, if those who failed to get it to grow will write me a postal giving their post office address, I will mail to each a three-ounce packet gratis, that they may try it again. I think that if planted in the fall and covered with soil about ½ inch deep, it will not fail to grow in any part of the country where the ground freezes in the winter.
DR. G. L. TINKER.
New Philadelphia, O.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about eight words; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole paid in advance:

For 4 weeks.....	10 per cent. discount
" 8 ".....	20 " "
" 13 " (3 months)....	30 " "
" 26 " (6 months)....	40 " "
" 39 " (9 months)....	50 " "
" 52 " (1 year).....	60 " "

Discount, for 1 year, in the MONTHLY alone 25 per cent., 6 months, 10 per cent., 3 months 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,
925 West Madison Street., Chicago, Ill.

Special Notices.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,—	" Bees and Honey," in paper.
" " 3,—	an Emerson Binder, or " Bees and Honey," in cloth.
" " 4,—	Apiary Register for 50 Colonies, or Cook's Manual, paper.
" " 5,—	Cook's Manual, in cloth, or the Apiary Register for 100 Colonies
" " 6,—	Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Two subscribers for the Monthly will count the same as one for the Weekly, when getting up clubs for the above premiums.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

CLUBBING LIST.

We supply the **American Bee Journal** and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	Publishers' Price.	Club
The Weekly Bee Journal.....	\$2 00..	
and Gleanings in Bee-Culture (A.I. Root) 3 00..	2 75	
Bee-Keepers' Magazine (A.J. King) 3 00..	2 60	
Bee-Keepers' Instructor (W. Thomas) 2 50..	2 35

The Weekly Bee Journal one year and Prof. Cook's Manual (bound in cloth) 3 25..	3 00	
Bees and Honey, (T. G. Newman) " 2 75..	2 50	
Binder for Weekly, 1881.....	2 85..	2 75
Binder for Weekly for 1882.....	2 75..	2 50
The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.		

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Articles for publication must be written on a separate piece of paper from items of business.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

When changing a postoffice address, mention the *old* as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Hundreds of clergymen, doctors and others have used Kendall's Spavin Cure with the best success.

37w4.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., October 9, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—1 am paying 7c. for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17@22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@20c. on arrival; extracted, 7@10c. BEESWAX—Firm at 20@25c. per lb.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand is good for choice white comb honey in 1 and 2 lb. sections, and prices are without material change, 18@20c. being the range of this week's sales. White extracted, in cans, 10 @11c. in kegs and casks, 10c.; dark, 9@9½c. Dark comb honey, 12½@13c.
BEESWAX—Yellow, 26c.; dark, 18@22c.
R. A. BURNETT, 165 South Water St.

SAN FRANCISCO.

HONEY—The market is firm for choice qualities but the trade is not active.
We quote white comb, 18@20c.; dark to good, 12@15c. Extracted, choice to extra white, 8½@9½c.; dark and candied, 7½@8c. BEESWAX—30@32c.
STEARNES & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and dull. Comb lower, at 15 @18c—latter for choice white clover in small packages; strained in round lots at 6½c.; extracted in cans at 9@10c.
BEESWAX—Sold fairly at 26c. for prime.
R. C. GREEN & Co., 117 N. Main Street.

NEW YORK.

HONEY—Demand slow. We quote: Comb in the small sections, white, 18@22c. Extracted, 7@10c.
BEESWAX—The stock continues light, and prime Southern held up to 30c., with little if any obtainable below 20c. Western, pure, 28@29c.; Southern, pure, 29@30c.
D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Market active. We quote ¼ lb. combs 30c. per lb.; 1 lb. combs 22@25c.; 2 lb. combs 20@22c. Extracted, in half bbls., 12@14c.
BEESWAX—Prime quality, 25c.
CROCKER & BLAKE, 57 Chatham Street.

CLEVELAND.

HONEY—Sells very readily in 1 lb. sections at 21@22c. for best white, and 19@20c. for 1½ to 2 lb. Second grade, 1 lb. 18@20c.; and 2 lb. 17@19 cents. Extracted is selling very slowly at 12@14c.
BEESWAX—25@28c.
A. C. KENDEL, 115 Ontario Street.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages)..... \$1 00
" 100 colonies (220 pages)..... 1 50
" 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey. A new pamphlet of 32 pages. At the last meeting of the North American Bee-Keepers' Society, we were appointed on a committee to prepare instructions on the Exhibition of Bees and Honey at Fairs; this is also added to the above. Price, 10 cents.

Kendall's Spavin Cure is used from the Atlantic to the Pacific coast.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal stand for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame. Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$8 00
For 2 Langstroth " 10x18 "	8 00
For 3 " " 10x18 "	10 00
For 4 " " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " " 12 1/2 x 20 "	12 00
For 4 " " 13x20 "	16 00

A NEW BEE BOOK! Bees & Honey

OR THE Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN,
Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

- Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.
- A very valuable work to those engaged in bee-raising.—Newa, Prairie City, Iowa.
- We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.
- Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.
- Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.
- A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.
- New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.
- Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.
- Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.
- Just such a work as should be in the hands of every beginner with bees.—News, Keltshburg, Ill.
- A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.
- The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.
- The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.
- It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.
- A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.
- Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.
- Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.
- It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.
- Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.
- Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.
- It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.
- Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.
- Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.
- It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

I. R. GOOD,

5wly Nappanee, Elkhart Co., Ind.

New Kegs

FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore prepared kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well scalded, the pine will not flavor the honey.

Capacity, 175 pounds. Price, 80c. each.

The first car load of these kegs will arrive about Sept. 17th, and all orders will receive my prompt attention.

The 2 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

923 West Madison Street, CHICAGO, ILL.

The Bee-Keeper's Guide; OR, MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book:

All agree that it is the work of a master and of real value.—*L'Apiculteur*, Paris.

I think Cook's Manual is the best of our American works.—**LEWIS T. COLBY.**

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—**J. P. WEST.**

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—**E. H. VYNKOOP.**

This book is just what everyone interested in bees ought to have, and which, on any terms, it will ever regret having purchased.—*Mich. Fair.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—**A. E. WENZEL.**

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—**WM. VAN ANTWERP, M. D.**

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record.*

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—**L'ABBE DU BOIS**, editor of the *Bulletin D'Apiculture*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Pulaski, N. Y.

We have perused with great pleasure this *vade mecum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. By not taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor*.

PRICE—Bound in cloth, **\$1.25**; in paper cover, **\$1.00**—by mail prepaid. Published by

EARS FOR THE MILLION!
Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Charcharodon Roudletii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WHOLE CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by
THOMAS C. NEWMAN.
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide for Cook's Manual Spillery.—Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject. \$1.50.

Novice's ABC of Bee-Culture, by A. J. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of beekeeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Honey Culture, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. C. P. Dondant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how and 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. Price 5c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Chicken Cholera, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Enthusiasts.—The Cincinnati, O., *Daily Gazette*, speaking of the National Convention of Bee-Keepers, lately held in that city, says: "It would be difficult to find a body of men more enthusiastic than the North American Bee-Keepers' Society, as it assembled in Washington Park Hall, at 9 o'clock, yesterday morning, for the closing exercises of the Convention of 1882. So enthusiastic were they, indeed, that when a vote upon the subject was taken, it was unanimously decided not to adjourn for dinner, but to take a recess of ten minutes only." If they suffer with dyspepsia hereafter, they should charge it to enthusiasm! Ten minutes for dinner is worse than the railroads treat their passengers. Let us have more time and less enthusiasm hereafter. The *Gazette* then gets enthusiastic and says: "That the growth of bee-culture has been enormous is shown by the fact that in 1870 barely \$1,000,000 was invested in the pursuit, while in 1879 the profits were estimated at \$16,000,000 in the United States alone."

We had a call from Mrs. A. J. West, of Paxton, Ford Co., Ill., on Friday last. She is intelligent and very lady-like, and says Mr. West started in the spring with 9 colonies, which gave an average increase of 3 swarms. From 1 colony he has taken 241 pounds of honey, and it has enough left for winter. The total product of the 9 colonies, spring count, has been over 1,400 pounds. The season has been very favorable and, with Mr. West, bee culture has met with its full reward.

Mr. and Mrs. F. F. Collins, of Houston, Texas, made us a pleasant visit on Saturday last. Mr. Collins says he is so much engaged with his manufacturing business that he can now pay but little attention to his bees. He has about 100 colonies, but his brother is taking care of them for him. Mr. Collins is an enthusiast on bees and regrets his inability to be with them more.

Mr. W. F. Clarke, late editor of this paper, has gone to Winnipeg, Manitoba, to take editorial charge of the *Winnipeg Sun*. He thus wrote to us concerning his leaving his former home at Listowel, Ontario:

My friends in Listowel gave me a good send-off. A surprise party headed by the Mayor, visited me the night before my departure and presented me with a farewell address, and a beautiful gold hunting-case Elgin watch, engraved on one side, "Presented to W. F. Clarke, by his Listowel friends, on his departure for Winnipeg, Sept. 25, 1882," and on the other, with the letters, W. F. C., in large and handsome monogram.

We learn, with regret, that Mr. Frank Benton, who is now in Beyrout, Syria, has been quite sick during the past summer, and has been unable to rear as many queens as he anticipated, on account of the extremely unfavorable weather.

Mr. James Heddon's essay for the National Convention was lost in the mails. This explanation is due to him, as it was not there produced.

As the time for the usual winter rush of correspondence is nearing, let us try to impress on our correspondents the necessity of being careful when writing to this office. If they live near one postoffice and get their mail at another, be sure to give the address we have on our list.

Another Bee Paper Dead.

The Bee-Keepers' *Instructor*, published at Somerset, Ky., for September is just received, and the editor, Mr. W. Thomas, announces that it is not paying him, and will not be continued any longer. This is the second that has died within 6 months.

A year or two ago, there was a regular mania for starting bee-papers, and as a result several of the weakest are now dead, and some others are quite weak, and one at least has not yet issued a number for September. The editor of the *Instructor* says:

With this issue the *Instructor* closes its existence, and hereafter will be numbered with the things that were. We much regret to make this announcement, and know there are others who will regret it also; for during its existence the *Instructor* has made many warm friends who will miss its accustomed monthly visits. We find, however, that it is not paying us—and has not during the two years we have had control of it—for the time, labor and money expended upon it. We are now, as we always have been, publishing it in connection with a weekly paper, and find that, owing to the pressure of other duties, we cannot continue its publication without increasing our office force—something we do not feel justified in doing. During the time it has been in our charge we have lost no opportunity of improving it whenever it could be done, and think that in quality of contents, typographical appearance, and general "make-up," it will now compare favorably with any of the other bee publications. Our support, however, has not kept pace with the improvements, and will not warrant us in continuing it at its present standard; so rather, than issue a second or third rate publication, we prefer to drop it altogether.

Unfilled subscriptions will be filled by the Bee-keepers' *Guide*.

The *Instructor* was a good paper, well worth double its subscription price, and had it been published at that figure, would probably have lived much longer. Any paper published for less than a paying price, must sooner or later "succumb to the inevitable," and die.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

MISCELLANEOUS.

Apiculture in Palestine.—The *Bienen Zeuchter*, of Alsace-Lorraine, gives the following from Jerusalem, which will also interest our readers:

Mr. Meyer, the venerable curate of Dingsheim, writes to us from Jerusalem, May 19th: "Apiculture is much neglected in this country. Bees which do not live wild are kept in tubes of baked earth, 16 to 18 inches long, 8 inches in diameter, and closed at one end. When a swarm has been lodged in one of these, the other end is closed with a wooden lid provided with an opening to let the bees in or out. The hive thus fitted up is set up under some poor shed. When August comes and the honey is wanted, the poor bees are smoked and smothered. An Arab offered to sell me his hives at 4 francs each. The father of the congregation of Notre Dame de Sion will deem it a duty and a pleasure to make Alsacian hives. In August, when the poor bees will be suffocated, he will buy combs to house swarms in movable-frame hives. Thanks for Bastian's Manual, which I brought with me, we will introduce here a sensible way to keep bees upon the more progressive plan, and thanks to the intervention of Mr. Zwelling, thousands of bees will hereafter be saved from the sad end which awaited them. I forward with this a few of our Palestine bees; they look very much like the Italian, but are longer in the waist. I admire their industry—always at work from 4 in the morning till 7 at night."

The Honey Harvest of Switzerland.—From the August number of the *Bulletin of Apiculture* for Italian-Switzerland, we extract the following:

The first honey crop in Switzerland was generally weak, except in a few localities of the plain, but the second, alas! has been everywhere almost or altogether nothing. Thus, in our apiary at Gryon, which had given us 550 kilog. last year, we have not been able to procure more than about 40 kilog. Mr. J. Jeker, at Sabingen, fares still worse, for his colonies have not only yielded nothing, but he will have to give them from 200 to 300 lbs. of sugar. From Friburg the reports are lamentable. Mr. B. De Vevey writes that in July colonies have starved to death, and that he and his neighbors can only keep theirs by feeding them largely. For many years we have not had a season like this. Our three apiaries, which last year gave us nearly 3,000 pounds, will not yield this present year more than 1,200, from about an equal number of colonies, and we class ourselves among the more fortunate.

Mons. Bertrand, the editor, remarks

as follows regarding sweet clover as a honey-producing plant:

We have received, concerning the white melilot, two communications, which confirm all we have said about it these few years past. Mr. H. is delighted with it; he has 8 acres of it, and his estimate is that during the whole of every day three or four colonies are gathering from this field. I was there in the evening, and they were still buzzing. Plant with it all the land you can.

Fraudulent Uses for Glucose.—Mr. L. D. Younkin, in the West Branch, Iowa, *Record*, gives the following on glucose:

A solution of glucose is often mixed with honey and sold as honey. Those buying honey that has been shipped from the East are often deceived by this adulteration. The principal gain is to the man who sells his glucose water for 15 or 20 or 25 cents per pound. Pure honey will become candied if let stand for a time, and when you see a bit of honey comb swimming about in a liquid syrup of brownish color, be not deceived, for it is likely to be glucose water with a little honey in it.

Glucose is also used extensively in the manufacture of candy. Excepting in liquors and beverages, there is no worse and more objectionable article made from it; not because of the glucose that is in it, but other stuffs, some of which in larger quantities would be poisonous. Candies are very much adulterated and should be eaten sparingly. Glucose is used in the manufacture of beer. This requires one third less barley. It is used in whisky, brandy and many wines. A little rain water sweetened with brown sugar (glucose), to which is added a third or equal quantity of alcohol, makes a coarse article of "rot-gut" whisky. Glucose is used in the manufacture of the these liquors because it is cheap and the process is rapid compared with the old way, and then because glucose will ferment, pure sugar will not.

All of these liquors thus make are very inferior articles. It is this that has been so much condemned as the adulteration of liquors.

From the fact that glucose ferments and sugar does not, brown sugar (glucose) should not be used in preserving or canning fruits, yet this difficulty cannot always be obviated, for pure sugar is turned to glucose when boiled with any acidulous fruit and is then liable to ferment.

The Ladies' Floral Cabinet, New York (\$1.25 per annum), in its October issue presents some choice reading for lovers of flowers. The literary and household departments have fresh and bright, as well as useful articles.

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

CORRESPONDENCE

For the American Bee Journal.

Wintering Bees Successfully.

JAMES HEDDON.

MR. EDITOR—In order to reply to a larger number of letters than I am able to answer privately, allow me to add still another paper to the great number already written by myself and others upon this subject.

I think that nearly all will agree, that aside from the disease known as "dysentery," "bee cholera," "diarrhoea," etc. We have little to fear in regard to successfully wintering our bees.

A knowledge of the cause of that disease or ailment, as any and all may choose to call it, would be of great aid in pointing out the cure, and with that fact in view many of us have

us, bees often fly more during a large portion of our winters than many beekeepers suppose. On account of the benefit of these flights, of pure air, the warmth and life-giving elements of the sun's rays during winter, and the fact that packing is of great benefit during the early working days of spring, I favor the out-door packing system of wintering.

The chaff-hive has a good winter record, but I have found that to get this record, it is not necessary to use hives that one cannot alone handle to advantage, and that he must lift every upper frame out, one at a time, in order to get at one of the lower frames.

I have further learned that where only eight Langstroth frames are used instead of ten, such a hive is, not only the best for the storing of surplus honey in summer, but that the winter stores it contains, will be much more accessible to the cluster of bees during protracted periods of cold. In this locality, we do not in any fall, find one colony in 25 short of winter stores, or find those stores in a false position in the hive. If we find any short of

we place one case, empty. This case we fill with chaff, or what is just as good, planer shavings, or forest leaves. It is hard to find an apiary, where one of these heat-saving absorbents are not abundant. Now place on the cover, E, with four shingle nails under each corner of it. The space thus created, is large enough to let out all moisture and not let in mice.

Now, we have packed the top of our shallow hive, and given it all the outlet for dampness needed. Now by the aid of Fig. 2, we will describe how we protect the sides, in the simplest and cheapest manner. A, shows the end of the permanent bottom board to the hive. F, the stand the hive sets in. D, the case as filled, as above described. H, our summer shade board. I, the winter bridge composed of 4 pieces, 1 piece $11\frac{1}{2}$ inches long (the inside width of the hive) by $3 \times \frac{3}{8}$, and the others $11\frac{1}{2} \times 4 \times \frac{3}{8}$, and the side pieces, each, $\frac{1}{2} \times \frac{1}{8} \times 9$. Now, let us proceed to push this bridge in its position, the points into the entrance, the piece marked I, outside for an alighting board, and the other piece, form-

FIG. 1.

FIG. 2.

thrown upon the eyes and ears of the apicultural world, theories and hypotheses, some of them seeming to bear very close relation to all the effects connected with the death of our bees. Yet none are satisfied of the true cause, and hence none have mapped out any practical, sure preventative.

Of the 14 years that I have wintered bees, with all sorts of results—my colonies numbering from 33 to 500—not one winter has passed, without a series of experiments and observations. I now fully believe, that I can winter colonies of bees with as much certainty as I can a horse or a cow.

But before any may take too much courage from the above statement, I wish to say that in my opinion the expenditure of time and money is greater than the risk we run, when our bees are prepared in the cheap and practical manner, I am about to describe.

The best methods of out-door and in-door protection have many advantages peculiar to themselves. In this latitude 42° , and South and West of

stores it takes only 24 hours time to give them 25 pounds of liquid feed, through our feeders, and they will put it in a proper position in the hive.

Now supposing that the hive is all in suitable condition in the breeding apartment, we proceed as follows:

Fig. 1, represents my modification of the 8 frame Langstroth hive, with one of the tiering cases shown. This case, D, being made to hold $28 \frac{1}{4} \times 4 \frac{1}{4} \times 1 \frac{3}{4}$ sections, without tin separators, or $24 \frac{1}{4} \times 4 \frac{1}{4} \times 2$ sections with separators, is just $4 \frac{3}{8}$ inches deep. This depth I believe to be more than ample for top packing. The honey board, C, is composed of a narrow outside frame, with 9 slats running from end to end, and the side and end pieces (outside) and 3 cross pieces, are $\frac{3}{8}$ inch higher than the slats, thus making a $\frac{3}{8}$ sink in the 4 centers of the board. It is turned over for winter (thus creating a space of $\frac{3}{4}$ over the tops of the frames), enabling the bees to better pass over the frames of comb, to get at plenty of honey at all times.

Over this honey board, or rack, we spread a piece of burlap, and on this

ing the bridge, to keep the packing out of the bee's passage-way. G, is a rim made of rough lumber, being 6, 8 or 10 inches larger, inside measure, than the hive is, outside measure, thus giving 3, 4 or 5 inches of space on all sides, to fill with packing. Sawdust preferred by me, and sawdust fresh from green logs does well, and soon dries out.

You will see by the engraving that the sides and back end are wider than the front, and they may be enough wider to come down to the ground, or no farther than shown in the engraving, as may be preferred. The hive being ten inches deep, the front end of our rim is represented as being about 12 inches, and the sides and back pieces about sixteen inches wide; any old "cull" lumber will do for this rim. When we use them as shown in the engraving, we fill in the dust till it banks up on the ground, and thus stops running down, and soon fills up. We press it snugly and fill up to the top of the rim, and the dotted line shown about two-thirds of the way up the case; this line be-

ing about 2 inches higher than the top of the rim. In a windy situation I would advise having the rim made wide enough to come to the ground at sides and back end; here we do not need it, as we have but little wind within our 8 feet board fence, and saw dust is plenty. Straw, chaff and leaves or almost any thing can be used to pack with.

Now adjust the shade board, H, as shown in the engraving, to keep the snow and rain from the packing. This board is 2x3 feet, and any moisture that drives into the top of the saw dust will dry but before it gets one inch deep; no dampness will arise 2 inches above the ground. I place a 15 lb. stone on the board to hold it there; this stone I use both in winter and summer, and it is clean and convenient to handle. We open our bees but very little between the time of packing in the fall and unpacking late in the spring, and when we are warned by outside appearances that something is wrong within, we take a bushel basket, and take out the sawdust at the top till we are below the top of the brood-chamber; by lifting the honey board or rack, the whole upper part is removed at once, and our bees examined, and aided, if any help is needed, and all replaced in a moment. You will see that though we accomplish a most thorough system of winter protection against cold and dampness, we do it, with the extra use of only 1 piece of cloth, the little bridge and the 15 or 16 feet of rough lumber in the rim, G.

Since I have been a bee-keeper, I have wintered bees in the following different ways, on quite an extensive scale: in the cellar; let alone, outdoors; put in clamps, above the surface level; in house apiary, with several modifications; in three different double-walled houses; packed in horse manure; flown in cold frames; fed with sugar, and almost every experiment, I could hear or think of; and my present opinion is that whatever the cause of this dysentery may be, its influences against us are much lessened by the system of protection in winter and spring, described in the foregoing. I feel that chances of any serious loss in winter, are now drawn to such a limit, that no further guard against it, pays its cost. I have tried to give such lucid description of the above method as would enable those who use a different style of hive, to make such slight variations as are needed to adapt the principles to it.

Dowagiac, Mich., Sept. 22, 1882.

Bee-Keepers Visiting One Another.

W. T. STEWART.

Messrs. Jones, Clark, Demaree and others have given accounts of their visits, among other bee-keepers, which have been very interesting, and now I too have been on a visit to see a brother bee-keeper and will report.

Two years ago Mr. G. W. Knight, of Ballardsville, Ky., came to me asking how to keep bees scientifically, saying

he had some bees, but knew nothing about the business, having never read any works on the subject, I loaned him one volume of the AMERICAN BEE JOURNAL besides telling him as best I could, how to proceed. Several times since Dr. Drane and I have "given him lessons" and prevailed on him to subscribe for the BEE JOURNAL. Dr. Drane and I sold him some Italian queens to start with and now I have paid him a visit. On entering his apiary I was so completely "taken in" that I have hardly gotten over it yet. Such an apiary in so short a time, and that too by a novice. He has 40 colonies, all in tip top condition; everything as neat as a pin; the best of hives, well painted, and no two hardly of one color. Bees were storing honey in boxes on every hive, in good style. He has the prettiest apiary I have yet seen. In a few years you will find him away up among the most progressive bee-keepers of the age.

That visit richly paid me; where shall I go next? I believe many bee-keepers could not spend a few days, or dollars, better than in visiting each other; every visit will learn us something useful, and then it is a real pleasure besides.

Now a few words concerning my own prospects, I have moved from town, four miles in the country, and taken in, as a partner, Mr. M. B. Moody, who knows but little about bees, but he owns nearly a thousand acres of fine land, mostly well set in pastures, and we are going to plant for honey on a large scale. Besides, we are in the small-fruit and gardening business and such another home-made location for bees and honey will be hard to find in this country; with no other bees near, we shall be able to keep our bees pure. We want no Cyprians; give us pure Italian bees, plenty of figwort, motherwort, catnip and melilot, and a good season, and we will risk the rest, for a big report.

But, Mr. Editor, don't ask me for a report, this year. I tell you what I have got "to get:" two barrels of coffee A sugar, to winter our bees on. That's my report.

Eminence, Ky., Oct. 1, 1882.

Shipping Bees to Australia.

S. MAC DONNELL.

On 22d of July Mr. Alfred H. Newman of your city, shipped to me, via San Francisco, an assortment of six queens, in four-frame nuclei. The queens were described as follows:

No. 1. A homebred American Italian.

No. 2 and 3. Prize queens.

No. 4. A Syrian queen mated with an Italian drone.

No. 5 and 6. Imported Italians.

The bees arrived on 25th ultimo by the steamer "Lealandia," and no time was lost in getting possession and giving them a fly. I ordered this assortment on joint account with a friend and we were both much pleased on inspection to find that the queens were all alive. The quantity of dead bees

was very large, and in many cases the surviving bees were much exhausted, in fact their general condition was not as good as that of the bees which Mr. Newman sent me last year, although in the present case the bees were immured for 35 or 36 days only, and in the former for 42 days. I attribute the difference in condition to the entrance having been closed, whereby the portico of the Langstroth hive was not made available as a promenade for the inhabitants. Immediately the bees were allowed to fly they exuded their feces, plentifully spotting the entrance. This did not occur last year, when, during a longer term of incarceration, the condition of the surviving bees were far better, and there was no visible dropping of feces on the first flight. Then the bees had access to the portico, covered by wire cloth.

I won the toss for first choice, in which I was guided by the manager of the Italian Bee Co., Mr. Abram, an expert holding excellent credentials from Dathe and other celebrated German bee-men. For 1st, 3d and 5th choice I selected respectfully Nos. 2, 1 and 5, and my friend Nos. 3, 4 and 6.

The exhausted condition of the bees was so much against their building up into good colonies that I united my three with three black colonies, so far successfully.

All the larvæ packed in the nuclei had not hatched out. There were no signs of their having been killed, but there were signs of foul brood.

These particulars may be useful to those having to send bees long distances.

Sydney, Australia, Sept. 1. 1882.

[Mr. A. H. Newman informs us that the nuclei were prepared by putting a partition, or division board, in the center each of three 10-frame Langstroth hives; the entrances were entirely closed, but a thorough ventilation was provided, by tacking wire cloth over the entire hive; following this were three wooden strips nailed crosswise over the top of the hive, which left about one-half of its upper surface comparatively open; a cotton cloth, doubled several thicknesses, was then wet and tucked under one of the wooden cross strips. Instructions were tacked on each hive to wet this cloth frequently on the trip. Probably too much water was used in this operation, or the brood may have been chilled, and the bees being constantly in confinement, could not remove it, but left it to putrefy in the cells.

For extended journeys, a chamber above is preferable, which gives the bees an opportunity to escape from the combs in case of accident. With the portico covered with wire cloth and the entrance left open, the queen and most of the bees are very liable to desert the brood chamber, when un-

duly excited, and cluster in the portico, where they soon chill; upon attempting to re-enter the hive, the entrance quickly becomes obstructed and the bees outside perish from starvation or other cause.—Ed.]

For the American Bee Journal.

Bee and Honey Show at St. Louis.

E. T. FLANAGAN.

The great St. Louis Fair has just closed, and was a grand success. There were over 25,000 persons on the grounds on Thursday, and it seemed as if they all visited the "Honey and Bee" department. Hundreds told me they came to the fair only to see the bees and honey, and learn something in regard to modern, progressive bee-keeping. The interest manifested was unprecedented, and was unabated from the opening, on Monday morning, till the close, on Saturday evening. Bee-keepers from all parts of the country were there, all inquiring about the improved methods of manipulating the hive, making and using comb foundation, sections, etc., the relative value of the new races of bees now being introduced, etc.

I took down the names of over 550 *bona fide* bee-keepers, and a great many promised to take the BEE JOURNAL at the beginning of the year; but few of our prominent bee men were on the grounds as they were all probably at the Cincinnati Convention. I heard Judge Andrews, of Texas, was present on Monday, but, unfortunately, I did not make his acquaintance.

Mr. Armstrong, of Jerseyville, and Mr. Barber, of Bloomington, Ill., had exceptionally fine displays of honey, and the former obtained a full share of first premiums, and deservedly, too, as his display would be hard to excel.

The Fair management were pleased with the display, and seem disposed to deal more liberally in the future with the bee-keeping fraternity, and I am sure they can afford to do so, as it will do much to develop a growing industry, for which Missouri is well adapted, but in which, at the last and greatest fair ever held, and which is really a National institution, she had not an entry, and her sister State of Illinois carried off all the premiums. Belleville, Ill., Oct. 9, 1882.

For the American Bee Journal.

How I Managed my Bees.

D. HIGBEE.

The season of 1882 is over, so far as the labors of the little busy bee are concerned. To me, the year has been satisfactory, though I am only engaged with bees in a small way.

I started in the spring of 1882 with 5 hybrid-Italian colonies and two nuclei. I sold one colony in July for \$10, and increased to 17, and took over 800 lbs. of comb honey. The most of which has been sold at 25 cents per pound at home. The nuclei were very

weak and drew heavily on the colonies to build them up. I offset them in the count against the colony I sold, and therefore call spring count 5 colonies which would give me a yield of honey for each (spring count), 160 lbs. comb honey or \$40 each, besides the increase of colonies.

I use the 2-story Langstroth hive. I put the top stories on when the dividing was done and the bees were all equalized, and each was full below. Then I put on the upper stories and raise to the upper story one-half of the frames from below, and put in frames above and below, empty frames alternating with full ones. This started the bees with a boom above as well as below. In ten days I returned the old frames to their places below, and put the new combs all above, I never saw bees work faster than they did to finish up the combs above, but I found that the queens would work both above and below, and I was troubled till September by brood in many of the combs above, that I designed for surplus—causing some of the combs when filled, to be dark and unsalable. I used a few 2-lb. sections; these generally were foundation and were free from brood but not uniform in shape.

This is comparatively a new business to me. If any one will tell me how, with the Langstroth hive, to still get the same quantity of honey but in better shape for market, and the quality to be of the first grade, they will help me out of my difficulty. Perhaps I should have used separators. I will never be satisfied until my honey shall be both in shape and quality first class, and if possible a large yield.

Avoca, Iowa, Oct. 10, 1882.

For the American Bee Journal.

Use of Onions when Uniting Bees.

PROF. S. J. ROBBINS.

I am exceedingly interested in letters published asking and giving information; oftentimes the very questions answered are the ones I would ask. Last year, in reading some of the discussions at Bee-keepers' Conventions, (I do not remember which one) one gentleman said, in uniting bees, he took slices of raw onions and put in the colonies to be united, the night before, and the next morning put them together. The bees all smelling of onions, there was no fighting. I have done this repeatedly with the best of success and I desire to thank the gentleman, although I don't remember his name, for it has been worth much to me. Last month I received two beautiful dollar queens from Kentucky. After receiving them I put them into Peet combination cages and having secured two black queens I placed a caged Italian in each queenless colony. After two days I examined and found one of the queens liberated and all right; the other I found in the cage dead; also the bees that came with her. There had been no effort to liberate her. We had a small nucleus in the yard, and Mrs. R. put a piece of onion in it and

a piece in the hive with the dead queen. After two or three hours, the comb from nucleus with queen and bees were put in the hive and "everything went merry as a marriage bell." No disturbance among the bees; and the queen went right along as though she had always been there. Now if bees go entirely by scent, why not make the queen and bees smell like onions, and put them in without any cage? Will any one tell us if they have tried this? Why did the queen and bees die that were eaged on a comb where they could get honey and should have lived a long time, even if the bees did not liberate them? We have had a very poor season for bees about here; scarcely any surplus honey, but they have a plenty for winter.

Penfield, N. Y., Oct. 6, 1882.

[They were evidently exhausted or fatally injured by the journey in some way.—Ed.]

For the American Bee Journal.

Bee-Keeping in Utah.

JOHN DUNN.

I like the BEE JOURNAL very much, it is of much benefit to me. I have taken from my bees this year, up to the present date, 30 gallons of extracted honey (we don't go much on comb honey), and still the bees are at work every day it does not storm; we have had a few cold storms that has kept them in. The mountains are dressed now with part of their winter covering; the leaves are turning yellow and red, and are beautiful to look upon, if we are only prepared for the cold embrace of "King Jack." I find quite a lot of young brood in all 7 hives, and am only able to take off one top box. I had only 3 hives with them on; the other 2 I was not able to take off, for when I took the frames of filled honey, in them, the bees would cluster on the sides of the box, so that I gave them some empty frames to cluster upon and will let them rest until I prepare them finally for winter. There is a plenty of surplus honey left in the hives to last them for the winter. I have taken more honey from one hive top in one week than some of the bee men have taken for a whole year. I intend to give it more of my time, so that I can get more honey than I have done even this year, if I should not lose all, as I did last winter. The bees are now in better condition, and they are better bees. Italians have proven themselves to be the best, and I have given to bee men here many queens, when I should have been looking after honey, but I am satisfied that I have done my own share of improving my neighbor's stock, and would have been pleased if I had been able to have done more. I have found 2 fertile queens in one hive, apparently at home, for when I undertook to take one out, I had to cage quite a number of bees with her, and they fed her before they could be forced to leave her. Toole, Utah, Oct. 3, 1882.

Local Convention Directory.

1882.	Time and Place of Meeting.
Oct. 18, 19—	Northwestern, at Chicago, Ill. C. C. Coffinberry, Sec., Chicago, Ill.
18, 19—	Southern California, at Los Angeles. J. E. Pleasants, Pres., Anaheim, Cal.
21—	Northern Ohio, at Norwalk, O. S. F. Newman, Sec., Norwalk, O.
Nov. 1—	New Jersey & Eastern, at New Brunswick. J. Hasbrouck, Sec., Bound Brook, N. J.
3—	Iowa Central, at Winterset, Iowa. Henry Wallace, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

THE NATIONAL CONVENTION.

The 13th Annual meeting of the North American Bee-keepers' Society, met at Cincinnati, O., on Friday, Oct. 3, 1882, and was called to order at 9:30 a.m., with Prof. A. J. Cook, of the Agricultural College of Michigan, President of the Society, in the chair. Dr. Ehrick Parmely, of New York, the Secretary of the Society, being absent, Mr. A. I. Root, of Medina, O., was chosen Secretary pro tem.

On the front of the stage were arranged a number of improved implements for bee culture, consisting of hives, smokers, extractors, foundation machines, and numerous samples of honey.

The Vice Presidents reported as follows:

D. A. Jones said the honey crop of Canada is not over 50 per cent, and is dark and not up to the standard. Many colonies will have to be fed: he had purchased 50 barrels of granulated sugar for feeding this fall.

Judge Andrews reports an excellent crop from Texas. He has 125 per cent of an increase, and an average of 100 lbs. of honey per colony.

Dr. C. C. Miller, of Marengo, Ill., started, last spring, with 174 colonies, increased to 202, and obtained 15,000 lbs. of comb honey in 1 lb. sections.

Dr. J. P. H. Brown, placed the honey crop of Georgia at about 26 lbs. to the colony. One colony yielded 350 lbs. of extracted honey.

Mr. J. C. Peden, of Kentucky, reported that the prospects in his section, at the beginning of the season were excellent, but the cold and rainy weather in the middle of it had cut the crop short, being only an average of about 15 to 20 lbs. per colony.

Mr. Wm. Williamson, of Lexington, Vice President from Kentucky, made substantially the same report.

Dr. O. M. Blanton, of Greenville, Miss., reported great success of the Mississippi bee-keepers. One had 3,745 pounds of comb honey and 1,500 pounds of extracted honey. He himself had 256 colonies of bees, and had 23,000 pounds of extracted honey, besides some 600 pounds of comb honey. A gentleman living across the river from him in Ark., had received 538 pounds of extracted honey from one hive alone. The Doctor had observed that his bees gathered a very good quality of honey from sorghum and the tassels of Indian corn.

Mr. C. F. Mnth reported that the finest honey he had secured this season was from Florida, and that he was informed of an enormous yield there.

Mr. O. O. Poppleton said that he estimated the average yield for Iowa to be 75 lbs. per colony, and the season had been a prosperous one for bee-keepers generally.

Mr. C. Grimm, had reports from 25 bee-keepers of Wisconsin, who had 3,025 colonies of bees, an average yield of 60 lbs. of surplus per colony, being 181,500 lbs. from them all. The increase is 80 per cent. Wisconsin has 50,000 colonies of bees, but his report is only from 3,025 or one-sixteenth of the whole.

W. M. Vinson reported from 22 beemen of Dakota, only a half crop; 267 colonies gave only 10,982 pounds of surplus.

Jonas Scholl said bees in Indiana had done well for themselves, but not for their owners. Much increase but not over 10 lbs. of surplus per colony.

Mr. Vandervoot reported a very peculiar season in Pennsylvania. The outlook had been good, but cold weather in July had done such damage that he had been compelled to feed bees to keep them from starving. The yield of buckwheat honey was good, but the general yield small in all portions of the State. From 175 colonies he had an increase of 12 swarms, and an average of 20 to 25 lbs. of honey per colony.

Mr. Morehouse, of Michigan, said bees in his section had wintered well and the fruit bloom yield had been immense. He had noticed greater production from swarms than from old colonies. The average yield of honey was about 40 pounds per hive.

Mr. E. T. Lewis, of Toledo, reported a very extraordinary yield in South-eastern Michigan and Northeastern Ohio.

The President had found the increase of bees in Central Michigan to be about 150 per cent, and the surplus honey at about 80 pounds per colony.

Mr. J. M. Hicks, of Indiana, reported that he had averaged 500 lbs. of honey per colony on alsike clover, and J. C. Carroll, of Dallas County, Texas, through a friend, reported from one of his Cyprian colonies a yield of 1,000 lbs., which was declared to be the largest yield ever known.

Mr. F. Della Torre, of Maryland, exhibited a small bottle of colorless honey from his apiary near Baltimore, which, he stated, was readily sold

there at 35 cents per lb., and that he was unable to account for its want of color, but that its consistency was good and its taste delicious. The exhibit excited much comment.

Mr. H. L. Jeffrey reported that Conn. has about 80,000 colonies of bees, of which 95 per cent are in box hives, etc., and two-thirds of them have not honey enough for winter.

J. A. Morton, of Maine, said that 9 of the best counties had 10,000 colonies of bees, but being kept in old-fogy style, 30 per cent died in winter.

Wm. Muth Rasmussen estimated the average crop of honey for California from 25 to 30 lbs. per colony.

Mr. R. S. Musser reported for Missouri, that bee culture was on the increase, but he had no definite figures at his command.

Mrs. L. Harrison said the honey crop of Ill. has been the best for 12 years, and is still continuing.

Dr. J. E. Lay, of Texas, gave a graphic description of bee culture in the Lone Star State. During the season, when horsemint bloomed, his bees would touch nothing else. Horsemint never failed to bloom; winter couldn't kill it, nothing on earth would eat it, and the only use it could be put to was to season sausage and give honey. He began with 15 colonies and increased to 55, and had secured 300 pounds of honey from each of his colonies.

Mr. Harrington, of Ohio, said he had heard so much about Texas that he intended to load his bees on a train, snap his fingers at the Northern blizzard, and winter in the Lone Star State.

After the laughter had subsided, upon motion, Dr. C. C. Miller, of Illinois; Judge Andrews, of Texas, and Mr. Poppleton, of Iowa, were appointed a Committee on Statistics, and the convention adjourned for dinner.

AFTERNOON SESSION—FIRST DAY.

The Convention was called to order at 2 p.m., and after the reception of new members, Mr. O. O. Poppleton's paper on Chaff Hives in Winter was read by the President, the author, though present, suffering from a serious affection of the eyes. [This essay may be found on page 629 of the BEE JOURNAL for Oct. 4.—ED.]

Mr. Christopher Grimm favors cellar wintering. He prepares his bees early, and they need no care afterward; uses sub-earth ventilation; has hives open full size of entrance, and one-quarter inch at top, full width of hive. Cellars will not get too warm, if too many bees are not put in.

C. C. Miller has most trouble in cellar wintering just before taking them out in spring.

D. A. Jones explains sub-earth ventilation, and says he keeps his pipes clear of cobwebs, etc., by firing a musket in at one end. The pipes are 100 to 150 feet long, and about 6 by 6 inches, for 100 colonies. Would by all means use sub-earth ventilation, as it keeps bees dry.

Prof. Cook strongly advocates cellar wintering and sub-earth ventilation. The exit pipe should be only about half the diameter of the sub-earth pipe.

Mr. Jones advises one square inch for each colony for the ventilating tube in the cellar.

G. G. Large reports 10 lbs. of honey consumed by colonies not packed in chaff, and 4½ lbs., chaff-packed, in out-door wintering.

C. C. Miller has not had the same experience.

Mr. Grimm uses S-frame hives.

Mr. Jones favors chaff and cellars combined; he has swept out from 1 to 1½ bushels of dead bees from 150 colonies.

Rev. L. Johnson says dark and light Italians are like dark and light men; he does not think that color makes any particular difference.

Mr. Pond, jr., of Foxboro, Mass., being absent, his paper on Advancing the Science of Apiculture was read by the Secretary. [This essay may also be found on page 630.—Ed.]

EVENING SESSION—FIRST DAY.

Secretary Root read a paper on Honey Plants and Their Culture. Dr. J. P. H. Brown, of Augusta, Ga., then read a paper on Honey Plants of Georgia, exhibiting specimens. He was tendered a vote of thanks, and requested by a unanimous vote to put it into suitable shape for publication. Mr. Peden, of Kentucky, at the request of the convention, made a few extemporaneous remarks on the Honey Plants of Kentucky, and was listened to with strict attention. Mr. D. A. Jones, of Ontario, Canada, then read, by request, a paper on Honey Plants of Canada.

MORNING SESSION—SECOND DAY.

Assembled at 9 o'clock. President Cook delivered an address on Experiment with bees, and the Secretary read a paper on Methods of Obtaining Queen Cells for Nuclei, furnished by Mr. Paul L. Viallon, of Louisiana, who was unable to be present. [Prof. Cook's address may be found on page 626 of the BEE JOURNAL for October 4.—Ed.]

Mr. Kleinow, of Michigan, invited the Convention to meet next year in Detroit. Mr. Jones, of Canada, suggested Toronto, offering the additional inducement of a free hall. Dr. Miller suggested Chicago, and was also willing to hire a hall. Mr. Shaw, of Indiana, presented the claims of Indianapolis, with the unanimous request of the State society, who could furnish free the rooms of the State Board of Agriculture. He could do even better than his predecessors, for a lady member would arrange for the free entertainment of the ladies who would attend the convention. It was voted to hold the next annual session in Toronto, Canada.

Dr. J. P. H. Brown, of Georgia, then read a paper on Rearing Queens, which will be published in a future number of the BEE JOURNAL.

The following were elected as the officers for the ensuing year:

President—D. A. Jones, Beeton, Ont.

Secretary—A. I. Root, Medina, O.

Treas.—C. F. Muth, Cincinnati, O.

Vice Presidents:—W. S. Hart, New Smyrna, Florida.

Dr. J. P. H. Brown, Augusta, Ga.

Dr. C. C. Miller, Marengo, Ill.

J. M. Hicks, Battle Ground, Ind.

O. O. Poppleton, Williamstown, Ioa.

P. Seovel, Columbus, Kansas.

Rev. L. Johnson, Walton, Ky.

P. L. Viallon, Bayou Goula, La.

A. G. Mason, Maine.

F. Della Torre, Reistertown, Md.

J. T. Davis, Shelburn Falls, Mass.

Prof. A. J. Cook, Lansing, Mich.

Dr. O. M. Blanton, Greenville, Miss.

E. M. Hayhurst, Kansas City, Mo.

Prof. J. Hasbrouck, N. J.

G. M. Doolittle, Borodino, N. Y.

Dr. H. Bessie, Delaware, O.

J. Vandervort, Lacysville, Pa.

H. Hammond, S. C.

J. T. Wilson, Tenn.

W. H. Andrews, McKinney, Texas.

A. E. Manum, Bristol, Vt.

J. L. Bowers, Va.

C. Grimm, Jefferson, Wis.

AFTERNOON SESSION.

The afternoon was passed by the society at the Exposition, where machines for honey production were exhibited in Power Hall, comb foundation being manufactured and distributed among the spectators.

EVENING SESSION.

In the evening the new officers took their official positions, and Mr. A. I. Root, of Medina, O., read a paper on Courtesy in Journalism, deploring the bitterness of many scientific controversies, and expressing the hope that for the future acrimonious controversies be dispensed with, in bee periodicals. A resolution to that effect was thereupon adopted.

Dr. C. C. Miller then read Mr. G. W. Demaree's paper on Control of Fertilization. [See page 628, for this essay.—Ed.]

Dr. C. C. Miller then read another paper by Mr. Paul L. Viallon on Experiments in Comb Building, which was published on page 627 of the BEE JOURNAL.

MORNING SESSION—THIRD DAY.

The Convention assembled at 9 a.m. and was called to order by President Jones.

A letter was read from Dr. Parmley, of New York, enclosing \$50 for the Rev. L. L. Langstroth, and this was increased to over \$100, by the persons present.

The evening meeting of the day previous had adjourned in the midst of an interesting discussion on Comb Building, which was resumed and carried on for some time.

President Jones announced that he desired to offer a paper on How to Cure Foul Brood, and that Mr. C. F. Muth desired to read another on the same subject.

The papers were thereupon read, and a spirited discussion on the subject ensued.

Prof. Cook said that salicylic acid was wonderfully potent in preventing fungoid growths, and mentioned the fact that a quart of mucilage will sour in a very short time in summer, but if a pinch of the acid be put in, it will remain unchanged for months. All agree that foul brood is a terrible thing in an apiary, and very much to be dreaded.

Mr. C. Grimm said that is best to burn both the hives and bees, saving only the queens. Nearly all agree that if the queen is unaccompanied by workers she will not communicate the disease. A queen cannot be reared in a colony that is afflicted with foul brood.

Prof. Cook gave some instructions concerning the disease, demonstrating how it may with certainty be invariably recognized.

Both of the papers that have been read suggested remedies, but Mr. J. M. Hicks, of Indiana, stated that, acting on the principle of an ounce of prevention being worth two or three pounds of cure, he had for 13 years set out a dish containing a solution of rock salt and water near his hives for the bees to drink from, and that his apiaries had been entirely free from the disease, while his neighbors suffered severely.

Dr. C. C. Miller, read his address on "Comb vs. Extracted Honey," which may be found on page 631, of the BEE JOURNAL for Oct. 4, and it was then discussed as follows:

C. F. Muth said he could get two or three times as much extracted as comb honey.

J. S. Hill thinks he can get twice as much.

Dr. Miller thinks not very much more.

G. G. Large said he could get three times as much extracted honey as he could of comb honey; and the former pays better at 10 cents per pound than the comb honey does at 20 cents per pound. From 70 colonies he obtained 6,000 pounds of extracted honey and 3,000 pounds of comb honey. Colonies made up from a single comb, in the spring, gave 100 pounds of extracted honey, besides making a full-sized colony.

D. A. Jones strongly favored the extracted honey, and said he could get from three to five times as much as he could of comb honey. He said he could make \$5 to \$1 over comb honey. It is aggravating to ship comb honey, but extracted honey will ship safely anywhere.

Dr. Miller, in 1881, increased 12 colonies to 81, and obtained 1,200 pounds of comb honey.

Dr. O. M. Blanton said that the value of the comb saved by extracting was worthy of very careful calculation.

D. A. Jones said that sections that were not square should be put on the hives in such a manner as to be the longest up and down; it is still better to reverse them after they are half sealed.

AFTERNOON SESSION.

President Jones described his manner of dipping, in order to obtain the sheets of wax all of one thickness, by using a dipping-board about two feet long and alike at both ends. After dipping once, he dips it again with the other end down, and in this way he obtains a long sheet of even thickness.

Mr. J. M. Hicks, Battle Ground, Ind., gave the following address:

It affords me much pleasure, as well as satisfaction to meet with the members of this great Society, now holding its 13th Annual Session. We see a few of those who met with us in our first organized meeting, and yet we see with regret some vacant seats, made so by the hand of death. The old veterans in apiculture, Quinby, Hamlin, Otis, and also more recently the lamented A. F. Moon, all of whom were members of this Society, actively engaged and much interested in the science of apiculture.

Time will not permit me to go into detail concerning all the good and noble traits of character of those who once met and occupied their seats with us and took part in the free discussions of this Society, composed as it was for years of some of the brightest intellects of the North American continent. Here it is that we have a free discussion of all important questions, as well as an interchange of views, thoughts and best plans for the proper management of our little pets, the bees; yet we often find ourselves differing in some of the appliances to be used. But one universal opinion prevails among all practical bee-keepers, that is, all who can expect to succeed, must adopt and use a good movable frame hive—one in which bees can be easily handled, causing as little irritation as possible to the bees.

We shall not discuss the merits or demerits of any particular hive, well knowing this is not the proper place.

We now come to the subject that should interest all who attempt to keep bees for profit—that of honey-gathering and the proper management of bees, for breeding queens of undoubted purity. It is a well known fact, that pasturage has a great deal to do with the success of an apiary. All of these lessons are of vast importance to the bee-keeper who expects to become master of his or her profession, and succeed in this, one of Nature's most beautiful departments of labor.

We have been for many years a student around the bee hive, among the bees, for the purpose of learning all we could of their wonderful workings and yet we find a rich reward for all pains taken in their behalf, as well as our own knowledge much advanced in the science of apiculture.

Let me now say a few words by way of advice to those who may be thinking of this particular branch of business as a calling or occupation, in future years. I especially address myself to the mere novice. There are many locations yet unoccupied that would well repay all diligent

and industrious workers in this occupation. It is now estimated that we have at present 250,000 bee-keepers engaged in this branch of business in the United States, and yet there is (on Uncle Sam's farm) plenty of room for as many more, yielding millions of revenue, making ourselves more happy and prosperous, and we should have the satisfaction of knowing that we could save many million pounds of honey that is now being lost every year, for the want of more bees to gather the rich stores contained in the bloom of Nature's fields, thereby supplying our tables, as well as many of the tables of our rich cousins, across the briny deep, who are just beginning to realize the fact of the magnitude of this branch of agriculture as now carried on in the United States.

In this, as well as many other countries, bees seem to be stirring up quite a lively interest, causing the people to meet in State and National bee meetings in almost every part of the civilized world, in order to advise, counsel and plan for more successful methods in the management of the honey bee, for the good of man.

Mr. J. S. Terrill, of Ridgeville, O., explained how he obtained the statistics of his County: He mailed letters, each containing a postal card addressed to himself, to every postmaster in the county, and requested him to write on it the names of all the bee-keepers getting their mail at his office, and mail the card back to him. Now, by mailing similar cards to all the bee men, with a printed request and blanks to fill out, he obtained nearly a full report of all the bees in his county, as well as of the honey produced. This list of names he says is worth all it has cost him, and may be used to advantage for calling conventions, or any other purpose for which it may be desired, pertaining to beekeeping.

The committee on exhibits then made its report:

The most important of these exhibits were the honey extractor of Mr. C. F. Muth, and the comb foundation machines of Messrs. Vandervort, A. I. Root, Wm. C. Pelham and C. C. Van Deusen; the honey knives of Messrs. Bingham & Hetherington, and Jones; the smokers of Messrs. A. I. Root, Bingham & Hetherington, Scovell & Anderson; the cages for shipping queens by mail by Messrs. A. I. Root and I. R. Good; the bee tent and observatory hive of Mr. A. I. Root; the straw mat of Mr. C. F. Muth; the beautiful honey labels for packages by Mr. D. A. Jones; the "A B C of Bee-Culture," by A. I. Root; "Manual of the Apiary," by Prof. A. J. Cook; the AMERICAN BEE JOURNAL and *Gleanings in Bee-Culture* were warmly indorsed. The rare and beautiful packages of honey, both in comb and extracted, were as follows: From Florida, Tennessee, Nebraska and Mississippi; C. F. Muth, of Cincinnati; Dr. J. E. Lay, Texas, and Dr. Bessie, of Delaware, O.; the microscopic observations of dry feces, and

of pollen, exhibited by Prof. Cook, and plants by Dr. Brown, of Georgia, were especially mentioned. Especial attention was called to the bee tent of Mr. Root, for preventing robbing; the honey sent from Volusia County, Fla., and the displays of Mr. L. Testor, of Nebraska, and Judge Andrews, of Texas.

The committee on statistics submitted the following report from 53 of the members present, a recapitulation of which is as follows:

Total No. of colonies last fall . . .	3,489
Average No. of colonies to each member	66
Colonies lost in winter	66
Colonies lost in spring	144
Colonies beginning the season . . .	3,087
Colonies devoted to other purposes than honey	636
Colonies at present working	4,748

Production—	Pounds.
Total comb honey	47,451
Average for each owner	895
Average for each colony	15½
Total extracted honey	99,808
Average for each owner	1,883
Average for each colony	32½
Total production both kinds . . .	147,259
Average per owner	2,778
Average per colony	48

The Convention then passed resolutions of thanks to the proprietors of the hall for its free use, and to Mr. C. F. Muth, for his great kindness in entertainment. Also to the Railroads, the exhibitors, and to the retiring president, Prof. A. J. Cook, for the faithful discharge of the many duties devolving upon him, during the past year.

The Convention adjourned to meet in Toronto, Canada, next October.

The Union Bee-Keepers' Association of Maryland, Virginia and West Virginia, will meet at Hagerstown, in the room of the County Commissioners, at the Court House, on Wednesday, Oct. 18, 1882, at 1 o'clock, p. m., the session to last two days. The Washington County Fair will then be in progress, which will give persons an opportunity to attend the exhibition. All persons intending to go will please drop me a card, so that I may secure for them half-fare rates.
J. LUTHER BOWERS, Sec.

The Iowa Central Bee-Keepers' Association will hold its annual meeting at the office of Graham & Steel, Winterset, Iowa, on Friday Nov. 3, 1882, at 10 a. m. All interested in bee culture are invited.
HENRY WALLACE.

The fall meeting of the Northern Ohio Bee-Keepers' Association will be held in Whittlesey Hall, Norwalk, O., Saturday, Oct. 21, commencing at 9 a. m. A full attendance is solicited, as it will be a meeting of more than usual interest. Principal subject for discussion: "How shall we winter our bees without loss?"
S. F. NEWMAN, Sec.

For the American Bee Journal.

The National Convention.

The Association adjourned in the afternoon of the 5th inst. after a pleasant, harmonious and instructive meeting, to meet again in Toronto, Canada, next fall. A larger number of members had collected than I had observed at any previous meeting. Before adjourning, a number of our members concluded to visit the apiary of Mr. J. S. Hill, at Mt. Healthy, about 10 miles from our city. Accordingly a large wagon was procured (a music-band wagon) with 4 gray horses to it, for our journey the next morning. Dr. Brown and wife and Mr. Poppleton and wife (the only ladies in the crowd) took the lead in a carriage. Our reception was one worthy of our friend Hill, his good wife and fair daughters. We went over friend Hill's apiary, every part of which is always in good order, examined his hives, colonies, tools, criticised young queens with their mothers and grandmothers, etc., and no doubt, every one made a note of some item of interest to himself. We next partook of a royal dinner and in the afternoon we bade farewell to our kind host and his interesting family. When we arrived home, we were in the best of spirits and every one appeared to be more than satisfied with the success of the day.

A Langstroth fund was made up of \$53.25 and the money duly forwarded to Mr. Langstroth on the same day by the treasurer.

When my essay on "foul brood" was read, Mr. D. A. Jones followed it. A lively discussion ensued. Mr. Jones said that he had cured foul brood by the starving process. I had tried it but had not succeeded. I had related my method, of late. I discovered the causes of my repeated re-infections, etc.

Mr. Bingham stated that about 20 years ago he had foul brood in his apiary, and that he simply cured it by the starving process; that I had never cured it, my apiary being afflicted now for 10 years, or more, showed it plainly, etc.

Thinking of the subject matter only I was the last one in the room to notice Mr. Bingham's remarks. A friend remarked afterwards that Mr. Bingham's was the only unpleasant language used during the Convention.

Mr. Jones was honest in his assertion, but one of Mr. Bingham's old neighbors stated that he had serious doubts of Mr. Bingham's ever having had the real foul brood in his apiary.

Mr. Jones offered that if Prof. Cook could not cure foul brood by the starving process, following his directions, that he would pay \$50.00. I offered to furnish the diseased colony and a wager of \$50. that Prof. Cook cannot cure it in that manner; the money to be added to the Langstroth fund. The wager was accepted. The money will be well spent and the public will profit thereby.

C. F. MUTH.

Cincinnati, Ohio, Oct. 9, 1882.

The Northwestern Bee-Keepers' Convention will meet at Chicago, Ill., on Wednesday and Thursday, Oct. 18 and 19, 1882. The office of the American Bee Journal has been kindly tendered as a place of meeting. A cordial invitation is extended to all bee-keepers, and especially those of the Northwestern States, to be present. The meeting takes place during the last week of the Inter-State Industrial Exposition, to enable all to obtain reduced railroad rates. First session at 10 a. m.

C. C. MILLER, Pres.
C. C. COFFINBERRY, Sec.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning County, in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

LEONIDAS CARSON, Pres.

The Southern California District Bee-Keepers' Association will hold their annual Convention in Union Hall, Los Angeles City, Oct. 19, 20, 1882, during the week of the Agricultural Fair. The Convention promises to be of so much interest that no bee-keeper should miss it. Ladies are pressing invited to attend.

J. E. PLEASANTS, Pres.

SELECTIONS FROM OUR LETTER BOX

A Land Flowing with Honey.—No frosts yet and my bees are now gathering from heartsease that came up in the stubble since harvest. Why don't some enterprising person, from the clay hills, come out here where he can buy land cheap, and sow 160 acres of sweet clover seed and make a fortune with bees and honey?

JOSEPH SAUNDERS.

Reynolds, Neb., Oct. 3, 1882.

Bees in Kentucky.—I am a beginner in the bee business; started in the spring with 12 colonies, all blacks and mostly in box hives; I increased to 30 fair colonies, by artificial swarming, with the exception of 2 natural swarms and have taken some surplus honey. The season for honey was very poor on account of so much rain. I have bought and introduced 6 Italian and 1 Syrian queens. My bees are mostly in the standard Langstroth hives. Please name the following flowers: No. 1 grows about 4 to 5 feet high has yellow bloom, and is found in old fields; it has been in bloom about 2 weeks and is still blooming; the bees are working on it every warm day. No. 2 grows

2½ to 3 feet tall, has a pink flower and is found mostly in woods and orchards; the bees are working on it all day. Please name quality of honey.

C. T. BIGGERS.

Minerva, Ky., Oct. 1, 1882.

[No. 1 is one of the family of gold-ens rods. No. 2 is an aster. Both yield excellent honey and plenty of it.—ED.]

A Large Yield.—This was one of my best honey seasons since I began bee-keeping, which is now 6 years ago. I commenced this spring, with 15 colonies, in fair condition; increased to 32, and took 1800 lbs. of comb honey and over 200 lbs. of extracted; have used about 25 lbs. of comb foundation which was a great help in getting so large a crop of honey from so few bees. My best colony yielded over 200 lbs. of comb honey counting in the increase, 1 swarm. My comb honey is all in sections. I have sold all but 400 lbs. at 15 to 18 cents per lb.

H. T. HARTMAN.

Freeport, Ills., Oct. 10, 1882

Few Bee Men There.—If I should say I was surprised, it would not half express my mind. I have more than ever satisfied myself that bee-keeping is in its infancy and that there is still vast tracts of territory unoccupied by bee-men and enough honey evaporated by the atmosphere to supply every family in this broad land of ours with all the honey they could use. In attending 3 fairs—Mendota, Princeton and Wenona—I met less than 10 men interested in bee-keeping, and the fairs were largely attended by all classes. My bees have been on a strike for a week or so. We had a light frost on Sept. 25, that seemed to discourage them, but they have now all gone to work in the sections again. The weather is very fine for this season and should it last so a few days, the bees will finish capping much honey that is now unfinished. The fall has been favorable and bees have done very well.

H. S. HACKMAN.

Peru, Ills., Oct. 2, 1882.

Another Good Report.—I did not intend sending in my report yet, as we have some honey yet coming, but noticing the good report of Wm. Malone, and your desire for those that have done as well, to "rise and explain," I send in a little report. I commenced the spring with 27 weak colonies of black bees and one good strong colony of Italians. I used but little foundation; have extracted 6,250 lbs. of honey; have a few hundred pounds on the hives yet, and have increased to 75.

THOS. BALCOMB.

Luling, Texas, Oct. 5, 1882.

Very Well Paid.—My bees have paid me well this summer for my time and labor. I put 15 colonies into winter quarters, last fall, and took out the same number in the spring. They have given me a surplus of 2,800 lbs. of honey, 1,000 lbs. in sections and 1,800 extracted. My colonies now number 35.

J. O. TODD.

Richmond, Iowa, Oct. 9, 1882.

Food for Shipping Queens.—On the 13th of September (if I am wrong in dates I hope the parties will correct), Mr. I. R. Good, of Nappanee, Ind., sent a cage of bees, rationed with the above food, to Prof. Cook, Lansing, Mich. The Professor remailed them to Mr. Paul L. Viallon, of Bayou Goula, La., with the request to remail them to me, to bring to the Convention at Cincinnati. I left home before they arrived, but my assistant informed me that they were taken from the postoffice on the 26th—13 days after they first started on their tiresome journey. One side of the cage contained a queen and a few workers, alive and in good condition; while the other side contained only workers, which were all dead. Both parts of the cage had still plenty of food; but in the part containing only bees, the entrance to the food was blocked up by dead bees. The above, I consider a severe test of the mixture, and speaks well for it. The desired improvement would seem to be—greater accessibility to the food.

J. P. H. BROWN.

Augusta, Ga., Oct. 10, 1882.

[We received a similar cage of bees from Mr. Good, and sent them to Dr. Howard, of Texas, on Aug. 26. They were received by him all alive (not one bee dead) on Aug. 30, and he returned them to this office, where they were received Sept. 4th, 2 bees only being dead. We sent them back again to Dr. Howard, Sept. 5th, and he received them Sept. 9, when 5 of the bees were still alive, after a confinement and constant travel of 4 weeks. Dr. Howard then filled the cage with food of his own preparation and a fresh lot of bees, and sent them to this office. These came in good order and we sent them to Dr. Brown, Augusta, Ga., and he sent them back to Dr. Howard.

Mr. Henry Alley has also sent some bees with food prepared by himself. These were forwarded to Mr. C. F. Muth, of Cincinnati, O., and they were, by him, sent back to Mr. Alley. They had been queenless for several weeks and we doubt not but that better results would have been obtained had the bees been taken from a colony having a good queen.

My. Alley remarks as follows on the "Good" food, and the manner of using it:

I do not think the bees starved, but died from long confinement. You probably noticed that I inclosed the "Good" food in paper when the cage was prepared—there were no loose grains in the cage when it came back. If that one trouble can be obviated I shall call the "Good" food, perfect. Perhaps, by putting paper about the food, or inclosing it in something so that the cage will not absorb the honey, the grains of sugar will not

rattle off so much. Of course the bees cannot use the sugar, as they have no water to dissolve it. I think bees will soon be excluded from the mails if the "Good" food is used as it has been; complaints will soon be made about so much sugar in the mail bags—those who use a sponge will have to be careful not to get on too much honey, as it will run out and soil the mail. Wooden cages should be coated with hot beeswax and rosin in the cavity, where the food is put.

Bee and Honey Show at St. Joseph, Mo.—We had a good bee and honey show here. There were about 2,000 lbs. of honey, 6 nuclei and 5 colonies of bees. The premiums were many and large, and the interest was more than double that of last year. Thousands of people said it was the best bee and honey show they ever saw. Many traveled hundred of miles to see our display, and went home well pleased with what they had seen. In 1879 I showed one colony of bees, and I with others had about 25 lbs. of honey—so we think we have done well, but we will try to do still better next year. May the BEE JOURNAL live till glucose and dollar queens shall be numbered with the past; then may the JOURNAL and its editor still live to bless our bees and us.

D. G. PARKER.

St. Joseph, Mo., Oct. 14, 1882.

An Excellent Report.—Commenced the season with two colonies; increased to 5, and have obtained 200 one pound boxes of honey. I took 65 from one colony. The fore part of the season was very poor; the honey is of prime quality.

B. W. PECK.

Richmond Center, O., Oct. 12, 1882.

Almost a Failure.—Honey is almost a total failure here this year. I did not get surplus enough to pay expenses. Have 50 colonies in good condition for winter.

W. H. FRANCIS.

Frankfort, Mich., Oct. 11, 1882.

Yellow Variety of Sweet Clover.—I had an acre of sweet clover in bloom, the past season, among which were a few stalks of the yellow variety. I watched curiously to see if the bees made any distinction. To all appearances they worked upon the yellow with the same satisfaction as upon the white. There seem to be two varieties of the white, one with a pure white blossom and light green stem; the other a pale pink blossom and dark green stem. As I sowed imported and native seed mixed, I surmise it might have occurred in that way.

D. P. NORTON.

Council Grove, Kan., Sept. 30, 1882.

Botanical.—Bees were working last week on the inclosed flowers. What are they? They were picked near Qu' Appelle, North Western Territory. I hear bees do well in Manitoba.

R. F. HOLTERMAN.

Fisherville, Ont., Sept. 28, 1882.

[They are asters, and yield excellent honey.—ED.]

Wonderful Success.—I would like to make a statement through your columns of what I have done this year with the investment of \$1.50. Seeing there was considerable interest manifested throughout the country in scientific bee-keeping, with 2 flourishing apiaries in our little town, I thought I would invest in a colony of bees as I could purchase them for \$1.50. I wanted to see if there was not much humbug in this "profitable" modern bee-keeping, but I think by this time I am fully convinced, that scientific bee-keeping must be one of, if not the most profitable business in existence, for I have to-day 8 colonies of bees worth (without hives) \$40. and have sold \$40. worth of honey. What business or occupation can compare with that? A profit of \$78.50 on the investment of 1.50. My success is due to Mr. Thos. Balcomb, of the Lone Star Apiary, who kindly offered to "work" my bees to prove that bee-keeping was profitable. Mr. Balcomb and others have assured me that this has been an exceptionally good honey season, but notwithstanding all that I am convinced that scientific bee-keeping is one of the most remunerative occupations of the age.

THOMAS WILSON.

Luling, Texas, Oct. 11, 1882.

No Surplus Honey.—I had 6 colonies in the spring, which I have increased to 12; the honey flow all through the summer was small, and the hives were almost without stores, but the fall crop is filling the hives rapidly. I have had no honey yet, but will have all that is needed for winter. My bees are all in the Langstroth hive.

A. E. FOSTER.

Covington, Ky., Oct. 2, 1882.

Well Done.—My honey crop of 1882 is 5,000 lbs.—2,000 lbs. of comb honey and 3,000 lbs. of extracted. I commenced in the spring with 57 colonies; increased to 85 and I think that I have done well this year. I find the BEE JOURNAL a great help to me.

JAMES CORBIT.

Palmyra, Mo., Oct. 10, 1883.

Sections, Frames, etc.—I increased from 9 to 42 colonies, by natural swarming. Swarms in August were larger and built up better than in June. I never before had drones fly as late as Oct. 10th. A part of my bees are the Cyprians, crossed with Italians; they are best for docility, and prolificness, but the Italians are best for honey. Please answer the following: 1. What is the difference between prize boxes and sections? 2. Is a frame as good without a bottom bar as with it? I got some from Mr. Salisbury of that kind.

D. S. KALLEY.

Mansfield, Ind., Oct. 13, 1882.

[A prize box, holds 2 lbs. of honey, and must be nailed; sections are usually known as those that are dove-tailed, or made all in one piece.

2. No; they are not as strong, and therefore we should not approve of them.—ED.]

Lady Bee-Keepers.—A few weeks ago I gave a brief account of Mrs. Ellen Gray's success as a bee-keeper. Her report for the season is 40 good colonies in Langstroth hives, from 20 colonies spring count, and 1,450 lbs. of nice comb honey. I think this pretty good for the first effort. Mrs. Esther Wirt, whose subscription I send to the WEEKLY BEE JOURNAL to-day, and whose bees I have kept for two seasons past, is going to fit herself to care for her own apiary in the future, and makes the very sensible move of ordering the BEE JOURNAL as the first step essential to success. All bee-keepers can extend to Mrs. Wirt a cordial welcome, for she is one of those women who possess clear heads, kind hearts and willing hands.

J. R. BAKER.

Keithsburg, Ill., Oct. 19, 1882.

An Extraordinary Season.—The past season has been an extraordinary one in more respects than one. The spring was so cold and wet that I had to feed my bees to keep them from starving, until white clover bloom. Since that, there has been one continuous flow of honey, not a large heavy flow, as is sometimes the case, but a steady moderate flow, without a gap, ever since white clover bloomed. My bees are, to day, working on white clover which sprang up in the pasture fields. Throughout the season there was no trouble from robber bees; this is the first time I ever saw it so since I have been keeping bees. Buckwheat and goldenrod yielded well in their season, and now wild aster and other fall flowers are keeping the bees busy. I send two sprigs of flowers for a name. The bees cover them all day. No. 1 seems to be better liked by the bees than No. 2. What are they? I have not done so well this season as I might as I farm 100 acres all alone, and, as a matter of course, bees must take the back seat. I commenced the season with 10 colonies, 2 Italians the rest blacks; lost 2 in May and June by abnormal swarming, increased by artificial swarming to 18, all in good condition for winter, all having young Italian queens, except 3. I have but one black queen and I will get rid of her another season. I ran three colonies for honey; obtained 100 lbs. of comb honey and about 50 lbs. of extracted. I can sell more than I can raise at 20c. for comb and 16c. for extracted, and cannot begin to supply the demand. This is the first time that honey has ever been produced in one pound sections in this vicinity. I have done some introducing this season, using the cage described on page 390 of BEE JOURNAL, 1879, and I have not had a failure with it. My method is to remove the queen to be superseded, and immediately cage the new queen on a comb; close the hive and not disturb it for at least three days, at which time I have always found the queen liberated and laying. But it would not do to leave the old queen in the hive, for the bees have, every time that I have tried it, liberated the new queen within three days and sometimes at the end of 24 hours. My experience will not agree

with your remarks about the cage on page 390 of AMERICAN BEE JOURNAL for 1879, I will say that I have just introduced 14 queens in all with the above described method and cage. There are a good many bees kept here in the old style, and there has been but few swarms. I did not have one natural swarm, and tried no prevention.

J. H. EBY.

North Robinson, O., Oct. 2, 1882.

[Both specimens belong to the aster family, which is a very numerous one. All yield honey of a good quality.—Ed.]

Heavy Day's Work.—Reports of big days' work seem to be in order. On Aug. 22d, my wife and I took 1,648 lbs. of honey in one-pound sections. We took it from the heaviest colonies in order to make a brag day's work. One-third the amount did well enough for an ordinary day's work. As I had 174 colonies on May 1st, and now have 202, I sign myself

C. C. MILLER, 174-202.

Marengo, Ill., Oct. 11, 1882.

Doolittle's Opinion of the Monthly Bee Journal.—I have received a sample copy of the Monthly BEE JOURNAL, as it will be published in 1883, and I must say that it will fill a place in bee literature much needed by many who do not feel able to pay for or peruse the Weekly. Of course, there is nothing like the Weekly for me, but all do not feel as I do about it, and this Monthly "just fills the bill" for all who do not desire a Weekly BEE JOURNAL. G. M. DOOLITTLE. Borodino, N. Y.

Well Pleased.—In the early part of the season, bees were doing well. The willow and maple trees bloomed early, and the weather was fine for a few days; but in the latter part of April and May it became very cool, and caused some delay in honey gathering. Although I failed to get any surplus honey this season, I am well pleased with my increase. I began with 6 colonies, spring count, and now have 14 colonies good and strong.

ERNST ZABEL.

Maxon, Kan., Oct. 9, 1882.

Honey Season in the Southern States.—As soon as the swarming season is over, is the proper time for going around the apiary to requeen, supersede old queens, and unite any weak colonies. If the bees are populous they will gather their winter stores from fall flowers, and a surplus in November. If the bees are strong and have honey, they winter first rate on the summer stands. In an early spring, breeding begins in January and February. Sometimes they gather honey enough in February and March for brood rearing, but our general honey crop begins in April, and our bees must be strong for the harvest when it comes. Bees have swarmed extraordinarily this season. The parent colonies are depopulated; late swarms have not honey enough and will starve unless fed. Then the moth

will come, and have all the blame. Bees are gathering honey from goldenrod and other flowers. The honey crop this year is large, but there is no sale, except in nice box and sections. The rules given by Northern bee men for having our bees strong for the honey crop, will not apply for this latitude.

FRANK THIAVILLE.

Forest City, Ark., Oct. 20, 1882.

No Fall Honey Yet.—I have no fall honey yet. My bees have been idle since August 1st. I began with 24 colonies, spring count, and now have 53. I have taken from my bees this season, 1,000 lbs. of honey, of which \$25 lbs. is extracted, and 175 lbs. comb. My bees are Cyprians and Italians; I shall winter them on the summer stands, protected from North and Northwest winds, and with plenty of lower ventilation. JOHN FERSTEL. Inglefield, Ind., Oct. 2, 1882.

Sweet Clover, etc.—DEAR EDITOR: I have read your instructive article on "sweet clover" in the BEE JOURNAL of the 6th inst., and as it is unknown here and not mentioned in any of our seedsmen's catalogues, I will take it as a great favor if you will send me a small packet of seed to experiment with in our climate. I am charmed with your JOURNAL, but rather at sea with some of your systems to which allusion only is made. For instance, what is the plan followed to make frames "reversible" so that they can be used upside down? Any improvements interest us most, and a particular description is what we want. Bee-keeping is becoming the "craze" in England, every other kind of husbandry being played out, thanks to our enterprising, and more fortunately situated "cousins over the water."

E. H. BELLAIRS.

Christchurch, England, Sept. 24, 1882

[We have sent a package of sweet clover seed to our correspondent, as requested. Reversible frames have no projections to hang them in the hive, and the side bars are $\frac{3}{4}$ of an inch longer than the frame is deep, projecting $\frac{3}{8}$ at top and bottom, serving as legs and can easily be reversed. These have been described many times in the BEE JOURNAL, as have all the supposed or real improvements, as fast as they are invented. Our correspondent has been a reader of the JOURNAL only for this year, and is therefore not posted in American inventions. Some of the American bee books would be interesting and instructive to him.—Ed.]

4,680 Lbs. of Surplus from 23 Colonies.—I commenced the season with 23 colonies; have increase to 48; I have taken 1,340 lbs. of comb and 3,340 lbs. extracted honey. I fed my bees as late as June 5th; they are in good condition now for wintering.

G. W. KEELER.

Marshalltown, Iowa, Oct. 2, 1882.

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about **eigh word**; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole paid in advance:

For 4 weeks.....	10	per cent. discount
" 8 ".....	20	" "
" 13 " (3 months)....	30	" "
" 26 " (6 months)....	40	" "
" 39 " (9 months)....	50	" "
" 52 " (1 year).....	60	" "

Discount, for 1 year, in the MONTHLY alone 25 per cent., 6 months, 10 per cent., 3 month 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,—	" Bees and Honey," in paper.
" " 3,—	an Emerson Binder, or " Bees and Honey," in cloth.
" " 4,—	Aplary Register for 50 Colonies, or Cook's Manual, paper.
" " 5,—	Cook's Manual, in cloth, or the Aplary Register for 100 Colonies
" " 6,—	Weekly Bee Journal for 1 year, or Aplary Register for 200 Col's.

Two subscribers for the Monthly will count the same as one for the Weekly, when getting up clubs for the above premiums.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7057—that being our telephone number.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

CLUBBING LIST.

We supply the American Bee Journal and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	<i>Publishers' Price.</i>	<i>Club</i>
The Weekly Bee Journal,.....	\$2 00..	\$2 00..

Binder for Weekly for 1882.....	2 75..	2 50

The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Articles for publication must be written on a separate piece of paper from items of business.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

When changing a postoffice address, mention the *old* as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Hundreds of clergymen, doctors and others have used Kendall's Spavin Cure with the best success.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, {
Monday, 10 a. m., October 16, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour :

Quotations of Cash Buyers.

CHICAGO.

HONEY—1 am paying 6½¢ for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17¢@22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16¢@20c. on arrival; extracted, 7¢@10c. BEESWAX—Firm at 20¢@25c. per lb.
CHAS. F. MUTR.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand is good for choice white comb honey in 1 and 2 lb. sections, and prices are without material change, 18¢@20c. being the range of this week's sales. White extracted, in cans, 10¢@11c. in kegs and casks, 10c.; dark, 9¢@9½c. Dark comb honey, 12¢@14c.
BEESWAX—Yellow, 26c.; dark, 18¢@22c.
R. A. BURNETT, 165 South Water St.

SAN FRANCISCO.

HONEY—The market is firm for choice qualities but the trade is not active.
We quote white comb, 18¢@20c.; dark to good, 12¢@15c. Extracted, choice to extra white, 8½¢@9½c.; dark and candied, 7½¢@8c. BEESWAX—30¢@32c.
STEARNS & SMITH, 423 Froot Street.

ST. LOUIS.

HONEY—Plentiful and dull. Comb lower, at 15¢@18c—latter for choice white clover in small packages; strained to round lots at 6¢@7c.; extracted in cans at 9¢@10c.
BEESWAX—Sold fairly at 26c. for prime.
R. C. GREER & CO., 117 N. Main Street.

NEW YORK.

HONEY—Demand slow. We quote: Comb in the small sections, white, 16¢@20c. Extracted, 7¢@10c.
BEESWAX—The stock continues light, and prime Southern held up to 30c., with little if any obtainable below 25c. Western, pure, 26¢@30c.; Southern, pure, 30¢@33c.
D. W. QUINCY, 105 Park Place.

BOSTON.

HONEY—Sells very readily in 1 lb. sections at 22¢@25c. for best white, and 20¢@22c. for 1½ to 2 lb. Boxes containing ½ pound, 30 c. per pound.
Extracted is selling very slowly at 12¢@14c.
BEESWAX—25¢@26c.
CROCKER & BLAKE, 57 Chatham Street.

CLEVELAND.

HONEY—For the past week prices have been a little low, still 1 pound sections of best white, in attractive shape, sell daily at 21¢@22c.; 2 pound sections are not much sought after, but are held at 19¢@20c. Extracted very dull at 11¢@14c.
BEESWAX—Prime quality, 25¢@28c.
A. C. KENDEL, 115 Ontario Street.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
" 100 colonies (220 pages)..... 1 50
" 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey. A new pamphlet of 32 pages. At the last meeting of the North American Bee-Keepers' Society, we were appointed on a committee to prepare instructions on the Exhibition of Bees and Honey at Fairs; this is also added to the above. Price, 10 cents.

Kendall's Spavin Cure is used from the Atlantic to the Pacific coast.

Rockford, Winnebago Co., Ill

Florida Land--640 Acres

CHEAP FOR CASH.

DESCRIPTION.—Sec. 4, township 7, south range 7 west, Franklin county, Florida, situated about 50 miles south of the Georgia line, 2½ miles west of the city of Tallahassee, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a seaport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loam, covered with timber.

It was conveyed on Dec. 31st, 1875, by Col. Alexander McDonald, who owned 6 sections, including the above, to J. M. Murphy, for \$3,200, and on Sept. 5th, 1877, by him conveyed to the undersigned for \$3,000. The title is perfect, and it is unincumbered, as shown by an abstract from the records of the county, duly attested by the County Clerk; the taxes are all paid and the receipts are in my possession.

I will sell the above at a bargain for cash, or trade for a small farm, or other desirable property. An offer for it is respectfully solicited. Address,

THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a size of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$8 00
For 2 Langstroth " 10x18 "	8 00
For 3 " 10x18 "	10 00
For 4 " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " 12 1/2 x 20 "	12 00
For 4 " 13x20 "	16 00

Bees & Honey

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN,
Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Teon.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Engle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

"The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written on an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

Excelsior Dunham and Vandervort FOUNDATION.

Owing to the large advance in the price of wax, I now quote prices thus: Dunham, 10 to 50 lbs., 42c., over 50 lbs., 41c., less than 10 lbs., 44c.; Vandervort, 10 sq. feet to the lb., 1 to 10 lbs., 57c., 10 to 50 lbs., 54c. No discounts. Circular free.

J. V. CALDWELL,

3wly Cambridge, Henry Co., Ill.

THE CONQUEROR.

Large Smokers need wide shields. Bingham's have them, and springs that do not rust and break, and bellows that sparks and smoke do not enter. The Conqueror has all improvements made to date, and a 5x7 inch stove, and 5x7 inch bellows. Sent postpaid for \$2. Address,

BINGHAM & HETHERINGTON,

13wttt Abonia, Mich.

SWEET CLOVER SEED,

This year's crop, all of the white variety, 28c. per pound; \$3.75 per peck; \$13.00 per bushel.

I can fill no more orders for Queens this fall, having sold all I had to spare, leaving many orders unfiled, and with orders still coming in. The advertisement in the Weekly Bee Journal did it.

I. R. GOOD,

5wly Nappanee, Elkhart Co., Ind.

New Kegs

FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore produced kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well scalded, the pine will not favor the honey.

Capacity, 175 pounds. Price, 80c. each.

The first car load of these kegs will arrive about Sept. 10th, and all orders will receive my prompt attention.

The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

923 West Madison Street, CHICAGO, ILL.

Scribner's Lumber and Log Book.

NEARLY A MILLION SOLD. Most complete book of its kind ever published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of elevators, cordwood tables, interests, etc. Standard book throughout United States and Canada. Ask your booksellers for it. Sent for 35 cents post-paid.

For sale at the BEE JOURNAL Office.

85 ENGRAVINGS.

The Horse

BY B. J. KENDALL, M. D.

A TREATISE giving an index of diseases, and the symptoms; cause and treatment of each, a table giving all the principal drugs used for the horse, with the ordinary dose, effects and antidote when a poison; a table with an engraving of the horse's teeth at different ages, with rules for telling the age of the horse; a valuable collection of recipes, and much valuable information.

Price 25 cents.—Sent on receipt of price, by

THOMAS G. NEWMAN,

The Bee-Keeper's Guide;

OR,

MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book:

All agree that it is the work of a master and of real value.—*L'Apiculture*, Paris.

I think Cook's Manual is the best of our American works.—*LEWIS T. COLBY*.

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—*J. P. WEST*.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—*E. H. WYNKOOP*.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Bee*.

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—*A. E. WENZEL*.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—*WM. VAN ANTWERP, M. D*

It is the latest book on the bee, and treats of both the bee and bees, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record*.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—*L'ABBE DU BOIS*, editor of the *Bulletin D' Apiculture*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Pulaski, N. Y.

We have perused with great pleasure this *volume* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor*.

EARS FOR THE MILLION!
Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carcharodon Rondeletti*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Day Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by
THOMAS C. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.— The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.— This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.— This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee— This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.— A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.— Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Bienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cts, or \$3 per dozen, postpaid.

Bzleron Theory;— presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine, by Thomas G. Newman.— This pamphlet discourses upon the Ancient History of Bees and Honey; the nature, quality, sources, and preparation of Honey for the Market; Honey as Food, giving recipes for making Honey-Cakes, Cookies, Pudding, Foam, Wine, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.— This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive I Use— Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.— A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman.— Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's view on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.— Hints to Beginners, by Thomas G. Newman. Price 5 cts.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Kendall's Horse Book.— No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Cheken Chetern, by A. J. Hill.— A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, containing over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

The Northwestern Convention.

We give a full report of the proceedings of the "Northwestern Bee-keepers' Association," in this week's issue, and we think it will be read with more than ordinary interest. There were no essays read; and it was solid discussion, from first to last; and the members were so much engaged that they could hardly wait long enough to eat, drink or sleep—so intent were they upon the sessions, of which five were held. The morning session of Thursday was appointed at 8 o'clock, and long before even that early hour, the members, like bees, were buzzing about the hall, and the office of the BEE JOURNAL, busily extracting IDEAS from one another, instead of honey from the flowers.

There were about 125 bee-keepers present, and this year the membership of the Society was double that of the last. The discussions took a wide range, and it will, we think, repay every one to read them carefully. A statistical table was also made of 50 apiaries, which may be found on page 681 of this issue.

As Chicago is a central point for a Convention for those within a radius of 200 miles, or more, the building up of a large society, of great influence and benefit, to the bee-keepers of the great Northwest, is only a matter of time. This Convention will increase and grow, year by year, and will no doubt, become the largest and most influential on the American Continent. Seven States were represented at its last session. This was very encouraging, and demonstrated the fact that

the Convention was destined to occupy as a field, the whole Northwest, and be a valuable educator of the people, on the production and sale of pure honey, and scientific bee-culture.

Cosmopolitan Convention.

Mr. Paul L. Viallon, Bayou Goula, La., writes to the BEE JOURNAL, thus: "Don't you think that the name Cosmopolitan Bee-keepers' Society would be more appropriate when the National Bee-keepers' Association exceeds the borders of the United States to hold its meeting and select its principal officer? Well, who knows? its next meeting may be in England or Germany." Our correspondent is informed that the correct name is "North American Bee-keepers' Society," and in selecting Canada for its place of meeting and a Canadian for President, it has not exceeded its original design, name or authority. We hope its next meeting will be one of the best and most interesting Conventions ever held. If enthusiasm will make it so, then it will be, for its President and his countrymen are among the most enthusiastic bee-keepers in the world.

Honest discussion of every theory in bee-keeping is to be desired and courted, but such discussion should never descend to unkind personal remarks. We admire the sentiment expressed in the following from one of our exchanges: "Discussion has for its true object to elicit truth. When this is the object sought after, it is profitable to hear both sides of the argument. But when the argument becomes interlarded with low personalities, honorable men withdraw from it and leave the field to the hero of the hour. He stands alone in his glory."

New Foreign Honey Plants.

Dr. G. L. Tinker, New Philadelphia, O., writes as follows:

DEAR EDITOR—I send you some specimens of the new foreign honey plants I am cultivating, the seed of which were sent to me by Mr. J. S. Wood, of Denmark.

The leaves and stems with buds and flowers, enclosed in red paper is the *Scrophularia Chrysantha*.

The stem and leaves wrapped in brown paper is the *Scrophularia lateriflora*.

The leaves and flowers enclosed in white paper is the *Scrophularia lancinata*.

The large hairy pubescent leaves with long leaf stalks is the *Scrophularia vermalis*. The plants from which these were taken now measure 3 feet across and 15 inches high. The whole being a dense circular mass of leaves.

The plant with leaves like sage or mullein is the *Strachyo Lanata*.

The other plant, with leaves in a whorl, is the *Arabis Alpina*.

All are perennial plants that will bloom another year when their merits can be better determined. The *S. Chrysantha*, I stated in the JOURNAL, would cease blooming the middle of August. But about this time new shoots came out so that there has been no interruption whatever to its wonderful blooming qualities. It has had right along from 200 to 400 flowers upon each plant from the time soon after it began to bloom (July 1) until the present. And now you can see that it would bloom all winter if it had a chance. Upon one plant on Aug. 11, I counted 19 bees at work at one time. If this plant can be successfully cultivated, it is full of bright promise to bee-keepers.

Dr. Tinker deserves the thanks of bee-keepers everywhere, for endeavoring to develop and obtain from abroad the best honey-producing plants.

Bee pasturage is the key to the situation. When we have provided the bees with continual bloom to gather honey from, we may expect, and obtain, a continual flow of honey. Until then we have no cause to complain if we obtain but a moiety of that crop which Nature would provide, did we supplement her efforts by providing pasturage for our bees.

Mr. J. S. Wood, of Denmark, is one of the most progressive and enterprising bee-keepers of that country, and also should have our united thanks for his exertions in developing the honey resources of the world.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

MISCELLANEOUS.

A Standard Frame.—The Indiana Farmer gives the following on the subject of the general adoption of a standard frame:

While in attendance at the State fair, we made it a point to inquire of our many bee-keeping friends and visitors their opinions as to the different sizes and styles of frames, and what was likely to become the standard frame for bee-keepers in America. With but very few exceptions the decisions were in favor of the Langstroth, size $9\frac{1}{8} \times 17\frac{3}{8}$. Some were inclined to the belief that a deeper frame was better to winter in for careless bee-keepers who never made any pretensions to preparing their bees for winter. One gentleman from near Bloomington, Ill., said "he worked about 75 colonies, in two apiaries, had tried both styles of frames extensively and was decidedly in favor of the Langstroth frame, and proposed to change all his remaining colonies to that style of frame in the spring," for, said he, "I work my bees exclusively for honey. I have watched the matter closely and am satisfied that the broad space directly over the brood is the place to secure the most surplus." And, said he, "honey brings money; it is a matter, with me, of dollars and cents, I do not keep bees for the fun of the thing, and if I can only raise them simply to see them 'come through the winter all right,' I do not care to bother with them. I do not raise bees to sell, I am no dealer in bee-keepers' supplies, neither have I any government bonds to clip. I must work for my living and if I cannot make the bees pay, I must give them up for something else. But I am candid to say, on an average of seven years my bees have paid me well, as well as anything else on the place, and I have quite a large farm, and rely on mixed farming, altogether."

The Eternal Fitness of Things.—An exchange gives the following eccentric item concerning the inauguration of a new glucose factory in Canada. It is very suggestive:

The promoters of a new glucose factory in Toronto conceived the odd notion of inaugurating it by a champagne luncheon served on the top of the chimney, a hundred and sixty feet high. When the champagne rose 5 or 6 feet higher, the cranial cavities that held it would hardly be a choice risk for a life insurance company. However, the precaution of a railing had been provided, and, as the relations of glucose to the wines of France made in Canadian cellars are well recognized, the ceremony was not altogether foreign to the fitness of things.

Bee and Honey Show in Scotland.—The following is from the London *Journal of Horticulture*:

The East of Scotland Bee-keepers' Society held its annual exhibition at Dundee on August 31st and two following days. Notwithstanding the unfavorable nature of the season, the display was unusually full and of splendid quality. Many of the leading bee-keepers in the lowland districts were unable to stage a single exhibit, but those from the interior and highland districts came forward in force with large and well finished lots. Altogether, about 2,000 lbs. of honey were staged, and every class was well competed in. The most striking exhibits were those in the classes for the most artistic displays over and under 100 lbs. Mr. Raitt was first in both classes, and his exhibits were justly admired for their excellent finish and tasteful arrangement. Part of the same lots took two first prizes at the great Preston Show in the following week, and there elicited many comments highly flattering to Scottish bee-keepers. Altogether, there were seven entries in the display classes, and in all the quality of the honey was very fair. The poor taste shown in the arrangement of some entries where shelves and stages were relied on, received a check in the awards of the judges in favor of those exhibiting less carpentry work, but more variety in the size, form and decoration of the sections and glasses of extracted honey.

In the classes for living bees the exhibition was unusually full, no less than ten observatory hives being staged, containing bees of four different races—blacks, Italians, Cyprians, and Syrians. Besides these, there were five neat nests of humble bees and one enormous "byke" of wasps. Several of the observatory hives presented novel features in the direction of an attempt to keep the combs in their natural position side by side, while rendering them capable of individual inspection. The one exhibited by the Secretary, Mr. Warden, accomplishes this by having the hive double the usual height, and so arranged that the padded quilt could be raised to the top, and any separate frame thereafter lifted to a position open for inspection.

Unkind Personalities.—The use of unkind personalities in argument is always an evidence of weakness on the part of the one who uses them. An exchange remarks:

When a controversy is ended, and the arguments on both sides are exhausted, you will sometimes see one of the contestants take his stand at a safe distance and call ugly names. He imagines himself a hero, has a bellowing voice, and can excel all others in the noise he continues to keep up after they are silent. He is at a safe distance from the scene of strife and can at any time make safe his retreat. Besides, if challenged, he can explain his personalities to mean anything in general and nothing in particular.

Northwestern Bee-keepers' Society.

The Northwestern Bee-keepers' Society met at Owsley's Hall, Chicago, Ill., on Wednesday, Oct. 18, at 10 a. m., Pres. C. C. Miller in the chair.

The Secretary being absent, T. G. Newman was elected Secretary, *pro tem*.

The minutes of the last meeting were read and approved.

The Treasurer reported a balance in the treasury of \$16.50; there being no expense incurred last year for a place to meet in, nor badges.

The President remarked that it was desirable to make a tabulated statement, showing the number of colonies kept by each member of the convention, the results of wintering and the crop of honey obtained, and appointed Mr. I. R. Good to obtain the information and get up the statistical table.

It was agreed that the election of officers be the first business of the afternoon session.

The following members paid their annual dues, seven states being represented:

James Heddon, Dowagiac, Mich.
 Dr. S. M. Slade, Elgin, Ill.
 I. R. Good, Nappanee, Ind.

LADY MEMBERS.

Mrs. L. Harrison, Peoria, Ill.
 Mrs. C. C. Miller, Marengo, Ill.
 Mrs. E. Lucas, Kirkland, Ill.

The following resolution was passed unanimously:

Resolved, That the editors of the different bee periodicals be requested to keep a standing notice in their papers requesting correspondents to add to their names, when writing for publication, the number of colonies they had at the commencement of the swarming season, and the number they had at the time of writing.

President Miller stated that such figures would aid all to understand the force and value of their remarks or reports, and serve to give a knowledge of their status as bee-keepers.

M. L. Trester desired to have a form of letter heading gotten up, stating the general occupation, if any, also bee and honey interest, and having blanks to be filled in with the number of the colonies, etc., which would be convenient for all honey producers.

The Syrian Bees.

George Thompson, Geneva, Ill., then addressed the Convention, as follows, on the Syrian bees:

This summer I have worked with some of my Syrians that are as vigorous, as gentle and as beautiful as the best of my Italians, and far more prolific; they had brood early and late, when the Italians had none.

It is well known by all those who have given any attention to scientific breeding that we can tone down any undesirable quality and raise all valuable points. Now, when we have found a bee that will breed late and early, thus in a great measure preventing death in winter, spring dwindling, and enabling us to have our bees in a condition in the spring to take advantage of the first honey harvest, then I consider we have made a long stride towards that bee of the future.—*Apis Americana*.

Has the Syrian been a proved benefit? When the Italian bee was introduced, it was found, on trial, to be in many points, far superior to the black bee. It was, therefore, retained, and for years has been the favorite bee for the

bee-keeper. But as time passed and knowledge increased it was found wanting, in some localities, in one important point, viz.: late and early breeding; for, as soon as the honey harvest begins to fail, the queen leaves off breeding, and unless the bee-keeper feeds back with a liberal hand to keep the queen up to her work, too many old bees go into winter quarters and one of the results that follows is, spring dwindling. What was wanted was, a bee that would breed late and early, and this has been found in the Syrian. Thanks to Mr. Jones and Frank Benton, the Syrian, not desirable in itself, owing to its irritable nature, by the cross with the Italian, I consider a valuable acquisition. In it we have obtained what we have long desired.

President Miller had a queen of the Jones importation of Syrians, and could see no remarkable results from her progeny.

A. D. Beckley said the Syrian bees bred early and late, and one colony gave him 400 lbs. of extracted honey; they were cross, but good workers. He preferred Syrian bees; his one colony had given him 9 swarms. His hive was a 9-frame Langstroth.

O. O. Poppleton asked if late breeding was any help in wintering bees?

Geo. Thompson: That is a very important point. My Syrians had brood when my Italians had none. I prefer the Syrians, crossed with Italian drones.

W. H. Bussey: I had 2 colonies late in September, 1881, and bred them up by feeding, but both died out during the winter.

Rev. D. Whitmer: I opened hives last Thursday and found in some 3 frames half filled with brood, while other colonies had none.

O. O. Poppleton: In the winter of 1872, while attending the Iowa State Fair at Cedar Rapids, Mr. Gallup and I went to the apiary of W. H. Furman in that city, and, upon examination, could not find six frames without brood, and yet I lost bees quite heavily that winter.

James Heddon: There are two classes of bee-keepers—one has an apiary in his head, the other has a real bee yard. Experience is what we want—we not only need statements, but logic as well. We have no fall crop of honey here. Spring dwindling results from dysentery, and young bees are more liable to be attacked with it. I think the quicker my bees stop breeding in the fall the better. I do not want young bees to winter successfully. Old bees are hardier. I want bees that know when to breed and when not to breed. I do not believe that pure bees are any better than those crossed for business—good qualities are what we should be careful to obtain and not so many bands; breed for business and not for white down, or hairs, or color. I would like to see the man who can determine the race of Cyprian, Syrian and Italian bees; I do not think there is one in this room that can tell them apart.

T. G. Newman said that he knew of an instance where some Italian bees had been pronounced pure Cyprians

udge of foreign races of bees; it certainly was very difficult to determine.

Dr. Slade would like for Mr. Thompson to state the difference in marks, if he could, and to describe the pure Syrian and Cyprian bees.

Geo. Thompson said that Mr. Heddon was quite changeable; he once said as much against the Italian bees as he now does against the Syrians.

L. H. Scudder suggested that personalities should be omitted.

E. J. Oatman: The cross between the Italian and Syrian bees is not the bee of the future. Syrian bees are good workers, but there were serious objections to them. He had 4 colonies of Syrians which gave 1,100 pounds of comb honey—they were the first cross with Italians. The second cross were not over the average as workers. He did not want them and would give them all to Mr. Thompson, if he wanted them.

T. G. Newman asked if the cross was made by having Italian drones fertilize Syrian queens, or *vice versa*?

E. J. Oatman: They were Syrian queens fertilized by Italian drones.

Dr. Slade said his Syrian-Italians were very cross, and he did not like them. Early breeding was important to get ready for the white clover harvest, where they have one.

W. H. Balch: The best queens I have are those that were reared late in the fall. Their bees are the best for honey-gathering during the following summer.

James Heddon: Late breeding is not the cause of spring dwindling, but is an aggravation of the disease. I own up to the charge that I am changeable; if I were not, I should know but little. I believe that the brown German bees, crossed with the leather-colored Italians, are the best honey-gatherers.

E. J. Oatman: We have found the half-bloods (Syrians fertilized by Italian drones) gave us the most honey. The quarter-bloods are no better than others; but these crosses are vicious. One colony of them, at the close of the white clover season drove me out of the apiary, in spite of smoker, etc. I took them to an outside apiary and shall let them remain there until next spring, when I shall destroy them. They do not cap the honey so that it will look as white and nice as I want. When I put it on the market, it is worth from 2 to 5 cents per pound under price. The bees do not stay on the combs as well as Italians, either.

Mr. Gray said that his neighbor, Mr. Miller, had 1,000 lbs. of honey in the comb on Water St., and he could take any one and point out all the honey gathered and capped by the Syrians. He agreed with Mr. Oatman.

President Miller: As they gather so fast, do you not obtain enough honey to more than counter-balance the loss in price?

E. J. Oatman: No; it will not make up the loss in price when we market our honey. They are so cross, that I don't want them at all.

Geo. Thompson: Some are cross, but I breed from the less irritable colonies. I have not noticed the dif-

ference in the marketability of the honey.

H. W. Funk: I have tried them, and don't want the Syrian bees.

Dr. Stevenson: I had a lot of sections prepared for an exhibit at the Fair, but when I was ready to crate them for the fair, I found that, in about one-third of the sections, the cappings were so imperfect that the honey was exuding through them, but in this case the colony that gathered and capped the honey was a black one. Why was this so in one-third, and not so in all?

Geo. Thompson: What was the temperature of the room?

Dr. Stevenson: It is the same place that I keep all my honey. I don't know what the temperature was.

Mr. Gray: The honey gathered by the Syrians looks dark as soon as taken off the hive.

J. K. Snyder: Some of the honey gathered by the Italians also has this watery appearance.

James Heddon: If the honey is kept in a room where the atmosphere is cooler than it is outside, it will draw water like an ice pitcher does—we call it "sweating." The blacks make the best combs, thinner and whiter than any other bees, but when any race is shown to have honey of an inferior quality it is proof that they are not as good.

Geo. Thompson: Does it not depend on the season? When the honey comes in with a rush, do they not fill the cells too full?

E. J. Oatman: I think the rush has no effect on the bees; last year the honey flow was slow, but we had the same result with the honey.

Adjourned to 2 p.m.

AFTERNOON SESSION.

Met at 2 p. m., and the election of officers was then proceeded with, the result being as follows:

President—Dr. C. C. Miller.

Vice-President—James Heddon.

Secretary—Thomas G. Newman.

Treasurer—O. O. Poppleton.

The subject of over-stocking a locality was then discussed.

Pres. Miller: One year my bees increased from 150 to 250 by July 1st, and then the honey flow stopped; why, I do not know. I would give considerable to know how many colonies I can keep in one locality.

E. J. Oatman: I have no fears of overstocking a locality during a yield of honey, but in the fall 100 colonies is sufficient for any locality.

James Marvin once had 650 colonies in one location, four feet apart, and obtained a good yield, but they had never done so well since, because the basswood and other trees were felled and cut up by saw mills, that had been established in his locality, and consequently the honey yield had been cut off, to a very great extent. He had seen the time when the clover, after the thirteenth day of its bloom, had yielded honey so profusely that the locality could not be overstocked, but now the same locality would be over-

stocked by 50 colonies. One of his apiaries, containing 140 colonies, had increased to 250, and given 7,500 lbs. of honey—some of it being comb.

Pres. Miller said that D. D. Palmer once said he could keep 400 colonies in one locality and not overstock it.

L. H. Scudder: Mr. Palmer had 200 colonies in one apiary, and obtained an average of 400 lbs. to the colony, spring count, but he afterwards lost all of them by neglect. I lived five miles from him, and had only 100 colonies, but fell some short of his average.

George Thompson: Much depends on the man, the season and location. In my location 35 colonies is usually sufficient, but this year 1,000 colonies could have done well there.

P. Dahl took some of his colonies to his neighbors' buckwheat, but he could see no difference between them and those he left at home. Where 50 colonies starved one season, 1,000 could not have overstocked the same location this year. It all depends on the season.

Planting Pasturage for Bees.

Pres. Miller: This leads us to a very interesting subject, that of planting for honey, and one that I want to know much about. I am willing to spend money and the labor of planting, if I can know just what to sow to make it pay, and return me money for my outlay.

James Marvin advised all to plant for honey, and especially recommended the planting of alsike and buckwheat for bees.

Pres. Miller said that there was one drawback to the planting of alsike—it did not re-seed itself; it often died out. He had tried to propagate it and failed.

G. L. Gast had planted a small patch with alsike, and it yielded hay as well as honey—better hay than timothy and clover—and last year it has re-seeded itself.

O. O. Poppleton had been told that alsike was considered by some to be a pest—that it would not permit anything else to grow, but he did not believe it. He had tried cutting it when it commenced to bloom, in order to have the second growth yield honey just after white clover ceased to be visited by the bees. This year, he intended to plant 20 acres or more of his farm to plants yielding honey alone.

Dr. Slade had some experience with melilot or sweet clover. The bees were working on it now. It had been browsed down by cattle and the second growth was yielding honey to-day.

T. G. Newman said that many of those present would remember, only a few years ago, when the question was asked at conventions and in bee papers: "Will it pay to plant for honey alone?" and the universal answer was, "No; plant only such as will be of value for honey and other things, such as fruit trees, berry shrubs, clovers, etc." But some three years ago, the BEE JOURNAL, of which he was editor, as all were aware—took a departure and advised the planting of *melilotus alba* or sweet clover for honey alone. Though it was, up to that

time, universally discouraged, he was gratified to know that now all the progressive bee-keepers are advising the planting of it, as well as alsike and scores of other plants, for honey alone. There was no doubt now that it was the key to the situation. In vain we may look the world over for the best and most industrious bees, unless we provide them with plenty of pasturage. There was no use of denying it—by supplying our bees with bloom from clover and basswood till frost, we are causing a continuous honey flow, and, consequently, an unbroken income of gold dollars for honey till fall. Planting for honey will be the most popular advice, hereafter, and will be given by every progressive apiarist in America. In Europe they are also beginning to echo the same advice, and soon no one will willingly own up to the fact that he ever discouraged the planting of any bloom for honey alone.

W. H. Bussey: There is a large crop of sweet clover within five miles of the place of this meeting, at Austin, and he had seen the bees working vigorously on it within a week.

Thomas G. Newman said that nearer still, were acres of it—within one-quarter of a mile on all the vacant lots just south of Madison and west of Oakley streets. The birds had scattered the seeds and the bees were still reveling on the delicious nectar it provides. Its modest little blossoms would continue until long after winter's frost and snow had withered or buried all vegetation, and enveloped the land in its sheet of snow—then you may still see the tiny little flowerets of sweet clover rise amid wind and storm, and show its verdure and loveliness.

James Heddon: Will it pay to buy land, pay taxes and keep up improvements, say, with interest on the investment, about \$5 per acre, to plant for honey?

Pres. Miller: I have confidence enough that it will pay, to say that I would be willing to yearly pay \$10 per acre, for good pasturage for my bees.

James Heddon: Then as I am the first to occupy it, and as others will not be foolish enough to come into the territory I occupy with any other bees, think of the territory surrounding my apiaries that I am reaping a harvest from—the property of my neighbors. Is it to be wondered at that I look with a jealous eye at any one who would think of coming and occupying the territory with me—dividing my pasturage. Is it not a wise thing to keep others out of my territory?

Pres. Miller: There is a point of interest there, but what we want to know most is, what are the best plants to sow to cover the gap after basswood bloom until frost. I shall try sweet clover and figwort thoroughly.

James Heddon: Some 12 years ago I planted several kinds, but did not succeed to my satisfaction. I want a staple bloom and I believe sweet clover will fill all our expectation. It grows anywhere, in any kind of soil, on the poorest or best of land, in fact, no land can be so poor that it will not grow, thrive upon and enrich it.

L. H. Scudder advocated the planting of figwort (also called Simpson's honey plant and carpenters' square), and produced a handful of seed to show to the members of the convention. You can fill the gaps in fences and roadways by scattering it in the fall. It will grow readily and give the bees abundance of forage. One acre of figwort, cultivated as you would corn, will yield more profit in honey than an acre of corn. He had counted 100 seeds in one bulb.

Pres. Miller had counted these tiny seeds in one bulb and there were 104 of them.

Rev. D. Whitmer: I shall sow figwort for my bees. I sowed some sweet clover, but from some cause it never came up.

Geo. Thompson: Of all the plants to cover the gap from white clover to frost, sweet clover is the best. It is a biennial. I once sowed a lot of it in a small box and it did not come up; I was disgusted with it and threw it out; next year I discovered it where I had thrown it out, coming up as thick as hairs on a dog's back.

W. H. Bussey: It should be frozen to get it to bud. He had sowed it in the spring and thought it would not come up, but after a frost it came abundantly; one of its recommendations being that it thrives well in dry and hot weather.

Geo. Thompson: The reason for that is that its roots are as long as my arm and it goes down to the water.

President Miller: I sowed some sweet clover in July, but it did not come up very strong. I will let it stand and resow the same ground with it this fall. By sowing two years in succession on the same ground, we can obtain a continuous bloom every year.

James Heddon: I sowed sweet clover 6 or 7 years ago, and it is now as thick as ever—it does not die out.

L. H. Scudder sowed an acre in the fall and it did not come up, but he saved some of the seed till spring and then sowed it, and it came up very thickly.

President Miller had sowed it on rich ground, broadcast, but it was choked with weeds. It should be sown in drills, and the weeds should be kept down. He sowed figwort in drills and it did well, but when sowed broadcast the weeds choked it, and killed it all out. Some of the stalks of figwort were taller than he could reach, when on good soil, and kept well watered.

M. M. Baldrige: Sweet clover should be sown on two pieces of land, alternate years, because when planted both successive years on the same land, its profuse growth may choke it and the roots die out. There is an old law against planting sweet clover I think, and it ought to be abolished.

The President appointed L. H. Scudder and M. M. Baldrige a committee to present a resolution calling for the abolition of the law against sweet clover if it really existed in the State of Illinois; the committee to ascertain and report at the next meeting of the Society.

M. M. Baldrige: It never grows on pasture lands or in cultivated fields and it is not a noxious weed.

President Miller had seen it growing on blue clay and rocky ground, where nothing else would grow.

Peter Dahl had plenty of it growing and preferred it to ragweed.

Fuel for Smokers.

W. H. Bussey: What is the best fuel for smokers?

J. E. Hunter: Dry corn cobs split up.

O. O. Poppleton: Elm wood partially rotten.

Dr. J. H. Shultz: Refuse ax handles; they are hickory wood and when split up fine and cut short will last for hours.

Dr. Stevenson thought cotton rags are best.

Mrs. L. Harrison also uses and likes cotton rags in smokers.

James Heddon: Hard wood is objectionable; it makes too hot a fire, and runs creosote. Punk or rotten maple wood is best.

Geo. Thompson likes rotten apple wood best.

Adjourned to 7 p. m.

EVENING SESSION.

The Convention was called to order at 7 p. m. by the President, Dr. C. C. Miller, who stated that it was his desire to prevent increase as much as possible, in order to work for honey, and, therefore, in the absence of any thing else before the Convention for discussion, he would name as a subject

The Prevention of Swarming.

E. J. Oatman: As a rule the colonies that do not swarm do not give as good results as those that give, at least one swarm each.

Geo. Thompson: It adds to the quantity of honey gathered, to let them swarm, for it is well known that swarms gather more honey than old colonies.

E. J. Oatman: Yes; swarms work with more vigor, and gather more honey than older colonies.

J. E. Hunter believes that the clipping of queens' wings has an influence on swarming. Before he clipped the wings of his queens he was troubled with excessive swarming; since then, he has not. In the spring he had 90 colonies, and now he has 135.

James Heddon: One of the causes of swarming is that bees are dissatisfied with their queen; they will be more likely to swarm when the queen's wing is clipped. The bees thought, with him, that a queen with a wing clipped was not a whole queen. By giving the queen plenty of room and using comb foundation judiciously, swarming can be largely controlled.

O. O. Poppleton: I do not desire increase, and have had only 4 natural swarms this season. I believe with Mr. Heddon that by the use of comb foundation and giving the queen room, swarming may be controlled.

W. H. Balch: Does the clipping of the queen's wing prevent her from laying the eggs, which will fill the hive wit be

swarming? If not, how does it prevent it? I clip the wings of my queens, and believe it to be an advantage, but do not know how it could prevent the swarming fever.

James Heddon: Bees are jealous of their queen, and do not like one that has her wings mutilated.

O. O. Poppleton: I have clipped the wings of a part of my queens, and can see no difference between them and those not having clipped wings. I shall clip one wing of them all, hereafter. The past season has been the greatest swarming season I have ever known.

Dr. Stevenson: I had 56 colonies in the spring, and have had 20 natural swarms. I follow the plan suggested by Mr. G. M. Doolittle, to prevent swarms, and I had no swarm issue until about July 10. One colony gave me 150 lbs. of nice comb honey. I now have 81 colonies.

President Miller: What is best for some persons, is not always the best for me. If I have all the bees I need I do not want increase, and am intent upon knowing how to prevent swarming. The bees acted differently this year than ever before. Swarm they would, despite all my efforts to the contrary—and swarmed even in the fall, a thing rarely known before.

James Heddon: Bees do not swarm when honey is coming in with a rush; let basswood yield honey profusely, and the bees find something else to do than to swarm.

Mrs. Harrison: When you can prevent bees from swarming, you may, perhaps, also find out how to prevent the human family from increasing. It is Nature's plan for perpetuating the race.

James Heddon: Yes; it is Nature's instinct for increase, and it cannot be prevented. It may be controlled some, or partially averted, but cannot be prevented.

Rev. D. Whitmer had found it impossible to control swarming, and will hereafter let them have their own way, and act out their natural instinct.

Peter Dahl: I let my bees swarm naturally until July 1, and then, as I have all the bees I need, I catch the queen, cage her, cut out the queen-cells, and return the swarm.

James Heddon did not believe in cutting out all the queen-cells but one and then expect that to give the future queen, with the best results. We could not be expected to select the best, when Nature had so arranged it, that the bees had 15 or more, queen cells to select from, in obtaining the future queen for the colony. We can control Nature in many things, and it will not always do to fold our arms and say, "Let Nature follow out its instincts." When we can improve on instinct, we should do it, as we do in dogs, cattle, chickens, hogs, etc., but we must also be careful not to change from Nature's instinct, the wrong way.

Feeding Bees.

QUESTION: "Does it pay to feed bees to keep them from starving?"

E. J. Oatman: Certainly; it will pay as well as to buy hay for our cat-

tle in winter. I have tried it. Having had a poor honey yield one season we fed largely to save our bees from starving, and the next season we obtained at least 19,000 lbs. of comb honey which we should not have had, if we had permitted the bees to die, by neglecting to feed them. It is safer to feed sugar syrup than honey. The best way to prepare the sugar syrup is to procure extra confectioners' C sugar (it is just as good as A sugar for feeding bees) and make a syrup by mixing 5 quarts of water to 20 lbs. of sugar. We feed about the middle of September. If for later feeding, the syrup should be a little thicker—using more sugar.

James Heddon: As glucose is now being crystalized, we must look out for adulteration in granulated sugar, like all other brands.

L. H. Scudder: What temperature is required when making the feed?

E. J. Oatman: We simply stir the sugar well, to mix it with the cold water. We do not heat it at all.

James Heddon had excellent results from feeding for winter stores.

J. M. Valentine: As the honey crop, two years ago, was a total failure, I made sugar syrup, two measures of sugar to one of water, and gave 20 lbs. of this to each of my colonies of bees, and I lost only 1 colony out of 65. All of the hives contained more or less honey besides the feed I gave them.

James Marvin prefers honey to sugar for feeding bees, even at the same cost. He knew of instances where colonies had been fed 25 lbs. of sugar syrup and then had starved. If they had that much of good capped honey they would not have starved.

Adjourned to 8 a. m.

MORNING SESSION.

The Convention met at 8 a. m. according to adjournment. President Miller in the chair, who announced that the first question to be discussed was: "How to prevent the queens from going up into the surplus department and depositing eggs there?"

J. E. Hunter said that he had experienced difficulty in trying to prevent the queens from occupying the upper story of the hive with eggs.

O. O. Poppleton had no trouble in that line. He used the long-idea hive, containing 25 frames and no upper story. He had only one "double-decker" in his apiary of 150 colonies.

James Heddon did not like the long-idea hive. It was natural for the bees to store honey above the brood-chamber. That hive should be called, the "wrong-idea" hive.

L. C. Wemple brought a large sprig of figwort, which he had plucked on his way to the Convention, and placed it on the table for inspection. It had a host of bulbs with seeds, ready for harvesting.

J. E. Hunter: I extract only ripe capped honey, in order to get the very best article for placing on the market.

O. O. Poppleton: Deep frames are the best for the long-idea hives.

James Heddon: I often extract from combs having brood in them but prefer those without it. If the brood

is uncapped the extractor gearing should be turned slower; there is no excuse for throwing out any larvæ, if care is taken in running the extractor. When the honey season is long drawn out, swarming is very much increased.

Comb vs. Extracted Honey.

Pres. Miller: One objection to the business of producing comb honey is the fact that, at the close of the season, there are so many sections only partly filled, and unmarketable. These must be extracted or the bees must take it out and deposit it below. I think it may be advisable to work for comb honey until clover bloom, and then for extracted, until the close of the season.

J. E. Hunter: As I keep all my honey separate, I extract the honey from the partly-filled sections at the close of clover bloom, and let the bees fill them with heartsease honey—my next crop.

O. O. Poppleton: I produce a little comb honey, as a fancy article, for my use, but I would only have it gathered before close of clover bloom.

V. M. Keeney: Will evaporating the honey in the sun, take away its flavor?

Geo. Thompson thought not. The flavor is all given to it before it is sealed over.

J. Heddon: It is almost impossible to retain the flavor of extracted honey after it leaves the comb—and that is the reason why nearly all prefer the comb to the extracted honey. They may say what they like; judge them by their acts, and, you will see that while they like extracted honey just as well as they do that in the comb—if you place both kinds before them, they take the comb, 9 times out of 10. It will candy quicker after it is taken out of the comb.

O. O. Poppleton: We can ripen the honey after extracting it, by placing it in open vessels and let the evaporation take place. Much of the honey that is marketed is not properly ripened, and if bottled up at once will often break the jars.

Thomas G. Newman said he once had a barrel of honey from Wisconsin that fermented and blew out the bung and wasted more than one-half of it. We could not be too careful in ripening honey, either by letting the bees do it before capping it, or let it ripen by being exposed to the air afterwards, before barreling.

M. M. Baldrige: I want the honey all sealed over before it is extracted. Then it will be safe to market it.

J. E. Hunter: I have kept honey in pails, had it candy, and warmed it to liquefy it, and find that the flavor was often improved by the warming. Care must be taken not to have it too warm, or the flavor might be gone. There is no fear of ever overstocking the market with a good ripe article of extracted honey.

How to get the Bees off the Sections.

Pres. Miller had been troubled very much to do it, and if any one had a better plan than he had, he would be glad to learn how to do it.

Dr. Stevenson: On a warm day, when the bees are flying, take off the sections one at a time; those partly filled put in a box all together, and let the bees clean the latter out when honey is scarce. The bees can generally be made to leave them by using the smoker.

James Heddon: My sections all have open tops, and it is the easiest thing in the world for me to drive out the bees by using a little smoke with a bellows smoker.

Pres. Miller: My sections all have closed tops, and I cannot get the bees out as Mr. Heddon does.

The Use of Separators.

John A. Williamson said he could not dispense with the use of separators in raising comb honey.

L. H. Scudder: Neither can I get along without them.

J. E. Hunter: I cannot; my wife forbids it.

J. C. Newman: I glass all my honey, and I cannot get along without separators. I use them made of very thin wood, which will not bend out of place nor kink, and they cost but little. I use a comb honey rack, and have all my sections nicely sand papered.

James Heddon: I formerly did the same thing, but those extremely white sections formed a contrast with the honey, and I found it a detriment. Then they often got dirty and looked worse than those that had not been as white.

Mrs. L. Harrison: I do not use separators, starters, nor comb foundation in my comb honey. I use a line of wax simply, but I find that the bees sometimes not only build the comb crooked, but actually build them cross-wise of the section boxes. Then we have to sell them at home.

L. H. Scudder: I have to change from two pound sections to one pound, and as I have to purchase all new separators, if I can get along without them I want to do so, and I would like to know how to do it.

E. J. Oatman: I have always used separators; there is nothing to be gained but the expense of cost saved, and as I have them already I see no reason in desiring to do without them.

James Heddon: I have used separators and discarded them, but I intend to give them one more trial for the purpose of finding out how much it will cost me, in honey, to use them.

Dr. Stevenson found that, when taking the combs apart, sometimes they were injured by being attached by small pieces of comb, one to the other—but usually they were quite straight and so good as to allow him to take the first premiums at fairs over those who used separators. He used no separators, but did use thin foundation.

Mrs. L. Harrison: Does not the inclination of the hives sometimes control the matter of building combs straight. I do not use comb foundation in comb honey.

Dr. Stevenson: I discarded the use of separators on account of the cost, and the fact that bees lengthen the cells in the spaces above and below.

Peter Dahl: I do not use separators, and there are not two sections of honey in a hundred that I cannot use and market.

O. O. Poppleton: I use sections 1½ inches in width and do not need separators.

James Heddon: I use sections 4¼x 4½, 1½ inches in width, and narrow tops. Can good one-piece sections be made of that width, and with the bee opening at the top and bottom, of the full length of the section and of ¾ inch in width.

James Forncrook: I have made one-piece sections in that way already; they can be made any way that beekeepers want them.

Mr. Carson said he had been successful with one pound sections made 2 inches wide, and used them without separators.

He produced a case showing how he used them, and to prove his assertion that he could get good straight combs without separators.

The case was duly inspected by the President, and pronounced very imperfect. Several combs had been connected by pieces of comb, built between them, and many of the sections were built so crooked that they could not be packed for market without touching one another.

The Use of Comb Foundation.

James Heddon: Modern bee culture is very modern. It grows daily. A book, written on the most progressive ideas and methods of management, is soon behind the times. The ink is hardly dry, before some of it needs to be re-written, with newer thoughts and views. The use of comb foundation is a growing subject; we want the best article and the best methods of using it. I believe that the foundation made on the Given press is the best that is now made, because the side walls are soft and can easily be drawn out, while the bases of the cells only are thin and hard pressed. The bees will manipulate it much more readily than any other I have ever used. The thin, used in sections, should be the full size of the sections, leaving ¼ inch space, each side, and ⅜ of an inch at the bottom. I would not use the best natural comb in sections if I could get soft foundation; the bees will use the latter so much more readily.

Mr. Heddon here exhibited a super of his one pound sections, and showed the manner of its use on the hive.

H. D. Burrell: I find that comb foundation that has been made sometime is just as readily received by the bees as that just made.

O. O. Poppleton had used it very extensively, and found that the bees would draw out the side walls of the cells in 48 hours or less.

Pres. Miller: I find that comb foundation, when piled together, will keep much better than when exposed to the atmosphere.

Adjourned to 1:30 p. m.

AFTERNOON SESSION.

Pres. Miller called the Convention to order at 1:30 p. m., and announced

that the next topic for discussion was

Wintering Bees.

James Heddon: The objection to cellar wintering is the expense. The cellar should have a plenty of pure air, with the temperature never below freezing, and the bees should be fed on pure sugar syrup. Pollen is the bane; it floats in the honey, and causes dysentery. Sugar syrup is best for winter food for bees.

J. E. Hunter: I do not believe that bees get enough pollen in the honey to do harm, but I have no doubt that pollen stored in the comb is often the cause of dysentery.

E. J. Oatman: Our loss of 50 per cent. of our bees, in 1880, was due to dysentery. I do not believe that bees should have pollen in winter.

James Heddon: My bees stored lots of pollen this fall, and I feared the result, but the weather has been so pleasant that breeding has used it up, and I have no fears now of success in wintering my bees.

L. H. Scudder: How do you prevent the bees from storing pollen while you are feeding them with sugar syrup?

James Heddon: Bees will not gather pollen, because they are fed syrup. With my feeders, holding 2½ lbs. each, I can give them enough for winter in 48 hours, and during this short time no pollen is gathered.

L. H. Scudder: The trouble is that the labor of extracting the honey in the fall and the cost and labor of feeding sugar syrup, will be more than the worth of the bees.

A. A. Rice: I would like to know how to prepare the sugar syrup.

James Heddon: Not knowing just when the honey season will close, we often get belated in feeding, in which case I prepare my feed as follows: 4 lbs. of water, 10 lbs. of granulated or confectioner's A sugar, and a piece of tartaric acid of about the size of a pea; bring to the point of boiling, and boil for a few moments. When lukewarm it is ready to feed.

E. J. Oatman: In the normal condition, when bees are wintered on the summer stands, the bees will not come out except when the weather is favorable. I have been asked why I have changed my plan of wintering from the cellar to that of packing in chaff on the summer stands, when we were so successful with wintering in cellar. In reply I would say that it was not because we were not successful, with that method, but because we had no good cellars in some of our apiaries. We now winter on the tenement plan—by putting clusters of 4 hives of bees together, two facing east and two facing west, and pack each four with chaff. It costs but 10 cents more to thus prepare 4, than it would to pack one.

Pres. Miller: But why did you change the manner of your wintering bees in your home apiary, where you had a good cellar? Is it not more expensive to pack them in chaff than to carry the bees into the cellar?

E. J. Oatman: Yes; but I think it safer to do so.

Pres. Miller: Why?

E. J. Oatman: Because they have more pure air.

Pres. Miller: That is the point. Then if I give my bees pure air in the cellar, is it not as well as to pack them in chaff?

J. E. Hunter: I ventilate my cellar with a pipe and keep the temperature even.

T. G. Newman: At about what temperature do you keep the cellar during the winter?

J. E. Hunter: At about 40 or 50 degrees, but 45° is the best and safest. I have a pipe from the outside to let in pure air, and one leading to the chimney to carry the foul air out.

Pres. Miller: When warm air is desired for the cellar the outer end of the pipe must be lower than the end inside.

A. A. Rice: Yes, and it must have ventilation to let the foul air out, or you can never get pure air in, because the foul air will rise to the top of the cellar and stay there, unless there is a manner of escape provided for it.

John Hodgson had 70 colonies in the cellar, and ran a pipe 150 feet to admit warm and fresh air.

The articles on exhibition were:

Bingham's Conqueror Smoker, Dr. Thurston's Wire Frame-Holder, Scovell & Anderson's Improved Smoker, Bees from Rev. D. Whitmer's Apiary, Bull's Spacer for the bottoms of brood frames, etc.

The Convention then adjourned to meet on Wednesday and Thursday of the last week of the Chicago Exposition, of 1883. C. C. MILLER, *Pres.*

THOS. G. NEWMAN, *Sec.*

Lebanon, Ind., Convention.

Quite a number of persons interested in bee culture met in the Court House, Lebanon, Ind., at 11 a. m., Monday Oct. 9, 1882; and effected a temporary organization, by electing Dr. O'Rear, of Lizton, Hendricks Co., President, and W. P. Parr, of Lebanon, Secretary.

The President briefly stated that the object of the meeting was the organization of a county society, auxiliary to the Indiana State Bee-keepers' Association, and a committee, consisting of Geo. W. Smith, S. H. Lane and F. B. Williams, was appointed to draft a constitution and by-laws with instructions to report at the next meeting, Dec. 2, 1882.

The following permanent officers were then elected: Geo. J. Frey, President; Geo. W. Smith, Vice President; S. H. Lane, Secretary and Treasurer; after which adjournment was taken until 1 p. m.

The association re-assembled at the appointed time, and, after being called to order, the following persons signified their purpose to become members of the association by paying the initiation fee, 75 cents (which also entitles them to full membership in the State Association), and they will sign the constitution and by-laws at the December meeting: Geo. J. Frey, Ora Knowlton and Miss Anna F. Weitzel, of New Brunswick; F. B. Williams, Geo. W. Smith, Adolphus Joyson and

Miss Maggie O. Smith, of Lebanon; S. H. Lane and W. R. Bohanon, of Whitestown; H. Cox, White Lick; John J. Goldsborough, Thorntown; William S. Smith, Phillip W. Beeler, Zionsville.

The afternoon was spent in the discussion of various questions relating to the best method of wintering bees, how to obtain the largest yield of honey, etc. Dr. O'Rear exhibited a case of Cyprian bees, and a queen supposed to be better than the Italian bee.

Mr. Frey had quite an assortment of comb foundation and some new styles of smokers.

One of the ladies gave the following receipt for a cup cake: 2 cups of honey, 1 cup of butter, 1 cup of sweet milk and 3 eggs; warm the honey to make it thin; use baking powder.

This meeting developed quite an interest in beeology, and there is no doubt but that the next meeting of the association will be interesting and profitable.

The following programme was arranged for the next meeting: How to produce the most extracted honey—Geo. J. Frey, Lebanon; The most convenient hive—F. B. Williams, Lebanon; Wintering bees—S. H. Lane, Whitestown; Honey in best marketable shape—Geo. W. Smith, Lebanon; Queen breeding—A. Cox, White Lick; Best method of producing comb honey—W. R. Bohanon, Whitestown; Forage for bees—Ora Knowlton, New Brunswick; Increase of bees—J. J. Goldsborough, Thorntown.

Essays—Miss Anna Weitzel, New Brunswick and Miss Maggie O. Smith, Lebanon, who will select their own subjects.

Saunders County (Neb.) Convention.

The Saunders county Bee-keepers' Association, held its semi-annual meeting at Wahoo, Oct. 7th, 1882. After the opening of the meeting, reading and approval of the minutes of the last meeting, and the treasurer and secretary's reports, the following officers were elected for the ensuing year: President, C. C. Gurney; Secretary, J. J. Burtch; Treasurer, S. V. Decker; Vice President, L. P. Whitbeck; Keeper of Supplies, G. Rouse.

The meeting was then open for general discussion, and quite an interesting discussion ensued on the price of bees, the preference of Italians over black bees, wintering bees, the color of Italian bees, etc. It was then announced that the State Bee-keepers' Association wished to hold its annual meeting at Wahoo, and a motion was unanimously carried that we send them a pressing invitation to meet at Wahoo, next January. After some experience had been given in bee culture, the meeting adjourned.

Mrs. C. L. STOCKING, *Sec.*

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

Local Convention Directory.

1882. *Time and Place of Meeting.*

Nov. 1.—New Jersey & Eastern, at New Brunswick, J. Hasbrouck, Sec., Bound Brook, N. J.

3.—Iowa Central, at Winterset, Iowa, Henry Wallace, Sec.

1883.

Jan. 16.—Eastern N. Y., at Albany, N. Y. E. Quakenbush, Sec., Barnersville, N. Y.

16-18, Northeastern, at Syracuse, N. Y. G. W. House, Fayetteville, N. Y.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning County, in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

LEONIDAS CARSON, *Pres.*

The Iowa Central Bee-keepers' Association will hold its annual meeting at the office of Graham & Steel, Winterset, Iowa, on Friday Nov. 3, 1882, at 10 a. m. All interested in bee culture are invited.

HENRY WALLACE.

CLUBBING LIST.

We supply the *American Bee Journal* and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	<i>Publishers' Price.</i>	<i>Club</i>
The Weekly Bee Journal,	\$2 00.	\$2 00.
and Gleanings in Bee-Culture (A. I. Root) 3 00., 2 75		
Bee-keepers' Magazine (A. J. King) 3 00., 2 80		
Bee-keepers' Exchange (H. N. & P. C.) 3 00., 2 80		
Bee-keepers' Guide (A. G. Hill).....	2 50., 2 35	
Kansas Bee-Keeper.....	2 60., 2 40	
The 6 above-named papers.....	6 00., 5 50	
The Weekly Bee Journal one year and		
Prof. Cook's Manual (bound in cloth) 3 25., 3 00		
Bees and Honey, (T. G. Newman) " 2 75., 2 50		
Binder for Weekly, 1881.....	2 85., 2 75	
Binder for Weekly for 1882.....	2 75., 2 60	

The Monthly *Bee Journal* and any of the above, \$1 less than the figures in the last column.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

A STATISTICAL TABLE.

The Committee on Statistics, appointed by the Northwestern Bee-Keepers' Association, at Chicago, Illinois, on October 18-19, 1882, reported the following Tabular Statement, showing the number of colonies of Bees, owned by fifty of the persons present, who had reported, and the amount of honey produced by them; together with other items of interest:

NAME.	RESIDENCE.	OCCUPATION besides KEEPING BEES.	KEEPING BEES.				Number of Colonies on hand now.	Number of pounds of Comb Honey.	Number of pounds of Extracted Honey.	HOW WINTERED.	
			Number of Colonies last Fall.	Number of Colonies lost in Winter.	Number of Colonies lost in the Spring.	Number of Colonies beginning of season. No. Colonies used for other than honey.					
Dr. C. C. Miller,	Marengo, Ills.,	None,	177	1	1	174	202	15,500	Cellar.

CORRESPONDENCE

For the American Bee Journal.

Bees and Honey Thieves.

A. R. KOHNKE.

On the 7th of last June, a honey thief from Colmac, Germany, who systematically plundered the apiaries of the valley of Muenster, was sentenced to 6 years in penitentiary.—*Alsacian Bienenzeitung.*

Another German exchange states, that the bee-keepers of a certain district in Northern Germany petitioned the Government officials to be permitted to lay iron fox or wolf-traps to catch bee thieves who stole their bees or took the honey and thus ruined the colonies. The petition was granted, provided the apiaries were enclosed by a fence.

Now and then we hear in this country of such depredations, and perhaps but very few of such cases are reported. Honey is sweet; but stolen honey seems to some people the sweetest of sweets and before you are able to raise the morals of the community to a higher standard so that they will let your bees alone, your best colonies may be ruined.

Different bee-keepers advise and use different precautions, among which are high, tight board fences, in addition to which a barbed-wire is run on top; others use a barbed-wire fence only; still others advise a bull dog, and some one advised an electrical alarm.

It will not be necessary to state my objections to arrangements I do not use, but I prefer the electrical alarm as the most reliable and least expensive. I am surrounded by some of the worst elements of society—miners and mill hands—but as soon as the bees were put on their stands I put up the alarm. Suspicious looking characters would come along and inquire about the object of those wires "they were certainly too high for clothes lines." I would tell them, I meant to use them to blow up thieves by electricity, and no one ever ventured to come into the garden after honey, fruit or vegetables, while my neighbors were robbed by, perhaps, strikers.

Now to construct or put up such an alarm, one should not apply to an electrician. I tried one, he wanted \$3.50 per hive, besides \$7.00 for the alarm proper, and about \$4.00 for a three-cell battery. Then I went to work and made everything myself, buying the material only, which did not come to more than about \$3.00, and the connections for each hive can be made for about 25 or 30 cents. They are made of small plates or pieces of sheet copper or brass, which touch when the hives are closed; the alarm being arranged on the closed circuit principle, as soon as a hive is opened or moved the circuit is broken and sets the alarm bell ringing; it

will be seen that by cutting the line, as some one hinted to me, nothing would be gained, but set the alarm going in a moment. The cost of running the alarm is very small, not more than a dollar a month, at the utmost, for any number of hives.

To describe my arrangement minutely would take too much space at present, but should there be a demand for it I may do so at some future time. Youngstown, O.

Rural New Yorker.

How to Winter Bees.

PROF. A. J. COOK.

As the winter again approaches, bee-keepers begin to inquire how they may safely winter their bees. This matter of wintering is the only element in apiculture that is precarious, and when we remember that such men as John Davis, of Michigan, with his scores of colonies, and O. O. Poppleton, of Iowa, with his hundreds of colonies, and D. A. Jones, of Ontario, with his thousands, all located in the cold, bleak North, winter without loss every winter, may we not conclude that wintering is only precarious as men are ignorant or careless? With the requisite knowledge, and an equal amount of care, it is more than probable that universal success might come with every winter.

As Mr. Poppleton says, to insure safe wintering, preparation should commence early in the season. The colonies should be kept strong, and should be kept breeding, by stimulative feeding if that is necessary, till well into September, that there may be the proper number of young bees. Some bee-keepers ridicule this idea, but such men as Jones hold it to be very essential.

As soon as frost comes, at least as early as October 1st, when the work of the year is over, the bees of each hive should be given at least 30 lbs. of good capped honey in frames that are at least two-thirds or three-fourths full. If from too close extracting, or a poor honey yield, the requisite amount is not in the hive, then the bees should be fed at once that they may have time to get all capped before the cold weather prevents work. Don't guess at the amount of honey, but weigh, that there may be no mistake. For feed, we may use good extracted honey, or, better still, granulated sugar made into a rich syrup by dissolving in water and heating till it boils. If we use hives with tight-bottom boards we can follow Mr. D. A. Jones's method, and turn the honey right into the back of the hive after we have raised the front. If we have separate bottom boards we may use any of the convenient feeders. In feeding we must be careful to feed late in the day, and not to spill any feed about the apiary, or we may have trouble with robbing. Should any bees get to robbing, which will be denoted by fighting and a great commotion in front at the entrance of the colony being robbed, we should either cover the entrance of this hive with

wire gauze, or else nearly close it with blocks. In two or three days the entrance may be again opened.

After we have given the bees sufficient food, we should, by the use of the division board, confine the bees on the frames which contain their stores, and exclude all others, so that the bees will have only to warm the part of the hive actually used. Above this chamber we should place fine, dry chaff or sawdust, which, for convenience and neatness, had better be confined in a sack. If we are to winter out-of-doors, either in chaff hives or with chaff or sawdust packed about our hives, we should put similar chaff or sawdust cushions at the sides of the winter combs, just outside the division boards, which latter had better not reach quite to the bottom of the hive.

In all the combs to be used in winter there should be cut a small central hole, so that the bees can easily pass through from one comb to another. These may be cut when we weigh the combs.

Many, with Mr. Poppleton, prefer chaff hives. These are double-walled at the ends of the frame, with a six-inch space filled with fine chaff. Thus we see that with the cushions already mentioned the bees are surrounded on all sides with a protection from the cold. By the use of chaff hives their friends claim that they can winter successfully, and that they are protected against "spring dwindling." Others object to the cost of these hives and to their weight, which makes them hard to handle, and many think them unsafe in very cold winters, perhaps because they were not fairly tried.

Owing to these objections, others, who wish to winter on the summer stands, place a box outside of the hives, leaving a space of ten or twelve inches, which they fill with chaff or sawdust. It is arranged so that the bees can fly if the weather is so warm as to incite activity, with this protection. Expense and ill success have robbed this method of many of its friends?

Probably no method has so many friends in the Northern States, where wintering is a vexed question, as that of cellar wintering. This is high praise for the cellar, as there are so many poor cellars that we should expect too many failures to keep this style of wintering in good repute. If we may judge from experience, a properly constructed cellar, with the proper preparation already referred to, will never fail.

The cellar should be entirely beneath the earth, and be so ventilated that the air should always be sweet, and the temperature always uniform at about 45° F. While it should never be more than two degrees warmer than this, it will do no harm if it is five degrees colder at times. The best way to secure this is by sub-earth ventilation. A four-inch pipe should extend from the bottom of the cellar to connect with a stove-pipe in the room above. From near the bottom of the cellar there should be another pipe (six-inch tile is the best) extend-

ing for 80 feet through the earth, running below the frost line and then reaching the surface of the earth, where it should be protected by wire gauze, so that vermin could not enter the pipe. We see that as a fire is built in the stove the air is drawn from the cellar and is supplied by the sub-earth pipe. This cools the air when the weather is warm and warms it when it is cold. I have known such a cellar to be in successful use for nearly half a score of years; and several others for a less time. Some secure ventilation by the usual means and keep the right temperature by a refrigerator, a cistern in the cellar, or a stream of water passing through it. The sub-earth plan is the most scientific, and works best. The cellar should be dry and quiet.

The bees should be removed to the cellar before winter sets in. The hives should be dry, if possible, when put in, and the bees should be set in so quietly that they would not be disturbed. Once in, we remove the covers, leaving the cushions on and opening the entrances. Thus arranged, we may leave the bees till the pollen of April bids us to prepare for the work of a new year.

The only valid objections to cellar wintering is the labor of moving the bees and the danger of spring dwindlings. The expense of moving is less than that of either of the other methods, and, if we properly confine the bees by use of the division board as they commence to work in spring, we may have no fear of dwindling, especially if we have such a cellar as suggested above.

Lansing, Mich.

For the American Bee Journal,

Bee and Honey Show at Baltimore.

C. H. LAKE.

DEAR EDITOR—I see by this week's issue of the JOURNAL you failed to receive several copies of our daily publications containing accounts of the great fair.

You will see our exhibit was an independent one, but no others entered the contest and we had a one-sided one, so to speak. Some how we can not get the bee-keepers to show their products at the fairs. The small premiums offered by most societies will not pay the trouble—is one great drawback. I don't know of another society in the State of Maryland that offer over \$3.00 in the apiarian department, except Baltimore, and the increase of premiums of this society is due to your article upon the subject, about two years ago. I placed it in the hands of the society and at their annual meeting it was argued and a portion of the premiums as recommended by you adopted as follows:

For Best Colony of Italian Bees in Movable Combs	\$5 00
For best display of Bees including their publication	5 00
For best 10 lbs. Comb Honey	2 00
For best display Extracted and Comb Honey	2 00
For best Crate of Honey ready for shipping	2 00

A second premium is also offered on the same exhibit, making about \$20,

offered as premiums in this class.

In the implement or machinery departments any new feature can be entered, as any labor saving implement for any purpose, the award of premiums to be from the societies—medals to a diploma, or equal cash premiums, as the exhibitor chooses. Under this head we are compelled to enter our hives, foundation machinery, extractors and whatever new things may be tried or proved worthy; all old articles, as those used at an early date, being ruled out.

Now, it would be much better for all agricultural societies, offering bee-keepers any inducements to show their products, to make one class of everything that bee-keeping requires, and have competent judges that know their business in this respect—especially on articles of known merit. As an illustration of this, one of our workmen conceived the idea of an automatic self spacer for the brood-chamber, something that every bee-keeper in the land that uses a bar hive requires. The device was duly entered but no committee came to examine it, consequently it went by unnoticed except by bee-keepers, who were universal in their decision of its being the "best thing out." I will send you a set of Langstroth frames with the appliance all ready, and they will "speak for themselves" as it would require too much writing to give a clear description of them at this time. A new feeder, also was passed by for the same reason.

Our exhibit was the largest ever seen in the State, and, as we went more for the benefit of advertising our business than the small premiums offered, we were well rewarded for the effort it cost us.

Scientific American.

Irritating Effect of Bee Stings.

PROF. A. VOGEL.

It is well known that the effect of a stinging nettle on the skin agrees very closely with the sensation produced by the sting of a bee or wasp. But the great similarity is not limited to the feeling it causes, but, what may not be so generally known, the cause of the irritation is essentially the same. It may be considered as definitely settled that formic acid is present in the poison sac of the bee sting, in the so-called bee poison. The same corrosive acid also occurs in the sting of the nettle. Some species of caterpillars have formic acid in some of their hairs, which they seem to shake off at will, and when a person touches such a caterpillar the poison penetrates the skin whenever it is moist, and causes burning, itching and inflammation. These poisonous members preserve their irritating powers, even after the death of the worm. This accounts for reliable statements that visitors to collections of caterpillars have suffered from exanthematous eruptions on the neck. "Many hairy caterpillars cause itching and burning of the skin when touched, and some-

times it gives rise to swelling and redness. This depends on the fine hairs, which produce the same effect when they float around the air. Many ladies who visited the caterpillar room of the naturalist Reaumur had a breaking out on the neck."

In the sting of the bee, wasp, hornet, etc., a minute drop of a transparent liquid may be observed on the sting, and is called "bee poison" (formic acid). It penetrates into the wound produced by the sting, and causes the well known effects. It would, however, be a great mistake to assume that the only object of this is to increase the effect of the sting, that is, that it serves only to injure. It has a far more important purpose, namely, to prevent fermentation and decay. The celebrated bee cultivator, Holz, reports that in his long experience with honey, that which came from what are called "ranchorous swarms" (boshaft) had peculiar properties. It always had a bitter, harsh taste, and its smell was sharp too. How can the character of the swarm affect the smell and taste of the honey they gather? We know that bees, when they are disturbed, run out their stings, on the end of which may be seen a tiny drop. This little drop, as we have already said, is bee poison, or formic acid. When the disturbance is at an end they draw in their stings again, but the little drop of liquid does not go back with it, but is wiped off on the comb, and sooner or later gets mixed up with the honey. This explains why the honey from such excited bees tastes and smells sharper than that from peaceable bees. Excitable bees will rub off this little drop of formic acid more frequently than other bees; perhaps a larger drop is formed by nervous bees than those that are not nervous, and hence the honey is much richer in formic acid. This acid is never absent in genuine honey, but the amount differs. This contamination is not only uninjurious but very useful, in fact necessary, for it keeps the honey from spoiling; we know, indeed, that purified honey, from which the formic acid has been removed, very soon ferments, while unpurified honey will keep unchanged for years. Nature furnishes the bees with this knowledge instinctively, and therefore they do not carry this drop of formic acid away out of the hive. Bee connoisseurs assure me that the bees add to it the nectar which they collect that is free from it so as to make it keep, and they do this in places where they are not disturbed, too.

Bee stings are often spoken of in agricultural and popular papers as a remedy for rheumatic affections, and numerous cures are adduced to prove it. If the formic acid that accompanies the sting can be looked upon as the principal agent in the cure, it would be worth while to try the experiment of rubbing the spot with this acid or injecting it under the skin so as to avoid the somewhat inconvenient method of applying live bees.

Two hundred years ago formic acid was made from the brown wood ants,

by triturating them with water and distilling it. The liquid acid was used to irritate the skin. The reddening of the skin, by using baths of pine leaves, is also due to the action of formic acid. The anti-fermentative action of formic acid has also been long recognized.

As regards the irritative action of stinging nettles and other similar vegetables, it depends, as already stated, on its formic acid. The point of the nettle is brittle as glass, and by the lightest touch penetrates the skin and breaks off, pouring out its acid and causing the burning sensation.

Frequent mention has been made of formic acid. In conclusion it may be stated that it gets its name from the ant (*formica*), because it was first found in them. If it had been first found in the bee or nettle it would have received another name. If an ant runs over a piece of blue litmus paper he will leave a red streak. Put a stick in an ant hill and they will squirt strong acid on it.

Munich, Germany.

SELECTIONS FROM OUR LETTER BOX

Building up Colonies.—I commenced July 8th, with 6 nuclei, which are built into strong colonies, except two, which I have just united. Pasturage here is fine and I will go into the bee business on a larger scale, if I find myself adapted to it. I will winter in A. I. Root's chaff hives, on summer stands and amuse myself this winter in making hives and frames. Please let me know the best and quickest way to stock up, supposing I have hives and frames with only foundation and no combs, can I build up colonies in these, simply by giving one-half pound of bees, purchased elsewhere, and giving them queens of my own rearing, without any brood, or in other words, is it necessary in order to establish a colony, no matter what quantity of bees, that brood should be given them to induce them to stay? How many bees would it require to establish a colony, that would give a surplus, if the colony were put in the hives as above on May 1st?

H. Z. SHRIVER.

Cranberry, W. Va., Oct. 8, 1882.

[It is too late now to attempt to build up colonies by buying one-half pound of bees, as is suggested above, and giving them a queen. In the spring it might do. It would be safer to give them a frame of brood to induce them to stay.—Ed.]

Packing Bees in Chaff.—On page 645 of the BEE JOURNAL for Oct. 11, the writer of the Prize Essay on Wintering Bees says: "Then remove the cover, and place on top of the quilt a cushion, and about 4 inches of sawdust packing." Are we to understand

that the sawdust should be in the cushion, the cover also to remain off, and the narrow strips to be placed on the cushion? W. W. MOORE.

Gillett's Grove, Iowa, Oct. 16, 1882.

[Mr. Clouse is invited to reply to these queries.—Ed.]

Wants a Society.—To the bee-keepers of Missouri, Arkansas and Kansas—it seems strange that the bee-keepers in the above-named States, remain so inactive concerning a Society or Convention. I should like to become a member of such a society consisting of enterprising men and women who are willing to make some effort, for the advancement of bee-culture, and the establishment of a good home market. I will be pleased to hear from any one interested in the organization of such an essential thing and who is willing to work for it. My bees have done finely this season. About how many bees must there be in a colony that it may be sufficiently strong for winter, and how many frames 11x12, partly filled, would it require to carry them through? I winter on summer stands, use division boards and quilts on top of the frames. My wife and I are giving our time and talent to our bees, and they have rewarded us well. We now have 84 colonies in good condition for winter. We read with much interest the reports of those Conventions.

J. T. BRUTON.

Joplin, Mo., Oct. 12, 1882.

[There should be bees enough to cover 6 frames, and they should have 25 pounds of honey.—Ed.]

Caution about Shipping Honey.—Seeing an advertisement in the BEE JOURNAL of a party on 22d street, Chicago, who would purchase honey in large or small quantities; and for comb would pay the highest market price, I concluded to call and try to dispose of mine. Accordingly I went to the place designated, and after some difficulty, found a young man who claimed to be one of the firm, who took me to their place of business, which proved to be a basement room, very poorly lighted and showing no signs of business. He did not want to purchase; had all the stock they required at present, etc. Now I write this to caution bee-keepers from sending their goods to any person, without knowing the standing of the party to whom they ship.

L. H. SCUDDER.

New Boston, Ill., Oct. 20, 1882.

[As the party in question only proposed to buy honey for cash, we did not deem it necessary to enquire into their standing. Of course, no one should trust any person, with whom they are unacquainted, without first ascertaining their business standing, and being fully assured of their ability to make all contracts good. We have repeatedly cautioned our readers on the necessity of this.—Ed.]

THE AMERICAN BEE JOURNAL

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about eight words; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole paid in advance:

For 4 weeks.....	10	per cent. discount
" 8 ".....	20	" " " "
" 12 " (3 months)....	30	" " " "
" 18 " (6 months)....	40	" " " "
" 24 " (9 months)....	50	" " " "
" 52 " (1 year).....	60	" " " "

Discount, for 1 year, in the MONTHLY alone 25 per cent., 6 months, 10 per cent., 3 months 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,—	" Bees and Honey," in paper.
" 3,—	" an Emerson Binder, or "Bees and Honey," in cloth.
" 4,—	" Apiary Register for 50 Colonies, or Cook's Manual, paper.
" 5,—	" Cook's Manual in cloth, or the Apiary Register for 100 Colonies
" 6,—	" Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Two subscribers for the Monthly will count the same as one for the Weekly, when getting up clubs for the above premiums.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

Kendall's Spavin Cure is used from the Atlantic to the Pacific coast.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., October 21, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—I am paying 6½c. for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17@22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@20c. on arrival; extracted, 7@10c. BEESWAX—Firm at 20@25c. per lb.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand increases with the cool weather, but not sufficiently fast to keep pace with receipts, which now accumulate, as it is time to get the surplus into market. There is some call for comb with perhaps a tendency downward, owing to many consignors desiring to realize quickly.
We quote: white comb, in small sections, 18@20c. Fine, well-filled, 1 lb. sections bring the outside price. Dark comb honey, little demand, 15@16c. Light honey, in larger boxes, 12@16c. Extracted—white clover, 9@10c.; dark, 8@9c., in barrels and half-barrels. Kegs will bring but a small advance, if any, above half-barrels.
BEESWAX—Very scarce. Choice Yellow, 30c.; dark to fair, 20@24c.
R. A. BURNETT, 165 South Water St.

CLEVELAND.

HONEY—In steady but moderate demand at 21@22c. per pound, for best white one pound sections, in attractive packages. Same quality in less attractive shape, 20@21c. In 2 lb. sections, 18@20c. Second grade sells about 2 cents per lb. less than the above prices. Buckwheat is unsalable in our market. Extracted, in small tin pails, 15c.; in 20 to 60 lb. cans, 14c.; in barrels, dull at 10@12p.
BEESWAX—Prime quality, 25@28c.
A. C. KENDEL, 115 Ontario Street.

SAN FRANCISCO.

HONEY—Extra choice, either comb or extracted, is inquired for, and extreme figures are offered.—Nearly all offered is second or third quality, for which the demand is not active at the prices demanded.
We quote white comb, 18@20c.; dark to good, 12@15c. Extracted, choice to extra white, 9½@10½c.; dark and candied, 7½@8½c.
BEESWAX—28@30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Prices unchanged and dull. Comb 15 @18c—latter for choice white clover in small packages; strained in round lots at 6@7c.; extracted in cans at 9@10c.
BEESWAX—Sold fairly at 26@27c. for prime.
R. C. GREER & Co., 117 N. Main Street.

NEW YORK.

HONEY—Demand slow. We quote: Comb in the small sections, white, 16@20c. Extracted, 7@10c.
BEESWAX—The stock continues light, and prime Southern held up to 30c., with little if any obtainable below 29c. Western, pure, 29@30c.; Southern, pure, 30@33c.
D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Sells very readily in 1 lb. sections at 22@25c. for best white, and 20@22c. for 1½ to 2 lb. Boxes containing ½ pound, 30 c. per pound. Extracted is selling very slowly at 12@14c.
BEESWAX—25@26c.
CROCKER & BLAKE, 57 Chatham Street.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages)..... \$1 00
" 100 colonies (220 pages)..... 1 50
" 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to new Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

Articles for publication must be written on a separate piece of paper from items of business.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

When changing a postoffice address, mention the old as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

WANTED.—The numbers of the BEE JOURNAL, from January 1 to Sept. 30, 1882. State price to JAS. P. BURDICK, Glen Falls, N. Y.

AT LULING, TEXAS.

I breed PURE ITALIAN BEES AND QUEENS for sale; manufacture Hives of any style and Comb Foundation. Dealer in Novice Honey Extractors, Bucham Smokers, and everything used by modern bee-keepers. Write for prices. Beeswax wanted.
14w38t
J. S. TADLOCK.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$8 00
For 2 Langstroth " 10x18 "	8 00
For 3 " " 10x18 "	10 00
For 4 " " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " " 12x20 "	12 00
For 4 " " 13x20 "	16 00

ALFRED H. NEWMAN,
923 West Madison Street, Chicago, Ill.

GOLDEN ITALIAN QUEENS.

1-frame Nucleus, with Tested Queen.....\$4.50
2-frame Nucleus, with Tested Queen.....5.00
Full Colony, with Tested Queen, before July 1.....12.00
Same, after July 1.....10.00
Tested Queen, before July 1, 3.00
" after July 1, 2.50
" per half doz., 13.50
Address, by Registered Letter or Postoffice Order,

Florida Land--640 Acres

CHEAP FOR CASH.

DESCRIPTION.—Sec. 4, township 7, south range 7 west, Franklin county, Florida, situated about 50 miles south of the Georgia line, 25 miles west of the city of Tallahassee, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a seaport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loam, covered with timber.

It was conveyed on Dec. 31st, 1875, by Col. Alexander McDonald, who owned 6 sections, including the above, to J. M. Murphy, for \$3,200, and on Sept. 5th, 1877, by him conveyed to the undersigned for \$3,000. The title is perfect, and it is unencumbered, as shown by an abstract from the Records of the county, duly attested by the County Clerk; the taxes are all paid and the receipts are in my possession.

I will sell the above at a bargain for cash, or trade for a small farm, or other desirable property. An offer for it is respectfully solicited. Address,

THOMAS G. NEWMAN,

925 West Madison Street, CHICAGO, ILL.

A NEW BEE BOOK!

Bees & Honey

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN,

Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bea Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pnaski, Tenn.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmer's Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

MARKETING HONEY

Send 15 CENTS for Dadant's pamphlet on "Harvesting, Handling, and Marketing Extracted Honey."—You will get many times the value of your 15 CENTS in the hints and ideas that it will give you. Address,

CHARLES DADANT & SON,

Hamilton, Hancock County, Ill.

New Kegs FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore procured kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well sealed, the pine will not flavor the honey.

Capacity, 175 pounds. Price, 80c. each.

The first car load of these kegs will arrive about Sept. 10th, and all orders will receive my prompt attention.

The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

923 West Madison Street, CHICAGO, ILL.

Scribner's Lumber and Log Book.

NEARLY A MILLION SOLD. Most complete book of its kind ever published. Gives measurement of all kinds of lumber, logs, and plunks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterna, cordwood tables, interests, etc. Standard book throughout United States and Canada. Ask your booksellers for it. Sent for 35 cents post-paid.

For sale at the BEE JOURNAL Office. 41

65 ENGRAVINGS.

The Horse

BY B. J. KENDALL, M. D.

A TREATISE giving an index of diseases, and the symptoms; causes and treatment of each, a table giving all the principal drugs used for the horse, with the ordinary dose, effects and antidote when a poison; a table with an engraving of the horse's teeth at different ages, with rules for telling the age of the horse; a valuable collection of recipes, and much valuable information.

Price 25 cents.—Sent on receipt of price, by

THOMAS G. NEWMAN,

925 West Madison Street, CHICAGO, ILL.

BINGHAM SMOKERS.

I can sell the above Smokers at MANUFACTURERS' PRICES, by mail or express, at wholesale or retail. All the latest improvements, including the CONQUEROR.

Send for my 32-page Illustrated Catalogue of Bee-keepers' Supplies of every description.

The Bee-Keeper's Guide; OR, MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—*L. Apiculture, Paris.*

I think Cook's Manual is the best of our American works.—*LEWIS T. COLBY.*

It appears to have cut the ground from under future book-makers.—*British Bee Journal.*

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—*J. P. WEST.*

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—*E. H. WYNKOOP.*

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald, Monticello, Ill.*

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—*A. E. WENZEL.*

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—*WM. VAN ANTWERP, M. D.*

It is the latest book on the bee, and treats of both the bee and bees, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record.*

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—*L'ABBE DU BOIS, editor of the Bulletin D'Apiculture, France.*

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat, Pulaski, N. Y.*

We have perused with great pleasure this *modus mecum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist, Quebec.*

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist.*

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor.*

PRICE—Bound in cloth, \$1.25; in paper cover, \$1.00 by mail prepaid. Published by

EARS FOR THE MILLION!

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carcharodon Rondelleti*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many an seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by
THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.— Entirely re-written, elegantly illustrated and full "up to the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.— The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.— This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.— This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee— This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.— A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.— Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Helen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon Theory— presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.— This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.— This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive I Use—Belong a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey: Harvesting, Handling and Marketing.— A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman— Giving advanced views on this important subject, with suggestions what to plant, and when and how to: 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees, Price, 10c.

Swarming, Dividing and Feeding Bees.— Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Kendall's Horse Book.— No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Chicken Cholera, by A. J. Hill.— A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gliders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED EXCLUSIVELY TO PROGRESSIVE BEE CULTURE.

Vol. XVIII. Chicago, Ill., November 1, 1882. No. 44.

THE AMERICAN BEE JOURNAL

Published every Wednesday by
THOMAS C. NEWMAN,
 EDITOR AND PROPRIETOR,
 925 WEST MADISON ST., CHICAGO, ILL.
 At \$2.00 a Year, in Advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

Sowing Alsike Clover.—A correspondent asks for information on this subject. When planted alone sow in the spring from 3 to 4 pounds to the acre. When mixed with white or red clover, sow about 2 lbs. to the acre. Timothy or red clover will do no harm, as they may be cut early enough, so that the Alsike will be the only plant ripe enough to furnish seed. Moist land is best for it. It should not be sown with grain. Some advocate its being sown in drills, in order to keep the weeds down.

Mr. Baldrige, who has had considerable experience with Alsike as a honey plant, says :

It is much the better way to mix Alsike with timothy, or the common red clover, or both. When thus mixed they are a help to each other. The Alsike being a native of a cold climate, does not winter-kill, and besides, it acts as a mulch in winter and spring to the common red, and keeps the latter from being destroyed by the heaving-out process. As the red clover shades the roots of the Alsike, which grow close to the surface, it protects the latter from the effects of drouth. The timothy and red clover being both upright growers, lift and keep up the Alsike from the ground, which is very desirable. The stem of the Alsike is too fine to support its many branches in an upright position, and hence is more inclined to lodge than the common red.

For the reasons given, the combination of the three named plants is very important, and will prove successful wherever tried.

The Vice President for Conn., Mr. Jeffrey, reports 80,000 colonies of bees in that State, and then adds that 95 per cent. of them are in box hives! Talk about progressive bee-keepers!

Preparing Bees for Winter.—Quite a number of queries have been propounded, besides those answered in this issue of the BEE JOURNAL, on this very important subject. In order to answer them all, without repeating, we shall, in the next issue, give some very full instructions on the subject, including Mr. D. A. Jones' plan for preparing bees for winter by five different methods. He says :

I have tried all the different methods; spent thousands of dollars in experimenting, and have no hesitation in saying I have had a larger and more varied experience than any other bee-keeper. I have succeeded for years in wintering by the system which I have adopted, and hundreds of others have been successful who have carefully followed the same instructions and directions.

On page 676, tenth line from the top of the last column, for 400 pounds to the colony, read 100 pounds. Here, at least, one figure makes a vast difference. Thanks to Mr. Scudder for calling our attention to it.

The Langstroth Fund.—The money raised at Cincinnati, O., and forwarded to Mr. Langstroth, was as follows, as far as we can determine :

E. Parnly, 19 W. 38th St., N. Y., \$50; D. A. Jones, Beeton, Ont., Can., \$20.00 (\$10.00 cash and a queen that afterwards sold for \$10); A. J. Cook, Lansing, Mich., and A. I. Root, Medina, Ohio, \$10 each; Dr. C. C. Miller, Marengo, Ill., \$5.00; Dr. Blanton, Greenville, Miss., \$2.00. The following persons contributed \$1.00 each; E. B. Vincent, Sunman, Ind.; J. M. Hyne, Stewartsville, Ind.; Christopher Grimm, Jefferson, Wis.; B. Price, Iowa City, Iowa; Rev. L. Johnson, Walton, Ky.; H. B. Harrington, Medina, O.; four "friends," each; Herriek; E. Peleman; E. G. Lewis, Ben Mullen, T. B. Hunt, and a friend, 50 cents each. Two "friends," 25 cents each. Total, \$112.50. We have given full addresses where they were given to us.—*Gleanings.*

The Purity of Honey.

Mr. J. O. Todd, Richmond, Iowa, writes us as follows :

I wish you would inform us, through the BEE JOURNAL, what constitutes pure honey. I have a large crop of honey this year, and some of the incredulous have said it must be adulterated. I know it is not; and when I have good authority as to the ingredients of pure honey, I wish to have mine analyzed and prove to the unbelievers that a large crop of honey is but the honest reward of the modern system of bee-keeping.

Honey is a substance so well known that it would seem almost a waste of space to describe it; and yet there are many things about its composition that are so varied by locality and the bloom from which it is obtained, which are generally unknown, that it may be well to answer the above question rather in detail.

Honey is solely a vegetable product, not made, but gathered from the nectar of flowers, where it is secreted in fine weather according to the rules of Nature's laboratory. Each flower yields honey of its own peculiar flavor, which, if not gathered, is soon evaporated and lost.

Honey, fresh from the comb, is clear, translucent, slightly amber-colored, and viscous, becoming granular in time, with whitish, transparent crystals. In taste and smell, it is sweet, agreeable and aromatic. It should not irritate the throat when eaten, and its peculiar flavor should be so decided, that it can be readily detected when mixed with other articles of diet.

Honey derived from the blossoms of cruciferous plants, granulates or crystallizes speedily—often, indeed, while yet in the comb, before removal from the hive; while that from labiate plants, and from fruit trees in general, maintains its original condition unchanged for several months, after being extracted from the comb. Honey produced in northern climates likewise crystallizes sooner than that from southern countries.

"Under the microscope," says the *Druggists' Advertiser*, "the solid part of honey is seen to consist of myriads of regularly-formed crystals; these crystals are for the most part exceedingly thin and transparent, and very brittle, so that many of them are broken and imperfect; but when entire, they consist of six-sided prisms, apparently identical in form with those of cane sugar. It is probable,

however, that these represent the crystals of dextrose, as they occur in honeys from which cane sugar is nearly or wholly absent. Intermingled with the crystals may also be seen pollen granules of different forms, sizes and structure, often in such perfect condition that they may be referred to the particular plant from which the juices have been gathered."

The Rev. L. L. Langstroth remarks that "honey and sugar contain, by weight, about eight pounds of oxygen to one of carbon and hydrogen."

The chemical properties of honey are as varied as the sources from which it is obtained; and therefore it would be difficult to give any universal rule to prove the query propounded by our correspondent, viz.: "What constitutes pure honey?"

Prof. Kedzie, of the Michigan Agricultural College, has written an article on this subject which we will append, as it is very pertinent to the subject. It is as follows:

Honey is one of the oldest things under the sun. At one time it was probably the only form of sugar known, and to-day is one of our most delicious articles of food. Does it not seem strange, then, that in this scientific age so little is known of its real composition or the changes it undergoes? Honey is composed of grape and sugar cane, together with water, acid and waxy matters. If honey be burned completely, a grayish colored ash remains, which amounts to about fifteen per cent. of the original honey. In this ash I succeeded in obtaining reactions for silica, lime and iron. There is also a small quantity of potash and phosphoric acid in honey. To estimate the quantity of these present I took two portions of "cap" honey, free from pollen and wax, and burned them to a coal-like mass. In one I extracted the potash with muriatic acid, and in the other, phosphoric acid with nitric acid, and estimated them in the usual manner.

The following are the amounts obtained: Potash .06 per cent.; phosphoric acid .08 per cent. These substances would naturally be present in honey, as they are found in soils, and circulate in the juices of plants. There are many things connected with honey about which, at the present time, but little is known. The following are a few:

1. Has honey a definite composition? Is there any difference between the relative amount of sugar in honey made from buckwheat, basswood, clover, goldenrod, brown sugar, etc., or between the relative amounts of cane and grape sugar? Probably this question can be answered only by comparing the analysis of different kinds of honey.

2. Does the bee add anything to nectar in changing it into honey? On

this point there is wide difference of opinion. But I know of no experiments having been tried to settle the matter. Perfectly pure honey, that has been dried completely, contains about one per cent. of nitrogen. Does the bee supply this nitrogenous matter? To decide this I gathered some nectar from flowers in the Agricultural College green-house (from the azalia, rhododendron, and fuchsia, but principally from the last), and carefully tested it for nitrogen. The result of my experiments is that nectar does contain traces of nitrogen. Therefore, the fact that honey contains nitrogen does not prove that it was furnished by the bee. May not this question be decided by feeding bees upon pure white sugar, which contains no nitrogen, and afterward examine the honey to see if any nitrogenous matter has been added to it?

3. After honey has staid for a certain length of time, a part of the grape sugar crystallizes out, and granulation or candying is the result. The cause of this change is not known. May not the condition under which granulation occurs be obtained by a series of experiments, by keeping honey at different temperatures, etc.? Answers to these questions may not advance the market a particle, but we shall enjoy the satisfaction of knowing the truth of the whole matter.

In the BEE JOURNAL, page 662, at the bottom of the second column, Mr. J. M. Hicks was made to say he "had averaged 500 lbs. of honey per colony, from alsike clover," in the report of the National Convention. It should have read that "Mr. Hicks said that alsike clover, in a good season, would yield 500 lbs. of honey per acre." In writing us of this error, Mr. Hicks adds: "I obtained 718 lbs. of extracted honey from one colony of Holy Land bees." So that he has even surpassed the amount, in one instance at least, stated in the paragraph on page 662. Mr. Hicks adds: "Bees have done splendidly here during the latter part of August and all of September."

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

Crop Report in Los Angeles Co., Cal.

We see that Mr. W. W. Bliss, in the *California Apiculturist*, for October, speaking of the report sent to the North American Bee-Keepers' Society, as published on page 693 of this issue, says:

I advertised through the *Apiculturist* for the names and addresses of all who kept bees in Los Angeles county. From that advertisement I received not one name from any one who is now keeping bees.

Mr. Gallup, of Santa Ana, was the only one who seemed to take any interest in the matter. He sent me the names, addresses, and number of colonies of 36 bee-keepers.

These, with the names I had, comprised a list of 65, to whom I sent blanks to be filled out and returned, and up to date I have received but 18.

Since the report was sent, I have received the following: 614 colonies of bees, 8,000 lbs. of comb honey, and 64,000 lbs. of extracted honey.

Mr. Gallup's report and the one above included, makes 4,864 colonies of bees in the county, that I could get any account of.

Now, I for one am ashamed to send in such a report as this, but it is the best that I could do. Some of the bee-keepers were very careless in filling out the blanks after they were sent to them. Some did not state whether the bees were Italian, hybrid, or black, and in those cases I put them down as the latter. Others sent reports of those out of the county, etc. Kind friends, do not think I am saying this to find fault, only to show you your mistakes, that you may do better next time.

I wish to make a suggestion, i. e., that every bee-keeper keep a correct record of everything taken from their respective apiaries, that brings in the cash, and let us see if we cannot present a better report for the year 1883.

Some will remember that last year we called for crop reports for the whole country and obtained statistics of only 520 colonies for California. Thereupon, a writer in the "Semi-Tropic California" roundly abused us for such a report, when the assessor of Los Angeles county alone had found some 17,000 colonies there. Time cures everything; the above from the "California Apiculturist" completely vindicates our report of last year. If the bee-keepers there do not take the trouble to report, they cannot expect to be correctly represented. Mr. Bliss gives some good advice to them, which we hope will be heeded.

Mr. Wm. Muth-Rasmussen, of Independence, Cal., also writes as follows, in that paper:

I have through the "Apiculturist," as well as by private correspondence, solicited reports for the National Convention, from the bee-keepers of this

State, and particularly from the secretaries of the various county associations, and have supplied many with blank forms to be filled out, and returned to me by the 15th of this month. After waiting for seven days over the appointed time, I closed my report, in order that it may reach the President in time for the Convention.

I have but a poor showing to make for this State. Many, to whom I sent blanks, have not responded, and others were unable to obtain statistics. As I could not answer each one individually, allow me hereby to thank those who have sent me their reports. To them, who have not responded, I can only say that they stand in their own light. We all know, that it has been a poor honey season, but that is no reason why not at least the number of colonies of bees should be given, from which an estimate might be formed of the extent of the industry, and the amount of honey and wax the State is capable of producing in an ordinary good season.

I am disappointed at the lack of interest shown in this matter. California ought to stand as the banner-State for bee-culture, even if it has its occasional failures, and I doubt not that her number of bee-keepers and colonies of bees would far eclipse any other State in the Union if the bee-men would take pride enough in their vocation to make a report of what they have, and what they can do, when Providence favors them.

We need more light. We must keep up with the times, or else take a back seat. No bee-keeper can afford to be without one or more bee papers, through which he is posted on the fluctuation in the price of his products. Improved bee-culture, although of recent date, has already reached such a point, that only he who keeps abreast of the leaders can make a success of it. The old fogies, who are hanging on behind, will soon miss their hold and drop off, to be replaced with a more intelligent class.

Thereupon the editor remarks as follows:

The report of Mr. Muth-Rasmussen, California's Vice President of the National Bee-Keepers' Society, certainly does California a great injustice. This is, however, no fault of Mr. M., as will be seen from his explanation in another column. Mr. M. discharged his duty faithfully. Notices from him to some of the secretaries of associations in other counties, passed through our hands and were promptly forwarded. Owing to the failure of the season, but little interest has been taken by apiarists, who do not feel like reporting blasted hopes. The amount is probably not more than about one-fourth as much as should have been reported. It is hoped that apiarists will see the importance of making a correct report hereafter, as it will enable the producers to determine the best time for marketing their honey and the price to be realized for the same, and buyers will know better what they can afford to pay. Those who have been actively engaged in collecting the

honey statistics of the State, we trust will be afforded greater facilities and a more general interest taken in the work when more reliable information will be obtained.

We have received Mr. D. A. Jones' new Circular and Price List of Bees and Apiarian Supplies. In this pamphlet of 24 pages may be found Mr. Jones' ideas upon Wintering Bees in Bee Houses, cellars, chaff and in dry goods boxes, packed. It is beautifully illustrated, and makes a handsome appearance. Mr. Jones is one of the most extensive bee-keepers in America, and has had much experience with bees.

**MISCELLANEOUS.**

Seasonable Hints. — The *American Agriculturist* for November, contains the following:

A subscriber asks if sugar can be safely fed to bees in winter. There is no other food so good for bees as pure sugar. The granulated form is best. All bee-keepers that have fed this sugar for winter stores are agreed that it is even superior to honey for bees. This is owing, doubtless, to its composition, as it contains more cane sugar, and also to the absence of pollen, which is to be found in all honey. While pollen generally does no harm to bees in winter, it is not good in some cases and may be the cause of fatal dysentery. Dissolve the sugar for feeding in an equal bulk of water, and heat until it boils, and when cold it is ready to feed.

It will be remembered that many bees were lost during the winter of 1880-81, from neglect. They were caught by the exceptionally early season. They need at least 30 pounds of good food per hive, and they should be crowded upon just enough frames to contain them, by using division boards. If the bees are to be packed, this should be done as early as Oct. 1st, and if chaff hives are used, the packing above and at the ends of the frames should be added at the same time. It is always best to have the fine chaff or sawdust in sacks. However we winter, whether in chaff hives, or in the common hives with chaff packing, or in cellars, it will always pay to pack above and at the sides of the frames. The hives should be put into the cellar as early as November 1st, before the severe weather sets in. The hives should be dry when set in, and, in the removal, disturb the bees as little as possible. When in the cellar, remove the tops of the hives, but not the chaff pillow. The entrance should be left open.

An East Indian climbing a Tree in search of *Apis Dorsata*.

Some time ago we published an engraving, showing the home of Mr. Frank Benton, in the island of Cyprus, which he has since left to go to Suk-el-Gharb, Mount Lebanon, in Palestine, Asia. Now we present an engraving of a native East Indian (Cingalese) climbing a tree, in search of the "giant bees," found only in the island of Java—the *Apis dorsata*. Our readers will

remember the many articles published a year ago in the BEE JOURNAL, concerning Mr. Benton's journeys in the far East in search of these giant bees, and of his sad failure to procure any of them. The engraving on this page is from a drawing which he sent to Mr. Root then, and explained in the last *Juvenile Gleanings*.

Making Tin Cans Tight.—Mr. J. M. Brooks, Columbus, Indiana, writes to *Gleanings in Bee-Culture* on the above subject, and gives his experience as follows:

Being a tinner by trade, I will give you the plan we used to test our fruit-cans with at the shop. Get a thick piece of harness leather, a little larger square than the mouth of your cans. Next place a lighted lamp or candle in front of you, and a cup of alcohol at your left. Now with a bit of sponge touch the alcohol, then the candle; drop it burning into the can, and place the leather (previously softened with

water) over the mouth of the can, and hold it down to exclude air. The burning alcohol destroys the air in the can, forming a strong vacuum. After two or three seconds (not longer), if in pulling off the leather it comes off with a crack, or report, the can is tight; while those from which the leather comes off easily, without resistance or report, are faulty. Such can be quickly tested, and the leaks found, by applying your mouth to the seams, and trying to suck air through them. I think, after giving this plan a trial, and "kind o' get the hang on't," that you will like it, as being the quickest, neatest and cleanest.

Best Size for a Colony in Winter.—The *Country Gentleman* gives the following on this subject:

Considerable controversy has taken place with regard to the best size for a colony when put into winter quarters. In my estimation, six Langstroth frames, well covered with bees, answer as well as eight or ten, particularly if in a chaff hive; they will be found as strong in the spring usually as the larger ones. I would myself prefer four or five frames crowded with bees, with a young laying queen, to twice as many with a two-year old queen—the results on the first of April next year would be much more satisfactory. On the final examination, before putting the bees away for winter, I prefer to take away, if necessary, some frames of their fall-gathered honey and pollen, and introduce into the middle of the hive two frames of empty worker comb; then feed the bees liberally pure sugar syrup (made of coffee A sugar and water), until those frames are filled and sealed over.

The bees will come out cleaner, brighter and more healthy in spring on sugar syrup than on any fall honey they may gather. The frames removed should be kept in a warm, dry room until spring, and then be fed back to them for brood-rearing, after the bees are able to fly and void their feces. Pollen consumed in winter is now acknowledged to be the main cause of dysentery, and by removing the frames filled or partially filled with pollen, and substituting pure sugar syrup, the bees can live for months without any necessity of leaving their hives, and come out in spring clean, bright and healthy.

The Northwestern Convention.—Mrs. L. Harrison, in the *Prairie Farmer*, remarks thus on the late bee-meeting in Chicago:

The third annual reunion of the Northwestern Bee-Keepers' Society, held in Chicago, Oct. 18 and 19th, has just closed. This society convenes yearly, during the last week of the Inter-State Exposition, so that cheap fares are obtainable on the roads leading hither. At its initial meeting three years ago, it was a tiny plant, but under the fostering care of Thomas G. Newman, Esq., it now spreads its wings over seven states of the great Northwest. Over one hundred able representatives from these states were in attendance at the recent meeting. It is to be regretted that there are not more farmers and bee-keepers in a small way, to partake of the rich repast that is spread at these reunions. The whole ground of bee-culture was plowed, sub-soiled, harrowed and afterwards brushed in with clippings of the hedge, by intelligent and practical apiarists during the sessions of the society. The deliberations of this society show that bee-keeping is no mean pursuit, and by its culture the Northwest may rival, if not surpass, the sunny South in the production of sweets.

Crop Reports for 1882.

The following crop reports of both bees and honey, were sent to the North American Bee-Keepers' Society, and read at its late meeting in Cincinnati, O. They were kindly sent to us by the Secretary, Mr. Root, and will appear simultaneously in the BEE JOURNAL and *Gleanings in Bee Culture* to-day. These reports are quite full and interesting and cover eight States. The first is from

GEORGIA.

From an extensive correspondence with all parts of the State, I place the honey crop, the present season, at an average of about 26 lbs. to the colony. In some sections it has been unusually fine, while in others no surplus has been taken. The greatest yield reported from a single colony was 350 lbs. extracted honey.

The most of my correspondents reported the greatest yield when the atmosphere was moderately dry, while a few reported the largest flow when the atmosphere was "decidedly humid." Summing up these reports, we find that an atmosphere neither dry nor wet, but moderately cool and moist, is the most favorable for a flow of honey.

Our honey is mostly of a dark amber color, though the flavor is good. This year the quality was above an average.

Geographically considered, Georgia possesses a greater variety of climate and soil than any other State in the Union, and consequently a greater variety of forage. Cultivated forage plants, including clover and buckwheat, grow well in the northern parts of the State; while in most of the middle region and southern part, the honey sources are confined to the native flora of the forests and fields.

The majority of bees are kept in the old box hive, or gum; but movable-frame hives are being rapidly introduced, as well as the improved races of bees.

Augusta, Ga.

IOWA.

About a month ago I issued a call through some of the bee papers, asking individual bee-keepers in the State to send me reports as to the status of our industry in their several sections. In response, I have received twenty reports from seventeen different counties—about one-sixth of the whole number of counties in the State. Of course, I cannot make an accurate report from such meager materials.

In my own section of the State, the northeastern, bees went into winter quarters last fall in excellent condition. The winter was short, open, and mild, and, as a general thing, the 1st of April found bees nearly all alive and in excellent condition, no matter by what mode wintered. From that time until the middle of summer, we find the worst kind of weather for bees, it being cold, windy, and cloudy

nearly all the time, preventing bees from gathering much pollen or honey, or rearing much brood. As a consequence they were in poorer condition on the first of June than on the 1st of April, with quite a large number of colonies entirely dead, some reports estimate the loss during these two months at 25 per cent. I do not think, however, that the loss over the entire State will average so large as that, although it was very serious. It would have been much larger but for feeding having been very generally resorted to.

White clover was nearly two weeks later in commencing to bloom than ordinary, but yielded honey from the first: that is, whenever the weather allowed bees to gather it, which was but little more than one day in four, until the middle of July, when we had about twelve days of good weather, and as heavy a flow of honey from both white clover and basswood as I ever saw. Bad weather caused another interval of several days, followed by a heavy run for two weeks from buckwheat, and a light run the rest of the season.

I judge that the season over the State at large has been very similar to what we have had in our section, except that the central and southern parts of the State had less bad weather to contend with, and consequently a steadier flow and much larger crop of honey; in fact, the largest crop gathered for years. Of course, it is impossible to estimate the average yield per colony over the State, but I am satisfied that those who practice improved bee-culture have obtained not less than 75 lbs. per colony. The slow but steady yield of honey during the earlier part of the season caused a larger amount of brood-rearing than common, which resulted in excessive swarming. Nearly all the reports speak of this fact.

The reports quite generally indicate an increasing interest in our modern methods of bee-keeping, also that bees are in excellent condition for winter.

All things considered, the season of 1882 has been a prosperous one to a large majority of bee-keepers in Iowa. Those in the northern part of the State have had a full average season, while those in the other parts have had a much more than average yield. As the flow of beer and whisky has this year lessened in our State, that of honey has largely increased.

O. O. POPPLETON.

Williamstown, Iowa.

CALIFORNIA.

I hereby send you my report for this State, as far as I have been able to make it out.

In Los Angeles county 39 bee-keepers report 4,220 colonies, but say nothing about honey.

In Ventura county, 160 apiarists, with 7,500 colonies of bees, report 220,000 lbs. of extracted honey, and 2,000 lbs. of wax.

In Kern county 3 apiaries, report 400 colonies, but no honey.

In Alameda county, 1,500 colonies are reported with a crop of 75,000 lbs.

In Inyo county 46 bee-keepers, with 865 colonies, report 23,450 lbs. of comb honey, 6,000 lbs. of extracted, and 2,750 lbs. of strained, and 100 lbs. of wax.

In Napa county 6 bee-keepers reported 50 colonies of Italians, 50 hybrids and 150 blacks; 100 lbs. of wax, and 350 lbs. of comb honey, 2,000 lbs. of extracted and 3,350 lbs. of strained.

Owing to unfavorable atmospheric conditions in the spring, and in some localities to a total lack of rain during last winter, the flowers throughout the State have failed to yield an average amount of honey this year. In the southern counties, which is the principal honey-producing part of the State, the season is regarded as nearly a complete failure, but few bee-keepers securing part of a crop. Mr. E. Gallup writes me that the amount of honey is all guesswork. Others positively refuse to give any estimate of the honey crop. Owing to the failure, many bee-keepers are discouraged, and seem to take no interest in the matter; wherefore I find it difficult to make out any report, which will be at all satisfactory. Several bee-keeping counties have not yet been heard from. Some place the average of honey per colony at 25 lbs., others at 40 lbs. It is impossible to form any correct idea of the true amount. But few give the quantity of wax produced; it will probably all be made into foundation. Much of the honey reported as "comb" is produced in large boxes or even whole upper stories, without any idea or means of placing it on the market in a salable shape. Foul brood is reported very prevalent in some parts of the State, but I have no statistics in that regard. In this, Inyo county, there is no trace of it, as far as I have been able to ascertain.

W. MUTH-RASMUSSEN.

Independence, Cal.

CONNECTICUT.

The fall forage for 1881 was not quite up to that of 1880. A great many colonies went into winter-quarters with light stores, though strong in bees. The latter part of September was very pleasant. The month of October, bees flew about half the time. During November, bees were very quiet, unless in sheltered places, until the 29th and 30th, when they flew almost as in summer, to be again shut in until December 20. Those in sheltered localities flew enough to keep them healthy, when there was another general shut-in until March 2d, when there was a general fly, and again on the 5th, but not so strong. On the 23d there was a good flying-out, and no more generally good weather till the last week in May, though in extra sheltered places bees came out a little.

Apple bloom was only patchy, and more the exception than the rule. Raspberries were fair, and worked on considerably.

In the northwest part of the State I found a variety of willow that is new to me (the spikes are a canary yellow, about 2 inches long, sometimes longer) that holds its bloom from two to three weeks. The wood is very brittle.

The flowers possess only stamens; the cup of the flower contains a drop of honey, as large as a medium-size pin-head, light amber color the consistency of basswood, and of good flavor. I consider it as good as goldenrod, if not better. The bees work steadily on it, and are very good natured, even hybrids being quite docile. One good colony of bees having 7 combs were given three more empty combs, and they filled and capped them in one week. The same colony boxed about 20 lbs. besides, of clear willow honey. It was the only colony tried, but all the others in the same locality did equally well, considering their chance. I have been through over one-half of the State, and I never saw but few of the same kind of willows, and then but solitary bushes always covered with bees.

White clover showed itself in favorable patches June 7, and was in general bloom by the 15th; but the general lightness of the colonies, caused by the late spring, made but little surplus honey from white clover.

Basswood was a medium bloom in a few places, though the majority of the trees did not show a single flower.

Sumac bloomed uncommonly heavy, and the flowers were dripping with honey, but of short duration, caused by the drought.

Buckwheat was a failure, as a rule, though exceptional pieces on wet land yielded honey abundantly.

The early fall forage plants being dried up, there has been but little honey gathered since sumac; but the past three weeks of showers have made vegetation again look green, which, with some warm weather, may give us an ample late supply for winter. Brood in the hives is a scarcity, and colonies are generally quite weak.

At the New Milford Agricultural Fair, Sept. 30, through the untiring efforts of Mr. Wm. L. Burgess, of West Morris, Conn., the nucleus of a State bee-keepers' society was formed, with Mr. Burgess the elected President. He is very enthusiastic and energetic in the cause.

If I remember rightly, at the last annual meeting of North American Bee-keepers' Society, a resolution was passed to make the Presidents of the State societies the vice-presidents of the National Society; therefore, before I vacate to my worthy successor, I would offer as a resolution, that the National Society request all the editors of the several bee papers to send a list of their subscribers to the vice-presidents of the different States, thereby placing the vice-president in possession of a means of obtaining a general and more correct knowledge of the exact apiarian condition of his State, making his report more valuable and informative.

As nearly as I have been able to ascertain, Connecticut contains about 80,000 colonies of bees, of which 95 per cent. are still kept in box hives, half-barrels, nail-kegs, and the like patent devices of the fogy style.

Of the number of colonies heard of, not over two-thirds will have a supply of stores sufficient for wintering.

Woodbury, Ct. H. L. JEFFREY.

MISSOURI.

There are but few bee-keepers' conventions in this State, consequently I am unable to give definite and certain statistical information of the productions of honey for 1882.

I know that there has been a great increase in the number engaged in the industry in Missouri in the past two years. There is more honey in the market in the cities and country towns this fall than ever was offered before. It is in better condition and of a better quality; most of the honey offered for sale is in one and two lb. prize boxes.

The "St. Joseph Inter-State Exposition" for the last two years has offered very liberal premiums in the Apiarian Department, and the premium list was a varied one, covering every branch of the apiarian business.

The past season the display in this department was limited, but very creditable. It was the center of attraction, especially to the farmer. They learned the "new way," and where improved apiarian supplies can be bought. The consumer, groceryman, and producer, who were in attendance here, for the first time saw taste, order, and neatness displayed in the productions of the apiary, and preparing honey for the market; also an order and system in the handling and management of bees.

People were in attendance on the Exposition in the fall of 1881 from all the counties in Northwest Missouri. They returned home with new ideas on "bee and honey culture." Quite a number of the country papers made special mention of the display in the Apiarian Department.

Hon. Thomas G. Newman, editor of the AMERICAN BEE JOURNAL, attended the Exposition in September, 1881, and delivered an interesting lecture on "Bees and Honey" one evening, to a large and appreciative audience. The daily papers reported his instructive lecture in full, and in addition made very favorable comments. I feel safe in saying that seven-tenths of the people of Missouri have read more or less on this subject and the profits of the apiary, since the fall of 1881. The circulation of the bee papers has increased in the meantime.

The display in the Apiarian Department of the St. Joseph Inter-State Exposition this fall was the largest and best ever seen at a State or county fair or Exposition in the United States. There were over 3,000 lbs. of comb and extracted honey on exhibition; also Cyprian, Albino, Italian and black bees, and almost every tool and implement used in the apiary.

The increased number of exhibitors and the increased quantity and quality of honey on exhibition this year, warrants me in saying that the interest awakened in this industry in the last two years has been greater than the most enthusiastic could have expected. Most of the county fairs made an Apiarian Department for the first time.

From the above statements you will see that Missouri is on the right road to take a prominent position in this

industry. In 1870, according to the census of the general government, she ranked fifth in the production of honey. I have been unable to procure the reports for 1880. I predict that in 1890 Missouri will rank first in the production of honey. Nature has smiled upon this territory; she has made the groundwork for a land which will flow with "milk and honey." On account of its diversified climate, soil, foliage, wild and cultivated flowers, etc., and its abundant and never-failing streams of water, some portion of the State will have an abundant crop of honey each year.

The honey on exhibition this year at our various fairs was white-clover, basswood, buckwheat, honey-locust, goldenrod, etc. Quite a quantity of honey on exhibition this fall was flavored with heliotrope and mignonette. It was of such a superior flavor to any produced in this State heretofore, that bee-masters hereafter will ornament their yards and gardens with these beautiful and useful plants, for the purpose of giving the bees something to flavor honey with.

I deemed it useless to attempt to organize bee associations this year. Until you practically demonstrate to the producer, as a general rule, the practicability of our enterprise, and that there is not only pleasure but also profit in it, you have an up-hill undertaking to encounter. I concluded that the best plan was to have the various county fair associations make an apiarian department, and offer liberal premiums; then to furnish the local papers with articles or ideas on the subject, to be prepared and published. By this means, every farmer in the several counties is prepared to learn something when he visits that department at the several fairs, and converses with those engaged in the industry, who are in attendance. The producer in each county can see the improved beehives, and apiarian tools and implements, and he learns the improved manner of preparing honey for market. Furnish the idea and evidence of the results, and let him draw his own conclusion, and he will go home with the consciousness that he knows more than the professional bee-master, and with the resolution that he will furnish evidence of that conclusion next season. The most conclusive idea to present is, that in an ordinary season each farmer can pay his State and county taxes from the profits of a few colonies of bees, and have something left for spending money for the "old woman and the girls." I would suggest that you, by resolution, indicate the best plan for vice-presidents to adopt in their respective States to further the work.

From my experience and observation, I would suggest that each vice-president give his special attention to the local fair in his county; make the apiarian department attractive and instructive. If it is a success, the papers will mention it with favor. Other papers will copy the articles, and advise their readers to do likewise. By this way you furnish ideas, and the evidence that there is profit

and pleasure in the industry; and you have one less difficulty (which is the greatest one) to overcome; that is, the idea that you have some patent right to sell. Furnish the idea and evidence generally, and that there is pleasure and profit in the investment, and the producer will, in a short time, buy the improved bees, hives, and apian implements, and will be compelled to organize local bee conventions.

If this plan, or some one similar, could be adopted, in five years the honey crop of the United States would be enormous.

In behalf of the friends of "Improved Bee Culture" in Missouri, I must extend thanks to the Hon. Thomas G. Newman, of Chicago, Ill., for the good send-off he gave the honey and bee interest in Missouri, in September, 1881. By his coming here and delivering his lecture on "Bees and Honey," he gave character to the enterprise and stability to the industry.

Those who profited by his lecture and bought a few colonies of bees, were again benefited by a distinguished bee-master from Illinois, Mr. Elvin Armstrong, of Jerseyville. He made one of the neatest displays of comb and extracted honey ever seen in the West. He showed producers how to prepare comb honey for market, and how to put extracted honey in good marketable shape, in glass jars and bottles neatly labeled. These ideas were practical, and are invaluable to our people. He was awarded the \$25.00 sweepstake premium for the best display of honey; also \$15.00 for the best display of extracted honey. He had his "Crown bee-hive" on exhibition. It was the first time many of our farmers had seen a frame hive with surplus honey. Mr. Armstrong took great pains in explaining to visitors the advantages of frame hives over the old-style "gum." He was awarded the special premium, \$10.00, for the best bee-hive.

Missourians engaged in bee culture invite every person engaged in the same industry to come and contest for our liberal premiums offered by fair associations. Bring in ideas, and take the money premiums. Therefore, Mr. President, you see we Missourians are not only just, but we are generous.

St. Joseph, Mo. R. S. MUSSER.

DAKOTA.

Number of colonies in the fall, 267; in spring, 260; lost in spring, 5; colonies sold, 40; number of colonies now, 420; comb honey, 9,381 lbs.; extracted honey, 1,601 lbs.; total honey crop, 10,982 lbs. Eighty per cent. were in movable-frame hives, and twenty per cent. in box hives and log gums. Ten per cent. of increase was obtained by division, and 90 per cent. by natural swarming. The crop, as compared with last year, is one-half.

The above report is compiled from tabulated reports received by me from 22 bee-keepers—about one-half the number that are in the Territory.

The fore part of the season up to July 10, was very wet and cool; so much so that bees had to be fed, being

unable to obtain enough to subsist on; from July 10 to Aug. 15, the honey-flow was good; after the 15th of Aug. the weather was so dry the bees did but little; so on the whole there will be only one-half the honey here this year that we ought to have had.

W. M. VINSON.

Elk Point, Dakota.

Nine of the best counties give over 10,000 colonies at the beginning of winter, 1881, of which more than 30 per cent. died during the winter from starving, freezing, smothering and various other causes too numerous to mention. Nine-tenths were in box hives, and about the same proportion were black bees; the rest were in improved hives of various designs, mostly with movable-frames, of all sizes, from 7x9 to 9x18.

Nearly all the box hives are arranged to receive sections for surplus over the brood-nest. This is especially the case in Aroostook county, where the colonies number nearly 3,000, and produce 20,000 lbs. of box honey at 20 cents per pound. These are all black bees in box hives, and nearly every one wintered in cellars or special receptacles.

In Penobscot and other eastern counties, there are a few Italians; also in Kennebec, which is a good county for bees. Many of the bee-keepers bought quite freely out of the State, thus increasing their stock, and these were nearly all Italians in movable-frame hives.

About one-half of the bees in the State are wintered on their summer stands, with slight protection. There are, so far as I could ascertain, but few chaff hives. Most of those dying which were wintered in cellars or warm rooms, die from spring dwindling, caused, as many think, by the sudden and severe changes of temperature to which they are subjected. The winter of 1881 was a hard one; the spring of 1882 was late, cold, and changeable. Bees came through very weak; many had to be fed, or died before they could gather any honey. Along the northern and northeastern counties, the midsummer harvest was quite good; but along the sea shore and southwest portion of the State the drouth was too severe for any honey. The fall harvest from goldenrod and other fall flowers was excellent, and I think nearly all will have sufficient winter stores. But the rate of in-

crease, which is almost entirely by natural swarming, is low, many bee-keepers not having a single swarm come off; and the amount of surplus honey is ridiculously small—far below our usual average. Maine is not a bad State for bees; what we want is more improved methods in handling them and their products. I think almost the whole country, or the northern part of it at least, needs a universal frame, so that it may be changed easily from hive to hive and man to man the country over; then we must solve the winter problem, so that our bees will all live through and come out in the spring strong and healthy, and then we shall be able to gather up some of the best of all sweet things, which are now wasted on the desert air. J. A. MORTON.

Bethel, Maine.

WISCONSIN.

According to a request of the President, I respectfully submit my meager report from this State. To a notice published in the BEE JOURNAL to the bee-keepers in this State, only a small percentage responded, and sent me an abbreviated report of the result of the season's operations. The reports I received are from 25 bee-keepers living in different parts of the State, with a return of 3,025 colonies they commenced with May 1, 1882. According to said reports, the average yield per colony I find to be 60 lbs. of surplus, or 181,500 lbs. from all. The honey is of most excellent quality.

The increase reported amounts to over 50 per cent. (two-thirds by natural swarming). The weather of the whole season was exceptionally cold, wet, and windy. The fall is favorable, although cold.

We had a profusion of white clover bloom, but only a moderate yield of honey, owing to the unfavorable weather. A great part of the basswood yield was lost by rain on 6 successive days. The fall yield did not amount to any thing; they hardly got enough to keep up brood-rearing.

According to my own, and from the reports I have received, I estimate the crop of this season to be about two-thirds in Wisconsin. There are in this State about 50,000 colonies of bees; but my report is from only 3,025—a little over one-sixteenth of the whole. If the 3,025 colonies that are reported are a fair average of the whole, then the crop of Wisconsin honey for 1882 amounts to 3,000,000 lbs.; it will bring the net sum of \$450,000.

The above figures will show that the industry of bee-keeping is of sufficient magnitude to be supported by the government. C. GRIMM.

Jefferson, Wis.

CORRESPONDENCE

For the American Bee Journal.

Bee and Honey Report for 1882.

G. M. DOOLITTLE.

By referring to back numbers of the BEE JOURNAL, the reader will see how my 80 colonies of bees came through the winter in good condition, but, owing to the cold weather the last half of April, they were quite reduced in population, although no colonies were lost. As April 30th was a pleasant day, all had a fine fly, and a little pollen was brought in for the first time. With May 2d it became cold, and snow and frost prevailed till the 12th, when we had a few warm days. Apple blossoms were late, not opening till about June 5th; and owing to cold winds, clouds, and rain, no honey was secured from them except a little on June 8th. Owing to the cold spring, the bees had reared but little brood previous to this, hence, a good supply of honey still remained in the hives to carry them through till white clover.

About the middle of April I sold all my bees, except forty-five colonies on account of the continued sickness of my father, which brought an extra amount of care upon me, so that I feared I could not properly handle a larger number of colonies. Of these 30 were set apart for the production of honey, and the remaining 15 devoted to queen rearing. White clover, although quite abundant, yielded no honey, and July 6 found the honey in my hives all equalized and so reduced that each colony had but little more than enough to last 4 or 5 days. But fortunately the cold weather caused the wild mustard, which is plenty in the fields of grain hereabout, to secrete a little honey, so that July 8th bees obtained a living, and from the 12th to the 20th, a small gain was made in the nearly destitute brood-chamber. July 26 found the basswood open, and as the weather was just right for the secretion of nectar, and my bees, being in readiness for a flow of honey, splendid work was done during the five days yield which followed. Then came two days of closing up, and the shortest season for honey I have ever known was at an end. Although a large acreage of buckwheat was sown, and the bees hummed merrily over the sea of white blossoms, still not a cell of dark honey was to be seen in the sections. As this is the fifth year buckwheat has failed to produce honey, it is hardly worthy the name of "honey plant," in this locality.

My bees have been increased to 80 colonies in good condition for winter. As a result from the 30 colonies set apart for honey, I have obtained 1,089 lbs. of comb honey and 441 lbs. of extracted, giving a total of 1,530 lbs., or an average yield of 51 lbs. per colony, which is the lightest crop I have received for the past 10 years, except in

1876, when the yield was 50 lbs. I also took about 500 lbs. in nicely sealed frames, but as I have used that to prepare my united nuclei for winter, I shall not bring it into the average yield.

From the 15 colonies set apart for queen rearing, I have sent out 197 queens. My section honey was sold at 17c. per pound and extracted 10c., delivered on board the cars here.

After footing up the total sales from my bees, and deducting all expenses therefrom, except my own work, I find I have \$822. As I have the same number that I had one year ago, this gives me the above amount clear, except my work, for one of the poorest seasons known in this State. As a decade of years has now passed since I have kept a close account with my bees, perhaps it may be interesting to your readers to know how such report stands; for it is only by a number of years' experience, in any business, that a true result can be obtained. A report of a very prosperous year, is often misleading, but one extending through a period of 10 years, should approximate very nearly to what might be expected for the same length of time to come. My average yield for each colony in the spring of 1873, was 80 lbs.; 1874, about 100 lbs.; 1875, a little over 106 lbs.; 1876, 50 lbs.; 1877, a fraction of a pound, less than 167 lbs.; 1878, 71 lbs.; 1879, 58 lbs.; 1880, a little less than 62 lbs.; 1881, nearly 135 lbs.; and in 1882, the present year, it was 51 lbs.; making an average yield each year, for the past 10 years, of 88 lbs. per colony, five-sixths of which has been comb honey. The average price at which it has been sold, is about 20c. for comb honey, the highest price 28½c. being obtained in 1874, and the lowest 10¼c. in 1878. Thus the 88 lbs. at 20c. per pound gives \$17.60 average cash yield for each colony. Hence, if a man is capable of keeping 50 colonies, his income would be \$880 a year; if 100, it would be \$1,760. After an experience of 14 years in the bee business, I can see no reason why it does not compare favorable with any other pursuit in life, as far as dollars and cents are concerned, and when I look at it as a fascinating and health-giving pursuit, it places most other avocations in the shade.

Borodino, N. Y., Oct. 17, 1882.

Bees and Honey Shows at Fairs.

S. HANSON.

Hagerstown, a picturesque, thriving town situated at the head of the Cumberland Valley, has been the scene of considerable excitement, occasioned by the Agricultural Fair; and the second meeting of the Union Bee-Keepers' Convention. The exhibits at the fair were unusually large and fine, and the number of visitors in excess of any previous year. As your readers are most interested in bee matters, we will omit a description of mammoth pumpkins, etc., and devote our time to a description of apiarian exhibits.

Mrs. L. Valentine had on exhibition, at the main hall, several fine specimens of honey in the comb; also, specimens of comb foundation.

Dr. Herman also showed several pounds of choice comb honey; both exhibitors receiving premiums.

The largest and most extensive, however, was that of "Sunnyside Apiary," Baltimore, Md., C. H. Lake, manager, and deserves especial mention. Mr. L. made his exhibit in a large tent, profusely decorated with flags, while the word "Apiary," in large letters, stretched upon the side, caught the eye of the visitors as they entered the fair grounds. Tables were constructed around the sides of the tent, laden with every conceivable appliance required in a first-class apiary. A magnificent display of bees, in variety, were shown in glass hives of unique construction, finished in ebony and maple, where every movement of the bees could be seen—the queens depositing their eggs, brood hatching, bees nursing, queen cells in all stages of development, etc.

Among the different varieties we noticed the new Holy Land or Syrian bee, the Cyprian and the Bellazona, claimed by the gentleman in charge to be the largest bee known in America. Also imported Italians, producing the so-called Albinos; Holy Land hybrids, also producing the same bee; Golden Italians and improved American strains of Italian and other bees.

A full colony of the most docile of any bees that ever came under my notice was that of a daughter of an imported queen of this season, were handled in public, without smoke or protection of any kind, and all the bees flying as if in their own home, upon our first visit to the tent. Later, we found them all confined, owing to the annoyance they gave the proprietors of the confectionery stands.

In the center of the tent, upon a raised base, was a pyramid of 220 lbs. of comb honey—the production of one colony of bees in about six weeks. This was shown in a case, constructed with full glass sides and erected with great taste. Upon the top stood a counter-boy and shipping crate combined, filled with the most luscious nectar. The whole was crowned with a French glass shade, containing 18 sections of 11½ lbs. each, of the choicest and clearest honey ever seen in these parts, perfect in every particular and white as snow. On either side of the case was a photographic view of the apiary—the hives in full working order, showing the honey in the hives.

We noticed, in a conspicuous place, a photograph of an old friend and pioneer in bee culture, Richard Colvin.

Among the hives we saw the "Old Reliable," an air chamber hive, said to winter and summer the bee satisfactorily.

Among the new features were the Automatic self-spacing frame of tin or wood, that causes the frames always to fall into position upon the rabbit, and cannot be glued together by the bees.

The "Boss" feeder, on the principle of "Root's" Tea-kettle feeder, deserves attention. A grass-knife for

cutting around the hives and adjustable to any bevel, were also noticed as being shown at this fair for the first time.

We came away, highly pleased with our visit and with the information gained through the popular manager of Sunnyside Apiary, who deserves much credit for his zeal and energy in the cause of bee culture and the courteous attention given to the many visitors who examined that fine display. Philadelphia, Pa., Oct. 21, 1882.

Norwalk Chronicle.

Spring Management of Bees.

H. K. BOARDMAN.

The queen stops laying at the approach of cold weather, thus leaving the hive destitute of brood during the winter, but resumes her duties on the approach of spring. Usually brood rearing commences some time in February in the bee house or cellar, either later or earlier, according to the condition of temperature, and somewhat later on the summer stand. As the life of a bee is very short only a few weeks at most in the summer when in full activity, and as many months of the winter the occupants of the hive at the close of the winter are aged and infirm and their lease of life necessarily short, if no brood were raised to supply the places of the rapidly diminishing numbers of old bees at this season the hive would soon be depleted of its numbers. Colonies that are queenless may winter very well but they are very soon all gone when the warm weather of spring calls them into active life. The dying out of the old bees thus rapidly at this season when not accompanied by a corresponding increase from the hatching brood causes that much feared and much talked of casualty, spring dwindling.

Therefore, it is important that the bee-keeper see to it that the brood is hatching, to bridge over this important and critical period in the history of the colony.

It is a disputed point even among very practical bee-keepers as to how early brood rearing should be encouraged; but I think there need be no doubt about the economy of continuing it uninterrupted when once begun.

After brood rearing has continued for a time in winter quarters it will cease entirely for want of water, and colonies will suffer from thirst. The higher the temperature the greater the suffering. They may be supplied to a limited extent with drink, provided the temperature is high enough (not under 50), or, they may be set outside if the weather will permit and take the chances of sudden changes of cold and winter blizzards which is very demoralizing to colonies that have been wintered in a warm bee house. The prudent and thoughtful bee-keeper will often find himself in a dilemma at this point not easy to decide. Pollen is also necessary to carry on brood rearing to any considerable extent. If bees are out before

natural pollen appears and the weather will permit, pollen may be supplied by a substitute of flour which will take the place of natural pollen.

Before the time comes in the spring to set the bees out permanently some attention should be given to the preparation of the yard. All rubbish, the harbor of the bee moth and its progeny, should be removed; the yard made level and smooth, the shrubbery trimmed, and everything possible done for the pleasure and convenience of the summer work and last, but not least, every stand leveled with a spirit level, for if this be omitted the combs in the hives will hang to one side and be built irregular. When all is ready the bees should be carried out on a warm day and each hive set upon its own stand from where it was taken.

Examination of all colonies should be attended to without delay on the first warm days after they have had a thorough flight, to determine: 1st. The amount of stores. 2d. The quantity of bees. 3d. If supplied with a good queen. This may be done by raising the hive and looking in at the bottom of a bottomless hive or box hive, thus determining at one operation the amount of stores and bees, or by removing the cover of the hive, if it has a fixed bottom. For more minute examination the hive must be opened, if movable-frame hive. If box hives are used they may be examined on cool mornings by raising the hive and examining the bottom board for immature young bees and larvae, which determines as nearly as we can the presence of a queen. I would advise that all such colonies be transferred to movable-frame hives and queenless ones should be carefully marked, and particular attention given them at the first favorable opportunity, when the weather will admit.

Although these light and queenless colonies are really worth little, they will be a source of much trouble and annoyance if not looked after, by inducing robbing, which may result in a general demoralization of the whole apiary.

Weak colonies may be very much assisted by aid of the division board, by which we may contract the hive so as to confine the bees upon such a number of combs as they will be able to cover, and by placing the stores upon the other side of the board they are made accessible to the bees and constitute a perpetual feeder.

By use of the division-board too, we may unite such colonies as we wish to unite by placing the colony containing a queen on one side of the board, and carefully cover with a cloth or quilt, and the other colony deprived of its queen on the other side, leave them thus for several days when the board may be removed and the brood packed together as compactly as possible and the work is done. All queenless colonies before mentioned should be disposed of in this manner. I have practised this mode of uniting bees almost entirely for several years with the most perfect success.

If this work has been neglected and our bees are found robbing, the en-

trances of all hives should be closed, so that but one or two bees can pass at a time and if no disposition is shown to defend themselves the hives should be closed or removed to a room or bee house. If the hive is closed and the weather is warm and the colony of considerable strength, some caution should be exercised about their becoming heated and even melted down. If after carrying in, for a day or two, no disposition can be encouraged to defend their stores the sooner they are united with a colony of more spirit the better.

I have only to say in my opinion if bees have been properly wintered and judiciously managed during the spring there will be no such thing as spring dwindling.

There is neither excuse, nor profit, in having strong and weak colonies in the same apiary. The light should be encouraged by feed and strengthened by brood from the strong. A comb of brood just hatching from a strong colony placed in a weak one will give it an astonishing impetus, and in the place where the brood was removed from, the strong colony is supplied with a nice empty comb or foundation which will be filled with eggs, and the work of the hive go on without interruption. In this way the whole apiary may be built-up into uniform strength and when the harvest comes the result will be a uniform yield of honey.

The amount of honey, and consequently the amount of profit, depends entirely upon the force of workers we have ready when the harvest comes. If we feed when natural stores fail, and thus keep brood rearing steadily going on, the hives will be full of industrious workers when the harvest comes, our brightest dreams of a sweet harvest will be realized, and our bank balance will be a substantial encouragement of judicious management.

East Townsend, O.

For the American Bee Journal.

Purity of the Atmosphere.

S. CORNELL.

To assist Mr. E. Moore in his investigations as to the purity of the air surrounding his hives permit me to make the following quotations:

"All gases of different densities which are not disposed to unite chemically with one another have a strong tendency to mutual admixture. Thus, if a vessel be partly filled with hydrogen and partly with carbonic acid the latter, which is twenty-two times heavier than the former, will not remain at the bottom but the two gases will in a short time be found to have uniformly and equably mixed. And it is on this principle that the constitution of the atmosphere is every where the same, although the gases which compose it are of different specific gravities."—*Carpenter's Principles of Comparative Physiology*, page 295.

"It (diffusion) is of the greatest importance in terrestrial physics being the cause of the uniform composition

of the atmosphere at all elevations and one of the causes of the speedy dissipation of noxious gases and vapors in the open air."—*Chambers' Encyclopaedia, subject, Diffusion.*

"There is a very remarkable property enjoyed by gases and vapors in general which is seen in a high degree of intensity in the case of hydrogen; this is what is called *diffusive power*. . . It is impossible to overestimate the importance in the great economy of nature of this very curious law affecting the constitutions of gaseous bodies; it is the principal means by which the atmosphere is preserved in an uniform state and the accumulation of poisonous gases and exhalations in towns and other confined localities prevented."—*Fowne's Chemistry for Students, page 112.*

As Mr. Moore refers to some statements of mine made at the Toronto Convention, allow me to take this opportunity of saying that, in condensing the report, my remarks on that occasion have been very much mangled. For instance, I did not say that it required bacteria to produce dysentery, but that if there were any bacteria, the dampness and consequent fermentation in the hive, were the causes. There are other misrepresentations, but it is hardly worth while now to correct them. I wish to say, however, that in regard to the purity of the air in rooms I am correctly reported.

Lindsay, Ont., Oct. 16, 1882.

Translated from *Bienenwatter.*

Gleanings from Germany.

A. R. KOHNKE.

In a village near Zempelberg, the tavern keeper was attacked by rowdies, who began to demolish his furniture, threatening also to abuse him bim and his family. To save himself he ran out into the garden, picked up one of his colonies of bees and threw it through the window among the drunken crowd; the bees, enraged, went for them with a will, and cleared the house and premises in less than two minutes.

SPIRÆA ULMARIA.—The blossoms of *Spiræa Ulmaria* contain, as a natural product, salicylic acid. The plant is a native of Germany, where it grows in low, wet places and blooms from June till August; it attains a height of from three to six feet, and furnishes honey and pollen; in gathering which, the bees also gather the disinfectant. Cases of malignant foul brood having disappeared without the aid of the bee-keeper, it was discovered that it was due to the profuse bloom of this shrub. Thus, it appears, that nature has provided means to check and cure this dreaded pest among bees.

KNOWLEDGE OF BEES.—Reaumer remarks, that whenever he attempts to go near his bees in full state dress, they will sting badly, but when in his old dressing gown, will not molest him. [It is rather curious, but a fact, that my bees will not permit me to

handle them in my fine suit, unless I give them a severe smoking, whilst in my every day clothes I can usually go about them without smoke, though both are of the same color.—*Translator.*]

OBSELETE MEANS TO PROMOTE BEE-KEEPING.—One hundred years ago, in Prussia, prevailed a law that every farmer, being in possession of a certain number of acres, had to keep at least four colonies of bees; those having about half the number of acres, two, and those having a garden only, one colony. In case of neglect, the occupier of the premises was fined.

TO TEST THE PURITY OF WAX.—1. Specific gravity. Pure wax, whether bleached or not, has a specific gravity of between 0.956 and 964, generally from 0.958 to 0.960. Adulterations with stearic acid, resin or japanisian tree wax, makes it heavier; with those of paraffine or tallow, lighter.

2. Pure beeswax is dissolved by chloroform, on warming it; not so with adulterated wax.

RULES FOR BEGINNERS IN BEE-KEEPING.—1. Before you spend any money for bees or fixtures, seek the advice of an experienced bee-keeper, even if you have to travel many miles to obtain the same. What you profit, by good advice, will richly repay your traveling expenses.

2. Don't attempt to make your own hives, if you have nothing but a hand-saw; but buy them in the flat, of reliable manufacturers.

3. Buy only strong colonies, even if they cost a little more.

4. Use but one style or kind of hive in your apiary.

5. Keep your colonies strong; do not divide for increase too soon; rather buy strong colonies.

6. See to it that your colonies have all worker comb, which may be had by the use of worker comb foundation.

7. If some of your colonies have not winter stores enough, feed them plentifully. One pound above what they will need will do no harm; if but one ounce is lacking, they will starve and the colony will be lost.

8. During winter, but especially in early spring, keep the colonies warm, otherwise the rearing of brood will proceed slowly.

9. In spring, contract the brood-nest by a division board, and add more frames only when the bees cover well what frames they have. Do not add more than one frame at a time.

10. What you do not understand, learn of bee papers, or books, but especially of your bees. Exercise your powers of observation to gain practical experience, and you will be successful.

Vienna, Austria.

	G. W. House, Fayetteville, N. Y.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning County, in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

LEONIDAS CARSON, *Pres.*

The Iowa Central Bee-keepers' Association will hold its annual meeting at the office of Graham & Steel, Winterset, Iowa, on Friday Nov. 3, 1882, at 10 a. m. All interested in bee culture are invited.

HENRY WALLACE.

CLUBBING LIST.

We supply the *American Bee Journal* and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	<i>Publishers' Price.</i>	<i>Club</i>
The Weekly Bee Journal,	\$2 00.	
and Gleanings in Bee-Culture (A. I. Root) 3 00..	2 75

The Monthly *Bee Journal* and any of the above, \$1 less than the figures in the last column.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

SELECTIONS FROM OUR LETTER BOX

Winter Depository.—I began keeping bees with 9 colonies and now have 24, in Langstroth hives. I have taken 32 gallons of extracted honey and 400 lbs. of comb, and my bees are in splendid condition for winter. Some time ago I took off the upper stories and removed to the lower story some of the combs containing brood, I noticed a great many dead bees. What was the cause of this? The operation was performed during the warmest portion of the day. I feel certain of great success another season, if I can winter without loss. I am about to build a winter repository for my bees, and will give you my plan. Our soil is clay loam; I shall make an excavation 4 feet in depth, wall it with stone to the top, and above the surface build a hollow wall 4 feet high, making 8 feet in all, and filling in, with spent tan bark. The wall will be 8 inches thick, tightly clap-boarded on the outside. I shall then have another wall lathed and plastered inside of this, leaving 2 inches space between; this wall will connect with the ceiling, but will leave a small aperture at the base and will have ventilation by pipes. Do you think this will cause a current of air, and keep the room free from moisture?

S. J. YOUNGMAN.

Cato, Mich., Oct. 5, 1882.

[The dead bees were probably those that had been worn out during the honey harvest and had died of old age. The winter depository you describe should winter bees well, everything else being equal.—ED.]

A Good Report from Canada.—That cloud with the silver lining hovered over my bee yard for about ten days in the beginning of August. We were ready. Our dish was "right side up," and we obtained 152 lbs. per colony, in ten days, of basswood honey, and increased over 100 per cent. With all of the good reports in the BEE JOURNAL, I have seen none as good for ten days. All our colonies are in good condition and ready for winter, when it comes.

R. L. MEADE.

Nassagaweya, Canada.

Iowa Honey Crop for 1882.—Our honey season, and time for queen rearing has come to an end for the year 1882! It has been one which in Iowa was rich in the yield of honey-producing plants and all the blossoms rich in the production of honey after they once commenced. The spring was a month later than usual, but the honey season after it commenced continued until October. Swarms continued to issue till the 10th of September, and have generally collected enough honey to winter on; though coming off so late. I had 5-lb. honey

boxes filled and capped over, that were put on during the last week in August. Tons upon tons of honey is the result.

E. L. BRIGGS.

Wilton Junction, Iowa, Oct. 21, 1882.

Wintering Bees in Clamps.—On page 254, of *Cook's Manual*, is a brief and favorable mention of wintering bees in clamps, and I have met the recommendation in other sources of information. Having no cellar fit for winter storage of bees, but a sand bank, easy to excavate, and with perfect natural drainage, near my apiary, I intend to bury two or three colonies, as an experiment. Please give us some information on the subject in the BEE JOURNAL?

W. B.

Louisville, N. Y., Oct. 23, 1882.

[Mr. M. Quinby favored wintering bees by burying, which is practiced by many at the present day. The mode is to dig a trench in a hillside or ground with sufficient slope to insure drainage. This is partly filled in with straw, on which the hives are placed; boards are slanted up in front; wooden tubes placed in position to ventilate the pit, straw thrown on the hives, over which boards are laid lengthwise, and dirt piled over all to turn off the water.—ED.]

Well Satisfied.—I began the season with 19 colonies; increased to 56, and have taken 2,000 lbs. of extracted and 200 lbs. of comb honey. Thirty of the colonies are in two-story Langstroth hives, full of sealed honey and some brood in the lower story. By weighing the combs and averaging the surplus stores to be removed, I find that my bees have gathered about 5,668 lbs. of honey in 60 days, and have sufficient amount remaining to winter on. When I gave the report before, I had only taken a portion of the honey and averaged the rest. WM. MALONE.

Oakley, Iowa, Oct. 15, 1882.

His First Report.—As this is my third year in bee culture, and I have never made a report, I think it would be in order to do so now. My wife bought the first colony of bees three years ago. Last year we increased to 19 colonies, lost 1, sold 1, and with the remaining 17 I began this season. Our colonies now number 41. We have taken 1,435 lbs. of comb honey from them in one and two-pound sections, and 78 pounds of extracted, giving us an average of 89 lbs. per colony, spring count, and my bees are in splendid condition for winter. G. E. HILTON.

Fremont Center, Mich., Oct. 24, 1882.

Late Breeding of Queens.—I had two queens hatch on Oct. 7; three weeks later than I ever had any before. To-day (Oct. 17), both were fertilized, a thing I could hardly believe would be done. In my 23 years' experience I never had it occur before. The weather has been very warm here for several days, but not much sunshine till to-day. We have had no

frost here as yet to kill even the tenderest vines. Our fields and hills are as green as in June. H. ALLEY.

Wenham, Mass., Oct. 17, 1882.

Botanical.—I send by mail a plant called the *spider weed* here. It secretes nectar plentifully early in the morning and late in the evening. It dies down in midsummer and a second crop comes from the seed and blooms until frost. Please give correct name in BEE JOURNAL. GEO. E. BOGGS.

Milledgeville, Ga., Oct. 16, 1882.

[The plant is *Gynandropsis pentaphylla*, for which I know no common name. It is a native of the West Indies, but has become naturalized over a wide area of the southeastern States, and seems well adapted to its new home. The small family to which it belongs (*Capparidaceae*), is made up of plants having fine flowers and an abundance of nectar, of excellent quality.—T. J. BURRILL.]

How to Keep Honey.—How can we keep unripe or partly ripened honey, from June to cold weather? I extract when the bees begin to cap the cells, and sometimes have a portion of it sour. H. M. MOYER.

Hill Church, Pa., Oct. 23, 1882.

[Keep it in an open vessel, exposed to the sun and air, where it may ripen before barreling it up. The Californians use a sun evaporator for this purpose, with success.—ED.]

Two-Story Hives for Winter.—I have two colonies of bees, in two-story hives. Will they winter as well without taking off the upper story?

WM. ROBERTS.

Vaughansville, O., Oct. 17, 1882.

[You can leave the upper story on and use it as an air-chamber over the chaff packing, if you winter on the summer stands. If you put the bees in the cellar, take off the upper story and cover, put a quilt over the frames, and leave the entrances open.—ED.]

Good Honey Crop in New York.—I have just marketed 16,800 lbs. of comb honey from 250 colonies, spring count, and increased nearly 90 per cent.

GEO. W. HOUSE.

Fayetteville, N. Y., Oct. 18, 1882.

Best Crop ever had in Illinois.—This has been one of the best seasons for bees and honey we ever had in this region. T. G. MCGAW.

Monmouth, Ill., Oct. 23, 1882.

Almost a Failure.—Honey was almost a failure with us this year. I increased from 6 to 18 colonies, and have taken 96 lbs. of extracted, and 56 lbs. of comb honey. My bees are in good condition for winter.

CHAS. H. HISGEN.

Hopkinsville, Ky., Oct. 23, 1882.

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about **eight words**; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole paid in advance:

For 4 weeks.....	10	per cent. discount
" 8 ".....	20	" " " "
" 13 " (3 months)....	30	" " " "
" 26 " (6 months)....	40	" " " "
" 39 " (9 months)....	50	" " " "
" 52 " (1 year).....	60	" " " "

Discount, for 1 year, in the MONTHLY alone 25 per cent., 6 months, 10 per cent., 3 months 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,
925 West Madison Street., Chicago, Ill.

Special Notices.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,—	" Bees and Honey," in paper.
" " 3,—	an Emerson Binder, or " Bees and Honey," in cloth.
" " 4,—	Apiary Register for 50 Colonies, or Cook's Manual, paper.
" " 5,—	Cook's Manual in cloth, or the Apiary Register for 100 Colonies
" " 6,—	Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Two subscribers for the Monthly will count the same as one for the Weekly, when getting up clubs for the above premiums.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., November 1, 1882.

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—1 am paying 6½c. for dark and 9c. for light extracted.
BEESWAX—Choice lots are worth 25c. here; bright yellow, 24c.; dark to good, 17@22c.
AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@20c. on arrival; extracted, 7@10c. **BEESWAX**—Firm at 30@25c. per lb.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand increases with the cool weather, but not sufficiently fast to keep pace with receipts, which now accumulate, as it is time to get the surplus into market. Prices remain unchanged with perhaps a tendency downward, owing to many consignors desiring to realize quickly.
We quote: white comb, in small sections, 18@20c. Fine, well-filled, 1 lb. sections bring the outside price. Dark comb honey, little demand, 15@16c. Light honey, in larger boxes, 12@16c. Extracted—white clover, 9½@10c.; dark, 8@9c., in barrels and half-barrels. Kegs will bring but a small advance, if any, above half-barrels.
BEESWAX—very scarce. Choice Yellow, 30c.; dark to fair, 20@24c.
R. A. BURNETT, 165 South Water St.

SAN FRANCISCO.

HONEY—Extra choice, either comb or extracted, is inquired for, and extreme figures are offered.—Nearly all offered is second or third quality, for which the demand is not active at the prices demanded.
We quote white comb, 18@20c.; dark to good, 12@15c. Extracted, choice to extra white, 9½@10½c.; dark and candied, 7½@8½c.
BEESWAX—28@30c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Prices unchanged and dull. Comb 15 @18c.—latter for choice white clover in small packages; strained in round lots at 6@7c.; extracted in cans at 9@10c.
BEESWAX—Sold fairly at 26@27c. for prime.
R. C. GREER & CO., 117 N. Main Street.

CLEVELAND.

HONEY—In sections, has been in extraordinary demand this week at full prices. Sales have been quite up to receipts, and all lots except recent arrivals were closed out. One pound sections of best white sells for 21@22c. per pound, in attractive packages. Same quality, in less attractive shape, 20@21c. In 1½ lb. sections, best quality, 19@20c. Second grade sells about 16@22 cents per lb. less. Buckwheat is unsaleable. Extracted, in small packages, pails and tin cans sells pretty well at 14@15c.; but extracted, in barrels, is very dull at 10@11c.
BEESWAX—Prime quality, 25@28c.
A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HONEY—There is some light enquiry for fancy lots, and our quotations have been exceeded for small lots. We quote: White clover, fancy, small boxes, 19@20c.; white clover, fair to good, 16@18c. Buckwheat, 13@16c.
BEESWAX—The receipts of wax continue rather moderate, but the high prices asked checked the demand, and the tone at the close is a trifle easier, with 3½c. about the top, and only reached for strictly prime, Western, pure, 29@30c.; Southern, pure, 30@33c.
D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Sells very readily in 1 lb. sections at 22@25c. for best white, and 20@22c. for 1½ to 2 lb. Boxes containing ½ pound, 30 c. per pound. Extracted is selling very slowly at 12@14c.
BEESWAX—25@26c.
CROCKER & BLAKE, 57 Chatham Street.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
" 100 colonies (220 pages)..... 1 50
" 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

Kendall's Spavin Cure is used from the Atlantic to the Pacific coast.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

When changing a postoffice address, mention the old as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Every lady should send 25 cents to Strawbridge & Clothier, Philadelphia, and receive their Fashion Quarterly for six months, 1,000 illustrations and four pages new music each issue.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

IMPORTANT TO BEE-KEEPERS!

TWENTY-THREE years' experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Something new. Send for Circular. 44wt HENRY ALLEY, Wenham, Mass.

LANGSTROTH AND SIMPLICITY L CHAFF HIVES, with movable upper story, section boxes, metal-cornered brood frames, wide Langstroth frames and comb foundation. Send for Price List. A. B. MILLER & SON, 44wt Wakarusa, Elkhart Co., Ind.

SECTIONS.

We make a specialty of our "Boss" One-Piece Sections. Patented June 28th, 1881. We have not sold any right to manufacture, therefore we caution the public against buying any One-Piece Sections not bearing our stamp. Send for Price List. J. A. S. FORNCROOK & CO. Watertown, Jeff. Co., Wis., Sept. 1, 1882. 36m5t

Address, THOMAS G. NEWMAN, 925 West Madison Street, Chicago, Ill.

FLAT-BOTTOM COMB FOUNDATION,

high side-walls, 4 to 16 square feet to the pound. Circular and samples free.

J. VAN DEUSEN & SONS, Sole Manufacturers, Sprout Brook, Mont. Co., N. Y.

Florida Land--640 Acres

CHEAP FOR CASH.

DESCRIPTION.—Sec. 4, township 7, south range 7 west, Franklin county, Florida, situated about 50 miles south of the Georgia line, 25 miles west of the city of Tallahassee, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a seaport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loam, covered with timber.

It was conveyed on Dec. 31st, 1875, by Col. Alexander McDonald, who owned 6 sections, including the above, to J. M. Murphy, for \$3,200, and on Sept. 5th, 1877, by him conveyed to the undersigned for \$3,000. The title is perfect, and it is unincumbered, as shown by an abstract from the Records of the county, duly attested by the County Clerk; the taxes are all paid and the receipts are in my possession.

I will sell the above at a bargain for cash, or trade for a small farm, or other desirable property. An offer for it is respectfully solicited. Address,

THOMAS G. NEWMAN, 925 West Madison Street, CHICAGO, ILL.

A NEW BEE BOOK!

Bees & Honey

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS C. NEWMAN,

Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturing a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-keeping.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

EXTRACTED AND COMB HONEY WANTED—for which I will pay the highest Market price. Correspondence solicited.

W. G. WATKINS,
41w4tp 172 22nd Street, CHICAGO, ILL.

New Kegs

FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore prepared kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well scalded, the pine will not flavor the honey.

Capacity, 175 pounds. Price, 80c. each.

The first car load of these kegs will arrive about Sept. 10th, and all orders will receive my prompt attention.

The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,
923 West Madison Street, CHICAGO, ILL.

Scribner's Lumber and Log Book.

The Bee-Keeper's Guide; OR, MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages, 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—*L'Apiculture, Paris.*

I think Cook's Manual is the best of our American works.—*LEWIS T. COLBY.*

It appears to have out the ground from under future book-makers.—*British Bee Journal.*

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—*J. P. WEST.*

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—*E. H. WYNKOOP.*

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald, Monticello, Ill.*

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—*A. E. WENZEL.*

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—*Wm. VAN ANTWERP, M. D.*

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record.*

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—*L'ABBE DU BOIS, editor of the Bulletin D'Apiculture, France.*

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat, Pulaski, N. Y.*

We have perused with great pleasure this *volume* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist, Quebec.*

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist.*

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor.*

PRICE—Bound in cloth, \$1.25; in paper cover, \$1.00, by mail prepaid. Published by

THOMAS G. NEWMAN,
West Madison Street, CHICAGO, ILL.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have strainers over the canal leading to the honey gate, and movable sides in the Comb Baskets. The \$5.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$8 00
For 2 Langstroth " 10x18 "	10 00
For 3 " " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " " 12 1/2 x 20 "	12 00
For 4 " " 13x20 "	16 00

EARS FOR THE MILLION!

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carcharodon Rondellei*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years an Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthy noises in my head, and hear much better.

I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by
THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.—Originally written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quintly's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject. \$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Beien Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Bzieron Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, gives recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price, 10c.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey: Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dandant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Paper, 25c.

Chicken Cholera, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Mechanics, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gliders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Glutting the Honey Market.

President J. E. Pleasants, at the meeting of the Southern California Bee-Keepers' Association, makes this remark: "There are now no more fears of glutting the honey market; for the foreign demand is almost unlimited. We have for years been knocking at these foreign doors, and now that they are opened, it rests with us whether they shall remain so, or not. We can here produce honey which is fit for the gods, and only such ought to be put upon the market."

Mr. Pleasants is right—the markets of the world are now open to us, and will take all the honey that we can produce—but it will be mainly extracted honey that will go abroad. There is too much risk attending the shipment of comb honey to foreign ports for it ever to become a staple in those markets. Hence, the necessity of properly ripening extracted honey, and putting it in convenient packages, to suit the trade of the world.

It is only a year ago that we said the day would speedily come when agents of the great metropolitan markets would scour the country for honey, as they do now for butter and eggs. This is now an accomplished fact. Agents from New York and Boston, have, this fall, been sent to visit the larger producers of honey, to buy their crops at their very doors, and tons upon tons have been so purchased this very year. This does but presage the coming demand, and clearly indicates the fact that honey has become a staple product.

Just now the home markets are fully supplied, but very soon the foreign

demand will clean them out, and then we may look for a more lively demand and better prices.

The Glucose Fraud.—In answer to a query concerning glucose, the Chicago *Inter-Ocean* says:

"Glucose is essentially the same as grape sugar, and glucose syrup is nearly identical with pure strained honey. It consists of 24 parts of carbon to 28 each of hydrogen and oxygen, whereas cane sugar contains the same amount of carbon to only 22 parts each of hydrogen and oxygen. It is manufactured from the starch in corn and other grains, by the action of dilute acids and alkalies, by a process too technical to be described here. It is not unwholesome, but does not possess the same degree of sweetness as cane sugar."

In stating that commercial "glucose syrup is nearly identical with pure strained honey," the *Inter-Ocean* is assisting a fraud, and winking at adulteration. It is *not* honey, but a fraudulent and poisonous adulteration, prepared by the use of sulphuric acid, and should be avoided and denounced by all honest persons. To sell it for honey is a swindle upon the purchaser, aided by the *Inter-Ocean*.

Home Market.—The Pine Grove, Pa., *Herald*, says that Mr. W. H. Stout, of that town, has been very successful with his bees this year, and that they have gathered a large quantity of a very superior quality of honey, that he has sold readily at 25 cents per pound in his home market.

In answer to several inquiries we will state that the *American Bee Keeper*, Lebanon, Mo., is the bee paper we mentioned some time since, that has issued no number since August. If any have been published they have not been received at this office, and it is to be presumed that it also has "ceased to exist."

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

Interesting Statistics.

We have heard it remarked that the North American Bee-Keepers' Society, at its late meeting at Cincinnati, O., appointed a committee for the purpose of collecting statistics on "Bees and Honey," to report at the next meeting of the Society. And we are further informed that we were appointed a member of that Committee—perhaps the Secretary will be able to tell us if such is the case, though nothing is said about it in his report, published in *Gleanings in Bee-Culture*. And we should also like to know who were appointed on that committee, and what they were requested to attempt to accomplish. We say attempt, for we well know the difficulties attending such a work, and the expense and labor it entails, especially if it is to encompass the whole of the territory embraced by the "North American Bee-Keepers' Society."

Speaking only for ourself, we regret that any part of such a work is demanded of us, for we have already more labor than we can perform with any degree of satisfaction to ourself and others, but we will do all we can to further the object—if it is to be accomplished.

Dr. Miller, the President of the Northwestern Bee-Keepers' Society has figured out some statistical items of interest, in connection with the Tables already published of the two conventions held this year in Cincinnati and Chicago. Believing that these items will be read with interest, we give them to our readers in full. They are as follows:

On page 681 of the BEE JOURNAL is given a statistical table of fifty apiaries, represented at the Northwestern Convention at Chicago. Summing up, we find as follows:

Total No. colonies last fall.....	3,339
Average No. to each apiary....	67
Colonies lost in winter.....	85
Colonies lost in spring.....	79
Colonies beginning the season..	3,122
Colonies devoted to other purposes than honey.....	62
Colonies at present time.....	5,432
Average No. per Apiary.....	108½
Production. Pounds.	
Total comb honey.....	167,510
Average for each owner....	3,350
Average for each colony....	53½
Total extracted honey.....	107,960
Average for each owner....	2,159
Average for each colony....	34½
Total production, both kinds.....	275,470
Average per owner.....	5,509
Average per colony.....	88

On page 664 of the BEE JOURNAL, is given a recapitulation of reports from 53 apiaries represented at the

North American Convention at Cincinnati. A comparison of the two may be interesting, if not instructive. It is not wise to draw conclusions hastily, and whether the favorable showing of the Northwestern, in some respects, as compared with the country at large, is due to locality, to a specially favorable season in the Northwest, to an adverse season in other localities, or to some other circumstance, I will not pretend to say.

The average number of colonies last fall, per owner, is nearly the same, being 66 for the North American and 67 for the Northwestern.

The North American lost 1.89 per cent. in wintering, the Northwestern 2.55 per cent., a small loss in each case, but the loss of the Northwestern was about one-third greater than the North American. On the other hand, the North American lost nearly double as much as the Northwestern in spring, the loss of the North American being 4.12 per cent., that of the Northwestern 2.37 per cent. Taking both winter and spring, the North American lost 6.11 per cent., the Northwestern 4.92 per cent. In neither case was there a very heavy increase of colonies. Taking the spring count as a basis, the North American increased 53.8 per cent., and the Northwestern 73.9 per cent.

Of the colonies of the North American, 20½ per cent. were used for other purposes than honey-raising and only two per cent. of the Northwestern.

Deducting these, in each case, from the spring count, we find the number of pounds of honey, per colony, to be as follows:

	North American.	North-western.
Extracted.....	40.7	35.2
Comb.....	19.3	54.7
Both kinds.....	60.0	89.9

Thirty-two per cent. of the North American's honey was comb, and 60 per cent. of the Northwestern's.

Looking at individual results, some unusual ones are given on page 681.

It is difficult to compare results where one man runs for increase, a second for combhoney, and a third for extracted.

In order to have something as a basis, although I am not at all sure it is a correct one, I have figured the net profit of increase at \$5 per colony, the net profit on comb honey at 16 cents and extracted at eight cents per lb.; and, at this rate, I give below the gain, per colony, of several bee-keepers, naming first the number of colonies kept by each:

D. Rawhouser.....	15	\$44 73
L. H. Scudder.....	63	29 35
H. Newhaus.....	34	28 82
H. W. Funk.....	75	27 87
P. P. Nelson.....	20	24 20
M. L. Trester.....	20	22 50
J. K. Snyder.....	43	21 95
Oatman & Son.....	229	20 88

These are certainly very desirable results, but to know more definitely about them we should know something about the quality and condition of the honey, also the condition of the new swarms. Mr. Rawhouser could hardly have gained his success with-

out season and locality of first quality, yet even then it would require the management of a first-class bee-keeper. It would have been interesting to know the result with ten times the number of colonies, and this is, I am afraid, too often not taken into account as it should be.

I admire the results obtained by Messrs. Scudder and Funk more than those of Mr. Rawhouser, because they had four or five times the number of colonies, and the item which most nearly excited my envy in looking over the whole list is that of Oatman & Son, who, although they make a poorer showing by colony than any others I have named and some I have not named, more than make up for it by getting such magnificent aggregate results. Too much stress is apt to be laid on exceptional yields from single colonies or a few colonies; I am more interested to know the yield per apiary or per man.

C. C. MILLER, 174-202. Marengo, Ill., Oct. 30, 1882.

If we are correctly informed Dr. C. C. Miller is also a member of the committee mentioned above. He is just the man for the work, being perfectly at home in figures. He has a clear head, sound brain, and unbounded energy.

Anticipating our getting up a statistical table this year, we have received the following:

Report of W. C. Preston, Iowa City, for 1882. Occupation, teacher.

No. of colonies in spring.....	14
No. of colonies on hand now.....	27
No. lbs. comb honey.....	100
No. lbs. extracted.....	2800

Total .. 2900
Pounds average, spring count.... 207
Wintered in chaff packing.

EDITOR BEE JOURNAL:—The above is my contribution toward making up statistics of the honey industry for 1882.

It is to be hoped that the task, so well begun by you last year, and of such great importance to the bee-keeping craft in general, will be taken up again this season, and that you will have the hearty co-operation of all bee men throughout the Union in making these statistics as complete as possible. I have no doubt all the apiarists of this city and vicinity will send in complete reports.

WM. C. PRESTON.

As before stated, we shall not get up a statistical table this fall. As the different societies are now getting up tabular statements there is no need of our doing so. We may, however, at some future time, aggregate them, to ascertain the consolidated results.

New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

MISCELLANEOUS.

Does the Queen Lead the Swarm?—

The *British Bee Journal* remarks as follows on this subject, correctly concluding that she does not:

There is an impression prevailing among the uninitiated that the queen of a hive leads off the swarm, but this is by no means the case with first issues, for, as a rule, the queen does not come forth from the hive until the greater part of the bees are on the wing. Another erroneous idea in existence is that the queen bee is the first to alight upon a branch or a bush, and that the bees congregate about her, but the reverse of this is the fact. When a swarm begins to issue, if the bee-keeper will place himself on the shady side of the hive and watch the stream of bees which pour forth like an army through a gateway, he may see the queen come out, and, if inclined to prove our assertions, he may capture and cage her, and put her in his pocket while he watches the proceedings of the bees. When the throng is circling in the air he may imagine that the bees are searching for her, and will perhaps conclude that as they cannot find her, they will return at once to the hive; but no, they will first congregate near a convenient tree or bush, and make a great noise sufficient to attract the attention of her majesty, if she were abroad, and they will alight and form a cluster, and wait for some minutes to give her an opportunity of joining them. If now she be taken to them, she will join the mass and all will be well; if not, the bees after a short time will disperse and return to the hive. Now this kind of experiment has been so often proved that it may be taken for granted when a swarm of bees has alighted, and afterwards returned to the hive, that the queen was not able to join them, or she would assuredly have done so.

Enormous Honey Yields.—The *Bee-Keepers' Magazine*, for November, contains the following enormous yields of honey from one colony of bees during the past summer:

Mr. Ira Yager, Vice President of the New Jersey and Eastern Bee-Keepers' Association has taken 496 pounds of nice honey from a single colony of bees. If any other Jerseyman has ever beaten this, let him report at once. Mr. Y. has 132 colonies. He reports the season as poor.

Mr. B. F. Carroll, of whom so much has been said in the bee papers, has at last accounts reached the enormous and unparalleled yield of 800 pounds of nice honey from one colony, and the end is not yet. Texas is the banner State and Mr. Carroll now wears the belt. Who dare prophesy that 1,

000 pounds will not yet be taken from single colonies when the cultivation of honey crops shall be fairly inaugurated?

Since writing the above regarding Mr. Carroll's wearing the belt, the following has come to hand. Dr. Farley, of Raleigh, Navarro Co., Texas, has a colony of bees which has sent out ten swarms, and from these and the old colony he has taken about 1,200 pounds of comb and extracted honey. Now, reckoning this honey at only ten cents per pound, and the new colonies (from this one hive) at only \$3 each, and we have \$150 as the product of one colony in one season, which is 32.50 better than friend Carroll has done, and he sold his honey at 15 cents per pound, all but 100 pounds which brought 12½ cents per pound. The report comes backed up by good authority, and if not disproved, it entitles the Dr. to the "belt."

Honey Harvest Abundant.—The Cedar Rapids, Iowa, *Standard* in an article on keeping bees, says:

The honey crop of this year exhibits the general affluence; it is abundant and very good. Clover, buckwheat, tulip blossoms, horsemint, goldenrod, Spanish needles, and other producers of nectar, have borne an unusual supply of sweets, and the bees have faithfully gathered it and stored it in the hives provided by man for their accommodation and spoliation. At the recent Convention of the North American Bee-Keepers' Society, at Cincinnati, it was stated that in 1870 only about \$1,000,000 was invested in the pursuit, but in 1879 the profits of it were estimated at \$16,000,000—showing that the delightful and profitable business of bee-keeping is beginning to attract the attention it so richly deserves.

Prepare for Winter.—Mrs. L. Harrison, in the *Prairie Farmer*, gives the following advice, including her plan for preparing bees for winter:

The Good Book says, "look well to thy flocks and thy herds," and I suppose that the bees were such tiny folks that they were forgotten then, as they are now, by most farmers, except when they happen to think that there might be some honey in the hives, or they make an uproar by swarming.

Although the fall has been so lovely, warm and balmy, day after day, there may be cold, driving storms and blizzards before flowers bloom again, and we should be prepared for their reception. Bees never freeze to death—O, no! they are dead before they reach the freezing point. And they are not a bit like fish, for they cannot live in the water. Therefore they should have a good roof over their heads; a leaky roof has caused the death of many a fine colony of bees. The severe winter of 1880-81 caused such havoc among our bees, that we hesitate to give directions for others to follow. That season, with few exceptions, they flew on the first of March, but many of them died by spring-

dwindling before flowers bloomed. They were in tight, closely-jointed hives, well painted, and not a leaky roof among them, and the bees covered with chaff cushions.

Perhaps they were coddled too much. In the spring we purchased a black colony of bees, in a Langstroth hive, made by a saw and hatchet carpenter, with such loose joints that the bees are always trying to enter them when honey is scarce. This colony, the owner said, "he didn't care whether it lived or died," and took no care of it whatever; and yet in the spring it was boiling over with bees, and was a bonanza to us in strengthening up our weak colonies.

Many instances similar to the foregoing show that bees can endure cold, but that impure air is fatal to them.

How to protect our bees so that they will keep dry, have pure air and no cold draughts through the cluster, seems to be the desideratum for successful wintering. Old settlers tell us that when they dwelt in log cabins, with their great fire-places and roaring chimneys, their families were healthier than they were after they built comfortable houses; and that their fowls, roosting in trees, and bees in log gums which sometimes cracked from top to bottom, lived through it, and never had cholera. What are we going to do about it? Go back to log houses and gums? Heaven forbid! But we are going to have pure air and keep comfortable at the same time.

Some of our readers may like to know how we are fixing up our bees for winter. On part of our bees we place Hill's device, which is similar to this: If a keg hoop was cut into four pieces, and a strip nailed to the middle of each, so that they would be three inches apart, it would form a hollow under which the bees can cluster, and pass readily from frame to frame. On this we spread new muslin, and it reaches over the frames far enough so that when the cap is put on, the bees are securely fastened below. We have not devices enough for all, and on the remainder we place four corn cobs, which we think will answer the purpose as well. Our bees are in the eight frame Langstroth hives, and we have made a tall hive of a few of them by putting four frames in the upper hive or cap, right over the four in the lower story. These frames are in the center of the hive, and we put chaff or dry leaves each side. We leave the entrance open and the same size as in the summer. Chaff cushions, four or five inches in thickness, are put in the cap over the bees, and complete the outfit for every hive. An abundance of fresh air is given above the cushions by raising the covers. It would be better to bore holes in the cap at each end, under the projection of the roof.

Articles for publication must be written on a separate piece of paper from items of business.

When changing a postoffice address, mention the *old* as well as the new address.

My Experience with the New Bees.

G. M. DOOLITTLE.

In the fall of 1881, I obtained some of the new races of bees to give them a trial, for how should I know for certain of their superiority, or otherwise, unless I tried them myself? To be sure, I had heard what others had said, *pro* and *con* regarding them, but these persons did not live in my locality, neither would their tests be the same that I should apply. This is where the reader of bee lore often draws wrong conclusions, and the different opinions of various virtues clash. The same locality, and the same tests would reconcile much that now appears to be directly opposite in its teachings.

On an average, neither the Cyprians or Syrians came out in the spring as strong as the Italians, but if we had had a winter like 1880-81, the case might have been different, still I am satisfied that in a mild winter, their wintering qualities are inferior to the Italians, as my experience is, they are more restless, thereby causing greater mortality, and a greater consumption of honey. From all reports, I expected to see them start to brood-rearing more rapidly in the spring, than the Italians; but in this I was disappointed, for they were nearly a week behind, and kept so until into June, when, about the time the Italians commenced to swarm, they began to exert themselves beyond anything I ever saw done by the Italians.

In this matter of brood-rearing the Syrians seemed to be ahead, beginning a little sooner, and filling every available cell with brood during the month of July; but as fall came on apace, I could see no difference between them and the Italian, as regards late brood. Right in the height of the honey season, they fill their hive with brood to overflowing, and with a person who does not spread brood so as to get every available cell full at the commencement of the honey harvest, this trait is just the thing, for no matter how much honey there is in the brood-chamber, or how fast it comes in from the field, the Syrian queens are not to be crowded down to a small portion of the bottom of the combs, with honey, as the Italians sometimes are. This is splendid for those who do not wish to be to the bother of getting their bees ready for the honey harvest.

I also found they would enter the boxes much more readily, if left to themselves, than would the Italians, and the capping to their cells of honey was whiter than those of the Italian; much resembling the work of the blacks in this respect. The yield of comb honey from them, nearly equaled the average yield throughout my yard and it was excellent in quality.

I was quite enthusiastic regarding the Syrians (and should have been over the Cyprians had they not been so vindictive) until I came to prepare them for winter, when I found that, while nearly every one of my Italians had from 10 to 15 lbs. more honey in the hive than they needed for winter, these new bees had to be fed about that amount, to give them honey enough to winter upon. This sustains friend Heddon's idea, as regards the possibility of our having too much brood for profit. It also sustains what I have said regarding the preparing of our bees, in just the right time for the harvest and not afterward, thus having them consumers, instead of producers. Could I have had a good yield from buckwheat these bees might have been of use, if they had not still kept on breeding to such an extent as to consume the larger part they gathered.

One thing I noticed of the Cyprian bees, which I have never seen in print, was that they were from 1 to 2 hours later in starting out in the morning, than any of the rest of the bees. Hot mornings, during basswood bloom, the other bees would be tumbling down, on the bottom boards to their hives, with great loads of honey, before sunrise, but scarcely a bee would be seen to leave the Cyprian colonies, until an hour after sunrise, when they would sally out with a rush, and seem to work faster than the rest for a few hours, after which, the difference was not noticeable. As to vindictiveness, the Cyprians are ahead of anything I ever saw, as soon as the hive was opened, but if undisturbed, a person could walk in front of their hive, and sit there without being molested; but raise the cover to the sections, where there was glass on one side, and they would rush toward you, against the glass, with perfect fury, and if there chanced to be a few on the outside of the sections, but separated from the main cluster, they would dart on to me, taking hold with such a grasp that it was impossible to shake them off. With all other bees I ever saw, a few bees isolated from the cluster will not sting, but on the contrary run till they can find a place to join the cluster.

The Syrians I found quite peaceable, until deprived of a queen, when they were nearly as bad to sting as the Cyprians. In not a single point, did I find the Cyprians superior to the Italians, unless I except the whiteness of comb produced, and in many points they are inferior. Their stinging quality was the worst of all, and effectually debars them from being kept, as a pure race, in my opinion. I care for no further experiments with them, and shall supersede them with my more worthy Italians.

As to the Syrians I have them from 4 different parties, and shall try them again another year, being careful, as in the past, to clip the heads of all the drones, till I find them worthy of a permanent place in my apiary.

Borodino, N. Y.

[The new races of bees are now on trial—let it be a thorough one.—ED.]

For the American Bee Journal.

Electric Alarm for the Apiary.

C. H. DIBBERN.

Mr. Kohnke has described, in the BEE JOURNAL on page 682, a very good electric thief alarm; but it strikes me as being too complicated and expensive for most of us. I have had an automatic alarm in use, the present summer, that works like a charm, and did not cost me over twenty-five cents.

During the past few years I have been greatly annoyed by thieves robbing my hives and even carrying them off whole. In June, these depredations commenced again, and my son and I then put our wits to work to trap the thieves.

Every apiary has one or two sides that are particularly exposed to thieves. On these exposed sides we drove stakes so that the top would be about eighteen inches high, into these we put common screw eyes. Now we ran a copper wire, such as is commonly used for private telephones, through these, and into one corner of our work shop. Here we place a trap, which consists of a weight of about twenty pounds, fastened on the end of a two-foot piece of wood. Now fasten the other end to side of shop, with a screw, so that the weight arm will move up and down easily. Now attach your trip wire to the arm, so the weight will be suspended high and drawing the wire tight. Now cut the wire near the trap and connect it again by bending the ends slightly and hooking them together, so that any pull on the outside wire will cause the wire to part, and let the weight drop. The same will happen should the thieves cut the wire. All sharp angles in this wire should be run over screw pullies. Now to the weight arm attach another wire, to run to the house. At the house we placed an old clock that was worn out, all but the striking part. Tie a string to the ratchet that holds the strike wheel, and over through a hole in top of clock and attach to the wire. Tie a nail or button on the wire, where it comes through the wall, so that the weight in the shop can only pull the end in the house, an inch or two, so it will set the clock striking, but not bind the striking parts. If properly put up, and any person comes against the trip wire, it will be sure to break at the hook splice; this will cause the weight to drop, giving the house wire a sharp pull, instantly making the clock strike.

Now, jump out of bed, get your revolver quick, and run out into the apiary in your night clothes, as I have done several times this summer, only to hear some one jump over the fence, and disappear in the bushes and darkness. You can blaze away, anyhow, and have a little Fourth of July all to yourself. Now you can go back to bed, and congratulate yourself that you was too smart for them that time.

By a little ingenuity the trip wire can be run across windows in honey rooms or other places where thieves are liable to break in.

Milan, Ill., Oct. 27, 1882.

The Wintering of Bees.

D. A. JONES.

This is a subject which has baffled our most scientific bee-keepers for ages, and a doubt still seems to exist in the minds of some if this subject has been fathomed, which, however, to my mind, is not the case. To me the wintering of bees is very simple, and I have no more question about wintering every colony in proper condition than I have in wintering horses, cattle, or any other kind of stock. It is only necessary to have a knowledge of their requirements; complying with these, means success.

I have tried all the different methods; spent thousands of dollars in experimenting, and have no hesitation in saying I have had a larger and more varied experience than any other bee-keeper. I have succeeded for years in wintering by the system which I have adopted, and hundreds of others have been successful who have carefully followed the same instructions and directions.

This system is so simple and easy that any novice can carry it out without difficulty, and can be applied to suit all bee-keepers irrespective of number or kind of hive.

I will give five different methods of wintering, viz: In Bee House; in Cellar; in Clamp; in Chaff or Sawdust Hives; in Boxes Packed.

WINTERING IN BEE HOUSES.

To do this successfully it should be so constructed that the out-door temperature cannot affect that of the bee house; and, in order to accomplish this, its walls should be packed tightly with two feet of dry sawdust or three feet of chaff, packing overhead same thickness, and the bottom so protected that no frost can penetrate. Next, it should have a ventilating tube at the top, of not less than one square inch to each colony of bees. It should have sub-earth ventilation by means of a tube laid below the depth frost will penetrate, and from one to three hundred feet in length, coming in contact with the outside atmosphere at the other end; as air passes through this tube it is tempered by the distance through the earth, and comes into the house at an even temperature. By means of slides at these ventilators, the temperature can be arranged in the bee house, which should stand from 43° to 46°, and in no case should it fall lower than 42°. Now, if a bee house is constructed in this way it will not change its temperature more than from 1° to 3° during the winter, and can be regulated, as before stated, by means of ventilating slides. Have tight fitting triple doors, making two dead air spaces.

When the bee house is filled, and during warm weather in the spring, where a person does not want to set them out until the first pollen appears (which is generally from Tag Alder or Black Willow), it is necessary that the temperature of the room be kept at the wintering standpoint. This may be done by means of an ice-box or refrigerator, filled with ice or snow,

and suspended at the top of the room in close proximity to the ceiling. The bottom of the box must be so constructed that while the warm air may be allowed to pass up through the refrigerator, the drippings will not drop to the floor and create a moisture. This latter may be prevented by means of a tube running from the box down through the floor.

PREPARATION.—All this must be done in the fall. They should be strong in stores, have plenty of young bees, and should be crowded up to have no more comb than they can cover, and these should be well stored with pollen and honey (say 20 to 30 lbs. of the latter). If you have not this quantity, feed granulated sugar and water (2 lbs. of the former to 1 lb. of the latter) brought to a boil and allowed to cool before feeding. This makes a good, and even better, feed than the best of honey, and should be fed in time for the bees to seal it over. Commence feeding about the 1st of September, or immediately after the first frost has killed the flowers. *No glucose should ever be fed.* Winter passages should be made through the combs, between which a space of half an inch should be left. During the last sunshining days in the fall remove the lid and cloth from the hive and allow the sun to shine in; this purifies and dries them. Then put on a cloth free from propolis; that same evening carry the bees carefully into the house, placing them on a bench 10 to 12 inches from the floor or ground; this keeps them out of the carbonic acid gas, which is given off by the bees in the hive, and which sinks to the lowest part of the bee house. The lids should be removed, and only a cloth or cushion of chaff or sawdust allowed to remain on the hive. Leave the entrance wide open.

When the first row has been placed on the platform, from 2 to 6 inches apart, take two strips 1 to 2 inches wide, and place on top at the rear and front of the hives, and upon these place another row, so that the spaces between the hives in the second row will come over the center of the hives in the first row, thus allowing a free circulation of air and the escape of the moisture. Thus—

Continue the above until all the hives are placed. Care should be taken to have the stronger colonies in the bottom rows.

Two thermometers should be placed in every house—one opposite the bottom and the other opposite the top row, the former indicating 43° and the latter 46°.

Keep the house perfectly dark and let them alone until you set them out in the spring, unless they show signs of dysentery by soiling the entrance of their hive, in which case take them out quietly on the first favorable day and give them a fly, taking care to replace the hive immediately after they have returned from their flight.

WINTERING IN CELLARS.

The preparation and management in the fall and throughout the winter is the same as is necessary in the bee house, but they must be placed at least two feet from the cellar bottom; keep the temperature the same as in the bee house.

Do not allow any decaying vegetables in the cellar with the bees. If they show signs of dysentery and the weather is fine, give them a flight, being sure to always put them on the same stand again after the first flight. Never leave them out over night, but put them back in the cellar after they return from their flight. Set out of the bee house and cellar the first favorable weather when pollen appears.

The hives must all be examined carefully when setting out, and only what combs the bees can cover must be left. Take care that plenty of stores are left in the hives, and have the bees crowded together as much as possibly by the use of the division board.

WINTERING IN CLAMPS.

Prepare the colonies the same as before. Make a platform six inches above the ground and wide enough to have from 10 to 12 inches of space in front of the hive, 12 to 15 inches at the rear of the hive, and a platform long enough to hold all your hives. After placing them 4 to 6 inches apart, if there is any space in the rear of division board, pack it with dry sawdust or chaff; remove the lids and put clean cloths on the frames, or, if a box hive or log gum, bore half a dozen inch holes in the top of the hive, and that covered with cloth allows moisture to pass up into the packing above. Place a stick, half an inch thick, each side of the entrance, long enough to reach the edge of the platform; upon these lay a board, by means of this there will be a communication with the outside at all times; then drive stakes at the front and rear of the platform, set up boards all around this platform inside the stakes of sufficient height to allow packing 18 inches above the hive, pack firmly with dry sawdust or chaff around and between the hives and about 18 inches on top, then lay boards on the top of the packing, upon these place stones or other heavy weights (100 lbs. on each hive is not too much). This will pack firmly and prevent heat from passing up through it from the inside of the hive and yet allow moisture to escape. The packing should not be removed until about fruit blossom, except slightly to examine condition of colonies.

This clamp should be banked outside sufficiently to prevent frost from getting under; if sawdust were packed under the clamp it would be better. A slanting roof keeps off rain and thawing snow.

WINTERING IN DRY GOODS BOXES.

Where parties have only a few colonies old dry-goods boxes may be taken, the bees placed in them and packed in a similar manner to a clamp, but there should always be 6 inches of dry packing under the hive, preventing frost

from below. Care should be taken to make the entrance perfect, enabling them to have access to the outside, so that they may have a flight when the weather is favorable.

WINTERING IN CHAFF OR SAWDUST HIVES.

These hives are intended to winter safely without any outside packing, only requiring the same preparation as those for the bee house, viz., strong in bees, plenty of young, plenty of stores (if not sufficient, feed), crowd up on a few combs, cut a passage in the comb, the combs half an inch apart, and fill up the space in the rear of the division board with dry sawdust or chaff, filling the space, between the top of the frames and lid, with the large cushion.

Taking all seasons through, nothing pays better than a careful preparation of bees for winter, and I would caution people to beware and not expect this winter to be the same as last, as that was the best winter we have had for many years, and the indications are that the next may not be so favorable, and those who do not properly prepare will likely be found mourning over their empty hives in the spring.

I sincerely hope that no one will have to repent their neglect in this matter when too late.

Beeton, Ont.

[We give the foregoing plans delineated by Mr. Jones, as there are so many inquires as to how he prepares his bees for winter.—ED.]

Southern World.

The Progress of Scientific Bee Culture.

C. R. MITCHELL.

The subject of bee-keeping has claimed the attention of many of our most learned men of ancient and of modern times, who looked upon it as a science worthy of their study and their philosophy. Gratwell, Schirach, and Huber the elder, were among those of antiquity who devoted their wisdom to the advancement of the knowledge of the habits and character of these insects, and to the latter especially, as every school-boy knows, we are indebted for much that is of inestimable value in the studies of the naturalist. Although he became blind at the early age of fifteen, his works gave an impulse to this branch of rural industry in Europe, which caused the management of bees in common hives to be brought to a high degree of perfection. Lombard, Radonan, Desormes and others, in the first part of the present century spread abroad this acquired knowledge and added to it the results of their own ingenious inventions, observations and experiments.

Debeauvois, in 1844, invented his movable frame hive, but it was found to be too inconvenient for general use. Its merits were contradicted and its inventor ridiculed by all, until Mr. Bastian, a clergyman of Germany, published a work in which he gave proper credit to the movable frame of

hives, and Mr. Sagot offered to the public an improved frame hive of his own construction. In spite of all opposition, this new system worked itself into the favor of many apiarian societies, and through them the movable frame hive began to be widely used with the recommendation of such learned men as M. M. Balsamo Crivelli, Visconti di Saliceto, Angelo Dubini and Major von Hruslika, at the head of the bee culture of Italy, and to the last named of whom we are indebted for the principle of the honey extractor.

The improvements, inventions and discoveries made in Germany, in the last twenty years, are almost beyond number, and up to 1868 four hundred and twelve publications had been issued upon this subject. Notwithstanding the advances made by the countries of Europe in theoretical bee culture, none have excelled in the practical knowledge of the science the bee-keepers of our own grand commonwealth.

The theories of Dzierzon, the experiments of Berlepsch, and the precepts and examples of many of modern days have passed into our language and been given to us for our guidance and amelioration. What a vast difference to-day, even in our own land, from what was considered perfection in bee-keeping less than half a century ago, when to "let bees do as they have a mind to" was the orthodox philosophy of practice, and he who would experiment must suffer for his temerity.

A new field of enterprise opened up and bee-keepers and hive makers issued numerous patents, but none seemed to advance beyond a certain point until about 1850, Mr. Langstroth introduced his own ingeniously-constructed movable frames and their method of successful manipulation to the public mind. Perfection seemed almost attained; the interior of the bee hive need no longer remain a labyrinth of mysteries, and the assertions of the naturalist could be easily verified at every man's door. The golden-banded bees were imported from Italy, in the light of the new science, and the moth worm, the great bug-bear of inexperience, need no longer be feared as the destroyer. Under such favorable auspices as these, with numerous bee periodicals, modern conveniences and appliances, and gentle, industrious Italians, can it be supposed that bee culture could be other than a pleasant and profitable vocation, when properly and intelligently pursued?

You may search out a knowledge of the material, and stumble over the things which impede your progress, but if you adhere to the foggy notions of your ancestry and flatter yourself with the delusive hopes of abundant success, you will find a mountain of despair at almost every stride; while on the contrary, all obstacles fade with the fleetness of a shadow amid the progress and improvements of an enlightened age.

Bees in themselves have the same essential habits that were given to them when they first winged their

flight in the Garden of Eden, as permanent and as unvarying as the attraction of gravitation, or the natural laws of our solar system. They act alike under like circumstances, are incapable of education and learn nothing. It is by taking advantage of these unchangeable habits, that we can control their actions and make them subservient to our purposes at our own good pleasure, just as we take advantage of the immutable laws of the universe and appropriate them to our own conveniences for scientific investigation, domestic manufactures and foreign commerce. Review the annals of bee culture for the past few years, and you will find yourself astonished beyond measure, at the advancement it has made as a science, at the reputation it has achieved as a remunerative employment, and at its present magnitude and importance as a leading industry among domestic pursuits.

Local Convention Directory.

1882. *Time and Place of Meeting.*
 Nov. 1.—New Jersey & Eastern, at New Brunswick. J. Hasbrouck, Sec., Bound Brook, N. J.
 3.—Iowa Central, at Winterset, Iowa, Henry Wallace, Sec.
 29-30, Western Michigan, at Grand Rapids, Wm. M. S. Dodge, Sec.
 1883.
 Jan. 16.—Eastern N. Y., at Albany, N. Y. E. Quakenbush, Sec., Barnerville, N. Y.
 11, Nebraska State, at Wahoo, Neb. Geo. M. Hawley, Sec.
 16-18, Northeastern, at Syracuse, N. Y. G. W. House, Fayetteville, N. Y.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning County, in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

LEONIDAS CARSON, *Pres.*

The Nebraska State Bee-keepers' Association, will hold its annual session in Wahoo, Saunders county, Neb., commencing Thursday, Jan. 11th, 1883. Arrangements have been made with the railroads to secure 14 fare for the round trip. The Saunders county Bee-keepers' Association will furnish entertainment free to all visiting apiarists.

T. L. VONDORN, *Pres.*
 GEO. M. HAWLEY, *Sec.*

Southern California Convention.

The following is the annual address delivered at the Southern California District Bee-Keepers' Association in Los Angeles City, Oct. 19, 1882, by Pres. J. E. Pleasants, who was re-elected president of the association:

Since last we met, another year has crossed the bridge of time and passed into the dark unknown. To some it has brought sorrow and to others joy. We should come to these annual gatherings, like workers to a hive, each one laden with the experience of another year. For whatever adds to our knowledge of the bees, and aids us in manipulating them, thereby increasing the quantity and quality of honey, is of great value. Therefore, an association which brings the bee-keepers together and imparts useful knowledge, causing them to advance in their avocation, is well worthy of encouragement; and those who are not willing to aid, should be classed as the lazy, yawning drones of the hive.

The bee season for 1882 cannot be called a success, but it is not as bad as it might have been. There has been fully one-fourth of a crop, with a fair increase of colonies, and the bees are now in excellent condition. The price of honey is better than it has been for years.

With "our mind's eye," let us take a retrospect of the bee business. In the year of 1875 we see a tidal wave, as it were, approaching. In 1878 it takes it to the highest point, where for a while it holds it tottering, for it is above its level. Then the wave recedes and it takes it down to the lowest depth, where it stays until 1880, when it slowly, but surely, commenced coming back to its true level.

This tidal wave, when it was going up, caused many mushrooms to engage in the bee business. These mushrooms crowded into every available place with a few colonies, expecting to make a fortune in a year or two, by increasing their bees at lightning speed; and they extracted, at the same rate, what they called honey, but it afterwards proved to be vinegar. When they started, they thought of revolutionizing the business; and so they did, by almost ruining the reputation of California honey.

The general supposition is that the drouth has injured the bee business. I would say not as much as the unscrupulous mushrooms. They are not worthy to handle

"Creatures that by a rule in nature teach
The act of order to a peopled kingdom."

Fortunately, for the honey interest, the mushrooms were so shaken up in the tidal wave, that they abandoned the business and "went to pastures new."

The apiarist well deserves to be called a benefactor to all mankind, for through his agency the bees utilize millions upon millions of flowers which would otherwise waste their sweetness in the mountain air. Let us gird ourselves anew, for we have good reasons for renewed enthusiasm in our calling. The future looks very

promising. Let us pull every oar; there is land ahead."

There are now no more fears of glutting the honey market; for the foreign demand is almost unlimited. We have for years been knocking at these foreign doors, but now that they are opened, it rests with us whether they shall remain so or not. We can here produce honey which is fit for the gods, and only such ought to be put upon the market.

There is a bright side to bee-keeping, even in a bad year. At the beginning of the winter our hopes are great; we expect plenty of rain and a large yield of honey; as the season advances, and no rain comes, we let ourselves down from a full crop to $\frac{3}{4}$, then to $\frac{1}{2}$, then, if we can save the bees; by and by, if we can save the combs, and at last are well satisfied to save the hives. In the face of all the difficulties that the bee-business has had to contend with, I would say, that if it is properly managed, it is one of the most independent of pursuits.

Apiculture is advancing with rapid strides. The production of honey is now one of the great industries of California. The agricultural society could, if it would, aid this industry. It suffers neglect at their hands; for it is certainly worthy of a more prominent position upon their premium list, and I firmly believe we can get such a position if we strive for it.

I thank you for the honor of having been twice elected president of this association. To serve you faithfully, has been my most earnest desire. How far this has been accomplished, it is for you to judge. I hope that the time spent here will be agreeable and profitable to all.

Northern Ohio Convention.

The Northern Ohio Bee-Keepers' Association met in Norwalk, Ohio, Saturday, Oct. 21st, and was called to order at 10:30 a. m., with Samuel Fish, of Milan, President, in the chair.

The Secretary's report of the last meeting was read and adopted.

The President requested those present, who were not members, to join the Society, the gentlemen by signing the constitution and by-laws and paying a fee of fifty cents, and the ladies by signing the constitution and by-laws.

Eight new members were added: J. S. Terrell, North Ridgeville, Lorain county; O. J. Terrell, North Ridgeville, Lorain county; T. S. Johnson, Erie county; J. B. Darling, Hartland; E. Walker, Berlin Heights; J. S. Tilton, Norwalk; Mrs. M. J. Campbell, Steuben; Mrs. W. B. Harrison, Berlin Heights.

Mr. Fish said the season of 1882 had opened favorably for bee-keepers, and they were elated with hopes of obtaining large crops of honey, but it soon changed to a most unfavorable and unprofitable one. The cold and wet weather, which continued many weeks, not only prevented the bees from gathering any surplus of honey, but also from gathering sufficient for their own use, and many were obliged

to feed as late as the 10th of June, to keep their bees from starving.

He next took up the subject of wintering. He remarked that Langstroth had said "that the time would come when bees would be wintered as successfully as horses or cattle," and that James Heddon, a prominent Michigan bee-keeper, claims that he can, by his system, winter with perfect success. He advised all who had not prepared their bees for winter, to do so as soon as possible. Two things were to be guarded against, dysentery and spring dwindling. Some advised, as a precaution against these two, so-called, diseases, to remove all combs from the hive, containing pollen. He had not followed such advice, and had always wintered successfully. One very important thing was to prevent an excess of moisture (the principal cause of dysentery). This could be done by regulating the temperature and using absorbents. Absorbents remove the moisture.

Mr. Fish closed his remarks by giving a description of the house he uses for wintering. It consists of two rooms adjoining each other. One contains his bees, and the other a stove to regulate the temperature.

Mr. E. F. Waldron being called on, said he did not depend on books, or the experience of others, but on his own experience. Three things were necessary for successful wintering; warmth, dryness and good ventilation. He prepared his bees for winter Oct. 20th; did not think bees could cluster in the small spaces contained between two combs as used in summer, and retain the proper degree of heat; removed a comb from the center of the hive and left the space vacant for the bees to cluster in; used chaff cushions above the cluster to absorb the moisture. By the use of a tube he admitted the cold air into the hive in such a way that it did not come directly in contact with his bees.

[When Mr. Waldron examines his hives next spring he will probably find one of two things to have happened. His bees will either fill the space from which he removed the comb, with a new comb, or will all cluster on one side of the space.—Secretary.]

Mr. Bartow gave a description of his method of protection. He encloses the summer hive in a box three or four inches larger each way, and fills the space with leaves. Also packs leaves over the cluster. Would wait until after frost comes before he packed his bees for winter, and would not remove the packing until the weather became quite warm.

Mr. Boardman asked Mr. Fish how he knew an excess of moisture caused dysentery. Mr. Fish replied that with moisture in excess bees died with dysentery, without it they did not.

S. F. Newman said that to winter bees successfully several things must be attended to at the proper time. Each colony should have, as early as the 1st of August, a young and prolific queen, because young queens lay much later than old ones, and thus the colony is provided with a large stock of young bees; a very important fac-

tor in successful wintering. All preparation for wintering should be finished not later than October 1st, and it probably would be better not to disturb bees after the middle of September, for by that time they have begun to place their food where it will be easy of access, and if the weather is cool, form themselves into a compact cluster, which should not be broken afterwards.

Each colony should have at least 20 lbs. of sealed honey, and each space between the combs which contains bees, should contain enough honey for the bees clustered in that space to feed upon, for the less they are compelled to move about the hive to obtain food, and the quieter they keep, the less likely they will be to become diseased. Absorbents of some kind should be used above the cluster, for if the hive becomes damp and the combs mouldy, the colony cannot be healthy. The entrance of the hive should be large enough to give an abundance of pure air.

By following these directions, bees can be wintered in suitable bee-houses or dry cellars, or on their summer stands in chaff hives, with but little loss.

Mr. Albright said he had wintered out doors for six or seven years. Hives were not protected except by his house and a fence. Lost only one colony during the winter of 1881-2. Used the American hive.

Mr. Walker winters out doors. Does not like chaff hives. Would not give a cent for a cart-load of them. Uses a dead air space instead of chaff. Says chaff conducts moisture. Wintered in chaff hives in 1880 and 1881, and lost 34 out of 41. Left a sheet of oil-cloth between the cluster of bees and the chaff cushion. Uses only seven frames in brood chamber.

C. H. Hoyt said that several years ago he wintered in clamps with ventilation, and was successful. The year following he wintered in a damp cellar without loss. He was now using chaff hives, and preferred them to any other.

Mr. Boardman did not think bees could be wintered with as much certainty as horses and cattle. If they could, the business would be very profitable. There was no difficulty in getting old bees through the winter alive, but they died in the spring before there were young bees enough hatched to perpetuate a colony. He winters in a frost-proof house, without absorbents, without bottom boards, and with but very little upward ventilation.

Mr. Boardman thinks the moisture which collects in the hives is not produced by the breath of the bees, but by the cold air coming into the hive from the outside and mixing with the warm air inside, and that this moisture is utilized by the bees for drink. Prefers in-door wintering, on account of the less amount of stores consumed. Did not think sub-earth ventilation as good as a room containing a stove adjoining the winter bee house.

J. S. Terrel winters in Simplicity hive, with only a piece of cotton cloth over the brood nest. Removes one comb and equalizes the space left.

Intends to winter in a clamp the coming winter. Had fed liquid food in the winter time, when bees could not fly, without any bad result.

J. B. Darling said that he found no difficulty in wintering, but could not obtain any surplus honey, and would like to have some one tell him how to get it. He said he knew as much about bees now as he did twenty years ago, and no more.

The Secretary gave the following statistics, using numbers in place of the names of those persons making the reports :

STATISTICAL TABLE.

Apiarist, No.	Number of Colonies June 1, 1882.	Number of Colonies Sept. 20, 1882.	Comb Honey, pounds, 1882.	Extracted Honey, pounds, 1882.	Pounds of Wax obtained.
1	21	39	400	325	20
2	9	14	150	75	..

32	9	12	50	50	..
33	27	47	700	100	..
34	42	63	1200	300	..
35	15	25	400	600	10

The table shows that 35 bee-keepers owned, June 1st, 1882, 1,453 colonies, which increased to 1,973 by Sept. 20th, 1882. These colonies gathered 55,099 pounds of honey, which was an average of about 28 pounds to the colony. The honey is worth about \$10,000, and the wax produced \$100.

After a vote of thanks to the Whitteley Association for the use of Whitteley Hall, the meeting adjourned to meet again the first Saturday in February, 1883.

Read before the Union, Ky., Convention.

Inter-Breeding of Bees.

DR. W. M. ROGERS.

The laws regulating the inter-breeding of bees have received too little attention from Apiculturists. With reference to the relations of characteristics, to any system of breeding or crossing, we are nearly ignorant. But little of the knowledge contained in works upon the honey-bee, refer to principles of breeding, or is susceptible of arrangement upon a line of law pertaining thereto. In a first effort at developing a science, one may be pardoned for venturing upon hypothesis. With greater light a theory may be promulgated. From accumulated and convergent facts law is deduced. With law clearly in sight, all factors are reduced to order, and sequences are definite. We shall probably die without the accomplishment—scientific precision in breeding bees. With the conviction that *all breeding* is arranged upon a line of law, I am hopeful that the future has much of interest and profit in store for us, arising out of correct interpretation of the phenomenal pertaining to the breeding, inter-breeding and crossing of bees.

Nature works upon a wider range of correlations than we might expect to find. Comparative anatomy makes us wonderfully near the animals below us.

Corresponding devices *always implying intelligence* are found everywhere about us, in applications of widest range. The device of an umbilical cord, serves a purpose alike for the horse chesnut and the man who aspires to know God or dares to deny Him.

The beautiful modifications of the feather serve the purpose of the swan upon the lake; the swallow that cleaves the air—the gay butterfly that flaunts her colors in the sunlight—the pretty moth that glints the moonbeams, or the industrious honey-bee with corsage of gold. I hope for much yet to be revealed from the wide and illimitable infinitude of intelligent correlations inhering in the coordinations of all nature. The pathway of intelligence is marked. The thought of the Mighty One is feebly followed by the thought of the tiny mould of his image. I have studied this subject until I have discovered my own ignorance and am grown curious to learn. I think I could hardly breed a flock of Cotswolds or of Southdowns, without some effort to discover the possibilities of modification of character inhering in them under differences in breeding and mating. I am satisfied that Bakewell had a law of breeding applicable to sheep—and that any man to-day could, with a knowledge of that law, take the same character of material and arrive at the same results essentially.

Returning to the immediate subject of this paper I express the opinion that the introduction of the new races of bees into America, affords opportunity for advance in discovery of the susceptibility of bees under the vari-

ous conditions of mating. In the AMERICAN BEE JOURNAL of Sept. 27th, 1882, the editor in reply to a question, answers: "If Italian queens are mated to black drones, they (*the bees*) are much more irascible than the pure blacks; if black queens mate with Italian drones, then the traits of disposition are most likely to be reversed." This statement has, I believe been asserted in substance by others. Accepting it as a fact and remembering that black bees are more irascible than Italians, we may fairly draw the inference that where these races are intermated, the drones participating in the inter-breeding, subordinate the cross in nervous character. This should be accepted as a rule, modified by exceptions that confirm the rule. From experiments conducted with whatever care and discrimination I am able to bring to the work, I have proved to my satisfaction that it is practicable to breed from Italian queens, mated to Cyprian drones, a progeny that resembles, in characteristics, pure Cyprians. The first and second generations from such matings are liable to sport. Italian queens bred to Cyprian drones do not produce the same results in royal progeny, as we secure from Cyprian queens bred to Italian drones. We are not to presume, therefore, that mere equivalents in blood will produce the same characteristics in bees, else a Cyprian queen mated to an Italian drone, and conversely, an Italian queen mated to a Cyprian drone, each producing half and half from the two races, should throw queens alike, which is not the fact. My experiments in 1881 and 1882, incline me to think that in mating between Cyprians and Italians, the drones are prepotent. In a letter just received from Mr. H. Alley, he re-affirms his oft-repeated statement of opinion to the same effect.

In order to correct results it will be necessary to conduct experiments with pure races. Pure blacks and Cyprians would afford excellent subjects. The most useful material results would probably be reached in inter-breeding Italians and Cyprians. The same assurances of correct matings could be had in these experiments, that we have in breeding Italians or Cyprians in purity, accepting the theory of parthenogenesis. I consider the blood of all drones as derived from the matings of their grand dams. Hence, when the queens are half and half of the two races, the drones would be pure bloods of the line of the queen, and when in process of breeding the drones are half and half of the blood of the race participating, the bees and queen progeny would be three-fourths bloods, if the order of the matings has been continuous. Consideration of these facts is essential to definite results in inter-breeding bees. I do not ignore the influence of climate, isolation, food and natural selection. As factors in breeding, all should be considered. These alone did not make Bakewell's sheep, nor the shorthorn cattle, nor the Essex pig. A sire of prepotencies is not an accident. In order to be improved, a race must offer in itself the suggestion of the

possibilities of its future. In other words, we do not create, but we evolve a character already inherent in the subject. More than this we may not hope to accomplish.

A cross and its inversion may differ widely in useful characteristics. A familiar illustration is found in the mule, an animal of great hardihood usefulness, and the invoice Hinny, a product so useless as to be rarely seen. In crosses, the strongest tendencies are back toward the pure blood of either parent, rather than a balanced result of the inter-breeding. Hence variations are quickly merged into the original type if bred into line. Hope of success in inter-breeding bees may be drawn from the fact of their near alliance with each other, and the consequent plasticity of the races relatively. No process of breeding, more certainly develops primordial characteristic than that of crossing. The significance of a cross may antedate all history, leaping a chasm of centuries of time.

The Italian queen from which my experiments were made this year, was sent me as a tested one by a breeder of assured integrity, yet such was the tendency to sports in the second generation of queens bred from her, that I at first hesitated in the belief of her purity, but reflecting that the Italian is a continental race, and that the Cyprian is of insular breeding, I conclude that this is precisely the development that should be anticipated. The sporting in color has been upon varied shades of mingled chestnut and yellow. The queens that I have seen from Cyprians bred to Italian drones have been uniformly marked, showing the prepotency and purity of the Cyprian relatively. Queens bred from the Italian, being of the second generation mated to Cyprian drones were prolific and gentle. The first crosses of bees are as a class active, prolific, hardy and industrious. Formerly, I was inclined to find a reason for this in the idea that the strongest and most energetic queens would seek their matings at greatest distances of flight from their homes, and I yet ascribe importance to that view, but the analogies point to the conclusion that the result arises mainly from crossing. Flowers show undoubted co-aptation to pollen brought from other individuals of the same race, and hence, perhaps, the conclusion among botanists that the pollen or male principle is prepotent with flowers. It should not be forgotten that hybrids may lose their qualities as easily as pure races when too closely inter-bred. In view of the foregoing, I accept it as a theoretical proposition that a race of bees should be sustained by new blood. Since among bees, the queen submits the question of the survival of the fittest to the wager of battle, and since the queen gives character largely to her progeny, I submit the hypothesis, that when a race of bees produce queen-cells in large numbers, this handing over to the best fighter among many the possession of the colony, the race itself, may reasonably be expected to afford staunch defenders of their rights. I have counted 75 per-

fect queen-cells in a single colony of Cyprians, formed under natural impulse. It would be irrational to deny to the survivor of 75 queens in battle, her well-earned laurels.

I close this paper with an apt quotation from an article by Sir J. Lubbock, "on certain relations between plants and insects." He says: "I venture to think the evidence now brought forward, however imperfectly, is at least sufficient to justify the conclusion that there is not a hair, or a line, not a spot, or a color, for which there is not a reason, which has not a purpose or a meaning in the economy of nature." Shelbyville, Ky.

Utah Bee-Keepers' Convention.

The Utah bee-keepers' assembled at Salt Lake City, on Oct. 5, at 7 p. m. Pres. A. M. Musser in the chair.

Tooele county was represented by Secretary T. W. Lee, who said that in Tooele City they started with 65 colonies of bees this spring. Their increase had been 96 swarms, making a total of 161 colonies at this time in good condition for winter. The honey season had been fair this year. They had extracted 3,060 pounds of honey, and taken considerable comb honey. Swarming commenced on the 28th of May. Some of our bee-keepers allowed natural swarming, while others divided for increase. They had no foul brood. In Grantsville there was no organization, but would like a branch association there. They were pleased with the profitable enterprise and would try and give a better report next meeting.

Vice President Samuel McKay put into winter quarters 76 colonies of bees, in good condition, and, when the very late spring set in, he had only 15 colonies left and some of them in a very weak condition. He had nursed and cared for them this summer, and had them back nearly to their former number, having his hives well stocked with combs and honey, facilitating very much his increase, but he had not taken much honey this year. Some of his hives now had 90 lbs. of honey in them. From the best information he could gain, about 90 per cent. of the bees had died in Salt Lake county. The sudden changes of last winter and the late spring, he thought was the cause of so many losses. Mr. Murphy, of Mill Creek, had lost 100 colonies out of 107. Mr. Bailey also had lost nearly all of his bees at the same place. Mr. Woodruff lost his entire stock of over 20 colonies; also John and Edward Morgan, of Mill Creek, lost all of their colonies. W. A. O. Smoot, of Sugar House Ward, lost 40 colonies. The loss to Mr. Murphy alone would be, counting his colonies at \$12 each, \$1,200.

A question, by Secretary Lee, was asked: Could a September swarm of bees be successfully wintered if furnished with young brood and honey?

Edward Stevenson said that two years ago, late in September, he captured a stray swarm and gave them to one of his small boys. The night he

thived them was so frosty that a few straggling bees around the hive perished. Some young brood and honey was given them, and now there were 4 good colonies, and surplus this year.

Geo. Luff, of this city, had 17 colonies last fall, 10 this spring; 4 died during the late spring; has 9 now, and had taken 100 lbs. of honey this season.

Bishop Madson, said there were 20 colonies of bees in that place, all in good condition. The inspector of Manti had visited and pronounced their bees healthy. Did not know how much honey was taken.

Edward Stevenson, of this county, said his experience in the mortality of bees, during the past winter and spring, excelled any previous year, in this county, but he could not agree with Mr. McKay, of 90 per cent. being the average loss, but thought 50 per cent. would cover it. In East Mill Creek 5 colonies of his bees wintered on a plank close to the ground, the snow drifted against them and remained in that condition until late in the spring, and while other bees, exposed to the warm rays of the sun, would often fly out, and the cool air and snow on the ground caused them by thousands to chill and fall into the snow, thus depleting the colonies, so that the late spring and cool frosty nights either caused them to dwindle away so that they could not gather honey from fruit bloom, and entirely perished, as hundreds of colonies did, but those 5 colonies imprisoned, could not waste away, and, consequently, were strong, and able to gather supplies from fruit bloom and other blossoms. They increased to 15 this season. Some of them are in two-story hives, and now have 100 lbs. of honey each; 2 colonies have gathered 300 or 400 lbs of honey this season, from the five thus wintered.

Bishop Bills, of South Jordan, wintered quite a number of colonies of bees, surrounded by chaff, in long boxes, removing to tops of the hives, placing cloths over them, and then chaff, keeping them mouse-proof. So that the warm rays of the sun could not affect them until it was sufficiently warm for them to fly and return home again. He lost none during the winter.

Pres. Musser said that the bee industry should be interesting and kept alive. It paid a better per cent. than farming, and other industries, when intelligently managed. Honey has medicinal properties and is healthy, as well as a luxury. Thought it would be well to have blanks to be filled as reports from branch associations. Said some considered the smoke from the numerous smelters in this city detrimental to apiculturists.

E. Stevenson moved that a committee be appointed from this meeting to get up blanks to be sent to branch associations, to be filled up and returned, to facilitate general reports from the various counties of our Territory. The motion was carried. Edward Stevenson and Wm. Egan were appointed as that committee. The convention adjourned until next April 5th. Benediction by Mr. Thos. Lee. E. STEVENSON, Sec.

SELECTIONS FROM OUR LETTER BOX

The Sweet Clover Still in Bloom.—On Nov. 1st, 1881, I sent you a few sprigs of sweet clover. I now send you another bunch, picked in an open field to-day, it is just as sweet and fresh now as then. This clover has been in blossom continuously since about July 1, and the bees have visited it whenever the weather was favorable. The past season was a very good one, yet I fully believe that 10 acres of sweet clover would have been worth \$500 to me. I shall sow several acres next spring. I have been experimenting with a number of honey plants, for several years, but find nothing equal to sweet clover.

C. H. DIBBERN.

Milan, Ills., Nov. 1st, 1882.

[It is indeed of "sweet-smelling savor" and shows its value as a honey plant—blooming till long after the weather will allow the bees to fly.—ED.]

Cowardly Bees.—I have one colony of bees that will not defend themselves against invaders. They have a good queen, and are strong in numbers, with plenty of stores. I have tried everything I have read or heard of, to induce them to have more spirit, but all to no purpose. If I cannot find some effectual remedy soon, I shall resort to brimstone. Who can give me a prescription?

W. D. SMYSER.

Nineveh, Ind., Oct. 27, 1882.

One Hundred Pounds of Honey per Colony.—I am not able to make a complete report for the past season, for I have not taken off all my surplus honey yet; but enough to show that I shall obtain 100 lbs. to the colony, spring count. We have had the heaviest honey flow ever known in this section. I shall put into winter quarters about 40 colonies. I had 20 in the spring. I wish to build a "honey house" and shop, combined, in the spring, and would like for someone to give a good plan, dimensions, etc., in the AMERICAN BEE JOURNAL, at an early day.

W. H. GRAVES.

Duncan, Ill., Oct. 25, 1882.

Chilled Brood and Robbing.—I started, spring count, with 2 strong and 1 weak colonies, and bought of Mr. Robertson, of Pevamo, 1 fine colony and 4 tested queens. One of the queens died soon after being introduced, through a very cold spell which we had about the first of June; the other three queens did well. I only increased from 4 to 7, and from these I took only 70 lbs. of extracted honey, from frames having no brood. White clover was a poor crop; basswood gave nothing, on account of wet weather. In the early fall I had 5 strong and 2

good colonies, with plenty of stores, and had serious intentions of dividing 3 of them. I noticed the brood was not hatching out; it appeared chilled (no bad smell from it). I had one thickness of burlap over the frames, and at once put two and three thickness more on; still the brood did not hatch, though the weather was very fine and warm. Some of the young bees could only get their heads out, and then die. The bees, of course, commenced to dwindle; they had plenty of stores, on an average, on which to winter. I commenced feeding granulated sugar, 8 lbs. to 6 lbs. of water, in syrup, taking care while boiling not to scorch or burn. I fed from 12 to 20 lbs. per hive, as I thought they needed it. To cap all, while in Toronto, Sunday, Oct. 22, my bees commenced robbing and on Monday I had the remnants of 3 colonies. I put these together and now have a moderate one, with plenty of stores. Can you give me any idea of all this trouble, particularly the cause of the brood not hatching? I use frames 18x10x1. My hives are double, with 2 inches of a space all round, some of them packed with leaves.

S. G. HOLLEY.

New Hamburg, Ont., Oct. 57, 1882.

[Your colonies were evidently weak. From some cause or other there must have been a loss of old bees, until there were too few of them to take care of the brood, and so it became "chilled," resulting in still more weakening the colonies—no young bees to take the place of those dying from old age or other causes. Still more proof for this theory is found in the fact that they were unable to protect themselves from the robbers. Weak colonies are an easy prey, and very often such will incite the bees to excessive robbing.—ED.]

Peppermint to Prevent Stings.—Has any one used peppermint, rubbed on their hands, while handling bees? I have used it, and very rarely do I get stung. We now have a good spell of weather after the snow storm. Bees are out briskly. We have a plant that is called skunk weed, that bees even go miles to work upon, in the fall. It seems to grow best on our country roads. I do not know of but one plant growing in a garden in this city. I saw a few plants the other day, and bees were working on them, although they did not appear to have any honey about them. I will send you a sprig of them when I go out in the country again. I send you a report of the bee convention held in Salt Lake City, on the 5th inst.; 3,060 lbs. is not all the honey that should be reported from this city; two of our largest bee men did not report; 1,000 lbs. is the largest yield from one apiary. Thanks to Mr. Heddon for his article on the easy way of wintering bees, on page 659 of the AMERICAN BEE JOURNAL.

JOHN DUNN.

Tooele City, Utah, Oct. 26, 1882.

Bees in Clamps.—Please inform me, through the BEE JOURNAL, of the best method of storing bees in clamps. When should they be put into the clamps? When should they be taken out, in the spring? How would thaws affect them in clamps?

A SUBSCRIBER.

[Our subscriber will find his queries answered in Mr. Jones' article on Wintering Bees, found on pages 709 and 710 of this paper.—ED.]

Sweet Clover yet alive with Bees.—W. S. Bair, of Rollersville, O., gives such a good report in the BEE JOURNAL for Oct. 4th, of the success of his plan of tiering up with his large hive, that as I use a hive having the same size frames, I intend to give it a trial, with one hive, next spring. I would like him to tell whether the entrance in the upper as well as the lower hive is to be left open, also, if he waits till the honey season is over to extract from the lower story. Also, whether he finds brood in both stories or only in the upper one?

Do the roots of cleome, which has flowered this summer, live through the winter and grow up again next year? I am much pleased with it as a honey plant, though it does not continue in bloom as long as either melilot or mignonette, still it is very good, especially for Italian bees, which work on it from day light till dark all the time it is in bloom, which is for many weeks. Melilot and mignonette are still in full flower, and alive with bees every fine day, which is more than can be said for any other honey plants that I know of. H. F. BULLER.

Campbellford, Ont., Oct. 19, 1882.

[Cleome is a biennial, blooming the second year after being planted, and reseeds itself. It may be sown either broadcast or in drills; if the latter, let the drills be 30 inches apart, with plants about every six inches.—ED.]

Entrance regulating Bottom Board.—I send you, by to-day's mail, a rough model of the bottom board I use. It will show for itself, without explanation, further than that the hives will fit anywhere, top or bottom. You can give it to the readers of the BEE JOURNAL, if you think it worthy.

F. M. JOHNSON.

Greystone, Ct., Oct. 4, 1882.

[It is a loose, bottom board, with a portion cut out in front to regulate the entrance. Such an entrance-regulating bottom board has been illustrated several times in the BEE JOURNAL. It has some advantages, but there are many objections to using it, and we think the latter will more than counterbalance the former.—ED.]

Planting Basswood Trees.—The BEE JOURNAL makes a welcome visit to our home each Wednesday. I commenced this spring with one colony of bees, in a box hive, transferred them

to the Mitchell hive, and have increased to four good strong colonies, besides taking 80 lbs. of comb honey. My bees are blacks, and I have used no foundation. Can you inform me how to raise basswood trees from the seed? HERBERT LUTHER.

Lemont, Ill., Oct. 26, 1882.

[It is hardy and grows readily from the seed. I had been known to bloom and secrete honey in six years after planting. The seeds should be sown in drills, and cultivated for a year, and then should be transplanted, leaving them from 10 to 14 feet apart each way. Yearlings transplanted from the bottom lands are very desirable.—ED.]

Troublesome Mice.—Is it better to take off the tops of the bee hives during winter? I have cushions on, would the tops left on, with cushions, cause dampness? If the tops were left off, would wire screen on top of the frames, with cushion on top, do any harm? The wire sieve on is to exclude mice, when I leave off the top. I winter in bee hives.

GEO. KEMP.

[Yes; the tops should be taken off; wire cloth over the frames, to keep out mice, will do no harm.—ED.]

Will it pay to use Sections.—I commenced with 24 colonies last spring; increased to 48, by natural swarming. My bees are black bees. I took off 2,500 lbs. of comb honey in 3½ lb. boxes. I had not the means to obtain sections. I sold at home for 15 cents per pound. I am satisfied that I should do better if it had been in sections. Preparing the hives for sections will cost quite a little. I lost a good deal by tramps, say 70 lbs. Last year it amounted to 50 lbs. I thought of making a high board fence, eight feet high; would it hinder the bees from coming home with their loads of honey? I want to move my bees 20 rods. Had I better do it this fall or next spring? JOSEPH LEE.

Farmers', Mich.

[Certainly, it will pay to get honey in sections instead of the old-fashioned boxes, no matter what it may cost to alter over the hives. A board fence will be no particular detriment to the bees, if the apiary is not too contracted. You can move the bees now without materially injuring them, just as well as you could in the spring.—ED.]

Honey Crop for 1882.—Jack Frost closed the honey season with me on Sept. 21. My honey crop amounts to 3,077 lbs. from 20 colonies in the spring. I increased them, by natural swarming and dividing, to 40 colonies. They all have sufficient to winter on, of good capped honey. I have packed them on the summer stands. I sell all my honey in my home market—comb at 20 cents, and extracted at 15

cents. Young white clover never looked better at this time of the year.

R. M. OSBORN.

Kane, Ill., Oct. 27, 1882.

My first Experience.—I commenced this spring with eight black and two hybrid colonies of bees. In May I procured three dollar queens of Dr. Brown, of Georgia, which proved to be as good as any I want; one was a Cyprian and the other two Italians. They are in good condition for winter. I use the Langstroth hive.

Casey, Ill. D. R. ROSEBROUGH.

Sundry Questions.—My queen ceased laying Sept. 25, I presume on account of the cool weather. Upon examining the colony since placing it in winter quarters (which is a large box filled with sawdust) the queen has commenced laying anew and some of the brood is capped over. 1. Is it the increased warmth occasioned by the packing that causes that? 2. Is this late breeding desirable? The bees are bringing in a very little pollen, but scarcely any honey. I fed them honey comb Sept. 15 from another colony; 3. Will they consume this in breeding? 4. I have one comb of unsealed honey. Will this keep until spring or must I feed it now? 5. Will a full comb of pollen keep until spring? 6. Are bees attracted by cheese?

ROLLAND McDONALD.

Montreal, Canada, Oct. 18, 1882.

1. It is.
2. No; it is too late.
3. They will, if they need it.
4. You can extract it, if the bees do not require it.
5. Yes.
6. Not that we are aware of.—ED.]

Candied Honey.—How shall I get candied honey out of a barrel, to put it into cans? What tools are necessary to do it? F. MINNICH.

North Freedom, Wis., Nov. 2, 1882.

[The best way is to fill the pails while it is liquid and let it candy after being put into the pails. It can, however, be dug out with a strong hand scoop, or a wide knife, but it is a very slow and tedious job.—ED.]

☞ The Western Michigan Beekeepers' Association will meet at Supervisors' Hall, in the city of Grand Rapids, on Wednesday and Thursday, Nov. 29th and 30th, 1882. The co-operation of all bee-keepers of this section is desired.

WM. M. S. DODGE, Sec.

☞ The New York Weekly Tribune says in regard to the Noyes Dictionary Holder, manufactured by L. W. Noyes, 99 West Monroe St., Chicago: "We know of but one satisfactory Holder; that, however, is so good that a second is not needed." Mr. Noyes sends to all applicants a handsome illustrated circular. Prices reduced.

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about eight words; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole is paid in advance:

For 4 weeks.....	10	per cent. discount.
" 8 ".....	20	" "
" 13 " (3 months)....	30	" "
" 26 " (6 months)....	40	" "
" 39 " (9 months)....	50	" "
" 52 " (1 year).....	60	" "

Discount, for 1 year, in the MONTHLY alone, 25 per cent., 6 months, 10 per cent., 3 months, 5 per cent., if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent., 6 months, 20 per cent., 3 months, 10 per cent., if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,
925 West Madison Street., Chicago, Ill.

Special Notices.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Premiums.—Those who get up clubs for the Weekly BEE JOURNAL for one year, will be entitled to the following premiums. Their own subscription may count in the club:

For a Club of 2,—	" Bees and Honey," in paper.
" " 3,—	an Emerson Binder, or "Bees and Honey," in cloth.
" " 4,—	Apiary Register for 50 Colonies, or Cook's Manual, paper.
" " 5,—	Cook's Manual in cloth, or the Apiary Register for 100 Colonies
" " 6,—	Weekly Bee Journal for 1 year, or Apiary Register for 200 Col's.

Two subscribers for the Monthly will count the same as one for the Weekly, when getting up clubs for the above premiums.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to new Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$1.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....	\$1 00
" 100 colonies (220 pages).....	1 50
" 200 colonies (420 pages).....	2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

Kendall's Spavin Cure is used from the Atlantic to the Pacific coast.

CLUBBING LIST.

We supply the American Bee Journal and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	<i>Publishers' Price.</i>	<i>Club</i>
The Weekly Bee Journal.....	\$2 00..	
and Gleanings in Bee-Culture (A.I. Root) 3 00..	2 75	
Bee-Keepers' Magazine (A.J. King) 3 00..	2 60	
Bee-Keepers' Exchange (Honk & Peet) 3 00..	2 80	
Bee-Keepers' Guide (A.G. Hill).....	2 50..	2 35
Kansas Bee-Keeper.....	2 60..	2 40
The 6 above-named papers.....	6 00..	5 50

The Weekly Bee Journal one year and Prof. Cook's Manual (bound in cloth) 3 25..	3 00
Bees and Honey, (T. G. Newman).....	2 75..
Binder for Weekly, 1881.....	2 85..
Binder for Weekly for 1882.....	2 75..
The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.	

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., November 8, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour :

Quotations of Cash Buyers.

CHICAGO.

HONEY—The supply of extracted honey is fully up to the demand. My quotations are : 6½c. for dark and 9c. for light, delivered here.
BEESWAX—It is quite scarce. 1 am paying 27c. for good yellow wax, on arrival ; dark and off color, 17@22c.

AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@20c. on arrival ; extracted, 7@10c. **BEESWAX**—Firm at 20@25c. per lb.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand increases with the cool weather, but not sufficiently fast to keep pace with receipts, which now accumulate, as it is time to get the surplus into market. Prices remain unchanged with perhaps a tendency downward, owing to many consignors desiring to realize quickly.

We quote : white comb, in small sections, 18@20c. Fine, well-filled, 1 lb. sections bring the outside price. Dark comb honey, little demand, 15@16c. Light honey, in larger boxes, 12@16c. Extracted—white clover, 9½@10c.; dark, 8@9c., in barrels and half-barrels. Eggs will bring but a small advance, if any, above half-barrels.

BEESWAX—Very scarce. Choice Yellow, 30c.; dark to fair, 20@24c.

R. A. BURNETT, 165 South Water St.

SAN FRANCISCO.

HONEY—Market is quiet, and for strictly choice prices are firm. Medium and dark qualities are not in special request. For a lot of fair comb, unbroken, 13c. is the best offer made, 15c. asked.

White comb, 18@20c.; dark to good, 12@15c.; extracted, choice to extra white, 9@10c.; dark and candied, 7½@8½c.

BEESWAX—We quote 25@27½c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and slow. We quote, in lots, comb at 15@18c.; strained at 6@7c.; extracted at 9@10c.

BEESWAX—Prime bright quotable at 27c.
R. C. GREER & Co., 117 N. Main Street.

CLEVELAND.

HONEY—In sections, has been in extraordinary demand this week, at full prices. Sales have been quite up to receipts, and all lots except recent arrivals were closed out. One pound sections of best white sells for 21@22c. per pound, in attractive packages. Same quality, in less attractive shape, 20@21c. In 1½ @ 2 lb. sections, best quality, 19@20c. Second grade sells about 16@22 cents ½ lb. less. Buckwheat is unsalable. Extracted, in small packages, pails and tin cans sells pretty well at 14@15c.; but extracted, in barrels, is very dull at 10@11c.

BEESWAX—Prime quality, 25@28c.
A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HONEY—There is a fair supply of honey scattered around, but the movement is as yet rather moderate, though prices held steady, with fancy white clover in boxes occasionally exceeding quotations slightly.

We quote : White clover, fancy, small boxes, 19 @20c.; white clover, fair to good, 16@18c. Buckwheat, 13@16c.

BEESWAX—There is only a moderate demand for wax, but the supply is ample and generally under control, and held firmly at 29@31c., according to quality.

Western, pure, 29@30c.; Southern, pure, 30@31c.
D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Sells very readily in 1 lb. sections at 22@25c. For best white, and 20@22c. for 1½ to 2 lb. Boxes containing ½ pound, 30 c. per pound.

Extracted is selling very slowly at 12@14c.
BEESWAX—25@26c.
CROCKER & BLAKE, 57 Chatham Street.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Every lady should send 25 cents to Strawbridge & Clothier, Philadelphia, and receive their *Fashion Quarterly* for six months. 1,000 illustrations and four pages new music each issue.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

IMPORTANT TO BEE-KEEPERS!

TWENTY-THREE years' experience in rearing queen bees. The cheapest, easiest and best way to raise queens. Never before published. Something new. Send for Circular.
44w2t HENRY ALLEY, Wenham, Mass.

LANGSTROTH AND SIMPLICITY
L. CHAFF HIVES, with movable upper story, section boxes, metal-cornered brood frames, wide Langstroth frames and comb foundation. Send for Price List.
A. B. MILLER & SON,
44wtf Wakarusa, Elkhart Co., Ind.

LIVE BEE-KEEPERS WANTED,

to introduce the new line cushion, the only protection yet discovered that will carry the bees safely through winter and spring without fail. Send \$50, for right to retail this cushion in your county, or send \$5 for one apitary right to patentee.
F. DELLA TORRE,
Reisterstown, Baltimore co., Md.
Remit by registered letter or P. O. order.
Patented April 25, 1882. No. 254,932. 45w13t

FRANCES DUNHAM,
Inventor and Sole Manufacturer of
THE DUNHAM

FOUNDATION MACHINE.

Patented Aug. 23d, 1881.

Send for New Circular for January, 1882.

CAUTION.

Having obtained LETTERS PATENT Number 248,639 for Dunham Foundation Machine, making comb foundation with base of cells of natural shape, and side-walls brought up to form an even surface; also on the foundation made on said machine, I hereby give notice to all parties infringing my rights, either by manufacturing said machines or foundation, as well as to all parties purchasing machines as above, other than my manufacture, that I am prepared to protect my rights, and shall prosecute all infringements to the full extent of the law.
FRANCES A. DUNHAM,
23m4t DePere, Wis.

MUNN & CO PATENTS
NEW YORK
ESTABLISHED 1846

We continue to act as solicitors for patents, caveats, trade-marks, copyrights, etc., for the United States, and to obtain patents in Canada, England, France, Germany, and all other countries.

Thirty-six years' practice. No charge for examination of models or drawings. Advice by mail free.

Patents obtained through us are noticed in the SCIENTIFIC AMERICAN, which has the largest circulation, and is the most influential newspaper of its kind published in the world. The advantages of such a notice every patentee understands.

This large and splendidly illustrated newspaper is published WEEKLY at \$3.20 a year, and is admitted to be the best paper devoted to science, mechanics, inventions, engineering works, and other departments of industrial progress, published in any country. Single copies by mail, 10 cents. Sold by all news-dealers.

Address, Munn & Co., publishers of Scientific American, 261 Broadway, New York.
Handbook about patents mailed free.

New Kegs FOR HONEY.

In order to satisfy the demand for small packages for Extracted Honey, I have heretofore procured kegs intended for syrup, fish, lard, etc., and in view of this growing trade, I now feel justified in having made to order a **Special Keg**

Designed Expressly for Honey.

These I am obliged to buy in large quantities in order to supply them at popular prices, and procure a package not used for any other purpose. They are made of Norway Pine, and have from 7 to 9 chine hoops on each end.

I have tested a sample keg by filling it DRY with white clover honey, and without the heads being painted.

It neither leaks nor flavors the Honey.

It is not necessary to paint the heads, but when painted I will guarantee them not to leak, and if well sealed, the pine will not flavor the honey.

Capacity, 175 pounds. Price, 80c. each. The 5 and 10 gallon kegs will be sold, as heretofore, at 40c. and 55c. each, respectively.

ALFRED H. NEWMAN,

DARWINISM with its theory of the evolution of man from the animals and his extinction at death overthrown. A personal God and an eternal existence for man proven by science. Idolatry and Materialism dethroned. The Wave theory of Sound, taught in colleges and high schools for 2,000 years, proven to be a stupendous scientific fallacy. Revolutionary in a scientific and the most remarkable book of this or any other age. Royal Octavo, 528 double column pages, handsomely bound and containing very superior likenesses of the great scientists of the age. Darwin, Huxley, Hensholt, Mayer, Tyndal and Huxkel, \$2, by mail, postpaid. Local and Travelling Agents Wanted. Circulars, with table of contents and "opinions of the press," and of Clergymen, Professors in Colleges, etc., free to all.

SHELL & CO., 52 Broadway, N. Y.

BEESWAX.

BAKER & CO.
DESIGNERS AND
ENGRAVERS IN WOOD
CORNER OF
CLARK & MONROE STS.
CHICAGO.
Foot Block. DEALERS IN
ENGRAVERS TOOLS & SUPPLIES.

Florida Land--640 Acres CHEAP FOR CASH.

DESCRIPTION.—Sec. 4, township 7, south range 7 west, Franklin county, Florida, situated about 50 miles south of the Georgia line, 25 miles west of the city of Tallahassee, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a seaport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loam, covered with timber.

It was conveyed on Dec. 31st, 1875, by Col. Alexander McDonald, who owned 6 sections, including the above, to J. M. Murphy, for \$3,200, and on Sept. 5th, 1877, by him conveyed to the undersigned for \$3,000. The title is perfect, and it is unnumbered, as shown by an abstract from the Records of the county, duly attested by the County Clerk; the taxes are all paid and the receipts are in my possession.

I will sell the above at a bargain for cash, or trade for a small farm, or other desirable property. An offer for it is respectfully solicited. Address,

THOMAS G. NEWMAN,

A NEW BEE BOOK!

Bees & Honey

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN.

Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Engle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

The Bee-Keeper's Guide; OR, MANUAL OF THE APIARY,

By **A. J. COOK,**

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—*L'Apiculteur, Paris.*

I think Cook's Manual is the best of our American works.—**LEWIS T. COLBY.**

It appears to have cut the ground from under future book-makers.—*British Bee Journal.*

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—**J. P. WEST.**

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—**E. H. WYNKOOP.**

This book is just what everyone interested in bees ought to have, and which, to one who obtains it, will ever regret having purchased.—*Mich. Bee.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald, Monticello, Ill.*

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—**A. E. WENZEL.**

My success has been so great as to almost astound myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—**W. L. VAN ANTWERP, M. D.**

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record.*

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—**L'ABBE DU BOIS,** editor of the *Bulletin D'Apiculture, France.*

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat, Pulaski, N. Y.*

We have perused with great pleasure this *mode mecum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To him taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist, Quebec.*

This book is pronounced by the press and leading manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor.*

PRICE—Bound in cloth, \$1.25; in paper cover, \$1.00. by mail prepaid. Published by

THOMAS G. NEWMAN,
West Madison Street, CHICAGO, ILL.

EXCELSIOR HONEY EXTRACTORS.

In answer to frequent inquiries for Extractors carrying 3 and 4 Langstroth frames, I have concluded to adopt these two new sizes. The 3 frame basket is in a can of the same size and style as the 2 frame. The 4 frame basket is in the larger can, with the cone or metal standard for the basket to revolve upon, leaving room underneath the basket for 75 or 80 lbs. of honey. It will be complete, with covers, and in every way identical, except in size, with the \$16.00 Extractor, 13x20, which is intended for any size of frame.

Excepting with the \$8.00 Extractors, all the different styles have casters over the cans leading to the honey gate, and movable sides in the Comb Baskets. The \$8.00 and \$10.00 Extractors have no covers.

For 2 American frames, 13x13 inches.....	\$8 00
For 2 Langstroth " 10x18 "	8 00
For 3 " " 10x18 "	10 00
For 4 " " 10x18 "	14 00
For 2 frames of any size, 13x20 "	12 00
For 3 " " 12 1/2 x 20 "	12 00
For 4 " " 13x20 "	16 00

EARS FOR THE MILLION!

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carcharodon Rondeletii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so exceedingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthy noises in my head, and hear much better.

I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

OLDEST BEE PAPER IN AMERICA

THE AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

DEVOTED EXCLUSIVELY TO PROGRESSIVE BEE CULTURE.

Vol. XVIII. Chicago, Ill., November 15, 1882. No. 46.

Published every Wednesday by
THOMAS C. NEWMAN,
 EDITOR AND PROPRIETOR,
 925 WEST MADISON ST., CHICAGO, ILL.
 At \$2.00 a Year, in Advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

The Coming Winter.

We are all very much interested in the question now so often asked, viz.: "What is to be the general character of the ensuing five winter months?" An exchange very truthfully remarks that whether the comet is causing us trouble or not, certain it is that this planet of ours is very much disturbed of late. Our own cyclone period had scarcely subsided in the West when the eastern States were visited with wind storms and flooded with heavy rains. Then the weather took a jump to the Phillipine Islands, where 60,000 persons were rendered homeless in less than an hour; then another jump to Cuba. Now, the Spanish dominions are again visited, this time by a gale on the southern coast, which has done much damage to shipping and caused the death of several fishermen. In England, the inundations of the Thames valley have flooded the suburbs of many towns, impeded traffic and done immense damage to property. In France the river Seine is rapidly rising. Floods have stopped traffic between Marseilles and Cannes on the Mediterranean, and the Austrian empire is also to be counted a severe sufferer from these convulsions of nature.

On another page we have quoted the weather predictions of Mr. R. Mansill, of Rock Island, Ill., as given by him in his "Perhelia Crisis," a new work on meteorology, which will be read with interest.

According to Mansill, the winter will be an unusually mild one, but the spring will be backward and cold. June will open the summer with fine

weather, but from July to September it will be cold, below the average temperature. These predictions are given for what they are worth, but should serve to warn bee-keepers generally to prevent the spring dwindling of bees, by their careful and wise protection, and be ready with populous colonies for the honey-flow in June; then, whether they get much more or not, they will be sure of so much honey, and can cheerfully take the risk for the future.

Up to the present time the weather generally has been warm, with but little wind or anything to indicate winter, while by this time, two years ago, everything was frozen up, and winter had come in good earnest.

Instincts of Bees.—At a meeting of the British Bee-Keepers' Association, held at London, Oct. 18, 1882, after the routine business, Mr. G. D. Haviland read an interesting paper on "The Social Instincts of Bees: Their Origin by Natural Selection." Mr. Haviland treated his subject in a masterly manner, and was heartily applauded at its close. There was a large attendance of members, including several ladies. The Rev. F. T. Scott presided. The Honorary Secretary announced that Sir John Lubbock would have taken the chair on this occasion, but a prior engagement prevented him from doing so.

Mr. C. H. Lake has sent us a photographic view of his bee tent, used at the various Bee and Honey Shows during the past summer. We have given it a place in the BEE JOURNAL Album.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

Statistical Information—Suggestions.

In reference to the committee appointed by the late meeting of the North American Bee-Keepers' Association, at Cincinnati, O., we have received the following letter from ex-President Cook, being a duplicate of one he has sent to the New Jersey State Bee-Keepers' Association :

At the recent very interesting meeting of the North American Bee-Keepers' Society, there was a very full discussion of the importance of more full and accurate statistics of the present condition of Apiculture in the United States, both as to the number of colonies of bees and the honey product. It was thought that nothing would so aid our art as such information. The magnitude of the business once known, and it would be better appreciated as one of the important industries of the country. As a result of the discussion, a committee was appointed to take the subject into consideration, and act, if possible, so as to accomplish the result.

The committee were: Messrs. C. C. Miller, T. G. Newman and A. I. Root. All of the money in the treasury of the Society was pledged to the accomplishment of this result.

Of course no one will fail to recognize the value of such statistics; but the possibility of gathering them is a question of reasonable doubt. I have thought of a plan which I believe may be made practicable; I wish to suggest it for discussion, in hope that it may be improved, or a better plan suggested.

The plan is that the Committee prepare blanks, suggesting the desirable facts, and that these be sent to an enterprising bee-keeper in every town or county of the United States, upon application, and that said person see that the supervisor of his town or the supervisors of his county have these blanks, and that said supervisor be pledged to get the desired facts as he takes the assessments. It would seem that there must be such a bee-keeper in every county, if not in every township. These could be reached through the bee periodicals and other journals. These blanks, when once filled, could be gathered by the same bee-keeper, and sent to the committee. I have already asked several supervisors in this State of the practicability of this scheme, and all report favorably. It seems to me the information could be made more correct and be secured more cheaply in this way than in any other. In fact, I can see no other way to compass it. I hope that the matter will be thoroughly discussed by you, and that we shall get some practical results as the outcome of your deliberations.

A. J. COOK.

We cheerfully give place to the above suggestion of Prof. A. J. Cook, and, by the time the committee shall assemble, organize and prepare to act, the members will, no doubt, have given them due consideration, and be

then and there enabled to decide upon a plan of operation—if they undertake this work.

Incidentally, we will remark that we do not think that "supervisors" (more generally called "assessors"), will take any trouble to get the "desired facts," unless they are well paid for it. Our experience with such men gives us no confidence either to ask or expect anything of them above or beyond the regular routine of their duties. There are some who would be obliging enough to do it—but we fear the great majority would either absolutely refuse to do so, or else lightly promise, with the intention of forgetting to fulfill their promise, "made just to get rid of it," or, in some other way, fail to obtain the desired information.

Unless the bee-keepers, individually, can be enlisted in the work, and for the sake of benefitting themselves and aiding the honey markets generally throughout the country, we fear it will be a failure.

We rather prefer the plan suggested by Mr. J. S. Terrill, P. M., of Ridgeville, O., at the National Convention, which is described thus by the Secretary of the Convention: "He mailed postal cards to every post office in the county, asking the postmaster to write on it the names of the bee-men at his office. The cards were all addressed to himself, so the postmaster had nothing to do but to put it on in pencil, and drop the card in the mail. Now, by mailing similar cards to all the bee-men, with a printed request, and blanks to fill out, he got almost a correct report of all the bees in Lorain county, and of the honey raised. This list of names he considers worth all their cost, for calling a convention or any other purpose pertaining to the industry."

The Vice Presidents of each State could appoint some bee-keeper in each county to act, in the way that Mr. Terrill did, and thus obtain, with some degree of absolute certainty, the desired information. This he could transmit to the State Vice President, and he to the Chairman of the Committee on Statistics, to be tabulated and published. But the great drawback to all this is the cost. Perhaps no one has even thought of that; we have, however, made a careful estimate of the cost of postal cards, envelopes, circulars, etc., and at the least calculation, such alone will cost \$4,000, even if the labor of the committee be given to the cause.

Prof. Cook remarks that "all of the money in the treasury of the Society was pledged to the accomplishment of this result." That amount is, we think, less than \$150—where is the small balance of \$3,850 to come from? Is it expected that the committee shall make up the small deficiency? As it is only about \$1,300 for each member of the committee, for the honor, work and abuse combined, we presume they will, cheerfully—"go home and think about it?"

Bees and Honey at Virginia State Fair.—We notice by the Richmond, Va., papers that there was a very creditable display of bees and honey at the Virginia State Fair. The daily papers at Richmond contained the following notices of it on Nov. 3, 1882:

The exhibit of the Sunny Side Apiary, of Baltimore, deserves more than what the newspapers have said about it. Mr. C. H. Lake is the manager, and was very busy yesterday showing the workings of his new hives, which are considered by bee keepers to be the best made. Mr. Lake exhibited Cyprian, Holy Land or Syrian, and the two species of Italian bees. From one colony 220 pounds of honey was obtained in six weeks.—*Daily Whig*.

One of the attractions at the Fair is the exhibition of Mr. Charles H. Lake, manager of the Sunny Side Apiary at Baltimore, Md. This gentleman has a large tent, under which he shows a case of over two hundred pounds of honey made from one hive; has several colonies of Italian bees, one of Cyprian bees, and also other foreign bees. Every appliance used in this business is shown by Mr. Lake. He is running seven hundred hives this season.—*Daily Dispatch*.

☞ We have received, from the publishers, a copy of Edwin Alden & Bro.'s American Newspaper Catalogue, including lists of newspapers and magazines published in the United States and the Canadas; together with the population of the Cities, Towns, Counties and States in which they are published, and many other items of interest. It is a large volume of over 700 pages, and is nicely bound in cloth. There are in America 2,945 counties in which papers are published—and the whole number of papers published is stated in this catalogue to be 12,158. It is a very useful book. It is published by Edwin Alden & Bro., Cincinnati and New York.

☞ New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

Weather Predictions for 1883.

Mr. Richard Mansill, of Rock Island, Ill., has published a work called the "Perihelia Crisis." In it we find the following concerning the weather from now until the end of next year. Concerning December, he remarks as follows:

The world must expect to hear of considerable wild earth disturbances from about the 6th to the 14th of December of this year, 1882, or at about the time of Venus' transit, Dec. 6. At its transit, Dec. 8, 1874, there occurred a great storm on the Baltic sea, that made a thousand people homeless; many vessels and lives were lost on the British coast on the 9th; a severe earthquake occurred at New York and along the Hudson on the 10th, and coinciding with these occurred the breaking out of the volcanic ash showers of Iceland.

He gives the following predictions for each month of the next year:

January—the temperature is likely to average above the mean of the season during January, both in Europe and in the United States—or between latitudes 35 and 37 degrees north latitude in the United States and parts of Canada, and between latitudes 35 and 55 degrees north latitude in Europe. There may be sharp depression of temperature between the 9th and 12th, and between the 22d and 24th, together with storms, and again about the 29th.

February—The temperature of February is also likely to average a little above the mean of the season—with sharp depressions, perhaps below the mean, from the 16th to the 12th, and from the 20th to the 25th, accompanied with severe snow storms in the more northern districts, and heavy rains and some lightning in southern sections.

March—The temperature of March is not expected to average above the mean of the season, neither is it likely to be an unusually stormy month. It will not probably run to great extremes of temperature, either of elevations or depressions. It may be somewhat stormy from the 8th to the 12th, and from about the 22d to the 25th.

April—The temperature of April will probably average below the mean of the season. It will also be a more stormy month than March, with elevations and depressions of temperature greater than those of March, for the season.

May—The temperature for May will probably average below the mean of the season. It is not expected to be quite as stormy a month as April.

June—The temperature of the first half of June will probably average about the mean of the season, and the last ten days below, with strong storms between the 4th and 9th.

July—The temperature for July will probably average considerably below the mean of the season, both in Europe and the United States. In fact, July is expected to be the cold, stormy

month for the season of 1883, as that of May, 1882, was (as pointed out by this theory) for that year.

August—The temperature is also likely to average below the mean of the season during August, but perhaps it will not be quite so stormy as July.

September—The temperature for September will probably average a little below the mean of the season in the United States and Europe, though the temperature should begin to improve toward the latter part of this month. There should not be an excess of storms during this period.

October—The temperature for October will likely average a little above the mean of the season. The month will be somewhat stormy, or more so than September.

November—The temperature will likely average above the mean of the season during November, in the United States and Europe. The month will have a full average of storms, but not perhaps quite as many as October.

December—The temperature for December is likely to average considerable above the mean of the season in the United States and Europe. In fact, it is likely to be a pleasant winter month, with less than an average of severe storms.

We will probably have this year, (1882) a warm autumn and mild winter, on the average, continuing up to the 1st of January.

From the above monthly statements or forecasts of the weather temperature of the year 1883, it may be said that we are expecting to experience a moderately mild winter (1882-3), followed after March by a long, cool spring and summer again during 1883—while from this prospect it may be inferred that a mild winter north and south brings about a sort of an unusually early spring in southern latitudes, or latitudes lying between 33 and 38 degrees in the United States.

Swarming vs. Dividing.

Very often we have enquiries, asking our advice as to whether it will pay better to divide, for increase, than to trust to natural swarming; we, invariably, answer by saying that it saves time and money, and gives more pleasure and profit to the bee-keeper to divide for increase. We have just noticed the experience of Mr. W. W. Dunham, of North Paris, Me., as given in *Home Farm*, and append it, to illustrate in a practical way, the points of pleasure and profit. He says:

On July 11, my first swarm came off, at about seven o'clock in the morning, and as it was so early in the day, it was by the merest chance that we discovered them. It was a nice large swarm and I was on hand with all the pride of a young bee-keeper, to hive them, but after circling around in the

air for some time they arose up over my house and started off. I did not feel like giving them up in that quiet manner and started after them. I had two men at work for me who also started in pursuit. We soon got left behind but we kept on in the direction they had taken, as near as we could through fields, pastures, meadows of stout, wet grass, through brooks, bushes, brush and mud until we came to a large piece of woods, certainly a mile and a half from home. We then separated and began to hunt for the bees, and after hunting a long time one of the men heard them up overhead, and we at last discovered them clustered out on a limb of a rock maple tree about fifty feet from the ground. I then returned home and got a line, saw, rope, etc., and prepared to hive my bees. One man climbed the tree with the rope, passed it around the limb the bees were on, and up through another crotched one, dropping the end down to the ground. I then took hold of the rope while he sawed the limb off and steadied it down as I lowered away on the rope, and to my gratification we soon had them in the hive, where I let them remain until evening when I took a hand with me and went after them, bringing them home lashed between two poles.

Now, I just saved my swarm of bees, but after spending three half days work, besides part of the night, I concluded that it was rather an expensive way of swarming bees and that another year I would control the swarming myself. I had two more natural swarms come off, which I hived without any trouble, after which my bees quit swarming for the season. My bees gathered a good lot of honey and were very strong in bees, so I thought I would do a little swarming and dividing myself, and from the seven hives that I then had, I made four more.

Subscription Credits.—After sending subscriptions to this office, we would respectfully ask every one to look at the label on the wrapper of the next two papers, and there they will find the credit indicated thus: Those who have paid for the first six months of next year will find "June 83" after their names. Those who have paid for the whole year will find "Dec. 83" on their papers. The credit runs to the end of the month indicated. If the mark is "Dec. 82," it means that the subscription is paid until the end of the present year. Please remember that the credit given on this label is a sufficient notification of subscriptions due and receipt for payments made. If not so indicated within two weeks after sending money to us, you may be sure something is wrong, and should write to us about it. It will save annoyance and trouble if our subscribers will give this matter due attention.

New Premiums for 1883.

As the season for reading has now arrived, we hope that each of our subscribers will endeavor to send at least one new subscriber for the Weekly BEE JOURNAL for 1883 and thus not only help on the cause of progressive bee-culture, but assist in sustaining the only Weekly bee paper in the world.

Providence has smiled on the bee-keepers during the past season, and as a general thing they are abundantly able to procure a good assortment of bee-literature.

In order to encourage every one who keeps bees, be they few or many colonies, to thoroughly read the many very interesting books on bee-culture, now published, we have determined to make liberal offers, which will be available until January 1, 1883, as follows:

To any one sending us \$8 for any books they may select from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for one year.

To any one purchasing \$4 worth of books, selected from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for six months or the Monthly for one year.

Any one sending us a club of two subscribers for 1883, for the Weekly, with \$4, will be entitled to a copy of Bees and Honey, in cloth, postpaid.

For three subscribers, with \$6, we will send Cook's Manual, in paper, Emerson's Binder for the Weekly, or Apiary Register for 50 colonies.

For four subscribers, with \$8, we will send Cook's Manual in cloth, or Apiary Register for 100 colonies.

For five subscribers, with \$10, we will send the Apiary Register for 200 colonies, Quinby's New Bee-Keeping, Root's A B C of Bee Culture, or an extra copy of the Weekly BEE JOURNAL for one year.

To get any of the above premiums for the Monthly BEE JOURNAL send double the number of subscribers, and the same amount of money.

☞ We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

MISCELLANEOUS.

Strained vs. Extracted Honey.—The Cincinnati *Gazette* makes the following comparative statement, showing the difference between extracted and strained honey:

Before the invention of honey extractors, the so-called Cuban honey flooded our markets. It was produced wild in the trees of the West India Islands, and with larvæ in different stages of development, and bee bread and other impurities mashed into a promiscuous mess, and thus shipped to New York and Boston. Druggists then pretended to cleanse and clarify it, but it was not always done, and besides, it was almost impossible to make it a palatable article, or fit for the use of the sick. Now a much finer article is used, even for manufacturing purposes.

Bakers, tobaccoists, meat curers, druggists, compounders of liquors, and other manufacturers, use honey extensively, though they do not require for their purposes the choicest of all brands, the white clover honey, but instead the linden, buckwheat, or poplar honey.

The white clover honey is confined to table use and medical purposes. Jacob Vogel, pork packer in this city, buys a barrel of honey every other week from Mr. Muth for curing hams.

Honey Production in Pennsylvania.

—The Germantown, Pa., *Telegraph* gives the following on honey-production in Pennsylvania:

Some thirty or forty years ago there was much more honey produced in eastern Pennsylvania, and especially in the counties contiguous to Philadelphia, than there is at the present time, and we may ask why less attention is bestowed upon this really important branch of farm industry now, than before. It cannot be on account of the price obtained, for that is higher now than we believe at any former period. One person, who abandoned the business, said that the bees gathered less honey than formerly, in consequence of the scarcity of clover fields and other seeding resorts of the bees; but this can hardly be, as while it is an undecided question that the cultivation of clover has fallen off, the increase of other bee pastures has clearly taken place. Take for instance the marked increase of flowers in the garden of every farmer, as well as the increase of vegetable crops, many of which put forth immense quantities of blooms. There are many of the cultivated trees also that flower enormously, and far more than make up for all the other losses combined. We rather think that the extra care that bee culture requires, over any other

business, to produce the same amount of income, is the cause of its decline. The honey culture, in fact, is a science, and should inspire in those who pursue it, a love for it outside of the profit account, and in this case, the enjoyment which it imparts, must be considered as a part, and a very desirable part, of the returns.

The improved hives, which have taken the place of the old, cumbersome ones, that were so awkward in handling and failed to yield an equal supply of honey, when compared to these remodeled ones, make the care of bee-keeping much easier and pleasanter. The small sections of honey make the article much more salable than formerly, though they require careful handling. Altogether, with due care and a proper management of this beautiful and interesting branch of domestic industry, the apiary should be found upon a dozen farms, where it is now found only upon one.

Systematic Labor will Win.—The Valparaiso, Ind., *Vidette*, of Oct. 26, 1882, contains the following notice of a visit of its correspondent to the apiary of Mr. T. S. Bull:

Those who pay the closest attention to their home interests, meet with surest success. System and sufficient labor causes the poorest land in our county to produce and amply repay all pains. It was our pleasant opportunity to call on an old resident, Mr. Theodore S. Bull, not long since. Mr. Bull showed us through his cellars, which are arranged in separate apartments; one expressly for bees, accommodating nearly 200 colonies, in such manner that any temperature can be maintained. The next is a very large room, arranged for milk and butter, with a refrigerating cupboard where all kinds of eatables can be kept in perfect condition. Such a room as this is much to the convenience of a house wife, and the comfort of a family. The next room was arranged for vegetables, easy of access and well ventilated. These cellars are probably the best in the country.

We were next conducted through the bee house—consisting of two apartments—a work room and a store room. Mr. Bull manufactures his hives, boxes for honey, racks, and everything needed in this line; also comb foundation to use in hives and boxes, thereby saving much time and labor for his bees. His honey extractor is a modern invention, so that his bees can fill the same comb several times. He then invited us, if we were not afraid, into his apiary, which was really a sight, consisting of about one hundred and eighty colonies, which were the largest and strongest we ever saw. He quietly gave each a few puffs or smoke, and then showed us the different queens and explained their habits, handling them as if they were flies.

☞ Articles for publication must be written on a separate piece of paper from items of business.

For the American Bee Journal.

How and Why I Clip Queen's Wings.

G. M. DOOLITTLE.

While writing my series of articles, I mentioned having my queens' wings clipped, in connection with natural swarming. At that time, I was requested by several to tell how I clipped the queens' wings, and why I did so, which I will now try to do.

The first thing to be done is to find the queen. This is quite easily accomplished at any time during the first rush for pollen or early honey in the spring, for, at this time, the major part of the bees are old, or field bees. Hence, during the middle of fine days but few bees are at home to hinder our seeing the queen; the rest being busy bringing in the first forage. I take advantage of this fact, and make sure that all queens are clipped, the knowledge of which makes me feel sure that no swarm can steal a march on me and get to the woods.

Before starting for the apiary, we want a pocket knife, the blade of which should be as sharp as possible; then we are ready for finding the queen. Having found her, I hold the frame in my right hand, and with the thumb and fore finger of my left hand, carefully lift her from the comb, by taking hold of her wings. Now put down the frame and hold the queen within two inches of the tops of the frames in the hive. Take the knife and carefully draw it across the wings till the queen drops, and the work is done.

There is no danger of cutting yourself, for the knife will not cut your finger till the queen's wings are off, and as soon as she drops you will stop cutting, of course. I generally cut all the wings I get between my thumb and finger, if it takes *all* the wings, for the reason that a queen without wings is much more easily found. If she can't fly with a part of one wing off she may as well have all off, for wings were created for the purpose of flying.

Now I come to why I clip them. The third year I kept bees, about two o'clock in the afternoon, a large nice swarm came out which was hived. At four o'clock they were busily at work and continued thus the remainder of the day. The next morning I was called from home till nine o'clock, and upon going to the apiary to look for father's swarms, I saw that scarcely a bee was to be seen about this new hive. I at once opened it and found it deserted, except a few bees which had returned from the field after the swarm had left. During the night several pieces of comb had been built and the queen had laid a few eggs therein. I was very much disappointed and vexed at the loss of my swarm, and vowed then and there that this one should be the last which

should leave in that way, which has proved true. I at once clipped all my queens' wings, and soon found that I had not only made sure that no bees could go to the woods, but I also had made a saving as regards the trouble of hiving swarms; for before, I often had to climb tall trees to get swarms, or what was still worse, bother half an hour or more, trying to get a swarm out of the forks of a tree or off the body of the same.

Now, all I had to do when a swarm issued, was to go, with a wire cloth queen cage in my hand, to the front of the hive casting a swarm, and when the queen came out let her run into the cage, into which she was fastened. Then the hive was moved to a new location, and a new hive, all ready for the bees, was put in place of the old one. Missing the queen, the bees would soon return, when the queen was liberated and all entered the hive or hived themselves, as it were. No climbing of trees, cutting off limbs, or lugging a cumbersome swarming box about, was necessary. If, for any reason, I wished to have the swarm stay out awhile, I would hang the cage containing the queen, with the alighting swarm, and thus hold them until I was ready for them. If I did not wish to cut off the limb when I was ready to hive them, the changing of hives was done as before, the queen taken from the cluster, and soon the bees would return.

Again, when two or more swarms came out together, by having the queens back in cages, they could be made to go back to the place they came from, by a little trouble being taken to spread a sheet over the hive likely to receive the most bees. As the hives were changed while they were out, each swarm was secured where I wished them.

In one case I had as high as eight or ten swarms out all together, and one of the queens was placed with them till I could get the eight hives changed; when I shook all into a large basket and put them into the different hives till I had an equal amount of bees in each hive.

In all cases I have observed, a part of the bees, upon returning, will find the queen and cluster upon her, if no one is present to cage her when the swarm issues; so there is little danger of losing a queen. If I am called away from home during swarming time, and if Mrs. D. is absent also; when I return I go through the yard, looking about, and, if any colony has swarmed, I readily find this little cluster of bees with the queen. Now, to find where she belongs and which one has swarmed, take the queen, after caging her, and put her where the bees cannot find her, when they will soon return to the hive from which they issued, thus showing where the queen belongs.

Much has been said about the fountain pump to keep bees from decamping. The reader will readily see that the clipping of queens' wings does away with that expense. If you wish to use a fountain pump for other purposes, it might pay for such, but the clipping of queens' wings is a more

effectual preventive to keep the bees from going to the woods. Other reasons might be given why I clip the queens' wings, but the above are the most of them. I will say that I would as soon think of going back to black bees and box hives as I would of leaving the wings of my queens so that they could fly.

Borodino, N. Y.

For the American Bee Journal.

How I Winter My Bees.

IRA BARBER.

As the time is now at hand for getting our bees into safe quarters for winter, and as the plan that I have practiced for the last twenty years has not failed to bring them through safely, and nearly as strong as when they were put into winter quarters, unless they starved, I give it for the benefit of those that have failed to winter their bees successfully.

Any warm cellar, under a dwelling house, occupied by a family, no matter how damp, if the water does not reach the bees, I consider a safe place for them; while a cellar that freezes and thaws, at every change in winter, I should consider a very unsafe place to risk them. I have wintered bees in wet cellars (so wet that water stood all over the cellar bottom, all the winter), and have had them come out in fine condition, after remaining there from the middle of November until May 10. Bees will winter in a warmer atmosphere than many suppose, as they will stand more heat than cold, where the atmosphere is kept pure.

Where small lots are kept, there is no necessity of ventilating a cellar, but when a cellar is to be filled with bees it is necessary to ventilate from the top of the room. I use a three-inch tin pipe, 24 feet long, with an elbow at the bottom, long enough to reach through the wall. This pipe goes up on the outside of the building and enters the cellar near the top of the room, where the bees are kept. I have no draft of fresh air coming into the room from any quarter, and have found that if I wish the bees to keep quiet I must keep fresh air away from them.

I carry my bees into the cellar about the middle of November. My hive is the Quinby eight-frame hive. I do not use any division boards, neither do I punch holes in the combs to make passage for the bees, but all are put in, just as they were when the honey was taken off, with a cloth on the top of the frames, all covered with bee glue, and a board on the top of that. I use no plank or benches to put them on in the cellar, but pile up in columns, four deep; the first, or bottom tier is placed on caps from the hives, ten inches high, this brings the bottom tier about one foot from the cellar bottom, and every colony on the bottom tier are raised up from the bottom board one-half inch, while all the rest are left just as they were when in the yard; entrance all open and top of hive tight as glue, cloth, top board and the weight of the pile will make them.

When all are packed in this way, I close and bank up the cellar, including the windows, and let them entirely alone, until it is time to put them out, which, as a rule, is the latter part of April or first of May. The hives are placed close together; no spaces or alleys left. Many will want to know how bees appear in a close, warm cellar. I will say that the atmosphere is warm, and that the bees are comfortable, outside of the hive as in it, and do not cluster, but stand on the combs just as they will in summer. I have left them there in November, when the bees were standing out on the ends of every hive, that I could see, and found them just so when I went there in April. I found no dead bees on the bottom boards, and the loss last winter was less than three bushels from 193 colonies, in one cellar; and 1½ bushels in the other cellar, where 130 were kept, but as a rule I find about 3 bushels to 100 colonies. I find the hives bright and clean when the cellar is first opened, showing plainly that if there is any discharge from the bees, it is in a dry state, for they cannot get the dysentery in as warm a room as the one in which mine are wintered. When they are carried out in the spring, their bodies are not distended, but look as they did all through May and June of the past season, in this section.

To those that question this plan of wintering on so high a pressure as I have described, I will say that I will show bees that I bought of M. Quinby, in 1863, or rather the hives and combs that have stood 19 winters and are good for many more, if wintered as I have described.

Bees wintered thus will come through in as good condition as they were in the fall; and if not put out until there is something for them to do, they will not dwindle, but be ready for swarming in about forty days after leaving the cellar, as a rule.

I would not attempt to winter bees in a very dry cellar, as warm as I have described, for they require more moisture than could be found in so warm a room. Had I an exceedingly dry cellar, and was obliged to use it, I should thoroughly drench the bottom with water before using it. I once used a dry cellar in which to winter my bees, and found it the worst cellar that I ever tried. Bees were not quiet for a single day while in it. I have thought that a solid cold winter was best for bees, on the plan that I have described, but as last winter was the warmest that I ever knew, and that the bees came through in fine condition, I can now say that either hot or cold, the warm damp cellar does not fail to bring them through in good condition.

Where bees require feeding I use coffee A sugar, and feed enough in one night. I give the feed hot, and use common tin pans for feeders, and if one does not hold enough, give them two at the same time. I put the pans on the ground, near the hive to be fed, fill it with hot syrup, break up some old comb for floats, to keep the bees out of the liquid, then put the colony over the pan, wrap them up at the bottom to keep out the cold air, and

find in the morning that all the feed is up in the hive; the hive should then be put back on the stand, and all pans taken away. I feed as late in the season as I can; then I know what they have. It is not necessary to have the feed sealed, when wintered in my warm cellar. When a hive is but one-third, or half filled with combs, I prefer to lay combs of honey on top of the frames, well wrapped in cloth, and the cap of the hive over all; this I prefer to any other plan of feeding.

DeKalb Junction, N. Y., Oct 24, '82.

Kansas Bee-Keeper.

Bee-Keepers' Visits to One Another.

J. E. POND.

If our brother bee-keepers would often make interchanges of visits with each other, much benefit, as well as pleasure, would be derived therefrom. While we gain much by reading accounts of experience, far more could be gained by seeing the results in person, and a personal conversation will often cause truth to rise and error to disperse, when a discussion carried on in print might only serve to more firmly fasten the different views of the matter under consideration in the minds of those conducting the discussion.

Acting on the above idea, I lately stole a day from my business and made a trip to the beautiful town of Wenham, in this State, where is located the apiary of Henry Alley, the largest queen breeder in New England and one of the largest in the whole country. I luckily found friend Alley at home, and he, although quite busy, devoted a half day to showing me his apiary and making the visit a pleasant one to me. At present he is breeding Italian, Cyprian and Holy Land queens, having dropped the Egyptian and Hungarian. He has his queen cells built in full colonies in his home apiary, but has the different races fertilized in different yards, located about three miles apart. As no bees other than his own are kept in town, he has no trouble with impure fertilization, but is enabled to warrant every queen he sends out. He has been engaged in breeding queens since the first introduction of the Italian, some twenty years ago, and as he has made that business a specialty, and his experience has enabled him to arrive at results far in advance of the ordinary queen breeder.

By the aid of much study, and by experiment largely, he has at last discovered a plan by which he accomplishes what a short time ago would have been considered almost a miracle. I opened hive after hive devoted to building queen cells, and found such cells, built in straight rows, each cell spaced as evenly apart as the teeth of a coarse comb, and not a single cell among the four or five hundred, that I saw, but could be transferred from the comb without injury to its neighbor. Each cell pointing downwards in the position naturally given it by the bees, and this without the use of any sticks or slats. I was much sur-

prised at what I saw, for it far excels anything which I had ever seen or heard of, and after much persuasion I induced Mr. Alley to inform me how it was done, and after receiving the desired information, I was more surprised in thinking that no one had hit upon the idea before, so simple is it, and so little labor to be done in operating it.

By his plan he has all cells built in full colonies, which are never queenless, and consequently never without brood. The cells are built in exactly that position in the hive which the owner desires, with their points downward, and so regularly spaced that not a cell need be destroyed. As his plan gives plenty of room there is no crowding, and every queen reared is large and full size. Everything is laid out to a certainty by the owner, and nothing is left to the whims or vagaries of the bees. They must build the cells in just the position desired, and the only chance there is to have an imperfect cell, is an egg being carried out from the cell given them, to some other cell, a thing which, in practice, by this plan, Mr. Alley has never seen done. Were I to take up the business of breeding queens I would adopt this plan and use no other, for it combines simplicity, economy and certainty to a remarkable degree.

Foxboro, Mass.

For the American Bee Journal.

Comments on the Chicago Convention.

MOUCH AMIEL.

I have read in the BEE JOURNAL with more than usual interest, the proceedings of the Northwestern Convention, held at Chicago, Oct. 18. The discussions are valuable when reported by an experienced bee-keeper, but are usually of very little value when reported by ordinary newspaper or periodical reporters; so that, as a rule, I much prefer the reading of essays. All cannot attend the conventions, or all of them; and but few men, in the haste of description, can communicate their knowledge as lucidly as they would in an essay.

Mr. Bussey asked, "What is the best fuel for smokers?" Why not roll blotting paper, and, if it is burned too fast, roll it very fine, and also alternate with the sheets, common straw paper, or, what may be better, procure pulp from paper mills, mold it into rolls, pressing it very firm.

Mr. Valentine said that in feeding winter stores, he mixes two measures of sugar and one of water. I tried it, (crushed sugar,) and in twenty-four hours one half was granulated. Acid may prevent it, but I think not. I tried strong vinegar, and the vial with acid in it, had mold on it in three months; the other had not, but both had a few perfect crystals, ¼ inches square, at the bottom. I am of opinion that the proportions given by Mr. Oatman would be rather thin, if fed late.

Permit me to ask those that have fed bees mostly, or entirely with sugar syrup (fed in season for the bees to

cap it over), if they ever had such a colony, so fed, have the dysentery? We do not seem to differ at all as to the conditions necessary to successful wintering (if there was no dysentery). to wit: Cellar, cave, clamp, spare room, hay-packing or chaff, if the thermometer is kept between 30° and 45°; dark, pure air, dry room, and if you can, upward ventilation, or, more correctly called, upward absorbents, little or no current, plenty of bees and healthy food. By complying with these conditions we have made, either naturally or artificially, what is equivalent to a very mild winter, but with all the most favorable conditions.

Some seasons bees are attacked with disease, and my experience is that one flight a week, say during a fine January thaw, will but little improve a colony that is much diseased. Many of us know that with, to all human appearance, identically the same conditions, each season, during some winters they have the disease, and in the succeeding and preceding ones they have been perfectly healthy. How, or why is this? Do not all rise, at once, to tell me that the winter was very cold. You forget that you had them housed and cared for exactly the same as in many preceding winters; the same room, the same temperature, the same everything, so far as you can by any possibility see. I repeat, what is the cause of this difference in their health? Is it in the honey they have stored? the pollen, or possibly, the condition of the atmosphere? We may, and often do find but a portion, say one or two, affected, the remainder perfectly healthy! How, or why is this? We all know that the honey gathered by one colony, or a portion of it, is quite different from the remainder, or other colonies in the same yard. All these are questions to be thought of. We may never agree as to the cause of the disease, but, as in the case of fowl brood, or many diseases of the human family, we may find a remedy, without being able to trace it to the cause. I fully believe and hope such will be the result of well and thoroughly conducted experiments, and am fully convinced that the remedy will be found in sugar syrup.

St. Paul, Minn., Nov. 1, 1882.

Wintering Problem Solved by Lime.

F. DELLA TORRE.

Without being egotistical, I am not afraid to state that the proper use of quick lime in a hive, solves the wintering problem. Pure dry air, and stores enough, is all that a good colony of bees require to winter successfully. It is impossible to have dry air in a hive in damp weather, without using chemical absorbents; mere chemical absorbents, such as chaff, sawdust, corn cobs, and the like, only retain moisture. When the atmosphere outside is damp, that in the hive is more so, for it has the large amount additional, from the breath of the bees, added to it. Dry cold has never killed

a colony of bees for me yet; even when most of the stores were cider.

I have tried many, and costly experiments, carried on uninterruptedly through winter and summer, in my endeavors to solve this wintering problem, and until some bees are produced that can winter like wasps, or some methods, that we don't dream of now, are discovered, for protecting bees in winter with absolute certainty, I repeat that I have, in the lime protection idea, all that I desire.

Some of my friends tried the lime last winter, and their letters are enough to turn bee-keepers towards my way of thinking on this subject.

Reisterstown, Md.

Translated from Deutscher Bienenfrend, by A. R. Kohnke.

Sowing Honey Plant Seeds.

FR. HUCK.

We meet with first-class honey plants among the annuals and biennials, as well as among the perennials and plants of woody structure. Many are natives of a warmer climate than our own, but have become acclimated, so much so, that we are not aware that they are from a foreign and warmer country. The importation and culture of them in this country has been altogether a different object from providing for bee-feed, and we may assume the existence of numerous excellent bee plants, which will become known only as planting for bees especially is practiced. But even our native flora contains many plants which furnish honey in large quantities and very fine quality, and to improve bee pasturage we should notice these as well as those of foreign origin.

In regard to annuals they have this advantage, that they furnish ready means to improve the bee pasture the first year they are sown, and are easily cultivated. Besides that, they may be sown at such time as to come into bloom when natural sources fail, thus filling gaps in the honey season. Such annuals have to be sown generally every year, though some of them will perpetuate themselves by the dropping of their ripe seed.

The number of biennials is rather small; most generally known is *Echium vulgare*, as also rape and some varieties of clover, because they are cultivated as biennials; although, strictly considered, they are not such.

More numerous are the perennials, shrubs and trees, furnishing honey for the bees; many of them being ornamental, on which account they should largely be cultivated in gardens, parks and cemeteries. Many of them get to be very old, and may occupy the same space for scores of years. To further this dissemination they should be presented to all who would give them a place in their garden or premises. We also find that many of them may be used for other purposes, especially kitchen vegetables and plants possessing medicinal properties, so that we may derive some profit from them aside from the honey they furnish.

The most important for the bee-keeper are those plants which are of a woody structure. Once planted, they will last a generation or more. True, they do not furnish honey the first few years after being planted, like the annuals and perennials of an herbaceous character, but when once planted, will cause little or no further trouble and work.

One of the most desirable for our country is the lapwood or linden, and should be planted most extensively. To prolong the honey yield of this tree it should be planted in different situations, such as the south and north side of hills, in valleys and on top of hills; besides that, there are different varieties of this tree, some of which come to bloom earlier in the season and some later. A close observer will very often meet with specimens of such different kinds.

Through earnest work we will learn and enlarge our views. Nature is inexhaustible, and provides for the need of mankind. Nowhere is this more noticeable than in the world of plants. As soon as it becomes desirable to have a certain vegetable possess especial properties, as for instance, with respect to earliness or size, it is soon obtained. The rose, for instance, usually blooms in May and part of June, and but once a year, but now we have varieties which bloom a second time, in autumn; and some even all summer. Some varieties of our common acacias bloom all summer. It can, therefore, not be considered as an impossibility to obtain from our red clover a variety, by selection of seed of course, which would permit the bee to empty its forets of their sweet contents, which, at present, is well nigh impossible, on account of their length. The industrious and progressive should try everything.

[It seems to me more rational to adapt the plant to the animal than the animal to the plant, as to change the size of a plant is more easily accomplished, than to change the size of an animal, or any part of it. If we decrease the size of the clover heads, we may look for an increase in the number of them from each root, which would be a double gain; but if we increase the length of the bee's tongue, we may decrease the size of some other essential part, which would be a disadvantage.—KOHNE.]

Experience and science in bee-keeping make commendable progress. Noble and high-minded men devote their time and energies to it, hence all who take an interest in progressive bee-keeping, should lend a helping hand, by the dissemination and cultivation of honey plants. Look how many honey plants your surrounding country contains, and how many it might hold in place of obnoxious weeds in fence corners and waste places, and then go to work and try to change such an aspect for the better. Those who wish to cultivate honey plants should begin at first on a small scale to learn their cultivation, and discover what kinds do best in the soil and situation at his disposal.

And now, brother bee-keeper, when you have read these few lines, plant a

basswood tree; plant it this year. Awaken the interest of your children and neighbors in this good work. Having thus been industrious, your conscience will tell you at your parting hour from this world that your works and deeds are sweeter than honey.

Besides *Tilia*, there are other trees and shrubs, furnishing an abundance of honey. Chief among many may be mentioned *Asclepias syriaca*. I have seen this plant covering the side of a hill, having been there fifty years or more. Its flesh-red blossoms are eagerly visited by bees in summer and fall; the honey is said to be of excellent quality.

Another plant, furnishing a large quantity of honey, is *Borago officinalis* (borage). Being an annual herb, it must be sown every year and may be made to bloom any time in the summer or fall, by sowing in proper time.

Nepeta batavia (catnip) should also be encouraged to grow wherever possible; it is perennial, sometimes biennial.

Especially recommendable is, *Hyssopus officinalis* (hyssop). This herb blooms in the latter part of summer when there is not much else for bees to be had. It will grow anywhere and sow itself afterwards. This plant should receive special attention, as it furnishes more honey than any other plant occupying the same ground surface.

Well worthy of consideration also, is *Hedysarum cibirichis* (esparsette), fennel, rump, caraway. The first furnishes as well good feed for cattle, whilst the seed of the three last mentioned generally bring a good price in market.

[Planting for honey is the key note to success; and we are glad to note the fact that not only are the best and most progressive bee-keepers in America now convinced of this fact, but also those of Europe and Australia.—ED.]

For the American Bee Journal.

Effect of Dampness on Bees in Winter.

S. CORNEIL.

In looking over the back volumes of the BEE JOURNAL I find that writers on wintering always give the temperature at which the repositories for bees should be kept, but they never seem to think of giving the proper degree of humidity of the atmosphere, although the latter is the more important of the two. The writers generally seem to be agreed that bees when clustered can endure severe cold, but cannot stand dampness, yet it seems not to have occurred to any one to test the degree of dampness at which they will remain healthy, and beyond which they will become diseased. The natural laws relating to the production of moisture by the consumption of food, the evaporation of moisture and the humidity of the air have been pretty well investigated and ascertained, and we only need to compre-

hend and apply them to attain our object. With a view to place before your readers the ideas of some of the leading scientific lecturers and writers on those subjects I will quote some of them.

Mr. Frank Cheshire, in the AMERICAN BEE JOURNAL for 1879, page 277, says: "Honey is a hydro-carbon, consisting almost entirely of saccharine matter, and like common sugar does not undergo digestion, but simply transudes through the delicate tissues into the circulation, being utilized for giving heat and force. So used, it is converted into water on the one hand, and carbonic acid on the other. These escape through the lungs, no residue remaining to be carried off in the excreta. When bees take honey it is gradually absorbed into the fluids, and passes off from the organism of the bee through the breathing apparatus."

It has been ascertained that about 70 per cent. of the honey consumed is transformed into water, and will pass off through the trachæ as vapor, if the surrounding air be dry enough to absorb it.

Mr. L. C. Root, on page 218 of the same volume of the BEE JOURNAL, says: "Some of Mr. Quinby's last experiments led him to believe that the liquid portion of the feces was evaporated through the body of the bee, when surrounded by proper conditions."

In Carpenter's Principles of Comparative Physiology, on page 356 and 358, we find these statements: "There is no reason to believe that the pulmonary exhalation is liberated in any other way than by *evaporation*, under the peculiarly favorable circumstances afforded by the delicacy and permeability of the respiratory membrane.

"In insects, it has been ascertained by Newport, that transpiration of fluid takes place to a considerable extent; it is, of course, difficult to ascertain what proportion of the loss of fluid takes place from the external surface, and from the prolongation of it that lines the air passages, which in this class are so extensive and minutely ramified; probably it is from the respiratory membrane that the principal liberation of it occurs.....

"If, however, the external air be saturated with moisture, and be of the same temperature with the body (so as to be unable to acquire its heat any increase of capacity for vapor), it is obvious that the evaporation from the lungs, as well as that from the skin, will be entirely checked."

From the principles here laid down, it is plain that if the air breathed by the bees be overloaded with moisture, the large amount of water generated by the consumption of honey will not be exhaled by evaporation from the respiratory membrane, but will remain in the bodies of the bees, and, if this condition of the air be long continued, it is at least sufficient cause for the bees becoming sick, and, I think, the most probable cause of abdominal distension and dysentery.

It will, perhaps, surprise some to learn that the natural dampness of

the atmosphere is much greater during the coldest weather than it is during the months when the bees are most active. The results of observations, at the observatory at Toronto, show that for a period of thirty years, from 1841 to 1871, the monthly means of relative humidity were as follows: Of course, 0, representing dry air and 100 the point of saturation. January 83°, February 81°, March 78°, April 72°, May 71°, June 74°, July 73°, August 76°, September 76°, October 79°, November 81°, December 81°. Average for the year 77°. Taking the months of November, December, January, February and March, during which bees are confined to their hives, the average is about 81°; while for the remaining seven months, when they can fly, the average is a little over 74°, a difference of more than six degrees of dampness when the bees are least able to resist its effects.

The report also shows that the humidity of different winters varies as much as does their temperature, and it often occurs that excessively cold winters are also excessively humid, and on turning to the reports of bee-keepers, I find those are the winters in which the heaviest losses have occurred. On the other hand, it is found that when the humidity has been about normal the bees have wintered well. For instance, in the winter 1874-5, the temperature for December was 1° colder than the average for that month; January 6.89°, February 12.74°, and March 5.20°. The humidity for January was 84°, for February 86°, and for March 81°. Prof. Cook, in his prize essay, refers to it as "That terrible winter of 1874-5, terrible alike for its cold and bee-mortality." He might have appropriately added "and remarkable for its humidity."

Again, in the winter of 1850-1, December was 4.30° colder than the average for that month, January 6.35°, February 2.87°. The mean relative humidity for each of these months was 85°. The heavy losses sustained by bee-keepers during that season were too serious to be readily forgotten.

On the other hand, in the winter of 1877-8, the temperature for December was 8.68° above the average for that month, January 1.60°, February 1.60°, March 8.18°. The humidity for December was 81°, January 84°, February 81°, March 79°; on the whole, being about normal and in no case varying more than a degree from the average for each particular month. So far as I can learn from the reports of bee-keepers for that season, the bees wintered well.

The humidity as well as the temperature of different localities in the same latitude varies considerably. In selecting a location, and in preparing bees for winter, it is of importance to know exactly how those matters stand. We are told that in the old country they have meteorological societies whose special object is to ascertain the degree of heat, cold, and moisture in various localities and the usual periods of their occurrence, together with their effects on the health of the

people and upon the different agricultural productions. Our bee-keepers' associations might add to their usefulness if the members were to resolve themselves into such societies, reporting the conditions of the climate and its effect on the bees, to the bee journals, for publication.

The American continent is now pretty well dotted over with observatory stations from which reports might be obtained. To collect and tabulate the results as regards temperature and humidity, would involve a good deal of labor, but it would be a valuable addition to the knowledge at present, available to those making a specialty of bee-culture.

But it may be asked what good, if we did know all about the humidity, since it is a matter beyond our control and since we are obliged to take the climate as we find it. As far as out-door wintering is concerned, this is partly true. All we can do is to give the best possible ventilation, while we, at the same time, confine the heat. A damp atmosphere will absorb some moisture, provided it be frequently changed.

The reports of Dr. Tinker, Jerome Wiltz, and Thadden Smith go to show that the hives having the best ventilation came through best in 1880-1. But in good cellars having a constant upcast of air, connected with a chimney, and a steady supply of fresh air through a six-inch glazed pipe, running underground, say 200 ft., and buried below the reach of frost, experience has shown that bees winter well.

The temperature is generally nearly right, or can be controlled, but the most important element in the success of such wintering repositories seems to have been overlooked, and that is that the air in such cellars is much drier than the external atmosphere, even though water be standing on the cellar bottom.

Speaking of pulmonary evaporation, Dr. Carpenter says: "Wholly to suppress it, the air must not only be of extreme humidity, but must also have a temperature not inferior to that of the animal, since, if the air be colder it will be warmed by contact with the body, and thus be capable of holding an additional quantity of aqueous vapor in solution."

On the same principle the cold air, in its passage through the pipe, will be warmed, and thus become a better absorbent of moisture when it reaches the cellar. For instance, if the temperature of the external air be 15°, in its passage through the pipe, it will be warmed to, say 42°. It should then be just twice as dry as the external atmosphere, because for every addition of 27° to the atmosphere its capacity for moisture is doubled. Last winter a six-inch wooden pipe running 140 feet under ground, brought the air to my cellar at an average of about 40°. On the 24th of January last, at 7 a. m., the temperature outside was 36° below zero. A thermometer in the mouth of the pipe in the cellar stood at 35° above zero; that is, the air in passing through 140 feet of pipe acquired 71° of heat. The humidity

must have been many times less, but I had no means of testing it. The success of this method depends a great deal on having the air carried up from the cellar with sufficient rapidity and constancy, and for this purpose the ordinary wood-burning stove is hardly sufficient. It will pay well to take pains to have the exhaust pipe working steadily and vigorously.

Thus, for wintering our bees, we can create an artificial climate, or about the right temperature and humidity, and we can have them surrounded by air just as pure as it is out-doors.

If, in such a cellar, the hives have thick quilts of wool over the clustering space, and the combs raised two or three inches above the bottom board and this space open on at least one side, so as to give full play to the principle of the mutual diffusion of gases, there will certainly be no wet or moldy comb; and if the food is good I think there will be no abdominal distension or dysentery, even if the combs do contain pollen; and experience affords grounds for saying that in the spring the bees will not dwindle any more than bees wintered most successfully on their summer stands.

In making reports as to how bees have wintered, it is desirable that, where accuracy is possible, all the conditions should be accurately given, and as the time to begin taking notes is drawing near, I would suggest the propriety of using a wet bulb hygrometer for determining the humidity. The expense is only trifling, probably less than ten dollars. Any one who understands long division can make the calculations.

Lindsay, Ont., Oct. 17, 1882.

Local Convention Directory.

1882.	Time and Place of Meeting.
Nov. 29-30,	Western Michigan, at Grand Rapids, Wm. M. S. Dodge, Sec.
1883.	
Jan. 16.—	Eastern N. Y., at Albany, N. Y. E. Quakenbush, Sec., Barnerville, N. Y.
	11, Nebraska State, at Wahoo, Neb. Geo. M. Hawley, Sec.
	16-18, Northeastern, at Syracuse, N. Y. G. W. House, Fayetteville, N. Y.
	19, 20.—Mahoning Valley, at Berlin Centre, O. L. Carson, Pres.
Feb. 3.—	Northern Ohio, at Norwalk, O.
April 5.—	Utah, at Salt Lake City. E. Stevenson, Sec.
Oct. 17, 18.—	Northwestern, at Chicago, Ill. Thomas G. Newman, Sec.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—Ed.

The Western Michigan Bee-keepers' Association will meet at Supervisors' Hall, in the city of Grand Rapids, on Wednesday and Thursday, Nov. 29th and 30th, 1882. The co-operation of all bee-keepers of this section is desired.

WM. M. S. DODGE, Sec.

Haldimand, Ontario, Convention.

A meeting of the Haldimand Bee-keepers' Association was held at Cayuga, Ontario, Canada, on Friday, Oct. 27, at 1 o'clock p. m., the President, E. DeCew, Esq., in the chair. The President explained the object of the meeting, viz: The adoption of a constitution for the association, and election of additional officers.

The constitution was adopted, fixing an annual fee of 50c. for membership,

Present—E. DeCew, President; E. C. Campbell, Secretary; Robt. Buckley, Robt. Anguish, David Anguish, Ambrose Gloyd, James Gloyd, Wm. Harrison, Fred. Mehlenbacher, Andrew Vanderburgh, B. Byers, Wm. Jack, etc.

The construction of the best kind of hives was discussed by Messrs. DeCew, Vanderburgh, Gloyd, Byers and Buckley, but no result arrived at.

The wintering of bees was discussed by Messrs. DeCew, Gloyd, Vanderburgh, and Buckley, the main essentials being plenty of young bees and stores, and proper protection in winter.

The question of swarming was discussed; the general opinion being in favor of dividing.

The following additional officers were elected for the following townships: Waipole, Wm. Harrison; Seneca, Lawrence Welch; Dunn, Abraham Albright; South Cayuga, Andrew Vashinder; Rainham, James Gloyd; North Cayuga, Robt. Coverdale; Dunville, Dr. McCallum; Seneca, James T. Nelles.

On motion it was Resolved, that the next meeting will be held at Nelles' Corners on the last Friday in March, at 11 o'clock a. m.

A committee, consisting of the President, Secretary, and Mr. Wm. Jack, was appointed to prepare a list of subjects for discussion at the next meeting. E. DeCew, President.

E. C. CAMPBELL, Secretary.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Centre, Mahoning Co., O., in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

LEONIDAS CARSON, Pres.

The Nebraska State Bee-keepers' Association will hold its annual session in Wahoo, Saunders county, Neb., commencing Thursday, Jan. 11th, 1883. Arrangements have been made with the railroads to secure 1½ fare for the round trip. The Saunders county Bee-keepers' Association will furnish entertainment free to all visiting apiarists. Bee-keepers from neighboring States will be welcomed.

T. L. VONDORN, Pres.

GEO. M. HAWLEY, Sec.

For the American Bee Journal

Texas Bee-Keepers' Convention.

The Texas Bee-Keepers' Association held its fourth annual convention at the apiary of Judge W. H. Andrews, at McKinney, Collins county, Texas, April 25-26, 1882.

The Convention met at 9 a. m., under the shade of some fine, ever-bearing mulberry trees, one of which measured twenty-eight inches in circumference, heavily laden with ripe, luscious fruit, as well as berries just beginning to form. The situation was in full view of the Judge's apiary of 300 colonies, of the brightest Italians. On the other hand was a grove of trees, planted by Judge A. many years ago, among which were the poplar, chestnut, sugar maple, and several other fine specimens of deciduous trees, also a choice selection of evergreens.

Thus pleasantly situated, the Convention was called to order by the President, Judge Andrews, who introduced W. K. Marshall, D. D., of Marshall, Harrison county, Texas, as the oldest scientific bee-keeper in the State, and tendered him the chair to preside over the meeting of the convention.

Dr. Marshall delivered an able address on practical bee culture.

He said that many persons would undertake bee culture but for fear of the bee-moth destroying their bees; that anyone who would allow the moth larva to commit destructive depredations, ought to have no bees. He felt friendly toward all bee publications and those engaged in the pursuit, but said that the bee literature of the majority of journals was not adapted to bee culture in the South, the subject of wintering and bee cholera or dysentery consumed nearly one-half of the space; and he thought he spoke the experience of a majority of the scientific bee-keepers in the South when he said that he did not read one-half of the articles on wintering. He had grown tired of so much of it, it did not interest the Southern bee-men.

He had a few cases of dysentery caused by bad feed, several years ago. He had had no experience with fowl brood. The only place where it existed in the State was Dallas county. He was often asked if bee-keeping was a success in Texas,—will it pay a reasonable compensation according to capital invested, as compared with other profitable pursuits? His experience was, that a greater income could be realized from the skillful management of the honey bee than from any other pursuit, capital and labor considered.

He advised all to be up with the times, take the best bee periodicals, get the best books, read the best bee literature.

He said that practical bee culture resolved itself into three important factors: Locality, race of bees, and marketing the products of the apiary.

We have good and bad localities. To secure a good locality, we must have an understanding of the honey-

producing plants, what produces honey, and at what season? Among the leading honey plants he mentioned were the red bud (Judas tree), the willow, fruit trees, black locust, honey locust, ratan vine, corn and cotton; he was convinced that a large portion of his honey was from cotton. He gave some very valuable statistics of the honey crop for the past thirty years. In 1860, he said that the honey yield was enormous, almost incredible. The yield was mostly from honey dew, which exuded from the leaves. He saw 400 lbs. of honey taken from one tree at one time. He had never before, nor since, seen such a season. He spoke of Red River and Sulphur bottoms as being excellent localities for apiaries.

He spoke at length of the improved races of bees, and stated that by careful breeding they could be brought to a higher standard, and he regarded the home-bred queen as superior and discouraged the further importation of new races other than the Italians, and even some of these were not well marked. He regarded the pure Italians as superior to any other race. Their docility and capacity for storing honey were objects of much respect.

He gave an interesting account of his experience with the Cyprian bees. They were very prolific, and good honey gatherers, but consumed the most of their stores in brood-rearing. They must be made queenless in order to obtain surplus. They would become infested with laying workers in three days after the removal of the queen—were swift flyers and *stingers*.

To beginners, he would advise the buying of good colonies to commence with, and consider what kind of honey to produce, and to produce that kind, comb or extracted, which would find a ready home market.

He considered the 8-frame Langstroth hive the best size for surplus. In marketing honey, his own experience was in favor of extracted honey; comb honey would not bear shipping. Extracted honey was more wholesome to the consumer and more economical to the producer. He considered some bees lazy, while others were industrious; had tried tiering-up to four stories high, with upper chamber over the brood chamber, and obtained 86 lbs. of extracted honey by the tiering plan, against 130 lbs. for the ordinary 2-story hive; he had easier access to the brood-chamber with the latter than the former. He encouraged building up a home market; he had sold, last fall, 4,000 lbs. of honey, at home. He considered Texas equal to any other State for its natural honey resources.

He opposed, in the strongest terms, the unjust and malicious attacks made by unprincipled men upon the character of the father of American bee literature—Rev. L. L. Langstroth, and regretted that any of the bee periodicals should give space in their publications for such malignancy.

The Association tendered a vote of thanks to Dr. Marshall for his able and interesting address.

The following committees were appointed:

On Resolutions—Dr. Howard, Jno. S. Kerr and G. R. Cooper.

On Apiarian Supplies and Exhibits—R. C. Horn, T. C. Boone and G. A. Wilson.

On Subjects for Discussion—W. K. Marshall, F. P. Cline and Judge T. C. Goodner.

Judge W. H. Andrews gave an interesting account of his visit to Lexington, Ky., as delegate from Texas to the North American Bee-Keepers' Society. He was highly pleased with the acquaintance made with the distinguished bee-masters of America whom he met there, and spoke in the highest terms of the ladies who participated in the convention and took such a great interest in bee culture. The manner in which the representative from Texas was received, and the attention given the Texas delegate was encouraging to the Society of Texas; which, though young as an organization, attracted much attention in the older States.

On motion, the Convention adjourned till 1:30 p. m.

AFTERNOON SESSION.

Committee on Subjects for Discussion reported the following questions: "Which is most desirable—natural or artificial swarming?"

Dr. Marshall was selected to open the discussion. He favored artificial swarming; his apiary being located among large forest trees, natural swarming was impractical with him. He could increase artificially with less labor than natural swarming.

Judge Andrews favored natural swarming, he thought that his bees went to work with more spirit and zeal when allowed to swarm naturally.

Judge Goodner gave his experience with artificial swarming, as a novice. He succeeded in dividing his bees; received something less than 40,000 stings; it was his first effort, therefore he had not decided which plan he would adopt in the future.

The next subject for discussion was "Is it advisable to plant for honey?" Judge W. H. Andrews favored planting for honey, and recommended black locust. It was valuable for honey and the timber was useful and demanded a good price in the markets; it was a fast grower and a profuse bloomer.

Dr. W. K. Marshall was in favor of planting black locust, peas, Simpson's honey plant, and linden for honey. He stated that some peas yielded more honey than others, which was owing, perhaps, to the depth of the corolla of the flower, the nectar being secreted beyond the reach of the bee.

G. A. Wilson asked if it would pay to plant sweet clover (melilot).

Judge Andrews said that he had had it growing for several years, and had noticed, only occasionally, a stray bee upon it, but it was highly recommended by good authority.

Dr. Howard had grown it, and found his bees to work on it after horse-mint had dried up, and that it furnished a fine quality of honey, well flavored. He recommended planting and cultivating the first year, as it was to stand.

He was asked if it would do to cultivate the first year and transplant.

He gave his experience with transplanting a few thousand, year-old plants, that had been cultivated. He said that it took two pair of oxen to plow it up, and then a furrow had to be opened on either side of the row, and the plants plowed, or rather cut off, leaving most of the roots in the ground; that the laterals were very numerous and strong, and were three or four feet in length, and often an inch in diameter; the tap-roots were as large and perhaps as long. He dug two wagon loads of roots from the rows and left half of them in the ground. He plants an acre of ground from a pound of seed in this way, but considered too much unnecessary labor. He was asked if stock would eat it. He thought they would not; as they had free access to it, both cattle and horses, and had never seen anything eat it.

He was asked if there were more than one kind of it.

He said that two species were described, and by some three.

Dr. Marshall stated that horse-mint did not grow in his locality, asked what time it bloomed.

Dr. Howard answered that it usually commenced rather after the 20th of May, and lasted, when seasonable, over forty-five days, but that this year it would commence the first week in May, before the ratan vine was done, and it lasted, usually, more than forty-five days.

"Is the bee moth an enemy to the culture of the honey-bee?" was next discussed.

Dr. Marshall remarked that no one need to fear any losses from the ravages of the moth worm, if he kept strong colonies; that the worm would injure combs if allowed free access to them, could not be denied, but that no one need fear destruction. He thought that the Italians were more vigilant, and more apt to protect their homes against its ravages than were the blacks.

Judge Andrews said that the bee-moth was not to be feared among scientific bee-keepers, that all moth-proof hives and their vendors were humbugs. He spoke in positive terms against moth-traps.

Dr. Howard said that the natural food of the moth larva was wax, and not bees or honey, and that during the spring and summer months beeswax was liable to become infested with these larvae, if exposed, and he regarded them as an enemy to bee-culturists, as they certainly destroy wax, and this article is becoming one of great importance. That comb honey should be noticed occasionally and fumigated with sulphur to destroy the larvae; that strong colonies was the key-note to the successful protection of the hive—that a hive giving at all times free access to every part, furnished with a full colony of bees, with a vigorous laying queen, was absolutely moth-proof so far as the injurious inroads of this insect was concerned.

"The best method of transferring bees from old boxes to movable frame hives," was next discussed. Dr. Howard read an essay on "transferring

bees," in which he gave the *modus operandi* at length.

"The best method of marketing honey" was next discussed.

Dr. Marshall thought that the cultivation of a home market was advisable, and should be encouraged. He had sold 4,000 lbs. at home, last fall.

All favored the cultivation of a home market, and putting up honey in an attractive shape, and convenient size, to suit the purchaser.

Adjourned till 9 a. m., to-morrow.

SECOND DAY—MORNING SESSION.

The meeting was called to order by Dr. Marshall. Judge W. H. Andrews read an essay on "bee literature—what it is and what it should be," in which he stripped the literature of the present, of its fallacies, its "fine spun theories" and aerial speculations, and dealt fairly and squarely with solid facts, and claimed that all deductions should be based upon the same solid basis. It was highly interesting.

The committee on subjects for discussion reported the following:

What is the best mode of Italianizing an apiary?

Judge Andrews gave his views and condemned the method described in the books. He then asked Dr. Howard to answer the question he had asked him to answer in the AMERICAN BEE-JOURNAL, to wit:

"Does the Dzierzon drone theory necessarily follow from the establishment of the much cherished idea of parthenogenesis?"

Dr. Howard answered the question, but the Judge rather accused him of being on the fence. The doctor said it was, to the scientific mind, a mooted point. He gave in detail many interesting experiments with bees. The anatomy of the queen under different circumstances, as revealed by the aid of the microscope, he dwelt on at length; all of which was interesting.

[For answer to Judge Andrews' question, see—"Review of the Dzierzon Theory," AMERICAN BEE-JOURNAL, Vol. xviii, p. 277.—SEC.]

The Judge admitted parthenogenesis so far as related to the production of drones from unfecundated mothers and no further. He related several interesting experiments in the breeding of other stock—cattle and hogs.

Is it advisable to import other races of bees than Italians? was discussed. It was the general expression that the Italians were superior to any other race yet introduced, all things considered; and the importation of other races was advisable.

AFTERNOON SESSION.

The election of officers for the ensuing year was held, which resulted as follows:

President—W. H. Andrews, of McKinney.

Vice President—W. K. Marshall, of Marshall.

Secretary—W. R. Howard, Kingston.

Treasurer—F. P. Cline, Mesquite.

Resolutions were passed, thanking Judge Andrews and the citizens of McKinney for hospitality; expressing sympathy with the Rev. L. L. Langs-

troth in his affliction; and thanking Dr. Marshall for his kind assistance and presence, and the exhibitors of apiarian supplies.

Adjourned to meet in April, 1883.

WM. R. HOWARD, Sec.

[The foregoing report has but just reached this office, on account of the Secretary being unable sooner to prepare it for publication.—ED.]

SELECTIONS FROM OUR LETTER BOX

My Season's Work.—Bees are still working on mignonette and some drones are yet in the hives. Spring count, I had 17 colonies starving, I have now 57 colonies rich in honey; 3 being from the woods. My surplus is between 1,200 and 1,500 lbs. honey, one-half comb and half extracted. I am selling the comb at 20c; extracted at 25c. I received a package of Golden Honey Plant seed from Dr. Tinker, he having learned that seed purchased last spring failed to grow.

WM. CAMM.

Murraysville, Ill., Nov. 9, 1882.

My Report for 1882.—Number of colonies in the spring, 8 good and one weak; the good ones were as good or better as when they went into winter quarters; the weak one had a good young queen, but not one pint of bees. I built it up with brood from strong colonies. The early spring was good for bees, but April was cold and wet. I had to feed some to keep them breeding; fruit bloom did not amount to much, as we had some hard frosts, which killed it. White clover came on in due time and continued in abundance until September, but think that it did not yield much honey; just enough to keep bees breeding all the summer. Swarming commenced June 12, and they kept it up until September. Bees were stronger in numbers, but gave very little surplus honey. I winter them on the summer stands, packed in dry sawdust, 6 inches all around the hive and on top, and lost none. My increase by swarming was 21, and I put back 12 or 15 swarms. In September I doubled down to 21. I have now on the summer stands 5 packed in sawdust, same as last winter, 16 in double walled brick hives, with dead air space of one-inch between the brick walls; on the top, a cover of old carpet, and on that one foot of dry sawdust, covered with a good shingle roof. The idea of brick hives I obtained from the Bee-JOURNAL, but what number, or who wrote on the subject, I do not know, whoever it was, only spoke of brick hives and gave no description. So far I like them, but I may hate them next spring. One of our bee-keepers is brimstoning about one-half of his bees and taking the honey. Murder! murder!

ABE HOKE.

Union City, Ind., Nov. 5, 1882.

Packing Bees in Chaff.—Replying to the query on page 684 of W. W. Moore, of Gillette's Grove, Iowa, I would say that either through an error in writing, or through a misprint in the Canadian *Farmer*, my essay was not quite as intelligible in that portion of it as it might have been. It should have read:

"Then remove the cover and place on top of quilt, a cushion large enough to cover the frame, and containing about four inches thick of sawdust."

The better plan when using cushions is to have platforms or shelving, one above another, on the wall, and far enough apart to allow the hive, with cushion, to be set in; if, however, this method cannot easily be adopted, the strips can be placed upon the cushions, as described in my essay.

H. COUSE.

Beeton, Ont., Nov. 6, 1882.

Satisfactory.—My bees have done very well this season; they have increased 100 per cent., and I have taken 52 lbs. of honey per colony, nearly all in sections, which sold readily at 30c. per lb. My hybrids gave me the most honey, and the Italians the most increase. I get all my increase by natural swarming; and all are now in good condition for winter. I shall winter some in the cellar, and the others packed on the summer stands.

M. H. WOLFER.

Richmond, Ind., Nov. 4, 1882.

What Is It?—I inclose a peculiar kind of bug. Please give name. I can say that I have seen the silver lining edged with gold. I have still more honey to take off, as soon as the weather will permit.

W. G. MCLENDON,

Lake Village, Ark., Sept. 9, 1882.

[The bug was duly received, and sent to Prof. Cook for name, but we fear it was lost in the mails, as we have never heard anything of it.—ED.]

A Partial Report.—I had two small apiaries to care for this season. One was at my home in the village and the other (Mrs. Wirt's), a half mile from town, and a mile from where I reside. I did not keep an account of the yield from the home apiary, which consisted of 20 colonies, but am quite certain that I did not get quite as much honey as from the Wirt apiary, which numbered 19 colonies, spring count. I increased this apiary to 44 colonies by natural swarming, and as many as a half dozen swarms went to the woods. From this apiary I harvested just 2,000 pounds of comb honey, mostly in 2 lb. sections, and 600 lbs. of extracted. I used no foundation in the brood chamber, and only small starters in the sections; and some of the colonies had to be built up from six frames, with no honey, and being rather light in bees. Taking all the conditions into consideration, I believe I have no reason to complain of the result. My bees are all in excellent condition for winter, and I hope to get them through their long period of inactivity well

prepared for the next season's campaign. I propose using foundation quite freely next season, if all goes well. Our honey is excellent and the home demand is good. I got one of Mr. Heddon's 8-frame Langstroth hives to try, and am of the opinion that I shall adopt it as my standard hive. I never like to jump at conclusions, but think it is the very hive I have been looking for. This year, as last, my best workers were a cross between the Italian and the black, or German bees.

J. R. BAKER.

Keithsburg, Ill., Nov. 7, 1882.

Averaged 100 lbs. of Honey per Colony.—I commenced in the spring with 40 colonies of bees in fair condition. On the early-spring honey-flow I made all strong, and had my swarming on the ratan vine honey-flow, and all good and strong by the time our house-mints came in, which was earlier this season than usual, connecting with the ratan-vine harvest. The season has been a good one in this portion of Texas. My entire apiary averaged 100 lbs. of extracted honey, per colony. My best colony gave one swarm, and the proceeds of both was a little over 400 lbs. of extracted honey. The fall harvest was good, and the honey was of better quality than usual. The honey plants furnishing our fall honey are different from what they have been heretofore, and the outlook for the future fall honey crop is favorable for a better quality of honey, if not a greater quantity. I now have about 90 colonies in good condition.

WM. R. HOWARD.

Kingston, Texas, Nov. 4, 1882.

To Prof. A. J. Cook.—Will you be kind enough to state in the AMERICAN BEE JOURNAL who made the Given foundation which you stated sagged so badly in your tests this summer? This is a matter that concerns all users of foundation, and I feel sure very many would be interested to know if the sagging is the result of an inherent defect in that make of foundation, or whether it was faulty manufacture? T. L. VONDORN.

Omaha, Neb., Nov. 4, 1882.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

When changing a postoffice address, mention the *old* as well as the new address.

The New York Weekly *Tribune* says in regard to the Noyes Dictionary Holder, manufactured by L. W. Noyes, 99 West Monroe St., Chicago: "We know of but one satisfactory Holder; that, however, is so good that a second is not needed." Mr. Noyes sends to all applicants a handsome illustrated circular. Prices reduced.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL. }
Monday, 10 a. m., November 13, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—The supply of extracted honey is fully up to the demand. My quotations are: 6½c. for dark and 8½c. for light, delivered here.
BEEWAX—It is quite scarce. I am paying 27c. for good yellow wax on arrival; dark and off-colors, 17@22c.

AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@20c. on arrival; extracted, 7@10c. **BEEWAX**—Firm at 20@25c. per lb.
CRAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand increases with the cool weather, but not sufficiently fast to keep pace with receipts, which now accumulate, as it is time to get the surplus into market. Prices remain unchanged with perhaps a tendency downward, owing to many consignors desiring to realize quickly.

We quote: white comb, in small sections, 18@20c. Fine, well-filled, 1 lb. sections bring the outside price. Dark comb honey, little demand, 15@16c. Light honey, in larger boxes, 12@16c. Extracted—white clover, 9½@10c.; dark, 8@9c., in barrels and half-barrels. Kegs will bring but a small advance, if any, above half-barrels.

BEEWAX—Very scarce. Choice Yellow, 30c.; dark to fair, 20@24c.

R. A. BURNETT, 165 South Water St.

SAN FRANCISCO.

HONEY—There is considerable amber and dark and candied extracted offering. A small sale of light amber, in barrels, was made at 9c. For dark and candied extracted 7½c. is a full figure.

White comb, 18@20c.; dark to good, 12@15c.; extracted, choice to extra white, 9@10c.; dark and candied, 7½c.

BEEWAX—We quote 25@28c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and slow. We quote, in lots, comb at 15@17c.; strained at 6@7c.; extracted at 9@10c.

BEEWAX—Prime bright quotable at 26@27c.

R. C. GREER & Co., 117 N. Main Street.

CLEVELAND.

HONEY—The demand for comb honey, in sections, continues very good, at the following prices: Best quality white, in 1 lb. sections, sells for 21@22c. per pound, in attractive packages. Same quality, in less attractive shape, 20@21c. In 1½@2 lb. sections, white, best quality, 19@20c. Second quality, of all grades, sells about 2 cents ½ lb. less. Extracted, in small packages, tin pails and cans sells at 12@15c.; but extracted, in barrels, is slow at 9@12c.

BEEWAX—Prime quality, 25@28c.

A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HONEY—The arrivals of honey are light, and some fancy lots held above quotations, but the actual demand is very slow.

We quote: White clover, fancy, small boxes, 19@20c.; white clover, fair to good, 16@18c. Buckwheat, 13@16c.

BEEWAX—The supply of wax has been more liberal the past week, and 26@30c. for top prices for large cuts, though in a small way sales are reported 1@2c. higher.

Western, pure, 29@30c.; Southern, pure, 30@31c.
D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Sells very readily in 1 lb. sections at 22@25c. for best white, and 20@22c. for 1½ to 2 lb. Boxes containing ½ pound, 30c. per pound. Extracted is selling very slowly at 12@14c.

BEEWAX—25@26c.

CROCKER & BLAKE, 57 Chatham Street.

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about eight words; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole is paid in advance:

For 4 weeks.....	10	per cent. discount.
" 8 ".....	20	" " " "
" 13 " (3 months)....	30	" " " "
" 26 " (6 months)....	40	" " " "
" 39 " (9 months)....	50	" " " "
" 52 " (1 year).....	60	" " " "

Discount, for 1 year, in the MONTHLY alone, 25 per cent.—6 months, 10 per cent.—3 months, 5 per cent.—if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent.—6 months, 20 per cent.—3 months, 10 per cent.—if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

A few of our subscribers are in arrears for the present year—having requested us to continue, and they would pay soon. Will all such please take this as a request to send on the two dollars with a renewal for next year, if possible.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to new Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....	\$1 00
" 100 colonies (220 pages).....	1 50
" 200 colonies (420 pages).....	2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

CLUBBING LIST.

We supply the American Bee Journal and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

Binder for Weekly for 1882.....	2 75..	2 50
The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.		

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

Kendall's Spavin Cure is used from the Atlantic to the Pacific coast.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

The BEE JOURNAL is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Every lady should send 25 cents to Strawbridge & Clothier, Philadelphia, and receive their Fashion Quarterly for six months. 1,000 illustrations and four pages new music each issue.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

DARWINISM with its theory of the evolution of man from the animals and his extinction at death overthrown. A personal God and an eternal existence for man proven by science. Fidelity and Materialism dethroned. The *Wave theory of Sound*, taught in colleges and high schools for 2,000 years, proven to be a stupendous scientific fallacy. Revolutionary in Science and the most remarkable book of this or any other age. Royal Octavo, 628 double column pages, handsomely bound and containing very superior likenesses of the great scientists of the age. Darwin, Huxley, Hembholtz, Mayer, Tyndall and Haeckel. \$2, by mail, postpaid. Local and Travelling Agents Wanted. Circulars, with table of contents and "opinions of the press," and of Clergymen, Professors in Colleges, etc., free to all.

J. H. ROBERTSON,
36wtf Pewamo, Ionla Co., Mich.

The Bee-Keeper's Guide; OR, MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 15 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book:

All agree that it is the work of a master and of real value.—*L. Apiculture, Paris.*

I think Cook's Manual is the best of our American works.—LEWIS T. COLBY.

It appears to have cut the ground from under future book-makers.—*British Bee Journal.*
Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYKHOOP.

This book is just what everyone interested in bees ought to have, and which, no one who owns it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald, Monticello, Ill.*

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—WM. VAN ANTWERP, M. D.

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Love Stock Record.*

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—L'ABBE DU BOIS, editor of the *Bulletin D'Apiculture, France.*

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat, Pulaski, N. Y.*

We have perused with great pleasure this *modus operandi* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist, Quebec.*

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist.*

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the completion of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor.*

PRICE—Bound in cloth, \$1.25; in paper cover, \$1.00 by mail prepaid. Published by

925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Munnal of the Aptary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.— The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.— This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.— This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.— This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.— A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Aptary for Pleasure and Profit, by Thomas G. Newman.—Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Bienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon Theory,— presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine, by Thomas G. Newman.— This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.— This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.— A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their aptary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman.— Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.— Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.— Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 cents postpaid.

Chicken Cholera, by A. J. Hill.— A treatise on its cause, symptoms and cure. Price, 25c.

Kendall's Horse Book.— No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

EARS FOR THE MILLION!

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carcharodon Rondeletii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthy noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

To avoid loss in the mails, please send money by REGISTERED LETTER.

Another Editorial Change.—On the first of January next, the *British Bee Journal* is to change hands. The present editor, Mr. C. N. Abbott, who has done very much to encourage and advance the interests of bee-keepers in Great Britain, will retire, and the Rev. Herbert R. Peel, the honorary secretary of the British Bee-Keepers' Association, will be duly installed as its editor. While extending our congratulations to Mr. Abbott for his able management in the past, we welcome the new editor, Mr. Peel, through whose exertions the British Bee-Keepers' Association has been made so much of a success.

Mr. James Anderson, the apiarist from Scotland, who is on his way home now, after a tour of this country for the past 4 months, called at the BEE JOURNAL office last Thursday. He goes to New York, and thence to Glasgow, where he will, no doubt, be welcomed home by the Caledonian bee-keepers, among whom he is one of the most progressive and successful.

Mr. George Doolittle, of Bridgeport, Conn., has sent us some fasteners for holding the wires in frames, which he desires us to place in the BEE JOURNAL Museum, for the inspection of visitors, which we have cheerfully done. They consist of small links of a metal chain cut in twos so as to form little staples.

We had a pleasant call from Mr. O. O. Poppleton, of Williamstown, Iowa, on Friday last. He was on his way to Florida, to spend the winter.

Jordan's White Sulphur Springs, we notice by the *Baltimorean*, is to undergo many valuable improvements during the winter. Mr. Jordan, who is one of the most thorough and progressive apiarists in Virginia, is also the very popular proprietor of the "Springs," which is one of the leading summer resorts of the Southeast. We have received an invitation to spend a few weeks there next summer, and should be delighted to accept, could we leave the office for so long.

We notice a very complimentary item in the Union City, Ind., *Eagle*, showing a correspondent's appreciation of the BEE JOURNAL, and the benefit it has been to him in the management of his bees.

The Quarterly Report of the Kansas State Board of Agriculture, for the quarter ending September 30, has just been issued.

The report contains the acres and product of principal crops, by counties, accompanied by market quotations of the Kansas City market for each month from January, 1877, to September, 1882, for the crops of wheat and corn and can be obtained by addressing the Secretary, Wm. Sims, Topeka, Kansas, and inclosing the necessary postage, three cents.

Honey, according to A. Vogel, says the *Scientific American*, contains on an average one per cent of formic acid. Observing that crude honey keeps better than that which has been clarified, E. Mylius has tried the addition of formic acid, and found that it prevents fermentation without impairing the flavor of the honey.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

Sir J. Lubbock's New Book on Bees.

ANTS, BEES AND WASPS. A Record of Observations, on the Habits of Social Hymenoptera. By SIR JOHN LUBBOCK, M. P., F. R. S., etc. New York: D. Appleton & Co. 1882. Price, \$2.00.

We have received from the publishers the above work for review in the AMERICAN BEE JOURNAL.

As stated by the author, it is a "record of observations" which were, doubtless, made with much care, but not for the purpose of sustaining any theory regarding them, but to ascertain existing facts. In his preface, the author says: "My object has been not so much to describe the usual habits of these insects as to test their mental condition and powers of sense." And, in another place, he says: "I have endeavored, therefore, by actual experiments, which anyone may and I hope others will, repeat and verify, to throw some light on these interesting questions."

But few scientific workers have spread their interests over so wide a field as Sir John Lubbock; but we may easily discover that a thread of continuity runs through all of them. His researches into the habits of bees, wasps and ants, deal with the evolution of social communities from the lower types of life. He holds that the ants are the nearest to man in social organization and general intelligence, though the apes are nearer in bodily structure. Ants even show some indication of progressive development among themselves. Some of them live by the chase, as do hunting savages; others, more highly evolved, resemble the pastoral races of men, because they have domesticated the aphides; the harvesting ants have risen still higher in civilization, and reach the agricultural man. He finds in their nests, analogy to human societies, in their marked division of labor, their elaborate architecture, their regular roadways, and in their peculiar institution of slavery. In some of these things, bees, also, show their near approach to man's intelligence.

At first, Sir John Lubbock intended to confine his experiments to bees and wasps, but he found these insects with wings were unpleasantly excitable in temper and could easily elude his watchfulness. This led him to deal more particularly with the ants, which were much easier to observe from every point of view.

Hour after hour did the author watch his bees and wasps with unceasing care, and he has recorded their

movements with minuteness in this volume.

The author thinks that bees and ants have, in their antennae, some means of communication with one another. His experiments on the perception of color by the bees show that they can distinguish all the hues as well as can man, and these observations will, in some measure, at least, account for the origin and development of the prismatic hues of flowers.

In order to show the author's experiments in detail on many mooted points, we will here give some extracts from Chapter X. Sir John Lubbock says:

As already mentioned, the current statements with reference to the language of social insects depend much on the fact that when one of them, either by accident or in the course of its rambles, has discovered a stock of food, in a very short time many others arrive, to profit by the discovery. This, however, does not necessarily imply any power of describing localities. If the bees or ants merely follow their more fortunate comrade, the matter is comparatively simple; if, on the contrary, others are sent, the case becomes very different.

In order to test this I proposed to keep honey in a given place for some time, in order to satisfy myself that it would not readily be found by the bees; and then, after bringing a bee to the honey, to watch whether it brought others, or sent them—the latter of course implying a much higher order of intelligence and power of communication.

I therefore placed some honey in a glass, close to an open window in my sitting-room, and watched it for sixty hours of sunshine, during which no bees came to it.

I then, at 10 a. m., on a beautiful morning in June, went to my hives, and took a bee which was just starting out, brought it in my hand up to my room (a distance of somewhat less than 200 yards), and gave it some honey, which it sucked with evident enjoyment. After a few minutes it flew quietly away, but did not return; nor did any other bee make its appearance.

The following morning I repeated the same experiment. At 7:15 I brought up a bee, which sipped up the honey with readiness, and after doing so for about four minutes flew away with no appearance of alarm or annoyance. It did not, however, return; nor did any other bee come to my honey.

On several other occasions I repeated the same experiments with a like result. Altogether I tried it more than twenty times. Indeed, I rarely found bees to return to honey if brought any considerable distance at once. By taking them, however, some twenty yards each time they came to the honey, I at length trained them to come to my room. On the whole, however, I found it more con-

venient to procure one of Marriott's observatory hives, both on account of its construction, and also because I could have it in my room, and thus keep the bees more immediately under my own eye. My room is square, with three windows, two on the southwest side, where the hive was placed, and one on the southeast. Besides the ordinary entrance from the outside, the hive had a small postern door opening into the room; this door was provided with an alighting-board, and closed by a plug; as a general rule the bees did not notice it much unless the passage was very full of them.

I then placed some honey on the table close to the hive, and from time to time fed certain bees on it. Those which had been fed soon got accustomed to come for the honey; but partly on account of my frequent absence from home, and partly from the difficulty in finding their way about, and their tendency to lose themselves, I could never keep any marked bee under observation for more than a few days. . . . I might give some other similar cases, but these are, I think, sufficient to show that bees do not bring their friends to share any treasure they have discovered, so invariably as might be assumed from the statements of previous observers. Possibly the result is partly due to the fact that my room is on the top floor, so that the bees coming to it flew at a higher level than that generally used by their companions, and hence were less likely to be followed.

Indeed, I have been a good deal surprised at the difficulty which bees experience in finding their way.

For instance, I put a bee into a bell-glass 18 inches long, and with a mouth 6½ inches wide, turning the closed end to the window; she buzzed about for an hour, when, as there seemed no chance of her getting out, I put her back into the hive. Two flies, on the contrary, which I put in with her, got out at once. At 11:30 I put another bee and a fly into the same glass; the latter flew out at once. For half an hour the bee tried to get out at the closed end; I then turned the glass with its open end to the light, when she flew out at once. To make sure, I repeated the experiment once more, with the same result.

Some bees, however, have seemed to me more intelligent in this respect than others. A bee which I had fed several times, and which had flown about in the room, found its way out of the glass in a quarter of an hour, and when put in a second time came out at once. Another bee, when I closed the postern door which opened from my hive directly into my room, used to come round to the honey through an open window.

One day (April 14, 1872), when a number of them were very busy on some berberries, I put a saucer with some honey between two bunches of flowers; these flowers were repeatedly visited, and were so close that there was hardly room for the saucer between them, yet from 9:30 to 3:30 not a single bee took any notice of the honey. At 3:30 I put some honey on one of the bunches of flowers, and it

was eagerly sucked by the bees; two kept continually returning till past five in the evening.

One day, when I came home in the afternoon, I found that at least a hundred bees had got into my room through the postern and were on the window, yet not one was attracted by an open jar of honey which stood in a shady corner about three feet five inches from the window.

Another day (April 29, 1872), I placed a saucer of honey close to some forget-me-nots, on which bees were numerous and busy; yet from 10 a. m. till 6 only one bee went to the honey.

I put some honey in a hollow in the garden wall opposite my hives at 10:30 (this wall is about five feet high and four feet from the hives), yet the bees did not find it during the whole day.

On March 30, 1873, a fine, sunshiny day, when the bees were very active, I placed a glass containing honey at 9 in the morning on the wall in front of the hives; but not a single bee went to the honey the whole day. On April 20 I tried the same experiment with the same result.

September 19.—At 9:30 I placed some honey in a glass about four feet from and just in front of the hive, but during the whole day not a bee observed it.

As it then occurred to me that it might be suggested that there was something about this honey which rendered it unattractive to the bees, on the following day I first placed it again on the top of the wall for three hours, during which not a single bee came, and then moved it close to the alighting-board of the hive. It remained unnoticed for a quarter of an hour, when two bees observed it, and others soon followed in considerable numbers.

It is generally stated not only that the bees in a hive all know one another but also that they immediately recognize and attack any intruder from another hive. It is possible that the bees of a particular hive have a particular smell. Thus Langstroth, in his interesting Treatise on the Honey Bee, says, "Members of different colonies appear to recognize their hive companions by the sense of smell;" and I believe that if colonies are sprinkled with scented syrup they may generally be safely mixed. Moreover, a bee returning to its own hive with a load of treasure is a very different creature from a hungry marauder; and it is said that a bee, if laden with honey, is allowed to enter any hive with impunity. Mr. Langstroth continues: "There is an air of roguery about a thieving bee which, to the expert, is as characteristic as are the motions of a pickpocket to the skillful policeman. Its sneaking look and nervous guilty agitation, once seen, can never be mistaken." It is at any rate natural that a bee which enters a wrong hive by accident should be much surprised and alarmed, and would thus probably betray herself.

So far as my own observations go, though bees habitually know and return to their own hive, still, if placed on the alighting-board of another, they often enter it without molestation.....

Though bees which have stung and lost their sting always perish, they do not die immediately; and in the meantime they show little sign of suffering from the terrible injury. On August 25, a bee which had come several times to my honey was startled, flew to one of the windows, and had evidently lost her way. While I was putting her back she stung me, and lost her sting in doing so. I put her in through the postern, and for twenty minutes she remained on the landing stage; she then went into the hive, and after an hour returned to the honey and fed quietly, notwithstanding the terrible injury she had received. After this, however, I did not see her any more.

Like many other insects, bees are much affected by light. One evening, having to go down to the cellar, I lit a small covered lamp. A bee which was out came to it, and flying round and round like a moth, followed me the whole of the way there.

I often found that if bees which were brought to honey did not return at once, still they would do so a day or two afterwards. For instance, on July 11, 1874, a hot thundery day, and when the bees were much out of humor, I brought twelve bees to some honey; only one came back, and that one only once; but on the following day several returned.

My bees sometimes ceased work at times when I could not account for their doing so. October 19 was a beautiful, sunshiny, warm day. All the morning the bees were fully active. At 11:25 I brought one to the honey-comb, and she returned at the usual intervals for a couple of hours; but after that she came no more, nor were there any other bees at work. Yet the weather was lovely, and the hive is so placed as to catch the afternoon sun.

.....
Far, indeed, from having been able to discover any evidence of affection among them, they appear to be thoroughly callous and indifferent to one another. As already mentioned, it was necessary for me occasionally to kill a bee; but I never found that the others took the slightest notice. Thus, on Oct. 11, I crushed a bee close to one which was feeding—in fact, so close that their wings touched; yet the survivor took no notice whatever of the death of her sister, but went on feeding with every appearance of composure and enjoyment, just as if nothing had happened. When the pressure was removed, she remained by the side of the corpse without the slightest appearance of apprehension, sorrow or recognition. She evidently did not feel the slightest emotion at her sister's death, nor did she show any alarm lest the same fate should befall her also. In a second case exactly the same occurred. Again, I have several times, while a bee has been feeding, held a second bee by the leg close to her; the prisoner, of course, struggled to escape, and buzzed as loudly as she could; yet the bee which was feeding took no notice whatever. So far, therefore, from being at all affectionate, I doubt whether bees are in the least fond of one another.....

Thus in nine experiments, out of the

ninety-seven bees which came out first, no less than seventy-one were marked ones, though out of the whole number of bees in the hive there were only twelve marked for this purpose, and, indeed, even fewer in the earlier experiments. I ought, perhaps, to add that I generally fed the bees when I called them out.

THE SENSE OF HEARING.

August 29.—The result of my experiments on the hearing of bees has surprised me very much. It is generally considered that to a certain extent the emotions of bees are expressed by the sounds they make, which seems to imply that they possess the power of hearing. I do not by any means intend to deny that this is the case. Nevertheless I never found them take any notice of any noise which I made, even when it was close to them. I tried one of my bees with a violin. I made all the noise I could, but to my surprise she took no notice. I could not even see a twitch of the antenna. The next day I tried the same with another bee, but could not see the slightest sign that she was conscious of the noise. On August 31 I repeated the same experiment with another bee with the same result. On September 12 and 13 I tried several bees with a dog-whistle and a shrill pipe; but they took no notice whatever, nor did a set of tuning-forks which I tried on a subsequent day have any more effect. These tuning-forks extended over three octaves, beginning with *a* below the ledger line. I also tried with my voice, shouting, etc., close to the head of a bee; but, in spite of my utmost efforts, the bees took no notice. I repeated these experiments at night when the bees were quiet; but no noise that I could make seemed to disturb them in the least.

In this respect the results of my observations on bees entirely agreed with those on ants, and I will here, therefore, only refer to what has been said in a preceding chapter.

THE COLOR SENSE OF BEES.

The consideration of the causes which have led to the structure and coloring of flowers is one of the most fascinating parts of natural history. Most botanists are now agreed that insects, and especially bees, have played a very important part in the development of flowers. While in many plants, almost invariably with inconspicuous blossoms, the pollen is carried from flower to flower by the wind, in the case of almost all large and brightly colored flowers this is effected by the agency of insects. In such flowers the colors, scent, and honey serve to attract insects, while the size and form are arranged in such a manner that the insects fertilize them with pollen brought from another plant.

There could, therefore, be little doubt that bees possess a sense of color. Nevertheless I thought it would be desirable to prove this if possible by actual experiment, which had not yet been done: Accordingly on July 12 I brought a bee to some honey which I placed on blue paper, and about 3 feet

off I placed a similar quantity of honey on orange paper. After she had returned twice I transposed the papers; but she returned to the honey on the blue paper. After she had made three more visits, always to the blue paper, I transposed them again, and she again followed the color, though the honey was left in the same place. The following day I was not able to watch her; but on the 14th, at 7:29 a. m., she returned to the honey on the blue paper; she left at 7:31 and returned at 7:44; she again left at 7:51 and returned at 7:56.

I then again transposed the papers. At 8:5 she returned to the old place, and was just going to alight; but observing the change of colors, without a moment's hesitation darted off to the blue. No one who saw her at that moment could have entertained the slightest doubt about her perceiving the difference between the two colors.

The book is a very interesting one and we can supply it at the publishers' price, postpaid.

MISCELLANEOUS.

Bee-keeping in Maine.—Mr. E. P. Churchill writes thus to the *Home Farm*, concerning his fall and winter management of bees:

This season has been rather a poor one, on the whole, for bees, until a few weeks ago, when the honey was coming in much faster than at any other time and all looked bright; but a few cold days shut them up for a time; and more than the cold, we have now had a very heavy rain for a number of days, which will wash out and dilute much of the nectar that was so plenty in the goldenrod, and what few other fall flowers there are. But if the month opens clear and warm for a few days we are in hopes of an opportunity for a little more stores for wintering. But be the case as it may, let us attend to them at once, to know just how every colony is.

If they are on a full set of frames there should be about one-half taken out as soon as the brood is all hatched or out of the cells, and a division board set down on each side of what frames are left, and leaves filled in the open spaces. I find cedar shingles make the best division boards, by running the thin ends to lap each other so as to be one-fourth of an inch shorter than the hive, and deep enough to come up level with the tops of the frames; then clear them at each end and in the middle, and have them perfectly square and even; then tack one thickness of woolen cloth on the bottom and enough on the ends to cause them to fit snug when run down. I

leave a few inches of cloth on the upper ends to roll down and tuck down into the ends of the boards. This is very handy, as it is always ready, keeps all snug, and also keeps the bees from getting outside. There need not be strips of cloth on the tops of the boards, as the cloth that covers the frames will answer. Now this is done there should be a chaff cushion on the cloth over the frames. A bran sack is a good and cheap article for this purpose and oat chaff the best, but if this chaff is not to be obtained, about half very dry leaves and sawdust mixed will do. The cushion should be four inches thick and filled out even at all corners, and packed down quite snug. If the rims and cap are all nailed together, I would take the cap off and put strips under at each end so as to shut outside of the rim; then there is a good chance to do all packing, etc., very handily.

One who has never used hives thus, will be surprised with one trial, for it is impossible to do the packing thoroughly with the rim and cap altogether. There should, of course, be no cracks, no holes for the least rain to get in, but there should be an inch air hole at each end and at the side of the rim near the top, bored slanting to turn water, and wire cloth tacked inside. These will take away the moisture that passes up through the packing, and keep the bees dry and warm. I did not lose one-half a pint of bees from my two heaviest colonies last winter packed in this manner.

Food Adulterators.—The *Western Rural* contains the following very sensible article on food adulterations, and the way to punish the adulterators:

Our coming legislatures in the West will need give some further attention to the subject of adulterating food products. In Illinois and in some other States we have some pretty good statutes touching upon this matter, but, perhaps, they are all susceptible of improvement, and if not, we sincerely believe that all attempts to legislate in such cases, are a most excellent means of agitation and of arousing the people to action. We are among those who believe that we should be vastly better off if we had less law making, but as we seem to be fated to have the infliction of a legislature every year, or every two years at least, we are in favor of their making all the noise possible on such important questions as that of putting a stop to the infamous work of the adulterators. The last legislature of Illinois gave us a very fair law against the sale of bogus butter as the genuine article, and for a time, there was an energetic and successful effort to enforce the law. Recently, however, there seems to have been a suspicious calm after the storm, and a corresponding suspicious flavor to a considerable of the butter that is found in the market. There are fairly grounded fears that the people have gone to sleep, and if we can get the legislature to discuss the matter again,

and some such man as Evans, of Kane county, running about to raise a corruption fund to prevent legislation against food adulteration—as was the case when our last legislature sat—it will undoubtedly have the effect of once more attracting public attention.

We have about the least patience with food adulterations that we are called upon to manifest. The common swindler who assaults the pocket-book alone, will probably meet in time something like just punishment in the penitentiary; but the conscienceless scamp who robs us of both our money and our health, can never be punished according to his deserts; and the knowledge of this greatly irritates us. Our farmers are quietly engaged in raising products which support our population and add wealth to the nation. They are producing the flour which makes our bread, the honey and syrups which sweeten it, the sugar that makes our tea and coffee palatable, the butter and cheese and vinegar which we demand for daily consumption; and with the railroad to cut deeply into his profits, boards of trade to gamble with his products, until prices are forced down below what they ought to be, and with the tax collector demanding of him his own tax and the tax of a whole horde of tax shirkers besides, he stands poor enough show, without being compelled to compete with dishonest imitators of the products named. But without stringent legislation to prevent it, our stores are filled with adulterated flour, glucose for honey and the sweets of the cane, oleomargarine butter and cheese, and vile acids for cider vinegar. It costs next to nothing to manufacture these imitations, and if they are sold a few cents cheaper than the genuine articles are sold for, under the representation that they are first-class, which they often look to be and taste as if they were, it does not require much perception to see that an incalculable injury is done the honest producer. During the last half dozen years we believe that millions of dollars have been wrongfully taken from the pockets of our farmers through the audacious adulteration of farm products, and during that time we have no doubt that thousands have lost their lives by eating such imitations. The business, therefore, assumes a most villainous character, in whatever light it is viewed, and there is no class of our people, except those who are engaged in the disreputable business, that is not interested in having a stop put to it. The legislatures or Congress—and there is great need of national legislation upon this subject—cannot find a more hearty or universal support in legislation than they will find in any attempt to protect the producer and consumer from these greedy leeches. The *Rural*, in behalf of the producer, demands that the market shall be cleared of bogus food products which are not so marked as to convey a clear idea of their character. When so marked, they will not be very productive of harm, for the great majority of people will not purchase imitations if they know what they are.

CORRESPONDENCE

For the American Bee Journal.

How I Built My Bee Cellar.

G. M. DOOLITTLE.

During the winter of 1875-6, I ascertained that P. H. Elwood, Capt. J. E. Hetherington, and other extensive apirists in Herkimer, Montgomery and Otsego counties, N. Y., wintered their bees quite successfully in what was called "mud huts."

These were made by digging a place, about four feet deep, in the ground, and providing a good drain therefor. Timbers were laid on the ground for the plates, upon which was placed the roof, which was about five feet high from the bottom, at the sides; and in the center, from 7 to 9, according to the width of the cave. The whole was then covered with earth to the depth of 2 to 3 feet. Over the earth was placed another roof to keep the dirt between the upper and lower roof dry. In the front end a portion was partitioned off, in which was placed a stove, the heat from which was made to permeate the bee cellar as desired, so as to maintain the temperature considered necessary for successful wintering.

After the chaff packing had been decided to be a success, I conceived the idea of wintering a part of my bees out on their summer stands, and a part in the cellar, thus working on the plan which is called "mixed farming" by those tilling the soil about here. Accordingly, in 1876, I prepared chaff hives for a part, and built a cheap temporary cellar for the rest. Instead of regulating the temperature with stoves, as was done by my bee friends of the East, I placed this temporary cellar in a hillside, believing that, if it went into the earth deep enough, an even temperature would be maintained without the aid of a stove, which proved to be a fact, for the temperature in this cellar did not change more than two degrees during all the winter.

After using it a few years I ascertained that a winter that was favorable for outdoor wintering was not as favorable for cellar wintering, and *vice versa*, thus proving that the plan of mixed wintering was a good one.

In the spring of 1879, out of ninety left on their summer stands, only fifteen came through; while fifty-three out of sixty, wintered in this cellar, came out in excellent condition. The following spring, after a very mild winter, all those out of doors came out strong, while the bee-cellar gave a loss of 10 per cent. However, the percentage of loss for the term of six years was far greater out of doors than in the cellar; hence this fall I have put up a permanent bee-cellar in place of the temporary one, and shall hereafter winter at least half of my bees in it.

Near my apiary is a small knoll, and into this I dug thirty-two feet, by nine

feet wide. A drain was then dug around the outside, which was eighteen inches deep at the front, and six inches at the back. This drain was filled up level with the ground, or floor of the cellar, with small stone. From the lowest point of this drain I dug a ditch one hundred feet long, in which was placed two tiers of three and one-half inch tiles, one above the other, and so arranged as to serve the place of ventilation and drain combined, if any water should accumulate in the drain around the cellar. These tiles were covered to the depth of about three feet, so as to warm the air as it came to the bee-cellar. Upon the drain around the cellar, a good wall was built of stone, laid up with mortar, which is five feet eight inches high and gives me a cellar twenty-four feet long and six and one-half feet wide inside. Upon the top of the wall I placed plates 4x6 inches square, bedding them in mortar, which raised my walls to six feet high. Upon these plates, rafters were placed close together, so as to hold a great weight, and then covered with inch boards. A ventilator was placed in the opposite end, giving about two-thirds the capacity of the other, when the whole was covered to the depth of three and one-half feet with dry earth; over this was placed an outer roof, which extends six feet farther out than the wall on either side, and a good incline was given, to conduct all the water off.

The front end of the cellar is three and one-half feet lower than the surface of the ground about it, while the back end is about ten feet. I intended to grout the bottom with gravel and mortar, but the ground was so hard and dry that I have postponed it, for the present at least. At the end next the bee yard, I placed three well-built door frames, which were two feet apart from center to center. To these were spiked plank at the sides and on top, and covered with earth (with a slope wall standing out toward the bee-yard, so as to have as much earth here as elsewhere), over which the outer roof is allowed to come, so as to keep all dry. A door is hung on each door frame, which gives three doors and two dead air spaces, of two feet each, before the cellar is reached. The total cost of this cellar is a few cents over \$75.

The hives are to be set around the outside of the cellar, one on top of the other, with chaff, or fine straw used as packing, the same as if they were to be left out of doors. As an experiment I shall leave one row of hives with the entrance the same as they are when on the summer stand; another row will have the full entrance, a third be raised on half-inch blocks, and the fourth upon inch blocks.

The cellar will hold eighty hives and leave plenty of room for an aisle to the back end, and 120 if filled full. One-fourth of my colonies of bees were placed in this bee-cellar on Nov. 3d, and to-morrow I shall put in one-fourth more. In one week I shall place in another fourth, and on the first of December the remainder, which are to be placed therein, and see which

winters the best. Although the thermometer marks 40° inside, those already in are so still that scarcely a sound from them can be heard, but I find those raised on the inch blocks are aroused quicker by the light of the lamp when taken in.

About one-half of my number will be left on the summer stands, thoroughly packed in chaff, as heretofore, for I think such a course gives the best results, taking a number of years together.

If anyone could tell just what the winter would be beforehand, I would place my bees in the cellar for a cold winter, and leave them out during a mild one; but as no one can do this, I adopt the above, considering it the best, all things considered.

Borodino, N. Y., Nov. 10, 1882.

For the American Bee Journal.

Wintering Bees in Chaff.

E. B. SOUTHWICK.

I have noticed some articles on wintering bees in chaff from some of our most consistent bee-keepers, and I think they are good, very good. I agree with them in what is necessary for successfully wintering our bees: that is, the bees should be young, healthy, and plenty of them; they should be kept dry and comfortable the entire season; they should have just food enough to keep them, and that easy of access at all time. If we can do this we may defy long, cold winters and all their consequences.

We have different ways of producing the same effect. Mr. Heddon's way is very good, and I think it will succeed; but I think it is more work, and not so handy, as Mr. Poppleton's; I suppose it is as good; as anyone could fix up such a hive as he uses.

Mr. Poppleton's way is so near like mine, that I will say nothing about it, only where it differs from mine. He says he has used his seven years, I have used mine about the same time, and think I have not lost a colony that was good in the fall, that did not die of starvation.

My way of packing and unpacking is as follows: My hive, inside, is 13 in. wide, 12 in. deep, and as long as I wish to have it. There is a space on each side of 4 inches to pack with chaff or leave as a dead air space,—and experiments have convinced me that the dead air space is as good without the chaff as with it. The back end board is loose and fastened in its place by a clasp across the end of the hive; it can be moved backward or forward to increase or diminish the size of the hive, at pleasure; the frame is made to stand on the bottom and not hang in the hive; it has a division in the centre and a slot that runs nearly from the top to the bottom; this slot answers instead of the holes that Mr. Poppleton makes in his combs, and the sticks that Mr. Heddon places across the top of his frames—that is, they all allow the bees to move comfortably from one part of the hive to another.

The frames run crosswise of the hive and the bees go in at the side instead of the ends of the frames; this I think better for several reasons. I will mention one: We find in all good colonies when the honey season closes, a quantity of brood in the centre of the hive, and as this brood hatches out, the bees bring the honey farthest from the centre to fill up the combs; in my hives they generally empty the front and back combs entirely, so that, when I pack up, I can remove them, but in long frames, and where they go in at ends of short ones, they will remove the honey from the ends of the frames to the centre, so that we cannot remove the frames without removing the honey they need for winter, and consequently have a quantity of unoccupied room at the ends of the frames, which I very much dislike in packing.

This is my plan for fixing them up for winter. I wait three or four weeks after the bees have stopped gathering honey, and then I commence by taking out all the combs and putting in front a cushion, $2\frac{1}{2}$ inches thick; this closes all the outlets for the bees, except one, 2 inches by $\frac{3}{8}$ inches, through which the bees can pass under the cushions to the frames. I then select from three to five combs (according to the size of the colony) well filled with honey, and put them in front next to the cushion, and if there are more of such, I brush off the bees and put them away for other colonies or for spring use. I then put in those partly filled, the heaviest first, until all are in that have any honey in, then put in the end board and cover up the hive. I let them remain two or three weeks longer, then open the hive; and if the weather has been warm, I will find that the bees have carried most of the honey from back combs to those partly filled near the center. I then remove all the combs except five to eight in front, put in a cushion like the front one, behind these, and put in the end board, put cloth over the frame, put on the surplus honey case or upper story, and in this place a thick cushion, tuck it down all round, put on the top and it is done. The cushion should not reach to the top into an inch or more.

Now for the unpacking. As we cannot tell what the weather will be in the spring, we cannot set any day to commence, but when I see the oak leaves begin to grow, I take off the front cushion, and when the corn begins to grow rapidly, I take off the back cushions, but I generally leave on the top one until I want the room for the sections.

Allow me to give an opinion or two of my own. I know that such are worthless without proof, but somebody else may prove them. Feeding to produce breeding I think is entirely wrong; for breeding out of season, in my opinion, uses up more bees than it produces, and those reared late in the season are not worth as much in the spring as those that reared them would have been, had they not reared them. Early breeding amounts to the same, and both are productive of spring dwindling.

The convention at Chicago was a good one, just such as I like to attend, where I can exchange thoughts and ideas, which are always useful. Some one there said Mr. Heddon had changed. Well, really! When you show me a man that never changes, I will show you a god or a fool. There is nothing more admirable in a man than for him to as publicly admit that he is wrong, if convinced, as he previously advocated it. I think Mr. Heddon belongs to that society, the first tenet of which is, "Do right because it is right, and not for love, fear or policy." Such being the case, we shall always expect an honest opinion from him whether it agrees with his previous assertions or not.

Mendon, Mich.

For the American Bee Journal.

The Syrian or Holy Land Bees.

REV. M. MAHIN, D. D.

It has been well said that the new races of bees are our trial; and, the only way to try them and ascertain their merits and demerits, is to place them side by side with the Italians, give them precisely the same treatment, and note the results. I have had one of them, the Syrian, on trial for more than a year past, and it will take me another year, at least, to decide whether I will supplant my Italians with them or not. I have never seen a Cyprian bee, and I have not much curiosity to try them, owing to their bad reputation for stinging qualities; but I have 22 colonies of Syrian or Holy Land bees, and I wish to report the results of my trial of them, so far. The most of those I had last summer were half-bloods, the queens having mated with Italian drones. In the latter part of the summer I had colonies that were pure.

They have more than sustained their reputation for prolificness; I have never before seen anything like it. I have not fully decided whether their prolificness may not be an objection to them. It is, unless precaution is taken to give them very large hives, or to remove combs of brood frequently and give empty combs or frames to make room for the queen to lay. Unless this is done, the surplus apartment is sure to be filled with brood in the midst of the honey harvest.

Taking the season through, I found the Syrians ahead of the Italians in the amount of honey gathered, with the exception of one or two extra Italian colonies, which equaled, but did not excel the Syrians. I found the half-blood Syrians to be wonderfully productive. Their comb building and honey gathering were marvelous during the time of the greatest yield.

What about their temper? Last fall I found them no more inclined to sting than the Italians. Last spring, while the weather was cool and little or no honey was being gathered, they were very cross, and it was exceedingly difficult to do anything with them; but when the flowers began to yield honey they were as gentle as could be

desired; and this fall, while preparing them for winter, in which process I handled every comb in every hive, I found them quite as manageable as my Italians. In fact I got more stings from the Italians than from the Syrians. I am of opinion that they learn gentleness from careful handling, more readily than either blacks or Italians.

I cannot express any very positive opinion in regard to their wintering qualities. I will probably know more on that subject in four or five months from now; but my observation is very different from Mr. Doolittle's. He represents the Syrians as being more restless than Italians; on the contrary, the most remarkable characteristic of mine last winter was their unusual quietness.

In the fall, after the flowers were all gone, we had many days of warm sunshine; and while the Italians were out in full force every day, very few Syrians were seen about the entrances of the hives, except once in several days when they would take a good fly. And what was true of them in the fall, was true during all of the warm weather last winter. While the Italians could fly the whole of every warm day, the Syrians would only fly for an hour or two, once in several days; no matter how warm the weather might be. I have not noticed much, if any, difference between the two races, in this particular, this fall; for we have had no warm weather when they could not find something to work on. They were carrying pollen on Nov. 11, and seemed to be loaded with honey also.

It may be that, in a locality in which there is very little honey to be gathered after basswood, the Syrians may not be desirable; but up to the present time I am inclined to give them the preference over all others.

Huntington, Ind., Nov. 14, 1882.

For the American Bee Journal.

Bees for Business—A Report.

S. A. SHUCK.

Enormous reports from single colonies have been given from all parts of the country, and great claims are being made for the various races of bees, especially the Cyprians and Syrians. The reports given were from entire apiaries and a few select or single colonies; and, in most cases, where large yields are reported from a few select colonies, the average for the entire apiary was only ordinary, and, in some instances, the average was small.

Mr. Carroll, of Texas, reports 1,000 pounds from one colony and its increase, and 800 lbs. from a single colony, yet this 1,800 lbs. is nearly one-third of the entire product of 36 colonies.

Mr. Heddon and Mr. Doolittle both claim to have superior strains of bees, yet they both complain, more or less, of the frequent occurrence of inferior queens. Mr. Doolittle reports having destroyed fifty or sixty queens, a year ago, on account of their inferiority.

I wish to submit a report of my little apiary for the past season, and

allow the readers of the BEE JOURNAL to judge as to whether, or not, I am entitled to the claim of having a superior strain of bees.

I wish, first, to submit the following table of 30 colonies containing bees on June 1, 1882:

STATISTICAL TABLE.

Number of Colony.	Age of Queen.	No. of Frames occupied, June 1, 1882.	No. Frames of brood and bees given during the season.	No. Frames brood and bees taken away.	Comb Honey, lbs.	Extracted Honey, lbs.	Total product of each hive.

REFERENCES.—a, cast one swarm; b, sold June 7; c, daughter of imported queen; d, cast two swarms; e, young queen, laying; f, virgin queen; g, cast swarm, Aug. 9th; h, hybrid; i, hybrid; j, daughter of imported queen; k, imported queen; l, virgin queen, June 1st; hybrid.

The above-named 30 colonies were all I had left of 50 colonies last fall. Their pitiable condition on June 1, as shown in the table, was due to the extreme wet and cold in March, April and May.

On May 27 I do not think there was a pound of honey in my apiary. The last feeding was done on May 28. The weather, through June and the first half of July, was extremely wet and cool for the time of year. From June 1 to Oct. 1 rain fell on 35 different days.

We have 53 colonies now, with ample provision for winter, and the total amount of honey taken is 4,700 lbs.; 1,097 lbs. of it is comb.

Reckoning nine frames to the hive (the size I use), and allowing for the

nuclei that was sold June 7, I had, on June 1, the bees for 18 full colonies. This gives 261 lbs to the colony, or a little over 28½ lbs. to the frame. Some may object to reckoning in this way, on account of the extra queens; but I know of no other way to come at it fairly, and I think, too, that the disadvantage of having the bees in so many hives more than offsets the advantage of the extra queens.

Our bees are a strain of Italians, procured in August, 1878, of Samuel Replege, Hagarstown, Ind. I have bred them for stripes, industry, hardiness, prolificness, docility and size.

Judging from what I have read in the journals, my bees will not compare in prolificness and color with the Cyprians or Syrians, and some strains of Italian will surpass them in these respects, but for industry, hardiness, docility and size, I do not think I could get better bees anywhere.

As for comb building, my bees, like other Italians, build an excess of drone comb, but for comb honey I see no difference in the whiteness of the comb of that which they build, and that built by black or hybrid bees. In order to satisfy the readers of the BEE JOURNAL, as well as myself, I will forward a sample of my comb honey to the editor, and he may decide for us all in this respect. The greater part of our comb honey was taken off in September, of which the sample is a specimen.

Bryant, Ill.
[The sample of comb honey was received in excellent condition—not a drop of leakage—and presents a very nice appearance. The cappings are exceedingly white, having more of the appearance of that done by black rather than Italian bees. The honey is light, but not the lightest; one of the combs is not fastened to the sides or bottom of the section, as well as we may desire, but on the whole it would grade No. 1 as to marketability.]

—Ed.]
For the American Bee Journal.
Development of "The Coming Bee."
E. L. BRIGGS.

The public bee fraternity are always interested in anything that looks like the improvement of the race of honey gatherers in America, or elsewhere. So I wish to report progress; and offer another prize for the best Italian queen out of eight; to be sent to me at any time before the 1st of July, 1883; to be not over 18 months old; home-bred or imported.

I hereby offer \$25 for the best queen in eight, to be sent to me, by as many different breeders, on or before the 1st of July, A. D. 1883; in addition to the usual price for each queen sent as a contestant for the prize; subject to the following conditions: She must be better than either my Wilson Queen, No. 4; or my Lake Queen, No. 3; or my Henderson Queen, No. 6; in one, or

more, of the five following particulars, viz.:

1. She must be larger in size and produce larger workers and drones than either of the above prize queens.

2. She and her offspring, workers, drones, and queens, must be as bright, or brighter yellow than the above.

3. She, and her worker offspring, must be as gentle, or more so, to handle; clinging to the combs when lifted out, with the same or greater tenacity.

4. Her worker progeny must manifest a greater industry in gathering honey, and filling surplus boxes, than either of the above.

5. She must be the most prolific as a breeder, keeping her colony strongest in numbers.

I reserve to myself the right: 1. To accept the breeder who offers to become a contestant, or reject his offer, at my own option. 2. To keep any one of the queens forwarded, by paying the catalogue price for the same, or one of my young prize queens, in exchange, as the seuder may elect, or, of returning her to the sender, if she does not come up to the standard of those I already have. 3. The sender must pay the expressage to this place; and in all cases, when she is returned, both ways. On the first Thursday in next September the prize to be awarded by a committee of three or five breeders to be named by Thos. G. Newman, editor of the AMERICAN BEE-JOURNAL. At which time I will here, and now, invite a convention of bee-keepers, and others, to assemble and witness the award, and to discuss the interests of the cause generally; for a couple of days, or more.

I make this offer, not in the way of a banter, but in good faith. For I believe that every now and then there will appear a very superior queen, which the producer would perhaps slip off, at the ordinary price, and her superiority would be lost in mingling with ordinary stock. But by a careful selection he not only insures himself the selling price, which he charges, but he stands a chance of getting \$25, in addition. And I make it further, because I am determined, if money, time, patience, and careful selection will do it, to breed the honey-bee up to the highest possible state of perfection. And I am confident that it is best for the whole bee-keeping fraternity that there should be "one best apiary" where stock is bred for perfection; and where it can be procured in its highest purity at any time.

I flatter myself that among the fifty or more tested young queens, now heading as many colonies in my apiary, bred from my three prize mothers of last year, I could select several which would take the prize I offer. And, doubtless, there are other breeders who can do the same. Out of our one hundred other colonies, there are not five, I think, which contain bees with less than three yellow bands. They have all been queened by imported stock, or the best of home-bred mothers. And as to their honey-making qualities, they have filled nearly every receptacle which I have given them to fill, this summer.

Come, fellow workmen, let us correspond, interchange, compare notes, and work together for the "Coming Bee." To this end, under like circumstances, I would like to compete for a similar prize in any part of the country. Let some one try his hand with other races, if he thinks they will prove better producers; whether it be with brown, black, two-banded, or one-banded, Cyprian, Holy-Land, Austrian or Egyptian; there is room enough for all.

But I, with many others, am content with the beautiful, golden hued, gentle, industrious, and prolific Italians. When coming in from the fields of clover and linden, laden with golden drops of nectar, as they drop upon the alighting-board, like a shower of golden drops, I know that it is not the poetry of the matter alone which delights me, but the golden coins as well, which their produce brings.

Wilton Junction, Iowa, Oct. 21, 1882.

For the American Bee Journal.

Bee Notes from Iowa.

WM. PAXTON.

The busy bee is at rest and the season is at hand to compare notes and prepare for another season's work.

My small report went in with south-east Dakota, with which my location and the flora are nearest allied, although I live on the east bank of the Sioux.

I commenced the spring with four colonies, one strong and three little more than nuclei. I took 400 lbs. of extracted honey and increased to nine, by division; I will not say in good condition for winter, because I succeeded in getting a live queen so late that I expect to find unfertile queens, next spring. Probably Good's food for queen cages would have saved the shipper two valuable queens, and me much valuable time. I fed my bees up to July.

Some years ago while residing near Manchester, Delaware Co., Iowa, I made a trip west, leaving home about Aug. 20th. At Fort Dodge I found bees just building up, and on returning, in September, that the first swarm had issued Aug. 28 and they were still swarming and at work in the supers. This was so unusual to me that I inquired whence came the nectar, and I was answered goldenrod; but my informant was unable to point out the plant with which at that time I was not familiar.

My bees had closed the season's work and killed the drones. I never looked for surplus from fall bloom. I wrote to a friend, suggesting the moving a part of his bees and mine for another harvest, but he did not look upon the proposal with favor. Yet I could not rid my mind of the practicability of extending the season by change of location, and especially where a short remove, as in this State, will carry you from the richest fields of clover and forests of linden to the best fall pasturage.

Had business matters favored it was my plan to spend the coming winter

in the South—buy, transfer and handle bees past the best honey flow, and ship North by carload, not caring to reach this point before July.

Will some readers of the BEE JOURNAL, located where bees are comparatively idle consumers, at a season not later than the last of June, correspond with me on the subject.

Controlling fertilization is among the important unsettled problems. D. A. Jones on his isolated island can test the pure races and crosses, beyond any-guess work, but the high latitude and chilly lake breeze make the season short, and the surrounding water must make the loss of queens heavy. In my opinion it is only on a prairie, comparatively new, without tree, stub, or stump, to harbor wild bees, that queens can be bred to the best advantage, and fertilization absolutely controlled, without confinement. It is only a matter of moving your nuclei with the desired drones to a safe distance from tame bees.

The dollar queen has come in for a good share of abuse during the season. Even the lazy drone has found its advocate, while scarcely a voice is raised for the cheap queen. It may be true that the drone gives heat to the young brood, but to me it seems very like feeding a dozen idle loafers to warm a room by animal heat. Other drones may build comb, I believe mine do not.

That some breeders of dollar queens are honorable men, breeding and sending out just such queens as they would use at home, you are all forced to admit; the dollar queen, then, is only such, because untested; breeders think they can afford them for that price. I want to know that the strain is of the best, with good chances for pure mating, and for obvious reasons I will do my own testing, and believe I can do so cheaper than the breeder can.

I am not a dealer in bee-keepers' supplies; never raised a queen, but for my own use or to give away, and could not give time for the necessary correspondence; but to him who has had the courage to advertise, and by fair dealing has worked up a trade, I would say, if he has a choice strain he wishes to keep pure, some one could undertake to breed and test for him, at wholesale only, for one dollar, because to do so he would only have to take a queen for shipping from a full colony and replace her by one from nuclei, with full assurance that twenty-one days would show her brood pure as the one she replaced.

Mr. Heddon has placed before us his dark, long, red-clover bees, with such candor and force, that I am almost a convert to the principle: "Handsome is, that handsome does."

What untrained eye would look for beauty in the Merino, his coarse, ugly horn, wrinkled, surly face, and gaunt, ill-shaped body, several sizes too small for his dirty coat? Yet his owner could see beauty in "Gold Drop," when every ounce of blood in his veins was worth its weight in gold, and he could see additional beauty in each fold of his loose, dirty, wool-covered skin—yet, the intrinsic value being

equal, I must confess a preference for the compact Down, or the square, stately Cotswold, with snow-white fleece in graceful ringlets.

The interesting test of Prof. Cook and others, shows the tongue of the Italian longer than the black, the Cyprian still longer, and the Syrian equal to either, in the yellow; then by breeding in the good points, and out the vicious, may we not hope to find all the good qualities, that, by careful selection, Mr. Heddon has found in his mixture of yellow and black?

Mr. Jones says the best in his yard is a cross of Italian with Syrian; his chances for observation are large and his opinion worthy of consideration, and I, for one, fondly hope to find the advent of the new races result in improvement worthy of the bold enterprise of the man who at great cost has given them to us.

Beloit, Iowa, Nov. 7, 1882.

For the American Bee Journal.

Revolving Frame Holder.

N. H. BARNHILL.

I send you a rough sketch of a contrivance I use, and find of great assistance while examining frames, and introducing queens. It consists of a frame somewhat similar to a clothes horse, with a revolving head, to the end of which two wires are attached, which can be expanded to suit any frame. The revolving head enables you to examine both sides, also to flip

the queen's wings, without disturbing her, by the use of a pair of spring scissors, as used in knives, etc. I could not get on without it, unless I had some other assistance.

A A are strips of cloth, tacked to pins to prevent spreading, and are handy for tools to hang on.

B B, pins of wood to hold the cloth. C C are wires to hold the frames, by slipping them over the end bars.

D, the hive.

E, the bolt to hold the wooden revolving head to the upper bar of the frame holder.

F, the frame in position. G, revolving head, containing wires to hold the frames.

Evelyn, Ga., Oct. 14, 1882.

West Texas Bee-Keepers' Association.

A number of bee-keepers from different parts of the State met at Bower's Hall, Luling, Texas, on Nov. 1, 1882, for the purpose of permanently organizing the West Texas Bee-Keepers' Association. The President called the meeting to order and stated the object of the meeting; after which a constitution and by-laws were adopted. Then followed a number of very interesting discussions.

A resolution was passed constituting the President and Secretary a committee to communicate with the various Fair Associations for the purpose of getting a department of agriculture.

The Secretary was also instructed to correspond with the honey dealers of Europe, that we may get a direct European market for our surplus products.

The meeting then adjourned to meet in San Antonio, about the 20th of Oct., 1883, or during the West Texas Fair.

The following gentlemen were elected as officers for the coming year: President, J. S. Tadlock; Vice President, Capt. W. L. Foster; Secretary, Thos. Balcomb; Treasurer, Rev. S. C. Orchard. THOS. BALCOMB, Sec. Luling, Texas, Nov. 8, 1882.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning Co., O., in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th. L. CARSON, Pres.

Read before the Union, Ky., Convention.

Queen Rearing and Honey Producing.

J. H. READ.

The apiarist who produces honey only, need not spend the whole of his time in the business, hence he may add some other business to that of honey producing with profit. In this respect the business of honey producing differs from the business of queen rearing. Of course my remarks are to have a general application, for I believe there are many locations where it will not pay to attempt to produce honey at a profit; am I right? yet, I am convinced that there are many localities where honey can be produced at a profit, and the business safely made a specialty.

In breeding queens as a business of profit there are many drawbacks. The breeder must sell queens from his colonies early in the spring, to satisfy his customers, and he sometimes sustains loss—even the loss of a colony in filling these early orders. His queens are sometimes lost or die in transit, and he has sometimes to return money to dissatisfied customers. All these things have to be endured by the queen breeder. It is gratifying, however, to have on hand nice queens for sale, and to have orders for them from all over the country. It is not only pleasant to receive the cash for them, but it is a pleasure to send them away to please customers, and to introduce the finest stock everywhere. I have been breeding queens for years, and yet, had I to commence anew, I think I would be a honey-producer.

Orleans, Ind.

The Nebraska State Bee-keepers' Association, will hold its annual session in Wahoo, Saunders county, Neb., commencing Thursday, Jan. 11th, 1883. Arrangements have been made with the railroads to secure $1\frac{1}{2}$ fare for the round trip. The Saunders county Bee-keepers' Association will furnish entertainment free to all visiting apiarists. Bee-keepers from neighboring States will be welcomed.

T. L. VON DORN, Pres.

GEO. M. HAWLEY, Sec.

The Western Michigan Bee-keepers' Association will meet at Supervisors' Hall, in the city of Grand Rapids, on Wednesday and Thursday, Nov. 29th and 30th, 1882. The co-operation of all bee-keepers of this section is desired.

WM. M. S. DODGE, Sec.

The 17th annual convention of the Michigan State Bee-keepers' Association will be held in Kalamazoo, Dec. 6 and 7, 1882. All interested are cordially invited to participate in the discussions—which will embrace the live issues of the Apiculture of to-day. Thomas G. Newman, A. I. Root, D. A. Jones, Prof. A. J. Cook, and many other distinguished apiculturists are expected to be present. Low rates of board at hotels have been secured. T. F. BINGHAM, Sec., Abronia, Mich.

SELECTIONS FROM OUR LETTER BOX

A Home Market.—I commenced with 10 colonies last spring; increased to 26 by natural swarming. I obtained 1,100 lbs. of comb honey, in 2 lb. sections, and sold it at home, from 15 to 20 cts. per pound. My bees are in good condition to go into winter quarters. I winter them in the cellar. I think this is a good location for bees, as there are many honey-producing plants; although there are not many bee-keepers in the country. I am taking seven papers, and if I were compelled to do with only one, that one would be the AMERICAN BEE JOURNAL.

D. M. DIERDORFF.

Waterloo, Iowa, Nov. 11, 1882.

That 1,000 Pounds of Honey from One Colony.—Last year you put me down as an Ohio man in your report, and I think I see another little mistake this year. Dr. J. E. Lay tells me he thinks the J. C. Carroll of Dallas Co., Texas, who reported to the National Bee-keepers' Convention that he had a colony of Cyprian bees that had gathered 1,000 lbs. of honey during the season, was myself. I made the statement that I had obtained 800 lbs. of surplus, 115 lbs. now in the hive and about 50 lbs. wasted by evaporation, as the loss was from two to five pounds during the horsemint flow. (I did not keep a daily memoranda of the colony, only now and then weighing, to see if any loss would occur during night, which was as above stated.) And I said I thought they had consumed not less than fifty pounds in brood rearing, making over 1,000 lbs. brought in by this colony. My bees are gathering honey from cotton, similar to the horsemint in June. Drones by thousands are flying and I have a nice lot of queen cells ready to hatch. The thermometer stood at 90° F. at noon yesterday, and at 10 o'clock p. m., yesterday, it stood at 76° F. The bees were roaring at night, like summer time. No frost, and not even a cold spell yet. Send on your bees, Mr. Harrington, before the blizzards set in; you can have part of my range. The horsemint is up, a fine stand, three to six inches high. Look out for another big crop. B. F. CARROLL.

Dresden, Navarro Co., Texas.

[We gave the name just as it came to us in the report of the National Convention, but it is evident that it meant you. The mistake last year, of giving Ohio as your address, was our own, which we regret we did not discover in time to correct it then.—ED.]

Cold Wave.—The weather was warm here last week. The cold wave which struck Chicago last Sunday, reached here before daylight this morning. It is not cold, however, and it is quite pleasant.

HENRY ALLEY.

Wenham, Mass., Nov. 14, 1882.

And Still Sweet Clover is Blooming.

—Please find enclosed some sweet clover that is in full bloom yet; it came up on one side of our house this spring and the bees were found working on it on Nov. 11, and now the ground is covered with snow 3 inches deep, so you see it blossoms with us until winter. Bees have done very well here for such a bad season. I bought one colony, last July, of E. T. Flanagan and have increased to three now, in good condition for winter. I bought 4 colonies of blacks this fall and sent to W. Z. Hutchinson for a queen and introduced her into one of the colonies of blacks. Success to the Weekly BEE JOURNAL. I shall give you my plan for wintering bees after a while, and see what you think of it. I never have lost one colony in wintering yet. G. L. PRAY.

Petoskey, Mich.

[The fragrant little blossom is received and gives another proof of its hardihood.—Ed.]

Bee-keeping in Canada.—I often wonder what is called good work for a colony of bees to do in a certain time. One of my colonies of brown bees gathered last season 34 lbs. in 3 days, and threw a large swarm the day before I commenced the test. The hive has 3,000 cubic inches. It will not pay to double up the bees in the spring of a good season, though this is not the common advice and rule. Last year I got 75 lbs. of honey from one colony, with only 100 bees on May 1. The same queen has done well two seasons since. I believe many good queens lose their heads when they are not always to blame; if she is not producing drones, give her a chance. Pack the hive inside, not outside, leaving only three frames at most, and put a few sheets of paper on top of the frames to keep the heat in and drive it down. The golden willow is the only thing in Canada that gives honey before the dandelions. Bees work on it here until quite dark in good weather; it fairly rains honey and can be seen easily with the naked eye. If you wish to plant it, and have a creek or permanent lane on your farm, with an ax cut off branches 4 to 6 feet long, any size, in the spring, and drive them where wanted; if put along a creek they make a good shade for cattle, and in three years they will support a wire fence. When my bees are getting honey I like to know how much, what from, and what kind of day. As to Bokhara clover not growing, it will grow anywhere, if there is moisture to sprout it and keep it alive until it gets hold of the ground, the same as other clover and timothy. I hoed the seed in, in rows, between mangolds, and it did well; I harrowed it in with oats, on June 1, with last stroke of harrow; it was two feet high before I cut my oats. It has given the barn a fine smell, and the bees have haunted it all the fall, in vain, for honey. I find onions are good to use in doubling bees; I have tried them and without loss. Honey is an excellent medicine for the eyes, it is unequalled for inflammation. As to whether bee-keep-

ing pays, I will let the bees speak for themselves. Last season there were only four colonies to make profits in the good year. They gathered 126 lbs. on an average, having come through two years without loss. The willow and apple trees were killed while in bloom, and we had to kill the young bees. The expenditure in two years for bees was \$80, and the receipts \$480. CHAS. MITCHELL.

Molesworth, Ont.

Comb Foundation.—What is comb foundation, and how is it made? Please describe it in the BEE JOURNAL. JOHN KRAINIK.

[We have repeatedly described comb foundation and its manufacture; and will now content ourself with saying that comb foundation consists of sheets of beeswax, formed by dipping wooden plates into melted wax, and, upon being rolled through a machine, these sheets have indentations made

COMB FOUNDATION.

on both sides, that form the foundation of cells, which the bees readily accept and work out into comb.

It would be tedious to review all the various styles of foundation presented to bee-keepers since it was first introduced in America. We have had foundation with triangular-shaped cells, with flat-bottomed cells, with high side-walls, and with no walls at all; with linen, cotton, wood, paper, tin-foil and woven-wire for a base; while, latterly, we have had foundation with fine wires imbedded in it, and frames of foundation with wires pressed therein. Experience is demonstrating, however, that a medium heavy sheet—say, four-and-a-half to five feet per pound, with a thin base or septum, and heavy prominent side-walls or lines, is the most desirable for economy in the use of wax, and rapidity in comb-building by the bees.—Ed.]

My Little Report.—I had 17 Italian colonies in the fall of 1881. I wintered them in American hives, modified, but using the American frame. They wintered in the cellar. I had 17 in the spring of 1882; sold one, and obtained 1,600 lbs. of extracted and 200 lbs. of comb honey, in 1 and 2 lb. sections; increased to 23 colonies, which are now in good condition for wintering. In justice to my report, I should say that owing to the severe drouth last

season, 5 of my colonies were mere nuclei, which, with queen, were wintered on 4 frames, and they not covered with bees. Some of my neighbors have obtained as high an average as 150 lbs. of honey to the colony, in spring, with a larger increase than I have had. Bee culture will receive quite a boom in this locality another year, on account of the large yield this year. M. LEIDY.

Carthage, Mo., Nov. 13, 1882.

Packing My Bees.—In a few days I shall pack my bees in boxes, each in a single box, with 5 inches of sawdust all around, like Mr. Heddon does. I have 35 colonies of Italians. Three days ago I noticed that my best colony (which had given 200 lbs. of comb honey) was very uneasy, and carrying out dead bees; in the night they were still uneasy, but yesterday they were more peaceful. To-day they are all alarmed again, so I opened the hive and found that the middle comb (drone comb) which I placed there 3 weeks ago, having sealed honey for winter use, was nearly emptied of honey, and to my astonishment was full of eggs, from 12 to 20 eggs in each cell, on both sides, and two queen cells were started, the bees acting like they would when swarming. I took out the comb and gave them another with sealed spring honey. Please explain the cause of this. G. DAMKÖHLER.

Clarence, Mo., Nov. 3, 1882.

[The colony had become queenless, and while in a state of commotion, consequent upon the bees learning their condition, it was also attacked by robber bees. If you had watched closely you would have seen that the bees went away filled with honey, which is always a very suspicious circumstance. The commotion at night also shows that the colony was invaded by robbers. Or the colony might have been invaded by robbers and in the commotion caused, the queen may have been killed. The 12 to 20 eggs in a cell were the result of fertile workers, an unnatural development consequent upon the loss of the queen. Had you removed the colony to the cellar for a few days, or contracted the entrance so as to admit only one bee at a time, or thrown some grass loosely over the entrance you would have aided the robbed colony, and prevented the second attack. To give them another queen, or unite some weak colony with it, is now the best thing to do, as it is very late to repair the loss.—Ed.]

Small Wire Worms in Pollen.—I would like to enquire if anyone has been troubled with small wire worms, that are hatched in the pollen, while it is packed in cells around the brood nest. It is great injury to the brood. They are from $\frac{1}{4}$ to $\frac{1}{2}$ inch in length, and work along the centre of the comb

and attack the larvæ before it is fully capped over, and pushes it out of the cells for the bees to carry out of the hive. They work for months and do not increase in strength. I have had 2 colonies this season invaded by these worms, and one of my neighbors also had colonies invaded by them. I took the bees from one of these hives and gave them new combs, to start them anew. Being late in the season, both I and my neighbor put a sulphur match to the other hives, and thus we got rid of them for the present. My theory is this: In breeding time I noticed a quantity of flies at the entrance of the hive, and saw the bees pounce on them and drive them away, thus showing them to be enemies. What were those flies after, if not to deposit eggs in the hive, where the heat of the bees will hatch them out? They are very different from the moth, which I can find, if on the combs; their heads are of a different color, and their bodies are whiter. If any one has noticed these flies or worms I hope to hear from them in the BEE JOURNAL.

ROBERT CORBET.

Manhattan, Kansas, Nov. 3, 1882.

Moving Bees, etc.—I enclose some plants for name, and please state where they grow extensively, for they are very scarce here. No. 1 is 2 feet in height, and is very thick with bloom and branches. It commences to bloom in July and is blooming still. No. 2 grows from 5 to 6 feet high and blossoms same as No. 1. No. 3 grows from 4 to 6 feet high and blooms from September till frost. I want to ship my bees 150 miles. Shall I ship them by freight or express—now or next spring? Will it injure the brood to ship them in the spring?

SYLVESTER MARSHALL.

Prattfork, O., Sept. 28, 1882.

[No. 1 belongs to the aster family, and abounds in low, rich bottom lands all through the Northern States. It is now also spreading in the South.

No. 2 is the *melilotus alba* or sweet clover, and will grow anywhere on any soil, and in any climate.

No. 3 is goldenrod and is also found on the low lands and river bottoms. They are all good honey producers.

The best time for shipping bees any considerable distance, is in April, or quite early in May, before the combs are too heavy with brood; but with proper care in preparing them and ordinary usage in handling, they may be shipped at any time with comparative safety except in very cold weather.

The first work is to go through the hives and extract all the uncapped honey, as the least daubing will prove fatal to the bees; then procure a block one inch square, and as long as the hive is wide, in this cut notches and tack in the bottom of the hive, in which to place the frames to keep them steady; now select the new

combs and those heavy with brood or sealed honey, secure them well in the frames with strip-binders, and place in the hive; tack the ends of the frames firmly to the rabbets on which they rest; dip the blanket in clean water, lightly wring, fold about six thicknesses, and lay on the front ends of the frames. If the hive has no portico, leave off the cover, and use wire cloth instead, nailing on top of that, three one-inch strips, two inches wide—one across the center, the others across each end, to insure ventilation when piled on each other. Now tack wire cloth over the entrance, and your bees are ready for shipment.

If the hive has a portico, prepare in the same manner as above, except to bore a one-and-a-half inch hole in each side of the brood chamber, and also in the cover, which will be used in place of the wire cloth over the frames; the holes to be covered inside and outside wire cloth to admit of ventilation. Leave the entrance open full size, but cover the entire portico securely with wire cloth, leaving free access to it from the interior of the hive; care must be taken, however, to bore a one-and-a-half inch hole under the roof-board of the portico, and left open, to allow free ingress to the interior of the hive, as the entrance beneath may become choked up, and the cluster of bees, with the queen, die of starvation through inability to get at the honey in the hive. Hives made with porticoes are much better for shipping bees, for it allows them to drag out the dead, cleanse the hive, and, to a great extent, prevent dysentery. Prepared in this manner, full colonies may be shipped at all seasons, from May 1st to Aug. 10th, with perfect success. They should be sent by freight; the expressage will cost too much, and they will be no more carefully handled.—Ed.]

Quick Work.—I get the quickest return from an advertisement in the AMERICAN BEE JOURNAL of any paper I ever advertised in. The BEE JOURNAL is mailed at the office on Tuesday; it reaches me on Friday, and on Saturday, the day after the BEE JOURNAL comes to hand, I frequently get calls for my circular; these calls come from Pennsylvania and New York States.

HENRY ALLEY.

Wenham, Mass., Nov. 14, 1882.

☞ We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., November 20, 1882.

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—The supply of extracted honey is fully up to the demand. My quotations are: 6½c. for dark and 8½c. for light, delivered here.

BEESWAX—It is quite scarce. I am paying 27c. for good yellow wax, on arrival; dark and off colors, 17@22c.

AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—The market for extracted honey is very satisfactory. We have received within the last three weeks more than 200 bbls., principally from Louisiana, Mississippi and Florida, and the demand exceeds our experience and expectations. We have sold more than ever at this time of the year. Florida furnishes a honey which equals our Northern clover, and excels all the Southern honey I have had so far. There is some call for comb honey, but we have had no arrivals yet of a choice article. Comb honey brings 16@22c. on arrival; extracted, 7@10c. **BEESWAX**—Firm at 24@25c. per lb.

CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand increases with the cool weather, but not sufficiently fast to keep pace with receipts, which now accumulate, as it is time to get the surplus into market. Prices remain unchanged with perhaps a tendency downward, owing to many consignors desiring to realize quickly.

We quote: white comb, in small sections, 18@20c. Fine, well-filled, 1 lb. sections bring the outside price. Dark comb honey, little demand, 15@16c. Light honey, in larger boxes, 12@16c. Extracted—white clover, 14½@16c.; dark, 8@9c., in barrels and half-barrels. Boxes will bring but a small advance, if any, above half-barrels.

BEESWAX—Very scarce. Choice Yellow, 30c.; dark to fair, 20@24c.

R. A. BURNETT, 165 South Water St.

SAN FRANCISCO.

HONEY—Stocks are abundant of medium and dark grades, and the demand for such is light. A sale of 150 cases extra C comb was made Wednesday at 14c.

White comb, 18@20c.; dark to good, 12@15c.; extracted, choice to extra white, 9@10c.; dark and candied, 7½@8½c.

BEESWAX—We quote 25@28c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Plentiful and slow. We quote, in lots, comb at 15@17c.; strained at 6@7c.; extracted at 9@10c.

BEESWAX—Prime bright quotable at 26@27c.

R. C. GREER & Co., 117 N. Main Street.

CLEVELAND.

HONEY—There has been no change in honey the past week. No. 1 white, in 1 lb. sections, continues in good demand at 21@22c. per pound. No. 1 in 2 lb. sections, is also in good request at 19@20c. Second grade, less active, at 1@2 cents ½ lb. less. Extracted, in all shapes, was dull and very little sale. Some Louisiana honey, rather dark, in barrels, was sold at 9c.

BEESWAX—Prime quality, 25@28c.

A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HONEY—There is a fair demand for prime lots of honey, and choice is held firmly, with occasional sales of fancy a trifle higher than we quote.

We quote: White clover, fancy, small boxes, 19@22c.; white clover, fair to good, 16@18c.; buckwheat, 13@16c.; extracted clover, 10@13c.; extracted buckwheat, 9@10c.

BEESWAX—There is only a moderate movement of wax, but prices held about steady at 24@30c. for Western, and 30@31c. for Southern.

Western, pure, 23@26c.; Southern, pure, 30@31c.

D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Sells very readily in 1 lb. sections at 22@25c. for best white, and 20@22c. for 1½ to 2 lb. Boxes containing ½ pound, 30c. per pound.

Extracted is selling very slowly at 12@14c.

BEESWAX—25@28c.

CROCKER & BLAKE, 57 Chatham Street.

ESTABLISHED 1862
THE AMERICAN BEE JOURNAL
 ESTABLISHED 1862

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about **eight words**; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published **WEEKLY** as follows, if the whole is paid in advance :

For 4 weeks.....	10	per cent. discount.
" 8 ".....	20	" " " "
" 13 " (3 months)....	30	" " " "
" 26 " (6 months)....	40	" " " "
" 39 " (9 months)....	50	" " " "
" 52 " (1 year).....	60	" " " "

Discount, for 1 year, in the **MONTHLY** alone, **25 per cent.**—6 months, **10 per cent.**—3 months, **5 per cent.**—if wholly paid in advance.

Discount, for 1 year, in the **SEMI-MONTHLY** alone, **40 per cent.**—6 months, **20 per cent.**—3 months, **10 per cent.**—if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

A few of our subscribers are in arrears for the present year—having requested us to continue, and they would pay soon. Will all such please take this as a request to send on the two dollars with a renewal for next year, if possible.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....	\$1 00
" 100 colonies (220 pages).....	1 50
" 200 colonies (420 pages).....	2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

CLUBBING LIST.

We supply the **American Bee Journal** and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	Publishers' Price.	Club
The Weekly Bee Journal.....	\$2 00..	\$2 00..
and Gleanings in Bee-Culture (A.I. Root) 3 00..	2 75	2 75

Bees and Honey, (T. G. Newman) " 2 75..	2 50	2 50
Binder for Weekly, 1881.....	2 85..	2 75
Binder for Weekly for 1882.....	2 75..	2 50
The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.		

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Advertisements intended for the **BEE JOURNAL** must reach this office by Saturday of the previous week.

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

Kendall's Spavin Cure is used from the Atlantic to the Pacific coast.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly **BEE JOURNAL**, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly **BEE JOURNALS** will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly **BEE JOURNAL** a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Emerson Binders—made especially for the **BEE JOURNAL**, are lettered in gold on the back, and make a very convenient way of preserving the **BEE JOURNAL** as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

The **BEE JOURNAL** is mailed at the Chicago Postoffice every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Sample Copies of the **AMERICAN BEE JOURNAL** will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Every lady should send 25 cents to Strawbridge & Clothier, Philadelphia, and receive their *Fashion Quarterly* for six months, 1,000 illustrations and four pages new music each issue.

Do not let your numbers of the **BEE JOURNAL** for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

New Premiums for 1883.

As the season for reading has now arrived, we hope that each of our subscribers will endeavor to send at least one new subscriber for the Weekly BEE JOURNAL for 1883 and thus not only help on the cause of progressive bee-culture, but assist in sustaining the only Weekly bee paper in the world.

Providence has smiled on the bee-keepers during the past season, and as a general thing they are abundantly able to procure a good assortment of bee-literature.

In order to encourage every one who keeps bees, be they few or many colonies, to thoroughly read the many very interesting books on bee-culture, now published, we have determined to make liberal offers, which will be available until January 1, 1883, as follows:

To any one sending us \$8 for any books they may select from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for one year.

To any one purchasing \$4 worth of books, selected from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for six months or the Monthly for one year.

Any one sending us a club of two subscribers for 1883, for the Weekly, with \$4, will be entitled to a copy of Bees and Honey, in cloth, postpaid.

For three subscribers, with \$6, we will send Cook's Manual, in paper, Emerson's Binder for the Weekly, or Apiary Register for 50 colonies.

For four subscribers, with \$8, we will send Cook's Manual in cloth, or Apiary Register for 100 colonies.

For five subscribers, with \$10, we will send the Apiary Register for 200 colonies, Quinby's New Bee-Keeping, Root's A B C of Bee Culture, or an extra copy of the Weekly BEE JOURNAL for one year.

To get any of the above premiums for the Monthly BEE JOURNAL send double the number of subscribers, and the same amount of money.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

Subscription Credits.—After sending subscriptions to this office, we would respectfully ask every one to look at the label on the wrapper of the next two papers, and there they will find the credit indicated thus: Those who have paid for the first six months of next year will find "June 83" after their names. Those who have paid for the whole year will find "Dec. 83" on their papers. The credit runs to the end of the month indicated. If the mark is "Dec. 82," it means that the subscription is paid until the end of the present year. Please remember that the credit given on this label is a sufficient notification of subscriptions due and receipt for payments made. If not so indicated within two weeks after sending money to us, you may be sure something is wrong, and should write to us about it. It will save annoyance and trouble if our subscribers will give this matter due attention.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Articles for publication must be written on a separate piece of paper from items of business.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

The New York Weekly Tribune says in regard to the Noyes Dictionary Holder, manufactured by L. W. Noyes, 99 West Monroe St., Chicago: "We know of but one satisfactory Holder; that, however, is so good that a second is not needed." Mr. Noyes sends to all applicants a handsome illustrated circular. Prices reduced.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

"BEE-KEEPERS' HANDY BOOK."

22 Years Experience in Rearing Queen Bees.

A book written and published by HENRY ALLEY, WENHAM, MASS. A NEW SYSTEM OF QUEEN REARING.

It will teach you how to prepare your bees for cell building; what eggs to select, and when to select them; how to remove drones from a swarm of bees; how to have the cells hatched without having them destroyed; how to keep the queens after they have hatched; how to introduce virgin queens to nuclei colonies; the best way to introduce laying queens to full colonies; how to test queens without keeping them in the hive three weeks after they are fertilized; how to know a good hardy queen from an inferior one the moment she leaves the cell; how to judge of a prolific queen before she has laid 100 eggs; how to select a queen to use for one to breed from; how to raise and preserve drones late in the season; what kind of a queen to raise drones from as well as the kind of drones to use; how and when to transfer bees from box to frame hives, and, in fact, many things that have never appeared in print, that are invaluable to any bee-keeper, whether he keeps a few or many colonies. Send for circular.

LOOK HERE!

If you want cheap bees and hives to suit, good Cyprian, Albino or Italian Queens, Comb Foundation, all kinds, section Boxes, and everything a live apiarist needs, send for prices.

Full Colonies and Nuclei a Specialty

with good young Queens. Give me a call, friends, and I will try and please you. (Box 819)

THE BRITISH BEE JOURNAL AND BEE-KEEPER'S ADVISER.

THE BRITISH BEE JOURNAL is published monthly, and contains the best practical information for the time being, showing what to do, and when and how to do it. It is edited and published by

C. N. ABBOTT, Bee-Master, School of Apiculture, Fairlawn, Southall, London.

We send the Weekly AMERICAN BEE JOURNAL and the British Bee Journal, both for \$3.50 per annum.

For sale at the BEE JOURNAL Office.

We continue to act as solicitors for patents, caveats, trade-marks, copyrights, etc., for the United States, and to obtain patents in Canada, England, France, Germany, and all other countries. Thirty-six years' practice. No charge for examination of models or drawings. Advice by mail free.

Patents obtained through us are noticed in the SCIENTIFIC AMERICAN, which has the largest circulation, and is the most influential newspaper of its kind published in the world. The advantages of such a notice every patentee understands.

This large and splendidly illustrated newspaper is published WEEKLY at \$3.20 a year, and is admitted to be the best paper devoted to science, mechanics, inventions, engineering works, and other departments of industrial progress, published in any country. Single copies by mail, 10 cents. Sold by all newdealers.

Address, Munn & Co., publishers of Scientific American, 261 Broadway, New York.

Handbook about patents mailed free.

LIVE BEE-KEEPERS WANTED,

to introduce the new lime cushion, the only protection yet discovered that will carry the bees safely through winter and spring without fail. Send \$30, for right to retail this cushion in your county, or send \$5 for an apiary right to patentee.

The Bee-keeper's Guide; OR, MANUAL OF THE APIARY,

By **A. J. COOK,**

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary to the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—*L. Apicultur, Paris.*

I think Cook's Manual is the best of our American works.—*LEWIS T. COLBY.*

It appears to have cut the ground from under future book-makers.—*British Bee Journal.*

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—*J. P. WEST.*

I have derived more practical knowledge from Prof. Cook's New Manual 10 of the Apiary than from any other book.—*E. H. WYNKOPF.*

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mick, Fair.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald, Monticello, Ill.*

The richest reward awaits its author.—*A. E. WENZEL.*

My success has been so great as to almost astonish myself, and much of it is due to the clear, distinct information contained in Cook's Manual.—*WM. VAN ANTWERP, M. D.*

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record.*

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—*L'ABBE DU BOIS, editor of the Bulletin D'Apiculture, France.*

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat, Pulaski, N. Y.*

We have perused with great pleasure this *volume* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To ul taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist, Quebec.*

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist.*

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor.*

PRICE—Bound in cloth, \$1.25; in paper cover, \$1.00 by mail prepaid. Published by

Bee-Keeper's Guide; or, Cook's Manual of the Apilary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.— The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author's master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.— This embraces "every thing pertaining to the care of the honey-bee," and is adapted to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.— This edition is revised and brought down to the present time. Cloth, \$1.00.

Langetroth on the Hive and Honey-Bees.— This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.— A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.— Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Bienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Izlerzon Theory— presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine, by Thomas G. Newman.— This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.— This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive I Use— Being a description of the hive used by G. M. Doolittle. Price, 5c.

Extracted Honey Harvesting, Handling, and Marketing.— A 24-page pamphlet, by Ch. & C. P. Dadant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman— Giving advanced views on this important subject, with suggestions what to plant, and when and how; 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.— Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.— Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading, bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Chicken Cholera, by A. J. Hill.— A treatise on its cause, symptoms and cure. Price, 25c.

Kendall's Horse Book.— No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

W. F. & JOHN BARNES, No. 2017 Main street, Rockford, Winnebago Co. Ill.

EARS FOR THE MILLION! Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small **White Shark**, caught in the Yellow Sea, known as *Carcharodon Rondelleii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over **300 years no Deafness has existed among the Chinese people**. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better.

I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

PURDY'S FRUIT RECORDER

Published and edited by a man having 36 YEARS practical experience, and now having 200 acres under fruit, with evaporating buildings, green-houses, &c., &c., right in the midst of the great fruit section of Western N.Y. Monthly, 20 pages. Valuable premium to every subscriber. GRAND and LIBERAL Inducement to Club Agents. Address,

A. M. PURDY, Palmyra, N.Y.

PURDY'S SMALL FRUIT INSTRUCTOR

It tells in plain, simple language how to plant, grow, and market the above, how to get the best crops, giving the best plans for growing; how to dry, force, pot, grow seedlings; plans of drying-houses, grape-trellises, etc., etc. It is as full of practical matter as an egg is of meat. You wouldn't exchange it for any \$1.00 or \$1.50 book on the same subject that you ever saw. The writer has compressed into this work his thirty years' experience. 64 pages. Paper cover, 25c.; cloth bound, 50c.; postpaid. Postage stamps accepted. AGENTS WANTED. Also his Catalogue on

SMALL FRUITS (40 pages), FREE to all applicants. Address A. M. PURDY, Palmyra, N. Y.

BEE JOURNAL

DEVOTED EXCLUSIVELY TO PROGRESSIVE BEE CULTURE.

Vol. XVIII.

Chicago, Ill., November 29, 1882.

No. 48.

ESTABLISHED IN 1861

THE AMERICAN BEE JOURNAL

Published every Wednesday by

THOMAS C. NEWMAN,
EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.
At \$2.00 a Year, in Advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

Another New Bee Book.

We have received the prospectus of a new book by Henry Alley, Wenham, Mass., entitled "Twenty-two Years Experience in Rearing Queen Bees." Mr. Alley says, "this work is intended to teach the best, easiest, most scientific and practical method for rearing queens." The price will be \$1.00. The author, in his prospectus, remarks as follows:

For twenty-two years I have made the business of rearing queen-bees my sole occupation, and during that time have probably reared more queens than any other man in the world. I have experimented largely in queen-rearing, when, about four years ago, I discovered a new method of building queen cells, that does not take one-half the time, labor, trouble or expense required by the old process. By this method I rear just as many or few queens as I put eggs into a hive, and in the exact locality in which I desire them built. The cells are all large, and so evenly spaced apart, that each one can be cut out without injury to its neighbor cell. The queens produced are as large, hardy, long-lived and prolific, as any reared under the swarming impulse. The cells are all built in full colonies, which are queenless only four days, consequently always have a large proportion of young bees. The time of hatching of a given lot of cells can be determined within an hour of each other, as they are never from one to three days apart in hatching out, as by the old process. By my method at least as much honey can be produced by use of the extractor, as though the colony was not engaged in cell building. My method is entirely new, and has never been published; only three persons besides myself have any knowledge of it, and they (all old bee-keepers) assure me that I have reduced the matter of queen-breeding to a perfect science. I propose to publish my method, in

book form, and at the same time give many of the valuable ideas gained by me during my long experience in this branch of apiculture, and that have never before been made public. As this work will require an outlay of from \$150 to \$200 for engravings, etc., to illustrate my method, I propose to charge a fair price for it.

We can fill orders for this work as soon as published, which will be duly announced in the BEE JOURNAL.

Throw Away the Old Honey Boxes.—A bee-keeper came to Chicago last week to sell his honey. In order to save a lot of six-pound boxes he had on hand, he used them, and consequently depreciated his honey 5 cents per pound. He said, most emphatically, as he was leaving the BEE JOURNAL office: "It would have paid me much better to have burned up the old boxes and bought new sections." It certainly would have paid him better, and been much more satisfactory to all concerned to have done so. Let all who may have any old large boxes on hand bear this transaction in mind.

We have received a copy of Mr. G. M. Doolittle's Club List of Papers for 1883. It consists of 12 pages besides the cover, and is very neatly printed. Those who want to subscribe for several publications should send for it. They will find much in it to interest them. His address is Bordino, N. Y.

We intend to be present at the Michigan State Convention, at Kalamazoo, on Dec. 6, 1882, and hope there will be a good attendance.

Many bee-keepers have done well during the past season, and should be feeling quite happy. Now it will be in order to prepare for the next season's work by procuring your hives and sections in proper time for use.

Glucose Factory Failures.

In these factories more than a million dollars are locked up. As the price of corn is high and the production of glucose is in excess of the demand there is a proposition on foot to consolidate the factories, and thus prevent competition, so as to make the product pay. A meeting was called at Davenport, Iowa, and the proposition for consolidation was well considered, for there was a session of three or four hours, and at last it was referred to the Board of Directors with power to act.

Of course there are several glucose manufactories which are failures, so greatly encumbered that they are not worth the amounts loaned on them—and these will not be accepted in the consolidation, although the creditors are making frantic efforts for admission into the scheme.

The Davenport Democrat, in giving an account of a recent meeting of the stockholders of the Davenport Glucose Works, states that the business has reached a peculiar crisis. Because the glucose works at Buffalo, New York, proved profitable, a multitude of glucose companies were organized in the West and hundreds of thousands of capital were put into buildings and machinery, and now the proprietors of these factories, with only three or four exceptions, are dissatisfied with their experiments, which have proven losing investments. There are thirteen in number in the West, besides the works in Peoria and Leavenworth, which are owned by the Hamlins, of Buffalo, N. Y. The Davenport Democrat gives the following statement of the present condition of the several companies named:

Davenport works—capacity, 3,000 to 3,500 bushels of corn per day, shut down two weeks ago, that the present proposition might be considered: will resume operations in thirty days, whether the consolidation is affected or not.

The Des Moines, Iowa, and Sagetown, Illinois, works have proved failures, sinking all the capital invested.

Marshalltown, Iowa, works, after having used up \$250,000 capital, are being enlarged from 1,500 to 3,000 bushel capacity for profitable working! The stockholders have never received a cent of dividend.

Rockford, Ill., capacity 1,500 bushels per day—heavily encumbered and idle.

Geneva, Ill., capacity 800 bushels per day. Idle—failure.

Freeport, Ill, capacity 3,000 bushels per day. Idle, with 7,000 barrels of syrup on hand. Resumption of operations improbable.

Iowa City, Iowa, capacity 1,500 bushels per day. Shut down because of dull trade. Profitless so far.

St. Louis, Mo., capacity 2,000 bushels per day—idle.

St. Joseph, Mo., capacity 1,000 bushels per day—working occasionally as there may be demand.

Danville, Ill., capacity 3,000 bushels per day—shut down because of dull trade.

Tippecanoe, Ohio, closed for repairs. The only really successful works in the West, outside of those owned by the Hamlins, and the Davenport works.

Peoria, Ill., capacity 3,000 bushels per day—idle.

The factories of the Hamlins—two in Buffalo, one in Peoria, and one in Leavenworth, having an aggregate of 20,000 bushels per day—are in operation, but selling the product at a very unremunerative price.

The Firmerick works, in Buffalo, are refining works—for the purpose of making sugar out of corn starch for mixing with real sugars for table use, use 6,000 to 8,000 bushels of corn daily. The great works being built in Chicago, capacity 15,000 bushels daily, contemplate the same business.

There are big works near New York—owned by Duryea and Booth & Edgar—having an aggregate capacity of 10,000 bushels daily, in operation. Will not enter consolidation, but make combination with the consolidated companies.

The works at Kansas City, Mo., and Wheeling, W. Va., were built for refining by the dry process. They absorbed \$100,000 each, and are dead failures.

Detroit works, capacity 3,000 bushels daily—are idle.

The above is the results of the rush of many men to get rich, even if they had to sell their manhood to do it. We are heartily glad that corn is too high in price to allow its conversion into such a fraud as glucose.

The Chicago Bee Convention.

We have already remarked that we thought the late convention of beekeepers in Chicago was the best we ever attended, and added that, the enthusiasm being so great, those in attendance wanted to meet at 8 o'clock in the morning, and held that session until about 1 o'clock in the afternoon. In the last *Juvenile Gleanings*, Mrs. L. Harrison likens conventions of beekeepers to schools, and the presidents to schoolmasters, and adds:

I have always thought that beekeepers ought to take their wives and children with them to the bee meetings, and have a good time as well as themselves; but I am really glad that you were not at the Northwestern, that was lately held at Chicago. Why, the master wanted to hold a session from eight in the morning until one in the afternoon, and not give us a bit of a recess; and he would not let us

whisper a bit. I did, though, just once; I only asked his wife how many children she had, and down came his stick with a whack that made me jump. I wanted so much to ask her if she liked to make beeswax, but I didn't dare to after that. He called me horrid, too; I don't believe in whispering in school, and I would not have done it had he given a recess to do my talking in.

Mrs. Harrison then made the following suggestions about the management of such meetings. She evidently looks to the rising generation for reform, and adds:

When you boys and girls have a convention, and have talked about black, brown and yellow bees for one hour, throw open the windows to let in fresh air, make on a fresh fire, stand up and sing a bee song, or the doxology, or have an old-fashioned recess, and play leap-frog, or anything you like; after recess you can keep still, listen, or talk at pleasure.

This is a thought well worthy of consideration. We often get weary, and know that a rest, a song, or a recess would be very agreeable and refreshing, and we will now promise that at the next convention we will have some songs ready to intersperse in the meetings, such as "The Bees Among the Clover," "Charlie, the Bees are Swarming," etc., and, if the president does not object, we will have a lively time. We really think he will be glad not only to permit it, but to help do the singing, for he is a musician, and, if we do not mistake, the leader of a quartette or church choir.

President Miller's son, 14 years of age, sends the following statistics to *Gleanings*, showing "some of the results of wintering reported by 50 beekeepers at the Chicago convention:—"

HOW WINTERED.					
	Number of colonies last fall.	Number lost in winter.	Per cent. lost in winter.	Number lost in spring.	Per cent. lost in spring.
Chaff hive.....	136	1	.7	1	.7
Packed in hay.....	37	0	0	1	2.7
Bee-house.....	203	4	2.0	5	2.5
Cellar.....	1671	24	1.6	52	3.1
Chaff packing.....	1188	52	4.4	14	1.2
Out unpacked.....	78	1	5.6	0	0
Chaff and cellar.....	16	1	1.3	5	6.6
In a cave.....	12	0	0	1	8.3
Total.....	3339	85	2.5	79	2.4

Mr. Root remarks that "the report shows well for chaff hives, but not quite so well for chaff packing as for cellar wintering." And President Miller says: "We had a good, solid, working convention at Chicago; more honey being represented than at Cincinnati."

Cost of Getting Those Statistics.

In reference to this very important subject we have received the following letter:

I am much interested in the honey statistics of the country, so much so that I worked up this county at my own expense; the account of which has been published in the BEE JOURNAL and credited to J. S. Terrill, by mistake of the Secretary of the Convention, at Cincinnati, O. Now, I have a plan which I have been thinking about, that would cut down your \$4,000 some, if it could be made to work. There are a great many bee-keepers in the country who are fourth-class postmasters (I happen to be one of the unlucky class), whose salary is made up of from 60 per cent. of the amount of stamps canceled; on the first \$100 each quarter; 50 per cent. of the second \$100, and so on. Now, the most of these postmasters cancel less than \$100 each quarter, so you see they get 60 per cent. of all the stamps canceled. My idea is to get these bee-keeping postmasters interested in these statistics; let them work up their own counties, and donate the per cent. of cancellation at their office to the statistical fund; also, ask each bee-keeper to donate a few cents to carry on the work. What enterprising bee-keeper is there who would not give a few pennies to know the amount of bees and honey raised in the country. It cost me ten times that amount to get the statistics of one county, and yet I feel paid for the cost and trouble, and if each bee-keeper that I corresponded with had sent me a three cent stamp (which I think they would have done if I had asked it), it would have covered the whole expense.

There might be counties where you could not find a P. M. to do the work; then let one man work two or more counties. This is a small job if you will use a copying pad, for with once writing you take 75 legible copies; these pass through the mails for one cent, thereby cutting down the postage two-thirds, and the letter writing to a mere shadow. I am confident that these plans will work with a trifling expense, and if you will authorize me, I will try one county at my own expense. I would prefer a county joining Lorain. Now, from these suggestions, perhaps some one can suggest something better. But don't let that \$4,000 scare us out of the work which is necessary in the interests of the bee fraternity.

O. J. TERRELL.

North Ridgeville, O., Nov. 17, 1882.

There may be some postmasters who would be willing to aid the work of obtaining statistics in the way Mr. Terrill mentions,—but, we fear, they would be very few in number, not over one in a thousand!

We did not mention the amount necessary to defray the expense and postage, in order to "scare" any one "out of the work," but to have its magnitude fully understood.

We only calculated on one-cent postage each way, but there are 45,000 post offices in the United States. To get a circular to each one with a return postal card will cost over \$1,000. Then there will be an average of say 3 bee-keepers to each post office; to get a circular and postal card to each of these will cost over \$3,000 more; or over \$4,000 in all. It is very generous in him to offer to get the statistics of another county; who else will volunteer to get the statistics of a county, if we will undertake to furnish blanks for each county, to be filled up and returned to us to tabulated? We *may* get this started yet.

Since writing the above we have received the following letter from Mr. Hackman, which will fully explain itself:

DEAR EDITOR:—You are correct on the expenses regarding the statistics of bee-keepers, but why not get the statistics of live bee men: that is, of those who read bee periodicals? They could be easily reached by simply making a call through the different bee publications? It seems to be of very little use or consequence, as far as it regards the box-hive and log-gum bee men; their product will never affect the market much. Let us have the statistics of progressive and systematic bee men, and I, for one, would be much pleased. We have but 3 of such bee men in this locality. If there is a call made, according to my idea as stated above, I will do all I can to get information. We have a few box-hive men around here, but their goods are generally in such a condition that they will never affect the market much.

H. S. HACKMAN.

Peru, Ill., Nov. 17, 1882.

In order to make a table, showing the honey production of America, that will be of any value, it must include all the honey produced, no matter whether it be obtained by progressive bee-keepers or not. It is very kind of Mr. Hackman to promise to do all he can—but if it is not to be a thorough and complete statistical table, it will be better not to undertake it at all. It should be organized at the start so completely that it cannot fail to overcome every obstacle which can be thrown in the way. The funds must all be provided in advance, for there will be enough work in the legitimate performance of their duties to occupy the entire energies of the committee, without looking after such trifles as the money to pay postage and expenses, etc.

Until that is done we can do no more than to discuss the plans proposed, in the hope of finding one that will reduce the expenses to the minimum.

Last year we tried the plan suggested by Mr. Hackman, of calling for reports of the progressive bee-men who read bee-periodicals, and our experience is that but few will take the trouble to report, and such are always those who have been most successful, consequently the Tabulated Statistical Table we published last October was assailed by some who did not report, and, by perversion and malicious misrepresentation, attempted to make it look ridiculous; as may be seen in extracts from some of these impulsive correspondents, as quoted in the BEE JOURNAL for Dec. 14, 1881, and Jan. 11, 1882. Several other attacks were made upon us and that Table, which we deemed too malicious to answer.

International Exhibition at Hamburg.

Some months since we mentioned the fact that there would be an "International Exhibition of Animals connected with Agriculture," at Hamburg, Germany, from July 3 to 11, 1883. This Exhibition includes implements, machinery, literature, etc., connected with each department; the fifth being "Bees; appliances for the keeping and culture of bees, and products of the same." Now we desire to announce that we have a number of programmes, giving specific directions for exhibitors, etc., and will send these to any one applying for them, who may contemplate sending an exhibit.

We were requested by the Provisional Committee to take charge of the American exhibits in the fifth class, (see page 306), and Richard Gottel & Co., Export Commission Merchants, 202 Walnut St., Philadelphia, Pa., have consented to forward exhibits to Michaelis & Hoffmann, at Hamburg, who will take charge of exhibits and sell them, if requested, and return the proceeds to the owners of the articles exhibited, at a moderate percentage.

This Exhibition will be one of great magnitude. Much interest in it is already manifested throughout the world; it is, therefore, advisable that those who wish to exhibit should secure the proper space as early as possible. The Hamburg commission firm wishes to be informed of any one desiring to secure space, and will obtain it for exhibitors in America.

They will also supply all necessary information concerning the Exhibition and its management, together with circulars and other papers referring to it.

MISCELLANEOUS.

Bees in China.—Mr. O. W. Willits, writes a letter from Peking, China, to the *Juvenile Gleanings*, concerning the only colony of bees he had seen during a residence of three years in China, and the bee pasturage he found there. He thus describes the bees and the place where he found them, etc.:

I have hurried out to examine more closely the only hive of bees it has been my fortune to see in China during a residence of three summers. This is in a hollow tree in the rear of the pagoda of a large Buddhist temple. The bees are not so large as our common bees, nor do they seem as much inclined to sting, though some Chinamen were stung the other day by a few who had been disturbed in their work of building a new home. The entrance to this tree is just above the ground. The bees are so thick about it that I cannot determine where the hole begins, though it ends about fourteen inches above the earth. I should think there were bees enough for several ordinary hives; in places they are five or six layers deep. I wonder if they are going to swarm. They are of a general brownish hue, but have three broad bright-yellow bands. I wish I had more courage, and I would go up and get one. How I should like to get into that old tree!

While I have been writing, my little girl, with two playmates, has been wading in a lotus pond. I wonder if I can describe the lotus flower so that your boys and girls will get a correct idea of how it looks. It grows out of the water much like the water-lily, but doesn't stop growing so soon; for the stalk, which becomes half an inch or more in diameter, stretches up from three to five feet above the water. One solitary leaf forms at the top. The leaf, in front of me, and there are larger ones in the pond, measures eighteen inches in diameter. It is of coarse texture, almost round, and has some twenty or twenty-one strongly marked veins radiating from the center. It resembles a green umbrella which the wind has turned inside out.

On a similar stalk, but not on one bearing a leaf, there forms the largest and most beautiful flower I ever saw. It reminds one much of the peony, though it has not so many petals, and is on a much grander scale. These before me are pink, though there are also red and white ones. Within these beautiful petals stands up the seed-pod. It is shaped somewhat like a cucumber cut crosswise. The seeds are arranged in a circular form, and set in like cartridges in a repeating rifle, which they also resemble in other respects. These seeds, when ripe, are eaten with a relish. The root, also, is a salable article of diet, much

desired, and bringing a good price. A slice of it looks like a slice of raw potato after a boy has filled his pop-gun as many times as possible without breaking the partitions. It has a pleasant, sweetish taste, and is prepared for food in many ways. The Emperor has a lake of lotus-flowers. After not many days, hundreds of men will find employment in gathering the succulent roots.

Reversible.—The *Scientific American* in a late issue, mentions the following:

An improved honey extractor has been patented, consisting of a series of comb holders resting on a plate or frame loosely mounted on a vertical shaft in a vessel, the comb holders having pivots or pintles projecting from the bottoms, on which pintles pinions are mounted, which engage with a cog wheel rigidly mounted on the shaft below the loosely mounted plate, this cog wheel being provided on its upper surface with a series of notches, and the plate or frame being provided on its under side with a pawl strip adapted to catch on the notches, so that the honey will be thrown from the combs by the centrifugal force when the shaft is rotated, and when the motion of the shaft is slackened the comb holders will be reversed. The comb holders can thus be reversed very rapidly and easily by simply retarding the motion of the cog wheel by holding back on the crank.

Effects of Conventions and Honey Shows.—The *American Agriculturist* for December is received, and under the heading of "Bee Notes for December," we find the following, on the beneficial effect of Conventions and Bee and Honey Shows, which the BEE JOURNAL has persistently advocated for many years:

A leading cause for the recent rapid progress in Apiculture, is to be found in our numerous Conventions. These County, District, State, Inter-state, and National meetings, to consider, and discuss important questions, are now numbered by hundreds, and are lending a powerful influence to develop practical apiculture. The most influential of all these societies is the North American Association. This gathers the "meat" from all the lesser associations and freely distributes it to the whole country. Reports were made at the recent Cincinnati meeting from nearly all the States of the honey yield for the past season. The records for the South and West were encouraging. The South especially has had a wonderful yield of the best honey. In the East, and north from Ohio, the yield has been unprecedentedly light. In Southern Ohio, and portions of New York and Canada, the report is of an entire failure. In California and the East the crop is poor. From these reports we gather three important facts: first, cold, no less than excessive drouth or wet, will dry up the nectar glands, and blast the bee-keeper's hopes. Secondly, the Gulf States, especially Tex-

as, bid fair to rival California as honey producing regions. The winters are as safe, the honey season as long, and the seasons more sure. Thirdly, the South can furnish as fine honey as any section of the United States. Honey exhibited from Florida, Mississippi, and Texas, was greatly admired. From these reports, we also learn an important lesson: that to secure a certain harvest, bee-keepers must grow special honey plants. Then, if the white clover, or the basswood fail, we still have hope.

If rightly managed, it is impossible to clog the market even with extracted honey. Pure honey in every sales-room and factory, put up in the best style, will sell in almost unlimited quantity. Overstocking the market need no longer be feared.

Whence Cometh Many Diseases?—The *Grange Bulletin* remarks as follows on the danger of adulteration:

Remember that pure honey has no equal as a medical sweet and far exceeds that of ordinary or common sugar syrup (or glucose), which should at all times be used in preference to either of the two last named articles. Besides, let us ask, would it not be wise in us, as a people, to reflect and study from whence comes many of the ailments the human family seem to be heir to of late years, when we see so many cases of cancer that fasten upon the vitals of the human system.

A \$20.00 Biblical Reward.—The publishers of *Rutledge's Monthly* offer twelve valuable rewards in their *Monthly* for December, among which is the following:

We will give \$20.00 in gold to the person telling us how many verses there are in the New Testament Scriptures (not the New Revision) by December 10th, 1882. Should two or more correct answers be received, the reward will be divided. The money will be forwarded to the winner December 15th, 1882. Persons trying for the reward must send 20 cents in silver (no postage stamps taken) with their answer, for which they will receive the *Christmas Monthly*, in which the name and address of the winner of the reward and the correct answer will be published. This may be worth \$20.00 to you; cut it out. Address RUTLEDGE PUBLISHING COMPANY, Easton, Penna.

Very Crooked.—The crookedest of crooked work, and yet that which has grace and elegance in every crook, may be seen in the *Noves Dictionary Holders* and *Noyes Handy Tables*. In them the fact is clearly demonstrated that if the inventor has *not* made the crooked straight, he *has* made the straight crooked, and thereby increased its beauty and utility. People in search of holiday presents will appreciate his success. A fine illustrated circular may be had *free* by addressing L. W. Noyes, 99 W. Monroe-st., Chicago. The prices have been greatly reduced.

CORRESPONDENCE

For the American Bee Journal.

Our Railroad Apiary, Car and Track.

M. A. WILLIAMS.

DEAR EDITOR:—We enclose picture of our railroad apiary, showing our extracting car, etc. We have 140 colonies in this apiary and with the aid of our extracting car two men can take the honey from them in one day. At

6 feet wide, painted bright scarlet, and trimmed with white, and makes a very showy appearance; but the car is not for show, by any means. It has a double sash, one side being glass and the other wire cloth, so that we can have free ventilation through. Each side of the car is fitted up with two drawers that hold just ten Langstroth frames.

We start out with one drawer full of empty combs on each side. Pushing the drawer alongside of the hive, we take the full frames from the hive to the empty drawer and fill the hives right up with the combs from the other drawer. Then we are through with one colony, the time oc-

will be noticed that our friends run their honey right to the station on this same car, so that their honey is shipped without the need of a team at all. Now, by having other apiaries along the line of the main railroad, 10 or even 100 miles away, where there is found unusual pasturage, the car, with all its appurtenances, may be quickly and easily transported, and then, with suitable switches, the honey can be taken with little bother and expense. It rather seems to me now as if this were a more promising field to develop than the floating apiary that made such a sensation a few years ago."

Berkshire, N. Y.

RAILROAD APIARY, EXTRACTING CAR AND TRACK.

the end of the center track is our honey house, fitted up with tanks, where we empty the honey as fast as we get a load. You will see that each side of the car is fitted with drawers,

TRACK AND SWITCHES.

one for full combs and the other for empty ones.

The extracting car and track we have already described, as follows, in *Gleanings*: The car is 12 feet long by

occupied being incredibly short. Then we are ready for No. 2, and the combs from No. 1, when extracted, go into the hive of No. 2. Of course, the honey is being extracted inside the car at the same time. The drawers are so arranged that the car is bee-tight when they are either open or shut.

Figure 2 shows our track and how we switch from one track to another. There is one movable length of track that easily moves from the main track to the switch, on either side. The sketch rather shortens the yard, as the distance from the maple tree to the honey house is greater than the breadth. The two rows on the left are chaff hives, and the rest of them are the Langstroth. The sketch shows how we are located as to the depot, railroad, etc.

Mr. Root makes the following remarks about the use of the car: "It

For the American Bee Journal.

How I Make Nuclei and Queen Cells.

G. M. DOOLITTLE.

When I was writing my series of articles on the "Production, Care, and Sale of Comb Honey," I was requested by several persons to write an article on making nuclei, and getting queen cells for the same. Many ways of making nuclei have been described, some of which are good; still after trying nearly all the plans described in the bee publications, I have settled on one which I prefer to all others.

Nearly all are aware that if we take a frame of brood, bees and honey, from a populous colony and put it in an empty hive without a queen, that nearly all the bees will return to their former home; but if we take the

queen with them the majority of the bees will stay with her. This one point of so many bees returning to their old home, thereby causing the brood and queen-cell given to perish, is the great objection to most of the plans stated for making nuclei. As bees without a queen become attached to their queen-cells, to nearly the same extent they do to a queen, I reasoned that if a colony having queen-cells were divided into several parts (each part having a queen-cell), the bees would remain where they were put nearly as well as those would that had a queen. After several experiments in the matter I found the above reasoning to be correct.

Hence, to make my nuclei, I found out how many queen-cells the colony rearing cells contains, as soon as they are sealed over; and then I go to other hives and get as many frames of brood (having plenty of young bees hatching out) as I have sealed queen-cells, less those having queen-cells upon them, in the queen-rearing hive. These frames of hatching brood are placed in the hive with those having the cells; and if one hive is not large enough, a second story is added. Now leave them until 48 hours before the first queen is expected to hatch, when I transfer the queen-cells till each frame contains a cell. The next day these frames are placed one in a hive, thus making as many nuclei as there are frames, leaving one on the old stand, of course. Beside the frame of brood, bees, and queen-cell, I place a frame of honey, and then shut them up close to one side of the hive, by means of a division board. If I wish to be sure that none of the bees will go back, I shut the entrance and hive tight, for 36 hours, thus confining the bees till the young queen is hatched. Open the hive first at night and you will find, upon examination a day or two afterward, that you have a splendid nucleus in good working order.

HOW I GET THE CELLS.

As I believe queens reared under the impulse of natural swarming are superior to those reared in queenless colonies, most of the cells for my queens are built by colonies preparing to swarm. As soon as the first cell is sealed, the first swarm issues as a rule, a part of which swarm, with the queen, is hived, and the rest returned, to keep the brood warm, which is to be placed therein for making nuclei as given above. If but few queen-cells are wanted, enough will generally be built without any interference of the bee-keeper, but as I desire as many as possible from my best colonies, I adopt this plan: In going through the yard spreading brood, etc., I find, a few weeks before swarming, rudimentary queen-cells, or queen-cups started. All these are carefully taken from the combs, and collected in a dish I have for the purpose. At the time I think my best colonies are preparing to swarm, I take a frame of old comb and cut it full of slots, about 1 inch wide, or else take a frame and nail four strips of wood across the inside of it, and by means of melted wax, stick strips of old comb to the under side of these

wooden strips. Now, take the embryo queen-cells, and with melted wax fasten them all along on this comb, or in the slots where it is to be set, in place of the center frame in one of the best colonies, which should be selected with care as to all the points required to give the best bees. By this means, a large number of superior queen-cells are secured (as the queen will lay in these cups) and so arranged as to be easily transferred. If from any cause I wish more queens than can be reared from my best colony in this way, I proceed as above till I get the queen-cups attached to the strips of comb, when I go to my best colony and get a piece of comb containing larvæ just hatched. The cells to this piece of comb are shaved off near to the base, when the little larvæ are easily lifted from the bottom of the cells, by means of a goose-quill tooth-pick, with a curved point, and placed in the queen-cups. Twenty-four hours previous to this, I have taken a queen from a populous colony, and at this time I take away all their brood, leaving the combs containing honey and pollen. If they have none, two or three such combs are given them. In half an hour they will show signs of distress by running over the hive and flying about in the air. Now give them the frame with the prepared cells (putting the larvæ in the very last thing) and see what a hum of content they will set up as you leave the frame in the hive. In six hours these cells are supplied with plenty of royal jelly, and in about 12 days as large fine queens will be hatching as can be reared outside of natural swarming.

I see by the last number of the BEE JOURNAL that Mr. H. Alley has a plan whereby he gets his queen cells built in full colonies having a laying queen, and that these cells are built just when and where he wants them. This is something new, and if practical will be of great benefit to those desiring to rear queens. I understand through Mr. Pond, the writer of the article, that Mr. Alley is about to publish a book giving a full explanation of his process of getting queen cells, which will, without doubt, be quite an addition to the apicultural books already published. The above plans may not be as good as Mr. Alley's but I believe them as good as any yet given to the public.

Borodino, N. Y., Nov. 23, 1882.

"Boil it Down."

Whatever you have to say, my friend,
Whether witty or grave or gay,
Condense it as much as ever you can,
And say it the readiest way;
And whether you write of rural affairs,
Or of bees, or honey in town,
Just take a word of friendly advice—
Boil it down.

For if you go spluttering over a page
When a couple of lines would do,
Your honey is spread so much, you see
That the bread breaks plainly through;
So, when you have a story to tell
And would like a little renown,
To make quite sure of your wish, my friend—
Boil it down.

Prairie Farmer.

Different Kinds of Bee-Keepers.

MRS. L. HARRISON.

Bee-keepers no longer hear the whistling notes of a swarm, or the happy hum of the bees, after a prosperous day, as they evaporate nectar; in lieu of this they love to hear the jingle of clean cash as the result of their labors. There are different kinds of bee-keepers, though; some do not keep bees for profit, as, for instance, the amateurs who rear them for love, or recreation, or to acquire knowledge of insect life. It is an ornament to a lawn to have a nice hive tenanted with beautiful Italians, to fertilize the fruit and to protect it when ripe, from marauding boys. There is yet another class who neither keep bees for profit nor pleasure, but apparently to damage others. This latter class are an intolerable pest. They keep bees in a hap-hazard way, and do not care whether they get much surplus, regarding the bees as a sort of nuisance, and let them spread disease and raise moths *ad libitum*. When they have, by a mere streak of good luck, some surplus honey to dispose of, they bring it to market in bad shape. Sometimes in sulphuring the bees they spell the honey; sometimes they load in the hive, dead bees and all; or sell "chunk honey" in tubs and buckets; some a little better stored in rough boxes. A person does not find ready sale for this stuff, and as a last resort, puts it in a commission house, saying, "Sell it for whatever you can get."

When a person who keeps bees as a means of profit, comes to market with honey in nice shape, and demands a living price, he is hooped at by dealers who ask, "Do you think I will pay such an exorbitant price for honey? The other day a commission merchant offered me honey at ten cents per pound, and some dark for as low as four cents." A case of this kind occurred not long since, and when the bee-keeper inquired in what shape it was, the dealer owned that it was not in good marketable condition. But he retaliated by saying, "If it was not in sections like yours, some of it was just as good and white, and would taste just as well when eaten."

It would be well for bee-keepers, if they would imitate commercial travelers more, and pack their grip-sack with samples only, when they are ready to dispose of their goods. In this way they can quickly visit consumers, groceries, drug stores and manufactories, and receive a far different reception than they would if they had a wagon load at their doors. And if the bee-keeper needs anything in the line of those to whom he seeks to sell honey, so much the better. A mutual exchange benefits both. It is bad policy for bee-keepers to ship their honey to distant cities and towns, and leave their own locality unprovided for, thus forcing groceries and apothecaries to order these same goods from the cities to which they were sent. The best persons to sell extracted honey, owing to the many adulterations in this class

of goods, are its producers. The hue and cry about glucose in honey, benefits local bee-keepers, as those desiring pure honey purchase of those known to be its producers.

Peoria, Ill.

Translated from *Bienenfreund* by A. R. Kohnke.

Duties of Bee-Keepers in the Spring.

HERR HENNING.

As suggestions for spring work will be in order during the winter, I will attempt to give a few.

As soon as the weather becomes sufficiently warm to permit an examination of the colonies, the apiarist should do so, to ascertain if the bees have plenty of stores; and, if not, they should be fed abundantly, but very carefully, so as not to disturb the bees too much. Water for the bees should be put near the bees in a sheltered place. Queenless colonies should be re-queened, if they are strong enough; if not, they should be united with other weak colonies.

Re-queening, in early spring, should be done by furnishing such colony a fertile queen; never have them rear one themselves. Keep the bees warm. Contract the brood-nest and add frames, one every week or ten days; later in spring, when young bees begin to hatch, additional frames may be added more frequently, and stimulative feeding commenced. For the latter purpose I use the following composition: 1 pound of sugar, 3 ounces of water, $\frac{1}{2}$ ounce of starch, 7 grains albumen (dried), 7 grains phosphate of lime, 7 grains carbonate of lime, 7 grains salicylic acid.

Dissolve the sugar in the amount of water given, and boil to a thick syrup. Have the other ingredients very finely powdered and well mixed; add them, stirring continually, so as to well incorporate them in the solution of sugar. The sugar should be of the very best, not showing a bluish cast, which would indicate artificial coloring. The starch should also be pure—odorless and tasteless. All the ingredients can be obtained in a good drug store, with, perhaps, the exception of sugar. If you cannot get the albumen (white of eggs) there, you may prepare it yourself by spreading it thinly on window glass, and drying it in a warm temperature, not higher than 135° F. After it has thoroughly dried it may be scratched off, and by the aid of a druggist's mortar, converted into a fine powder.

After having stirred in all the ingredients, let it boil 3 or 4 minutes, pour it into frames which fit the hives, lay your frame on an even smooth board and see that no sugar runs out. In order to better prevent running, a piece of paper, larger than the frame should be pasted on the one side of the same, bending the edges and pasting them also to the different bars of the frame; then lay the frame on the board, with the paper next to it, and cast your cake.

After it has cooled it will stay in the frame and should be hung in the hive as near the brood-nest as convenient,

the paper on the off-side. If the colony has but little honey, two such frames should be given, one on each side of the brood-nest; but, if there is plenty of honey, one will be sufficient to enable the bees to raise brood and bees enough to crowd the hive when the honey season arrives; to accomplish this, such frames must be given from 4 to 6 weeks before the bees are wanted to gather the honey when the wave strikes your locality.

For the American Bee Journal.

New Plan for Introducing Queens, etc.

E. H. THURSTON, M. D.

The BEE JOURNAL is a regular and most welcome visitor; it make its appearance at my office every Wednesday almost as regular as the day itself, and is always filled with the most interesting and valuable information on apiculture of any publication I have ever read.

Allow me, Mr. Editor, to relate briefly a few experiments and give some thoughts on the introduction of queens. As I do not wish to consume much of your valuable space, I will touch lightly upon ventilation and wintering at present, but perhaps at some future time may give more upon these subjects. It has been said "Modern bee-keeping is very modern indeed," and it is well said; with so many practical and scientific investigators, how could it be otherwise?

My attention was attracted by an article in the BEE JOURNAL for Oct. 18, page 661, by Prof. S. J. Robbins, on the "Use of Onions when Uniting Bees."

A few days after reading the article I transferred a colony of bees from a box to a frame hive. I had a few bees with a queen in a Langstroth observatory hive; not caring to winter them alone, and, wanting the combs for my new colony as well as the bees, I concluded to try the onions while uniting the bees.

I placed some onions in the observatory hive and in my new one; left them for 24 hours; I then removed the bees and combs and placed them in the new hive; there did not at the time appear to be any disturbance; they seemed to get along nicely, but on the next day I found my experiment had resulted in the death of all the bees from the observatory hive. I do not consider this a fair trial of the use of onions, and shall some time try it again.

Prof. R. spoke of using the onions for introducing queens, upon the theory of their changing the scent of the bees; this gave me a new idea. The thought occurred to me that if onion would do so well why would not some article having a stronger odor do better? Asafetida suggested itself; also a new method of introducing queens by the use of asafetida water, thrown on the queen and bees by a hand atomizer; the queen being let loose on the combs, among the bees; at the same time spraying among them quite thoroughly.

Here was a chance for experiment; and all that was lacking was the fact that I had no colony to put my queen in. My friend and neighbor S. N. Roplege, who by the way is one of our best and most successful bee-keepers, a man of much experience and a careful observer, and practical in every respect, informed me that he was in need of a queen for a queenless colony that had been queenless for two months. I made known to him my plan of introducing, and told him I would give him the queen if he would try the experiment, to which he readily assented.

I prepared the water by using half a drachm of tincture of asafetida to 2 ounces of water; gave him a hand atomizer and he proceeded as follows: he sprayed the bees in the hive through the entrance; the hive was then opened and the bees sprayed again; the queen in the cage was now sprayed and a center frame taken out, put up in a convenient place, the bees on it thoroughly sprayed and the queen turned loose among them; at the same time spraying the bees and queen lightly and watching her movements closely. He said she, as well as the bees, were considerably excited at first, but no attack was made upon her. After about five minutes the excitement passed off and they became quiet. He then sprayed the frame, bees, and also the bees in the hive and the frame was returned to the hive which was at once closed and remained so until the next day, when he opened it to see what the results had been. He found that all was peace and harmony; the queen had commenced laying and all hands were at work.

Mr. R. informed me that this colony had refused three queens, and that about three weeks before trying this experiment he had given them a frame of brood, that they had attempted to rear a queen, but as he thought, had failed; but about a week after introducing my queen, he found her all right, but, to his astonishment, he also found a small, runty queen, with no wings, in with her; and he is now satisfied that she was in the hive when he introduced my queen, and that she was there when he attempted to introduce the last one of the three before mentioned.

I do not claim anything wonderful for this method, nor do I know whether it is new or not, but I think it an experiment worth trying, and I would like to hear of some one else trying it.

Asafetida is somewhat of a disinfectant, and I think it would not be a bad plan to spray all colonies occasionally with the water.

I have consumed more space already than I had intended, but with your permission, Mr. Editor, I will add a few words touching ventilation and wintering.

The use of the enameled sheet I consider one of the very convenient thing, but my impression was when I first saw it spoken of, that it would not permit the escape of the breath of the bees, and would retain too much of the animal heat; that the cold air on the outside would condense the heat, causing too much moisture in the hive.

To avoid this I punch the sheets full of small holes, for spring and fall use, and for winter I make an opening in the center of the cloth, 3x6 inches, cutting on one side and both ends of the opening and turning the flap back; over the opening I place a piece of wire cloth and then put on the chaff cushion, having first placed Hill's device, or something of the kind, over the frames under the sheet. This I think gives a thorough ventilation.

I was pleased to find in the October number of the BEE JOURNAL, page 659, the plans of Mr. James Heddon for wintering, as it was the plan I had determined on. I think the addition of lime to the sawdust would be of great benefit. I shall also add lime to my chaff cushions. I am of the opinion that if chloride of lime, camphor, and articles of a disinfectant and absorbent nature, were used in and around our hives, during winter and summer, that we would be troubled but little, if any, with cholera or foul brood.

I am more favorable to wintering out doors than in cellars, as I think it approaches nearer to nature. It gives the bees better ventilation as well as the advantage of a cleansing slight during favorable winter weather.

The Ohio State Bee-Keepers' Association will meet in Columbus, in the rooms of the *Ohio State Journal*, on Tuesday and Wednesday, Jan. 9 and 10, 1883. A full attendance of members, and all interested in bee-culture, is requested, as matters of interest and importance will be discussed.

Dr. H. BESSE, Delaware, O., *Pres.*
 DANIEL SPEAR, Cardington, O., *Sec.*

Maine Bee-Keepers' Association.

The regular quarterly meeting of the Maine Bee-Keepers' Association was held at Bangor, on Thursday, Nov. 9, 1882.

The President, Mr. F. O. Addition of Dexter, called the meeting to order, and Mr. Wm. Hoyt, the Secretary, read the report of the last meeting.

Several new members signed the constitution, among them a number of ladies; and it was noticeable that both during the forenoon and afternoon, there was a good sprinkling of ladies who were among the most interested participants in the convention. The Association now has a membership of about fifty, embracing the leading bee-keepers in all parts of the State.

After some discussion it was voted to hold the next annual meeting at Dexter, on Thursday, February 8, 1883.

It was a matter of much regret to all bee-keepers present at the convention, that Mr. R. S. Torrey, who had made all arrangements for the meeting, was prevented, through severe illness, from being in attendance.

In the afternoon, after disposing of some business, the following papers were read in the order named: "On Wintering Bees," by R. S. Torrey, Bangor; "Bee-Keeping, Past, Present and Prospective," by Lucian French, Dexter; "Wintering and Springing Bees," by O. L. Sawyer, Gardiner; "Bee-Keeping for Ladies," by I. F. Plummer, Augusta. In the absence of Mr. Torrey his essay was read by Mrs. Torrey, herself a most thorough and accomplished person in the science of bee-keeping.

WINTERING BEES.

Mr. French said that the first requisite to successful wintering was a strong colony, not less than three quarts, to give an adequate idea of quantity. Then some protection must be given, the amount depending upon the degree of cold the bees have to withstand. Next is a young and prolific queen. Then it is sure the colony must have plenty of stores. He believed that from twelve to fifteen pounds of honey were sufficient on which to winter a colony. Mr. French detailed at some length, but in an interesting manner, his various ways of wintering bees, and gave an account of some experiments in wintering which he intends to try the coming winter. He has had success in wintering hives on their summer stands by providing them with an outer box of rough boards, which left from six inches to a foot of room between that and the hive that was filled with chaff. One foot of chaff packing was also put on top of the hive. A report on some eight or ten different ways of wintering which he intends to try in his apiary of about forty colonies, he hopes to present to the Association at its next summer meeting. He is sure that more depends upon the vitality of the colony than any other one thing; and that the thing most to be dreaded is spring dwindling. Human wisdom has not yet devised the best way of wintering bees, but Mr. French lives

in hopes that it will soon be accomplished.

Mr. Plummer made some interesting remarks on wintering, and on providing artificial pasturage for bees. As to the former subject, he said that in different years, and in different places, bees had sometimes wintered well in all kinds of situations. He thought one of the most difficult features of wintering was to carry the bees through from the middle of March to the middle of May, successfully. In regard to the latter he advocated with much earnestness the providing of artificial feeding ground, as without it, in the older portions of the State he thought we could not get so much honey from bees as was desirable. In some years, probably, owing to atmospheric influences, white clover will yield little or no honey. He thought highly of sweet clover and borage, with the latter being especially well pleased. The question with him was, as to whether we should grow crops for honey alone, or grow such crops as would yield grain after the honey had been gathered. He was going to sow half an acre of sweet clover another spring. As to borage, he had had a small piece the past season, which was in bloom perpetually from July 1st to very late in the fall, and the plants had been fairly black with bees from morning till night. From considerable experience he had but a slight opinion of buckwheat as a honey plant.

Secretary Hoyt said he had wintered one colony very successfully last winter by covering it "head and ears" with buckwheat straw, on its summer stand—the straw being piled on pretty thick. On April 5th last, he opened one side, and after getting into the straw a few inches found it perfectly dry. There was no loss to this colony, and it did not eat but little honey, as the top of the frames had sealed honey on them. The colony was strong, one of his best. He was intending to try half a dozen hives this winter in the same way—it was at least a cheap means of wintering. He thought if bees could be kept perfectly dormant in winter, in whatever location they were, and could be in a normal condition in the fall (*i. e.*, young bees) they would winter well; and should not raise brood or pollen till in the best possible condition to breed for summer say the last of May or the first of June. He knew of a friend had wintered bees in square boxes on the south side of a bank where the snow had drifted completely over them, and where they did not thaw out for the winter. They came out in as good condition as others kept in a different way. If bees are strong, they can fly toward spring, or even in winter, if the sun is warm, alight on the snow and rise again before becoming cold.

BEE PASTURAGE.

In regard to pasturage for bees. Mr. Hoyt thought it a subject of much importance, but said he believed we could not afford to grow a crop for honey alone, as a general thing. He believed we should grow white, and the small Western red clover for this purpose. He had sowed borage to

some extent. It was a plant that was in flower from July 15th to the 2d of September, and when in flower was fairly black with bees feeding upon it from early till late, every fair day. They would leave goldenrod and buckwheat to work upon it. Mr. Hoyt, in speaking of the value of pasturage, remarked that he had one colony that gathered twenty-five pounds of honey in a single week on bass. If such pasturage as a bass forest afforded could be continued through the season, what stores our colonies would gather! In regard to buckwheat he had sowed it for six years, and thought it had paid almost every year, as he usually raised twenty bushels per acre.

Mr. French gave some of his ideas on bee pasturage. He has provided sweet clover, borage, buckwheat, Simpson's honey plant, and the spider plant, at different times, but did not think much of the spider plant, as he found his bees did not work upon it. He should try it one season more and if the bees did not work on it to a greater extent than formerly, should discard it. The bees worked on borage all the day long. He thought they worked but very little on red clover.

Brief remarks were made by Mr. J. E. Bennoch of Orono; Mr. Sampson of Oldtown; Mr. Wilmont, a California bee-keeper who was present, and other gentlemen, after which the convention adjourned.—*Home Farm.*

Iowa Central Convention.

The Iowa Central Bee-Keepers' Association met at Winterset, on Friday, Nov. 3, 1882, and was called to order at 10:30 a. m. with Pres. A. J. Adkison in the chair.

No report of the last meeting read, the minutes having been lost.

The following officers were elected for the ensuing year: President, A. J. Adkison, Winterset; Vice President, J. W. Graham, Winterset; Secretary, J. E. Pryor, Arbor Hill; Treasurer, Mrs. Mary Pryor, Arbor Hill, Iowa.

From 94 colonies of bees at the beginning of the honey season of 1882, there was reported an increase of 135 colonies, and a production of 1,943 pounds of comb honey, 6,980 pounds of extracted honey, and 48 pounds of wax. Of the 232 colonies reported at the close of 1882, there were 94 Italians, 127 Hybrids, and 11 Blacks. Kinds of hives used: 150 Langstroth, 50 North Star, 8 box hives, and 2 American.

This is hardly a fair representation of the bee-keepers within the bounds of the Association, several of the principal apiaries not being reported.

After receiving several new members and discussing methods of wintering, etc., the meeting adjourned to meet in the council room in the Court House at Winterset, on Friday, May 11, 1883. J. E. Pryor, Sec.

The annual meeting of the Cortland Union Bee-keepers' Association will be held in Cortland, N. Y., on Tuesday, Jan. 9, 1883.

M. C. BEAN, Sec., McGrawville, N. Y.

Read before the N. A. B. K. S.

How to Cure Foul Brood.

D. A. JONES.

This is a subject on which much has been said and written; and there seems to be a great many and varied ways of curing it; some of them, however, are rather difficult, and not within the reach of every bee-keeper, as well as being slightly costly.

I purpose setting forth in the following the most easy and cheap, as well as the surest method that has yet come under my notice, and one that comes within the reach of every apiarist on however large or small a scale. This mode of procedure (by starving) has never yet failed when properly carried out, and I have tried it in many cases in our country.

I shall give the process, first where there is no brood or where one does not care to save it; and secondly, where there is brood in the hive, and one is desirous of saving it. First, smoke and drum the bees until they have all gorged themselves with honey; and it is important that they be all well filled, otherwise that portion of them whose sacs are not full will not live the time that the other portion would be required to starve, to affect the cure; hence the necessity of having their sacs filled evenly. They should not be allowed to settle down again after having gorged themselves; the operations when once commenced should be carried through without the loss of any time, as a short space only would require to elapse, if left quiet, before some of them would replace their honey in the cells again, when the work of smoking, etc., would have to be repeated. After they have been smoked and drummed sufficiently, shake the bees into a clean hive or box, over which place a wire-cloth cover, care being taken that none escape, as one bee escaping and entering another hive would, in all probability, spread the disease, as it is by the depositing of the diseased honey in the cells of clean colonies that this disease is generally contracted. To prevent the spreading of the disease, the operations should be performed either early in the morning or late in the evening, when no bees are flying; or if the work is done during the day, it should be beneath a wire tent, or in some other place of confinement, where there is no chance of any of the bees from the affected colony escaping. These precautions are required only where a portion of the yard is diseased; but where the whole apiary is attacked, the work may be carried on with impunity.

When all the bees have been secured in the hive or box covered by the wire cloth, carry it to a cool, dark place, and there lay it on its side; and why? First, because when in a dark, cool place the bees will cluster and remain more quiet than when subjected to light and heat; and secondly, when clustering in the top of the hive; and were the hive or box to be placed on its proper bottom they would all cluster on the wire cloth, and thus prevent

a proper ventilation, which would cause suffocation; whereas, by placing the hive or box on its side, the other side would then become the top; and on this the bees would cluster, thus securing a free circulation of air. The temperature of the place where the starving takes place should be from 50° to 55°, never above 60°, and a cellar would therefore be the best place in hot weather. They should then be left alone, perfectly quiet, from 80 to 120 hours, or until the bees are noticed crawling around the bottom of the box or hive in a starving condition, and a few of them are dead; then put them in a clean hive with clean comb or foundation; if comb, there should be honey in it, and if there is not, the bees should be fed honey or sugar syrup, as also should they be fed when foundation is used, and remove them to a place one or two miles distant, where let them remain until the whole yard is cleansed, when they may be returned to their original stands in the old yard. While the bees are starving, scald the hives and frames from which the affected colonies have been taken; extract the honey from the combs, which may be boiled and fed back to them again; render the combs into wax; and the wax, manufacture into foundation, and place it in the scalded frames, for use in the scalded hive, into which put the bees, after their allotted time of starving has expired.

Great caution should be exercised to see that the queen is placed in the hive or box in which the bees are to starve, unless in the case where the colony has been queenless some days previous, when they will do almost as well without one.

Now, in the second case, where one desires to save the brood, proceed as in the former instance, with the smoking and drumming and transferring of the bees and queen to the hive or box for starvation, only sufficient being left in the diseased hive to nurse the brood.

With those placed in the clean hive or box, the operations will be the same as heretofore described. The remaining brood and bees, if weak, should then be doubled up and otherwise strengthened as much as possible; and when hatched out, put through the same process as the others. This method, if properly carried out, will invariably prove successful. It was my intention to have referred to the various causes of the disease; but I find that my paper is already sufficiently lengthy. I will therefore defer it at this time. Before closing, I may say that, by referring to page 103 of the AMERICAN BEE JOURNAL for 1882, in its issue of Feb. 15, some further explanations may be found regarding this method of curing foul brood by starvation.

The Western Michigan Bee-keepers' Association will meet at Supervisors' Hall, in the city of Grand Rapids, on Wednesday and Thursday, Nov. 29th and 30th, 1882. The co-operation of all bee-keepers of this section is desired.

W. M. S. DODGE, Sec.

The 17th annual convention of the Michigan State Bee-Keepers' Association will be held in Kalamazoo, Dec. 6 and 7, 1882. All interested are cordially invited to participate in the discussions—which will embrace the live issues of the Apiculture of to-day. Thomas G. Newman, A. I. Root, D. A. Jones, Prof. A. J. Cook, and many other distinguished apiculturists are expected to be present. Low rates of board at hotels have been secured. T. F. BINOHAM, Sec., Abromia, Mich.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning Co.; O., in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th. L. CARSON, Pres.

The Nebraska State Bee-keepers' Association, will hold its annual session in Wahoo, Saunders county, Neb., commencing Thursday, Jan. 11th, 1883. Arrangements have been made with the railroads to secure 1/4 fare for the round trip. The Saunders county Bee-keepers' Association will furnish entertainment free to all visiting apiarists. Bee-keepers from neighboring States will be welcomed. T. L. VONDORN, Pres.

GEO. M. HAWLEY, Sec.

SELECTIONS FROM OUR LETTER BOX

Report for 1882.—Basswood is very scarce in our neighborhood, and there are no other blooming trees, except fruit trees. White clover was a fair crop here this season. Therefore, I am obliged to resort to planting to make the business a profitable one. I sowed sweet clover in the spring, on sandy soil; it came up very nice, but did not bloom. I also sowed about three acres this fall with wheat, and will resow the same ground again in the spring, as the first time it was sowed thin with that intention; there being so many different reports about sweet clover during the last year, as to the time of sowing and its value afterward; that every man must do his own experimenting in the best way he can. There will be one consolation, I will have the pleasure of knowing some of its traits when it once comes to perfection. Last year I was told to sow catnip, and motherwort in the fall; I did so and failed, now I shall sow in the spring; should I fail on these three plants then there will be a small apiary for sale; should I meet with success, and learn more properly the ways of success of the

apiary, I may hereafter be able to give a more satisfactory report upon apiculture. I started the season with 3 colonies, increased to 12 by natural swarming and returned 4 swarms; I used foundation in the brood chamber and surplus boxes. I obtained 201 lbs. comb honey; average, 67 lbs. spring count. The honey sold at 20 cts. per pound. \$13.40 per colony.

Elida, O. JNO. G. RIDENOUR.

A Natural Bee Hive.—MR. EDITOR:—I send you a sample bee hive, with the side cut away, showing the inside arrangement. It maybe that you can see progression in it.

W. H. BUSSEY.
Chicago, Ill., Nov. 20, 1882.

[It is a hornet-bee's nest, and we suppose was intended to call attention to the 7 dead-air spaces between the inside and outside of the nest, which Nature must have taught these insects to have in order to resist the cold in autumn, and protect the brood, during the fall. There is some difference, however, between their thin paper hives and the board and straw used for bees in winter, as also much difference between the cold weather during autumn and that of the winter from January to March. We have no doubt, however, that dead-air spaces are as good as any other method of winter protection.—Ed.]

4,000 lbs. of Honey from 19 Colonies.—My report is as follows: Extracted honey, 3,000 lbs.; comb honey in one-pound sections, 1,000 lbs. I have also 100 full Langstroth and American frames extra for spring feeding, if next spring should be late. I increased to 71 from 16, spring count. All this increase has come from 11 colonies and their increase, as I have 8 colonies in American Long-Idea hives containing 16 full-size frames and 16 half-frames that did not swarm this season. I increased by natural swarming, giving old colonies an old hive and a laying queen as long as I could keep up with them. I have returned 32 swarms, and 3 went to the woods. Honey-flow was almost continuous from June 4, to Sept. 23, and since that another short flow of about a week, so that the lower stories of many of the hives are honey-bound.

S. H. MOSS.
Colchester, Ill., Oct. 23, 1882.

Ready for Winter.—To-day I have finished my packing my bees for winter. I have packed them in a clamp, similar to the one described by D. A. Jones, except where he says "set the hives about six inches apart," etc. I have put mine one against another, and I leave the propolized cloths on my hives. They have been prepared for winter for some three weeks and the cloths were well stuck fast. I use no packing except buckwheat chaff, which has never failed, even when other material did. In answer to Miss

H. F. Buller in the BEE JOURNAL for Nov. 8, where she asks whether I close the upper fly holes when I raise the lower hive, I will say that I always close all but those at the bottom. In place of extracting, if I have the combs, etc., and honey is plenty, I put a third hive on, by parting the two and putting the third between the first two, or I extract from the lower hive at any time, setting the upper one on the stand while extracting the lower. There is no brood below, unless the colony has a very prolific queen.

W. S. BAIR.
Rollersville, O., Nov. 15, 1882.

Care of Empty Combs.—Will it injure empty combs to be left in a hive, without bees, out-of-doors, all the winter?
JOHN RUDD.

London, Ont., Nov. 13, 1882.

[There need be no fear of worms for they cannot develop except in warm weather. Spread the combs 2 inches or more apart and they will be safe.—Ed.]

My Season's Work.—I had 3 colonies of bees last spring, and last summer obtained six natural swarms. I hived them all on empty extracted combs. I made two of them into two-story hives for extracting, and I extracted 200 pounds of excellent honey from the two. From the other 7 colonies I obtained 200 pounds of comb honey, and they have plenty of honey for winter. I sold the honey at 10 cents a pound for the extracted and 15 cents for the comb honey. I sold all my money at home at the above price.

WM. ROBERTS.
Vaughansville, O., Nov. 22, 1882.

Sensible Bees?—I have packed 135 colonies of bees; all strong but about 6, which are a little weak in numbers. If they do not go to rearing young bees this warm weather I think they will winter well. Nothing makes me dislike men or bees so much as to see them try to do what they cannot or ought not to do.

E. B. SOUTHWICK.
Mendon, Mich., Nov. 22, 1882.

Wintering Bees.—I will give my experience during the season of 1880-1 and 1881-2; which were the two extremes of temperature during the past 26 years. In 1880-1 I took charge of the Omaha apiary, consisting of 107 colonies, which had been packed during the month of October, 1880, in chaff, thus: they were put on 5 frames, with division boards on each side and the spaces filled with dry chaff; a box 4 inches deep, with mustin bottom, filled with chaff, was put over the frames; then the hives were covered with sough grass. In January the snow filled the apiary so full that I could scarcely see the location of the hives; then came a rain causing the snow to melt, for about 2 days in the beginning of February; after which, it all froze into one solid mass. In March, when it was warm enough for the bees to fly, they knew nothing of the outside world, for they were com-

pletely closed in; the larger portion had to be released by chopping them out. After shoveling out the snow from 18 to 24 inches, I found from 4 to 6 inches of solid ice at the entrance and had to use a small chisel in cutting it out, so that the bees could have their first flight, March 23. Out of 107 colonies 98 came through all right, with plenty of young bees. Now, will some apiarist tell me what saved these bees through that hard winter when 75 per cent. of the bees in the country perished?
G. ROUSE.

Wahoo, Neb., Nov. 20, 1882.

Cause of Foul Brood.—Will some one through the Weekly BEE JOURNAL inform me of the cause of foul brood? I have looked for it under that heading, in Cook's Manual, but could not get a description of it. I am only young in the business and would like to get all the information possible. I like Cook's Manual very much. I bought my bees, which are blacks, last year, and I am not at all satisfied with them. I shall Italianize them next spring. How early would it be advisable to do so? How do you tell foul brood from chilled brood? When I packed my bees for winter I noticed on some of the outside frames a few cells capped over; they were not together, and the rest of the frames were empty. On uncapping some of the cells they contained a dark substance which I took for chilled brood, but I would like to be sure about it. There is an unpleasant smell from it, but not very bad. We are having a very fine fall, this year; the season is something like the spring, one month late.

W. H. WESTON.

London, Ontario, Nov. 23, 1882.

[Our correspondent is referred to the article by Mr. D. A. Jones in this issue of the BEE JOURNAL, on foul brood, for the information he desires. Mr. Muth and Mr. Kohnke have published pamphlets on the subject, which it may be well to read and compare. Transferring should be done as early in the spring as the weather will permit, and before there is much honey in the hive.—ED.]

My Bee Report.—As my bees are now all in winter quarters I will give to the readers of the BEE JOURNAL an account of my season's work. I commenced the last season with 10 colonies of bees, 5 of which were weak. By following the advice of Mr. Doolittle I have increased them to 40 strong colonies, and 6 nuclei consisting of from 4 to 7 frames each, making 46 in all, to winter. I obtained from 800 to 1,000 pounds of honey—one-half each comb and extracted. I have 20 colonies packed on the summer stands, in flax-straw; the rest are in my cellar under the kitchen, 10x14 feet, partitioned off from the main cellar and ventilated, so that I can keep the bees in such temperature as I may desire. I have one colony with 2 queens, which have resided there in harmony for 2 months, and both were alive when put

into winter quarters. I cut one wing of a queen last spring, and she was superseded, but as Mr. Doolittle says it does no harm to them, to clip their wings, I will try again.

J. A. WICHERTS.

Matteson, Ill., Nov. 20, 1882.

Questions.—Is a square hive better to winter in than a long one? In other words, is the Langstroth hive as good to winter in as any other? Mr. Manum's hive you call "a modified Langstroth." The brood-box holds 12 frames 9½x12 inches. I mean, more particularly, for out of door wintering. Mr. Manum admits that it costs more to make his chaff hives than it would to build a house, or put them in the cellar, and now the question is, are bees better wintered out of doors? I have been told they do not dwindle so much in spring, wintered on their summer stands. Are they better in other respects? If so, it will pay to build chaff hives. Mr. M. has 500 colonies. What do you think of the "Given Press" as compared to other machines?
A. P. FLETCHER.

Ludlow, Vt., Nov. 12, 1882.

[If for out-door winter alone we should prefer a square frame—but for all purposes we prefer the Langstroth hive and frame. As to the manner of wintering bees there is a diversity of opinion, and as yet the point is unsettled. We have not yet concluded to give any decision on the chaff hive. Wait until next spring and then we may be able to decide more intelligently. Some like the "Given Press" and some do not. Mr. Heddon thinks it as good or better than others.—ED.]

A Humbug or Swindler, which?—

About the 1st of March, 1882, I sent \$5 to J. J. Ritchie, of 142 Linn St., Cincinnati, Ohio, for the purchase of a Mitchell honey extractor. I waited until April for the extractor to come, then I wrote him a postal card, and told him to send it soon, etc. To this I got no answer; then I wrote a letter and said, that the extractor must come or else the money, or I would expose him. This he answered, as follows: "Cincinnati, May 1st, 1882. Dear Sir: Your favor of 27th April at hand; your register was received, but no postal card. Your order was sent to our factory at Indianapolis, and I supposed your order was filled. Will see what the matter is and have your extractor sent.—J. J. RITCHIE." I have never heard any more from J. J. Ritchie or the \$5 either. I got tired of waiting for it, so I enclosed \$7 to a well-known supply dealer, and I received an extractor in due time, in prime condition. It pays to deal with an honest man. JOHN F. SELLERS.

Hamlet, Ill., Nov. 16, 1882.

Report for the Past Season.—I had 29 colonies in the spring, and have increased to 40. I have obtained 958 lbs. comb honey and 158 lbs of extracted.

F. H. SEARES.

Girard, Pa., Nov. 17, 1882.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL. }
Monday, 10 a. m., November 27, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—The supply of extracted honey is fully up to the demand. My quotations are: 6½¢ for dark and 8½¢ for light, delivered here.

BEEWAX—It is quite scarce. I am paying 27¢ for good yellow wax, on arrival; dark and off colors, 17@22¢.

AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—Demand is good for extracted honey by the barrel for manufacturing purposes and for table use. The demand is very good for honey in 1½ lb. jars. A good deal of comb honey could be sold if we had a good article at a rate within the views of the consumer; 4 c., which could be sold at 20c. in the jobbing way and 25c. at retail.

We pay 7@10c. for extracted, and 16@20c. for good comb honey in sections
BEEWAX—Is in good demand at 20@27c. per lb. on arrival.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand for comb honey does not keep pace with the receipts. There is a large surplus on this market at present, and prices are from 2 to 3c. lower than last month.

We quote: white comb honey, in 1@2 lb. sections, 17@18c. Dark comb honey, hardly any demand. It is held at 13½@15c. Extracted—White brings from 9@10c.; dark, 8@9c.; kegs, half-barrels and casks bring about same price.

BEEWAX—Choice Yellow, 30c.; dark to medium, 18@25c.

R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY—A sailing vessel this week took 1,013 cases for Liverpool from a packing house. The market is quiet. Such quantities as are in good supply, dark and medium, are in poor demand.

White comb, 18@20c.; dark to good, 12@15c.; extracted, choice to extra white, 9@10c.; dark and candied, 7½@8½c.

BEEWAX—We quote 25@28c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Was in better demand and sales were freer; prices steady. Comb sold at 16@18c. in lots; extracted at 8@9c. in barrels; strained, 6½@7c.; choice, in small lots or fancy packages, brings more.

BEEWAX—Prime bright steady at 26@27c.

R. C. GREER & Co., 117 N. Main Street.

CLEVELAND.

HONEY—There has been no change in honey the past week. No. 1 white in 1 lb. sections, continues in good demand at 21@22c. per pound, No. 1 in 2 lb. sections, is also in good request at 19@20c. Second grade, less active, at 16@2 cents ½ lb. less. Extracted, in all shapes, was dull and very little sale. Some Louisiana honey, rather dark, in barrels, was sold at 9c.

BEEWAX—Prime quality, 25@28c.

A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HONEY—There is a continued fair inquiry for prime lots of honey, and prices held steadily. Extracted honey quiet and unchanged.

We quote: White clover, fancy, small boxes, 22@25c.; white clover, fair to good, 18@22c.; buckwheat, 16c.; extracted clover, 10@13c.; extracted buckwheat, 9@10c.

BEEWAX—There is only a moderate movement of wax, but prime lots are held about steady. Western, pure, 29@30c.; Southern, pure, 30@31c.

D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Our market is fairly active. We quote: ½ lb. sections at 30c.; 1 lb. sections, 22@25c.; 2 lb. sections, 20@22c. Extracted, 10c. per lb. Good lots of extracted are wanted in kegs or barrels.

BEEWAX—30c.

CROCKER & BLAKE, 57 Chatham Street.

☞ New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

ADVERTISING RATES.

20c. per agate line of space, each insertion.

A line of Agate type will contain about **eight words**; fourteen lines will occupy 1 inch of space. Transient Advertisements payable in advance. Special Notices, 50 cents per line.

DISCOUNTS will be given on advertisements published WEEKLY as follows, if the whole is paid in advance:

For 4 weeks.....	10	per cent. discount.
" 8 " (3 months)....	20	" "
" 13 " (6 months)....	40	" "
" 26 " (9 months)....	50	" "
" 52 " (1 year).....	60	" "

Discount, for 1 year, in the MONTHLY alone, 25 per cent.,—6 months, 10 per cent.,—3 months, 5 per cent.—if wholly paid in advance.

Discount, for 1 year, in the SEMI-MONTHLY alone, 40 per cent.,—6 months, 20 per cent.,—3 months, 10 per cent.—if wholly paid in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

A few of our subscribers are in arrears for the present year—having requested us to continue, and they would pay soon. Will all such please take this as a request to send on the two dollars with a renewal for next year, if possible.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

New Premiums for 1883.

As the season for reading has now arrived, we hope that each of our subscribers will endeavor to send at least one new subscriber for the Weekly BEE JOURNAL for 1883 and thus not only help on the cause of progressive bee-culture, but assist in sustaining the only Weekly bee paper in the world.

Providence has smiled on the bee-keepers during the past season, and as a general thing they are abundantly able to procure a good assortment of bee-literature.

In order to encourage every one who keeps bees, be they few or many colonies, to thoroughly read the many very interesting books on bee-culture, now published, we have determined to make liberal offers, which will be available until January 1, 1883, as follows:

To any one sending us \$8 for any books they may select from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for one year.

To any one purchasing \$4 worth of books, selected from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for six months or the Monthly for one year.

Any one sending us a club of two subscribers for 1883, for the Weekly, with \$4, will be entitled to a copy of Bees and Honey, in cloth, postpaid.

For three subscribers, with \$6, we will send Cook's Manual, in paper, Emerson's Binder for the Weekly, or Apiary Register for 50 colonies.

For four subscribers, with \$8, we will send Cook's Manual in cloth, or Apiary Register for 100 colonies.

For five subscribers, with \$10, we will send the Apiary Register for 200 colonies, Quinby's New Bee-Keeping, Root's A B C of Bee Culture, or an extra copy of the Weekly BEE JOURNAL for one year.

To get any of the above premiums for the Monthly BEE JOURNAL send double the number of subscribers, and the same amount of money.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

The BEE JOURNAL is mailed at the Chicago post office every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Articles for publication must be written on a separate piece of paper from items of business.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Subscription Credits.—After sending subscriptions to this office, we would respectfully ask every one to look at the label on the wrapper of the next two papers, and there they will find the credit indicated thus: Those who have paid for the first six months of next year will find "June 83" after their names. Those who have paid for the whole year will find "Dec. 83" on their papers. The credit runs to the end of the month indicated. If the mark is "Dec. 82," it means that the subscription is paid until the end of the present year. Please remember that the credit given on this label is a sufficient notification of subscriptions due and receipt for payments made. If not so indicated within two weeks after sending money to us, you may be sure something is wrong, and should write to us about it. It will save annoyance and trouble if our subscribers will give this matter due attention.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Examine the Date following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the BEE JOURNAL.

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to new Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

The time for the usual winter rush of correspondence is here, and we wish to impress upon all our patrons the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address that we already have on our books.

CLUBBING LIST.

We supply the American Bee Journal and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

Binder for Weekly for 1882.....	2 75.. 2 50

The Monthly Bee Journal and any of the above, \$1 less than the figures in the last column.

We want a copy of No. 41 of the BEE JOURNAL for Oct. 11, 1882. If any one has that copy to spare and will risk sending us a postal card saying so, we will take the first offered and give in exchange any 25 cent pamphlet selected from our Book List.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

The result of the election has proved a grand success, but not more so than Kendall's Spavin Cure is proved to be every day. 4Sw4t

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

"BEE-KEEPERS' HANDY BOOK."

22 Years Experience in Rearing Queen Bees.

A book written and published by

HENRY ALLEY, WENHAM, MASS.

A NEW SYSTEM OF QUEEN REARING.

It will teach you how to prepare your bees for cell building; what eggs to select, and when to select them; how to remove drones from a swarm of bees; how to have the cells hatched without having them destroyed; how to keep the queens after they have hatched; how to introduce virgin queens to nuclei colonies; the best way to introduce laying queens to full colonies; how to test queens without keeping them in the hive three weeks after they are fertilized; how to know a good hardy queen from an inferior one the moment she leaves the cell; how to judge of a prolific queen before she has laid 100 eggs; how to select a queen to use for one to breed from; how to raise and preserve drones late in the season; what kind of a queen to raise drones from as well as the kind of drones to use; how and when to transfer bees from box to frame hives, and, in fact, many things that have never appeared in print, that are invaluable to any bee-keeper, whether he keeps a few or many colonies. Send for Circular. 47w2

FLORAL INSTRUCTOR now in its third year, has been enlarged to 28 pages. Monthly.

THE INSTRUCTOR is in magazine form with an attractive cover. It is printed from new type, on excellent paper, and is sold for 50 CENTS A YEAR, with Seeds, Plants, Etc., as premium. Extra inducements to club raisers. Specimen Copy FREE. Address

A NEW BEE BOOK!

Bees & Honey

OR THE

Management of an Apiary for Pleasure and Profit; by

THOMAS G. NEWMAN.

Editor of the Weekly Bee Journal.

It contains 160 profusely illustrated pages, is "fully up with the times" in all the various improvements and inventions in this rapidly developing pursuit, and presents the apiarist with everything that can aid in the successful management of the honey bee, and at the same time produce the most honey in its best and most attractive condition. Chief among the new chapters are "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. Price, bound in cloth, 75 cents; in paper covers, 50 cents, postpaid.

925 W. Madison Street, Chicago, Ill.

Appreciative Notices.

Carefully prepared for beginners.—Farmers Cabinet, Amherst, N. H.

A very valuable work to those engaged in bee-raising.—News, Prairie City, Iowa.

We advise all who keep bees to send for this excellent work.—Journal, Louisiana, Mo.

Its chapter on marketing honey is worth many times its cost.—Citizen, Pulaski, Tenn.

Carefully prepared, and of vast importance to bee-raisers.—Indianian, Clinton, Ind.

A neat and abundantly illustrated hand-book of apiculture.—American Agriculturist, N. Y.

New and valuable, and embellished with 109 beautiful engravings.—Democrat, Salem, Ind.

Much practical useful information, in a cheap form.—Daily Standard, New Bedford, Mass.

Contains all the information needed to make bee-culture successful.—Eagle, Union City, Ind.

Just such a work as should be in the hands of every beginner with bees.—News, Keithsburg, Ill.

A valuable work for all who are interested in the care and management of bees.—Democrat, Allegan, Mich.

The most perfect work for the price ever yet produced on the subject of bee-culture.—Anti-Monopolist, Lebanon, Mo.

The engravings are fine. It is gotten up in the very best style, and is cheap at the price.—Farmer, Cleveland, O.

It comprises all that is necessary for successful bee-culture, save experience and good judgment.—Daily Republican, Utica, N. Y.

A manual, containing all the newest discoveries in the management of these little workers.—Plain Dealer, St. Lawrence, N. Y.

Full of practical instruction, that no one who contemplates keeping bees can do without.—Farmers' Journal, Louisville, Ky.

Gives minute details for the management and manipulations necessary to make bee-keeping a success.—Col. Valley and Farm.

It embraces every subject that can interest the beginner in bee-culture. The engravings perfectly illustrate the text.—Farm and Fireside, Springfield, O.

Embraces every subject of interest in the apiary, giving very thorough details of the management and manipulations necessary to make bee-keeping a success.—Farm, Longmont, Colo.

Written in an interesting and attractive manner, and contains valuable information for all readers, even though they be not directly interested in the care of bees.—Sentinel, Rome, N. Y.

It is a valuable and practical book, and contains a complete resume of the natural history of the little busy bee, as well as of all that one needs to know in their care and management.—Chicago Herald.

Describes all the newest discoveries in the art, by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive shape.—Signal, Napoleon, O.

Contains a vast fund of information in regard to bee-culture. He who would keep abreast of the times must keep posted in all the improvements in his line. We advise all interested to get a copy of this book.—Daily Times, San Bernardino, Cal.

It embraces every subject that will interest the beginner. It describes all the newest discoveries in the art by which the production of delicious and health-giving honey is obtained, as well as how to prepare it for the market in the most attractive form. It is embellished with beautiful engravings, and is the most perfect work of the kind, for the price, that has ever come under our notice.—Farmer, Lancaster, Pa.

The Bee-keeper's Guide; OR, MANUAL OF THE APIARY, By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book:

All agree that it is the work of a master and of real value.—*L'Apiculteur*, Paris.

I think Cook's Manual is the best of our American works.—**LEWIS T. COLBY.**

It appears to have cut the ground from under future book-makers.—*British Bee Journal*.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—**J. P. WEST.**

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—**E. H. WYNKOOP.**

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret buying purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald*, Monticello, Ill.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—**A. E. WENZEL.**

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—**W. L. VAN ANTWERP, M. D.**

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record*.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—**L'ABBE DU BOIS**, editor of the *Bulletin D'Apiculteur*, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat*, Pulaski, N. Y.

We have perused with great pleasure this *vide mecum* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Apiculturist*, Quebec.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist*.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor*.

EARS FOR THE MILLION! Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small **White Shark**, caught in the Yellow Sea known as *Carcharodon Rondeletii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 500 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and bear much better.

I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE. AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Day Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

We regret to learn that Mr. William Williamson, of Lexington, Ky., who has been, for 2 years, Secretary of the Kentucky State Bee-Keepers' Association, has been in very poor health during the past summer. He is a progressive bee-keeper and a lover of the art of bee-culture, and, we hope, will soon be restored to his usual good health.

Messrs. J. Oatman & Sons have sold all their very fine and magnificent crop of honey in the comb to Messrs. Thurber & Co., of New York, at 20 cents per pound, delivered at the depot at Dundee, Ill. This is an excellent sale and speaks well for the producers who are some of the most progressive and successful honey producers of America.

Mr. R. J. Bennett, of Glasgow, Scotland, the very efficient honorary secretary of the Caledonian Apian Society, is now on a visit to Syria, and intends to make a call on Mr. Frank Benton, in Palestine, before returning to Scotland. We expect he will kindly give our readers an account of his trip when he returns. We shall all be glad to hear anything of public interest concerning our fellow-countryman in that far-off land of the rising sun.

Mr. W. J. Andrews, ex-President of the North American Bee-Keepers' Society, has just been re-elected Mayor of Columbia, Tenn. This is Mr. Andrews' third term as mayor of that city, and we congratulate him. He is very popular at home, as shown by the handsome majority given him.

This year there is a very marked improvement in the style and artistic character of Christmas cards. These go into thousands of homes, every year, and should be a means of elevating, if possible, the innate love for that which is beautiful in art. The bees love to visit and revel in the beautiful bloom provided so lavishly by nature, and bee-keepers should all aspire to be lovers of the beautiful, both in nature and art. This leads us to say that we have received some very beautiful samples of these cards for Christmas from L. Prang & Co., Boston, Mass., which excel anything we ever have seen before.

Mr. D. Higbee, Avoca, Iowa, after saying that he could not get along without the BEE JOURNAL, says: "By following its instructions this year, from 5 colonies, spring count, I obtained over 800 pounds of comb honey, the most of which I have already sold at 25 cents per lb., thus giving me \$200, or \$40 per colony (spring count) besides an increase of 12 colonies; in all now 17, to go into winter quarters." Mr. Higby is a progressive apiarist and has done very well.

On account of resuming the publication of the Monthly BEE JOURNAL for next year, we have found it necessary to adopt a new scale of charges for large advertisements or those that are to be inserted for a long time. We have, therefore, prepared a Table which gives liberal rates on advertisements by the inch in depth of column, when inserted in the Weekly as well as the Monthly editions. We feel sure that it will pay advertisers to employ both papers, and thus reach the many new subscribers that are now coming in for the new Monthly for next year.

The Ignorance of the Past Ages.

Mr. Thomas Balcomb, Luling, Texas, has sent us the following letter, and article on bees: "I have enclosed an article on bees taken from the *British Agriculture* of 1860. How strange it all reads to an advanced apiarist of the present day!" We will publish it as a relic of ignorance and superstition. It is as follows, and will amuse and interest as well as disgust our readers:

The word "Bee" is *beo*, Saxon—*bi*, Swedish—*bye*, Danish—*biene*, German—*byan*, Anglo-Saxon, to build—a name applied to an insect animal, of which the body has the appearance of being composed of circles or rings, and being cut into divisions by "incisure." An insect, *insecta*, Latin, being cut into segments, is an invertebral animal, without bones, breathing through lateral spiracles, and furnished with articulated extremities and movable antennæ. The bee is the "Apis" of scientific language, from *a*, by, and *pes*, a foot, as the animals cling or are suspended by the feet—from Greek word, as they are born without feet; *apio*, Latin, to collect; or from Greek for the sting of poison; and placed in the order "*Insecta hymenoptera*," from the Greek word for a membrane and a wing, as having four membranaceous wings, and a sting in the tail, which instil poison and pierce other bodies, as leaves and fruit, in which to deposit their eggs.

The species of the order are very numerous, of which the Domestic or Honey Bee, the "*Apis mellifica*," is the type. The insect has the mouth furnished with two jaws, and a proboscis folded in a double sheath—four wings, of which the foremost cover the hind ones when at rest—with the sting in the tail of the female and working bees. The animals are found in many countries in a great abundance, and attracted the earliest notice of recorded antiquity, and the nature and economy of the insect has employed much attention in the natural world. Congregations of many thousands form a society under the despotism of a queen, and the kinds are three—in males or drones, females, and neuters, without sex. The employment is most busy, hence the "busy bee" in extracting the honey or sweet juice of plants and flowers by piercing with the proboscis into the growing body, and conveying the honey into the bag within the body of the bee. Three vegetable substances are thence prepared—honey, pollen, or bee-bread, and wax—the first is deposited in combs or cells in store for food, the second, mixed with honey, feeds the larvæ or young, and wax is excreted by the bee for the purpose of constructing the cells. The pollen is extracted from the anthers of flowers, and is carried on the outer surface of the hinder legs, on which a hairy concave or basket is formed for lading the matters. The wax is exuded at the time in building the cells. The

nest is built in hollows of trees or suspended from a bough, and is constructed in the interior with cells or combs that have in all ages raised the wonder of the mathematician and the admiration of the architect. The form is hexagonal with angular bottoms—the dimensions are exactly the same in length, width, and height, with partitions equally exact. No compass is able to surmount the accuracy of the structure, which is cemented and joined with wax as the work proceeds. The cells are used in storing the honey and for rearing the young, as the females lay the eggs for the purpose of being hatched there. About twenty-four days elapse from the laying of the eggs till the animal emerges a perfect imago, or a winged bee. The three kinds of bees, (queens, males and females) are bred separately, and reared by the distinction.

The instinct of nature directs bees to separate into colonies when the number becomes inconveniently enlarged for one abode—the migration is called "swarming," by which a new family is formed under the government of a queen, who leads every departure and settlement. The cluster of bees attaches generally on a tree not very distant from the old abode, when the swarm is enticed into a hive, and carried for domestic use. Two or three swarms are generally cast off in a season, of which the first is always the strongest and most valuable in May.

Bees are domesticated for the purpose of producing honey and wax, both of which substances are manufactured by the animals from the juices of plants. Honey is a thick, viscous fluid substance—*honyg*, Saxon—*honiq*, Dutch—*honeg-honag*, German—*mel*, Latin. The article is whitish or yellowish in color. Sweet to the taste, soluble in water and becoming vinous on fermentation, liquefying by a gentle heat, and of a fragrant smell. It was very early discovered to be a most delicious food, and has been used in all ages in various forms. It is a species of sugar, and of two varieties—liquid and crystallized, the two qualities being always mixed. Honey is composed of sugar, mucilage, and an acid, which are separated by melting, and the cooling deposits the crystals of sugar. The use of honey is not so great as formerly, but still retained in medicine, and for domestic purposes as an article of provision.

Domesticated bees are lodged in hives 12 inches in diameter and of the same height, made of rolls of straw plaited together with shrubby fibres, circular in shape, flat on the bottom, and with a dome roof. The bottom is placed on a board a little wider than the hive, fronting the south and west, as bees like warm temperature. A small square opening cut in front of the hive and on the platform, affords an entry to the animals, 3 inches long and $\frac{1}{2}$ -inch high, with a little shelf in front on which the bees alight. The position of a hive may be on the low end of a garden, as laden bees like to descend, and have an open view by which the animals rise in the morning. The door of the hive is closed in No-

vember, and the animals are torpid during winter: the hives are thatched, and the opening for work happens by the beginning of May. In October, the honey is taken by suffocating the bees with fumes of sulphur over a hole in the ground, into which the bees fall from the comb and are buried—a cruel practice, as may be said, but yet retained, and not more cruel than the killing of other animals to procure flesh for food. Bees are preserved in life, and the honey, or part of it, obtained by several methods—but the animals seldom thrive, and the remaining honey is lost. The loss of the animals is compensated by the great increase by breeding, which would soon overstock the country—the old is still retained. The honey is squeezed from the combs—8 to 10 lbs. from a hive, and best from the top swarms, or the first casting of the spring—or it may remain in the combs, which are cut into portions for use. The drained honey is preserved in pots and for medicinal purposes and confectionery.

Wax, *wax*, Saxon—*wacks*, German—*wax*, Swedish—*viscum*, Latin—is a thick, viscid, tenacious substance, excreted for the purpose of building the cells, and at the time when required, and from any food as well as from flowers and plants. The honey being drained from the combs, the waxy structure remains to afford the article, which is purified into the manufacture of several purposes, two pounds of wax being got from a good hive of bees. The color is a lively yellow, smell like to that of honey, tough when new, brittle when old, becomes hard and loses the smell and fine color. Wax resembles resin, having a different oil: contains—

Oxygen.....	5.544
Hydrogen.....	12.672
Carbon.....	81.784

100.000

Both wax and honey are articles of a very large use, and are correspondingly estimated.

The economy of bees forms a subject of great curiosity and delight. The government by a queen has shown the constitution of monarchies, and the attachment to the single choice exhibits the regard of subjects to their superiors. The flights of the animals with a number in front of the queen, with a larger portion forming the rear, has exhibited the modern processions of dignity, with trumpeters and outriders in the van, a central or body guard, and promiscuous multitude bringing up the rear. The materials and structure of the cells form an unceasing admiration, in the shape and correct dimensions, the unerring similarity, and the very thin and delicate partitions. The active life in procuring and storing food for the whole family, exhibits a lesson of care and providence of universal application to all observation and to every thoughtfulness. The smallness of the animal and the natural provisions of the body add very much to the curious investigation, and the wonderful and most useful products of its labor are a great recommendation to the subject. The injury said to be done by boring flow-

ers and puncturing fruits is very trifling, if any, and it may be safely affirmed that no provision of a country residence is more pleasant or more profitable than a hive, or several lodgings of bees, exhibiting a most splendid specimen of useful activity, and with a most striking portraiture of Nature in the minute creations of her plastic handiwork. If the scale be minute, the grandeur appears in the arrangement and detail, to be equally admired with the Alps or the elephant. Small objects excite wonder, as the larger create admiration.

In this number we enclose a blank, to be used in sending on subscriptions for 1883. Very many run out with the present year, and by renewing *at once*, it will save us much labor in taking the names in type from the subscription list, and then, that of returning them a few days after. We hope all, who can, will send on their renewals immediately and save any errors that might occur during the rush at the end of this month, in the holidays. May we ask you, reader, to speak a good word for the BEE JOURNAL to neighbors who keep bees, and send on *at least one new* subscription with your own? Our premium, "Bees and Honey," in cloth, will pay you for your trouble, besides having the satisfaction of knowing that you have aided the BEE JOURNAL to a new subscriber, and progressive apiculture to another devotee.

When changing a postoffice address, mention the *old* as well as the new address.

A Religious Newspaper.—We desire to call the attention of our readers to one of the largest, ablest and most popular religious newspapers published—one that secures the best writers in this country and Europe, regardless of expense; has the best and fullest book reviews of any paper in the country; has able articles upon financial and commercial subjects; has departments edited by specialists and devoted to Fine Arts, Music, Science, Religious Intelligence, Missions, School and College, News of the Week, Hymn Notes, the Sunday-school, Legal and Sanitary questions, Biblical Research (something that cannot be found in any other newspaper in the United States), Farm and Garden, Insurance, Weekly Market Reports, etc.—in fact, a newspaper which, with its twenty-two distinct departments, is suited to the requirements of every family, containing a fund of information which cannot be had in any other shape, and having a wide circulation all over the country and in Europe. We refer to THE INDEPENDENT, of New York, now called "The largest, the ablest, the best." See advertisement, in another column, and send a postal card for free specimen copy.

National Agricultural Convention.—The National Agricultural Convention, to be held at the Grand Pacific Hotel, Chicago, will begin Tuesday, December 12, and continue four days. The attendance promises to be large, and representative of all sections of the United States and all branches of agriculture. We are assured that the addresses, lectures and papers will be by the highest authorities in agriculture and practical affairs. There will be discussions on stock breeding, ensilage—the new system of preserving green fodder, which is attracting so much attention in the Eastern States, the tariff and other questions.

All interested in agriculture and its advancement are cordially invited to attend the convention and participate in its proceedings.

Joseph H. Reall is the Secretary, and may be addressed at 142 Dearborn street, Chicago, and *World* building, New York, for railroad rates, etc.

A Conundrum.—In the *Bee-Keepers' Magazine* for December, Mr. King asked us to explain why the quotation he gives in the *Magazine* does not agree with those we give in the BEE JOURNAL. We "give it up—ask us something easier." We have no means of knowing the methods employed by Mr. King in the management of the *Magazine*. We only know that we obtain the printed "Prices Current" of the New York market from Mr. Quincy every week, and quote from it *verbatim*. The *Magazine* only gives a very brief summary, and may be imposed upon by some clerk of the house, who may not be informed as to the correct quotations.

CLUBBING LIST.

We supply the *American Bee Journal* and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	Publishers' Price.	Club

The *Monthly Bee Journal* and any of the above, \$1 less than the figures in the last column.

New subscribers for the Weekly BEE JOURNAL for 1883, can obtain all the rest of the numbers for this year by sending \$2 to this office.

MISCELLANEOUS.

What Bees Accomplish.—A writer in *Good Words*, remarks as follows:

By far the most serious difficulty in the process of honey-collecting by bees arises from the extremely minute quantity of nectar which each flower yields, and from its being dilute—in some cases so poor in saccharine matter that its sweetness is not appreciable to the tongue. The strength of the sugary fluid varies in different flowers, and even in the flower at different times. Consequently the most direct way of estimating the yield of honey is to ascertain the actual quantity of sugar in each flower. This can be easily be done by chemical methods. If we take a large number of flowers, wash out their nectar, and determine the sugar in the solution, we can calculate from the number of flowers used the average amount of sugar in each flower with the greatest precision.

Experiments conducted in this way showed each flower of the fuchsia to contain little more than the tenth part of a grain of sugar. In monk's-hood the amount was rather less than the tenth of a grain, while in the everlasting pea it was found to be three-twentieths of a grain for each flower. In smaller flowers the quantity is proportionately less. Thus each flower of the little naturalized American water-blank only contains six-hundredths of a grain, and in those minute flowers which grow together in compact masses the amount was still smaller. A raceme, consisting of 20 flowers of the vetch, only yielded five-hundredths of a grain, or a little more than one five-hundredth for each floret. One head of common red clover gave a little over one-tenth of a grain (exactly .1224). Now each head of clover contains about sixty distinct flower tubes, each of which must therefore have a portion of sugar not exceeding the one five-hundredth part of a grain. The proboscis of the bee must consequently be inserted into 500 clover tubes before one grain of sugar can be obtained. There are 7,000 grains in a pound, so that for every pound of sugar procured in this way 3,500,000 flower tubes must be emptied. Honey, however, only contains $\frac{3}{4}$ of its weight of dry sugar; so that every pound of honey is equivalent to more than 2,500,000 clover tubes sucked by bees!

This shows what an amazing amount of labor they must perform. Their industry would appear to be indispensable to their existence. These amounts also reveal to what an extent the visitation of flowers must go on in the insect world, and help us to understand how it is that flowers are so dependent on insects for fertilization, so that we can well believe the forais of flowers to have been determined in reference to the insects fre-

quencing them, and that the colors of the petals may serve to attract insects by way of advertisement, as colored bills attract the eyes of busy men. This view of the use of color and odor in flowers may seem to smack too much of trade and commerce, nevertheless it is the view to which science now gives undivided support. We have been so long accustomed to look on the beauty of the floral world as if it were exclusively for man's gratification, that it is difficult for us to believe that the delicately perfumed and showy petals of the rose or lily should be primarily intended for the benefit of the plant possessing them. But it must be remembered that each organism lives for itself, has its own laws, and does not possess any organ which is exclusively for the advantage of another.

Curious Observations of an Early Writer.—We find the following in Capt. Wudrington's "Spain and the Spaniards" in 1843. We presume the writer referred to the "Keever" hive, in use about that time:

Bees abound in this district and increase to such an extent that they return an enormous profit to those who take the trouble to care for or look after them. The common hive is the hollow stem of the cork tree which is cut into suitable lengths, and is perhaps the best material in the world for the purpose; next to it, is the common straw hive used in England; both these substances have the same valuable qualities of being non-conductors of heat and cold.

They never had heard of such a thing, much less practice it, as killing bees, and were surprised when I mentioned such a custom.

I ascertained a very curious fact, in their economy, that is well worth attention. The Canon Cepres, so well known in the first Cortes, being shut up in the Convent of the Carina at Seville, by order of King Ferdinand, by way of passing the time, applied himself to study the economy of bees, which he had followed up at Cozalla, and was so successful in his management that in a very short time he had a thousand colonies. When the civil war commenced circumstances caused their being neglected and dispersed, and some colonies, finding no holes or cavities to suit them, attached themselves to a beam in an outhouse, where they made their combs in a similar manner to that by which the tree wasp suspend their curious fabric from the branches.

They were so well satisfied with this novel situation that they never left it, nor swarmed, but kept adding successive combs until they nearly reached the ground, and hung from the point of suspension like a huge living stalactite. The owner never disturbed them, but had the lower combs cut off, as they were wanted, and the colony remained for a considerable period without their showing the least disposition to change it.

This is certainly rather important information for the managers of apia-

ries, and may serve to confirm the statements lately published on the practicability of inducing the bee to work downward.

The Labor of Obtaining Correct Statistics.—The editor of the *Bee-Keepers' Magazine* remarks as follows on this subject:

We realized the necessity for accurate statistics when writing the article on bee-keeping for Appleton's *Encyclopedia*, and later in the preparation of an article on the same subject for one of the late supplemental volumes of the *Encyclopedia Britannica*. We spent more time and hard labor in collecting, culling and averaging in order to fairly approximate the true amount of the honey and beeswax production of the United States, both collectively and in geographical groups, than was required for any other three questions in the discussion of the whole subject.

We found that no reliance whatever could be placed on this class of statistics emanating from the Department at Washington, and this on the testimony of Gen. LeDuc, at one time Commissioner of Agriculture. We found that the annual amount of beeswax exported presupposed the collection of more than a hundred million pounds of honey to produce it. We made various calculations from many different standpoints, and, as a result, we concluded that from 150 to 200,000,000 pounds of honey could not vary far from the actual production. Such information as has been furnished by the Department hitherto, has only served to belittle the profession, hence the urgent necessity of some plan which shall give accurately the facts, and so enable beginners to enter on the business understandingly.

Feeding Bees.—A writer in the *German town Telegraph* gives his method of feeding bees in winter, as follows:

In the first place let me say that I would prepare the feed in the shape of a syrup, thus: Take of pure, clean water two pounds to four pounds of sugar; A coffee or extra C is best. Bring the water to a boiling heat and then add the sugar; stir well until it again boils and skim off all impurities; then let it cool and fill up glass tumblers and tie cotton cloth over each, and turn them upside down over holes in the top of the hives, if of the old-fashioned box or gum log, and you will have the satisfaction of seeing the tumblers soon emptied and stored in the brood combs. If you are using a good movable frame hive you can feed your syrup in the top of it in the following way: Take some old bits of combs and lay in the surplus chambers, and pour the syrup over them, and the bees will take it all down. Feed as fast as they empty the glasses or combs referred to. We should always feed all weak stocks late of an evening, which will prevent robbing in a great degree. If you use the glass tumblers to feed from, would recom-

mend boxes to be turned over them so as to keep robber bees out.

Follow Some Well-Digested Plan.—The *Indiana Farmer* makes the following very sensible observations on the above subject:

Work with the bees, for the year 1882 is now done. Are we all satisfied with the result taking everything into consideration? Have we learned by mistakes made? Will we profit by them in the future? Will we learn wisdom by the mistakes of others, or must we continue going over the same ground to pay the penalty of experience? These questions, in the abstract, were called to mind by a letter from a correspondent now before us. Early last season he wrote us, asking some general questions of guidance for the season's work, stating at the time that he had some knowledge of the business, but knew that we were successful and wanted simply a general outline of work. He had then 10 colonies. We gave the required information as best we could, warning him of pitfalls in the line of some experimental suggestions which he contemplated.

Our general directions were to build up the colonies as fast as possible, strengthening the weaker ones from the strong when it could be done without injury to the latter, allowing each colony to swarm once; putting on and removing sections, removing queen-cells to prevent afterswarms, natural increase, building up nuclei, etc.

Now he says: "I wish I could in some manner convince our many bee-keeping friends, especially beginners, of the folly of trying to follow the many theories advanced by Tom, Dick and Harry, as to bee-keeping. I am a little ashamed to confess my failures, but in the hope it may be of benefit to some one, I will make a partial confession. I was not entirely satisfied with the directions you gave me. I concluded to work 4 colonies with your plan, the other 6 according to my own notions, with the hope that I would make a better showing in the fall and be able to tell you so. The 4 colonies each swarmed once, and gave me 30 pounds each of nice section honey, with from 10 to 20 each in unfinished sections, each first swarm filled their hives with comb and made some 60 pounds of honey altogether. Two of them swarmed again in August, I gave these six frames each, taken from the other colonies. So I have from the 4, 10 colonies in good condition, and about 210 pounds of honey.

My letter is already much too long to tell you of the mistakes I made with the other 6 colonies. Suffice it to say. I shall in the future work all my colonies on a plan similar to the one you gave me and shall experiment with one or two selected for that purpose only. My earnest advice to all beginners is to follow some well known plan of work until they become well enough versed in the business to have one of their own."

CORRESPONDENCE

A Charge to the Bees.

EDITH M. THOMAS.

Go forth, O bees, at blush of prime,
Go forth, O bees, and waste no time;
Into the jeweled chalice climb
Of every bloom that opens fresh this hour;
And be ye sure ye find the clover flower.

Oh, slight the violet, if ye will,
And slight the green gold daffodil,
And hyacinth, made sweeter still
By soft caressings of the midnight shower;
But see ye pass not by the clover flower.

I could forgive ye, that ye missed
The lilac tubes of amethyst,
Lillies, that heaven's breath has kissed,
And all the sweets in wildwood Flora's bower;
But see ye pass not by the clover flower.

O bees, though ye were now released
To search the gardens of the East,
I'll call ye home amidst your feast;
I charge you bring me honey for my dower,
Bring me the honey of the clover flower.

For the American Bee Journal.

The "Coming Bee," for Business.

JAMES HEDDON.

On pages 742 and 743 of the Weekly BEE JOURNAL we find two articles upon the above subject. The object sought is a grand one, and one to which no man can take any exception.

I wish, however, to discuss the methods pursued. Mr. Briggs has not enlarged enough upon the plan he operated upon last season, to convince me that it amounted to much. I feel quite confident that the best queen breeders of the country will not respond to his call. If a popular vote could now be taken as to *who* our best queen breeders are, I would be willing to wager a prize on the best judgment, that not one of such breeders would send a queen. I fancy that I can see good reasons for not doing so. I believe those judicious enough to produce the best strains, would not be injudicious enough to send Mr. B. their choicest queens for \$2.50, with one chance in 5, 10, or 20 of drawing a prize of \$25. Many are averse to lotteries, and many know that a verdict of any one man, or committee of men, regarding the best out of 5, 10, or 20 queens never seen before, would decide about as meritoriously as the decision obtained by the casting of dice. They know that after all, the future use of the bees reared from these queens, their use by the honey producers of the country at large will be the final and only satisfactory test, and almost surely reverse the decision of the most worthy committee that could be selected.

Queen breeders, knowing that they have a valuable strain of bees, will not be very fast to deliver the best of it over into the hands of another breeder. My own opinion is, that, down in

the bottom of their understanding, most of the queen breeders feel that, as I have just said, the selection of prize queens will be a "happen-so" affair, and should it turn against them, (and chance will leave them out as many times to one as there are queens entered,) some novice purchasers would turn their patronage from them.

Fine wool sheep, Jersey cattle, or any fixed type of best stock, might be thus judged upon with some degree of accuracy, but as we have no fixed type of the "coming," or "best bees for business," no such course of action will prove any thing, or get any nearer to the best bees than we now are.

If Mr. Briggs could by this unprecedented method call out the best queens from the best strains now extant, he would then have a good groundwork upon which to commence breeding up a strain worthy to compete for the title of *Apis Americana*, or "best bee," and when he had devoted five years more to the pruning and testing of this strain, I would like a queen from his apiary. But as no queen breeder can progress with his work toward the "best bee," and send out his choicest from his selected queens, Mr. B. cannot expect to commence where the prize breeder leaves off. Speaking for myself I now have a few queens in my apiary that \$27.50 each, could not buy. I feel thus sure of the cause of what success I do meet with. To sell them at that price would be a loss in dollars and cents, to say nothing of discomfiture.

I think Mr. Briggs, like Mr. Shuck, as stated on the same page, is breeding for too many points at the same time. All he wants is the most honey with the least capital, labor, and discomfiture. It is my opinion that he who leaves out the brown bee, thus breeding for yellow bands, will get away behind in the race. Read the following points of excellence given the German bees over the Italians, by L. L. Langstroth: "They commence to breed earlier in the season, build the straightest and most worker comb, work more readily in surplus boxes; they make the whitest comb honey, less inclined to swarm, more sensibly affected by loss of queen."

Prof. Cook credits them with being more hardy and likely to survive our most trying winters.

I wish to add that these black or German bees being so different in their nature and disposition from the Italians, have many other minor points of advantage to the master, which, though small, all play a large part in the success and comfort of a season's experience. I will mention a few: they alight sooner when swarming, which often saves a mixing of swarms and its consequent troubles; they also hive more readily, each one seeming to be determined to get in first; they drive up into the forcing box in less than half the time (queen and all), when making swarms artificially; they mind the admonitions of the smoker much more readily than do the Italians, etc.

Now I am not pleading for Germans vs. Italians, but I do insist on retaining some of their valuable superiori-

ties, possessed also by the brown German bee, by adding this cross to the "Coming Bee."

Mr. Shuck's tabulated report, proves beyond a doubt, a good season. Whatever there may be of good bees, good management, or good anything else, we know there was a good season. Now, as there is no comparison made between Mr. Shuck's strain and any other, we have no evidence that the large yield of honey reported, is at all due to his strain of bees. If such is a fair inference, then their "pitiable honeyless" condition about June first, is the same evidence of a worthless strain.

Mr. Shuck says, "Mr. Heddon and Mr. Doolittle both claim to have superior strains of bees, yet they both complain more or less of the frequent occurrence of inferior queens."

Then he goes on with a report of his honey shower. Now, are we to infer that Mr. Shuck never finds any inferior queens? I can not speak for Mr. Doolittle's; all I can say is that if I found "fifty or sixty inferior queens," judged by a reasonable standard of superiority, I should think that something unusual had happened to my bees. But, passing through the crucible of my standard, I find from none to 3 or 5 worthless queens each spring, and I supersede many more, not "worthless," but from various ways not coming up to a certain standard of excellence that I have fixed in my mind and in the better part of my apiary. Of course, this standard moves as fast as the improvement of my apiary moves forward and upward.

If Mr. Shuck has a strain of bees so nearly perfect, that they have no inferior queens, a supersedeure of which is not labor well spent, then he is ahead of my imagination. I never expect to reach such a point of excellence. I know what these honey showers are. I have had a larger yield, the apiary through, than that reported by Mr. Shuck. I had one colony, that same season, which gave more than twice the surplus obtained by his best colony, and at the same time my bees were nearly all of the German variety. I never expect to realize as great a difference in results from different colonies, different management, different strains or races of bees, as from different seasons.

In my next I will have something to say about some of the methods and implements used in breeding for better bees.

Dowagiac, Mich., Nov. 26, 1882.

For the American Bee Journal.

Comb vs. Extracted Honey.

W. H. BUSSEY.

I have been much interested in the discussions at the different conventions this fall, reports of which have been given in the BEE JOURNAL. There seems to be no definite conclusion as to the exact comparative cost of the production of comb and extracted honey, and if, by means of these few lines, I can get it definitely settled, I shall feel well repaid.

I notice that Mr. Jones, *et al.*, at the National Convention, stated that they could produce from two to five times as much extracted as of comb honey, and also that they could make \$5 on extracted to \$1.00 on comb honey.

Now, while I do not wish to contradict these statements, it seems to me that it should not be so. Taking the reports of the National and the Northwestern Conventions, together or separately, they do not show it; yet they ought to be considered a fair average. It does not seem reasonable to me and I will try to give some of my reasons for thinking differently. The profits are what we are after.

Take, for illustration, the report of Messrs. Oatman & Son, who obtained 26,000 lbs. of honey in the comb from 229 colonies, with an increase of about 50 per cent. I understand that they disposed of their entire crop, at Dundee, for 20 cents per lb., net. No doubt it was a fine lot of honey, but even estimating it at Dr. Miller's figures, (page 706), 16 cents *net* (which I think is cutting too much for expense, as will be seen further on), it is double the price that can be obtained for extracted in the best shape, and a slower sale. If we look at the market reports from week to week, we shall see the same thing.

Regarding the cost of production, I think it will be admitted by all that there is less work in obtaining comb honey than in getting extracted, with the difference in favor of the comb. The main part of the work for comb honey can be done in the winter and spring, while, with extracted honey, the work must be done in the heat of summer, when we are the busiest.

Now, let us see what the comb honey costs? Nothing but your labor! You sell the honey in sections for enough to pay for the sections themselves, the foundation, boxing, glassing, etc., etc. If you do not believe it weigh 1,000 sections and figure it up. With extracted honey you have to buy barrels, and then sell the honey, less the package, at half the price of comb honey.

I stated that the reports of the two conventions showed poorly for extracted honey. It will be seen, by referring to Dr. Miller's table, page 706, that the eight persons referred to as having such big results, the majority of them ran for comb honey.

We know that the field bees do not build the comb. If the colony is strong in young bees when your honey flow begins, I think there need be no fear that the foundation will get drawn out as fast as it will be needed, and by giving them plenty of sections, can we not obtain just as many pounds of comb as extracted honey? Of course, if we have only a small number of colonies and had built up a home trade, using tin pails and jelly cups, we could dispose of it to advantage, but I did not refer to that; I had reference to the wholesale trade only. Comb honey will sell itself, while we have to force the extracted. Therefore, I fail to see how we can make it pay like comb honey.

Cannot we get at the facts? We ought to know; a farmer ought to

know what an acre produces, and what it has cost to produce it; just as much as a manufacturer knows what a certain piece of goods or machinery costs.

We ought to know what it costs to produce a queen; what it costs to produce a colony of bees; how much honey it takes; how much it costs to keep a colony through the season, and how much it costs to produce a pound of comb or extracted honey. I, for one, am anxious to know, and how much more (if any) of extracted honey can be produced under the same circumstances than of honey in the comb.

Chicago, Ill., Nov. 17, 1882.

For the American Bee Journal.

How I Introduce Queens.

G. M. DOOLITTLE.

Having been requested to describe my method of introducing queens, in the AMERICAN BEE JOURNAL, I will now try to do so. The reason why so many fail in introducing queens, is, in my opinion, because they are not careful enough in noting the behavior of the bees toward the queen given them. If only one or two bees are hostile toward a queen, I have found that the same are capable of turning the whole colony against her. If beginners were to fully learn that, so long as a single bee appeared hostile toward a queen, she should be kept caged, we should hear less of the loss of queens in introducing.

My method of introducing any queen I consider valuable, is this: I first make a cage from wire cloth, containing 14 to 16 meshes to the inch, by cutting a piece 4x6 inches square. I now cut from each corner a piece $\frac{3}{4}$ of an inch square, when the sides and ends are bent at right angles, so as to form a box, as it were, without a bottom. $2\frac{1}{2}$ x $4\frac{1}{2}$ inches square. Now take out the cross wires one-half the way down the sides and ends you have bent up, and you have the cage so that you can press it to the combs $\frac{3}{8}$ of an inch wherever you choose.

In order to get the new queen introduced with the least trouble, I prefer not to remove the queen I wish to supersede, till I am ready to put the new one in her place. To be sure that the new queen cannot get away from me I take her to the house, open the cage she came in before a window and clip her wings, after which she is put into a round wire-cloth cage (the same as was formerly used in introducing), when we are ready to look for the queen to be superseded. To best find her, I commence to take frames out at the side of the hive, looking the first two over hastily, and putting them in an empty hive. As I take out the third, I look down the side of the fourth frame, as it hangs in the hive, for, if the queen should be on the side of that comb, she will start to go around to the opposite side of the frame as soon as the light strikes her, in which undertaking she is readily seen. If she is not there, I look on the side of the third frame opposite me, holding it so that the vision strikes it oblique-

ly, as a queen is more readily seen by looking at her side than on her back. I keep on taking out frames until she is found, and rarely fail in finding one on trying the first time. If I do not succeed, I commence to place them back, looking at them in the same way, as I take them from the empty hive. The knowledge that a queen will always run from the side of the frame exposed to the light, upon opening a hive, saves much looking for the queen on the side of the frame next the operator.

Having found the queen, I look the combs over till I find one from which the young bees are hatching quite plentifully, and having some honey in it also. From this comb I shake all the bees, and then let the queen crawl from the round cage upon the comb. When she gets where I can place the cage over her, so as to enclose some honey and hatching brood within it, I do so, and press the points into the comb as far as unraveled, when the frame is put in the hive, leaving space enough between the frames, so that the bees can get around and over the cage.

In 24 hours I go and look at the cage. If the bees are thickly clustered over the cage, biting the wire cloth and showing signs of anger, I put it back and wait 24 hours more. So I keep on until not a single bee shows signs of trying to get into the cage to sting the queen; but all are spread evenly, standing on the cage as they do on the combs. When such is the case I carefully lift the cage from over the queen, letting her and the young bees, which have been hatched during her confinement, go where they please, keeping watch all the while to see that the bees treat her kindly. If they do, I put the comb in the hive; if not, she is caged again. In from one-half to one hour after liberating, I go and look at the queen again, and if she is now treated as their old queen was before removal, I shut the hive considering her safely introduced.

Right here I wish to say that I often release a queen in 12 hours and find that she is all right, and I rarely have to wait, about letting her out, more than 24 hours. Still, in extreme cases, I have been obliged to keep them caged nearly 10 days. Do not be afraid of the queen dying in the cage, for if placed over honey, as I have spoken of, she will live a month. The only trouble when left so long, is, that the bees may gnaw the comb away so as to get under the cage. If liable to do this, I shake all the bees off and move the cage to a different place.

On page 437 of the present volume of the AMERICAN BEE JOURNAL, Mr. G. W. Demaree says, "The queen will generally begin to lay in one or two days after she is accepted by the bees; and after she begins to lay, she is as safe as if she had been reared in the hive." This can be laid down as a rule, and I will say that one-half of the queens introduced by me by the above method are fed by the bees outside of the cage, and acknowledged as mistress by those hatching within the cage; hence eggs are laid in the cells from which the young bees have

hatched. When I find these circumstances existing I remove the cage and close the hive without fear of the queen being disturbed.

I have used the above plan for nearly 3 years, and have not lost a single queen. If I wish to exchange queens in the yard, which are not valued very highly; or wish to give a queen from a nucleus to a queenless colony, I simply take the frame having the queen on, with all the adhering bees and put it in the center of the queenless colony. In this way I save much valuable time, both to me and the bees, and do not lose 1 queen in 20. But when a queen has come from a distance, or in case of a valuable queen, I know of no better way than the plan first given.

Borodino, N. Y.

For the American Bee Journal.

The Statistical Report for Maine.

J. A. MORTON, M. D.

DEAR EDITOR—I owe to the bee-keepers an apology for the imperfect and incomplete report of bees and honey for Maine, as given to the National Society. I did not have the blanks, or any definite instructions what to do; and I waited so long that I had scarcely any time to even do what I did. I may in a future communication give you some idea of the industry of the remaining 7 counties of the State. All or nearly all I gave was obtained by 2 days hard work at our State fair, and I was sick while there and just able to scribble off what I could before 5 a. m., Monday, Oct. 2d, and mail it at that hour, actually not having time to read it over after writing. So when you gave the slight notice in your next issue and punched us on the "old foggy 30 per cent. loss in wintering," I felt ashamed but when in a recent number you gave the full report, table and all, I felt better, but sorry I had not obtained the report for the whole 16 counties, and given a little more time and care to my report. I also thank you for its insertion,—and pledge my word, if I can have the necessary blanks and instructions, to do all I can for a full and correct report of every town in Maine, either in assisting our Vice President or on a sub-committee under your supervision. Cannot a postal card be ruled and printed with headings so as to give all needed information from bee-men to the committee, also full instructions on a slip of paper printed and the card with slip of instructions mailed in unsealed envelope either from vice president or some other person appointed for the purpose, to at least one bee-man in each town, and he could collect the statistics, filling the blank cards and forward without any additional postage? This plan, if practicable, it seems to me, would involve the least expense to the society and none to each bee-man returning the postal cards. If one card is not enough use two, one in the spring and one in the fall. How does the idea strike you? These cards could have either your name and address or that of vice president or sub-

committee of each State or county all printed ready to mail. Then if returned to the latter they could all be condensed on one card or on blanks and returned to headquarters. It seems to me this plan would be less expensive and more direct than that of Mr. Terrell.

I think more and more of the JOURNAL every week it comes. I shall be willing to pay something towards aiding in some plan to attain the desired end, in bee statistics.

J. A. MORTON.

Bethel, Maine, Nov. 22, 1882.

[Yes; if we can find at least one bee-man in every county who could and would get the desired information and send it to the State vice-president, and he to the committee, it would be a cheap plan. But, we fear, the *if* ruins the proposition. We shall see, however, and the future will determine. Dr. Miller is, we are informed, the chairman of the committee, and when the committee are called together and have a deliberation on the subject, the several plans suggested will have due consideration.

Since the above was in type, the following, from the Secretary of the State Association, has come to hand. Maine is setting an example to all the Vice Presidents of the National Society and Secretaries of State Associations, which we hope will be followed by those officers in every State in America:

Wishing to make out as full a report as possible of the number of colonies of bees owned, and honey, wax, etc., taken for the past year in the State of Maine; bee-keepers will confer a favor on the bee-keeping fraternity by filling out the following and sending the same to William Hoyt, Secretary of the Maine Bee-Keepers' Association, Ripley, Me.

1. Name.
2. P. O. Address.
3. Number of colonies owned October 1, 1881.
4. Number of colonies owned May 1, 1882.
5. Number of colonies owned October 1, 1882.
6. Number of colonies showing yellow bands.
7. Number of colonies of blacks.
8. Number of colonies sold during the year.
9. Number of colonies bought during the year.
10. Number of queens sold.
11. Number of queens bought.
12. Number of pounds of honey taken.
13. Number of pounds of wax taken.
14. Kind of hive used or preferred.
15. How and where wintered.

We hope that the matter of obtaining correct statistics will receive that attention due to such an important subject.—Ed.]

From the Apiculturist.

The Cheap Queen Traffic.

G. W. DEMAREE.

I have taken no part heretofore in the discussion of the subject pertaining to the traffic in "cheap queens," because I have regarded much that has been said on the subject as a species of cheap advertisements. I have wondered at the patience of the proprietors whose columns have been filled with arguments, *pro* and *con*, as to whether or not it pays to rear queens at a certain price. It is not a matter of general interest to bee-keepers, as to whether or not queens can be reared for \$1 at a profit. That is a matter which concerns the breeder alone. There is a phase of the cheap queen business, however, which does concern every intelligent bee-keeper, and that is as to whether or not the slipshod methods so commonly practised in queen-rearing and queen-bartering has been conducive to the best interests of bee-culture.

Although many have disposed of the subject in short order, by either condemning or approving of it, to my mind the subject is not so easily disposed of.

If we are willing to admit that bee-culture is yet in a "crude state," and are content for it to remain so for years to come, why, then, the tons of honey obtained and put upon the market of late years would indicate that the "cheap traffic in queens" has done wonders for bee-culture.

But there is another view of the subject. Many of us believe that if the breeders of queens had, all this time, been pursuing a more scientific course in selecting and breeding, with one eye to the very best stock that can be obtained, and had been less selfish and greedy, and more determined to send out none but the best queens, bee-culture would be far in advance of what it is to-day.

Most persons seem to be unable to perceive that there is quite a difference between the shoddy "dollar queen" business, and the legitimate business of rearing and selling either tested or untested queens to suit customers.

"Dollar queen" is a shoddy phrase, borrowed from the trashy dollar store business. It means about this: "I have many hundreds of articles to sell, they are worth from little or nothing up to one or two dollars, but these articles which are worth one or two dollars, are in comparison to those that are worth little or nothing, about as one is to a hundred. My customers must take them all, you can have any of them for a dollar, you may get a bargain."

You will see that the shoddy dollar queen business requires of you to buy with your eyes shut, and take anything that is "born alive." The wise man suggested that no man was weak enough to expect to capture a bird by laying the "snare in its sight," but it would appear that intelligent bipeds can be taken in that way.

The generality of mankind have a weakness for "cheap goods," and

there is nothing particularly strange or wrong about it; nevertheless, it works evil and that continually. This false notion of "cheap traffic," is at the bottom of all shoddy business.

I have kept a small queen-rearing department to my apiary for several years past to supply my own apiary with choice stock and for experiment, and in this way I have gained quite an experience in queen-rearing. The breeder should make it an undeviating rule to reject at the start all queens which are abnormal in size, color or form. This I believe to be essential to scientific queen-breeding. This rule will apply to the scientific breeding of all animals, but more particularly to queen breeding, because the queen is a creature of "development." Were I rearing queens for the market, I would pursue this course with fidelity, and would have no hesitation to sell such selected queens to suit customers, reducing the price when sold, before they were tested as to their mating.

That the reader may have a glimpse at the inside of the dollar queen business, I quote from the catalogue of one of our largest dealers in cheap as well as dear queens. And, by the way, a gentleman who is as square as a brick in his dealings, and hence has nothing to conceal as to his manner of doing business. Here it is, *verbatim et literatim*:

"DOLLAR QUEENS.—The dollar queens are always taken just as they come, and are *never culled*. Customers often ask us to pick out a large yellow one for them. My friends, who would then have the *small dark* ones? We can't do it for anybody, not even the Queen of England. If you want us to pick, you must buy *tested* ones." [Italics mine.]

The above speaks a whole volume for the "true inwardness" of the shoddy dollar queen business. The dollar queen man will not "pick" for anybody, not even the Queen of England, but he will pick for his dear, precious self, else where does he get those "large yellow" ones to sell as "tested ones." But, then, who will take the "small, dark ones," if it is known that the large yellow ones are sold at the same price? Echo answers, who?

It will be seen that by following the rules of scientific breeding, instead of the slipshod dollar queen methods, the breeders will have no "small dark or otherwise abnormal queens for sale, and not resort to the wily tricks of "trade" to work off the trash.

Taking this view of the case, the difference between the lottery dollar queen business, and the business of careful breeding and selling each queen upon its own merits, is as wide as the heavens are above the earth.

Oregon Convention.

Quite a number of persons interested in bee culture attended the preliminary meeting at Willamette, on October 25.

An organization was effected, constitution and by-laws adopted, and the following officers elected for the ensuing year: Dr. J. W. Morris, President; A. Warner, Vice-President; E. E. Charman, Secretary; A. F. Miller, Treasurer; J. D. Rusk of Clackamas, M. V. Ensey of Yamhill, and T. L. Riggs of Multnomah, were chosen as an Executive Committee.

The first annual meeting of the newly-formed society will be held November 22, 1882, at 10 o'clock, at Oregon City.—*Willamette Farmer*.

Southern Cal. District Convention.

The following report is gleaned from the *Apiculturist*, but we cannot find out where the Convention was held—we presume it was at Los Angeles, but the report does not state. It was held on Oct. 19.

The subject of shipping honey, the most suitable package for the different markets, and the crop of Southern California, was fully discussed by those present. The subject of the different races of bees was then brought up. Mr. Harbinson thought that the Holy Land bees were very good, but preferred a cross between them and the Italians to either race in its purity, and that the Holy Land bees were very uneasy when there was no honey to be obtained from natural sources,

consequently they were more apt to rob and were not a very good bee for a poor year.

At half-past one the meeting was opened with President Pleasants in the chair. The books were then open for the reception of new members. The following joined the Association: D. S. Given, Los Angeles; M. H. Mendelson, Newhall; A. W. Osburn, Los Angeles, and M. F. Ritchie, of Florence, Los Angeles county, was elected an honorary member.

The President read his address. Mr. Levering moved that a vote of thanks be tendered the President for his able address, and that it be placed on file with the Secretary. Carried.

The election of officers being next in order, Mr. Levering moved that the same officers be re-elected. Carried.

A paper on different subjects was read by Mr. Harbinson, for which he received a vote of thanks from the association. He referred to the importance of taking steps at once to memorialize Congress to pass a law similar to the timber law, whereby the settler may acquire a title to government land by planting a specified number of acres of the same in bee feed-trees, flowers, etc. Such an act, if it could be secured, would be very applicable to the rough mountain lands, and would insure the occupation of them, whereas they might never be settled and remain barren mountains as they now are. The passage of such a law would cause the barren wastes to bloom as an Eden and flow with sweetness as a Canaan. Apiculture would soon become more reliable and assume a more important position among the industries of the country.

It was moved by Mr. Levering that Mr. Harbinson be appointed a committee of one to draft a memorial embodying the main object of this paper. Carried.

A communication was received from Mr. S. N. Wickoff and read by the secretary, for which he (Mr. Wickoff) received a vote of thanks, and it was ordered placed on file.

A report of San Diego county was then handed in by Mr. Harbinson, and was as follows: 4,650 cases comb honey, net, 262,080 lbs.; extracted honey, 226,000 lbs.; value of honey, \$46,139.60; value of wax, \$3,860.40; total value, \$50,000.00.

The report of the committee on the protection of bees against foul brood was received, and the committee discharged. The committee on new constitution and by-laws reported that they had never met; they were given till the next annual meeting to report.

The subject of foul brood was then taken up and discussed by those present; each one giving his experience and belief as to its origin.

There being no further business, the meeting adjourned to meet during Fair week, 1883.

☞ The annual meeting of the Cortland Union Bee-keepers' Association will be held in Cortland, N. Y., on Tuesday, Jan. 9, 1883.

M. C. BEAN, Sec.
McGrawville, N. Y.

Read before the N. A. B. K. S.

Courtesy in Journalism.

A. I. ROOT.

I should never have chosen such a subject had not Professor Cook kindly asked me to take it; or, rather suggested it, as it were. In the first place, I do not feel sure that my experience in journalism would warrant my taking such a subject; and then again, I am not sure that my ideas might not be called queer and singular, by some.

As this is a bee convention, I presume the kind of journalism I am expected to speak of is bee journalism, if I am to be allowed the term; and as we now have a half dozen or more bee periodicals published in our own country, and about as many more in other countries, it very likely behooves us to consider well this very matter of courtesy in journalism. Are the editors and the writers for the bee periodicals more uncourteous to each other than those of other class journals? I trust not, although I think it has been said, that all bee-men, so long accustomed to stinging ways, sometimes go so far as to think that stinging things in print are right and proper.

A manager of a theater once said, by way of excusing himself for some things in the play, that theaters are just what the public demand they should be, thus throwing the blame all on his patrons. Editors of bee periodicals might doubtless say, that their journals are edited in such a way as to please the wants and wishes of the greater number of their subscribers. There may be truth in this, and it would be a very convenient way for us who have the periodicals in charge, to throw all blame for what want of courtesy there may have been in our respective publications on to the shoulders of our patrons and contributors. It might be very convenient, but it would not be right. At the same time that we strive to please those who give us their support, it is our duty to strive to elevate and ennoble. It is every teacher's duty to do this; and what teacher should be more careful than the editor? These papers go into our homes, and it is to be hoped they are read by our children. We all know it will not do to give our children all they ask for. As we are all but children of a larger growth, the same rule will apply to most of us, I believe. It is not always well or wise to give us all we ask for.

All bodies are in the habit, usually, of choosing some one from among their number to look after their best interests. We have teachers for our youth, pastors of our churches for grown-up children, and our papers and magazines for the people at large. Perhaps these latter are primarily for the purpose of keeping us informed of the events of the times; but at the same time they must exercise a powerful influence over the morals of the people before whom they speak. What, then, should be the character of these leaders and teachers? If it is a fact, that our papers are to a great extent what we, as a people, demand of those who publish them, what is our duty as

a people in the matter? Your pastor is very glad indeed to have you take him by the hand and tell him that his sermons have been helpful to you, and your doing so helps him, perhaps more than you imagine, to preach better sermons. So every editor is glad to hear from those whom his words reach; and not only is he glad of words of commendation, but those of kind criticism. In fact, he is often led to do things he would never think of doing, because some one suggested it. Of course, these suggestions are not always wise, and, on this account, an editor needs more than ordinary wisdom and discrimination.

I need hardly say that those who wield the power of the press should be free from and entirely above, if it were possible, all feelings of prejudice, spite or jealousy. The wants and needs and rights of his readers should be all equally dear to him. The peculiarities and, perhaps, weaknesses of each member of his large family should be held sacred and touched upon with the greatest gentleness; and he, above all others, should have a wide charity.

Think gently of the erring:
Ye may not know the power
With which the dark temptation came
In some unguarded hour.

Whatever appears in print is a public matter. It is more public than any thing that can be said in any public meeting, because it stands there to be read of all men—ay, and women and children too. When we have visitors at our homes we are very careful to be courteous to them, and we are on our best behavior as it were; for who would think of indulging in little spites, or unkind words, before company? I fear we sometimes forget that whatever is printed is before a very large company. Few can realize how it cuts and smarts to be held up in derision in public print, who have not passed through it. It may be urged that this dread of being published is a most powerful restraint to one who is strongly tempted to do wrong, and I grant this, and would by all means advise warning the public when the matter is something demanding that they should be warned. I think we all agree in this; but at the same time I believe in putting it mildly, and using a few kind words instead of harsh, to do the most good.

There is one kind of temptation into which we may all of us be drawn, that I would speak of. Sooner or later somebody will "come down" on you a little roughly, and perhaps a trifle unjustly, or what amounts to the same thing, you may, if you are of the proper temperament, imagine some one has publicly insulted you, when such is really not the case. In either instance, what should a real live man do, when publicly and falsely accused? In a great many cases I would say, do nothing at all. One reason for giving this advice would be, because if you say anything you will say too much. While it is bad for a contributor to fill a column or more in endeavoring to set himself right before the people, it is still worse for the editor to use space in this way.

Years ago some one accused me unjustly, through one of the bee papers. I have forgotten now what it was about, and who it was that wrote it. I thank God I have forgotten, dear friends; for if I should meet the man here to-day who wrote it, I could shake hands with him pleasantly, without even remembering it was he who wronged me. Well, I was so badly stirred up I could hardly write without trembling. I would write only just a few words to set myself right. Those few should be right to the point. I wrote and wrote and wrote, and still there was just one more very important point that you all ought to know in the case. I had neglected my work an hour or more; and when I looked at the long manuscript, I had a sort of misgiving that there ought not to be any occasion for any such a long rigmarole, no matter how much I had been abused. At this crisis our pastor happened to come in, and I laid the matter before him in a general way. "Brother R.," said I, "is it not a fact, that there is something wrong, whenever it becomes necessary for us to use that amount of space in self-defense?" and I held up the long manuscript. His assent was more in his kind look than the words: "Yes, my friend, there is something wrong when so much needs to be said, or seems to need to be said, on either side." Down it went into the waste basket, and you can hardly tell how thankful I am that it did go there. The controversy stopped at the beginning. I do not think I ever suffered much in the estimation of any one, for people judge more by the life a man lives right along year after year than by what somebody says about him, even if it is said in print.

Do you ask, then, what harm these unjust attacks do in a paper? My friend, it harms the one who writes them; it harms the editor who gives place to it, and it harms those who read. If every word of it be true, and it be written in an unkind and unchristianlike spirit, it harms the guilty party, for it makes him harder and more wicked. As quarrels are contagious, and in one sense fascinating to the young,—are you aware, friends, that a dog-fight has its fascinations?—well, our children, growing up at your house and my house enter into the spirit of these controversies, and get to thinking it is the way to do business, to fight it out in words in this way, both parties get stirred up, and fearfully exaggerate without meaning to, or, in fact, without knowing they have done so, and on and on it goes, and, it may be, ending in law-suits, and years of quarrels. Did you never observe, that when a man has a quarrel or controversy with one person, he is pretty sure to have another very soon with somebody else? He has got mentally sick, as it were; and the worst part of it is, he does not know he is sick.

It is not alone we, who are comparatively without talent, and a high order of education, that are guilty of a want of courtesy through the papers; but it sometimes happens that ministers of the gospel, and professors in

our schools and colleges, seem to forget, or be sorely tempted, at least, and to have faith in a war of words, rather than to have faith in the teachings of our Savior when he said, "Do good to those that hate you."

A very good friend of mine was once shamefully abused by one who, like himself, stood prominently before the people. The injured one sat down at his desk and took the article, point by point, and paid him back in his own coin, driving him into corners he could never get out of, and he did it so nicely, and with such skill, he could not resist the temptation of carrying the paper home to his wife, to let her see how cleverly he had done it. To his surprise, she did not commend him for his wisdom and skill in making his clever hits, but, on the contrary, declared he must, under no circumstances, think of having it go into print. Like a good husband, he yielded to his wife's superior wisdom, and and wrote so kind a reply that his opponent was ashamed of himself, and the two are, I trust, to-day on a friendly footing, even though their lifework both lies in the same department of natural science. I believe if these things were shown to our wives, oftener than they are, it would be a better world than it is. I presume we cannot all of us be always quiet and cool under all provocations; but I feel sure we can, if we try hard, let nothing ever go into print, over our own signatures, but what is kind and gentle, even though it be written to and of the unthankful. "He that ruleth his spirit, is greater than he that taketh a city."

Medina, Ohio.

The 17th annual convention of the Michigan State Bee-Keepers' Association will be held in Kalamazoo, Dec. 6 and 7, 1882. All interested are cordially invited to participate in the discussions—which will embrace the live issues of the Apiculture of to-day. Thomas G. Newman, A. I. Root, D. A. Jones, Prof. A. J. Cook, and many other distinguished apiculturists are expected to be present. Low rates of board at hotels have been secured.

T. F. BINGHAM, Sec.

Abronia, Mich.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning Co., O., in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.

L. CARSON, Pres.

The annual meeting of the Champlain Valley Bee-keepers' Association will be held at Middleburg, Vt., on Thursday, January 18, 1883, at 10 a. m.

T. BROOKINS, Sec.

The Nebraska State Bee-Keepers' Association, will hold its annual session in Wahoo, Saunders county, Neb., commencing Thursday, Jan. 11th, 1883. Arrangements have been made with the railroads to secure 1½ fare for the round trip. The Saunders county Bee-Keepers' Association will furnish entertainment free to all visiting apiarists. Bee-keepers from neighboring States will be welcomed.

T. L. VONDORN, Pres.

GEO. M. HAWLEY, Sec.

The Ohio State Bee-Keepers' Association will meet in Columbus, in the rooms of the *Ohio State Journal*, on Tuesday and Wednesday, Jan. 9 and 10, 1883. A full attendance of members, and all interested in bee-culture, is requested, as matters of interest and importance will be discussed.

Dr. H. BESSE, Delaware, O., Pres.

DANIEL SPEAR, Cardington, O., Sec.

SELECTIONS FROM OUR LETTER BOX

Swarming, Moving Bees, Etc.—Where I lived during the past summer (Warren Co., Iowa) we had a fair crop of honey. I commenced the season with 39 colonies of Italians, hybrid and black bees; and obtained an average of 115 lbs. of extracted honey per colony, spring count. I hived 20 swarms and returned about as many more to the parent hives. The spring was cold and backward, up to the 4th of July. We had a profuse white clover bloom, but it yielded honey very sparingly from about the 10th of June until the 10th of July, when basswood opened and gave a moderate run. About the 10th of August, bees began to gather honey dew rapidly, and kept it up until fall flowers came, which lasted until the drouth cut it short; but the late harvest was decidedly the best run of the season. Your advice to divide for increase rather than trust to natural swarming is, I think, good. I practiced it for several years but have now ceased to do so, for I believe it is an acknowledged fact, by experienced bee-men, that there is no other condition in which a swarm will work so readily, as when it was obtained in the natural way, and if any one asks me for advice as to what plan to follow for increase, I refer them to G. M. Doolittle's article on "How I Clip Queen's Wings and Why," on page 725 of the present volume. That is my plan exactly; but that makes it necessary for the bee-keeper to be on hand. I have had a little experience in moving bees, having just had 18 colonies shipped from Ackworth, Warren Co., Iowa, to Weston, Platte Co., Mo., a distance of 200 miles, by rail. They came on the express, for two reasons; in the first place, the freight would have been \$2.65 per hundred pounds, while by express it was \$2.15; and, in the second place, they came through without delay, while as freight they would have been a week

on the way, perhaps causing the loss of some colonies. They were shipped over the Chicago, Burlington & Quincy Railroad, and I would like to ask if it is customary for railroads to discriminate against bees in the matter of freight, in this way. Their rates for bees in hives was 3 times first-class in Iowa, and double first-class in Missouri, which made it more expensive than to ship by express. I am going to give the bee business a trial either here in Missouri or just across the Missouri river in Kansas; I think this is a good locality for the business, in the forepart of the season, as the pastures are covered with white clover and basswood is abundant, honey locust, red bud and buck brush are plenty, but I do not know how the late harvest will be here.

L. G. PURVIS.

Weston, Mo., Nov. 27, 1882.

[Railroads sometimes make very unjust discriminations; they charge more than twice as much to carry honey in barrels as they do syrup. In the matter of bees, too, they are very unreasonable.—Ed.]

Report.—I had, spring count, 63 colonies; increased to 100, and obtained about 8,000 pounds of honey; no fall crop.

O. R. FLOURNEY.

San Antonio, Texas, Nov. 27, 1882.

Had No Honey Except from White Clover.—Bees have done well here this summer. I commenced the honey season with 25 colonies and increased to 52; took from them 4,000 pounds of extracted honey and 1,000 of comb honey, and they have plenty to winter on. We had no honey from fruit blossom worth speaking of, and there was but little fall honey; it was too cold both in spring and fall; the only yield of honey we obtained was from white clover. Winter has come now; to-day there are two inches of snow on the ground. My bees are safe in the cellar. I put them in yesterday, the 28th; so we have another winter before us which I hope will be favorable for the bees.

H. J. SMITH.

Burlington, Wis., Nov. 29, 1882.

It Pays to Plant for Honey.—I have had the pleasure of seeing bees work, during the past summer, on a number of kinds of honey plants of my own raising, and I am so well satisfied that "it pays to plant for honey," that I shall use all the ground I can spare for that purpose. I set out some catnip, motherwort and sweet clover plants last fall and some Simpson plants in the spring, and am well satisfied with them all as honey plants. They were thronged with bees all day long while they were in bloom, except sweet clover, which is in blossom yet. I saw a few bees at work on it Nov. 11. An acre of ground, at a low estimate, will, if set out with the plants I have named, give employment to 300,000 bees all day long for weeks when there is nothing else in this part of the country for them to work on. I started Simpson plants in a greenhouse, about

the time to start early tomatoes; some of them grew six feet high, and I counted over 2,000 blossoms on each plant. I planted Mammoth mignonette, borage and spider plant; the bees worked a little on the spider and borage, but were not eager for it; the mignonette was thronged with bees all the time. I have 33 colonies of bees; I had 9 in the spring and took 2 out of trees; the increase was by natural swarming. T. ELLICOTT.
Fentonville, Mich., Nov. 27, 1882.

\$28.15 Per Colony.—My report for the past season is as follows: I began the season with 23 colonies, in fair condition; 2 colonies lost their queens after May 1, and had to rear others, to take their place, thus lessening the general average. The early part of the season was cold and backward and bees had to be fed until June 10, after which the season was fine till late in the fall. My bees increased to 42 good colonies, and I obtained 3,200 lbs. of fine comb honey from them, all in 1 and 2 lb. sections, except 400 pounds, being an average of 140 lbs. spring count. My best colony gave 245 lbs., all in 1 lb. sections, except 10 lbs. My honey sold at an average of 17c. per lb., making from this colony \$41.65. On Nov. 25 my bees were put in winter quarters in good condition, all having on an average 40 lbs. of good thick honey. They are in a cellar built in a side hill, with good ventilation and 3 feet of earth and straw on the roof. In this the temperature will vary but little, as I know by experience, and fully expect them to come out in good condition, let the winter be mild or severe. In the above report I have counted the 20 new swarms at one dollar each. J. V. CALDWELL.
Cambridge, Ill., Nov. 28, 1882.

The Past Season in Scotland.—Our honey season here, is now a thing of the past, and I am sorry to say it has not been so successful as was expected this year. In some quarters, such as Ayr and Perth Shires, a fair quantity was gathered in. I saw Mr. Wood (of Benmore, Argyleshire) yesterday and he said that his bees have been pretty successful, considering the weather. The observatory hive (which I wrote about in my last report of our Shire) has been a great success; the bees in it have gathered in a good quantity of honey, but he intends to leave it all with them, to bring them safely through the winter. He intends to keep the bees in this hive permanently and wishes to have them strong and healthy in the spring. The bees around here are all in their winter quarters, so that all will be dormant for a few months. The most of the bee-keepers here winter them on the outside, very few putting them in cellars or out-houses. Mr. Bennett left here for a cruise in the Mediterranean about a month ago; he intends to visit Mr. Benton in Cyprus, before returning home. The weather has been very bad here for some time, and we have had a considerable amount of rain of late. JOHN D. HUTCHISON.
Glasgow, Scotland, Nov. 11, 1882.

ESTABLISHED 1861
THE AMERICAN BEE JOURNAL
PUBLISHED WEEKLY
BY THOMAS G. NEWMAN, CHICAGO, ILL.

ADVERTISING RATES for 1883.

20 cents per line of space, each insertion,

For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

SPECIAL RATES.—Advertisements will be inserted in both Weekly and Monthly editions, at the following prices, if wholly paid in advance:

SPACE.	One month	Two mo'ths	Three mo'ths	Six mo'ths	One Year.
1 in. 12 lines	10.00	18.00	25.00	38.00	50.00
2 in. 24 lines	20.00	32.00	40.00	60.00	80.00
3 in. 36 lines	25.00	40.00	50.00	75.00	100.00
4 in. 48 lines	32.00	50.00	65.00	90.00	125.00
5 in. 60 lines	40.00	60.00	75.00	110.00	150.00
6 in. 72 lines	45.00	70.00	90.00	130.00	175.00

For the Weekly alone, 20 per cent. less than the above rates. On yearly advertisements, payments may be made quarterly, but must be in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,
925 West Madison Street., Chicago, Ill.

Special Notices.

A few of our subscribers are in arrears for the present year—having requested us to continue, and they would pay soon. Will all such please take this as a request to send on the two dollars with a renewal for next year, if possible.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
Monday, 10 a. m., December 4, 1882.

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HONEY—The supply of extracted honey is fully up to the demand. My quotations are: 6½c. for dark and 8½c. for light, delivered here.
BEESWAX—It is quite scarce. I am paying 27c. for good yellow wax, on arrival; dark and off colors, 17@22c.

AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—Demand is good for extracted honey by the barrel for manufacturing purposes and for table use. The demand is very good for honey in 1@2 lb. jars. A good deal of comb honey could be sold if we had a good article at a rate within the views of the consumer; i. e., which could be sold at 20c. in the jobbing way and 25c. at retail.
We pay 7@10c. for extracted, and 16@20c. for good comb honey in sections.
BEESWAX—Is in good demand at 20@27c. per lb. on arrival.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand for comb honey does not keep pace with the receipts. There is a large surplus on this market at present, and prices are from 2 to 3c. lower than last month.
We quote: white comb honey, in 1@2 lb. sections, 17@18c. Dark comb honey, hardly any demand. It is held at 12½@15c. Extracted—White brings from 9@10c.; dark, 8@9c.; kegs, half-barrels and casks bring about same price.
BEESWAX—Choice Yellow, 30c.; dark to medium, 18@25c.

R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY—A sailing vessel this week took 1,018 cases for Liverpool from a packing house. The market is quiet. Such qualities as are in good supply, dark and medium, are in poor demand.
White comb, 18@20c.; dark to good, 12@15c.; extracted, choice to extra white, 9@10c.; dark and candied, 7½@8½c.
BEESWAX—We quote 25@28c.
STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—In fair demand. Comb, large, sells at 16c., medium do., 17@18c., fancy small do., 19@20c. Extracted at 8@9c. in barrels and half barrels, and 10c. in smaller packages; strained, 6½@7½c.; choice, in small fancy packages brings more.
BEESWAX—Prime bright steady at 26@27c.
R. C. GREER & CO., 117 N. Main Street.

CLEVELAND.

HONEY—There has been no change in honey the past week. No. 1 white, in 1 lb sections, continues in good demand at 21@22c. per pound. No. 1 in 2 lb. sections, is also in good request at 19@20c. Second grade, less active, at 16@17c. Extracted, in all shapes, was dull and very little sale. Some Louisiana honey, rather dark, in barrels, was sold at 9c.
BEESWAX—Prime quality, 25@28c.
A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HONEY—There is a moderate demand for choice lots of clover honey, in view of the holidays, and prices steadily sustained. Buckwheat and extracted honey rather slow.
We quote: White clover, fancy, small boxes, 19@22c.; white clover, fair to good, 16@18c.; buckwheat, 13@16c.; extracted clover, 10@13c.; extracted buckwheat, 9@10c.
BEESWAX—The market continues quiet and without essential change.
Western, pure, 25@30c.; Southern, pure, 30@31c.
D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Our market is fairly active. We quote: ¼ lb. sections at 30c.; 1 lb. sections, 22@25c.; 2 lb. sections, 20@22c. Extracted, 10c. per lb. Good lots of extracted are wanted in kegs or barrels.
BEESWAX—30c.
CROCKER & BLAKE, 57 Chatham Street.

So we may rely upon President Miller to do anything in reason for the welfare of the meeting and the pleasure of those in attendance.

New Premiums for 1883.

As the season for reading has now arrived, we hope that each of our subscribers will endeavor to send at least one new subscriber for the Weekly BEE JOURNAL for 1883 and thus not only help on the cause of progressive bee-culture, but assist in sustaining the only Weekly bee paper in the world.

Providence has smiled on the bee-keepers during the past season, and as a general thing they are abundantly able to procure a good assortment of bee-literature.

In order to encourage every one who keeps bees, be they few or many colonies, to thoroughly read the many very interesting books on bee-culture, now published, we have determined to make liberal offers, which will be available until January 1, 1883, as follows:

To any one sending us \$8 for any books they may select from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for one year.

To any one purchasing \$4 worth of books, selected from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for six months or the Monthly for one year.

Any one sending us a club of two subscribers for 1883, for the Weekly, with \$4, will be entitled to a copy of Bees and Honey, in cloth, postpaid.

For three subscribers, with \$6, we will send Cook's Manual, in paper, Emerson's Binder for the Weekly, or Apiary Register for 50 colonies.

For four subscribers, with \$8, we will send Cook's Manual in cloth, or Apiary Register for 100 colonies.

For five subscribers, with \$10, we will send the Apiary Register for 200 colonies, Quinby's New Bee-Keeping, Root's A B C of Bee Culture, or an extra copy of the Weekly BEE JOURNAL for one year.

To get any of the above premiums for the Monthly BEE JOURNAL send double the number of subscribers, and the same amount of money.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly is now permanently established, and will be continued as heretofore.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

The BEE JOURNAL is mailed at the Chicago post office every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Articles for publication must be written on a separate piece of paper from items of business.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Subscription Credits.—After sending subscriptions to this office, we would respectfully ask every one to look at the label on the wrapper of the next two papers, and there they will find the credit indicated thus: Those who have paid for the first six months of next year will find "June 83" after their names. Those who have paid for the whole year will find "Dec. 83" on their papers. The credit runs to the end of the month indicated. If the mark is "Dec. 82," it means that the subscription is paid until the end of the present year. Please remember that the credit given on this label is a sufficient notification of subscriptions due and receipt for payments made. If not so indicated within two weeks after sending money to us, you may be sure something is wrong, and should write to us about it. It will save annoyance and trouble if our subscribers will give this matter due attention.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

The time for the usual winter rush of correspondence is here, and we wish to impress upon all our patrons the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address that we already have on our books.

The result of the election has proved a grand success, but not more so than Kendall's Spavin Cure has proved to be every day. 48w4t

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

A \$20.00 Biblical Reward.—The publishers of *Rutledge's Monthly* offer twelve valuable rewards in their *Monthly* for December, among which is the following :

We will give \$20.00 in gold to the person telling us how many verses there are in the New Testament Scriptures (not the New Revision) by December 10th, 1882. Should two or more correct answers be received, the reward will be divided. The money will be forwarded to the winner December 15th, 1882. Persons trying for the reward must send 20 cents in silver (no postage stamps taken) with their answer, for which they will receive the Christmas *Monthly*, in which the name and address of the winner of the reward and the correct answer will be published. This may be worth \$20.00 to you; cut it out. Address RUTLEDGE PUBLISHING COMPANY, Easton, Penna.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Santa Claus is said to be putting in a large stock of Noyes Dictionary Holders and Noyes Handy Tables among his supplies for this year. This is well. No more appropriate and acceptable presents can be made at so small a cost. The prices are greatly reduced. A large illustrated catalogue will be sent free on application to L. W. Noyes, 99 West Monroe Street, Chicago.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

Our new location, No. 925 West Madison St., is only a few doors from the new branch postoffice. We have a telephone and any one in the city wishing to talk to us through it will please call for No. 7087—that being our telephone number.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Advertisements.

THE AMERICAN BEE JOURNAL is the oldest Bee Paper in America, and has a large circulation in every State, Territory and Province, among farmers, mechanics, professional and business men, and is, therefore, the best advertising medium.

"BEE-KEEPERS' HANDY BOOK."
\$1.00 PER COPY.

Worth 20 times its cost to any bee-keeper. A work giving the author's 22 years' experience in rearing queens. It will be so illustrated and all made so plain that any one can raise as few or as many queens as desired, and have the cells built in rows so that all can be removed without destroying any. It will teach how and when to remove the cells from a colony that has swarmed, and how to preserve all such queens and have them fertilize for future use. Send name for Circular. 49smft

JAS. FORNCROOK & CO.
Watertown, Jeff. Co., Wis., Sept. 1, 1882. 49m2t

NATIONAL THE PATRON'S GUIDE is devoted to the various departments of Rural and Household Affairs, making it a **DETECTIVE** family paper. Its choice miscellaneous reading matter is one of its features, as well as the Detective Organization to which every farmer should belong. THE GUIDE is published **UNION** weekly at Boyd, Kentucky, at \$1 a year.

HEADQUARTERS IN THE SOUTH

For the manufacture of **BEE-KEEPERS' SUPPLIES.**
Dunham and Root Foundation a specialty. Italian Queens and Bees from March to November. Send for my Illustrated Catalogue.
5mtf **PAUL L. VIALON,** Bayou Goula, La.

THE INDEPENDENT.

THE INDEPENDENT needs only to be better known to add to its already large list of friends. It has been published for thirty-five years and has acquired a world-wide reputation as the best religious and literary newspaper.

THE INDEPENDENT is not denominational. Its creed and field are broader than any sect. As a Christian journal, its aim is to strengthen and extend Evangelical religion and to defend it against the attacks of Materialism, Atheism and unbelief. It is free to approve or criticise in any of the denominations whatever it believes is designed to advance or hinder the progress of the Gospel of Christ.

In civil and political affairs THE INDEPENDENT will contend for sound ideas and principles. It fought against slavery and the iniquitous system of the Oaedia Community. It is now fighting against Mormonism. It believes in the reform of the civil service and tariff, in the purification of politics and in cheap postage, and will maintain these principles which the highest ethics and best intelligence require.

THE INDEPENDENT is designed to suit all tastes and wants. We provide weekly stories by the best American writers, poems by the leading poets of America and England (we first published in America Tennyson's last poem), and for others, who look especially for instruction, whether in religious, literary, educational, philosophical, or scientific articles, we furnish what no other periodical does or can. We pay large prices to obtain the most eminent writers. Besides the editorials, there are twenty-two distinct departments, edited by twenty-two specialists, which include Biblical Research, Sanitary, Legal, Fine Arts, Music, Science, Pebbles, Personalities, Ministerial Register, Hymn Notes, School and College, Literature, Religious Intelligence, Missions, Sunday School, News of the Week, Finance, Commerce, Insurance, Stories, Puzzles, Selections, and Agriculture. **32 Pages** in all.

We will report in full Rev. Joseph Cook's celebrated Boston Monday Lectures, which will begin in January. Mr. Cook has just returned from a two years' trip round the world, and his lectures this Winter will attract greater attention than ever.

OUR NEW TERMS FOR 1883.

One subscription, one year.....\$3 00
For 6 months, \$1.50; for 3 months..... 0 75
One subscription, two years..... 5 00
One subscription, five years..... 10 00

These reduced prices (\$2 per annum in clubs of five or more) are very much lower than any of the standard religious weeklies.

"TRIAL TRIP."

In order that one may read a few consecutive numbers of THE INDEPENDENT, and thus learn its value, we offer a month's subscription, as a "Trial Trip," for 30 cents, which can be remitted by postage stamps. Payment of \$2.70 in addition will secure the balance of a year's subscription.

Send postal card for free specimen copy and judge for yourself. Address

A Common-sense Remedy.

SALICYLICA.

No more Rheumatism, Gout or Neuralgia.

Immediate Relief Warranted. Permanent Cure Guaranteed.

Five years established and never known to fail in a single case, acute or chronic. Refer to all prominent physicians and druggists for the standing of Salicylica.

SECRET!

THE ONLY DISSOLVER OF THE POISONOUS URIC ACID WHICH EXISTS IN THE BLOOD OF GOUTY AND RHEUMATIC PATIENTS.

SALICYLICA is known as a common-sense remedy, because it strikes directly at the cause of Rheumatism, Gout and Neuralgia, while so many so-called specifics and supposed panaceas only treat locally the effects.

It has been conceded by eminent scientists that outward applications, such as rubbing with oils, ointments, liniments and soothing lotions will not eradicate these diseases which are the result of the poisoning of the blood with Uric Acid.

SALICYLICA works with marvelous effect on this acid and so removes the disorder. It is now exclusively used by all celebrated physicians of America and Europe. Highest Medical Academy of Paris reports 95 per cent. cures in three days.

REMEMBER

that SALICYLICA is a certain cure for **Rheumatism, Gout and Neuralgia.** The most intense pains are subdued almost instantly. Give it a trial. Relief guaranteed or money refunded. Thousands of testimonials sent on application.

\$1 a Box. 6 Boxes for \$5.

Sent free by mail on receipt of money.

ASK YOUR DRUGGIST FOR IT.

But do not be deluded into taking imitations or substitutes, or something recommended as "just as good!" Just to the genuine with the name of **WASHBURNE & CO.** on each box, which is guaranteed chemically pure under our signature, an indispensable requisite to insure success in the treatment. Take no other, or send to us.

WASHBURNE & CO., Proprietors,
287 Broadway, cor. Reade St., NEW YORK. decly-n1

THIS PAPER may be found on file at Geo. P. Rowell & Co.'s Newspaper Advertising Bureau (10 Spruce St.), where advertising contracts may be made for in NEW YORK.

BOOKS,

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide for, Cook's Manual of the Apary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping. by L. C. Root.— The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture. by A. I. Root.— This embraces "every thing pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book. by A. J. King.— This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.— This is a standard scientific work. Price, \$2.

Blessed Bees. by John Allen.— A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apary for Pleasure and Profit. by Thomas G. Newman.— Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Be Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Bienen Kultur. by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon Theory— presents the fundamental principles of bee-culture, and turns the facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine. by Thomas G. Newman.— This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.— This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market.— including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by P. G. Newman. Price 10c.

The Hive I Use.— Being a description of the hive used by G. M. Doolittle. Price, 5c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.— A 24-page pamphlet, by Ch. & C. P. Dandant, giving in detail the methods and management adopted in their apary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity. by Thomas G. Newman.— Giving advanced views on this important subject, with suggestions what to plant, and when and how; 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers. by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.— Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Fond Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.— Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Kendall's Horse Book.— No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Moore's Universal Assistant, and Complete Mechanic. contains over 1,000 of the Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Gliders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postpaid, \$2.50.

Fisher's Grain Tables for Farmers. etc.— 192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. Ask your bookseller for it. Sent post-paid for 40 cents.

Chicken Cholera. by A. J. Hill.— A treatise on its cause, symptoms and cure. Price, 25c.

Deutscher Buecher Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände — Vertlichkeit des Bienenstandes — Honig pflanzen — Erziehung der Königin — Füttern — Schwärmen — Ableger — Verjäten — Italienisieren — Züfsetzen von Königinnen — Ausziehen — Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschrieben ist. Preis 40 Cents.

Bienezüchters Zeitfaden. — nebst gründlicher Anleitung zur Behandlung der Bienen. Von H. N. King. Es ist nicht nur lehrreich, sondern auch äußerst interessant und praktisch. Preis 40 Cents.

Honig als Nahrung und Medizin— von Thomas G. Newman. Dieses enthält eine klare darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigtuchen, Formkucheln, Puddings, Schaumtonseet, Weine, u. f. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Conumenten bestimmt, und sollte vieltaufendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten— Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniß der verschiedenen Pferdekrantheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Recepte. Preis 25 Cents.

THOMAS G. NEWMAN,
925 West Madison Street, Chicago, Ill.

EARS FOR THE MILLION! Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carcharodon Rondeletii*. Every Chinese Fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better.

I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

To avoid loss in the mails, please send money by REGISTERED LETTER.

The Michigan Convention.

As announced in the BEE JOURNAL, we attended the State Convention of the bee-keepers in Michigan, held at Kalamazoo last week, a report of which may be found in this issue of the BEE JOURNAL.

The convention was well attended, considering the extremely disagreeable weather that prevailed during the two days when its sessions were held.

The Michigan State Bee-Keepers' Association is the oldest in America, and we are pleased to say that it has been among the first to realize the importance of appointing a committee for the purpose of conferring with the officers of the State Fair relative to giving the bee-keeping interests their due share of attention and prominence at the Fair. This was done last year, as was duly noted in the report of the proceedings published in the BEE JOURNAL last December, and the results were very flattering indeed. The display was very creditable, and the officers of the State Fair were so well pleased with the attention it attracted from those in attendance at the Fair, that they say, anything in reason in the shape of accommodations and premiums demanded by the bee-keepers for the coming State Fair, will be granted.

The present Secretary, Mr. H. D. Cutting, was the chairman of the committee, and the results show what can be accomplished by one man, when thoroughly in earnest. He was supported but very little by the rest of the committee, except by encouraging words, and acted almost alone in the matter. He now has the satisfaction

of knowing that his labors were not only crowned with success, but they were duly appreciated by the Bee-Keepers' Association. We hope that the next Fair will have a far greater exhibit, larger premiums and a more suitable building and location on the Fair grounds.

Let this stimulate Associations all over the land to exertion in a similar way and thus aid in popularizing the demand for honey, as well as giving general information in regard to bees and honey to all who may attend the Fairs for 1883.

In the last number we enclosed a blank, to be used in sending on subscriptions for 1883. Very many run out with the present year, and by renewing *at once*, it will save us much labor in taking the names in type from the subscription list, and then, that of returning them a few days after. We hope all, who can, will send on their renewals immediately and save any errors that might occur during the rush at the end of this month, in the holidays. May we ask you, reader, to speak a good word for the BEE JOURNAL to neighbors who keep bees, and send on *at least one new* subscription with your own? Our premium, "Bees and Honey," in cloth, will pay you for your trouble, besides having the satisfaction of knowing that you have aided the BEE JOURNAL to a new subscriber, and progressive apiculture to another devotee.

Attention is called to a few changes in our clubbing list for 1883, as given on page 797. Those interested will please take notice.

The Bee-Keepers' Magazine is to have a Poultry department for 1883, and the price will be \$1.25 a year. Issued monthly by King, Keith & Co.

Planting Sweet Clover.

Dr. R. W. Keene, Versailles, Ky., writes us as follows:

I desire a sure way to get a good stand of sweet clover? I have been sowing it for three years, have tried all seasons and every plan, and it does not come up for me. I sowed about ten acres last fall and spring, in different places, and I think $\frac{1}{4}$ of an acre would cover the whole of it now, that is worth anything. How will it do to sow it on rye this winter? I thought I would sow four pounds of alsike and two pounds of sweet clover to the acre, on ten acres of rye that I have. How will that do? It does not grow worth a cent on poor clay land for me, and now, I will try it on good land. Our honey crop was almost nothing the past season. I obtained 1200 pounds from 43 colonies, spring count, and increased to 80 colonies. Bees in good condition for winter, and I hope, from the present abundance of white clover, to have a good harvest for 1883.

We are astonished at the statement made by Dr. Keene. We have had no experience in sowing it as a field plant, having a large amount of it growing spontaneously over scores of acres near our residence. We are able only to give the experience of others. Sand is said to be best for it. Prof. Cook says that it grows luxuriantly on sandy soil, and it is generally reported to do well on any kind of soil, and in every climate.

Prof. C. E. Thorne, of the Ohio State University, thus testifies regarding its value as a field plant: "It will grow luxuriantly in hard, poor clay, where even white clover will scarcely live at all, and grows much more rapidly than red clover in any soil, while in the soils that are, as is said, 'clover-sick,' it thrives as well as anywhere. It is a good forage plant for bees and for cattle, and is well adapted for soiling, as it makes a growth of four to six feet during the season, and is said to bear two or three cuttings. A German analysis gives its hay a feeding value of fifteen dollars per ton as against sixteen dollars and twenty-eight cents for very good red clover hay. While red clover, upon which our farming in many sections, and especially in clay lands, depends so essentially for crops of grain, is becoming more and more uncertain. It would seem to be worth while to try this 'fast weed' as a resource for recuperative green manuring, in heavy soils especially."

But its greatest recommendation for the general bee-keeper is the fact that it requires no especial cultivation, thus making it particularly desirable

for roadsides and commons. Being a biennial, the seeds possess great vitality, and may be kept over for a long time, and scattered, a handful at a time, as opportunity offers, or a bare place develops itself. Where possible to devote even a limited time to its cultivation, the ground may be plowed and the seed lightly harrowed under in the fall with winter wheat, or planted with barley; or in early spring it can be sown with wheat, oats or rye, without detriment to the grain. If wanted, however, in its greatest perfection, it should be planted in drills four feet apart, and once hilled up with the cultivator. Sweet clover blooms and yields nectar continuously in this latitude from about June 10th till Aug. 1st, when the first seed crop matures, which is succeeded with a new foliage and profuse second bloom about Aug. 15th, and this continues till winter sets in. If a part of the field be mown about July 1st, it will bloom and yield nectar, except when rains are falling or during the prevalence of strong, adverse winds, from the middle of June till past the middle of October—certainly as long a period as our impatient little workers can utilize it; nor will it then cease to "waste its sweetness on the desert air," but, after the advent of winter, when all else has passed into "the sere and yellow leaf," its modest flowers will waft a fragrant good-bye to the bees on their last flight, and leave pleasant memories for their long winter dreams.

H. S. Hackman, of Peru, Ill., commenced the season of 1881 with 10 colonies, which he increased to 70, and obtained 1,200 pounds of surplus honey—1,000 pounds of extracted and 200 of comb honey—equal to 120 pounds per colony, spring count, and an increase to over seven colonies from one! Mr. Hackman, who is an experienced bee-keeper, and whose veracity is unquestionable, writes: "Please find inclosed flowers of the sweet clover, picked from the roadside, on the prairie, yesterday, Nov. 14. I suppose I owe my wonderful summer success largely to the sweet clover. We had the hottest and driest season we ever had—no rain from June 15th until Sept. 15th. The hotter and drier the more honey, seemingly. Sweet clover, as a weed! Although it has been growing in our roads, on waste land, along railroads, and on our hillsides for twenty-five years, it does not seem to get into the fields, except where water has carried the seeds into low places."

Sagacity of Bees.

An English *Journal*, in 1841, gave the following item on this subject:

A few pounds of honey were taken from a hive (about six miles from London) and placed in a closet, under lock and key. The windows of the room having been left open, the bees obtained admission, and, entering the closet under the door, removed the whole of the honey. The cells of wax were left entire and the honey was conveyed to the central division of the hive, where it was safely deposited during the day. It is evident that spies must have been employed to observe where the honey was placed, and that as soon as the information was communicated to the hive, they took this vigorous measure for the recovery of their stolen property. It is remarkable that they should have succeeded so completely, and in so short a time, since the closet was entirely dark and they could only enter by a crevice under the door.

This circumstance is by no means proof that the bees had sent out spies, who discovered the stolen honey and informed their comrades of its whereabouts. When there is no honey to be obtained from the flowers, bees will go in where any open door, crack, or crevice large enough presents itself, in search of sweets, and if there is any honey to be found, their sense of smell is strong enough to find it; and when one has found it others will follow, in hope of obtaining some of the treasure.

MISCELLANEOUS.

Packing Bees in Chaff.—Mr. F. O. Addition, Dexter, Me., writes as follows, to the *Home Farm*:

For the average bee-keeper I think wintering on the summer stand with proper protection the safest way. My method is this: Take a box large enough to give from four to six inches space around the hive except on the front, that should be two inches. Make a spout from the entrance of the hive through the box for the free passage of the bees at any time. Remove the cap from the hive, spread a piece of burlap or other porous material over the frames, then pack the space around the hive with dry sawdust or wheat chaff, with a foot on top directly on the cloth. Then put on a tight cover and the bees are in a good place to withstand the long, cold winters of Maine. I have known two quarts of bees to be wintered with success in this way. The bees should first be confined to as few frames as will give them sufficient stores, using a chaff division board.

American Honey in England.—The *London Grocers' Journal* of Nov. 17, 1882, contains the following on the above subject:

California ranks first among the honey-producing States of the Union. The soft and equable climate, in which wild flowers of every variety are in bloom for seven or eight months in the year, makes her peculiarly the home of the bee. Even before the building of the Pacific railway the production of her apiaries was enormous, and the honey market was glutted.

On the opening of the road, Mr. W. M. Hoge began to transport honey from the Pacific to the Atlantic coast, taking it to New York in barrels, selling it to the retailers, and thus finding a good market.

It was not until 1878 that the problem of safely bringing honey in the comb from California to England was satisfactorily solved. The infinite care and judgment demanded in the transportation of a cargo, and the extreme liability of breakage from the breaking away of the comb, from its bruising through the slightest jolting of the railway vans, were considered insurmountable difficulties.

Mr. Hoge, whose name is so well known in connection with honey, both here and in America, and of whom the *AMERICAN BEE JOURNAL* once said, "To Mr. Hoge, more than to any other man living, is America indebted for developing the great demand for American honey in Europe, as well as greatly enlarging the call for it at home. In saying this we but accord him that credit which is his honest due," overcame these difficulties, and showed that the transit of honey in the comb could be made as successfully as a cargo of tea.

In 1878, Mr. Hoge successfully landed in Liverpool 80 tons of comb honey, and, early in 1879, another cargo of 100 tons in London. Since these pioneer importations the sale of American honey in Europe has been unlagging.

In the extreme southwestern corner of the United States there is a narrow strip of country known as the bee belt of California. The hillsides are covered with a growth of stunted brushwood, from which springs a luxuriant growth of white sumac and other flowering shrubs, which bloom there nine months of the year—our honey season in England does not last that many weeks. There are no less than three hundred apiaries of several hives each along the "Bee Belt."

The California bee season, Mr. Hoge says, begins by February 1. In March or April the bees swarm, and the bee culturist has lively times saving his swarms.

The science has become so systematized now that the apiculturist knows within a day or two when a given colony may be expected to swarm, and as the young bees always settle somewhere near the parent hive at least once before selecting their new quarters, a swarm is seldom lost. The flowers are at the height of their luxuriance in May and June, and the taking of honey is begun usually about

May 20, and the bees are kept at work as long as the flowers last. They cease to yield more than a sufficient quantity than to subsist the bees, in the early part of August, but the little workers are able to find enough to live on without consuming their stores, as late as October. After October begins, although the air is still mild and spring-like, the bees cease to work and retire into a semi-dormant condition. Once every eight or ten days, a colony will turn out at midday and fly around for an hour or two in the sunshine, but they never fly far from home, and are never seen at work. The food of the bees in the bee belt is generally the flower of the white sage, a plant that closely resembles the garden sage, but must not be confounded with the wormwood species, and has not the family bitterness. Next to the sage in importance as bee food is the sumac. There is no poisonous flowering plants in the bee range, and the honey has none of the colicky qualities that make the honey from semi-savage countries so objectionable.

Mr. Hoge, whose headquarters in England are at "The Apiary," in Leonsfield-road, London, represents some of the largest American bee-keepers, and speaks encouragingly of the future prospects of the honey trade in this country.

Have Bees a Language?—A clergyman writes to the *British Bee Journal* the following incident, as proof that bees have a language:

On Ascension Day, 18th of May, just as my church bells began ringing for service I took a walk round my apiary, the sun was shining beautifully and the weather in every way lovely. A hive which about a week before I had fitted with comb foundation, ready for the next swarm, attracted my attention, for there were hundreds of bees flying about it and going in and out of it. I concluded, therefore, that probably a swarm was coming to it. I watched the bees carefully—ten minutes later there was scarcely a bee to be seen near it. I pretty well knew then what was coming. I kept a pretty full lookout all round when all of a sudden a roar of bees was heard in the distance, getting louder and louder; over the roof of my cottage they came, and straight over the hive where a quarter of an hour before I had seen several hundred of reconnoiterers. They wheeled high up in the air almost out of sight, and then down they came like a water-spout, covering the whole roof of the hive, legs, alighting-board, and a good space of the ground. Now, sir, who can doubt but that the bees forming the reconnoitering party left the hive together in order to pilot the others on? There was apparently no reason why they should so suddenly have left unless it were because the sun was out the whole time, and the air beautifully warm. After I came out of church I found the bees working briskly in their new home. I then went in search of the owner, and soon found out they had come from a hive about half a

mile off, the man failed to keep up with them, and so lost sight of them. Now, sir, here is a proof that bees like comb foundation, and do you not think it a proof that they have a language too?

The Honey Production of To-Day.—The *Germantown Telegraph* gives this description of the honey of to-day, as compared with that of yore:

The honey culture, in fact, is a science, and should inspire in those who pursue it a love for it outside of the profit account, and in this case the enjoyment which it imparts must be considered as a part, and a very desirable part of the returns.

The improved hives, which have taken the place of the old, cumbersome ones that were so awkward in handling and failed to yield an equal supply of honey when compared to these re-modeled ones, makes the care of bee-keeping much easier and pleasanter. The small sections, each holding one or two pounds of honey, which go with their disposal, make the article much more salable than formerly, though they require careful handling. The bees have a way of hermetically sealing the combs, and if these are kept intact, the contents will remain undiminished in quantity and unimpaired in quality. If, however, the combs become cracked for want of care in packing, handling and transporting, the sweet store crystallizes and becomes opaque and unmarketable, though not very materially injured. Altogether, with due care and a proper management of this beautiful and interesting branch of domestic industry, the apiary should be found upon a dozen farms where it is now found only upon one.

Providing Pasturage for Bees.—The *Indiana Farmer* makes the following very sensible remarks on the subject:

Planting for honey has ceased to be an experiment, and is sure to be one of the certainties of success in modern bee-culture. Situated as we are we feel very perceptibly the several regular honey drouths, as any lack of the nectar flow in the several regular honey-producing plants. We have not had the time or room for extensive experiments in this line, but have watched closely those made by our friends and neighbors. And we note the fact that the best and most progressive bee-keepers of America as well as those of the Old World have decided it a success. Sweet clover, (mellilot) is probably at the head of all special honey-producing plants for planting, under all conditions and circumstances, and we noticed, even up to middle of November, the bees working, on a few scattered flowers of this plant in protected places.

Figwort is a decided favorite and has some advantages as it does not die out, but grows from the root year after year. Spider plant is another. J. Lammey, Bateham, Ind., says in a letter to us Oct. 15: "The spider plant seed I got of you last spring was a de-

cided success. It began blooming July 1, is in bloom yet, and to see the bees on it of a morning would delight the heart of any bee-man." In planting sweet clover we notice that sown in the fall and winter does the best, and we conclude the cold of winter to be of some benefit to the seed thus sown. A united effort of the many bee-keepers would soon produce a flora in the land of uncalculable worth.

CORRESPONDENCE

For the American Bee Journal.

Golden Willow as a Honey Producer.

E. B. BEEBEE.

As a great deal depends on the strength of our colonies when the main honey harvest commences, perhaps it is well for us to look closely to what makes them so.

As I have had bees for some time in localities where there was no willow, and at the same time had others where there was plenty of willow, I think I can tell something about its value to bees.

As soon as this willow begins to bloom, which is about the last of April, our bees commence to work in good earnest; and if we had as fine weather for bees to work as we have in July, I think they would gather almost as much honey from it as they do from basswood. As far as my observations extend, I think they gather more honey from willow than from apple blossoms, and we have plenty of both. A bee-keeper came to my apiary when willow was in bloom and was astonished to find that my bees did not rob, when he saw a hive of frames full of honey exposed in the apiary; and when I called his attention to the bees working on the willow he thought he never saw bees work busier.

The quality and flavor of the honey is very poor. Although it is not as dark as some, it has a very repugnant and inferior flavor, but I cannot see but that they build up and breed just as fast on it as on any other, and that is just what we want at this season. Aside from this, we have the advantage of knowing there is no robbing going on at this most critical time; as with our bees in the locality where there is no willow, they have to be closely watched and the entrances contracted, especially if there is work to be done which requires opening the hives; we also find there is a vast difference in the strength and condition of the colonies in these two locations, say about the last of May.

I do not wish to compare willow as equal to basswood or any of the main honey plants, but, coming as it does first in the spring, it is of much value as it has the double advantage of stimulating the bees to breed and keep them from robbing and spring dwindling.

I know of no tree or shrub that is as easily propagated as this willow; it will grow anywhere without any care or cultivation, wet or swampy locations being preferable, and it does not spread any more than as it is set out or planted. It also makes a fine shade tree, being handsome for lawns, yards or walks. It is a very rapid and thrifty grower; a cutting set out in the spring will make a good sized tree in four years. There are three varieties

The Willow.

of willow in this vicinity, but the golden or yellow willow is far preferable for the bees, as the others yield but little honey compared to this one. Oneida, N. Y., Nov. 27, 1882.

For the American Bee Journal.

The Rearing of Cheap Queens.

G. M. DOOLITTLE.

EDITOR BEE JOURNAL: The following article I wrote for the *Rural New Yorker* but thinking it may be interesting to the readers of the BEE JOURNAL, I should be glad to see it in its valuable columns:

The great Creator of all things pronounced his work good when he rested from the same, and so it came to pass that it was good for bees to multiply and increase by natural swarming. In the preparation for this, the first work is the laying of eggs in the drone cells which are already built; or if no drone comb is in hive, some is built, or worker comb is cut down and drone comb substituted for the purpose of producing drones, or male bees. Next, large acorn-cup-like cells are built for a royal cradle for the young queen, in which in due time the reigning queen deposits an egg intended for a queen. At about the time this egg hatches, a copious supply of food is placed in this large cell for the royal larva to feed upon, and as it grows more food is given, till it actually floats in a sea of food—so much so that I have repeatedly seen a lump of uneaten food larger than a marrowfat pea left in the bottom of the cell after the queen had emerged therefrom. Another thing which is always noticeable is that this food is prepared and queens

reared when forage (both honey and pollen) is abundant, and at no other time do we expect natural swarms.

Again, there is a hiveful of bees of all ages, from the nurse bees which prepare this food to the aged veteran with wings tattered and torn with the labors of the field. Thus, with prosperity on every side, the highest queens of the highest type are raised. Now, if such queens as the above were reared and sold for a "dollar," or one dozen of them for \$9, the cheap queen controversy would have had no existence. In the course of time, it was ascertained that by removing the queen from the hive the bees could convert the larva hatching from an egg intended for a worker bee into a queen by building a queen cell over a worker cell and supplying the same with royal jelly, the food of the queen larva. Thus queens without number could be reared at the pleasure of the apiarist, either during the season of natural swarming or at any other time of the year when there were eggs and larvae in the hive. All went well for a time, but after a while it began to be whispered by our most practical apiarists that such queens were tending toward depreciating the quality of our bees; so it was proposed that, as a remedy, all queens should be reared as nearly as possible under the same conditions as those reared by natural swarming. Others claimed that such talk was nonsense, and still continued on as before. At about this time I was greatly excited over the bee question, and so to accomplish the most in the least time, I took to rearing queens "artificially," as this process was termed at that time. All seemed to go well the first season, and I was about to decide against our practical bee men, and say such queens were as good as any, although I invariably found that such queens were much smaller than those reared in natural swarming, and after the queen emerged from the cell not a bit of food remained, but the cell was licked as dry as any drone or worker ever licked its cell.

The next season queens were reared in the same way, although I saw quite a perceptible difference in the working qualities of my bees, but I was not fully convinced of my mistake till through the next winter and spring over two-thirds of my queens reared the season previous, died of old age, while queens reared by natural swarming lived from three to five years. Fully convinced that such queens were not as good as any, I have, as far as possible since that time, had all my queens reared from cells produced during natural swarming.

Soon after this it was proposed by a certain man, prominent before the bee-keeping world, that queens should be sent out and sold as soon as they were found to be laying, without any guarantee of any sort, and that the price be one dollar. Heretofore none but tested queens had been sold, and as the price had been from three to ten dollars each, fair queens had been the rule, for at these prices pains could be taken to rear queens as good as possible by any process except nat-

ural swarming. As the public had demanded this for tested queens, but few of a low grade as to prolificness and short life were sent out. Many opposed this untested dollar-queen business, but as the people demanded something "cheap," the business grew to large proportions. Those receiving queens which were dead were not satisfied with no guarantee, and demanded that such loss should be made good. Thus one claim after another was made till we have to-day queens advertised at 90c. each, or nine dollars a dozen, safe arrival guaranteed. As a result of all this we soon hear our prominent "dollar-queen" man saying that the way to rear good "dollar queens" was to take a comb containing eggs from your best colony, place it in an empty hive, then set it in the place of another colony and the returning bees from the field will raise good queens. Thus these old bees, long unused to preparing food for feeding larvæ, are forced to do the best they can at queen-rearing, in season or out of season to meet this increasing demand for cheap queens.

Another, crying "Headquarters for Dollar Queens," says about Aug. 20th, "now is the time to rear good queens cheaply." Upon inquiry it is found that small nucleus boxes 5x6 inches square are used with a little handful of bees which are compelled to rear queens at a time when the bees should be preparing for their winter repose. Is it any wonder that a party writes, "out of nine dollar queens purchased, seven did not live six months and only one of them a year?" Another says: "I am disgusted with this dollar queen business; five out of six purchased this season, died of old age." In this controversy about cheap queens, talk about the dishonesty of the parties has had a prominent place, as if there was not room for dishonesty outside of the queen business. The question is not as regards honesty or dishonesty, but it is regarding a traffic which demands such a scrimping and pinching on every side in order to live, that the quality of our bees is liable to be injured for all future time.

Talk about queens reared as above being as good as those reared by natural swarming! No one really believes such a thing. But says our worthy friend W. Z. Hutchinson, in the *Rural* for July 16, "You say that Mr. Doolittle 'evidently sees and feels deeply the tendency of the cheap queen traffic to depreciate the quality of our bees.' Judging from his writing he certainly does, but what are we to think of his rearing and advertising for sale 'dollar queens?' Actions sometimes speak louder than words!" For some reason or other Mr. H. forgot to say that such queens were reared under protest by myself. Merchants often keep goods they do not approve of because the demand calls for them, and they must keep them or lose customers. This is why I sell "dollar queens" and probably no one knows it better than does Mr. H.

When changing a postoffice address, mention the *old* as well as the new address.

For the American Bee Journal.

Mating of a Queen Bee.

S. A. SHUCK.

On the 10th of July, having some queens that had been kept confined for the purpose, about 2:30 p. m. I liberated, before an open window, a very strong and active one, five days old, and proceeded to loop a silk thread around her waist. After many fruitless efforts I succeeded in doing so. The thread was attached to a pole about 18 feet long, the thread being about 10 feet long. I carried her to the apiary, and hoisted the pole, allowing her to swing at the end of the thread, or fly as far as the thread would permit. A stiff breeze was blowing, but the weather was clear and warm, and drones were flying in great numbers. In less than a minute several drones were pursuing her and the number increased rapidly, until there were, perhaps, fifty, when, for some reason, they all dispersed, like a flash. In a short time, perhaps, a few seconds, and, at times, a minute or more, they were again chasing her, and disappeared in a twinkling again.

This was kept up for some time, until I thought the queen needed some food and let her down and gave her some honey. This was repeated several times.

During the time the drones were chasing the queen, a great many caught her, one at a time, and would cling to her a few seconds and then let go. Finally, one caught her, and she appeared to have caught the thread with her front feet. They appeared to be face to face and for a few seconds only. The drone, letting loose his hold, swung head downward, and the instant he reached a straight line, his head in the opposite direction from that of the queen. Snap! Did you ever, in your boyhood days, pinch the ripe seed pods of the wild touch-me-not to hear them snap, and see the seeds cast in every direction? The above occurrence reminded me of these ripe seed pods, and the drone struck the grass near my feet, as if impelled by a force similar to that which casts these ripe seeds away.

The queen bore the evidence of her mating, but there was not that white thread-like appendage that we see in so many cases where the queen has just mated, but in this case the organ she held was large and appeared to be perfectly smooth, so I conclude that, in most cases, the drone is not so easily freed from the queen, as in this case.

Later in the season I tried to secure, in the same way, the mating of queens, with imperfect wings. The drones appeared, as before, but I failed to accomplish my undertaking.

The question now arises, have I gained any information leading to the successful mating of queens in confinement. This is what prompted me to make the above experiments. I had learned that others had mated queens in this way, but not one word have I seen in regard to the disposition of the drones in such experiments. During my last experiment the

weather was very still and pleasant and the actions of the drones were observed with more ease and more definite conclusions were formed concerning their natural actions. On such occasions they become very much excited, and notwithstanding their sudden fright and dispersal, occasioned by any unnatural turn or jerk of the queen, caused by her attachment to the thread, they may be seen several rods away and in different directions, chasing each other, and often, a dozen or more together, as though each suspected the other of chasing the queen. One of these little swarms, as it were, of drones, I saw come to the ground in chasing each other, and if there had been any virgin queen in the apiary, except the one I had attached to the thread, I should have thought they were in pursuit of her.

From my observations in these little experiments, I have concluded that any efforts to secure the mating of queens in small boxes, barrels or any like devices, will in the main, prove unsuccessful. However, it may be accomplished in a building covering several rods of ground, provided sufficient light can be given, and at the same time have sufficient shading to prevent the bees from striving to get out.

British Bee Journal.

Introducing Queens Without Encaging.

SAMUEL SIMMINS.

It is well known that a serious loss is occasioned to a colony of bees, especially in early spring, by the exchange of queens through the stranger being caged for 48 hours, on even a less time. The colony does not only lose the eggs that might have been produced during that time, but the sudden check imposed upon a full laying queen by being imprisoned, throws her back so much, that she does not recover her usual fecundity for some days. Imported queens will often not lay at all for the first few days; and the original sovereign having been deposited or destroyed the colony suffers the loss equivalent to an average swarm before the new arrival is in good order for laying.

This has been so strongly impressed upon my mind, that for a long time past I have been experimenting, in the hope that I might ultimately be enabled to dispense with the introducing cage entirely. I am happy to say that I have succeeded beyond my expectations, and the method is so simple that the only wonder is that I had not thought of it sooner. Colonies with fertile workers, or those that have been long queenless without brood (as they are sometimes found in early spring), cause me no trouble whatever, as I can give them a laying queen without her ceasing her work, except for the few moments that she is being transferred from one hive to another. When a queen is sold with a swarm, another can be immediately inserted, and the queen of one colony can be exchanged with that of another with-

out confinement and none of the bees of the respective colonies will know the difference.

It is generally known that the bees of one colony may be united with those of another by alternating their combs, and there is no disposition to fight. Having always succeeded in uniting them thus, I came to the conclusion that a queen on a comb with her own bees and brood, would be taken no more notice of than the others; and this I have proved to be the case by continued and unvarying success. Taken from one hive and placed in another, while parading among her own subjects and without being handled, the queen takes no notice whatever of the change, and thus her unconcerned behavior saves her from any rude inquisitiveness. I have introduced them under all the respective conditions before mentioned, by this means, and I have not met with a single failure; and during the last two seasons I have been saved a large amount of extra work by this method, besides a considerable gain in increase in bees. As soon as the comb, queen, and bees are inserted, the job is done, and I never trouble to look at the hive again until its turn comes in the ordinary course of manipulation.

The foregoing applies, of course, to queens reared in the same apiary when taken from nuclei or other hives with frames all of one size, as should be the case in every well conducted apiary. If a nucleus cannot afford to lose the comb of brood taken with the queen, it is easily replaced by one from some other colony. When queens come from other apiaries, the mode of procedure is slightly different, though a state of things somewhat similar has to be introduced. An imported queen will never lay vigorously for the first few days, therefore it might be said what delay would there be in engaging her? There would be considerable delay if the present laying queen were at once deposited.

To make the most of the queens, first secure as many combs of *hatching* brood as there are queens to be introduced, and after cleaning them of every bee, place each in a nucleus hive with a tight-fitting division board on either side, put the queens in, and close each so that no bees can get out, but give ample ventilation. Now put these nuclei into a moderately warm room for two or three days, when many young bees having hatched, and the queens nearly recovered from the effects of their previous confinement, each nucleus may be stood by the side of the hive its queen is to be introduced to, and the bees allowed to fly for a day or two before being united to the full colony. As soon as the imported queen is laying nicely on her one comb, the condemned queen can be removed and the former inserted (on her own comb with the bees) at one and the same operation, and no notice will be taken of her. By reserving the condemned queen till the moment the other is introduced, the colony receives no check whatever. The single comb is quite enough for the new arrival for nearly a week, as, after her long confinement, she is

some days before getting into full laying order. It will be observed that instead of the usual way of allowing the bees to find out their loss, the exchange is completed before they are aware of the occurrence.

I have no doubt many will still cling to the cage, but no advancing beekeeper can afford to lose so much valuable time at the beginning of the season. My experience bears me out in stating that there is absolutely no risk whatever in introducing in this way, even in what might be thought most obstinate cases.

For the American Bee Journal.

Honey Dew Explained.

C. H. LAKE.

Many of the old articles written 40 or 50 years ago, are very interesting to me, and thinking other readers of the *Weekly Bee Journal* would be edified, I have made such extracts from them as I thought were worthy a place in your valuable journal. I quote one from the *American Agriculturist* of 1844, as follows:

"At a late meeting of the Farmers' Club, at New York, the subject under consideration being insects injurious to vegetation, the Chairman, Ben Johnson, of Long Island, is reported to have said: 'It is my opinion the dew (called, by the Dutch, honey dew) which always falls the latter part of June, always kills off most insects; they uniformly disappear after it has fallen.'"

"Now, since I have embraced the new doctrine of cause and effect in the matter of blight and its consequences, I am led to consider the honey dew merely the extravasated juices of the plant or tree, which, having been for a time in a stagnant and putrid state occasioned by unfriendly atmospheric influence, are at length thrown off by a new circulation of the sap, the effect being the deprivation of food to the insect tribe, which are created for the purpose of feeding on putricity, and hence the cause of their disappearance." (W. FAX, in *Boston Cultivator*.)

The editor of the *Agriculturist* adds: "We have consulted Mr. Browne, who is well versed in matters of this kind, and he regards honey dew, in most cases, as the exudation of plant lice. (*Aphides*.)"

"He says, however, that there are saccharine exudations from the leaves of plants and trees, which are not distinguished by the name of honey dew, as the labdanum from the *cestes creticus*, and the manna which exudes from the ash of Italy and the larch of France. There are also analogous productions observable on plants after very dry weather, which Mr. Murray, in his treatise on Atmospheric Electricity, ascribes to an electric change in the air. Mr. Murray also states "that the honey dew was found on plants that were entirely free from plant lice, and so copious was this substance, that had their number been a hundred fold, they could not certainly have been the source of the supply.

He supposed that he set the question at rest by washing a leaf and wiping it dry with a sponge; immediately after which he observed, through a lens, that excreted globules were apparent."

But, in this experiment, might not the leaf have been previously wounded, perhaps, by the beak of a plant-louse, and hence the exudation of sap, instead of honey dew? And may not the circumstance of his finding the honey dew on leaves where there were no plant lice, be accounted for on the principle that these insects had left, as they always do, the parts covered with their exudations?

Mr. Sanvages, in the *Transactions of the Royal Society, at Montpelier*, remarks "that *aphis* (plant lice) are careful to eject the honey dew to a distance from the place where they may be feeding."

Mr. Burn cites an instance "of a plant of the Chinese chrysanthemum, the young shoots of which swarmed with aphides, and that the leaves below were covered with honey dew. The experiment was tried of wiping it off from a leaf, and no more was formed when it was protected by a piece of paper from the aphides above. Beside, the paper became sprinkled with honey dew in a few hours, and by means of a lens, the aphides were actually seen to eject their fluid."

Dr. Harris, in his report on "Insects of Massachusetts, describes the habits of these insects, as follows: "Plant-lice seem to love society, and often herd together in dense masses, each one remaining fixed to the plant by means of its long tubular beak, and they rarely change their places till they have exhausted the parts first attacked. The attitudes and manners of these little things are exceedingly amusing. When disturbed, like restive horses, they begin to kick and sprawl in the most ludicrous manner. They may be seen, at times, suspended by their beaks alone, and throwing up their legs, as if in a high frolic, but too much engaged in sucking to withdraw their beaks. As they take in great quantities of sap they would soon become gorged if they did not get rid of the superabundant fluid through the two little tubes or pores in the extremities of their bodies. When one of them gets running overfull, it seems to communicate its uneasy sensations by a kind of animal magnetism to the whole flock, upon which they all, with one accord, jerk upward their bodies and eject a shower of the honied fluid."

The fecundity of plant lice is almost incalculable. Reaumur supposed that in one year there may be twenty generations, and he proved, by experiment, that one of these insects may be the parent of 5,904,900,000 descendants during its life."

Latrille says, "one female, during the summer months, usually produces about twenty-five a day, and more than one thousand have been counted on a single leaf of the hop."

Honey dew is in no way regarded as poisonous, but, on the contrary, it is devoured with eagerness by bees, ants, and other insects, and in the forests

of Lithuania, this substance and linden flowers afford the finest honey in the world."

Baltimore, Md.

The Transformations of Life.

CHARLES J. BEATTIE.

Though living forces teem with living strife,
All Nature sings one song of deathless life.
Grass, flower, and shrub, and tree of every name—
All living things—a deathless life proclaim.
The tiny song-bird 'mid the boughs and leaves,
Builds its warm nest with skillful ease, and weaves
With bramble, twig, and leaf, its castle free—
A jocund homestead in the growing tree,
To keep its feathered darlings snug and warm,
Safe from the cold and sheltered from the storm.
The restless bee rears its industrious home,
And fills with treasured sweets its honey-comb—
The strange chrysalis that assumes to die,
Rises to life a gorgeous butterfly.
Night's radiant Queen, the everlasting Moon,
Changeful, yet changeless as eternal noon—
The lesser orbs which light the night or day,
The constellations of the Milky-Way,
And every star that shines from pole to pole,
Are sentinels that watch the ages roll.
Chicago, November, 1882.

Local Convention Directory.

1883. *Time and Place of Meeting.*
- Jan. 9.—Cortland and, at Cortland, N. Y.
M. C. Bean, Sec., McGrawville, N. Y.
- 9.—Ohio State, at Columbus, Ohio.
D. Spear, Sec., Cardington, Ohio.
- 9-11, Northeastern, at Syracuse, N. Y.
G. W. House, Fayetteville, N. Y.
- 11, Nebraska State, at Wahoo, Neb.
Geo. M. Hawley, Sec.
- 16.—Eastern N. Y., at Albany, N. Y.
E. Quakenbush, Sec., Barnerville, N. Y.
- 18, Champlain Valley, at Middleburg, Vt.
T. Brookins, Sec.
- 19, 20.—Mahoning Valley, at Berlin Centre, O.
L. Curson, Pres.
- Feb. 3.—Northern Ohio, at Norwalk, O.
8.—Maine State, at Dexter. Wm. Hoyt, Sec.
- April 5.—Utah, at Salt Lake City. E. Stevenson, Sec.
- May 11.—Iowa Central, at Winterset. J. E. Pryor, Sec.
- , —Texas State Convention, at McKinney. Dr. W. R. Howard, Sec.
- Oct. 17, 18.—Northwestern, at Chicago, Ill. Thomas G. Newman, Sec.
- Dec. 5-6, Michigan State, at Flint. I. L. Cutting, Sec., Union, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning Co., O., in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th. L. CARSON, Pres.

Michigan State Convention.

The 17th annual meeting of the Michigan State Bee-keepers' Society, was held at Kalamazoo, Mich., on Dec. 6, 7, 1882, commencing Wednesday at 10:30 a. m., Vice President Southard, M. D., in the chair. There was a very fair attendance and those present indulged in a free and easy kind of a talk on various subjects, awaiting the arrival of the trains at about noon, which augmented the number quite considerably.

The chairman said that President Heddon was in favor of proceeding without a programme, leaving those present to suggest subjects which could be accepted or refused by vote of the convention.

Dr. Miller, of Marengo, Ill., said as president of the Northwestern convention he prepared a programme which covered all the points of interest, and was faithfully adhered to. He said that all wanted to know about some point, and he would suggest that slips of paper be handed around for the members to name subjects for discussion.

Dr. Southwick, A. C. Balch and others desired to have topics to be discussed arranged, and a committee was appointed consisting of Dr. Miller, Dr. Ranney, Dr. Southwick, and Mr. A. I. Root, to arrange a programme. Adjourned to 2 p. m.

The afternoon session was called to order by President Heddon, and the minutes of the last annual convention at Battle Creek was read and approved.

President Heddon said that the president's address was first in order but as he believed that discussion would be far better than an address, he would at once proceed to business.

The committee reported a "programme" which was adopted, and the convention proceeded to take up the first topic as follows:

How Shall We Begin to Keep Bees?

Dr. Southwick said he would look about and find the bees that produced the most honey.

Dr. Miller remarked that disaster might be occasioned by the location and not from the kind of bees. He bought his bees of Adam Grimm, who never had a large crop, on account of having a poor location. He had tried the Cyprians, but would not like to say which was best—the Cyprians or the Italians.

A. C. Balch wished to know if the best colony would duplicate itself in its progeny?

A. I. Root did not believe that queens would duplicate themselves.

Mr. Kazartee, of Cicero, said bee-keeping was like farming; one man would do well while others would fail. He had never tried the Cyprians, but believed that black bees made the whitest combs.

Prof. Cook introduced Mr. W. Z. Hutchinson, who had just arrived.

Dr. Miller remarked that he had lots of bare-headed bees, and asked, what shall I do? Pinch the queen's head or let them alone.

A. I. Root had seen such bees, but had noticed no difference in their work

A. C. Balch did not want the bees uncapped by moth millers. Black bees were troubled in this way more than Italians.

Prof. Cook said we should prove all things and hold fast to that which was good. He agreed perfectly with Mr. Geo. Thompson in his speech at the Chicago convention about the new races of bees. Such thoughts were valuable.

President Heddon would advise beginners to get the Italian bees—the light-colored ones are the most gentle, but the leather-colored ones were the best workers.

Prof. Cook: Like others, he would say, if there is a better bee he wanted it.

Dr. Miller could not discover any difference. His Syrians did not reach the average Italians.

The president said that good judges could not tell the difference between Cyprians and Italians; at least one did not when a bottle of Italians in alcohol was produced at the Cincinnati convention, for he said they were Cyprians.

Prof. Cook said Syrians were easily discerned—the queens of the Syrians had bars across the abdomen by which he could distinguish them very readily.

Secretary Bingham gave the Colvin test for pure Italians: that of placing the hand over an open hive of bees and with a sudden jerk, let it fall about 6 inches toward the frames. If the bees were pure Italians they would not be disturbed; if blacks or hybrids, they would at once commence an attack. He thought it a good test of Cyprians also. They would act like the hybrids.

A. I. Root said, at first he could not tell them apart at sight, but he could do so by the amount of brood and their dislike of jars; they were very irritable. The drones are much alike.

Prof. Cook: You can go close to the hive and the Syrians will not interfere with you, unless you molest them; but when thoroughly aroused they will follow you into the house, and even into a bedroom, so intent are they upon stinging.

A. C. Balch said that H. E. Bidwell obtained 216 lbs. of comb honey from one colony of Syrians.

President Heddon said that E. J. Oatman remarked at the Chicago convention that the honey produced by Syrian bees was of inferior quality.

Prof. Cook said he had not noticed that the honey capped by the Syrians was inferior, and would like to know more on that point.

The president said that Mr. Newman, editor of the AMERICAN BEE JOURNAL, had just come in, and, no doubt, he could give some light on the point as to the value of the honey produced by Syrian bees, in the Chicago market.

T. G. Newman, being called for, said that Mr. Oatman remarked something of the kind at the Chicago convention, and the best he could do would be to read it; as he happened to have a report of that convention in his pocket. He read as follows: "E. J. Oatman: We have found that the half-bloods (Syrians fertilized by Italian drones) gave us the most honey.

The quarter-bloods are no better than others; but these crosses are vicious. One colony of them, at the close of the white clover season, drove me out of the apiary, in spite of smoker, etc. I took them to an outside apiary and shall let them remain there till next spring, when I shall destroy them. They do not cap the honey so that it will look as nice and white as I want. When I put it on the market, it is worth from 2 to 5 cents per pound under price. The bees do not stay on the combs as well as Italians, either. Mr. Gray said that his neighbor, Mr. Miller, had 1,000 pounds of honey in the comb on Water street, and he could take any one and point out all the honey gathered and capped by the Syrians. He agreed with Mr. Oatman. President Miller asked: As they gather so fast, do you not obtain enough honey to more than counter-balance the loss in price? E. J. Oatman: No; it will not make up the loss in price when we market our honey. They are so cross that I do not want them at all."

Dr. Miller said that Mr. Oatman had sent a sample lot of honey to New York, and among it was some honey gathered by his Syrians, and the buyer said he would not take any more of that Syrian honey when he ordered another lot.

T. F. Bingham said he did not think it best to advise the introduction of untested and high-tempered bees.

Small Frames or Sections for Honey.

Mr. Newman said that bee-keeping was progressive, more so than any other pursuit. President Heddon said, at the Chicago convention, that "the ink of a book was hardly dry before the author was at work on a revision"—and it was true. We must keep abreast, if not in advance of the times. The requirements of the trade should be ascertained, and then beekeepers should supply the demand, whatever it may be. Only a short time ago the 2 lb. section was considered small—now, one holding one pound of honey was the most popular—and when Mr. Ripley, a member of the firm of Crocker & Blake, of Boston, was here, he said that Boston required a smaller section, holding only half a pound of honey. If that is to be the demand, we must supply it.

Dr. Southwick did not object to progress, but he did not think that the section should be smaller than two pounds.

Mr. St. John said that we must educate everybody to eat honey, and a small package was best.

H. D. Cutting said that small sections sold first, and not until they were all gone could you sell the larger ones.

President Heddon said that he had used the 2 lb. sections in one apiary, and the 1 lb. sections in the other, and could not see but the small ones were filled as quickly as the larger ones. He thought of using half pound sections next season, and would have the combs thinner, about the same thickness as brood combs.

T. F. Bingham said that thin combs were better for the table, cut out bet-

ter and made a better appearance on the plate. He recommended 1½ inches for the sections, and said that when thin foundation was used no separators would be necessary. The demands of the market must be met.

T. G. Newman said that honey was more healthy for the children than confectionery made with glucose; that Solomon knew what he was recommending to the children when he said, "My son, eat thou honey, because it is good." We must popularize the sale and use of honey by tempting the working man to take it home to his wife and children; they need sweets, and honey is the best and most healthy of all sweets for the consumption of humanity. When properly developed the market could not be overstocked with honey. All we had to do was to educate the masses to eat honey—to popularize it, and then the demand would be far greater than the supply.

H. D. Cutting said separators must be used if the sections are not filled with comb foundation.

Dr. Miller said variety was necessary, and if others made smaller sections, he should make larger.

Dr. Ranney: People do not buy the large sections of honey as quickly; nor as many of them as they do the small ones.

Mr. House said that he knew of a dealer in Chicago who had a lot of comb honey in half-pound sections, and he had sold it far more quickly than he could have sold one or two pound sections.

T. G. Newman remarked that he was not an advocate of half pound sections, but if they were used, they should have as large a surface as possible, because they would look more for the money, and the bees would work more readily on them, if they had more surface and less thickness of comb.

A. I. Root said that years ago we talked of a section for 25 cents, now we want one for 10 cents. If we make such they will sell readily. His wife wants the section so small that it is all eaten up at one meal. It is never so good to put back on the table the second time.

T. F. Bingham said that the extra thinness, by using 1½ inch sections, would render the use of separators comparatively unnecessary, as the bees did not often enlarge their combs so as to encroach on the next one, if they are only made of the thickness of the brood combs.

Side and Top Storing.

Mr. Balch had experienced no trouble with eggs in the sections when using sections in broad frames for side storing.

Dr. Miller is a side as well as top storer—uses a frame of brood to decoy the bees up to the sections. He wants to get them over as much ground as possible in the spring, and as little as possible at the end of the season. He had 174 colonies last spring and had only an increase of 28. His honey crop amounted to 16,549 pounds; all comb honey.

Adjourned.

EVENING SESSION.

The convention assembled at 7:30 p. m., President Heddon in the chair.

Dr. Miller was, on motion of Prof. Cook, made an honorary member.

The following committees were appointed:

On Resolutions—Prof. Cook, Dr. Southwick and R. L. Taylor.

On Exhibits—Dr. Haskins, W. Z. Hutchinson and Dr. Miller.

On Statistics—H. D. Cutting, Mr. Kazartee and Dr. O. B. Ranney.

The convention then proceeded to discuss the subject of

Overstocking a Locality.

President Heddon said bees would gather honey profitably about 3 miles, and it was useless to move bees less than 4 miles unless there existed a barrier of trees, rocks, hills, etc.

A. I. Root had 200 in one apiary, one year, when, in July, with clover in full bloom, the bees suddenly stopped gathering.

J. H. Robertson, of Pewamo, usually had 300 colonies in his home apiary, but he thought he was overstocked last year, for there was no honey to gather. He had seen his bees 7 miles away from the apiary.

James Heddon found that east of his apiary bees had not done as well as they had on the west. He was just at the edge of the honey shower.

Dr. Miller wanted to know how to get the greatest aggregate amount from 100 colonies of bees.

Dr. Ranney had tried to manage so as to prevent increase, and obtained much more than his neighbors did, by cutting out queen-cells.

Dr. Miller had kept 120 colonies down to 122.

Prof. Cook had visited D. A. Jones, of Canada, who had 1,000 colonies this year, but no honey, and was feeding them hundreds of barrels of sugar.

Clipping Queens' Wings.

Dr. Miller said that when a swarm comes out, I put back the bees and cage the queen (her wings being clipped she is easily secured). I let them remain 5 days and then cut out the queen-cells; 5 days later I cut out the queen-cells again and let the queen loose in the hive and they do not swarm again. This was usually sufficient to prevent swarming, but this year they came out again in spite of my precaution. The plan I have described is Mr. Doolittle's plan, and I have now practiced a plan of my own, which is as follows: I kill the queen and wait until "piping" is heard; then I cut out the other queen-cells, and take 4 brood frames and put in a super with the new queen and place this on the top of the honey board, leaving the lower hives queenless. Ten days after I cut out all the queen-cells and put the nucleus above, back in the lower story. This has been successful.

President Heddon said he did not believe in cutting the queen's wings; he did not like a part of a queen and did not believe the bees liked her any better than he did.

Prof. Cook could not consent to abandon the clipping of the queens' wings.

W. Z. Hutchinson said by using the extractor freely he could generally prevent swarming.

Mr. Southwick had no success in preventing swarming by cutting out queen-cells.

President Heddon hives the swarm on frames of wired foundation, let them work and after 5 days united them with the parent colony.

Mr. Swarthout hives the bees in a new hive, all but a few which he returns to the parent colony and puts in a young laying queen, and finds that this usually prevents swarming.

Mr. Townsend said that bees did not like to build comb when they were queenless.

Prof. Cook remarked that many extensive bee-keepers thought it profitable to clip the wings of their queens, and for himself he did not see how any one could afford not to do so.

Dr. Miller did not think he could keep bees successfully without clipping the queens' wings.

Adjourned.

SECOND DAY.

The convention met at 9 a. m., and Mr. Cutting, chairman of the committee on obtaining a suitable place for exhibits at the State Fair and obtaining a good list of premiums, reported by request. The report was unanimously received and \$20 were allowed for expenses and an order on the treasury for the amount was drawn.

Mr. Cutting said that the State Fair officers were so well pleased with the honey exhibit that they would do anything reasonable to encourage the bee-keeping interest for the coming year.

Prof. Cook said that we could not do anything that would go farther to popularize honey consumption than to make a large display at the State Fair, and have it sold on the ground, and Mr. Cutting had done his work so well that he would move a vote of thanks to him for the way in which he had managed the exhibit and secured the approbation of the officers of the State Fair.

The election of officers for the ensuing year was then had, with the following result:

President—Prof. A. J. Cook.

Vice Presidents—Dr. A. S. Haskins and W. Z. Hutchinson.

Secretary—H. D. Cutting.

Treasurer—T. M. Cobb.

The secretary's expense account was presented, amounting to \$18.47 and ordered paid.

Flint was selected as the place for holding the next annual session, on the first Wednesday after the first Tuesday in December, 1883.

Secretary Bingham was requested to continue his duties during the present session.

President Cook was then conducted to the chair by Mr. T. G. Newman and Dr. Haskins and welcomed by President Heddon.

Discussion was then resumed, and

the next subject on the programme taken up, viz.:

Wintering Bees.

W. Z. Hutchinson wintered his bees in a cellar, ventilated by a pipe running underground. With this ventilating pipe the air was kept pure and odorless, and the bees wintered well.

Mr. St. John said that spring dwindling was caused by the bees taking cold and they died of pneumonia.

R. L. Taylor used chaff cushions on each side of the hives, for winter, and was successful.

Mr. Kezartee kept his bees dry with absorbents and they wintered well.

Dr. Ranney packed with 4 inches of chaff and allows no escape of air from the inner hive. He packed the chaff over the cover and around the hive, and they wintered well.

Dr. Southwick uses chaff cushions; the top cushions never get damp if there is an air-space between them and the outside boards. He took off the packing when the apple trees bloomed, and kept the bees from breeding as late as possible.

Dr. Southard found that if any cover of the inside hive, as described by Dr. Ranney, got displaced, the bees in that hive had the dysentery if the winter was very cold.

James Heddon said he could demonstrate that dysentery was not produced by lack of upward ventilation. Cold is not the cause but the aggravation of the disease. He had the best results in packing bees on the summer stands.

Mr. Robertson wintered his bees in a cellar, piled 8 high; water run through the cellar and carried off the gasses, and winters successfully.

Prof. Cook remarked that water in a cellar was a valuable thing. He had a brother who has a cistern in his cellar where his bees are put, and they winter well.

Adjourned.

AFTERNOON SESSION.

President Cook called the convention to order at 1:30 p. m., and the subject of wintering was further discussed.

Dr. Southard weighs all his hives before putting into winter quarters; takes out all poor honey and gives them 25 pounds each to winter on.

James Heddon wanted boxes on for winter, and said, dark honey, if thick, was best for winter.

Comb Foundation.

Dr. Miller liked the Given foundation best.

Dr. Southwick also liked it best.

A. I. Root said rubber plates make the softest foundation, and bees work on it very promptly; next to that was the Given. He used wire woven in the frames and embedded in the foundation.

James Heddon: It pays a good profit to make foundation, and when a man has 50 colonies it will pay him to own a machine or press.

Mr. Taylor likes the Given best; he could put combs in with the press easier than he could fasten other kinds in the frames. Damp days were best for making foundation.

The Committee on Statistics made the following report:

Apiarists.	Number of Colonies in spring.	Number of Colonies in fall.	Comb Honey, lbs.	Extracted Honey, lbs.	Beeswax, lbs.
1	110	140	3,000	..
2	185	185
3	26	36	1,500	1,500	25
4	175	280	6,000	5,000	..
5	6	17	50	650	5
6	3	27	32	72	..
7	30	80	600	100	..
8	19	40	200	1,000	..

Total	1,284	2,147	19,818	30,676	54

The reports given, show an increase of 863 colonies, or about two-thirds of the spring number.

The wax was included in the report of but three persons, while one or two reported a good business in the rearing and sale of queens.

Respectfully submitted,
H. D. CUTTING,
O. B. RANNEY.

The report was accepted and the committee discharged.

T. F. Bingham gave the result of his experiments with the cappings. When converted into wax, it took 60 lbs. of cappings to make 30 lbs. of wax, or about 10 lbs. of wax from the uncapping of 3,000 lbs. of sealed honey.

Pasturage for Bees.

Dr. Miller has sowed sweet clover in buckwheat, and should sow it again next year so as to have a continuous crop.

Julius Tomlinson had sweet clover near his foundry and it had re-seeded itself for 10 years and grew thicker; had sowed some about trees, but very little came up.

Dr. Miller said he would sow a few acres of sweet clover if he was sure it would pay as a honey plant or otherwise.

Prof. Cook said it would grow well on sandy soil.

Dr. Miller said that a farmer in Wisconsin had found sweet clover of value as feed for cows.

Julius Tomlinson said his cows would eat it.

J. H. Robertson said figwort was always sought after by bees, while sweet clover was sometimes neglected by them. His sweet clover grew on clay soil. Alsike clover was his pet pasturage for bees.

Dr. Miller: It failed to grow on my soil.

Dr. Southwick sowed alsike with other clovers and it did better than when sowed alone; it made better hay. He should sow 13 acres next spring with timothy, for bee pasturage and hay.

Julius Tomlinson thought it would pay to give seed to farmers.

A. I. Root had great faith in alsike; it should be cut just as it began to bloom, in order to get the best results in a honey crop, at the season when it is needed, just after basswood and clover.

Dr. Southard said he sowed sweet clover and his man cut it with the oats, but some of it grew and the bees worked on it till fall.

James Heddon said bees do not get honey from plants that bloom out of season.

Prof. Cook: Rape will prove to be a good honey plant; sow it 4 weeks before you want it to bloom.

Mr. Townsend: Nohoney plant will yield honey under all conditions.

Dr. Ranuey: Buckwheat will yield honey only now and then; not every year.

Prof. Cook: Texas horsemint is not the same as our bergamot.

Adjourned.

T. F. BINGHAM, Sec.

☞ The Nebraska State Bee-Keepers' Association, will hold its annual session in Wahoo, Saunders county, Neb., commencing Thursday, Jan. 11th, 1883. Arrangements have been made with the railroads to secure 1½ fare for the round trip. The Saunders county Bee-Keepers' Association will furnish entertainment free to all visiting apiarists. Bee-keepers from neighboring States will be welcomed.

T. L. VONDORN, Pres.

GEO. M. HAWLEY, Sec.

☞ The Ohio State Bee-Keepers' Association will meet in Columbus, in the rooms of the *Ohio State Journal*, on Tuesday and Wednesday, Jan. 9 and 10, 1883. A full attendance of members, and all interested in bee-culture, is requested, as matters of interest and importance will be discussed.

Dr. H. BESSE, Delaware, O., Pres.
DANIEL SPEAR, Cardington, O., Sec.

☞ The annual meeting of the Cortland Union Bee-keepers' Association will be held in Cortland, N. Y., on Tuesday, Jan. 9, 1883.

Read at Maine State Convention.

Wintering and Springing of Bees.

O. L. SAWYER.

The successful wintering and springing of bees is a subject of vast importance to every bee-keeper. While one comes out in the spring with flying colors, his neighbor meets with heavy losses. One may winter one season with good results, the next winter his bees may come out in bad shape. As we never have two winters or two seasons exactly alike, it is quite difficult for one rule to apply to the various conditions in which bees are kept.

The causes of bees not wintering well are numerous and great. In the last fourteen years, during which I have been keeping bees, my experience has been of a decidedly mixed nature. Not having a first-class cellar I have tried various ways, some winters meeting with good success, and at other times coming out in bad shape. It has been my experience that there are some colonies that it is almost impossible to winter. One season I attempted to winter two colonies of Italians; one came out the 29th of July, the other the 20th of August. They both gathered sufficient stores to carry them through the winter, but in less than ten days after I had put them in my building they became quite uneasy and began to have a very bad smell. I gave them more ventilation, but it did no good; and at last I set them out doors, the temperature being below zero, hoping to quiet them down, if nothing more. But it had but little effect and in a few days they were dead. I think that there might have been disease or poor honey that caused it. I kept the hives and comb till the next year, putting new swarms in them, and they wintered as well as any that I had. The cause of this queer freak I never could give any reason for, excepting that it is something a little natural to the Italian bees, having had several such cases in a light form.

A great many attempt to winter colonies that are perfectly unfit to stand the test of our long and cold winters, starting with too few bees or without sufficient stores. Last winter I attempted to winter some fifteen colonies, that came out in August, they having quite enough to carry them through, but the honey was on more frames than it should have been. I put them in the cellar and they did as well as any of my strong ones until about the 1st of March. At that time they had eaten the honey out of the combs on which they clustered. Then came the trouble. As soon as they had to change their position for stores they would sicken and die. The placing of comb honey on the frames over them seemed to have no good effect. Had I succeeded in getting them safely through the winter it would have been impossible to have carried them through such a spring as our last. Bees to winter and do well the next season, should first have a young and healthy queen, with a plenty of bees not too old. Second, twenty to

thirty pounds of nice honey or sugar syrup. This must not be scattered through the hive, but must be as nearly in one solid mass above the bees as possible.

A great many bees die in the spring by getting away from their stores. This fall, while traveling in Aroostook county, I found men who had had varied success. G. W. P. Jerrard, of Caribou, told me that he could keep his bees in the cellar six months, and bring them out in good shape in the spring; having lost scarcely any last winter of his one hundred and thirty; while Mr. Oliver Ames, of Fort Fairfield, having one of the finest cellars that I ever saw, lost fifty out of ninety colonies, last winter or spring. Other men have wintered bees well in the cellar, but such a spring as our last was a hard one to get by.

Not having a cellar satisfactory to my mind in which to winter fifty colonies, some six years ago, I put up a building for the purpose, having it nicely ventilated, with the walls thick enough to keep the bees at a proper temperature. It seemed as if this was all one could wish for, but while I could winter fifty colonies successfully one year, the next I would lose a greater portion of them; and those that came out well, would dwindle away in the spring. This having been unsatisfactory, I have, in the meantime, packed a few on their summer stands, with better results; it seeming to be more natural, and the long, cold springs not having so much effect on them as those wintered in doors.

My manner of packing is to build up around them on three sides, leaving the front open, exposed to the sun. I fill in on the three sides with leaves or planer shavings, covering the top the same as the sides. I then shingle the roof and all is done until next June; the time I consider that winter has ended. I shall winter the most of my bees as above stated this season.

☞ The annual meeting of the Champlain Valley Bee-Keepers' Association will be held at Middleburg, Vt., on Thursday, January 18, 1883, at 10 a. m.

T. BROOKINS, Sec.

The North Eastern Bee-Keepers' Association will hold their thirteenth Annual Convention in the City Hall, at Syracuse, N. Y., on the 9th, 10th and 11th days of January, 1883.

Business of great value to every bee-keeper in the State will be brought before the meeting. Every member is requested to attend and bring their friends, that all may be benefited by the action there taken.

The question drawer will be opened each day, and questions answered and discussed. All are invited to send questions. Appropriate diplomas will be awarded to successful exhibitors of implements, etc. Let all attend.

GEO. W. HOUSE, Sec.

☞ Attention is called to our *new* and liberal advertising rates for 1883.

SELECTIONS FROM OUR LETTER BOX

Facts About Bees.—A knowledge of some facts familiar to bee-hunters will aid any one who may propose to repeat Sir J. Lubbock's experiments quoted on page 738 of the last number of the BEE JOURNAL. Bees cannot be induced to work freely on honey when honey-bearing flowers are in bloom. A single bee may continue for hours to carry to the hive the honey it has found and finally stop without having any companions. The case is very different after frosts have ended the natural honey harvest. Then, if on a bright, warm day a stray bee can be caught ranging the fields and allowed to quietly fill itself with honey and depart without alarm, by the time it has made a second return, if not before, it is almost sure to be accompanied or preceded by other bees, even if the hive is a mile or two away. I presume the experiment might also be made successfully in warm days of early spring. It is the opinion of many who have hunted wild bees that bees do find their way from the hive to the honey without accompanying a bee who knows the way, but I have never observed any fact to positively sustain the theory and it is very improbable.

W. BRADFORD.

Louisville, N. Y.

[Sir John Lubbock's experiments were made in England, where bee pasturage is very limited and can not be compared to that found in America. Some of his experiments were no doubt made when the honey harvest was in its height, and this may have given an erroneous conclusion to some of his experiments. But his book is very interesting to the student.—ED.]

Good!—From 16 colonies, spring count, I took 1,710 lbs. of comb honey in 1 pound sections. Long life to the BEE JOURNAL. I hope you will never come in contact with my "Coming Bees."

JAMES RONIAN.

Villisca, Iowa, Dec. 1, 1882.

Lime for Wintering.—I have just read the article by F. Della Torre, in No. 46 of the BEE JOURNAL, and agree with him, although I have no acquaintance with the gentleman. I am surprised that others do not see the advantages lime presents over all other *modus operandi*. I have read, in the BEE JOURNAL, all the methods of wintering that have been published, and his is the first mention of the true method. The lime cushion can be applied to almost any hive, either under, over, or at the side, effectively. It is a common sense and scientific protection. It absorbs all the moisture and gives some heat. Mr. S. Corneil sounds the key note as to the cause of dysentery, when he says in the BEE JOURNAL, No. 46, page 728, "that bees, when clustered, can endure se-

vere cold, but cannot stand dampness." It is plain that if the air, heated by the bees, be overloaded with moisture, the large amount of water generated by the consumption of honey will not be inhaled by evaporation from the respiratory membrane, but will remain in the bees bodies, and if this condition of the air be long continued, it is sufficient cause of dysentery. I only have 12 colonies, but I am as desirous of saving them through the winter as though I had a thousand. I have no axe to grind and give my opinion for what it is worth, as I have used the lime and know whereof I speak.

DR. J. C. OLDHAM.

Springfield, O., Dec. 3, 1882.

Poor Honey for Winter Use.—Having 8 colonies of bees which have not swarmed the past season (and I can not hear of one which has in this vicinity), and none of the bee-keepers here have obtained more than 10 lbs. of comb honey (and some none) and that very dark and slightly offensive, last spring being very cold and the summer the driest we ever experienced, I write to inquire if their store of honey is judged safe for their winter food? If not, should it be taken from them or may sugar be fed to them and let them take their choice? I have packed them so heavily in dry sawdust as to require nearly two feet of inlet which is 1x3 inches. Is the length objectionable?

L. H. MERRITT.

Hartland, Vt., Nov., 1882.

[The honey may or may not be safe winter feed—we cannot tell unless we knew more of its quality. Sugar would be safe, if made into a syrup, as often stated in the BEE JOURNAL. There is nothing objectionable about a passage way of even 2 feet for bees entering a hive, except the time taken to travel it. We have seen several as long or even longer in observatory hives at Fairs. We fear you have wasted packing-boards in using so liberal an amount of sawdust.—ED.]

Old Foggy Bee-Keepers.—I have 50 colonies of Italian bees; my neighbor has about the same number with the exception there is very few Italian bees within several miles. We are greatly annoyed with old foggy bee-keepers who will not Italianize or even transfer to movable frames or take a bee paper of any kind. Let me give an instance of this. One of these (an old neighbor of mine) who boasts of having kept bees for 30 years, and who has heretofore stated that he knew all about bees that is to be known. In conversation with him a few days ago in relation to queen-rearing and cell-building, he asked me how they got the eggs from the queen to make the queen cells, and when I informed him how it was done, he said, "oh, yes, that would do; I thought they had to take them out of the queen." evidently thinking the best queen in the apiary had to be sacrificed to get a few eggs. This is too good a joke to be lost; let us have it in the BEE JOUR-

NAL for the benefit of others who think "what they don't know is not worth knowing," and as a sample of the gross ignorance and innocence of "old fogies."

HENRY LARGE.

Whigville, O., Nov. 20, 1882.

My Report.—I commenced in the spring with 100 colonies; increased to 173 by natural swarming. I obtained 15,000 lbs. of comb honey and 500 lbs. of extracted. I now have 170 colonies in winter quarters, with plenty of honey and bees. I winter in a cellar and bee-house.

H. F. PUTNAM.

Galesburg, Ill., Dec. 4, 1882.

Poor Honey Season.—We had a poor season here for honey. From 30 colonies in spring, I received 500 lbs. of comb honey and 400 of extracted, besides 90 swarms and nuclei.

Holt, Mich. JOHN L. DAVIS.

Snow, and Upward Ventilation.—Will it be detrimental to bees to have snow drift over the entrance? When the hives are packed with chaff, on the top, must I keep more top ventilation when the thermometer is below zero, than when it is 40 degrees above?

Nineveh, Ind. W. D. SMYSER.

[Snow is not detrimental, if it is not permitted to thaw and freeze and run down over and close up the entrance. If a board is slanted over the front, to protect the entrance, the snow is a protection against the cold.

The chaff packing will give sufficient ventilation at any time in winter; it should not touch the outer cover, however, or it may become frozen in severe weather. An air space, above the chaff, is an advantage in keeping out the cold as well as allowing the moisture to escape, leaving the chaff-packing dry. Too much ventilation is conducive to dysentery. The heat should not be allowed to escape from the cluster.—ED.]

Spring Dwindling.—Last spring I had 64 colonies of bees, all in good condition, which dwindled down until I had only 48 left. On May 24th they were in good condition at which time I first noticed drones. A cold storm, June 7-9, came on and killed all the drones; all the stores were exhausted and there was nothing coming in from the fields. About Sept. 1, they began to gain. I had but two natural swarms, one of which got away. I have increased by artificial swarming to 66, but have only obtained about 500 lbs. of comb honey and 400 of extracted.

J. G. A. WALLACE.

Brighton, Ont.

A, No. 1.—I have found the AMERICAN BEE JOURNAL to be "A, No. 1," as an advertising medium, and I shall, of course, advertise, during the coming year, in both the Weekly and Monthly editions.

E. T. FLANAGAN.

Belleville, Ill., Nov. 27, 1882.

ADVERTISING RATES for 1883.
20 cents per line of space, each insertion,
For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

SPECIAL RATES.—Advertisements will be inserted in both Weekly and Monthly editions, at the following prices, if wholly paid in advance:

SPACE.	One month	Two mo'ths	Three mo'ths	Six mo'ths	One Year.
1 in. 12 lines	10.00	18.00	25.00	38.00	50.00
2 in. 24 lines	20.00	32.00	40.00	60.00	80.00
3 in. 36 lines	25.00	40.00	50.00	75.00	100.00
4 in. 48 lines	32.00	50.00	65.00	90.00	125.00
5 in. 60 lines	40.00	60.00	75.00	110.00	150.00
6 in. 72 lines	45.00	70.00	90.00	130.00	175.00

For the Weekly alone, 20 per cent. less than the above rates. On yearly advertisements, payments may be made quarterly, but must be in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

A few of our subscribers are in arrears for the present year—having requested us to continue, and they would pay soon. Will all such please take this as a request to send on the two dollars with a renewal for next year, if possible.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

New Premiums for 1883.

As the season for reading has now arrived, we hope that each of our subscribers will endeavor to send at least one new subscriber for the Weekly BEE JOURNAL for 1883 and thus not only help on the cause of progressive bee-culture, but assist in sustaining the only Weekly bee paper in the world.

Providence has smiled on the bee-keepers during the past season, and as a general thing they are abundantly able to procure a good assortment of bee-literature.

In order to encourage every one who keeps bees, be they few or many colonies, to thoroughly read the many very interesting books on bee-culture, now published, we have determined to make liberal offers, which will be available until January 1, 1883, as follows:

To any one sending us \$8 for any books they may select from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for one year.

To any one purchasing \$4 worth of books, selected from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for six months or the Monthly for one year.

Any one sending us a club of two subscribers for 1883, for the Weekly, with \$4, will be entitled to a copy of Bees and Honey, in cloth, postpaid.

For three subscribers, with \$6, we will send Cook's Manual, in paper, Emerson's Binder for the Weekly, or Apiary Register for 50 colonies.

For four subscribers, with \$8, we will send Cook's Manual in cloth, or Apiary Register for 100 colonies.

For five subscribers, with \$10, we will send the Apiary Register for 200 colonies, Quinby's New Bee-Keeping, Root's A B C of Bee Culture, or an extra copy of the Weekly BEE JOURNAL for one year.

To get any of the above premiums for the Monthly BEE JOURNAL send double the number of subscribers, and the same amount of money.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers. The Weekly will contain all that the Monthly does, besides twice as much other matter.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Subscription Credits.—After sending subscriptions to this office, we would respectfully ask every one to look at the label on the wrapper of the next two papers, and there they will find the credit indicated thus: Those who have paid for the first six months of next year will find "June 83" after their names. Those who have paid for the whole year will find "Dec. 83" on their papers. The credit runs to the end of the month indicated. If the mark is "Dec. 82," it means that the subscription is paid until the end of the present year. Please remember that the credit given on this label is a sufficient notification of subscriptions due and receipt for payments made. If not so indicated within two weeks after sending money to us, you may be sure something is wrong, and should write to us about it. It will save annoyance and trouble if our subscribers will give this matter due attention.

The time for the usual winter rush of correspondence is here, and we wish to impress upon all our patrons the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address that we already have on our books.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages)..... \$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

The BEE JOURNAL is mailed at the Chicago post office every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Articles for publication must be written on a separate piece of paper from items of business.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid on any address for 10 cents.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL,
 Monday, 10 a. m., December 11, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour :

Quotations of Cash Buyers.

CHICAGO.

HONEY—The supply of extracted honey is fully up to the demand. My quotations are: 7c. for dark and 9c. for light, delivered here.
 BEESWAX—It is quite scarce. I am paying 27c. for good yellow wax, on arrival; dark and off colors, 17@22c.
 AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—Demand is good for extracted honey by the barrel for manufacturing purposes and for table use. The demand is very good for honey in 1@2 lb. jars. A good deal of comb honey could be sold if we had a good article at a rate within the views of the consumer; 4 c., which could be sold at 20c. in the jobbing way and 25c. at retail.
 We pay 7@10c. for extracted, and 16@20c. for good comb honey in sections.
 BEESWAX—Is in good demand at 26@27c. per lb. on arrival. CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HONEY—The demand for comb honey does not keep pace with the receipts. There is a large surplus on this market at present, and prices are from 2 to 3c. lower than last month.
 We quote: white comb honey, in 1@2 lb. sections, 17@18c. Dark comb honey, hardly any demand. It is held at 12½@15c. Extracted—White brings from 9@10c.; dark, 8@9c.; kegs, half-barrels and casks bring about same price.
 BEESWAX—Choice Yellow, 30c.; dark to medium, 18@25c.
 R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY—A sailing vessel this week took 1,018 cases for Liverpool from a packing house. The market is quiet. Such qualities as are in good supply, dark and medium, are in poor demand.
 White comb, 18@20c.; dark to good, 12@15c.; extracted, choice to extra white, 9@10c.; dark and candied, 7½@8½c.
 BEESWAX—We quote 25@28c.
 STERN'S & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Dull. Comb, at 16c. for large or hard to 19@20c. for choice bright in small packages; extracted at 8@9c.; strained, 6½@7c.; choice, in smaller quantities, brings more.
 BEESWAX—Prime bright steady at 26@27c.
 R. C. GREER & CO., 117 N. Main Street.

CLEVELAND.

HONEY—There has been no change in honey the past week. No. 1 white, in 1 lb. sections, continues in good demand at 21@22c. per pound. No. 1 in 2 lb. sections, is also in good request at 19@20c. Second grade, less active, at 16@20 cents @ lb. less. Extracted, in all shapes, was dull and very little sale. Some Louisiana honey, rather dark, in barrels, was sold at 9c.
 BEESWAX—Prime quality, 25@28c.
 A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HONEY—There is a fair demand, but mostly for small lots, and the general tone of prices remain steady.
 We quote: White clover, first quality, 1 lb boxes, 25c.; 2 lb boxes, 23@25c.; second quality, 20c.; buckwheat, 1 lb boxes, 20c.; 2 lb boxes, 18c.
 BEESWAX—30@32c.
 D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Our market is fairly active. We quote: ½ lb. sections at 30c.; 1 lb. sections, 22@25c.; 2 lb. sections, 20@22c. Extracted, 10c. per lb. Good lots of extracted are wanted in kegs or barrels.
 BEESWAX—30c.
 CROCKER & BLAKE, 57 Chatham Street.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to new Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

CLUBBING LIST.

We supply the American Bee Journal and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

	<i>Publishers' Price. Club</i>
The Weekly Bee Journal.....	\$2 00..
and Gleanings in Bee-Culture (A. I. Root) 3 00..	2 75

BOOKS,

Sent by mail, on receipt of price, by

THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide for Cook's Manual of the Apiary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quincy's New Bee-Keeping, by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject.—\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keeper's Text-Book, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Bienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon Theory—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive I Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Foul Brood; its origin, development and cure. By Albert R. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling, and Marketing.—A 24-page pamphlet, by Chas. C. P. Dadant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 10c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how; 25 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarmlog, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. Price 5c.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 300 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35c. postpaid.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Glaziers, Metal and Wood Workers of every kind. The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables; wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. Ask your bookseller for it. Sent post-paid for 40 cents.

Chicken Cholera, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

THOMAS G. NEWMAN,
925 West Madison Street, Chicago, Ill.

EARS FOR THE MILLION!

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small **White Shark**, caught in the Yellow Sea, known as *Carcharodon Koidohii*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly **miraculous**, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over **500 years** no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefited. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

To avoid loss in the mails, please send money by REGISTERED LETTER.

Only Imported by HAYLOCK & JENNEY, (Late HAYLOCK & CO.)

Entered at Chicago post office as second class matter.

New York Honey Market.

In the *Bee-Keepers' Magazine* for December Mr. King inquired why the quotations given by Mr. D. W. Quinby, honey dealer of New York, to the *Magazine*, did not agree with those he sent to the BEE JOURNAL. We replied in No. 49, page 771, that we received from Mr. Quinby, the "New York Price Current," every week, and copied the honey quotations *verbatim*. We also wrote to Mr. Quinby, asking him for an explanation why the quotations were so different. He replied as follows:

DEAR SIR:—The "New York Price Current" is published for the accommodation of all marketmen; the editor goes around and gets quotations from different dealers and they strike an average of the whole. I give my own quotation; they (other dealers) do not get the prices, and do not quote it so high. I will mark my own quotations on "Price Current" hereafter.

D. W. QUINBY.

We have written to Mr. Quinby that we want his own quotations, hereafter, and he has promised us to give them, in all future reports of the New York honey market sent to us.

Mr. King has our thanks for calling attention to the matter. Relying upon the quotations received every week, we had not compared them with any others, and had not, therefore, noticed any discrepancies. Each dealer reporting the "Honey and Beeswax Market," is entirely responsible for his own quotations. We will do all in our power to have them correct, but do not hold ourselves responsible for their correctness, nor endorse either the dealers or their methods of doing business.

One more number of the Weekly BEE JOURNAL will complete the second year of its weekly issue, and we are assured that its readers are well satisfied with it. Had we any doubts, they could be dispelled by the hundreds of encouraging letters we are receiving, with the renewal of subscriptions for the coming year. The complete volume contains 816 pages, making a very large book; and both in quantity as well as quality it is enough to satisfy the most economical of its patrons.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but should be written on separate pieces of paper.

May we ask you, dear reader, to speak a good word for the BEE JOURNAL to neighbors who keep bees, and send on *at least one new* subscription with your own? Our premium, "Bees and Honey," in cloth, will pay you for your trouble, besides having the satisfaction of knowing that you have aided the BEE JOURNAL to a new subscriber, and progressive apiculture to another devotee.

Attention is called to a few changes in our clubbing list for 1883, as given on page 813. Those interested will please take notice.

On account of Christmas coming on our regular day for printing, the BEE JOURNAL will be one day late, next week.

Half-Pound Sections for Honey.

At the Michigan State Convention the subject of putting up comb honey in sections containing only a half-pound was considerably discussed. It will be remembered that Mr. Ripley, of the firm of Crocker & Blake, honey dealers, of Boston, Mass., who visited the BEE JOURNAL office last September, then remarked that in the Eastern cities comb honey was required in still smaller packages than those containing one pound. It has also been discussed at some other conventions, and several of our most enterprising bee-keepers have determined to put up some of their crops of comb honey next year in sections containing but one-half pound.

Mr. James Heddon, of Dowagiac, Mich., intends to adopt some of these small packages, and announced that intention at the convention in Kalamazoo, two weeks ago. Dr. C. C. Miller has, by request, been figuring out the proper size for such a section, and thinks about 10 to a Langstroth broad frame will be about right in size. Mr. T. F. Bingham stated, at the same convention, that a good plan to determine the right width of comb necessary to use a $4\frac{1}{2} \times 4\frac{1}{4}$ section, was to shave down some honey that was candied, until the proper thickness was ascertained, to make the right weight. We requested him to make the experiment, and have received the following from him concerning his experiments:

PENNY PACKAGES OF HONEY, OR "THE SECTION OF THE FUTURE."

Agreeably to request, I have made a few measurements, to ascertain at what thickness comb honey could be made, so that a $4\frac{1}{2} \times 4\frac{1}{4}$ section would weigh one-half pound.

The result is, three-fourths of an inch. Such honey would cost the producer more than if the sections were thicker—as such a section would cost the same essentially as if it held one pound. The expense of foundation for 100 pounds would be more also. These two items are all that I now see that militate against their use.

They would meet the wants of the market in the cities and larger towns, and find an unlimited sale everywhere. One such piece would supply any moderate sized family with a much coveted luxury for tea, at a moderate cost. I need not say how nicely it would cut for the plate. It would be simply "too fine." It would cut twelve pieces over one inch square, or nine a little larger. Some might think this too small a piece, but it would be ample for anyone in my family, or any other that has honey always on the table, and it is reason-

able to presume that with such comb honey, few families would be long without it. It would largely take the place of canned fruit, as it would compete in price and economy, and avoid the risk of lead and tin poisoning, and stale fruit.

To the producer there are some points to balance the extra expense.

1. It would ship with perfect safety.
 2. No separator would be needed.
 3. Twice as many bees could be engaged in lengthening the foundation.
 4. It would ripen taster and better.
- No watery caps would be on such combs.

I am aware that many producers would prefer, before trial, thicker combs, and sections of smaller dimensions, holding the same weight of honey, but such combs would be like all other combs of greater thickness, the cells would not be made at right angles with the septum. It is well known that deep cells always incline upward, while cells designed for brood or short cells are always straight. This is one reason why their combs cut without much dripping or waste.

Broad Frame holding eight half-pound or pound Sections of Honey.

I have taken $4\frac{1}{2} \times 4\frac{1}{4}$ sections, preferably, on account of the fact that those who have used them would not be compelled to materially change their supers or crates. Other forms might be desired and, perhaps, would be more beautiful. Art has favored rectangles measuring in width $\frac{2}{3}$ the length or height, as most desirable for pictures and paintings. The same might be true of comb sections. For such as would prefer different forms, I will give, as the weight of one $\frac{1}{2}$ pound of honey, the measure of the same in cubic eighths of an inch, viz., about 4992. The section would be $4\frac{1}{2} \times 4\frac{1}{4}$ in. by nine-eighths wide outside.

T. F. BINGHAM.

Mr. Bingham, in the above article, gives some very strong reasons for retaining the size of section as it is now used for the one-pound, $4\frac{1}{2} \times 4\frac{1}{4}$, but, of course, having the combs much thinner, and dispensing with separators.

Mr. A. I. Root, editor of *Gleanings in Bee Culture*, in a private letter to us on the 12th inst., says he prefers them "six across a broad frame and two deep," and then adds: "this will be right for the half-pound sections, according to my mind, at present."—Also, in reply to a query of ours, since meeting him at the convention at Kalamazoo, he remarks: "I do think conventions are great promoters of acquaintance and fraternal feelings

among bee-keepers." To this let us add, "and ascertaining the requirements of progressive apiculture and taking measures to adopt them."

Whatever may be demanded of us in the manner of marketing honey, we must cheerfully and readily adopt, and we are often much better qualified to judge of the practicability of the methods to be employed, after having thoroughly discussed the matter "in convention assembled."

If the half-pound sections are made the same size as the one-pound, viz.: $4\frac{1}{4} \times 4\frac{1}{4}$, they can be used in the "super," similar to the Heddon surplus arrangement, without any alteration. There are very many good reasons for adopting that size, and if there are serious objections, let those who discover any disadvantages, state them in the BEE JOURNAL, so that a wise decision may be arrived at.

Some years ago, Mr. Bingham gave an amusing address at the Michigan State Convention, on "Penny Packages for Honey," which, though it was then but a fanciful pleasantry, clearly foreshadowed the coming demands for marketing honey in very small packages. Then, "six-pound boxes" were the popular packages for comb honey, even with Mr. Bingham, if we mistake not; and large barrels, containing from 500 to 800 pounds, for extracted honey, at wholesale, and glass jars at retail, were thought "just the thing."

The small sections of enticing comb honey, and beautiful little pails of extracted honey, have driven the glucose-honey peddlers to the wall, and no less than two of these larger houses, running scores of wagons in this city, have already gone out of the business; and now we hear that four more of the smaller fry, running 6 or 8 wagons each, will close up their business at the end of this year. There can be no doubt but that the small packages of pure honey have done more to kill off the adulterators of honey than anything else could have done.

Time was when the two-pound section was considered too small to suit the ideas of apiarists, but now even those containing one pound are voted to be too large. Truly, apiculture is progressive—advancing quite as fast as any other pursuit.

Any step that will aid in popularizing the consumption of honey, and bring it into *universal demand* will be welcomed by apiarists everywhere,—no matter if it be a half-pound section for comb honey, or a five cent pail for the extracted.

MISCELLANEOUS.

Bees Putting Besiegers to Flight.—The *London Times* "Beemaster" gives amusing instances of the application of bees to defensive purposes:

A privateer manned by fifty men, but having on board some hives of bees, was pursued by a Turkish galley, manned by 500 seamen and soldiers. When the latter came alongside, the crew of the privateer mounted the rigging with their hives, and threw them upon their foes, who, astonished at this novel mode of warfare, hastened to escape from the fury of the enraged bees. Another instance occurred, when a rabble at Hohnstein, in Hungaria, attempted to pillage the house of the parish minister; he caused some beehives to be thrown among the mob, who in consequence soon dispersed. Again, Vauban relates how bees played an important part at the siege of Chatte, in Lorraine. After a siege, the town was being stormed, and, during the assault, the besieged threw a few hives of bees upon the heads of the storming party. The little creatures stung the besiegers so dreadfully that they had to retire; and the historian tells that "the bees were not the least cause of the siege being abandoned."

Bee-Keeping as a Business.—The *Saginaw, Mich., Evening News* of Dec. 4, contains the following on this subject:

Few people are aware of the importance of the bee-keeping business in Michigan, or of the amount of honey annually gathered in the State. Dr. Whiting, the local authority on apian questions, estimates the Saginaw county crop for the present season at not less than 40,000 pounds, a large portion of which finds a market in other States.

Under the old system of bee-keeping apiarists used to gangle their success by the number of swarms produced. Now, however, within certain reasonable limits, "swarming" is considered a misfortune and a new "swarm" a loss, for a populous colony will keep at work and gather more honey than the two "swarms."

The article painted on signs and used as a device on one or two State seals is no longer recognized as a bee hive, for its place has been supplied by something more convenient. Many of our older readers will remember, perhaps some of them have used, the process of extracting honey by smoking the bees to death and thus safely getting at the sweets they have stored up, taking white comb and yellow, bee bread, pollen and young bees in one indiscriminate mass. Processes have been changed with the hives, and now honey is extracted by the centrifugal

process, not only being as pure and white as that in the whitest comb, but the bees are not disturbed and the coarser article left for "home consumption"—that is, the bees consume it and do not seem to feel angry or discouraged because they have been robbed.

In the not very olden times a bee-keeper felt satisfied if he got 15 or 20 pounds of yellow honey per colony, and considered himself peculiarly lucky if he did not get his head stung off in the operation. Nowadays, apiarists consider less than 100 pounds of honey per colony a poor season's work, and he must have a strong and healthy colony of bees left as well as the honey.

Bee-keepers now take as much pains to improve their stock as cattle or horse breeders. No slow-going bees are tolerated; they must get to work early in the morning and keep at it until late at night, and to get bees of this industrious disposition the beemen send to the uttermost parts of the earth.

Among the States, Michigan stands in the front rank in the bee-keeping business. The first society for improvement in bee-keepers' methods and appliances was started in Michigan, and its success has been such that the greatly-increased product of honey and consequent reduction in price is fast causing the article to be regarded as a necessity, rather than a luxury.

Do Bees Hear?—The *London Capital and Labor* of Nov. 15, 1882, gives the following on this subject:

At the meeting of the Linnean Society last week, Sir John Lubbock read an account of his further observations on the habits of insects made during the past year. The two queen ants which have lived with him since 1874, and which are now, therefore, no less than eight years old, are still alive, and laid eggs last summer as usual. His oldest workers are seven years old. Dr. Muller, in a recent review, had courteously criticised his experiments on the color sense of bees, but Sir John Lubbock pointed out that he had anticipated the objections suggested by Dr. Muller, and had guarded against the supposed source of error. The difference was, moreover, not one of principle, nor did Dr. Muller question the main conclusions arrived at, or doubt the preference of bees for blue, which, indeed, was strongly indicated by his own observations on flowers.

Sir John also recorded some further experiments with reference to the power of hearing. Some bees were trained to come to honey which was placed on a musical box on the lawn close to a window. The musical box was kept going for several hours a day for a fortnight. It was then brought into the house and placed out of sight, but at the open window, and only about seven yards from where it had been before. The bees, however, did not find the honey, though when it was once shown them they came to it readily enough. Other experiments with a microphone were without re-

sults. Every one, Sir John Lubbock said, knew that bees when swarming were popularly, and had been, ever since the time of Aristotle, supposed to be influenced by clanging kettles, etc.

Experienced apiarists were now disposed to doubt whether the noise has really any effect, but Sir John Lubbock suggested that even if it had, with reference to which he expressed no opinion, it was possible that what the bees heard were not the loud, low sounds, but the higher overtones at the verge of, or beyond, our range of hearing.

As regards the industry of wasps, he timed a bee and a wasp, for each of which he provided a store of honey, and found that the wasp began earlier in the morning (at 4 a. m.), worked on later in the evening, and came oftener during the day. He did not, however, quote this as proving greater industry on the wasp, as it might be that it was less sensitive to cold. Moreover, though the bee's proboscis was admirably adapted to extract honey from tubular flowers, when the honey was exposed, as in this case, the wasp appeared able to swallow it more rapidly. This particular wasp began work at 4 in the morning, and went on without any rest or intermission till a quarter to 8 in the evening, during which time she paid Sir John 116 visits.

Honey Exhibits at Fairs.—The *Indiana Farmer* remarks as follows:

An examination of the various premium lists of the district and county fairs of the State, shows there is not the encouragement given to the bee-keeping interest that it is justly entitled to. The production of honey is growing rapidly and is becoming of equal interest to that of any of the several agricultural industries of the State and is fully entitled to equal consideration at the hands of the county and district boards, and we have no doubt would receive just consideration if properly presented. It is the duty of each and all who are interested in this pursuit to see that the matter is brought to the attention of the gentlemen composing the boards. The usual meetings for the revision of the premium lists takes place during the month of January. Let the many bee-keeping societies see that the matter is attended to without delay, and in counties where no societies exist let several bee-keepers join together, make up a list which they think would be suitable for the premium list and present it to their county fair officers.

☞ The deacon's son was telling the minister about the bees stinging his pa. "Did they? Well, what did your pa say?" "Step this way a moment," said the boy, "I'd rather whisper it to you."—*Ex.*

For the American Bee Journal.

The Sunflower for Honey.

ARTHUR TODD.

I have read with great and increasing interest many articles upon this subject, and there is an aspect of the question that appears to me well worth study, on which I would say a few words. The flow of honey from plants being so largely dependent on climatic influences, should bad weather come at flowering time, the honey crop may prove a total failure; but, if the plant chosen for the honey yield has a value totally separate from any honey value, then the failure of the honey crop will not be so serious an item. In any case then the bee-keeper would raise a crop.

This consideration has set me thinking, and having read some articles lately upon sunflower cultivation and the cultivation of green fodder plants, I made some research, and find that the sunflower, which is highly extolled as a bee plant has a large value in itself as a grain-producing and forage-producing plant. I have copied and sent you herewith some information as to its cultivation and yield that may not be known to the majority of your readers. There are plants that are suitable for fodder that yield 100 tons and over (when it is cut green) to the acre, the flowers of which are admirable for bees. The borage family produce such.

If the good farmer cannot consume all his green fodder in the summer, he has only to store it in silos to have his crop available in midwinter, or if near a town he can readily dispose of it as cut. Any bee-keeper that plants for his bees, should, in my opinion look well, first to the honey value of the flower of the plant he plants; secondly, the honey crop over, what does he receive from the plant itself?

This subject is one well worthy of ventilation, and as a result we will all enjoy "more light."

THE SUNFLOWER.—A light, rich soil, and as unshaded by trees as possible suits it best. It is now much cultivated for its oil and as a food for cattle and poultry. The following directions for its culture on a large scale, are applicable on a reduced extent for the garden.

The earlier the seed can be got into the ground the better, say the beginning of April, as the crop will be ready to harvest by the latter part of August, which will be of the greatest importance to growers. The necessary quantity of seed required for an acre depends upon the condition of the soil, and varies from four pounds to five pounds; but of course, it is advisable to sow a little more than is actually wanted, to provide against accidents. The seed should be drilled into the ground, and the distance from row to row 18 inches, the plants to be thinned

out to 30 inches from plant to plant, and the number of plants at this distance would be about 14,500 per acre; at 18 inches from plant to plant 25,000 per acre, and at 12 inches from plant to plant, 32,000. The produce of this kind of grain, like that of most others, varies considerably, according to the state of the soil, climate, and the culture that is employed, but the average quantity is about 50 bushels per acre. This will produce 50 gallons of oil, and of oil cake 1,500 lbs. The stalks when burnt for alkali, give 1,120 pounds of potash.—*Johnson's Dictionary of Gardening.*

A well-known large composite plant, yielding an abundance of seeds which are excellent for feeding poultry. It requires a good soil of a clay basis, but it will grow on most tilled lands. It is raised in France for oil, and should be sown broadcast, and thinly, or in rows 18 inches apart. It soon grows sufficiently to cover weeds. An acre will carry 25,000 plants 12 inches apart, and yield 50 bushels of seeds, and upward of 50 gallons of good oil, valuable for the table, lamps, or soap making. The cake is one of the most nutritious fodders known. 1,500 lbs. will be obtained from the above crop. The leaves are also eaten by cattle, and the young plants removed in thinning, form good provender. The stalks are rich in potash, yielding from eight to ten per cent. of it in their ash, but should be returned to the land as manure. It also contains a large proportion of nitre.

The young plants form as good a crop to plough in as the Jerusalem artichoke which is indeed of the same genus as the sunflower.—*Gardner's Farmers' Dictionary.*

Some of the uses of this now popular flower may be enumerated. In France the leaves are used as forage for the cattle, who are said to eat them with great relish and avidity. The stalks make an excellent fuel, and yield a large quantity of potash after they are burned; or if not wanted for that purpose, the ashes may be used as manure by sowing it over the land, or mixing it in the manure heap.

In Portugal the seeds are used to make a wholesome and nutritious bread, and when roasted, they form an excellent substitute for coffee; in some parts of the Continent a kind of *bouilli* is made of them, which serves as food for infants. They also yield, by expression, a fixed oil, little, if any, inferior to olive oil, which is used in some parts of Europe, both for burning in lamps, and for other domestic purposes to which olive oil is applied, and for making soups. As food for poultry they have been found to be very nutritious.

One acre will produce 50 bushels of seed, yielding 50 gallons of oil and about 1,500 lbs. of oil cake, and the stems will yield about 10 per cent. of potash. The pith of the sunflower has been recommended by M. Perry for the preparation of Moxa, for which it is well adapted by the nitre it contains, enabling it to burn without being blown upon.—*Journal of Horticulture*, London, England.

Bee-Keepers' Exchange.

Non-Swarming Strains of Bees.

E. E. HASTY.

Some years ago it seemed to me very desirable to develop a strain of bees that would not swarm. The idea was to have them prolific and energetic, so that any reasonable increase could be obtained at will by dividing, and yet have them so averse to swarming that all the progeny of a queen would remain and work together, when that course seemed best. Is this practicable? Is it desirable? I have come to doubt a little in both points. As it is best to be sure we are right before we go ahead, it may be well to have the matter a little more thoroughly talked over than it has been heretofore.

On the second query just let me talk heresy a little. I have been so much at home in the *Exchange*, almost ever since its commencement, that I believe the boys will bear good-naturedly with just a little heresy. Non-swarming means colonies of immense size, and I do not more than half believe we want them, except for purposes of brag. I think that immense hordes of bees, like great masses of men, get in one another's way and waste time. I would expect 40,000 bees to store more honey, working as two colonies, than the same bees would working together. I cheerfully confess, however, that I may be utterly wrong in this. And my doubts only extend to the warm season; in winter and spring I am quite willing to have all the bees together we are likely to get together. It is also plain that where there is but one principal honey harvest, we do not want the bees to swarm right in the midst of it. Swarming, if allowed, should be reduced to some sort of control.

As to practicability, it looks at first very simple to get a colony that has not swarmed for many years, and divide them and sub-divide them and build them up, until a whole apiary of non-swarming bees is obtained. I have not tried this, nor can I put my finger on any other man who has tried it; but, using the best light that is in me, I should predict that, when such an apiary was once built up, the owner would find his bees swarming almost as bad as other people's bees. Success is probably possible in this line; but it will take a great many years to reach it, I fear. Stirring the fire makes things "bile over." Increase an old, neglected, unprofitable, stagnant, non-swarming colony to a hundred, and perhaps only two or three of that number will show any disinclination to swarm whatever. These few would then have to be taken as a new starting point, and the apiary built up afresh from them. The second result would probably be the same as the first, except there might be a little increase in the number that were slow to swarm. Again, and again, the process would have to be gone through with, gaining the desired result only little by little. Then new blood would have to be brought in, or allowed to come in, else the whole es-

tablishment would become degenerate and worthless from close breeding; and to introduce fresh blood without losing all the little that had been gained would be a very difficult problem.

Because a single colony omits to swarm when the others around it are swarming, it by no means follows that it is developing the non-swarming tendencies.

I think that most such cases are caused by a failing queen. If the queen begins to fail early in the season, and the bees do not supersede her, it may be expected that the colony will dwindle down and neither swarm nor store much honey. If, however, the queen lays pretty well in March and April, and begins to decline in fertility in May, the colony may, if I mistake not, make a fine record in honey storing. In such a case the keeper would be liable to think that he had a non-swarming colony when he had nothing of the kind.

Again, we will suppose that a lot of bees become generally and utterly lifeless and worthless, like a flock of sheep that have "all run out;" whatever non-swarming tendencies they might show would not prove of any account to the breeder, I think. I have had a case this season where what seems to be a sort of constitutional disease has prevented swarming. The ground in front of the hive has been almost constantly sprinkled with dead bees, and the sentinels have been kept very busy trying to expel the invalids and cripples. I presume that the best of the bees of this colony do not live as many days as they ought. The net result is, that the colony has never been crowded enough to be driven to swarming, although a large amount of brood has been raised. It would be a bad mistake to begin with such a colony as this one to breed non-swarmers.

Swarming has raged greatly with me this summer, and only one other out of 68 colonies has omitted to swarm. In the last case I think there was some reluctance to swarm, but also very moderate fertility on the part of their queen.

As to the size of the brood chamber affecting swarming, my opinion is like this. Contracting stimulates swarming up to a certain moderate limit; but excessively small room for brood, especially if the pinch is caused by the combs being blocked up with honey, hinders or prevents swarming. Here, then, we have about four sorts of non-swarming, that may occur without the bees having any real non-swarming tendencies that could be transmitted to progeny. There is such a thing, however, as a tendency to non-swarming, and it may be, after all, that we want it; and it may be, that some time in the future we shall have non-swarming breeds of bees, as we now have non-sitting breeds of fowls.

It is a somewhat surer indication of genuine non-swarming when a considerable apiary refrains, but even then I suspect that some discounts must be made. It is no very uncommon thing for an apiarist to report only 10 or 12, or 20 swarms from a large apiary. Is there not in most of these cases, not

degeneracy exactly, but just a little of what might be termed stagnation of the blood? If a good queen from somebody else's apiary was made the mother of the drones, would not the number of natural swarms increase three or fourfold? It also looks as if swarming was very largely a matter of locality. I have a locality where the early supply of pollen is very profuse, hosts of alders shedding pollen even before bees can get out to gather it. Acres upon acres of poplars and willows follow. The willows are of many species, some very early and some very late. Fruit bloom is about medium. White clover is abundant, but seldom yields much honey, owing, I suppose, to the sandy nature of the soil. Basswood is found scarcely anywhere except a little fringe of it along a creek that runs by. August, instead of being a gap in the honey, is not unfrequently better than July, and about as good as June. A splendid spread of late fall flowers closes the season. Failure to get honey enough to winter on is almost unknown—at least during the thirty years we have kept bees here. But, on the other hand, it is quite rare for a day's run of honey to reach even three pounds. Another man's locality has so little early pollen that he feeds flour to get his bees started; a rush of honey in June, coming in at the rate of ten pounds a day; and almost nothing at all afterwards. It is pretty plain that the steady, long continued supply of my locality will provoke the maximum of swarming (31 swarms in August this year, and a total of 167); while the year's honey all in a heap, of the other man's locality, will favor the minimum. I take it that a great rush of honey tempts all the bees, except the very young ones, to go out and gather, and soon the cells are so blocked up with honey that the queen has little room to lay.

In those cases sometimes reported where a colony of bees has continued without swarming for many years, there is one condition that is almost always present, if my memory is not at fault. Such bees are in diverse situations, often in a bee-house, sometimes on a bench out of doors, or, most frequently of all, in a quiet garret; but they agree in this one thing, comb built abundantly outside the hive. Meditating on this circumstance a theory arose in my mind that may possibly prove valuable. The overflow of bees from such a hive, spread out among the outside combs and make themselves comfortable, while the overflow from an ordinary hive cling together in a hot and torpid mass, until they resolve that "anywhere, anything is better than this." The discomfort of hanging out, we may well believe, impels many that have nothing to do to remain inside, sadly in the way of those actually at work, until they, too, are discontented, and inclined to "fly to other ills they know not of." It may transpire that surplus of bees does not necessarily compel swarming, as long as we can keep them comfortable and out of the way of where work is going on.

Richards. O.

Honey and Money.

I love you, love, for good or ill,
As good bees love sweet honey—
I love you, love, soul, heart and will,
For sober skies or sunny,
And yet I pause, I falter still,
For O! one doubt, one fear doth thrill,
My darling, have you money
To buy some clover honey?

I love you, love, I love you, love,
But, O, you must have money—
A red rose is a rose, my love,
But if it hold not honey,
The busy bee he will not stay,
But, humming airs, he hies away,
My darling, have you money
To buy the clover honey?—Selected.

For the American Bee Journal.

Another Instance of "Old Fogysm."

C. THEILMANN.

While reading J. E. Pond's article, on page 630 of the Weekly BEE JOURNAL, I remembered a conversation I had this fall with an old acquaintance, and an early settler of this part of the country, to whom I paid a visit while on a business trip through the country.

Arriving at his place I found him just at the brimstone business, destroying his bees. Taking a look around where he was at work, I saw a lot of box hives torn apart, and honey, with pollen and some brood in the combs, in pans, dishes, etc., while he was killing another colony. I can hardly describe the feelings which came over me at the sight. I asked him why he destroyed his bees in such a manner, and obtained the honey in such an impracticable way? He answered: "My father kept bees for 30 years, and I was raised among them, and I guess this is as good a way to obtain honey as any; and this is the way my father did it." (All his bees were in box hives.) I then asked him in what way he could control his bees in his hive? "How do you control yours?" he replied. "Look up there," he said, pointing to a slim, tall tree, "I was in danger of my life this summer in getting a swarm of bees down from it." I then told him that my bees were in Langstroth movable-frame hives, that I could control them, to a great extent, in swarming, and that I could look in and examine every comb in the hive in a few minutes, and if the bees acted strangely, I could see what was wrong; besides enumerating many other advantages.

I then asked him about the sale of his honey. "Well," said he, "I could only get 12½¢ per lb. for it, in Plainview, the other day, by the side of yours, and the storekeeper did not much care to buy mine at all." He also acknowledged that my honey, which was in the one piece sections, was very nice and neatly put up. I sold it readily for 18¢ per pound.

It is hard for some of these old fogies to turn to practical apiculture; they still hang to their father's ways of bee-keeping, and not only realize but little for their produce, but in

many instances reduce the local price of the honey which is put up in good style.

Theilmanton, Minn., Dec. 8, 1882.

For the American Bee Journal.

Dry Clover Chaff for Packing Bees.

G. L. PRAY.

Having but a few colonies and lots of dry goods boxes, I take a box large enough to put the hive in, with a 4 or 5 inch space all around the hive, and saw the box so that the top will be slanting enough to run the water off, and make a tight roof over the box. I then tack two 2-inch strips across the bottom of the box, on the inside, and fill it up even with the top of the 2-inch strips with dry clover chaff, and lay an inch board on that, and cut a hole through the box of the same size as the entrance of the hive, covering it on a level with the top of the inch board, and then take the board out and put the hive in the box, bottom board and all, the entrance facing the hole through the box and make a bridge from the entrance of the hive to the hole in the box, so the bees can go out and in when they please, and pack with dry clover chaff all around the hive. I take the cloth over the frames off, if it is thickly covered with wax on the under side, and put on a thick piece of factory cloth or canvas over the frames, and then I cover the whole hive with clover chaff, about 6 or 7 inches thick, and put on the roof, and keep the entrance all open in cold weather, and keep the snow away from the front of the box. The same can be done with rough, cheap lumber. If put away for winter in the above plan, I think it is as safe to winter bees as it is to winter sheep or calves, if they have plenty of good honey, and lots of bees, and a good queen. I have wintered my bees on this plan, with clover-chaff packing, for the last 3 winters, and have yet to lose the first colony in wintering.

Petoskey, Mich.

The Southeastern Michigan Bee-Keepers' Association will hold their annual meeting in the courthouse at Ann Arbor, Jan. 20, 1883. All are invited.

H. D. CUTTING, *Pres.*
G. J. PEASE, *Sec.*, Ann Arbor.

The Ohio State Bee-Keepers' Association will meet in Columbus, in the rooms of the *Ohio State Journal*, on Tuesday and Wednesday, Jan. 9 and 10, 1883. A full attendance of members, and all interested in bee-culture, is requested, as matters of interest and importance will be discussed.

Dr. H. BESSE, Delaware, O., *Pres.*
DANIEL SPEAR, Cardington, O., *Sec.*

Local Convention Directory.

The Rearing of Good Queens.

DR. J. P. H. BROWN.

The matter of rearing queens with a view to the improvement of our bees, is certainly of no mean consideration to the bee-keeper. It involves principles, collateral influences and manipulations, that, to discuss fully, would require a volume instead of a short paper. Hence I can do no more than simply touch upon a few of the most important points bearing upon the subject.

Before proceeding further it may be well to refer to queens reared under what is called the "swarming impulse." This swarming fever, if it may be so called, usually takes place under the most favorable circumstances. The colony is in the most prosperous condition. It is crowded with worker bees of every age. Drones make the air resonant with their powerful wings. Both honey and pollen are coming in abundantly, and the atmosphere within the hive is maintained at an even temperature. The queen-cells that are built are usually well developed, particularly if in localities on the comb favorable for their construction. The food is bountifully supplied, and the queens that come forth are mostly good specimens of this class.

These natural conditions of a colony of bees when building queen-cells must never be lost sight of by the breeder of queens. They are all-important, for no good queens can be reared without their observance.

With these conditions kept constantly in mind, the principles of rearing queens may be formulated into the following propositions:

1. The hive must be well filled with bees and the bulk of them must be young ones.
2. There must be a most abundant supply of both pollen and honey.

3. The amount of brood supplied should be limited in quantity, in order to concentrate the working force of the colony, and it should embrace eggs just hatching or larvæ not over one day old.

4. The temperature should be warm enough not to chill the brood; and the weather mild, pleasant and settled.

5. Drones must be flying.

Now I believe it possible that collateral influences can be brought to bear upon these natural conditions so that they can be aided and directed toward bee-improvement. These influences may be summed up to be:

1. Careful selection of breeding stock with special reference to those qualities that it is desirable to perpetuate and add to.

2. Selection of drones from the most vigorous queens whose worker progeny are noted for size, strength, and honey-gathering capacity.

3. Endeavoring to breed out bad qualities and to breed in good.

4. A rigid system of pruning cells and killing defective queens.

That there is a capacity for improvement in the honey bee, I think can hardly be questioned. We know that both plants and animals are endowed with such a capacity, and why should the bee be an exception to this natural law?

Our very delicious and wholesome apple of the present day, was, originally, the sour, miserable Siberian crab; our sweet and juicy peach was from a bitter fruit of Asia; our improved Irish potato sprang from an insignificant tuber of South America. Our short-horns and improved breeds of cattle, our Essex and Berkshire hogs, our fancy breeds of poultry, pigeons, etc., have been brought to their present state of high perfection by intelligently and carefully breeding up the wild originals.

It may be asked by what *modus operandi* can these improvements best be effected? To the practical and trained mind each of these collateral propositions naturally suggests the best method of applying the means to secure the ends.

Queen-rearing establishments should be, if possible, located in isolated localities where there are no other apiaries to interfere. For this reason, towns and villages, where usually abound many bees, are no fit places to rear pure queens. All apiaries should be supplied with pure stock. Objectionable drones must be excluded. Fertilization in confinement would smooth this task, but as this seems to be, for practical results, off in the distant future, we must resort to some other measures. By the use of the knife, comb-foundation, and drone traps, it becomes rather easy to regulate the drones in our own apiary; while the most available means must be resorted to for their extermination in contiguous apiaries.

How far this improvement can be carried with the bee is difficult to determine; as the organs of reproduction in the queen, as well as her fertilization, are anomalous—marvels!—a volume!!—so unlike the breeding of our domestic animals, that the queen

breeder will always have immense difficulties to contend with.

Ever since the creation of the bee, for thousands of years, the theory of the "survival of the fittest" has been in practical operation, and it is very doubtful if the common bee of to-day is any improvement over the bees that Samson found in the lion's carcass. Nature, unaided, is kind enough to perpetuate the race, but she has left it to man's intelligence to assist in the improvement.

It is not yet a quarter of a century since the first Italian bees landed on our shores, and in this limited time they have been improved both in looks and in honey-gathering capacity. I am bold to assert that there are breeders of this race in America, whose queens will average better in looks, in vigor and in prolificness—workers better for business—than queens that come from Italy to-day.

Augusta, Ga.

Read at Maine State Convention.

Bee-Keeping—Past, Present, Future.

LUCIEN FRENCH.

I shall begin as far back as my memory extends and perhaps give some stories or reminiscences I have heard farther back. I recollect that grandfather and my father kept bees together, and used a hive about twenty inches high and one foot square, with sticks across. Often, when the busy workers had gathered a winter's supply, they would consign from one to ten colonies to the brimstone pit, or rob them of their stores, getting from five to fifty pounds of honey, such as it was.

They would then select the whitest and best honey in the comb, to eat in the family. The rest, with bees, larvæ, and bee bread, they would mash all up together, and strain it through a cloth (or what they could of it), and soak out the remainder in water and make an intoxicating beverage of it called "metheglin." They kept from 10 to 20 colonies and never sold any honey. All they knew about beeology was that bees had stings and knew how to use them, which I learned to my cost in early life; that they made honey, not collected it, and that they would rob and kill them in spite of their stings.

They also said that when the head of a family, who kept bees, died, they must go and tell the bees, and dress them in mourning, and, if they did not, the bees would all die; and when the bees swarmed, they must drum on old tin pails and milk pans, and blow on trumpets or anything to make a noise, creating a general hubbub in order to make the bees cluster or light, so as to give them. I am sorry to say there are many who manage their bees in this way now, in the nineteenth century, with all the light that has been thrown on the subject of bee-management.

Now I will contrast some modern improvements with the old methods of managing bees, and will say that these have not been done in one or two

years, but are the work of from one to three hundred years.

In introducing my next proposition, *i. e.*, bee-culture at the present time, I shall have to go back to where I find something in the direction of a movable frame hive, which I find in L. L. Langstroth's book on the "Hive and Honey Bee," which book I shall draw largely on, in connection with this subject. I shall also quote from other sources often, giving due credit.

Mr. L. says on page 210 (foot note): "On page 15 I have spoken of the bee hive as a hundred years ago." From "A Journey into Greece" by George Wheeler in 1675-6, it appears that it was at that time in common use there, and probably even then an old invention. Francis Huber, a Swiss naturalist, born in 1750, an enthusiastic apiarist, invented a hive containing 12 frames, one and one-fourth inches wide, and hung with hinges which opened like a book, which he used in his investigations. But to L. L. Langstroth, I think, we are indebted to-day for full, movable comb hives, invented in the year 1851. Dzierzon used his hives. There have been many alterations in his hives, and I may say, "some wise and some otherwise." From the many changes made, we can all take our choice, or make others, but be sure and not have two sizes of frames in your bee yard. Use them until their merits or demerits have been established.

Comb-foundation is another indispensable article for the advanced beekeeper. A. I. Root says in his "A B C of Bee Culture": "The first mention we have of wax foundation that was accepted by the bees, was published in the *German Bienen Zeitung* as far back as 1857. Mr. J. Mebring, of Frankenthal, Germany, if I am correct, seems to have been the inventor. Mr. Wagner and others tried it and dropped it again. The sheets made in England and Germany had no side walls, but simply indentations. Mr. Wagner adopted shallow side walls, making it more like natural comb. Until recently it was made upon a pair of plates. Then Mr. Root says: "in the latter part of 1875, I talked with a friend, Mr. A. Washburn, of Medina, Ohio, who is quite an artist in the way of fine mechanical work and machinery, and told him what I wanted. The result was, he made me a machine. Since that time we have had the Dunham, the Olm, the Vandusen flat bottom, with mine included." Then there are quite a number of plate machines, and probably all have some good qualities and their advocates, and with prices from five dollars up to fifty; so we can all have a chance to get such as we like best.

We may change queens, poor to good, change from black bees to Italians, Cyprians, Syrians, etc., or make other changes or crosses we please, even to the wonderful *Apis dorsata* of Java, or the little insignificant South American stingless bee (if we could only get them here and introduce them). We can feed weak colonies in the hive, without fear of robbing; can take out the frames, extract the honey, and put the frames back in the hives

for the bees to fill again; can look over the bees at any time, and know the condition of them at all times. If we have the right kind of movable comb hives, we may pile stories on top, or put them under, according as the bees need room; or can use section boxes on top or in the sides of the hive.

The extractor is another improvement in getting larger yields of honey. We have from the South some extraordinary returns, even as high as 700 pounds from one colony in Texas; getting more swarms, even 12 from one; getting more honey and better, than the old way of straining from bee bread, larvæ, dead bees and dirt. Quite a contrast to the old way of getting strained honey!

Comb foundation is another great help to the bees and their owner. You can have a swarm of bees on foundation (in times when honey is coming in plenty) one day, and the next day the bees will be carrying in pollen and honey. In three days, some claiming as high as 20 pounds, saving the bees some one or two week's time, perhaps right in the midst of our best honey harvest of white clover or basswood. We may have straighter combs and less drone comb in the brood chamber. It takes, it is estimated, at least 20 pounds of honey for the bees to consume while they are secreting one pound of wax, which makes a saving of about 17 pounds of honey, or the price of it, as wax is a secretion of the bees. You can have small or late swarms on foundation, and instead of consigning them to the brimstone pit, can feed them up (if we have a strong colony) and put in a young and prolific queen, and make a valuable colony of them, worth from five to ten dollars the next spring, at a cost of from one to four dollars. There is still another way in which you can save the loss of your pets, that is to go to some of your neighbors, who kill their bees, and ask them to let you have the bees, if you will take the honey from them, letting them have the honey and you the bees—those they have condemned to death by brimstone, or some other way. Then feed them up on sugar, as you would weak colonies, and rescue them from destruction.

In consequence of the improvements that have been made, and others not named, honey is put on the market in a purer and neater state, gives better satisfaction and commands a higher price than formerly. It formerly sold (when it could be sold at all) from eight to twelve cents per pound; now, honey in Maine sells at from twenty to thirty cents at wholesale and higher at retail.

Finally and lastly, bee-keeping in prospective, or what I think the improvements will be. There are points not yet settled, which I think will be, and the first is: the best way to winter bees without loss; second, dysentery, the cause and cure; third, the pollen theory, causing dysentery; fourth, spring dwindling, the cause and cure; fifth, improving our race of bees by not only selecting the best races of queens, but the best drones, and the way to do it; sixth, the dry feces theory, but, this I think Prof.

Cook of the State Agricultural College, Michigan, has about settled.

First, the best way to winter bees without loss. There is one thing certain, and that is, they must have some kind of protection in this cold latitude, but the amount and kind we must all decide for ourselves by experimenting. But one thing we shall all have to acknowledge, that is, between the torrid and the frigid zone, there would be quite a difference in protection. While, in Texas, they need none; in Greenland, bees could not be kept at all; but, between the two extremes, we must use the kind and amount, which, by experimenting, we find is best adapted to our latitude and our climate. I know that some "old fogies" still winter their bees in box hives, without any protection except on the lea side of some building or high board fence, without losing any bees; often having killed all their small and weak colonies. But we think there is a better way, that is, to feed and protect them. What should we think of a man who tried to winter his cattle, sheep and swine, in the way many do their bees? The different kinds of protection now in use, are the cellar, a clamp, chaff all around and on top of hives, hives with dead-air spaces, in some building, and some leave them out, at the cold mercies of the winter blast. But I like a properly-constructed chaff hive, or a good dry cellar properly ventilated, or a chaff box, built around the hives, with at least one foot of chaff all around them. Instead of from two to five inches of chaff, I would have from eight to twelve inches. In conclusion I will say that we shall yet find a way to winter bees as safely as any other stock.

For the American Bee Journal.

Bee and Honey Show at Toledo, Ohio.

Owing to sickness, which was followed by paralysis of my hands and wrists, it has been impossible for me to make a report of the bee and honey show, as a department of the Tri-State Fair, held at Toledo, O., last September.

Every person I have heard speak of it says it was a grand success, but when I read what the editor of the BEE JOURNAL said of it in the number for Sept. 20, I thought he rather "stretched the truth" a little, when he said it was "utterly impossible for one quarter of those who desired to examine the exhibits, to even get within a stone's throw of them," but since the fair was over many have told me they could not get anywhere near the exhibits owing to the crowd, and viewed our fine display only at a distance, and the officers of the Fair Association who, at first, thought any little corner or *old shed* would do for the "bee fixins," were delighted with the display, and have promised us all the room we may want next year, toward making a grand display.

Messrs. Thomas G. Newman, James Heddon, C. F. Muth, and Prof. A. J. Cook, kindly consented to act as awarding committee, but Mr. Heddon

was kept at home by sickness; Mr. Muth had to return home when on his way to the fair, and Prof. Cook's college duties kept him at home, so Mr. Newman was the only one of the committee in attendance, and he did his "level best" during his two days' stay to make up for our disappointment in not having the others with us. He seemed as much interested in the exhibits as the exhibitors themselves, answering questions by bee-keepers and others, and doing all he could to make the undertaking a success, and I think that all who had the pleasure of his acquaintance during his stay, will say that he succeeded pretty well.

On the afternoon of Wednesday the bee-keepers present met in the office of the secretary of the fair, on the grounds. Mr. T. G. Newman was chosen temporary chairman and Dr. A. B. Mason of Wagon Works, O., temporary secretary. On taking the chair, Mr. Newman gave a brief, but instructive talk on matters connected with our specialty, and at once made the impression that he was at home on bee matters and well qualified to edit a bee journal.

Mr. F. L. Ripley, of Boston, Mass., was present at some inconvenience, and being obliged to leave in a short time, was called upon and introduced by Mr. Newman. Being a member of the firm of Crocker & Blake, Boston, Mass., dealers in honey, foreign fruit, produce, etc., he spoke intelligently on the marketing of honey and the best methods of fitting it up, highly recommending the pound or half-pound sections for comb honey, with 12 or 24 sections in a crate; and one-pound honey jars, "by all means," for extracted honey. He said that "butter is more of a luxury than honey, and we are selling more of it than ever before." Mr. Ripley's remarks were frequently interrupted by applause, and a vote of thanks was given him, "for the sacrifice he had made to meet with us, and for his able address."

Mr. Newman made a brief address in regard to bee and honey shows, and honey as food and medicine, and the best way to put up honey for the market.

Dr. E. B. Southwick, of Mendon, Mich., spoke of his home trade and said that he could sell more honey in 1½ pound sections than in one-pound sections. Others spoke of their method of putting up and selling their honey, and all were in favor of the smaller sections.

The secretary read an extract from a letter from Mr. C. F. Muth, in which he said, "I have, I think, the best trade in jar honey in America. Desirable packages and purity of honey made my trade. I have failed in getting comb honey this season and am not so very particular about it, as I have lost money on almost every large lot purchased so far. Comb honey will remain a fancy article, while extracted honey is used already by almost every manufacturer using sweets. The increase in the demand from all quarters is very encouraging indeed. My receipts last week were 84 bbls.; this

week (three days) 26 bbls.; I am satisfied that I shall have it all sold in about two months. It was different a few years ago. One was afraid of getting an overstock then."

On motion of the secretary, it was voted "that we proceed to organize a Tri-State Bee-Keepers' Association, and Mr. P. M. Puhl, of South Toledo, O., was chosen President; Dr. A. B. Mason, of Wagon Works, O., Secretary; G. W. Zimmerman, of Napoleon, Treasurer.

An evening session of the association was held, Mr. Newman acting as chairman. Mr. Puhl having declined to act as president, Dr. E. B. Southwick was chosen to fill the vacancy, and James Heddon of Mich., H. R. Boardman, East Townsend, O., and Mrs. Dr. E. Rolshausen of Logansport, Ind., were chosen vice presidents.

A committee was appointed to prepare a premium list and make all arrangements for the bee and honey department at the next Tri-State Fair, to be held next fall, and to confer with the officers of the fair association in regard to the same.

There being no programme for the evening Mr. Newman was invited to address the convention. His subject was "The Progress of Bee Culture," and, as usual, being himself interested in what he said, every one who heard him was also interested. He exhibited a queen-cage, that was supplied with the "Good bee food," and which contained a queen and accompanying bees that had already been twice sent to Louisiana and returned, and were in excellent condition. A hearty vote of thanks was given him for his attendance at the fair, his aid in organizing the association, and for his able and instructive addresses, after which the association adjourned to meet at the call of the secretary.

The next day there was a perfect jam of people in our department and a great many went away with only a distant glimpse at the fine display of bees and honey.

Mr. Muth exhibited his honey extractors and honey knife, and made a fine display of choice palmetto honey in one-pound bottles, none of which, on account of his being a member of the awarding committee, was entered for competition.

King, Keith & Co., of New York, exhibited two feeders and a smoker. One of the feeders and the smoker was awarded 1st premium.

Dr. Southwick made a fine display of comb honey, on which he was awarded 1st premium, and also the special, a tested Italian queen, offered by Thomas & Sons, of Somerset, Ky. He was also awarded 1st for comb honey in the most marketable shape, and 2d on his bee-hive.

A. M. Gander, Adrian, Mich., took 1st premium on crate of comb honey, 2d on comb honey in most marketable shape, and on dovetailed sections.

L. A. Lowmaster, Belle Vernon, Ohio, 1st premium on extracted honey in most marketable shape and 1 piece sections; 2d, on display of extracted honey and foundation for surplus; 2d, on display of foundation, "Excelsior"

honey extractor and apiarian supplies, and 1st. on Cyprian and Syrian queens and colony of Syrian bees.

L. Eastwood, of Waterville, O., took 2d premium on display of comb honey and on exhibition hive and crate of comb honey.

E. T. Lewis & Co., of Toledo, Ohio, made a nice display of 8 or 10 honey extractors, and a large quantity of apiarian supplies and were awarded 1st premium on display of supplies, foundation mill, honey extractor, bee hive, wax extractor, foundation for brood chamber, foundation for surplus, and honey knife.

D. S. Given & C., Hoopston, Ill., had one of their foundation presses and samples of foundation on exhibition, and attracted a good deal of attention, especially from bee-keepers. Their press was also awarded the first premium.

And, Mr. Editor, your "humble correspondent feels no little pride" in being able to say that he was awarded 1st premium on display of extracted honey in the most marketable shape, beeswax, glass hive, honey vinegar, package for extracted honey, Italian queens, and 1st and 2d on colonies of Italian bees, and 2d on extracted honey and foundation for brood chamber.

The awarding committee, consisting of Thomas G. Newman, H. H. Overmeyer and H. R. Boardman, did what I think I am safe in saying but few committees have accomplished where the competition was so earnest, and the exhibitors so competent to act as judges themselves—they gave perfect satisfaction in their awards; not a single exhibitor making a word of complaint, but saying they were satisfied, the awards being all right.

Nearly all of the comb and some of the extracted honey on exhibition, was sold during the fair at good prices and a fair amount that was not on exhibition was disposed of, as were also a goodly quantity of supplies.

A supply of the AMERICAN BEE JOURNAL, the *Bee-Keepers' Magazine* and *Bee-Keepers' Exchange*, were furnished for distribution to those interested in bee-keeping, and the BEE JOURNAL office accommodated those wanting Cook's Manual, Bees and Honey, and the *Apiary Register*; as did also the publishers of the *Magazine* with the *Bee-Keepers' Text Book* and bound copies of the *Bee-Keepers' Magazine*.

Mr. Lowmaster exhibited an ingeniously-constructed drone-trap, one that would be of service to such bee-keepers as raise more drones than they have use for, and Mr. Heddon sent a supply of Given foundation, both heavy and very thin, that was fine indeed; also, quite a quantity of figured white spruce sections, that were very nice. Mr. Lowmaster's foundation and sections were not entered for competition.

During his stay at the fair, Mr. Newman gave several addresses, and on the afternoon of Thursday a large box was made to do service as a platform, on which, supplied with honey put up in the most approved styles, he gave a pleasing and instructive talk

to such of the crowd as were willing to listen.

When all was done and the fair was over, the verdict of exhibitors, bee-keepers and others was—*Success*.

A. B. MASON.

Wagon Works, O., Dec. 5, 1882.

[We are very sorry that Dr. Mason is so afflicted. To his energy and skill is due the excellent display and exhibit of bees and honey, and we hope he will be able to give the Bee and Honey Show for 1883 his best attention.—Ed.]

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning Co., O., in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th. L. CARSON, *Pres.*

The Nebraska State Bee-keepers' Association, will hold its annual session in Wahoo, Saunders county, Neb., commencing Thursday, Jan. 11th, 1883. Arrangements have been made with the railroads to secure $1\frac{1}{4}$ fare for the round trip. The Saunders county Bee-keepers' Association will furnish entertainment free to all visiting apiarists. Bee-keepers from neighboring States will be welcomed. T. L. VON DORN, *Pres.*

GEO. M. HAWLEY, *Sec.*

The annual meeting of the Cortland Union Bee-keepers' Association will be held in Cortland, N. Y., on Tuesday, Jan. 9, 1883.

M. C. BEAN, *Sec.*

McGrawville, N. Y.

The annual meeting of the Champlain Valley Bee-keepers' Association will be held at Middleburg, Vt., on Thursday, January 18, 1883, at 10 a. m. T. BROOKINS, *Sec.*

The North Eastern Bee-keepers' Association will hold their thirteenth Annual Convention in the City Hall, at Syracuse, N. Y., on the 9th, 10th and 11th days of January, 1883.

Business of great value to every bee-keeper in the State will be brought before the meeting. Every member is requested to attend and bring their friends, that all may be benefited by the action there taken.

The question drawer will be opened each day, and questions answered and discussed. All are invited to send questions. Appropriate diplomas will be awarded to successful exhibitors of implements, etc. Let all attend.

GEO. W. HOUSE, *Sec.*

SELECTIONS FROM OUR LETTER BOX

Bees on Shares, Honey Comb, Etc.—I commenced with 8 colonies in the spring; I obtained 6 natural swarms, made 3 by dividing, and bought 3 queens. I put into winter quarters 17 colonies, all in good condition. I am trying to winter on the summer stands by packing in different ways, which I will try, to see whether I can safely bring them through. I think I can ascertain the number of colonies in our county without much expense. I think it will reach 1,000. I bought 13 colonies. I like the BEE JOURNAL well and would not do without it if it cost twice as much. Does honey comb injure the stomach? In taking bees on shares what arrangements should be made? The amount of honey I obtained was 450 pounds in 2-pound sections. I sold my honey at home at 20c. per pound.

D. R. ROSEBROUGH.

Casey, Ill., Dec. 1, 1882.

[Wax is indigestible in the human stomach, but we do not know that it injures it; the wax must pass off through the alimentary canal in the same condition it went into the stomach. There is so little of it in comb honey that it would hardly be noticed, unless eaten in large quantities. Besides, there is something about even the comb that is sweet and enticing to the palate; hence the expression—"sweet as honey, or the honey comb." It is usual for one party to furnish the hives of bees, and the other party the care and labor. The expense of new hives, surplus boxes, comb foundation and queens is usually divided equally, and at the end of the season the honey and increase of bees are equally divided—leaving each to take all chances of marketing, as well as wintering.

Always make a written contract, stating the agreement in full, and then there will be less liability of a misunderstanding.

We shall be pleased to receive the report you offer for your county.—Ed.]

The Season's Work.—Our bees came out last spring in fine condition, without the loss of a colony or a queen.

After our spring sales we had 40 colonies to begin the season with. We keep none but pure Italians. We now have 105 colonies, all in winter quarters, in good condition. Surplus honey secured, in comb, 2,500 lbs.; extracted, 2,700 lbs.; total, 5,200. About one-fourth of our colonies, spring count, were devoted to queen-rearing. I have been engaged in bee-culture for many years, and I think the prospects for energetic bee-keepers brighter than ever before. F. A. SNELL.

Milledgeville, Ill., Dec. 12, 1882.

From Geneva, N. Y.—I commenced the season with 25 colonies of Italian bees; took 800 lbs. of comb honey in 2 pound sections and increased to 15 by natural swarming. I will send you statistics from Ontario Co., N. Y., as near as I can get at them, if desired.

WM. BERRYMAN.

Geneva, N. Y., Dec. 12, 1882.

[Certainly; we shall be pleased to have the statistics you so kindly offer to give. State the number of colonies last fall, in spring, and now, as well as the honey crop.—ED.]

Experience of a Beginner.—In December, 1878, I bought 18 colonies of black bees, 13 of them in Langstroth and 5 of them in box hives, for which I paid \$54. They were in bad condition. I wintered them in a bee house and lost all but 7 colonies. During the summer of 1879, the 7 colonies increased to 16, but produced no surplus honey. I wintered them again in a bee house and lost all but 4 colonies. During the summer of 1880 I had no increase, and no surplus honey. I packed them in chaff for winter and lost all but 2 colonies. During that winter I read Cook's *Manual* and the *AMERICAN BEE JOURNAL*. The success of others prompted me to persevere and make use of the knowledge I had gained. On the 11th of May, 1881, I transferred my 2 colonies to Langstroth hives. In the latter part of June I divided and increased them to 6 colonies; during the summer I obtained 60 lbs. of surplus honey. On October 15 I packed them in chaff on their summer stands, each colony having from 40 to 60 lbs. of honey. April 6, 1882, I found them all in good condition, with a shrinkage of 10½ to 16 pounds of honey, per colony. About April 15 I took 2 frames of honey from each hive and replaced them with foundation, which, in 8 days, was drawn out and filled with brood. Each week I spread the brood, as directed by Mr. Doolittle in the *BEE JOURNAL*, and when the white clover blossomed, the hives were full of bees and the combs full of brood. I then put on the boxes. The result of this year's work is as follows:

No. of Colony.	Swarms.	Comb Honey, lbs.
1.....	3.....	132½
2.....	0.....	111
3.....	0.....	84
4.....	1.....	116
5.....	2.....	129½
6.....	3.....	189
Total.... 9.....		762

During July and August I Italianized my 15 colonies with dollar queens, which have proved to be all pure Italians. October 20th I packed them in chaff for winter, each colony having 36 to 50 lbs. of honey. I think the successful bee-keeper needs a good knowledge of the principles of his business to start with. He will then get much help and encouragement from the continual teachings of a good periodical like the *AMERICAN BEE JOURNAL*.

WM. MORSE.

Rockford, Ill.

Troubled with Moth Worms.—My experience in bee-culture is limited, and, so far, not encouraging. The greatest trouble with which I have to contend is the moth; even some of my strong colonies have been seriously annoyed by worms. I give them close attention, at least, weekly, and every time I examine I find my bottom boards with numerous bee-moths on them. I look in vain in your journal for some remedy or preventive. I hope you or some of your subscribers will come to my relief. I use the frame hives and have the Italian bees.

JNO. H. BASS.

Glennville, Ala., Dec. 8, 1882.

[Italian bees, unless the colonies are weak, will usually soon expel the bee-moth. As soon as the weather is warm enough, take out the combs, and with the point of a knife remove the worms and webs, being careful to kill the worms in the debris, or they will crawl back again. To hang the frames infested with moth in the middle of a strong colony of Italian bees, one at a time, is the best way we know of to get them thoroughly expelled. If your colonies had been really strong in numbers the invaders could not have gained control.—ED.]

Hard on the Bees.—Yesterday morning a blizzard struck us which caused the mercury to sink to 2° above zero this morning, while the day before yesterday the bees had a flight. So severe a change would certainly make havoc among my bees were they not all snugly packed in chaff. Chaff packing is a necessity here; without it, wintering would be risky; with it, a single colony need not be lost.

J. W. CARTER.

Pleasant Dale, W. Va., Dec. 8, 1882.

Prolific, but Dark and Cross.—I commenced this season with 2 colonies and one queen (a 3 frame nuclei) from W. P. Henderson. I have increased them to 15, a few of them being weak in numbers. I obtained about 50 lbs. of honey. The Henderson queen was as prolific as any two I had; her bees are very good workers; they are dark in color and as cross as any hybrid I have.

HUGH WILLIAMS.

Racine, Wis., Dec. 11, 1882.

The Coldest Day of the Year.—The warmest day during the year was September 18, when it was 96 degrees in the shade. Our bees had frequent flights up to December 6, when we had 3 inches of snow; on December 7 the thermometer stood at 22 degrees below zero, 14 degrees colder than at any time during the past winter. I have read Mr. L. G. Purvis' letter, on page 778, with great interest; his former apiary in Warren Co., Iowa, was two miles from mine. Mr. Purvis is a progressive apiarist and has done much to develop the science of bee-keeping in this neighborhood.

HIBERT CLARK.

Palmyra, Iowa, Dec. 11, 1882.

My Report for 1882.—I commenced the spring with 18 colonies, increased to 25 by natural swarming. I have taken 1,800 lbs. of comb honey in 2-lb. sections, used in hanging frames. My best colony gave 210 lbs. Bees in this locality are in good condition for winter; strong in numbers and have plenty of stores.

E. DOTY.

Macksburg, Iowa, Dec. 10, 1882.

More Apiaries Than One.—I would be glad to learn of some one, through the *BEE JOURNAL*, who has had experience with two or three apiaries away from home, if it would be better to place them in the hands of some family and go to them often, or to hire some experienced hand. Any information in regard to this subject will be thankfully received.

G. W. CHURCH.

Benton Harbor, Mich., Dec. 11, '82.

[Mr. James Heddon has had such experience and we presume will say what has been his custom and state his experience. The late Mr. Adam Grimm, we believe, put out quite a number of colonies each season, on the farms of neighbors, giving them a small sum, per colony, for allowing them to remain on their farms. The stipulated amount, as well as the quantity of care they were to receive, we do not now remember. Perhaps Mr. George Grimm will kindly give us the information.—ED.]

Wax from Cappings.—The report of what I said at the Michigan State Convention, concerning the amount of wax obtained from cappings, is not quite correctly stated on page 793 of the *BEE JOURNAL* for Dec. 13. It should be as follows: "When melted, I only obtained 30 lbs. of wax from 60 lbs. of caps; 50 lbs. from 3,000 lbs. of sealed honey; and 10 lbs. from 1,000 lbs. of sealed honey. Cappings are only one-half net wax." A line was evidently omitted by the printer.

Abronia, Mich. T. F. BINGHAM.

Success to the Bees.—I had, last spring, 12 colonies; wintered on the summer stands; came through all in good condition; swarmed naturally May 1, and the last swarm came off on September 2; I now have, in all, 65 colonies in good condition for winter. They gathered 2,000 lbs. of comb honey.

E. C. CRANE.

Burlington, Iowa, Dec. 6, 1882.

My Bee House for Winter.—Last winter I had 75 colonies in a double-walled bee house, made on purpose for wintering bees. I left 25 on their summer stands without protection, the latter came through in excellent condition; of the former, 1 starved before spring, and 4 dwindled away in spring, which left me 95 colonies. The early part of the season was very cold and wet, but my bees gathered enough to keep up breeding. Basswood buds were killed on May 23 by frost, but from Aug. 15 to Sept. 23 my bees were

very busy, and gathered about 4,500 lbs. of surplus honey, half of which was comb, the other half extracted, and increased to 186, which are all in good condition for winter. 130 are now in the bee house and keep very quiet at a temperature of 40° to 42° above zero. The outside temperature this morning showed 23° below zero. I feel myself obliged to add that I obtained more profit by the three years' subscription to the BEE JOURNAL than would overrun a hundred times the price I paid for it.

C. THEILMANN.

Theilmanton, Minn.

Platform for Hives.—Has any one used stones for platforms for hives? What size sections can I use on a hive 12x15 $\frac{1}{4}$ inches? I have heretofore used small frames. This has been the best honey season I have had since 1877.

GEORGE DREW.

Bunker Hill, Ill., Dec. 12, 1882.

[We can see no advantage in using stones for platforms; they will be very cold for the bees to travel over. You can use either the regular one or two-pound sections in a comb honey rack, or even the half-pound sections; or you can use "cases" to hold either size, for side storing, as may be desired. See article on small sections for surplus honey elsewhere in this paper.—ED.]

The Season's Operations.—I had 48 colonies of bees last spring. I had to feed all my bees from the last of April till the 1st of June, when they began to gather some honey from white and red clover, but not very much. Next came basswood and sourwood. I took 800 lbs. of honey that was gathered from basswood and sourwood, and obtained 1,800 lbs. of aster honey. I had 2,100 lbs. of extracted honey and 500 lbs. of very nice comb honey in 1, 2 and 4-lb. sections. My honey is all of the very best quality. I increased from 48 to 63 colonies, mostly by natural swarming. I have a good home market for all my honey. I sell extracted honey at 15 cents per pound, and comb honey at 20 cts.

JNO. F. FRY.

Ronceverte, W. Va., Dec. 6, 1882.

Best Honey Crop in 10 Years.—As the season's work has closed I will send in my report for the year 1882. I commenced in early spring (February) with 27 colonies; had 52 natural swarms; have taken 6,461 lbs. of extracted honey and 274 lbs. of comb honey; total, 6,735 lbs. Average, per colony, spring count, 249 lbs. The largest amount from 1 colony and its increase was 475 lbs.; largest yield from 1 colony 263 $\frac{1}{2}$ lbs. (Pure hybrid.) From a 3-frame nucleus, set out with queen-cell February 25, I took 162 lbs. of honey; 3 of my nuclei swarmed. About the time the queen's progeny began to fly, the queens, not being clipped, the bees made good their escape to the woods, but they were not counted as swarms. I cannot say

what my yield of honey would have been if I could have kept up with them. For about 12 days, right in the height of the honey harvest, my hives were all honey-bound, and I could get no help, and being engaged in the supply business, with such a rush on me for hives, etc., that I could not avoid it. Could not tier-up, for I had no extra hives; hived many swarms in boxes until I could catch up with my work. Now, for fear that some may think this was an average season in Texas, I would say that it has been the best of many seasons, perhaps, the best in ten. I have kept bees for 30 years in Texas. I enclose \$2 for the Weekly BEE JOURNAL for 1883, for no progressive bee-man could do without it.

J. S. TADLOCK.

Luling, Texas, Dec. 11, 1882.

Do Bees Pay?—In 1881, hive No. 1 (in my care) increased to 6 by natural swarming, and gave 126 $\frac{1}{2}$ lbs. of comb honey. In 1882, the 6 wintered all right, and gave 16 swarms and \$23 lbs. of comb honey. They are all blacks or hybrids. One of them, No. 35, gave 236 $\frac{3}{4}$ lbs.; its first swarm gave 123 $\frac{3}{4}$ lbs. No. 35 was a swarm on the 1st of August, 1881, from a swarm from No. 1.

E. PICKUP.

Limerick, Ill., Dec. 4, 1882.

Excellent.—I had 5 colonies of bees, all blacks, last spring; bought 1 three-frame nucleus of Italians; increased by dividing and natural swarming to 23 colonies, in good condition. I have 6 colonies of Italians, 1 Cyprian, and 16 blacks and hybrids. I received from them 573 pounds of comb honey, and 227 lbs. of extracted; in all, 800 lbs. I think that is doing tolerably well for a novice. I shall try and do better next year.

JOHN NEBEL.

High Hill, Mo., Dec. 14, 1882.

Have Done Well.—I have 40 colonies packed in sawdust. I had several colonies that gave over 100 lbs. of comb honey, each, in 2-lb. sections. I am a life subscriber to the BEE JOURNAL.

HENRY W. BURNHAM.

Ballston Spa, N. Y.

Progress in Bee-Keeping.—With the BEE JOURNAL in its present form, it seems to me all should be satisfied, and also with the reading matter it contains. When I look back over the 25 or 30 years that have passed, and compare the management of bees at that time with the present, I feel satisfied, as one in the family of bee-keepers, that we have made as great progress as in any other calling in life's labor. One very important part in the management of our bees to make them more profitable and less vexatious, is to be able to successfully carry them through all kinds of winters. As there are so many of us experimenting in this direction, it is to be hoped some will succeed perfectly. There may be such now, but it is not generally known; when it is, and when such is generally followed, then our business will be more reliable. In its present uncertainty, few of us can know what

amount of preparation to make for our bees in the way of hives or honey receptacles. Many have had an apiary in the fall of which they were proud, but that pride was turned into disgust the next spring. Be patient, dear editor, and keep giving us the experience of the bee keepers in this part of our calling, and, by-and-by, we shall get right.

L. JAMES.

Atlanta, Ill., Dec. 14, 1882.

Packed in Chaff.—I now have 70 colonies in good condition. My bees are principally Italians and are packed in chaff. 20 colonies were packed as early as the latter part of September. I think, next year, I shall pack all my bees as early as September. I do not think my bees were ever so uniformly in good condition for winter as at the present time. From 43 colonies in the spring they have increased to 70, principally by natural swarming. My surplus honey was 2,200 lbs., one-third extracted honey, and the rest, comb. I sold the comb honey at 15 cents and the extracted honey at 12 $\frac{1}{2}$ c. per lb. I think I have done well with my bees for the past two years, and how could I do otherwise with so good an instructor as the AMERICAN BEE JOURNAL, and with such appliances as the Excelsior honey extractor, Hetherington's uncapping knife and Bingham's smoker? Long life to the BEE JOURNAL.

W. S. PIERSON.

Eureka, Mich., Dec. 8, 1882.

Large Increase.—I began with 2 colonies in the fall of 1881, and now have 23 colonies in good condition, in winter quarters.

WM. SABINS.

Burlington, Iowa, Dec. 14, 1882.

☞ When changing a postoffice address, mention the *old* as well as the new address.

A Religious Newspaper.—We desire to call the attention of our readers to one of the largest, ablest and most popular religious newspapers published—one that secures the best writers in this country and Europe, regardless of expense; has the best and fullest book reviews of any paper in the country; has able articles upon financial and commercial subjects; has departments edited by specialists and devoted to Fine Arts, Music, Science, Religious Intelligence, Missions, School and College, News of the Week, Hymn Notes, the Sunday-school, Legal and Sanitary questions, Biblical Research (something that cannot be found in any other newspaper in the United States), Farm and Garden, Insurance, Weekly Market Reports, etc.—in fact, a newspaper which, with its twenty-two distinct departments, is suited to the requirements of every family, containing a fund of information which cannot be had in any other shape, and having a wide circulation all over the country and in Europe. We refer to THE INDEPENDENT, of New York, now called "The largest, the ablest, the best." See advertisement, in another column, and send a postal card for free specimen copy.

THE AMERICAN BEE JOURNAL

ADVERTISING RATES for 1883.

20 cents per line of space, each insertion,
For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

SPECIAL RATES.—Advertisements will be inserted in both Weekly and Monthly editions, at the following prices, if wholly paid in advance:

SPACE.	One month	Two mo'ths	Three mo'ths	Six mo'ths	One Year.
1 in. 12 lines	10.00	18.00	25.00	38.00	50.00
2 in. 24 lines	20.00	32.00	40.00	60.00	80.00
3 in. 36 lines	25.00	40.00	50.00	75.00	100.00
4 in. 48 lines	32.00	50.00	65.00	90.00	125.00
5 in. 60 lines	40.00	60.00	75.00	110.00	150.00
6 in. 72 lines	45.00	70.00	90.00	130.00	175.00

For the Weekly alone, 20 per cent. less than the above rates. On yearly advertisements, payments may be made quarterly, but must be in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

THOMAS G. NEWMAN,

925 West Madison Street., Chicago, Ill.

Special Notices.

A few of our subscribers are in arrears for the present year—having requested us to continue, and they would pay soon. Will all such please take this as a request to send on the two dollars with a renewal for next year, if possible.

The American Express Company money order system is the cheapest, safest and most convenient way of remitting small sums of money. Their rates for \$1 to \$5 are 5 cents; over \$5 to \$10, 8 cents. They can be purchased at any point where the company have an office, except Canada, and can be made payable at any one of the company's 4,000 offices.

For safety, when sending money to this office get either a post office or express money order, a bank draft on New York or Chicago, or register the letter. Postage stamps of any kind may be sent for amounts less than one dollar. Local checks are subject to a discount of 25 cents at Chicago banks.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, instructions on the exhibition of bees and honey at Fairs, etc. This is a new 10 cent pamphlet, of 32 pages.

New Premiums for 1883.

As the season for reading has now arrived, we hope that each of our subscribers will endeavor to send at least one new subscriber for the Weekly BEE JOURNAL for 1883 and thus not only help on the cause of progressive bee-culture, but assist in sustaining the only Weekly bee paper in the world.

Providence has smiled on the bee-keepers during the past season, and as a general thing they are abundantly able to procure a good assortment of bee-literature.

In order to encourage every one who keeps bees, be they few or many colonies, to thoroughly read the many very interesting books on bee-culture, now published, we have determined to make liberal offers, which will be available until January 1, 1883, as follows:

To any one sending us \$8 for any books they may select from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for one year.

To any one purchasing \$4 worth of books, selected from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for six months or the Monthly for one year.

Any one sending us a club of two subscribers for 1883, for the Weekly, with \$4, will be entitled to a copy of Bees and Honey, in cloth, postpaid.

For three subscribers, with \$6, we will send Cook's Manual, in paper, Emerson's Binder for the Weekly, or Apiary Register for 50 colonies.

For four subscribers, with \$8, we will send Cook's Manual in cloth, or Apiary Register for 100 colonies.

For five subscribers, with \$10, we will send the Apiary Register for 200 colonies, Quinby's New Bee-Keeping, Root's A B C of Bee Culture, or an extra copy of the Weekly BEE JOURNAL for one year.

To get any of the above premiums for the Monthly BEE JOURNAL send double the number of subscribers, and the same amount of money.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 32 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers. The Weekly will contain all that the Monthly does, besides twice as much other matter.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

Subscription Credits.—After sending subscriptions to this office, we would respectfully ask every one to look at the label on the wrapper of the next two papers, and there they will find the credit indicated thus: Those who have paid for the first six months of next year will find "June 83" after their names. Those who have paid for the whole year will find "Dec. 83" on their papers. The credit runs to the end of the month indicated. If the mark is "Dec. 82," it means that the subscription is paid until the end of the present year. Please remember that the credit given on this label is a sufficient notification of subscriptions due and receipt for payments made. If not so indicated within two weeks after sending money to us, you may be sure something is wrong, and should write to us about it. It will save annoyance and trouble if our subscribers will give this matter due attention.

The time for the usual winter rush of correspondence is here, and we wish to impress upon all our patrons the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address that we already have on our books.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages).....\$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

The BEE JOURNAL is mailed at the Chicago post office every Tuesday, and any irregularity in its arrival is due to the postal employes, or some cause beyond our control.

Articles for publication must be written on a separate piece of paper from items of business.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Do not let your numbers of the BEE JOURNAL for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Emerson Binders—made especially for the BEE JOURNAL, are lettered in gold on the back, and make a very convenient way of preserving the BEE JOURNAL as fast as received. They will be sent, post-paid, for 75 cents, for the Weekly; or for the Monthly, 50 cents. They cannot be sent by mail to Canada.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

We carefully mail the BEE JOURNAL to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
 Monday, 10 a. m., December 18, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.**CHICAGO.**

HONEY—The supply of extracted honey is fully up to the demand. My quotations are: 7c. for dark and 9c. for light, delivered here.

BEE-SWAX—It is quite scarce. I am paying 27c. for good yellow wax, on arrival; dark and off colors, 17c@22c.

AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HONEY—Demand is good for extracted honey by the barrel for manufacturing purposes and for table use. The demand is very good for honey in 1@2 lb. jars. A good deal of comb honey could be sold if we had a good article at a rate within the views of the consumer; i. e., which could be sold at 20c. in the jobbing way and 25c. at retail.

We pay 7@10c. for extracted, and 16@20c. for good comb honey in sections.

BEE-SWAX—Is in good demand at 26@27c. per lb. on arrival.

CHAS. F. MUTH.

Quotations of Commission Merchants.**CHICAGO.**

HONEY—The demand for comb honey does not keep pace with the receipts. There is a large surplus on this market at present, and prices are from 2 to 3c. lower than last month.

We quote: white comb honey, in 1@2 lb. sections, 17@18c. Dark comb honey, hardly any demand. It is held at 12½@15c. Extracted—White brings from 9@10c.; dark, 8@9c.; kegs, half-barrels and casks bring about same price.

BEE-SWAX—Choice Yellow, 30c.; dark to medium, 18@25c.

R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HONEY—Stock is small, with but little demand, and buyers bid low.

White comb, 17@20c; dark to good, 11@14c; extracted, choice to extra white, 8@9½c.; dark and candied, 7@7½c.

BEE-SWAX—We quote 25@28c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HONEY—Dull. Comb, at 16c. for large or hard to 19@20c. for choice bright in small packages; extracted at 8@9c.; strained, 6½@7c.; choice, in smaller quantities, brings more.

BEE-SWAX—Prime bright steady at 26@27c.

R. C. GREER & Co., 117 N. Main Street.

CLEVELAND.

HONEY—Has changed in price a very little, we find it necessary to sell all grades about 1 cent per lb. less. Best white, in 1 lb. sections, 20@21c. per pound; in 2 lb. sections, 18@20c. Extracted is very dull indeed, hardly any sale.

BEE-SWAX—Scarce, 28@30c.

A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HONEY—There is a fair demand, but mostly for small lots, and the general tone of prices remain steady.

We quote: White clover, first quality, 1 lb. boxes, 25c; 2 lb. boxes, 23@25c.; buckwheat, 1 lb. boxes, 20c.; 2 lb. boxes, 16c. Extracted, white, 13c.; dark, 10@11c.

BEE-SWAX—30@32c.

D. W. QUINBY, 105 Park Place.

BOSTON.

HONEY—Our market is fairly active. We quote: ½ lb. sections at 30c.; 1 lb. sections, 22@25c.; 2 lb. sections, 20@22c. Extracted, 10c. per lb. Good lots of extracted are wanted in kegs or barrels.

BEE-SWAX—30c.

CROCKER & BLAKE, 57 Chatham Street.

Sample Copies of the AMERICAN BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to new Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

CLUBBING LIST.

We supply the American Bee Journal and any of the following periodicals, one year, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage is prepaid by the publishers.

"BEE-KEEPERS' HANDY BOOK."

\$1.00 PER COPY.

Worth 20 times its cost to any bee-keeper. A work giving the author's 22 years' experience in rearing queens. It will be so illustrated and all made so plain that any one can raise as few or as many queens as desired, and have the cells built in rows so that all can be removed without destroying any. It will teach how and when to remove the cells from a colony that has swarmed, and how to preserve all such queens and have them fertilize for future use. Send name for Circular. 49smtf

HENRY ALLEY, WENHAM, MASS.

THE INDEPENDENT.

THE INDEPENDENT needs only to be better known to add to its already large list of friends. It has been published for thirty-five years and has acquired a world-wide reputation as the best religious and literary newspaper.

THE INDEPENDENT is not denominational. Its creed and field are broader than any sect. As a Christian journal, its aim is to strengthen and extend Evangelical religion and to defend it against the attacks of Materialism, Atheism and unbelief. It is free to approve or criticize in any of the denominations whatever it believes is designed to advance or hinder the progress of the Gospel of Christ.

In civil and political affairs THE INDEPENDENT will contend for sound ideas and principles. It fought against slavery and the iniquitous system of the Oneida Community. It is now fighting against Mormonism. It believes in the reform of the civil service and tariff, in the purification of politics and in cheap postage, and will maintain those principles which the highest ethics and best intelligence require.

THE INDEPENDENT is designed to suit all tastes and wants. We provide weekly stories by the best magazine writers, poems by the leading poets of America and England (we first published in America Tennyson's last poem), and for others, who look especially for instruction, whether in religious, literary, educational, philosophical, or scientific articles, we furnish what no other periodical does or can. We pay large prices to obtain the most eminent writers. Besides the editorials, there are twenty-two distinct departments, edited by twenty-two specialists, which include Biblical Research, Sanitary, Legal, Fine Arts, Music, Science, Pebbles, Personalities, Ministerial Register, Lyman Notes, School and College, Literature, Religious Intelligence, Missions, Sunday School, News of the Week, Finance, Commerce, Insurance, Stories, Puzzles, Selections, and Agriculture. 32 Pages in all.

We will report in full Rev. Joseph Cook's celebrated Boston Monday Lectures, which will begin in January. Mr. Cook has just returned from a two years' trip round the world, and his lectures this Winter will attract greater attention than ever.

OUR NEW TERMS FOR 1883.

One subscription, one year.....\$3 00
For 6 months, \$1.50; for 3 months..... 0 75
One subscription, two years..... 5 00
One subscription, five years..... 10 00

These reduced prices (\$2 per annum in clubs of five or more) are very much lower than any of the standard religious weeklies.

"TRIAL TRIP."

In order that one may read a few consecutive numbers of THE INDEPENDENT, and thus learn its value, we offer a month's subscription, as a "Trial Trip," for 30 cents, which can be remitted by postage stamps. Payment of \$2.70 in addition will secure the balance of a year's subscription.

Send postal card for free specimen copy and judge for yourself. Address

Hartford, Wash. Co., N. Y.

The Bee-Keeper's Guide;

OR,
MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—*L'Apiculture, Paris.*

I think Cook's Manual is the best of our American works.—**LEWIS T. COLBY.**

It appears to have cut the ground from under future book-makers.—*British Bee Journal.*

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—**J. P. WEST.**

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—**E. H. WYNKOOP.**

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Far.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald, Monticello, Ill.*

With Cook's Manual I am more than pleased. It is full of up with the times in every particular. The richest reward awaits its author.—**A. E. WENZEL.**

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—**WM. VAN ANTWERP, M. D.**

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record.*

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—**L'ABBE DU BOIS, editor of the Bulletin D'Apiculteur, France.**

It not only gives the natural history of these indigestible insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat, Pulaski, N. Y.*

We have perused with great pleasure this *tride mium* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist, Quebec.*

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound and is a credit to the West.—*Western Agriculturist.*

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor.*

THIS PAPER may be found on file at Geo. P. Rowell & Co.'s Newspaper Advertising Bureau (10 Spruce St.), where advertising contracts may be made for it in NEW YORK.

BOOKS,

Sent by mail, on receipt of price, by
THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide; or, Cook's Manual of the Apiary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping, by L. C. Root.— The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject. —\$1.50.

Novice's ABC of Bee-Culture, by A. I. Root.— This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book, by A. J. King.— This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.— This is a standard scientific work. Price, \$2.

Bleasod Bees, by John Allen.— A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.— Third Edition "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 160 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Bienen Kultur, by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$4 per dozen, postpaid.

Bzierzon Theory— presents the fundamental principles of bee-keeping, and furnishes the facts and arguments to demonstrate them. 15c.

Honey, as Food and Medicine, by Thomas G. Newman.— This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and production of Honey for the Market; Honey as food, and recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, etc.; and Honey as Medicine with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.— This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market, including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive I Use— Being a description of the hive used by G. M. Doolittle. Price, 5c.

Foul Brood; its origin, development and cure. By Albert K. Kohnke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.— A 24-page pamphlet, by Ch. & C. P. Dadasht, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman. Giving advanced views on this important subject, with suggestions what to plant, and when and how: 25 engravings. Price, 10c.

Practical Hints to Bee-Keepers, by Chas. F. Muth: 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarmlog, Dividing and Feeding Bees.— Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 300 pages 50c.

Scribner's Lumber and Log Book.— Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round timber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 35 c. postpaid.

Kendall's Horse Book.— No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 items for Grs. Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Bronzers, Golders, Metal and Wood Workers of every kind. The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Fisher's Grain Tables for Farmers, etc.— 192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest, wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. Ask your bookseller for it. Sent post-paid for 40 cents.

Chicken Cholera, by A. J. Hill.— A treatise on its cause, symptoms and cure. Price, 25c.

Deutscher Buecher Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände — Der Tlichkeit des Bienenstandes — Honig pflanzen — Erziehung der Königin — Züthern — Schwärmen — Ablegen — Verjehen — Z t a l i e n i f i e r e n — Züchter von Königinnen — Ausziehen — Bienen behandeln und beruhigen; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschrieben ist. Preis 40 Cents.

Honig als Nahrung und Medizin— von Thomas G. Newman. Dieses enthält eine klare Darstellung über Bienen und Honig des Alterthums; die Beschaffenheit, Qualität, Quellen und Zubereitung des Honigs für den Handel; Honig als Nahrungsmittel, angebend wie man Honigkuchen, Formkucheln, Puddings, Schaumkonfekt, Weine, u. s. w. zubereiten kann; ferner Honig als Medizin mit vielen Rezepten. Es ist für den Consumenten bestimmt, und sollte vieltausendfältig über das ganze Land verbreitet werden. Preis 6 Cents.

Das Pferd und seine Krankheiten— Von B. J. Kendall, M. D., enthaltend ein alphabetisch geordnetes Verzeichniz der verschiedenen Pferdekrankheiten, sammt den Ursachen, Symptomen und der richtigen Behandlung derselben; ferner, eine Sammlung werthvoller Rezepte. Preis 25 Cents.

EARS FOR THE MILLION! Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.
This Oil is abstracted from a peculiar species of small White Shark, caught in the Yellow Sea, known as *Carcharodon Rondeletti*. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many so seemingly permanent, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over 300 years no Deafness has existed among the Chinese people. Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unhearably noises in my head, and hear much better.
I have been greatly benighted. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WHIFERCAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street, New York, enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.

Our price for this instrument, boxed and delivered on board cars at New York, with fine Piano Cover, Stool, \$245, and Book, only..... \$245.

Reduced from our late wholesale factory price, \$295, for 60 day - only, to have this beautiful Piano introduced. This is now, by far, the greatest bargain ever offered the musical public. Unprecedented success! Tremendous demand for this style! Order at once.

This Piano will be sent on 15 days' test trial. Please send reference if you do not send money with order. Cash sent with order will be refunded and freight charges paid by us both ways if Piano is not just as represented. Several other special bargains: Pianos, \$160 up. Over 1500 in use, and not one dissatisfied purchaser. Handsome Illustrated Catalogue mailed free, giving the highest testimonials ever awarded any manufacturer. Every Piano fully warranted for 5 years.

STREET MUSIC 1/4 price. Catalogue of 3,000 choice pieces sent for 5c. stamp.
MENDELSSOHN PIANO CO.,
21st St. Box 2958, New York.

OLDEST BEE PAPER
IN AMERICA

ESTABLISHED
IN 1861

THE AMERICAN

BEE JOURNAL

DEVOTED EXCLUSIVELY TO PROGRESSIVE BEE CULTURE.

Vol. XVIII.

Chicago, Ill., December 27, 1882.

No. 52.

THE AMERICAN BEE JOURNAL

PUBLISHED BY

THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

925 WEST MADISON ST., CHICAGO, ILL.

Weekly, \$2 a year; Monthly, \$1.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

FOREIGN POSTAGE, EXTRA:

To Europe—Weekly, 50 cents; Monthly, 12 cents.
To Australia—Weekly, \$1; Monthly, 24 cents.

George Neighbour & Sons, London, England, are our authorized agents for Europe.

Entered at Chicago post office as second class matter.

The contents of this number being included in the General Index to the volume, commencing on page 825 and closing on 828, we omit it here from its usual place.

We send this number of the BEE JOURNAL to all the subscribers for the year 1882—Weekly, Monthly and Semi-Monthly—on account of the extensive indexes it contains. Those who have paid for two Weekly numbers a month for a part of next year, will get the new Monthly until the expiration of their subscriptions. Those who have paid for one Weekly number a month will have the new Monthly until the time paid for expires. The new Monthly will be published about the 15th of each month, during 1883.

Prospective and Retrospective.

With this number we close another volume of the Weekly BEE JOURNAL—the pioneer bee paper of America! When its publication was begun, some 21 years ago, it was a venture, which even its best friends feared may be a financial loss to its proprietor, the late Mr. Samuel Wagner. But now, it can count its offspring (bee papers, living and dead,) nearly by the score, and subscribers and patrons by many thousands.

At first it fought the battle of progressive apiculture single-handed and alone; but, as one after another of the strongholds of superstition and ignorance have been subdued and silenced, many new bee periodicals have appeared, paying a just tribute to the BEE JOURNAL by imitation—the sincerest form of flattery.

The BEE JOURNAL in the future will be as it has been during the past score of years of its existence, save as it advances in every feature of progressive journalism. It will continue to lead in all the qualities of our ever advancing art, and maintain its high position as the most enterprising bee paper in the world. It will enter upon the new year with the most flattering prospects, fully expecting all whose subscriptions expire with the present number to promptly renew, and thus enroll themselves as companions for the year 1883.

The Weekly BEE JOURNAL will continue to be the medium for the promulgation of the best thoughts of the most advanced bee-keepers of the day—keeping abreast of the highest progress, favoring the freest discussion of all disputed points of apiculture, advancing progressive ideas and the most modern thoughts and improvements—and, while we at once enter upon the work of the new year, we

stop but just moment, to wish all our readers and patrons

A HAPPY NEW YEAR.

A postal car, with tons of papers and letters coming to the West, was destroyed near Schenectady, on the New York Central Railway, Thursday last. We hope none of the letters sent by our correspondents were in it. There were 18 sacks and 2 pouches of mail for Chicago in that car, and all were totally destroyed.

We point, with pride, to the comprehensive indexes to be found in this number of the BEE JOURNAL. The Index to Correspondents contains about 1,200 names of those whose experience and counsel have been given one or more times in the Weekly BEE JOURNAL for the present year. These all have our thanks and we hope they will favor us with similar correspondence during the coming year. Over a thousand subjects have been discussed, as shown by our "Index to Subjects," covering the entire vocabulary of bee-culture, and the correspondence is from every State, Province and Territory of North America, as well as from Europe, Asia, Africa and Australia. To all we give a thousand thanks, and ask them to send on their articles and letters during the coming year, so that the Weekly BEE JOURNAL may not only equal the present volume, but even surpass it.

A correspondent, in this number of the BEE JOURNAL, says that he has noticed that an "open winter" is succeeded by a poor season. This was not the experience of the bee-keepers of the West during the past year. The last winter was an "open" one, but the honey crop was abundant; that of the year before was not so large, though it succeeded a "snug" winter.

The Medicinal Qualities of Honey.

There is no doubt but that honey is one of the most valuable of medicines. We have often advocated its use and seen its good effects, and would now add another testimonial to those already published. It is from Mr. Luther Corey, Yorkshire, N. Y. He says: "On Oct. 1 I was taken with bilious and gastric fever, followed by a relapse in the shape of inflammation of the lungs and their surroundings, also congestion of a portion. Until within 2 or 3 weeks I was unconscious, and therefore not aware of my condition, at which time I commenced eating honey and have taken it at all times of the day and night, until I have eaten five two-pound boxes of honey. My cough has subsided, and my lungs are healing much beyond the physician's expectations. I think the honey is doing the business. I am now able to walk about the house."

Karl Gatter, editor of the *Bienerwarter*, at Vienna, Austria, with whom we had an excellent visit in the summer of 1879, assured us that his life was saved by the use of honey. He published a small pamphlet on the curative powers of honey, and said:

"A strong influence for publishing this book was the fact that I, a sufferer from hemorrhages, already given up to despair and at the verge of the grave, was saved by the wonderfully curative powers of honey; and now, thank God, I am freed, not only from weakness of my lungs, but rejoice in the possession of perfect health.

"At my first attack, upwards of thirty years ago, powders and tea were ordered for me, which benefitted me but little. I then placed but little confidence in honey, which I had used occasionally, and in small quantities. Judging from my present knowledge, I believe that the honey was the only remedy that was doing me any good, and it is this that I have to thank for the gradual, but sure restoration of my health.

As my disease increased I began to use cod liver oil, which weakened and injured my stomach so that I could hardly digest anything more, and my condition became worse and worse. Again I returned to honey, when my sufferings immediately began to decrease and disappear. Besides the use of honey, I took pains to preserve my breast and lungs from injury, which, in my trying situation as public teacher, was almost impossible. My disease being caused by my constant teaching during so many years. I gave up my profession, and honey was my only medicine, whereby I, by the simplest, safest, quickest and pleasantest manner (for I was fond of honey), relieved the disease in my throat; and out of thankfulness I now write this book for the use and benefit of many,

especially for the use of those suffering from diseases of the throat and lungs."

Though Mr. Gatter is now nearly 70 years of age, he is hale and hearty, and nearly as active as a man of 30.

In ancient times the free and regular use of it as an article of diet, was regarded as a means of securing long life; and it thus came to be popularly considered as a specific against disease. Honey is nutritive and laxative, and is employed largely in the preparation of medicine. In diseases of the bladder and kidneys, honey is an excellent remedy. Honey is a sedative of no ordinary power. A friend, who is a practicing physician, mentions one of his patients, whose habits of observation were seldom equaled, having by the kick of a horse one of his knee-joints badly broken, the pain and anguish being very severe, his daughter offered him some wine or tea. He declined, but said she might give him some honey. Dr. A. remarks: "My own observations justifies the wisdom of his selection. Try it."

Sweet Clover in England.

Mr. Henry Jonas, of London, England, writes us as follows:

I want to try some sweet clover seed to see if it will flourish in England. If it will, I think it is not likely to be planted for honey only, but as sheep feed. Our farmers are much dependent on their clovers in the summer; these frequently from drought and from the land being "clover sick" and I hope the *Melilotus Alba* will give our land the change of crop it needs, and our bees a bountiful harvest into the bargain.

American readers of the *British Bee Journal* will be pleased to hear that it changes hands with the new year. It is the only bee paper in England and hitherto has been in the hands of a good bee master, but unfortunately a hive maker, and for the future our paper will be in the hands of the Rev. H. R. Peel, the honorable secretary of the British Bee-Keepers' Association, who has done more to advance bee-keeping in England than any man living, and we all hope it will be far more valuable to our bee-keepers. Our British Bee-Keepers' Association was only established in 1874, but since that time we have advanced far beyond our expectations.

Concerning the *Melilot*, or sweet clover, in England, the *London Journal of Horticulture* says, that "it is well known in England and we have cultivated it for a period of thirty years solely for our bees, and have repeatedly seen it growing in cottage gardens in various parts of this country." The *Journal of Horticulture* then adds:

"The term "Sweet Clover," is simply a misnomer, since all clovers (*Trifolium*s) are sweet-scented, and preferred by the bees to any other plant grown. The proper name of this plant is *Melilotus leucantha*, in plain English, White-flowered Melilot, a biennial which grows freely in any soil to the height of 6 feet, with very branching stems and large cluster of sweet-scented white flowers.

The best time for sowing is the early autumn, and generally speaking it does not bloom until the second year, flowering profusely through July and August, when it forms seed and dies. It may, however, be sown at the spring time, and succeeds well. Its one great disadvantage is that it is useless to the farmer, even as bedding for his cattle, after seeding. We have known it harvested as hay, though doubtless if well secured before blooming it might form a rough kind of clover hay. It is of the same class as the *Melilotus officinalis*, or yellow Melilot, so common in many parts of the country, although it has been described as a distinct species—the result of cultivation. The yellow kind is an annual, grows to the height of 2 or 3 feet only, and is cultivated as food for cattle, growing in thickets, hedges, and borders of fields. When dried it gives a strong scent of new-mown hay.

From our own observation the *Melilotus leucantha* is preferred by the bees to any known plant, and is unequalled as regards the quantity and quality of the nectar secreted, and, which is even of more importance, yields its precious nectar in all seasons. We have never found any difficulty in procuring the seed from our principal seedsmen when giving its proper name, and we strongly advise our bee-keeping readers, if not already cultivating it, to give it a trial."

Millions for Defense.—An Iowa paper is responsible for the following, which evidently refers to the Rev. O. Clute, of Iowa City. He must have been troubled with chicken thieves last summer:

An Iowa City clergyman has 153 hives of bees, which are arranged around his hen house, and when he hears a thief fooling round that establishment in the darkness, he just lies still and waits to hear a hive upset, and then laughs at the sound of wild yells gradually dying away in the distance.

When writing to this office on business, our correspondents should not write anything for publication on the same sheet of paper, unless it can be torn apart without interfering with either portion of the letter. The editorial and business departments are separate and distinct, and when the business is mixed up with items for publication it often causes confusion. They may both be sent in one envelope but should be written on separate pieces of paper.

New Premiums for 1883.

As the season for reading has now arrived, we hope that each of our subscribers will endeavor to send at least one new subscriber for the Weekly BEE JOURNAL for 1883 and thus not only help on the cause of progressive bee-culture, but assist in sustaining the only Weekly bee paper in the world.

Providence has smiled on the bee-keepers during the past season, and as a general thing they are abundantly able to procure a good assortment of bee-literature.

In order to encourage every one who keeps bees, be they few or many colonies, to thoroughly read the many very interesting books on bee-culture, now published, we have determined to make liberal offers, which will be available until January 1, 1883, as follows:

To any one sending us \$8 for any books they may select from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for one year.

To any one purchasing \$4 worth of books, selected from our "Book List," on the last page of this paper, we will present the Weekly BEE JOURNAL for six months or the Monthly for one year.

Any one sending us a club of two subscribers for 1883, for the Weekly, with \$4, will be entitled to a copy of Bees and Honey, in cloth, postpaid.

For three subscribers, with \$6, we will send Cook's Manual, in paper, Emerson's Binder for the Weekly, or Apiary Register for 50 colonies.

For four subscribers, with \$8, we will send Cook's Manual in cloth, or Apiary Register for 100 colonies.

For five subscribers, with \$10, we will send the Apiary Register for 200 colonies, Quinby's New Bee-Keeping, Root's A B C of Bee Culture, or an extra copy of the Weekly BEE JOURNAL for one year.

To get any of the above premiums for the Monthly BEE JOURNAL send double the number of subscribers, and the same amount of money.

We will send Cook's Manual in cloth, or an Apiary Register for 100 colonies, and Weekly BEE JOURNAL for one year, for \$3.00; or with King's Text-Book, in cloth, for \$2.75; or with Bees and Honey, in cloth, \$2.50. The Monthly BEE JOURNAL and either of the above for one dollar less.

The Monthly Bee Journal for 1883.

At the request of many who have heretofore taken the Monthly and Semi-Monthly BEE JOURNAL, we shall next year print a Monthly consisting of 82 pages, issuing it about the middle of each month, at \$1.00 a year, in advance; 2 copies for \$1.80; 3 copies for \$2.50; 5 copies for \$4.00; 10 or more copies at 75 cents each. An extra copy to the person getting up a club of 5 or more.

The Weekly and Monthly BEE JOURNALS will be distinct papers, each having its own sphere of operation and different readers. The Weekly will contain all that the Monthly does, besides twice as much other matter.

We shall aim to make the Monthly BEE JOURNAL a welcome and profitable visitor to the homes of those who feel the need of a cheap, first class, reliable bee paper in pamphlet form—whose time is too much occupied to read a weekly, or whose means or requirements are more limited, and who can dispense with the routine matter more properly belonging to a weekly.

MISCELLANEOUS.

Do bees remove eggs from one cell to another?—This question is answered by Mr. A. Pettigrew in the London *Journal of Horticulture* in the following language:

Yes, certainly. This I have known and witnessed for fifty years. I have often seen eggs, laid by queen bees before being removed from their hives, set in other cells after their removal, and have known such eggs become queens, thus proving that they were not the eggs of fertile workers. Queen-excluders, then, so much talked about at present, cannot be of much use? No, they are valueless; for if bees determine to breed in any part of a hive queen-excluders will not prevent them. Last September a correspondent of a journal wrote that one of his colonies lost its queen when the combs were filled with honey, brood, and eggs. He removed the frame of honey and gave them a frame of empty comb in its place. The hive was examined four or five days after, when there were found several queen cells on the empty sheet of comb. As it contained no eggs when placed in the hive, he saw that the bees had taken them from one comb to another. Eight queen-cells were erected and filled on the empty sheet. He adds, "There can be no mistake about this, for I

took the empty frame from my honey room where it had been laid six or seven weeks." If more evidence be wanted it may be found in the fact that in many instances—I might venture to say in all instances of breeding in supers—the bees first prepare the cells for the reception of eggs; and experienced men on examining supers can tell where the eggs will be deposited. Bees are the masters and determine these matters themselves without consulting queen or queen-excluders. It will be well for bee-keepers to remember these facts.

Bees require but little Oxygen.—A correspondent of the *Country Gentleman* remarks as follows on the amount of oxygen required by bees:

The idea that a comparatively small supply of oxygen for the healthy existence of the bees, is one which will help to explain some problems in apiculture. It is not in a quiescent state only that they require less pure air than the larger animals. Left to their natural instincts they seal up every crevice about their hives except the entrance. A moment's reflection must convince anyone that with only one small external orifice, and with every space between the combs filled with the living, working, breathing insects, the queen and her progeny must be doing their work in an atmosphere which would be speedy death to any quadruped. The pupæ, sealed up in their cells in this same slightly ventilated hive, afford another example of how the growth and change in insect life may go on with a very slight supply of oxygen.

Subscription Credits.—After sending subscriptions to this office, we would respectfully ask every one to look at the label on the wrapper of the next two papers, and there they will find the credit indicated thus: Those who have paid for the first six months of next year will find "June 83" after their names. Those who have paid for the whole year will find "Dec. 83" on their papers. The credit runs to the end of the month indicated. If the mark is "Dec. 82," it means that the subscription is paid until the end of the present year. Please remember that the credit given on this label is a sufficient notification of subscriptions due and receipt for payments made. If not so indicated within two weeks after sending money to us, you may be sure something is wrong, and should write to us about it. It will save annoyance and trouble if our subscribers will give this matter due attention.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

For the American Bee Journal.

Giving Bees a Flight in Winter.

G. M. DOOLITTLE.

Many seem to think that it is necessary to remove the bees from the cellar, during the winter, for a flight, should a warm day occur. When I first began keeping bees I wintered entirely in the cellar.

Believing it to be a good plan to give the bees a chance to void their excrement as often as possible, I carried them all out of the cellar about the 1st of February, if such a thing was possible, returning them at evening, and again they were carried out about 10th of March; thus giving them two flights. One thing I always noticed, that after returning them to the cellar they never settled down as quiet as they were before. Brood rearing was started and the loss caused by the excitement, always noticeable when bees are breeding, was greater than was the accumulation of young bees hatching from the brood, hence each colony were really damaged by being set out.

About this time, I thought I would try the setting out of a part of the bees as before, and leave a part in; so I placed them in the cellar in the fall in such a manner that those I wished to put out, could be removed without disturbing the rest. As opportunity presented they were put out, for their winter flight, while the rest were left quiet until about the 1st of May. Upon setting them out for good, I ascertained that those which had not been disturbed were much the strongest; and upon weighing them I found that those which had not been put out had consumed but about one pound of honey a month, while those given two flights had consumed nearly double that amount.

I remember at about this time a neighbor keeping bees in box hives, invited me over to see his bees, it being about the 1st of February. I found them in rather bad shape, for it had been a cold winter, and the bees out doors could not fly. In looking them over I found a second swarm, whose combs were bright and clean, and seemed to contain a fair colony of bees. A bargain was struck up and I brought this colony home with me, over a rough road, nearly two miles. In the evening I took them into the cellar, turned the hive bottom side up, and threw an old carpet over them. As I had read that bees should never be disturbed in winter, unless just after a flight, I feared that I should lose them unless a warm day occurred so that I could put them out. As none occurred for a week or two I kept close watch of them, and was surprised to find them even more quiet than those that had been in the cellar all winter. As they continued thus quiet I did not put them out until April 25, and the result

showed that no other colony in my yard was as good as this one was on May 20.

Since then, after once placing my bees in the cellar, I have left them there till ready to put them out to remain.

If we have a cellar with an even temperature, and that pretty warm, (from 45° to 50°) there is but little difficulty in keeping bees quiet; but if the temperature is allowed to go from 30° to 50°, as it happens, the bees are apt to become uneasy. The keeping of the bees quiet during the whole winter is the great desideratum in cellar wintering, and if they can be thus kept, no flight is necessary, experience has led me to believe.

If I find a colony of bees restless, I ventilate the hive until they are quiet. The cause of uneasiness is (barring disturbing influences, such as mice, etc.) too cold or too warm. If a good colony is uneasy, I try more ventilation by raising the hive up at the bottom, and if it is still uneasy, I take off the chaff at the top, and roll back the quilt a little, sometimes taking it clear off, so as to have them suspended in mid-air, as it were. If it is a small colony, I close the entrance and wrap them up as warm as possible.

When everything is just right, they will appear like so many dead bees upon looking at them with a light, but breath on them slightly and they will move, and thrust out their stings.

To know when they are all quiet and just as I wish to have them, I go some evening to the cellar, open the doors carefully, shutting them after me, and stand listening in the darkness. If they are as they should be, I will hear just a low quiet humming, with, perhaps, one bee in a minute taking wing and flying to the bottom of the cellar, if the cellar contains 50 colonies. If, on the contrary, I hear a loud roaring, with three or four bees flying at a time, I know that all is not right, and ventilate the cellar and hives, until they are as they should be.

As spring comes on, the humming noise grows a little louder, and more bees fly out; so that allowance must be made for the time of the year. Many try to keep these bees that come out on the cellar bottom, in their hives, by using wire cloth, but my experience is that such are bees about to die with old age, and if they are not allowed to come out, they will die in the hive.

Borodino, N. Y.

For the American Bee Journal.

My Experience with Cyprian Bees.

WM. M. ROGERS.

I have two or three times attempted to write an article on Cyprian bees. I have now concluded that a summary would be useful, and therefore forbear sending the longer article that I at first proposed.

I have had great faith in the Cyprians, and I have proved my faith by handling them almost exclusively, since their introduction into this country.

After being well pleased with them,

having rarely lighted a smoker when manipulating the colonies, I was all at once put squarely to rout by the fierce and vindictive temper of which others spoke so much, and of which I had previously witnessed so little; even my selected, choicest, *gentlest* colony, proved as refractory as the worst.

On a few points I am well satisfied. If all bees were like Cyprians, there would be but few amateur apiarists and all the interests that flourish through the fondness of men for bees, would languish.

The Cyprian queen is very prolific, but the actual number of bees on hand, except in the hottest weather, is always less than the promise of the preceding brood; but, in settled warm weather, it is practicable to increase Cyprian bees almost indefinitely.

Chaff hives are peculiarly well adapted to spring rearing of Cyprian bees, for in early spring the extensive brood requires uniform protection from atmospheric changes. The Cyprians have taught me that chilled brood means short-lived bees.

I am sure that Cyprians work extensively on the second crop of red clover. They are very prolific queen rearers. I counted this year 75 queen-cells, formed under swarming impulse, in one colony. They are certainly good honey-gatherers, but I cannot run an intelligent line of comparison between them and Italians.

I do not think that their capped honey looks as inviting as that sealed by black bees.

Last spring my Cyprians dwindled badly, but came up rapidly on the approach of warm weather, and were ready for the harvest that did not come in these parts.

I shall return to Italians, unless I can develop a bee of superior qualities on a balanced cross between Italians and Cyprians.

Shelbyville, Ky.

For the American Bee Journal.

Wood Separators for Surplus Honey.

F. C. BENEDICT.

In reviewing the numbers of the BEE JOURNAL for the year 1882, I came to the article by Mr. C. R. Isham on the above subject, on page 120, No. 8. Your closing comments on it leads me to give my experience, and I can endorse all that he says on the subject.

Allow me to give a few facts that will demonstrate themselves to any apiarist who will give them a fair trial. I hold that wood is the best for separators, of any substance yet tried. Paper is good, but the bees will gnaw it badly, when not gathering honey rapidly. The expense of wood separators is much less than tin, wood separators can be furnished at one-third the cost of tin, thereby saving two-thirds in favor of wood, and with one that has machinery they can be made for less. Again, wood, being a non-conductor of heat, absorbs less heat than the tin, making the surplus chamber warmer and more readily entered by the bees when the weather is cool; and on cool nights during the

honey flow they are not as liable to leave the sections and go below. Another point in favor of wood, for some who are a little tardy in removing the sections as soon as capped, is that the bees will run upon the wood instead of the capping; when, if tin is used, being colder, they will run upon the capping, soiling it soon, and injuring the sale in market. The wood will not kink in cleaning and will stand more careless handling than tin.

While some contend that bees will brace from separator to capping more with wood than tin, my experience does not prove it to be a fact.

Since I began using wood for separators, in 1880, I have produced from 7 to 10 thousand boxes of comb honey, and not one in 500 was braced from cap to separator.

I do not know the amount of demonstration necessary to prove that wood is practical, better, and cheaper than tin, but if you, Mr. Editor, will come to my place, I will take you into my cutter and we will visit a few of our best and most successful comb-honey producers, such as Messrs. Newman & Son, and C. R. Isham, of Peoria, N. Y.; W. S. Benedict, Moscow, N. Y.; R. B. Rians and Van Eten, of York; M. Dodds and R. Buck, of Warsaw, N. Y.; Stanley Bros. of Wyoming, and many others, and if it is not demonstrated to your satisfaction, we shall feel glad to have met you and we will "kill the fatted calf" and eat the salt of friendship just the same.

My closing advice to those who wish to make any change in their surplus arrangement, where wood can be substituted for tin, is to do it, by all means; for to get the best results, financially, we must invest on that which is the most practical for the least money, and still have that which will aid us in producing a *first class article*, for that will command a good price.

In my next I will have something to say of our surplus arrangement and the use of separators.

Perry Center, N. Y., Dec. 9, 1882.

[We have had some very flattering reports from those who have used the wood separators. We should be glad to take the sleigh-ride with Mr. B. but must forego the pleasure now.—Ed.]

For the American Bee Journal.

The "Coming Bee."

S. A. SHUCK.

I do not wish Mr. Heddon to infer that I never find any inferior or worthless queens; but, as Mr. Doolittle tells us of having destroyed so many in one season, and, as Mr. Heddon speaks of inferior queens without mentioning this fearful slaughter by Mr. Doolittle, why should it be thought a thing incredible, if I, or any one, should have imagined that Mr. Heddon had found more than 3 or 5 worthless queens each spring, in his apiaries of 150 to 200 or 300 colonies?

To say that I am surprised, is a very feeble expression of my thoughts

concerning Mr. Heddon's statement, that he "finds from none to 3 or 5 worthless queens each spring."

In my report, I had no thought of superannuated queens; for all queens, if permitted to live, must, eventually become worthless. Queens that are permitted to live, on account of the superior quality of their offspring, until they become too old to be profitable, I do not consider as belonging to that class called inferior. What I understand by inferior queens, are those that from the time they commence to lay, manifest feebleness, sluggishness or a lack of prolificness; or whose progeny show a lack of some of the traits necessary to place them on a high standard of excellence, such as productiveness, hardiness, etc.

I have had so few of this class of queens, (except where they have mated, thereby producing inferior, and sometimes worthless workers,) during the past three years, and as all of my queens proved to be from fair to very good for productiveness this season, I do not see why Mr. Heddon takes exception to the yellow bands on my bees, so long as these (yellow-banded) bees are bringing in more honey than any others I have been able to pick up during the past seven years. I have had blacks and hybrids for four years, and Italians and hybrids for three years, and I have become so dissatisfied with hybrids that I destroyed every queen in my apiary this fall, which did not produce three-banded bees.

No. 20, in my report, is the best colony of hybrids I ever owned; but as they were no better than many of my Italian colonies, I destroyed their queen and gave them a young one.

Mr. Heddon says, "as there is no comparison made between Mr. Shuck's strain and any other, we have no evidence that the large yield of honey reported, is at all due to the strain of bees." He also suggests the inference that their honeyless condition on June 1st, is evidence of a worthless strain. If their honeyless condition at so late a date in the season, is evidence of a worthless strain, then I am puzzled to know how it is that, from these bees, with an expense of \$45, and my own labor, I have honey to the value of over \$500, valuing comb honey at 15 cts. per lb., and extracted at 10 cts. My average yield is larger than that of any other apiary in this section of country, so far as I can learn, and from two to four times greater than that obtained by farmers in this community.

Mr. Heddon characterizes my yield with the phrase "honey shower," and says:—"I know what these honey showers are." Does not Mr. Heddon see that his efforts in this direction, plainly show that, if I had a "honey shower," his "shower" was only twice or three times as "big" as mine? I am willing to admit that we had a good season, all things considered.

Our honey was obtained from white clover, red clover, basswood and heartsease. If Mr. Heddon could have stood as I did on the first week in September, in a large field of red clover and beheld his bees in every

direction, and heard that hum of "business," he would again have "thrown his hat" through the columns of the BEE JOURNAL, as he did in August, and the faint echoes of "Eureka! Eureka!" would have sounded in our ears, as we read his description of how those leather-colored bees sipped the nectar, and of the tons of comb honey that would soon be completed.

Mr. Heddon says: "It is my opinion that he who leaves out the brown bee, thus breeding for yellow-bands, will get away behind in the race," and mention the points of excellence given the German bee over the Italian by Mr. L. L. Langstroth.

While I respect Mr. Heddon's opinion very much, and I am willing to admit that the points of excellence mentioned, do exist with many strains of the German bee, I am not willing to admit that all brown bees possess all these points of excellence; nor am I willing to admit that all strains of Italian bees are lacking in all these points of excellence, and as nine-tenths of the practical apiarists of this country have declared and still claim that the Italian bees are the most superior race ever had in this country, I wish to say that it is "*my opinion*" that he who looks for "the coming bee" through the best strains of a superior race, will far outstrip the one who strives to find it by incorporating into a superior race the blood of an inferior one.

Mr. Heddon desires to cultivate the good qualities of the two races, and leave off the bad. This appears very nice on paper, but in practice presents quite a different picture! So much had been said of imported stock, that in July, 1880, I purchased a selected imported queen, and I reared a few queens from her that season, and a few in 1881, and although she maintained one of the most populous colonies in my apiary during the past season, I did not rear a single queen from her. And if such queens are considered the highest standard of imported stock, (which they must be,) I am not surprised that Mr. Heddon should have a strain of hybrids that are superior to them.

While I esteem the Rev. L. L. Langstroth and his judgment very highly, I recognize the fact that apiarists at the present day have many advantages that Mr. L. did not possess. Mr. L. had but few intellects equal to his own to consult, and a less number of strains of bees to compare with each other; while we have the experience, not only of this great and good man, but of scores of others, and all the appliances that American genius could devise; coupled with a constant importation of foreign bees, and all the improvements that American industry could accomplish. If, with all these advantages, a strain of Italian bees could not be found that is superior to those possessed by Mr. Langstroth during his experiments, then I cannot see how it is that Mr. Heddon can have produced a superior strain of bees in so short a time by crossing the Italian bee with an inferior race.

Bryant, Ill.

For the American Bee Journal.

Comb vs. Extracted Honey.

J. L. GRAY.

Mr. Bussey, in BEE JOURNAL of Dec. 6th, has started a subject of interest to me, and one that I think should have a share of the most careful thought and experiment of our most successful apiarists. The BEE JOURNAL is full of articles on almost every conceivable subject, but this one has not had the attention that its importance should attach to it.

While I shall differ very materially from Mr. Bussey's conclusions, still I am glad he has taken the grounds he has, for, perhaps, it will draw out articles from the most experienced apiarists.

My experience this year, and for the last 7 or 8 years, has established the opinion very firmly in my mind, that I can produce at least three times as much extracted honey as I can of comb honey from the same number of colonies. From 15 colonies run for extracted honey this year, my crop of extracted honey was 3,600 lbs. or 240 lbs. per colony; from over 50 colonies run from comb honey, my receipts were 2,500 lbs., or about 50 lbs. per colony. Of course there was an occasional comb, from some of those that were run for comb honey, taken and extracted, but not enough to materially change the figures.

Now, as to prices: Mr. Bussey says that Mr. Oatman received 20 cts. per lb. for his honey, and deducting 4 cts. for expenses, leaving him 16 cts. net, it is then double the price received for extracted honey. Mr. Oatman receives an exceptionally good price for his honey, on account of quality and amount; buyers always giving more for large lots than small ones; but even at those figures it is not double the price that I am receiving for my extracted honey at home.

I sent some comb honey and some extracted honey to two of the most prominent commission firms on Water St., Chicago, a short time ago; one of them wrote me the other day that the extracted honey was all sold at 9½ cts. per lb., but the comb honey was unsold. The other wrote me that the extracted honey sold for 9½ cts.; the comb for 15 cts. per lb. These are fair figures as an example, for the honey was produced from the same apiary, sold in the same market by the same class of men, and collected from the same flowers, at the same time of year.

Now, as to the proper condition of producing and getting in proper condition for market. One barrel, holding 50 gallons or 550 lbs. can be bought for \$2, at the most, while to get 550 lbs. of comb honey in good marketable condition, costs, if I count my time anything, \$8, at the least.

My 15 colonies that we run for extracted honey gave a profit of \$22.80 gross per colony, while those run for comb gave \$7.50 gross. Taking out the actual cost of each, for getting in condition and marketing, you can very clearly see where they would come out.

There are some mitigating circumstances in these figures, which would help the showing of the comb honey side, which I have not mentioned, such as increasing; the colonies run for extracted honey did not increase very much; while those run for comb honey have nearly all swarmed once; but they had the advantage of having all the honey gathered by their increase accounted for.

Mr. Bussey will probably want to know why I ran 50 colonies for comb honey and only 15 for extracted, if I knew that extracted honey paid so much the best?

To this I can only reply that circumstances control all of us, to a certain extent. My fixtures were all gotten up for comb honey production, and having, some years, 80 to 150 colonies to look after alone, I can care for them during the busy season, a good deal easier by running them for comb honey than for extracted. If I were trying to make the best showing possible for one apiary, I would not have over 50 colonies of bees in it; I would not allow them to increase at all, and I would run them all for extracted honey.

I hope to hear from others on this subject, and I will close by saying that I had some 12 or 15 colonies in my yard run for other purposes than honey-producing that I did not count. I now have 138 colonies in winter quarters.

H. D. Cutting, Sec., Union, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The Texas State Bee-Keepers' Association will hold its Fifth Annual Convention at McKinney, Collin Co., on Tuesday and Wednesday, April 17th and 18th, 1883; at the residence of Hon. W. H. Andrews.

The following committees have been appointed, and the programme arranged for the next meeting, by the executive committee; viz: on Resolutions; Apiarian Supplies and Exhibits; Subjects for Discussion; and Arrangements, to receive and entertain those in attendance from abroad.

Programme.—President's Address. Subject—State and National Conventions.

Subjects for general discussion: *Essays.*—The "Coming bee," W. H. Andrews. Honey plants, Native Horsemints, different varieties, Wm. R. Howard. "Extracted vs. Comb Honey," W. K. Marshall, D. D. "Bee-Moth," W. H. Andrews. "The Queen Bee, her nature and habits," Wm. R. Howard. "The different races of bees in America; their relative value to apiculture," W. K. Marshall, D. D.

Other essays are promised, and a general good time is anticipated. Ample arrangements are made to accommodate those from a distance. Those wishing to place anything on exhibition or correspond with the committee of arrangements, will be promptly attended to, by addressing, W. H. Andrews, President, McKinney, Collin Co., Texas. All other correspondence to the Secretary. We would be pleased to have any one propound questions of interest for discussion, as we have found great interest, as well as valuable information gained by the discussion of questions contributed to our "Question Box."

Wm. R. HOWARD, Sec.
Kingston, Texas.

The annual meeting of the Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association will be held in Temperance Hall, Freeport, Stephenson county, Ill., on January 16 and 17, 1883.

JONATHAN STEWART, Sec.
Rock City, Ill.

The Eastern New York Bee-Keepers' Union will hold their 11th Semi-Annual Convention on Tuesday, Wednesday and Thursday, January 2nd, 3d, and 4th, 1883, at the State Agricultural Rooms, State Street, Albany, at 10 o'clock, a. m. All interested in bees are invited to attend.

C. QUACKENBUSH, Sec.
W. L. TENNANT, Pres.

The Nebraska State Bee-Keepers' Association, will hold its annual session in Wahoo, Saunders county, Neb., commencing Thursday, Jan. 11th, 1883. Arrangements have been made with the railroads to secure 1¼ fare for the round trip. The Saunders county Bee-Keepers' Association will furnish entertainment free to all visiting apiarists. Bee-keepers from neighboring States will be welcomed.

T. L. VON DORN, Pres.
GEO. M. HAWLEY, Sec.

The Southeastern Michigan Bee-Keepers' Association will hold their annual meeting in the courthouse at Ann Arbor, Jan. 20, 1883. All are invited. H. D. CUTTING, *Pres.*
G. J. PEASE, *Sec.*, Ann Arbor.

The Ohio State Bee-Keepers' Association will meet in Columbus, in the rooms of the *Ohio State Journal*, on Tuesday and Wednesday, Jan. 9 and 10, 1883. A full attendance of members, and all interested in bee-culture, is requested, as matters of interest and importance will be discussed.
Dr. H. BESSE, Delaware, O., *Pres.*
DANIEL SPEAR, Cardington, O., *Sec.*

The Northeastern Bee-Keepers' Association will hold their thirteenth Annual Convention in the City Hall, at Syracuse, N. Y., on the 9th, 10th and 11th days of January, 1883.

Business of great value to every bee-keeper in the State will be brought before the meeting. Every member is requested to attend and bring their friends, that all may be benefited by the action there taken.

The question drawer will be opened each day, and questions answered and discussed. All are invited to send questions. Appropriate diplomas will be awarded to successful exhibitors of implements, etc. Let all attend.
GEO. W. HOUSE, *Sec.*

The annual meeting of the Mahoning Valley Bee-keepers' Association will be held at Berlin Center, Mahoning Co., O., in the town hall on Friday and Saturday the 19th and 20th of January, 1883. All bee-keepers are invited to attend and send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. In fact, the meetings will be so interesting that you cannot afford to miss them. We expect a lecturer from abroad on the evening of the 19th.
L. CARSON, *Pres.*

The annual meeting of the Cortland Union Bee-keepers' Association will be held in Cortland, N. Y., on Tuesday, Jan. 9, 1883.
M. C. BEAN, *Sec.*
McGrawville, N. Y.

The annual meeting of the Champlain Valley Bee-Keepers' Association will be held at Middleburg, Vt., on Thursday, January 18, 1883, at 10 a. m.
T. BROOKINS, *Sec.*

The Indiana State Bee-Keepers' Association will hold its annual meeting at Indianapolis, Ind., on Jan. 10 and 11, 1883. All are invited.
Dr. J. H. O'REAR, *Pres.*

The quarterly meeting of the Marshall County Bee-Keepers' Association will meet in Marshalltown, Iowa, on Saturday, Jan. 6, 1883, at the Sheriff's office, in the Court House, at 10:30 a. m. The subject for discussion being "Winter and Spring Care."
J. W. SANDERS, *Sec.*

Honey and Beeswax Market.

OFFICE OF AMERICAN BEE JOURNAL, }
Monday, 10 a. m., December 25, 1882. }

The following are the latest quotations for honey and beeswax received up to this hour:

Quotations of Cash Buyers.

CHICAGO.

HOONEY—The supply of extracted honey is fully up to the demand. My quotations are: 7c. for dark and 9c. for light, delivered here.

BEESWAX—It is quite scarce. I am paying 27c. for good yellow wax, on arrival; dark and off colors, 17@22c.

AL. H. NEWMAN, 923 W. Madison St.

CINCINNATI.

HOONEY—The demand is good for extracted in barrels as well as in glass jars and tin buckets; arrivals are fair. The demand is fair for comb honey, which, however, is not cheap enough to make trade lively. Extracted brings 7@10c. on arrival; comb honey, 14@20c.

BEESWAX—Is scarce and brings 20@27c. on arrival.
CHAS. F. MUTH.

Quotations of Commission Merchants.

CHICAGO.

HOONEY—The demand for comb honey does not keep pace with the receipts. There is a large surplus on this market at present, and prices are from 2 to 3c. lower than last month.

We quote: white comb honey, in 1@2 lb. sections, 17@18c. Dark comb honey, hardly any demand. It is held at 12@15c. Extracted—White brings from 9@10c.; dark, 8@9c.; kegs, half-barrels and casks bring about same price.

BEESWAX—Choice Yellow, 30c.; dark to medium, 18@25c.

R. A. BURNETT, 161 South Water St.

SAN FRANCISCO.

HOONEY—Stock is small, with but little demand, and buyers bid low.

White comb, 16@20c.; dark to good, 11@14c.; extracted, choice to extra white, 8@9c.; dark and candied, 7@8c.

BEESWAX—We quote 25@28c.

STEARNS & SMITH, 423 Front Street.

ST. LOUIS.

HOONEY—Dull. Comb, at 16c. for large or hard to 19@20c. for choice bright in small packages; extracted at 8@9c.; strained, 6@7c.; choice, in smaller quantities, brings more.

BEESWAX—Prime bright steady at 27@28c.

R. C. GREER & Co., 117 N. Main Street.

CLEVELAND.

HOONEY—Has changed in price a very little, we find it necessary to sell all grades about 1 cent per lb. less. Best white, in 1 lb. sections, 20@21c. per pound; in 2 lb. sections, 18@20c. Extracted is very dull indeed, hardly any sale.

BEESWAX—Scarce, 28@30c.

A. C. KENDEL, 115 Ontario Street.

NEW YORK.

HOONEY—There is only a moderate supply of choice to fancy white clover honey, and prices are still held firmly, though the demand is not large. Buckwheat and extracted honey continue slow.

We quote: White clover, first quality, 1 lb. boxes, 25c.; fair to good, 20@25c.; buckwheat, 1 lb. boxes, 17c. Extracted, clover, 13c.; buckwheat, 10c.

BEESWAX—The supply has been light and prime lots held a shade higher.

Western pure, 30@31c.; southern, pure, 31@32c.

D. W. QUINBY, 105 Park Place.

BOSTON.

HOONEY—Our market is fairly active. We quote: ½ lb. sections at 30c.; 1 lb. sections, 22@25c.; 2 lb. sections, 20@22c. Extracted, 10c. per lb. Good lots of extracted are wanted in kegs or barrels.

BEESWAX—30c.

CROCKER & BLAKE, 57 Chatham Street.

May we ask you, dear reader, to speak a good word for the BEE JOURNAL to neighbors who keep bees, and send on at least one new subscription with your own? Our premium, "Bees and Honey," in cloth, will pay you for your trouble, besides having the satisfaction of knowing that you have aided the BEE JOURNAL to a new subscriber, and progressive apiculture to another devotee.

SELECTIONS FROM OUR LETTER BOX

Duty on Beeswax.—I see that beeswax is in the tariff list of chemicals, and is to be assessed 20 per cent. in the new tariff bill. The home supply of wax is not large enough to furnish wax for comb foundation, and the demand for foundation is rapidly increasing. This means a big raise in the price of wax, and also in comb foundation. Chemical and mechanical purposes will use some, and must have it. Comb foundation manufacturers and dealers would make as much with lower-priced wax. Bee-keepers would use more of it and succeed better. The burden will be heaviest on the users of foundation. Cannot something be done to let the wax be imported free of duty.

C. E. MEAD.

Chicago, Ill., Dec. 14, 1882.

[We get but little beeswax from foreign countries, and none from Europe; to the latter, however, we export large quantities of our brightest yellow wax.

The law of "supply and demand" will regulate the price; and, as the value of beeswax increases here, on account of bee keepers becoming consumers, instead of producers, the foreign demand will be less, and thus prevent its rising to such figures as it would if the European markets were constantly demanding all we had in stock. We do not see, therefore, that the tariff cuts any figure in the matter.—ED.]

Correction.—On looking over the AMERICAN BEE JOURNAL, No. 50, just received, I notice on page 795, 2nd column, 3d line from the top, what may be a typographical error. The word "heated" should be *breathed*. And in the 6th line from the top, "inhaled" should be *exhaled*. See the passage near the foot of page 728, 2nd column. Possibly it was misquoted by Dr. Oldham. It might be worth while to correct these errors. If there is any good in it, give it a chance; if not, it will not be necessary to strangle it.

S. CORNELL.

Lindsay, Ont., Dec. 15, 1882.

[It was an error in the copy; we printed it as it was written. It was an oversight, of course.—ED.]

My Report for 1882.—I started, last spring, with 11 colonies; all middling strong, until May 28, when on account of cold and wet weather, I came near losing 5 out of the 11; but, by feeding them I brought them through, and got 1 swarm from each. The strongest commenced swarming on May 14, and from that time until May 22, I got 5 swarms; they commenced swarming again on June 21, and continued until

Sept. 14. Which gave me No. 74. I took up 1, doubled 2, and have 71 left, all in good condition, and will average 25 lbs. of honey more than they need to winter on. I took off over 1,500 lbs. of honey, nearly all in 1½ lb. sections, and sold it for 15c. per pound. The swarms were all natural except one.

M. H. LEWIS.

Greentop, Mo.

Bees Have Dysentery.—The bees in this locality are badly affected with dysentery, having had no flight since winter began.

J. A. BUCKLEW.

Clarks, O., Dec. 16, 1882.

2,000 Pounds of Honey from 9 Colonies.—I started with 10 colonies last spring, sold one, leaving 9; increased to 31; took from them 2,000 lbs. of honey. The last swarm was hived Aug. 28, which filled its hive, besides giving some surplus.

GEO. BISCHOFF.

Burlington, Iowa, Dec. 15, 1882.

Breeding in the Fall.—Upon examining my bees, on the first of Nov., I found no brood of any kind. What does that indicate? I have kept bees for five years, and it is the first I remember of finding them without brood that time of the year. I extracted on Sept. 15. I winter on their summer stands and have never lost a colony. I pack them all round with hay, except the front; that is exposed to the weather.

H. A. PIERCE.

Fremont, Neb.

[All well-behaved bees cease to breed in the fall, and by "the first of November," there ought to be no brood in the hive.—ED.]

Moving Bees.—I moved my bees last spring, from Nebraska to Kansas, about 200 miles, but farther than that by rail. I had 11 colonies, spring count; they have increased to 40 by natural swarming, and are all in good condition, strong, with a good supply of honey. I took off nearly 1000 lbs. of surplus honey. From my experience during the past summer, I think bees will do well in this part of Kansas.

G. W. GORUM.

Meredith, Cloud Co., Kansas.

Bees in California.—So far, this fall, we have had three rains. At the present time, vegetation is nicely started, the valleys and hills look nice and green. We had, the past season, ½ of a crop; for the past three year we have averaged ¾ of a crop. The year 1879 being the only total failure in this vicinity for the past fifteen years. From the above, we think our location will compare favorably with any portion of the country. Experience has taught us that in a hot, dry climate, like California, bees must be shaded to keep the hive cool, so that the bees will keep to work all day. The hives having no shade, the bees are clustered on the outside, remaining idle on all hot days, between the hours of 9 a. m. and 4 p. m., California is like all other places; to insure success, you have to

introduce new tested queens every few years, from some different locality, into your apiary. We find it pays. We have disposed of all our crop, and have all supplies in for another year; all bees are in good condition for winter, every hive having a laying queen and an ample supply of honey. We have some hives on hand, and intend to make 300 new ones. We do not wish much of an increase, and intend to use the extractor freely.

BRAY & SEACORD.

Wartham, Cal., Dec. 5, 1882.

My first Report.—I am well satisfied with my summer's work. I commenced the spring of 1882 with 2 colonies in tolerable condition. I received 5 natural swarms, and one by dividing, making 8 in good condition, and received 200 lbs. of comb honey, or 100 lbs. per colony, spring count. Is that not tolerably good? The honey was in 2½ lb. sections. I have nearly one-half of it sold at 15 cts. per lb. Old foggy bee-keepers are injuring the market. I can sympathize with Mrs. Harrison, for I have had the same experience. I will give my method for wintering bees on the summer stands in the future. Success to the BEE JOURNAL and its Editor.

S. C. FREDERICK.

Coal Vale, Kansas, Dec. 14, 1882.

A Poor Season.—I cannot get along without the BEE JOURNAL, so long as I keep bees. It has paid for itself many times over, by the instruction it has given me in the care and handling of bees during the past season. I commenced the season of 1882 with 3 colonies; increased to 7, and as this has been a very poor season in this part of the country, I obtained only 50 lbs. of surplus, per colony, spring count. All 7 colonies went into winter quarters in splendid condition, in "Cotton" hives, packed with hay, cut fine with a hay cutter, and on their summer stands. Seeing so much published about Mrs. Lizzie E. Cotton, I decided last fall to visit the lady, and consequently took a journey of 600 miles, and am now able to judge of her, and her method of doing business, based on personal observation. It is enough for the present to say that I returned home with a less favorable impression of her than when I left. A description of what I saw I may give you this winter, if desired.

S. H. WOOD.

St. Albans, Vt., Dec. 18, 1882.

Good.—I take this opportunity to extend thanks to you, Mr. Editor, for the many able articles which have appeared, from time to time, in your paper, on all subjects of interests to bee-keepers. I put into winter quarters, in 1881, 4 colonies, and wintered them all successfully. I used cut chaff to pack them with. The size of frames I use is the Cary, 10¾x14 in. My yield for 1882 was 370 lbs. of comb honey, and I increased from 4 colonies to 9, by natural swarming. I obtained that amount of honey under some disadvantages. I was compelled to remove 3 of my colonies to another

locality, about 2½ miles, during the best honey flow of the season, but I feel like congratulating myself, taking everything into consideration.

HENRY HARTMAN.

Hokendauqua, Pa., Dec., 14, 1882.

Not Encouraging.—My report for this year is, I think, so very poor that I did not deem it worth sending in, but I could not help that, for the season would not permit me to do any better. Some of my colonies have not gathered a single pound of honey, and hardly enough to winter on; others have gathered a little. The best that any colony did was one of black bees. This colony obtained 54 lbs. in one-pound sections, and it was a swarm on June 15. All the honey that I have obtained from 10 colonies, spring count, was a little over 400 lbs. The clover honey I sold for 20 cts. per lb., and buckwheat honey I sold for 16 cts. I hope for a better crop in Western Pennsylvania next season.

C. M. CLARK.

Lincolnton, Pa., Nov. 27, 1882.

Water in the Bee Cellar.—The BEE JOURNAL makes its regular weekly visits, and has become a necessity. I could not well do without it. My bees are enjoying their winter rest in the cellar, with plenty to eat and nothing to disturb them. I can endorse the methods described by Mr. Ira Barber, of DeKalb, N. Y., for wintering bees, having perused the same course for a number of years without loss, often with 6 inches of water in the cellar. I believe water is a benefit to them, although writers generally advocate a dry atmosphere. There are but few bees in this township besides my 45 colonies. There are 2 or three box-hive men; quite enough to keep up the supply of moth. They will not learn anything better.

L. EASTWOOD.

Waterville, O., Dec. 19, 1882.

Snow three feet Deep.—I have kept bees for 50 years, but do not see how I can get along without the BEE JOURNAL. The experience of the many is what we want to know in any business. The past year was the poorest, but one, for honey during the past 50 years, but I look for a good honey season next year. The bees are now snowed under, 3 feet deep. I have always noticed that a good honey season follows a "snug" winter, and a poor one after a mild and open winter. I wish the BEE JOURNAL came twice a week instead of weekly.

T. A. C. EVERETT.

Randolph, N. Y., Dec. 18, 1882.

Good Increase.—My brother and myself commenced the last spring with 19 colonies; two swarms escaped to the woods; we have now 45, packed in chaff and saw-dust. All are Italians but 8 colonies. We use the Langstroth hive, but had no extractor, so that our hives are now full of honey. We had some honey in sections, besides the increase.

Aster. 236, 603, 651, 666, 667, 747
Bacopa japonica. 240
Barberry. 449
Basswood. 35, 410, 423, 427, 538, 571, 715
Bitter sweet. 390, 536
Buckhorn clover. 588
Buc eye. 395
Buckwheat. 108, 475, 714
Butterfly weed. 466, 337
Cattail. 188, 538, 534
Celandine. 586
Climbers. 123
Cleome. 566
Coralberry. 185, 538, 570
Corn. 219, 340, 456, 556
Crane's-bill. 530
Dandelion. 578
Figwort. 474, 518, 553, 570
Giant hyssop. 650
Golden honey plant. 107, 514, 517, 567, 652
Golden rod. 555, 586, 587, 608, 619
Grindella squarrosa. 651
Honey-mulberry. 659
Horse mint. 794
Honey locust. 286, 396, 418, 423
Laurel. 249
Maple. 217
Mignonette. 12, 183
Milkweed. 532, 537
Mint. 534, 731
Motherwort. 410, 427, 443, 476, 491, 536, 586
Osage orange. 411
Partridge pea. 466
Persimmon. 752
Purple prairie clover. 347
Potatoes. 104
Raspberry. 11
Rape. 791
Red clover. 186, 378, 441
Saw palmetto. 282
Sea coll heater. 3
Sour clover. 10, 30, 35, 61, 113, 137, 148, 155, 186, 219, 266, 314, 361, 376, 347, 481, 556, 562, 642, 697, 666, 711, 730, 745, 786, 793, 818

Pasturage—continued.

Smart weed. 586
Sterculia. 442
Thyme. 29
Tilia Americana. 348
Yarrow. 537, 540, 589
Washington bayonet. 633
White clover. 61, 263, 412, 427, 539, 603
Wild bergamot. 537
Wild camomile. 568
Wild honey-suckle. 362
Willow. 783
Wormwood. 235
Yellow melilot. 611, 696
How to gather sweet clover. 571
How to sow. 727
New foreign honey plants. 674
Notes on honey plants. 517, 602, 639, 690
Ornamental pasturage. 337, 339
Planting. 545, 556
Plenty of bloom. 267, 410
Questions on honey plants. 473, 545
Seeding an orchard. 555
Seeding alisike clover. 689
Sweet clover as a honey producer. 615
Sweet clover as stock pasture. 10
Sweet clover in the woods. 377
Tree planting. 423

Queens

Clipping the wings of. 12, 187, 200, 231, 361, 417, 421, 504, 554, 724, 732
Crawlers. 131
Crumbs for the curious. 534
Deserting the hive. 44
Dollor. 104, 145, 149, 317, 377, 185, 249, 289, 321, 340, 443, 345, 376, 392, 393, 436, 483, 520, 620, 775, 788
Doollittle's method of rearing. 454
Drone layers. 75, 586
Eggs duplicated in cells. 363
Eggs laid in queen-cells. 357
Eggs removed by workers. 452
Eggs of drone. 410, 412
Fertilization. 311, 343, 588, 789
Froctions of. 311, 472
Good ones necessary. 315, 363, 424
Importation of. 34, 104
Introducing. 108, 223, 249, 357, 424, 426, 437, 507, 643, 739, 791
Lamp nursery. 271
Late breeding. 889
Leading the swarm. 617, 707
Loss of. 377, 385
Poor queens. 474

Queen-cells. 451, 363, 267, 265
Queenlessness. 283
Queen-trap. 533
Rearings. 9, 86, 137, 190, 226, 265, 316, 341, 347, 354, 657, 410, 440, 454, 500, 745, 790, 806
Shipping. 411, 517, 531, 538, 550, 564, 593, 610
Superseding. 45, 107, 140, 265, 331, 424
Taking flight from the comb. 618
Two in one hive. 613
Untested. 133, 184, 218, 343, 393, 436, 514, 520

Wintering Bees

Absorbents. 61
Bee house. 41, 134, 314, 411, 703, 810
Bees deserting hives. 61
Best hive for. 61, 82
Breeding in winter. 234
Building a bee cellar. 741
Burying in cave. 11, 309, 375, 376, 694, 709, 715
Causes of disaster. 164
Cellars. 45, 61, 108, 123, 133, 171, 203, 236, 267, 556, 613, 649, 692, 725
Clover hives. 629, 708, 741
Cider for. 38
Clover chaff for packing. 806
D. A. Jones' plan. 709
Feeding in winter. 35, 76, 140, 410, 619, 692
Greenhouse for. 689
Honey winter bee. 682
In England. 612
In Texas. 44
Is the problem settled? 71, 331
Lime for. 329, 727, 595
Moving in winter. 29, 54
Packed with chaff. 13, 107, 224, 124, 151, 314, 322, 426, 659, 684, 709, 733, 786, 811
Packed with hay, etc. 10, 29, 61, 123
Pollen detrimental. 25, 38, 198, 627
Preparation for. 30, 38, 57, 87, 121, 186, 228, 348, 395, 598, 611, 654, 643, 646, 679, 686, 692, 693, 714, 740, 746, 760, 762, 808, 825, 828, 830
Results of the past winter. 44, 76, 108, 169, 170, 172, 249, 265, 314, 754
Snow drifts. 795, 824
Successful. 12, 107, 124, 186, 217, 236, 252, 332, 390, 347, 395, 659
Summer sands. 13, 41, 97, 124, 137, 236, 251, 381
Taking out of winter quarters. 140
Temperature during. 76, 153, 183, 502
Two-story hive for. 689
Ventilation. 39, 45, 215, 240, 390, 380, 795
Water for. 29, 45, 60, 72, 82, 124, 203, 820
Winter passages. 379
Young bees for. 124, 643

 * The 6 above-named papers..... 6 35.. 5 50

The Weekly Bee Journal one year and Prof. Cook's Manual (bound in cloth) 3 25.. 3 00
 Bees and Honey, (T. G. Newman) " 2 75.. 2 50
 Binder for Weekly Bee Journal..... 2 75.. 2 50
 Apiary Register for 100 colonies 3 50.. 3 00
 Apiary Register for 200 colonies 4 00.. 3 50

The **Monthly Bee Journal** and any of the above, \$1 less than the figures in the last column.

The time for the usual winter rush of correspondence is here, and we wish to impress upon all our patrons the necessity of being very specific, and carefully to state what they desire for the money sent. Also, if they live near one post office, and get their mail at another, be sure to give us the address we already have on our books.

Sample Copies of the **AMERICAN BEE JOURNAL** will be sent *free* to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the **Date** following your name on the wrapper label of this paper; it indicates the end of the month to which you have paid your subscription on the **BEE JOURNAL**.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

The **BEE JOURNAL** is mailed at the Chicago post office every Tuesday, and any irregularity in its arrival is due to the postal employees, or some cause beyond our control.

Attention is called to a few changes in our clubbing list for 1883, as given on page 829. Those interested will please take notice.

We carefully mail the **BEE JOURNAL** to every subscriber, but should any be lost in the mails we will cheerfully send another, if notified before all the edition is exhausted.

Renewals may be made at any time; but all papers are stopped at the expiration of the time paid for, unless requested to be continued.

Honey as Food and Medicine.

A new edition, revised and enlarged, the new pages being devoted to *new* Recipes for Honey Medicines, all kinds of cooking in which honey is used, and healthful and pleasant beverages.

We have put the price of them low to encourage bee-keepers to scatter them far and wide. Single copy 6 cents, postpaid; per dozen, 50 cents; per hundred, \$4.00. On orders of 100 or more, we print, if desired, on the cover-page, "Presented by," etc., (giving the name and address of the bee-keeper who scatters them). This alone will pay him for all his trouble and expense—enabling him to dispose of his honey at home, at a good profit.

The Apiary Register.

All who intend to be systematic in their work in the apiary, should get a copy and commence to use it.

For 50 colonies (120 pages)..... \$1 00
 " 100 colonies (220 pages)..... 1 50
 " 200 colonies (420 pages)..... 2 00

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable ones.

Do not let your numbers of the **BEE JOURNAL** for 1881 be lost. The best way to preserve them is to procure a binder and put them in. They are very valuable for reference.

Bee Pasturage a Necessity.—We have just issued a new pamphlet giving our views on this important subject, with suggestions what to plant, and when and how. It is illustrated with 26 engravings, and will be sent postpaid to any address for 10 cents.

A few of our subscribers are in arrears for the present year—having requested us to continue, and they would pay soon. Will all such please take this as a request to send on the two dollars with a renewal for next year, if possible.

Advertisements intended for the **BEE JOURNAL** must reach this office by Saturday of the previous week.

Postage stamps, of one, two or three cent denomination, accepted for fractional parts of a dollar; but money is preferred.

LANGSTROTH AND SIMPLICITY L CHAFF HIVES, with movable upper story, section boxes, metal-cornered brood frames, wide Langstroth frames and comb foundation. Send for Price List. A. B. MILLER & SON, 44 W. Wabasha St., Chicago, Ill.

ADVERTISING RATES for 1883.

20 cents per line of space, each insertion,
 For either the Weekly or Monthly Editions.

A line of this type will contain about 8 words; TWELVE lines will occupy ONE-INCH of space. Transient Advertisements payable in advance. Editorial Notices, 50 cents per line.

SPECIAL RATES.—Advertisements will be inserted in both Weekly and Monthly editions, at the following prices, if wholly paid in advance:

SPACE.	One month	Two mo'ths	Three mo'ths	Six mo'ths	One Year.
1 in. 12 lines	10.00	18.00	25.00	38.00	50.00
2 in. 24 lines	20.00	32.00	40.00	60.00	80.00
3 in. 36 lines	25.00	40.00	50.00	75.00	100.00
4 in. 48 lines	32.00	50.00	65.00	90.00	125.00
5 in. 60 lines	40.00	60.00	75.00	110.00	150.00
6 in. 72 lines	45.00	70.00	90.00	130.00	175.00

For the Weekly alone, 20 per cent. less than the above rates. On yearly advertisements, payments may be made quarterly, but must be in advance.

Advertisements withdrawn before the expiration of the contract, will be charged the full rate for the time the advertisement is inserted.

The Bee-Keeper's Guide

OR,

MANUAL OF THE APIARY,

By **A. J. COOK,**

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

—:—

320 Pages; 133 Fine Illustrations.

—:—

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

—:—

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—*L'Apiculteur, Paris.*

I think Cook's Manual is the best of our American works.—*LEWIS T. COLBY.*

It appears to have cut the ground from under future book-makers.—*British Bee Journal.*

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the apiary.—*J. P. WEST.*

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—*E. H. WYKHOOP.*

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—*Mich. Fur.*

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—*Herald, Monticello, Ill.*

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—*A. E. WENZEL.*

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—*WM. VAN ANTWERP, M. D.*

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—*Ky. Live Stock Record.*

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much.—*LADBE DU BOIS, editor of the Bulletin D'Apiculture, France.*

It not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—*Democrat, Pulaski, N. Y.*

We have perused with great pleasure this *volume* of the bee-keeper. It is replete with the best information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—*Agriculturist, Quebec.*

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, neatly bound, and is a credit to the West.—*Western Agriculturist.*

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowledge of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—*American Inventor.*

—:—

PRICE—Bound in cloth, \$1.25; in paper cover, \$1.00 by mail prepaid. Published by

THOMAS G. NEWMAN,

West Madison Street, CHICAGO, ILL.

BOOKS,

Sent by mail, on receipt of price, by
THOMAS G. NEWMAN,
925 West Madison Street, CHICAGO, ILL.

Bee-Keeper's Guide for Cook's Manual of the Apiary.— Entirely re-written, elegantly illustrated and fully "up with the times" on every subject of bee-culture. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper cover, \$1.

Quinby's New Bee-Keeping. by L. C. Root.—The author treats the subject of bee-keeping so that it cannot fail to interest all. Its style is plain and forcible, making all its readers realize that its author is master of the subject. —\$1.50.

Novice's ABC of Bee-Culture. by A. I. Root.—This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25.

King's Bee-Keepers' Text-Book. by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1.00.

Langstroth on the Hive and Honey Bee.—This is a standard scientific work. Price, \$2.

Blessed Bees, by John Allen.—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, 75c.

Bees and Honey, or Management of an Apiary for Pleasure and Profit. by Thomas G. Newman.—Third Edition. "Fully up with the times," including all the various improvements and inventions. Chief among the new chapters are: "Bee Pasturage a Necessity," "Management of Bees and Honey at Fairs," "Marketing Honey," etc. It contains 199 pages, and is profusely illustrated. Price, bound in cloth, 75c.; in paper covers, 50c., postpaid.

Bienen Kultur. by Thomas G. Newman, in the GERMAN language. Price, in paper covers, 40 cents, or \$3 per dozen, postpaid.

Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes the facts and arguments to demonstrate them. 15 c.

Honey, as Food and Medicine. by Thomas G. Newman.—This pamphlet discourses upon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market; Honey as Food, giving recipes for making Honey Cakes, Cookies, Puddings, Fonn, Wines, etc.; and Honey as Medicine, with many useful Recipes. It is intended for consumers, and should be scattered by thousands, creating a demand for honey everywhere. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This contains the Prize Essays on this subject, read before the Centennial Bee-Keepers' Association. Price, 10c.

Preparation of Honey for the Market. including the production and care of both comb and extracted honey, and instructions on the exhibition of bees and honey at Fairs, etc., by T. G. Newman. Price 10c.

The Hive in Use—Being a description of the hive used by G. M. Doolittle. Price, 5c.

Font Brand; its origin, development and cure. By Albert R. Konke. Price, 25c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dudant, giving in detail the methods and management adopted in their apiary. This contains many useful hints.—Price 15c.

Bee Pasturage a Necessity, by Thomas G. Newman—Giving advanced views on this important subject, with suggestions what to plant, and when and how: 26 engravings. Price, 10c.

Practical Hints to Bee-Keepers. by Ches. F. Muth; 32 pages. It gives Mr. Muth's views on the management of bees. Price, 10c.

Swarming, Dividing and Feeding Bees.—Hints to Beginners, by Thomas G. Newman. Price 5 cents.

Bees in Winter, with instructions about Chaff-Packing, Cellars and Bee Houses, by Thomas G. Newman. Price 5c.

Food Adulteration; What we eat and should not eat. This book should be in every family, and ought to create a sentiment against adulteration of food products, and demand a law to protect the consumer against the numerous health-destroying adulterations offered as food. 200 pages 50c.

Scribner's Lumber and Log Book.—Most complete book of its kind published. Gives measurement of all kinds of lumber, logs, and planks by Doyle's Rule, cubical contents of square and round lumber, staves and heading bolt tables, wages, rent, board capacity of cisterns, cordwood tables, interests, etc. Standard book throughout United States & Canada. Price 45 c. postpaid.

Kendall's Horse Book.—No book could be more useful to horse owners. It has 35 engravings illustrating positions of sick horses, and treats all diseases in a plain and comprehensive manner. It has recipes, a table of doses, and much valuable horse information. Price 25c. for either the English or German editions.

Moore's Universal Assistant, and Complete Mechanic, contains over 1,000,000 Industrial Facts, Calculations, Processes, Trade Secrets, Legal Items, Business Forms, etc., of vast utility to every Mechanic, Farmer and Business Man. Gives 200,000 Items for Gas, Steam, Civil and Mining Engineers, Machinists, Millers, Blacksmiths, Founders, Miners, Metallurgists, Assayers, Plumbers, Gas and Steam Fitters, Brokers, Gliders, Metal and Wood Workers of every kind.

The work contains 1,016 pages, is a veritable Treasury of Useful Knowledge, and worth its weight in gold to any Mechanic, Business Man, or Farmer. Price, postage paid, \$2.50.

Fisher's Grain Tables for Farmers, etc.—192 pages, pocket form; full of useful tables for casting up grain, produce, hay; cost of pork, interest; wages tables, wood measurer, ready reckoner, plowing tables and more miscellaneous matter and useful tables for farmers and others than any similar book ever published. Ask your bookseller for it. Sent post-paid for 40 cents.

Chicken Cholera, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

Deutscher Buecher Ueber Bienenzucht.

Bienen Kultur, oder erfolgreiche Behandlung der Bienen, von Thos. G. Newman. Dieses Pamphlet enthält Belehrungen über folgende Gegenstände—**Der Urfickheit des Bienenstandes**—**Honig pflanzen**—**Erziehung der Königin**—**Gittern**—**Schwärmen**—**Ableger**—**Verfegen**—**Italienisieren**—**Züfcher von Königinnen**—**Ausziehen**—**Bienen behandeln und beruhigen**; weiter enthält es ein Kapitel, worin die neueste Methode für die Herrichtung des Honigs für den Handel beschrieben ist. EARS FOR THE MILLION!

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the Only Absolute Cure for Deafness Known.

This Oil is abstracted from a peculiar species of small **White Shark,** caught in the Yellow Sea, known as **Carcharodon Rondellei.** Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest about the year 1410. Its cures were so numerous and many an seemingly miraculous, that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for over **300 years no Deafness has existed among the Chinese people.** Sent, charges prepaid, to any address at \$1.00 per bottle.

HEAR WHAT THE DEAF SAY!

It has performed a miracle in my case. I have no unearthly noises in my head, and hear much better. I have been greatly benefitted. My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to **HAYLOCK & JENNEY, 7 Dey Street, New York,** enclosing \$1, and you will receive by return a remedy that will enable you to hear like anybody else, and whose curative effects will be permanent. You will never regret doing so."—EDITOR OF MERCANTILE REVIEW.
